## 1 Get Started
1.1 Introduction ................................................. 3
1.2 What You Need ............................................. 3
   1.2.1 Hardware ............................................. 3
   1.2.2 Software ............................................ 53
1.3 Installation ............................................... 53
   1.3.1 IDE .................................................. 54
   1.3.2 Manual Installation ................................. 54
1.4 Build Your First Project ................................. 86
1.5 Uninstall ESP-IDF ......................................... 86

## 2 API Reference
2.1 API Conventions ........................................... 87
   2.1.1 Error Handling ...................................... 87
   2.1.2 Configuration Structures ............................ 87
   2.1.3 Private APIs ......................................... 89
   2.1.4 Components in Example Projects .................... 89
   2.1.5 API Stability ....................................... 89
2.2 Application Protocols ..................................... 90
   2.2.1 ASIO Port ............................................ 90
   2.2.2 ESP-Modbus .......................................... 91
   2.2.3 ESP-MQTT ........................................... 91
   2.2.4 ESP-TLS ............................................ 109
   2.2.5 ESP HTTP Client .................................. 128
   2.2.6 ESP Local Control ................................ 145
   2.2.7 ESP Serial Slave Link .............................. 155
   2.2.8 ESP x509 Certificate Bundle ....................... 169
   2.2.9 HTTP Server ........................................ 172
   2.2.10 HTTPS Server ...................................... 200
   2.2.11 ICMP Echo ......................................... 204
   2.2.12 mDNS Service ..................................... 209
   2.2.13 Mbed TLS .......................................... 210
   2.2.14 IP Network Layer ................................ 212
2.3 Error Codes Reference .................................... 212
2.4 Networking APIs ........................................... 218
   2.4.1 Wi-Fi ............................................... 218
   2.4.2 Ethernet ............................................. 354
   2.4.3 Thread .............................................. 388
   2.4.4 ESP-NETIF .......................................... 397
   2.4.5 IP Network Layer ................................ 434
   2.4.6 Application Layer ................................ 437
2.5 Peripherals API ............................................ 437
   2.5.1 Analog to Digital Converter (ADC) Oneshot Mode Driver 437
   2.5.2 Analog to Digital Converter (ADC) Continuous Mode Driver 448
   2.5.3 Analog to Digital Converter (ADC) Calibration Driver 458
2.5.4 Clock Tree .................................................. 461
2.5.5 Digital To Analog Converter (DAC) .................. 472
2.5.6 GPIO & RTC GPIO ....................................... 486
2.5.7 General Purpose Timer (GPTimer) ................... 508
2.5.8 Dedicated GPIO .......................................... 523
2.5.9 Hash-Based Message Authentication Code (HMAC) 529
2.5.10 Digital Signature (DS) ................................ 534
2.5.11 Inter-Integrated Circuit (I2C) ....................... 539
2.5.12 Inter-IC Sound (I2S) .................................. 561
2.5.13 LCD ...................................................... 586
2.5.14 LED Control (LED) .................................... 604
2.5.15 Pulse Counter (PCNT) ................................. 624
2.5.16 Remote Control Transceiver (RMT) ................. 639
2.5.17 SD SPI Host Driver ..................................... 666
2.5.18 Sigma-Delta Modulation (SDM) ..................... 672
2.5.19 SPI Flash API .......................................... 678
2.5.20 SPI Master Driver ...................................... 709
2.5.21 SPI Slave Driver ........................................ 732
2.5.22 SPI Slave Half Duplex ................................ 739
2.5.23 Temperature Sensor .................................... 747
2.5.24 Touch Sensor ............................................ 751
2.5.25 Touch Element ......................................... 780
2.5.26 Two-Wire Automotive Interface (TWAI) .......... 810
2.5.27 Universal Asynchronous Receiver/Transmitter (UART) 833
2.5.28 USB Device Driver ...................................... 858
2.5.29 USB Host ............................................... 862

2.6 Project Configuration ........................................ 909
  2.6.1 Introduction ............................................. 909
  2.6.2 Project Configuration Menu ......................... 909
  2.6.3 Using sdkconfig.defaults ......................... 910
  2.6.4 Kconfig Format Rules ................................. 910
  2.6.5 Backward Compatibility of Kconfig Options ...... 910
  2.6.6 Configuration Options Reference .................. 911

2.7 Provisioning API ........................................... 1221
  2.7.1 Protocol Communication ............................... 1221
  2.7.2 Unified Provisioning ................................ 1237
  2.7.3 Wi-Fi Provisioning ................................... 1244

2.8 Storage API ................................................. 1263
  2.8.1 FAT Filesystem Support .............................. 1263
  2.8.2 Manufacturing Utility ............................... 1272
  2.8.3 Non-Volatile Storage Library ...................... 1277
  2.8.4 NVS Encryption ....................................... 1301
  2.8.5 NVS Partition Generator Utility .................. 1307
  2.8.6 NVS Partition Parser Utility ...................... 1313
  2.8.7 SD/SDIO/MMC Driver ................................ 1314
  2.8.8 Partitions API ....................................... 1327
  2.8.9 SPIFFS Filesystem ................................... 1337
  2.8.10 Virtual Filesystem Component .................... 1341
  2.8.11 Wear Levelling API ................................ 1357

2.9 System API ................................................ 1360
  2.9.1 App Image Format .................................... 1360
  2.9.2 Bootloader Image Format ............................ 1366
  2.9.3 Application Level Tracing ......................... 1368
  2.9.4 Call Function with External Stack ................ 1374
  2.9.5 Chip Revision ........................................ 1375
  2.9.6 Console ............................................... 1379
  2.9.7 eFuse Manager ....................................... 1388
  2.9.8 Error Code and Helper Functions ................. 1418

# 9 ESP-IDF Versions

9.1 Releases ................................................. 2201
9.2 Which Version Should I Start With? .................. 2201
9.3 Versioning Scheme ...................................... 2202
9.4 Support Periods ......................................... 2202
This is the documentation for Espressif IoT Development Framework (esp-idf). ESP-IDF is the official development framework for the ESP32, ESP32-S, ESP32-C, ESP32-H and ESP32-P Series SoCs.

This document describes using ESP-IDF with the ESP32-S2 SoC.

| Get Started | API Reference | API Guides |
Chapter 1

Get Started

This document is intended to help you set up the software development environment for the hardware based on the ESP32-S2 chip by Espressif. After that, a simple example will show you how to use ESP-IDF (Espressif IoT Development Framework) for menu configuration, then for building and flashing firmware onto an ESP32-S2 board.

Note: This is documentation for the master branch (latest version) of ESP-IDF. This version is under continual development. Stable version documentation is available, as well as other ESP-IDF Versions.

1.1 Introduction

ESP32-S2 is a system on a chip that integrates the following features:

- Wi-Fi (2.4 GHz band)
- High performance single core Xtensa® 32-bit LX7 CPU
- Ultra Low Power co-processor running either RISC-V or FSM core
- Multiple peripherals
- Built-in security hardware
- USB OTG interface

Powered by 40 nm technology, ESP32-S2 provides a robust, highly integrated platform, which helps meet the continuous demands for efficient power usage, compact design, security, high performance, and reliability.

Espressif provides basic hardware and software resources to help application developers realize their ideas using the ESP32-S2 series hardware. The software development framework by Espressif is intended for development of Internet-of-Things (IoT) applications with Wi-Fi, Bluetooth, power management and several other system features.

1.2 What You Need

1.2.1 Hardware

- An ESP32-S2 board.
- USB cable - USB A / micro USB B.
- Computer running Windows, Linux, or macOS.

Note: Currently, some of the development boards are using USB Type C connectors. Be sure you have the correct cable to connect your board!
Chapter 1. Get Started

If you have one of ESP32-S2 official development boards listed below, you can click on the link to learn more about the hardware.

**ESP32-S2-Saola-1**

This user guide provides information on ESP32-S2-Saola-1, a small-sized ESP32-S2 Datasheet based development board produced by Espressif.

The document consists of the following major sections:

- **Getting started**: Provides an overview of the ESP32-S2-Saola-1 and hardware/software setup instructions to get started.
- **Hardware reference**: Provides more detailed information about the ESP32-S2-Saola-1’s hardware.
- **Hardware Revision Details**: Revision history, known issues, and links to user guides for previous versions (if any) of ESP32-S2-Saola-1.
- **Related Documents**: Gives links to related documentation.

**Getting Started**  
This section describes how to get started with ESP32-S2-Saola-1. It begins with a few introductory sections about the ESP32-S2-Saola-1, then Section *Start Application Development* provides instructions on how to get the ESP32-S2-Saola-1 ready and flash firmware into it.

**Overview**  
ESP32-S2-Saola-1 is a small-sized ESP32-S2 based development board produced by Espressif. Most of the I/O pins are broken out to the pin headers on both sides for easy interfacing. Developers can either connect peripherals with jumper wires or mount ESP32-S2-Saola-1 on a breadboard.

To cover a wide range of users’ needs, ESP32-S2-Saola-1 supports:

- **ESP32-S2-WROVER**
- **ESP32-S2-WROVER-I**
- **ESP32-S2-WROOM**
- **ESP32-S2-WROOM-I**

In this guide, we take ESP32-S2-Saola-1 equipped with ESP32-S2-WROVER as an example.

**Contents and Packaging**
Chapter 1. Get Started

Retail Orders  If you order a few samples, each ESP32-S2-Saola-1 comes in an individual package in either antistatic bag or any packaging depending on your retailer.

Wholesale Orders  If you order in bulk, the boards come in large cardboard boxes.

For wholesale orders, please go to https://www.espressif.com/en/contact-us/sales-questions.

![ESP32-S2-Saola-1 - front](image)

**Description of Components**  The key components of the board are described in a clockwise direction.

<table>
<thead>
<tr>
<th>Key Component</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ESP32-S2-WROVER</td>
<td>ESP32-S2-WROVER is a powerful, generic Wi-Fi MCU module that integrates ESP32-S2. It has a PCB antenna, a 4 MB external SPI flash and an additional 2 MB PSRAM.</td>
</tr>
<tr>
<td>Pin Headers</td>
<td>All available GPIO pins (except for the SPI bus for flash and PSRAM) are broken out to the pin headers on the board. Users can program ESP32-S2 chip to enable multiple functions such as SPI, I2S, UART, I2C, touch sensors, PWM etc.</td>
</tr>

</tr>
<tr>
<td>RGB LED</td>
<td>Addressable RGB LED (WS2812), driven by GPIO18.</td>
</tr>
</tbody>
</table>

**Start Application Development**  Before powering up your ESP32-S2-Saola-1, please make sure that it is in good condition with no obvious signs of damage.

**Required Hardware**

- ESP32-S2-Saola-1
- USB 2.0 cable (Standard-A to Micro-B)
- Computer running Windows, Linux, or macOS
Note: Be sure to use an appropriate USB cable. Some cables are for charging only and do not provide the needed data lines nor work for programming the boards.

Software Setup Please proceed to Get Started, where Section Installation will quickly help you set up the development environment and then flash an application example into your ESP32-S2-Saola-1.

Note: ESP32-S2 series of chips only supports ESP-IDF master or version v4.2 and higher.

Hardware Reference

Block Diagram A block diagram below shows the components of ESP32-S2-Saola-1 and their interconnections.

Power Supply Options There are three mutually exclusive ways to provide power to the board:

- Micro-USB port, default power supply
- 5V and GND pin headers
- 3V3 and GND pin headers

It is recommended to use the first option: Micro-USB Port.

Header Block The two tables below provide the Name and Function of the pin headers on both sides of the board (J2 and J3). The pin header names are shown in ESP32-S2-Saola-1 - front. The numbering is the same as in the ESP32-S2-Saola-1 Schematics (PDF).

ESP32-S2-DevKitM-1

This user guide provides information on Espressif’s small-sized development board ESP32-S2-DevKitM-1. ESP32-S2-DevKitM-1 is entry-level development board. Most of the I/O pins on the module are broken out to the pin headers on both sides for easy interfacing. Developers can either connect peripherals with jumper wires or mount ESP32-S2-DevKitM-1 on a breadboard.
Chapter 1. Get Started

The document consists of the following major sections:

- **Getting started**: Provides an overview of the ESP32-S2-DevKitM-1 and hardware/software setup instructions to get started.
- **Hardware reference**: Provides more detailed information about the ESP32-S2-DevKitM-1’s hardware.
- **Hardware Revision Details**: Revision history, known issues, and links to user guides for previous versions (if any) of ESP32-S2-DevKitM-1.
- **Related Documents**: Gives links to related documentation.

**Getting Started** This section describes how to get started with ESP32-S2-DevKitM-1. It begins with a few introductory sections about the ESP32-S2-DevKitM-1, then Section *Start Application Development* provides instructions on how to get the ESP32-S2-DevKitM-1 ready and flash firmware into it.

**Contents and Packaging**

**Ordering Information** The development board has a variety of variants to choose from, as shown in the table below.

**ESP32-S2-DevKitC-1**

This user guide will help you get started with ESP32-S2-DevKitC-1 and will also provide more in-depth information. ESP32-S2-DevKitC-1 is an entry-level development board. This board integrates complete Wi-Fi functions. Most of the I/O pins are broken out to the pin headers on both sides for easy interfacing. Developers can either connect peripherals with jumper wires or mount ESP32-S2-DevKitC-1 on a breadboard.

![ESP32-S2-DevKitC-1 with ESP32-S2-SOLO Module](image)

**Fig. 9: ESP32-S2-DevKitC-1 with the ESP32-S2-SOLO Module**

The document consists of the following major sections:
- **Getting Started**: Overview of ESP32-S2-DevKitC-1 and hardware/software setup instructions to get started.
- **Hardware Reference**: More detailed information about the ESP32-S2-DevKitC-1’s hardware.
- **Hardware Revision Details**: Revision history, known issues, and links to user guides for previous versions (if any) of ESP32-S2-DevKitC-1.
- **Related Documents**: Links to related documentation.
**Getting Started**  This section provides a brief introduction of ESP32-S2-DevKitC-1, instructions on how to do the initial hardware setup and how to flash firmware onto it.

![ESP32-S2-DevKitC-1-front](image)

**Description of Components**  The key components of the board are described in a clockwise direction.

<table>
<thead>
<tr>

</table>

**Start Application Development**  Before powering up your ESP32-S2-DevKitC-1, please make sure that it is in good condition with no obvious signs of damage.

**Required Hardware**

- ESP32-S2-DevKitC-1
Chapter 1. Get Started

- USB 2.0 cable (Standard-A to Micro-B)
- Computer running Windows, Linux, or macOS

**Note:** Be sure to use an appropriate USB cable. Some cables are for charging only and do not provide the needed data lines nor work for programming the boards.

**Hardware Setup** Connect the board with the computer using **USB-to-UART Port** or **ESP32-S2 USB Port**. In subsequent steps, **USB-to-UART Port** will be used by default.

**Software Setup** Please proceed to **ESP-IDF Get Started**, where Section **Installation Step by Step** will quickly help you set up the development environment and then flash an application example into your ESP32-S2-DevKitC-1.

**Contents and Packaging**

**Ordering Information** The development board has a variety of variants to choose from, as shown in the table below.

**Retail Orders** If you order a few samples, each ESP32-S2-DevKitC-1 comes in an individual package in either antistatic bag or any packaging depending on your retailer.

**Wholesale Orders** If you order in bulk, the boards come in large cardboard boxes.

For wholesale orders, please go to https://www.espressif.com/en/contact-us/sales-questions.

**Hardware Reference**

**Block Diagram** The block diagram below shows the components of ESP32-S2-DevKitC-1 and their interconnections.

1 The ESP32-S2-SOLO-2 and ESP32-S2-SOLO-2U modules use chip revision v1.0, and the rest use chip revision v0.0. For more information about chip revisions, please refer to ESP32-S2 Series SoC Errata.
Power Supply Options  There are three mutually exclusive ways to provide power to the board:

- USB-to-UART Port and ESP32-S2 USB Port (either one or both), default power supply (recommended)
- 5V and G (GND) pins
- 3V3 and G (GND) pins

Header Block  The two tables below provide the Name and Function of the pin headers on both sides of the board (J1 and J3). The pin header names are shown in ESP32-S2-DevKitC-1 - front. The numbering is the same as in the ESP32-S2-DevKitC-1 Schematic (PDF).

**ESP32-S2-Kaluga-1 Kit v1.3**

Older version: *ESP32-S2-Kaluga-1 Kit v1.2*

The ESP32-S2-Kaluga-1 kit v1.3 is a development kit by Espressif that is mainly created to:

- Demonstrate the ESP32-S2’s human-computer interaction functionalities
- Provide the users with the tools for development of human-computer interaction applications based on the ESP32-S2

There are many ways of how the ESP32-S2’s abundant functionalities can be used. For starters, the possible use cases may include:

- **Smart home**: From simplest smart lighting, smart door locks, smart sockets, to video streaming devices, security cameras, OTT devices, and home appliances
- **Battery-powered equipment**: Wi-Fi mesh sensor networks, Wi-Fi-networked toys, wearable devices, health management equipment
- **Industrial automation equipment**: Wireless control and robot technology, intelligent lighting, HVAC control equipment, etc.
- **Retail and catering industry**: POS machines and service robots

Fig. 13: ESP32-S2-Kaluga-1-Kit Overview (click to enlarge)

The ESP32-S2-Kaluga-1 kit consists of the following boards:
• Main board: ESP32-S2-Kaluga-1
• Extension boards:
  – ESP-LyraT-8311A v1.3 - audio player
  – ESP-LyraP-TouchA v1.1 - touch panel
  – ESP-LyraP-LCD32 v1.2 - 3.2” LCD screen
  – ESP-LyraP-CAM v1.1 - camera board

Due to the presence of multiplexed pins on ESP32-S2, certain extension board combinations have limited compatibility. For more details, please see Compatibility of Extension Boards.

This document is mostly dedicated to the main board and its interaction with the extension boards. For more detailed information on each extension board, click their respective links.

This guide covers:
• Getting Started: Provides an overview of the ESP32-S2-Kaluga-1 and hardware/software setup instructions to get started.
• Hardware reference: Provides more detailed information about the ESP32-S2-Kaluga-1’s hardware.
• Hardware Revision Details: Covers revision history, known issues, and links to user guides for previous versions of the ESP32-S2-Kaluga-1.
• Related Documents: Gives links to related documentation.

Getting Started This section describes how to get started with the ESP32-S2-Kaluga-1. It begins with a few introductory sections about the ESP32-S2-Kaluga-1, then Section Start Application Development provides instructions on how to do the initial hardware setup and then how to flash firmware onto the ESP32-S2-Kaluga-1.

Overview The ESP32-S2-Kaluga-1 main board is the heart of the kit. It integrates the ESP32-S2-WROVER module and all the connectors for extension boards. This board is the key tool in prototyping human-computer interaction interfaces.

The ESP32-S2-Kaluga-1 board has connectors for boards with:
• Extension header (ESP-LyraT-8311A, ESP-LyraP-LCD32)
• Camera header (ESP-LyraP-CAM)
• Touch FPC connector (ESP-LyraP-TouchA)
• LCD FPC connector (no official extension boards yet)
• I2C FPC connector (no official extension boards yet)

All the four extension boards are specially designed to support the following features:
• Touch panel control
  – Six touch buttons
  – Supports acrylic panels up to 5 mm
  – Wet hand operation
  – Water rejection, ESP32-S2 can be configured to disable all touchpads automatically if multiple pads are simultaneously covered with water and to re-enable touchpads if the water is removed
• Audio playback
  – Connect speakers to play audio
  – Use together with the Touch panel to control audio playback and adjust volume
• LCD display
  – LCD interface (8-bit parallel RGB, 8080, and 6800 interface)
• Camera image acquisition
  – Supports OV2640 and OV3660 camera modules
  – 8-bit DVP image sensor interface (ESP32-S2 also supports 16-bit DVP image sensors, you can design it yourself)
  – Clock frequency up to 40 MHz
  – Optimized DMA transmission bandwidth for easier transmission of high-resolution images

Description of Components The description of components starts from the ESP32-S2 module on the left side and then goes clockwise.
Fig. 14: ESP32-S2-Kaluga-1 (click to enlarge)
Fig. 15: ESP32-S2-Kaluga-1 - front (click to enlarge)

Fig. 16: ESP32-S2-Kaluga-1 - back (click to enlarge)
**Reserved** means that the functionality is available, but the current version of the kit does not use it.

</table>

**Start Application Development** Before powering up your ESP32-S2-Kaluga-1, please make sure that it is in good condition with no obvious signs of damage.

**Required Hardware**
- ESP32-S2-Kaluga-1
- Two USB 2.0 cables (Standard-A to Micro-B)
  - For power supply
  - For UART/JTAG communication
- Computer running Windows, Linux, or macOS
- Any extension boards of your choice

**Hardware Setup**
1. Connect the extension board(s) of your choice (go to their respective user guides if necessary)
2. Plug in both USB cables
3. Turn the **Power Switch** to ON - the Power On LED will light up
Chapter 1. Get Started

**Software Setup**  Please proceed to *Get Started*, where Section *Installation* will quickly help you set up the development environment.

The programming guide and application examples for your ESP32-S2-Kaluga-1 kit can be found in `esp-dev-kits` repository on GitHub.

A Board Support Package can be found in IDF Component Registry.

**Contents and Packaging**

**Retail Orders**  If you order one or several samples of the kit, each ESP32-S2-Kaluga-1 development kit comes in an individual package.

![Fig. 17: ESP32-S2-Kaluga-1 - package](image)

The contents are as follows:

- **Main Board**
- ESP32-S2-Kaluga-1
- **Extension Boards:**
  - ESP-LyraT-8311A
  - ESP-LyraP-CAM
  - ESP-LyraP-TouchA
  - ESP-LyraP-LCD32
- **Connectors**
  - 20-pin FPC cable (to connect ESP32-S2-Kaluga-1 to ESP-LyraP-TouchA)
- **Fasteners**
Chapter 1. Get Started

- Mounting bolts (x8)
- Screws (x4)
- Nuts (x4)

Wholesale Orders If you order in bulk, the boards come in large cardboard boxes.
For wholesale orders, please go to https://www.espressif.com/en/contact-us/sales-questions.

Hardware Reference

Block Diagram A block diagram below shows the components of the ESP32-S2-Kaluga-1 and their interconnections.

Fig. 18: ESP32-S2-Kaluga-1 block diagram

Power Supply Options There are four ways to provide power to the board:

- Micro USB port, default power supply
- External battery via the 2-pin battery connector
- 5V and GND header pins
- 3V3 and GND header pins

Compatibility of Extension Boards If you want to use more than one extension board at the same time, please check the table given below.
### Boards Used

<table>
<thead>
<tr>
<th>Hardware</th>
<th>HW Conflict</th>
<th>Limitations</th>
<th>Solution</th>
</tr>
</thead>
<tbody>
<tr>
<td>8311Av1.3+CAM v1.1</td>
<td>I2S Controller</td>
<td>ESP32-S2 has only one I2S interface. Both extension boards require connection via the ESP32-S2’s I2S interface (LyraT-8311A in Standard mode, ESP-LyraP-CAM in Camera mode).</td>
<td>Utilize time division multiple access, or use a different audio module that can be connected via other GPIOs or DAC.</td>
</tr>
<tr>
<td>TouchA v1.1 + LCD32 v1.2</td>
<td>IO11, IO6</td>
<td>Touch actions cannot be triggered because of the multiplexed pin IO11. ESP-LyraP-LCD32 will not be affected because its BLCT pin will be disconnected from IO6.</td>
<td>Do not initialize IO11 (NETWORK) for your ESP-LyraP-TouchA, or configure the BLCT pin to -I (= do not use BLCT) for your ESP-LyraP-LCD32.</td>
</tr>
<tr>
<td>8311A v1.3 + LCD32 v1.2</td>
<td>IO6</td>

<td>Configure the BK pin to -I (= do not use BLCT) for your ESP-LyraP-LCD32.</td>
</tr>
<tr>
<td>TouchA v1.1 + 8311Av1.3</td>
<td>Pin BT_ADC on ESP-LyraT-8311A</td>
<td>This pin is required for initialization of the six button on ESP-LyraT-8311A. At the same time, ESP-LyraP-TouchA needs this pin for its touch actions.</td>
<td>If you plan to use buttons on ESP-LyraT-8311A, do not initialize pin IO6 (PHOTO) for your ESP-LyraP-TouchA.</td>
</tr>
<tr>
<td>TouchA v1.1 + CAM v1.1</td>
<td>IO1, IO2, IO3</td>
<td>Cannot be used simultaneously because of the mentioned multiplexed pins.</td>
<td>For ESP-LyraP-TouchA, do not initialize IO1 (VOL_UP), IO2 (PLAY), and IO3 (VOL_DOWN).</td>
</tr>
<tr>
<td>TouchA v1.1 + LCD32 v1.2 + CAM v1.1</td>
<td>IO1, IO2, IO3, IO11</td>
<td>Conflicts on the mentioned multiplexed pins.</td>
<td>For ESP-LyraP-TouchA, do not initialize IO1 (VOL_UP), IO2 (PLAY), IO3 (VOL_DOWN), and IO11 (NETWORK).</td>
</tr>
<tr>
<td>TouchA v1.1 + LCD32 v1.2 + 8311Av1.3</td>
<td>IO6, IO11</td>
<td>If ESP-LyraT-8311A’s pin BT_ADC is used to initialize the board’s six buttons, IO6 and IO11 will not be available for the other boards.</td>
<td>Do not initialize IO11 (NETWORK) for your ESP-LyraP-TouchA. Also, if you need to use BT_ADC, do not initialize IO6 (PHOTO).</td>
</tr>
</tbody>
</table>

Also, all extension boards and the **JTAG interface** share the same pins IO39, IO40, IO41 and IO42. For this reason, the following may disturb the JTAG operation:

- Plugging in any extension board
- Debugging an application that is using an extension board

### Hardware Revision Details

**ESP32-S2-Kaluga-1 Kit v1.3**

- The following pins re-assigned to fix the download issue
  - Camera D2: GPIO36
  - Camera D3: GPIO37
  - AU_I2S1_SDI: GPIO34
  - AU_WAKE_INT: GPIO46
- RGB pin header moved to the board’s edge
- All dip switches moved to the flip side for convenient operation

**ESP32-S2-Kaluga-1 Kit v1.2** *Initial release*

Chapter 1. Get Started

ESP32-S2-Kaluga-1 Kit v1.2

New version available: *ESP32-S2-Kaluga-1 Kit v1.3*

The ESP32-S2-Kaluga-1 kit v1.2 is a development kit by Espressif that is mainly created to:

- Demonstrate the ESP32-S2’s human-computer interaction functionalities
- Provide the users with the tools for development of human-computer interaction applications based on the ESP32-S2

There are many ways of how the ESP32-S2’s abundant functionalities can be used. For starters, the possible use cases may include:

- **Smart home**: From simplest smart lighting, smart door locks, smart sockets, to video streaming devices, security cameras, OTT devices, and home appliances
- **Battery-powered equipment**: Wi-Fi mesh sensor networks, Wi-Fi-networked toys, wearable devices, health management equipment
- **Industrial automation equipment**: Wireless control and robot technology, intelligent lighting, HVAC control equipment, etc.
- **Retail and catering industry**: POS machines and service robots

![ESP32-S2-Kaluga-1-Kit Overview](image)

The ESP32-S2-Kaluga-1 kit consists of the following boards:

- **Main board**: *ESP32-S2-Kaluga-1*
- **Extension boards**:
  - *ESP-LyraT-8311A v1.2* - audio player
  - *ESP-LyraP-TouchA v1.1* - touch panel
  - *ESP-LyraP-LCD32 v1.1* - 3.2” LCD screen
  - *ESP-LyraP-CAM v1.0* - camera board

Due to the presence of multiplexed pins on ESP32-S2, certain extension board combinations have limited compatibility. For more details, please see *Compatibility of Extension Boards*.

This document is *mostly dedicated to the main board* and its interaction with the extension boards. For more detailed information on each extension board, click their respective links.

This guide covers:

- **Getting Started**: Provides an overview of the ESP32-S2-Kaluga-1 and hardware/software setup instructions to get started.
- **Hardware reference**: Provides more detailed information about the ESP32-S2-Kaluga-1’s hardware.
- **Hardware Revision Details**: Covers revision history, known issues, and links to user guides for previous versions of the ESP32-S2-Kaluga-1.
• **Related Documents**: Gives links to related documentation.

**Getting Started** This section describes how to get started with the ESP32-S2-Kaluga-1. It begins with a few introductory sections about the ESP32-S2-Kaluga-1, then Section *Start Application Development* provides instructions on how to do the initial hardware setup and then how to flash firmware onto the ESP32-S2-Kaluga-1.

**Overview** The ESP32-S2-Kaluga-1 main board is the heart of the kit. It integrates the ESP32-S2-WROVER module and all the connectors for extension boards. This board is the key tool in prototyping human-computer interaction interfaces.

The ESP32-S2-Kaluga-1 board has connectors for boards with:
- Extension header (ESP-LyraT-8311A, ESP-LyraP-LCD32)
- Camera header (ESP-LyraP-CAM)
- Touch FPC connector (ESP-LyraP-TouchA)
- LCD FPC connector (no official extension boards yet)
- I2C FPC connector (no official extension boards yet)

All the four extension boards are specially designed to support the following features:
- **Touch panel control**
  - Six touch buttons
  - Supports acrylic panels up to 5 mm
  - Wet hand operation
  - Water rejection, ESP32-S2 can be configured to disable all touchpads automatically if multiple pads are simultaneously covered with water and to re-enable touchpads if the water is removed
- **Audio playback**

*Fig. 20: ESP32-S2-Kaluga-1 (click to enlarge)*
– Connect speakers to play audio
– Use together with the Touch panel to control audio playback and adjust volume

• **LCD display**
  – LCD interface (8-bit parallel RGB, 8080, and 6800 interface)

• **Camera image acquisition**
  – Supports OV2640 and OV3660 camera modules
  – 8-bit DVP image sensor interface (ESP32-S2 also supports 16-bit DVP image sensors, you can design it yourself)
  – Clock frequency up to 40 MHz
  – Optimized DMA transmission bandwidth for easier transmission of high-resolution images

![Fig. 21: ESP32-S2-Kaluga-1 - front (click to enlarge)](image)

**Description of Components**

The description of components starts from the ESP32-S2 module on the left side and then goes clockwise.

**Reserved** means that the functionality is available, but the current version of the kit does not use it.
### Key Component

<table>
<thead>
<tr>
<th>Key Component</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ESP32-S2-WROVER Module</td>
<td>Module integrating the ESP32-S2 chip that provides Wi-Fi connectivity, data processing power, and flexible data storage.</td>
</tr>
<tr>
<td>4.3” LCD FPC Connector</td>
<td>(Reserved) Connect to a 4.3” LCD extension board using the FPC cable.</td>
</tr>
<tr>
<td>ESP Prog Connector</td>
<td>(Reserved) Connection for Espressif’s download device (ESP-Prog) to flash ESP32-S2 system.</td>
</tr>
<tr>
<td>JTAG Switch</td>
<td>Switch to ON to enable connection between ESP32-S2 and FT2232; JTAG debugging will then be possible using USB-UART/JTAG Port. See also JTAG Debugging.</td>
</tr>
<tr>
<td>Breakout Header 2</td>
<td>Some GPIO pins of the ESP32-S2-WROVER module are broken out to this header, see labels on the board.</td>
</tr>
<tr>
<td>USB-to-UART/JTAG Bridge</td>
<td>FT2232 adapter board allowing for communication over USB port using UART/JTAG protocols.</td>
</tr>
<tr>
<td>Camera Header</td>
<td>Mount a camera extension board here (e.g., ESP-LyraP-CAM).</td>
</tr>
<tr>
<td>Extension Header</td>
<td>Mount the extension boards having such connectors here.</td>
</tr>
<tr>
<td>Reset Button</td>
<td>Press this button to restart the system.</td>
</tr>
<tr>
<td>Boot Button</td>
<td>Holding down Boot and then pressing Reset initiates Firmware Download mode for downloading firmware through the serial port.</td>
</tr>
<tr>
<td>USB-UART/JTAG Port</td>
<td>Communication interface (UART or JTAG) between a PC and the ESP32-S2 module.</td>
</tr>
<tr>
<td>USB Power Port</td>
<td>Power supply for the board.</td>
</tr>
<tr>
<td>Battery Port</td>
<td>Connect an external battery to the 2-pin battery connector.</td>
</tr>
<tr>
<td>Power On LED</td>
<td>Turns on when the USB or an external power supply is connected to the board.</td>
</tr>
<tr>
<td>Power Switch</td>
<td>Switch to ON to power the system.</td>

<tr>
<td>RGB Jumper</td>
<td>To have access to the RGB LED, place a jumper onto the pins.</td>
</tr>
<tr>
<td>RGB LED</td>
<td>Programmable RGB LED and controlled by GPIO45. Before using it, you need to put RGB Jumper ON.</td>
</tr>
<tr>
<td>Power Regulator</td>
<td>Regulator converts 5 V to 3.3 V.</td>
</tr>
<tr>
<td>I2C FPC Connector</td>
<td>(Reserved) Connect to other I2C extension boards using the FPC cable.</td>
</tr>
<tr>
<td>Breakout Header 1</td>
<td>Some GPIO pins of the ESP32-S2-WROVER module are broken out to this header, see labels on the board.</td>
</tr>
<tr>
<td>Touch FPC Connector</td>
<td>Connect the ESP-LyraP-TouchA extension board using the FPC cable.</td>
</tr>
<tr>
<td>Touch Switch</td>
<td>In OFF position, GPIO1 to GPIO14 are used for connection to touch sensors; switch to ON if you want to use them for other purposes.</td>
</tr>
<tr>
<td>3.2” LCD FPC connector</td>
<td>Connect a 3.2” LCD extension board (e.g., ESP-LyraP-LCD32) using the FPC cable.</td>
</tr>
</tbody>
</table>

### Start Application Development

Before powering up your ESP32-S2-Kaluga-1, please make sure that it is in good condition with no obvious signs of damage.

### Required Hardware

- ESP32-S2-Kaluga-1
- Two USB 2.0 cables (Standard-A to Micro-B)
  - For power supply
  - For UART/JTAG communication
- Computer running Windows, Linux, or macOS
- Any extension boards of your choice

### Hardware Setup

1. Connect the extension board(s) of your choice (go to their respective user guides if necessary)
2. Plug in both USB cables
3. Turn the **Power Switch** to ON - the Power On LED will light up
Software Setup  Please proceed to *Get Started*, where Section *Installation* will quickly help you set up the development environment.

The programming guide and application examples for your ESP32-S2-Kaluga-1 kit can be found in *esp-dev-kits* repository on GitHub.

Contents and Packaging

Retail Orders  If you order one or several samples of the kit, each ESP32-S2-Kaluga-1 development kit comes in an individual package containing:

- **Main Board**
  - ESP32-S2-Kaluga-1

- **Extension Boards**:
  - ESP-LyraT-8311A
  - ESP-LyraP-CAM
  - ESP-LyraP-TouchA
  - ESP-LyraP-LCD32

- **Connectors**
  - 20-pin FPC cable (to connect ESP32-S2-Kaluga-1 to ESP-LyraP-TouchA)

- **Fasteners**
  - Mounting bolts (x8)
  - Screws (x4)
  - Nuts (x4)

Wholesale Orders  If you order in bulk, the boards come in large cardboard boxes.

Hardware Reference

Block Diagram  A block diagram below shows the components of the ESP32-S2-Kaluga-1 and their interconnections.

Power Supply Options  There are four ways to provide power to the board:

- Micro USB port, default power supply
- External battery via the 2-pin battery connector
- 5V and GND header pins
- 3V3 and GND header pins

Compatibility of Extension Boards  If you want to use more than one extension board at the same time, please check the table given below.
Chapter 1. Get Started

Fig. 22: ESP32-S2-Kaluga-1 block diagram

<table>
<thead>
<tr>
<th>Boards Used</th>
<th>HW Conflict</th>
<th>Limitations</th>
<th>Solution</th>
</tr>
</thead>
<tbody>
<tr>
<td>8311A v1.2 + CAM v1.0</td>
<td>I2S Controller, IO46</td>
<td>ESP32-S2 has only one I2S interface. But both extension boards require connection via the ESP32-S2’s I2S interface (ESP-LyraT-8311A in Standard mode, ESP-LyraP-CAM in Camera mode). If IO46 is used by both extension boards at the same time, ESP-LyraP-CAM experiences interferences when used.</td>
<td>No ready solution for now.</td>
</tr>
<tr>
<td>TouchA v1.1 + LCD32 v1.1</td>
<td>IO11, IO6</td>
<td>Touch actions cannot be triggered because of the multiplexed pin IO11. ESP-LyraP-LCD32 is also affected because its BK (BLCT) pin is connected to pin IO6.</td>
<td>Do not initialize IO11 (NETWORK) and IO6 (PHOTO) for your ESP-LyraP-TouchA.</td>
</tr>
<tr>
<td>8311A v1.2 + LCD32 v1.1</td>
<td>IO6</td>
<td>The two extension boards can be used at the same time. However, since the BK (BLCT) pin of ESP32-S2-Kaluga-1 is connected to IO6, ESP-LyraT-8311A’s pin BT_ADC cannot be used and the board’s six buttons will not be available.</td>
<td>There is a solution that will allow you to use ESP-LyraT-8311A’s pin BT_ADC, but will stop you from controlling the display background brightness with software: on your ESP-LyraP-LCD32 board, remove R39, change R41 to 100 Ohm, switch BLCT_L to on.</td>
</tr>
<tr>
<td>TouchA v1.1 + 8311A v1.2</td>
<td>Pin BT_ADC on ESP-LyraT-8311A</td>
<td>The two extension boards can be used at the same time. However, ESP-LyraP-TouchA cannot be triggered if ESP-LyraT-8311A’s pin BT_ADC is used</td>
<td>If you plan to use ESP-LyraT-8311A’s pin BT_ADC, do not initialize pin IO6 (PHOTO) for your ESP-LyraP-TouchA.</td>
</tr>
</tbody>
</table>

ESP-LyraP-LCD32 v1.1

This user guide provides information on the ESP-LyraP-LCD32 extension board.

This extension board cannot be bought separately and is usually sold together with other Espressif development boards (e.g., ESP32-S2-Kaluga-1), which will be referred to as main boards below.

Currently, ESP-LyraP-LCD32 v1.1 is sold as part of the ESP32-S2-Kaluga-1 Kit v1.2.

The ESP-LyraP-LCD32 extends the functionality of your main board by adding an LCD graphic display.

Fig. 26: ESP-LyraP-LCD32 (click to enlarge)

The document consists of the following major sections:

- **Overview**: Provides an overview and hardware/software setup instructions to get started.
- **Hardware reference**: Provides more detailed information about the ESP-LyraP-LCD32’s hardware.
- **Hardware Revision Details**: Covers revision history, known issues, and links to user guides for previous versions of the ESP-LyraP-LCD32.
- **Related Documents**: Gives links to related documentation.

**Overview**  This extension board adds a 3.2” LCD graphic display with the resolution of 320x240. This display is connected to ESP32-S2 over the SPI bus.

**Description of Components**  In the description of components below, **Reserved** means that the functionality is available, but the current version of the kit does not use it.
Key Component | Description
---|---
Extension Header | Male Extension Header for mounting onto a female Extension Header
LCD display | This version has a 3.2” 320x240 SPI LCD display module; the display driver/controller is Sitronix ST7789V
Touch Screen Switch | No support for touch screens, keep the switches to OFF to make the pins available for other uses
Main Board 3.2” LCD FPC Connector | (Reserved) Connect to main board’s 3.2” LCD FPC connector
Control Switch | Switch to ON to set Reset/Backlight_control/CS to default high or low; switch to OFF to make the pins available for other uses

**Start Application Development** Before powering up your ESP-LyraP-LCD32, please make sure that it is in good condition with no obvious signs of damage.

**Required Hardware**
- Board with a female Extension Header (e.g., ESP32-S2-Kaluga-1, ESP-LyraT-8311A)
- ESP-LyraP-LCD32 extension board
- Four mounting bolts (for stable mounting)
- Computer running Windows, Linux, or macOS

**Hardware Setup** To mount your ESP-LyraP-LCD32 onto the board with a female Extension Header:
1. Install the four mounting bolts onto the board with a female Extension Header
2. Align the ESP-LyraP-LCD32 with the bolts and Extension Header and insert it carefully

**Software Setup** See Section *Software Setup* of the ESP32-S2-Kaluga-1 kit user guide.

ESP-LyraP-TouchA v1.1

This user guide provides information on the ESP-LyraP-TouchA extension board.

This board cannot be bought separately and is usually sold together with other Espressif development boards (e.g., ESP32-S2-Kaluga-1), which will be referred to as main boards below.

Currently, ESP-LyraP-TouchA v1.1 is sold as part of the following kits:

- ESP32-S2-Kaluga-1 Kit v1.3
- ESP32-S2-Kaluga-1 Kit v1.2

The ESP-LyraP-TouchA extends the functionality of your main board by adding touch buttons.

The document consists of the following major sections:

- **Overview**: Provides an overview and hardware setup instructions.
- **Hardware reference**: Provides more detailed information about the ESP-LyraP-TouchA’s hardware.
- **Hardware Revision Details**: Covers revision history, known issues, and links to user guides for previous versions of the ESP-LyraP-TouchA.
- **Related Documents**: Gives links to related documentation.

Overview The ESP-LyraP-TouchA has six touch buttons and is mainly designed for audio applications. However, the touch buttons can also be used for any other purposes.

ESP-LyraT-8311A v1.2

This user guide provides information on the ESP-LyraT-8311A extension board.

This board cannot be bought separately and is usually sold together with other Espressif development boards (e.g., ESP32-S2-Kaluga-1), which will be referred to as main boards below.

Currently, ESP-LyraT-8311A v1.2 is sold as part of the ESP32-S2-Kaluga-1 Kit v1.2.

The ESP-LyraT-8311A extends the functionality of your main board by adding sound processing functionality:

- Audio playback/recording
- Processing of audio signals
- Programmable buttons for easy control

This extension board can be used in many ways. The applications might include voice user interface, voice control, voice authorization, recording and playback of sound, etc.

Fig. 32: ESP-LyraT-8311A (click to enlarge)

The document consists of the following major sections:

ESP-LyraP-CAM v1.1

This user guide provides information on the ESP-LyraP-CAM extension board. This extension board cannot be bought separately and is usually sold together with other Espressif development boards (e.g., ESP32-S2-Kaluga-1), which will be referred to as main boards below. Currently, ESP-LyraP-CAM v1.1 is sold as part of the ESP32-S2-Kaluga-1 Kit v1.3.

The ESP-LyraP-CAM extends the functionality of your main board by adding a camera.

The document consists of the following major sections:

- **Overview**: Provides an overview and hardware/software setup instructions to get started.
- **Hardware reference**: Provides more detailed information about the ESP-LyraP-CAM’s hardware.
- **Hardware Revision Details**: Covers revision history, known issues, and links to user guides for previous versions of the ESP-LyraP-CAM.
- **Related Documents**: Gives links to related documentation.

**Overview**  This extension board adds a camera to your main board.
Chapter 1. Get Started

**Fig. 36: ESP-LyraP-CAM - front and back**

### Description of Components

<table>
<thead>
<tr>
<th>Key Component</th>
<th>Description</th>
</tr>

</tr>
<tr>
<td>Power ON LED</td>
<td>Red LED is on if the power supply voltage is correct</td>
</tr>
<tr>
<td>Camera Module Connector</td>
<td>Supports OV2640 and OV3660 camera modules; this extension board is supplied with an OV2640 camera module</td>
</tr>
<tr>
<td>Power Regulators</td>
<td>LDO Regulators converting 3.3 V to 2.8 V and 1.5 V</td>
</tr>
</tbody>
</table>

**Start Application Development**  Before powering up your ESP-LyraP-CAM, please make sure that it is in good condition with no obvious signs of damage.

**Required Hardware**

- Board with a female Camera Header (e.g., ESP32-S2-Kaluga-1)
- ESP-LyraP-CAM extension board
- Computer running Windows, Linux, or macOS

**Hardware Setup**  Insert the ESP-LyraP-CAM extension board into your board’s female Camera Header.

**Software Setup**  See Section *Software Setup* of the ESP32-S2-Kaluga-1 kit user guide.

**Hardware Reference**

**Block Diagram**  A block diagram below shows the components of the ESP-LyraP-CAM and their interconnections.

**Hardware Revision Details**
ESP-LyraP-CAM v1.1
- Silk screen updated
- No actual hardware updates

ESP-LyraP-CAM v1.0  *Initial release*

- ESP-LyraP-CAM PCB Layout (PDF)

For other design documentation for the board, please contact us at sales@espressif.com.

ESP-LyraP-LCD32 v1.2

This user guide provides information on the ESP-LyraP-LCD32 extension board.

This extension board cannot be bought separately and is usually sold together with other Espressif development boards (e.g., ESP32-S2-Kaluga-1), which will be referred to as *main boards* below.

Currently, ESP-LyraP-LCD32 v1.2 is sold as part of the *ESP32-S2-Kaluga-1 Kit v1.3*.

The ESP-LyraP-LCD32 extends the functionality of your main board by adding an LCD graphic display.

The document consists of the following major sections:
- **Overview**: Provides an overview and hardware/software setup instructions to get started.
- **Hardware reference**: Provides more detailed information about the ESP-LyraP-LCD32’s hardware.
- **Hardware Revision Details**: Covers revision history, known issues, and links to user guides for previous versions of the ESP-LyraP-LCD32.
- **Related Documents**: Gives links to related documentation.

**Overview**  This extension board adds a 3.2” LCD graphic display with the resolution of 320x240. This display is connected to ESP32-S2 over the SPI bus.

**Description of Components**  In the description of components below, *Reserved* means that the functionality is available, but the current version of the kit does not use it.
Fig. 38: ESP-LyraP-LCD32 (click to enlarge)

Fig. 39: ESP-LyraP-LCD32 - front (click to enlarge)
Key Component | Description
--- | ---
Extension Header | Male Extension Header for mounting onto a female Extension Header
LCD Display | This version has a 3.2" 320x240 SPI LCD display module; the display driver/controller is either Sitronix ST7789V or Ilitek ILI9341
Touch Screen Switch | No support for touch screens, keep the switches to OFF to make the pins available for other uses
Main Board 3.2" LCD FPC Connector | (Reserved) Connect to main board’s 3.2" LCD FPC connector
Control Switch | Switch to ON to set Reset/Backlight_control/CS to default high or low; switch to OFF to make the pins available for other uses

**Start Application Development** Before powering up your ESP-LyraP-LCD32, please make sure that it is in good condition with no obvious signs of damage.

**Required Hardware**
- Board with a female Extension Header (e.g., ESP32-S2-Kaluga-1, ESP-LyraT-8311A)
- ESP-LyraP-LCD32 extension board
- Four mounting bolts (for stable mounting)
- Computer running Windows, Linux, or macOS

**Hardware Setup** To mount your ESP-LyraP-LCD32 onto the board with a female Extension Header:
1. Install the four mounting bolts onto the board with a female Extension Header
2. Align the ESP-LyraP-LCD32 with the bolts and Extension Header and insert it carefully

**Software Setup** See Section *Software Setup* of the ESP32-S2-Kaluga-1 kit user guide.
Hardware Reference

**Block Diagram** A block diagram below shows the components of the ESP-LyraP-LCD32 and their interconnections.

![ESP-LyraP-LCD32 block diagram](Fig.41)

Hardware Revision Details

**ESP-LyraP-LCD32 v1.2**

- LCD backlight default ON, cannot be controlled by MCU
- Touch Driver and related switch removed for major limitations caused by multiplexed pins

**ESP-LyraP-LCD32 v1.1  Initial release**

**ESP-LyraT-8311A v1.3**

This user guide provides information on the ESP-LyraT-8311A extension board.

This board cannot be bought separately and is usually sold together with other Espressif development boards (e.g., ESP32-S2-Kaluga-1), which will be referred to as **main boards** below.

Currently, ESP-LyraT-8311A v1.3 is sold as part of the ESP32-S2-Kaluga-1 Kit v1.3.

The ESP-LyraT-8311A extends the functionality of your main board by adding sound processing functionality:

- Audio playback/recording
- Processing of audio signals
- Programmable buttons for easy control

This extension board can be used in many ways. The applications might include voice user interface, voice control, voice authorization, recording and playback of sound, etc.

The document consists of the following major sections:

- **Overview**: Provides an overview and hardware setup instructions.
Fig. 42: ESP-LyraT-8311A (click to enlarge)
• **Hardware reference**: Provides more detailed information about the ESP-LyraT-8311A’s hardware.
• **Hardware Revision Details**: Covers revision history, known issues, and links to user guides for previous versions of the ESP-LyraT-8311A.
• **Related Documents**: Gives links to related documentation.

**Overview**  The ESP-LyraT-8311A is mainly designed for audio applications. However, you can use your creativity to come up with any other use cases.

**Figure 43: ESP-LyraT-8311A - front (click to enlarge)**

**Description of Components**  The description of components starts from the top right corner and then goes clockwise.

**Reserved** means that the functionality is available, but the current version of the kit does not use it.

Start Application Development  Before powering up your ESP-LyraT-8311A, please make sure that it is in good condition with no obvious signs of damage.

Required Hardware

- Board with a female Extension Header (e.g., ESP32-S2-Kaluga-1)
- ESP-LyraT-8311A extension board
- Four mounting bolts (for stable mounting)
- Computer running Windows, Linux, or macOS

Hardware Setup  To mount your ESP-LyraT-8311A onto the board with a female Extension Header:

1. Install the four mounting bolts onto the board with a female Extension Header
2. Align the ESP-LyraT-8311A with the bolts and Extension Header and insert it carefully

Software Setup  Depending on your application, see:

- ESP-ADF Getting Started Guide if you develop with ESP-ADF (Espressif Audio Development Framework).
- Section Software Setup of the ESP32-S2-Kaluga-1 kit user guide if you develop directly with ESP-IDF (Espressif IOT Development Framework).

Hardware Reference

Block Diagram  A block diagram below shows the components of ESP-LyraT-8311A and their interconnections.

1.2.2 Software

To start using ESP-IDF on ESP32-S2, install the following software:

- Toolchain to compile code for ESP32-S2
- Build tools - CMake and Ninja to build a full Application for ESP32-S2
- ESP-IDF that essentially contains API (software libraries and source code) for ESP32-S2 and scripts to operate the Toolchain

1.3 Installation

To install all the required software, we offer some different ways to facilitate this task. Choose from one of the available options.
1.3.1 IDE

**Note:** We highly recommend installing the ESP-IDF through your favorite IDE.

- Eclipse Plugin
- VSCode Extension

1.3.2 Manual Installation

For the manual procedure, please select according to your operating system.

**Standard Setup of Toolchain for Windows**

**Introduction** ESP-IDF requires some prerequisite tools to be installed so you can build firmware for supported chips. The prerequisite tools include Python, Git, cross-compilers, CMake and Ninja build tools.

For this Getting Started we are going to use the Command Prompt, but after ESP-IDF is installed you can use Eclipse Plugin or another graphical IDE with CMake support instead.

**Note:** Limitations: - The installation path of ESP-IDF and ESP-IDF Tools must not be longer than 90 characters. Too long installation paths might result in a failed build. - The installation path of Python or ESP-IDF must not contain white spaces or parentheses. - The installation path of Python or ESP-IDF should not contain special characters (non-ASCII) unless the operating system is configured with “Unicode UTF-8” support.

System Administrator can enable the support via Control Panel > Change date, time, or number formats > Administrative tab > Change system locale > check the option Beta: Use Unicode UTF-8 for worldwide language support > Ok > reboot the computer.

**ESP-IDF Tools Installer** The easiest way to install ESP-IDF’s prerequisites is to download one of ESP-IDF Tools Installers.

![Windows Installer](image)

**Windows Installer Download**

**What Is the Use Case for Online and Offline Installer**

Online Installer is very small and allows the installation of all available releases of ESP-IDF. The installer downloads only necessary dependencies including Git For Windows during the installation process. The installer stores downloaded files in the cache directory `%userprofile%\.
espressif`

Offline Installer does not require any network connection. The installer contains all required dependencies including Git For Windows.
Chapter 1. Get Started

Components of the Installation  The installer deploys the following components:

- Embedded Python
- Cross-compilers
- OpenOCD
- CMake and Ninja build tools
- ESP-IDF

The installer also allows reusing the existing directory with ESP-IDF. The recommended directory is `%userprofile%\Desktop\esp-idf` where `%userprofile%` is your home directory.

Launching ESP-IDF Environment  At the end of the installation process you can check out option Run ESP-IDF PowerShell Environment or Run ESP-IDF Command Prompt (cmd.exe). The installer launches ESP-IDF environment in selected prompt.

Run ESP-IDF PowerShell Environment:

![Setup - ESP-IDF Tools 2.9](image)

Fig. 45: Completing the ESP-IDF Tools Setup Wizard with Run ESP-IDF PowerShell Environment

Run ESP-IDF Command Prompt (cmd.exe):

Using the Command Prompt  For the remaining Getting Started steps, we are going to use the Windows Command Prompt.

ESP-IDF Tools Installer also creates a shortcut in the Start menu to launch the ESP-IDF Command Prompt. This shortcut launches the Command Prompt (cmd.exe) and runs `export.bat` script to set up the environment variables (PATH, IDF_PATH and others). Inside this command prompt, all the installed tools are available.

Note that this shortcut is specific to the ESP-IDF directory selected in the ESP-IDF Tools Installer. If you have multiple ESP-IDF directories on the computer (for example, to work with different versions of ESP-IDF), you have
Chapter 1. Get Started

C:\Users\test\esp\tool\python_env\idfv4.3_py3.7_env\Scripts\C:\Users\test\esp\tool\esp\idf\tools

Checking if Python packages are up to date...
Python requirements from C:\Users\test\esp\esp-idf\requirements.txt are satisfied.

Done! You can now compile ESP-IDF projects.
Go to the project directory and run:
```
idf.py build
```
C:\Users\test\esp\esp-idf>
two options to use them:

1. Create a copy of the shortcut created by the ESP-IDF Tools Installer, and change the working directory of the new shortcut to the ESP-IDF directory you wish to use.
2. Alternatively, run `cmd.exe`, then change to the ESP-IDF directory you wish to use, and run `export.bat`. Note that unlike the previous option, this way requires Python and Git to be present in `PATH`. If you get errors related to Python or Git not being found, use the first option.

**First Steps on ESP-IDF**  Now since all requirements are met, the next topic guides you on how to start your first project.

This guide helps you on the first steps using ESP-IDF. Follow this guide to start a new project on the ESP32-S2 and build, flash, and monitor the device output.

**Note:** If you have not yet installed ESP-IDF, please go to **Installation** and follow the instruction in order to get all the software needed to use this guide.

**Start a Project**  Now you are ready to prepare your application for ESP32-S2. You can start with `get-started/hello_world` project from `examples` directory in ESP-IDF.

**Important:** The ESP-IDF build system does not support spaces in the path to either ESP-IDF or to projects.

Copy the project `get-started/hello_world` to `~/esp` directory:

```
cd %userprofile%\esp
xcopy /e /i %IDF_PATH%\examples\get-started\hello_world hello_world
```

**Note:** There is a range of example projects in the `examples` directory in ESP-IDF. You can copy any project in the same way as presented above and run it. It is also possible to build examples in-place without copying them first.

**Connect Your Device**  Now connect your ESP32-S2 board to the computer and check under which serial port the board is visible.

Serial port names start with `COM` in Windows.

*If you are not sure how to check the serial port name, please refer to **Establish Serial Connection with ESP32-S2** for full details.*

**Note:** Keep the port name handy as it is needed in the next steps.

**Configure Your Project**  Navigate to your `hello_world` directory, set ESP32-S2 as the target, and run the project configuration utility `menuconfig`.

**Windows**

```
cd %userprofile%\esp\hello_world
idf.py set-target esp32s2
idf.py menuconfig
```

After opening a new project, you should first set the target with `idf.py set-target esp32s2`. Note that existing builds and configurations in the project, if any, are cleared and initialized in this process. The target may
be saved in the environment variable to skip this step at all. See *Select the Target Chip: set-target* for additional information.

If the previous steps have been done correctly, the following menu appears:

![Project configuration - Home window](image)

You are using this menu to set up project specific variables, e.g., Wi-Fi network name and password, the processor speed, etc. Setting up the project with menuconfig may be skipped for “hello_word”, since this example runs with default configuration.

**Note:** The colors of the menu could be different in your terminal. You can change the appearance with the option `--style`. Please run `idf.py menuconfig --help` for further information.

If you are using one of the supported development boards, you can speed up your development by using Board Support Package. See *Additional Tips* for more information.

To use the USB for flashing the ESP32-S2, you need to change the channel for the console output to USB. For the ESP32-S2, the default console output channel is the UART:

1. Navigate to the option `Channel for console output`
2. Change to the option (the default is always UART):
   - `USB CDC`
3. Save the new configuration and exit the `menuconfig` screen.

**Build the Project**  
Build the project by running:

```
idf.py build
```

This command compiles the application and all ESP-IDF components, then it generates the bootloader, partition table, and application binaries.

```
$ idf.py build
Running cmake in directory /path/to/hello_world/build
Executing "cmake -G Ninja --warn-uninitialized /path/to/hello_world"...
Warn about uninitialized values.
-- Found Git: /usr/bin/git (found version "2.17.0")
```

(continues on next page)
Chapter 1. Get Started

(continued from previous page)

```shell
-- Building empty aws_iot component due to configuration
-- Component names: ...
-- Component paths: ...

... (more lines of build system output)

[527/527] Generating hello_world.bin
esptool.py v2.3.1

Project build complete. To flash, run this command:
.../.../components/esptool_py/esptool/esptool.py -p (PORT) -b 921600 write_flash
--flash_mode dio --flash_size detect --flash_freq 40m 0x10000 build/hello_world.
--bin build 0x1000 build/bootloader/bootloader.bin 0x8000 build/partition_table/
--partition-table.bin
or run 'idf.py -p PORT flash'
```

If there are no errors, the build finishes by generating the firmware binary .bin files.

**Flash onto the Device** To flash the binaries that you just built for the ESP32-S2 in the previous step, you need to run the following command:

```
idf.py -p PORT flash
```

Replace PORT with your ESP32-S2 board’s USB port name. If the PORT is not defined, the `idf.py` will try to connect automatically using the available USB ports.

For more information on `idf.py` arguments, see `idf.py`.

**Note:** The option `flash` automatically builds and flashes the project, so running `idf.py build` is not necessary.

Encountered Issues While Flashing? See the “Additional Tips” below. You can also refer to Flashing Troubleshooting page or Establish Serial Connection with ESP32-S2 for more detailed information.

**Normal Operation** When flashing, you will see the output log similar to the following:

```
... esptool.py --chip esp32s2 -p /dev/ttyUSB0 -b 460800 --before=default_reset --
--after-hard_reset write_flash --flash_mode dio --flash_freq 40m --flash_size 2MB...
--0x8000 partition_table/partition-table.bin 0x1000 bootloader/bootloader.bin...
--0x10000 hello_world.bin
esptool.py v3.0-dev
Serial port /dev/ttyUSB0
Connecting....
Chip is ESP32-S2
Features: WiFi
Crystal is 40MHz
Uploading stub...
Running stub...
Stub running...
Changing baud rate to 460800
Changed.
Configuring flash size...
Compressed 3072 bytes to 103...
Writing at 0x000008000... (100 %)
Wrote 3072 bytes (103 compressed) at 0x000008000 in 0.0 seconds (effective 3851.6...
--kbit/s)... Hash of data verified.
```
If there are no issues by the end of the flash process, the board will reboot and start up the "hello_world" application.

If you would like to use the Eclipse or VS Code IDE instead of running `idf.py`, check out Eclipse Plugin, VSCode Extension.

**Monitor the Output**  To check if "hello_world" is indeed running, type `idf.py -p PORT monitor` (Do not forget to replace PORT with your serial port name).

This command launches the **IDF Monitor** application:

```
$ idf.py -p <PORT> monitor
Running idf_monitor in directory [...]/esp/hello_world/build
Executing "python [...]/esp-idf/tools/idf_monitor.py -b 115200 [...]/esp/hello_world/build/hello_world.elf"...
--- idf_monitor on <PORT> 115200 ---
--- Quit: Ctrl+] | Menu: Ctrl+T | Help: Ctrl+T followed by Ctrl+H ---
ets Jun 8 2016 00:22:57
rst:0x1 (POWERON_RESET),boot:0x13 (SPI_FAST_FLASH_BOOT)
ets Jun 8 2016 00:22:57
...  
```

After startup and diagnostic logs scroll up, you should see “Hello world!” printed out by the application.

```
...  
    Hello world!
    Restarting in 10 seconds...
    This is esp32s2 chip with 1 CPU core(s), WiFi, silicon revision 0, 2 MB...
    Minimum free heap size: 253900 bytes
    Restarting in 9 seconds...
    Restarting in 8 seconds...
    Restarting in 7 seconds...
```

To exit IDF monitor use the shortcut `Ctrl+]`.

**Note:** You can combine building, flashing and monitoring into one step by running:

```
idf.py -p PORT flash monitor
```

See also:
Chapter 1. Get Started

- **IDF Monitor** for handy shortcuts and more details on using IDF monitor.
- **idf.py** for a full reference of idf.py commands and options.

That is all that you need to get started with ESP32-S2!

Now you are ready to try some other examples, or go straight to developing your own applications.

**Important:** Some of examples do not support ESP32-S2 because required hardware is not included in ESP32-S2 so it cannot be supported.

If building an example, please check the README file for the Supported Targets table. If this is present including ESP32-S2 target, or the table does not exist at all, the example will work on ESP32-S2.

### Additional Tips

**Permission Denied Issue**  With some Linux distributions, you may get the error message similar to *Could not open port <PORT>: Permission denied: '<PORT>'* when flashing the ESP32-S2. *This can be solved by adding the current user to the specific group*, such as dialout or uucp group.

**Python Compatibility**  ESP-IDF supports Python 3.8 or newer. It is recommended to upgrade your operating system to a recent version satisfying this requirement. Other options include the installation of Python from sources or the use of a Python version management system such as pyenv.

**Start with Board Support Package**  To speed up prototyping on some development boards, you can use Board Support Packages (BSPs), which makes initialization of a particular board as easy as few function calls.

A BSP typically supports all of the hardware components provided on development board. Apart from the pinout definition and initialization functions, a BSP ships with drivers for the external components such as sensors, displays, audio codecs etc.

The BSPs are distributed via IDF Component Manager, so they can be found in IDF Component Registry.

**Here is an example of how to add ESP32-S2-Kaluga-Kit BSP to your project:**

```bash
idf.py add-dependency esp32_s2_kaluga_kit
```

More examples of BSP usage can be found in BSP examples folder.

**Flash Erase**  Erasing the flash is also possible. To erase the entire flash memory you can run the following command:

```bash
idf.py -p PORT erase-flash
```

For erasing the OTA data, if present, you can run this command:

```bash
idf.py -p PORT erase-otadata
```

The flash erase command can take a while to be done. Do not disconnect your device while the flash erasing is in progress.

For advanced users who want to customize the install process:

- Updating ESP-IDF Tools on Windows
- Establish Serial Connection with ESP32-S2
- Eclipse Plugin
- VSCode Extension
- IDF Monitor
Chapter 1. Get Started

Updating ESP-IDF Tools on Windows

Install ESP-IDF Tools Using a Script

From the Windows Command Prompt, change to the directory where ESP-IDF is installed. Then run:

```
install.bat
```

For Powershell, change to the directory where ESP-IDF is installed. Then run:

```
install.ps1
```

This downloads and installs the tools necessary to use ESP-IDF. If the specific version of the tool is already installed, no action will be taken. The tools are downloaded and installed into a directory specified during ESP-IDF Tools Installer process. By default, this is `C:\Users\username\.espressif`.

Add ESP-IDF Tools to PATH Using an Export Script

ESP-IDF tools installer creates a Start menu shortcut for “ESP-IDF Command Prompt”. This shortcut opens a Command Prompt window where all the tools are already available.

In some cases, you may want to work with ESP-IDF in a Command Prompt window which was not started using that shortcut. If this is the case, follow the instructions below to add ESP-IDF tools to PATH.

In the command prompt where you need to use ESP-IDF, change to the directory where ESP-IDF is installed, then execute `export.bat`:

```
cd %userprofile%\esp\esp-idf
export.bat
```

Alternatively in the Powershell where you need to use ESP-IDF, change to the directory where ESP-IDF is installed, then execute `export.ps1`:

```
cd ~/esp/esp-idf
export.ps1
```

When this is done, the tools will be available in this command prompt.

Establish Serial Connection with ESP32-S2

Establishing a serial connection with the ESP32-S2 target device could be done using USB-to-UART bridge or USB peripheral supported in ESP32-S2.

Some development boards have the USB-to-UART bridge installed. If a board does not have a bridge then an external bridge may be used.

**Supported USB Peripheral**

The ESP32-S2 supports the USB peripheral. In this case, the USB-to-UART bridge is not needed and the device can be flashed directly.

Apart from the USB peripheral, some development boards also include the USB-to-UART bridge.

**USB-to-UART Bridge on Development Board**

For boards with an installed USB-to-UART bridge, the connection between the personal computer and the bridge is USB and between the bridge and ESP32-S2 is UART.

**External USB-to-UART Bridge**

Sometimes the USB-to-UART bridge is external. This is often used in small development boards or finished products when space and costs are crucial.
Chapter 1. Get Started

Fig. 50: SoC with Supported USB

Fig. 51: Development Board with USB-to-UART Bridge

Fig. 52: External USB-to-UART Bridge
**Flash Using USB**  For the ESP32-S2, the USB peripheral is available, allowing you to flash the binaries without the need for an external USB-to-UART bridge.

The USB on the ESP32-S2 uses the GPIO20 for D+ and GPIO19 for D-.

After flashing the binaries, a manual reset is needed.

**Flash Using UART**  This section provides guidance on how to establish a serial connection between ESP32-S2 and PC using USB-to-UART Bridge, either installed on the development board or external.

**Connect ESP32-S2 to PC**  Connect the ESP32-S2 board to the PC using the USB cable. If device driver does not install automatically, identify USB-to-UART bridge on your ESP32-S2 board (or external converter dongle), search for drivers in internet and install them.

Below is the list of USB to serial converter chips installed on most of the ESP32-S2 boards produced by Espressif together with links to the drivers:

- CP210x: [CP210x USB to UART Bridge VCP Drivers](#)
- FTDI: [FTDI Virtual COM Port Drivers](#)

Please check the board user guide for specific USB-to-UART bridge chip used. The drivers above are primarily for reference. Under normal circumstances, the drivers should be bundled with an operating system and automatically installed upon connecting the board to the PC.

For devices downloaded using a USB-to-UART bridge, you can run the following command including the optional argument to define the baud rate.

```
idf.py -p PORT [-b BAUD] flash
```

You can change the flasher baud rate by replacing BAUD with the baud rate you need. The default baud rate is 460800.

**Note:** If the device does not support the auto download mode, you need to get into the download mode manually. To do so, press and hold the BOOT button and then press the RESET button once. After that release the BOOT button.

**Check Port on Windows**  Check the list of identified COM ports in the Windows Device Manager. Disconnect ESP32-S2 and connect it back, to verify which port disappears from the list and then shows back again.

Figures below show serial port for ESP32 DevKitC and ESP32 WROVER KIT

**Check Port on Linux and macOS**  To check the device name for the serial port of your ESP32-S2 board (or external converter dongle), run this command two times, first with the board/dongle unplugged, then with plugged in. The port which appears the second time is the one you need:

**Linux**

```
ls /dev/tty*
```

**macOS**

```
ls /dev/cu.*
```

**Note:** macOS users: if you do not see the serial port then check you have the USB/serial drivers installed. See Section **Connect ESP32-S2 to PC** for links to drivers. For macOS High Sierra (10.13), you may also have to explicitly allow the drivers to load. Open System Preferences -> Security & Privacy -> General and check if there is a message shown here about “System Software from developer …” where the developer name is Silicon Labs or FTDI.
Fig. 53: USB to UART bridge of ESP32-DevKitC in Windows Device Manager
Fig. 54: Two USB Serial Ports of ESP-WROVER-KIT in Windows Device Manager
Adding User to *dialout* or *uucp* on Linux  The currently logged user should have read and write access the
serial port over USB. On most Linux distributions, this is done by adding the user to *dialout* group with the
following command:

```bash
sudo usermod -a -G dialout $USER
```

On Arch Linux this is done by adding the user to *uucp* group with the following command:

```bash
sudo usermod -a -G uucp $USER
```

Make sure you re-login to enable read and write permissions for the serial port.

Verify Serial Connection  Now verify that the serial connection is operational. You can do this using a serial
terminal program by checking if you get any output on the terminal after resetting ESP32-S2.

The default console baud rate on ESP32-S2 is 115200.

Windows and Linux  In this example, we use *PuTTY SSH Client* that is available for both Windows and Linux.
You can use other serial programs and set communication parameters like below.

Run terminal and set identified serial port. Baud rate = 115200 (if needed, change this to the default baud rate of the
chip in use), data bits = 8, stop bits = 1, and parity = N. Below are example screenshots of setting the port and such
transmission parameters (in short described as 115200-8-1-N) on Windows and Linux. Remember to select exactly
the same serial port you have identified in steps above.

![PuTTY Configuration](image)

Fig. 55: Setting Serial Communication in PuTTY on Windows

Then open serial port in terminal and check, if you see any log printed out by ESP32-S2. The log contents depend
on application loaded to ESP32-S2, see *Example Output*. Reset the board if no log has been printed out.
Fig. 56: Setting Serial Communication in PuTTY on Linux
Note: Close the serial terminal after verification that communication is working. If you keep the terminal session open, the serial port will be inaccessible for uploading firmware later.

Note: If there is no log output, check
- if the required power is supplied to ESP32-S2
- if the board was reset after starting the terminal program
- if the selected serial port is the correct one by using the method stated in Check Port on Windows and Check Port on Linux and macOS
- if the serial port is not being used by another program
- if the identified port has been selected in serial terminal programs you are using, as stated in Windows and Linux
- if settings of the serial port in serial terminal programs are applicable to corresponding applications
- if the correct USB connector (UART) is used on the development board
- if your application is expected to output some log
- if the log output has not been disabled (use hello world application to test)

macOS To spare you the trouble of installing a serial terminal program, macOS offers the screen command.
- As discussed in Check port on Linux and macOS, run:
  ```bash
  ls /dev/cu.*
  ```
- You should see similar output:
  ```
  /dev/cu.Bluetooth-Incoming-Port /dev/cu.SLAB_USBtoUART /dev/cu.SLAB_USBtoUART
  ```
- The output varies depending on the type and the number of boards connected to your PC. Then pick the device name of your board and run (if needed, change “115200” to the default baud rate of the chip in use):
  ```bash
  screen /dev/cu.device_name 115200
  ```
  Replace device_name with the name found running ls /dev/cu.*.
- What you are looking for is some log displayed by the screen. The log contents depend on application loaded to ESP32-S2, see Example Output. To exit the current screen session, type Ctrl-A + K.

Note: Do not forget to exit the current screen session after verifying that the communication is working. If you fail to do it and just close the terminal window, the serial port will be inaccessible for uploading firmware later.

Example Output An example log is shown below. Reset the board if you do not see anything.

```
ets Jun 8 2016 00:22:57
rst:0x5 (DEEPSLEEP_RESET),boot:0x13 (SPI_FAST_FLASH_BOOT)
ets Jun 8 2016 00:22:57
rst:0x7 (TG0WDT_SYS_RESET),boot:0x13 (SPI_FAST_FLASH_BOOT)
configspi: 0, SPIWP:0x00
clk_drv:0x00,q_drv:0x00,d_drv:0x00,cs0_drv:0x00,hd_drv:0x00,wp_drv:0x00
mode:DIO, clock div:2
load:0x3fff0000,len:8
load:0x3fff0010,len:3464
load:0x40078000,len:7828
load:0x40080000,len:252
entry 0x40080034
```
If you can see readable log output, it means serial connection is working and you are ready to proceed with installation and finally upload an application to ESP32-S2.

**Note:** For some serial port wiring configurations, the serial RTS & DTR pins need to be disabled in the terminal program before the ESP32-S2 booting and producing serial output. This depends on the hardware itself, most development boards (including all Espressif boards) do not have this issue. The issue is present if RTS & DTR are wired directly to the EN & GPIO0 pins. See the *esptool documentation* for more details.

If you got here from *Step 5. First Steps on ESP-IDF* when installing s/w for ESP32-S2 development, then you can continue with *Step 5. First Steps on ESP-IDF*.

**Flashing Troubleshooting**

**Failed to Connect** If you run the given command and see errors such as “Failed to connect”, there might be several reasons for this. One of the reasons might be issues encountered by *esptool.py*, the utility that is called by the build system to reset the chip, interact with the ROM bootloader, and flash firmware. One simple solution to try is to manually reset as described below. If it does not help, you can find more details about possible issues in the *esptool troubleshooting* page.

*esptool.py* resets ESP32-S2 automatically by asserting DTR and RTS control lines of the USB-to-UART bridge, i.e., FTDI or CP210x (for more information, see *Establish Serial Connection with ESP32-S2*). The DTR and RTS control lines are in turn connected to GPIO0 and CHIP_PU (EN) pins of ESP32-S2, thus changes in the voltage levels of DTR and RTS will boot ESP32-S2 into Firmware Download mode. As an example, check the *schematic* for the ESP32 DevKitC development board.

In general, you should have no problems with the official *esp-idf development boards*. However, *esptool.py* is not able to reset your hardware automatically in the following cases:

- Your hardware does not have the DTR and RTS lines connected to GPIO0 and CHIP_PU.
- The DTR and RTS lines are configured differently.
- There are no such serial control lines at all.

Depending on the kind of hardware you have, it may also be possible to manually put your ESP32-S2 board into Firmware Download mode (reset).

- For development boards produced by Espressif, this information can be found in the respective getting started guides or user guides. For example, to manually reset an ESP-IDF development board, hold down the Boot button (GPIO0) and press the EN button (CHIP_PU).
- For other types of hardware, try pulling GPIO0 down.

**IDF Monitor**

IDF Monitor uses the *esp-idf-monitor* package as a serial terminal program which relays serial data to and from the target device’s serial port. It also provides some ESP-IDF-specific features.

IDF Monitor can be launched from an ESP-IDF project by running *idf.py monitor*.

**Keyboard Shortcuts** For easy interaction with IDF Monitor, use the keyboard shortcuts given in the table. These keyboard shortcuts can be customized, for more details see *Configuration File* section.
<table>
<thead>
<tr>
<th>Keyboard Shortcut</th>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ctrl + ]</td>
<td>Exit the program</td>
<td></td>
</tr>
<tr>
<td>Ctrl + T</td>
<td>Menu escape key</td>
<td>Press and follow it by one of the keys given below.</td>
</tr>
<tr>
<td>• Ctrl + T</td>
<td>Send the menu character itself to remote</td>
<td></td>
</tr>
<tr>
<td>• Ctrl + J</td>
<td>Send the exit character itself to remote</td>
<td></td>
</tr>
<tr>
<td>• Ctrl + P</td>
<td>Reset target into bootloader to pause app via RTS line</td>
<td>Resets the target, into bootloader via the RTS line (if connected), so that the board runs nothing. Useful when you need to wait for another device to startup.</td>
</tr>
<tr>
<td>• Ctrl + R</td>
<td>Reset target board via RTS line</td>
<td>Resets the target board and re-starts the application via the RTS line (if connected).</td>
</tr>
<tr>
<td>• Ctrl + F</td>
<td>Build and flash the project</td>
<td>Pauses idf_monitor to run the project flash target, then resumes idf_monitor. Any changed source files are recompiled and then re-flashed. Target encrypted-flash is run if idf_monitor was started with argument -E.</td>
</tr>
<tr>
<td>• Ctrl + A (or A)</td>
<td>Build and flash the app only</td>
<td>Pauses idf_monitor to run the app-flash target, then resumes idf_monitor. Similar to the flash target, but only the main app is built and re-flashed. Target encrypted-app-flash is run if idf_monitor was started with argument -E.</td>
</tr>
<tr>
<td>• Ctrl + Y</td>
<td>Stop/resume log output printing on screen</td>
<td>Discards all incoming serial data while activated. Allows to quickly pause and examine log output without quitting the monitor.</td>
</tr>
<tr>
<td>• Ctrl + L</td>
<td>Stop/resume log output saved to file</td>
<td>Creates a file in the project directory and the output is written to that file until this is disabled with the same keyboard shortcut (or IDF Monitor exits).</td>
</tr>
<tr>
<td>• Ctrl + I (or I)</td>
<td>Stop/resume printing timestamps</td>
<td>IDF Monitor can print a timestamp in the beginning of each line. The timestamp format can be changed by the --timestamp-format command line argument.</td>
</tr>
<tr>
<td>• Ctrl + H (or H)</td>
<td>Display all keyboard shortcuts</td>
<td></td>
</tr>
<tr>
<td>• Ctrl + X (or X)</td>
<td>Exit the program</td>
<td></td>
</tr>
<tr>
<td>Ctrl + C</td>
<td>Interrupt running application</td>
<td>Pauses IDF Monitor and runs GDB project debugger to debug the application at runtime. This requires CON-FIG_ESP_SYSTEM_GDBSTUB_RUNTIME option to be enabled.</td>
</tr>
</tbody>
</table>

Any keys pressed, other than Ctrl-] and Ctrl-T, will be sent through the serial port.

**ESP-IDF-specific Features**

**Automatic Address Decoding**  Whenever the chip outputs a hexadecimal address that points to executable code, IDF monitor looks up the location in the source code (file name and line number) and prints the location on the next line in yellow.

If an ESP-IDF app crashes and panics, a register dump and backtrace are produced, such as the following:
Chapter 1. Get Started

Guru Meditation Error of type StoreProhibited occurred on core 0. Exception was unhandled.

Register dump:

To decode each address, IDF Monitor runs the following command in the background:

xtensa-esp32s2-elf-addr2line -pfiaC -e build/PROJECT.elf ADDRESS

If an address is not matched in the app source code, IDF monitor also checks the ROM code. Instead of printing the source file name and line number, only the function name followed by in ROM is displayed:
abort() was called at PC 0x40007c69 on core 0
0x40007c69: ets_write_char in ROM

Backtrace: 0x40081656:0x3ffb4ac0 0x40085729:0x3ffb4ae0 0x4008a7ce:0x3ffb4b00...
→ 0x40007c69:0x3ffb4b70 0x40008148:0x3ffb4b90 0x400d51d7:0x3ffb4c20...

→ c:208 (discriminator 13)
0x400e31bc: vPortTaskWrapper at /Users/espressif/esp-idf/components/freertos/
→ FreeRTOS-Kernel/portable/xtensa/port.c:162

The ROM ELF file is automatically loaded from a location based on the IDF_PATH and ESP_ROM_ELF_DIR
environment variables. This can be overridden by calling esp_idf_monitor and providing a path to a specific
ROM ELF file: python -m esp_idf_monitor --rom-elf-file [path to ROM ELF file].

Note: Set environment variable ESP_MONITOR_DECODE to 0 or call esp_idf_monitor with specific command line
option: python -m esp_idf_monitor --disable-address-decoding to disable address decoding.

Target Reset on Connection  
By default, IDF Monitor will reset the target when connecting to it. The reset of the
target chip is performed using the DTR and RTS serial lines. To prevent IDF Monitor from automatically resetting
the target on connection, call IDF Monitor with the --no-reset option (e.g., idf.py monitor --no-reset).

Note: The --no-reset option applies the same behavior even when connecting IDF Monitor to a particular port
(e.g., idf.py monitor --no-reset -p [PORT]).

Launching GDB with GDBStub  
GDBStub is a useful runtime debugging feature that runs on the target and
connects to the host over the serial port to receive debugging commands. GDBStub supports commands such as
reading memory and variables, examining call stack frames etc. Although GDBStub is less versatile than JTAG
debugging, it does not require any special hardware (such as a JTAG to USB bridge) as communication is done
totally over the serial port.

A target can be configured to run GDBStub in the background by setting the CONFIG_ESP_SYSTEM_GDBSTUB_RUNTIME. GDBStub will run in the background until a Ctrl+C message is
sent over the serial port and causes the GDBStub to break (i.e., stop the execution of) the program, thus allowing
GDBStub to handle debugging commands.

Furthermore, the panic handler can be configured to run GDBStub on a crash by setting the CONFIG_ESP_SYSTEM_PANIC to GDBStub on panic. When a crash occurs, GDBStub will output a special string
pattern over the serial port to indicate that it is running.

In both cases (i.e., sending the Ctrl+C message, or receiving the special string pattern), IDF Monitor will automatically
launch GDB in order to allow the user to send debugging commands. After GDB exits, the target is reset via
the RTS serial line. If this line is not connected, users can reset their target (by pressing the board’s Reset button).

Note: In the background, IDF Monitor runs the following command to launch GDB:
xtensa-esp32s2-elf-gdb -ex "set serial baud BAUD" -ex "target remote PORT" -ex ...
→ interrupt build/PROJECT.elf :idf_target:`Hello NAME chip`

Output Filtering  IDF monitor can be invoked as *idf.py monitor --print-filter="xyz"*, where 
*--print-filter* is the parameter for output filtering. The default value is an empty string, which means that 
everything is printed.

Restrictions on what to print can be specified as a series of `<tag>:<log_level>` items where `<tag>` is the tag 
string and `<log_level>` is a character from the set `{N, E, W, I, D, V, *}` referring to a level for logging.

For example, PRINT_FILTER="tag1:W" matches and prints only the outputs written with ESP_LOGW("tag1", ...) or at lower verbosity level, i.e., ESP_LOGE("tag1", ...). Not specifying a `<log_level>` or using * defaults to Verbose level.

Note: Use primary logging to disable at compilation the outputs you do not need through the *logging library*. Output filtering with ESP-monitor is a secondary solution which can be useful for adjusting the filtering options without recompiling the application.

Your app tags must not contain spaces, asterisks *, or colons : to be compatible with the output filtering feature.

If the last line of the output in your app is not followed by a carriage return, the output filtering might get confused, i.e., the monitor starts to print the line and later finds out that the line should not have been written. This is a known issue and can be avoided by always adding a carriage return (especially when no output follows immediately afterwards).

Examples of Filtering Rules:

- * can be used to match any tags. However, the string PRINT_FILTER="*:I tag1:E" with regards to 
tag1 prints errors only, because the rule for tag1 has a higher priority over the rule for *.
- The default (empty) rule is equivalent to *:V because matching every tag at the Verbose level or lower means 
matching everything.
- "*:N" suppresses not only the outputs from logging functions, but also the prints made by printf, etc. To 
avoid this, use *:E or a higher verbosity level.
- Rules "tag1:V","tag1:v","tag1:","tag1:*", and "tag1" are equivalent.
- Rule "tag1:W tag1:E" is equivalent to "tag1:E" because any consequent occurrence of the same tag 
name overwrites the previous one.
- Rule "tag1:I tag2:W" only prints tag1 at the Info verbosity level or lower and tag2 at the Warning 
verbosity level or lower.
- Rule "tag1:I tag2:W tag3:N" is essentially equivalent to the previous one because tag3:N specifies 
that tag3 should not be printed.
- tag3:N in the rule "tag1:I tag2:W tag3:N *:V" is more meaningful because without tag3:N the 
tag3 messages could have been printed; the errors for tag1 and tag2 will be printed at the specified (or 
lower) verbosity level and everything else will be printed by default.

A More Complex Filtering Example  The following log snippet was acquired without any filtering options:

```
load:0x40078000,len:13564
entry 0x40078b4c
E (31) esp_image: image at 0x30000 has invalid magic byte
W (31) esp_image: image at 0x30000 has invalid SPI mode 255
E (39) boot: Factory app partition is not bootable
I (568) cpu_start: Pro cpu up.
I (569) heap_init: Initializing. RAM available for dynamic allocation:
I (603) cpu_start: Pro cpu start user code
D (309) light_driver: [light_init, 74]:status: 1, mode: 2
```
The captured output for the filtering options \texttt{PRINT\_FILTER=\textasciitilde\texttildelow wifi esp\_image:E light\_driver:I} is given below:

<table>
<thead>
<tr>
<th>Level</th>
<th>Message</th>
</tr>
</thead>
<tbody>
<tr>
<td>E (31)</td>
<td>esp_image: image at 0x30000 has invalid magic byte</td>
</tr>
<tr>
<td>I (328)</td>
<td>wifi driver task: 3ffdbf84, prio:23, stack:4096, core=0</td>
</tr>
</tbody>
</table>

The options \texttt{PRINT\_FILTER=\texttildelow light\_driver:D esp\_image:N boot:N cpu\_start:N vfs:N wifi:N \*:V} show the following output:

<table>
<thead>
<tr>
<th>Message</th>
</tr>
</thead>
<tbody>
<tr>
<td>load:0x40078000,len:13564</td>
</tr>
<tr>
<td>entry 0x40078d4c</td>
</tr>
<tr>
<td>I (569)</td>
</tr>
<tr>
<td>D (309)</td>
</tr>
</tbody>
</table>

### Configuration File

\texttt{esp-idf-monitor} is using \texttt{C0 control codes} to interact with the console. Characters from the config file are converted to their \texttt{C0} control codes. Available characters include the English alphabet (A-Z) and special symbols: [,.\,\^\,\_,\].

**Warning:** Please note that some characters may not work on all platforms or can be already reserved as a shortcut for something else. Use this feature with caution!

### File Location

The default name for a configuration file is \texttt{esp-idf-monitor.cfg}. First, the same directory \texttt{esp-idf-monitor} is being run if it is inspected.

If a configuration file is not found here, the current user’s OS configuration directory is inspected next:

- **Linux:** /home/\textless user\textgreater/.config/esp-idf-monitor/
- **MacOS:** /Users/\textless user\textgreater/.config/esp-idf-monitor/
- **Windows:** c:\Users\\textless user\textgreater\AppData\Local\esp-idf-monitor\n
If a configuration file is still not found, the last inspected location is the home directory:

- **Linux:** /home/\textless user\textgreater/
- **MacOS:** /Users/\textless user\textgreater/
- **Windows:** c:\Users\\textless user\textgreater\

On Windows, the home directory can be set with the \texttt{HOME} or \texttt{USERPROFILE} environment variables. Therefore, the Windows configuration directory location also depends on these.

A different location for the configuration file can be specified with the \texttt{ESP\_IDF\_MONITOR\_CFGFILE} environment variable, e.g., \texttt{ESP\_IDF\_MONITOR\_CFGFILE = ~/custom_config.cfg}. This overrides the search priorities described above.

\texttt{esp-idf-monitor} will read settings from other usual configuration files if no other configuration file is used. It automatically reads from \texttt{setup.cfg} or \texttt{tox.ini} if they exist.

### Configuration Options

Below is a table listing the available configuration options:
<table>
<thead>
<tr>
<th>Option Name</th>
<th>Description</th>
<th>Default Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>menu_key</td>
<td>Key to access the main menu.</td>
<td>T</td>
</tr>
<tr>
<td>exit_key</td>
<td>Key to exit the monitor.</td>
<td>]</td>
</tr>
<tr>
<td>chip_reset_key</td>
<td>Key to initiate a chip reset.</td>
<td>R</td>
</tr>
<tr>
<td>recompile_upload_key</td>
<td>Key to recompile and upload.</td>
<td>F</td>
</tr>
<tr>
<td>recompile_upload_app_key</td>
<td>Key to recompile and upload just the application.</td>
<td>A</td>
</tr>
<tr>
<td>toggle_output_key</td>
<td>Key to toggle the output display.</td>
<td>Y</td>
</tr>
<tr>
<td>toggle_log_key</td>
<td>Key to toggle the logging feature.</td>
<td>L</td>
</tr>
<tr>
<td>toggle_timestamp_key</td>
<td>Key to toggle timestamp display.</td>
<td>I</td>
</tr>
<tr>
<td>chip_reset_bootloader_key</td>
<td>Key to reset the chip to bootloader mode.</td>
<td>P</td>
</tr>
<tr>
<td>exit_menu_key</td>
<td>Key to exit the monitor from the menu.</td>
<td>X</td>
</tr>
<tr>
<td>skip_menu_key</td>
<td>Pressing the menu key can be skipped for menu commands.</td>
<td>False</td>
</tr>
</tbody>
</table>

**Syntax**  The configuration file is in .ini file format: it must be introduced by an [esp-idf-monitor] header to be recognized as valid. This section then contains name = value entries. Lines beginning with # or ; are ignored as comments.

```ini
# esp-idf-monitor.cfg file to configure internal settings of esp-idf-monitor
[esp-idf-monitor]
menu_key = T
exit_key = ]
chip_reset_key = R
recompile_upload_key = F
recompile_upload_app_key = A
toggle_output_key = Y
toggle_log_key = L
toggle_timestamp_key = I
chip_reset_bootloader_key = P
exit_menu_key = X
skip_menu_key = False
```

**Known Issues with IDF Monitor**

**Issues Observed on Windows**

- Arrow keys, as well as some other keys, do not work in GDB due to Windows Console limitations.
- Occasionally, when “idf.py” exits, it might stall for up to 30 seconds before IDF Monitor resumes.
- When “gdb” is run, it might stall for a short time before it begins communicating with the GDBStub.

**Standard Toolchain Setup for Linux and macOS**

**Installation Step by Step**  This is a detailed roadmap to walk you through the installation process.

**Setting up Development Environment**  These are the steps for setting up the ESP-IDF for your ESP32-S2.

- **Step 1. Install Prerequisites**
- **Step 2. Get ESP-IDF**
- **Step 3. Set up the Tools**
- **Step 4. Set up the Environment Variables**
- **Step 5. First Steps on ESP-IDF**
Step 1. Install Prerequisites In order to use ESP-IDF with the ESP32-S2, you need to install some software packages based on your Operating System. This setup guide helps you on getting everything installed on Linux and macOS based systems.

For Linux Users To compile using ESP-IDF, you need to get the following packages. The command to run depends on which distribution of Linux you are using:

- Ubuntu and Debian:
  ```
  sudo apt-get install git wget flex bison gperf python3 python3-pip python3-venv cmake ninja-build ccache libffi-dev libssl-dev dfu-util libusb-1.0-0
  ```

- CentOS 7 & 8:
  ```
  sudo yum -y update && sudo yum install git wget flex bison gperf python3 cmake ninja-build ccache dfu-util libusb
  ```

CentOS 7 is still supported but CentOS version 8 is recommended for a better user experience.

- Arch:
  ```
  sudo pacman -S --needed gcc git make flex bison gperf python cmake ninja-ccache dfu-util libusb
  ```

Note:
- CMake version 3.16 or newer is required for use with ESP-IDF. Run “tools/idf_tools.py install cmake” to install a suitable version if your OS versions does not have one.
- If you do not see your Linux distribution in the above list then please check its documentation to find out which command to use for package installation.

For macOS Users ESP-IDF uses the version of Python installed by default on macOS.

- Install CMake & Ninja build:
  - If you have HomeBrew, you can run:
    ```
    brew install cmake ninja dfu-util
    ```
  - If you have MacPorts, you can run:
    ```
    sudo port install cmake ninja dfu-util
    ```

- Otherwise, consult the CMake and Ninja home pages for macOS installation downloads.
- It is strongly recommended to also install ccache for faster builds. If you have HomeBrew, this can be done via brew install ccache or sudo port install ccache on MacPorts.

Note: If an error like this is shown during any step:
```
```

Then you need to install the XCode command line tools to continue. You can install these by running xcode-select --install.

Apple M1 Users If you use Apple M1 platform and see an error like this:
Chapter 1. Get Started

WARNING: directory for tool xtensa-esp32-elf version esp-2021r2-patch3-8.4.0 is present, but tool was not found. ERROR: tool xtensa-esp32-elf has no installed versions. Please run 'install.sh' to install it.

or:

zsh: bad CPU type in executable: ~/.espressif/tools/xtensa-esp32-elf/esp-2021r2-patch3-8.4.0/xtensa-esp32-elf/bin/xtensa-esp32-elf-gcc

Then you need to install Apple Rosetta 2 by running

/usr/sbin/softwareupdate --install-rosetta --agree-to-license

Installing Python 3 Based on macOS Catalina 10.15 release notes, use of Python 2.7 is not recommended and Python 2.7 is not included by default in future versions of macOS. Check what Python you currently have:

```bash
python --version
```

If the output is like Python 2.7.17, your default interpreter is Python 2.7. If so, also check if Python 3 is not already installed on your computer:

```bash
python3 --version
```

If the above command returns an error, it means Python 3 is not installed.

Below is an overview of the steps to install Python 3.

- Installing with HomeBrew can be done as follows:

```bash
brew install python3
```

- If you have MacPorts, you can run:

```bash
sudo port install python38
```

Step 2. Get ESP-IDF To build applications for the ESP32-S2, you need the software libraries provided by Espressif in ESP-IDF repository.

To get ESP-IDF, navigate to your installation directory and clone the repository with `git clone`, following instructions below specific to your operating system.

Open Terminal, and run the following commands:

```bash
mkdir -p ~/esp
cd ~/esp
git clone --recursive https://github.com/espressif/esp-idf.git
```

ESP-IDF is downloaded into ~/esp/esp-idf.

Consult ESP-IDF Versions for information about which ESP-IDF version to use in a given situation.

Step 3. Set up the Tools Aside from the ESP-IDF, you also need to install the tools used by ESP-IDF, such as the compiler, debugger, Python packages, etc, for projects supporting ESP32-S2.

```bash
cd ~/esp/esp-idf
./install.sh esp32s2
```

or with Fish shell

```
```
Chapter 1. Get Started

```plaintext
cd ~/esp/esp-idf
./install.fish esp32s2
```

The above commands install tools for ESP32-S2 only. If you intend to develop projects for more chip targets then you should list all of them and run for example:

```plaintext
cd ~/esp/esp-idf
./install.sh esp32,esp32s2
```

or with Fish shell

```plaintext
cd ~/esp/esp-idf
./install.fish esp32,esp32s2
```

In order to install tools for all supported targets please run the following command:

```plaintext
cd ~/esp/esp-idf
./install.sh all
```

or with Fish shell

```plaintext
cd ~/esp/esp-idf
./install.fish all
```

**Note:** For macOS users, if an error like this is shown during any step:

```plaintext
<urlopen error [SSL: CERTIFICATE_VERIFY_FAILED] certificate verify failed: unable...
   --> to get local issuer certificate (_ssl.c:xxx)
```

You may run `Install Certificates.command` in the Python folder of your computer to install certificates. For details, see Download Error While Installing ESP-IDF Tools.

---

**Alternative File Downloads** The tools installer downloads a number of files attached to GitHub Releases. If accessing GitHub is slow then it is possible to set an environment variable to prefer Espressif’s download server for GitHub asset downloads.

**Note:** This setting only controls individual tools downloaded from GitHub releases, it does not change the URLs used to access any Git repositories.

To prefer the Espressif download server when installing tools, use the following sequence of commands when running `install.sh`:

```plaintext
cd ~/esp/esp-idf
export IDF_GITHUB_ASSETS="dl.espressif.com/github_assets"
./install.sh
```

**Note:** For users in China, we recommend using our download server located in China for faster download speed.

```plaintext
cd ~/esp/esp-idf
export IDF_GITHUB_ASSETS="dl.espressif.cn/github_assets"
./install.sh
```
Chapter 1. Get Started

Customizing the Tools Installation Path  The scripts introduced in this step install compilation tools required by ESP-IDF inside the user home directory: $HOME/.espressif on Linux. If you wish to install the tools into a different directory, set the environment variable IDF_TOOLS_PATH before running the installation scripts. Make sure that your user account has sufficient permissions to read and write this path.

If changing the IDF_TOOLS_PATH, make sure it is set to the same value every time the Install script (install.bat, install.ps1 or install.sh) and an Export script (export.bat, export.ps1 or export.sh) are executed.

Step 4. Set up the Environment Variables  The installed tools are not yet added to the PATH environment variable. To make the tools usable from the command line, some environment variables must be set. ESP-IDF provides another script which does that.

In the terminal where you are going to use ESP-IDF, run:

```
$HOME/esp/esp-idf/export.sh
```

or for fish (supported only since fish version 3.0.0):

```
$HOME/esp/esp-idf/export.fish
```

Note the space between the leading dot and the path!

If you plan to use esp-idf frequently, you can create an alias for executing export.sh:

1. Copy and paste the following command to your shell’s profile (.profile, .bashrc, .zprofile, etc.)

   ```
   alias get_idf='.` $HOME/esp/esp-idf/export.sh`
   ```

2. Refresh the configuration by restarting the terminal session or by running source [path to profile], for example, source ~/.bashrc.

Now you can run get_idf to set up or refresh the esp-idf environment in any terminal session.

Technically, you can add export.sh to your shell’s profile directly; however, it is not recommended. Doing so activates IDF virtual environment in every terminal session (including those where IDF is not needed), defeating the purpose of the virtual environment and likely affecting other software.

Step 5. First Steps on ESP-IDF  Now since all requirements are met, the next topic will guide you on how to start your first project.

This guide helps you on the first steps using ESP-IDF. Follow this guide to start a new project on the ESP32-S2 and build, flash, and monitor the device output.

Note:  If you have not yet installed ESP-IDF, please go to Installation and follow the instruction in order to get all the software needed to use this guide.

Start a Project  Now you are ready to prepare your application for ESP32-S2. You can start with get-started/hello_world project from examples directory in ESP-IDF.

Important:  The ESP-IDF build system does not support spaces in the paths to either ESP-IDF or to projects.

Copy the project get-started/hello_world to ~/esp directory:

```
cd ~/esp
cp -r $IDF_PATH/examples/get-started/hello_world .
```
Chapter 1. Get Started

**Note:** There is a range of example projects in the examples directory in ESP-IDF. You can copy any project in the same way as presented above and run it. It is also possible to build examples in-place without copying them first.

**Connect Your Device**  Now connect your ESP32-S2 board to the computer and check under which serial port the board is visible.

Serial ports have the following naming patterns:

- **Linux:** starting with `/dev/tty`
- **macOS:** starting with `/dev/cu`

If you are not sure how to check the serial port name, please refer to *Establish Serial Connection with ESP32-S2* for full details.

**Note:** Keep the port name handy as it is needed in the next steps.

**Configure Your Project**  Navigate to your `hello_world` directory, set ESP32-S2 as the target, and run the project configuration utility `menuconfig`.

```bash
cd ~/esp/hello_world
idf.py set-target esp32s2
idf.py menuconfig
```

After opening a new project, you should first set the target with `idf.py set-target esp32s2`. Note that existing builds and configurations in the project, if any, are cleared and initialized in this process. The target may be saved in the environment variable to skip this step at all. See *Select the Target Chip: set-target* for additional information.

If the previous steps have been done correctly, the following menu appears:

![Project configuration - Home window](image)

Fig. 57: Project configuration - Home window

You are using this menu to set up project specific variables, e.g., Wi-Fi network name and password, the processor speed, etc. Setting up the project with menuconfig may be skipped for “hello_world” since this example runs with default configuration.
Chapter 1. Get Started

**Note:** The colors of the menu could be different in your terminal. You can change the appearance with the option --style. Please run `idf.py menuconfig --help` for further information.

If you are using one of the supported development boards, you can speed up your development by using Board Support Package. See *Additional Tips* for more information.

**Console Output Configuration** If you are using the USB for flashing the ESP32-S2, you need to change the channel for the console output from UART (default) to USB.

1. Navigate to the option Channel for console output.
   - Component config > ESP System Settings > Channel for console output
2. Change to the option (the default is always UART):
   - USB CDC
3. Save the new configuration and exit the menuconfig screen.

**Build the Project** Build the project by running:

```
idf.py build
```

This command compiles the application and all ESP-IDF components, then it generates the bootloader, partition table, and application binaries.

```
$ idf.py build
Running cmake in directory /path/to/hello_world/build
Executing "cmake -G Ninja --warn-uninitialized /path/to/hello_world"...
Warn about uninitialized values.
-- Found Git: /usr/bin/git (found version "2.17.0")
-- Building empty aws_iot component due to configuration
-- Component names: ...
-- Component paths: ...

... (more lines of build system output)

[527/527] Generating hello_world.bin
esptool.py v2.3.1
Project build complete. To flash, run this command:
.. ./components/esptool_py/esptool/esptool.py -p (PORT) -b 921600 write_flash --flash_mode dio --flash_size detect --flash_freq 40m 0x10000 build/hello_world.
   --bin build 0x1000 build/bootloader/bootloader.bin 0x8000 build/partition_table/
   --partition-table.bin
or run 'idf.py -p PORT flash'
```

If there are no errors, the build finishes by generating the firmware binary .bin files.

**Flash onto the Device** To flash the binaries that you just built for the ESP32-S2 in the previous step, you need to run the following command:

```
idf.py -p PORT flash
```

Replace PORT with your ESP32-S2 board’s USB port name. If the PORT is not defined, the `idf.py` will try to connect automatically using the available USB ports.

For more information on `idf.py` arguments, see `idf.py`.

**Note:** The option flash automatically builds and flashes the project, so running `idf.py build` is not necessary.
Chapter 1. Get Started

Encountered Issues While Flashing? See the “Additional Tips” below. You can also refer to Flashing Troubleshooting page or Establish Serial Connection with ESP32-S2 for more detailed information.

Normal Operation When flashing, you will see the output log similar to the following:

```
... esptool.py --chip esp32s2 -p /dev/ttyUSB0 -b 460800 --before=default_reset --
  → after=hard_reset write_flash --flash_mode dio --flash_freq 40m --flash_size 2MB
  → 0x8000 partition_table/partition-table.bin 0x1000 bootloader/bootloader.bin
  → 0x10000 hello_world.bin
esptool.py v3.0-dev
Serial port /dev/ttyUSB0
Connecting....
Chip is ESP32-S2
Features: WiFi
Crystal is 40MHz
Uploading stub...
Running stub...
Stub running...
Changing baud rate to 460800
Changed.
Configuring flash size...

Hard resetting via RTS pin...
Done
```

If there are no issues by the end of the flash process, the board will reboot and start up the “hello_world” application.

If you would like to use the Eclipse or VS Code IDE instead of running `idf.py`, check out Eclipse Plugin, VSCode Extension.

Monitor the Output To check if “hello_world” is indeed running, type `idf.py -p PORT monitor` (Do not forget to replace PORT with your serial port name).

This command launches the IDF Monitor application:

```
$ idf.py -p <PORT> monitor
Running idf_monitor in directory [...]/esp/hello_world/build
Executing "python [...]/esp-idf/tools/idf_monitor.py -b 115200 [...]/esp/hello_
  → world/build/hello_world.elf"...
```

(continues on next page)
After startup and diagnostic logs scroll up, you should see "Hello world!" printed out by the application.

```
Hello world!
Restarting in 10 seconds...
This is esp32s2 chip with 1 CPU core(s), WiFi, silicon revision 0, 2 MB...
Minimum free heap size: 253900 bytes
Restarting in 9 seconds...
Restarting in 8 seconds...
Restarting in 7 seconds...
```

To exit IDF monitor use the shortcut Ctrl+].

**Note:** You can combine building, flashing and monitoring into one step by running:

```
idf.py -p PORT flash monitor
```

See also:

- **IDF Monitor** for handy shortcuts and more details on using IDF monitor.
- **idf.py** for a full reference of idf.py commands and options.

**That is all that you need to get started with ESP32-S2!**

Now you are ready to try some other examples, or go straight to developing your own applications.

**Important:** Some of examples do not support ESP32-S2 because required hardware is not included in ESP32-S2 so it cannot be supported.

If building an example, please check the README file for the Supported Targets table. If this is present including ESP32-S2 target, or the table does not exist at all, the example will work on ESP32-S2.

**Additional Tips**

**Permission Denied Issue**  With some Linux distributions, you may get the error message similar to `Could not open port <PORT>: Permission denied: '<PORT>'` when flashing the ESP32-S2. *This can be solved by adding the current user to the specific group*, such as dialout or uucp group.

**Python Compatibility**  ESP-IDF supports Python 3.8 or newer. It is recommended to upgrade your operating system to a recent version satisfying this requirement. Other options include the installation of Python from sources or the use of a Python version management system such as pyenv.

**Start with Board Support Package**  To speed up prototyping on some development boards, you can use Board Support Packages (BSPs), which makes initialization of a particular board as easy as few function calls.
A BSP typically supports all of the hardware components provided on development board. Apart from the pinout definition and initialization functions, a BSP ships with drivers for the external components such as sensors, displays, audio codecs etc.

The BSPs are distributed via IDF Component Manager, so they can be found in IDF Component Registry.

Here is an example of how to add ESP32-S2-Kaluga-Kit BSP to your project:

```
idf.py add-dependency esp32_s2_kaluga_kit
```

More examples of BSP usage can be found in BSP examples folder.

**Flash Erase**   Erasing the flash is also possible. To erase the entire flash memory you can run the following command:

```
idf.py -p PORT erase-flash
```

For erasing the OTA data, if present, you can run this command:

```
idf.py -p PORT erase-otadata
```

The flash erase command can take a while to be done. Do not disconnect your device while the flash erasing is in progress.

**Tip: Updating ESP-IDF**   It is recommended to update ESP-IDF from time to time, as newer versions fix bugs and/or provide new features. Please note that each ESP-IDF major and minor release version has an associated support period, and when one release branch is approaching end of life (EOL), all users are encouraged to upgrade their projects to more recent ESP-IDF releases, to find out more about support periods, see ESP-IDF Versions.

The simplest way to do the update is to delete the existing esp-idf folder and clone it again, as if performing the initial installation described in Step 2. Get ESP-IDF.

Another solution is to update only what has changed. The update procedure depends on the version of ESP-IDF you are using.

After updating ESP-IDF, execute the Install script again, in case the new ESP-IDF version requires different versions of tools. See instructions at Step 3. Set up the Tools.

Once the new tools are installed, update the environment using the Export script. See instructions at Step 4. Set up the Environment Variables.

### 1.4 Build Your First Project

If you already have the ESP-IDF installed and are not using an IDE, you can build your first project from the command line following the Start a Project on Windows or Start a Project on Linux and macOS.

### 1.5 Uninstall ESP-IDF

If you want to remove ESP-IDF, please follow Uninstall ESP-IDF.
Chapter 2

API Reference

2.1 API Conventions

This document describes conventions and assumptions common to ESP-IDF Application Programming Interfaces (APIs).

ESP-IDF provides several kinds of programming interfaces:

- C functions, structures, enums, type definitions, and preprocessor macros declared in public header files of ESP-IDF components. Various pages in the API Reference section of the programming guide contain descriptions of these functions, structures, and types.
- Build system functions, predefined variables, and options. These are documented in the ESP-IDF CMake Build System API.
- Kconfig options can be used in code and in the build system (CMakeLists.txt) files.
- Host tools and their command line parameters are also part of the ESP-IDF interfaces.

ESP-IDF is made up of multiple components where these components either contain code specifically written for ESP chips, or contain a third-party library (i.e., a third-party component). In some cases, third-party components contain an “ESP-IDF specific” wrapper in order to provide an interface that is either simpler or better integrated with the rest of ESP-IDF’s features. In other cases, third-party components present the original API of the underlying library directly.

The following sections explain some of the aspects of ESP-IDF APIs and their usage.

2.1.1 Error Handling

Most ESP-IDF APIs return error codes defined with the `esp_err_t` type. See Error Handling section for more information about error handling approaches. Error Codes Reference contains the list of error codes returned by ESP-IDF components.

2.1.2 Configuration Structures

**Important:** Correct initialization of configuration structures is an important part of making the application compatible with future versions of ESP-IDF.
Most initialization, configuration, and installation functions in ESP-IDF (typically named ..._init(), ..._config(), and ..._install()) take a configuration structure pointer as an argument. For example:

```c
const esp_timer_create_args_t my_timer_args = {  
  .callback = &my_timer_callback,  
  .arg = callback_arg,  
  .name = "my_timer"  
};
esp_timer_handle_t my_timer;
```

These functions never store the pointer to the configuration structure, so it is safe to allocate the structure on the stack.

The application must initialize all fields of the structure. The following is incorrect:

```c
esp_timer_create_args_t my_timer_args;
my_timer_args.callback = &my_timer_callback;
/* Incorrect! Fields .arg and .name are not initialized */
esp_timer_create(&my_timer_args, &my_timer);
```

Most ESP-IDF examples use C99 designated initializers for structure initialization since they provide a concise way of setting a subset of fields, and zero-initializing the remaining fields:

```c
const esp_timer_create_args_t my_timer_args = {  
  .callback = &my_timer_callback,  
  /* Correct, fields .arg and .name are zero-initialized */  
};
```

The C++ language supports designated initializer syntax, too, but the initializers must be in the order of declaration. When using ESP-IDF APIs in C++ code, you may consider using the following pattern:

```c
/* Correct, fields .dispatch_method, .name and .skip_unhandled_events are zero- initialized */
const esp_timer_create_args_t my_timer_args = {  
  .callback = &my_timer_callback,  
  /* Correct, fields .arg and .name are zero-initialized */  
};
```

For more information on designated initializers, see Designated Initializers. Note that C++ language versions older than C++20, which are not the default in the current version of ESP-IDF, do not support designated initializers. If you have to compile code with an older C++ standard than C++20, you may use GCC extensions to produce the following pattern:

```c
esp_timer_create_args_t my_timer_args = {  
  /* All the fields are zero-initialized */  
  my_timer_args.callback = &my_timer_callback;
};
```

### Default Initializers

For some configuration structures, ESP-IDF provides macros for setting default values of fields:

```c
httpd_config_t config = HTTPD_DEFAULT_CONFIG();
/* HTTPD_DEFAULT_CONFIG expands to a designated initializer. Now all fields are—set to the default values, and any field can still be modified: */
config.server_port = 8081;
```

(continues on next page)
httpd_handle_t server;
esp_err_t err = httpd_start(&server, &config);

It is recommended to use default initializer macros whenever they are provided for a particular configuration structure.

2.1.3 Private APIs

Certain header files in ESP-IDF contain APIs intended to be used only in ESP-IDF source code rather than by the applications. Such header files often contain private or esp_private in their name or path. Certain components, such as hal only contain private APIs.

Private APIs may be removed or changed in an incompatible way between minor or patch releases.

2.1.4 Components in Example Projects

ESP-IDF examples contain a variety of projects demonstrating the usage of ESP-IDF APIs. In order to reduce code duplication in the examples, a few common helpers are defined inside components that are used by multiple examples. This includes components located in common_components directory, as well as some of the components located in the examples themselves. These components are not considered to be part of the ESP-IDF API.

It is not recommended to reference these components directly in custom projects (via EXTRA_COMPONENT_DIRS build system variable), as they may change significantly between ESP-IDF versions. When starting a new project based on an ESP-IDF example, copy both the project and the common components it depends on out of ESP-IDF, and treat the common components as part of the project. Note that the common components are written with examples in mind, and might not include all the error handling required for production applications. Before using, take time to read the code and understand if it is applicable to your use case.

2.1.5 API Stability

ESP-IDF uses Semantic Versioning as explained in the Versioning Scheme.

Minor and bugfix releases of ESP-IDF guarantee compatibility with previous releases. The sections below explain different aspects and limitations to compatibility.

Source-level Compatibility

ESP-IDF guarantees source-level compatibility of C functions, structures, enums, type definitions, and preprocessor macros declared in public header files of ESP-IDF components. Source-level compatibility implies that the application source code can be recompiled with the newer version of ESP-IDF without changes.

The following changes are allowed between minor versions and do not break source-level compatibility:

- Deprecating functions (using the deprecated attribute) and header files (using a preprocessor #warning). Deprecations are listed in ESP-IDF release notes. It is recommended to update the source code to use the newer functions or files that replace the deprecated ones, however, this is not mandatory. Deprecated functions and files can be removed from major versions of ESP-IDF.
- Renaming components, moving source and header files between components —provided that the build system ensures that correct files are still found.
- Renaming Kconfig options. Kconfig system’s backward compatibility ensures that the original Kconfig option names can still be used by the application in sdkconfig file, CMake files, and source code.
Lack of Binary Compatibility

ESP-IDF does not guarantee binary compatibility between releases. This means that if a precompiled library is built with one ESP-IDF version, it is not guaranteed to work the same way with the next minor or bugfix release. The following are the possible changes that keep source-level compatibility but not binary compatibility:

- Changing numerical values for C enum members.
- Adding new structure members or changing the order of members. See Configuration Structures for tips that help ensure compatibility.
- Replacing an `extern` function with a `static inline` one with the same signature, or vice versa.
- Replacing a function-like macro with a compatible C function.

Other Exceptions from Compatibility

While we try to make upgrading to a new ESP-IDF version easy, there are parts of ESP-IDF that may change between minor versions in an incompatible way. We appreciate issuing reports about any unintended breaking changes that do not fall into the categories below.

- Private APIs.
- Components in Example Projects.
- Features clearly marked as “beta”, “preview”, or “experimental”.
- Changes made to mitigate security issues or to replace insecure default behaviors with secure ones.
- Features that were never functional. For example, if it was never possible to use a certain function or an enumeration value, it may get renamed (as part of fixing it) or removed. This includes software features that depend on non-functional chip hardware features.
- Unexpected or undefined behavior that is not documented explicitly may be fixed/changed, such as due to missing validation of argument ranges.
- Location of `Kconfig` options in menuconfig.
- Location and names of example projects.

2.2 Application Protocols

2.2.1 ASIO Port

ASIO is a cross-platform C++ library, see https://think-async.com/Asio/. It provides a consistent asynchronous model using a modern C++ approach.

The ESP-IDF component ASIO has been moved from ESP-IDF since version v5.0 to a separate repository:

- ASIO component on GitHub

To add ASIO component in your project, please run `idf.py add-dependency espressif/asio`.

Hosted Documentation

The documentation can be found on the link below:

- ASIO documentation (English)
2.2.2 ESP-Modbus

The Espressif ESP-Modbus Library (esp-modbus) supports Modbus communication in the networks based on RS485, Wi-Fi, and Ethernet interfaces. Since ESP-IDF version v5.0, the component freemodbus has been moved from ESP-IDF to a separate repository:

- ESP-Modbus component on GitHub

Hosted Documentation

The documentation can be found through the link below:

- ESP-Modbus documentation (English)

Application Example

The examples below demonstrate the ESP-Modbus library of serial and TCP ports for both slave and master implementations respectively.

- protocols/modbus/serial/mb_slave
- protocols/modbus/serial/mb_master
- protocols/modbus/tcp/mb_tcp_slave
- protocols/modbus/tcp/mb_tcp_master

Please refer to the README.md documents of each specific example for details.

Protocol References

- For the detailed protocol specifications, see The Modbus Organization.

2.2.3 ESP-MQTT

Overview

ESP-MQTT is an implementation of MQTT protocol client, which is a lightweight publish/subscribe messaging protocol. Now ESP-MQTT supports MQTT v5.0.

Features

- Support MQTT over TCP, SSL with Mbed TLS, MQTT over WebSocket, and MQTT over WebSocket Secure
- Easy to setup with URI
- Multiple instances (multiple clients in one application)
- Support subscribing, publishing, authentication, last will messages, keep alive pings, and all 3 Quality of Service (QoS) levels (it should be a fully functional client)

Application Examples

- protocols/mqtt/tcp: MQTT over TCP, default port 1883
- protocols/mqtt/ssl: MQTT over TLS, default port 8883
- protocols/mqtt/ssl_ds: MQTT over TLS using digital signature peripheral for authentication, default port 8883
- protocols/mqtt/ssl_mutual_auth: MQTT over TLS using certificates for authentication, default port 8883
Chapter 2. API Reference

- protocols/mqtt_ssl_psk: MQTT over TLS using pre-shared keys for authentication, default port 8883
- protocols/mqtt/ws: MQTT over WebSocket, default port 80
- protocols/mqtt/wss: MQTT over WebSocket Secure, default port 443
- protocols/mqtt5: Uses ESP-MQTT library to connect to broker with MQTT v5.0

MQTT Message Retransmission

A new MQTT message is created by calling `esp_mqtt_client_publish` or its non blocking counterpart `esp_mqtt_client_enqueue`.

Messages with QoS 0 is sent only once. QoS 1 and 2 have different behaviors since the protocol requires extra steps to complete the process.

The ESP-MQTT library opts to always retransmit unacknowledged QoS 1 and 2 publish messages to avoid losses in faulty connections, even though the MQTT specification requires the re-transmission only on reconnect with Clean Session flag been set to 0 (set `disable_clean_session` to true for this behavior).

QoS 1 and 2 messages that may need retransmission are always enqueued, but first transmission try occurs immediately if `esp_mqtt_client_publish` is used. A transmission retry for unacknowledged messages will occur after `message_retransmit_timeout`. After `CONFIG_MQTT_OUTBOX_EXPIRED_TIMEOUT_MS` messages will expire and be deleted. If `CONFIG_MQTT_REPORT_DELETED_MESSAGES` is set, an event will be sent to notify the user.

Configuration

The configuration is made by setting fields in `esp_mqtt_client_config_t` struct. The configuration struct has the following sub structs to configure different aspects of the client operation.

- `esp_mqtt_client_config_t::broker_t` - Allow to set address and security verification.
- `esp_mqtt_client_config_t::credentials_t` - Client credentials for authentication.
- `esp_mqtt_client_config_t::session_t` - Configuration for MQTT session aspects.
- `esp_mqtt_client_config_t::network_t` - Networking related configuration.
- `esp_mqtt_client_config_t::task_t` - Allow to configure FreeRTOS task.
- `esp_mqtt_client_config_t::buffer_t` - Buffer size for input and output.

In the following sections, the most common aspects are detailed.

Broker

Address

Broker address can be set by usage of `address` struct. The configuration can be made by usage of `uri` field or the combination of `hostname`, `transport` and `port`. Optionally, `path` could be set, this field is useful in WebSocket connections.

The `uri` field is used in the format `scheme://hostname:port/path`.

- Currently support `mqtt, mqtts, ws, wss` schemes
- MQTT over TCP samples:
  - `mqtt://mqtt.eclipseprojects.io`: MQTT over TCP, default port 1883
  - `mqtt://mqtt.eclipseprojects.io:1884`: MQTT over TCP, port 1884
  - `mqtt://username:password@mqtt.eclipseprojects.io:1884`: MQTT over TCP, port 1884, with username and password
- MQTT over SSL samples:
  - `mqtts://mqtt.eclipseprojects.io`: MQTT over SSL, port 8883
  - `mqtts://mqtt.eclipseprojects.io:8884`: MQTT over SSL, port 8884
- MQTT over WebSocket samples:
  - `ws://mqtt.eclipseprojects.io:80/mqtt`
- MQTT over WebSocket Secure samples:
  - `wss://mqtt.eclipseprojects.io:443/mqtt`
- Minimal configurations:
```c
const esp_mqtt_client_config_t mqtt_cfg = {
    .broker.address.uri = "mqtt://mqtt.eclipseprojects.io",
};
esp_mqtt_client_handle_t client = esp_mqtt_client_init(&mqtt_cfg);
esp_mqtt_client_register_event(client, ESP_EVENT_ANY_ID, mqtt_event_handler, _client);
esp_mqtt_client_start(client);
```

**Note:** By default MQTT client uses event loop library to post related MQTT events (connected, subscribed, published, etc.).

**Verification**  For secure connections with TLS used, and to guarantee Broker’s identity, the `verification` struct must be set. The broker certificate may be set in PEM or DER format. To select DER, the equivalent `certificate_len` field must be set. Otherwise, a null-terminated string in PEM format should be provided to `certificate` field.

- Get certificate from server, example: `mqtt.eclipseprojects.io`

  ```bash
  openssl s_client -showcerts -connect mqtt.eclipseprojects.io:8883 < /dev/null |
  2> /dev/null | openssl x509 -outform PEM > mqtt_eclipse_org.pem
  ```

- Check the sample application: `protocols/mqtt/ssl`
- Configuration:

  ```c
  const esp_mqtt_client_config_t mqtt_cfg = {
      .broker = {
          .address.uri = "mqtts://mqtt.eclipseprojects.io:8883",
          .verification.certificate = (const char *)mqtt_eclipse_org_pem_start,
      },
  },
  ```

For details about other fields, please check the [API Reference](#) and [TLS Server Verification](#).

**Client Credentials**  All client related credentials are under the `credentials` field.

- `username`: pointer to the username used for connecting to the broker, can also be set by URI
- `client_id`: pointer to the client ID, defaults to ESP32_%CHIPID% where %CHIPID% are the last 3 bytes of MAC address in hex format

**Authentication**  It is possible to set authentication parameters through the `authentication` field. The client supports the following authentication methods:

- `password`: use a password by setting
- `certificate` and `key`: mutual authentication with TLS, and both can be provided in PEM or DER format
- `use_secure_element`: use secure element available in ESP32-WROOM-32SE
- `ds_data`: use Digital Signature Peripheral available in some Espressif devices

**Session**  For MQTT session related configurations, `session` fields should be used.

**Last Will and Testament**  MQTT allows for a last will and testament (LWT) message to notify other clients when a client ungracefully disconnects. This is configured by the following fields in the `last_will` struct.

- `topic`: pointer to the LWT message topic
- `msg`: pointer to the LWT message
- `msg_len`: length of the LWT message, required if `msg` is not null-terminated
• **qos**: quality of service for the LWT message
• **retain**: specifies the retain flag of the LWT message

**Change Settings in Project Configuration Menu**  The settings for MQTT can be found using `idf.py menu-config under Component config > ESP-MQTT Configuration`.

The following settings are available:

• `CONFIG_MQTT_PROTOCOL_311`: enable 3.1.1 version of MQTT protocol
• `CONFIG_MQTT_TRANSPORT_SSL` and `CONFIG_MQTT_TRANSPORT_WEBSOCKET`: enable specific MQTT transport layer, such as SSL, WEBSOCKET, and WEBSOCKET_SECURE
• `CONFIG_MQTT_CUSTOM_OUTBOX`: disable default implementation of `mqtt_outbox`, so a specific implementation can be supplied

**Events**

The following events may be posted by the MQTT client:

• **MQTT_EVENT_BEFORE_CONNECT**: The client is initialized and about to start connecting to the broker.
• **MQTT_EVENT_CONNECTED**: The client has successfully established a connection to the broker. The client is now ready to send and receive data.
• **MQTT_EVENT_DISCONNECTED**: The client has aborted the connection due to being unable to read or write data, e.g., because the server is unavailable.
• **MQTT_EVENT_SUBSCRIBED**: The broker has acknowledged the client’s subscribe request. The event data contains the message ID of the subscribe message.
• **MQTT_EVENT_UNSUBSCRIBED**: The broker has acknowledged the client’s unsubscribe request. The event data contains the message ID of the unsubscribe message.
• **MQTT_EVENT_PUBLISHED**: The broker has acknowledged the client’s publish message. This is only posted for QoS level 1 and 2, as level 0 does not use acknowledgements. The event data contains the message ID of the publish message.
• **MQTT_EVENT_DATA**: The client has received a publish message. The event data contains: message ID, name of the topic it was published to, received data and its length. For data that exceeds the internal buffer, multiple MQTT_EVENT_DATA events are posted and `current_data_offset` and `total_data_len` from event data updated to keep track of the fragmented message.
• **MQTT_EVENT_ERROR**: The client has encountered an error. The field `error_handle` in the event data contains `error_type` that can be used to identify the error. The type of error determines which parts of the `error_handle` struct is filled.

**API Reference**

**Header File**

• `components/mqtt/esp-mqtt/include/mqtt_client.h`
• This header file can be included with:

```
#include "mqtt_client.h"
```

• This header file is a part of the API provided by the `mqtt` component. To declare that your component depends on `mqtt`, add the following to your `CMakeLists.txt`:

```
REQUIRES mqtt
```

or

```
PRIV_REQUIRES mqtt
```

**Functions**
**esp_mqtt_client_init**

`esp_mqtt_client_init` creates a MQTT client handle based on the configuration.

**Parameters**
- `config` - A MQTT configuration structure

**Returns**
- `esp_mqtt_client_handle` if successfully created, `NULL` on error

**esp_mqtt_client_set_uri**

`esp_mqtt_client_set_uri` sets the MQTT connection URI. This API is usually used to override the URI configured in `esp_mqtt_client_init`.

**Parameters**
- `client` - MQTT client handle
- `uri` - The MQTT connection URI

**Returns**
- `ESP_FAIL` if URI parse error, `ESP_OK` on success

**esp_mqtt_client_start**

`esp_mqtt_client_start` starts the MQTT client with already created client handle.

**Parameters**
- `client` - MQTT client handle

**Returns**
- `ESP_OK` on success, `ESP_ERR_INVALID_ARG` on wrong initialization, `ESP_FAIL` on error

**esp_mqtt_client_reconnect**

This API is typically used to force reconnection upon a specific event.

**Parameters**
- `client` - MQTT client handle

**Returns**
- `ESP_OK` on success, `ESP_ERR_INVALID_ARG` on wrong initialization, `ESP_FAIL` if client is in invalid state

**esp_mqtt_client_disconnect**

This API is typically used to force disconnection from the broker.

**Parameters**
- `client` - MQTT client handle

**Returns**
- `ESP_OK` on success, `ESP_ERR_INVALID_ARG` on wrong initialization

**esp_mqtt_client_stop**

Stops the MQTT client tasks.

**Parameters**
- `client` - MQTT client handle

**Returns**
- `ESP_OK` on success, `ESP_ERR_INVALID_ARG` on wrong initialization, `ESP_FAIL` if client is in invalid state

**esp_mqtt_client_subscribe_single**

Subscribes the client to a defined topic with defined QoS.

**Parameters**
- `client` - MQTT client handle
- `topic` - The topic filter to subscribe
- `qos` - The max QoS level of the subscription

**Returns**
- `message_id` of the subscribe message on success, `-1` on failure, `-2` in case of full outbox

Notes:
- The client must be connected to send subscribe messages.
- This API can be executed from the internal MQTT task, i.e., internal MQTT task is protected by internal mutex, so it might block if a longer data receive operation is in progress.
- `esp_mqtt_client_subscribe` could be used to call this function.
int esp_mqtt_client_subscribe_multiple (esp_mqtt_client_handle_t client, const esp_mqtt_topic_t *topic_list, int size)

Subscribe the client to a list of defined topics with defined qos.

Notes:
- Client must be connected to send subscribe message
- This API is could be executed from a user task or from a MQTT event callback i.e. internal MQTT task (API is protected by internal mutex, so it might block if a longer data receive operation is in progress.
- esp_mqtt_client_subscribe could be used to call this function.

Parameters
- client - MQTT client handle
- topic_list - List of topics to subscribe
- size - size of topic_list

Returns message_id of the subscribe message on success -1 on failure -2 in case of full outbox.

int esp_mqtt_client_unsubscribe (esp_mqtt_client_handle_t client, const char *topic)

Unsubscribe the client from defined topic.

Notes:
- Client must be connected to send unsubscribe message
- It is thread safe, please refer to esp_mqtt_client_subscribe_single for details

Parameters
- client - MQTT client handle
- topic -

Returns message_id of the subscribe message on success -1 on failure

int esp_mqtt_client_publish (esp_mqtt_client_handle_t client, const char *topic, const char *data, int len, int qos, int retain)

Client to send a publish message to the broker.

Notes:
- This API might block for several seconds, either due to network timeout (10s) or if publishing payloads longer than internal buffer (due to message fragmentation)
- Client doesn’t have to be connected for this API to work, enqueuing the messages with qos>1 (returning -1 for all the qos=0 messages if disconnected). If MQTT_SKIP_PUBLISH_IF_DISCONNECTED is enabled, this API will not attempt to publish when the client is not connected and will always return -1.
- It is thread safe, please refer to esp_mqtt_client_subscribe for details

Parameters
- client - MQTT client handle
- topic - topic string
- data - payload string (set to NULL, sending empty payload message)
- len - data length, if set to 0, length is calculated from payload string
- qos - QoS of publish message
- retain - retain flag

Returns message_id of the publish message (for QoS 0 message_id will always be zero) on success.
- -1 on failure, -2 in case of full outbox.

int esp_mqtt_client_enqueue (esp_mqtt_client_handle_t client, const char *topic, const char *data, int len, int qos, int retain, bool store)

Enqueue a message to the outbox, to be sent later. Typically used for messages with qos>0, but could be also used for qos=0 messages if store=true.
This API generates and stores the publish message into the internal outbox and the actual sending to the network is performed in the mqtt-task context (in contrast to the esp_mqtt_client_publish() which sends the publish message immediately in the user task’s context). Thus, it could be used as a non blocking version of esp_mqtt_client_publish().

**Parameters**
- **client** - MQTT client handle
- **topic** - topic string
- **data** - payload string (set to NULL, sending empty payload message)
- **len** - data length, if set to 0, length is calculated from payload string
- **qos** - QoS of publish message
- **retain** - retain flag
- **store** - if true, all messages are enqueued; otherwise only QoS 1 and QoS 2 are enqueued

**Returns**
message_id if queued successfully, -1 on failure, -2 in case of full outbox.

**esp_err_t esp_mqtt_client_destroy**(esp_mqtt_client_handle_t client)
Destroys the client handle.

**Notes:**
- Cannot be called from the MQTT event handler

**Parameters**
- **client** - MQTT client handle

**Returns**
ESP_OK ESP_ERR_INVALID_ARG on wrong initialization

**esp_err_t esp_mqtt_set_config**(esp_mqtt_client_handle_t client, const esp_mqtt_client_config_t *config)
Set configuration structure, typically used when updating the config (i.e. on “before_connect” event).

**Parameters**
- **client** - MQTT client handle
- **config** - configuration structure

**Returns**
ESP_ERR_NO_MEM if failed to allocate ESP_ERR_INVALID_ARG if conflicts on transport configuration. ESP_OK on success

**esp_err_t esp_mqtt_client_register_event**(esp_mqtt_client_handle_t client, esp_mqtt_event_id_t event, esp_event_handler_t event_handler, void *event_handler_arg)
Registers MQTT event.

**Parameters**
- **client** - MQTT client handle
- **event** - event type
- **event_handler** - handler callback
- **event_handler_arg** - handlers context

**Returns**
ESP_ERR_NO_MEM if failed to allocate ESP_ERR_INVALID_ARG on wrong initialization ESP_OK on success

**esp_err_t esp_mqtt_client_unregister_event**(esp_mqtt_client_handle_t client, esp_mqtt_event_id_t event, esp_event_handler_t event_handler)
Unregisters mqtt event.

**Parameters**
- **client** - mqtt client handle
- **event** - event ID
- **event_handler** - handler to unregister

**Returns**
ESP_ERR_NO_MEM if failed to allocate ESP_ERR_INVALID_ARG on invalid event ID ESP_OK on success

**int esp_mqtt_client_get_outbox_size**(esp_mqtt_client_handle_t client)
Get outbox size.

**Parameters**
- **client** - MQTT client handle
Returns  outbox size 0 on wrong initialization

\[ \text{esp_err_t} \text{ esp_mqtt_dispatch_custom_event} (\text{esp_mqtt_client_handle_t} \text{ client}, \text{esp_mqtt_event_t} *\text{event}) \]

Dispatch user event to the mqtt internal event loop.

Parameters
- \text{client} \quad \text{MQTT} \text{ client handle}
- \text{event} \quad \text{MQTT} \text{ event handle structure}

Returns  ESP_OK on success ESP_ERR_TIMEOUT if the event couldn’t be queued (ref also CONFIG_MQTT_EVENT_QUEUE_SIZE)

Structures

struct \text{esp_mqtt_error_codes}  

\text{MQTT} \text{ error code structure to be passed as a contextual information into ERROR event}

Important: This structure extends \text{esp_tls_last_error} \text{ error structure and is backward compatible with it (so might be down-casted and treated as \text{esp_tls_last_error} error, but recommended to update applications if used this way previously)}

Use this structure directly checking \text{error_type} first and then appropriate error code depending on the source of the error:

<table>
<thead>
<tr>
<th>error_type</th>
<th>related member variables</th>
<th>note</th>
</tr>
</thead>
<tbody>
<tr>
<td>MQTT_ERROR_TYPE_TCP_TRANSPORT</td>
<td>\text{esp_tls_last_esp_err}, \text{esp_tls_stack_err}, \text{esp_tls_cert_verify_flags}, \text{sock_errno}</td>
<td>Error reported from tcp_transport/esp-tls</td>
</tr>
<tr>
<td>MQTT_ERROR_TYPE_CONNECTION_REFUSED</td>
<td>\text{connect_return_code}</td>
<td>Internal error reported from \text{MQTT} \text{ broker on connection}</td>
</tr>
</tbody>
</table>

Public Members

\text{esp_err_t} \text{ esp_tls_last_esp_err}  

last \text{esp_err} code reported from \text{esp-tls} component

int \text{esp_tls_stack_err}  

tls specific error code reported from underlying tls stack

int \text{esp_tls_cert_verify_flags}  

tls flags reported from underlying tls stack during certificate verification

\text{esp_mqtt_error_type_t} \text{ error_type}  

type referring to the source of the error

\text{esp_mqtt_connect_return_code_t} \text{ connect_return_code}  

connection refused error code reported from \text{MQTT} \text{* broker on connection}

int \text{esp_transport_sock_errno}  

errno from the underlying socket

struct \text{esp_mqtt_event_t}  

\text{MQTT} \text{ event configuration structure}

Public Members
esp_mqtt_event_id_t event_id
  MQTT event type

esp_mqtt_client_handle_t client
  MQTT client handle for this event

char *data
  Data associated with this event

int data_len
  Length of the data for this event

int total_data_len
  Total length of the data (longer data are supplied with multiple events)

int current_data_offset
  Actual offset for the data associated with this event

char *topic
  Topic associated with this event

int topic_len
  Length of the topic for this event associated with this event

int msg_id
  MQTT message id of message

int session_present
  MQTT session_present flag for connection event

esp_mqtt_error_codes_t *error_handle
  esp-mqtt error handle including esp-tls errors as well as internal MQTT errors

bool retain
  Retained flag of the message associated with this event

int qos
  QoS of the messages associated with this event

bool dup
  dup flag of the message associated with this event

esp_mqtt_protocol_ver_t protocol_ver
  MQTT protocol version used for connection, defaults to value from menuconfig

struct esp_mqtt_client_config_t
  MQTT client configuration structure
• Default values can be set via menuconfig
• All certificates and key data could be passed in PEM or DER format. PEM format must have a terminating NULL character and the related len field set to 0. DER format requires a related len field set to the correct length.

Public Members

struct esp_mqtt_client_config_t::broker_t broker
    Broker address and security verification

struct esp_mqtt_client_config_t::credentials_t credentials
    User credentials for broker

struct esp_mqtt_client_config_t::session_t session
    MQTT session configuration.

struct esp_mqtt_client_config_t::network_t network
    Network configuration

struct esp_mqtt_client_config_t::task_t task
    FreeRTOS task configuration.

struct esp_mqtt_client_config_t::buffer_t buffer
    Buffer size configuration.

struct esp_mqtt_client_config_t::outbox_config_t outbox
    Outbox configuration.

struct broker_t
    Broker related configuration

Public Members

struct esp_mqtt_client_config_t::broker_t::address_t address
    Broker address configuration

struct esp_mqtt_client_config_t::broker_t::verification_t verification
    Security verification of the broker

struct address_t
    Broker address

    • uri have precedence over other fields
    • If uri isn’t set at least hostname, transport and port should.
Public Members

const char *uri
    Complete MQTT broker URI

const char *hostname
    Hostname, to set ipv4 pass it as string

esp_mqtt_transport_t transport
    Selects transport

const char *path
    Path in the URI

uint32_t port
    MQTT server port

struct verification_t
    Broker identity verification
    If fields are not set broker’s identity isn’t verified. It’s recommended to set the options in this struct for security reasons.

Public Members

bool use_global_ca_store
    Use a global ca_store, look esp-tls documentation for details.

esp_err_t (*crt_bundle_attach)(void *conf)
    Pointer to ESP x509 Certificate Bundle attach function for the usage of certificate bundles.

const char *certificate
    Certificate data, default is NULL, not required to verify the server.

size_t certificate_len
    Length of the buffer pointed to by certificate.

const struct psk_key_hint *psk_hint_key
    Pointer to PSK struct defined in esp_tls.h to enable PSK authentication (as alternative to certificate verification). PSK is enabled only if there are no other ways to verify broker.

bool skip_cert_common_name_check
    Skip any validation of server certificate CN field, this reduces the security of TLS and makes the MQTT client susceptible to MITM attacks

const char **alpn_protos
    NULL-terminated list of supported application protocols to be used for ALPN
const char *common_name
   Pointer to the string containing server certificate common name. If non-NULL, server certificate CN must match this name, If NULL, server certificate CN must match hostname. This is ignored if skip_cert_common_name_check=true.

struct buffer_t
   Client buffer size configuration
   Client have two buffers for input and output respectively.

   Public Members

   int size
      size of MQTT send/receive buffer

   int out_size
      size of MQTT output buffer. If not defined, defaults to the size defined by buffer_size

struct credentials_t
   Client related credentials for authentication.

   Public Members

   const char *username
      MQTT username

   const char *client_id
      Set MQTT client identifier. Ignored if set_null_client_id == true If NULL set the default client id.
      Default client id is ESP32_CHIPID% where CHIPID% are last 3 bytes of MAC address in hex format

   bool set_null_client_id
      Selects a NULL client id

struct esp_mqtt_client_config_t::credentials_t::authentication_f authentication
   Client authentication

struct authentication_t
   Client authentication
   Fields related to client authentication by broker
   For mutual authentication using TLS, user could select certificate and key, secure element or digital signature peripheral if available.

   Public Members

   const char *password
      MQTT password
Chapter 2. API Reference

const char *certificate  
Certificate for ssl mutual authentication, not required if mutual authentication is not needed. Must be provided with key.

size_t certificate_len  
Length of the buffer pointed to by certificate.

const char *key  
Private key for SSL mutual authentication, not required if mutual authentication is not needed. If it is not NULL, also certificate has to be provided.

size_t key_len  
Length of the buffer pointed to by key.

const char *key_password  
Client key decryption password, not PEM nor DER, if provided key_password_len must be correctly set.

int key_password_len  
Length of the password pointed to by key_password

bool use_secure_element  
Enable secure element, available in ESP32-ROOM-32SE, for SSL connection

void *ds_data  
Carrier of handle for digital signature parameters, digital signature peripheral is available in some Espressif devices.

struct network_t  
Network related configuration

Public Members

int reconnect_timeout_ms  
Reconnect to the broker after this value in milliseconds if auto reconnect is not disabled (defaults to 10s)

int timeout_ms  
Abort network operation if it is not completed after this value, in milliseconds (defaults to 10s).

int refresh_connection_after_ms  
Refresh connection after this value (in milliseconds)

bool disable_auto_reconnect  
Client will reconnect to server (when errors/disconnect). Set disable_auto_reconnect=true to disable
esp_transport_handle_t transport
    Custom transport handle to use. Warning: The transport should be valid during the client lifetime and is destroyed when esp_mqtt_client_destroy is called.

struct ifreq *if_name
    The name of interface for data to go through. Use the default interface without setting

struct outbox_config_t
    Client outbox configuration options.

Public Members

uint64_t limit
    Size limit for the outbox in bytes.

struct session_t
    MQTT Session related configuration

Public Members

struct esp_mqtt_client_config_t::session_t::last_will_t last_will
    Last will configuration

bool disable_clean_session
    MQTT clean session, default clean_session is true

int keepalive
    MQTT keepalive, default is 120 seconds When configuring this value, keep in mind that the client attempts to communicate with the broker at half the interval that is actually set. This conservative approach allows for more attempts before the broker’s timeout occurs

bool disable_keepalive
    Set disable_keepalive=true to turn off keep-alive mechanism, keepalive is active by default. Note: setting the config value keepalive to 0 doesn’t disable keepalive feature, but uses a default keepalive period

esp_mqtt_protocol_ver_t protocol_ver
    MQTT protocol version used for connection.

int message_retransmit_timeout
    timeout for retransmitting of failed packet

struct last_will_t
    Last Will and Testament message configuration.
**Public Members**

- const char *`topic`
  
  LWT (Last Will and Testament) message topic

- const char *`msg`
  
  LWT message, may be NULL terminated

- int `msg_len`
  
  LWT message length, if msg isn’t NULL terminated must have the correct length

- int `qos`
  
  LWT message QoS

- int `retain`
  
  LWT retained message flag

```c
struct task_t
    Client task configuration
```

**Public Members**

- int `priority`
  
  MQTT task priority

- int `stack_size`
  
  MQTT task stack size

```c
struct topic_t
    Topic definition struct
```

**Public Members**

- const char *`filter`
  
  Topic filter to subscribe

- int `qos`
  
  Max QoS level of the subscription

---

**Macros**

- `MQTT_ERROR_TYPE_ESP_TLS`
  
  MQTT_ERROR_TYPE_TCP_TRANSPORT error type hold all sorts of transport layer errors, including ESP-TLS error, but in the past only the errors from MQTT_ERROR_TYPE_ESP_TLS layer were reported, so the ESP-TLS error type is re-defined here for backward compatibility
The function `esp_mqtt_client_subscribe` is used to subscribe to a topic in the MQTT protocol. The function signature is:

```c
esp_mqtt_client_subscribe(client_handle, topic_type, qos_or_size)
```

**Convenience macro to select subscribe function to use.**

**Notes:**
- Usage of `esp_mqtt_client_subscribe_single` is the same as previous `esp_mqtt_client_subscribe`, refer to it for details.

**Parameters**
- `client_handle` - MQTT client handle
- `topic_type` - Needs to be char* for single subscription or `esp_mqtt_topic_t` for multiple topics
- `qos_or_size` - It’s either a qos when subscribing to a single topic or the size of the subscription array when subscribing to multiple topics.

**Returns**
- message_id of the subscribe message on success -1 on failure -2 in case of full outbox.

**Type Definitions**

```c
typedef struct esp_mqtt_client * esp_mqtt_client_handle_t

typedef enum esp_mqtt_event_id_t esp_mqtt_event_id_t
    MQTT event types.

    User event handler receives context data in `esp_mqtt_event_t` structure with
    - client - MQTT client handle
    - various other data depending on event type

typedef enum esp_mqtt_connect_return_code_t esp_mqtt_connect_return_code_t
    MQTT connection error codes propagated via ERROR event

typedef enum esp_mqtt_error_type_t esp_mqtt_error_type_t
    MQTT connection error codes propagated via ERROR event

typedef enum esp_mqtt_transport_t esp_mqtt_transport_t

typedef enum esp_mqtt_protocol_ver_t esp_mqtt_protocol_ver_t
    MQTT protocol version used for connection

typedef struct esp_mqtt_error_codes esp_mqtt_error_codes_t
    MQTT error code structure to be passed as a contextual information into ERROR event

    Important: This structure extends `esp_tls_last_error` error structure and is backward compatible with it (so might be down-casted and treated as `esp_tls_last_error` error, but recommended to update applications if used this way previously)

    Use this structure directly checking error_type first and then appropriate error code depending on the source of the error:

    | error_type | related member variables | note |
    |------------|--------------------------|------|
    | MQTT_ERROR_TYPE_TCP_TRANSPORT | esp_tls_last_err, esp_tls_stack_err, esp_tls_cert_verify_flags, sock_errno | Error reported from tcp_transport/esp-tls |
    | MQTT_ERROR_TYPE_CONNECTION_REFUSED | connect_return_code | Internal error reported from MQTT broker on connection |

typedef struct esp_mqtt_event_t esp_mqtt_event_t
    MQTT event configuration structure
```
typedef esp_mqtt_event_t *esp_mqtt_event_handle_t

typedef struct esp_mqtt_client_config_t esp_mqtt_client_config_t

MQTT client configuration structure

- Default values can be set via menuconfig
- All certificates and key data could be passed in PEM or DER format. PEM format must have a terminating NULL character and the related len field set to 0. DER format requires a related len field set to the correct length.

typedef struct topic_t esp_mqtt_topic_t

Topic definition struct

Enumerations

enum esp_mqtt_event_id_t

MQTT event types.

User event handler receives context data in esp_mqtt_event_t structure with

- client - MQTT client handle
- various other data depending on event type

Values:

enumerator MQTT_EVENT_ANY

enumerator MQTT_EVENT_ERROR

on error event, additional context: connection return code, error handle from esp_tls (if supported)

enumerator MQTT_EVENT_CONNECTED

connected event, additional context: session_present flag

enumerator MQTT_EVENT_DISCONNECTED

disconnected event

enumerator MQTT_EVENT_SUBSCRIBED

subscribed event, additional context:

- msg_id message id
- error_handle error_type in case subscribing failed
- data pointer to broker response, check for errors.
- data_len length of the data for this event

enumerator MQTT_EVENT_UNSUBSCRIBED

unsubscribed event, additional context: msg_id

enumerator MQTT_EVENT_PUBLISHED

published event, additional context: msg_id

enumerator MQTT_EVENT_DATA

data event, additional context:
• msg_id message id
• topic pointer to the received topic
• topic_len length of the topic
• data pointer to the received data
• data_len length of the data for this event
• current_data_offset offset of the current data for this event
• total_data_len total length of the data received
• retain retain flag of the message
• qos QoS level of the message
• dup dup flag of the message Note: Multiple MQTT_EVENT_DATA could be fired for one message, if it is longer than internal buffer. In that case only first event contains topic pointer and length, other contain data only with current data length and current data offset updating.

enumerator MQTT_EVENT_BEFORE_CONNECT
The event occurs before connecting

event

enumerator MQTT_EVENT_DELETED
Notification on delete of one message from the internal outbox, if the message couldn’t have been sent and acknowledged before expiring defined in OUTBOX_EXPIRED_TIMEOUT_MS. (events are not posted upon deletion of successfully acknowledged messages)

• This event id is posted only if MQTT_REPORT_DELETED_MESSAGES==1
• Additional context: msg_id (id of the deleted message).

event

enumerator MQTT_USER_EVENT
Custom event used to queue tasks into mqtt event handler All fields from the esp_mqtt_event_t type could be used to pass an additional context data to the handler.

enum esp_mqtt_connect_return_code_t
MQTT connection error codes propagated via ERROR event

Values:

event

enumerator MQTT_CONNECTION_ACCEPTED
Connection accepted

event

enumerator MQTT_CONNECTION_REFUSE_PROTOCOL
MQTT connection refused reason: Wrong protocol

event

enumerator MQTT_CONNECTION_REFUSE_ID_REJECTED
MQTT connection refused reason: ID rejected

event

enumerator MQTT_CONNECTION_REFUSE_SERVER_UNAVAILABLE
MQTT connection refused reason: Server unavailable

event

enumerator MQTT_CONNECTION_REFUSE_BAD_USERNAME
MQTT connection refused reason: Wrong user

event

enumerator MQTT_CONNECTION_REFUSE_NOT_AUTHORIZED
MQTT connection refused reason: Wrong username or password

enum esp_mqtt_error_type_t
MQTT connection error codes propagated via ERROR event

Values:
Chapter 2. API Reference

enumerator MQTT_ERROR_TYPE_NONE

enumerator MQTT_ERROR_TYPE_TCP_TRANSPORT

enumerator MQTT_ERROR_TYPE_CONNECTION_REFUSED

enumerator MQTT_ERROR_TYPE_SUBSCRIBE_FAILED

enum esp_mqtt_transport_t
  Values:

enumerator MQTT_TRANSPORT_UNKNOWN

enumerator MQTT_TRANSPORT_OVER_TCP
  MQTT over TCP, using scheme: MQTT

enumerator MQTT_TRANSPORT_OVER_SSL
  MQTT over SSL, using scheme: MQTT

enumerator MQTT_TRANSPORT_OVER_WS
  MQTT over Websocket, using scheme:: ws

enumerator MQTT_TRANSPORT_OVER_WSS
  MQTT over Websocket Secure, using scheme: wss

enum esp_mqtt_protocol_ver_t
  MQTT protocol version used for connection
  Values:

enumerator MQTT_PROTOCOL_UNDEFINED

enumerator MQTT_PROTOCOL_V_3_1

enumerator MQTT_PROTOCOL_V_3_1_1

enumerator MQTT_PROTOCOL_V_5

2.2.4 ESP-TLS

Overview

The ESP-TLS component provides a simplified API interface for accessing the commonly used TLS functions. It supports common scenarios like CA certification validation, SNI, ALPN negotiation, and non-blocking connection among others. All the configurations can be specified in the esp_tls_cfg_t data structure. Once done, TLS communication can be conducted using the following APIs:
Chapter 2. API Reference

- `esp_tls_init()`: for initializing the TLS connection handle.
- `esp_tls_conn_new_sync()`: for opening a new blocking TLS connection.
- `esp_tls_conn_new_async()`: for opening a new non-blocking TLS connection.
- `esp_tls_conn_read()`: for reading from the connection.
- `esp_tls_conn_write()`: for writing into the connection.
- `esp_tls_conn_destroy()`: for freeing up the connection.

Any application layer protocol like HTTP1, HTTP2, etc can be executed on top of this layer.

**Application Example**

Simple HTTPS example that uses ESP-TLS to establish a secure socket connection: [protocols/https_request](/protocols/https_request).

**Tree Structure for ESP-TLS Component**

```
├── esp_tls.c
├── esp_tls.h
├── esp_tls_mbedtls.c
├── esp_tls_wolfssl.c
└── private_include
    ├── esp_tls_mbedtls.h
    └── esp_tls_wolfssl.h
```

The ESP-TLS component has a file `esp-tls/esp_tls.h` which contains the public API headers for the component. Internally, the ESP-TLS component operates using either MbedTLS or WolfSSL, which are SSL/TLS libraries. APIs specific to MbedTLS are present in `esp-tls/private_include/esp_tls_mbedtls.h` and APIs specific to WolfSSL are present in `esp-tls/private_include/esp_tls_wolfssl.h`.

**TLS Server Verification**

ESP-TLS provides multiple options for TLS server verification on the client side. The ESP-TLS client can verify the server by validating the peer’s server certificate or with the help of pre-shared keys. The user should select only one of the following options in the `esp_tls_cfg_t` structure for TLS server verification. If no option is selected, the client will return a fatal error by default during the TLS connection setup.

- **cacert_buf** and **cacert_bytes**: The CA certificate can be provided in a buffer to the `esp_tls_cfg_t` structure. The ESP-TLS uses the CA certificate present in the buffer to verify the server. The following variables in the `esp_tls_cfg_t` structure must be set.
  - `cacert_buf`: pointer to the buffer which contains the CA certification.
  - `cacert_bytes`: the size of the CA certificate in bytes.

- **use_global_ca_store**: The `global_ca_store` can be initialized and set at once. Then it can be used to verify the server for all the ESP-TLS connections which have set `use_global_ca_store = true` in their respective `esp_tls_cfg_t` structure. See the API Reference section below for information regarding different APIs used for initializing and setting up the `global_ca_store`.

- **crt_bundle_attach**: The ESP x509 Certificate Bundle API provides an easy way to include a bundle of custom x509 root certificates for TLS server verification. More details can be found at [ESP x509 Certificate Bundle](/esp-tls/certificate_bundle).

- **psk_hint_key**: To use pre-shared keys for server verification, `CONFIG_ESP_TLS_PSK_VERIFICATION` should be enabled in the ESP-TLS menuconfig. Then the pointer to the PSK hint and key should be provided to the `esp_tls_cfg_t` structure. The ESP-TLS will use the PSK for server verification only when no other option regarding server verification is selected.

- **skip server verification**: This is an insecure option provided in the ESP-TLS for testing purposes. The option can be set by enabling `CONFIG_ESP_TLS_INSECURE` and `CONFIG_ESP_TLS_SKIP_SERVER_CERT_VERIFY` in the ESP-TLS menuconfig. When this option
is enabled the ESP-TLS will skip server verification by default when no other options for server verification are selected in the `esp_tls_cfg_t` structure.

**Warning**: Enabling this option comes with a potential risk of establishing a TLS connection with a server that has a fake identity, provided that the server certificate is not provided either through API or other mechanisms like ca_store etc.

### ESP-TLS Server Cert Selection Hook

The ESP-TLS component provides an option to set the server certification selection hook when using the MbedTLS stack. This provides an ability to configure and use a certificate selection callback during server handshake. The callback helps to select a certificate to present to the client based on the TLS extensions supplied in the client hello message, such as ALPN and SNI. To enable this feature, please enable `CONFIG_ESP_TLS_SERVER_CERT_SELECT_HOOK` in the ESP-TLS menuconfig.

The certificate selection callback can be configured in the `esp_tls_cfg_t` structure as follows:

```c
int cert_selection_callback(mbedtls_ssl_context *ssl)
{
    /* Code that the callback should execute */
    return 0;
}

esp_tls_cfg_t cfg = {
    cert_select_cb = cert_section_callback,
};
```

### Underlying SSL/TLS Library Options

The ESP-TLS component offers the option to use MbedTLS or WolfSSL as its underlying SSL/TLS library. By default, only MbedTLS is available and used, WolfSSL SSL/TLS library is also available publicly at `https://github.com/espressif/esp-wolfssl`. The repository provides the WolfSSL component in binary format, and it also provides a few examples that are useful for understanding the API. Please refer to the repository `README.md` for information on licensing and other options. Please see the below section for instructions on how to use WolfSSL in your project.

**Note**: As the library options are internal to ESP-TLS, switching the libraries will not change ESP-TLS specific code for a project.

### How to Use WolfSSL with ESP-IDF

There are two ways to use WolfSSL in your project:

1) Directly add WolfSSL as a component in your project with the following three commands:

   ```
   (First, change the directory (cd) to your project directory)
   mkdir components
   cd components
   git clone --recursive https://github.com/espressif/esp-wolfssl.git
   ```

2) Add WolfSSL as an extra component in your project.

   - Download WolfSSL with:
     ```
     git clone --recursive https://github.com/espressif/esp-wolfssl.git
     ```
   - Include ESP-WolfSSL in ESP-IDF with setting `EXTRA_COMPONENT_DIRS` in `CMakeLists.txt` of your project as done in `wolfssl/examples`. For reference see `Optional Project Variables` in `build-system`.  

After the above steps, you will have the option to choose WolfSSL as the underlying SSL/TLS library in the configuration menu of your project as follows:

```
idf.py menuconfig > ESP-TLS > SSL/TLS Library > Mbedtls/Wolfssl
```

### Comparison Between MbedTLS and WolfSSL

The following table shows a typical comparison between WolfSSL and MbedTLS when the `protocols/https_request` example (which includes server authentication) is running with both SSL/TLS libraries and with all respective configurations set to default. For MbedTLS, the IN_CONTENT length and OUT_CONTENT length are set to 16384 bytes and 4096 bytes respectively.

<table>
<thead>
<tr>
<th>Property</th>
<th>WolfSSL</th>
<th>MbedTLS</th>
</tr>
</thead>
<tbody>
<tr>
<td>Total Heap Consumed</td>
<td>~19 KB</td>
<td>~37 KB</td>
</tr>
<tr>
<td>Task Stack Used</td>
<td>~2.2 KB</td>
<td>~3.6 KB</td>
</tr>
<tr>
<td>Bin size</td>
<td>~858 KB</td>
<td>~736 KB</td>
</tr>
</tbody>
</table>

**Note:** These values can vary based on configuration options and version of respective libraries.

### Digital Signature with ESP-TLS

ESP-TLS provides support for using the Digital Signature (DS) with ESP32-S2. Use of the DS for TLS is supported only when ESP-TLS is used with MbedTLS (default stack) as its underlying SSL/TLS stack. For more details on Digital Signature, please refer to the [Digital Signature (DS)](#). The technical details of Digital Signature such as how to calculate private key parameters can be found in [ESP32-S2 Technical Reference Manual > Digital Signature (DS)](#)[PDF]. The DS peripheral must be configured before it can be used to perform Digital Signature, see [Configure the DS Peripheral for a TLS Connection](#).

The DS peripheral must be initialized with the required encrypted private key parameters, which are obtained when the DS peripheral is configured. ESP-TLS internally initializes the DS peripheral when provided with the required DS context, i.e., DS parameters. Please see the below code snippet for passing the DS context to the ESP-TLS context. The DS context passed to the ESP-TLS context should not be freed till the TLS connection is deleted.

```c
#include "esp_tls.h"

esp_ds_data_ctx_t *ds_ctx;
/* initialize ds_ctx with encrypted private key parameters, which can be read from
   the nvs or provided through the application code */

esp_tlscfg_t cfg = {
    .clientcert_buf = /* the client certification */,
    .clientcert_bytes = /* length of the client certification */,
    /* other configurations options */
    .ds_data = (void *)ds_ctx,
};
```

**Note:** When using Digital Signature for the TLS connection, along with the other required params, only the client certification (`clientcert_buf`) and the DS params (`ds_data`) are required and the client key (`clientkey_buf`) can be set to NULL.

- An example of mutual authentication with the DS peripheral can be found at `ssl mutual auth` which internally uses (ESP-TLS) for the TLS connection.
TLS Ciphersuites

ESP-TLS provides the ability to set a ciphersuites list in client mode. The TLS ciphersuites list informs the server about the supported ciphersuites for the specific TLS connection regardless of the TLS stack configuration. If the server supports any ciphersuite from this list, then the TLS connection will succeed; otherwise, it will fail.

You can set `ciphersuites_list` in the `esp_tls_cfg_t` structure during client connection as follows:

```c
/* ciphersuites_list must end with 0 and must be available in the memory scope, active during the entire TLS connection */
static const int ciphersuites_list[] = {MBEDTLS_TLS_ECDHE_ECDSA_WITH_AES_256_GCM_SHA384, MBEDTLS_TLS_ECDHE_RSA_WITH_AES_256_GCM_SHA384, 0};
esp_tls_cfg_t cfg = {
    .ciphersuites_list = ciphersuites_list,
};
```

ESP-TLS will not check the validity of `ciphersuites_list` that was set, you should call `esp_tls_get_ciphersuites_list()` to get ciphersuites list supported in the TLS stack and cross-check it against the supplied list.

---

**Note:** This feature is supported only in the MbedTLS stack.

---

API Reference

Header File

- components/esp-tls/esp_tls.h

This header file can be included with:

```c
#include "esp_tls.h"
```

This header file is a part of the API provided by the `esp-tls` component. To declare that your component depends on `esp-tls`, add the following to your CMakeLists.txt:

```cmake
REQUIRES esp-tls
```

or

```cmake
PRIV_REQUIRES esp-tls
```

Functions

```c
esp_err_t esp_tls_cfg_server_session_tickets_init (esp_tls_cfg_server_t *cfg)
```

Initialize the server side TLS session ticket context.

This function initializes the server side TLS session ticket context which holds all necessary data structures to enable TLS session tickets according to RFC5077. Use `esp_tls_cfg_server_session_tickets_free()` to free the data.

**Parameters** `cfg` **-[in]** server configuration as `esp_tls_cfg_server_t`

**Returns** ESP_OK if setup succeeded ESP_ERR_INVALID_ARG if context is already initialized ESP_ERR_NO_MEM if memory allocation failed ESP_ERR_NOT_SUPPORTED if session tickets are not available due to build configuration ESP_FAIL if setup failed

```c
void esp_tls_cfg_server_session_tickets_free (esp_tls_cfg_server_t *cfg)
```

Free the server side TLS session ticket context.

**Parameters** `cfg` - server configuration as `esp_tls_cfg_server_t`

```c
est_p4_t *esp_tls_init (void)
```

Create TLS connection.

This function allocates and initializes esp-tls structure handle.
## Returns

tls Pointer to esp-tls as esp-tls handle if successfully initialized, NULL if allocation error

```
esp_tls_t *esp_tls_conn_http_new (const char *url, const esp_tls_cfg_t *cfg)
```

Create a new blocking TLS/SSL connection with a given “HTTP” url.

*Note:* This API is present for backward compatibility reasons. Alternative function with the same functionality is `esp_tls_conn_http_new_sync` (and its asynchronous version `esp_tls_conn_http_new_async`)

### Parameters

- `url` [in] url of host.
- `cfg` [in] TLS configuration as esp_tls_cfg_t. If you wish to open non-TLS connection, keep this NULL. For TLS connection, a pass pointer to `esp_tls_cfg_t` . At a minimum, this structure should be zero-initialized.

### Returns

pointer to esp_tls_t, or NULL if connection couldn’t be opened.

```
int esp_tls_conn_http_new_sync (const char *url, const esp_tls_cfg_t *cfg, esp_tls_t *tls)
```

Create a new blocking TLS/SSL connection.

This function establishes a TLS/SSL connection with the specified host in blocking manner.

### Parameters

- `hostname` [in] Hostname of the host.
- `hostlen` [in] Length of hostname.
- `port` [in] Port number of the host.
- `cfg` [in] TLS configuration as esp_tls_cfg_t. If you wish to open non-TLS connection, keep this NULL. For TLS connection, a pass pointer to esp_tls_cfg_t. At a minimum, this structure should be zero-initialized.
- `tls` [in] Pointer to esp-tls as esp-tls handle.

### Returns

-1 If connection establishment fails.
- 1 If connection establishment is successful.
- 0 If connection state is in progress.

```
int esp_tls_conn_new_sync (const char *hostname, int hostlen, int port, const esp_tls_cfg_t *cfg, esp_tls_t *tls)
```

Create a new blocking TLS/SSL connection.

The behaviour is same as `esp_tls_conn_new_sync()` API. However this API accepts host’s url.

### Parameters

- `url` [in] url of host.
- `cfg` [in] TLS configuration as esp_tls_cfg_t. If you wish to open non-TLS connection, keep this NULL. For TLS connection, a pass pointer to `esp_tls_cfg_t` . At a minimum, this structure should be zero-initialized.
- `tls` [in] Pointer to esp-tls as esp-tls handle.

### Returns

-1 If connection establishment fails.
- 1 If connection establishment is successful.
- 0 If connection state is in progress.

```
int esp_tls_conn_new_async (const char *hostname, int hostlen, int port, const esp_tls_cfg_t *cfg, esp_tls_t *tls)
```

Create a new non-blocking TLS/SSL connection.

This function initiates a non-blocking TLS/SSL connection with the specified host, but due to its non-blocking nature, it doesn’t wait for the connection to get established.

### Parameters

- `hostname` [in] Hostname of the host.
- `hostlen` [in] Length of hostname.
- `port` [in] Port number of the host.
Chapter 2. API Reference

- **cfg** - [in] TLS configuration as esp_tls_cfg_t. The non_block member of this structure should be set to be true.
- **tls** - [in] pointer to esp-tls as esp-tls handle.

**Returns**
- -1 If connection establishment fails.
- 0 If connection establishment is in progress.
- 1 If connection establishment is successful.

```c
int esp_tls_conn_http_new_async(const char *url, const esp_tls_cfg_t *cfg, esp_tls_t *tls)
```

Create a new non-blocking TLS/SSL connection with a given “HTTP” url.

The behaviour is same as esp_tls_conn_new_async() API. However this API accepts host’s url.

**Parameters**
- **url** - [in] url of host.
- **cfg** - [in] TLS configuration as esp_tls_cfg_t.
- **tls** - [in] pointer to esp-tls as esp-tls handle.

**Returns**
- -1 If connection establishment fails.
- 0 If connection establishment is in progress.
- 1 If connection establishment is successful.

```c
ssize_t esp_tls_conn_write(esp_tls_t *tls, const void *data, size_t datalen)
```

Write from buffer ‘data’ into specified tls connection.

**Parameters**
- **tls** - [in] pointer to esp-tls as esp-tls handle.
- **data** - [in] Buffer from which data will be written.
- **datalen** - [in] Length of data buffer.

**Returns**
- >=0 if write operation was successful, the return value is the number of bytes actually written to the TLS/SSL connection.
- <0 if write operation was not successful, because either an error occurred or an action must be taken by the calling process.
- ESP_TLS_ERR_SSL_WANT_READ/ ESP_TLS_ERR_SSL_WANT_WRITE. if the handshake is incomplete and waiting for data to be available for reading. In this case this functions needs to be called again when the underlying transport is ready for operation.

```c
ssize_t esp_tls_conn_read(esp_tls_t *tls, void *data, size_t datalen)
```

Read from specified tls connection into the buffer ‘data’.

**Parameters**
- **tls** - [in] pointer to esp-tls as esp-tls handle.
- **data** - [in] Buffer to hold read data.
- **datalen** - [in] Length of data buffer.

**Returns**
- >0 if read operation was successful, the return value is the number of bytes actually read from the TLS/SSL connection.
- 0 if read operation was not successful. The underlying connection was closed.
- <0 if read operation was not successful, because either an error occurred or an action must be taken by the calling process.

```c
int esp_tls_conn_destroy(esp_tls_t *tls)
```

Close the TLS/SSL connection and free any allocated resources.

This function should be called to close each tls connection opened with esp_tls_conn_new_sync() (or esp_tls_conn_http_new_sync()) and esp_tls_conn_new_async() (or esp_tls_conn_http_new_async()) APIs.

**Parameters**
- **tls** - [in] pointer to esp-tls as esp-tls handle.

**Returns**
- 0 on success
- -1 if socket error or an invalid argument
**Chapter 2. API Reference**

`ssize_t esp_tls_get_bytes_avail(esp_tls_t *tls)`

Return the number of application data bytes remaining to be read from the current record.

This API is a wrapper over mbedtls’s mbedtls_ssl_get_bytes_avail() API.

**Parameters** `tls` - [in] pointer to esp-tls as esp-tls handle.

**Returns**
- `-1` in case of invalid arg
- bytes available in the application data record read buffer

`esp_err_t esp_tls_get_conn_sockfd(esp_tls_t *tls, int *sockfd)`

Returns the connection socket file descriptor from esp_tls session.

**Parameters**
- `tls` - [in] handle to esp_tls context
- `sockfd` - [out] int pointer to sockfd value.

**Returns**
- ESP_OK on success and value of sockfd will be updated with socket file descriptor for connection
- ESP_ERR_INVALID_ARG if (tls == NULL || sockfd == NULL)

`esp_err_t esp_tls_set_conn_sockfd(esp_tls_t *tls, int sockfd)`

Sets the connection socket file descriptor for the esp_tls session.

**Parameters**
- `tls` - [in] handle to esp_tls context
- `sockfd` - [in] sockfd valuetoset.

**Returns**
- ESP_OK on success and value of sockfd for the tls connection shall updated with the provided value
- ESP_ERR_INVALID_ARG if (tls == NULL || sockfd < 0)

`esp_err_t esp_tls_get_conn_state(esp_tls_t *tls, esp_tls_conn_state_t *conn_state)`

Gets the connection state for the esp_tls session.

**Parameters**
- `tls` - [in] handle to esp_tls context
- `conn_state` - [out] pointer to the connection state value.

**Returns**
- ESP_OK on success and value of sockfd for the tls connection shall updated with the provided value
- ESP_ERR_INVALID_ARG (Invalid arguments)

`esp_err_t esp_tls_set_conn_state(esp_tls_t *tls, esp_tls_conn_state_t conn_state)`

Sets the connection state for the esp_tls session.

**Parameters**
- `tls` - [in] handle to esp_tls context
- `conn_state` - [in] connection state valuetoset.

**Returns**
- ESP_OK on success and value of sockfd for the tls connection shall updated with the provided value
- ESP_ERR_INVALID_ARG (Invalid arguments)

`void *esp_tls_get_ssl_context(esp_tls_t *tls)`

Returns the ssl context.

**Parameters** `tls` - [in] handle to esp_tls context

**Returns**
- ssl_ctxt pointer to ssl context of underlying TLS layer on success
- NULL in case of error

`esp_err_t esp_tls_init_global_ca_store(void)`

Create a global CA store, initially empty.

This function should be called if the application wants to use the same CA store for multiple connections. This function initialises the global CA store which can be then set by calling esp_tls_set_global_ca_store(). To be effective, this function must be called before any call to esp_tls_set_global_ca_store().
Returns
- ESP_OK if creating global CA store was successful.
- ESP_ERR_NO_MEM if an error occurred when allocating the mbedTLS resources.

```c
esp_err_t esp_tls_set_global_ca_store(const unsigned char *cacert_pem_buf, const unsigned int cacert_pem_bytes)
```

Set the global CA store with the buffer provided in pem format.

This function should be called if the application wants to set the global CA store for multiple connections
i.e. to add the certificates in the provided buffer to the certificate chain. This function implicitly calls
esp_tls_init_global_ca_store() if it has not already been called. The application must call this function before
calling esp_tls_conn_new().

Parameters
- **cacert_pem_buf** - [in] Buffer which has certificates in pem format. This buffer is used
  for creating a global CA store, which can be used by other tls connections.
- **cacert_pem_bytes** - [in] Length of the buffer.

Returns
- ESP_OK if adding certificates was successful.
- Other if an error occurred or an action must be taken by the calling process.

```c
void esp_tls_free_global_ca_store(void)
```

Free the global CA store currently being used.

The memory being used by the global CA store to store all the parsed certificates is freed up. The application
can call this API if it no longer needs the global CA store.

```c
esp_err_t esp_tls_get_and_clear_last_error(esp_tls_error_handle_t h, int *esp_tls_code, int *esp_tls_flags)
```

Returns last error in esp_tls with detailed mbedtls related error codes. The error information is cleared internally
upon return.

Parameters
- **h** - [in] esp-tls error handle.
- **esp_tls_code** - [out] last error code returned from mbedtls api (set to zero if none) This pointer could be NULL if caller does not care about esp_tls_code.
- **esp_tls_flags** - [out] last certification verification flags (set to zero if none) This pointer could be NULL if caller does not care about esp_tls_code.

Returns
- ESP_ERR_INVALID_STATE if invalid parameters
- ESP_OK (0) if no error occurred
- specific error code (based on ESP_ERR_ESP_TLS_BASE) otherwise

```c
esp_err_t esp_tls_get_and_clear_error_type(esp_tls_error_handle_t h, esp_tls_error_type_t err_type, int *error_code)
```

Returns the last error captured in esp_tls of a specific type. The error information is cleared internally upon return.

Parameters
- **h** - [in] esp-tls error handle.
- **err_type** - [in] specific error type
- **error_code** - [out] last error code returned from mbedtls api (set to zero if none) This pointer could be NULL if caller does not care about esp_tls_code.

Returns
- ESP_ERR_INVALID_STATE if invalid parameters
- ESP_OK if a valid error returned and was cleared

```c
esp_err_t esp_tls_get_error_handle(esp_tls_t *tls, esp_tls_error_handle_t *error_handle)
```

Returns the ESP-TLS error handle.

Parameters
- **tls** - [in] handle to esp_tls context
• **error_handle** -[out] pointer to the error handle.

**Returns**
- ESP_OK on success and error_handle will be updated with the ESP-TLS error handle.
- ESP_ERR_INVALID_ARG if (tls == NULL || error_handle == NULL)

```c
mbedtls_x509_crt *esp_tls_get_global_ca_store (void)
```

Get the pointer to the global CA store currently being used.

The application must first call `esp_tls_set_global_ca_store()`. Then the same CA store could be used by the application for APIs other than `esp_tls`.

**Note:** Modifying the pointer might cause a failure in verifying the certificates.

```c
const int *esp_tls_get_ciphersuites_list (void)
```

Get supported TLS ciphersuites list.

See [https://www.iana.org/assignments/tls-parameters/tls-parameters.xhtml#tls-parameters-4](https://www.iana.org/assignments/tls-parameters/tls-parameters.xhtml#tls-parameters-4) for the list of ciphersuites

**Returns** Pointer to a zero-terminated array of IANA identifiers of TLS ciphersuites.

```c
int esp_tls_server_session_create (esp_tls_cfg_server_t *cfg, int sockfd, esp_tls_t *tls)
```

Create TLS/SSL server session.

This function creates a TLS/SSL server context for already accepted client connection and performs TLS/SSL handshake with the client

**Parameters**
- **cfg** -[in] Pointer to `esp_tls_cfg_server_t`
- **sockfd** -[in] FD of accepted connection
- **tls** -[out] Pointer to allocated `esp_tls_t`

**Returns**
- 0 if successful
- <0 in case of error

```c
void esp_tls_server_session_delete (esp_tls_t *tls)
```

Close the server side TLS/SSL connection and free any allocated resources.

This function should be called to close each tls connection opened with `esp_tls_server_session_create()`

**Parameters**
- **tls** -[in] pointer to `esp_tls_t`

```c
esp_err_t esp_tls_plain_tcp_connect (const char *host, int hostlen, int port, const esp_tls_cfg_t *cfg, esp_tls_error_handle_t error_handle, int *sockfd)
```

Creates a plain TCP connection, returning a valid socket fd on success or an error handle.

**Parameters**
- **host** -[in] Hostname of the host.
- **hostlen** -[in] Length of hostname.
- **port** -[in] Port number of the host.
- **cfg** -[in] ESP-TLS configuration as `esp_tls_cfg_t`
- **error_handle** -[out] ESP-TLS error handle holding potential errors occurred during connection
- **sockfd** -[out] Socket descriptor if successfully connected on TCP layer

**Returns** ESP_OK on success ESP_ERR_INVALID_ARG if invalid output parameters ESP-TLS based error codes on failure
Chapter 2. API Reference

Structures

struct psk_key_hint
ESP-TLS preshared key and hint structure.

Public Members

const uint8_t *key
key in PSK authentication mode in binary format

const size_t key_size
length of the key

const char *hint
hint in PSK authentication mode in string format

struct tls_keep_alive_cfg
esp-tls client session ticket ctx
Keep alive parameters structure

Public Members

bool keep_alive_enable
Enable keep-alive timeout

int keep_alive_idle
Keep-alive idle time (second)

int keep_alive_interval
Keep-alive interval time (second)

int keep_alive_count
Keep-alive packet retry send count

struct esp_tls_cfg
ESP-TLS configuration parameters.

Note: Note about format of certificates:

- This structure includes certificates of a Certificate Authority, of client or server as well as private keys, which may be of PEM or DER format. In case of PEM format, the buffer must be NULL terminated (with NULL character included in certificate size).
- Certificate Authority’s certificate may be a chain of certificates in case of PEM format, but could be only one certificate in case of DER format
- Variables names of certificates and private key buffers and sizes are defined as unions providing backward compatibility for legacy *_pem_buf and *_pem_bytes names which suggested only PEM format was supported. It is encouraged to use generic names such as cacert_buf and cacert_bytes.
Public Members

const char **alpn_protos
Application protocols required for HTTP2. If HTTP2/ALPN support is required, a list of protocols that should be negotiated. The format is length followed by protocol name. For the most common cases the following is ok: const char **alpn_protos = { "h2", NULL };
• where ‘h2’ is the protocol name

const unsigned char *cacert_buf
Certificate Authority’s certificate in a buffer. Format may be PEM or DER, depending on mbedtls-support This buffer should be NULL terminated in case of PEM

const unsigned char *cacert_pem_buf
CA certificate buffer legacy name

unsigned int cacert_bytes
Size of Certificate Authority certificate pointed to by cacert_buf (including NULL-terminator in case of PEM format)

unsigned int cacert_pem_bytes
Size of Certificate Authority certificate legacy name

const unsigned char *clientcert_buf
Client certificate in a buffer Format may be PEM or DER, depending on mbedtls-support This buffer should be NULL terminated in case of PEM

const unsigned char *clientcert_pem_buf
Client certificate legacy name

unsigned int clientcert_bytes
Size of client certificate pointed to by clientcert_pem_buf (including NULL-terminator in case of PEM format)

unsigned int clientcert_pem_bytes
Size of client certificate legacy name

const unsigned char *clientkey_buf
Client key in a buffer Format may be PEM or DER, depending on mbedtls-support This buffer should be NULL terminated in case of PEM

const unsigned char *clientkey_pem_buf
Client key legacy name

unsigned int clientkey_bytes
Size of client key pointed to by clientkey_pem_buf (including NULL-terminator in case of PEM format)

unsigned int clientkey_pem_bytes
Size of client key legacy name
const unsigned char *clientkey_password
Client key decryption password string

unsigned int clientkey_password_len
String length of the password pointed to by clientkey_password

bool use_ecdsa_peripheral
Use the ECDSA peripheral for the private key operations

uint8_t ecdsa_key_efuse_blk
The efuse block where the ECDSA key is stored

bool non_block
Configure non-blocking mode. If set to true the underneath socket will be configured in non blocking mode after tls session is established

bool use_secure_element
Enable this option to use secure element or atecc608a chip (Integrated with ESP32-WROOM-32SE)

int timeout_ms
Network timeout in milliseconds. Note: If this value is not set, by default the timeout is set to 10 seconds. If you wish that the session should wait indefinitely then please use a larger value e.g., INT32_MAX

bool use_global_ca_store
Use a global ca_store for all the connections in which this bool is set.

const char *common_name
If non-NULL, server certificate CN must match this name. If NULL, server certificate CN must match hostname.

bool skip_common_name
Skip any validation of server certificate CN field

tls_keep_alive_cfg_t *keep_alive_cfg
Enable TCP keep-alive timeout for SSL connection

const psk_hint_key_t *psk_hint_key
Pointer to PSK hint and key. If not NULL (and certificates are NULL) then PSK authentication is enabled with configured setup. Important note: the pointer must be valid for connection

esp_err_t (*crt_bundle_attach)(void *conf)
Function pointer to esp_crt_bundle_attach. Enables the use of certification bundle for server verification, must be enabled in menuconfig

void *ds_data
Pointer for digital signature peripheral context

bool is_plain_tcp
Use non-TLS connection: When set to true, the esp-tls uses plain TCP transport rather then TLS/SSL connection. Note, that it is possible to connect using a plain tcp transport directly with esp_tls_plain_tcp_connect() API
struct ifreq *if_name
  The name of interface for data to go through. Use the default interface without setting

*esp_tls_addr_family_t addr_family
  The address family to use when connecting to a host.

const int *ciphersuites_list
  Pointer to a zero-terminated array of IANA identifiers of TLS ciphersuites. Please check the list validity
  by esp_tls_get_ciphersuites_list() API

*esp_tls_proto_ver_t tls_version
  TLS protocol version of the connection, e.g., TLS 1.2, TLS 1.3 (default - no preference)

struct esp_tls_cfg_server
  ESP-TLS Server configuration parameters.

Public Members

class char **alpn_protos
  Application protocols required for HTTP2. If HTTP2/ALPN support is required, a list of protocols that
  should be negotiated. The format is length followed by protocol name. For the most common cases the
  following is ok: const char **alpn_protos = [ "h2", NULL ];

  • where ‘h2’ is the protocol name

class unsigned char *cacert_buf
  Client CA certificate in a buffer. This buffer should be NULL terminated

class unsigned char *cacert_pem_buf
  Client CA certificate legacy name

unsigned int cacert_bytes
  Size of client CA certificate pointed to by cacert_pem_buf

unsigned int cacert_pem_bytes
  Size of client CA certificate legacy name

const unsigned char *servercert_buf
  Server certificate in a buffer This buffer should be NULL terminated

const unsigned char *servercert_pem_buf
  Server certificate legacy name

unsigned int servercert_bytes
  Size of server certificate pointed to by servercert_pem_buf

unsigned int servercert_pem_bytes
  Size of server certificate legacy name
const unsigned char *serverkey_buf
Server key in a buffer. This buffer should be NULL terminated.

const unsigned char *serverkey_pem_buf
Server key legacy name.

unsigned int serverkey_bytes
Size of server key pointed to by serverkey_pem_buf.

unsigned int serverkey_pem_bytes
Size of server key legacy name.

const unsigned char *serverkey_password
Server key decryption password string.

unsigned int serverkey_password_len
String length of the password pointed to by serverkey_password.

bool use_ecdsa_peripheral
Use ECDSA peripheral to use private key.

uint8_t ecdsa_key_efuse_blk
The efuse block where ECDSA key is stored.

bool use_secure_element
Enable this option to use secure element or atecc608a chip (Integrated with ESP32-WROOM-32SE).

void *userdata
User data to be added to the ssl context. Can be retrieved by callbacks.

**Type Definitions**

typedef enum esp_tls_conn_state esp_tls_conn_state_t
ESP-TLS Connection State.

typedef enum esp_tls_role esp_tls_role_t

typedef struct psk_key_hint psk_hint_key_t
ESP-TLS preshared key and hint structure.

typedef struct tls_keep_alive_cfg tls_keep_alive_cfg_t
esp-tls client session ticket ctx.

Keep alive parameters structure.

typedef enum esp_tls_addr_family esp_tls_addr_family_t
typedef struct esp_tls_cfg esp_tls_cfg_t

ESP-TLS configuration parameters.

**Note:** Note about format of certificates:

- This structure includes certificates of a Certificate Authority, of client or server as well as private keys, which may be of PEM or DER format. In case of PEM format, the buffer must be NULL terminated (with NULL character included in certificate size).
- Certificate Authority’s certificate may be a chain of certificates in case of PEM format, but could be only one certificate in case of DER format.
- Variables names of certificates and private key buffers and sizes are defined as unions providing backward compatibility for legacy *_pem_buf and *_pem_bytes names which suggested only PEM format was supported. It is encouraged to use generic names such as cacert_buf and cacert_bytes.

typedef struct esp_tls_cfg_server esp_tls_cfg_server_t

ESP-TLS Server configuration parameters.

typedef struct esp_tls esp_tls_t

Enumerations

enum esp_tls_conn_state

ESP-TLS Connection State.

*Values:*

- enumerator ESP_TLS_INIT
- enumerator ESP_TLS_CONNECTING
- enumerator ESP_TLS_HANDSHAKE
- enumerator ESP_TLS_FAIL
- enumerator ESP_TLS_DONE

enum esp_tls_role

*Values:*

- enumerator ESP_TLS_CLIENT
- enumerator ESP_TLS_SERVER

enum esp_tls_addr_family

*Values:*

- enumerator ESP_TLS_AF_UNSPEC
  
  Unspecified address family.
enum \texttt{ESP\_TLS\_AF\_INET}\n\hspace{0.5em}IPv4 address family.\n\nenum \texttt{ESP\_TLS\_AF\_INET6}\n\hspace{0.5em}IPv6 address family.\n\n\textbf{enum \texttt{esp\_tls\_proto\_ver\_t}}\n

Chapter 2. API Reference

Macros

ESP_ERR_ESP_TLS_BASE
Starting number of ESP-TLS error codes

ESP_ERR_ESP_TLS_CANNOT_RESOLVE_HOSTNAME
Error if hostname couldn’t be resolved upon tls connection

ESP_ERR_ESP_TLS_CANNOT_CREATE_SOCKET
Failed to create socket

ESP_ERR_ESP_TLS_UNSUPPORTED_PROTOCOL_FAMILY
Unsupported protocol family

ESP_ERR_ESP_TLS_FAILED_CONNECT_TO_HOST
Failed to connect to host

ESP_ERR_ESP_TLS_SOCKET_SETOPT_FAILED
Failed to set/get socket option

ESP_ERR_ESP_TLS_CONNECTION_TIMEOUT
New connection in esp_tls_low_level_conn connection timed out

ESP_ERR_ESP_TLS_SE_FAILED

ESP_ERR_ESP_TLS_TCP_CLOSED_FIN

ESP_ERR_MBEDTLS_CERT_PARTLY_OK
mbedtls parse certificates was partly successful

ESP_ERR_MBEDTLS_CTR_DRBG_SEED_FAILED
mbedtls api returned error

ESP_ERR_MBEDTLS_SSL_SET_HOSTNAME_FAILED
mbedtls api returned error

ESP_ERR_MBEDTLS_SSL_CONFIG_DEFAULTS_FAILED
mbedtls api returned error

ESP_ERR_MBEDTLS_SSL_CONF_ALPN_PROTOCOLS_FAILED
mbedtls api returned error

ESP_ERR_MBEDTLS_X509_CRT_PARSE_FAILED
mbedtls api returned error

ESP_ERR_MBEDTLS_SSL_CONF_OWNCERT_FAILED
mbedtls api returned error

ESP_ERR_MBEDTLS_SSL_SETUP_FAILED
mbedtls api returned error
Chapter 2. API Reference

ESP_ERR_MBEDTLS_SSL_WRITE_FAILED
  mbedtls api returned error

ESP_ERR_MBEDTLS_PK_PARSE_KEY_FAILED
  mbedtls api returned failed

ESP_ERR_MBEDTLS_SSL_HANDSHAKE_FAILED
  mbedtls api returned failed

ESP_ERR_MBEDTLS_SSL_CONF_PSK_FAILED
  mbedtls api returned failed

ESP_ERR_MBEDTLS_SSL_TICKET_SETUP_FAILED
  mbedtls api returned failed

ESP_ERR_WOLFSSL_SSL_SET_HOSTNAME_FAILED
  wolfSSL api returned error

ESP_ERR_WOLFSSL_SSL_CONF_ALPN_PROTOCOLS_FAILED
  wolfSSL api returned error

ESP_ERR_WOLFSSL_CERT_VERIFY_SETUP_FAILED
  wolfSSL api returned error

ESP_ERR_WOLFSSL_KEY_VERIFY_SETUP_FAILED
  wolfSSL api returned error

ESP_ERR_WOLFSSL_SSL_HANDSHAKE_FAILED
  wolfSSL api returned failed

ESP_ERR_WOLFSSL_CTX_SETUP_FAILED
  wolfSSL api returned failed

ESP_ERR_WOLFSSL_SSL_SETUP_FAILED
  wolfSSL api returned failed

ESP_ERR_WOLFSSL_SSL_WRITE_FAILED
  wolfSSL api returned failed

ESP_TLS_ERR_SSL_WANT_READ
  Definition of errors reported from IO API (potentially non-blocking) in case of error:
  * esp_tls_conn_read()
  * esp_tls_conn_write()

ESP_TLS_ERR_SSL_WANT_WRITE

ESP_TLS_ERR_SSL_TIMEOUT
Type Definitions

typedef struct esp_tls_last_error *esp_tls_error_handle_t

typedef struct esp_tls_last_error esp_tls_last_error_t

Error structure containing relevant errors in case tls error occurred.

Enumerations

enum esp_tls_error_type_t

Definition of different types/sources of error codes reported from different components

Values:

enumerator ESP_TLS_ERR_TYPE_UNKNOWN

enumerator ESP_TLS_ERR_TYPE_SYSTEM

System error &#8212; errno

enumerator ESP_TLS_ERR_TYPE_MBEDTLS

Error code from mbedTLS library

enumerator ESP_TLS_ERR_TYPE_MBEDTLS_CERT_FLAGS

Certificate flags defined in mbedTLS

enumerator ESP_TLS_ERR_TYPE_ESP

ESP-IDF error type &#8212; esp_err_t

enumerator ESP_TLS_ERR_TYPE_WOLFSSL

Error code from wolfSSL library

enumerator ESP_TLS_ERR_TYPE_WOLFSSL_CERT_FLAGS

Certificate flags defined in wolfSSL

enumerator ESP_TLS_ERR_TYPE_MAX

Last err type &#8212; invalid entry

2.2.5 ESP HTTP Client

Overview

esp_http_client component provides a set of APIs for making HTTP/S requests from ESP-IDF applications. The steps to use these APIs are as follows:

- esp_http_client_init(): Creates an esp_http_client_handle_t instance, i.e., an HTTP client handle based on the given esp_http_client_config_t configuration. This function must be the first to be called; default values are assumed for the configuration values that are not explicitly defined by the user.
Chapter 2. API Reference

- **esp_http_client_perform()**: Performs all operations of the esp_http_client - opening the connection, exchanging data, and closing the connection (as required), while blocking the current task before its completion. All related events are invoked through the event handler (as specified in esp_http_client_config_t).
- **esp_http_client_cleanup()**: Closes the connection (if any) and frees up all the memory allocated to the HTTP client instance. This must be the last function to be called after the completion of operations.

**Application Example**

Simple example that uses ESP HTTP Client to make HTTP/S requests can be found at protocols/esp_http_client.

**Basic HTTP Request**

Check out the example functions http_rest_with_url and http_rest_with_hostname_path in the application example for implementation details.

**Persistent Connections**

Persistent connection means that the HTTP client can re-use the same connection for several exchanges. If the server does not request to close the connection with the Connection: close header, the connection is not dropped but is instead kept open and used for further requests.

To allow ESP HTTP client to take full advantage of persistent connections, one should make as many requests as possible using the same handle instance. Check out the example functions http_rest_with_url and http_rest_with_hostname_path in the application example. Here, once the connection is created, multiple requests (GET, POST, PUT, etc.) are made before the connection is closed.

**HTTPS Request**

ESP HTTP client supports SSL connections using mbedTLS, with the url configuration starting with https scheme or transport_type set to HTTP_TRANSPORT_OVER_SSL. HTTPS support can be configured via CONFIG_ESP_HTTP_CLIENT_ENABLE_HTTPS (enabled by default).

**Note:** While making HTTPS requests, if server verification is needed, an additional root certificate (in PEM format) needs to be provided to the cert_pem member in the esp_http_client_config_t configuration. Users can also use the ESP x509 Certificate Bundle for server verification using the crt_bundle_attach member of the esp_http_client_config_t configuration.

Check out the example functions https_with_url and https_with_hostname_path in the application example for implementation details of the above note.

**HTTP Stream**

Some applications need to open the connection and control the exchange of data actively (data streaming). In such cases, the application flow is different from regular requests. Example flow is given below:

- **esp_http_client_init()**: Create a HTTP client handle.
- **esp_http_client_set_* or esp_http_client_delete_***: Modify the HTTP connection parameters (optional).
- **esp_http_client_open()**: Open the HTTP connection with write_len parameter (content length that needs to be written to server), set write_len=0 for read-only connection.
- **esp_http_client_write()**: Write data to server with a maximum length equal to write_len of esp_http_client_open() function; no need to call this function for write_len=0.
• *esp_http_client_fetch_headers()*: Read the HTTP Server response headers, after sending the request headers and server data (if any). Returns the `content-length` from the server and can be succeeded by *esp_http_client_get_status_code()* for getting the HTTP status of the connection.

• *esp_http_client_read()*: Read the HTTP stream.

• *esp_http_client_close()*: Close the connection.

• *esp_http_client_cleanup()*: Release allocated resources.

Check out the example function `http_perform_as_stream_reader` in the application example for implementation details.

**HTTP Authentication**

ESP HTTP client supports both Basic and Digest Authentication.

• Users can provide the username and password in the `url` or the `username` and `password` members of the `esp_http_client_config_t` configuration. For `auth_type = HTTP_AUTH_TYPE_BASIC`, the HTTP client takes only one perform operation to pass the authentication process.

• If `auth_type = HTTP_AUTH_TYPE_NONE`, but the `username` and `password` fields are present in the configuration, the HTTP client takes two perform operations. The client will receive the 401 Unauthorized header in its first attempt to connect to the server. Based on this information, it decides which authentication method to choose and performs it in the second operation.

• Check out the example functions `http_auth_basic`, `http_auth_basic_redirect` (for Basic authentication) and `http_auth_digest` (for Digest authentication) in the application example for implementation details.

**Examples of Authentication Configuration**

• Authentication with URI

```c
esp_http_client_config_t config = {
  .url = "http://user:passwd@httpbin.org/basic-auth/user/passwd",
  .auth_type = HTTP_AUTH_TYPE_BASIC,
};
```

• Authentication with username and password entry

```c
esp_http_client_config_t config = {
  .url = "http://httpbin.org/basic-auth/user/passwd",
  .username = "user",
  .password = "passwd",
  .auth_type = HTTP_AUTH_TYPE_BASIC,
};
```

**Event Handling**

ESP HTTP Client supports event handling by triggering an event handler corresponding to the event which takes place. `esp_http_client_event_id_t` contains all the events which could occur while performing an HTTP request using the ESP HTTP Client.

To enable event handling, you just need to set a callback function using the `esp_http_client_config_t::event_handler` member.

**ESP HTTP Client Diagnostic Information**

Diagnostic information could be helpful to gain insights into a problem. In the case of ESP HTTP Client, the diagnostic information can be collected by registering an event handler with the Event Loop library. This feature has been added by keeping in mind the ESP Insights framework which collects the diagnostic information. However, this
feature can also be used without any dependency on the ESP Insights framework for the diagnostic purpose. Event handler can be registered to the event loop using the `esp_event_handler_register()` function.

Expected data types for different HTTP Client events in the event loop are as follows:

- **HTTP_EVENT_ERROR**: `esp_http_client_handle_t`
- **HTTP_EVENT_ON_CONNECTED**: `esp_http_client_handle_t`
- **HTTP_EVENT_HEADERS_SENT**: `esp_http_client_handle_t`
- **HTTP_EVENT_ON_HEADER**: `esp_http_client_handle_t`
- **HTTP_EVENT_ON_DATA**: `esp_http_client_on_data_t`
- **HTTP_EVENT_ON_FINISH**: `esp_http_client_handle_t`
- **HTTP_EVENT_DISCONNECTED**: `esp_http_client_handle_t`
- **HTTP_EVENT_REDIRECT**: `esp_http_client_redirect_event_data_t`

The `esp_http_client_handle_t` received along with the event data will be valid until `HTTP_EVENT_DISCONNECTED` is not received. This handle has been sent primarily to differentiate between different client connections and must not be used for any other purpose, as it may change based on client connection state.

### API Reference

#### Header File

- `components/esp_http_client/include/esp_http_client.h`
- This header file can be included with:

```c
#include "esp_http_client.h"
```
- This header file is a part of the API provided by the `esp_http_client` component. To declare that your component depends on `esp_http_client`, add the following to your CMakeLists.txt:

```c
REQUIRES esp_http_client
```

or

```c
PRIV_REQUIRES esp_http_client
```

#### Functions

- **`esp_http_client_handle_t esp_http_client_init(const esp_http_client_config_t *config)`**

  Start a HTTP session. This function must be the first function to call, and it returns a `esp_http_client_handle_t` that you must use as input to other functions in the interface. This call MUST have a corresponding call to `esp_http_client_cleanup` when the operation is complete.

  **Parameters**
  
  config - [in] The configurations, see `http_client_config_t`

  **Returns**
  
  - `esp_http_client_handle_t`
  - `NULL` if any errors

- **`esp_err_t esp_http_client_perform(esp_http_client_handle_t client)`**

  Invoke this function after `esp_http_client_init` and all the options calls are made, and will perform the transfer as described in the options. It must be called with the same `esp_http_client_handle_t` as input as the `esp_http_client_init` call returned. `esp_http_client_perform` performs the entire request in either blocking or non-blocking manner. By default, the API performs request in a blocking manner and returns when done, or if it failed, and in non-blocking manner, it returns if EAGAIN/EWOULDBLOCK or EINPROGRESS is encountered, or if it failed. And in case of non-blocking request, the user may call this API multiple times unless request & response is complete or there is a failure. To enable non-blocking `esp_http_client_perform()`, `is_async` member of `esp_http_client_config_t` must be set while making a call to `esp_http_client_init()` API. You can do any amount of calls to `esp_http_client_perform` while using the same `esp_http_client_handle_t`. The underlying connection may be kept open if the server allows it. If you intend to transfer more than one file, you are even encouraged to do so. `esp_http_client` will then attempt to re-use the same connection for the following transfers, thus making the operations faster, less CPU intense and using less network resources.
Just note that you will have to use `esp_http_client_set_**` between the invokes to set options for the following `esp_http_client_perform`.

**Note:** You must never call this function simultaneously from two places using the same client handle. Let the function return first before invoking it another time. If you want parallel transfers, you must use several `esp_http_client_handle_t`. This function include `esp_http_client_open -> esp_http_client_write -> esp_http_client_fetch_headers -> esp_http_client_read (and option) esp_http_client_close`.

### Parameters client
- The `esp_http_client` handle

### Returns
- ESP_OK on successful
- ESP_FAIL on error

```c
esp_err_t esp_http_client_cancel_request (esp_http_client_handle_t client)
```

Cancel an ongoing HTTP request. This API closes the current socket and opens a new socket with the same `esp_http_client` context.

### Parameters client
- The `esp_http_client` handle

### Returns
- ESP_OK on successful
- ESP_FAIL on error
- ESP_ERR_INVALID_ARG
- ESP_ERR_INVALID_STATE

```c
esp_err_t esp_http_client_set_url (esp_http_client_handle_t client, const char* url)
```

Set URL for client, when performing this behavior, the options in the URL will replace the old ones.

### Parameters
- `client` - [in] The `esp_http_client` handle
- `url` - [in] The url

### Returns
- ESP_OK
- ESP_FAIL

```c
esp_err_t esp_http_client_set_post_field (esp_http_client_handle_t client, const char *data, int len)
```

Set post data, this function must be called before `esp_http_client_perform`. Note: The data parameter passed to this function is a pointer and this function will not copy the data.

### Parameters
- `client` - [in] The `esp_http_client` handle
- `data` - [in] post data pointer
- `len` - [in] post length

### Returns
- ESP_OK
- ESP_FAIL

```c
int esp_http_client_get_post_field (esp_http_client_handle_t client, char **data)
```

Get current post field information.

### Parameters
- `client` - [in] The client
- `data` - [out] Point to post data pointer

### Returns
Size of post data

```c
esp_err_t esp_http_client_set_header (esp_http_client_handle_t client, const char *key, const char *value)
```

Set http request header, this function must be called after `esp_http_client_init` and before any perform function.

### Parameters
**Chapter 2. API Reference**

- **client** [in] The esp_http_client handle
- **key** [in] The header key
- **value** [in] The header value

**Returns**
- ESP_OK
- ESP_FAIL

*esp_err_t* `esp_http_client_get_header(esp_http_client_handle_t client, const char* key, char** value)`

Get http request header. The value parameter will be set to NULL if there is no header which is same as the key specified, otherwise the address of header value will be assigned to value parameter. This function must be called after `esp_http_client_init`.

**Parameters**
- **client** [in] The esp_http_client handle
- **key** [in] The header key
- **value** [out] The header value

**Returns**
- ESP_OK
- ESP_FAIL

*esp_err_t* `esp_http_client_get_username(esp_http_client_handle_t client, char** value)`

Get http request username. The address of username buffer will be assigned to value parameter. This function must be called after `esp_http_client_init`.

**Parameters**
- **client** [in] The esp_http_client handle
- **value** [out] The username value

**Returns**
- ESP_OK
- ESP_ERR_INVALID_ARG

*esp_err_t* `esp_http_client_set_username(esp_http_client_handle_t client, const char* username)`

Set http request username. The value of username parameter will be assigned to username buffer. If the username parameter is NULL then username buffer will be freed.

**Parameters**
- **client** [in] The esp_http_client handle
- **username** [in] The username value

**Returns**
- ESP_OK
- ESP_ERR_INVALID_ARG

*esp_err_t* `esp_http_client_get_password(esp_http_client_handle_t client, char** value)`

Get http request password. The address of password buffer will be assigned to value parameter. This function must be called after `esp_http_client_init`.

**Parameters**
- **client** [in] The esp_http_client handle
- **value** [out] The password value

**Returns**
- ESP_OK
- ESP_ERR_INVALID_ARG

*esp_err_t* `esp_http_client_set_password(esp_http_client_handle_t client, const char* password)`

Set http request password. The value of password parameter will be assigned to password buffer. If the password parameter is NULL then password buffer will be freed.

**Parameters**
- **client** [in] The esp_http_client handle
- **password** [in] The password value

**Returns**
- ESP_OK
Chapter 2. API Reference

- ESP_ERR_INVALID_ARG

**esp_err_t esp_http_client_set_auth_type** *(esp_http_client_handle_t client, esp_http_client_auth_type_t auth_type)*

Set http request auth_type.

**Parameters**
- `client` - [in] The esp_http_client handle
- `auth_type` - [in] The esp_http_client auth type

**Returns**
- ESP_OK
- ESP_ERR_INVALID_ARG

**esp_err_t esp_http_client_get_user_data** *(esp_http_client_handle_t client, void** data)*

Get http request user_data. The value stored from the `esp_http_client_config_t` will be written to the address passed into data.

**Parameters**
- `client` - [in] The esp_http_client handle
- `data` - [out] A pointer to the pointer that will be set to user_data.

**Returns**
- ESP_OK
- ESP_ERR_INVALID_ARG

**esp_err_t esp_http_client_set_user_data** *(esp_http_client_handle_t client, void* data)*

Set http request user_data. The value passed in +data+ will be available during event callbacks. No memory management will be performed on the user’s behalf.

**Parameters**
- `client` - [in] The esp_http_client handle
- `data` - [in] The pointer to the user data

**Returns**
- ESP_OK
- ESP_ERR_INVALID_ARG

**int esp_http_client_get_errno** *(esp_http_client_handle_t client)*

Get HTTP client session errno.

**Parameters**
- `client` - [in] The esp_http_client handle

**Returns**
- (-1) if invalid argument
- errno

**esp_err_t esp_http_client_set_method** *(esp_http_client_handle_t client, esp_http_client_method_t method)*

Set http request method.

**Parameters**
- `client` - [in] The esp_http_client handle
- `method` - [in] The method

**Returns**
- ESP_OK
- ESP_ERR_INVALID_ARG

**esp_err_t esp_http_client_set_timeout_ms** *(esp_http_client_handle_t client, int timeout_ms)*

Set http request timeout.

**Parameters**
- `client` - [in] The esp_http_client handle
- `timeout_ms` - [in] The timeout value

**Returns**
- ESP_OK
- ESP_ERR_INVALID_ARG
**esp_err_t esp_http_client_delete_header(esp_http_client_handle_t client, const char *key)**  
Delete http request header.

**Parameters**
- **client**  [in] The esp_http_client handle
- **key**  [in] The key

**Returns**
- ESP_OK
- ESP_FAIL

**esp_err_t esp_http_client_open(esp_http_client_handle_t client, int write_len)**  
This function will be open the connection, write all header strings and return.

**Parameters**
- **client**  [in] The esp_http_client handle
- **write_len**  [in] HTTP Content length need to write to the server

**Returns**
- ESP_OK
- ESP_FAIL

**int esp_http_client_write(esp_http_client_handle_t client, const char* buffer, int len)**  
This function will write data to the HTTP connection previously opened by esp_http_client_open()

**Parameters**
- **client**  [in] The esp_http_client handle
- **buffer**  The buffer
- **len**  [in] This value must not be larger than the write_len parameter provided to esp_http_client_open()

**Returns**
- (-1) if any errors
- Length of data written

**int64_t esp_http_client_fetch_headers(esp_http_client_handle_t client)**  
This function need to call after esp_http_client_open, it will read from http stream, process all receive headers.

**Parameters**
- **client**  [in] The esp_http_client handle

**Returns**
- (0) if stream doesn’t contain content-length header, or chunked encoding (checked by esp_http_client_is_chunked_response)
- (-1: ESP_FAIL) if any errors
- (-ESP_ERR_HTTP_EAGAIN = -0x7007) if call is timed-out before any data was ready
- Download data length defined by content-length header

**bool esp_http_client_is_chunked_response(esp_http_client_handle_t client)**  
Check response data is chunked.

**Parameters**
- **client**  [in] The esp_http_client handle

**Returns**
- true or false

**int esp_http_client_read(esp_http_client_handle_t client, char *buffer, int len)**  
Read data from http stream.

**Note:** (-ESP_ERR_HTTP_EAGAIN = -0x7007) is returned when call is timed-out before any data was ready

**Parameters**
- **client**  [in] The esp_http_client handle
- **buffer**  The buffer
- **len**  [in] The length

**Returns**
- (-1) if any errors
• Length of data was read

```c
int esp_http_client_get_status_code(esp_http_client_handle_t client)

Get http response status code, the valid value if this function invoke after esp_http_client_perform

Parameters client  – [in] The esp_http_client handle
Returns Status code
```

```c
int64_t esp_http_client_get_content_length(esp_http_client_handle_t client)

Get http response content length (from header Content-Length) the valid value if this function invoke after esp_http_client_perform

Parameters client  – [in] The esp_http_client handle
Returns
• (-1) Chunked transfer
• Content-Length value as bytes
```

```c
esp_err_t esp_http_client_close(esp_http_client_handle_t client)

Close http connection, still kept all http request resources.

Parameters client  – [in] The esp_http_client handle
Returns
• ESP_OK
• ESP_FAIL
```

```c
esp_err_t esp_http_client_cleanup(esp_http_client_handle_t client)

This function must be the last function to call for an session. It is the opposite of the esp_http_client_init function and must be called with the same handle as input that a esp_http_client_init call returned. This might close all connections this handle has used and possibly has kept open until now. Don’t call this function if you intend to transfer more files, re-using handles is a key to good performance with esp_http_client.

Parameters client  – [in] The esp_http_client handle
Returns
• ESP_OK
• ESP_FAIL
```

```c
esp_http_client_transport_t esp_http_client_get_transport_type(esp_http_client_handle_t client)

Get transport type.

Parameters client  – [in] The esp_http_client handle
Returns
• HTTP_TRANSPORT_UNKNOWN
• HTTP_TRANSPORT_OVER_TCP
• HTTP_TRANSPORT_OVER_SSL
```

```c
esp_err_t esp_http_client_set_redirection(esp_http_client_handle_t client)

Set redirection URL. When received the 30x code from the server, the client stores the redirect URL provided by the server. This function will set the current URL to redirect to enable client to execute the redirection request. When disable_auto_redirect is set, the client will not call this function but the event HTTP_EVENT_REDIRECT will be dispatched giving the user control over the redirection event.

Parameters client  – [in] The esp_http_client handle
Returns
• ESP_OK
• ESP_FAIL
```

```c
esp_err_t esp_http_client_set_auth_data(esp_http_client_handle_t client, const char *auth_data, int len)

On receiving a custom authentication header, this API can be invoked to set the authentication information from the header. This API can be called from the event handler.

Parameters
• client  – [in] The esp_http_client handle
```
### Chapter 2. API Reference

- **auth_data** - [in] The authentication data received in the header
- **len** - [in] length of auth_data.

**Returns**
- ESP_ERR_INVALID_ARG
- ESP_OK

```c
void esp_http_client_add_auth(esp_http_client_handle_t client)
```

On receiving HTTP Status code 401, this API can be invoked to add authorization information.

**Note:** There is a possibility of receiving body message with redirection status codes, thus make sure to flush off body data after calling this API.

**Parameters**
- **client** - [in] The esp_http_client handle

```c
bool esp_http_client_is_complete_data_received(esp_http_client_handle_t client)
```

Checks if entire data in the response has been read without any error.

**Parameters**
- **client** - [in] The esp_http_client handle

**Returns**
- true
- false

```c
int esp_http_client_read_response(esp_http_client_handle_t client, char*buffer, int len)
```

Helper API to read larger data chunks This is a helper API which internally calls `esp_http_client_read` multiple times till the end of data is reached or till the buffer gets full.

**Parameters**
- **client** - [in] The esp_http_client handle
- **buffer** - The buffer
- **len** - [in] The buffer length

**Returns**
- Length of data was read

```c
esp_err_t esp_http_client_flush_response(esp_http_client_handle_t client, int*len)
```

Process all remaining response data This uses an internal buffer to repeatedly receive, parse, and discard response data until complete data is processed. As no additional user-supplied buffer is required, this may be preferrable to `esp_http_client_read_response` in situations where the content of the response may be ignored.

**Parameters**
- **client** - [in] The esp_http_client handle
- **len** - Length of data discarded

**Returns**
- ESP_OK If successful, len will have discarded length
- ESP_FAIL If failed to read response
- ESP_ERR_INVALID_ARG If the client is NULL

```c
esp_err_t esp_http_client_get_url(esp_http_client_handle_t client, char *url, const int len)
```

Get URL from client.

**Parameters**
- **client** - [in] The esp_http_client handle
- **url** - [inout] The buffer to store URL
- **len** - [in] The buffer length

**Returns**
- ESP_OK
- ESP_FAIL

```c
esp_err_t esp_http_client_get_chunk_length(esp_http_client_handle_t client, int *len)
```

Get Chunk-Length from client.
Chapter 2. API Reference

Parameters

- **client** - [in] The esp_http_client handle
- **len** - [out] Variable to store length

Returns

- ESP_OK If successful, len will have length of current chunk
- ESP_FAIL If the server is not a chunked server
- ESP_ERR_INVALID_ARG If the client or len are NULL

Structures

struct *esp_http_client_event*

HTTP Client events data.

Public Members

`esp_http_client_event_id_t event_id`

event_id, to know the cause of the event

`esp_http_client_handle_t client`

esp_http_client_handle_t context

void *data

data of the event

int data_len

data length of data

void *user_data

user_data context, from esp_http_client_config_t user_data

char *header_key

For HTTP_EVENT_ON_HEADER event_id, it’s store current http header key

char *header_value

For HTTP_EVENT_ON_HEADER event_id, it’s store current http header value

struct *esp_http_client_on_data*

Argument structure for HTTP_EVENT_ON_DATA event.

Public Members

`esp_http_client_handle_t client`

Client handle

int64_t data_process

Total data processed

struct *esp_http_client_redirect_event_data*

Argument structure for HTTP_EVENT_REDIRECT event.
Public Members

`esp_http_client_handle_t client`
Client handle

`int status_code`
Status Code

Structure: `esp_http_client_config_t`
HTTP configuration.

Public Members

`const char* url`
HTTP URL, the information on the URL is most important, it overrides the other fields below, if any

`const char* host`
Domain or IP as string

`int port`
Port to connect, default depend on `esp_http_client_transport_t` (80 or 443)

`const char* username`
Using for Http authentication

`const char* password`
Using for Http authentication

`esp_http_client_auth_type_t auth_type`
Http authentication type, see `esp_http_client_auth_type_t`

`const char* path`
HTTP Path, if not set, default is `/`

`const char* query`
HTTP query

`const char* cert_pem`
SSL server certification, PEM format as string, if the client requires to verify server

`size_t cert_len`
Length of the buffer pointed to by cert_pem. May be 0 for null-terminated pem

`const char* client_cert_pem`
SSL client certification, PEM format as string, if the server requires to verify client

`size_t client_cert_len`
Length of the buffer pointed to by client_cert_pem. May be 0 for null-terminated pem
const char *client_key_pem
SSL client key, PEM format as string, if the server requires to verify client

size_t client_key_len
Length of the buffer pointed to by client_key_pem. May be 0 for null-terminated pem

const char *client_key_password
Client key decryption password string

size_t client_key_password_len
String length of the password pointed to by client_key_password

esp_http_client_proto_ver_t tls_version
TLS protocol version of the connection, e.g., TLS 1.2, TLS 1.3 (default - no preference)

const char *user_agent
The User Agent string to send with HTTP requests

esp_http_client_method_t method
HTTP Method

int timeout_ms
Network timeout in milliseconds

bool disable_auto_redirect
Disable HTTP automatic redirects

int max_redirection_count
Max number of redirections on receiving HTTP redirect status code, using default value if zero

int max_authorization_retries
Max connection retries on receiving HTTP unauthorized status code, using default value if zero. Disables authorization retry if -1

http_event_handle_cb event_handler
HTTP Event Handle

esp_http_client_transport_t transport_type
HTTP transport type; see esp_http_client_transport_t

int buffer_size
HTTP receive buffer size

int buffer_size_tx
HTTP transmit buffer size

void *user_data
HTTP user_data context
bool is_async
    Set asynchronous mode, only supported with HTTPS for now

bool use_global_ca_store
    Use a global ca_store for all the connections in which this bool is set.

bool skip_cert_common_name_check
    Skip any validation of server certificate CN field

cstmt char *common_name
    Pointer to the string containing server certificate common name. If non-NULL, server certificate CN must match this name, If NULL, server certificate CN must match hostname.

esp_err_t (**crt_bundle_attach)(void *conf)
    Function pointer to esp_crt_bundle_attach. Enables the use of certification bundle for server verification, must be enabled in menuconfig

bool keep_alive_enable
    Enable keep-alive timeout

int keep_alive_idle
    Keep-alive idle time. Default is 5 (second)

int keep_alive_interval
    Keep-alive interval time. Default is 5 (second)

int keep_alive_count
    Keep-alive packet retry send count. Default is 3 counts

struct ifreq *if_name
    The name of interface for data to go through. Use the default interface without setting

void *ds_data
    Pointer for digital signature peripheral context, see ESP-TLS Documentation for more details

Macros

DEFAULT_HTTP_BUF_SIZE

ESP_ERR_HTTP_BASE
    Starting number of HTTP error codes

ESP_ERR_HTTP_MAX_REDIRECT
    The error exceeds the number of HTTP redirects

ESP_ERR_HTTP_CONNECT
    Error open the HTTP connection

ESP_ERR_HTTP_WRITE_DATA
    Error write HTTP data
ESP_ERR_HTTP_FETCH_HEADER
Error read HTTP header from server

ESP_ERR_HTTP_INVALID_TRANSPORT
There are no transport support for the input scheme

ESP_ERR_HTTP_CONNECTING
HTTP connection hasn’t been established yet

ESP_ERR_HTTP_EAGAIN
Mapping of errno EAGAIN to esp_err_t

ESP_ERR_HTTP_CONNECTION_CLOSED
Read FIN from peer and the connection closed

Type Definitions

typedef struct esp_http_client *esp_http_client_handle_t

typedef struct esp_http_client_event *esp_http_client_event_handle_t

typedef struct esp_http_client_event esp_http_client_event_t
HTTP Client events data.

typedef struct esp_http_client_on_data esp_http_client_on_data_t
Argument structure for HTTP_EVENT_ON_DATA event.

typedef struct esp_http_client_redirect_event_data esp_http_client_redirect_event_data_t
Argument structure for HTTP_EVENT_REDIRECT event.

typedef esp_err_t (*http_event_handle_cb)(esp_http_client_event_t *evt)

Enumerations

tenum esp_http_client_event_id_t
HTTP Client events id.
Values:

enumerator HTTP_EVENT_ERROR
This event occurs when there are any errors during execution

enumerator HTTP_EVENT_ON_CONNECTED
Once the HTTP has been connected to the server, no data exchange has been performed

enumerator HTTP_EVENT_HEADERS_SENT
After sending all the headers to the server

enumerator HTTP_EVENT_HEADER_SENT
This header has been kept for backward compatibility and will be deprecated in future versions esp-idf
enumerator HTTP_EVENT_ON_HEADER
   Occurs when receiving each header sent from the server

enumerator HTTP_EVENT_ON_DATA
   Occurs when receiving data from the server, possibly multiple portions of the packet

enumerator HTTP_EVENT_ON_FINISH
   Occurs when finish a HTTP session

enumerator HTTP_EVENT_DISCONNECTED
   The connection has been disconnected

enumerator HTTP_EVENT_REDIRECT
   Intercepting HTTP redirects to handle them manually

enum esp_http_client_transport_t
   HTTP Client transport.
   Values:

   enumerator HTTP_TRANSPORT_UNKNOWN
      Unknown

   enumerator HTTP_TRANSPORT_OVER_TCP
      Transport over tcp

   enumerator HTTP_TRANSPORT_OVER_SSL
      Transport over ssl

enum esp_http_client_proto_ver_t
   Values:

   enumerator ESP_HTTP_CLIENT_TLS_VER_ANY
   enumerator ESP_HTTP_CLIENT_TLS_VER_TLS_1_2
   enumerator ESP_HTTP_CLIENT_TLS_VER_TLS_1_3
   enumerator ESP_HTTP_CLIENT_TLS_VER_MAX

enum esp_http_client_method_t
   HTTP method.
   Values:

   enumerator HTTP_METHOD_GET
      HTTP GET Method

   enumerator HTTP_METHOD_POST
      HTTP POST Method
enumerator **HTTP_METHOD_PUT**
   HTTP PUT Method

enumerator **HTTP_METHOD_PATCH**
   HTTP PATCH Method

enumerator **HTTP_METHOD_DELETE**
   HTTP DELETE Method

enumerator **HTTP_METHOD_HEAD**
   HTTP HEAD Method

enumerator **HTTP_METHOD_NOTIFY**
   HTTP NOTIFY Method

enumerator **HTTP_METHOD_SUBSCRIBE**
   HTTP SUBSCRIBE Method

enumerator **HTTP_METHOD_UNSUBSCRIBE**
   HTTP UNSUBSCRIBE Method

enumerator **HTTP_METHOD_OPTIONS**
   HTTP OPTIONS Method

enumerator **HTTP_METHOD_COPY**
   HTTP COPY Method

enumerator **HTTP_METHOD_MOVE**
   HTTP MOVE Method

enumerator **HTTP_METHOD_LOCK**
   HTTP LOCK Method

enumerator **HTTP_METHOD_UNLOCK**
   HTTP UNLOCK Method

enumerator **HTTP_METHOD_PROPFIND**
   HTTP PROPFIND Method

enumerator **HTTP_METHOD_PROPPATCH**
   HTTP PROPPATCH Method

enumerator **HTTP_METHOD_MKCOL**
   HTTP MKCOL Method

enumerator **HTTP_METHOD_MAX**
enum `esp_http_client_auth_type_t`

HTTP Authentication type.

Values:

enumerator `HTTP_AUTH_TYPE_NONE`
No authention

enumerator `HTTP_AUTH_TYPE_BASIC`
HTTP Basic authentication

enumerator `HTTP_AUTH_TYPE_DIGEST`
HTTP Digest authentication

enum `HttpStatus_Code`

Enum for the HTTP status codes.

Values:

enumerator `HttpStatus_Ok`

enumerator `HttpStatus_MultipleChoices`

enumerator `HttpStatus_MovedPermanently`

enumerator `HttpStatus_Found`

enumerator `HttpStatus_SeeOther`

enumerator `HttpStatus_TemporaryRedirect`

enumerator `HttpStatus_PermanentRedirect`

enumerator `HttpStatus_BadRequest`

enumerator `HttpStatus_Unauthorized`

enumerator `HttpStatus_Forbidden`

enumerator `HttpStatus_NotFound`

enumerator `HttpStatus_InternalError`

2.2.6 ESP Local Control
Overview

ESP Local Control (esp_local_ctrl) component in ESP-IDF provides capability to control an ESP device over HTTPS or Bluetooth® Low Energy. It provides access to application defined properties that are available for reading/writing via a set of configurable handlers.

Initialization of the esp_local_ctrl service over Bluetooth Low Energy transport is performed as follows:

```c
esp_local_ctrl_config_t config = {
    .transport = ESP_LOCAL_CTRL_TRANSPORT_BLE,
    .transport_config = {
        .ble = (protocomm_ble_config_t) {
            .device_name = SERVICE_NAME,
            .service_uuid = {
                /* LSB <---------------------------------------
                * ---------------------------------------> MSB */
                0x21, 0xd5, 0x3b, 0x8d, 0xbd, 0x75, 0x68, 0x8a,
                0xb4, 0x42, 0xeb, 0x31, 0x4a, 0x1e, 0x98, 0x3d
            }
        },
        .proto_sec = {
            .version = PROTOCOL_SEC0,
            .custom_handle = NULL,
            .sec_params = NULL
        },
        .handlers = {
            /* User defined handler functions */
            .get_prop_values = get_property_values,
            .set_prop_values = set_property_values,
            .usr_ctx = NULL,
            .usr_ctx_free_fn = NULL
        },
        /* Maximum number of properties that may be set */
        .max_properties = 10
    },
    /* Start esp_local_ctrl service */
    ESP_ERROR_CHECK(esp_local_ctrl_start(&config));
```

Similarly for HTTPS transport:

```c
/* Set the configuration */
httpd_ssl_config_t https_conf = HTTPD_SSL_CONFIG_DEFAULT();

/* Load server certificate */
extern const unsigned char servercert_start[] asm("_binary_servercert_pem_" start);
extern const unsigned char servercert_end[] asm("_binary_servercert_pem_" end);
https_conf.servercert = servercert_start;
https_conf.servercert_len = servercert_end - servercert_start;

/* Load server private key */
extern const unsigned char prvtkey_pem_start[] asm("_binary_prvtkey_pem_" start);
extern const unsigned char prvtkey_pem_end[] asm("_binary_prvtkey_pem_" end);
https_conf.prvtkey_pem = prvtkey_pem_start;
https_conf.prvtkey_len = prvtkey_pem_end - prvtkey_pem_start;
```

(continues on next page)
You may set security for transport in ESP local control using following options:

1. PROTOCOM_SEC2: specifies that SRP6a-based key exchange and end-to-end encryption based on AES-GCM are used. This is the most preferred option as it adds a robust security with Augmented PAKE protocol, i.e., SRP6a.
2. PROTOCOM_SEC1: specifies that Curve25519-based key exchange and end-to-end encryption based on AES-CTR are used.
3. PROTOCOM_SEC0: specifies that data will be exchanged as a plain text (no security).
4. PROTOCOM_SEC_CUSTOM: you can define your own security requirement. Please note that you will also have to provide custom_handle of type protocomm_security_t * in this context.

**Note:** The respective security schemes need to be enabled through the project configuration menu. Please refer to the Enabling protocom security version section in Protocol Communication for more details.

**Creating a Property**

Now that we know how to start the esp_local_ctrl service, let’s add a property to it. Each property must have a unique `name` (string), a `type` (e.g., enum), `flags` (bit fields) and `size`.

The `size` is to be kept 0, if we want our property value to be of variable length (e.g., if it is a string or bytestream). For data types with fixed-length property value, like int, float, etc., setting the `size` field to the right value helps esp_local_ctrl to perform internal checks on arguments received with write requests.

The interpretation of `type` and `flags` fields is totally up to the application, hence they may be used as enumerations, bitfields, or even simple integers. One way is to use `type` values to classify properties, while `flags` to specify characteristics of a property.

Here is an example property which is to function as a timestamp. It is assumed that the application defines TYPE_TIMESTAMP and READONLY, which are used for setting the `type` and `flags` fields here.

```c
/* Create a timestamp property */
esp_local_ctrl_prop_t timestamp = {
    .name = "timestamp",
    .type = TYPE_TIMESTAMP,
    .size = sizeof(int32_t),
};
```
Also notice that there is a ctx field, which is set to point to some custom `func_get_time()`. This can be used inside the property get/set handlers to retrieve timestamp.

Here is an example of `get_prop_values()` handler, which is used for retrieving the timestamp.

```c
static esp_err_t get_property_values(size_t props_count, 
    const esp_local_ctrl_prop_t *props, 
    esp_local_ctrl_prop_val_t *prop_values, 
    void *usr_ctx)
{
    for (uint32_t i = 0; i < props_count; i++) {
        ESP_LOGI(TAG, "Reading %s", props[i].name);
        if (props[i].type == TYPE_TIMESTAMP) {
            /* Obtain the timer function from ctx */
            int32_t (*func_get_time)(void) = props[i].ctx;
            /* Use static variable for saving the value. This is essential because the value has to be valid even after this function returns. Alternative is to use dynamic allocation and set the free_fn field */
            static int32_t ts = func_get_time();
            prop_values[i].data = &ts;
        }
    }
    return ESP_OK;
}
```

Here is an example of `set_prop_values()` handler. Notice how we restrict from writing to read-only properties.

```c
static esp_err_t set_property_values(size_t props_count, 
    const esp_local_ctrl_prop_t *props, 
    esp_local_ctrl_prop_val_t *prop_values, 
    void *usr_ctx)
{
    for (uint32_t i = 0; i < props_count; i++) {
        if (props[i].flags & READONLY) {
            ESP_LOGE(TAG, "Cannot write to read-only property %s", props[i].name);
            return ESP_ERR_INVALID_ARG;
        } else {
            ESP_LOGI(TAG, "Setting %s", props[i].name);
            /* For keeping it simple, lets only log the incoming data */
            ESP_LOG_BUFFER_HEX_LEVEL(TAG, prop_values[i].data, prop_values[i].size, ESP_LOG_INFO);
        }
    }
    return ESP_OK;
}
```

For complete example see `protocols/esp_local_ctrl`.

. flags = READONLY,
. ctx = func_get_time,
. ctx_free_fn = NULL

/* Now register the property */
esp_local_ctrl_add_property(&timestamp);
Client Side Implementation

The client side implementation establishes a protocomm session with the device first, over the supported mode of transport, and then send and receive protobuf messages understood by the `esp_local_ctrl` service. The service translates these messages into requests and then call the appropriate handlers (set/get). Then, the generated response for each handler is again packed into a protobuf message and transmitted back to the client.

See below the various protobuf messages understood by the `esp_local_ctrl` service:

1. *get_prop_count*: This should simply return the total number of properties supported by the service.
2. *get_prop_values*: This accepts an array of indices and should return the information (name, type, flags) and values of the properties corresponding to those indices.
3. *set_prop_values*: This accepts an array of indices and an array of new values, which are used for setting the values of the properties corresponding to the indices.

Note that indices may or may not be the same for a property, across multiple sessions. Therefore, the client must only use the names of the properties to uniquely identify them. So, every time a new session is established, the client should first call *get_prop_count* and then *get_prop_values*, hence form an index-to-name mapping for all properties. Now when calling *set_prop_values* for a set of properties, it must first convert the names to indexes, using the created mapping. As emphasized earlier, the client must refresh the index-to-name mapping every time a new session is established with the same device.

The various protocomm endpoints provided by `esp_local_ctrl` are listed below:

<table>
<thead>
<tr>
<th>Endpoint Name (Bluetooth Low Energy + GATT Server)</th>
<th>URI (HTTPS Server + mDNS)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>esp_local_ctrl/version</td>
<td><code>https://&lt;mdns-hostname&gt;.local/esp_local_ctrl/version</code></td>
<td>Endpoint used for retrieving version string</td>
</tr>
<tr>
<td>esp_local_ctrl/control</td>
<td><code>https://&lt;mdns-hostname&gt;.local/esp_local_ctrl/control</code></td>
<td>Endpoint used for sending or receiving control messages</td>
</tr>
</tbody>
</table>

API Reference

Header File

- `components/esp_local_ctrl/include/esp_local_ctrl.h`
- This header file can be included with:
  ```c
  #include "esp_local_ctrl.h"
  ```
- This header file is a part of the API provided by the `esp_local_ctrl` component. To declare that your component depends on `esp_local_ctrl`, add the following to your CMakeLists.txt:
  ```cmake
  REQUIRES esp_local_ctrl
  
or
  PRIV_REQUIRES esp_local_ctrl
  ```

Functions

```c
const esp_local_ctrl_transport_t *esp_local_ctrl_get_transport_ble (void)
```

Function for obtaining BLE transport mode.
const esp_local_ctrl_transport_t *esp_local_ctrl_get_transport_httpd (void)
Function for obtaining HTTPD transport mode.

esp_err_t esp_local_ctrl_start (const esp_local_ctrl_config_t *config)
Start local control service.

Parameters config – [in] Pointer to configuration structure

Returns
• ESP_OK : Success
• ESP_FAIL : Failure

esp_err_t esp_local_ctrl_stop (void)
Stop local control service.

esp_err_t esp_local_ctrl_add_property (const esp_local_ctrl_prop_t *prop)
Add a new property.

This adds a new property and allocates internal resources for it. The total number of properties that could be added is limited by configuration option max_properties

Parameters prop – [in] Property description structure

Returns
• ESP_OK : Success
• ESP_FAIL : Failure

esp_err_t esp_local_ctrl_remove_property (const char *name)
Remove a property.

This finds a property by name, and releases the internal resources which are associated with it.

Parameters name – [in] Name of the property to remove

Returns
• ESP_OK : Success
• ESP_ERR_NOT_FOUND : Failure

const esp_local_ctrl_prop_t *esp_local_ctrl_get_property (const char *name)
Get property description structure by name.

This API may be used to get a property’s context structure esp_local_ctrl_prop_t when its name is known

Parameters name – [in] Name of the property to find

Returns
• Pointer to property
• NULL if not found

esp_err_t esp_local_ctrl_set_handler (const char *ep_name, protocomm_req_handler_t handler, void *user_ctx)
Register protocomm handler for a custom endpoint.

This API can be called by the application to register a protocomm handler for an endpoint after the local control service has started.

Note: In case of BLE transport the names and uuids of all custom endpoints must be provided beforehand as a part of the protocomm_ble_config_t structure set in esp_local_ctrl_config_t, and passed to esp_local_ctrl_start().
• ESP_OK : Success
• ESP_FAIL : Failure

Unions

union esp_local_ctrl_transport_config_t
#include <esp_local_ctrl.h> Transport mode (BLE / HTTPD) configuration.

Public Members

esp_local_ctrl_transport_config_ble_t *ble
This is same as protocomm_ble_config_t. See protocomm_ble.h for available configuration parameters.

esp_local_ctrl_transport_config_httpd_t *httpd
This is same as httpd_ssl_config_t. See esp_https_server.h for available configuration parameters.

Structures

struct esp_local_ctrl_prop
Property description data structure, which is to be populated and passed to the esp_local_ctrl_add_property() function.

Once a property is added, its structure is available for read-only access inside get_prop_values() and set_prop_values() handlers.

Public Members

char *name
Unique name of property

uint32_t type
Type of property. This may be set to application defined enums

size_t size
Size of the property value, which:
• if zero, the property can have values of variable size
• if non-zero, the property can have values of fixed size only, therefore, checks are performed internally by esp_local_ctrl when setting the value of such a property

uint32_t flags
Flags set for this property. This could be a bit field. A flag may indicate property behavior, e.g. read-only / constant

void *ctx
Pointer to some context data relevant for this property. This will be available for use inside the get_prop_values and set_prop_values handlers as a part of this property structure. When set, this is valid throughout the lifetime of a property, till either the property is removed or the esp_local_ctrl service is stopped.
Chapter 2. API Reference

void (*ctx_free_fn)(void *ctx)
Function used by esp_local_ctrl to internally free the property context when
esp_local_ctrl_remove_property() or esp_local_ctrl_stop() is called.

struct esp_local_ctrl_prop_val
Property value data structure. This gets passed to the get_prop_values() and set_prop_values() handlers for the purpose of retrieving or setting the present value of a property.

Public Members

void *data
Pointer to memory holding property value

size_t size
Size of property value

void (*free_fn)(void *data)
This may be set by the application in get_prop_values() handler to tell esp_local_ctrl to call this function on the data pointer above, for freeing its resources after sending the get_prop_values response.

struct esp_local_ctrl_handlers
Handlers for receiving and responding to local control commands for getting and setting properties.

Public Members

esp_err_t (*get_prop_values)(size_t props_count, const esp_local_ctrl_prop_t props[],
esp_local_ctrl_prop_val_t prop_values[], void *usr_ctx)
Handler function to be implemented for retrieving current values of properties.

Note: If any of the properties have fixed sizes, the size field of corresponding element in prop_values need to be set

Param props_count [in] Total elements in the props array
Param props [in] Array of properties, the current values for which have been requested by the client
Param prop_values [out] Array of empty property values, the elements of which need to be populated with the current values of those properties specified by props argument
Param usr_ctx [in] This provides value of the usr_ctx field of esp_local_ctrl_handlers_t structure
Return Returning different error codes will convey the corresponding protocol level errors to the client:
• ESP_OK : Success
• ESP_ERR_INVALID_ARG : InvalidArgument
• ESP_ERR_INVALID_STATE : InvalidProto
• All other error codes : InternalError

esp_err_t (*set_prop_values)(size_t props_count, const esp_local_ctrl_prop_t props[], const
esp_local_ctrl_prop_val_t prop_values[], void *usr_ctx)
Handler function to be implemented for changing values of properties.

**Note:** If any of the properties have variable sizes, the size field of the corresponding element in prop_values must be checked explicitly before making any assumptions on the size.

---

**Param props_count [in]** Total elements in the props array

**Param props [in]** Array of properties, the values for which the client requests to change

**Param prop_values [in]** Array of property values, the elements of which need to be used for updating those properties specified by props argument

**Param usr_ctx [in]** This provides value of the usr_ctx field of esp_local_ctrl_handlers_t structure

**Return** Returning different error codes will convey the corresponding protocol level errors to the client:

- ESP_OK : Success
- ESP_ERR_INVALID_ARG : InvalidArgument
- ESP_ERR_INVALID_STATE : InvalidProto
- All other error codes : InternalError

```c
void *usr_ctx
```

Context pointer to be passed to above handler functions upon invocation. This is different from the property level context, as this is valid throughout the lifetime of the esp_local_ctrl service, and freed only when the service is stopped.

```c
void (*usr_ctx_free_fn)(void *usr_ctx)
```

Pointer to function which will be internally invoked on usr_ctx for freeing the context resources when esp_local_ctrl_stop() is called.

```c
struct esp_local_ctrl_proto_sec_cfg
```

Protocol security configs

**Public Members**

```c
esp_local_ctrl_proto_sec_t version
```

This sets protocom security version, sec0/sec1 or custom If custom, user must provide handle via proto_sec_custom_handle below

```c
void *custom_handle
```

Custom security handle if security is set custom via proto_sec above This handle must follow protocomm_security_t signature

```c
const void *pop
```

Proof of possession to be used for local control. Could be NULL.

```c
const void *sec_params
```

Pointer to security params (NULL if not needed). This is not needed for protocomm security 0 This pointer should hold the struct of type esp_local_ctrl_security1_params_t for protocomm security 1 and esp_local_ctrl_security2_params_t for protocomm security 2 respectively. Could be NULL.

```c
struct esp_local_ctrl_config
```

Configuration structure to pass to esp_local_ctrl_start()
Chapter 2. API Reference

Public Members

const esp_local_ctrl_transport_t *transport
    Transport layer over which service will be provided

esp_local_ctrl_transport_config_t transport_config
    Transport layer over which service will be provided

esp_local_ctrl_proto_sec_cfg_t proto_sec
    Security version and POP

esp_local_ctrl_handlers_t handlers
    Register handlers for responding to get/set requests on properties

size_t max_properties
    This limits the number of properties that are available at a time

Macros

ESP_LOCAL_CTRL_TRANSPORT_BLE

ESP_LOCAL_CTRL_TRANSPORT_HTTPD

Type Definitions

typedef struct esp_local_ctrl_prop esp_local_ctrl_prop_t
    Property description data structure, which is to be populated and passed to the
    esp_local_ctrl_add_property() function.

    Once a property is added, its structure is available for read-only access inside get_prop_values() and
    set_prop_values() handlers.

typedef struct esp_local_ctrl_prop_val esp_local_ctrl_prop_val_t
    Property value data structure. This gets passed to the get_prop_values() and set_prop_values() handlers
    for the purpose of retrieving or setting the present value of a property.

typedef struct esp_local_ctrl_handlers esp_local_ctrl_handlers_t
    Handlers for receiving and responding to local control commands for getting and setting properties.

typedef struct esp_local_ctrl_transport esp_local_ctrl_transport_t
    Transport mode (BLE / HTTPD) over which the service will be provided.

    This is forward declaration of a private structure, implemented internally by esp_local_ctrl.

typedef struct protocomm_ble_config esp_local_ctrl_transport_config_ble_t
    Configuration for transport mode BLE.

    This is a forward declaration for protocomm_ble_config_t. To use this, application must set CONFIG_BT_BLUEDROID_ENABLED and include protocomm_ble.h.

typedef struct httpd_config esp_local_ctrl_transport_config_httpd_t
    Configuration for transport mode HTTPD.

    This is a forward declaration for httpd_ssl_config_t (for HTTPS) or httpd_config_t (for HTTP)
typedef enum esp_local_ctrl_proto_sec esp_local_ctrl_proto_sec_t
    Security types for esp_local_control.

typedef protocomm_security1_params_t esp_local_ctrl_security1_params_t

typedef protocomm_security2_params_t esp_local_ctrl_security2_params_t

typedef struct esp_local_ctrl_proto_sec_cfg esp_local_ctrl_proto_sec_cfg_t
    Protocom security configs

typedef struct esp_local_ctrl_config esp_local_ctrl_config_t
    Configuration structure to pass to esp_local_ctrl_start()

Enumerations

defined enum esp_local_ctrl_proto_sec
    Security types for esp_local_control.

    Values:

    enumerator PROTOCOM_SEC0

    enumerator PROTOCOM_SEC1

    enumerator PROTOCOM_SEC2

    enumerator PROTOCOM_SEC_CUSTOM

2.2.7 ESP Serial Slave Link

Overview

Espressif provides several chips that can work as slaves. These slave devices rely on some common buses, and have their own communication protocols over those buses. The esp_serial_slave_link component is designed for the master to communicate with ESP slave devices through those protocols over the bus drivers.

After an esp_serial_slave_link device is initialized properly, the application can use it to communicate with the ESP slave devices conveniently.

Note: The ESP-IDF component esp_serial_slave_link has been moved from ESP-IDF since version v5.0 to a separate repository:

- ESSL component on GitHub

To add ESSL component in your project, please run idf.py add-dependency espressif/esp_serial_slave_link.
Chapter 2. API Reference

Espressif Device Protocols

For more details about Espressif device protocols, see the following documents.

ESP SPI Slave HD (Half Duplex) Mode Protocol

**Introduction**

In the half duplex mode, the master has to use the protocol defined by the slave to communicate with the slave. Each transaction may consist of the following phases (listed in the order they should exist):

- **Command**: 8-bit, master to slave
  
  This phase determines the rest phases of the transactions. See Supported Commands.

- **Address**: 8-bit, master to slave, optional
  
  For some commands (WRBUF, RDBUF), this phase specifies the address of the shared register to write to/read from. For other commands with this phase, they are meaningless but still have to exist in the transaction.

- **Dummy**: 8-bit, floating, optional
  
  This phase is the turnaround time between the master and the slave on the bus, and also provides enough time for the slave to prepare the data to send to the master.

- **Data**: variable length, the direction is also determined by the command.
  
  This may be a data OUT phase, in which the direction is slave to master, or a data IN phase, in which the direction is master to slave.

The **direction** means which side (master or slave) controls the MOSI, MISO, WP, and HD pins.

**Data IO Modes**

In some IO modes, more data wires can be used to send the data. As a result, the SPI clock cycles required for the same amount of data will be less than in the 1-bit mode. For example, in QIO mode, address and data (IN and OUT) should be sent on all 4 data wires (MOSI, MISO, WP, and HD). Here are the modes supported by the ESP32-S2 SPI slave and the wire number (WN) used in corresponding modes.

<table>
<thead>
<tr>
<th>Mode</th>
<th>Command WN</th>

<td>4</td>
</tr>
<tr>
<td>QPI</td>
<td>4</td>
<td>4</td>
<td>4</td>
<td>4</td>
</tr>
</tbody>
</table>

Normally, which mode is used is determined by the command sent by the master (See Supported Commands), except the QPI mode.
**QPI Mode**  The QPI mode is a special state of the SPI Slave. The master can send the ENQPI command to put the slave into the QPI mode state. In the QPI mode, the command is also sent in 4-bit, thus it is not compatible with the normal modes. The master should only send QPI commands when the slave is in QPI mode. To exit from the QPI mode, master can send the EXQPI command.

**Supported Commands**  

**Note:** The command name is in a master-oriented direction. For example, WRBUF means master writes the buffer of slave.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Command</th>
<th>Address</th>
<th>Data</th>
</tr>
</thead>
<tbody>
<tr>
<td>WRBUF</td>

<td>Interrupt</td>
<td>0x09</td>
<td>•</td>
<td>•</td>
</tr>
<tr>
<td>CMD_A</td>
<td>Interrupt</td>
<td>0x0A</td>
<td>•</td>
<td>•</td>
</tr>
<tr>
<td>EXQPI</td>
<td>Exit QPI mode</td>
<td>0xDD</td>
<td>•</td>
<td>•</td>
</tr>
</tbody>
</table>

Moreover, WRBUF, RDBUF, WRDMA, and RDDMA commands have their 2-bit and 4-bit version. To do transactions in 2-bit or 4-bit mode, send the original command ORed by the corresponding command mask below. For example, command 0x1A means WRBUF in QIO mode.

<table>
<thead>
<tr>
<th>Mode</th>
<th>Mask</th>
</tr>
</thead>
<tbody>
<tr>
<td>1-bit</td>
<td>0x00</td>
</tr>
<tr>
<td>DOUT</td>
<td>0x10</td>

</tr>
<tr>
<td>QOUT</td>
<td>0x20</td>
</tr>
<tr>
<td>QIO</td>
<td>0xA0</td>
</tr>
<tr>
<td>QPI</td>
<td>0xA0</td>
</tr>
</tbody>
</table>

**Segment Transaction Mode**  Segment transaction mode is the only mode supported by the SPI Slave HD driver for now. In this mode, for a transaction the slave loads onto the DMA, the master is allowed to read or write in
segments. In this way, the master does not have to prepare a large buffer as the size of data provided by the slave. After the master finishes reading/writing a buffer, it has to send the corresponding termination command to the slave as a synchronization signal. The slave driver will update new data (if exist) onto the DMA upon seeing the termination command.

The termination command is WR_DONE (0x07) for WRDMA and CMD8 (0x08) for RDDMA.

Here is an example for the flow the master read data from the slave DMA:

1. The slave loads 4092 bytes of data onto the RDDMA.
2. The master do seven RDDMA transactions, each of them is 512 bytes long, and reads the first 3584 bytes from the slave.
3. The master do the last RDDMA transaction of 512 bytes (equal, longer, or shorter than the total length loaded by the slave are all allowed). The first 508 bytes are valid data from the slave, while the last 4 bytes are meaningless bytes.
4. The master sends CMD8 to the slave.
5. The slave loads another 4092 bytes of data onto the RDDMA.
6. The master can start new reading transactions after it sends the CMD8.

Terminology

- ESSL: Abbreviation for ESP Serial Slave Link, the component described by this document.
- Master: The device running the esp_serial_slave_link component.
- ESSL device: a virtual device on the master associated with an ESP slave device. The device context has the knowledge of the slave protocol above the bus, relying on some bus drivers to communicate with the slave.
- ESSL device handle: a handle to ESSL device context containing the configuration, status and data required by the ESSL component. The context stores the driver configurations, communication state, data shared by master and slave, etc.
  - The context should be initialized before it is used, and get deinitialized if not used any more. The master application operates on the ESSL device through this handle.
- ESP slave: the slave device connected to the bus, which ESSL component is designed to communicate with.
- Bus: The bus over which the master and the slave communicate with each other.
- Slave protocol: The special communication protocol specified by Espressif HW/SW over the bus.
- TX buffer num: a counter, which is on the slave and can be read by the master, indicates the accumulated buffer numbers that the slave has loaded to the hardware to receive data from the master.
- RX data size: a counter, which is on the slave and can be read by the master, indicates the accumulated data size that the slave has loaded to the hardware to send to the master.

Services Provided by ESP Slave

There are some common services provided by the Espressif slaves:

1. Tohost Interrupts: The slave can inform the master about certain events by the interrupt line. (optional)
2. Frhost Interrupts: The master can inform the slave about certain events.
3. TX FIFO (master to slave): The slave can receive data from the master in units of receiving buffers. The slave updates the TX buffer num to inform the master how much data it can receive, and the master then read the TX buffer num, and take off the used buffer number to know how many buffers are remaining.
4. RX FIFO (slave to master): The slave can send data in stream to the master. The SDIO slave can also indicate it has new data to send to master by the interrupt line. The slave updates the RX data size to inform the master how much data it has prepared to send, and then the master read the data size, and take off the data length it has already received to know how many data is remaining.
5. Shared registers: The master can read some part of the registers on the slave, and also write these registers to let the slave read.

The services provided by the slave depends on the slave’s model. See SPI Slave Capabilities of Espressif Chips for more details.
Initialization of ESP Serial Slave Link

**ESP SDIO Slave**  The ESP SDIO slave link (ESSL SDIO) devices rely on the SDMMC component. It includes the usage of communicating with ESP SDIO Slave device via the SDMMC Host or SDSPI Host feature. The ESSL device should be initialized as below:

1. Initialize a SDMMC card (see `Document of SDMMC driver`)
2. Call `sdmmc_card_init()` to initialize the card.
3. Initialize the ESSL device with `essl_sdio_config_t`. The `card` member should be the `sdmmc_card_t` got in step 2, and the `recv_buffer_size` member should be filled correctly according to pre-negotiated value.
4. Call `essl_init()` to do initialization of the SDIO part.
5. Call `essl_wait_for_ready()` to wait for the slave to be ready.

**ESP SPI Slave**

Note: If you are communicating with the ESP SDIO Slave device through SPI interface, you should use the `SDIO interface` instead.

Has not been supported yet.

**APIs**

After the initialization process above is performed, you can call the APIs below to make use of the services provided by the slave:

**Tohost Interrupts** (Optional)

1. Call `essl_get_intr_ena()` to know which events trigger the interrupts to the master.
2. Call `essl_set_intr_ena()` to set the events that trigger interrupts to the master.
3. Call `essl_wait_int()` to wait until interrupt from the slave, or timeout.
4. When interrupt is triggered, call `essl_get_intr()` to know which events are active, and call `essl_clear_intr()` to clear them.

**Frhost Interrupts**

1. Call `essl_send_slave_intr()` to trigger general purpose interrupt of the slave.

**TX FIFO**

1. Call `essl_get_tx_buffer_num()` to know how many buffers the slave has prepared to receive data from the master. This is optional. The master will poll `tx_buffer_num` when it tries to send packets to the slave, until the slave has enough buffer or timeout.
2. Call `essl_send_packet()` to send data to the slave.

**RX FIFO**

1. Call `essl_get_rx_data_size()` to know how many data the slave has prepared to send to the master. This is optional. When the master tries to receive data from the slave, it updates the `rx_data_size` for once, if the current `rx_data_size` is shorter than the buffer size the master prepared to receive. And it may poll the `rx_data_size` if the `rx_data_size` keeps 0, until timeout.
2. Call `essl_get_packet()` to receive data from the slave.

**Reset Counters** (Optional)  Call `essl_reset_cnt()` to reset the internal counter if you find the slave has reset its counter.
Application Example

The example below shows how ESP32-S2 SDIO host and slave communicate with each other. The host uses the ESSL SDIO:

peripherals/sdio

Please refer to the specific example README.md for details.

API Reference

Header File

- components/driver/test_apps/components/esp_serial_slave_link/include/esp_serial_slave_link/essl.h

Functions

**esp_err_t essl_init** (essl_handle_t handle, uint32_t wait_ms)

Initialize the slave.

**Parameters**

- **handle** – Handle of an ESSL device.
- **wait_ms** – Millisecond to wait before timeout, will not wait at all if set to 0-9.

**Returns**

- ESP_OK: If success
- ESP_ERR_NOT_SUPPORTED: Current device does not support this function.
- Other value returned from lower layer `init`.

**esp_err_t essl_wait_for_ready** (essl_handle_t handle, uint32_t wait_ms)

Wait for interrupt of an ESSL slave device.

**Parameters**

- **handle** – Handle of an ESSL device.
- **wait_ms** – Millisecond to wait before timeout, will not wait at all if set to 0-9.

**Returns**

- ESP_OK: If success
- ESP_ERR_NOT_SUPPORTED: Current device does not support this function.
- One of the error codes from SDMMC host controller

**esp_err_t essl_get_tx_buffer_num** (essl_handle_t handle, uint32_t *out_tx_num, uint32_t wait_ms)

Get buffer num for the host to send data to the slave. The buffers are size of `buffer_size`.

**Parameters**

- **handle** – Handle of a ESSL device.
- **out_tx_num** – Output of buffer num that host can send data to ESSL slave.
- **wait_ms** – Millisecond to wait before timeout, will not wait at all if set to 0-9.

**Returns**

- ESP_OK: If success
- ESP_ERR_NOT_SUPPORTED: This API is not supported in this mode
- One of the error codes from SDMMC/SPI host controller

**esp_err_t essl_get_rx_data_size** (essl_handle_t handle, uint32_t *out_rx_size, uint32_t wait_ms)

Get the size, in bytes, of the data that the ESSL slave is ready to send.

**Parameters**

- **handle** – Handle of an ESSL device.
- **out_rx_size** – Output of data size to read from slave, in bytes
- **wait_ms** – Millisecond to wait before timeout, will not wait at all if set to 0-9.

**Returns**

- ESP_OK: If success
- ESP_ERR_NOT_SUPPORTED: This API is not supported in this mode
- One of the error codes from SDMMC/SPI host controller
Chapter 2. API Reference

`esp_err_t essl_reset_cnt(essl_handle_t handle)`
Reset the counters of this component. Usually you don’t need to do this unless you know the slave is reset.

**Parameters** handle – Handle of an ESSL device.

**Returns**
- ESP_OK: Success
- ESP_ERR_NOT_SUPPORTED: This API is not supported in this mode
- ESP_ERR_INVALID_ARG: Invalid argument, handle is not init.

`esp_err_t essl_send_packet(essl_handle_t handle, const void *start, size_t length, uint32_t wait_ms)`
Send a packet to the ESSL Slave. The Slave receives the packet into buffers whose size is `buffer_size` (configured during initialization).

**Parameters**
- handle – Handle of an ESSL device.
- start – Start address of the packet to send
- length – Length of data to send, if the packet is over-size, the it will be divided into blocks and hold into different buffers automatically.
- wait_ms – Millisecond to wait before timeout, will not wait at all if set to 0-9.

**Returns**
- ESP_OK: Success
- ESP_ERR_INVALID_ARG: Invalid argument, handle is not init or other argument is not valid.
- ESP_ERR_INVALID_ARG: Invalid argument, handle is not init or other argument is not valid.
- ESP_ERR_TIMEOUT: No buffer to use, or error from SDMMC host controller.
- ESP_ERR_NOT_FOUND: Slave is not ready for receiving.
- ESP_ERR_NOT_SUPPORTED: This API is not supported in this mode
- One of the error codes from SDMMC/SPI host controller.

`esp_err_t essl_get_packet(essl_handle_t handle, void *out_data, size_t size, size_t *out_length, uint32_t wait_ms)`
Get a packet from ESSL slave.

**Parameters**
- handle – Handle of an ESSL device.
- out_data – [out] Data output address
- size – The size of the output buffer, if the buffer is smaller than the size of data to receive from slave, the driver returns ESP_ERR_NOT_FINISHED
- out_length – [out] Output of length the data actually received from slave.
- wait_ms – Millisecond to wait before timeout, will not wait at all if set to 0-9.

**Returns**
- ESP_OK: Success: All the data has been read from the slave.
- ESP_ERR_INVALID_ARG: Invalid argument, The handle is not initialized or the other arguments are invalid.
- ESP_ERR_NOT_FINISHED: Read was successful, but there is still data remaining.
- ESP_ERR_NOT_FOUND: Slave is not ready to send data.
- ESP_ERR_NOT_SUPPORTED: This API is not supported in this mode
- One of the error codes from SDMMC/SPI host controller.

`esp_err_t essl_write_reg(essl_handle_t handle, uint8_t addr, uint8_t value, uint8_t *value_o, uint32_t wait_ms)`
Write general purpose R/W registers (8-bit) of ESSL slave.

**Parameters**
- handle – Handle of an ESSL device.
- addr – Address of register to write. For SDIO, valid address: 0-59. For SPI, see `essl_spi.h`
- value – Value to write to the register.

---

Note: sdio 28-31 are reserved, the lower API helps to skip.
* value_o – Output of the returned written value.
* wait_ms – Millisecond to wait before timeout, will not wait at all if set to 0-9.

Returns
- ESP_OK Success
- One of the error codes from SDMMC/SPI host controller

```c
esp_err_t essl_read_reg(essl_handle_t handle, uint8_t add, uint8_t *value_o, uint32_t wait_ms)
```
Read general purpose R/W registers (8-bit) of ESSL slave.

Parameters
- handle – Handle of a essl device.
- add – Address of register to read. For SDIO, Valid address: 0-27, 32-63 (28-31 reserved, return interrupt bits on read). For SPI, see `essl_spi.h`
- value_o – Output value read from the register.
- wait_ms – Millisecond to wait before timeout, will not wait at all if set to 0-9.

Returns
- ESP_OK Success
- One of the error codes from SDMMC/SPI host controller

```c
esp_err_t essl_wait_int(essl_handle_t handle, uint32_t wait_ms)
```
wait for an interrupt of the slave

Parameters
- handle – Handle of an ESSL device.
- wait_ms – Millisecond to wait before timeout, will not wait at all if set to 0-9.

Returns
- ESP_OK: If interrupt is triggered.
- ESP_ERR_NOT_SUPPORTED: Current device does not support this function.
- ESP_ERR_TIMEOUT: No interrupts before timeout.

```c
esp_err_t essl_clear_intr(essl_handle_t handle, uint32_t intr_mask, uint32_t wait_ms)
```
Clear interrupt bits of ESSL slave. All the bits set in the mask will be cleared, while other bits will stay the same.

Parameters
- handle – Handle of an ESSL device.
- intr_mask – Mask of interrupt bits to clear.
- wait_ms – Millisecond to wait before timeout, will not wait at all if set to 0-9.

Returns
- ESP_OK: Success
- ESP_ERR_NOT_SUPPORTED: Current device does not support this function.
- One of the error codes from SDMMC host controller

```c
esp_err_t essl_get_intr(essl_handle_t handle, uint32_t *intr_raw, uint32_t *intr_st, uint32_t wait_ms)
```
Get interrupt bits of ESSL slave.

Parameters
- handle – Handle of an ESSL device.
- intr_raw – Output of the raw interrupt bits. Set to NULL if only masked bits are read.
- intr_st – Output of the masked interrupt bits. Set to NULL if only raw bits are read.
- wait_ms – Millisecond to wait before timeout, will not wait at all if set to 0-9.

Returns
- ESP_OK: Success
- ESP_INVALID_ARG: If both intr_raw and intr_st are NULL.
- ESP_ERR_NOT_SUPPORTED: Current device does not support this function.
- One of the error codes from SDMMC host controller

```c
esp_err_t essl_set_intr_ena(essl_handle_t handle, uint32_t ena_mask, uint32_t wait_ms)
```
Set interrupt enable bits of ESSL slave. The slave only sends interrupt on the line when there is a bit both the raw status and the enable are set.

Parameters
**Chapter 2. API Reference**

- **handle** – Handle of an ESSL device.
- **ena_mask** – Mask of the interrupt bits to enable.
- **wait_ms** – Millisecond to wait before timeout, will not wait at all if set to 0-9.

**Returns**
- ESP_OK: Success
- ESP_ERR_NOT_SUPPORTED: Current device does not support this function.
- One of the error codes from SDMMC host controller

```c
esp_err_t essl_get_intr_ena(essl_handle_t handle, uint32_t* ena_mask_o, uint32_t wait_ms)
```

Get interrupt enable bits of ESSL slave.

**Parameters**
- **handle** – Handle of an ESSL device.
- **ena_mask_o** – Output of interrupt bit enable mask.
- **wait_ms** – Millisecond to wait before timeout, will not wait at all if set to 0-9.

**Returns**
- ESP_OK Success
- One of the error codes from SDMMC host controller

```c
esp_err_t essl_send_slave_intr(essl_handle_t handle, uint32_t intr_mask, uint32_t wait_ms)
```

Send interrupts to slave. Each bit of the interrupt will be triggered.

**Parameters**
- **handle** – Handle of an ESSL device.
- **intr_mask** – Mask of interrupt bits to send to slave.
- **wait_ms** – Millisecond to wait before timeout, will not wait at all if set to 0-9.

**Returns**
- ESP_OK: Success
- ESP_ERR_NOT_SUPPORTED: Current device does not support this function.
- One of the error codes from SDMMC host controller

**Type Definitions**

```c
typedef struct essl_dev_t *essl_handle_t
```

Handle of an ESSL device.

**Header File**

- components/driver/test_apps/components/esp_serial_slave_link/include/esp_serial_slave_link/essl_sdio.h

**Functions**

```c
esp_err_t essl_sdio_init_dev(essl_handle_t *out_handle, const essl_sdio_config_t *config)
```

Initialize the ESSL SDIO device and get its handle.

**Parameters**
- **out_handle** – Output of the handle.
- **config** – Configuration for the ESSL SDIO device.

**Returns**
- ESP_OK: on success
- ESP_ERR_NO_MEM: memory exhausted.

```c
esp_err_t essl_sdio_deinit_dev(essl_handle_t handle)
```

Deinitialize and free the space used by the ESSL SDIO device.

**Parameters**
- **handle** – Handle of the ESSL SDIO device to deinit.

**Returns**
- ESP_OK: on success
- ESP_ERR_INVALID_ARG: wrong handle passed
Chapter 2. API Reference

Structures

struct essl_sdio_config_t

Configuration for the ESSL SDIO device.

Public Members

sdmmc_card_t *card

The initialized sdmmc card pointer of the slave.

int recv_buffer_size

The pre-negotiated recv buffer size used by both the host and the slave.

Header File

- components/driver/test_apps/components/esp_serial_slave_link/include/esp_serial_slave_link/essl_spi.h

Functions

esp_err_t essl_spi_init_dev (essl_handle_t *out_handle, const essl_spi_config_t *init_config)

Initialize the ESSL SPI device function list and get its handle.

Parameters

- out_handle - [out] Output of the handle
- init_config - Configuration for the ESSL SPI device

Returns

- ESP_OK: On success
- ESP_ERR_NO_MEM: Memory exhausted
- ESP_ERR_INVALID_STATE: SPI driver is not initialized
- ESP_ERR_INVALID_ARG: Wrong register ID

esp_err_t essl_spi_deinit_dev (essl_handle_t handle)

Deinitialize the ESSL SPI device and free the memory used by the device.

Parameters handle - Handle of the ESSL SPI device

Returns

- ESP_OK: On success
- ESP_ERR_INVALID_STATE: ESSL SPI is not in use

esp_err_t essl_spi_read_reg (void *arg, uint8_t addr, uint8_t *out_value, uint32_t wait_ms)

Read from the shared registers.

Note: The registers for Master/Slave synchronization are reserved. Do not use them. (see rx_sync_reg in essl_spi_config_t)
- ESP_ERR_INVALID_ARG: The address argument is not valid. See note 1.
- or other return value from :cpp:func:spl_device_transmit.

```
esp_err_t essl_spi_get_packet (void *arg, void *out_data, size_t size, uint32_t wait_ms)
```

Get a packet from Slave.

**Parameters**
- **arg** – Context of the component. (Member arg from essl_handle_t)
- **out_data** – [out] Output data address
- **size** – The size of the output data.
- **wait_ms** – Time to wait before timeout (reserved for future use, user should set this to 0).

**Returns**
- ESP_OK: On Success
- ESP_ERR_INVALID_STATE: ESSL SPI has not been initialized.
- ESP_ERR_INVALID_ARG: The output data address is neither DMA capable nor 4 byte-aligned
- ESP_ERR_INVALID_SIZE: Master requires size bytes of data but Slave did not load enough bytes.

```
esp_err_t essl_spi_write_reg (void *arg, uint8_t addr, uint8_t value, uint8_t *out_value, uint32_t wait_ms)
```

Write to the shared registers.

**Note:** The registers for Master/Slave synchronization are reserved. Do not use them. (see tx_sync_reg in essl_spi_config_t)

**Note:** Feature of checking the actual written value (out_value) is not supported.

```
Parameters
- **arg** – Context of the component. (Member arg from essl_handle_t)
- **addr** – Address of the shared registers. (Valid: 0 ~ SOC_SPI_MAXIMUM_BUFFER_SIZE, registers for M/S sync are reserved, see note1)
- **value** – Buffer for data to send, should be align to 4.
- **out_value** – [out] Not supported, should be set to NULL.
- **wait_ms** – Time to wait before timeout (reserved for future use, user should set this to 0).

Returns
- ESP_OK: success
- ESP_ERR_INVALID_STATE: ESSL SPI has not been initialized.
- ESP_ERR_INVALID_ARG: The address argument is not valid. See note 1.
- ESP_ERR_NOT_SUPPORTED: Should set out_value to NULL. See note 2.
- or other return value from :cpp:func:spl_device_transmit.
```

```
esp_err_t essl_spi_send_packet (void *arg, const void *data, size_t size, uint32_t wait_ms)
```

Send a packet to Slave.

**Parameters**
- **arg** – Context of the component. (Member arg from essl_handle_t)
- **data** – Address of the data to send
- **size** – Size of the data to send.
- **wait_ms** – Time to wait before timeout (reserved for future use, user should set this to 0).

**Returns**
- ESP_OK: On success
• ESP_ERR_INVALID_STATE: ESSL SPI has not been initialized.
• ESP_ERR_INVALID_ARG: The data address is not DMA capable
• ESP_ERR_INVALID_SIZE: Master will send size bytes of data but Slave did not load enough RX buffer

void essl_spi_reset_cnt (void *arg)
Reset the counter in Master context.

Note: Shall only be called if the slave has reset its counter. Else, Slave and Master would be desynchronized

Parameters arg – Context of the component. (Member arg from essl_handle_t)

esp_err_t essl_spi_rdbuf (spi_device_handle_t spi, uint8_t *out_data, int addr, int len, uint32_t flags)
Read the shared buffer from the slave in ISR way.

Note: The slave’s HW doesn’t guarantee the data in one SPI transaction is consistent. It sends data in unit of byte. In other words, if the slave SW attempts to update the shared register when a rdbuf SPI transaction is in-flight, the data got by the master will be the combination of bytes of different writes of slave SW.

Note: out_data should be prepared in words and in the DRAM. The buffer may be written in words by the DMA. When a byte is written, the remaining bytes in the same word will also be overwritten, even the len is shorter than a word.

Parameters
• spi – SPI device handle representing the slave
• out_data – [out] Buffer for read data, strongly suggested to be in the DRAM and aligned to 4
• addr – Address of the slave shared buffer
• len – Length to read
• flags – SPI_TRANS_ * flags to control the transaction mode of the transaction to send.

Returns
• ESP_OK: on success
• or other return value from :cpp:func:spi_device_transmit.

esp_err_t essl_spi_rdbuf_polling (spi_device_handle_t spi, uint8_t *out_data, int addr, int len, uint32_t flags)
Read the shared buffer from the slave in polling way.

Note: out_data should be prepared in words and in the DRAM. The buffer may be written in words by the DMA. When a byte is written, the remaining bytes in the same word will also be overwritten, even the len is shorter than a word.

Parameters
• spi – SPI device handle representing the slave
• out_data – [out] Buffer for read data, strongly suggested to be in the DRAM and aligned to 4
• addr – Address of the slave shared buffer
• len – Length to read
• flags – SPI_TRANS_ * flags to control the transaction mode of the transaction to send.

Returns
• ESP_OK: on success
• or other return value from :cpp:func:spi_device_transmit.
**Chapter 2. API Reference**

---

```c
esp_err_t essl_spi_wrbuf (spi_device_handle_t spi, const uint8_t *data, int addr, int len, uint32_t flags)
```

Write the shared buffer of the slave in ISR way.

**Note:** out_data should be prepared in words and in the DRAM. The buffer may be written in words by the DMA. When a byte is written, the remaining bytes in the same word will also be overwritten, even the len is shorter than a word.

**Parameters**

- **spi** – SPI device handle representing the slave
- **data** – Buffer for data to send, strongly suggested to be in the DRAM
- **addr** – Address of the slave shared buffer,
- **len** – Length to write
- **flags** – SPI_TRANS_* flags to control the transaction mode of the transaction to send.

**Returns**

- ESP_OK: success
- or other return value from :cpp:func:`spi_device_transmit`

---

```c
esp_err_t essl_spi_wrbuf_polling (spi_device_handle_t spi, const uint8_t *data, int addr, int len, uint32_t flags)
```

Write the shared buffer of the slave in polling way.

**Note:** out_data should be prepared in words and in the DRAM. The buffer may be written in words by the DMA. When a byte is written, the remaining bytes in the same word will also be overwritten, even the len is shorter than a word.

**Parameters**

- **spi** – SPI device handle representing the slave
- **data** – Buffer for data to send, strongly suggested to be in the DRAM
- **addr** – Address of the slave shared buffer,
- **len** – Length to write
- **flags** – SPI_TRANS_* flags to control the transaction mode of the transaction to send.

**Returns**

- ESP_OK: success
- or other return value from :cpp:func:`spi_device_polling_transmit`

---

```c
esp_err_t essl_spi_rddma (spi_device_handle_t spi, uint8_t *out_data, int len, int seg_len, uint32_t flags)
```

Receive long buffer in segments from the slave through its DMA.

**Note:** This function combines several :cpp:func:`essl_spi_rddma_seg` and one :cpp:func:`essl_spi_rddma_done` at the end. Used when the slave is working in segment mode.

**Parameters**

- **spi** – SPI device handle representing the slave
- **out_data** – [out] Buffer to hold the received data, strongly suggested to be in the DRAM and aligned to 4
- **len** – Total length of data to receive.
- **seg_len** – Length of each segment, which is not larger than the maximum transaction length allowed for the spi device. Suggested to be multiples of 4. When set < 0, means send all data in one segment (the rddma_done will still be sent.)
- **flags** – SPI_TRANS_* flags to control the transaction mode of the transaction to send.

**Returns**

- ESP_OK: success
- or other return value from :cpp:func:`spi_device_transmit`
**esp_err_t** **essl_spi_rddma_seg**( **spi_device_handle_t** **spi**, uint8_t** *out_data**, int seg_len, uint32_t flags)

Read one data segment from the slave through its DMA.

**Note:** To read long buffer, call :cpp:func:`essl_spi_rddma` instead.

**Parameters**
- **spi** – SPI device handle representing the slave
- **out_data** – [out] Buffer to hold the received data. strongly suggested to be in the DRAM and aligned to 4
- **seg_len** – Length of this segment
- **flags** – SPI_TRANS_\* flags to control the transaction mode of the transaction to send.

**Returns**
- ESP_OK: success
- or other return value from :cpp:func:`spi_device_transmit`.

**esp_err_t** **essl_spi_rddma_done**( **spi_device_handle_t** **spi**, uint32_t flags)

Send the rddma_done command to the slave. Upon receiving this command, the slave will stop sending the current buffer even there are data unsent, and maybe prepare the next buffer to send.

**Note:** This is required only when the slave is working in segment mode.

**Parameters**
- **spi** – SPI device handle representing the slave
- **flags** – SPI_TRANS_\* flags to control the transaction mode of the transaction to send.

**Returns**
- ESP_OK: success
- or other return value from :cpp:func:`spi_device_transmit`.

**esp_err_t** **essl_spi_wrdma**( **spi_device_handle_t** **spi**, const uint8_t** *data**, int len, int seg_len, uint32_t flags)

Send long buffer in segments to the slave through its DMA.

**Note:** This function combines several :cpp:func:`essl_spi_wrdma_seg` and one :cpp:func:`essl_spi_wrdma_done` at the end. Used when the slave is working in segment mode.

**Parameters**
- **spi** – SPI device handle representing the slave
- **data** – Buffer for data to send, strongly suggested to be in the DRAM
- **len** – Total length of data to send.
- **seg_len** – Length of each segment, which is not larger than the maximum transaction length allowed for the spi device. Suggested to be multiples of 4. When set < 0, means send all data in one segment (the wrdma_done will still be sent.)
- **flags** – SPI_TRANS_\* flags to control the transaction mode of the transaction to send.

**Returns**
- ESP_OK: success
- or other return value from :cpp:func:`spi_device_transmit`.

**esp_err_t** **essl_spi_wrdma_seg**( **spi_device_handle_t** **spi**, const uint8_t** *data**, int seg_len, uint32_t flags)

Send one data segment to the slave through its DMA.

**Note:** To send long buffer, call :cpp:func:`essl_spi_wrdma` instead.
Chapter 2. API Reference

Parameters
• spi – SPI device handle representing the slave
• data – Buffer for data to send, strongly suggested to be in the DRAM
• seg_len – Length of this segment
• flags – SPI_TRANS_* flags to control the transaction mode of the transaction to send.

Returns
• ESP_OK: success
• or other return value from :cpp:func:spi_device_transmit.

esp_err_t essl_spi_wrdma_done (spi_device_handle_t spi, uint32_t flags)
Send the wrdma_done command to the slave. Upon receiving this command, the slave will stop receiving, process the received data, and maybe prepare the next buffer to receive.

Note: This is required only when the slave is working in segment mode.

Parameters
• spi – SPI device handle representing the slave
• flags – SPI_TRANS_* flags to control the transaction mode of the transaction to send.

Returns
• ESP_OK: success
• or other return value from :cpp:func:spi_device_transmit.

Structures
struct essl_spi_config_t
Configuration of ESSL SPI device.

Public Members

spi_device_handle_t *spi
Pointer to SPI device handle.

uint32_t tx_buf_size
The pre-negotiated Master TX buffer size used by both the host and the slave.

uint8_t tx_sync_reg
The pre-negotiated register ID for Master-TX-SLAVE-RX synchronization. 1 word (4 Bytes) will be reserved for the synchronization.

uint8_t rx_sync_reg
The pre-negotiated register ID for Master-RX-Slave-TX synchronization. 1 word (4 Bytes) will be reserved for the synchronization.

2.2.8 ESP x509 Certificate Bundle
Overview

The ESP x509 Certificate Bundle API provides an easy way to include a bundle of custom x509 root certificates for TLS server verification.

Note: The bundle is currently not available when using WolfSSL.

The bundle comes with the complete list of root certificates from Mozilla’s NSS root certificate store. Using the gen_crt_bundle.py python utility, the certificates’ subject name and public key are stored in a file and embedded in the ESP32-S2 binary.

When generating the bundle you may choose between:

- The full root certificate bundle from Mozilla, containing more than 130 certificates. The current bundle was updated Tue Aug 22 03:12:04 2023 GMT.
- A pre-selected filter list of the name of the most commonly used root certificates, reducing the amount of certificates to around 41 while still having around 90% absolute usage coverage and 99% market share coverage according to SSL certificate authorities statistics.

In addition, it is possible to specify a path to a certificate file or a directory containing certificates which then will be added to the generated bundle.

Note: Trusting all root certificates means the list will have to be updated if any of the certificates are retracted. This includes removing them from cacrt_all.pem.

Configuration

Most configuration is done through menuconfig. CMake generates the bundle according to the configuration and embed it.

- CONFIG_MBEDTLS_CERTIFICATE_BUNDLE: automatically build and attach the bundle.
- CONFIG_MBEDTLS_DEFAULT_CERTIFICATE_BUNDLE: decide which certificates to include from the complete root certificate list.
- CONFIG_MBEDTLS_CUSTOM_CERTIFICATE_BUNDLE_PATH: specify the path of any additional certificates to embed in the bundle.

To enable the bundle when using ESP-TLS simply pass the function pointer to the bundle attach function:

```c
esp_tls_cfg_t cfg = {
    .crt_bundle_attach = esp_crt_bundle_attach,
};
```

This is done to avoid embedding the certificate bundle unless activated by the user.

If using mbedTLS directly then the bundle may be activated by directly calling the attach function during the setup process:

```c
mbedtls_ssl_config conf;
mbedtls_ssl_config_init(&conf);
esp_crt_bundle_attach(&conf);
```

Generating the List of Root Certificates

The list of root certificates comes from Mozilla’s NSS root certificate store, which can be found here

The list can be downloaded and created by running the script `mk-ca-bundle.pl` that is distributed as a part of curl.
Another alternative would be to download the finished list directly from the curl website: CA certificates extracted from Mozilla.

The common certificates bundle were made by selecting the authorities with a market share of more than 1% from w3tech’s SSL Survey.

These authorities were then used to pick the names of the certificates for the filter list, cmn_crtAuthorities.csv, from this list provided by Mozilla.

### Updating the Certificate Bundle

The bundle is embedded into the app and can be updated along with the app by an OTA update. If you want to include a more up-to-date bundle than the bundle currently included in ESP-IDF, then the certificate list can be downloaded from Mozilla as described in Generating the List of Root Certificates.

### Periodic Sync

The bundle is kept updated by periodic sync with the Mozilla’s NSS root certificate store. The deprecated certs from the upstream bundle are added to deprecated list (for compatibility reasons) in ESP-IDF minor or patch release. If required, the deprecated certs can be added to the default bundle by enabling CONFIGMBEDTLS_CERTIFICATE_BUNDLE_DEPRECATED_LIST. The deprecated certs shall be removed (reset) on the next major ESP-IDF release.

### Application Examples

Simple HTTPS example that uses ESP-TLS to establish a secure socket connection using the certificate bundle with two custom certificates added for verification: protocols/https_x509_bundle.

HTTPS example that uses ESP-TLS and the default bundle: protocols/https_request.

HTTPS example that uses mbedTLS and the default bundle: protocols/https_mbedtls.

### API Reference

#### Header File

- components/mbedtls/esp_crt_bundle/include/esp_crt_bundle.h

This header file can be included with:

```
#include "esp_crt_bundle.h"
```

- This header file is a part of the API provided by the mbedtls component. To declare that your component depends on mbedtls, add the following to your CMakeLists.txt:

```
REQUIRES mbedtls
```

or

```
PRIV_REQUIRES mbedtls
```

#### Functions

**esp_err_t esp_crt_bundle_attach (void *conf)**

Attach and enable use of a bundle for certificate verification.

Attach and enable use of a bundle for certificate verification through a verification callback. If no specific bundle has been set through esp_crt_bundle_set() it will default to the bundle defined in menuconfig and embedded in the binary.

**Parameters**

- `conf` - [in] The config struct for the SSL connection.
Returns
• ESP_OK if adding certificates was successful.
• Other if an error occurred or an action must be taken by the calling process.

void esp_crt_bundle_detach (mbedtls_ssl_config *conf)

Disable and dealloc the certification bundle.

Removes the certificate verification callback and deallocates used resources

Parameters
conf [in] The config struct for the SSL connection.

esp_err_t esp_crt_bundle_set (const uint8_t *x509_bundle, size_t bundle_size)

Set the default certificate bundle used for verification.

Overrides the default certificate bundle only in case of successful initialization. In most use cases the bundle should be set through menuconfig. The bundle needs to be sorted by subject name since binary search is used to find certificates.

Parameters
• x509_bundle [in] A pointer to the certificate bundle.
• bundle_size [in] Size of the certificate bundle in bytes.

Returns
• ESP_OK if adding certificates was successful.
• Other if an error occurred or an action must be taken by the calling process.

2.2.9 HTTP Server

Overview

The HTTP Server component provides an ability for running a lightweight web server on ESP32-S2. Following are detailed steps to use the API exposed by HTTP Server:

• httpd_start (): Creates an instance of HTTP server, allocate memory/resources for it depending upon the specified configuration and outputs a handle to the server instance. The server has both, a listening socket (TCP) for HTTP traffic, and a control socket (UDP) for control signals, which are selected in a round robin fashion in the server task loop. The task priority and stack size are configurable during server instance creation by passing httpd_config_t structure to httpd_start (). TCP traffic is parsed as HTTP requests and, depending on the requested URI, user registered handlers are invoked which are supposed to send back HTTP response packets.

• httpd_stop (): This stops the server with the provided handle and frees up any associated memory/resources. This is a blocking function that first signals a halt to the server task and then waits for the task to terminate. While stopping, the task closes all open connections, removes registered URI handlers and resets all session context data to empty.

• httpd_register_uri_handler (): A URI handler is registered by passing object of type httpd_uri_t structure which has members including uri name, method type (eg. HTTPD_GET / HTTPD_POST / HTTPD_PUT etc.), function pointer of type esp_err_t *handler (httpd_req_t *req) and user_ctx pointer to user context data.

Application Example

```c
/* Our URI handler function to be called during GET /uri request */
esp_err_t get_handler (httpd_req_t *req)
{
    /* Send a simple response */
    const char resp[] = "URI GET Response";
    httpd_resp_send (req, resp, HTTPD_RESP_USE_STRLEN);
    return ESP_OK;
}
```

(continues on next page)
Chapter 2. API Reference

*/ Our URI handler function to be called during POST /uri request */
esp_err_t post_handler(httpd_req_t *req)
{
    /* Destination buffer for content of HTTP POST request.
     * httpd_req_recv() accepts char* only, but content could
     * as well be any binary data (needs type casting).
     * In case of string data, null termination will be absent, and
     * content length would give length of string */
    char content[100];

    /* Truncate if content length larger than the buffer */
    size_t recv_size = MIN(req->content_len, sizeof(content));

    int ret = httpd_req_recv(req, content, recv_size);
    if (ret <= 0) { /* 0 return value indicates connection closed */
        /* Check if timeout occurred */
        if (ret == HTTPD_SOCK_ERR_TIMEOUT) {
            /* In case of timeout one can choose to retry calling
             * httpd_req_recv(), but to keep it simple, here we
             * respond with an HTTP 408 (Request Timeout) error */
            httpd_resp_send_408(req);
        }
        /* In case of error, returning ESP_FAIL will
         * ensure that the underlying socket is closed */
        return ESP_FAIL;
    }

    /* Send a simple response */
    const char resp[] = "URI POST Response";
    httpd_resp_send(req, resp, HTTPD_RESP_USE_STRLEN);
    return ESP_OK;
}

/* URI handler structure for GET /uri */
httpd_uri_t uri_get = {
    .uri = "/uri",
    .method = HTTP_GET,
    .handler = get_handler,
    .user_ctx = NULL
};

/* URI handler structure for POST /uri */
httpd_uri_t uri_post = {
    .uri = "/uri",
    .method = HTTP_POST,
    .handler = post_handler,
    .user_ctx = NULL
};

/* Function for starting the webserver */
httpd_handle_t start_webserver(void)
{
    /* Generate default configuration */
    httpd_config_t config = HTTPD_DEFAULT_CONFIG();

    /* Empty handle to esp_http_server */
    httpd_handle_t server = NULL;

    /* Start the httpd server */
}
if (httpd_start(&server, &config) == ESP_OK) {
    /* Register URI handlers */
    httpd_register_uri_handler(server, &uri_get);
    httpd_register_uri_handler(server, &uri_post);
}
/* If server failed to start, handle will be NULL */
return server;

/* Function for stopping the webserver */
void stop_webserver(httpd_handle_t server) {
    if (server) {
        /* Stop the httpd server */
        httpd_stop(server);
    }
}

Simple HTTP Server Example  Check HTTP server example under protocols/http_server/simple where handling of arbitrary content lengths, reading request headers and URL query parameters, and setting response headers is demonstrated.

Persistent Connections

HTTP server features persistent connections, allowing for the re-use of the same connection (session) for several transfers, all the while maintaining context specific data for the session. Context data may be allocated dynamically by the handler in which case a custom function may need to be specified for freeing this data when the connection/session is closed.

Persistent Connections Example

/* Custom function to free context */
void free_ctx_func(void *ctx) {
    /* Could be something other than free */
    free(ctx);}

esp_err_t adder_post_handler(httpd_req_t *req) {
    /* Create session's context if not already available */
    if (! req->sess_ctx) {
        req->sess_ctx = malloc(sizeof(ANY_DATA_TYPE)); /* Pointer to context data */
        req->free_ctx = free_ctx_func; /* Function to free context data */
    }
    /* Access context data */
    ANY_DATA_TYPE *ctx_data = (ANY_DATA_TYPE *)req->sess_ctx;
    /* Respond */
    ............
    ............
    ............

    return ESP_OK;
}
Chapter 2. API Reference

Check the example under protocols/http_server/persistent_sockets.

Websocket Server

The HTTP server component provides websocket support. The websocket feature can be enabled in menuconfig using the `CONFIG_HTTPD_WS_SUPPORT` option. Please refer to the protocols/http_server/ws_echo_server example which demonstrates usage of the websocket feature.

Event Handling

ESP HTTP server has various events for which a handler can be triggered by the Event Loop library when the particular event occurs. The handler has to be registered using `esp_event_handler_register()`. This helps in event handling for ESP HTTP server.

`esp_http_server_event_id_t` has all the events which can happen for ESP HTTP server.

Expected data type for different ESP HTTP server events in event loop:

- `HTTP_SERVER_EVENT_ERROR`: `httpd_err_code_t`
- `HTTP_SERVER_EVENT_START`: `NULL`
- `HTTP_SERVER_EVENT_ON_CONNECTED`: `int`
- `HTTP_SERVER_EVENT_ON_HEADER`: `int`
- `HTTP_SERVER_EVENT_HEADERS_SENT`: `int`
- `HTTP_SERVER_EVENT_ON_DATA`: `esp_http_server_event_data`
- `HTTP_SERVER_EVENT_SENT_DATA`: `esp_http_server_event_data`
- `HTTP_SERVER_EVENT_DISCONNECTED`: `int`
- `HTTP_SERVER_EVENT_STOP`: `NULL`

API Reference

Header File

- `components/esp_http_server/include/esp_http_server.h`
- This header file can be included with:

  ```c
  #include "esp_http_server.h"
  ```

  - This header file is a part of the API provided by the `esp_http_server` component. To declare that your component depends on `esp_http_server`, add the following to your CMakeLists.txt:

    ```
    REQUIRES esp_http_server
    ```

    or

    ```
    PRIV_REQUIRES esp_http_server
    ```

Functions

- `esp_err_t httpd_register_uri_handler (httpd_handle_t handle, const httpd_uri_t *uri_handler)`

  Registers a URI handler.

  Example usage:

  ```c
  esp_err_t my_uri_handler (httpd_req_t *req)
  {
    // Recv, Process and Send
    .
    .
  }  
  ```
  
  (continues on next page)
// Fail condition
if (....) {
  // Return fail to close session
  return ESP_FAIL;
}

// On success
return ESP_OK;

// URI handler structure
httpd_uri_t my_uri {
  .uri = "/my_uri/path/xyz",
  .method = HTTPD_GET,
  .handler = my_uri_handler,
  .user_ctx = NULL
};

// Register handler
if (httpd_register_uri_handler(server_handle, &my_uri) != ESP_OK) {
  // If failed to register handler
  ....
}

Note: URI handlers can be registered in real time as long as the server handle is valid.

Parameters
- handle -[in] handle to HTTPD server instance
- uri_handler -[in] pointer to handler that needs to be registered

Returns
- ESP_OK: On successfully registering the handler
- ESP_ERR_INVALID_ARG: Null arguments
- ESP_ERR_HTTPD_HANDLERS_FULL: If no slots left for new handler
- ESP_ERR_HTTPD_HANDLER_EXISTS: If handler with same URI and method is already registered

esp_err_t httpd_unregister_uri_handler (httpd_handle_t handle, const char *uri, httpd_method_t method)
Unregister a URI handler.

Parameters
- handle -[in] handle to HTTPD server instance
- uri -[in] URI string
- method -[in] HTTP method

Returns
- ESP_OK: On successfully deregistering the handler
- ESP_ERR_INVALID_ARG: Null arguments
- ESP_ERR_NOT_FOUND: Handler with specified URI and method not found

esp_err_t httpd_unregister_uri (httpd_handle_t handle, const char *uri)
Unregister all URI handlers with the specified uri string.

Parameters
- handle -[in] handle to HTTPD server instance
- uri -[in] uri string specifying all handlers that need to be deregistered

Returns
• ESP_OK : On successfully deregistering all such handlers  
• ESP_ERR_INVALID_ARG : Null arguments  
• ESP_ERR_NOT_FOUND : No handler registered with specified uri string

\texttt{esp_err_t httpd_sess_set_recv_override (httpd\_handle\_t hd, int sockfd, httpd\_recv\_func\_t recv\_func)}

Override web server’s receive function (by session FD)

This function overrides the web server’s receive function. This same function is used to read HTTP request packets.

\textbf{Note:} This API is supposed to be called either from the context of

• an http session APIs where sockfd is a valid parameter  
• a URI handler where sockfd is obtained using httpd\_req\_to\_sockfd()

\textbf{Parameters}

• \textbf{hd} – [in] HTTPD instance handle  
• \textbf{sockfd} – [in] Session socket FD  
• \textbf{recv\_func} – [in] The receive function to be set for this session

\textbf{Returns}

• ESP_OK : On successfully registering override  
• ESP_ERR_INVALID_ARG : Null arguments

\texttt{esp_err_t httpd_sess_set_send_override (httpd\_handle\_t hd, int sockfd, httpd\_send\_func\_t send\_func)}

Override web server’s send function (by session FD)

This function overrides the web server’s send function. This same function is used to send out any response to any HTTP request.

\textbf{Note:} This API is supposed to be called either from the context of

• an http session APIs where sockfd is a valid parameter  
• a URI handler where sockfd is obtained using httpd\_req\_to\_sockfd()

\textbf{Parameters}

• \textbf{hd} – [in] HTTPD instance handle  
• \textbf{sockfd} – [in] Session socket FD  
• \textbf{send\_func} – [in] The send function to be set for this session

\textbf{Returns}

• ESP_OK : On successfully registering override  
• ESP_ERR_INVALID_ARG : Null arguments

\texttt{esp_err_t httpd_sess_set_pending_override (httpd\_handle\_t hd, int sockfd, httpd\_pending\_func\_t pending\_func)}

Override web server’s pending function (by session FD)

This function overrides the web server’s pending function. This function is used to test for pending bytes in a socket.

\textbf{Note:} This API is supposed to be called either from the context of

• an http session APIs where sockfd is a valid parameter  
• a URI handler where sockfd is obtained using httpd\_req\_to\_sockfd()

\textbf{Parameters}

• \textbf{hd} – [in] HTTPD instance handle
Chapter 2. API Reference

- **sockfd** - [in] Session socket FD
- **pending_func** - [in] The receive function to be set for this session

**Returns**
- ESP_OK : On successfully registering override
- ESP_ERR_INVALID_ARG : Null arguments

`esp_err_t httpd_req_async_handler_begin(httpd_req_t *r, httpd_req_t **out)`

Start an asynchronous request. This function can be called in a request handler to get a request copy that can be used on a async thread.

**Note:**
- This function is necessary in order to handle multiple requests simultaneously. See examples/async_requests for example usage.
- You must call `httpd_req_async_handler_complete()` when you are done with the request.

**Parameters**
- `r` - [in] The request to create an async copy of
- `out` - [out] A newly allocated request which can be used on an async thread

**Returns**
- ESP_OK : async request object created

`esp_err_t httpd_req_async_handler_complete(httpd_req_t *r)`

Mark an asynchronous request as completed. This will:

- free the request memory
- relinquish ownership of the underlying socket, so it can be reused.
- allow the http server to close our socket if needed (lru_purge_enable)

**Note:** If async requests are not marked completed, eventually the server will no longer accept incoming connections. The server will log a “httpd_accept_conn: error in accept (23)” message if this happens.

**Parameters**
- `r` - [in] The request to mark async work as completed

**Returns**
- ESP_OK : async request was marked completed

`int httpd_req_to_sockfd(httpd_req_t *r)`

Get the Socket Descriptor from the HTTP request.

This API will return the socket descriptor of the session for which URI handler was executed on reception of HTTP request. This is useful when user wants to call functions that require session socket fd, from within a URI handler, ie. : `httpd_sess_get_ctx()`, `httpd_sess_trigger_close()`, `httpd_sess_update_lru_counter()`.

**Note:** This API is supposed to be called only from the context of a URI handler where `httpd_req_t` request pointer is valid.

**Parameters**
- `r` - [in] The request whose socket descriptor should be found

**Returns**
- Socket descriptor : The socket descriptor for this request
- -1 : Invalid/NULL request pointer
Chapter 2. API Reference

int httpd_req_recv (httpd_req_t *r, char *buf, size_t buf_len)

API to read content data from the HTTP request.

This API will read HTTP content data from the HTTP request into provided buffer. Use content_len provided in httpd_req_t structure to know the length of data to be fetched. If content_len is too large for the buffer then user may have to make multiple calls to this function, each time fetching 'buf_len' number of bytes, while the pointer to content data is incremented internally by the same number.

Note:

• This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.
• If an error is returned, the URI handler must further return an error. This will ensure that the erroneous socket is closed and cleaned up by the web server.
• Presently Chunked Encoding is not supported

Parameters

• r [in] The request being responded to
• buf [in] Pointer to a buffer that the data will be read into
• buf_len [in] Length of the buffer

Returns

• Bytes : Number of bytes read into the buffer successfully
• 0 : Buffer length parameter is zero / connection closed by peer
• HTTPD_SOCK_ERR_INVALID : Invalid arguments
• HTTPD_SOCK_ERR_TIMEOUT : Timeout/interrupted while calling socket recv()
• HTTPD_SOCK_ERR_FAIL : Unrecoverable error while calling socket recv()

size_t httpd_req_get_hdr_value_len (httpd_req_t *r, const char *field)

Search for a field in request headers and return the string length of it’s value.

Note:

• This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.
• Once httpd_resp_send() API is called all request headers are purged, so request headers need be copied into separate buffers if they are required later.

Parameters

• r [in] The request being responded to
• field [in] The header field to be searched in the request

Returns

• Length : If field is found in the request URL
• Zero : Field not found / Invalid request / Null arguments

esp_err_t httpd_req_get_hdr_value_str (httpd_req_t *r, const char *field, char *val, size_t val_size)

Get the value string of a field from the request headers.

Note:

• This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.
• Once httpd_resp_send() API is called all request headers are purged, so request headers need be copied into separate buffers if they are required later.
• If output size is greater than input, then the value is truncated, accompanied by truncation error as return value.
• Use httpd_req_get_hdr_value_len() to know the right buffer length
Parameters
- `r` - [in] The request being responded to
- `field` - [in] The field to be searched in the header
- `val` - [out] Pointer to the buffer into which the value will be copied if the field is found
- `val_size` - [in] Size of the user buffer “val”

Returns
- ESP_OK : Field found in the request header and value string copied
- ESP_ERR_NOT_FOUND : Key not found
- ESP_ERR_INVALID_ARG : Null arguments
- ESP_ERR_HTTPD_INVALID_REQ : Invalid HTTP request pointer
- ESP_ERR_HTTPD_RESULT_TRUNC : Value string truncated

`size_t httpd_req_get_url_query_len(httpd_req_t *r)`
Get Query string length from the request URL.

Note: This API is supposed to be called only from the context of a URI handler where `httpd_req_t*` request pointer is valid.

Parameters `r` - [in] The request being responded to

Returns
- Length : Query is found in the request URL
- Zero : Query not found / Null arguments / Invalid request

`esp_err_t httpd_req_get_url_query_str(httpd_req_t *r, char* buf, size_t buf_len)`
Get Query string from the request URL.

Note:
- Presently, the user can fetch the full URL query string, but decoding will have to be performed by the user. Request headers can be read using `httpd_req_get_hdr_value_str()` to know the ‘Content-Type’ (eg. Content-Type: application/x-www-form-urlencoded) and then the appropriate decoding algorithm needs to be applied.
- This API is supposed to be called only from the context of a URI handler where `httpd_req_t*` request pointer is valid
- If output size is greater than input, then the value is truncated, accompanied by truncation error as return value
- Prior to calling this function, one can use `httpd_req_get_url_query_len()` to know the query string length beforehand and hence allocate the buffer of right size (usually query string length + 1 for null termination) for storing the query string

Parameters
- `r` - [in] The request being responded to
- `buf` - [out] Pointer to the buffer into which the query string will be copied (if found)
- `buf_len` - [in] Length of output buffer

Returns
- ESP_OK : Query is found in the request URL and copied to buffer
- ESP_ERR_NOT_FOUND : Query not found
- ESP_ERR_INVALID_ARG : Null arguments
- ESP_ERR_HTTPD_INVALID_REQ : Invalid HTTP request pointer
- ESP_ERR_HTTPD_RESULT_TRUNC : Query string truncated
### esp_err_t `httpd_query_key_value` (const char *qry, const char *key, char *val, size_t val_size)

Helper function to get a URL query tag from a query string of the type param1=val1&param2=val2.

**Note:**
- The components of URL query string (keys and values) are not URL decoded. The user must check for ‘Content-Type’ field in the request headers and then depending upon the specified encoding (URL encoded or otherwise) apply the appropriate decoding algorithm.
- If actual value size is greater than val_size, then the value is truncated, accompanied by truncation error as return value.

**Parameters**
- `qry` – [in] Pointer to query string
- `key` – [in] The key to be searched in the query string
- `val` – [out] Pointer to the buffer into which the value will be copied if the key is found
- `val_size` – [in] Size of the user buffer “val”

**Returns**
- ESP_OK: Key is found in the URL query string and copied to buffer
- ESP_ERR_NOT_FOUND: Key not found
- ESP_ERR_INVALID_ARG: Null arguments
- ESP_ERR_HTTPD_RESULT_TRUNC: Value string truncated

### esp_err_t `httpd_req_get_cookie_val` (httpd_req_t *req, const char*cookie_name, char*val, size_t *val_size)

Get the value string of a cookie value from the “Cookie” request headers by cookie name.

**Parameters**
- `req` – [in] Pointer to the HTTP request
- `cookie_name` – [in] The cookie name to be searched in the request
- `val` – [out] Pointer to the buffer into which the value of cookie will be copied if the cookie is found
- `val_size` – [inout] Pointer to size of the user buffer “val”. This variable will contain cookie length if ESP_OK is returned and required buffer length increase ESP_ERR_HTTPD_RESULT_TRUNC is returned.

**Returns**
- ESP_OK: Key is found in the cookie string and copied to buffer
- ESP_ERR_NOT_FOUND: Key not found
- ESP_ERR_INVALID_ARG: Null arguments
- ESP_ERR_HTTPD_RESULT_TRUNC: Value string truncated
- ESP_ERR_NO_MEM: Memory allocation failure

### bool `httpd_uri_match_wildcard` (const char *uri_template, const char *uri_to_match, size_t match_upto)

Test if a URI matches the given wildcard template.

Template may end with “?” to make the previous character optional (typically a slash), “*” for a wildcard match, and “?*” to make the previous character optional, and if present, allow anything to follow.

**Example:**
- * matches everything
- /foo/* matches /foo and /foo/ and /foo/bar, but not /foo/ or /foo/bar
- /foo/* or /foo/ matches /foo/, /foo/bar, and also /foo, but not /foo/bar or /foo

The special characters “?”, “*” anywhere else in the template will be taken literally.

**Parameters**
- `uri_template` – [in] URI template (pattern)
- `uri_to_match` – [in] URI to be matched
Chapter 2. API Reference

• **match_upto**  [in] how many characters of the URI buffer to test (there may be trailing query string etc.)

Returns true if a match was found

```c
esp_err_t httpd_resp_send (httpd_req_t *r, const char *buf, ssize_t buf_len)
```

API to send a complete HTTP response.

This API will send the data as an HTTP response to the request. This assumes that you have the entire response ready in a single buffer. If you wish to send response in incremental chunks use `httpd_resp_send_chunk()` instead.

If no status code and content-type were set, by default this will send 200 OK status code and content type as text/html. You may call the following functions before this API to configure the response headers:

- `httpd_resp_set_status()` - for setting the HTTP status string,
- `httpd_resp_set_type()` - for setting the Content Type,
- `httpd_resp_set_hdr()` - for appending any additional field value entries in the response header

**Note:**

• This API is supposed to be called only from the context of a URI handler where `httpd_req_t`* request pointer is valid.
• Once this API is called, the request has been responded to.
• No additional data can then be sent for the request.
• Once this API is called, all request headers are purged, so request headers need be copied into separate buffers if they are required later.

**Parameters**

- `r`  [in] The request being responded to
- `buf`  [in] Buffer from where the content is to be fetched
- `buf_len`  [in] Length of the buffer, `HTTPD_RESP_USE_STRLEN` to use `strlen()`

**Returns**

- ESP_OK : On successfully sending the response packet
- ESP_ERR_INVALID_ARG : Null request pointer
- ESP_ERR_HTTPD_RESP_HDR : Essential headers are too large for internal buffer
- ESP_ERR_HTTPD_RESP_SEND : Error in raw send
- ESP_ERR_HTTPD_INVALID_REQ : Invalid request

```c
esp_err_t httpd_resp_send_chunk (httpd_req_t *r, const char *buf, ssize_t buf_len)
```

API to send one HTTP chunk.

This API will send the data as an HTTP response to the request. This API will use chunked-encoding and send the response in the form of chunks. If you have the entire response contained in a single buffer, please use `httpd_resp_send()` instead.

If no status code and content-type were set, by default this will send 200 OK status code and content type as text/html. You may call the following functions before this API to configure the response headers:

- `httpd_resp_set_status()` - for setting the HTTP status string,
- `httpd_resp_set_type()` - for setting the Content Type,
- `httpd_resp_set_hdr()` - for appending any additional field value entries in the response header

**Note:**

• This API is supposed to be called only from the context of a URI handler where `httpd_req_t`* request pointer is valid.
• When you are finished sending all your chunks, you must call this function with `buf_len` as 0.
• Once this API is called, all request headers are purged, so request headers need be copied into separate buffers if they are required later.

**Parameters**

- `r`  [in] The request being responded to
• **buf** -[in] Pointer to a buffer that stores the data
• **buf_len** -[in] Length of the buffer, HTTPD_RESP_USE_STRLEN to use strlen()

**Returns**
• ESP_OK : On successfully sending the response packet chunk
• ESP_ERR_INVALID_ARG : Null request pointer
• ESP_ERR_HTTPD_RESP_HDR : Essential headers are too large for internal buffer
• ESP_ERR_HTTPD_RESP_SEND : Error in raw send
• ESP_ERR_HTTPD_INVALID_REQ : Invalid request pointer

static inline esp_err_t httpd_resp_sendstr (httpd_req_t *r, const char *str)

API to send a complete string as HTTP response.

This API simply calls http_resp_send with buffer length set to string length assuming the buffer contains a null terminated string

**Parameters**
• **r** -[in] The request being responded to
• **str** -[in] String to be sent as response body

**Returns**
• ESP_OK : On successfully sending the response packet
• ESP_ERR_INVALID_ARG : Null request pointer
• ESP_ERR_HTTPD_RESP_HDR : Essential headers are too large for internal buffer
• ESP_ERR_HTTPD_RESP_SEND : Error in raw send
• ESP_ERR_HTTPD_INVALID_REQ : Invalid request

static inline esp_err_t httpd_resp_sendstr_chunk (httpd_req_t *r, const char *str)

API to send a string as an HTTP response chunk.

This API simply calls http_resp_send_chunk with buffer length set to string length assuming the buffer contains a null terminated string

**Parameters**
• **r** -[in] The request being responded to
• **str** -[in] String to be sent as response body (NULL to finish response packet)

**Returns**
• ESP_OK : On successfully sending the response packet
• ESP_ERR_INVALID_ARG : Null request pointer
• ESP_ERR_HTTPD_RESP_HDR : Essential headers are too large for internal buffer
• ESP_ERR_HTTPD_RESP_SEND : Error in raw send
• ESP_ERR_HTTPD_INVALID_REQ : Invalid request

**esp_err_t httpd_resp_set_status (httpd_req_t *r, const char *status)**

API to set the HTTP status code.

This API sets the status of the HTTP response to the value specified. By default, the ‘200 OK’ response is sent as the response.

**Note:**
• This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.
• This API only sets the status to this value. The status isn’t sent out until any of the send APIs is executed.
• Make sure that the lifetime of the status string is valid till send function is called.

**Parameters**
• **r** -[in] The request being responded to
• **status** -[in] The HTTP status code of this response

**Returns**
• ESP_OK : On success
• ESP_ERR_INVALID_ARG : Null arguments
Chapter 2. API Reference

- ESP_ERR_HTTPD_INVALID_REQ: Invalid request pointer

```c
esp_err_t httpd_resp_set_type(httpd_req_t *r, const char *type)
```

API to set the HTTP content type.

This API sets the ‘Content Type’ field of the response. The default content type is ‘text/html’.

**Note:**
- This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.
- This API only sets the content type to this value. The type isn’t sent out until any of the send APIs is executed.
- Make sure that the lifetime of the type string is valid till send function is called.

**Parameters**
- `r` - [in] The request being responded to
- `type` - [in] The Content Type of the response

**Returns**
- `ESP_OK`: On success
- `ESP_ERR_INVALID_ARG`: Null arguments
- `ESP_ERR_HTTPD_INVALID_REQ`: Invalid request pointer

```c
esp_err_t httpd_resp_set_hdr(httpd_req_t *r, const char *field, const char *value)
```

API to append any additional headers.

This API sets any additional header fields that need to be sent in the response.

**Note:**
- This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.
- The header isn’t sent out until any of the send APIs is executed.
- The maximum allowed number of additional headers is limited to value of max_resp_headers in config structure.
- Make sure that the lifetime of the field value strings are valid till send function is called.

**Parameters**
- `r` - [in] The request being responded to
- `field` - [in] The field name of the HTTP header
- `value` - [in] The value of this HTTP header

**Returns**
- `ESP_OK`: On successfully appending new header
- `ESP_ERR_INVALID_ARG`: Null arguments
- `ESP_ERR_HTTPD_RESP_HDR`: Total additional headers exceed max allowed
- `ESP_ERR_HTTPD_INVALID_REQ`: Invalid request pointer

```c
esp_err_t httpd_resp_send_err(httpd_req_t *req, httpd_err_code_t error, const char *msg)
```

For sending out error code in response to HTTP request.

**Note:**
- This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.
- Once this API is called, all request headers are purged, so request headers need be copied into separate buffers if they are required later.
• If you wish to send additional data in the body of the response, please use the lower-level functions directly.

Parameters
  • `req` - [in] Pointer to the HTTP request for which the response needs to be sent
  • `error` - [in] Error type to send
  • `msg` - [in] Error message string (pass NULL for default message)

Returns
  • ESP_OK: On successfully sending the response packet
  • ESP_ERR_INVALID_ARG: Null arguments
  • ESP_ERR_HTTPD_RESP_SEND: Error in raw send
  • ESP_ERR_HTTPD_INVALID_REQ: Invalid request pointer

static inline `esp_err_t httpd_resp_send_404 (httpd_req_t *r)`

Helper function for HTTP 404.
Send HTTP 404 message. If you wish to send additional data in the body of the response, please use the lower-level functions directly.

Note:
  • This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.
  • Once this API is called, all request headers are purged, so request headers need be copied into separate buffers if they are required later.

Parameters `r` - [in] The request being responded to

Returns
  • ESP_OK: On successfully sending the response packet
  • ESP_ERR_INVALID_ARG: Null arguments
  • ESP_ERR_HTTPD_RESP_SEND: Error in raw send
  • ESP_ERR_HTTPD_INVALID_REQ: Invalid request pointer

static inline `esp_err_t httpd_resp_send_408 (httpd_req_t *r)`

Helper function for HTTP 408.
Send HTTP 408 message. If you wish to send additional data in the body of the response, please use the lower-level functions directly.

Note:
  • This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.
  • Once this API is called, all request headers are purged, so request headers need be copied into separate buffers if they are required later.
static inline esp_err_t httpd_resp_send_500 (httpd_req_t *r)

Helper function for HTTP 500.

Send HTTP 500 message. If you wish to send additional data in the body of the response, please use the lower-level functions directly.

Note:

• This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.
• Once this API is called, all request headers are purged, so request headers need be copied into separate buffers if they are required later.

Parameters  

r - [in] The request being responded to

Returns

• ESP_OK : On successfully sending the response packet
• ESP_ERR_INVALID_ARG : Null arguments
• ESP_ERR_HTTPD_RESP_SEND : Error in raw send
• ESP_ERR_HTTPD_INVALID_REQ : Invalid request pointer

int httpd_send (httpd_req_t *r, const char*buf, size_t buf_len)

Raw HTTP send.

Call this API if you wish to construct your custom response packet. When using this, all essential header, eg. HTTP version, Status Code, Content Type and Length, Encoding, etc. will have to be constructed manually, and HTTP delimeters (CRLF) will need to be placed correctly for separating sub-sections of the HTTP response packet.

If the send override function is set, this API will end up calling that function eventually to send data out.

Note:

• This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.
• Unless the response has the correct HTTP structure (which the user must now ensure) it is not guaranteed that it will be recognized by the client. For most cases, you wouldn’t have to call this API, but you would rather use either of : httpd_resp_send(), httpd_resp_send_chunk()

Parameters  

r - [in] The request being responded to

buf - [in] Buffer from where the fully constructed packet is to be read

buf_len - [in] Length of the buffer

Returns

• Bytes : Number of bytes that were sent successfully
• HTTPD_SOCK_ERR_INVALID : Invalid arguments
• HTTPD_SOCK_ERR_TIMEOUT : Timeout/interrupted while calling socket send()
• HTTPD_SOCK_ERR_FAIL : Unrecoverable error while calling socket send()

int httpd_socket_send (httpd_handle_t hd, int sockfd, const char *buf, size_t buf_len, int flags)

A low level API to send data on a given socket.

This internally calls the default send function, or the function registered by httpd_sess_set_send_override().

Note: This API is not recommended to be used in any request handler. Use this only for advanced use cases, wherein some asynchronous data is to be sent over a socket.
### Chapter 2. API Reference

#### Parameters
- **hd** - [in] server instance
- **sockfd** - [in] session socket file descriptor
- **buf** - [in] buffer with bytes to send
- **buf_len** - [in] data size
- **flags** - [in] flags for the send() function

#### Returns
- Bytes: The number of bytes sent successfully
- HTTPD_SOCK_ERR_INVALID: Invalid arguments
- HTTPD_SOCK_ERR_TIMEOUT: Timeout/interrupted while calling socket send()
- HTTPD_SOCK_ERR_FAIL: Unrecoverable error while calling socket send()

```c
int httpd_socket_recv(httpd_handle_t hd, int sockfd, char *buf, size_t buf_len, int flags)
```

A low level API to receive data from a given socket.

This internally calls the default recv function, or the function registered by `httpd_sess_set_recv_override()`.

---

#### Note:
This API is not recommended to be used in any request handler. Use this only for advanced use cases, wherein some asynchronous communication is required.

---

#### Parameters
- **hd** - [in] server instance
- **sockfd** - [in] session socket file descriptor
- **buf** - [in] buffer with bytes to send
- **buf_len** - [in] data size
- **flags** - [in] flags for the send() function

#### Returns
- Bytes: The number of bytes received successfully
- 0: Buffer length parameter is zero / connection closed by peer
- HTTPD_SOCK_ERR_INVALID: Invalid arguments
- HTTPD_SOCK_ERR_TIMEOUT: Timeout/interrupted while calling socket recv()
- HTTPD_SOCK_ERR_FAIL: Unrecoverable error while calling socket recv()

```c
esp_err_t httpd_register_err_handler(httpd_handle_t handle, httpd_err_code_t error, httpd_err_handler_func_t handler_fn)
```

Function for registering HTTP error handlers.

This function maps a handler function to any supported error code given by `httpd_err_code_t`. See prototype `httpd_err_handler_func_t` above for details.

#### Parameters
- **handle** - [in] HTTP server handle
- **error** - [in] Error type
- **handler_fn** - [in] User implemented handler function (Pass NULL to unset any previously set handler)

#### Returns
- ESP_OK: handler registered successfully
- ESP_ERR_INVALID_ARG: invalid error code or server handle

```c
esp_err_t httpd_start(httpd_handle_t *handle, const httpd_config_t *config)
```

Starts the web server.

Create an instance of HTTP server and allocate memory/resources for it depending upon the specified configuration.

**Example usage:**
// Function for starting the webserver
httpd_handle_t start_webserver(void)
{
    // Generate default configuration
    httpd_config_t config = HTTPD_DEFAULT_CONFIG();
    // Empty handle to http_server
    httpd_handle_t server = NULL;
    // Start the httpd server
    if (httpd_start(&server, &config) == ESP_OK) {
        // Register URI handlers
        httpd_register_uri_handler(server, &uri_get);
        httpd_register_uri_handler(server, &uri_post);
    }
    // If server failed to start, handle will be NULL
    return server;
}

Parameters
- config - [in] Configuration for new instance of the server
- handle - [out] Handle to newly created instance of the server. NULL on error

Returns
- ESP_OK: Instance created successfully
- ESP_ERR_INVALID_ARG: Null argument(s)
- ESP_ERR_HTTPD_ALLOC_MEM: Failed to allocate memory for instance
- ESP_ERR_HTTPD_TASK: Failed to launch server task

esp_err_t httpd_stop(httpd_handle_t handle)
Stop the web server.

Deallocates memory/resources used by an HTTP server instance and deletes it. Once deleted the handle can no longer be used for accessing the instance.

Example usage:

// Function for stopping the webserver
void stop_webserver(httpd_handle_t server)
{
    // Ensure handle is non NULL
    if (server != NULL) {
        // Stop the httpd server
        httpd_stop(server);
    }
}

Parameters handle - [in] Handle to server returned by httpd_start
Returns
- ESP_OK: Server stopped successfully
- ESP_ERR_INVALID_ARG: Handle argument is Null

esp_err_t httpd_queue_work(httpd_handle_t handle, httpd_work_fn_t work, void *arg)
Queue execution of a function in HTTPD’s context.

This API queues a work function for asynchronous execution

Note: Some protocols require that the web server generate some asynchronous data and send it to the persistently opened connection. This facility is for use by such protocols.
Parameters
• handle [in] Handle to server returned by httpd_start
• work [in] Pointer to the function to be executed in the HTTPD’s context
• arg [in] Pointer to the arguments that should be passed to this function

Returns
• ESP_OK : On successfully queueing the work
• ESP_FAIL : Failure in ctrl socket
• ESP_ERR_INVALID_ARG : Null arguments

void *httpd_sess_get_ctx(httpd_handle_t handle, int sockfd)
Get session context from socket descriptor.

Parameters
• handle [in] Handle to server returned by httpd_start
• sockfd [in] The socket descriptor for which the context should be extracted.

Returns
• void* : Pointer to the context associated with this session
• NULL : Empty context / Invalid handle / Invalid socket fd

void httpd_sess_set_ctx(httpd_handle_t handle, int sockfd, void *ctx, httpd_free_ctx_fn_t free_fn)
Set session context by socket descriptor.

Parameters
• handle [in] Handle to server returned by httpd_start
• sockfd [in] The socket descriptor for which the context should be extracted.
• ctx [in] Context object to assign to the session
• free_fn [in] Function that should be called to free the context

void *httpd_sess_get_transport_ctx(httpd_handle_t handle, int sockfd)
Get session ‘transport’ context by socket descriptor.

This context is used by the send/receive functions, for example to manage SSL context.

See also:
httpd_sess_get_ctx()

Parameters
• handle [in] Handle to server returned by httpd_start
• sockfd [in] The socket descriptor for which the context should be extracted.

Returns
• void* : Pointer to the transport context associated with this session
• NULL : Empty context / Invalid handle / Invalid socket fd

void httpd_sess_set_transport_ctx(httpd_handle_t handle, int sockfd, void *ctx, httpd_free_ctx_fn_t free_fn)
Set session ‘transport’ context by socket descriptor.

See also:
httpd_sess_set_ctx()
• sockfd [in] The socket descriptor for which the context should be extracted.
• ctx [in] Transport context object to assign to the session
• free_fn [in] Function that should be called to free the transport context

void *httpd_get_global_user_ctx (httpd_handle_t handle)
Get HTTPD global user context (it was set in the server config struct)
Parameters handle [in] Handle to server returned by httpd_start
Returns global user context

void *httpd_get_global_transport_ctx (httpd_handle_t handle)
Get HTTPD global transport context (it was set in the server config struct)
Parameters handle [in] Handle to server returned by httpd_start
Returns global transport context

esp_err_t httpd_sess_trigger_close (httpd_handle_t handle, int sockfd)
Trigger an httpd session close externally.

Note: Calling this API is only required in special circumstances wherein some application requires to close an httpd client session asynchronously.

Parameters
• handle [in] Handle to server returned by httpd_start
• sockfd [in] The socket descriptor of the session to be closed
Returns
• ESP_OK: On successfully initiating closure
• ESP_FAIL: Failure to queue work
• ESP_ERR_NOT_FOUND: Socket fd not found
• ESP_ERR_INVALID_ARG: Null arguments

esp_err_t httpd_sess_update_lru_counter (httpd_handle_t handle, int sockfd)
Update LRU counter for a given socket.

LRU Counters are internally associated with each session to monitor how recently a session exchanged traffic. When LRU purge is enabled, if a client is requesting for connection but maximum number of sockets/sessions is reached, then the session having the earliest LRU counter is closed automatically.

Updating the LRU counter manually prevents the socket from being purged due to the Least Recently Used (LRU) logic, even though it might not have received traffic for some time. This is useful when all open sockets/session are frequently exchanging traffic but the user specifically wants one of the sessions to be kept open, irrespective of when it last exchanged a packet.

Note: Calling this API is only necessary if the LRU Purge Enable option is enabled.

Parameters
• handle [in] Handle to server returned by httpd_start
• sockfd [in] The socket descriptor of the session for which LRU counter is to be updated
Returns
• ESP_OK: Socket found and LRU counter updated
• ESP_ERR_NOT_FOUND: Socket not found
• ESP_ERR_INVALID_ARG: Null arguments

esp_err_t httpd_get_client_list (httpd_handle_t handle, size_t *fds, int *client_fds)
Returns list of current socket descriptors of active sessions.
Note: Size of provided array has to be equal or greater then maximum number of opened sockets, configured upon initialization with max_open_sockets field in httpd_config_t structure.

Parameters

- **handle** - [in] Handle to server returned by httpd_start
- **fds** - [inout] In: Size of provided client_fds array Out: Number of valid client fds returned in client_fds,
- **client_fds** - [out] Array of client fds

Returns

- ESP_OK : Successfully retrieved session list
- ESP_ERR_INVALID_ARG : Wrong arguments or list is longer than provided array

Structures

struct esp_http_server_event_data

Argument structure for HTTP_SERVER_EVENT_ON_DATA and HTTP_SERVER_EVENT_SENT_DATA event

Public Members

- **fd**
  - Session socket file descriptor

- **data_len**
  - Data length

struct httpd_config

HTTP Server Configuration Structure.

Note: Use HTTPD_DEFAULT_CONFIG() to initialize the configuration to a default value and then modify only those fields that are specifically determined by the use case.

Public Members

- **task_priority**
  - Priority of FreeRTOS task which runs the server

- **stack_size**
  - The maximum stack size allowed for the server task

- **core_id**
  - The core the HTTP server task will run on

- **server_port**
  - TCP Port number for receiving and transmitting HTTP traffic
Chapter 2. API Reference

uint16_t ctrl_port
    UDP Port number for asynchronously exchanging control signals between various components of the server

uint16_t max_open_sockets
    Max number of sockets/clients connected at any time (3 sockets are reserved for internal working of the HTTP server)

uint16_t max_uri_handlers
    Maximum allowed uri handlers

uint16_t max_resp_headers
    Maximum allowed additional headers in HTTP response

uint16_t backlog_conn
    Number of backlog connections

bool lru_purge_enable
    Purge “Least Recently Used” connection

uint16_t recv_wait_timeout
    Timeout for recv function (in seconds)

uint16_t send_wait_timeout
    Timeout for send function (in seconds)

void *global_user_ctx
    Global user context.

    This field can be used to store arbitrary user data within the server context. The value can be retrieved using the server handle, available e.g. in the httpd_req_t struct.

    When shutting down, the server frees up the user context by calling free() on the global_user_ctx field.

    If you wish to use a custom function for freeing the global user context, please specify that here.

httpd_free_ctx_fn_t global_user_ctx_free_fn
    Free function for global user context

void *global_transport_ctx
    Global transport context.

    Similar to global_user_ctx, but used for session encoding or encryption (e.g. to hold the SSL context). It will be freed using free(), unless global_transport_ctx_free_fn is specified.

httpd_free_ctx_fn_t global_transport_ctx_free_fn
    Free function for global transport context

bool enable_so_linger
    bool to enable/disable linger

int linger_timeout
    linger timeout (in seconds)
bool keep_alive_enable
   Enable keep-alive timeout

int keep_alive_idle
   Keep-alive idle time. Default is 5 (second)

int keep_alive_interval
   Keep-alive interval time. Default is 5 (second)

int keep_alive_count
   Keep-alive packet retry send count. Default is 3 counts

httpd_open_func_t open_fn
   Custom session opening callback.
   Called on a new session socket just after accept(), but before reading any data.
   This is an opportunity to set up e.g. SSL encryption using global_transport_ctx and the send/recv/pending
   session overrides.
   If a context needs to be maintained between these functions, store it in the session using
   httpd_sess_set_transport_ctx() and retrieve it later with httpd_sess_get_transport_ctx()
   Returning a value other than ESP_OK will immediately close the new socket.

httpd_close_func_t close_fn
   Custom session closing callback.
   Called when a session is deleted, before freeing user and transport contexts and before closing the socket.
   This is a place for custom de-init code common to all sockets.
   The server will only close the socket if no custom session closing callback is set. If a custom callback is
   used, close(sockfd) should be called in here for most cases.
   Set the user or transport context to NULL if it was freed here, so the server does not try to free it again.
   This function is run for all terminated sessions, including sessions where the socket was closed by the
   network stack - that is, the file descriptor may not be valid anymore.

httpd_uri_match_func_t uri_match_fn
   URI matcher function.
   Called when searching for a matching URI: 1) whose request handler is to be executed right after an HTTP
   request is successfully parsed 2) in order to prevent duplication while registering a new URI handler using
   httpd_register_uri_handler()
   Available options are: 1) NULL : Internally do basic matching using strcmp() 2)
   httpd_uri_match_wildcard(): URI wildcard matcher
   Users can implement their own matching functions (See description of the
   httpd_uri_match_func_t function prototype)

struct httpd_req
   HTTP Request Data Structure.

Public Members
**httpd_handle_t** `handle`

Handle to server instance

**int** `method`

The type of HTTP request, -1 if unsupported method

**const char** `uri[HTTPD_MAX_URI_LEN + 1]`

The URI of this request (1 byte extra for null termination)

**size_t** `content_len`

Length of the request body

**void ** `aux`

Internally used members

**void ** `user_ctx`

User context pointer passed during URI registration.

**void ** `sess_ctx`

Session Context Pointer

A session context. Contexts are maintained across ‘sessions’ for a given open TCP connection. One session could have multiple request responses. The web server will ensure that the context persists across all these request and responses.

By default, this is NULL. URI Handlers can set this to any meaningful value.

If the underlying socket gets closed, and this pointer is non-NULL, the web server will free up the context by calling free(), unless free_ctx function is set.

**httpd_free_ctx_fn_t** `free_ctx`

Pointer to free context hook

Function to free session context

If the web server’s socket closes, it frees up the session context by calling free() on the sess_ctx member. If you wish to use a custom function for freeing the session context, please specify that here.

**bool** `ignore_sess_ctx_changes`

Flag indicating if Session Context changes should be ignored

By default, if you change the sess_ctx in some URI handler, the http server will internally free the earlier context (if non NULL), after the URI handler returns. If you want to manage the allocation/reallocation/freeing of sess_ctx yourself, set this flag to true, so that the server will not perform any checks on it. The context will be cleared by the server (by calling free_ctx or free()) only if the socket gets closed.

**struct** `httpd_uri`

Structure for URI handler.

**Public Members**

**const char** `uri`

The URI to handle
api_table_t

Methods supported by the URI

esp_err_t (*handler)(httpd_req_t *r)

Handler to call for supported request method. This must return ESP_OK, or else the underlying socket
will be closed.

void *user_ctx

Pointer to user context data which will be available to handler

Macros

HTTPD_MAX_REQ_HDR_LEN

HTTPD_MAX_URI_LEN

HTTPD_SOCK_ERR_FAIL

HTTPD_SOCK_ERR_INVALID

HTTPD_SOCK_ERR_TIMEOUT

HTTPD_200

HTTP Response 200

HTTPD_204

HTTP Response 204

HTTPD_207

HTTP Response 207

HTTPD_400

HTTP Response 400

HTTPD_404

HTTP Response 404

HTTPD_408

HTTP Response 408

HTTPD_500

HTTP Response 500

HTTPD_TYPE_JSON

HTTP Content type JSON

HTTPD_TYPE_TEXT

HTTP Content type text/HTML
Chapter 2. API Reference

**HTTPD_TYPE_OCTET**
HTTP Content type octet-stream

**ESP_HTTPD_DEF_CTRL_PORT**
HTTP Server control socket port

**HTTP_DEFAULT_CONFIG**

**ESP_ERR_HTTPD_BASE**
Starting number of HTTPD error codes

**ESP_ERR_HTTPD_HANDLERS_FULL**
All slots for registering URI handlers have been consumed

**ESP_ERR_HTTPD_HANDLER_EXISTS**
URI handler with same method and target URI already registered

**ESP_ERR_HTTPD_INVALID_REQ**
Invalid request pointer

**ESP_ERR_HTTPD_RESULT_TRUNC**
Result string truncated

**ESP_ERR_HTTPD_RESP_HDR**
Response header field larger than supported

**ESP_ERR_HTTPD_RESP_SEND**
Error occurred while sending response packet

**ESP_ERR_HTTPD_ALLOC_MEM**
Failed to dynamically allocate memory for resource

**ESP_ERR_HTTPD_TASK**
Failed to launch server task/thread

**HTTPD_RESP_USE_STRLEN**

**Type Definitions**

typedef struct `httpd_req` **httpd_req_t**
HTTP Request Data Structure.

typedef struct `httpd_uri` **httpd_uri_t**
Structure for URI handler.

typedef int (*`httpd_send_func_t`)(`httpd_handle_t` hd, int sockfd, const char *buf, size_t buf_len, int flags)
Prototype for HTTPD's low-level send function.
Note: User specified send function must handle errors internally, depending upon the set value of errno, and return specific HTTPD_SOCK_ERR_ codes, which will eventually be conveyed as return value of httpd_send() function

**Parameters**

- **hd**: [in] server instance
- **sockfd**: [in] session socket file descriptor
- **buf**: [in] buffer with bytes to send
- **buf_len**: [in] data size
- **flags**: [in] flags for the send() function

**Return**

- **Bytes**: The number of bytes sent successfully
- **HTTPD_SOCK_ERR_INVALID**: Invalid arguments
- **HTTPD_SOCK_ERR_TIMEOUT**: Timeout/interrupted while calling socket send()
- **HTTPD_SOCK_ERR_FAIL**: Unrecoverable error while calling socket send()

typedef int (*httpd_recv_func_t)(httpd_handle_t hd, int sockfd, char *buf, size_t buf_len, int flags)

Prototype for HTTPDs low-level recv function.

Note: User specified recv function must handle errors internally, depending upon the set value of errno, and return specific HTTPD_SOCK_ERR_ codes, which will eventually be conveyed as return value of httpd_req_recv() function

**Parameters**

- **hd**: [in] server instance
- **sockfd**: [in] session socket file descriptor
- **buf**: [in] buffer with bytes to send
- **buf_len**: [in] data size
- **flags**: [in] flags for the send() function

**Return**

- **Bytes**: The number of bytes received successfully
- **0**: Buffer length parameter is zero / connection closed by peer
- **HTTPD_SOCK_ERR_INVALID**: Invalid arguments
- **HTTPD_SOCK_ERR_TIMEOUT**: Timeout/interrupted while calling socket recv()
- **HTTPD_SOCK_ERR_FAIL**: Unrecoverable error while calling socket recv()

typedef int (*httpd_pending_func_t)(httpd_handle_t hd, int sockfd)

Prototype for HTTPDs low-level “get pending bytes” function.

Note: User specified pending function must handle errors internally, depending upon the set value of errno, and return specific HTTPD_SOCK_ERR_ codes, which will be handled accordingly in the server task.

**Parameters**

- **hd**: [in] server instance
- **sockfd**: [in] session socket file descriptor

**Return**

- **Bytes**: The number of bytes waiting to be received
- **HTTPD_SOCK_ERR_INVALID**: Invalid arguments
- **HTTPD_SOCK_ERR_TIMEOUT**: Timeout/interrupted while calling socket pending()
- **HTTPD_SOCK_ERR_FAIL**: Unrecoverable error while calling socket pending()

typedef esp_err_t (*httpd_err_handler_func_t)(httpd_req_t *req, httpd_err_code_t error)

Function prototype for HTTP error handling.
This function is executed upon HTTP errors generated during internal processing of an HTTP request. This is used to override the default behavior on error, which is to send HTTP error response and close the underlying socket.

Note:

- If implemented, the server will not automatically send out HTTP error response codes, therefore, httpd_resp_send_err() must be invoked inside this function if user wishes to generate HTTP error responses.
- When invoked, the validity of uri, method, content_len and user_ctx fields of the httpd_req_t parameter is not guaranteed as the HTTP request may be partially received/parsed.
- The function must return ESP_OK if underlying socket needs to be kept open. Any other value will ensure that the socket is closed. The return value is ignored when error is of type HTTPD_500_INTERNAL_SERVER_ERROR and the socket closed anyway.

```
typedef void *httpd_handle_t
    HTTP Server Instance Handle.
Every instance of the server will have a unique handle.
```

typedef enum http_method httpd_method_t
    HTTP Method Type wrapper over "enum http_method" available in "http_parser" library.

typedef void (*httpd_free_ctx_fn_t)(void *ctx)
    Prototype for freeing context data (if any).

```
Param ctx [in] object to free
```

typedef esp_err_t (*httpd_open_func_t)(httpd_handle_t hd, int sockfd)
    Function prototype for opening a session.
    Called immediately after the socket was opened to set up the send/recv functions and other parameters of the socket.

```
Param hd [in] server instance
Param sockfd [in] session socket file descriptor
Return
    • ESP_OK : On success
    • Any value other than ESP_OK will signal the server to close the socket immediately
```

typedef void (*httpd_close_func_t)(httpd_handle_t hd, int sockfd)
    Function prototype for closing a session.

Note: It’s possible that the socket descriptor is invalid at this point, the function is called for all terminated sessions. Ensure proper handling of return codes.

```
Param hd [in] server instance
Param sockfd [in] session socket file descriptor
```
typedef bool (*httpd_uri_match_func_t)(const char *reference_uri, const char *uri_to_match, size_t match_upto)

Function prototype for URI matching.

Param reference_uri [in] URI/template with respect to which the other URI is matched
Param uri_to_match [in] URI/template being matched to the reference URI/template
Param match_upto [in] For specifying the actual length of uri_to_match up to which the matching algorithm is to be applied (The maximum value is strlen(uri_to_match), independent of the length of reference_uri)
Return true on match

typedef struct httpd_config httpd_config_t

HTTP Server Configuration Structure.

Note: Use HTTPD_DEFAULT_CONFIG() to initialize the configuration to a default value and then modify only those fields that are specifically determined by the use case.

typedef void (*httpd_work_fn_t)(void *arg)

Prototype of the HTTPD work function Please refer to httpd_queue_work() for more details.
Param arg [in] The arguments for this work function

Enumerations

enum httpd_err_code_t

Error codes sent as HTTP response in case of errors encountered during processing of an HTTP request.
Values:

enumerator HTTPD_500_INTERNAL_SERVER_ERROR
enumerator HTTPD_501_METHOD_NOT_IMPLEMENTED
enumerator HTTPD_505_VERSION_NOT_SUPPORTED
enumerator HTTPD_400_BAD_REQUEST
enumerator HTTPD_401_UNAUTHORIZED
enumerator HTTPD_403_FORBIDDEN
enumerator HTTPD_404_NOT_FOUND
enumerator HTTPD_405_METHOD_NOT_ALLOWED
enumerator HTTPD_408_REQ_TIMEOUT
enumerator HTTPD_411_LENGTH_REQUIRED
enumerator **HTTPD_414_URI_TOO_LONG**

eumerator **HTTPD_431_REQ_HDR_FIELDS_TOO_LARGE**

eumerator **HTTPD_ERR_CODE_MAX**

enum **esp_http_server_event_id_t**

HTTP Server events id.

*Values:*

eumerator **HTTP_SERVER_EVENT_ERROR**

This event occurs when there are any errors during execution

eumerator **HTTP_SERVER_EVENT_START**

This event occurs when HTTP Server is started

eumerator **HTTP_SERVER_EVENT_ON_CONNECTED**

Once the HTTP Server has been connected to the client, no data exchange has been performed

eumerator **HTTP_SERVER_EVENT_ON_HEADER**

Occurs when receiving each header sent from the client

eumerator **HTTP_SERVER_EVENT_HEADERS_SENT**

After sending all the headers to the client

eumerator **HTTP_SERVER_EVENT_ON_DATA**

Occurs when receiving data from the client

eumerator **HTTP_SERVER_EVENT_SENT_DATA**

Occurs when an ESP HTTP server session is finished

eumerator **HTTP_SERVER_EVENT_DISCONNECTED**

The connection has been disconnected

eumerator **HTTP_SERVER_EVENT_STOP**

This event occurs when HTTP Server is stopped

### 2.2.10 HTTPS Server

**Overview**

This component is built on top of **HTTP Server**. The HTTPS server takes advantage of hook registration functions in the regular HTTP server to provide callback function for SSL session.

All documentation for **HTTP Server** applies also to a server you create this way.
Chapter 2. API Reference

Used APIs

The following APIs of *HTTP Server* should not be used with *HTTPS Server*, as they are used internally to handle secure sessions and to maintain internal state:

- “send”, “receive” and “pending” callback registration functions - secure socket handling
  - `httpd_sess_set_send_override()`
  - `httpd_sess_set_recv_override()`
  - `httpd_sess_set_pending_override()`

- “transport context” - both global and session
  - `httpd_sess_get_transport_ctx()` - returns SSL used for the session
  - `httpd_sess_set_transport_ctx()`
  - `httpd_get_global_transport_ctx()` - returns the shared SSL context
  - `httpd_config::global_transport_ctx`
  - `httpd_config::global_transport_ctx_free_fn`
  - `httpd_config::open_fn` - used to set up secure sockets

Everything else can be used without limitations.

Usage

Please see the example `protocols/https_server` to learn how to set up a secure server.

Basically, all you need is to generate a certificate, embed it into the firmware, and pass the init struct into the start function after the certificate address and lengths are correctly configured in the init struct.

The server can be started with or without SSL by changing a flag in the init struct - `httpd_ssl_config::transport_mode`. This could be used, e.g., for testing or in trusted environments where you prefer speed over security.

Performance

The initial session setup can take about two seconds, or more with slower clock speed or more verbose logging. Subsequent requests through the open secure socket are much faster (down to under 100 ms).

API Reference

Header File

- `components/esp_https_server/include/esp_https_server.h`
- This header file can be included with:
  ```
  #include "esp_https_server.h"
  ```
- This header file is a part of the API provided by the *esp_https_server* component. To declare that your component depends on *esp_https_server*, add the following to your CMakeLists.txt:
  ```
  REQUIRES esp_https_server
  ```
  or
  ```
  PRIV_REQUIRES esp_https_server
  ```

Functions

- `httpd_ssl_config_t httpd_ssl_config_default (void)`
  Returns the httpd config struct with default initialisation
  ```
  Returns  httpd_ssl_config_t HTTPD ssl config struct with default initialisation Notes:
  • port is set when starting the server, according to ‘transport_mode’
  ```
• one socket uses ~ 40kB RAM with SSL, we reduce the default socket count to 4
• SSL sockets are usually long-lived, closing LRU prevents pool exhaustion DOS
• Stack size may need adjustments depending on the user application

```c
esp_err_t httpd_ssl_start(httpd_handle_t *handle, httpd_ssl_config_t *config)
```
Create a SSL capable HTTP server (secure mode may be disabled in config)

**Parameters**
- `config` - [inout] - server config, must not be const. Does not have to stay valid after calling this function.
- `handle` - [out] - storage for the server handle, must be a valid pointer

**Returns**
- success

```c
esp_err_t httpd_ssl_stop(httpd_handle_t handle)
```
Stop the server. Blocks until the server is shut down.

**Parameters**
- `handle` - [in]

**Returns**
- ESP_OK: Server stopped successfully
- ESP_ERR_INVALID_ARG: Invalid argument
- ESP_FAIL: Failure to shut down server

**Structures**

```c
struct esp_https_server_user_cb_arg
```
Callback data struct, contains the ESP-TLS connection handle and the connection state at which the callback is executed.

**Public Members**

```c
httpd_ssl_user_cb_state_t user_cb_state
```
State of user callback

```c
esp_tls_t *tls
```
ESP-TLS connection handle

```c
struct httpd_ssl_config
```
HTTPS server config struct

Please use HTTPD_SSL_CONFIG_DEFAULT() to initialize it.

**Public Members**

```c
httpd_config_t httpd
```
Underlying HTTPD server config

Parameters like task stack size and priority can be adjusted here.

```c
const uint8_t *servercert
```
Server certificate

```c
size_t servercert_len
```
Server certificate byte length
const uint8_t *cacert_pem
    CA certificate ((CA used to sign clients, or client cert itself)

size_t cacert_len
    CA certificate byte length

const uint8_t *prvtkey_pem
    Private key

size_t prvtkey_len
    Private key byte length

bool use_ecdsa_peripheral
    Use ECDSA peripheral to use private key

uint8_t ecdsa_key_efuse_blk
    The efuse block where ECDSA key is stored

httpd_ssl_transport_mode_t transport_mode
    Transport Mode (default secure)

uint16_t port_secure
    Port used when transport mode is secure (default 443)

uint16_t port_insecure
    Port used when transport mode is insecure (default 80)

bool session_tickets
    Enable tls session tickets

bool use_secure_element
    Enable secure element for server session

esp_https_server_user_cb *user_cb
    User callback for esp_https_server

void *ssl_userdata
    user data to add to the ssl context

const char **alpn_protos
    Application protocols the server supports in order of preference. Used for negotiating during the TLS handshake, first one the client supports is selected. The data structure must live as long as the https server itself!

**Macros**

HTTPD_SSL_CONFIG_DEFAULT
Type Definitions

typedef struct esp_https_server_user_cb_arg esp_https_server_user_cb_arg_t

Callback data struct, contains the ESP-TLS connection handle and the connection state at which the callback is executed.

typedef void esp_https_server_user_cb (esp_https_server_user_cb_arg_t *user_cb)

Callback function prototype Can be used to get connection or client information (SSL context) E.g. Client certificate, Socket FD, Connection state, etc.

    Param user_cb Callback data struct

typedef struct httpd_ssl_config httpd_ssl_config_t

Enumerations

enum httpd_ssl_transport_mode_t

    Values:

        enumerator HTTPD_SSL_TRANSPORT_SECURE

        enumerator HTTPD_SSL_TRANSPORT_INSECURE

enum httpd_ssl_user_cb_state_t

    Indicates the state at which the user callback is executed, i.e at session creation or session close.

    Values:

        enumerator HTTPD_SSL_USER_CB_SESS_CREATE

        enumerator HTTPD_SSL_USER_CB_SESS_CLOSE

2.2.11 ICMP Echo

Overview

ICMP (Internet Control Message Protocol) is used for diagnostic or control purposes or generated in response to errors in IP operations. The common network util ping is implemented based on the ICMP packets with the type field value of 0, also called Echo Reply.

During a ping session, the source host firstly sends out an ICMP echo request packet and wait for an ICMP echo reply with specific times. In this way, it also measures the round-trip time for the messages. After receiving a valid ICMP echo reply, the source host will generate statistics about the IP link layer (e.g., packet loss, elapsed time, etc).

It is common that IoT device needs to check whether a remote server is alive or not. The device should show the warnings to users when it got offline. It can be achieved by creating a ping session and sending or parsing ICMP echo packets periodically.

To make this internal procedure much easier for users, ESP-IDF provides some out-of-box APIs.
Create a New Ping Session  
To create a ping session, you need to fill in the `esp_ping_config_t` configuration structure firstly, specifying target IP address, interval times, and etc. Optionally, you can also register some callback functions with the `esp_ping_callbacks_t` structure.

Example method to create a new ping session and register callbacks:

```c
static void test_on_ping_success(esp_ping_handle_t hdl, void *args)
{
    // optionally, get callback arguments
    // const char * str = (const char*) args;
    // printf("%s\r\n", str); // "foo"
    uint8_t ttl;
    uint32_t seqno;
    uint16_t seqno;
    uint32_t elapsed_time, recv_len;
    ip_addr_t target_addr;
    esp_ping_get_profile(hdl, ESP_PING_PROF_SEQNO, &seqno, sizeof(seqno));
    esp_ping_get_profile(hdl, ESP_PING_PROF_TTL, &ttl, sizeof(ttl));
    esp_ping_get_profile(hdl, ESP_PING_PROF_IPADDR, &target_addr, sizeof(target_addr));
    esp_ping_get_profile(hdl, ESP_PING_PROF_SIZE, &recv_len, sizeof(recv_len));
    esp_ping_get_profile(hdl, ESP_PING_PROF_TIMEGAP, &elapsed_time, sizeof(elapsed_time));
    printf("%d bytes from %s icmp_seq=%d ttl=%d time=%d ms\n",
        recv_len, inet_ntoa(target_addr.u_addr.ip4), seqno, ttl, elapsed_time);
}

static void test_on_ping_timeout(esp_ping_handle_t hdl, void *args)
{
    uint16_t seqno;
    ip_addr_t target_addr;
    esp_ping_get_profile(hdl, ESP_PING_PROF_SEQNO, &seqno, sizeof(seqno));
    esp_ping_get_profile(hdl, ESP_PING_PROF_IPADDR, &target_addr, sizeof(target_addr));
    printf("From %s icmp_seq=%d timeout\n", inet_ntoa(target_addr.u_addr.ip4), seqno);
}

static void test_on_ping_end(esp_ping_handle_t hdl, void *args)
{
    uint32_t transmitted;
    uint32_t received;
    uint32_t total_time_ms;
    esp_ping_get_profile(hdl, ESP_PING_PROF_REQUEST, &transmitted, sizeof(transmitted));
    esp_ping_get_profile(hdl, ESP_PING_PROF_REPLY, &received, sizeof(received));
    esp_ping_get_profile(hdl, ESP_PING_PROF_DURATION, &total_time_ms, sizeof(total_time_ms));
    printf("%d packets transmitted, %d received, time %dms\n", transmitted, received, total_time_ms);
}

void initialize_ping()
{
    /* convert URL to IP address */
    ip_addr_t target_addr;
    addrinfo hint;
    addrinfo *res = NULL;
    memset(&hint, 0, sizeof(hint));
    memset(&target_addr, 0, sizeof(target_addr));
    getaddrinfo("www.espressif.com", NULL, &hint, &res);
    struct in_addr addr4 = ((struct sockaddr_in *) (res->ai_addr))->sin_addr;
    inet_addr_to_ip4addr(ip2ip4(&target_addr), &addr4);
}
```

(continues on next page)
freeaddrinfo(res);

esp_ping_config_t ping_config = ESP_PING_DEFAULT_CONFIG();
ping_config.target_addr = target_addr; // target IP address
ping_config.count = ESP_PING_COUNT_INFINITE; // ping in infinite mode, esp_ping_stop can stop it

/* set callback functions */
esp_ping_callbacks_t cbs;
cbs.on_ping_success = test_on_ping_success;
cbs.on_ping_timeout = test_on_ping_timeout;
cbs.on_ping_end = test_on_ping_end;
cbs.cb_args = "foo"; // arguments that feeds to all callback functions, can be NULL
   cbs.cb_args = eth_event_group;

esp_ping_handle_t ping;
esp_ping_new_session(&ping_config, &cbs, &ping);
}

Start and Stop Ping Session  You can start and stop ping session with the handle returned by esp_ping_new_session. Note that, the ping session does not start automatically after creation. If the ping session is stopped, and restart again, the sequence number in ICMP packets will recount from zero again.

Delete a Ping Session  If a ping session will not be used any more, you can delete it with esp_ping_delete_session. Please make sure the ping session is in stop state (i.e., you have called esp_ping_stop before or the ping session has finished all the procedures) when you call this function.

Get Runtime Statistics  As the example code above, you can call esp_ping_get_profile to get different runtime statistics of ping session in the callback function.

Application Example

ICMP echo example: protocols/icmp_echo

API Reference

Header File

- components/lwip/include/apps/ping/ping_sock.h
- This header file can be included with:

```
#include "ping/ping_sock.h"
```

- This header file is a part of the API provided by the lwip component. To declare that your component depends on lwip, add the following to your CMakeLists.txt:

REQUIRES lwip
```

or

```
PRIV_REQUIRES lwip
```
Chapter 2. API Reference

Functions

`esp_err_t esp_ping_new_session` (const `esp_ping_config_t` *config, const `esp_ping_callbacks_t` *cbs, `esp_ping_handle_t` *hdl_out)

Create a ping session.

Parameters

- `config` – ping configuration
- `cbs` – a bunch of callback functions invoked by internal ping task
- `hdl_out` – handle of ping session

Returns

- `ESP_ERR_INVALID_ARG`: invalid parameters (e.g. configuration is null, etc)
- `ESP_ERR_NO_MEM`: out of memory
- `ESP_FAIL`: other internal error (e.g. socket error)
- `ESP_OK`: create ping session successfully, user can take the ping handle to do follow-on jobs

`esp_err_t esp_ping_delete_session` (`esp_ping_handle_t` hdl)

Delete a ping session.

Parameters `hdl` – handle of ping session

Returns

- `ESP_ERR_INVALID_ARG`: invalid parameters (e.g. ping handle is null, etc)
- `ESP_OK`: delete ping session successfully

`esp_err_t esp_ping_start` (`esp_ping_handle_t` hdl)

Start the ping session.

Parameters `hdl` – handle of ping session

Returns

- `ESP_ERR_INVALID_ARG`: invalid parameters (e.g. ping handle is null, etc)
- `ESP_OK`: start ping session successfully

`esp_err_t esp_ping_stop` (`esp_ping_handle_t` hdl)

Stop the ping session.

Parameters `hdl` – handle of ping session

Returns

- `ESP_ERR_INVALID_ARG`: invalid parameters (e.g. ping handle is null, etc)
- `ESP_OK`: stop ping session successfully

`esp_err_t esp_ping_get_profile` (`esp_ping_handle_t` hdl, `esp_ping_profile_t` profile, void *data, uint32_t size)

Get runtime profile of ping session.

Parameters

- `hdl` – handle of ping session
- `profile` – type of profile
- `data` – profile data
- `size` – profile data size

Returns

- `ESP_ERR_INVALID_ARG`: invalid parameters (e.g. ping handle is null, etc)
- `ESP_ERR_INVALID_SIZE`: the actual profile data size doesn’t match the “size” parameter
- `ESP_OK`: get profile successfully

Structures

```c
struct esp_ping_callbacks_t
```

Type of “ping” callback functions.
Public Members

void *cb_args
    arguments for callback functions

doctor (*on_ping_success)(esp_ping_handle_t hdl, void *args)
    Invoked by internal ping thread when received ICMP echo reply packet.

doctor (*on_ping_timeout)(esp_ping_handle_t hdl, void *args)
    Invoked by internal ping thread when receive ICMP echo reply packet timeout.

void (*on_ping_end)(esp_ping_handle_t hdl, void *args)
    Invoked by internal ping thread when a ping session is finished.

struct esp_ping_config_t
    Type of “ping” configuration.

Public Members

uint32_t count
    A “ping” session contains count procedures

uint32_t interval_ms
    Milliseconds between each ping procedure

uint32_t timeout_ms
    Timeout value (in milliseconds) of each ping procedure

uint32_t data_size
    Size of the data next to ICMP packet header

int tos
    Type of Service, a field specified in the IP header

int ttl
    Time to Live, a field specified in the IP header

ip_addr_t target_addr
    Target IP address, either IPv4 or IPv6

uint32_t task_stack_size
    Stack size of internal ping task

uint32_t task_prio
    Priority of internal ping task

uint32_t interface
    Netif index, interface=0 means NETIF_NO_INDEX
Chapter 2. API Reference

Macros

ESP_PING_DEFAULT_CONFIG()
Default ping configuration.

ESP_PING_COUNT_INFINITE
Set ping count to zero will ping target infinitely

Type Definitions
typedef void *esp_ping_handle_t
Type of “ping” session handle.

Enumerations
enum esp_ping_profile_t
Profile of ping session.

Values:
enumerator ESP_PING_PROF_SEQNO
Sequence number of a ping procedure

enumerator ESP_PING_PROF_TOS
Type of service of a ping procedure

enumerator ESP_PING_PROF_TTL
Time to live of a ping procedure

enumerator ESP_PING_PROF_REQUEST
Number of request packets sent out

enumerator ESP_PING_PROF_REPLY
Number of reply packets received

enumerator ESP_PING_PROF_IPADDR
IP address of replied target

enumerator ESP_PING_PROF_SIZE
Size of received packet

enumerator ESP_PING_PROF_TIMEGAP
Elapsed time between request and reply packet

enumerator ESP_PING_PROF_DURATION
Elapsed time of the whole ping session

2.2.12 mDNS Service

mDNS is a multicast UDP service that is used to provide local network service and host discovery.
The ESP-IDF component mDNS has been moved from ESP-IDF since version v5.0 to a separate repository:
Chapter 2. API Reference

- mDNS component on GitHub

To add mDNS component in your project, please run `idf.py add-dependency espressif/mdns`.

**Hosted Documentation**

The documentation can be found on the link below:

- mDNS documentation

### 2.2.13 Mbed TLS

Mbed TLS is a C library that implements cryptographic primitives, X.509 certificate manipulation and the SSL/TLS and DTLS protocols. Its small code footprint makes it suitable for embedded systems.

**Note:** ESP-IDF uses a fork of Mbed TLS which includes a few patches (related to hardware routines of certain modules like bignum (MPI) and ECC) over vanilla Mbed TLS.

Mbed TLS supports SSL 3.0 up to TLS 1.3 and DTLS 1.0 to 1.2 communication by providing the following:

- TCP/IP communication functions: listen, connect, accept, read/write.
- SSL/TLS communication functions: init, handshake, read/write.
- X.509 functions: CRT, CRL and key handling
- Random number generation
- Hashing
- Encryption/decryption

Supported TLS versions include SSL 3.0, TLS 1.0, TLS 1.1, TLS 1.2, and TLS 1.3, but on the latest ESP-IDF, SSL 3.0, TLS 1.0, and TLS 1.1 have been removed from Mbed TLS. Supported DTLS versions include DTLS 1.0, DTLS 1.1, and DTLS 1.2, but on the latest ESP-IDF, DTLS 1.0 has been removed from Mbed TLS.

**Mbed TLS Documentation**

For Mbed TLS documentation please refer to the following (upstream) pointers:

- API Reference
- Knowledge Base

**Mbed TLS Support in ESP-IDF**

Please find the information about the Mbed TLS versions presented in different branches of ESP-IDF here.

**Note:** Please refer the Mbed TLS to migrate from Mbed TLS version 2.x to version 3.0 or greater.

**Application Examples**

Examples in ESP-IDF use ESP-TLS which provides a simplified API interface for accessing the commonly used TLS functionality.

Refer to the examples protocols/https_server/simple (Simple HTTPS server) and protocols/https_request (Make HTTPS requests) for more information.

If the Mbed TLS API is to be used directly, refer to the example protocols/https_mbedtls.
Alternatives

ESP-TLS acts as an abstraction layer over the underlying SSL/TLS library and thus has an option to use Mbed TLS or wolfSSL as the underlying library. By default, only Mbed TLS is available and used in ESP-IDF whereas wolfSSL is available publicly at <https://github.com/espressif/esp-wolfSSL> with the upstream submodule pointer.

Please refer to ESP-TLS: Underlying SSL/TLS Library Options docs for more information on this and comparison of Mbed TLS and wolfSSL.

Important Config Options

Following is a brief list of important config options accessible at Component Config -> mbedTLS. The full list of config options can be found here.

- `CONFIG_MBEDTLS_SSL_PROTO_TLS1_2`: Support for TLS 1.2
- `CONFIG_MBEDTLS_SSL_PROTO_TLS1_3`: Support for TLS 1.3
- `CONFIG_MBEDTLS_CERTIFICATE_BUNDLE`: Support for trusted root certificate bundle (more about this: ESP x509 Certificate Bundle)
- `CONFIG_MBEDTLS_CLIENT_SSL_SESSION_TICKETS`: Support for TLS Session Resumption: Client session tickets
- `CONFIG_MBEDTLS_SERVER_SSL_SESSION_TICKETS`: Support for TLS Session Resumption: Server session tickets
- `CONFIG_MBEDTLS_HARDWARE_SHA`: Support for hardware SHA acceleration
- `CONFIG_MBEDTLS_HARDWARE_AES`: Support for hardware AES acceleration
- `CONFIG_MBEDTLS_HARDWARE_MPI`: Support for hardware MPI (bignum) acceleration

Note: Mbed TLS v3.0.0 and later support only TLS 1.2 and TLS 1.3 (SSL 3.0, TLS 1.0, TLS 1.1, and DTLS 1.0 are not supported). The support for TLS 1.3 is experimental and only supports the client-side. More information about this can be found out here.

Performance and Memory Tweaks

Reducing Heap Usage The following table shows typical memory usage with different configs when the protocols/https_request example (with Server Validation enabled) was run with Mbed TLS as the SSL/TLS library.

<table>
<thead>
<tr>
<th>Mbed TLS Test</th>
<th>Related Configs</th>
<th>Heap Usage (approx.)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default</td>
<td>NA</td>
<td>42196 B</td>
</tr>
<tr>
<td>Enable SSL Variable Length</td>
<td><code>CONFIG_MBEDTLS_SSL_VARIABLE_BUFFER_LENGTH</code></td>
<td>42120 B</td>
</tr>
<tr>
<td>Disable Keep Peer Certificate</td>
<td><code>CONFIG_MBEDTLS_SSL_KEEP_PEER_CERTIFICATE</code></td>
<td>38533 B</td>
</tr>
<tr>
<td>Enable Dynamic TX/RX Buffer</td>
<td><code>CONFIG_MBEDTLS_DYNAMIC_BUFFER</code> <code>CONFIG_MBEDTLS_DYNAMIC_FREE_CONFIG_DATA</code> <code>CONFIG_MBEDTLS_DYNAMIC_FREE_CA_CERT</code></td>
<td>22013 B</td>
</tr>
</tbody>
</table>

Note: These values are subject to change with change in configuration options and versions of Mbed TLS.

Reducing Binary Size Under Component Config -> mbedTLS, there are multiple Mbed TLS features which are enabled by default but can be disabled if not needed to save code size. More information can be about this can be found in Minimizing Binary Size docs.

Code examples for this API section are provided in the protocols directory of ESP-IDF examples.
2.2.14 IP Network Layer

Documentation for IP Network Layer protocols (below the Application Protocol layer) are provided in Networking APIs.

2.3 Error Codes Reference

This section lists various error code constants defined in ESP-IDF.

For general information about error codes in ESP-IDF, see Error Handling.

- **ESP_FAIL** (-1): Generic esp_err_t code indicating failure
- **ESP_OK** (0): esp_err_t value indicating success (no error)
- **ESP_ERR_NO_MEM** (0x101): Out of memory
- **ESP_ERR_INVALID_ARG** (0x102): Invalid argument
- **ESP_ERR_INVALID_STATE** (0x103): Invalid state
- **ESP_ERR_INVALID_SIZE** (0x104): Invalid size
- **ESP_ERR_NOT_FOUND** (0x105): Requested resource not found
- **ESP_ERR_NOT_SUPPORTED** (0x106): Operation or feature not supported
- **ESP_ERR_TIMEOUT** (0x107): Operation timed out
- **ESP_ERR_INVALID_RESPONSE** (0x108): Received response was invalid
- **ESP_ERR_INVALID_CRC** (0x109): CRC or checksum was invalid
- **ESP_ERR_INVALID_VERSION** (0x10a): Version was invalid
- **ESP_ERR_INVALID_MAC** (0x10b): MAC address was invalid
- **ESP_ERR_NOT_FINISHED** (0x10c): Operation has not fully completed
- **ESP_ERR_NOT_ALLOWED** (0x10d): Operation is not allowed
- **ESP_ERR_NVS_BASE** (0x1100): Starting number of error codes
- **ESP_ERR_NVS_NOT_INITIALIZED** (0x1101): The storage driver is not initialized
- **ESP_ERR_NVS_NOT_FOUND** (0x1102): A requested entry couldn’t be found or namespace doesn’t exist yet and mode is NVS_READONLY
- **ESP_ERR_NVS_TYPE_MISMATCH** (0x1103): The type of set or get operation doesn’t match the type of value stored in NVS
- **ESP_ERR_NVS_READ_ONLY** (0x1104): Storage handle was opened as read only
- **ESP_ERR_NVS_NOT_ENOUGH_SPACE** (0x1105): There is not enough space in the underlying storage to save the value
- **ESP_ERR_NVS_INVALID_NAME** (0x1106): Namespace name doesn’t satisfy constraints
- **ESP_ERR_NVS_INVALID_HANDLE** (0x1107): Handle has been closed or is NULL
- **ESP_ERR_NVS_REMOVE_FAILED** (0x1108): The value wasn’t updated because flash write operation has failed. The value was written however, and update will be finished after re-initialization of nvs, provided that flash operation doesn’t fail again.
- **ESP_ERR_NVS_KEY_TOO_LONG** (0x1109): Key name is too long
- **ESP_ERR_NVS_PAGE_FULL** (0x110a): Internal error; never returned by nvs API functions
**ESP_ERR_NVS_INVALID_STATE** *(0x110b)*: NVS is in an inconsistent state due to a previous error. Call nvs_flash_init and nvs_open again, then retry.

**ESP_ERR_NVS_INVALID_LENGTH** *(0x110c)*: String or blob length is not sufficient to store data

**ESP_ERR_NVS_NO_FREE_PAGES** *(0x110d)*: NVS partition doesn’t contain any empty pages. This may happen if NVS partition was truncated. Erase the whole partition and call nvs_flash_init again.

**ESP_ERR_NVS_VALUE_TOO_LONG** *(0x110e)*: Value doesn’t fit into the entry or string or blob length is longer than supported by the implementation

**ESP_ERR_NVS_PART_NOT_FOUND** *(0x110f)*: Partition with specified name is not found in the partition table

**ESP_ERR_NVS_NEW_VERSION_FOUND** *(0x1110)*: NVS partition contains data in new format and cannot be recognized by this version of code

**ESP_ERR_NVS_XTS_ENCR_FAILED** *(0x1111)*: XTS encryption failed while writing NVS entry

**ESP_ERR_NVS_XTS_DECR_FAILED** *(0x1112)*: XTS decryption failed while reading NVS entry

**ESP_ERR_NVS_XTS_CFG_FAILED** *(0x1113)*: XTS configuration setting failed

**ESP_ERR_NVS_XTS_CFG_NOT_FOUND** *(0x1114)*: XTS configuration not found

**ESP_ERR_NVS_ENCR_NOT_SUPPORTED** *(0x1115)*: NVS encryption is not supported in this version

**ESP_ERR_NVS_KEYS_NOT_INITIALIZED** *(0x1116)*: NVS key partition is uninitialized

**ESP_ERR_NVS_CORRUPT_KEY_PART** *(0x1117)*: NVS key partition is corrupt

**ESP_ERR_NVS_CONTENT_DIFFERS** *(0x1118)*: Internal error; never returned by nvs API functions. NVS key is different in comparison

**ESP_ERR_NVS_WRONG_ENCRYPTION** *(0x1119)*: NVS partition is marked as encrypted with generic flash encryption. This is forbidden since the NVS encryption works differently.

**ESP_ERR_ULP_BASE** *(0x1200)*: Offset for ULP-related error codes

**ESP_ERR_ULP_SIZE_TOO_BIG** *(0x1201)*: Program doesn’t fit into RTC memory reserved for the ULP

**ESP_ERR_ULP_INVALID_LOAD_ADDR** *(0x1202)*: Load address is outside of RTC memory reserved for the ULP

**ESP_ERR_ULP_DUPLICATE_LABEL** *(0x1203)*: More than one label with the same number was defined

**ESP_ERR_ULP_UNDEFINED_LABEL** *(0x1204)*: Branch instructions references an undefined label

**ESP_ERR_ULP_BRANCH_OUT_OF_RANGE** *(0x1205)*: Branch target is out of range of B instruction (try replacing with BX)

**ESP_ERR_OTA_BASE** *(0x1500)*: Base error code for ota_ops api

**ESP_ERR_OTA_PARTITION_CONFLICT** *(0x1501)*: Error if request was to write or erase the current running partition

**ESP_ERR_OTA_SELECT_INFO_INVALID** *(0x1502)*: Error if OTA data partition contains invalid content

**ESP_ERR_OTA_VALIDATE_FAILED** *(0x1503)*: Error if OTA app image is invalid

**ESP_ERR_OTA_SMALL_SEC_VER** *(0x1504)*: Error if the firmware has a secure version less than the running firmware.

**ESP_ERR_OTA_ROLLBACK_FAILED** *(0x1505)*: Error if flash does not have valid firmware in passive partition and hence rollback is not possible

**ESP_ERR_OTA_ROLLBACK_INVALID_STATE** *(0x1506)*: Error if current active firmware is still marked in pending validation state (ESP_OTA_IMG_PENDING_VERIFY), essentially first boot of firmware image post upgrade and hence firmware upgrade is not possible

**ESP_ERR_EFUSE** *(0x1600)*: Base error code for efuse api.

**ESP_OK_EFUSE_CNT** *(0x1601)*: OK the required number of bits is set.
**ESP_ERR_EFUSE_CNT_IS_FULL** (0x1602): Error field is full.

**ESP_ERR_EFUSE_REPEATED_PROG** (0x1603): Error repeated programming of programmed bits is strictly forbidden.

**ESP_ERR_CODING** (0x1604): Error while an encoding operation.

**ESP_ERR_NOT_ENOUGH_UNUSED_KEY_BLOCKS** (0x1605): Error not enough unused key blocks available.

**ESP_ERR_DAMAGED_READING** (0x1606): Error. Burn or reset was done during a reading operation leads to damage read data. This error is internal to the efuse component and not returned by any public API.

**ESP_ERR_IMAGE_BASE** (0x2000)

**ESP_ERR_IMAGE_FLASH_FAIL** (0x2001)

**ESP_ERR_IMAGE_INVALID** (0x2002)

**ESP_ERR_WIFI_BASE** (0x3000): Starting number of WiFi error codes

**ESP_ERR_WIFI_NOT_INIT** (0x3001): WiFi driver was not installed by esp_wifi_init

**ESP_ERR_WIFI_NOT_STARTED** (0x3002): WiFi driver was not started by esp_wifi_start

**ESP_ERR_WIFI_NOT_STOPPED** (0x3003): WiFi driver was not stopped by esp_wifi_stop

**ESP_ERR_WIFI_IF** (0x3004): WiFi interface error

**ESP_ERR_WIFI_MODE** (0x3005): WiFi mode error

**ESP_ERR_WIFI_STATE** (0x3006): WiFi internal state error

**ESP_ERR_WIFI_CONN** (0x3007): WiFi internal control block of station or soft-AP error

**ESP_ERR_WIFI_NVS** (0x3008): WiFi internal NVS module error

**ESP_ERR_WIFI_MAC** (0x3009): MAC address is invalid

**ESP_ERR_WIFI_SSID** (0x300a): SSID is invalid

**ESP_ERR_WIFI_PASSWORD** (0x300b): Password is invalid

**ESP_ERR_WIFI_TIMEOUT** (0x300c): Timeout error

**ESP_ERR_WIFI_WAKE_FAIL** (0x300d): WiFi is in sleep state (RF closed) and wakeup fail

**ESP_ERR_WIFI_WOULD_BLOCK** (0x300e): The caller would block

**ESP_ERR_WIFI_NOT_CONNECT** (0x300f): Station still in disconnect status

**ESP_ERR_WIFI_POST** (0x3012): Failed to post the event to WiFi task

**ESP_ERR_WIFI_INIT_STATE** (0x3013): Invalid WiFi state when init/deinit is called

**ESP_ERR_WIFI_STOP_STATE** (0x3014): Returned when WiFi is stopping

**ESP_ERR_WIFI_NOT_ASSOC** (0x3015): The WiFi connection is not associated

**ESP_ERR_WIFI_TX_DISALLOW** (0x3016): The WiFi TX is disallowed

**ESP_ERR_WIFI_TWT_FULL** (0x3017): no available flow id

**ESP_ERR_WIFI_TWT_SETUP_TIMEOUT** (0x3018): Timeout of receiving twt setup response frame, timeout times can be set during twt setup

**ESP_ERR_WIFI_TWT_SETUP_TXFAIL** (0x3019): TWT setup frame tx failed

**ESP_ERR_WIFI_TWT_SETUP_REJECT** (0x301a): The twt setup request was rejected by the AP

**ESP_ERR_WIFI_DISCARD** (0x301b): Discard frame

**ESP_ERR_WIFI_REGISTRAR** (0x3033): WPS registrar is not supported

**ESP_ERR_WIFI_WPS_TYPE** (0x3034): WPS type error

**ESP_ERR_WIFI_WPS_SM** (0x3035): WPS state machine is not initialized
**ESP_ERR_ESPNOW_BASE** (0x3064): ESPNOW error number base.
**ESP_ERR_ESPNOW_NOT_INIT** (0x3065): ESPNOW is not initialized.
**ESP_ERR_ESPNOW_ARG** (0x3066): Invalid argument
**ESP_ERR_ESPNOW_NO_MEM** (0x3067): Out of memory
**ESP_ERR_ESPNOW_FULL** (0x3068): ESPNOW peer list is full
**ESP_ERR_ESPNOW_NOT_FOUND** (0x3069): ESPNOW peer is not found
**ESP_ERR_ESPNOW_EXIST** (0x306a): ESPNOW peer has existed
**ESP_ERR_ESPNOW_IF** (0x306b): Interface error
**ESP_ERR_DPP_FAILURE** (0x3097): Generic failure during DPP Operation
**ESP_ERR_DPP_TX_FAILURE** (0x3098): DPP Frame Tx failed OR not Acked
**ESP_ERR_DPP_INVALID_ATTR** (0x3099): Encountered invalid DPP Attribute
**ESP_ERR_MESH_BASE** (0x4000): Starting number of MESH error codes
**ESP_ERR_MESH_WIFI_NOT_START** (0x4001)
**ESP_ERR_MESH_NOT_INIT** (0x4002)
**ESP_ERR_MESH_NOT_CONFIG** (0x4003)
**ESP_ERR_MESH_NOT_START** (0x4004)
**ESP_ERR_MESH_NOT_SUPPORT** (0x4005)
**ESP_ERR_MESH_NOT_ALLOWED** (0x4006)
**ESP_ERR_MESH_NO_MEMORY** (0x4007)
**ESP_ERR_MESH_ARGUMENT** (0x4008)
**ESP_ERR_MESH_EXCEED_MTU** (0x4009)
**ESP_ERR_MESH_TIMEOUT** (0x400a)
**ESP_ERR_MESH_DISCONNECTED** (0x400b)
**ESP_ERR_MESH_QUEUE_FAIL** (0x400c)
**ESP_ERR_MESH_QUEUE_FULL** (0x400d)
**ESP_ERR_MESH_NO_PARENT_FOUND** (0x400e)
**ESP_ERR_MESH_NO_ROUTE_FOUND** (0x400f)
**ESP_ERR_MESH_NO_PERSISTENCE** (0x400f)
**ESP_ERR_MESH_SHORTEN_HEADER** (0x4010)
**ESP_ERR_MESH_OPTION_NULL** (0x4011)
**ESP_ERR_MESH_OPTION_UNKNOWN** (0x4012)
**ESP_ERR_MESH_INTERFACE** (0x4013)
**ESP_ERR_MESH_DISCARD_DUPLICATE** (0x4014)
**ESP_ERR_MESH_DISCARD** (0x4015)
**ESP_ERR_MESH_VOTING** (0x4016)
**ESP_ERR_MESH_XMIT** (0x4017)
**ESP_ERR_MESH_QUEUE_READ** (0x4018)
**ESP_ERR_MESH_PS** (0x4019)
**ESP_ERR_MESH_RECV_RELEASE** (0x401a)

ESP_ERR_FLASH_UNSUPPORTED_CHIP (0x6005)
ESP_ERR_FLASH_PROTECTED (0x6006)
ESP_ERR_HTTP_BASE (0x7000): Starting number of HTTP error codes
ESP_ERR_HTTP_MAX_REDIRECT (0x7001): The error exceeds the number of HTTP redirects
ESP_ERR_HTTP_CONNECT (0x7002): Error open the HTTP connection
ESP_ERR_HTTP_WRITE_DATA (0x7003): Error write HTTP data
ESP_ERR_HTTP_FETCH_HEADER (0x7004): Error read HTTP header from server
ESP_ERR_HTTP_INVALID_TRANSPORT (0x7005): There are no transport support for the input scheme
ESP_ERR_HTTP_CONNECTING (0x7006): HTTP connection hasn’t been established yet
ESP_ERR_HTTP_EAGAIN (0x7007): Mapping of errno EAGAIN to esp_err_t
ESP_ERR_HTTP_CONNECTION_CLOSED (0x7008): Read FIN from peer and the connection closed
ESP_ERR_ESP_TLS_BASE (0x8000): Starting number of ESP-TLS error codes
ESP_ERR_ESP_TLS_CANNOT_RESOLVE_HOSTNAME (0x8001): Error if hostname couldn’t be resolved upon tls connection
ESP_ERR_ESP_TLS_CANNOT_CREATE_SOCKET (0x8002): Failed to create socket
ESP_ERR_ESP_TLS_UNSUPPORTED_PROTOCOL_FAMILY (0x8003): Unsupported protocol family
ESP_ERR_ESP_TLS_FAILED_CONNECT_TO_HOST (0x8004): Failed to connect to host
ESP_ERR_ESP_TLS_SOCKET_SETOPT_FAILED (0x8005): failed to set/get socket option
ESP_ERR_ESP_TLS_CONNECTION_TIMEOUT (0x8006): new connection in esp_tls_low_level_conn connection timeouted
ESP_ERR_ESP_TLS_SE_FAILED (0x8007)

ESP_ERR_PING_NO_MEM (0xa002)
ESP_ERR_HTTPD_BASE (0xb000): Starting number of HTTPD error codes
ESP_ERR_HTTPD_HANDLERS_FULL (0xb001): All slots for registering URI handlers have been consumed
ESP_ERR_HTTPD_HANDLER_EXISTS (0xb002): URI handler with same method and target URI already registered
ESP_ERR_HTTPD_INVALID_REQ (0xb003): Invalid request pointer
ESP_ERR_HTTPD_RESULT_TRUNC (0xb004): Result string truncated
ESP_ERR_HTTPD_RESP_HDR (0xb005): Response header field larger than supported
ESP_ERR_HTTPD_RESP_SEND (0xb006): Error occurred while sending response packet
ESP_ERR_HTTPD_ALLOC_MEM (0xb007): Failed to dynamically allocate memory for resource
ESP_ERR_HTTPD_TASK (0xb008): Failed to launch server task/thread
ESP_ERR_HW_CRYPTO_BASE (0xc000): Starting number of HW cryptography module error codes
ESP_ERR_HW_CRYPTO_DS_HMAC_FAIL (0xc001): HMAC peripheral problem
ESP_ERR_HW_CRYPTO_DS_INVALID_KEY (0xc002)
ESP_ERR_HW_CRYPTO_DS_INVALID_DIGEST (0xc004)
ESP_ERR_HW_CRYPTO_DS_INVALID_PADDING (0xc005)

ESP_ERR_MEMPROT_BASE (0xd000): Starting number of Memory Protection API error codes
ESP_ERR_MEMPROT_MEMORY_TYPE_INVALID (0xd001)
ESP_ERR_MEMPROT_SPLIT_ADDR_INVALID (0xd002)
ESP_ERR_MEMPROT_SPLIT_ADDR_OUT_OF_RANGE (0xd003)
ESP_ERR_MEMPROT_SPLIT_ADDR_UNALIGNED (0xd004)
ESP_ERR_MEMPROT_UNIMGMT_BLOCK_INVALID (0xd005)
ESP_ERR_MEMPROT_WORLD_INVALID (0xd006)
ESP_ERR_MEMPROT_AREA_INVALID (0xd007)
ESP_ERR_MEMPROT_CPUID_INVALID (0xd008)

ESP_ERR_TCP_TRANSPORT_BASE (0xe000): Starting number of TCP Transport error codes
ESP_ERR_TCP_TRANSPORT_CONNECTION_TIMEOUT (0xe001): Connection has timed out
ESP_ERR_TCP_TRANSPORT_CONNECTION_CLOSED_BY_FIN (0xe002): Read FIN from peer and the connection has closed (in a clean way)
ESP_ERR_TCP_TRANSPORT_CONNECTION_FAILED (0xe003): Failed to connect to the peer
ESP_ERR_TCP_TRANSPORT_NO_MEM (0xe004): Memory allocation failed

ESP_ERR_NVS_SEC_BASE (0xf000): Starting number of error codes
ESP_ERR_NVS_SEC_HMAC_KEY_NOT_FOUND (0xf001): HMAC Key required to generate the NVS encryption keys not found
ESP_ERR_NVS_SEC_HMAC_KEY_BLK_ALREADY_USED (0xf002): Provided eFuse block for HMAC key generation is already in use
ESP_ERR_NVS_SEC_HMAC_KEY_GENERATION_FAILED (0xf003): Failed to generate/write the HMAC key to eFuse
ESP_ERR_NVS_SEC_HMAC_XTS_KEYS_DERIV_FAILED (0xf004): Failed to derive the NVS encryption keys based on the HMAC-based scheme

2.4 Networking APIs

2.4.1 Wi-Fi

ESP-NOW

Overview   ESP-NOW is a kind of connectionless Wi-Fi communication protocol that is defined by Espressif. In ESP-NOW, application data is encapsulated in a vendor-specific action frame and then transmitted from one Wi-Fi device to another without connection.

CTR with CBC-MAC Protocol (CCMP) is used to protect the action frame for security. ESP-NOW is widely used in smart light, remote controlling, sensor, etc.
Frame Format  ESP-NOW uses a vendor-specific action frame to transmit ESP-NOW data. The default ESP-NOW bit rate is 1 Mbps. The format of the vendor-specific action frame is as follows:

<table>
<thead>
<tr>
<th>MAC Header</th>
<th>Category Code</th>
<th>Organization Identifier</th>
<th>Random Values</th>
<th>Vendor Specific Content</th>
<th>FCS</th>
</tr>
</thead>
<tbody>
<tr>
<td>24 bytes</td>
<td>1 byte</td>
<td>3 bytes</td>
<td>4 bytes</td>
<td>7-257 bytes</td>
<td>4 bytes</td>
</tr>
</tbody>
</table>

- Category Code: The Category Code field is set to the value (127) indicating the vendor-specific category.
- Organization Identifier: The Organization Identifier contains a unique identifier (0x18fe34), which is the first three bytes of MAC address applied by Espressif.
- Random Value: The Random Value field is used to prevent relay attacks.
- Vendor Specific Content: The Vendor Specific Content contains vendor-specific fields as follows:

<table>
<thead>
<tr>
<th>Element ID</th>
<th>Length</th>
<th>Organization Identifier</th>
<th>Type</th>

</tbody>
</table>

- Element ID: The Element ID field is set to the value (221), indicating the vendor-specific element.
- Length: The length is the total length of Organization Identifier, Type, Version and Body.
- Organization Identifier: The Organization Identifier contains a unique identifier (0x18fe34), which is the first three bytes of MAC address applied by Espressif.
- Type: The Type field is set to the value (4) indicating ESP-NOW.
- Version: The Version field is set to the version of ESP-NOW.
- Body: The Body contains the ESP-NOW data.

As ESP-NOW is connectionless, the MAC header is a little different from that of standard frames. The FromDS and ToDS bits of FrameControl field are both 0. The first address field is set to the destination address. The second address field is set to the source address. The third address field is set to broadcast address (0xff:0xff:0xff:0xff:0xff:0xff).

Security  ESP-NOW uses the CCMP method, which is described in IEEE Std. 802.11-2012, to protect the vendor-specific action frame. The Wi-Fi device maintains a Primary Master Key (PMK) and several Local Master Keys (LMK). The lengths of both PMK and LMK are 16 bytes.

- PMK is used to encrypt LMK with the AES-128 algorithm. Call `esp_now_set_pmk()` to set PMK. If PMK is not set, a default PMK will be used.
- LMK of the paired device is used to encrypt the vendor-specific action frame with the CCMP method. The maximum number of different LMKs is six. If the LMK of the paired device is not set, the vendor-specific action frame will not be encrypted.

Encrypting multicast vendor-specific action frame is not supported.

Initialization and Deinitialization  Call `esp_now_init()` to initialize ESP-NOW and `esp_now_deinit()` to de-initialize ESP-NOW. ESP-NOW data must be transmitted after Wi-Fi is started, so it is recommended to start Wi-Fi before initializing ESP-NOW and stop Wi-Fi after de-initializing ESP-NOW.

When `esp_now_deinit()` is called, all of the information of paired devices are deleted.

Add Paired Device  Call `esp_now_add_peer()` to add the device to the paired device list before you send data to this device. If security is enabled, the LMK must be set. You can send ESP-NOW data via both the Station and the SoftAP interface. Make sure that the interface is enabled before sending ESP-NOW data.

The maximum number of paired devices is 20, and the paired encryption devices are no more than 17, the default is 7. If you want to change the number of paired encryption devices, set `CONFIG_ESP_WIFI_ESPNOW_MAX_ENCRYPT_NUM` in the Wi-Fi component configuration menu.
A device with a broadcast MAC address must be added before sending broadcast data. The range of the channel of paired devices is from 0 to 14. If the channel is set to 0, data will be sent on the current channel. Otherwise, the channel must be set as the channel that the local device is on.

**Send ESP-NOW Data** Call `esp_now_send()` to send ESP-NOW data and `esp_now_register_send_cb()` to register sending callback function. It will return `ESP_NOW_SEND_SUCCESS` in sending callback function if the data is received successfully on the MAC layer. Otherwise, it will return `ESP_NOW_SEND_FAIL`. Several reasons can lead to ESP-NOW fails to send data. For example, the destination device does not exist; the channels of the devices are not the same; the action frame is lost when transmitting on the air, etc. It is not guaranteed that application layer can receive the data. If necessary, send back ack data when receiving ESP-NOW data. If receiving ack data timeouts, retransmit the ESP-NOW data. A sequence number can also be assigned to ESP-NOW data to drop the duplicate data.

If there is a lot of ESP-NOW data to send, call `esp_now_send()` to send less than or equal to 250 bytes of data once a time. Note that too short interval between sending two ESP-NOW data may lead to disorder of sending callback function. So, it is recommended that sending the next ESP-NOW data after the sending callback function of the previous sending has returned. The sending callback function runs from a high-priority Wi-Fi task. So, do not do lengthy operations in the callback function. Instead, post the necessary data to a queue and handle it from a lower priority task.

**Receiving ESP-NOW Data** Call `esp_now_register_recv_cb()` to register receiving callback function. Call the receiving callback function when receiving ESP-NOW. The receiving callback function also runs from the Wi-Fi task. So, do not do lengthy operations in the callback function. Instead, post the necessary data to a queue and handle it from a lower priority task.

**Config ESP-NOW Rate** Call `esp_wifi_config_espnow_rate()` to config ESP-NOW rate of specified interface. Make sure that the interface is enabled before config rate. This API should be called after `esp_wifi_start()`.

**Config ESP-NOW Power-saving Parameter** Sleep is supported only when ESP32-S2 is configured as station.

Call `esp_now_set_wake_window()` to configure Window for ESP-NOW RX at sleep. The default value is the maximum, which allowing RX all the time.

If Power-saving is needed for ESP-NOW, call `esp_wifi_connectionless_module_set_wake_interval()` to configure Interval as well.

Please refer to `connectionless module power save` to get more detail.

**Application Examples**

- Example of sending and receiving ESP-NOW data between two devices: `wifi/espnow`.
- For more application examples of how to use ESP-NOW, please visit ESP-NOW repository.

**API Reference**

**Header File**

- `components/esp_wifi/include/esp_now.h`
- This header file can be included with:

  ```
  #include "esp_now.h"
  ```

- This header file is a part of the API provided by the `esp_wifi` component. To declare that your component depends on `esp_wifi`, add the following to your CMakeLists.txt:
Functions

\texttt{esp_err_t esp_now_init (void)}

Initialize ESPNOW function.

\textbf{Returns}
- ESP_OK: succeed
- ESP_ERR_ESPNOW_INTERNAL: Internal error

\texttt{esp_err_t esp_now_deinit (void)}

De-initialize ESPNOW function.

\textbf{Returns}
- ESP_OK: succeed

\texttt{esp_err_t esp_now_get_version (uint32_t *version)}

Get the version of ESPNOW.

\textbf{Parameters} \texttt{version} – ESPNOW version

\textbf{Returns}
- ESP_OK: succeed
- ESP_ERR_ESPNOW_ARG: invalid argument

\texttt{esp_err_t esp_now_register_recv_cb (esp_now_recv_cb_t cb)}

Register callback function of receiving ESPNOW data.

\textbf{Parameters} \texttt{cb} – callback function of receiving ESPNOW data

\textbf{Returns}
- ESP_OK: succeed
- ESP_ERR_ESPNOW_NOT_INIT: ESPNOW is not initialized
- ESP_ERR_ESPNOW_INTERNAL: internal error

\texttt{esp_err_t esp_now_unregister_recv_cb (void)}

Unregister callback function of receiving ESPNOW data.

\textbf{Returns}
- ESP_OK: succeed
- ESP_ERR_ESPNOW_NOT_INIT: ESPNOW is not initialized

\texttt{esp_err_t esp_now_register_send_cb (esp_now_send_cb_t cb)}

Register callback function of sending ESPNOW data.

\textbf{Parameters} \texttt{cb} – callback function of sending ESPNOW data

\textbf{Returns}
- ESP_OK: succeed
- ESP_ERR_ESPNOW_NOT_INIT: ESPNOW is not initialized
- ESP_ERR_ESPNOW_INTERNAL: internal error

\texttt{esp_err_t esp_now_unregister_send_cb (void)}

Unregister callback function of sending ESPNOW data.

\textbf{Returns}
- ESP_OK: succeed
- ESP_ERR_ESPNOW_NOT_INIT: ESPNOW is not initialized

\texttt{esp_err_t esp_now_send (const uint8_t *peer_addr, const uint8_t *data, size_t len)}

Send ESPNOW data.
Chapter 2. API Reference

**Attention 1.** If peer_addr is not NULL, send data to the peer whose MAC address matches peer_addr

**Attention 2.** If peer_addr is NULL, send data to all of the peers that are added to the peer list

**Attention 3.** The maximum length of data must be less than ESP_NOW_MAX_DATA_LEN

**Attention 4.** The buffer pointed to by data argument does not need to be valid after esp_now_send returns

**Parameters**

- **peer_addr** – peer MAC address
- **data** – data to send
- **len** – length of data

**Returns**

- ESP_OK : succeed
- ESP_ERR_ESPNOW_NOT_INIT : ESPNOW is not initialized
- ESP_ERR_ESPNOW_ARG : invalid argument
- ESP_ERR_ESPNOW_INTERNAL : internal error
- ESP_ERR_ESPNOW_NO_MEM : out of memory, when this happens, you can delay a while before sending the next data
- ESP_ERR_ESPNOW_NOT_FOUND : peer is not found
- ESP_ERR_ESPNOW_IF : current WiFi interface doesn’t match that of peer

```c
esp_err_t esp_now_add_peer (const esp_now_peer_info_t *peer)
```

Add a peer to peer list.

**Parameters**

- **peer** – peer information

**Returns**

- ESP_OK : succeed
- ESP_ERR_ESPNOW_NOT_INIT : ESPNOW is not initialized
- ESP_ERR_ESPNOW_ARG : invalid argument
- ESP_ERR_ESPNOW_FULL : peer list is full
- ESP_ERR_ESPNOW_NO_MEM : out of memory
- ESP_ERR_ESPNOW_EXIST : peer has existed

```c
esp_err_t esp_now_del_peer (const uint8_t *peer_addr)
```

Delete a peer from peer list.

**Parameters**

- **peer_addr** – peer MAC address

**Returns**

- ESP_OK : succeed
- ESP_ERR_ESPNOW_NOT_INIT : ESPNOW is not initialized
- ESP_ERR_ESPNOW_ARG : invalid argument
- ESP_ERR_ESPNOW_NOT_FOUND : peer is not found

```c
esp_err_t esp_now_mod_peer (const esp_now_peer_info_t *peer)
```

Modify a peer.

**Parameters**

- **peer** – peer information

**Returns**

- ESP_OK : succeed
- ESP_ERR_ESPNOW_NOT_INIT : ESPNOW is not initialized
- ESP_ERR_ESPNOW_ARG : invalid argument
- ESP_ERR_ESPNOW_FULL : peer list is full

```c
esp_err_t esp_wifi_config_espnow_rate (wifi_interface_t ifx, wifi_phy_rate_t rate)
```

Config ESPNOW rate of specified interface.

*Deprecated*: please use `esp_now_set_peer_rate_config()` instead.

**Attention 1.** This API should be called after esp_wifi_start().
**Attention** 2. This API only work when not use Wi-Fi 6 and `esp_now_set_peer_rate_config()` not called.

**Parameters**
- `ifx` - Interface to be configured.
- `rate` - Phy rate to be configured.

**Returns**
- `ESP_OK`: succeed
- others: failed

```c
esp_err_t esp_now_set_peer_rate_config (const uint8_t* peer_addr, esp_now_rate_config_t *config)
```
Set ESPNOW rate config for each peer.

**Attention** 1. This API should be called after `esp_wifi_start()` and `esp_now_init()`.

**Parameters**
- `peer_addr` - peer MAC address
- `config` - rate config to be configured.

**Returns**
- `ESP_OK`: succeed
- `ESP_ERR_ESPNOW_NOT_INIT`: ESPNOW is not initialized
- `ESP_ERR_ESPNOW_ARG`: invalid argument
- `ESP_ERR_ESPNOW_INTERNAL`: internal error

```c
esp_err_t esp_now_get_peer (const uint8_t* peer_addr, esp_now_peer_info_t *peer)
```
Get a peer whose MAC address matches `peer_addr` from peer list.

**Parameters**
- `peer_addr` - peer MAC address
- `peer` - peer information

**Returns**
- `ESP_OK`: succeed
- `ESP_ERR_ESPNOW_NOT_INIT`: ESPNOW is not initialized
- `ESP_ERR_ESPNOW_ARG`: invalid argument
- `ESP_ERR_ESPNOW_NOT_FOUND`: peer is not found

```c
esp_err_t esp_now_fetch_peer (bool from_head, esp_now_peer_info_t *peer)
```
Fetch a peer from peer list. Only return the peer which address is unicast, for the multicast/broadcast address, the function will ignore and try to find the next in the peer list.

**Parameters**
- `from_head` - fetch from head of list or not
- `peer` - peer information

**Returns**
- `ESP_OK`: succeed
- `ESP_ERR_ESPNOW_NOT_INIT`: ESPNOW is not initialized
- `ESP_ERR_ESPNOW_ARG`: invalid argument
- `ESP_ERR_ESPNOW_NOT_FOUND`: peer is not found

```c
bool esp_now_is_peer_exist (const uint8_t* peer_addr)
```
Peer exists or not.

**Parameters**
- `peer_addr` - peer MAC address

**Returns**
- `true`: peer exists
- `false`: peer not exists

```c
esp_err_t esp_now_get_peer_num (esp_now_peer_num_t *num)
```
Get the number of peers.
### Parameters

- **num** - number of peers

### Returns

- **ESP_OK**: succeed
- **ESP_ERR_ESPNOW_NOT_INIT**: ESPNOW is not initialized
- **ESP_ERR_ESPNOW_ARG**: invalid argument

```c
esp_err_t esp_now_set_pmk(const uint8_t *pmk)
```

Set the primary master key.

---

**Attention**  1. primary master key is used to encrypt local master key

### Parameters

- **pmk** - primary master key

### Returns

- **ESP_OK**: succeed
- **ESP_ERR_ESPNOW_NOT_INIT**: ESPNOW is not initialized
- **ESP_ERR_ESPNOW_ARG**: invalid argument

```c
esp_err_t esp_now_set_wake_window(uint16_t window)
```

Set wake window for esp_now to wake up in interval unit.

---

**Attention**  1. This configuration could work at connected status. When ESP_WIFI_STA_DISCONNECTED_PM_ENABLE is enabled, this configuration could work at disconnected status.

**Attention**  2. Default value is the maximum.

### Parameters

- **window** - Milliseconds would the chip keep waked each interval, from 0 to 65535.

### Returns

- **ESP_OK**: succeed
- **ESP_ERR_ESPNOW_NOT_INIT**: ESPNOW is not initialized

---

**Structures**

```c
struct esp_now_peer_info
```

ESPNOW peer information parameters.

---

**Public Members**

```c
uint8_t peer_addr[ESP_NOW_ETH_ALEN]
```

ESPNOW peer MAC address that is also the MAC address of station or softap

```c
uint8_t lmk[ESP_NOW_KEY_LEN]
```

ESPNOW peer local master key that is used to encrypt data

```c
uint8_t channel
```

Wi-Fi channel that peer uses to send/receive ESPNOW data. If the value is 0, use the current channel which station or softap is on. Otherwise, it must be set as the channel that station or softap is on.

```c
wifi_interface_t ifidx
```

Wi-Fi interface that peer uses to send/receive ESPNOW data
bool **encrypt**
ESPNOW data that this peer sends/receives is encrypted or not

void **priv**
ESPNOW peer private data

struct **esp_now_peer_num**
Number of ESPNOW peers which exist currently.

Public Members

int **total_num**
Total number of ESPNOW peers, maximum value is ESP_NOW_MAX_TOTAL_PEER_NUM

int **encrypt_num**
Number of encrypted ESPNOW peers, maximum value is ESP_NOW_MAX_ENCRYPT_PEER_NUM

struct **esp_now_recv_info**
ESPNOW packet information.

Public Members

uint8_t **src_addr**
Source address of ESPNOW packet

uint8_t **des_addr**
Destination address of ESPNOW packet

**wifi_pkt_rx_ctrl_t** *rx_ctrl*
Rx control info of ESPNOW packet

struct **esp_now_rate_config**
ESPNOW rate config.

Public Members

**wifi_phy_mode_t** *phy_mode*
ESPNOW phymode of specified interface

**wifi_phy_rate_t** *rate*
ESPNOW rate of specified interface

bool **ersu**
ESPNOW using ersu send frame

bool **dcm**
ESPNOW using dcm rate to send frame
Macros

ESP_ERR_ESPNOW_BASE
   ESPNOW error number base.

ESP_ERR_ESPNOW_NOT_INIT
   ESPNOW is not initialized.

ESP_ERR_ESPNOW_ARG
   Invalid argument

ESP_ERR_ESPNOW_NO_MEM
   Out of memory

ESP_ERR_ESPNOW_FULL
   ESPNOW peer list is full

ESP_ERR_ESPNOW_NOT_FOUND
   ESPNOW peer is not found

ESP_ERR_ESPNOW_INTERNAL
   Internal error

ESP_ERR_ESPNOW_EXIST
   ESPNOW peer has existed

ESP_ERR_ESPNOW_IF
   Interface error

ESP_NOW_ETH_ALEN
   Length of ESPNOW peer MAC address

ESP_NOW_KEY_LEN
   Length of ESPNOW peer local master key

ESP_NOW_MAX_TOTAL_PEER_NUM
   Maximum number of ESPNOW total peers

ESP_NOW_MAX_ENCRYPT_PEER_NUM
   Maximum number of ESPNOW encrypted peers

ESP_NOW_MAX_DATA_LEN
   Maximum length of ESPNOW data which is sent very time

Type Definitions

typedef struct esp_now_peer_info esp_now_peer_info_t
   ESPNOW peer information parameters.

typedef struct esp_now_peer_num esp_now_peer_num_t
   Number of ESPNOW peers which exist currently.
typedef struct esp_now_recv_info esp_now_recv_info_t
ESPNOW packet information.

typedef struct esp_now_rate_config esp_now_rate_config_t
ESPNOW rate config.

typedef void (*esp_now_recv_cb_t)(const esp_now_recv_info_t *esp_now_info, const uint8_t *data, int data_len)
Callback function of receiving ESPNOW data.

**Attention** esp_now_info is a local variable, it can only be used in the callback.

Parameter

| Param esp_now_info | received ESPNOW packet information |
| Param data         | received data                        |
| Param data_len     | length of received data              |

typedef void (*esp_now_send_cb_t)(const uint8_t *mac_addr, esp_now_send_status_t status)
Callback function of sending ESPNOW data.

Parameter

| Param mac_addr    | peer MAC address                    |
| Param status      | status of sending ESPNOW data (succeed or fail) |

**Enumerations**

define esp_now_send_status_t
Status of sending ESPNOW data.

Values:

- enumerator ESP_NOW_SEND_SUCCESS
  Send ESPNOW data successfully

- enumerator ESP_NOW_SEND_FAIL
  Send ESPNOW data fail

**ESP-WIFI-MESH Programming Guide**

This is a programming guide for ESP-WIFI-MESH, including the API reference and coding examples. This guide is split into the following parts:

1. ESP-WIFI-MESH Programming Model
2. Writing an ESP-WIFI-MESH Application
3. Self-Organized Networking
4. Application Examples
5. API Reference

For documentation regarding the ESP-WIFI-MESH protocol, please see the ESP-WIFI-MESH API Guide. For more information about ESP-WIFI-MESH Development Framework, please see ESP-WIFI-MESH Development Framework.

**ESP-WIFI-MESH Programming Model**
**Software Stack**  The ESP-WIFI-MESH software stack is built atop the Wi-Fi Driver/FreeRTOS and may use the LwIP Stack in some instances (i.e., the root node). The following diagram illustrates the ESP-WIFI-MESH software stack.

![Diagram of ESP-WIFI-MESH Software Stack](image)

**Fig. 1: ESP-WIFI-MESH Software Stack**

**System Events**  An application interfaces with ESP-WIFI-MESH via **ESP-WIFI-MESH Events**. Since ESP-WIFI-MESH is built atop the Wi-Fi stack, it is also possible for the application to interface with the Wi-Fi driver via the **Wi-Fi Event Task**. The following diagram illustrates the interfaces for the various System Events in an ESP-WIFI-MESH application.

![Diagram of ESP-WIFI-MESH System Events Delivery](image)

**Fig. 2: ESP-WIFI-MESH System Events Delivery**

The `mesh_event_id_t` defines all possible ESP-WIFI-MESH events and can indicate events such as the connection/disconnection of parent/child. Before ESP-WIFI-MESH events can be used, the application must register a **Mesh Events handler** via `esp_event_handler_register()` to the default event task. The Mesh Events handler that is registered contain handlers for each ESP-WIFI-MESH event relevant to the application.

Typical use cases of mesh events include using events such as `MESH_EVENT_PARENT_CONNECTED` and `MESH_EVENT_CHILD_CONNECTED` to indicate when a node can begin transmitting data upstream and downstream respectively. Likewise, `IP_EVENT_STA_GOT_IP` and `IP_EVENT_STA_LOST_IP` can be used to indicate when the root node can and cannot transmit data to the external IP network.

**Warning:** When using ESP-WIFI-MESH under self-organized mode, users must ensure that no calls to Wi-Fi API are made. This is due to the fact that the self-organizing mode will internally make Wi-Fi API calls to connect/disconnect/scan etc. Any Wi-Fi calls from the application (including calls from callbacks and handlers of Wi-Fi events) may interfere with ESP-WIFI-MESH’s self-organizing behavior. Therefore, users should not call Wi-Fi APIs after `esp_mesh_start()` is called, and before `esp_mesh_stop()` is called.
LwIP & ESP-WIFI-MESH The application can access the ESP-WIFI-MESH stack directly without having to go through the LwIP stack. The LwIP stack is only required by the root node to transmit/receive data to/from an external IP network. However, since every node can potentially become the root node (due to automatic root node selection), each node must still initialize the LwIP stack.

Each node that could become root is required to initialize LwIP by calling `esp_netif_init()`. In order to prevent non-root node access to LwIP, the application should not create or register any network interfaces using `esp_netif` APIs.

ESP-WIFI-MESH requires a root node to be connected with a router. Therefore, in the event that a node becomes the root, the corresponding handler must start the DHCP client service and immediately obtain an IP address. Doing so will allow other nodes to begin transmitting/receiving packets to/from the external IP network. However, this step is unnecessary if static IP settings are used.

Writing an ESP-WIFI-MESH Application The prerequisites for starting ESP-WIFI-MESH is to initialize LwIP and Wi-Fi. The following code snippet demonstrates the necessary prerequisite steps before ESP-WIFI-MESH itself can be initialized.

```c
ESP_ERROR_CHECK(esp_netif_init());
/* event initialization */
ESP_ERROR_CHECK(esp_event_loop_create_default());
/* Wi-Fi initialization */
wifi_init_config_t config = WIFI_INIT_CONFIG_DEFAULT();
ESP_ERROR_CHECK(esp_wifi_init(&config));
/* register IP events handler */
ESP_ERROR_CHECK(esp_event_handler_register(IP_EVENT,
                                          IP_EVENT_STA_GOT_IP,
                                          &ip_,
                                          event_handler,
                                          NULL));
ESP_ERROR_CHECK(esp_wifi_set_storage(WIFI_STORAGE_FLASH));
ESP_ERROR_CHECK(esp_wifi_start());
```

After initializing LwIP and Wi-Fi, the process of getting an ESP-WIFI-MESH network up and running can be summarized into the following three steps:

1. **Initialize Mesh**
2. **Configuring an ESP-WIFI-MESH Network**
3. **Start Mesh**

Initialize Mesh The following code snippet demonstrates how to initialize ESP-WIFI-MESH.

```c
/* mesh initialization */
ESP_ERROR_CHECK(esp_mesh_init());
/* register mesh events handler */
ESP_ERROR_CHECK(esp_event_handler_register(MESH_EVENT,
                                          ESP_EVENT_ANY_ID,
                                          &mesh_,
                                          event_handler,
                                          NULL));
```

Configuring an ESP-WIFI-MESH Network ESP-WIFI-MESH is configured via `esp_mesh_set_config()` which receives its arguments using the `mesh_cfg_t` structure. The structure contains the following parameters used to configure ESP-WIFI-MESH:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Channel</td>
<td>Range from 1 to 14</td>
</tr>
<tr>
<td>Mesh ID</td>
<td>ID of ESP-WIFI-MESH Network, see <code>mesh_addr_t</code></td>
</tr>
<tr>
<td>Router</td>
<td>Router Configuration, see <code>mesh_router_t</code></td>
</tr>
<tr>
<td>Mesh AP</td>
<td>Mesh AP Configuration, see <code>mesh_ap_cfg_t</code></td>
</tr>
<tr>
<td>Crypto Functions</td>
<td>Crypto Functions for Mesh IE, see <code>mesh_crypto_funcs_t</code></td>
</tr>
</tbody>
</table>

The following code snippet demonstrates how to configure ESP-WIFI-MESH.
/* Enable the Mesh IE encryption by default */
mesh_cfg_t cfg = MESH_INIT_CONFIG_DEFAULT();
/* mesh ID */
memcpy((uint8_t *) &cfg.mesh_id, MESH_ID, 6);
/* channel (must match the router's channel) */
cfg.channel = CONFIG_MESH_CHANNEL;
/* router */
cfg.router.ssid_len = strlen(CONFIG_MESH_ROUTER_SSID);
memcpy((uint8_t *) &cfg.router.ssid, CONFIG_MESH_ROUTER_SSID,
cfg.router.ssid_len);
memcpy((uint8_t *) &cfg.router.password, CONFIG_MESH_ROUTER_PASSWD,
strlen(CONFIG_MESH_ROUTER_PASSWD));
/* mesh softAP */
cfg.mesh_ap.max_connection = strlen(CONFIG_MESH_AP_CONNECTIONS);
memcpy((uint8_t *) &cfg.mesh_ap.password, CONFIG_MESH_AP_PASSWD,
strlen(CONFIG_MESH_AP_PASSWD));
ESP_ERROR_CHECK(esp_mesh_set_config(&cfg));

ESP_ERROR_CHECK(esp_mesh_start());

After starting ESP-WIFI-MESH, the application should check for ESP-WIFI-MESH events to determine when it
has connected to the network. After connecting, the application can start transmitting and receiving packets over the
ESP-WIFI-MESH network using esp_mesh_send() and esp_meshRecv().

Self-Organized Networking  Self-organized networking is a feature of ESP-WIFI-MESH where nodes can au-
tonomously scan/select/connect/reconnect to other nodes and routers. This feature allows an ESP-WIFI-MESH net-
work to operate with high degree of autonomy by making the network robust to dynamic network topologies and
conditions. With self-organized networking enabled, nodes in an ESP-WIFI-MESH network are able to carry out
the following actions without autonomously:

- Selection or election of the root node (see Automatic Root Node Selection in Building a Network)
- Selection of a preferred parent node (see Parent Node Selection in Building a Network)
- Automatic reconnection upon detecting a disconnection (see Intermediate Parent Node Failure in Managing
  a Network)

When self-organized networking is enabled, the ESP-WIFI-MESH stack will internally make calls to Wi-Fi APIs.
Therefore, the application layer should not make any calls to Wi-Fi APIs whilst self-organized networking is
enabled as doing so would risk interfering with ESP-WIFI-MESH.

Toggling Self-Organized Networking  Self-organized networking can be enabled or disabled by the application
at runtime by calling the esp_mesh_set_self_organized() function. The function has the two following
parameters:

- bool enable specifies whether to enable or disable self-organized networking.
- bool select_parent specifies whether a new parent node should be selected when enabling self-
  organized networking. Selecting a new parent has different effects depending the node type and the node’s
  current state. This parameter is unused when disabling self-organized networking.

Disabling Self-Organized Networking  The following code snippet demonstrates how to disable self-organized
networking.

//Disable self-organized networking
esp_mesh_set_self_organized(false, false);

ESP-WIFI-MESH will attempt to maintain the node’s current Wi-Fi state when disabling self-organized networking.
• If the node was previously connected to other nodes, it will remain connected.
• If the node was previously disconnected and was scanning for a parent node or router, it will stop scanning.
• If the node was previously attempting to reconnect to a parent node or router, it will stop reconnecting.

Enabling Self-Organized Networking  ESP-WIFI-MESH will attempt to maintain the node’s current Wi-Fi state when enabling self-organized networking. However, depending on the node type and whether a new parent is selected, the Wi-Fi state of the node can change. The following table shows effects of enabling self-organized networking.

<table>
<thead>
<tr>
<th>Select Parent</th>
<th>Is Root Node</th>
<th>Effects</th>
</tr>
</thead>
</table>
| N             | N           | • Nodes already connected to a parent node will remain connected.
|               |             | • Nodes previously scanning for a parent nodes will stop scanning. Call `esp_mesh_connect()` to restart. |
| Y             | Y           | • A root node already connected to router will stay connected.
|               |             | • A root node disconnected from router will need to call `esp_mesh_connect()` to reconnect. |
| Y             | N           | • Nodes without a parent node will automatically select a preferred parent and connect.
|               |             | • Nodes already connected to a parent node will disconnect, reselect a preferred parent node, and connect. |
| Y             | Y           | • For a root node to connect to a parent node, it must give up it’s role as root. Therefore, a root node will disconnect from the router and all child nodes, select a preferred parent node, and connect. |

The following code snippet demonstrates how to enable self-organized networking.

```c
//Enable self-organized networking and select a new parent
esp_mesh_set_self_organized(true, true);
...

//Enable self-organized networking and manually reconnect
esp_mesh_set_self_organized(true, false);
esp_mesh_connect();
```
Calling Wi-Fi API  There can be instances in which an application may want to directly call Wi-Fi API whilst using ESP-WIFI-MESH. For example, an application may want to manually scan for neighboring APs. However, self-organized networking must be disabled before the application calls any Wi-Fi APIs. This will prevent the ESP-WIFI-MESH stack from attempting to call any Wi-Fi APIs and potentially interfering with the application’s calls.

Therefore, application calls to Wi-Fi APIs should be placed in between calls of `esp_mesh_set_self_organized()` which disable and enable self-organized networking. The following code snippet demonstrates how an application can safely call `esp_wifi_scan_start()` whilst using ESP-WIFI-MESH.

```
//Disable self-organized networking
esp_mesh_set_self_organized(0, 0);

//Stop any scans already in progress
esp_wifi_scan_stop();

//Manually start scan. Will automatically stop when run to completion
esp_wifi_scan_start();

//Process scan results
...

//Re-enable self-organized networking if still connected
esp_mesh_set_self_organized(1, 0);

...

//Re-enable self-organized networking if non-root and disconnected
esp_mesh_set_self_organized(1, 1);

...

//Re-enable self-organized networking if root and disconnected
esp_mesh_set_self_organized(1, 0); //Do not select new parent
esp_mesh_connect(); //Manually reconnect to router
```

Application Examples  ESP-IDF contains these ESP-WIFI-MESH example projects:

The Internal Communication Example  demonstrates how to set up a ESP-WIFI-MESH network and have the root node send a data packet to every node within the network.

The Manual Networking Example  demonstrates how to use ESP-WIFI-MESH without the self-organizing features. This example shows how to program a node to manually scan for a list of potential parent nodes and select a parent node based on custom criteria.

API Reference

Header File

- components/esp_wifi/include/esp_mesh.h
- This header file can be included with:

  ```c
  #include "esp_mesh.h"
  ```

- This header file is a part of the API provided by the esp_wifi component. To declare that your component depends on esp_wifi, add the following to your CMakeLists.txt:

  ```cmake
  REQUIRE ESP_WIFI
  ```
Functions

`esp_err_t esp_mesh_init(void)`

Mesh initialization.

- Check whether Wi-Fi is started.
- Initialize mesh global variables with default values.

**Attention** This API shall be called after Wi-Fi is started.

**Returns**

- ESP_OK
- ESP_FAIL

`esp_err_t esp_mesh_deinit(void)`

Mesh de-initialization.

- Release resources and stop the mesh

**Returns**

- ESP_OK
- ESP_FAIL

`esp_err_t esp_mesh_start(void)`

Start mesh.

- Initialize mesh IE.
- Start mesh network management service.
- Create TX and RX queues according to the configuration.
- Register mesh packets receive callback.

**Attention** This API shall be called after mesh initialization and configuration.

**Returns**

- ESP_OK
- ESP_FAIL
- ESP_ERR_MESH_NOT_INIT
- ESP_ERR_MESH_NOT_CONFIG
- ESP_ERR_MESH_NO_MEMORY

`esp_err_t esp_mesh_stop(void)`

Stop mesh.

- Deinitialize mesh IE.
- Disconnect with current parent.
- Disassociate all currently associated children.
- Stop mesh network management service.
- Unregister mesh packets receive callback.
• Delete TX and RX queues.
• Release resources.
• Restore Wi-Fi softAP to default settings if Wi-Fi dual mode is enabled.
• Set Wi-Fi Power Save type to WIFI_PS_NONE.

Returns

- ESP_OK
- ESP_FAIL

`esp_err_t esp_mesh_send` (const `mesh_addr_t *to`, const `mesh_data_t *data`, int `flag`, const `mesh_opt_t opt[]`, int `opt_count`)

Send a packet over the mesh network.

- Send a packet to any device in the mesh network.
- Send a packet to external IP network.

Attention This API is not reentrant.

Parameters

- **to** - [in] the address of the final destination of the packet
  - If the packet is to the root, set this parameter to NULL.
  - If the packet is to an external IP network, set this parameter to the IPv4:PORT combination. This packet will be delivered to the root firstly, then the root will forward this packet to the final IP server address.
- **data** - [in] pointer to a sending mesh packet
  - Field size should not exceed MESH_MPS. Note that the size of one mesh packet should not exceed MESH_MTU.
  - Field proto should be set to data protocol in use (default is MESH_PROTO_BIN for binary).
  - Field tos should be set to transmission tos (type of service) in use (default is MESH_TOS_P2P for point-to-point reliable).
- **flag** - [in] bitmap for data sent
  - Speed up the route search
    - If the packet is to the root and “to” parameter is NULL, set this parameter to 0.
    - If the packet is to an internal device, MESH_DATA_P2P should be set.
    - If the packet is to the root (“to” parameter isn’t NULL) or to external IP network, MESH_DATA_TODS should be set.
    - If the packet is from the root to an internal device, MESH_DATA_FROMDS should be set.
  - Specify whether this API is block or non-block, block by default
    - If needs non-blocking, MESH_DATA_NONBLOCK should be set. Otherwise, may use esp_mesh_send_block_time() to specify a blocking time.
  - In the situation of the root change, MESH_DATA_DROP identifies this packet can be dropped by the new root for upstream data to external IP network, we try our best to avoid data loss caused by the root change, but there is a risk that the new root is running out of memory because most of memory is occupied by the pending data which isn’t read out in time by esp_mesh_recv_toDS().
    Generally, we suggest esp_mesh_recv_toDS() is called after a connection with IP network is created. Thus data outgoing to external IP network via socket is just from reading esp_mesh_recv_toDS() which avoids unnecessary memory copy.
- **opt** - [in] options
  - In case of sending a packet to a certain group, MESH_OPT_SEND_GROUP is a good choice. In this option, the value field should be set to the target receiver addresses in this group.
Chapter 2. API Reference

Root sends a packet to an internal device, this packet is from external IP network in case the receiver device responds this packet, MESH_OPT_RECV_DS_ADDR is required to attach the target DS address.

- **opt_count** – [in] option count
  - Currently, this API only takes one option, so opt_count is only supported to be 1.

**Returns**

- ESP_OK
- ESP_FAIL
- ESP_ERR_MESH_ARGUMENT
- ESP_ERR_MESH_NOT_START
- ESP_ERR_MESH_DISCONNECTED
- ESP_ERR_MESH_OPT_UNKNOWN
- ESP_ERR_MESH_EXCEED_MTU
- ESP_ERR_MESH_NO_MEMORY
- ESP_ERR_MESH_TIMEOUT
- ESP_ERR_MESH_QUEUE_FULL
- ESP_ERR_MESH_NO_ROUTE_FOUND
- ESP_ERR_MESH_DISCARD

```c
esp_err_t esp_mesh_send_block_time(uint32_t time_ms)
```

Set blocking time of esp_mesh_send().

**Attention** This API shall be called before mesh is started.

**Parameters**

- **time_ms** – [in] blocking time of esp_mesh_send(), unit: ms

**Returns**

- ESP_OK

```c
esp_err_t esp_mesh_recv(mesh_addr_t *from, mesh_data_t *data, int timeout_ms, int *flag, mesh_opt_t *opt[], int opt_count)
```

Receive a packet targeted to self over the mesh network.

*flag could be MESH_DATA_FROMDS or MESH_DATA_TODS.*

**Attention** Mesh RX queue should be checked regularly to avoid running out of memory.

- Use esp_mesh_get_rx_pending() to check the number of packets available in the queue waiting to be received by applications.

**Parameters**

- **from** – [out] the address of the original source of the packet
- **data** – [out] pointer to the received mesh packet
  - Field proto is the data protocol in use. Should follow it to parse the received data.
  - Field tos is the transmission tos (type of service) in use.
- **timeout_ms** – [in] wait time if a packet isn’t immediately available (0: no wait, port-MAX_DELAY: wait forever)
- **flag** – [out] bitmap for data received
  - MESH_DATA_FROMDS represents data from external IP network
  - MESH_DATA_TODS represents data directed upward within the mesh network
- **opt** – [out] options desired to receive
  - MESH_OPT_RECV_DS_ADDR attaches the DS address
- **opt_count** – [in] option count desired to receive
  - Currently, this API only takes one option, so opt_count is only supported to be 1.

**Returns**

- ESP_OK
- ESP_ERR_MESH_ARGUMENT
- ESP_ERR_MESH_NOT_START
Receive a packet targeted to external IP network.

- Root uses this API to receive packets destined to external IP network
- Root forwards the received packets to the final destination via socket.
- If no socket connection is ready to send out the received packets and this esp_mesh_recv_toDS() hasn’t been called by applications, packets from the whole mesh network will be pending in toDS queue.

Use esp_mesh_get_rx_pending() to check the number of packets available in the queue waiting to be received by applications in case of running out of memory in the root.

Using esp_mesh_set_xon_qsize() users may configure the RX queue size, default:32. If this size is too large, and esp_mesh_recv_toDS() isn’t called in time, there is a risk that a great deal of memory is occupied by the pending packets. If this size is too small, it will impact the efficiency on upstream. How to decide this value depends on the specific application scenarios.

flag could be MESH_DATA_TODS.

**Attention** This API is only called by the root.

### Parameters

- **from** [out] the address of the original source of the packet
- **to** [out] the address contains remote IP address and port (IPv4:PORT)
- **data** [out] pointer to the received packet
  - Contain the protocol and applications should follow it to parse the data.
- **timeout_ms** [in] wait time if a packet isn’t immediately available (0: no wait, port-MAX_DELAY: wait forever)
- **flag** [out] bitmap for data received
  - MESH_DATA_TODS represents the received data target to external IP network. Root shall forward this data to external IP network via the association with router.
- **opt** [out] options desired to receive
- **opt_count** [in] option count desired to receive

### Returns

- ESP_OK
- ESP_ERR_MESH_ARGUMENT
- ESP_ERR_MESH_NOT_START
- ESP_ERR_MESH_TIMEOUT
- ESP_ERR_MESH_DISCARD
- ESP_ERR_MESH_RECV_RELEASE

### esp_err_t esp_mesh_set_config(const mesh_cfg_t *config)

Set mesh stack configuration.

- Use MESH_INIT_CONFIG_DEFAULT() to initialize the default values, mesh IE is encrypted by default.
- Mesh network is established on a fixed channel (1-14).
- Mesh event callback is mandatory.
- Mesh ID is an identifier of an MBSS. Nodes with the same mesh ID can communicate with each other.
- Regarding to the router configuration, if the router is hidden, BSSID field is mandatory.

If BSSID field isn’t set and there exists more than one router with same SSID, there is a risk that more roots than one connected with different BSSID will appear. It means more than one mesh network is established with the same mesh ID.
Root conflict function could eliminate redundant roots connected with the same BSSID, but couldn’t handle roots connected with different BSSID. Because users might have such requirements of setting up routers with same SSID for the future replacement. But in that case, if the above situations happen, please make sure applications implement forward functions on the root to guarantee devices in different mesh networks can communicate with each other. max_connection of mesh softAP is limited by the max number of Wi-Fi softAP supported (max:10).

**Attention** This API shall be called before mesh is started after mesh is initialized.

**Parameters**
- `config` [in] pointer to mesh stack configuration

**Returns**
- ESP_OK
- ESP_ERR_MESH_ARGUMENT
- ESP_ERR_MESH_NOT_ALLOWED

```c
esp_err_t esp_mesh_get_config(mesh_cfg_t *config)
```
Get mesh stack configuration.

**Parameters**
- `config` [out] pointer to mesh stack configuration

**Returns**
- ESP_OK
- ESP_ERR_MESH_ARGUMENT

```c
esp_err_t esp_mesh_set_router(const mesh_router_t *router)
```
Get router configuration.

**Attention** This API is used to dynamically modify the router configuration after mesh is configured.

**Parameters**
- `router` [in] pointer to router configuration

**Returns**
- ESP_OK
- ESP_ERR_MESH_ARGUMENT

```c
esp_err_t esp_mesh_get_router(mesh_router_t *router)
```
Get router configuration.

**Parameters**
- `router` [out] pointer to router configuration

**Returns**
- ESP_OK
- ESP_ERR_MESH_ARGUMENT

```c
esp_err_t esp_mesh_set_id(const mesh_addr_t *id)
```
Set mesh network ID.

**Attention** This API is used to dynamically modify the mesh network ID.

**Parameters**
- `id` [in] pointer to mesh network ID

**Returns**
- ESP_OK
- ESP_ERR_MESH_ARGUMENT: invalid argument

```c
esp_err_t esp_mesh_get_id(mesh_addr_t *id)
```
Get mesh network ID.

**Parameters**
- `id` [out] pointer to mesh network ID

**Returns**
Chapter 2. API Reference

- ESP_OK
- ESP_ERR_MESH_ARGUMENT

`esp_err_t esp_mesh_set_type(mesh_type_t type)`

Designate device type over the mesh network.

- MESH_IDLE: designates a device as a self-organized node for a mesh network
- MESH_ROOT: designates the root node for a mesh network
- MESH_LEAF: designates a device as a standalone Wi-Fi station that connects to a parent
- MESH_STA: designates a device as a standalone Wi-Fi station that connects to a router

Parameters type –[in] device type

Returns
- ESP_OK
- ESP_ERR_MESH_NOT_ALLOWED

`mesh_type_t esp_mesh_get_type(void)`

Get device type over mesh network.

Attention This API shall be called after having received the event MESH_EVENT_PARENT_CONNECTED.

Returns mesh type

`esp_err_t esp_mesh_set_max_layer(int max_layer)`

Set network max layer value.

- for tree topology, the max is 25.
- for chain topology, the max is 1000.
- Network max layer limits the max hop count.

Attention This API shall be called before mesh is started.

Parameters max_layer –[in] max layer value

Returns
- ESP_OK
- ESP_ERR_MESH_ARGUMENT
- ESP_ERR_MESH_NOT_ALLOWED

`int esp_mesh_get_max_layer(void)`

Get max layer value.

Returns max layer value

`esp_err_t esp_mesh_set_ap_password(const uint8_t *pwd, int len)`

Set mesh softAP password.

Attention This API shall be called before mesh is started.

Parameters
- pwd –[in] pointer to the password
- len –[in] password length

Returns
Chapter 2. API Reference

- ESP_OK
- ESP_ERR_MESH_ARGUMENT
- ESP_ERR_MESH_NOT_ALLOWED

```c
esp_err_t esp_mesh_set_ap_authmode (wifi_auth_mode_t authmode)
```
Set mesh softAP authentication mode.

**Attention** This API shall be called before mesh is started.

**Parameters** authmode - [in] authentication mode

**Returns**
- ESP_OK
- ESP_ERR_MESH_ARGUMENT
- ESP_ERR_MESH_NOT_ALLOWED

```c
wifi_auth_mode_t esp_mesh_get_ap_authmode (void)
```
Get mesh softAP authentication mode.

**Returns** authentication mode

```c
esp_err_t esp_mesh_set_ap_connections (int connections)
```
Set mesh max connection value.

- Set mesh softAP max connection = mesh max connection + non-mesh max connection

**Attention** This API shall be called before mesh is started.

**Parameters** connections - [in] the number of max connections

**Returns**
- ESP_OK
- ESP_ERR_MESH_ARGUMENT

```c
int esp_mesh_get_ap_connections (void)
```
Get mesh max connection configuration.

**Returns** the number of mesh max connections

```c
int esp_mesh_get_non_mesh_connections (void)
```
Get non-mesh max connection configuration.

**Returns** the number of non-mesh max connections

```c
int esp_mesh_get_layer (void)
```
Get current layer value over the mesh network.

**Attention** This API shall be called after having received the event MESH_EVENT_PARENT_CONNECTED.

**Returns** layer value

```c
esp_err_t esp_mesh_get_parent_bssid (mesh_addr_t *bssid)
```
Get the parent BSSID.

**Attention** This API shall be called after having received the event MESH_EVENT_PARENT_CONNECTED.
**Parameters** bssid [out] pointer to parent BSSID

**Returns**
- ESP_OK
- ESP_FAIL

bool esp_mesh_is_root (void)

Return whether the device is the root node of the network.

**Returns** true/false

**Attention** This API is used to dynamically modify whether to enable the self organizing.

**Parameters**
- enable [in] enable or disable self-organized networking
- select_parent [in] Only valid when self-organized networking is enabled.
  - if select_parent is set to true, the root will give up its mesh root status and search for a new parent like other non-root devices.

**Returns**
- ESP_OK
- ESP_FAIL

bool esp_mesh_get_self_organized (void)

Return whether enable self-organized networking or not.

**Returns** true/false

**Attention** This API is only called by the root.

**Parameters**
- vote [in] vote configuration
  - If this parameter is set NULL, the vote will perform the default 15 times.
  - Field percentage threshold is 0.9 by default.
– Field is_rc_specified shall be false.
– Field attempts shall be at least 15 times.

• reason [in] only accept MESH_VOTE_REASON_ROOT_INITIATED for now

Returns
• ESP_OK
• ESP_ERR_MESH_QUEUE_FULL
• ESP_ERR_MESH_DISCARD
• ESP_FAIL

`esp_err_t esp_mesh_set_vote_percentage(float percentage)`
Set vote percentage threshold for approval of being a root (default:0.9)

• During the networking, only obtaining vote percentage reaches this threshold, the device could be a root.

Attention This API shall be called before mesh is started.

Parameters percentage [in] vote percentage threshold

Returns
• ESP_OK
• ESP_FAIL

`float esp_mesh_get_vote_percentage(void)`
Get vote percentage threshold for approval of being a root.

Returns percentage threshold

`esp_err_t esp_mesh_set_ap_assoc_expire(int seconds)`
Set mesh softAP associate expired time (default:10 seconds)

• If mesh softAP hasn’t received any data from an associated child within this time, mesh softAP will take this child inactive and disassociate it.
• If mesh softAP is encrypted, this value should be set a greater value, such as 30 seconds.

Parameters seconds [in] the expired time

Returns
• ESP_OK
• ESP_FAIL

`int esp_mesh_get_ap_assoc_expire(void)`
Get mesh softAP associate expired time.

Returns seconds

`int esp_mesh_get_total_node_num(void)`
Get total number of devices in current network (including the root)

Attention The returned value might be incorrect when the network is changing.

Returns total number of devices (including the root)

`int esp_mesh_get_routing_table_size(void)`
Get the number of devices in this device’s sub-network (including self)

Returns the number of devices over this device’s sub-network (including self)

```c
esp_err_t esp_mesh_get_routing_table(mesh_addr_t *mac, int len, int *size)
```

Get routing table of this device’s sub-network (including itself)

**Parameters**
- `mac` - [out] pointer to routing table
- `len` - [in] routing table size (in bytes)
- `size` - [out] pointer to the number of devices in routing table (including itself)

**Returns**
- ESP_OK
- ESP_ERR_MESH_ARGUMENT

```c
esp_err_t esp_mesh_post_toDS_state(bool reachable)
```

Post the toDS state to the mesh stack.

**Attention** This API is only for the root.

**Parameters** `reachable` - [in] this state represents whether the root is able to access external IP network

**Returns**
- ESP_OK
- ESP_FAIL

```c
esp_err_t esp_mesh_get_tx_pending(mesh_tx_pending_t *pending)
```

Return the number of packets pending in the queue waiting to be sent by the mesh stack.

**Parameters** `pending` - [out] pointer to the TX pending

**Returns**
- ESP_OK
- ESP_FAIL

```c
esp_err_t esp_mesh_get_rx_pending(mesh_rx_pending_t *pending)
```

Return the number of packets available in the queue waiting to be received by applications.

**Parameters** `pending` - [out] pointer to the RX pending

**Returns**
- ESP_OK
- ESP_FAIL

```c
int esp_mesh_available_txupQ_num(const mesh_addr_t *addr, uint32_t *xseqno_in)
```

Return the number of packets could be accepted from the specified address.

**Parameters**
- `addr` - [in] self address or an associate children address
- `xseqno_in` - [out] sequence number of the last received packet from the specified address

**Returns** the number of upQ for a certain address

```c
esp_err_t esp_mesh_set_xon_qsize(int qsize)
```

Set the number of RX queue for the node, the average number of window allocated to one of its child node is: 

\[
\text{wnd} = \frac{\text{xon_qsize}}{(2 \times \text{max_connection} + 1)}
\]

However, the window of each child node is not strictly equal to the average value, it is affected by the traffic also.

**Attention** This API shall be called before mesh is started.

**Parameters** `qsize` - [in] default:32 (min:16)

**Returns**
- ESP_OK
- ESP_FAIL
int esp_mesh_get_xon_qsize (void)
Get queue size.

Returns the number of queue

esp_err_t esp_mesh_allow_root_conflicts (bool allowed)
Set whether allow more than one root existing in one network.

Parameters allowed [in] allow or not

Returns
  • ESP_OK
  • ESP_WIFI_ERR_NOT_INIT
  • ESP_WIFI_ERR_NOT_START

bool esp_mesh_is_root_conflicts_allowed (void)
Check whether allow more than one root to exist in one network.

Returns true/false

esp_err_t esp_mesh_set_group_id (const mesh_addr_t *addr, int num)
Set group ID addresses.

Parameters
  • addr [in] pointer to new group ID addresses
  • num [in] the number of group ID addresses

Returns
  • ESP_OK
  • ESP_MESH_ERR_ARGUMENT

esp_err_t esp_mesh_delete_group_id (const mesh_addr_t *addr, int num)
Delete group ID addresses.

Parameters
  • addr [in] pointer to deleted group ID address
  • num [in] the number of group ID addresses

Returns
  • ESP_OK
  • ESP_MESH_ERR_ARGUMENT

int esp_mesh_get_group_num (void)
Get the number of group ID addresses.

Returns the number of group ID addresses

esp_err_t esp_mesh_get_group_list (mesh_addr_t *addr, int num)
Get group ID addresses.

Parameters
  • addr [out] pointer to group ID addresses
  • num [in] the number of group ID addresses

Returns
  • ESP_OK
  • ESP_MESH_ERR_ARGUMENT

bool esp_mesh_is_my_group (const mesh_addr_t *addr)
Check whether the specified group address is my group.

Returns true/false

esp_err_t esp_mesh_set_capacity_num (int num)
Set mesh network capacity (max:1000, default:300)

Attention This API shall be called before mesh is started.
### Parameters num - [in] mesh network capacity

#### Returns
- ESP_OK
- ESP_ERR_MESH_NOT_ALLOWED
- ESP.Mesh_ERR_ARGUMENT

```c
int esp_mesh_get_capacity_num (void)
```

Get mesh network capacity.

#### Returns
mesh network capacity

### `esp_err_t esp_mesh_set_ie_crypto_funcs (const mesh_crypto_funcs_t *crypto_funcs)`

Set mesh IE crypto functions.

#### Attention
This API can be called at any time after mesh is configured.

#### Parameters crypto_funcs - [in] crypto functions for mesh IE
- If crypto_funcs is set to NULL, mesh IE is no longer encrypted.

#### Returns
- ESP_OK

### `esp_err_t esp_mesh_set_ie_crypto_key (const char *key, int len)`

Set mesh IE crypto key.

#### Attention
This API can be called at any time after mesh is configured.

#### Parameters
- key - [in] ASCII crypto key
- len - [in] length in bytes, range: 8-64

#### Returns
- ESP_OK
- ESP.Mesh_ERR_ARGUMENT

### `esp_err_t esp_mesh_get_ie_crypto_key (char *key, int len)`

Get mesh IE crypto key.

#### Parameters
- key - [out] ASCII crypto key
- len - [in] length in bytes, range: 8-64

#### Returns
- ESP_OK
- ESP.Mesh_ERR_ARGUMENT

### `esp_err_t esp_mesh_set_root_healing_delay (int delay_ms)`

Set delay time before starting root healing.

#### Parameters delay_ms - [in] delay time in milliseconds

#### Returns
- ESP_OK

```c
int esp_mesh_get_root_healing_delay (void)
```

Get delay time before network starts root healing.

#### Returns
delay time in milliseconds

### `esp_err_t esp_mesh_fix_root (bool enable)`

Enable network Fixed Root Setting.
• Enabling fixed root disables automatic election of the root node via voting.
• All devices in the network shall use the same Fixed Root Setting (enabled or disabled).
• If Fixed Root is enabled, users should make sure a root node is designated for the network.

Parameters enable – [in] enable or not

Returns
• ESP_OK

bool esp_mesh_is_root_fixed (void)
Check whether network Fixed Root Setting is enabled.

• Enable/disable network Fixed Root Setting by API esp_mesh_fix_root().
• Network Fixed Root Setting also changes with the “flag” value in parent networking IE.

Returns true/false

esp_err_t esp_mesh_set_parent (const wifi_config_t *parent, const mesh_addr_t *parent_mesh_id,
mesh_type_t my_type, int my_layer)
Set a specified parent for the device.

Attention This API can be called at any time after mesh is configured.

Parameters
• parent – [in] parent configuration, the SSID and the channel of the parent are mandatory.
  – If the BSSID is set, make sure that the SSID and BSSID represent the same parent, otherwise the device will never find this specified parent.
• parent_mesh_id – [in] parent mesh ID.
  – If this value is not set, the original mesh ID is used.
• my_type – [in] mesh type
  – MESH_STA is not supported.
  – If the parent set for the device is the same as the router in the network configuration, then my_type shall set MESH_ROOT and my_layer shall set MESH_ROOT_LAYER.
• my_layer – [in] mesh layer
  – my_layer of the device may change after joining the network.
  – If my_type is set MESH_NODE, my_layer shall be greater than MESH_ROOT_LAYER.
  – If my_type is set MESH_LEAF, the device becomes a standalone Wi-Fi station and no longer has the ability to extend the network.

Returns
• ESP_OK
• ESP_ERR_ARGUMENT
• ESP_ERR_MESH_NOT_CONFIG

esp_err_t esp_mesh_scan_get_ap_ie_len (int *len)
Get mesh networking IE length of one AP.

Parameters len –[out] mesh networking IE length

Returns
• ESP_OK
• ESP_ERR_WIFI_NOT_INIT
• ESP_ERR_INVALID_ARG
• ESP_ERR_WIFI_FAIL

esp_err_t esp_mesh_scan_get_ap_record (wifi_ap_record_t *ap_record, void *buffer)
Get AP record.
Attention  Different from `esp_wifi_scan_get_ap_records()`, this API only gets one of APs scanned each time. See “manual_networking” example.

Parameters
• `ap_record`  – [out] pointer to one AP record
• `buffer`  – [out] pointer to the mesh networking IE of this AP

Returns
• ESP_OK
• ESP_ERR_WIFI_NOT_INIT
• ESP_ERR_INVALID_ARG
• ESP_ERR_WIFI_FAIL

`esp_err_t esp_mesh_flush_upstream_packets (void)`
Flush upstream packets pending in to_parent queue and to_parent_p2p queue.

Returns
• ESP_OK

`esp_err_t esp_mesh_get_subnet_nodes_num (const mesh_addr_t *child_mac, int *nodes_num)`
Get the number of nodes in the subnet of a specific child.

Parameters
• `child_mac`  – [in] an associated child address of this device
• `nodes_num`  – [out] pointer to the number of nodes in the subnet of a specific child

Returns
• ESP_OK
• ESP_ERR_MESH_NOT_START
• ESP_ERR_MESH_ARGUMENT

`esp_err_t esp_mesh_get_subnet_nodes_list (const mesh_addr_t *child_mac, mesh_addr_t *nodes, int nodes_num)`
Get nodes in the subnet of a specific child.

Parameters
• `child_mac`  – [in] an associated child address of this device
• `nodes`  – [out] pointer to nodes in the subnet of a specific child
• `nodes_num`  – [in] the number of nodes in the subnet of a specific child

Returns
• ESP_OK
• ESP_ERR_MESH_NOT_START
• ESP_ERR_MESH_ARGUMENT

`esp_err_t esp_mesh_disconnect (void)`
Disconnect from current parent.

Returns
• ESP_OK

`esp_err_t esp_mesh_connect (void)`
Connect to current parent.

Returns
• ESP_OK

`esp_err_t esp_mesh_flush_scan_result (void)`
Flush scan result.

Returns
• ESP_OK
Chapter 2. API Reference

\texttt{esp_err_t \_esp\_mesh\_switch\_channel} (const uint8_t *new_bssid, int csa_newchan, int csa_count)

Cause the root device to add Channel Switch Announcement Element (CSA IE) to beacon.

- Set the new channel
- Set how many beacons with CSA IE will be sent before changing a new channel
- Enable the channel switch function

**Attention** This API is only called by the root.

**Parameters**
- \texttt{new\_bssid} – [in] the new router BSSID if the router changes
- \texttt{csa\_newchan} – [in] the new channel number to which the whole network is moving
- \texttt{csa\_count} – [in] channel switch period (beacon count), unit is based on beacon interval of its softAP, the default value is 15.

**Returns**
- ESP_OK

\texttt{esp_err_t \_esp\_mesh\_get\_router\_bssid} (uint8_t *router_bssid)

Get the router BSSID.

**Parameters** \texttt{router\_bssid} – [out] pointer to the router BSSID

**Returns**
- ESP_OK
- ESP_ERR_WIFI_NOT_INIT
- ESP_ERR_INVALID_ARG

\texttt{int64_t \_esp\_mesh\_get\_tsf\_time} (void)

Get the TSF time.

**Returns** the TSF time

\texttt{esp_err_t \_esp\_mesh\_set\_topology} (\texttt{esp\_mesh\_topology\_t} topo)

Set mesh topology. The default value is MESH_TOPO_TREE.

- MESH_TOPO_CHAIN supports up to 1000 layers

**Attention** This API shall be called before mesh is started.

**Parameters** \texttt{topo} – [in] MESH_TOPO_TREE or MESH_TOPO_CHAIN

**Returns**
- ESP_OK
- ESP_MESH_ERR_ARGUMENT
- ESP_ERR_MESH_NOT_ALLOWED

\texttt{esp\_mesh\_topology\_t \_esp\_mesh\_get\_topology} (void)

Get mesh topology.

**Returns** MESH_TOPO_TREE or MESH_TOPO_CHAIN

\texttt{esp_err_t \_esp\_mesh\_enable\_ps} (void)

Enable mesh Power Save function.

**Attention** This API shall be called before mesh is started.

**Returns**
Chapter 2. API Reference

- ESP_OK
- ESP_ERR_WIFI_NOT_INIT
- ESP_ERR_MESH_NOT_ALLOWED

`esp_err_t esp_mesh_disable_ps (void)`

Disable mesh Power Save function.

**Attention** This API shall be called before mesh is started.

**Returns**
- ESP_OK
- ESP_ERR_WIFI_NOT_INIT
- ESP_ERR_MESH_NOT_ALLOWED

`bool esp_mesh_is_ps_enabled (void)`

Check whether the mesh Power Save function is enabled.

**Returns** true/false

`bool esp_mesh_is_device_active (void)`

Check whether the device is in active state.

- If the device is not in active state, it will neither transmit nor receive frames.

**Returns** true/false

`esp_err_t esp_mesh_set_active_duty_cycle (int dev_duty, int dev_duty_type)`

Set the device duty cycle and type.

- The range of dev_duty values is 1 to 100. The default value is 10.
- dev_duty = 100, the PS will be stopped.
- dev_duty is better to not less than 5.
- dev_duty_type could be MESH_PS_DEVICE_DUTY_REQUEST or MESH_PS_DEVICE_DUTY_DEMAND.
- If dev_duty_type is set to MESH_PS_DEVICE_DUTY_REQUEST, the device will use a nwk_duty provided by the network.
- If dev_duty_type is set to MESH_PS_DEVICE_DUTY_DEMAND, the device will use the specified dev_duty.

**Attention** This API can be called at any time after mesh is started.

**Parameters**
- `dev_duty` - [in] device duty cycle
- `dev_duty_type` - [in] device PS duty cycle type, not accept MESH_PS_NETWORK_DUTY_MASTER

**Returns**
- ESP_OK
- ESP_FAIL

`esp_err_t esp_mesh_get_active_duty_cycle (int *dev_duty, int *dev_duty_type)`

Get device duty cycle and type.

**Parameters**
- `dev_duty` - [out] device duty cycle

Submit Document Feedback
• `dev_duty_type` [out] device PS duty cycle type

Returns
• ESP_OK

`esp_err_t esp_mesh_set_network_duty_cycle` (int `nwk_duty`, int `duration_mins`, int `applied_rule`)

Set the network duty cycle, duration and rule.

- The range of `nwk_duty` values is 1 to 100. The default value is 10.
- `nwk_duty` is the network duty cycle the entire network or the up-link path will use. A device that successfully sets the `nwk_duty` is known as a NWK-DUTY-MASTER.
- `duration_mins` specifies how long the specified `nwk_duty` will be used. Once `duration_mins` expires, the root will take over as the NWK-DUTY-MASTER. If an existing NWK-DUTY-MASTER leaves the network, the root will take over as the NWK-DUTY-MASTER again.
- `duration_mins = -1` represents `nwk_duty` will be used until a new NWK-DUTY-MASTER with a different `nwk_duty` appears.
- Only the root can set `duration_mins` to `-1`.
- If `applied_rule` is set to MESH_PS_NETWORK_DUTY_APPLIED_ENTIRE, the `nwk_duty` will be used by the entire network.
- If `applied_rule` is set to MESH_PS_NETWORK_DUTY_APPLIED_UPLINK, the `nwk_duty` will only be used by the up-link path nodes.
- The root does not accept MESH_PS_NETWORK_DUTY_APPLIED_UPLINK.
- A `nwk_duty` with `duration_mins` set by the root is the default network duty cycle used by the entire network.

Attention  This API can be called at any time after mesh is started.

- In self-organized network, if this API is called before mesh is started in all devices, (1) `nwk_duty` shall be set to the same value for all devices; (2) `duration_mins` shall be set to `(-1)`; (3) `applied_rule` shall be set to MESH_PS_NETWORK_DUTY_APPLIED_ENTIRE; after the voted root appears, the root will become the NWK-DUTY-MASTER and broadcast the `nwk_duty` and its identity of NWK-DUTY-MASTER.
- If the root is specified (FIXED-ROOT), call this API in the root to provide a default `nwk_duty` for the entire network.
- After joins the network, any device can call this API to change the `nwk_duty`, `duration_mins` or `applied_rule`.

Parameters
- `nwk_duty` [in] network duty cycle
- `duration_mins` [in] duration (unit: minutes)
- `applied_rule` [in] only support MESH_PS_NETWORK_DUTY_APPLIED_ENTIRE

Returns
- ESP_OK
- ESP_FAIL

`esp_err_t esp_mesh_get_network_duty_cycle` (int *`nwk_duty`, int *`duration_mins`, int *`dev_duty_type`, int *`applied_rule`)

Get the network duty cycle, duration, type and rule.

Parameters
- `nwk_duty` [out] current network duty cycle
- `duration_mins` [out] the duration of current `nwk_duty`
- `dev_duty_type` [out] if it includes MESH_PS_DEVICE_DUTY_MASTER, this device is the current NWK-DUTY-MASTER.
- `applied_rule` [out] MESH_PS_NETWORK_DUTY_APPLIED_ENTIRE

Returns
- ESP_OK
**Chapter 2. API Reference**

`int esp_mesh_get_running_active_duty_cycle (void)`

Get the running active duty cycle.

- The running active duty cycle of the root is 100.
- If duty type is set to MESH_PS_DEVICE_DUTY_REQUEST, the running active duty cycle is `nwk_duty` provided by the network.
- If duty type is set to MESH_PS_DEVICE_DUTY_DEMAND, the running active duty cycle is `dev_duty` specified by the users.
- In a mesh network, devices are typically working with a certain duty-cycle (transmitting, receiving and sleep) to reduce the power consumption. The running active duty cycle decides the amount of awake time within a beacon interval. At each start of beacon interval, all devices wake up, broadcast beacons, and transmit packets if they do have pending packets for their parents or for their children. Note that Low-duty-cycle means devices may not be active in most of the time, the latency of data transmission might be greater.

**Returns**  
the running active duty cycle

`esp_err_t esp_mesh_ps_duty_signaling (int fwd_times)`

Duty signaling.

**Parameters**  
`fwd_times` - [in] the times of forwarding duty signaling packets

**Returns**

- ESP_OK

**Unions**

`union mesh_addr_t`

#include `<esp_mesh.h>` Mesh address.

**Public Members**

uint8_t `addr[6]`  
mac address

`mip_t mip`

mip address

`union mesh_event_info_t`

#include `<esp_mesh.h>` Mesh event information.

**Public Members**

`mesh_event_channel_switch_t channel_switch`

channel switch

`mesh_event_child_connected_t child_connected`

child connected

`mesh_event_child_disconnected_t child_disconnected`

child disconnected
Chapter 2. API Reference

mesh_event_routing_table_change_t routing_table
    routing table change

mesh_event_connected_t connected
    parent connected

mesh_event_disconnected_t disconnected
    parent disconnected

mesh_event_no_parent_found_t no_parent
    no parent found

mesh_event_layer_change_t layer_change
    layer change

mesh_event_toDS_state_t toDS_state
    toDS state, devices shall check this state firstly before trying to send packets to external IP network. This state indicates right now whether the root is capable of sending packets out. If not, devices had better to wait until this state changes to be MESH_TODS_REACHABLE.

mesh_event_vote_started_t vote_started
    vote started

mesh_event_root_address_t root_addr
    root address

mesh_event_root_switch_req_t switch_req
    root switch request

mesh_event_root_conflict_t root_conflict
    other powerful root

mesh_event_root_fixed_t root_fixed
    fixed root

mesh_event_scan_done_t scan_done
    scan done

mesh_event_network_state_t network_state
    network state, such as whether current mesh network has a root.

mesh_event_find_network_t find_network
    network found that can join

mesh_event_router_switch_t router_switch
    new router information

mesh_event_ps_duty_t ps_duty
    PS duty information
union mesh_rc_config_t
   
   #include <esp_mesh.h> Vote address configuration.

   Public Members

   int attempts
      
      max vote attempts before a new root is elected automatically by mesh network. (min:15, 15 by default)

   mesh_addr_t rc_addr
      
      a new root address specified by users for API esp_mesh_waive_root()

   Structures

   struct mip_t
      
      IP address and port.

      Public Members

      esp_ip4_addr_t ip4
         
         IP address

      uint16_t port
         
         port

   struct mesh_event_channel_switch_t
      
      Channel switch information.

      Public Members

      uint8_t channel
         
         new channel

   struct mesh_event_connected_t
      
      Parent connected information.

      Public Members

      wifi_event_sta_connected_t connected
         
         parent information, same as Wi-Fi event SYSTEM_EVENT_STA_CONNECTED does

      uint16_t self_layer
         
         layer

      uint8_t duty
         
         parent duty
struct `mesh_event_no_parent_found_t`
   No parent found information.

   **Public Members**

   int `scan_times`
   scan times being through

struct `mesh_event_layer_change_t`
   Layer change information.

   **Public Members**

   uint16_t `new_layer`
   new layer

struct `mesh_event_vote_started_t`
   vote started information

   **Public Members**

   int `reason`
   vote reason, vote could be initiated by children or by the root itself

   int `attempts`
   max vote attempts before stopped

   `mesh_addr_t rc_addr`
   root address specified by users via API esp_mesh_waive_root()

struct `mesh_event_find_network_t`
   find a mesh network that this device can join

   **Public Members**

   uint8_t `channel`
   channel number of the new found network

   uint8_t `router_bssid[6]`
   router BSSID

struct `mesh_event_root_switch_req_t`
   Root switch request information.
### Public Members

#### int reason

Reason for root switch, generally root switch is initialized by users via API esp_mesh_waive_root()

#### mesh_addr_t rc_addr

Address of root switch requester.

#### struct mesh_event_root_conflict_t

Other powerful root address.

### Public Members

#### int8_t rssi

RSSI with router.

#### uint16_t capacity

Number of devices in current network.

#### uint8_t addr[6]

Other powerful root address.

#### struct mesh_event_routing_table_change_t

Routing table change.

### Public Members

#### uint16_t rt_size_new

The new value.

#### uint16_t rt_size_change

The changed value.

#### struct mesh_event_root_fixed_t

Root fixed.

### Public Members

#### bool is_fixed

Status.

#### struct mesh_event_scan_done_t

Scan done event information.
**Chapter 2. API Reference**

**Public Members**

```c
uint8_t number
```

the number of APs scanned

```c
struct mesh_event_network_state_t
```

Network state information.

**Public Members**

```c
bool is_rootless
```

whether current mesh network has a root

```c
struct mesh_event_ps_duty_t
```

PS duty information.

**Public Members**

```c
uint8_t duty
```

parent or child duty

```c
mesh_event_child_connected_t child_connected
```

child info

```c
struct mesh_opt_t
```

Mesh option.

**Public Members**

```c
uint8_t type
```

option type

```c
uint16_t len
```

option length

```c
uint8_t* val
```

option value

```c
struct mesh_data_t
```

Mesh data for esp_mesh_send() and esp_mesh_recv()

**Public Members**

```c
uint8_t* data
```

data
struct mesh_router_t
  Router configuration.

Public Members

uint8_t ssid[32]
  SSID

uint8_t ssid_len
  length of SSID

uint8_t bssid[6]
  BSSID, if this value is specified, users should also specify "allow_router_switch".

uint8_t password[64]
  password

bool allow_router_switch
  if the BSSID is specified and this value is also set, when the router of this specified BSSID fails to be found after "fail" (mesh_attempts_t) times, the whole network is allowed to switch to another router with the same SSID. The new router might also be on a different channel. The default value is false. There is a risk that if the password is different between the new switched router and the previous one, the mesh network could be established but the root will never connect to the new switched router.

struct mesh_ap_cfg_t
  Mesh softAP configuration.

Public Members

uint8_t password[64]
  mesh softAP password

uint8_t max_connection
  max number of stations allowed to connect in, default 6, max 10 = max_connection + non-mesh_max_connection max mesh connections

uint8_t nonmesh_max_connection
  max non-mesh connections
struct **mesh_cfg_t**
Mesh initialization configuration.

**Public Members**

uint8_t **channel**
channel, the mesh network on

bool **allow_channel_switch**
if this value is set, when “fail” (mesh_attempts_t) times is reached, device will change to a full channel scan for a network that could join. The default value is false.

**mesh_addr_t** **mesh_id**
mesh network identification

**mesh_router_t** **router**
router configuration

**mesh_ap_cfg_t** **mesh_ap**
mesh softAP configuration

const mesh_crypto_funcs_t * **crypto_funcs**
crypto functions

struct **mesh_vote_t**
Vote.

**Public Members**

float **percentage**
vote percentage threshold for approval of being a root

bool **is_rc_specified**
if true, rc_addr shall be specified (Unimplemented). if false, attempts value shall be specified to make network start root election.

**mesh_rc_config_t** **config**
vote address configuration

struct **mesh_tx_pending_t**
The number of packets pending in the queue waiting to be sent by the mesh stack.

**Public Members**

int **to_parent**
to parent queue
int to_parent_p2p
    to parent (P2P) queue

int to_child
    to child queue

int to_child_p2p
    to child (P2P) queue

int mgmt
    management queue

int broadcast
    broadcast and multicast queue

struct mesh_rx_pending_t
    The number of packets available in the queue waiting to be received by applications.

Public Members

int toDS
    to external DS

int toSelf
    to self

Macros

MESH_ROOT_LAYER
    root layer value

MESH_MTU
    max transmit unit (in bytes)

MESH_MPS
    max payload size (in bytes)

ESP_ERR_MESH_WIFI_NOT_START
    Mesh error code definition.
    Wi-Fi isn’t started

ESP_ERR_MESH_NOT_INIT
    mesh isn’t initialized

ESP_ERR_MESH_NOT_CONFIG
    mesh isn’t configured
Chapter 2. API Reference

ESP_ERR_MESH_NOT_START
mesh isn’t started

ESP_ERR_MESH_NOT_SUPPORT
not supported yet

ESP_ERR_MESH_NOT_ALLOWED
operation is not allowed

ESP_ERR_MESH_NO_MEMORY
out of memory

ESP_ERR_MESH_ARGUMENT
illegal argument

ESP_ERR_MESH_EXCEED_MTU
packet size exceeds MTU

ESP_ERR_MESH_TIMEOUT
timeout

ESP_ERR_MESH_DISCONNECTED
disconnected with parent on station interface

ESP_ERR_MESH_QUEUE_FAIL
queue fail

ESP_ERR_MESH_QUEUE_FULL
queue full

ESP_ERR_MESH_NO_PARENT_FOUND
no parent found to join the mesh network

ESP_ERR_MESH_NO_ROUTE_FOUND
no route found to forward the packet

ESP_ERR_MESH_OPTION_NULL
no option found

ESP_ERR_MESH_OPTION_UNKNOWN
unknown option

ESP_ERR_MESH_XON_NO_WINDOW
no window for software flow control on upstream

ESP_ERR_MESH_INTERFACE
low-level Wi-Fi interface error
ESP_ERR_MESH_DISCARD_DUPLICATE

discard the packet due to the duplicate sequence number

ESP_ERR_MESH_DISCARD

discard the packet

ESP_ERR_MESH_VOTING

vote in progress

ESP_ERR_MESH_XMIT

XMIT

ESP_ERR_MESH_QUEUE_READ

error in reading queue

ESP_ERR_MESH_PS

mesh PS is not specified as enable or disable

ESP_ERR_MESH_RECV_RELEASE

release esp_mesh_recv_toDS

MESH_DATA_ENC

Flags bitmap for esp_mesh_send() and esp_mesh_recv()
data encrypted (Unimplemented)

MESH_DATA_P2P

point-to-point delivery over the mesh network

MESH_DATA_FROMDS

receive from external IP network

MESH_DATA_TODS

identify this packet is target to external IP network

MESH_DATA_NONBLOCK

esp_mesh_send() non-block

MESH_DATA_DROP

in the situation of the root having been changed, identify this packet can be dropped by new root

MESH_DATA_GROUP

identify this packet is target to a group address

MESH_OPT_SEND_GROUP

Option definitions for esp_mesh_send() and esp_mesh_recv()
data transmission by group; used with esp_mesh_send() and shall have payload
MESH_OPT_RECV_DS_ADDR
    return a remote IP address; used with esp_mesh_send() and esp_mesh_recv()

MESH_ASSOC_FLAG_MAP_ASSOC
    Flag of mesh networking IE.
    Mesh AP doesn’t detect children leave yet

MESH_ASSOC_FLAG_VOTE_IN_PROGRESS
    station in vote, set when root vote start, clear when connect to router or when root switch

MESH_ASSOC_FLAG_STA_VOTED
    station vote done, set when connect to router

MESH_ASSOC_FLAG_NETWORK_FREE
    no root in current network

MESH_ASSOC_FLAG_STA_VOTE_EXPIRE
    the voted address is expired, means the voted device lose the chance to be root

MESH_ASSOC_FLAG_ROOTS_FOUND
    roots conflict is found, means that there are at least two roots in the mesh network

MESH_ASSOC_FLAG_ROOT_FIXED
    the root is fixed in the mesh network

MESH_PSDEVICE_DUTY_REQUEST
    Mesh PS (Power Save) duty cycle type.
    requests to join a network PS without specifying a device duty cycle. After the device joins the network, a
    network duty cycle will be provided by the network

MESH_PSDEVICE_DUTY_DEMAND
    requests to join a network PS and specifies a demanded device duty cycle

MESH_PSNETWORK_DUTY_MASTER
    indicates the device is the NWK-DUTY-MASTER (network duty cycle master)

MESH_PSNETWORK_DUTY_APPLIED_ENTIRE
    Mesh PS (Power Save) duty cycle applied rule.

MESH_PSNETWORK_DUTY_APPLIED_UPLINK

MESH_INIT_CONFIG_DEFAULT()

Type Definitions

typedef mesh_addr_t mesh_event_root_address_t
    Root address.
typedef wifi_event_sta_disconnected_t mesh_event_disconnected_t
    Parent disconnected information.

typedef wifi_event_ap_staconnected_t mesh_event_child_connected_t
    Child connected information.

typedef wifi_event_ap_stadisconnected_t mesh_event_child_disconnected_t
    Child disconnected information.

typedef wifi_event_sta_connected_t mesh_event_router_switch_t
    New router information.

Enumerations

define enum mesh_event_id_t
    Enumerated list of mesh event id.
    Values:

        enumerator MESH_EVENT_STARTED
            mesh is started

        enumerator MESH_EVENT_STOPPED
            mesh is stopped

        enumerator MESH_EVENT_CHANNEL_SWITCH
            channel switch

        enumerator MESH_EVENT_CHILD_CONNECTED
            a child is connected on softAP interface

        enumerator MESH_EVENT_CHILD_DISCONNECTED
            a child is disconnected on softAP interface

        enumerator MESH_EVENT_ROUTING_TABLE_ADD
            routing table is changed by adding newly joined children

        enumerator MESH_EVENT_ROUTING_TABLE_REMOVE
            routing table is changed by removing leave children

        enumerator MESH_EVENT_PARENT_CONNECTED
            parent is connected on station interface

        enumerator MESH_EVENT_PARENT_DISCONNECTED
            parent is disconnected on station interface

        enumerator MESH_EVENT_NO_PARENT_FOUND
            no parent found
enumerator **MESH_EVENT_LAYER_CHANGE**
layer changes over the mesh network

enumerator **MESH_EVENT_TODS_STATE**
state represents whether the root is able to access external IP network. This state is a manual event that needs to be triggered with esp_mesh_post_toDS_state().

enumerator **MESH_EVENT_VOTE_STARTED**
the process of voting a new root is started either by children or by the root

enumerator **MESH_EVENT_VOTE_STOPPED**
the process of voting a new root is stopped

enumerator **MESH_EVENT_ROOT_ADDRESS**
the root address is obtained. It is posted by mesh stack automatically.

enumerator **MESH_EVENT_ROOT_SWITCH_REQ**
root switch request sent from a new voted root candidate

enumerator **MESH_EVENT_ROOT_SWITCH_ACK**
root switch acknowledgment responds the above request sent from current root

enumerator **MESH_EVENT_ROOT_ASKED_YIELD**
the root is asked yield by a more powerful existing root. If self organized is disabled and this device is specified to be a root by users, users should set a new parent for this device. If self organized is enabled, this device will find a new parent by itself, users could ignore this event.

enumerator **MESH_EVENT_ROOT_FIXED**
when devices join a network, if the setting of Fixed Root for one device is different from that of its parent, the device will update the setting the same as its parent’s. Fixed Root Setting of each device is variable as that setting changes of the root.

enumerator **MESH_EVENT_SCAN_DONE**
if self-organized networking is disabled, user can call esp_wifi_scan_start() to trigger this event, and add the corresponding scan done handler in this event.

enumerator **MESH_EVENT_NETWORK_STATE**
network state, such as whether current mesh network has a root.

enumerator **MESH_EVENT_STOP_RECONNECTION**
the root stops reconnecting to the router and non-root devices stop reconnecting to their parents.

enumerator **MESH_EVENT_FIND_NETWORK**
when the channel field in mesh configuration is set to zero, mesh stack will perform a full channel scan to find a mesh network that can join, and return the channel value after finding it.

enumerator **MESH_EVENT_ROUTER_SWITCH**
if users specify BSSID of the router in mesh configuration, when the root connects to another router with the same SSID, this event will be posted and the new router information is attached.
enumerator **MESH_EVENT_PS_PARENT_DUTY**
    parent duty

enumerator **MESH_EVENT_PS_CHILD_DUTY**
    child duty

enumerator **MESH_EVENT_PS_DEVICE_DUTY**
    device duty

enumerator **MESH_EVENT_MAX**

enum **mesh_type_t**
    Device type.
    Values:
    
    enumerator **MESH_IDLE**
    has not joined the mesh network yet

    enumerator **MESH_ROOT**
    the only sink of the mesh network. Has the ability to access external IP network

    enumerator **MESH_NODE**
    intermediate device. Has the ability to forward packets over the mesh network

    enumerator **MESH_LEAF**
    has no forwarding ability

    enumerator **MESH_STA**
    connect to router with a standalone Wi-Fi station mode, no network expansion capability

enum **mesh_proto_t**
    Protocol of transmitted application data.
    Values:
    
    enumerator **MESH_PROTO_BIN**
    binary

    enumerator **MESH_PROTO_HTTP**
    HTTP protocol

    enumerator **MESH_PROTO_JSON**
    JSON format

    enumerator **MESH_PROTO_MQTT**
    MQTT protocol

    enumerator **MESH_PROTO_AP**
    IP network mesh communication of node’s AP interface
enum **MESH_PROTO_STA**
   IP network mesh communication of node’s STA interface

```c
enum mesh_tos_t
    For reliable transmission, mesh stack provides three type of services.
    Values:

enumerator MESH_TOS_P2P
    provide P2P (point-to-point) retransmission on mesh stack by default

enumerator MESH_TOS_E2E
    provide E2E (end-to-end) retransmission on mesh stack (Unimplemented)

enumerator MESH_TOS_DEF
    no retransmission on mesh stack
```

enum **mesh_vote_reason_t**
    Vote reason.
    Values:

enumerator MESH_VOTE_REASON_ROOT_INITIATED
    vote is initiated by the root

enumerator MESH_VOTE_REASON_CHILD_INITIATED
    vote is initiated by children

enum **mesh_disconnect_reason_t**
    Mesh disconnect reason code.
    Values:

enumerator MESH_REASON_CYCLIC
    cyclic is detected

enumerator MESH_REASON_PARENT_IDLE
    parent is idle

enumerator MESH_REASON_LEAF
    the connected device is changed to a leaf

enumerator MESH_REASON_DIFF_ID
    in different mesh ID

enumerator MESH_REASON_ROOTS
    root conflict is detected

enumerator MESH_REASON_PARENT_STOPPED
    parent has stopped the mesh
Chapter 2. API Reference

enumerator MESH_REASON_SCAN_FAIL
    scan fail
enumerator MESH_REASON_IE_UNKNOWN
    unknown IE
enumerator MESH_REASON_WAIVE_ROOT
    waive root
enumerator MESH_REASON_PARENT_WORSE
    parent with very poor RSSI
enumerator MESH_REASON_EMPTY_PASSWORD
    use an empty password to connect to an encrypted parent
enumerator MESH_REASON_PARENT_UNENCRYPTED
    connect to an unencrypted parent/router

define enum esp_mesh_topology_t
    Mesh topology.
    Values:
    enumerator MESH_TOPO_TREE
        tree topology
    enumerator MESH_TOPO_CHAIN
        chain topology

define enum mesh_event_toDS_state_t
    The reachability of the root to a DS (distribute system)
    Values:
    enumerator MESH_TODS_UNREACHABLE
        the root isn’t able to access external IP network
    enumerator MESH_TODS_REACHABLE
        the root is able to access external IP network

**SmartConfig**

The SmartConfig™ is a provisioning technology developed by TI to connect a new Wi-Fi device to a Wi-Fi network. It uses a mobile application to broadcast the network credentials from a smartphone, or a tablet, to an un-provisioned Wi-Fi device.

The advantage of this technology is that the device does not need to directly know SSID or password of an Access Point (AP). This information is provided using the smartphone. This is particularly important to headless device and systems, due to their lack of a user interface.

If you are looking for other options to provision your ESP32-S2 devices, check [Provisioning API](#).
Application Example  Connect ESP32-S2 to the target AP using SmartConfig: wifi/smart_config.

API Reference

Header File

- components/esp_wifi/include/esp_smartconfig.h
- This header file can be included with:

  ```
  #include "esp_smartconfig.h"
  ```
- This header file is a part of the API provided by the esp_wifi component. To declare that your component depends on esp_wifi, add the following to your CMakeLists.txt:

  ```
  REQUIRES esp_wifi
  ```
  or

  ```
  PRIV_REQUIRES esp_wifi
  ```

Functions

`const char *esp_smartconfig_get_version (void)`
Get the version of SmartConfig.

Returns

- SmartConfig version const char.

`esp_err_t esp_smartconfig_start (const smartconfig_start_config_t *config)`
Start SmartConfig, config ESP device to connect AP. You need to broadcast information by phone APP. Device sniffer special packets from the air that containing SSID and password of target AP.

Attention 1. This API can be called in station or softAP-station mode.
Attention 2. Can not call esp_smartconfig_start twice before it finish, please call esp_smartconfig_stop first.

Parameters config – pointer to smartconfig start configure structure

Returns

- ESP_OK: succeed
- others: fail

`esp_err_t esp_smartconfig_stop (void)`
Stop SmartConfig, free the buffer taken by esp_smartconfig_start.

Attention  Whether connect to AP succeed or not, this API should be called to free memory taken by smartconfig_start.

Returns

- ESP_OK: succeed
- others: fail

`esp_err_t esp_esptouch_set_timeout (uint8_t time_s)`
Set timeout of SmartConfig process.

Attention  Timing starts from SC_STATUS_FIND_CHANNEL status. SmartConfig will restart if timeout.

Parameters time_s – range 15s~255s, offset:45s.
Returns

• ESP_OK: succeed
• others: fail

`esp_err_t esp_smartconfig_set_type (smartconfig_type_t type)`

Set protocol type of SmartConfig.

Attention If users need to set the SmartConfig type, please set it before calling `esp_smartconfig_start`.

Parameters type – Choose from the `smartconfig_type_t`.

Returns

• ESP_OK: succeed
• others: fail

`esp_err_t esp_smartconfig_fast_mode (bool enable)`

Set mode of SmartConfig. default normal mode.

Attention 1. Please call it before API `esp_smartconfig_start`.
Attention 2. Fast mode have corresponding APP(phone).
Attention 3. Two mode is compatible.

Parameters enable – false-disable (default); true-enable;

Returns

• ESP_OK: succeed
• others: fail

`esp_err_t esp_smartconfig_get_rvd_data (uint8_t *rvd_data, uint8_t len)`

Get reserved data of ESPTouch v2.

Parameters

• rvd_data – reserved data
• len – length of reserved data

Returns

• ESP_OK: succeed
• others: fail

Structures

`struct smartconfig_event_got_ssid_pswd_t`  
Argument structure for SC_EVENT_GOT_SSID_PSWD event

Public Members

uint8_t ssid[32]

SSID of the AP. Null terminated string.

uint8_t password[64]

Password of the AP. Null terminated string.

bool bssid_set

whether set MAC address of target AP or not.
uint8_t bssid[6]
    MAC address of target AP.

smartconfig_type_t type
    Type of smartconfig (ESPTouch or AirKiss).

uint8_t token
    Token from cellphone which is used to send ACK to cellphone.

uint8_t cellphone_ip[4]
    IP address of cellphone.

struct smartconfig_start_config_t
    Configure structure for esp_smartconfig_start

Public Members

bool enable_log
    Enable smartconfig logs.

bool esp_touch_v2_enable_crypt
    Enable ESPTouch v2 crypt.

char *esp_touch_v2_key
    ESPTouch v2 crypt key, len should be 16.

Macros
SMARTCONFIG_START_CONFIG_DEFAULT()
enumerator **SC_EVENT_SCAN_DONE**
Station smartconfig has finished to scan for APs

enumerator **SC_EVENT_FOUND_CHANNEL**
Station smartconfig has found the channel of the target AP

enumerator **SC_EVENT_GOT_SSID_PSWD**
Station smartconfig got the SSID and password

enumerator **SC_EVENT_SEND_ACK_DONE**
Station smartconfig has sent ACK to cellphone

**Wi-Fi**

**Introduction**
The Wi-Fi libraries provide support for configuring and monitoring the ESP32-S2 Wi-Fi networking functionality. This includes configuration for:

- Station mode (aka STA mode or Wi-Fi client mode). ESP32-S2 connects to an access point.
- AP mode (aka Soft-AP mode or Access Point mode). Stations connect to the ESP32-S2.
- Station/AP-coexistence mode (ESP32-S2 is concurrently an access point and a station connected to another access point).
- Various security modes for the above (WPA, WPA2, WPA3, etc.)
- Scanning for access points (active & passive scanning).
- Promiscuous mode for monitoring of IEEE802.11 Wi-Fi packets.

**Application Examples**
Several application examples demonstrating the functionality of Wi-Fi library are provided in `wifi` directory of ESP-IDF repository. Please check the README for more details.

**API Reference**

**Header File**

- `components/esp_wifi/include/esp_wifi.h`
  - This header file can be included with:
    ```
    #include "esp_wifi.h"
    ```
  - This header file is a part of the API provided by the `esp_wifi` component. To declare that your component depends on `esp_wifi`, add the following to your CMakeLists.txt:
    ```
    REQUIRES esp_wifi
    ```
  - or
    ```
    PRIV_REQUIRES esp_wifi
    ```

**Functions**

`esp_err_t esp_wifi_init (const wifi_init_config_t *config)`

Initialize WiFi Allocate resource for WiFi driver, such as WiFi control structure, RX/TX buffer, WiFi NVS structure etc. This WiFi also starts WiFi task.
**Attention** 1. This API must be called before all other WiFi API can be called

**Attention** 2. Always use WIFI_INIT_CONFIG_DEFAULT macro to initialize the configuration to default values, this can guarantee all the fields get correct value when more fields are added into wifi_init_config_t in future release. If you want to set your own initial values, overwrite the default values which are set by WIFI_INIT_CONFIG_DEFAULT. Please be notified that the field ‘magic’ of wifi_init_config_t should always be WIFI_INIT_CONFIG_MAGIC!

**Parameters** config – pointer to WiFi initialized configuration structure; can point to a temporary variable.

**Returns**
- ESP_OK: succeed
- ESP_ERR_NO_MEM: out of memory
- others: refer to error code esp_err.h

```c
esp_err_t esp_wifi_deinit (void)
```
Deinit WiFi Free all resource allocated in esp_wifi_init and stop WiFi task.

**Attention** 1. This API should be called if you want to remove WiFi driver from the system

**Returns**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init

```c
esp_err_t esp_wifi_set_mode (wifi_mode_t mode)
```
Set the WiFi operating mode.

| Set the WiFi operating mode as station, soft-AP, station+soft-AP or NAN. The default mode is station mode. |

**Parameters** mode – WiFi operating mode

**Returns**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument
- others: refer to error code esp_err.h

```c
esp_err_t esp_wifi_get_mode (wifi_mode_t *mode)
```
Get current operating mode of WiFi.

**Parameters** mode – [out] store current WiFi mode

**Returns**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument

```c
esp_err_t esp_wifi_start (void)
```
Start WiFi according to current configuration If mode is WIFI_MODE_STA, it creates station control block and starts station If mode is WIFI_MODE_AP, it creates soft-AP control block and starts soft-AP If mode is WIFI_MODE_APSTA, it creates soft-AP and station control block and starts soft-AP and station If mode is WIFI_MODE_NAN, it creates NAN control block and starts NAN.

**Returns**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument
- ESP_ERR_NO_MEM: out of memory
- ESP_ERR_WIFI_CONN: WiFi internal error, station or soft-AP control block wrong
Chapter 2. API Reference

• ESP_FAIL: other WiFi internal errors

`esp_err_t esp_wifi_stop (void)`

Stop WiFi. If mode is WIFI_MODE_STA, it stops station and frees station control block. If mode is WIFI_MODE_AP, it stops soft-AP and frees soft-AP control block. If mode is WIFI_MODE_APSTA, it stops station/soft-AP and frees station/soft-AP control block. If mode is WIFI_MODE_NAN, it stops NAN and frees NAN control block.

Returns
• ESP_OK: succeed
• ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init

`esp_err_t esp_wifi_restore (void)`

Restore WiFi stack persistent settings to default values.

This function will reset settings made using the following APIs:
• esp_wifi_set_bandwidth,
• esp_wifi_set_protocol,
• esp_wifi_set_config related
• esp_wifi_set_mode

Returns
• ESP_OK: succeed
• ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init

`esp_err_t esp_wifi_connect (void)`

Connect WiFi station to the AP.

Attention 1. This API only impact WIFI_MODE_STA or WIFI_MODE_APSTA mode
Attention 2. If station interface is connected to an AP, call esp_wifi_disconnect to disconnect.
Attention 3. The scanning triggered by esp_wifi_scan_start() will not be effective until connection between device and the AP is established. If device is scanning and connecting at the same time, it will abort scanning and return a warning message and error number ESP_ERR_WIFI_STATE.
Attention 4. This API attempts to connect to an Access Point (AP) only once. To enable reconnection in case of a connection failure, please use the ‘failure_retry_cnt’ feature in the ‘wifi_sta_config_t’. Users are suggested to implement reconnection logic in their application for scenarios where the specified AP does not exist, or reconnection is desired after the device has received a disconnect event.

Returns
• ESP_OK: succeed
• ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
• ESP_ERR_WIFI_NOT_STARTED: WiFi is not started by esp_wifi_start
• ESP_ERR_WIFI_CONN: WiFi internal error, station or soft-AP control block wrong
• ESP_ERR_WIFI_SSID: SSID of AP which station connects is invalid

`esp_err_t esp_wifi_disconnect (void)`

Disconnect WiFi station from the AP.

Returns
• ESP_OK: succeed
• ESP_ERR_WIFI_NOT_INIT: WiFi was not initialized by esp_wifi_init
• ESP_ERR_WIFI_NOT_STARTED: WiFi was not started by esp_wifi_start
• ESP_FAIL: other WiFi internal errors

`esp_err_t esp_wifi_clear_fast_connect (void)`

Currently this API is just an stub API.

Returns
• ESP_OK: succeed
Chapter 2. API Reference

- others: fail

```c
esp_err_t esp_wifi_deauth_sta(uint16_t aid)
```
deauthenticate all stations or associated id equals to aid

**Parameters**
- **aid** — when aid is 0, deauthenticate all stations, otherwise deauthenticate station whose associated id is aid

**Returns**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_NOT_STARTED: WiFi was not started by esp_wifi_start
- ESP_ERR_INVALID_ARG: invalid argument
- ESP_ERR_WIFI_MODE: WiFi mode is wrong

```c
esp_err_t esp_wifi_scan_start(const wifi_scan_config_t *config, bool block)
```
Scan all available APs.

**Attention** If this API is called, the found APs are stored in WiFi driver dynamic allocated memory and the will be freed in esp_wifi_scan_get_ap_records, so generally, call esp_wifi_scan_get_ap_records to cause the memory to be freed once the scan is done

**Attention** The values of maximum active scan time and passive scan time per channel are limited to 1500 milliseconds. Values above 1500ms may cause station to disconnect from AP and are not recommended.

**Parameters**
- **config** — configuration settings for scanning, if set to NULL default settings will be used of which default values are show_hidden:false, scan_type:active, scan_time.active.min:0, scan_time.active.max:120 miliseconds, scan_time.passive:360 miliseconds
- **block** — if block is true, this API will block the caller until the scan is done, otherwise it will return immediately

**Returns**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_NOT_STARTED: WiFi was not started by esp_wifi_start
- ESP_ERR_WIFI_TIMEOUT: blocking scan is timeout
- ESP_ERR_WIFI_STATE: wifi still connecting when invoke esp_wifi_scan_start
- others: refer to error code in esp_err.h

```c
esp_err_t esp_wifi_scan_stop(void)
```
Stop the scan in process.

**Returns**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_NOT_STARTED: WiFi is not started by esp_wifi_start

```c
esp_err_t esp_wifi_scan_get_ap_num(uint16_t *number)
```
Get number of APs found in last scan.

**Attention** This API can only be called when the scan is completed, otherwise it may get wrong value.

**Parameters**
- **number** — [out] store number of APs found in last scan

**Returns**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_NOT_STARTED: WiFi is not started by esp_wifi_start
- ESP_ERR_INVALID_ARG: invalid argument
**esp_err_t esp_wifi_scan_get_ap_records** (uint16_t *number, wifi_ap_record_t *ap_records)

Get AP list found in last scan.

**Parameters**
- `number` - [inout] As input param, it stores max AP number ap_records can hold. As output param, it receives the actual AP number this API returns.
- `ap_records` - wifi_ap_record_t array to hold the found APs

**Returns**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_NOT_STARTED: WiFi is not started by esp_wifi_start
- ESP_ERR_INVALID_ARG: invalid argument
- ESP_ERR_NO_MEM: out of memory

**esp_err_t esp_wifi_clear_ap_list** (void)

Clear AP list found in last scan.

**Attention** When the obtained ap list fails, bss info must be cleared, otherwise it may cause memory leakage.

**Returns**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_NOT_STARTED: WiFi is not started by esp_wifi_start
- ESP_ERR_WIFI_MODE: WiFi mode is wrong
- ESP_ERR_INVALID_ARG: invalid argument

**esp_err_t esp_wifi_sta_get_ap_info** (wifi_ap_record_t *ap_info)

Get information of AP to which the device is associated with.

**Attention** When the obtained country information is empty, it means that the AP does not carry country information

**Parameters** `ap_info` - the wifi_ap_record_t to hold AP information sta can get the connected ap’s phy mode info through the struct member phy_11b, phy_11g, phy_11n, phy_Lr in the wifi_ap_record_t struct. For example, phy_11b = 1 imply that ap support 802.11b mode

**Returns**
- ESP_OK: succeed
- ESP_ERR_WIFI_CONN: The station interface don’t initialized
- ESP_ERR_WIFI_NOT_CONNECT: The station is in disconnect status

**esp_err_t esp_wifi_set_ps** (wifi_ps_type_t type)

Set current WiFi power save type.

**Attention** Default power save type is WIFI_PS_MIN_MODEM.

**Parameters** `type` - power save type

**Returns** ESP_OK: succeed

**esp_err_t esp_wifi_get_ps** (wifi_ps_type_t *type)

Get current WiFi power save type.

**Attention** Default power save type is WIFI_PS_MIN_MODEM.

**Parameters** `type` - [out] store current power save type
Chapter 2. API Reference

Returns ESP_OK: succeed

esp_err_t esp_wifi_set_protocol(wifi_interface_t ifx, uint8_t protocol_bitmap)
Set protocol type of specified interface The default protocol is (WIFI_PROTOCOL_11B|WIFI_PROTOCOL_11G|WIFI_PROTOCOL_11N).
if CONFIG_SOC_WIFI_HE_SUPPORT, the default protocol is (WIFI_PROTOCOL_11B|WIFI_PROTOCOL_11G|WIFI_PROTOCOL_11N|WIFI_PROTOCOL_11AX).

Attention Support 802.11b or 802.11bg or 802.11bgn or 802.11bgnax or LR mode

Parameters
• ifx – interfaces
• protocol_bitmap – WiFi protocol bitmap

Returns
• ESP_OK: succeed
• ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
• ESP_ERR_WIFI_IF: invalid interface
• others: refer to error codes in esp_err.h

esp_err_t esp_wifi_get_protocol(wifi_interface_t ifx, uint8_t* protocol_bitmap)
Get the current protocol bitmap of the specified interface.

Parameters
• ifx – interface
• protocol_bitmap – [out] store current WiFi protocol bitmap of interface ifx

Returns
• ESP_OK: succeed
• ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
• ESP_ERR_WIFI_IF: invalid interface
• ESP_ERR_INVALID_ARG: invalid argument
• others: refer to error codes in esp_err.h

esp_err_t esp_wifi_set_bandwidth(wifi_interface_t ifx, wifi_bandwidth_t bw)
Set the bandwidth of specified interface.

Attention 1. API return false if try to configure an interface that is not enabled
Attention 2. WIFI_BW_HT40 is supported only when the interface support 11N

Parameters
• ifx – interface to be configured
• bw – bandwidth

Returns
• ESP_OK: succeed
• ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
• ESP_ERR_WIFI_IF: invalid interface
• ESP_ERR_INVALID_ARG: invalid argument
• others: refer to error codes in esp_err.h

esp_err_t esp_wifi_get_bandwidth(wifi_interface_t ifx, wifi_bandwidth_t* bw)
Get the bandwidth of specified interface.

Attention 1. API return false if try to get a interface that is not enable

Parameters
• ifx – interface to be configured
• bw – [out] store bandwidth of interface ifx

Returns
• ESP_OK: succeed
• ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
• ESP_ERR_WIFI_IF: invalid interface
• ESP_ERR_INVALID_ARG: invalid argument

`esp_err_t esp_wifi_set_channel (uint8_t primary, wifi_second_chan_t second)`
Set primary/secondary channel of device.

**Attention** 1. This API should be called after esp_wifi_start() and before esp_wifi_stop()
**Attention** 2. When device is in STA mode, this API should not be called when STA is scanning or connecting to an external AP
**Attention** 3. When device is in softAP mode, this API should not be called when softAP has connected to external STAs
**Attention** 4. When device is in STA+softAP mode, this API should not be called when in the scenarios described above
**Attention** 5. The channel info set by this API will not be stored in NVS. So If you want to remember the channel used before wifi stop, you need to call this API again after wifi start, or you can call esp_wifi_set_config() to store the channel info in NVS.

**Parameters**
• **primary** – for HT20, primary is the channel number, for HT40, primary is the primary channel
• **second** – for HT20, second is ignored, for HT40, second is the second channel

**Returns**
• ESP_OK: succeed
• ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
• ESP_ERR_WIFI_IF: invalid interface
• ESP_ERR_INVALID_ARG: invalid argument
• ESP_ERR_WIFI_NOT_STARTED: WiFi is not started by esp_wifi_start

`esp_err_t esp_wifi_get_channel (uint8_t* primary, wifi_second_chan_t* second)`
Get the primary/secondary channel of device.

**Attention** 1. API return false if try to get a interface that is not enable

**Parameters**
• **primary** – store current primary channel
• **second** – [out] store current second channel

**Returns**
• ESP_OK: succeed
• ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
• ESP_ERR_INVALID_ARG: invalid argument

`esp_err_t esp_wifi_set_country (const wifi_country_t* country)`
configure country info

**Attention** 1. It is discouraged to call this API since this doesn’t validate the per-country rules, it’s up to the user to fill in all fields according to local regulations. Please use esp_wifi_set_country_code instead.
**Attention** 2. The default country is “01” (world safe mode) { .cc=“01”, .schan=1, .nchan=11, .policy=WIFI_COUNTRY_POLICY_AUTO }.
**Attention** 3. The third octet of country code string is one of the following: ‘ ‘, ‘O’, ‘I’, ‘X’, otherwise it is considered as ‘ ‘.
**Attention** 4. When the country policy is WIFI_COUNTRY_POLICY_AUTO, the country info of the AP to which the station is connected is used. E.g. if the configured country info is { .cc=“US” , .schan=1,
.nchan=11} and the country info of the AP to which the station is connected is \{.cc="JP", schan=1, .nchan=14\} then the country info that will be used is \{.cc="JP", schan=1, .nchan=14\}. If the station disconnected from the AP the country info is set back to the country info of the station automatically, \{.cc="US", schan=1, .nchan=11\} in the example.

**Attention** 5. When the country policy is WIFI_COUNTRY_POLICY_MANUAL, then the configured country info is used always.

**Attention** 6. When the country info is changed because of configuration or because the station connects to a different external AP, the country IE in probe response/beacon of the soft-AP is also changed.

**Attention** 7. The country configuration is stored into flash.

**Attention** 8. When this API is called, the PHY init data will switch to the PHY init data type corresponding to the country info.

### Parameters

- **country** – the configured country info

### Returns

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument

```c
esp_err_t esp_wifi_get_country (wifi_country_t *country)
```

get the current country info

### Parameters

- **country** – country info

### Returns

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument

```c
esp_err_t esp_wifi_set_mac (wifi_interface_t ifx, const uint8_t mac[6])
```

Set MAC address of WiFi station, soft-AP or NAN interface.

**Attention** 1. This API can only be called when the interface is disabled

**Attention** 2. Above mentioned interfaces have different MAC addresses, do not set them to be the same.

**Attention** 3. The bit 0 of the first byte of MAC address can not be 1. For example, the MAC address can set to be “1a:XX:XX:XX:XX:XX”, but can not be “15:XX:XX:XX:XX:XX”.

### Parameters

- **ifx** – interface
- **mac** – the MAC address

### Returns

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument
- ESP_ERR_WIFI_IF: invalid interface
- ESP_ERR_WIFI_MAC: invalid mac address
- ESP_ERR_WIFI_MODE: WiFi mode is wrong
- others: refer to error codes in esp_err.h

```c
esp_err_t esp_wifi_get_mac (wifi_interface_t ifx, uint8_t mac[6])
```

Get mac of specified interface.

### Parameters

- **ifx** – interface
- **mac** – [out] store mac of the interface ifx

### Returns

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument
- ESP_ERR_WIFI_IF: invalid interface
### esp_err_t esp_wifi_set_promiscuous_rx_cb (wifi_promiscuous_cb_t cb)

Register the RX callback function in the promiscuous mode.

Each time a packet is received, the registered callback function will be called.

**Parameters**
- `cb` – callback

**Returns**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init

### esp_err_t esp_wifi_set_promiscuous (bool en)

Enable the promiscuous mode.

**Parameters**
- `en` – false - disable, true - enable

**Returns**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init

### esp_err_t esp_wifi_get_promiscuous (bool *en)

Get the promiscuous mode.

**Parameters**
- `en` – [out] store the current status of promiscuous mode

**Returns**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument

### esp_err_t esp_wifi_set_promiscuous_filter (const wifi_promiscuous_filter_t *filter)

Enable the promiscuous mode packet type filter.

**Note:** The default filter is to filter all packets except WIFI_PKT_MISC

**Parameters**
- `filter` – the packet type filtered in promiscuous mode.

**Returns**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init

### esp_err_t esp_wifi_get_promiscuous_filter (wifi_promiscuous_filter_t *filter)

Get the promiscuous filter.

**Parameters**
- `filter` – [out] store the current status of promiscuous filter

**Returns**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument

### esp_err_t esp_wifi_set_promiscuous_ctrl_filter (const wifi_promiscuous_filter_t *filter)

Enable subtype filter of the control packet in promiscuous mode.

**Note:** The default filter is to filter none control packet.

**Parameters**
- `filter` – the subtype of the control packet filtered in promiscuous mode.

**Returns**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
**esp_err_t esp_wifi_get_promiscuous_ctrl_filter** *(wifi_promiscuous_filter_t *filter)*  
Get the subtype filter of the control packet in promiscuous mode.

**Parameters**  
- **filter** - [out] store the current status of subtype filter of the control packet in promiscuous mode

**Returns**  
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument

**esp_err_t esp_wifi_set_config** *(wifi_interface_t interface, wifi_config_t *conf)*  
Set the configuration of the STA, AP or NAN.

**Attention**  
1. This API can be called only when specified interface is enabled, otherwise, API fail
2. For station configuration, bssid_set needs to be 0; and it needs to be 1 only when users need to check the MAC address of the AP.
3. ESP devices are limited to only one channel, so when in the soft-AP+station mode, the soft-AP will adjust its channel automatically to be the same as the channel of the station.
4. The configuration will be stored in NVS for station and soft-AP

**Parameters**  
- **interface** - interface
- **conf** - station, soft-AP or NAN configuration

**Returns**  
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument
- ESP_ERR_WIFI_IF: invalid interface
- ESP_ERR_WIFI_MODE: invalid mode
- ESP_ERR_WIFI_PASSWORD: invalid password
- ESP_ERR_WIFI_NVS: WiFi internal NVS error
- others: refer to the error code in esp_err.h

**esp_err_t esp_wifi_get_config** *(wifi_interface_t interface, wifi_config_t *conf)*  
Get configuration of specified interface.

**Parameters**  
- **interface** - interface
- **conf** - [out] station or soft-AP configuration

**Returns**  
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument
- ESP_ERR_WIFI_IF: invalid interface

**esp_err_t esp_wifi_ap_get_sta_list** *(wifi_sta_list_t *sta)*  
Get STAs associated with soft-AP.

**Attention**  
SSC only API

**Parameters**  
- **sta** - [out] station list ap can get the connected sta’s phy mode info through the struct member phy_11b, phy_11g, phy_11n, phy_lr in the wifi_sta_info_t struct. For example, phy_11b = 1 imply that sta support 802.11b mode

**Returns**  
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument
Chapter 2. API Reference

- ESP_ERR_WIFI_MODE: WiFi mode is wrong
- ESP_ERR_WIFI_CONN: WiFi internal error, the station/soft-AP control block is invalid

```c
esp_err_t esp_wifi_ap_get_sta_aid(const uint8_t mac[6], uint16_t *aid)
```

Get AID of STA connected with soft-AP.

**Parameters**
- `mac` – STA’s mac address
- `aid` – [out] Store the AID corresponding to STA mac

**Returns**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument
- ESP_ERR_NOT_FOUND: Requested resource not found
- ESP_ERR_WIFI_MODE: WiFi mode is wrong
- ESP_ERR_WIFI_CONN: WiFi internal error, the station/soft-AP control block is invalid

```c
esp_err_t esp_wifi_set_storage(wifi_storage_t storage)
```

Set the WiFi API configuration storage type.

**Attention**
1. The default value is WIFI_STORAGE_FLASH

**Parameters**
- `storage` – storage type

**Returns**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument

```c
esp_err_t esp_wifi_set_vendor_ie(bool enable, wifi_vendor_ie_type_t type, wifi_vendor_ie_id_t idx, const void *vnd_ie)
```

Set 802.11 Vendor-Specific Information Element.

**Parameters**
- `enable` – If true, specified IE is enabled. If false, specified IE is removed.
- `type` – Information Element type. Determines the frame type to associate with the IE.
- `idx` – Index to set or clear. Each IE type can be associated with up to two elements (indices 0 & 1).
- `vnd_ie` – Pointer to vendor specific element data. First 6 bytes should be a header with fields matching `vendor_ie_data_t`. If enable is false, this argument is ignored and can be NULL. Data does not need to remain valid after the function returns.

**Returns**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init()
- ESP_ERR_INVALID_ARG: Invalid argument, including if first byte of vnd_ie is not WIFI_VENDOR_IE_ELEMENT_ID (0xDD) or second byte is an invalid length.
- ESP_ERR_NO_MEM: Out of memory

```c
esp_err_t esp_wifi_set_vendor_ie_cb(esp_vendor_ie_cb_t cb, void *ctx)
```

Register Vendor-Specific Information Element monitoring callback.

**Parameters**
- `cb` – Callback function
- `ctx` – Context argument, passed to callback function.

**Returns**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
**esp_err_t esp_wifi_set_max_tx_power** (int8_t power)
Set maximum transmitting power after WiFi start.

**Attention 1.** Maximum power before wifi startup is limited by PHY init data bin.

**Attention 2.** The value set by this API will be mapped to the max_tx_power of the structure wifi_country_t variable.

**Attention 3.** Mapping Table \{Power, max_tx_power\} = \{(8, 2), (20, 5), (28, 7), (34, 8), (44, 11), (52, 13), (56, 14), (60, 15), (66, 16), (72, 18), (80, 20)\}.

**Attention 4.** Param power unit is 0.25dBm, range is [8, 84] corresponding to 2dBm - 20dBm.

**Attention 5.** Relationship between set value and actual value. As follows: \{set value range, actual value\} = \{[8, 19], 8\}, \{[20, 27], 20\}, \{[28, 33], 28\}, \{[34, 43], 34\}, \{[44, 51], 44\}, \{[52, 55], 52\}, \{[56, 59], 56\}, \{[60, 65], 60\}, \{[66, 71], 66\}, \{[72, 79], 72\}, \{[80, 84], 80\}.

**Parameters**
- `power` – Maximum WiFi transmitting power.

**Returns**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_NOT_STARTED: WiFi is not started by esp_wifi_start
- ESP_ERR_INVALID_ARG: invalid argument, e.g. parameter is out of range

**esp_err_t esp_wifi_get_max_tx_power** (int8_t *power)
Get maximum transmitting power after WiFi start.

**Parameters**
- `power` – Maximum WiFi transmitting power, unit is 0.25dBm.

**Returns**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_NOT_STARTED: WiFi is not started by esp_wifi_start
- ESP_ERR_INVALID_ARG: invalid argument

**esp_err_t esp_wifi_set_event_mask** (uint32_t mask)
Set mask to enable or disable some WiFi events.

**Attention 1.** Mask can be created by logical OR of various WIFI_EVENT_MASK_ constants. Events which have corresponding bit set in the mask will not be delivered to the system event handler.

**Attention 2.** Default WiFi event mask is WIFI_EVENT_MASK_AP_PROBEREQRECVED.

**Attention 3.** There may be lots of stations sending probe request data around. Don’t unmask this event unless you need to receive probe request data.

**Parameters**
- `mask` – WiFi event mask.

**Returns**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init

**esp_err_t esp_wifi_get_event_mask** (uint32_t *mask)
Get mask of WiFi events.

**Parameters**
- `mask` – WiFi event mask.

**Returns**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument

**esp_err_t esp_wifi_80211_tx** (wifi_interface_t ifx, const void *buffer, int len, bool en_sys_seq)
Send raw ieee80211 data.
**Attention** Currently only support for sending beacon/probe request/probe response/action and non-QoS data frame

**Parameters**
- **ifx** - interface if the Wi-Fi mode is Station, the ifx should be WIFI_IF_STA. If the Wi-Fi mode is SoftAP, the ifx should be WIFI_IF_AP. If the Wi-Fi mode is Station+SoftAP, the ifx should be WIFI_IF_STA or WIFI_IF_AP. If the ifx is wrong, the API returns ESP_ERR_WIFI_IF.
- **buffer** - raw ieee80211 buffer
- **len** - the length of raw buffer, the len must be <= 1500 Bytes and >= 24 Bytes
- **en_sys_seq** - indicate whether use the internal sequence number. If en_sys_seq is false, the sequence in raw buffer is unchanged, otherwise it will be overwritten by WiFi driver with the system sequence number. Generally, if esp_wifi_80211_tx is called before the Wi-Fi connection has been set up, both en_sys_seq=true and en_sys_seq=false are fine. However, if the API is called after the Wi-Fi connection has been set up, en_sys_seq must be true, otherwise ESP_ERR_INVALID_ARG is returned.

**Returns**
- ESP_OK: success
- ESP_ERR_WIFI_IF: Invalid interface
- ESP_ERR_INVALID_ARG: Invalid parameter
- ESP_ERR_WIFI_NO_MEM: out of memory

```c
esp_err_t esp_wifi_set_csi_rx_cb (wifi_csi_cb_t cb, void *ctx)
```
Register the RX callback function of CSI data.

Each time a CSI data is received, the callback function will be called.

**Parameters**
- **cb** - callback
- **ctx** - context argument, passed to callback function

**Returns**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init

```c
esp_err_t esp_wifi_set_csi_config (const wifi_csi_config_t *config)
```
Set CSI data configuration.

**Parameters**
- **config** - configuration

```c
esp_err_t esp_wifi_set_csi (bool en)
```
Enable or disable CSI.

**Returns**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
• ESP_ERR_WIFI_NOT_STARTED: WiFi is not started by esp_wifi_start or promiscuous mode is not enabled
• ESP_ERR_INVALID_ARG: invalid argument

Parameters en –true - enable, false - disable

```
esp_err_t esp_wifi_set_ant_gpio (const wifi_ant_gpio_config_t *config)
```
Set antenna GPIO configuration.

Parameters config –Antenna GPIO configuration.

Returns
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: Invalid argument, e.g. parameter is NULL, invalid GPIO number etc

```
esp_err_t esp_wifi_get_ant_gpio (wifi_ant_gpio_config_t *config)
```
Get current antenna GPIO configuration.

Parameters config –Antenna GPIO configuration.

Returns
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument, e.g. parameter is NULL

```
esp_err_t esp_wifi_set_ant (const wifi_ant_config_t *config)
```
Set antenna configuration.

Parameters config –Antenna configuration.

Returns
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument, e.g. parameter is NULL, invalid antenna mode or invalid GPIO number

```
esp_err_t esp_wifi_get_ant (wifi_ant_config_t *config)
```
Get current antenna configuration.

Parameters config –Antenna configuration.

Returns
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument, e.g. parameter is NULL

```
int64_t esp_wifi_get_tsf_time (wifi_interface_t interface)
```
Get the TSF time In Station mode or SoftAP+Station mode if station is not connected or station doesn’t receive at least one beacon after connected, will return 0.

Attention Enabling power save may cause the return value inaccurate, except WiFi modem sleep

Parameters interface - The interface whose tsf_time is to be retrieved.

Returns 0 or the TSF time

```
esp_err_t esp_wifi_set_inactive_time (wifi_interface_t ifx, uint16_t sec)
```
Set the inactive time of the STA or AP.

Attention 1. For Station, If the station does not receive a beacon frame from the connected SoftAP during the inactive time, disconnect from SoftAP. Default 6s.
**Attention** 2. For SoftAP, if the softAP doesn’t receive any data from the connected STA during inactive time, the softAP will force deauth the STA. Default is 300s.

**Attention** 3. The inactive time configuration is not stored into flash.

### Parameters
- `ifx` – interface to be configured.
- `sec` – Inactive time. Unit seconds.

### Returns
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_NOT_STARTED: WiFi is not started by esp_wifi_start
- ESP_ERR_INVALID_ARG: invalid argument, For Station, if sec is less than 3. For SoftAP, if sec is less than 10.

```c
esp_err_t esp_wifi_get_inactive_time(wifi_interface_t ifx, uint16_t* sec)
```

Get inactive time of specified interface.

### Parameters
- `ifx` – Interface to be configured.
- `sec` – Inactive time. Unit seconds.

### Returns
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_NOT_STARTED: WiFi is not started by esp_wifi_start
- ESP_ERR_INVALID_ARG: invalid argument

```c
esp_err_t esp_wifi_stats_dump(uint32_t modules)
```

Dump WiFi statistics.

### Parameters
- `modules` – statistic modules to be dumped

### Returns
- ESP_OK: succeed
- others: failed

```c
esp_err_t esp_wifi_set_rssi_threshold(int32_t rssi)
```

Set RSSI threshold, if average rssi gets lower than threshold, WiFi task will post event WIFI_EVENT_STA_BSS_RSSI_LOW.

### Parameters
- `rssi` – threshold value in dbm between -100 to 10 Note that in some rare cases where signal strength is very strong, rssi values can be slightly positive.

### Returns
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument

```c
esp_err_t esp_wifi_ftm_initiate_session(wifi_ftm_initiator_cfg_t *cfg)
```

Start an FTM Initiator session by sending FTM request If successful, event WIFI_EVENT_FTM_REPORT is generated with the result of the FTM procedure.

### Parameters
- `cfg` – FTM Initiator session configuration

**Attention** 1. Use this API only in Station mode.

**Attention** 2. If FTM is initiated on a different channel than Station is connected in or internal SoftAP is started in, FTM defaults to a single burst in ASAP mode.
**Returns**

- ESP_OK: succeed
- others: failed

`esp_err_t esp_wifi_ftm_end_session(void)`

End the ongoing FTM Initiator session.

**Attention** This API works only on FTM Initiator

**Returns**

- ESP_OK: succeed
- others: failed

`esp_err_t esp_wifi_ftm_resp_set_offset(int16_t offset_cm)`

Set offset in cm for FTM Responder. An equivalent offset is calculated in picoseconds and added in TOD of FTM Measurement frame (T1).

**Attention** Use this API only in AP mode before performing FTM as responder

**Parameters**

- **offset_cm** – T1 Offset to be added in centimeters

**Returns**

- ESP_OK: succeed
- others: failed

`esp_err_t esp_wifi_config_11b_rate(wifi_interface_t ifx, bool disable)`

Enable or disable 11b rate of specified interface.

**Attention** 1. This API should be called after esp_wifi_init() and before esp_wifi_start().
**Attention** 2. Only when really need to disable 11b rate call this API otherwise don’t call this.

**Parameters**

- **ifx** – Interface to be configured.
- **disable** – true means disable 11b rate while false means enable 11b rate.

**Returns**

- ESP_OK: succeed
- others: failed

`esp_err_t esp_wifi_connectionless_module_set_wake_interval(uint16_t wake_interval)`

Set wake interval for connectionless modules to wake up periodically.

**Attention** 1. Only one wake interval for all connectionless modules.
**Attention** 2. This configuration could work at connected status. When ESP_WIFI_STA_DISCONNECTED_PM_ENABLE is enabled, this configuration could work at disconnected status.
**Attention** 3. Event WIFI_EVENT_CONNECTIONLESS_MODULE_WAKE_INTERVAL_START would be posted each time wake interval starts.
**Attention** 4. Recommend to configure interval in multiples of hundred. (e.g. 100ms)
**Attention** 5. Recommend to configure interval to ESP_WIFI_CONNECTIONLESS_INTERVAL_DEFAULT_MODE to get stable performance at coexistence mode.

**Parameters**

- **wake_interval** – Milliseconds after would the chip wake up, from 1 to 65535.
**esp_err_t esp_wifi_force_wakeup_acquire (void)**

Request extra reference of Wi-Fi radio. Wi-Fi keep active state (RF opened) to be able to receive packets.

**Attention** Please pair the use of **esp_wifi_force_wakeup_acquire** with **esp_wifi_force_wakeup_release**.

**Returns**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_NOT_STARTED: WiFi is not started by esp_wifi_start

**esp_err_t esp_wifi_force_wakeup_release (void)**

Release extra reference of Wi-Fi radio. Wi-Fi goes to sleep state (RF closed) if no more use of radio.

**Attention** Please pair the use of **esp_wifi_force_wakeup_acquire** with **esp_wifi_force_wakeup_release**.

**Returns**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_NOT_STARTED: WiFi is not started by esp_wifi_start

**esp_err_t esp_wifi_set_country_code (const char* country, bool ieee80211d_enabled)**

Configure country

**Attention**
1. When ieee80211d_enabled is set, the country info of the AP to which the station is connected is used. E.g. if the configured country is US and the country info of the AP to which the station is connected is JP then the country info that will be used is JP. If the station disconnected from the AP the country info is set back to the country info of the station automatically, US in the example.
2. When ieee80211d_enabled is disabled, then the configured country info is used always.
3. When the country info is changed because of configuration or because the station connects to a different external AP, the country IE in probe response/beacon of the soft-AP is also changed.
4. The country configuration is stored into flash.
5. When this API is called, the PHY init data will switch to the PHY init data type corresponding to the country info.
7. When country code “01” (world safe mode) is set, SoftAP mode won’t contain country IE.
8. The default country is “01” (world safe mode) and ieee80211d_enabled is TRUE.
9. The third octet of country code string is one of the following: ‘I’, ‘O’, ‘I’, ‘X’, otherwise it is considered as ‘I’.

**Parameters**
- **country** – the configured country ISO code
- **ieee80211d_enabled** – 802.11d is enabled or not

**Returns**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument
**esp_err_t esp_wifi_get_country_code** (char *country)

Get the current country code.

**Parameters**
- country - Country code

**Returns**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument

**esp_err_t esp_wifi_config_80211_tx_rate** (wifi_interface_t ifx, wifi_phy_rate_t rate)

Config 80211 tx rate of specified interface.

**Attention** 1. This API should be called after esp_wifi_init() and before esp_wifi_start().

**Parameters**
- ifx - Interface to be configured.
- rate - Phy rate to be configured.

**Returns**
- ESP_OK: succeed
- others: failed

**esp_err_t esp_wifi_disable_pmf_config** (wifi_interface_t ifx)

Disable PMF configuration for specified interface.

**Attention** This API should be called after esp_wifi_set_config() and before esp_wifi_start().

**Parameters**
- ifx - Interface to be configured.

**Returns**
- ESP_OK: succeed
- others: failed

**esp_err_t esp_wifi_sta_get_aid** (uint16_t *aid)

Get the Association id assigned to STA by AP.

**Attention** aid = 0 if station is not connected to AP.

**Parameters**
- aid - [out] store the aid

**Returns**
- ESP_OK: succeed

**esp_err_t esp_wifi_sta_get_negotiated_phymode** (wifi_phy_mode_t *phymode)

Get the negotiated phymode after connection.

**Parameters**
- phymode - [out] store the negotiated phymode.

**Returns**
- ESP_OK: succeed

**esp_err_t esp_wifi_set_dynamic_cs** (bool enabled)

Config dynamic carrier sense.

**Attention** This API should be called after esp_wifi_start().

**Parameters**
- enabled - Dynamic carrier sense is enabled or not.

**Returns**
- ESP_OK: succeed
• others: failed

```c
esp_err_t esp_wifi_sta_get_rssi(int *rssi)
```

Get the rssi info after station connected to AP.

**Attention** This API should be called after station connected to AP.

**Parameters** `rssi` – store the rssi info received from last beacon.

**Returns**

- ESP_OK: succeed
- ESP_ERR_INVALID_ARG: invalid argument
- ESP_FAIL: failed

**Structures**

struct `wifi_init_config_t`

WiFi stack configuration parameters passed to esp_wifi_init call.

**Public Members**

```c
int csi_enable
    WiFi channel state information enable flag

int ampdu_rx_enable
    WiFi AMPDU RX feature enable flag

int ampdu_tx_enable
    WiFi AMPDU TX feature enable flag

int amsdru_tx_enable
    WiFi AMSDU TX feature enable flag

int nvse_enable
    WiFi NVS flash enable flag

int nano_enable
    Nano option for printf/scan family enable flag

int rx_ba_win
    WiFi Block Ack RX window size

int wifi_task_core_id
    WiFi Task Core ID

int beacon_max_len
    WiFi softAP maximum length of the beacon

int mgmt_sbuf_num
    WiFi management short buffer number, the minimum value is 6, the maximum value is 32

uint64_t feature_caps
    Enables additional WiFi features and capabilities

bool sta_disconnected_pm
    WiFi Power Management for station at disconnected status

int espnow_max_encrypt_num
    Maximum encrypt number of peers supported by espnow

int magic
    WiFi init magic number, it should be the last field
```

**Macros**

**ESP_ERR_WIFI_NOT_INIT**
WiFi driver was not installed by esp_wifi_init

**ESP_ERR_WIFI_NOT_STARTED**
WiFi driver was not started by esp_wifi_start
ESP_ERR_WIFI_NOT_STOPPED
   WiFi driver was not stopped by esp_wifi_stop

ESP_ERR_WIFI_IF
   WiFi interface error

ESP_ERR_WIFI_MODE
   WiFi mode error

ESP_ERR_WIFI_STATE
   WiFi internal state error

ESP_ERR_WIFI_CONN
   WiFi internal control block of station or soft-AP error

ESP_ERR_WIFI_NVS
   WiFi internal NVS module error

ESP_ERR_WIFI_MAC
   MAC address is invalid

ESP_ERR_WIFI_SSID
   SSID is invalid

ESP_ERR_WIFI_PASSWORD
   Password is invalid

ESP_ERR_WIFI_TIMEOUT
   Timeout error

ESP_ERR_WIFI_WAKE_FAIL
   WiFi is in sleep state (RF closed) and wakeup fail

ESP_ERR_WIFI_WOULD_BLOCK
   The caller would block

ESP_ERR_WIFI_NOT_CONNECT
   Station still in disconnect status

ESP_ERR_WIFI_POST
   Failed to post the event to WiFi task

ESP_ERR_WIFI_INIT_STATE
   Invalid WiFi state when init/deinit is called

ESP_ERR_WIFI_STOP_STATE
   Returned when WiFi is stopping
ESP_ERR_WIFI_NOT_ASSOC
The WiFi connection is not associated

ESP_ERR_WIFI_TX_DISALLOW
The WiFi TX is disallowed

ESP_ERR_WIFI_TWT_FULL
no available flow id

ESP_ERR_WIFI_TWT_SETUP_TIMEOUT
Timeout of receiving twt setup response frame, timeout times can be set during twt setup

ESP_ERR_WIFI_TWT_SETUP_TXFAIL
TWT setup frame tx failed

ESP_ERR_WIFI_TWT_SETUP_REJECT
The twt setup request was rejected by the AP

ESP_ERR_WIFI_DISCARD
Discard frame

Type Definitions

typedef void (*wifi_promiscuous_cb_t)(void *buf, wifi_promiscuous_pkt_type_t type)

The RX callback function in the promiscuous mode. Each time a packet is received, the callback function will be called.

Param buf Data received. Type of data in buffer (wifi_promiscuous_pkt_t or wifi_pkt_rx_ctrl_t) indicated by ‘type’ parameter.

Param type promiscuous packet type.

typedef void (*esp_vendor_ie_cb_t)(void *ctx, wifi_vendor_ie_type_t type, const uint8_t sa[6], const vendor_ie_data_t *vnd_ie, int rssi)

Function signature for received Vendor-Specific Information Element callback.

Param ctx Context argument, as passed to esp_wifi_set_vendor_ie_cb() when registering callback function.

Param type Information element type, based on frame type received.

Param sa Source 802.11 address.

Param vnd_ie Pointer to the vendor specific element data received.

Param rssi Received signal strength indication.

typedef void (*wifi_csi_cb_t)(void *ctx, wifi_csi_info_t *data)

The RX callback function of Channel State Information(CSI) data.

Each time a CSI data is received, the callback function will be called.

Param ctx context argument, passed to esp_wifi_set_csi_rx_cb() when registering callback function.

Param data CSI data received. The memory that it points to will be deallocated after callback function returns.
## Header File

- `components/esp_wifi/include/esp_wifi_types.h`
- This header file can be included with:

  ```
  #include "esp_wifi_types.h"
  ```
- This header file is a part of the API provided by the `esp_wifi` component. To declare that your component depends on `esp_wifi`, add the following to your `CMakeLists.txt`:

  ```
  REQUIRES esp_wifi
  or
  PRIV_REQUIRES esp_wifi
  ```

## Unions

**union wifi_config_t**

`#include <esp_wifi_types.h>` Configuration data for device’s AP or STA or NAN.

The usage of this union (for ap, sta or nan configuration) is determined by the accompanying interface argument passed to `esp_wifi_set_config()` or `esp_wifi_get_config()`

## Public Members

- `wifi_ap_config_t ap`
  - configuration of AP
- `wifi_sta_config_t sta`
  - configuration of STA
- `wifi_nan_config_t nan`
  - configuration of NAN

## Structures

**struct wifi_country_t**

Structure describing WiFi country-based regional restrictions.

## Public Members

- `char cc[3]`
  - country code string
- `uint8_t schan`
  - start channel
- `uint8_t nchan`
  - total channel number
int8_t max_tx_power
   This field is used for getting WiFi maximum transmitting power, call esp_wifi_set_max_tx_power to set
   the maximum transmitting power.

wifi_country_policy_t policy
   country policy

struct wifi_active_scan_time_t
   Range of active scan times per channel.

Public Members

uint32_t min
   minimum active scan time per channel, units: millisecond

uint32_t max
   maximum active scan time per channel, units: millisecond, values above 1500ms may cause station to
disconnect from AP and are not recommended.

struct wifi_scan_time_t
   Aggregate of active & passive scan time per channel.

Public Members

wifi_active_scan_time_t active
   active scan time per channel, units: millisecond.

uint32_t passive
   passive scan time per channel, units: millisecond, values above 1500ms may cause station to disconnect
   from AP and are not recommended.

struct wifi_scan_config_t
   Parameters for an SSID scan.

Public Members

uint8_t * ssid
   SSID of AP

uint8_t * bssid
   MAC address of AP

uint8_t channel
   channel, scan the specific channel

bool show_hidden
   enable to scan AP whose SSID is hidden
**wifi_scan_type_t**

`scan_type`

Scan type, active or passive

**wifi_scan_time_t**

`scan_time`

Scan time per channel

**uint8_t**

`home_chan_dwell_time`

Time spent at home channel between scanning consecutive channels.

**struct wifi_he_ap_info_t**

Description of a WiFi AP HE Info.

**Public Members**

**uint8_t**

`bss_color`

An unsigned integer whose value is the BSS Color of the BSS corresponding to the AP.

**uint8_t**

`partial_bss_color`

Indicate if an AID assignment rule based on the BSS color.

**uint8_t**

`bss_color_disabled`

Indicate if the use of BSS color is disabled.

**uint8_t**

`bssid_index`

In M-BSSID set, identifies the nontransmitted BSSID.

**struct wifi_ap_record_t**

Description of a WiFi AP.

**Public Members**

**uint8_t**

`bssid[6]`

MAC address of AP.

**uint8_t**

`ssid[33]`

SSID of AP.

**uint8_t**

`primary`

Channel of AP.

**wifi_secondChan_t**

Secondary channel of AP.

**int8_t**

`rssi`

Signal strength of AP. Note that in some rare cases where signal strength is very strong, rssi values can be slightly positive.
**wifi_auth_mode_t authmode**
authmode of AP

**wifi_cipher_type_t pairwise_cipher**
pairwise cipher of AP

**wifi_cipher_type_t group_cipher**
group cipher of AP

**wifi_ant_t ant**
antenna used to receive beacon from AP

```c
uint32_t phy_11b
    bit: 0 flag to identify if 11b mode is enabled or not

uint32_t phy_11g
    bit: 1 flag to identify if 11g mode is enabled or not

uint32_t phy_11n
    bit: 2 flag to identify if 11n mode is enabled or not

uint32_t phy_lr
    bit: 3 flag to identify if low rate is enabled or not

uint32_t phy_11ax
    bit: 4 flag to identify if 11ax mode is enabled or not

uint32_t wps
    bit: 5 flag to identify if WPS is supported or not

uint32_t ftmResponder
    bit: 6 flag to identify if FTM is supported in responder mode

uint32_t ftmInitiator
    bit: 7 flag to identify if FTM is supported in initiator mode

uint32_t reserved
    bit: 8..31 reserved
```

**wifi_country_t country**
country information of AP

**wifi_he_ap_info_t he_ap**
HE AP info

**struct wifi_scan_threshold_t**
Structure describing parameters for a WiFi fast scan.
Public Members

int8_t rssi

The minimum rssi to accept in the fast scan mode

wifi_auth_mode_t authmode

The weakest authmode to accept in the fast scan mode Note: Incase this value is not set and password is set as per WPA2 standards(password len >= 8), it will be defaulted to WPA2 and device won’t connect to deprecated WEP/WPA networks. Please set authmode threshold as WIFI_AUTH_WEP/WIFI_AUTH_WPA_PSK to connect to WEP/WPA networks

struct wifi_pmf_config_t

Configuration structure for Protected Management Frame

Public Members

bool capable

Deprecated variable. Device will always connect in PMF mode if other device also advertizes PMF capability.

bool required

Advertizes that Protected Management Frame is required. Device will not associate to non-PMF capable devices.

struct wifi_ap_config_t

Soft-AP configuration settings for the device.

Public Members

uint8_t ssid[32]

SSID of soft-AP. If ssid_len field is 0, this must be a Null terminated string. Otherwise, length is set according to ssid_len.

uint8_t password[64]

Password of soft-AP.

uint8_t ssid_len

Optional length of SSID field.

uint8_t channel

Channel of soft-AP

wifi_auth_mode_t authmode

Auth mode of soft-AP. Do not support AUTH_WEP, AUTH_WAPI_PSK and AUTH_OWE in soft-AP mode. When the auth mode is set to WPA2_PSK, WPA2_WPA3_PSK or WPA3_PSK, the pairwise cipher will be overwritten with WIFI_CIPHER_TYPE_CCMP.

uint8_t ssid_hidden

Broadcast SSID or not, default 0, broadcast the SSID
uint8_t **max_connection**
Max number of stations allowed to connect in

uint16_t **beacon_interval**
Beacon interval which should be multiples of 100. Unit: TU (time unit, 1 TU = 1024 us). Range: 100 ~ 60000. Default value: 100

**wifi_cipher_type_t** pairwise_cipher
Pairwise cipher of SoftAP, group cipher will be derived using this. Cipher values are valid starting from WIFI_CIPHER_TYPE_TKIP, enum values before that will be considered as invalid and default cipher suites (TKIP+CCMP) will be used. Valid cipher suites in softAP mode are WIFI_CIPHER_TYPE_TKIP, WIFI_CIPHER_TYPE_CCMP and WIFI_CIPHER_TYPE_TKIP_CCMP.

bool **ftm_responder**
Enable FTM Responder mode

**wifi_pmf_config_t** pmf_cfg
Configuration for Protected Management Frame

**wifi_sae_pwe_method_t** sae_pwe_h2e
Configuration for SAE PWE derivation method

struct **wifi_sta_config_t**
STA configuration settings for the device.

**Public Members**

uint8_t **ssid[32]**
SSID of target AP.

uint8_t **password[64]**
Password of target AP.

**wifi_scan_method_t** scan_method
Do all channel scan or fast scan

bool **bssid_set**
whether set MAC address of target AP or not. Generally, station_config.bssid_set needs to be 0; and it needs to be 1 only when users need to check the MAC address of the AP.

uint8_t **bssid[6]**
MAC address of target AP

uint8_t **channel**
channel of target AP. Set to 1~13 to scan starting from the specified channel before connecting to AP. If the channel of AP is unknown, set it to 0.
uint16_t listen_interval
Listen interval for ESP32 station to receive beacon when WIFI_PS_MAX_MODEM is set. Units: AP beacon intervals. Defaults to 3 if set to 0.

wifi_sort_method_t sort_method
sort the connect AP in the list by rssi or security mode

wifi_scan_threshold_t threshold
When scan_threshold is set, only APs which have an auth mode that is more secure than the selected auth mode and a signal stronger than the minimum RSSI will be used.

wifi_pmf_config_t pmfCfg
Configuration for Protected Management Frame. Will be advertised in RSN Capabilities in RSN IE.

uint32_t rm_enabled
Whether Radio Measurements are enabled for the connection

uint32_t btm_enabled
Whether BSS Transition Management is enabled for the connection

uint32_t mbo_enabled
Whether MBO is enabled for the connection

uint32_t ft_enabled
Whether FT is enabled for the connection

uint32_t owe_enabled
Whether OWE is enabled for the connection

uint32_t transition_disable
Whether to enable transition disable feature

uint32_t reserved
Reserved for future feature set

wifi_sae_pwe_method_t sae_pwe_h2e
Configuration for SAE PWE derivation method

wifi_sae_pk_mode_t sae_pk_mode
Configuration for SAE-PK (Public Key) Authentication method

uint8_t failure_retry_cnt
Number of connection retries station will do before moving to next AP. scan_method should be set as WIFI_ALL_CHANNEL_SCAN to use this config. Note: Enabling this may cause connection time to increase incase best AP doesn’t behave properly.

uint32_t he_dcm_set
Whether DCM max.constellation for transmission and reception is set.
Chapter 2. API Reference

`uint32_t he_dcm_max_constellation_tx`
Indicate the max.constellation for DCM in TB PPDU the STA supported. 0: not supported. 1: BPSK, 2: QPSK, 3: 16-QAM. The default value is 3.

`uint32_t he_dcm_max_constellation_rx`
Indicate the max.constellation for DCM in both Data field and HE-SIG-B field the STA supported. 0: not supported. 1: BPSK, 2: QPSK, 3: 16-QAM. The default value is 3.

`uint32_t he_mcs9_enabled`
Whether to support HE-MCS 0 to 9. The default value is 0.

`uint32_t he_su_beamformee_disabled`
Whether to disable support for operation as an SU beamformee.

`uint32_t he_trig_su_bmforming_feedback_disabled`
Whether to disable support the transmission of SU feedback in an HE TB sounding sequence.

`uint32_t he_trig_mu_bmforming_partial_feedback_disabled`
Whether to disable support the transmission of partial-bandwidth MU feedback in an HE TB sounding sequence.

`uint32_t he_trig_cqi_feedback_disabled`
Whether to disable support the transmission of CQI feedback in an HE TB sounding sequence.

`uint32_t he_reserved`
Reserved for future feature set

`uint8_t sae_h2e_identifier[SAE_H2E_IDENTIFIER_LEN]`
Password identifier for H2E. this needs to be null terminated string

```
struct wifi_nan_config_t
NAN Discovery start configuration.
```

**Public Members**

`uint8_t op_channel`
NAN Discovery operating channel

`uint8_t master_pref`
Device’s preference value to serve as NAN Master

`uint8_t scan_time`
Scan time in seconds while searching for a NAN cluster

`uint16_t warm_up_sec`
Warm up time before assuming NAN Anchor Master role

```
struct wifi_sta_info_t
Description of STA associated with AP.
```
Public Members

uint8_t mac[6]
    mac address

int8_t rssi
    current average rssi of sta connected

uint32_t phy_11b
    bit: 0 flag to identify if 11b mode is enabled or not

uint32_t phy_11g
    bit: 1 flag to identify if 11g mode is enabled or not

uint32_t phy_11n
    bit: 2 flag to identify if 11n mode is enabled or not

uint32_t phy_lr
    bit: 3 flag to identify if low rate is enabled or not

uint32_t phy_11ax
    bit: 4 flag to identify if 11ax mode is enabled or not

uint32_t is_mesh_child
    bit: 5 flag to identify mesh child

uint32_t reserved
    bit: 6..31 reserved

struct wifi_sta_list_t
    List of stations associated with the Soft-AP.

Public Members

wifi_sta_info_t sta[ESP_WIFI_MAX_CONN_NUM]
    station list

int num
    number of stations in the list (other entries are invalid)

struct vendor_ie_data_t
    Vendor Information Element header.
    The first bytes of the Information Element will match this header. Payload follows.

Public Members
Chapter 2. API Reference

uint8_t element_id
Should be set to WIFI_VENDOR_IE_ELEMENT_ID (0xDD)

uint8_t length
Length of all bytes in the element data following this field. Minimum 4.

uint8_t vendor_oui[3]
Vendor identifier (OUI).

uint8_t vendor_oui_type
Vendor-specific OUI type.

uint8_t payload[0]
Payload. Length is equal to value in ‘length’ field, minus 4.

struct wifi_pkt_rx_ctrl_t
Received packet radio metadata header, this is the common header at the beginning of all promiscuous mode RX callback buffers.

Public Members

signed rssi
Received Signal Strength Indicator (RSSI) of packet. unit: dBm

unsigned rate
PHY rate encoding of the packet. Only valid for non HT(11bg) packet

unsigned __pad0__
reserved

unsigned sig_mode
0: non HT(11bg) packet; 1: HT(11n) packet; 3: VHT(11ac) packet

unsigned __pad1__
reserved

unsigned mcs
Modulation Coding Scheme. If is HT(11n) packet, shows the modulation, range from 0 to 76(MSC0 ~ MCS76)

unsigned cwb
Channel Bandwidth of the packet. 0: 20MHz; 1: 40MHz

unsigned __pad2__
reserved

unsigned smoothing
reserved
unsigned not_sounding
    reserved

unsigned __pad3__
    reserved

unsigned aggregation
    Aggregation. 0: MPDU packet; 1: AMPDU packet

unsigned stbc
    Space Time Block Code(STBC). 0: non STBC packet; 1: STBC packet

unsigned fec_coding
    Flag is set for 11n packets which are LDPC

unsigned sgi
    Short Guide Interval(SGI). 0: Long GI; 1: Short GI

unsigned __pad4__
    reserved

unsigned ampdu_cnt
    ampdu cnt

unsigned channel
    primary channel on which this packet is received

unsigned secondary_channel
    secondary channel on which this packet is received. 0: none; 1: above; 2: below

unsigned __pad5__
    reserved

unsigned timestamp
    timestamp. The local time when this packet is received. It is precise only if modem sleep or light sleep is not enabled. unit: microsecond

unsigned __pad6__
    reserved

unsigned __pad7__
    reserved

unsigned __pad8__
    reserved

unsigned ant
    antenna number from which this packet is received. 0: WiFi antenna 0; 1: WiFi antenna 1
signed noise_floor
    noise floor of Radio Frequency Module(RF). unit: dBm

unsigned __pad9__
    reserved

unsigned sig_len
    length of packet including Frame Check Sequence(FCS)

unsigned __pad10__
    reserved

unsigned rx_state
    state of the packet. 0: no error; others: error numbers which are not public

struct wifi_promiscuous_pkt_t
    Payload passed to `buf` parameter of promiscuous mode RX callback.

    Public Members

    wifi_pkt_rx_ctrl_t rx_ctrl
        metadata header

    uint8_t payload[0]
        Data or management payload. Length of payload is described by rx_ctrl.sig_len. Type of content determined by packet type argument of callback.

struct wifi_promiscuous_filter_t
    Mask for filtering different packet types in promiscuous mode.

    Public Members

    uint32_t filter_mask
        OR of one or more filter values WIFI_PROMIS_FILTER_ *

struct wifi_csi_config_t
    Channel state information(CSI) configuration type.

    Public Members

    bool lltf_en
        enable to receive legacy long training field(lltf) data. Default enabled

    bool htltf_en
        enable to receive HT long training field(htltf) data. Default enabled
bool stbc_htltf2_en
   enable to receive space time block code HT long training field(stbc-htltf2) data. Default enabled

bool ltf_merge_en
   enable to generate htlft data by averaging lltf and ht_ltf data when receiving HT packet. Otherwise, use ht_ltf data directly. Default enabled

bool channel_filter_en
   enable to turn on channel filter to smooth adjacent sub-carrier. Disable it to keep independence of adjacent sub-carrier. Default enabled

bool manu_scale
   manually scale the CSI data by left shifting or automatically scale the CSI data. If set true, please set the shift bits. false: automatically. true: manually. Default false

uint8_t shift
   manually left shift bits of the scale of the CSI data. The range of the left shift bits is 0~15

struct wifi_csi_info_t
   CSI data type.

   Public Members

   wifi_pkt_rx_ctrl_t rx_ctrl
      received packet radio metadata header of the CSI data

   uint8_t* mac[6]
      source MAC address of the CSI data

   uint8_t* dmac[6]
      destination MAC address of the CSI data

   bool first_word_invalid
      first four bytes of the CSI data is invalid or not

   int8_t* buf
      buffer of CSI data

   uint16_t len
      length of CSI data

struct wifi_ant_gpio_t
   WiFi GPIO configuration for antenna selection.

   Public Members

   uint8_t gpio_select
      Whether this GPIO is connected to external antenna switch
uint8_t **gpio_num
   The GPIO number that connects to external antenna switch

struct wifi_ant_gpio_config_t
   WiFi GPIOs configuration for antenna selection.

Public Members

wifi_ant_gpio_t gpio_cfg[4]
   The configurations of GPIOs that connect to external antenna switch

struct wifi_ant_config_t
   WiFi antenna configuration.

Public Members

wifi_ant_mode_t rx_ant_mode
   WiFi antenna mode for receiving

wifi_ant_mode_t rx_ant_default
   Default antenna mode for receiving, it’s ignored if rx_ant_mode is not WIFI_ANT_MODE_AUTO

wifi_ant_mode_t tx_ant_mode
   WiFi antenna mode for transmission, it can be set to WIFI_ANT_MODE_AUTO only if rx_ant_mode is set to WIFI_ANT_MODE_AUTO

uint8_t enabled_ant0
   Index (in antenna GPIO configuration) of enabled WIFI_ANT_MODE_ANT0

uint8_t enabled_ant1
   Index (in antenna GPIO configuration) of enabled WIFI_ANT_MODE_ANT1

struct wifi_action_tx_req_t
   Action Frame Tx Request.

Public Members

wifi_interface_t ifx
   WiFi interface to send request to

uint8_t dest_mac[6]
   Destination MAC address

bool no_ack
   Indicates no ack required
Chapter 2. API Reference

wifi_action_rx_cb / rx_cb
Rx Callback to receive any response

uint32_t data_len
Length of the appended Data

uint8_t data[0]
Appended Data payload

struct wifi_ftm Initiator cfg_t
FTM Initiator configuration.

Public Members

uint8_t resp_mac[6]
MAC address of the FTM Responder

uint8_t channel
Primary channel of the FTM Responder

uint8_t frm_count
No. of FTM frames requested in terms of 4 or 8 bursts (allowed values - 0(No pref), 16, 24, 32, 64)

uint16_t burst_period
Requested time period between consecutive FTM bursts in 100's of milliseconds (0 - No pref)

struct wifi_beacon monitor config_t
WiFi beacon monitor parameter configuration.

Public Members

bool enable
Enable or disable beacon monitor

uint8_t loss_timeout
Beacon lost timeout

uint8_t loss_threshold
Maximum number of consecutive lost beacons allowed

uint8_t delta_intr_early
Delta early time for RF PHY on

uint8_t delta_loss_timeout
Delta timeout time for RF PHY off

struct wifi_nan publish cfg_t
NAN Publish service configuration parameters.
Public Members

char *service_name [ESP_WIFI_MAX_SVC_NAME_LEN]
Service name identifier

wifi_nan_service_type_t type
Service type

char *matching_filter [ESP_WIFI_MAX_FILTER_LEN]
Comma separated filters for filtering services

char *svc_info [ESP_WIFI_MAX_SVC_INFO_LEN]
Service info shared in Publish frame

uint8_t single_replied_event
Give single Replied event or every time

uint8_t datapath_reqd
NAN Datapath required for the service

uint8_t reserved
Reserved

struct wifi_nan_subscribe_cfg_t
NAN Subscribe service configuration parameters.

Public Members

char *service_name [ESP_WIFI_MAX_SVC_NAME_LEN]
Service name identifier

wifi_nan_service_type_t type
Service type

char *matching_filter [ESP_WIFI_MAX_FILTER_LEN]
Comma separated filters for filtering services

char *svc_info [ESP_WIFI_MAX_SVC_INFO_LEN]
Service info shared in Subscribe frame

uint8_t single_match_event
Give single Match event or every time

uint8_t reserved
Reserved

struct wifi_nan_followup_params_t
NAN Follow-up parameters.
**Public Members**

```c
uint8_t inst_id
   Own service instance id
```

```c
uint8_t peer_inst_id
   Peer’s service instance id
```

```c
uint8_t peer_mac[6]
   Peer’s MAC address
```

```c
char svc_info[ESP_WIFI_MAX_SVC_INFO_LEN]
   Service info(or message) to be shared
```

```c
struct wifi_nan_datapath_req_t
   NAN Datapath Request parameters.
```

**Public Members**

```c
uint8_t pub_id
   Publisher’s service instance id
```

```c
uint8_t peer_mac[6]
   Peer’s MAC address
```

```c
bool confirm_required
   NDP Confirm frame required
```

```c
struct wifi_nan_datapath_resp_t
   NAN Datapath Response parameters.
```

**Public Members**

```c
bool accept
   True - Accept incoming NDP, False - Reject it
```

```c
uint8_t ndp_id
   NAN Datapath Identifier
```

```c
uint8_t peer_mac[6]
   Peer’s MAC address
```

```c
struct wifi_nan_datapath_end_req_t
   NAN Datapath End parameters.
```
Public Members

```c
uint8_t ndp_id
   NAN Datapath Identifier

uint8_t peer_mac[6]
   Peer’s MAC address
```

```c
struct wifi_event_sta_scan_done_t
   Argument structure for WIFI_EVENT_SCAN_DONE event
```

Public Members

```c
uint32_t status
   status of scanning APs: 0 — success, 1 - failure

uint8_t number
   number of scan results

uint8_t scan_id
   scan sequence number, used for block scan
```

```c
struct wifi_event_sta_connected_t
   Argument structure for WIFI_EVENT_STA_CONNECTED event
```

Public Members

```c
uint8_t ssid[32]
   SSID of connected AP

uint8_t ssid_len
   SSID length of connected AP

uint8_t bssid[6]
   BSSID of connected AP

uint8_t channel
   channel of connected AP

wifi_auth_mode_t authmode
   authentication mode used by AP

uint16_t aid
   authentication id assigned by the connected AP
```

```c
struct wifi_event_sta_disconnected_t
   Argument structure for WIFI_EVENT_STA_DISCONNECTED event
```
Public Members

- `uint8_t ssid[32]`
  SSID of disconnected AP

- `uint8_t ssid_len`
  SSID length of disconnected AP

- `uint8_t bssid[6]`
  BSSID of disconnected AP

- `uint8_t reason`
  reason of disconnection

- `int8_t rssi`
  rssi of disconnection

struct `wifi_event_sta_authmode_change_t`
  Argument structure for WIFI_EVENT_STA_AUTHMODE_CHANGE event

Public Members

- `wifi_auth_mode_t old_mode`
  the old auth mode of AP

- `wifi_auth_mode_t new_mode`
  the new auth mode of AP

struct `wifi_event_sta_wps_er_pin_t`
  Argument structure for WIFI_EVENT_STA_WPS_ER_PIN event

Public Members

- `uint8_t pin_code[8]`
  PIN code of station in enrollee mode

struct `wifi_event_sta_wps_er_success_t`
  Argument structure for WIFI_EVENT_STA_WPS_ER_SUCCESS event

Public Members

- `uint8_t ap_cred_cnt`
  Number of AP credentials received

- `uint8_t ssid[MAX_SSID_LEN]`
  SSID of AP
uint8_t passphrase[MAX_PASSPHRASE_LEN]
   Passphrase for the AP

struct wifi_event_sta_wps_er_success_t::[anonymous] ap_cred[MAX_WPS_AP_CRED]
   All AP credentials received from WPS handshake

struct wifi_event_ap_staconnected_t
   Argument structure for WIFI_EVENT_AP_STACONNECTED event

   Public Members

   uint8_t t mac[6]
      MAC address of the station connected to Soft-AP

   uint8_t t aid
      the aid that soft-AP gives to the station connected to

   bool is_mesh_child
      flag to identify mesh child

struct wifi_event_ap_stadisconnected_t
   Argument structure for WIFI_EVENT_AP_STADISCONNECTED event

   Public Members

   uint8_t t mac[6]
      MAC address of the station disconnects to soft-AP

   uint8_t t aid
      the aid that soft-AP gave to the station disconnects to

   bool is_mesh_child
      flag to identify mesh child

   uint8_t t reason
      reason of disconnection

struct wifi_event_ap_probe_req_rx_t
   Argument structure for WIFI_EVENT_AP_PROBEREQRECVED event

   Public Members

   int rssi
      Received probe request signal strength
Chapter 2. API Reference

```c
uint8_t mac[6]

MAC address of the station which send probe request
```

```c
struct wifi_event_bss_rssi_low_t

Argument structure for WIFI_EVENT_STA_BSS_RSSI_LOW event
```

**Public Members**

```c
int32_t rssi

RSSI value of bss
```

```c
struct wifi_ftm_report_entry_t

Argument structure for
```

**Public Members**

```c
uint8_t dlog_token

Dialog Token of the FTM frame
```

```c
int8_t rssi

RSSI of the FTM frame received
```

```c
uint32_t rtt

Round Trip Time in pSec with a peer
```

```c
uint64_t t1

Time of departure of FTM frame from FTM Responder in pSec
```

```c
uint64_t t2

Time of arrival of FTM frame at FTM Initiator in pSec
```

```c
uint64_t t3

Time of departure of ACK from FTM Initiator in pSec
```

```c
uint64_t t4

Time of arrival of ACK at FTM Responder in pSec
```

```c
struct wifi_event_ftm_report_t

Argument structure for WIFI_EVENT_FTM_REPORT event
```

**Public Members**

```c
uint8_t peer_mac[6]

MAC address of the FTM Peer
```
**wifi_ftm_status_t** `status`
Status of the FTM operation

`uint32_t rtt_raw`
Raw average Round-Trip-Time with peer in Nano-Seconds

`uint32_t rtt_est`
Estimated Round-Trip-Time with peer in Nano-Seconds

`uint32_t dist_est`
Estimated one-way distance in Centi-Meters

**wifi_ftm_report_entry_t **`*ftm_report_data`
Pointer to FTM Report with multiple entries, should be freed after use

`uint8_t ftm_report_num_entries`
Number of entries in the FTM Report data

**struct wifi_event_action_tx_status_t**
Argument structure for WIFI_EVENT_ACTION_TX_STATUS event

**Public Members**

`wifi_interface_t ifx`
WiFi interface to send request to

`uint32_t context`
Context to identify the request

`uint8_t da[6]`
Destination MAC address

`uint8_t status`
Status of the operation

**struct wifi_event_roc_done_t**
Argument structure for WIFI_EVENT_ROC_DONE event

**Public Members**

`uint32_t context`
Context to identify the request

**struct wifi_event_ap_wps_rg_pin_t**
Argument structure for WIFI_EVENT_AP_WPS_RG_PIN event
Chapter 2. API Reference

Public Members

uint8_t \texttt{pin\_code}[8]
PIN code of station in enrollee mode

struct \texttt{wifi\_event\_ap\_wps\_rg\_fail\_reason\_t}
Argument structure for WiFi\_EVENT\_AP\_WPS\_RG\_FAILED event

Public Members

\texttt{wps\_fail\_reason\_t reason}
WPS failure reason \texttt{wps\_fail\_reason\_t}

uint8_t \texttt{peer\_macaddr}[6]
Enrollee mac address

struct \texttt{wifi\_event\_ap\_wps\_rg\_success\_t}
Argument structure for WiFi\_EVENT\_AP\_WPS\_RG\_SUCCESS event

Public Members

uint8_t \texttt{peer\_macaddr}[6]
Enrollee mac address

struct \texttt{wifi\_event\_nan\_svc\_match\_t}
Argument structure for WiFi\_EVENT\_NAN\_SVC\_MATCH event

Public Members

uint8_t \texttt{subscribe\_id}
Subscribe Service Identifier

uint8_t \texttt{publish\_id}
Publish Service Identifier

uint8_t \texttt{pub\_if\_mac}[6]
NAN Interface MAC of the Publisher

bool \texttt{update\_pub\_id}
Indicates whether publisher’s service ID needs to be updated

struct \texttt{wifi\_event\_nan\_replied\_t}
Argument structure for WiFi\_EVENT\_NAN\_REPLIED event
Public Members

uint8_t publish_id
    Publish Service Identifier

uint8_t subscribe_id
    Subscribe Service Identifier

uint8_t sub_if_mac[6]
    NAN Interface MAC of the Subscriber

struct wifi_event_nan_receive_t
    Argument structure for WIFI_EVENT_NAN_RECEIVE event

Public Members

uint8_t inst_id
    Our Service Identifier

uint8_t peer_inst_id
    Peer’s Service Identifier

uint8_t peer_if_mac[6]
    Peer’s NAN Interface MAC

uint8_t peer_svc_info[ESP_WIFI_MAX_SVC_INFO_LEN]
    Peer Service Info

struct wifi_event_ndp_indication_t
    Argument structure for WIFI_EVENT_NDP_INDICATION event

Public Members

uint8_t publish_id
    Publish Id for NAN Service

uint8_t ndp_id
    NDP instance id

uint8_t peer_nmi[6]
    Peer’s NAN Management Interface MAC

uint8_t peer_ndi[6]
    Peer’s NAN Data Interface MAC

uint8_t svc_info[ESP_WIFI_MAX_SVC_INFO_LEN]
    Service Specific Info
struct wifi_event_ndp_confirm_t
   Argument structure for WIFI_EVENT_NDPCONFIRM event

   **Public Members**

   uint8_t status
      NDP status code

   uint8_t ndp_id
      NDP instance id

   uint8_t peer_nmi[6]
      Peer’s NAN Management Interface MAC

   uint8_t peer_ndi[6]
      Peer’s NAN Data Interface MAC

   uint8_t own_ndi[6]
      Own NAN Data Interface MAC

   uint8_t svc_info[ESP_WIFI_MAX_SVC_INFO_LEN]
      Service Specific Info

struct wifi_event_ndp_terminated_t
   Argument structure for WIFI_EVENT_NDP_TERMINATED event

   **Public Members**

   uint8_t reason
      Termination reason code

   uint8_t ndp_id
      NDP instance id

   uint8_t init_ndi[6]
      Initiator’s NAN Data Interface MAC

**Macros**

WIFI_OFFCHAN_TX_REQ

WIFI_OFFCHAN_TX_CANCEL

WIFI_ROC_REQ

WIFI_ROC_CANCEL
WIFI_PROTOCOL_11B
WIFI_PROTOCOL_11G
WIFI_PROTOCOL_11N
WIFI_PROTOCOL_LR
WIFI_PROTOCOL_11AX
SAE_H2E_IDENTIFIER_LEN

ESP_WIFI_MAX_CONN_NUM
   max number of stations which can connect to ESP32/ESP32S3/ESP32S2 soft-AP

WIFI_VENDOR_IE_ELEMENT_ID

WIFI_PROMIS_FILTER_MASK_ALL
   filter all packets

WIFI_PROMIS_FILTER_MASK_MGMT
   filter the packets with type of WIFI_PKT_MGMT

WIFI_PROMIS_FILTER_MASK_CTRL
   filter the packets with type of WIFI_PKT_CTRL

WIFI_PROMIS_FILTER_MASK_DATA
   filter the packets with type of WIFI_PKT_DATA

WIFI_PROMIS_FILTER_MASK_MISC
   filter the packets with type of WIFI_PKT_MISC

WIFI_PROMIS_FILTER_MASK_DATA_MPDU
   filter the MPDU which is a kind of WIFI_PKT_DATA

WIFI_PROMIS_FILTER_MASK_DATA_AMPDU
   filter the AMPDU which is a kind of WIFI_PKT_DATA

WIFI_PROMIS_FILTER_MASK_FCSFAIL
   filter the FCS failed packets, do not open it in general

WIFI_PROMIS_CTRL_FILTER_MASK_ALL
   filter all control packets

WIFI_PROMIS_CTRL_FILTER_MASK_WRAPPER
   filter the control packets with subtype of Control Wrapper
WIFI_PROMIS_CTRL_FILTER_MASK_BAR
filter the control packets with subtype of Block Ack Request

WIFI_PROMIS_CTRL_FILTER_MASK_BA
filter the control packets with subtype of Block Ack

WIFI_PROMIS_CTRL_FILTER_MASK_PSPOLL
filter the control packets with subtype of PS-Poll

WIFI_PROMIS_CTRL_FILTER_MASK_RTS
filter the control packets with subtype of RTS

WIFI_PROMIS_CTRL_FILTER_MASK_CTS
filter the control packets with subtype of CTS

WIFI_PROMIS_CTRL_FILTER_MASK_ACK
filter the control packets with subtype of ACK

WIFI_PROMIS_CTRL_FILTER_MASK_CFEND
filter the control packets with subtype of CF-END

WIFI_PROMIS_CTRL_FILTER_MASK_CFENDACK
filter the control packets with subtype of CF-END+CF-ACK

WIFI_EVENT_MASK_ALL
mask all WiFi events

WIFI_EVENT_MASK_NONE
mask none of the WiFi events

WIFI_EVENT_MASK_AP_PROBEREQRECVED
mask SYSTEM_EVENT_AP_PROBEREQRECVED event

ESP_WIFI_NAN_MAX_SVC_SUPPORTED

ESP_WIFI_NAN_DATAPATH_MAX_PEERS

ESP_WIFI_NDP_ROLE_INITIATOR

ESP_WIFI_NDP_ROLE_RESPONDER

ESP_WIFI_MAX_SVC_NAME_LEN

ESP_WIFI_MAX_FILTER_LEN

ESP_WIFI_MAX_SVC_INFO_LEN
MAX_SSID_LEN

MAX_PASSPHRASE_LEN

MAX_WPS_AP_CRED

WIFI_STATIS_BUFFER

WIFI_STATIS_RXTX

WIFI_STATIS_HW

WIFI_STATIS_DIAG

WIFI_STATIS_PS

WIFI_STATIS_ALL

Type Definitions

typedef int (*wifi_action_rx_cb_t)(uint8_t *hdr, uint8_t *payload, size_t len, uint8_t channel)

The Rx callback function of Action Tx operations.

Param hdr  pointer to the IEEE 802.11 Header structure
Param payload  pointer to the Payload following 802.11 Header
Param len  length of the Payload
Param channel  channel number the frame is received on

Enumerations

enum wifi_mode_t

Values:

enumerator WIFI_MODE_NULL
null mode

enumerator WIFI_MODE_STA
WiFi station mode

enumerator WIFI_MODE_AP
WiFi soft-AP mode

enumerator WIFI_MODE_APSTA
WiFi station + soft-AP mode

enumerator WIFI_MODE_NAN
WiFi NAN mode

enumerator WIFI_MODE_MAX
enum wifi_interface_t

Values:

denumerator WiFi_IF_STA

denumerator WiFi_IF_AP

denumerator WiFi_IF_NAN

denumerator WiFi_IF_MAX

enum wifi_country_policy_t

Values:

denumerator WiFi_COUNTRY_POLICY_AUTO
Country policy is auto, use the country info of AP to which the station is connected

denumerator WiFi_COUNTRY_POLICY_MANUAL
Country policy is manual, always use the configured country info

enum wifi_auth_mode_t

Values:

denumerator WiFi_AUTH_OPEN
authenticate mode: open

denumerator WiFi_AUTH_WEP
authenticate mode: WEP

denumerator WiFi_AUTH_WPA_PSK
authenticate mode: WPA_PSK

denumerator WiFi_AUTH_WPA2_PSK
authenticate mode: WPA2_PSK

denumerator WiFi_AUTH_WPA_WPA2_PSK
authenticate mode: WPA_WPA2_PSK

denumerator WiFi_AUTH_ENTERPRISE
authenticate mode: WiFi EAP security

denumerator WiFi_AUTH_WPA2_ENTERPRISE
authenticate mode: WiFi EAP security

denumerator WiFi_AUTH_WPA3_PSK
authenticate mode: WPA3_PSK
enumerator WIFI_AUTH_WPA2_WPA3_PSK
    authenticate mode : WPA2_WPA3_PSK

enumerator WIFI_AUTH_WAPI_PSK
    authenticate mode : WAPI_PSK

enumerator WIFI_AUTH_OWE
    authenticate mode : OWE

enumerator WIFI_AUTH_WPA3_ENT_192
    authenticate mode : WPA3_ENT_SUITE_B_192_BIT

enumerator WIFI_AUTH_WPA3_EXT_PSK
    authenticate mode : WPA3_PSK_EXT_KEY

enumerator WIFI_AUTH_MAX

enum wifi_err_reason_t

Values:

enumerator WIFI_REASON_UNSPECIFIED
enumerator WIFI_REASON_AUTH_EXPIRE
enumerator WIFI_REASON_AUTH_LEAVE
enumerator WIFI_REASON_ASSOC_EXPIRE
enumerator WIFI_REASON_ASSOC_TOOMANY
enumerator WIFI_REASON_NOT_AUTHED
enumerator WIFI_REASON_NOT_ASSOCED
enumerator WIFI_REASON_ASSOC_LEAVE
enumerator WIFI_REASON_ASSOC_NOT_AUTHED
enumerator WIFI_REASON_DISASSOC_PWRCAP_BAD
enumerator WIFI_REASON_DISASSOC_SUPCHAN_BAD
enumerator WIFI_REASON_BSS_TRANSITION_DISASSOC
enumerator WIFI_REASON_IE_INVALID
enumerator WIFI_REASON_MIC_FAILURE
enumerator WIFI_REASON_4WAY_HANDSHAKE_TIMEOUT

enumerator WIFI_REASON_INVALID_PMKID
enumerator WIFI_REASON_INVALID_MDE
enumerator WIFI_REASON_INVALID_FTE
enumerator WIFI_REASON_TRANSMISSION_LINK_ESTABLISH_FAILED
enumerator WIFI_REASON_ALTERNATIVE_CHANNEL_OCCUPIED
enumerator WIFI_REASON_BEACON_TIMEOUT
enumerator WIFI_REASON_NO_AP_FOUND
enumerator WIFI_REASON_AUTH_FAIL
enumerator WIFI_REASON_ASSOC_FAIL
enumerator WIFI_REASON_HANDSHAKE_TIMEOUT
enumerator WIFI_REASON_CONNECTION_FAIL
enumerator WIFI_REASON_AP_TSF_RESET
enumerator WIFI_REASON_ROAMING
enumerator WIFI_REASON_ASSOC_COMEBACK_TIME_TOO_LONG
enumerator WIFI_REASON_SA_QUERY_TIMEOUT

enum wifi_second_chan_t
   
   Values:
enumerator WIFI_SECOND_CHAN_NONE
   the channel width is HT20

enumerator WIFI_SECOND_CHAN_ABOVE
   the channel width is HT40 and the secondary channel is above the primary channel

enumerator WIFI_SECOND_CHAN_BELOW
   the channel width is HT40 and the secondary channel is below the primary channel

enum wifi_scan_type_t
   Values:

   enumerator WIFI_SCAN_TYPE_ACTIVE
      active scan

   enumerator WIFI_SCAN_TYPE_PASSIVE
      passive scan

enum wifi_cipher_type_t
   Values:

   enumerator WIFI_CIPHER_TYPE_NONE
      the cipher type is none

   enumerator WIFI_CIPHER_TYPE_WEP40
      the cipher type is WEP40

   enumerator WIFI_CIPHER_TYPE_WEP104
      the cipher type is WEP104

   enumerator WIFI_CIPHER_TYPE_TKIP
      the cipher type is TKIP

   enumerator WIFI_CIPHER_TYPE_CCMP
      the cipher type is CCMP

   enumerator WIFI_CIPHER_TYPE_TKIP_CCMP
      the cipher type is TKIP and CCMP

   enumerator WIFI_CIPHER_TYPE_AES_CMAC128
      the cipher type is AES-CMAC-128

   enumerator WIFI_CIPHER_TYPE_SMS4
      the cipher type is SMS4

   enumerator WIFI_CIPHER_TYPE_GCMP
      the cipher type is GCMP
enumerator WIFI_CIPHER_TYPE_GCMP256
the cipher type is GCMP-256

enumerator WIFI_CIPHER_TYPE_AES_GMAC128
the cipher type is AES-GMAC-128

enumerator WIFI_CIPHER_TYPE_AES_GMAC256
the cipher type is AES-GMAC-256

enumerator WIFI_CIPHER_TYPE_UNKNOWN
the cipher type is unknown

enum wifi_ant_t
  WiFi antenna.
  Values:

  enumerator WIFI_ANT_ANT0
    WiFi antenna 0

  enumerator WIFI_ANT_ANT1
    WiFi antenna 1

  enumerator WIFI_ANT_MAX
    Invalid WiFi antenna

enum wifi_scan_method_t
  Values:

  enumerator WIFI_FAST_SCAN
    Do fast scan, scan will end after find SSID match AP

  enumerator WIFI_ALL_CHANNEL_SCAN
    All channel scan, scan will end after scan all the channel

enum wifi_sort_method_t
  Values:

  enumerator WIFI_CONNECT_AP_BY_SIGNAL
    Sort match AP in scan list by RSSI

  enumerator WIFI_CONNECT_AP_BY_SECURITY
    Sort match AP in scan list by security mode

enum wifi_ps_type_t
  Values:

  enumerator WIFI_PS_NONE
    No power save
Chapter 2. API Reference

enumerator **WIFI_PS_MIN_MODEM**
   Minimum modem power saving. In this mode, station wakes up to receive beacon every DTIM period

enumerator **WIFI_PS_MAX_MODEM**
   Maximum modem power saving. In this mode, interval to receive beacons is determined by the listen_interval parameter in `wifi_sta_config_t`

enum **wifi_bandwidth_t**
   Values:
   
   enumerator **WIFI_BW_HT20**
   enumerator **WIFI_BW_HT40**

enum **wifi_sae_pwe_method_t**
   Configuration for SAE PWE derivation
   Values:
   
   enumerator **WPA3_SAE_PWE_UNSPECIFIED**
   enumerator **WPA3_SAE_PWE_HUNT_AND_PECK**
   enumerator **WPA3_SAE_PWE_HASH_TO_ELEMENT**
   enumerator **WPA3_SAE_PWE_BOTH**

enum **wifi_sae_pk_mode_t**
   Configuration for SAE-PK
   Values:
   
   enumerator **WPA3_SAE_PK_MODE_AUTOMATIC**
   enumerator **WPA3_SAE_PK_MODE_ONLY**
   enumerator **WPA3_SAE_PK_MODE_DISABLED**

enum **wifi_storage_t**
   Values:
   
   enumerator **WIFI_STORAGE_FLASH**
   all configuration will store in both memory and flash
   
   enumerator **WIFI_STORAGE_RAM**
   all configuration will only store in the memory
enum wifi_vendor_ie_type_t

Vendor Information Element type.
Determines the frame type that the IE will be associated with.

Values:

enumerator WIFI_VND_IE_TYPE_BEACON
enumerator WIFI_VND_IE_TYPE_PROBE_REQ
enumerator WIFI_VND_IE_TYPE_PROBE_RESP
enumerator WIFI_VND_IE_TYPE_ASSOC_REQ
enumerator WIFI_VND_IE_TYPE_ASSOC_RESP

enum wifi_vendor_ie_id_t

Vendor Information Element index.
Each IE type can have up to two associated vendor ID elements.

Values:

enumerator WIFI_VND_IE_ID_0
enumerator WIFI_VND_IE_ID_1

enum wifi_phy_mode_t

Operation Phymode.

Values:

enumerator WIFI_PHY_MODE_LR
    PHY mode for Low Rate
enumerator WIFI_PHY_MODE_11B
    PHY mode for 11b
enumerator WIFI_PHY_MODE_11G
    PHY mode for 11g
enumerator WIFI_PHY_MODE_HT20
    PHY mode for Bandwidth HT20
enumerator WIFI_PHY_MODE_HT40
    PHY mode for Bandwidth HT40
enumerator WIFI_PHY_MODE_HE20
    PHY mode for Bandwidth HE20
enum wifi_promiscuous_pkt_type_t

Promiscuous frame type.
Passed to promiscuous mode RX callback to indicate the type of parameter in the buffer.

Values:

enumerator WIFI_PKT_MGMT
  Management frame, indicates ‘buf’ argument is wifi_promiscuous_pkt_t

enumerator WIFI_PKT_CTRL
  Control frame, indicates ‘buf’ argument is wifi_promiscuous_pkt_t

enumerator WIFI_PKT_DATA
  Data frame, indicates ‘buf’ argument is wifi_promiscuous_pkt_t

enumerator WIFI_PKT_MISC
  Other type, such as MIMO etc. ‘buf’ argument is wifi_promiscuous_pkt_t but the payload is zero length.

enum wifi_ant_mode_t

WiFi antenna mode.

Values:

enumerator WIFI_ANT_MODE_ANT0
  Enable WiFi antenna 0 only

enumerator WIFI_ANT_MODE_ANT1
  Enable WiFi antenna 1 only

enumerator WIFI_ANT_MODE_AUTO
  Enable WiFi antenna 0 and 1, automatically select an antenna

enumerator WIFI_ANT_MODE_MAX
  Invalid WiFi enabled antenna

enum wifi_nan_service_type_t

NAN Services types.

Values:

enumerator NAN_PUBLISH_SOLICITED
  Send unicast Publish frame to Subscribers that match the requirement

enumerator NAN_PUBLISH_UNSOLICITED
  Send broadcast Publish frames in every Discovery Window(DW)

enumerator NAN_SUBSCRIBE_ACTIVE
  Send broadcast Subscribe frames in every DW

enumerator NAN_SUBSCRIBE_PASSIVE
  Passively listens to Publish frames
enum wifi_phy_rate_t

WiFi PHY rate encodings.

Values:

enumerator WIFI_PHY_RATE_1M_L
    1 Mbps with long preamble

enumerator WIFI_PHY_RATE_2M_L
    2 Mbps with long preamble

enumerator WIFI_PHY_RATE_5M_L
    5.5 Mbps with long preamble

enumerator WIFI_PHY_RATE_11M_L
    11 Mbps with long preamble

enumerator WIFI_PHY_RATE_2M_S
    2 Mbps with short preamble

enumerator WIFI_PHY_RATE_5M_S
    5.5 Mbps with short preamble

enumerator WIFI_PHY_RATE_11M_S
    11 Mbps with short preamble

enumerator WIFI_PHY_RATE_48M
    48 Mbps

enumerator WIFI_PHY_RATE_24M
    24 Mbps

enumerator WIFI_PHY_RATE_12M
    12 Mbps

enumerator WIFI_PHY_RATE_6M
    6 Mbps

enumerator WIFI_PHY_RATE_54M
    54 Mbps

enumerator WIFI_PHY_RATE_36M
    36 Mbps

enumerator WIFI_PHY_RATE_18M
    18 Mbps

enumerator WIFI_PHY_RATE_9M
    9 Mbps rate table and guard interval information for each MCS rate
enumerator `WIFI_PHY_RATE_MCS0_LGI`  
MCS0 with long GI

enumerator `WIFI_PHY_RATE_MCS1_LGI`  
MCS1 with long GI

enumerator `WIFI_PHY_RATE_MCS2_LGI`  
MCS2 with long GI

enumerator `WIFI_PHY_RATE_MCS3_LGI`  
MCS3 with long GI

enumerator `WIFI_PHY_RATE_MCS4_LGI`  
MCS4 with long GI

enumerator `WIFI_PHY_RATE_MCS5_LGI`  
MCS5 with long GI

enumerator `WIFI_PHY_RATE_MCS6_LGI`  
MCS6 with long GI

enumerator `WIFI_PHY_RATE_MCS7_LGI`  
MCS7 with long GI

enumerator `WIFI_PHY_RATE_MCS0_SGI`  
MCS0 with short GI

enumerator `WIFI_PHY_RATE_MCS1_SGI`  
MCS1 with short GI

enumerator `WIFI_PHY_RATE_MCS2_SGI`  
MCS2 with short GI

enumerator `WIFI_PHY_RATE_MCS3_SGI`  
MCS3 with short GI

enumerator `WIFI_PHY_RATE_MCS4_SGI`  
MCS4 with short GI

enumerator `WIFI_PHY_RATE_MCS5_SGI`  
MCS5 with short GI

enumerator `WIFI_PHY_RATE_MCS6_SGI`  
MCS6 with short GI

enumerator `WIFI_PHY_RATE_MCS7_SGI`  
MCS7 with short GI
Chapter 2. API Reference

enumerator WiFi_PHY_RATE_LORA_250K
   250 Kbps

enumerator WiFi_PHY_RATE_LORA_500K
   500 Kbps

enumerator WiFi_PHY_RATE_MAX

enum wifi_event_t
WiFi event declarations

Values:

enumerator WiFi_EVENT_WIFI_READY
   WiFi ready

enumerator WiFi_EVENT_SCAN_DONE
   Finished scanning AP

enumerator WiFi_EVENT_STA_START
   Station start

enumerator WiFi_EVENT_STA_STOP
   Station stop

enumerator WiFi_EVENT_STA_CONNECTED
   Station connected to AP

enumerator WiFi_EVENT_STA_DISCONNECTED
   Station disconnected from AP

enumerator WiFi_EVENT_STA_AUTHMODE_CHANGE
   the auth mode of AP connected by device’s station changed

enumerator WiFi_EVENT_STA_WPS_ER_SUCCESS
   Station wps succeeds in enrollee mode

enumerator WiFi_EVENT_STA_WPS_ER_FAILED
   Station wps fails in enrollee mode

enumerator WiFi_EVENT_STA_WPS_ER_TIMEOUT
   Station wps timeout in enrollee mode

enumerator WiFi_EVENT_STA_WPS_ER_PIN
   Station wps pin code in enrollee mode

enumerator WiFi_EVENT_STA_WPS_ER_PBC_OVERLAP
   Station wps overlap in enrollee mode
enumerator **WIFI_EVENT_AP_START**
   Soft-AP start

enumerator **WIFI_EVENT_AP_STOP**
   Soft-AP stop

enumerator **WIFI_EVENT_AP_STACONNECTED**
   a station connected to Soft-AP

enumerator **WIFI_EVENT_AP_STADISCONNECTED**
   a station disconnected from Soft-AP

enumerator **WIFI_EVENT_AP_PROBEREQRECVED**
   Receive probe request packet in soft-AP interface

enumerator **WIFI_EVENT_FTM_REPORT**
   Receive report of FTM procedure

enumerator **WIFI_EVENT_STA_BSS_RSSI_LOW**
   AP’s RSSI crossed configured threshold

enumerator **WIFI_EVENT_ACTION_TX_STATUS**
   Status indication of Action Tx operation

enumerator **WIFI_EVENT_ROC_DONE**
   Remain-on-Channel operation complete

enumerator **WIFI_EVENT_STA_BEACON_TIMEOUT**
   Station beacon timeout

enumerator **WIFI_EVENT_CONNECTIONLESS_MODULE_WAKE_INTERVAL_START**
   Connectionless module wake interval start

enumerator **WIFI_EVENT_AP_WPS_RG_SUCCESS**
   Soft-AP wps succeeds in registrar mode

enumerator **WIFI_EVENT_AP_WPS_RG_FAILED**
   Soft-AP wps fails in registrar mode

enumerator **WIFI_EVENT_AP_WPS_RG_TIMEOUT**
   Soft-AP wps timeout in registrar mode

enumerator **WIFI_EVENT_AP_WPS_RG_PIN**
   Soft-AP wps pin code in registrar mode

enumerator **WIFI_EVENT_AP_WPS_RG_PBC_OVERLAP**
   Soft-AP wps overlap in registrar mode
enumerator WIFI_EVENT_ITWT_SETUP
iTWT setup

enumerator WIFI_EVENT_ITWT_TEARDOWN
iTWT teardown

enumerator WIFI_EVENT_ITWT_PROBE
iTWT probe

enumerator WIFI_EVENT_ITWT_SUSPEND
iTWT suspend

enumerator WIFI_EVENT_NAN_STARTED
NAN Discovery has started

enumerator WIFI_EVENT_NAN_STOPPED
NAN Discovery has stopped

enumerator WIFI_EVENT_NAN_SVC_MATCH
NAN Service Discovery match found

enumerator WIFI_EVENT_NAN_REPLIED
Replied to a NAN peer with Service Discovery match

enumerator WIFI_EVENT_NAN_RECEIVE
Received a Follow-up message

enumerator WIFI_EVENT_NDP_INDICATION
Received NDP Request from a NAN Peer

enumerator WIFI_EVENT_NDP_CONFIRM
NDP Confirm Indication

enumerator WIFI_EVENT_NDP_TERMINATED
NAN Datapath terminated indication

enumerator WIFI_EVENT_MAX
Invalid WiFi event ID

enum wifi_event_sta_wps_fail_reason_t
Argument structure for WIFI_EVENT_STA_WPS_ER_FAILED event

Values:

enumerator WPS_FAIL_REASON_NORMAL
WPS normal fail reason

enumerator WPS_FAIL_REASON_RECV_M2D
WPS receive M2D frame
enumerator \texttt{WPS\_FAIL\_REASON\_MAX}

enum \texttt{wifi\_ftm\_status\_t}
FTM operation status types.

\textit{Values}:

enumerator \texttt{FTM\_STATUS\_SUCCESS}
FTM exchange is successful

enumerator \texttt{FTM\_STATUS\_UNSupported}
Peer does not support FTM

enumerator \texttt{FTM\_STATUS\_CONF\_REJECTED}
Peer rejected FTM configuration in FTM Request

enumerator \texttt{FTM\_STATUS\_NO\_RESPONSE}
Peer did not respond to FTM Requests

enumerator \texttt{FTM\_STATUS\_FAIL}
Unknown error during FTM exchange

enum \texttt{wps\_fail\_reason\_t}

\textit{Values}:

enumerator \texttt{WPS\_AP\_FAIL\_REASON\_NORMAL}
WPS normal fail reason

enumerator \texttt{WPS\_AP\_FAIL\_REASON\_CONFIG}
WPS failed due to incorrect config

enumerator \texttt{WPS\_AP\_FAIL\_REASON\_AUTH}
WPS failed during auth

enumerator \texttt{WPS\_AP\_FAIL\_REASON\_MAX}

PRIV_REQUIRES wpa_supplicant
\end{verbatim}
Functions

`esp_err_t esp_wifi_sta_enterprise_enable (void)`
Enable EAP authentication (WiFi Enterprise) for the station mode.

This function enables Extensible Authentication Protocol (EAP) authentication for the Wi-Fi station mode. When EAP authentication is enabled, the ESP device will attempt to authenticate with the configured EAP credentials when connecting to a secure Wi-Fi network.

**Note:** Before calling this function, ensure that the Wi-Fi configuration and EAP credentials (such as username and password) have been properly set using the appropriate configuration APIs.

**Returns**
- ESP_OK: EAP authentication enabled successfully.
- ESP_ERR_NO_MEM: Failed to enable EAP authentication due to memory allocation failure.

`esp_err_t esp_wifi_sta_enterprise_disable (void)`
Disable EAP authentication (WiFi Enterprise) for the station mode.

This function disables Extensible Authentication Protocol (EAP) authentication for the Wi-Fi station mode. When EAP authentication is disabled, the ESP device will not attempt to authenticate using EAP credentials when connecting to a secure Wi-Fi network.

**Note:** Disabling EAP authentication may cause the device to connect to the Wi-Fi network using other available authentication methods, if configured using esp_wifi_set_config().

**Returns**
- ESP_OK: EAP authentication disabled successfully.
- ESP_ERR_INVALID_STATE: EAP client is in an invalid state for disabling.

`esp_err_t esp_eap_client_set_identity (const unsigned char *identity, int len)`
Set identity for PEAP/TTLS authentication method.

This function sets the identity to be used during PEAP/TTLS authentication.

**Parameters**
- **identity** `[in]` Pointer to the identity data.
- **len** `[in]` Length of the identity data (limited to 1~127 bytes).

**Returns**
- ESP_OK: The identity was set successfully.
- ESP_ERR_INVALID_ARG: Invalid argument (len <= 0 or len >= 128).
- ESP_ERR_NO_MEM: Memory allocation failure.

`void esp_eap_client_clear_identity (void)`
Clear the previously set identity for PEAP/TTLS authentication.

This function clears the identity that was previously set for the EAP client. After calling this function, the EAP client will no longer use the previously configured identity during the authentication process.

`esp_err_t esp_eap_client_set_username (const unsigned char *username, int len)`
Set username for PEAP/TTLS authentication method.

This function sets the username to be used during PEAP/TTLS authentication.

**Parameters**
- **username** `[in]` Pointer to the username data.
- **len** `[in]` Length of the username data (limited to 1~127 bytes).

**Returns**
- ESP_OK: The username was set successfully.
• ESP_ERR_INVALID_ARG: Failed due to an invalid argument (len <= 0 or len >= 128).
• ESP_ERR_NO_MEM: Failed due to memory allocation failure.

void esp_eap_client_clear_username (void)
Clear username for PEAP/TTLS method.

This function clears the previously set username for the EAP client.

esp_err_t esp_eap_client_set_password (const unsigned char *password, int len)
Set password for PEAP/TTLS authentication method.

This function sets the password to be used during PEAP/TTLS authentication.

Parameters
- password - [in] Pointer to the password data.
- len - [in] Length of the password data (len > 0).

Returns
- ESP_OK: The password was set successfully.
- ESP_ERR_INVALID_ARG: Failed due to an invalid argument (len <= 0).
- ESP_ERR_NO_MEM: Failed due to memory allocation failure.

void esp_eap_client_clear_password (void)
Clear password for PEAP/TTLS method.

This function clears the previously set password for the EAP client.

esp_err_t esp_eap_client_set_new_password (const unsigned char *new_password, int len)
Set new password for MSCHAPv2 authentication method.

This function sets the new password to be used during MSCHAPv2 authentication. The new password is used to substitute the old password when an eap-mschapv2 failure request message with error code ERROR_PASSWD_EXPIRED is received.

Parameters
- new_password - [in] Pointer to the new password data.
- len - [in] Length of the new password data.

Returns
- ESP_OK: The new password was set successfully.
- ESP_ERR_INVALID_ARG: Failed due to an invalid argument (len <= 0).
- ESP_ERR_NO_MEM: Failed due to memory allocation failure.

void esp_eap_client_clear_new_password (void)
Clear new password for MSCHAPv2 method.

This function clears the previously set new password for the EAP client.

esp_err_t esp_eap_client_set_ca_cert (const unsigned char *ca_cert, int ca_cert_len)
Set CA certificate for EAP authentication.

This function sets the Certificate Authority (CA) certificate to be used during EAP authentication. The CA certificate is passed to the EAP client module through a global pointer.

Parameters
- ca_cert - [in] Pointer to the CA certificate data.
- ca_cert_len - [in] Length of the CA certificate data.

Returns
- ESP_OK: The CA certificate was set successfully.

void esp_eap_client_clear_ca_cert (void)
Clear the previously set Certificate Authority (CA) certificate for EAP authentication.

This function clears the CA certificate that was previously set for the EAP client. After calling this function, the EAP client will no longer use the previously configured CA certificate during the authentication process.
Set client certificate and private key for EAP authentication.
This function sets the client certificate and private key to be used during authentication. Optionally, a private key password can be provided for encrypted private keys.

**Attention** 1. The client certificate, private key, and private key password are provided as pointers to the respective data arrays.

**Attention** 2. The client_cert, private_key, and private_key_password should be zero-terminated.

### Parameters
- `client_cert` – [in] Pointer to the client certificate data.
- `client_cert_len` – [in] Length of the client certificate data.
- `private_key` – [in] Pointer to the private key data.
- `private_key_len` – [in] Length of the private key data (limited to 1~4096 bytes).
- `private_key_password` – [in] Pointer to the private key password data (optional).
- `private_key_passwd_len` – [in] Length of the private key password data (can be 0 for no password).

### Returns
- ESP_OK: The certificate, private key, and password (if provided) were set successfully.

Clear the previously set client certificate and private key for EAP authentication.
This function clears the client certificate and private key that were previously set for the EAP client. After calling this function, the EAP client will no longer use the previously configured certificate and private key during the authentication process.

### Parameters
- `disable` – [in] True to disable EAP client certificate time check, false to enable it.

### Returns
- ESP_OK: The EAP client certificate time check setting was updated successfully.

Get EAP client certificates time check status.
This function retrieves the current status of the EAP client certificates time check.

### Parameters
- `disable` – [out] Pointer to a boolean variable to store the disable status.

### Returns
- ESP_OK: The status of EAP client certificates time check was retrieved successfully.

Set EAP-TTLS phase 2 method.
This function sets the phase 2 method to be used during EAP-TTLS authentication.

### Parameters
- `type` – [in] The type of phase 2 method to be used (e.g., EAP, MSCHAPv2, MSCHAP, PAP, CHAP).

### Returns
- ESP_OK: The EAP-TTLS phase 2 method was set successfully.
esp_err_t esp_eap_client_set_suiteb_192bit_certification(bool enable)
Enable or disable Suite-B 192-bit certification checks.
This function enables or disables the 192-bit Suite-B certification checks during EAP-TLS authentication. Suite-B is a set of cryptographic algorithms which generally are considered more secure.

Parameters enable [in] True to enable 192-bit Suite-B certification checks, false to disable it.
Returns
• ESP_OK: The 192-bit Suite-B certification checks were set successfully.

esp_err_t esp_eap_client_set_pac_file(const unsigned char *pac_file, int pac_file_len)
Set the PAC (Protected Access Credential) file for EAP-FAST authentication.
EAP-FAST requires a PAC file that contains the client’s credentials.

Attention 1. For files read from the file system, length has to be decremented by 1 byte.
Attention 2. Disabling the ESP_WIFI_MBEDTLS_TLS_CLIENT config is required to use EAP-FAST.

Parameters
• pac_file [in] Pointer to the PAC file buffer.
• pac_file_len [in] Length of the PAC file buffer.
Returns
• ESP_OK: The PAC file for EAP-FAST authentication was set successfully.

esp_err_t esp_eap_client_set_fast_params(esp_eap_fast_config config)
Set the parameters for EAP-FAST Phase 1 authentication.
EAP-FAST supports Fast Provisioning, where clients can be authenticated faster using precomputed keys (PAC). This function allows configuring parameters for Fast Provisioning.

Attention 1. Disabling the ESP_WIFI_MBEDTLS_TLS_CLIENT config is required to use EAP-FAST.

Returns
• ESP_OK: The parameters for EAP-FAST Phase 1 authentication were set successfully.

esp_err_t esp_eap_client_use_default_cert_bundle(bool use_default_bundle)
Use the default certificate bundle for EAP authentication.
By default, the EAP client uses a built-in certificate bundle for server verification. Enabling this option allows the use of the default certificate bundle.

Parameters use_default_bundle [in] True to use the default certificate bundle, false to use a custom bundle.
Returns
• ESP_OK: The option to use the default certificate bundle was set successfully.

Structures
struct esp_eap_fast_config
Configuration settings for EAP-FAST (Extensible Authentication Protocol - Flexible Authentication via Secure Tunneling).
This structure defines the configuration options that can be used to customize the behavior of the EAP-FAST authentication protocol, specifically for Fast Provisioning and PAC (Protected Access Credential) handling.
Public Members

int fast_provisioning
   Enable or disable Fast Provisioning in EAP-FAST (0 = disabled, 1 = enabled)

int fast_max_pac_list_len
   Maximum length of the PAC (Protected Access Credential) list

bool fast_pac_format_binary
   Set to true for binary format PAC, false for ASCII format PAC

Enumerations

enum esp_eap_ttls_phase2_types
   Enumeration of phase 2 authentication types for EAP-TTLS.

   This enumeration defines the supported phase 2 authentication methods that can be used in the EAP-TTLS
   (Extensible Authentication Protocol - Tunneled Transport Layer Security) protocol for the second authentica-
   tion phase.

   Values:

   enumerator ESP_EAP_TTLS_PHASE2_EAP
      EAP (Extensible Authentication Protocol)

   enumerator ESP_EAP_TTLS_PHASE2_MSCHAPV2
      MS-CHAPv2 (Microsoft Challenge Handshake Authentication Protocol - Version 2)

   enumerator ESP_EAP_TTLS_PHASE2_MSCHAP
      MS-CHAP (Microsoft Challenge Handshake Authentication Protocol)

   enumerator ESP_EAP_TTLS_PHASE2_PAP
      PAP (Password Authentication Protocol)

   enumerator ESP_EAP_TTLS_PHASE2_CHAP
      CHAP (Challenge Handshake Authentication Protocol)

Header File

- components/wpa_supplicant/esp_supplicant/include/esp_wps.h
- This header file can be included with:

   #include "esp_wps.h"

  component depends on wpa_supplicant, add the following to your CMakeLists.txt:

   REQUIREES wpa_supplicant
   or

   PRIV_REQUIREES wpa_supplicant
**Chapter 2. API Reference**

**Functions**

*esp_err_t* **esp_wifi_wps_enable** *(const esp_wps_config_t *config)*

Enable Wi-Fi WPS function.

**Parameters**

- **config**: WPS config to be used in connection

**Returns**

- ESP_OK: succeed
- ESP_ERR_WIFI_WPS_TYPE: wpstype is invalid
- ESP_ERR_WIFI_WPS_MODE: wifi is not in station mode or sniffer mode is on
- ESP_FAIL: wps initialization fails

*esp_err_t* **esp_wifi_wps_disable** *(void)*

Disable Wi-Fi WPS function and release resource it taken.

**Returns**

- ESP_OK: succeed
- ESP_ERR_WIFI_WPS_MODE: wifi is not in station mode or sniffer mode is on

*esp_err_t* **esp_wifi_wps_start** *(int timeout_ms)*

Start WPS session.

**Attention**

WPS can only be used when station is enabled. WPS needs to be enabled first for using this API.

**Parameters**

- **timeout_ms**: deprecated: This argument’s value will have no effect in functionality of API. The argument will be removed in future. The app should start WPS and register for WIFI events to get the status. WPS status is updated through WPS events. See wifi_event_t enum for more info.

**Returns**

- ESP_OK: succeed
- ESP_ERR_WIFI_WPS_TYPE: wpstype is invalid
- ESP_ERR_WIFI_WPS_MODE: wifi is not in station mode or sniffer mode is on
- ESP_ERR_WIFI_WPS_SM: wps state machine is not initialized
- ESP_FAIL: wps initialization fails

*esp_err_t* **esp_wifi_ap_wps_enable** *(const esp_wps_config_t *config)*

Enable Wi-Fi AP WPS function.

**Attention**

WPS can only be used when softAP is enabled.

**Parameters**

- **config**: wps configuration to be used.

**Returns**

- ESP_OK: succeed
- ESP_ERR_WIFI_WPS_TYPE: wpstype is invalid
- ESP_ERR_WIFI_WPS_MODE: wifi is not in station mode or sniffer mode is on
- ESP_FAIL: wps initialization fails

*esp_err_t* **esp_wifi_ap_wps_disable** *(void)*

Disable Wi-Fi SoftAP WPS function and release resource it taken.

**Returns**

- ESP_OK: succeed
- ESP_ERR_WIFI_WPS_MODE: wifi is not in station mode or sniffer mode is on

*esp_err_t* **esp_wifi_ap_wps_start** *(const unsigned char *pin)*

WPS starts to work.

**Attention**

WPS can only be used when softAP is enabled.
Parameters **pin** - Pin to be used in case of WPS mode is pin. If Pin is not provided, device will use the pin generated/provided during `esp_wifi_ap_wps_enable()` and reported in WIFI_EVENT_AP_WPS_RG_PIN

Returns
- ESP_OK : succeed
- ESP_ERR_WIFI_WPS_TYPE : wpstype is invalid
- ESP_ERR_WIFI_WPS_MODE : wifi is not in station mode or sniffer mode is on
- ESP_ERR_WIFI_WPS_SM : wps state machine is not initialized
- ESP_FAIL : wps initialization fails

Structures

**struct wps_factory_information_t**

Structure representing WPS factory information for ESP device.

This structure holds various strings representing factory information for a device, such as the manufacturer, model number, model name, and device name. Each string is a null-terminated character array. If any of the strings are empty, the default values are used.

**Public Members**

- **char manufacturer[WPS_MAX_MANUFACTURER_LEN]**
  Manufacturer of the device. If empty, the default manufacturer is used.

- **char model_number[WPS_MAX_MODEL_NUMBER_LEN]**
  Model number of the device. If empty, the default model number is used.

- **char model_name[WPS_MAX_MODEL_NAME_LEN]**
  Model name of the device. If empty, the default model name is used.

- **char device_name[WPS_MAX_DEVICE_NAME_LEN]**
  Device name. If empty, the default device name is used.

**struct esp_wps_config_t**

Structure representing configuration settings for WPS (Wi-Fi Protected Setup).

This structure encapsulates various configuration settings for WPS, including the WPS type (PBC or PIN), factory information that will be shown in the WPS Information Element (IE), and a PIN if the WPS type is set to PIN.

**Public Members**

- **wps_type_t wps_type**
  The type of WPS to be used (PBC or PIN).

- **wps_factory_information_t factory_info**
  Factory information to be shown in the WPS Information Element (IE). Vendor can choose to display their own information.

- **char pin[PIN_LEN]**
  WPS PIN (Personal Identification Number) used when wps_type is set to WPS_TYPE_PIN.
Macros

ESP_ERR_WIFI_REGISTRAR
WPS registrar is not supported

ESP_ERR_WIFI_WPS_TYPE
WPS type error

ESP_ERR_WIFI_WPS_SM
WPS state machine is not initialized

WPS_MAX_MANUFACTURER_LEN
Maximum length of the manufacturer name in WPS information

WPS_MAX_MODEL_NUMBER_LEN
Maximum length of the model number in WPS information

WPS_MAX_MODEL_NAME_LEN
Maximum length of the model name in WPS information

WPS_MAX_DEVICE_NAME_LEN
Maximum length of the device name in WPS information

PIN_LEN
The length of the WPS PIN (Personal Identification Number).

WPS_CONFIG_INIT_DEFAULT (type)
Initialize a default WPS configuration structure with specified WPS type.

This macro initializes a `esp_wps_config_t` structure with default values for the specified WPS type. It sets the WPS type, factory information (including default manufacturer, model number, model name, and device name), and a default PIN value if applicable.

Parameters
• `type` - The WPS type to be used (PBC or PIN).

Returns An initialized `esp_wps_config_t` structure with the specified WPS type and default values.

Type Definitions

typedef enum wps_type wps_type_t
Enum of WPS (Wi-Fi Protected Setup) types.

Enumerations

enum wps_type
Enum of WPS (Wi-Fi Protected Setup) types.

Values:

enumerator WPS_TYPE_DISABLE
WPS is disabled
enumerator **WPS_TYPE_PBC**
WPS Push Button Configuration method

enumerator **WPS_TYPE_PIN**
WPS PIN (Personal Identification Number) method

enumerator **WPS_TYPE_MAX**
Maximum value for WPS type enumeration

**Header File**
- components/wpa_supplicant/esp_supplicant/include/esp_rrm.h
- This header file can be included with:
  ```
  #include "esp_rrm.h"
  ```
- This header file is a part of the API provided by the wpa_supplicant component. To declare that your component depends on wpa_supplicant, add the following to your CMakeLists.txt:
  ```
  REQUIRES wpa_supplicant
  or
  PRIV_REQUIRES wpa_supplicant
  ```

**Functions**

**int esp_rrm_send_neighbor_rep_request**(neighbor_rep_request_cb cb, void *cb_ctx)
Send Radio measurement neighbor report request to connected AP.

**Parameters**
- cb - callback function for neighbor report
- cb_ctx - callback context

**Returns**
- 0: success
- -1: AP does not support RRM
- -2: station not connected to AP

**bool esp_rrm_is_rrm_supported_connection**(void)
Check RRM capability of connected AP.

**Returns**
- true: AP supports RRM
- false: AP does not support RRM or station not connected to AP

**Type Definitions**

typedef void (**neighbor_rep_request_cb**(void *ctx, const uint8_t *report, size_t report_len)
Callback function type to get neighbor report.

**Param ctx** neighbor report context
**Param report** neighbor report
**Param report_len** neighbor report length

**Return**
- void
Header File

- components/wpa_supplicant/esp_supplicant/include/esp_wnm.h
- This header file can be included with:

```c
#include "esp_wnm.h"
```

- This header file is a part of the API provided by the wpa_supplicant component. To declare that your component depends on wpa_supplicant, add the following to your CMakeLists.txt:

```cmake
REQUIRES wpa_supplicant
```

or

```cmake
PRIV_REQUIRES wpa_supplicant
```

Functions

**int esp_wnm_send_bss_transition_mgmt_query** (enum btm_query_reason query_reason, const char *btm_candidates, int cand_list)

Send bss transition query to connected AP.

Parameters

- **query_reason** – reason for sending query
- **btm_candidates** – btm candidates list if available
- **cand_list** – whether candidate list to be included from scan results available in supplicant’s cache.

Returns

- 0: success
- -1: AP does not support BTM
- -2: station not connected to AP

**bool esp_wnm_is_btm_supported_connection** (void)

Check bss transition capability of connected AP.

Returns

- true: AP supports BTM
- false: AP does not support BTM or station not connected to AP

Enumerations

**enum btm_query_reason**

enum btm_query_reason: Reason code for sending btm query

Values:

- enumerator REASON_UNSPECIFIED
- enumerator REASON_FRAME_LOSS
- enumerator REASON_DELAY
- enumerator REASON_BANDWIDTH
- enumerator REASON_LOAD_BALANCE
- enumerator REASON_RSSI
enumerator **REASON_RETRANSMISSIONS**

enumerator **REASON_INTERFERENCE**

enumerator **REASON_GRAY_ZONE**

enumerator **REASON PREMIUM_AP**

**Header File**

- components/wpa_supplicant/esp_supplicant/include/esp_mbo.h
- This header file can be included with:

```c
#include "esp_mbo.h"
```

- This header file is a part of the API provided by the `wpa_supplicant` component. To declare that your component depends on `wpa_supplicant`, add the following to your CMakeLists.txt:

```cmake
REQUIRES wpa_supplicant
```

or

```cmake
PRIV_REQUIRES wpa_supplicant
```

**Functions**

`int esp_mbo_update_non_pref_chan (struct non_pref_chan_s *non_pref_chan)`

Update channel preference for MBO IE.

- **Parameters** `non_pref_chan` - Non preference channel list

- **Returns**
  - 0: success else failure

**Structures**

`struct non_pref_chan`

Structure representing a non-preferred channel in a wireless network.

This structure encapsulates information about a non-preferred channel including the reason for its non-preference, the operating class, channel number, and preference level.

**Public Members**

`enum non_pref_chan_reason reason`

Reason for the channel being non-preferred

`uint8_t oper_class`

Operating class of the channel

`uint8_t chan`

Channel number

`uint8_t preference`

Preference level of the channel
struct non_pref_chan_s
    Structure representing a list of non-preferred channels in a wireless network.
    This structure encapsulates information about a list of non-preferred channels including the number of non-preferred channels and an array of structures representing individual non-preferred channels.

Public Members

size_t non_pref_chan_num
    Number of non-preferred channels in the list

struct non_pref_chan chan[]
    Array of structures representing individual non-preferred channels

Enumerations

enum non_pref_chan_reason
    Enumeration of reasons for a channel being non-preferred in a wireless network.
    This enumeration defines various reasons why a specific channel might be considered non-preferred in a wireless network configuration.

    Values:

    enumerator NON_PREF_CHAN_REASON_UNSPECIFIED
        Unspecified reason for non-preference

    enumerator NON_PREF_CHAN_REASON_RSSI
        Non-preferred due to low RSSI (Received Signal Strength Indication)

    enumerator NON_PREF_CHAN_REASON_EXT_INTERFERENCE
        Non-preferred due to external interference

    enumerator NON_PREF_CHAN_REASON_INT_INTERFERENCE
        Non-preferred due to internal interference

Wi-Fi Easy Connect™ (DPP)

Wi-Fi Easy Connect™, also known as Device Provisioning Protocol (DPP) or Easy Connect, is a provisioning protocol certified by Wi-Fi Alliance. It is a secure and standardized provisioning protocol for configuration of Wi-Fi Devices. With Easy Connect, adding a new device to a network is as simple as scanning a QR Code. This reduces complexity and enhances user experience while onboarding devices without UI like Smart Home and IoT products. Unlike old protocols like Wi-Fi Protected Setup (WPS), Wi-Fi Easy Connect incorporates strong encryption through public key cryptography to ensure networks remain secure as new devices are added.

Easy Connect brings many benefits in the user experience:

• Simple and intuitive to use; no lengthy instructions to follow for new device setup
• No need to remember and enter passwords into the device being provisioned
• Works with electronic or printed QR codes, or human-readable strings
• Supports both WPA2 and WPA3 networks
Please refer to Wi-Fi Alliance’s official page on Easy Connect for more information.

ESP32-S2 supports Enrollee mode of Easy Connect with QR Code as the provisioning method. A display is required to display this QR Code. Users can scan this QR Code using their capable device and provision the ESP32-S2 to their Wi-Fi network. The provisioning device needs to be connected to the AP which need not support Wi-Fi Easy Connect™.

Easy Connect is still an evolving protocol. Of known platforms that support the QR Code method are some Android smartphones with Android 10 or higher. To use Easy Connect, no additional App needs to be installed on the supported smartphone.

**Application Example** Example on how to provision ESP32-S2 using a supported smartphone: wifi/wifi_easy_connect/dpp-enrollee.

**API Reference**

**Header File**

- components/wpa_supplicant/esp_supplicant/include/esp_dpp.h
- This header file can be included with:
  ```c
  #include "esp_dpp.h"
  ```

- This header file is a part of the API provided by the wpa_supplicant component. To declare that your component depends on wpa_supplicant, add the following to your CMakeLists.txt:
  ```cmake
  REQUIRES wpa_supplicant
  ```
  or
  ```cmake
  PRIV_REQUIRES wpa_supplicant
  ```

**Functions**

- `esp_err_t esp_supp_dpp_init (esp_supp_dpp_event_cb_t evt_cb)`
  
  Initialize DPP Supplicant.

  ```c
  Starts DPP Supplicant and initializes related Data Structures.
  ```

  return
  ```c
  • ESP_OK: Success
  • ESP_FAIL: Failure
  ```

  Parameters **evt_cb** – Callback function to receive DPP related events

  void `esp_supp_dpp_deinit` (void)
  
  De-initialize DPP Supplicant.

  ```c
  Frees memory from DPP Supplicant Data Structures.
  ```

  - `esp_err_t esp_supp_dpp_bootstrap_gen (const char *chan_list, esp_supp_dpp_bootstrap_t type, const char *key, const char *info)`
  
  Generates Bootstrap Information as an Enrollee.
Generates Out Of Band Bootstrap information as an Enrollee which can be used by a DPP Configurator to provision the Enrollee.

Parameters

- **chan_list** – List of channels device will be available on for listening
- **type** – Bootstrap method type, only QR Code method is supported for now.
- **key** – (Optional) 32 byte Raw Private Key for generating a Bootstrapping Public Key
- **info** – (Optional) Ancilliary Device Information like Serial Number

Returns

- ESP_OK: Success
- ESP_FAIL: Failure

```c
esp_err_t esp_supp_dpp_start_listen(void)
```

Start listening on Channels provided during esp_supp_dpp_bootstrap_gen.

Listens on every Channel from Channel List for a pre-defined wait time.

Returns

- ESP_OK: Success
- ESP_FAIL: Generic Failure
- ESP_ERR_INVALID_STATE: ROC attempted before WiFi is started
- ESP_ERR_NO_MEM: Memory allocation failed while posting ROC request

```c
void esp_supp_dpp_stop_listen(void)
```

Stop listening on Channels.

Stops listening on Channels and cancels ongoing listen operation.

Macros

- **ESP_ERR_DPP_FAILURE**
  Generic failure during DPP Operation
- **ESP_ERR_DPP_TX_FAILURE**
  DPP Frame Tx failed OR not Acked
- **ESP_ERR_DPP_INVALID_ATTR**
  Encountered invalid DPP Attribute

Type Definitions

```c
typedef enum dpp_bootstrap_type esp_supp_dpp_bootstrap_t
```

Types of Bootstrap Methods for DPP.

```c
typedef void (*esp_supp_dpp_event_cb_t)(esp_supp_dpp_event_t evt, void *data)
```

Callback function for receiving DPP Events from Supplicant.

Callback function will be called with DPP related information.

**Param** `evt` DPP event ID
**Param data** Event data payload

**Enumerations**

**enum dpp_bootstrap_type**
Types of Bootstrap Methods for DPP.

*Values:*

- enumerator **DPP_BOOTSTRAP_QR_CODE**
  QR Code Method
- enumerator **DPP_BOOTSTRAP_PKEX**
  Proof of Knowledge Method
- enumerator **DPP_BOOTSTRAP_NFC_URI**
  NFC URI record Method

**enum esp_supp_dpp_event_t**
Types of Callback Events received from DPP Supplicant.

*Values:*

- enumerator **ESP_SUPP_DPP_URI_READY**
  URI is ready through Bootstrapping
- enumerator **ESP_SUPP_DPP_CFG_RECV**
  Config received via DPP Authentication
- enumerator **ESP_SUPP_DPP_FAIL**
  DPP Authentication failure

**Wi-Fi Aware™ (NAN)**

Wi-Fi Aware™ or NAN (Neighbor Awareness Networking) is a protocol that allows Wi-Fi devices to discover services in their proximity. Typically, location-based services are based on querying servers for information about the environment and the location knowledge is based on GPS or other location reckoning techniques. However, NAN does not require real-time connection to servers, GPS or other geo-location, but instead uses direct device-to-device Wi-Fi to discover and exchange information. NAN scales effectively in dense Wi-Fi environments and complements the connectivity of Wi-Fi by providing information about people and services in the proximity.

Multiple NAN devices which are in the vicinity form a NAN cluster which allows them to communicate with each other. Devices within a NAN cluster can advertise (Publish method) or look for (Subscribe method) services using NAN Service Discovery protocols. Matching of services is done by service name, once a match is found, a device can either send a message or establish an IPv6 Datapath with the peer.

ESP32-S2 supports Wi-Fi Aware in standalone mode with support for both Service Discovery and Datapath. Wi-Fi Aware is still an evolving protocol. Please refer to Wi-Fi Alliance’s official page on Wi-Fi Aware for more information. Many Android smartphones with Android 8 or higher support Wi-Fi Aware. Refer to Android’s developer guide on Wi-Fi Aware Wi-Fi Aware for more information.

**Application Example** A pair of examples for a Publisher-Subscriber use case: wifi/wifi Aware/nan_publisher and wifi/wifi Aware/nan_subscriber. A user interactive console example to explore full functionality of Wi-Fi Aware: wifi/wifi Aware/nan Console. Please check the README for more details in respective example directories.
API Reference

Header File

- components/esp_wifi/wifi_apps/include/esp_nan.h
- This header file can be included with:
  ```
  #include "esp_nan.h"
  ```
- This header file is a part of the API provided by the esp_wifi component. To declare that your component depends on esp_wifi, add the following to your CMakeLists.txt:
  ```
  REQUIRES esp_wifi
  
or
  PRIV_REQUIRES esp_wifi
  ```

Functions

```c
esp_err_t esp_wifi_nan_start (const wifi_nan_config_t *nan_cfg)
```

Start NAN Discovery with provided configuration.

**Attention** This API should be called after esp_wifi_init().

**Parameters** `nan_cfg` - NAN related parameters to be configured.

**Returns**
- ESP_OK: succeed
- others: failed

```c
esp_err_t esp_wifi_nan_stop (void)
```

Stop NAN Discovery, end NAN Services and Datapaths.

**Returns**
- ESP_OK: succeed
- others: failed

```c
uint8_t esp_wifi_nan_publish_service (const wifi_nan_publish_cfg_t *publish_cfg, bool ndp_resp_needed)
```

Start Publishing a service to the NAN Peers in vicinity.

**Attention** This API should be called after esp_wifi_nan_start().

**Parameters**
- `publish_cfg` - Configuration parameters for publishing a service.
- `ndp_resp_needed` - Setting this true will require user response for every NDP Req using esp_wifi_nan_datapath_resp API.

**Returns**
- non-zero: Publish service identifier
- zero: failed

```c
uint8_t esp_wifi_nan_subscribe_service (const wifi_nan_subscribe_cfg_t *subscribe_cfg)
```

Subscribe for a service within the NAN cluster.

**Attention** This API should be called after esp_wifi_nan_start().

**Parameters** `subscribe_cfg` - Configuration parameters for subscribing for a service.
Returns

- non-zero: Subscribe service identifier
- zero: failed

```
esp_err_t esp_wifi_nan_send_message(wifi_nan_followup_params_t *fup_params)
```

Send a follow-up message to the NAN Peer with matched service.

**Attention** This API should be called after a NAN service is discovered due to a match.

**Parameters**

- **fup_params** - Configuration parameters for sending a Follow-up message.

**Returns**

- ESP_OK: succeed
- others: failed

```
esp_err_t esp_wifi_nan_cancel_service(uint8_t service_id)
```

Cancel a NAN service.

**Parameters**

- **service_id** - Publish/Subscribe service id to be cancelled.

**Returns**

- ESP_OK: succeed
- others: failed

```
uint8_t esp_wifi_nan_datapath_req(wifi_nan_datapath_req_t *req)
```

Send NAN Datapath Request to a NAN Publisher with matched service.

**Attention** This API should be called by the Subscriber after a match occurs with a Publisher.

**Parameters**

- **req** - NAN Datapath Request parameters.

**Returns**

- non-zero NAN Datapath identifier: If NAN datapath req was accepted by publisher
- zero: If NAN datapath req was rejected by publisher or a timeout occurs

```
esp_err_t esp_wifi_nan_datapath_resp(wifi_nan_datapath_resp_t *resp)
```

Respond to a NAN Datapath request with Accept or Reject.

**Attention** This API should be called if ndp_auto_accept is not set True by the Publisher and a WIFI_EVENT_NDP_INDICATION event is received due to an incoming NDP request.

**Parameters**

- **resp** - NAN Datapath Response parameters.

**Returns**

- ESP_OK: succeed
- others: failed

```
esp_err_t esp_wifi_nan_datapath_end(wifi_nan_datapath_end_req_t *req)
```

Terminate a NAN Datapath.

**Parameters**

- **req** - NAN Datapath end request parameters.

**Returns**

- ESP_OK: succeed
- others: failed

```
void esp_wifi_nan_get_ipv6_linklocal_from_mac(ip6_addr_t *ip6, uint8_t *mac_addr)
```

Get IPv6 Link Local address using MAC address.

**Parameters**

- **ip6** - [out] Derived IPv6 Link Local address.
• **mac_addr** – [in] Input MAC Address.

```c
esp_err_t esp_wifi_nan_get_own_svc_info(uint8_t* own_svc_id, char* svc_name, int *num_peer_records)
```

brief Get own Service information from Service ID OR Name.

**Attention** If service information is to be fetched from service name, set own_svc_id as zero.

**Parameters**

- **own_svc_id** – [inout] As input, it indicates Service ID to search for. As output, it indicates Service ID of the service found using Service Name.
- **svc_name** – [inout] As input, it indicates Service Name to search for. As output, it indicates Service Name of the service found using Service ID.
- **num_peer_records** – [out] Number of peers discovered by corresponding service.

**Returns**

- ESP_OK: succeed
- ESP_FAIL: failed

```c
esp_err_t esp_wifi_nan_get_peer_records(int *num_peer_records, uint8_t own_svc_id, struct nan_peer_record *peer_record)
```

brief Get a list of Peers discovered by the given Service.

**Parameters**

- **num_peer_records** – [inout] As input param, it stores max peers peer_record can hold. As output param, it specifies the actual number of peers this API returns.
- **own_svc_id** – Service ID of own service.
- **peer_record** – [out] Pointer to first peer record.

**Returns**

- ESP_OK: succeed
- ESP_FAIL: failed

```c
esp_err_t esp_wifi_nan_get_peer_info(char* svc_name, uint8_t* peer_mac, struct nan_peer_record *peer_info)
```

brief Find Peer’s Service information using Peer MAC and optionally Service Name.

**Parameters**

- **svc_name** – Service Name of the published/subscribed service.
- **peer_mac** – Peer’s NAN Management Interface MAC address.
- **peer_info** – [out] Peer’s service information structure.

**Returns**

- ESP_OK: succeed
- ESP_FAIL: failed

**Structures**

struct **nan_peer_record**

Parameters of a peer service record

**Public Members**

```c
uint8_t peer_svc_id
```

Identifier of Peer’s service

```c
uint8_t own_svc_id
```

Identifier of own service associated with Peer
uint8_t peer_nmi[6]
Peer’s NAN Management Interface address

destintes if the peer is null active datapath

uint8_t peer_svc_type
Peer’s service type (Publish/Subscribe)

uint8_t peer_ndi[6]
Peer’s NAN Data Interface address, only valid when ndp_id is non-zero

Macros
WIFI_NAN_CONFIG_DEFAULT()

NDP_STATUS_ACCEPTED

NDP_STATUS_REJECTED

NAN_MAX_PEERS_RECORD

ESP_NAN_PUBLISH

ESP_NAN_SUBSCRIBE

Code examples for the Wi-Fi API are provided in the wifi directory of ESP-IDF examples.
Code examples for ESP-WIFI-MESH are provided in the mesh directory of ESP-IDF examples.

2.4.2 Ethernet

Overview
ESP-IDF provides a set of consistent and flexible APIs to support both internal Ethernet MAC (EMAC) controller and external SPI-Ethernet modules.

This programming guide is split into the following sections:

1. Basic Ethernet Concepts
2. Configure MAC and PHY
3. Connect Driver to TCP/IP Stack
4. Misc Control of Ethernet Driver

Basic Ethernet Concepts
Ethernet is an asynchronous Carrier Sense Multiple Access with Collision Detect (CSMA/CD) protocol/interface. It is generally not well suited for low-power applications. However, with ubiquitous deployment, internet connectivity, high data rates, and limitless-range expandability, Ethernet can accommodate nearly all wired communications.

Normal IEEE 802.3 compliant Ethernet frames are between 64 and 1518 bytes in length. They are made up of five or six different fields: a destination MAC address (DA), a source MAC address (SA), a type/length field, a data payload, an optional padding field and a Cyclic Redundancy Check (CRC). Additionally, when transmitted on the
Ethernet medium, a 7-byte preamble field and Start-of-Frame (SOF) delimiter byte are appended to the beginning of the Ethernet packet.

Thus the traffic on the twist-pair cabling appears as shown below:

---

<table>
<thead>
<tr>
<th></th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Preamble (7 Bytes)</td>
</tr>
<tr>
<td>2</td>
<td>Start-of-Frame Delimiter (1 Byte)</td>
</tr>
<tr>
<td>3</td>
<td>Destination Address (6 Bytes)</td>
</tr>
<tr>
<td>4</td>
<td>Source Address (6 Bytes)</td>
</tr>
<tr>
<td>5</td>
<td>Type / Length (2 Bytes)</td>
</tr>
<tr>
<td>6</td>
<td>Payload (0 ~ 1500 Bytes)</td>
</tr>
<tr>
<td>7</td>
<td>Pad (if necessary)</td>
</tr>
<tr>
<td>8</td>
<td>Frame Check Sequence (4 Bytes)</td>
</tr>
</tbody>
</table>

---

**Preamble and Start-of-Frame Delimiter**  The preamble contains seven bytes of 55H. It allows the receiver to lock onto the stream of data before the actual frame arrives.

The Start-of-Frame Delimiter (SFD) is a binary sequence 10101011 (as seen on the physical medium). It is sometimes considered to be part of the preamble.

When transmitting and receiving data, the preamble and SFD bytes will be automatically generated or stripped from the packets.

**Destination Address**  The destination address field contains a 6-byte length MAC address of the device that the packet is directed to. If the Least Significant bit in the first byte of the MAC address is set, the address is a multicast destination. For example, 01-00-00-00-F0-00 and 33-45-67-89-AB-CD are multi-cast addresses, while 00-00-00-00-F0-00 and 32-45-67-89-AB-CD are not.

Packets with multi-cast destination addresses are designed to arrive and be important to a selected group of Ethernet nodes. If the destination address field is the reserved multicast address, i.e., FF-FF-FF-FF-FF, the packet is a broadcast packet and it will be directed to everyone sharing the network. If the Least Significant bit in the first byte of the MAC address is clear, the address is a unicast address and will be designed for usage by only the addressed node.

Normally the EMAC controller incorporates receive filters which can be used to discard or accept packets with multi-cast, broadcast and/or unicast destination addresses. When transmitting packets, the host controller is responsible for writing the desired destination address into the transmit buffer.
**Source Address**  The source address field contains a 6-byte length MAC address of the node which created the Ethernet packet. Users of Ethernet must generate a unique MAC address for each controller used. MAC addresses consist of two portions. The first three bytes are known as the Organizationally Unique Identifier (OUI). OUIs are distributed by the IEEE. The last three bytes are address bytes at the discretion of the company that purchased the OUI. For more information about MAC Address used in ESP-IDF, please see [MAC Address Allocation](#).

When transmitting packets, the assigned source MAC address must be written into the transmit buffer by the host controller.

**Type/Length**  The type/length field is a 2-byte field. If the value in this field is <= 1500 (decimal), it is considered a length field and it specifies the amount of non-padding data which follows in the data field. If the value is >= 1536, it represents the protocol the following packet data belongs to. The followings are the most common type values:

- IPv4 = 0800H
- IPv6 = 86DDH
- ARP = 0806H

Users implementing proprietary networks may choose to treat this field as a length field, while applications implementing protocols such as the Internet Protocol (IP) or Address Resolution Protocol (ARP), should program this field with the appropriate type defined by the protocol’s specification when transmitting packets.

**Payload**  The payload field is a variable length field, anywhere from 0 to 1500 bytes. Larger data packets violates Ethernet standards and will be dropped by most Ethernet nodes.

This field contains the client data, such as an IP datagram.

**Padding and FCS**  The padding field is a variable length field added to meet the IEEE 802.3 specification requirements when small data payloads are used.

The DA, SA, type, payload, and padding of an Ethernet packet must be no smaller than 60 bytes in total. If the required 4-byte FCS field is added, packets must be no smaller than 64 bytes. If the payload field is less than 46-byte long, a padding field is required.

The FCS field is a 4-byte field that contains an industry-standard 32-bit CRC calculated with the data from the DA, SA, type, payload, and padding fields. Given the complexity of calculating a CRC, the hardware normally automatically generates a valid CRC and transmit it. Otherwise, the host controller must generate the CRC and place it in the transmit buffer.

Normally, the host controller does not need to concern itself with padding and the CRC which the hardware EMAC will also be able to automatically generate when transmitting and verify when receiving. However, the padding and CRC fields will be written into the receive buffer when packets arrive, so they may be evaluated by the host controller if needed.

**Note:**  Besides the basic data frame described above, there are two other common frame types in 10/100 Mbps Ethernet: control frames and VLAN-tagged frames. They are not supported in ESP-IDF.

---

**Configure MAC and PHY**  The Ethernet driver is composed of two parts: MAC and PHY.

You need to set up the necessary parameters for MAC and PHY respectively based on your Ethernet board design, and then combine the two together to complete the driver installation.

Configuration for MAC is described in [eth_mac_config_t](#), including:

- `eth_mac_config_t::sw_reset_timeout_ms`: software reset timeout value, in milliseconds. Typically, MAC reset should be finished within 100 ms.
• `eth_mac_config_t::rx_task_stack_size` and `eth_mac_config_t::rx_task_prio`: the MAC driver creates a dedicated task to process incoming packets. These two parameters are used to set the stack size and priority of the task.

• `eth_mac_config_t::flags`: specifying extra features that the MAC driver should have, it could be useful in some special situations. The value of this field can be OR’d with macros prefixed with `ETH_MAC_FLAG_`. For example, if the MAC driver should work when the cache is disabled, then you should configure this field with `ETH_MAC_FLAG_WORK_WITH_CACHE_DISABLE`.

Configuration for PHY is described in `eth_phy_config_t`, including:

• `eth_phy_config_t::phy_addr`: multiple PHY devices can share the same SMI bus, so each PHY needs a unique address. Usually, this address is configured during hardware design by pulling up/down some PHY strapping pins. You can set the value from 0 to 15 based on your Ethernet board. Especially, if the SMI bus is shared by only one PHY device, setting this value to -1 can enable the driver to detect the PHY address automatically.

• `eth_phy_config_t::reset_timeout_ms`: reset timeout value, in milliseconds. Typically, PHY reset should be finished within 100 ms.

• `eth_phy_config_t::autonego_timeout_ms`: auto-negotiation timeout value, in milliseconds. The Ethernet driver starts negotiation with the peer Ethernet node automatically, to determine to duplex and speed mode. This value usually depends on the ability of the PHY device on your board.

• `eth_phy_config_t::reset_gpio_num`: if your board also connects the PHY reset pin to one of the GPIO, then set it here. Otherwise, set this field to -1.

ESP-IDF provides a default configuration for MAC and PHY in macro `ETH_MAC_DEFAULT_CONFIG` and `ETH_PHY_DEFAULT_CONFIG`.

### Create MAC and PHY Instance

The Ethernet driver is implemented in an Object-Oriented style. Any operation on MAC and PHY should be based on the instance of the two.

**SPI-Ethernet Module**

```c
eth_mac_config_t mac_config = ETH_MAC_DEFAULT_CONFIG(); // apply default MAC configuration
eth_phy_config_t phy_config = ETH_PHY_DEFAULT_CONFIG(); // apply default PHY configuration
phy_config.phy_addr = CONFIG_EXAMPLE_ETH_PHY_ADDR; // alter the PHY address according to your board design
phy_config.reset_gpio_num = CONFIG_EXAMPLE_ETH_PHY_RST_GPIO; // alter the GPIO used for PHY reset
// Install GPIO interrupt service (as the SPI-Ethernet module is interrupt-driven)
gpio_install_isr_service(0);
// SPI bus configuration
spi_device_handle_t spi_handle = NULL;
spi_bus_config_t buscfg = {
    .miso_io_num = CONFIG_EXAMPLE_ETH_SPI_MISO_GPIO,
    .mosi_io_num = CONFIG_EXAMPLE_ETH_SPI_MOSI_GPIO,
    .sclk_io_num = CONFIG_EXAMPLE_ETH_SPI_SCLK_GPIO,
    .quadwp_io_num = -1,
    .quadhd_io_num = -1,
};
ESP_ERROR_CHECK(spi_bus_initialize(CONFIG_EXAMPLE_ETH_SPI_HOST, &buscfg, 1));
// Configure SPI device
spi_device_interface_config_t spi_devcfg = {
    .mode = 0,
    .clock_speed_hz = CONFIG_EXAMPLE_ETH_SPI_CLOCK_MHZ * 1000 * 1000,
    .spics.io_num = CONFIG_EXAMPLE_ETH_SPI_CS_GPIO,
    .queue_size = 20
};
/* dm9051 ethernet driver is based on spi driver */
```

(continues on next page)

```c
eth_dm9051_config_t dm9051_config = ETH_DM9051_DEFAULT_CONFIG CONFIG_EXAMPLE_ETH_ 
~SPI_HOST, &spi_devcfg);
dm9051_config.int_gpio_num = CONFIG_EXAMPLE_ETH_SPI_INT_GPIO;
esp_eth_mac_t *mac = esp_eth_mac_new_dm9051(&dm9051_config, &mac_config);
esp_eth_phy_t *phy = esp_eth_phy_new_dm9051(sphy_config);
```

Note:

- When creating MAC and PHY instances for SPI-Ethernet modules (e.g., DM9051), the constructor function must have the same suffix (e.g., `esp_eth_mac_new_dm9051` and `esp_eth_phy_new_dm9051`). This is because we do not have other choices but the integrated PHY.
- The SPI device configuration (i.e., `spi_device_interface_config_t`) may slightly differ for other Ethernet modules or to meet SPI timing on specific PCB. Please check out your module’s specs and the examples in ESP-IDF.

**Install Driver**  To install the Ethernet driver, we need to combine the instance of MAC and PHY and set some additional high-level configurations (i.e., not specific to either MAC or PHY) in `esp_eth_config_t`:

- `esp_eth_config_t::mac`: instance that created from MAC generator (e.g., `esp_eth_mac_new_esp32()`).
- `esp_eth_config_t::phy`: instance that created from PHY generator (e.g., `esp_eth_phy_new_ip101()`).
- `esp_eth_config_t::check_link_period_ms`: Ethernet driver starts an OS timer to check the link status periodically, this field is used to set the interval, in milliseconds.
- `esp_eth_config_t::stack_input`: In most Ethernet IoT applications, any Ethernet frame received by a driver should be passed to the upper layer (e.g., TCP/IP stack). This field is set to a function that is responsible to deal with the incoming frames. You can even update this field at runtime via function `esp_eth_update_input_path()` after driver installation.
- `esp_eth_config_t::on_lowlevel_init_done` and `esp_eth_config_t::on_lowlevel_deinit_done`:

These two fields are used to specify the hooks which get invoked when low-level hardware has been initialized or de-initialized.

ESP-IDF provides a default configuration for driver installation in macro `ETH_DEFAULT_CONFIG`.

```c
esp_eth_config_t config = ETH_DEFAULT_CONFIG(mac, phy); // apply default driver _ 
configuration
esp_eth_handle_t eth_handle = NULL; // after the driver is installed, we will get_ 
the handle of the driver
esp_eth_driver_install(&config, &eth_handle); // install driver
```

The Ethernet driver also includes an event-driven model, which sends useful and important events to user space. We need to initialize the event loop before installing the Ethernet driver. For more information about event-driven programming, please refer to `ESP Event`.

```c
/** Event handler for Ethernet events */
static void eth_event_handler(void *arg, esp_event_base_t event_base, int32_t event_id, void *event_data)
{
    uint8_t mac_addr[6] = {0};
    /* we can get the ethernet driver handle from event data */
    esp_eth_handle_t eth_handle = *(esp_eth_handle_t *)event_data;

    switch (event_id) {
    case ETHERNET_EVENT_CONNECTED:
        esp_eth_ioctl(eth_handle, ETH_CMD_G_MAC_ADDR, mac_addr);
        ESP_LOGI(TAG, "Ethernet Link Up");
        ESP_LOGI(TAG, "Ethernet HW Addr %02x:%02x:%02x:%02x:%02x:%02x", 
                mac_addr[0], mac_addr[1], mac_addr[2], mac_addr[3], mac_ 
addr[4], mac_addr[5]);
```

(continues on next page)
break;

case ETHERNET_EVENT_DISCONNECTED:
    ESP_LOGI(TAG, "Ethernet Link Down");
    break;

case ETHERNET_EVENT_START:
    ESP_LOGI(TAG, "Ethernet Started");
    break;

case ETHERNET_EVENT_STOP:
    ESP_LOGI(TAG, "Ethernet Stopped");
    break;

default:
    break;

}
}

esp_event_loop_create_default(); // create a default event loop that runs in the background

esp_event_handler_register(ETH_EVENT, ESP_EVENT_ANY_ID, eth_event_handler, NULL); // register Ethernet event handler (to deal with user-specific stuff when events like link up/down happened)

Start Ethernet Driver  After driver installation, we can start Ethernet immediately.

    esp_eth_start(eth_handle); // start Ethernet driver state machine

Connect Driver to TCP/IP Stack  Up until now, we have installed the Ethernet driver. From the view of OSI (Open System Interconnection), we are still on level 2 (i.e., Data Link Layer). While we can detect link up and down events and gain MAC address in user space, it is infeasible to obtain the IP address, let alone send an HTTP request. The TCP/IP stack used in ESP-IDF is called LwIP. For more information about it, please refer to LwIP.

To connect the Ethernet driver to TCP/IP stack, follow these three steps:

1. Create a network interface for the Ethernet driver
2. Attach the network interface to the Ethernet driver
3. Register IP event handlers

For more information about the network interface, please refer to Network Interface.

/** Event handler for IP_EVENT_ETH_GOT_IP */
static void got_ip_event_handler(void *arg, esp_event_base_t event_base, int32_t event_id, void *event_data)
{
    ip_event_got_ip_t *event = (ip_event_got_ip_t *) event_data;
    const esp_netif_ip_info_t *ip_info = &event->ip_info;

    ESP_LOGI(TAG, "Ethernet Got IP Address");
    ESP_LOGI(TAG, "~~~~~~~~~~~~");
    ESP_LOGI(TAG, "ETHIP: " IPSTR(ip_info->ip));
    ESP_LOGI(TAG, "ETHMASK: " IPSTR(ip_info->netmask));
    ESP_LOGI(TAG, "ETHGW: " IPSTR(ip_info->gw));
    ESP_LOGI(TAG, "~~~~~~~~~~~~");
}

esp_netif_init(); // Initialize TCP/IP network interface (should be called only once in application)

esp_netif_config_t cfg = ESP_NETIF_DEFAULT_ETH(); // apply default network interface configuration for Ethernet

esp_netif_t *eth_netif = esp_netif_new(&cfg); // create network interface for Ethernet

(continues on next page)
esp_netif_attach(eth_netif, esp_eth_new_netif_glue(eth_handle)); // attach Ethernet driver to TCP/IP stack
esp_event_handler_register(IP_EVENT, IP_EVENT_ETH_GOT_IP, &got_ip_event_handler, NULL); // register user defined IP event handlers
esp_eth_start(eth_handle); // start Ethernet driver state machine

**Warning:** It is recommended to fully initialize the Ethernet driver and network interface before registering the user’s Ethernet/IP event handlers, i.e., register the event handlers as the last thing prior to starting the Ethernet driver. Such an approach ensures that Ethernet/IP events get executed first by the Ethernet driver or network interface so the system is in the expected state when executing the user’s handlers.

**Misc Control of Ethernet Driver** The following functions should only be invoked after the Ethernet driver has been installed.

- Stop Ethernet driver: `esp_eth_stop()`
- Update Ethernet data input path: `esp_eth_update_input_path()`
- Misc get/set of Ethernet driver attributes: `esp_eth_ioctl()`

```
/* get MAC address */
uint8_t mac_addr[6];
memset(mac_addr, 0, sizeof(mac_addr));
esp_eth_ioctl(eth_handle, ETH_CMD_G_MAC_ADDR, mac_addr);
ESP_LOGI(TAG, "Ethernet MAC Address: %02x:%02x:%02x:%02x:%02x:%02x",
        mac_addr[0], mac_addr[1], mac_addr[2], mac_addr[3], mac_addr[4], mac_addr[5]);

/* get PHY address */
int phy_addr = -1;
esp_eth_ioctl(eth_handle, ETH_CMD_G_PHY_ADDR, &phy_addr);
ESP_LOGI(TAG, "Ethernet PHY Address: %d", phy_addr);
```

**Flow Control** Ethernet on MCU usually has a limitation in the number of frames it can handle during network congestion, because of the limitation in RAM size. A sending station might be transmitting data faster than the peer end can accept it. The ethernet flow control mechanism allows the receiving node to signal the sender requesting the suspension of transmissions until the receiver catches up. The magic behind that is the pause frame, which was defined in IEEE 802.3x.

Pause frame is a special Ethernet frame used to carry the pause command, whose EtherType field is 0x8808, with the Control opcode set to 0x0001. Only stations configured for full-duplex operation may send pause frames. When a station wishes to pause the other end of a link, it sends a pause frame to the 48-bit reserved multicast address of 01-80-C2-00-00-01. The pause frame also includes the period of pause time being requested, in the form of a two-byte integer, ranging from 0 to 65535.

After the Ethernet driver installation, the flow control feature is disabled by default. You can enable it by:

```
bool flow_ctrl_enable = true;
esp_eth_ioctl(eth_handle, ETH_CMD_S_FLOW_CTRL, &flow_ctrl_enable);
```

One thing that should be kept in mind is that the pause frame ability is advertised to the peer end by PHY during auto-negotiation. The Ethernet driver sends a pause frame only when both sides of the link support it.

**Application Examples**

- Ethernet basic example: ethernet/basic
- Ethernet iperf example: ethernet/iperf
Advanced Topics

Custom PHY Driver  There are multiple PHY manufacturers with wide portfolios of chips available. The ESP-IDF already supports several PHY chips however one can easily get to a point where none of them satisfies the user’s actual needs due to price, features, stock availability, etc.

Luckily, a management interface between EMAC and PHY is standardized by IEEE 802.3 in Section 22.2.4 Management Functions. It defines provisions of the so-called “MII Management Interface” to control the PHY and gather status from the PHY. A set of management registers is defined to control chip behavior, link properties, auto-negotiation configuration, etc. This basic management functionality is addressed by esp_eth/src/esp_eth_phy_802_3.c in ESP-IDF and so it makes the creation of a new custom PHY chip driver quite a simple task.

Note:  Always consult with PHY datasheet since some PHY chips may not comply with IEEE 802.3, Section 22.2.4. It does not mean you are not able to create a custom PHY driver, but it just requires more effort. You will have to define all PHY management functions.

The majority of PHY management functionality required by the ESP-IDF Ethernet driver is covered by the esp_eth/src/esp_eth_phy_802_3.c. However, the following may require developing chip-specific management functions:

• Link status which is almost always chip-specific
• Chip initialization, even though not strictly required, should be customized to at least ensure that the expected chip is used
• Chip-specific features configuration

Steps to create a custom PHY driver:

1. Define vendor-specific registry layout based on the PHY datasheet. See esp_eth/src/esp_eth_phy_ip101.c as an example.
2. Prepare derived PHY management object info structure which:
   • must contain at least parent IEEE 802.3 phy_802_3_t object
   • optionally contain additional variables needed to support non-IEEE 802.3 or customized functionality.

   See esp_eth/src/esp_eth_phy_ksz80xx.c as an example.
3. Define chip-specific management call-back functions.
4. Initialize parent IEEE 802.3 object and re-assign chip-specific management call-back functions.

Once you finish the new custom PHY driver implementation, consider sharing it among other users via IDF Component Registry.

API Reference

• This header file can be included with:

   ```
   #include "esp_eth.h"
   ```

• This header file is a part of the API provided by the esp_eth component. To declare that your component depends on esp_eth, add the following to your CMakeLists.txt:

   ```
   REQUIRES esp_eth
   ```

or
Chapter 2. API Reference

PRIV_REQUIRES esp_eth

Header File

• components/esp_eth/include/esp_eth_driver.h
• This header file can be included with:

```c
#include "esp_eth_driver.h"
```
• This header file is a part of the API provided by the esp_eth component. To declare that your component depends on esp_eth, add the following to your CMakeLists.txt:

```cmake
REQUIRES esp_eth
```

Functions

```c
esp_err_t esp_eth_driver_install (const esp_eth_config_t *config, esp_eth_handle_t *out_hdl)
```
Install Ethernet driver.

**Parameters**
- `config` [in] configuration of the Ethernet driver
- `out_hdl` [out] handle of Ethernet driver

**Returns**
- ESP_OK: install esp_eth driver successfully
- ESP_ERR_INVALID_ARG: install esp_eth driver failed because of some invalid argument
- ESP_ERR_NO_MEM: install esp_eth driver failed because there’s no memory for driver
- ESP_FAIL: install esp_eth driver failed because some other error occurred

```c
esp_err_t esp_eth_driver_uninstall (esp_eth_handle_t hdl)
```
Uninstall Ethernet driver.

**Note:** It’s not recommended to uninstall Ethernet driver unless it won’t get used any more in application code. To uninstall Ethernet driver, you have to make sure, all references to the driver are released. Ethernet driver can only be uninstalled successfully when reference counter equals to one.

**Parameters**
- `hdl` [in] handle of Ethernet driver

**Returns**
- ESP_OK: uninstall esp_eth driver successfully
- ESP_ERR_INVALID_ARG: uninstall esp_eth driver failed because of some invalid argument
- ESP_ERR_INVALID_STATE: uninstall esp_eth driver failed because it has more than one reference
- ESP_FAIL: uninstall esp_eth driver failed because some other error occurred

```c
esp_err_t esp_eth_start (esp_eth_handle_t hdl)
```
Start Ethernet driver ONLY in standalone mode (i.e. without TCP/IP stack)

**Note:** This API will start driver state machine and internal software timer (for checking link status).

**Parameters**
- `hdl` [in] handle of Ethernet driver

**Returns**
Chapter 2. API Reference

- ESP_OK: start esp_eth driver successfully
- ESP_ERR_INVALID_ARG: start esp_eth driver failed because of some invalid argument
- ESP_ERR_INVALID_STATE: start esp_eth driver failed because driver has started already
- ESP_FAIL: start esp_eth driver failed because some other error occurred

`esp_err_t esp_eth_stop(esp_eth_handle_t hdl)`

Stop Ethernet driver.

**Note:** This function does the opposite operation of `esp_eth_start`.

**Parameters**
- `hdl` - [in] handle of Ethernet driver

**Returns**
- ESP_OK: stop esp_eth driver successfully
- ESP_ERR_INVALID_ARG: stop esp_eth driver failed because of some invalid argument
- ESP_ERR_INVALID_STATE: stop esp_eth driver failed because driver has not started yet
- ESP_FAIL: stop esp_eth driver failed because some other error occurred

`esp_err_t esp_eth_update_input_path(esp_eth_handle_t hdl, esp_err_t (*stack_input)(esp_eth_handle_t hdl, uint8_t*buffer, uint32_t length, void *priv), void *priv)`

Update Ethernet data input path (i.e. specify where to pass the input buffer)

**Note:** After install driver, Ethernet still don’t know where to deliver the input buffer. In fact, this API registers a callback function which get invoked when Ethernet received new packets.

**Parameters**
- `hdl` - [in] handle of Ethernet driver
- `stack_input` - [in] function pointer, which does the actual process on incoming packets
- `priv` - [in] private resource, which gets passed to `stack_input` callback without any modification

**Returns**
- ESP_OK: update input path successfully
- ESP_ERR_INVALID_ARG: update input path failed because of some invalid argument
- ESP_FAIL: update input path failed because some other error occurred

`esp_err_t esp_eth_transmit(esp_eth_handle_t hdl, void*buf, size_t length)`

General Transmit.

**Parameters**
- `hdl` - [in] handle of Ethernet driver
- `buf` - [in] buffer of the packet to transfer
- `length` - [in] length of the buffer to transfer

**Returns**
- ESP_OK: transmit frame buffer successfully
- ESP_ERR_INVALID_ARG: transmit frame buffer failed because of some invalid argument
- ESP_ERR_INVALID_STATE: invalid driver state (i.e. driver is not started)
- ESP_ERR_TIMEOUT: transmit frame buffer failed because HW was not get available in predefined period
- ESP_FAIL: transmit frame buffer failed because some other error occurred

`esp_err_t esp_eth_transmit_vargs(esp_eth_handle_t hdl, uint32_t argc, ...)`

Special Transmit with variable number of arguments.
Parameters

- **hdl** [in] handle of Ethernet driver
- **argc** [in] number variable arguments
- **...** variable arguments

Returns

- **ESP_OK:** transmit successfull
- **ESP_ERR_INVALID_STATE:** invalid driver state (e.g. driver is not started)
- **ESP_ERR_TIMEOUT:** transmit frame buffer failed because HW was not get available in predefined period
- **ESP_FAIL:** transmit frame buffer failed because some other error occurred

```c
esp_err_t esp_eth_ioctl(esp_eth_handle_t hdl, esp_eth_ioctl_t cmd, void *data)
```

Misc IO function of Ethernet driver.

The following common IO control commands are supported:

- **ETH_CMD_S_MAC_ADDR** sets Ethernet interface MAC address. **data** argument is pointer to MAC address buffer with expected size of 6 bytes.
- **ETH_CMD_G_MAC_ADDR** gets Ethernet interface MAC address. **data** argument is pointer to a buffer to which MAC address is to be copied. The buffer size must be at least 6 bytes.
- **ETH_CMD_S_PHY_ADDR** sets PHY address in range of <0-31>. **data** argument is pointer to memory of uint32_t datatype from where the configuration option is read.
- **ETH_CMD_G_PHY_ADDR** gets PHY address. **data** argument is pointer to memory of uint32_t datatype to which the PHY address is to be stored.
- **ETH_CMD_S_AUTONEGO** enables or disables Ethernet link speed and duplex mode autonegotiation. **data** argument is pointer to memory of bool datatype from which the configuration option is read. Preconditions: Ethernet driver needs to be stopped.
- **ETH_CMD_G_AUTONEGO** gets current configuration of the Ethernet link speed and duplex mode autonegotiation. **data** argument is pointer to memory of bool datatype to which the current configuration is to be stored.
- **ETH_CMD_S_SPEED** sets the Ethernet link speed. **data** argument is pointer to memory of eth_speed_t datatype to which the speed is to be stored.
- **ETH_CMD_G_SPEED** gets current Ethernet link speed. **data** argument is pointer to memory of eth_speed_t datatype from which the speed is to be read.
- **ETH_CMD_S_PROMISCUOUS** sets/resets Ethernet interface promiscuous mode. **data** argument is pointer to memory of bool datatype from which the configuration option is read.
- **ETH_CMD_S_FLOW_CTRL** sets/resets Ethernet interface flow control. **data** argument is pointer to memory of bool datatype from which the configuration option is read.
- **ETH_CMD_S_DUPLEX_MODE** sets the Ethernet duplex mode. **data** argument is pointer to memory of eth_duplex_t datatype from which the configuration option is read. Preconditions: Ethernet driver needs to be stopped and auto-negotiation disabled.
- **ETH_CMD_G_DUPLEX_MODE** gets current Ethernet link duplex mode. **data** argument is pointer to memory of eth_duplex_t datatype to which the duplex mode is to be stored.
- **ETH_CMD_S_PHY_LOOPBACK** sets/resets PHY to/from loopback mode. **data** argument is pointer to memory of bool datatype from which the configuration option is read.

Note that additional control commands may be available for specific MAC or PHY chips. Please consult specific MAC or PHY documentation or driver code.

Parameters

- **hdl** [in] handle of Ethernet driver
- **cmd** [in] IO control command
- **data** [inout] address of data for set command or address where to store the data when used with get command

Returns

- **ESP_OK:** process io command successfully
• ESP_ERR_INVALID_ARG: process io command failed because of some invalid argument
• ESP_FAIL: process io command failed because some other error occurred
• ESP_ERR_NOT_SUPPORTED: requested feature is not supported

`esp_err_t esp_eth_increase_reference (esp_eth_handle_t hdl)`
Increase Ethernet driver reference.

**Note:** Ethernet driver handle can be obtained by os timer, netif, etc. It’s dangerous when thread A is using Ethernet but thread B uninstall the driver. Using reference counter can prevent such risk, but care should be taken, when you obtain Ethernet driver, this API must be invoked so that the driver won’t be uninstalled during your using time.

**Parameters**
- `hdl` [in] handle of Ethernet driver

**Returns**
- ESP_OK: increase reference successfully
- ESP_ERR_INVALID_ARG: increase reference failed because of some invalid argument

`esp_err_t esp_eth_decrease_reference (esp_eth_handle_t hdl)`
Decrease Ethernet driver reference.

**Parameters**
- `hdl` [in] handle of Ethernet driver

**Returns**
- ESP_OK: increase reference successfully
- ESP_ERR_INVALID_ARG: increase reference failed because of some invalid argument

**Structures**

`struct esp_eth_config_t`
Configuration of Ethernet driver.

**Public Members**

`esp_eth_mac_t *mac`
Ethernet MAC object.

`esp_eth_phy_t *phy`
Ethernet PHY object.

`uint32_t check_link_period_ms`
Period time of checking Ethernet link status.

`esp_err_t (*stack_input)(esp_eth_handle_t eth_handle, uint8_t *buffer, uint32_t length, void *priv)`
Input frame buffer to user’s stack.

**Parameters**
- `eth_handle` [in] handle of Ethernet driver
- `buffer` [in] frame buffer that will get input to upper stack
- `length` [in] length of the frame buffer

**Return**
- ESP_OK: input frame buffer to upper stack successfully
- ESP_FAIL: error occurred when inputting buffer to upper stack
**esp_err_t** (*on_lowlevel_init_done*)(**esp_eth_handle_t** eth_handle)

Callback function invoked when lowlevel initialization is finished.

**Param**
- **eth_handle** [in]: handle of Ethernet driver

**Return**
- ESP_OK: process extra lowlevel initialization successfully
- ESP_FAIL: error occurred when processing extra lowlevel initialization

**esp_err_t** (*on_lowlevel_deinit_done*)(**esp_eth_handle_t** eth_handle)

Callback function invoked when lowlevel deinitialization is finished.

**Param**
- **eth_handle** [in]: handle of Ethernet driver

**Return**
- ESP_OK: process extra lowlevel deinitialization successfully
- ESP_FAIL: error occurred when processing extra lowlevel deinitialization

**esp_err_t** (*read_phy_reg*)(**esp_eth_handle_t** eth_handle, **uint32_t** phy_addr, **uint32_t** phy_reg, **uint32_t** *reg_value)

Read PHY register.

**Note:** Usually the PHY register read/write function is provided by MAC (SMI interface), but if the PHY device is managed by other interface (e.g. I2C), then user needs to implement the corresponding read/write. Setting this to NULL means your PHY device is managed by MAC’s SMI interface.

**Param**
- **eth_handle** [in]: handle of Ethernet driver
- **phy_addr** [in]: PHY chip address (0~31)
- **phy_reg** [in]: PHY register index code
- **reg_value** [out]: PHY register value

**Return**
- ESP_OK: read PHY register successfully
- ESP_ERR_INVALID_ARG: read PHY register failed because of invalid argument
- ESP_ERR_TIMEOUT: read PHY register failed because of timeout
- ESP_FAIL: read PHY register failed because some other error occurred

**esp_err_t** (*write_phy_reg*)(**esp_eth_handle_t** eth_handle, **uint32_t** phy_addr, **uint32_t** phy_reg, **uint32_t** reg_value)

Write PHY register.

**Note:** Usually the PHY register read/write function is provided by MAC (SMI interface), but if the PHY device is managed by other interface (e.g. I2C), then user needs to implement the corresponding read/write. Setting this to NULL means your PHY device is managed by MAC’s SMI interface.

**Param**
- **eth_handle** [in]: handle of Ethernet driver
- **phy_addr** [in]: PHY chip address (0~31)
- **phy_reg** [in]: PHY register index code
- **reg_value** [in]: PHY register value

**Return**
- ESP_OK: write PHY register successfully
- ESP_ERR_INVALID_ARG: write PHY register failed because of invalid argument
- ESP_ERR_TIMEOUT: write PHY register failed because of timeout
- ESP_FAIL: write PHY register failed because some other error occurred
Chapter 2. API Reference

Macros

**ETH_DEFAULT_CONFIG** *(emac, ephy)*
Default configuration for Ethernet driver.

Type Definitions

typedef void * **esp_eth_handle_t**
Handle of Ethernet driver.

Enumerations

defined **esp_eth_io_cmd_t**
Command list for ioctl API.

Values:

- enumerator **ETH_CMD_G_MAC_ADDR**
  Get MAC address
- enumerator **ETH_CMD_S_MAC_ADDR**
  Set MAC address
- enumerator **ETH_CMD_G_PHY_ADDR**
  Get PHY address
- enumerator **ETH_CMD_S_PHY_ADDR**
  Set PHY address
- enumerator **ETH_CMD_G_AUTONEGO**
  Get PHY Auto Negotiation
- enumerator **ETH_CMD_S_AUTONEGO**
  Set PHY Auto Negotiation
- enumerator **ETH_CMD_G_SPEED**
  Get Speed
- enumerator **ETH_CMD_S_SPEED**
  Set Speed
- enumerator **ETH_CMD_S_PROMISCUOUS**
  Set promiscuous mode
- enumerator **ETH_CMD_S_FLOW_CTRL**
  Set flow control
- enumerator **ETH_CMD_G_DUPLEX_MODE**
  Get Duplex mode
- enumerator **ETH_CMD_S_DUPLEX_MODE**
  Set Duplex mode
Chapter 2. API Reference

enumerator **ETH_CMD_S_PHY_LOOPBACK**
Set PHY loopback

enumerator **ETH_CMD_CUSTOM_MAC_CMDS**

enumerator **ETH_CMD_CUSTOM_PHY_CMDS**

Header File

- components/esp_eth/include/esp_eth_com.h
- This header file can be included with:
  ```
  #include "esp_eth_com.h"
  ```
- This header file is a part of the API provided by the esp_eth component. To declare that your component depends on esp_eth, add the following to your CMakeLists.txt:
  ```
  REQUIRES esp_eth
  ```
  or
  ```
  PRIV_REQUIRES esp_eth
  ```

Structures

struct **esp_eth_mediator_s**
Ethernet mediator.

Public Members

```cpp
esp_err_t (*phy_reg_read)(esp_eth_mediator_t *eth, uint32_t phy_addr, uint32_t phy_reg, uint32_t *reg_value)
```
Read PHY register.

- **Param eth** [in] mediator of Ethernet driver
- **Param phy_addr** [in] PHY Chip address (0~31)
- **Param phy_reg** [in] PHY register index code
- **Param reg_value** [out] PHY register value
- **Return**
  - ESP_OK: read PHY register successfully
  - ESP_FAIL: read PHY register failed because some error occurred

```cpp
esp_err_t (*phy_reg_write)(esp_eth_mediator_t *eth, uint32_t phy_addr, uint32_t phy_reg, uint32_t reg_value)
```
Write PHY register.

- **Param eth** [in] mediator of Ethernet driver
- **Param phy_addr** [in] PHY Chip address (0~31)
- **Param phy_reg** [in] PHY register index code
- **Param reg_value** [in] PHY register value
- **Return**
  - ESP_OK: write PHY register successfully
  - ESP_FAIL: write PHY register failed because some error occurred
*esp_err_t* (*stack_input*) (*esp_eth_mediator_t* *eth*, *uint8_t* *buffer*, *uint32_t* *length*)

Deliver packet to upper stack.

**Param**
- **eth** [in] mediator of Ethernet driver
- **buffer** [in] packet buffer
- **length** [in] length of the packet

**Return**
- ESP_OK: deliver packet to upper stack successfully
- ESP_FAIL: deliver packet failed because some error occurred

*esp_err_t* (*on_state_changed*) (*esp_eth_mediator_t* *eth*, *esp_eth_state_t* *state*, *void* *args*)

Callback on Ethernet state changed.

**Param**
- **eth** [in] mediator of Ethernet driver
- **state** [in] new state
- **args** [in] optional argument for the new state

**Return**
- ESP_OK: process the new state successfully
- ESP_FAIL: process the new state failed because some error occurred

### Type Definitions

typedef struct *esp_eth_mediator_s* esp_eth_mediator_t

Ethernet mediator.

### Enumerations

enum esp_eth_state_t

Ethernet driver state.

**Values:**

- enumerator ETH_STATE_LLINIT
  Lowlevel init done
- enumerator ETH_STATE_DEINIT
  Deinit done
- enumerator ETH_STATE_LINK
  Link status changed
- enumerator ETH_STATE_SPEED
  Speed updated
- enumerator ETH_STATE_DUPLEX
  Duplex updated
- enumerator ETH_STATE_PAUSE
  Pause ability updated

enum eth_event_t

Ethernet event declarations.

**Values:**
enumerator **ETHERNET_EVENT_START**
Ethernet driver start

enumerator **ETHERNET_EVENT_STOP**
Ethernet driver stop

enumerator **ETHERNET_EVENT_CONNECTED**
Ethernet got a valid link

enumerator **ETHERNET_EVENT_DISCONNECTED**
Ethernet lost a valid link

**Header File**

- components/esp_eth/include/esp_eth_mac.h
- This header file can be included with:

  ```c
  #include "esp_eth_mac.h"
  ```

- This header file is a part of the API provided by the *esp_eth* component. To declare that your component depends on *esp_eth*, add the following to your CMakeLists.txt:

  ```cmake
  REQUIRES esp_eth
  or
  PRIV_REQUIRES esp_eth
  ```

**Unions**

union **eth_mac_clock_config_t**

```c
#include <esp_eth_mac.h> Ethernet MAC Clock Configuration.
```

**Public Members**

struct **eth_mac_clock_config_t**::[anonymous] **mii**
EMAC MII Clock Configuration

**emac_rmii_clock_mode_t** **clock_mode**
RMII Clock Mode Configuration

**emac_rmii_clock_gpio_t** **clock_gpio**
RMII Clock GPIO Configuration

struct **eth_mac_clock_config_t**::[anonymous] **rmii**
EMAC RMII Clock Configuration

**Structures**

struct **esp_eth_mac_s**
Ethernet MAC.
Public Members

```
esp_err_t (*set_mediator)(esp_eth_mac_t *mac, esp_eth_mediator_t *eth)
```
Set mediator for Ethernet MAC.

**Param**
- **mac** [in] Ethernet MAC instance
- **eth** [in] Ethernet mediator

**Return**
- ESP_OK: set mediator for Ethernet MAC successfully
- ESP_ERR_INVALID_ARG: set mediator for Ethernet MAC failed because of invalid argument

```
esp_err_t (*init)(esp_eth_mac_t *mac)
```
Initialize Ethernet MAC.

**Param**
- **mac** [in] Ethernet MAC instance

**Return**
- ESP_OK: initialize Ethernet MAC successfully
- ESP_ERR_TIMEOUT: initialize Ethernet MAC failed because of timeout
- ESP_FAIL: initialize Ethernet MAC failed because some other error occurred

```
esp_err_t (*deinit)(esp_eth_mac_t *mac)
```
Deinitialize Ethernet MAC.

**Param**
- **mac** [in] Ethernet MAC instance

**Return**
- ESP_OK: deinitialize Ethernet MAC successfully
- ESP_FAIL: deinitialize Ethernet MAC failed because some error occurred

```
esp_err_t (*start)(esp_eth_mac_t *mac)
```
Start Ethernet MAC.

**Param**
- **mac** [in] Ethernet MAC instance

**Return**
- ESP_OK: start Ethernet MAC successfully
- ESP_FAIL: start Ethernet MAC failed because some other error occurred

```
esp_err_t (*stop)(esp_eth_mac_t *mac)
```
Stop Ethernet MAC.

**Param**
- **mac** [in] Ethernet MAC instance

**Return**
- ESP_OK: stop Ethernet MAC successfully
- ESP_FAIL: stop Ethernet MAC failed because some other error occurred

```
esp_err_t (*transmit)(esp_eth_mac_t *mac, uint8_t* buf, uint32_t length)
```
Transmit packet from Ethernet MAC.

**Note:** Returned error codes may differ for each specific MAC chip.
• ESP_ERR_INVALID_SIZE: number of actually sent bytes differs to expected
• ESP_FAIL: transmit packet failed because some other error occurred

```c
esp_err_t (*transmit_vargs)(esp_eth_mac_t *mac, uint32_t argc, va_list args)
```

Transmit packet from Ethernet MAC constructed with special parameters at Layer 2.

**Note:** Typical intended use case is to make possible to construct a frame from multiple higher layer buffers without a need of buffer reallocations. However, other use cases are not limited.

**Note:** Returned error codes may differ for each specific MAC chip.

**Param**
- **mac** [in] Ethernet MAC instance
- **argc** [in] number variable arguments
- **args** [in] variable arguments

**Return**
- ESP_OK: transmit packet successfully
- ESP_ERR_INVALID_SIZE: number of actually sent bytes differs to expected
- ESP_FAIL: transmit packet failed because some other error occurred

```c
esp_err_t (*receive)(esp_eth_mac_t *mac, uint8_t *buf, uint32_t *length)
```

Receive packet from Ethernet MAC.

**Note:** Memory of buf is allocated in the Layer 2, make sure it get free after process.

**Note:** Before this function got invoked, the value of “length” should set by user, equals the size of buffer. After the function returned, the value of “length” means the real length of received data.

**Param**
- **mac** [in] Ethernet MAC instance
- **buf** [out] packet buffer which will preserve the received frame
- **length** [out] length of the received packet

**Return**
- ESP_OK: receive packet successfully
- ESP_ERR_INVALID_ARG: receive packet failed because of invalid argument
- ESP_ERR_INVALID_SIZE: input buffer size is not enough to hold the incoming data. in this case, value of returned “length” indicates the real size of incoming data.
- ESP_FAIL: receive packet failed because some other error occurred

```c
esp_err_t (*read_phy_reg)(esp_eth_mac_t *mac, uint32_t phy_addr, uint32_t phy_reg, uint32_t *reg_value)
```

Read PHY register.

**Param**
- **mac** [in] Ethernet MAC instance
- **phy_addr** [in] PHY chip address (0~31)
- **phy_reg** [in] PHY register index code
- **reg_value** [out] PHY register value

**Return**
- ESP_OK: read PHY register successfully
- ESP_ERR_INVALID_ARG: read PHY register failed because of invalid argument
- ESP_ERR_INVALID_STATE: read PHY register failed because of wrong state of MAC
Chapter 2. API Reference

- ESP_ERR_TIMEOUT: read PHY register failed because of timeout
- ESP_FAIL: read PHY register failed because some other error occurred

```c
esp_err_t (*write_phy_reg)(esp_eth_mac_t *mac, uint32_t phy_addr, uint32_t phy_reg, uint32_t reg_value)
```

Write PHY register.

- **Param mac [in]** Ethernet MAC instance
- **Param phy_addr [in]** PHY chip address (0~31)
- **Param phy_reg [in]** PHY register index code
- **Param reg_value [in]** PHY register value

```c
return
```

- ESP_OK: write PHY register successfully
- ESP_ERR_INVALID_STATE: write PHY register failed because of wrong state of MAC
- ESP_ERR_TIMEOUT: write PHY register failed because of timeout
- ESP_FAIL: write PHY register failed because some other error occurred

```c
esp_err_t (*set_addr)(esp_eth_mac_t *mac, uint8_t *addr)
```

Set MAC address.

- **Param mac [in]** Ethernet MAC instance
- **Param addr [in]** MAC address

```c
return
```

- ESP_OK: set MAC address successfully
- ESP_ERR_INVALID_ARG: set MAC address failed because of invalid argument
- ESP_FAIL: set MAC address failed because some other error occurred

```c
esp_err_t (*get_addr)(esp_eth_mac_t *mac, uint8_t *addr)
```

Get MAC address.

- **Param mac [in]** Ethernet MAC instance
- **Param addr [out]** MAC address

```c
return
```

- ESP_OK: get MAC address successfully
- ESP_ERR_INVALID_ARG: get MAC address failed because of invalid argument
- ESP_FAIL: get MAC address failed because some other error occurred

```c
esp_err_t (*set_speed)(esp_eth_mac_t *mac, eth_speed_t speed)
```

Set speed of MAC.

- **Param mac [in]** Ethernet MAC instance
- **Param speed [in]** MAC speed

```c
return
```

- ESP_OK: set MAC speed successfully
- ESP_ERR_INVALID_ARG: set MAC speed failed because of invalid argument
- ESP_FAIL: set MAC speed failed because some other error occurred

```c
esp_err_t (*set_duplex)(esp_eth_mac_t *mac, eth_duplex_t duplex)
```

Set duplex mode of MAC.

- **Param mac [in]** Ethernet MAC instance
- **Param duplex [in]** MAC duplex

```c
return
```

- ESP_OK: set MAC duplex mode successfully
- ESP_ERR_INVALID_ARG: set MAC duplex failed because of invalid argument
- ESP_FAIL: set MAC duplex failed because some other error occurred
```

esp_err_t (*set_link)(esp_eth_mac_t *mac, eth_link_t link)
    Set link status of MAC.
    Param mac [in] Ethernet MAC instance
    Param link [in] Link status
    Return
    • ESP_OK: set link status successfully
    • ESP_ERR_INVALID_ARG: set link status failed because of invalid argument
    • ESP_FAIL: set link status failed because some other error occurred

esp_err_t (*set_promiscuous)(esp_eth_mac_t *mac, bool enable)
    Set promiscuous of MAC.
    Param mac [in] Ethernet MAC instance
    Param enable [in] set true to enable promiscuous mode; set false to disable promiscuous mode
    Return
    • ESP_OK: set promiscuous mode successfully
    • ESP_FAIL: set promiscuous mode failed because some error occurred

esp_err_t (*enable_flow_ctrl)(esp_eth_mac_t *mac, bool enable)
    Enable flow control on MAC layer or not.
    Param mac [in] Ethernet MAC instance
    Param enable [in] set true to enable flow control; set false to disable flow control
    Return
    • ESP_OK: set flow control successfully
    • ESP_FAIL: set flow control failed because some error occurred

esp_err_t (*set_peer_pause_ability)(esp_eth_mac_t *mac, uint32_t ability)
    Set the PAUSE ability of peer node.
    Param mac [in] Ethernet MAC instance
    Param ability [in] zero indicates that pause function is supported by link partner; non-zero indicates that pause function is not supported by link partner
    Return
    • ESP_OK: set peer pause ability successfully
    • ESP_FAIL: set peer pause ability failed because some error occurred

esp_err_t (*custom_ioctl)(esp_eth_mac_t *mac, uint32_t cmd, void *data)
    Custom IO function of MAC driver. This function is intended to extend common options of esp_eth_ioctl to cover specifics of MAC chip.
    Param mac [in] Ethernet MAC instance
    Param cmd [in] IO control command
    Param data [inout] address of data for set command or address where to store the data when used with get command
    Return
    • ESP_OK: process io command successfully
    • ESP_ERR_INVALID_ARG: process io command failed because of some invalid argument
    • ESP_FAIL: process io command failed because some other error occurred
    • ESP_ERR_NOT_SUPPORTED: requested feature is not supported
```
```c
esp_err_t (*del)(esp_eth_mac_t *mac)
    Free memory of Ethernet MAC.
    
    **Param** mac [in] Ethernet MAC instance
    **Return**
    • ESP_OK: free Ethernet MAC instance successfully
    • ESP_FAIL: free Ethernet MAC instance failed because some error occurred
```
**esp_err_t** (*deinit*)(void *spi_ctx)

Custom driver De-initialization.

**Param** spi_ctx [in] a pointer to driver specific context structure

**Return**

- ESP_OK: driver de-initialization was successful
- ESP_FAIL: driver de-initialization failed
- any other failure codes are allowed to be used to provide failure isolation

**esp_err_t** (*read*)(void *spi_ctx, uint32_t cmd, uint32_t addr, void *data, uint32_t data_len)

Custom driver SPI read.

**Note:** The read function is responsible to construct command, address and data fields of the SPI frame in format expected by particular SPI Ethernet module

**Param** spi_ctx [in] a pointer to driver specific context structure

**Param** cmd [in] command

**Param** addr [in] register address

**Param** data [out] read data

**Param** data_len [in] read data length in bytes

**Return**

- ESP_OK: read was successful
- ESP_FAIL: read failed
- any other failure codes are allowed to be used to provide failure isolation

**esp_err_t** (*write*)(void *spi_ctx, uint32_t cmd, uint32_t addr, const void *data, uint32_t data_len)

Custom driver SPI write.

**Note:** The write function is responsible to construct command, address and data fields of the SPI frame in format expected by particular SPI Ethernet module

**Param** spi_ctx [in] a pointer to driver specific context structure

**Param** cmd [in] command

**Param** addr [in] register address

**Param** data [in] data to write

**Param** data_len [in] length of data to write in bytes

**Return**

- ESP_OK: write was successful
- ESP_FAIL: write failed
- any other failure codes are allowed to be used to provide failure isolation

**Macros**

**ETH_MAC_FLAG_WORK_WITH_CACHE_DISABLE**

MAC driver can work when cache is disabled

**ETH_MAC_FLAG_PIN_TO_CORE**

Pin MAC task to the CPU core where driver installation happened

**ETH_MAC_DEFAULT_CONFIG()**

Default configuration for Ethernet MAC object.
**ETH_DEFAULT_SPI**

Default configuration of the custom SPI driver. Internal ESP-IDF SPI Master driver is used by default.

**Type Definitions**

```c
typedef struct esp_eth_mac_s esp_eth_mac_t
    Ethernet MAC.
```

**Enumerations**

```c
enum emac_rmii_clock_mode_t
    RMII Clock Mode Options.
    Values:
```

- **enumerator EMAC_CLK_DEFAULT**
  Default values configured using Kconfig are going to be used when “Default” selected.

- **enumerator EMAC_CLK_EXT_IN**
  Input RMII Clock from external. EMAC Clock GPIO number needs to be configured when this option is selected.

  **Note:** MAC will get RMII clock from outside. Note that ESP32 only supports GPIO0 to input the RMII clock.

- **enumerator EMAC_CLK_OUT**
  Output RMII Clock from internal APLL Clock. EMAC Clock GPIO number needs to be configured when this option is selected.

```c
enum emac_rmii_clock_gpio_t
    RMIIClockGPIO number Options.
    Values:
```

- **enumerator EMAC_CLK_IN_GPIO**
  MAC will get RMII clock from outside at this GPIO.

  **Note:** ESP32 only supports GPIO0 to input the RMII clock.

- **enumerator EMAC_APBCLK_OUT_GPIO**
  Output RMII Clock from internal APLL Clock available at GPIO0.

  **Note:** GPIO0 can be set to output a pre-divided PLL clock (test only!). Enabling this option will configure GPIO0 to output a 50MHz clock. In fact this clock doesn’t have a direct relationship with EMAC peripheral. Sometimes this clock won’t work well with your PHY chip. You might need to add some extra devices after GPIO0 (e.g., inverter). Note that outputting RMII clock on GPIO0 is an experimental practice. If you want the Ethernet to work with WiFi, don’t select GPIO0 output mode for stability.
enumerator **EMAC_CLK_OUT_GPIO**

Output RMII Clock from internal APLL Clock available at GPIO16.

enumerator **EMAC_CLK_OUT_180_GPIO**

Inverted Output RMII Clock from internal APLL Clock available at GPIO17.

**Header File**

- components/esp_eth/include/esp_eth_phy.h
  - This header file can be included with:
    ```
    #include "esp_eth_phy.h"
    ```
  - This header file is a part of the API provided by the esp_eth component. To declare that your component depends on esp_eth, add the following to your CMakeLists.txt:
    ```
    REQUIRE esp_eth
    ```
    or
    ```
    PRIV_REQUIRES esp_eth
    ```

**Functions**

*esp_eth_phy_t* `esp_eth_phy_new_ip101` (const *eth_phy_config_t* `config`)

Create a PHY instance of IP101.

**Parameters**

- *config* – [in] configuration of PHY

**Returns**

- instance: create PHY instance successfully
- NULL: create PHY instance failed because some error occurred

*esp_eth_phy_t* `esp_eth_phy_new_rtl8201` (const *eth_phy_config_t* `config`)

Create a PHY instance of RTL8201.

**Parameters**

- *config* – [in] configuration of PHY

**Returns**

- instance: create PHY instance successfully
- NULL: create PHY instance failed because some error occurred

*esp_eth_phy_t* `esp_eth_phy_new_lan87xx` (const *eth_phy_config_t* `config`)

Create a PHY instance of LAN87xx.

**Parameters**

- *config* – [in] configuration of PHY

**Returns**

- instance: create PHY instance successfully
- NULL: create PHY instance failed because some error occurred

*esp_eth_phy_t* `esp_eth_phy_new_dp83848` (const *eth_phy_config_t* `config`)

Create a PHY instance of DP83848.

**Parameters**

- *config* – [in] configuration of PHY

**Returns**

- instance: create PHY instance successfully
- NULL: create PHY instance failed because some error occurred

*esp_eth_phy_t* `esp_eth_phy_new_ksz80xx` (const *eth_phy_config_t* `config`)

Create a PHY instance of KSZ80xx.

The phy model from the KSZ80xx series is detected automatically. If the driver is unable to detect a supported model, NULL is returned.
Currently, the following models are supported: KSZ8001, KSZ8021, KSZ8031, KSZ8041, KSZ8051, KSZ8061, KSZ8081, KSZ8091

Parameters `config` [in] configuration of PHY

Returns
- instance: create PHY instance successfully
- NULL: create PHY instance failed because some error occurred

Structures

```c
struct esp_eth_phy_s
    Ethernet PHY.
```

Public Members

```c
esp_err_t (*set_mediator)(esp_eth_phy_t *phy, esp_eth_mediator_t *mediator)

Set mediator for PHY.

Param phy [in] Ethernet PHY instance
Param mediator [in] mediator of Ethernet driver

Return
- ESP_OK: set mediator for Ethernet PHY instance successfully
- ESP_ERR_INVALID_ARG: set mediator for Ethernet PHY instance failed because of some invalid arguments
```

```c
esp_err_t (*reset)(esp_eth_phy_t *phy)

Software Reset Ethernet PHY.

Param phy [in] Ethernet PHY instance

Return
- ESP_OK: reset Ethernet PHY successfully
- ESP_FAIL: reset Ethernet PHY failed because some error occurred
```

```c
esp_err_t (*reset_hw)(esp_eth_phy_t *phy)

Hardware Reset Ethernet PHY.

Note: Hardware reset is mostly done by pull down and up PHY's nRST pin
```

```c
esp_err_t (*init)(esp_eth_phy_t *phy)

Initialize Ethernet PHY.

Param phy [in] Ethernet PHY instance

Return
- ESP_OK: initialize Ethernet PHY successfully
- ESP_FAIL: initialize Ethernet PHY failed because some error occurred
```

```c
esp_err_t (*deinit)(esp_eth_phy_t *phy)

Deinitialize Ethernet PHY.
```
**Param phy** [in] Ethernet PHY instance

**Return**
- ESP_OK: deinitialize Ethernet PHY successfully
- ESP_FAIL: deinitialize Ethernet PHY failed because some error occurred

```c
esp_err_t (*autonego_ctrl)(esp_eth_phy_t *phy, eth_phy_autoneg_cmd_t cmd, bool *autonego_en_stat)
```
Configure auto negotiation.

**Param phy** [in] Ethernet PHY instance
**Param cmd** [in] Configuration command, it is possible to Enable (restart), Disable or get current status of PHY auto negotiation
**Param autonego_en_stat** [out] Address where to store current status of auto negotiation configuration

**Return**
- ESP_OK: restart auto negotiation successfully
- ESP_FAIL: restart auto negotiation failed because some error occurred
- ESP_ERR_INVALID_ARG: invalid command

```c
esp_err_t (*get_link)(esp_eth_phy_t *phy)
```
Get Ethernet PHY link status.

**Param phy** [in] Ethernet PHY instance

**Return**
- ESP_OK: get Ethernet PHY link status successfully
- ESP_FAIL: get Ethernet PHY link status failed because some error occurred

```c
esp_err_t (*pwrctl)(esp_eth_phy_t *phy, bool enable)
```
Power control of Ethernet PHY.

**Param phy** [in] Ethernet PHY instance
**Param enable** [in] set true to power on Ethernet PHY; set false to power off Ethernet PHY

**Return**
- ESP_OK: control Ethernet PHY power successfully
- ESP_FAIL: control Ethernet PHY power failed because some error occurred

```c
esp_err_t (*set_addr)(esp_eth_phy_t *phy, uint32_t addr)
```
Set PHY chip address.

**Param phy** [in] Ethernet PHY instance
**Param addr** [in] PHY chip address

**Return**
- ESP_OK: set Ethernet PHY address successfully
- ESP_FAIL: set Ethernet PHY address failed because some error occurred

```c
esp_err_t (*get_addr)(esp_eth_phy_t *phy, uint32_t *addr)
```
Get PHY chip address.

**Param phy** [in] Ethernet PHY instance
**Param addr** [out] PHY chip address

**Return**
- ESP_OK: get Ethernet PHY address successfully
- ESP_FAIL: get Ethernet PHY address failed because of invalid argument
- ESP_ERR_INVALID_ARG: get Ethernet PHY address failed because of invalid argument

```c
esp_err_t (*advertise_pause_ability)(esp_eth_phy_t *phy, uint32_t ability)
```
Advertise pause function supported by MAC layer.

**Param phy** [in] Ethernet PHY instance
**Param addr** [out] Pause ability

**Return**
- ESP_OK: Advertise pause ability successfully
- ESP_ERR_INVALID_ARG: Advertise pause ability failed because of invalid argument

```c
esp_err_t (*loopback)(esp_eth_phy_t *phy, bool enable)
```
Sets the PHY to loopback mode.

**Param phy** [in] Ethernet PHY instance
**Param enable** [in] enables or disables PHY loopback

**Return**
- ESP_OK: PHY instance loopback mode has been configured successfully
- ESP_FAIL: PHY instance loopback configuration failed because some error occurred

```c
esp_err_t (*set_speed)(esp_eth_phy_t *phy, eth_speed_t speed)
```
Sets PHY speed mode.

**Note:** Autonegotiation feature needs to be disabled prior to calling this function for the new setting to be applied

**Param phy** [in] Ethernet PHY instance
**Param speed** [in] Speed mode to be set

**Return**
- ESP_OK: PHY instance speed mode has been configured successfully
- ESP_FAIL: PHY instance speed mode configuration failed because some error occurred

```c
esp_err_t (*set_duplex)(esp_eth_phy_t *phy, eth_duplex_t duplex)
```
Sets PHY duplex mode.

**Note:** Autonegotiation feature needs to be disabled prior to calling this function for the new setting to be applied

**Param phy** [in] Ethernet PHY instance
**Param duplex** [in] Duplex mode to be set

**Return**
- ESP_OK: PHY instance duplex mode has been configured successfully
- ESP_FAIL: PHY instance duplex mode configuration failed because some error occurred

```c
esp_err_t (*custom_ioctl)(esp_eth_phy_t *phy, uint32_t cmd, void *data)
```
Custom IO function of PHY driver. This function is intended to extend common options of esp_eth_ioctl to cover specifics of PHY chip.

**Note:** This function may not be assigned when the PHY chip supports only most common set of configuration options.

**Param phy** [in] Ethernet PHY instance
**Param cmd** [in] IO control command
**Param data** [inout] address of data for set command or address where to store the data when used with get command

**Return**
• ESP_OK: process io command successfully
• ESP_ERR_INVALID_ARG: process io command failed because of some invalid argument
• ESP_FAIL: process io command failed because some other error occurred
• ESP_ERR_NOT_SUPPORTED: requested feature is not supported

```c
esp_err_t (*del)(esp_eth_phy_t *phy)
```
Free memory of Ethernet PHY instance.

**Param phy** [in] Ethernet PHY instance

**Return**
- ESP_OK: free PHY instance successfully
- ESP_FAIL: free PHY instance failed because some error occurred

```c
struct eth_phy_config_t
```
Ethernet PHY configuration.

**Public Members**

```c
int32_t phy_addr
```
PHY address, set -1 to enable PHY address detection at initialization stage

```c
uint32_t reset_timeout_ms
```
Reset timeout value (Unit: ms)

```c
uint32_t autonego_timeout_ms
```
Auto-negotiation timeout value (Unit: ms)

```c
int reset_gpio_num
```
Reset GPIO number, -1 means no hardware reset

**Macros**

```c
ESP_ETH_PHY_ADDR_AUTO
ETH_PHY_DEFAULT_CONFIG()
```
Default configuration for Ethernet PHY object.

**Type Definitions**

```c
typedef struct esp_eth_phy_s esp_eth_phy_t
```
Ethernet PHY.

**Enumerations**

```c
enum eth_phy_autoneg_cmd_t
```
Auto-negotiation control commands.

**Values**

```c
enumerator ESP_ETH_PHY_AUTONEGO_RESTART
```
enumerator **ESP_ETH_PHY_AUTONEGO_EN**

enumerator **ESP_ETH_PHY_AUTONEGO_DIS**

enumerator **ESP_ETH_PHY_AUTONEGO_G_STAT**

**Header File**

- components/esp_eth/include/esp_eth_phy_802_3.h
- This header file can be included with:

```c
#include "esp_eth_phy_802_3.h"
```

- This header file is a part of the API provided by the esp_eth component. To declare that your component depends on esp_eth, add the following to your CMakeLists.txt:

```cmake
REQUIRES esp_eth
```

or

```cmake
PRIV_REQUIRES esp_eth
```

**Functions**

**esp_err_t esp_eth_phy_802_3_set_mediator** *(phy_802_3_t *phy_802_3, esp_eth_mediator_t *eth)*

Set Ethernet mediator.

**Parameters**

- **phy_802_3** – IEEE 802.3 PHY object info structure
- **eth** – Ethernet mediator pointer

**Returns**

- ESP_OK: Ethernet mediator set successfully
- ESP_ERR_INVALID_ARG: if eth is NULL

**esp_err_t esp_eth_phy_802_3_reset** *(phy_802_3_t *phy_802_3)*

Reset PHY.

**Parameters**

- **phy_802_3** – IEEE 802.3 PHY object info structure

**Returns**

- ESP_OK: Ethernet PHY reset successfully
- ESP_FAIL: reset Ethernet PHY failed because some error occured

**esp_err_t esp_eth_phy_802_3_autonego_ctrl** *(phy_802_3_t *phy_802_3, eth_phy_autoneg_cmd_t cmd, bool *autonego_en_stat)*

Control autonegotiation mode of Ethernet PHY.

**Parameters**

- **phy_802_3** – IEEE 802.3 PHY object info structure
- **cmd** – autonegotiation command enumeration
- **autonego_en_stat** – [out] autonegotiation enabled flag

**Returns**

- ESP_OK: Ethernet PHY autonegotiation configured successfully
- ESP_FAIL: Ethernet PHY autonegotiation configuration fail because some error occured
- ESP_ERR_INVALID_ARG: invalid value of cmd

**esp_err_t esp_eth_phy_802_3_pwrctl** *(phy_802_3_t *phy_802_3, bool enable)*

Power control of Ethernet PHY.

**Parameters**

- **phy_802_3** – IEEE 802.3 PHY object info structure
Chapter 2. API Reference

- **enable** - set true to power ON Ethernet PHY; set false to power OFF Ethernet PHY

  **Returns**
  - ESP_OK: Ethernet PHY power down mode set successfully
  - ESP_FAIL: Ethernet PHY power up or power down failed because some error occurred

```c
esp_err_t esp_eth_phy_802_3_set_addr (phy_802_3_t *phy_802_3, uint32_t addr)
```

Set Ethernet PHY address.

  **Parameters**
  - `phy_802_3` - IEEE 802.3 PHY object infostructure
  - `addr` - new PHY address

  **Returns**
  - ESP_OK: Ethernet PHY address set

```c
esp_err_t esp_eth_phy_802_3_get_addr (phy_802_3_t *phy_802_3, uint32_t *addr)
```

Get Ethernet PHY address.

  **Parameters**
  - `phy_802_3` - IEEE 802.3 PHY object infostructure
  - `addr` - [out] Ethernet PHY address

  **Returns**
  - ESP_OK: Ethernet PHY address read successfully
  - ESP_ERR_INVALID_ARG: `addr` pointer is NULL

```c
esp_err_t esp_eth_phy_802_3_advertise_pause_ability (phy_802_3_t *phy_802_3, uint32_t ability)
```

Advertise pause function ability.

  **Parameters**
  - `phy_802_3` - IEEE 802.3 PHY object infostructure
  - `ability` - enable or disable pause ability

  **Returns**
  - ESP_OK: pause ability set successfully
  - ESP_FAIL: Advertise pause function ability failed because some error occurred

```c
esp_err_t esp_eth_phy_802_3_loopback (phy_802_3_t *phy_802_3, bool enable)
```

Set Ethernet PHY loopback mode.

  **Parameters**
  - `phy_802_3` - IEEE 802.3 PHY object infostructure
  - `enable` - set true to enable loopback; set false to disable loopback

  **Returns**
  - ESP_OK: Ethernet PHY loopback mode set successfully
  - ESP_FAIL: Ethernet PHY loopback configuration failed because some error occurred

```c
esp_err_t esp_eth_phy_802_3_set_speed (phy_802_3_t *phy_802_3, eth_speed_t speed)
```

Set Ethernet PHY speed.

  **Parameters**
  - `phy_802_3` - IEEE 802.3 PHY object infostructure
  - `speed` - new speed of Ethernet PHY link

  **Returns**
  - ESP_OK: Ethernet PHY speed set successfully
  - ESP_FAIL: Set Ethernet PHY speed failed because some error occurred

```c
esp_err_t esp_eth_phy_802_3_set_duplex (phy_802_3_t *phy_802_3, eth_duplex_t duplex)
```

Set Ethernet PHY duplex mode.

  **Parameters**
  - `phy_802_3` - IEEE 802.3 PHY object infostructure
  - `duplex` - new duplex mode for Ethernet PHY link

  **Returns**
  - ESP_OK: Ethernet PHY duplex mode set successfully
**Chapter 2. API Reference**

- ESP_ERR_INVALID_STATE: unable to set duplex mode to Half if loopback is enabled
- ESP_FAIL: Set Ethernet PHY duplex mode failed because some error occurred

**esp_err_t esp_eth_phy_802_3_init (phy_802_3_t *phy_802_3)**

Initialize Ethernet PHY.

**Parameters**
- phy_802_3 – IEEE 802.3 PHY object infostructure

**Returns**
- ESP_OK: Ethernet PHY initialized successfully

**esp_err_t esp_eth_phy_802_3_deinit (phy_802_3_t *phy_802_3)**

Power off Ethernet PHY.

**Parameters**
- phy_802_3 – IEEE 802.3 PHY object infostructure

**Returns**
- ESP_OK: Ethernet PHY powered off successfully

**esp_err_t esp_eth_phy_802_3_del (phy_802_3_t *phy_802_3)**

Delete Ethernet PHY infostructure.

**Parameters**
- phy_802_3 – IEEE 802.3 PHY object infostructure

**Returns**
- ESP_OK: Ethernet PHY infostructure deleted

**esp_err_t esp_eth_phy_802_3_reset_hw (phy_802_3_t *phy_802_3, uint32_t reset_assert_us)**

Performs hardware reset with specific reset pin assertion time.

**Parameters**
- phy_802_3 – IEEE 802.3 PHY object infostructure
- reset_assert_us – Hardware reset pin assertion time

**Returns**
- ESP_OK: reset Ethernet PHY successfully

**esp_err_t esp_eth_phy_802_3_detect_phy_addr (esp_eth_mediator_t *eth, int *detected_addr)**

Detect PHY address.

**Parameters**
- eth – Mediator of Ethernet driver
- *detected_addr – [out] a valid address after detection

**Returns**
- ESP_OK: detect phy address successfully
- ESP_ERR_INVALID_ARG: invalid parameter
- ESP_ERR_NOT_FOUND: can’t detect any PHY device
- ESP_FAIL: detect phy address failed because some error occurred

**esp_err_t esp_eth_phy_802_3_basic_phy_init (phy_802_3_t *phy_802_3)**

Performs basic PHY chip initialization.

**Parameters**
- phy_802_3 – IEEE 802.3 PHY object infostructure

**Returns**
- ESP_OK: initialized Ethernet PHY successfully
- ESP_FAIL: initialization of Ethernet PHY failed because some error occurred
- ESP_ERR_INVALID_ARG: invalid argument
- ESP_ERR_NOT_FOUND: PHY device not detected
- ESP_ERR_TIMEOUT: MII Management read/write operation timeout
- ESP_ERR_INVALID_STATE: PHY is in invalid state to perform requested operation

---

**Note:** It should be called as the first function in PHY specific driver instance
## Chapter 2. API Reference

### esp_err_t esp_eth_phy_802_3_basic_phy_deinit (phy_802_3_t *phy_802_3)

Performs basic PHY chip de-initialization.

**Note:** It should be called as the last function in PHY specific driver instance

**Parameters**
- `phy_802_3` - IEEE 802.3 PHY object infostructure

**Returns**
- ESP_OK: de-initialized Ethernet PHY successfully
- ESP_FAIL: de-initialization of Ethernet PHY failed because some error occurred
- ESP_ERR_TIMEOUT: MII Management read/write operation timeout
- ESP_ERR_INVALID_STATE: PHY is in invalid state to perform requested operation

### esp_err_t esp_eth_phy_802_3_read_oui (phy_802_3_t *phy_802_3, uint32_t *oui)

Reads raw content of OUI field.

**Parameters**
- `phy_802_3` - IEEE 802.3 PHY object infostructure
- `oui` - [out] OUI value

**Returns**
- ESP_OK: OUI field read successfully
- ESP_FAIL: OUI field read failed because some error occurred
- ESP_ERR_INVALID_ARG: invalid oui argument
- ESP_ERR_TIMEOUT: MII Management read/write operation timeout
- ESP_ERR_INVALID_STATE: PHY is in invalid state to perform requested operation

### esp_err_t esp_eth_phy_802_3_read_manufac_info (phy_802_3_t *phy_802_3, uint8_t *model, uint8_t *rev)

Reads manufacturer’s model and revision number.

**Parameters**
- `phy_802_3` - IEEE 802.3 PHY object infostructure
- `model` - [out] Manufacturer’s model number (can be NULL when not required)
- `rev` - [out] Manufacturer’s revision number (can be NULL when not required)

**Returns**
- ESP_OK: Manufacturer info read successfully
- ESP_FAIL: Manufacturer info read failed because some error occurred
- ESP_ERR_TIMEOUT: MII Management read/write operation timeout
- ESP_ERR_INVALID_STATE: PHY is in invalid state to perform requested operation

### inline phy_802_3_t *esp_eth_phy_into_phy_802_3 (esp_eth_phy_t *phy)

Returns address to parent IEEE 802.3 PHY object infostructure.

**Parameters**
- `phy` - Ethernet PHY instance

**Returns**
- `phy_802_3_t` - address to parent IEEE 802.3 PHY object infostructure

### esp_err_t esp_eth_phy_802_3_obj_config_init (phy_802_3_t *phy_802_3, const eth_phy_config_t *config)

Initializes configuration of parent IEEE 802.3 PHY object infostructure.

**Parameters**
- `phy_802_3` - Address to IEEE 802.3 PHY object infostructure
- `config` - Configuration of the IEEE 802.3 PHY object

**Returns**
- ESP_OK: configuration initialized successfully
- ESP_ERR_INVALID_ARG: invalid config argument
Chapter 2. API Reference

Structures

struct phy_802_3_t
IEEE 802.3 PHY object info structure.

Public Members

*esp_eth_phy_t* parent
Parent Ethernet PHY instance

*esp_eth_mediator_t* eth
Mediator of Ethernet driver

int addr
PHY address

uint32_t reset_timeout_ms
Reset timeout value (Unit: ms)

uint32_t autonego_timeout_ms
Auto-negotiation timeout value (Unit: ms)

eth_link_t link_status
Current Link status

int reset_gpio_num
Reset GPIO number, -1 means no hardware reset

Header File

* components/esp_eth/include/esp_eth_netif_glue.h
This header file can be included with:

```c
#include "esp_eth_netif_glue.h"
```

This header file is a part of the API provided by the esp_eth component. To declare that your component depends on esp_eth, add the following to your CMakeLists.txt:

```cmake
REQUIRES esp_eth
```
or

```cmake
PRIV_REQUIRES esp_eth
```

Functions

*esp_eth_netif_glue_handle_t* esp_eth_new_netif_glue(*esp_eth_handle_t* eth_hdl)
Create a netif glue for Ethernet driver.

Note: netif glue is used to attach io driver to TCP/IP netif

Parameters

eth_hdl - Ethernet driver handle

Returns glue object, which inherits esp_netif_driver_base_t
Chapter 2. API Reference

\texttt{esp_err_t esp_eth_del_netif_glue(esp_eth_netif_glue_handle_t eth_netif_glue)}

Delete netif glue of Ethernet driver.

\textbf{Parameters} \texttt{eth_netif_glue - netif glue}

\textbf{Returns} -ESP_OK: delete netif glue successfully

\textbf{Type Definitions}

\texttt{typedef struct esp_eth_netif_glue_t* esp_eth_netif_glue_handle_t}

Handle of netif glue - an intermediate layer between netif and Ethernet driver.

Code examples for the Ethernet API are provided in the \texttt{ethernet} directory of ESP-IDF examples.

2.4.3 Thread

Thread

\textbf{Introduction} Thread is an IP-based mesh networking protocol. It is based on the 802.15.4 physical and MAC layer.

\textbf{Application Examples} The openthread directory of ESP-IDF examples contains the following applications:

\begin{itemize}
\item The OpenThread interactive shell \texttt{openthread/ot_cli}
\item The Thread Border Router \texttt{openthread/ot_br}
\item The Thread Radio Co-Processor \texttt{openthread/ot_rcp}
\end{itemize}

\textbf{API Reference} For manipulating the Thread network, the OpenThread API shall be used. The OpenThread API docs can be found at the \texttt{OpenThread API docs}.

ESP-IDF provides extra APIs for launching and managing the OpenThread stack, binding to network interfaces and border routing features.

\textbf{Header File}

\begin{itemize}
\item \texttt{components/openthread/include/esp_openthread.h}
\item This header file can be included with:
\begin{verbatim}
#include "esp_openthread.h"
\end{verbatim}
\item This header file is a part of the API provided by the \texttt{openthread} component. To declare that your component depends on \texttt{openthread}, add the following to your \texttt{CMakeLists.txt}:
\begin{verbatim}
REQUIRES openthread
\end{verbatim}
\begin{verbatim}
or
PRIV_REQUIRES openthread
\end{verbatim}
\end{itemize}

\textbf{Functions}

\texttt{esp_err_t esp_openthread_init(const esp_openthread_platform_config_t *init_config)}

Initializes the full OpenThread stack.

\textbf{Note:} The OpenThread instance will also be initialized in this function.
Parameters **init_config** - [in] The initialization configuration.

**Returns**
- ESP_OK on success
- ESP_ERR_NO_MEM if allocation has failed
- ESP_ERR_INVALID_ARG if radio or host connection mode not supported
- ESP_ERR_INVALID_STATE if already initialized

**esp_err_t esp_openthread_auto_start (otOperationalDatasetTlvs *datasetTlvs)**

Starts the Thread protocol operation and attaches to a Thread network.

**Parameters** **datasetTlvs** - [in] The operational dataset (TLV encoded), if it’s NULL, the function will generate the dataset based on the configurations from kconfig.

**Returns**
- ESP_OK on success
- ESP_FAIL on failures

**esp_err_t esp_openthread_launch_mainloop (void)**

Launches the OpenThread main loop.

**Note:** This function will not return unless error happens when running the OpenThread stack.

**Returns**
- ESP_OK on success
- ESP_ERR_NO_MEM if allocation has failed
- ESP_FAIL on other failures

**esp_err_t esp_openthread_deinit (void)**

This function performs OpenThread stack and platform driver deinitialization.

**Returns**
- ESP_OK on success
- ESP_ERR_INVALID_STATE if not initialized

**otInstance *esp_openthread_get_instance (void)**

This function acquires the underlying OpenThread instance.

**Note:** This function can be called on other tasks without lock.

**Returns** The OpenThread instance pointer

**Header File**

- components/openthread/include/esp_openthread_types.h
- This header file can be included with:

```c
#include "esp_openthread_types.h"
```

- This header file is a part of the API provided by the openthread component. To declare that your component depends on openthread, add the following to your CMakeLists.txt:

```cmake
REQUIRES openthread
```

or

```cmake
PRIV_REQUIRES openthread
```
Structures

struct esp_openthread_role_changed_event_t
OpenThread role changed event data.

Public Members

otDeviceRole previous_role
Previous Thread role

otDeviceRole current_role
Current Thread role

struct esp_openthread_mainloop_context_t
This structure represents a context for a select() based mainloop.

Public Members

fd_set read_fds
The read file descriptors

fd_set write_fds
The write file descriptors

fd_set error_fds
The error file descriptors

int max_fd
The max file descriptor

struct timeval timeout
The timeout

struct esp_openthread_uart_config_t
The uart port config for OpenThread.

Public Members

uart_port_t port
UART port number

uart_config_t uart_config
UART configuration, see uart_config_t docs

gpio_num_t rx_pin
UART RX pin
struct esp_openthread_spi_host_config_t
The spi port config for OpenThread.

Public Members

spi_host_device_t host_device
SPI host device

spi_dma_chan_t dma_channel
DMA channel

spi_bus_config_t spi_interface
SPI bus

spi_device_interface_config_t spi_device
SPI peripheral device

gpio_num_t intr_pin
SPI interrupt pin

struct esp_openthread_spi_slave_config_t
The spi slave config for OpenThread.

Public Members

spi_host_device_t host_device
SPI host device

spi_bus_config_t bus_config
SPI bus config

spi_slave_interface_config_t slave_config
SPI slave config

gpio_num_t intr_pin
SPI interrupt pin

struct esp_openthread_radio_config_t
The OpenThread radio configuration.

Public Members
Chapter 2. API Reference

```c
esp_openthread_radio_mode_t radio_mode
The radio mode
```

```c
esp_openthread_uart_config_t radio_uart_config
The uart configuration to RCP
```

```c
esp_openthread_spi_host_config_t radio_spi_config
The spi configuration to RCP
```

```c
struct esp_openthread_host_connection_config_t
The OpenThread host connection configuration.
```

**Public Members**

```c
esp_openthread_host_connection_mode_t host_connection_mode
The host connection mode
```

```c
esp_openthread_uart_config_t host_uart_config
The uart configuration to host
```

```c
usb_serial_jtag_driver_config_t host_usb_config
The usb configuration to host
```

```c
esp_openthread_spi_slave_config_t spi_slave_config
The spi configuration to host
```

```c
struct esp_openthread_port_config_t
The OpenThread port specific configuration.
```

**Public Members**

```c
const char *storage_partition_name
The partition for storing OpenThread dataset
```

```c
uint8_t netif_queue_size
The packet queue size for the network interface
```

```c
uint8_t task_queue_size
The task queue size
```

```c
struct esp_openthread_platform_config_t
The OpenThread platform configuration.
```

**Public Members**
\texttt{esp_openthread_radio_config_t} \texttt{radio\_config}

The radio configuration

\texttt{esp_openthread_host_connection_config_t} \texttt{host\_config}

The host connection configuration

\texttt{esp_openthread_port_config_t} \texttt{port\_config}

The port configuration

**Type Definitions**

typedef void (*\texttt{esp_openthread_rlp\_failure\_handler}) (void)

**Enumerations**

enum \texttt{esp_openthread\_event\_t}

OpenThread event declarations.

\textit{Values:}

- enumerator \texttt{OPENTHREAD\_EVENT\_START}
  
  OpenThread stack start

- enumerator \texttt{OPENTHREAD\_EVENT\_STOP}
  
  OpenThread stack stop

- enumerator \texttt{OPENTHREAD\_EVENT\_DETACHED}
  
  OpenThread detached

- enumerator \texttt{OPENTHREAD\_EVENT\_ATTACHED}
  
  OpenThread attached

- enumerator \texttt{OPENTHREAD\_EVENT\_ROLE\_CHANGED}
  
  OpenThread role changed

- enumerator \texttt{OPENTHREAD\_EVENT\_IF\_UP}
  
  OpenThread network interface up

- enumerator \texttt{OPENTHREAD\_EVENT\_IF\_DOWN}
  
  OpenThread network interface down

- enumerator \texttt{OPENTHREAD\_EVENT\_GOT\_IP6}
  
  OpenThread stack added IPv6 address

- enumerator \texttt{OPENTHREAD\_EVENT\_LOST\_IP6}
  
  OpenThread stack removed IPv6 address

- enumerator \texttt{OPENTHREAD\_EVENT\_MULTICAST\_GROUP\_JOIN}
  
  OpenThread stack joined IPv6 multicast group
enumerator **OPENTHREAD_EVENT_MULTICAST_GROUP_LEAVE**
OpenThread stack left IPv6 multicast group

enumerator **OPENTHREAD_EVENT_TREL_ADD_IP6**
OpenThread stack added TREL IPv6 address

enumerator **OPENTHREAD_EVENT_TREL_REMOVE_IP6**
OpenThread stack removed TREL IPv6 address

enumerator **OPENTHREAD_EVENT_TREL_MULTICAST_GROUP_JOIN**
OpenThread stack joined TREL IPv6 multicast group

enumerator **OPENTHREAD_EVENT_SET_DNS_SERVER**
OpenThread stack set DNS server

enum **esp_openthread_radio_mode_t**
The radio mode of OpenThread.

Values:

enumerator **RADIO_MODE_NATIVE**
Use the native 15.4 radio

enumerator **RADIO_MODE_UART_RCP**
UART connection to a 15.4 capable radio co-processor (RCP)

enumerator **RADIO_MODE_SPI_RCP**
SPI connection to a 15.4 capable radio co-processor (RCP)

enumerator **RADIO_MODE_MAX**
Using for parameter check

enum **esp_openthread_host_connection_mode_t**
How OpenThread connects to the host.

Values:

enumerator **HOST_CONNECTION_MODE_NONE**
Disable host connection

enumerator **HOST_CONNECTION_MODE_CLI_UART**
CLI UART connection to the host

enumerator **HOST_CONNECTION_MODE_CLI_USB**
CLI USB connection to the host

enumerator **HOST_CONNECTION_MODE_RCP_UART**
RCP UART connection to the host

enumerator **HOST_CONNECTION_MODE_RCP_SPI**
RCP SPI connection to the host
enumerator HOST_CONNECTION_MODE_MAX

Using for parameter check

Header File

- components/openthread/include/esp_openthread_lock.h
- This header file can be included with:

```
#include "esp_openthread_lock.h"
```
- This header file is a part of the API provided by the openthread component. To declare that your component depends on openthread, add the following to your CMakeLists.txt:

```
REQUIRES openthread
```
or

```
PRIV_REQUIRES openthread
```

Functions

**esp_err_t esp_openthread_lock_init** (void)

This function initializes the OpenThread API lock.

**Returns**

- ESP_OK on success
- ESP_ERR_NO_MEM if allocation has failed
- ESP_ERR_INVALID_STATE if already initialized

**void esp_openthread_lock_deinit** (void)

This function deinitializes the OpenThread API lock.

**bool esp_openthread_lock_acquire** (TickType_t block_ticks)

This function acquires the OpenThread API lock.

**Parameters** block_ticks - [in] The maximum number of RTOS ticks to wait for the lock.

**Returns**

- True on lock acquired
- False on failing to acquire the lock with the timeout.

**void esp_openthread_lock_release** (void)

This function releases the OpenThread API lock.

**bool esp_openthread_task_switching_lock_acquire** (TickType_t block_ticks)

This function acquires the OpenThread API task switching lock.

**Note:**
Every OT APIs that takes an otInstance argument MUST be protected with this API lock except that the call site is in OT callbacks.

**Parameters** block_ticks - [in] The maximum number of RTOS ticks to wait for the lock.

**Note:**
In OpenThread API context, it waits for some actions to be done in other tasks (like lwip), after task switching, it needs to call OpenThread API again. Normally it’s not allowed, since the previous OpenThread API lock is not released yet. This task_switching lock allows the OpenThread API can be called in this case.

**Note:**
Please use esp_openthread_lock_acquire() for normal cases.
Chapter 2. API Reference

Returns
- True on lock acquired
- False on failing to acquire the lock with the timeout.

void **esp_openthread_task_switching_lock_release**(void)  
This function releases the OpenThread API task switching lock.

Header File
- components/openthread/include/esp_openthread_netif_glue.h
- This header file can be included with:

  ```
  #include "esp_openthread_netif_glue.h"
  ```
- This header file is a part of the API provided by the openthread component. To declare that your component depends on openthread, add the following to your CMakeLists.txt:

  ```
  REQUIRES openthread
  ```
  or
  ```
  PRIV_REQUIRES openthread
  ```

Functions
void **esp_openthread_netif_glue_init**(const esp_openthread_platform_config_t *config)  
This function initializes the OpenThread network interface glue.

  **Parameters**
  - config - [in] The platform configuration.

  **Returns**
  - glue pointer on success
  - NULL on failure

void **esp_openthread_netif_glue_deinit**(void)  
This function deinitializes the OpenThread network interface glue.

esp_netif_t **esp_openthread_get_netif**(void)  
This function acquires the OpenThread netif.

  **Returns**
  - The OpenThread netif or NULL if not initialized.

Macros

```
ESP_NETIF_INHERENT_DEFAULT_OPENTHREAD()
```
Default configuration reference of OT esp-netif.

```
ESP_NETIF_DEFAULT_OPENTHREAD()
```

Header File
- components/openthread/include/esp_openthread_border_router.h
- This header file can be included with:

  ```
  #include "esp_openthread_border_router.h"
  ```
- This header file is a part of the API provided by the openthread component. To declare that your component depends on openthread, add the following to your CMakeLists.txt:

  ```
  REQUIRES openthread
  ```
  or
  ```
  PRIV_REQUIRES openthread
  ```
Functions

**void esp_openthread_set_backbone_netif (esp_netif_t *backbone_netif)**

Sets the backbone interface used for border routing.

**Note:** This function must be called before esp_openthread_init

**Parameters**

backbone_netif - [in] The backbone network interface (WiFi or ethernet)

**esp_err_t esp_openthread_border_router_init (void)**

Initializes the border router features of OpenThread.

**Note:** Calling this function will make the device behave as an OpenThread border router. Kconfig option CONFIG_OPENTHREAD_BORDER_ROUTER is required.

**Returns**

- ESP_OK on success
- ESP_ERR_NOT_SUPPORTED if feature not supported
- ESP_ERR_INVALID_STATE if already initialized
- ESP_FIAL on other failures

**esp_err_t esp_openthread_border_router_deinit (void)**

Deinitializes the border router features of OpenThread.

**Returns**

- ESP_OK on success
- ESP_ERR_INVALID_STATE if not initialized
- ESP_FIAL on other failures

**esp_netif_t *esp_openthread_get_backbone_netif (void)**

Gets the backbone interface of OpenThread border router.

**Returns**

- The backbone interface or NULL if border router not initialized.

**void esp_openthread_register_rcp_failure_handler (esp_openthread_rcp_failure_handler handler)**

Registers the callback for RCP failure.

**void esp_openthread_rcp_deinit (void)**

Deinitializes the connection to RCP.

Thread is an IPv6-based mesh networking technology for IoT.

Code examples for the Thread API are provided in the openthread directory of ESP-IDF examples.

### 2.4.4 ESP-NETIF

**ESP-NETIF**

The purpose of the ESP-NETIF library is twofold:

- It provides an abstraction layer for the application on top of the TCP/IP stack. This allows applications to choose between IP stacks in the future.
• The APIs it provides are thread-safe, even if the underlying TCP/IP stack APIs are not.

ESP-IDF currently implements ESP-NETIF for the lwIP TCP/IP stack only. However, the adapter itself is TCP/IP implementation-agnostic and allows different implementations.

It is also possible to use a custom TCP/IP stack with ESP-IDF, provided it implements BSD API. For more information on building ESP-IDF without lwIP, please refer to components/esp_netif_stack/README.md.

Some ESP-NETIF API functions are intended to be called by application code, for example, to get or set interface IP addresses, and configure DHCP. Other functions are intended for internal ESP-IDF use by the network driver layer.

In many cases, applications do not need to call ESP-NETIF APIs directly as they are called by the default network event handlers.

ESP-NETIF Architecture

(continues on next page)
Data and Event Flow in the Diagram

- Initialization line from user code to ESP-NETIF and communication driver
- Data packets going from communication media to TCP/IP stack and back
- Events aggregated in ESP-NETIF propagate to the driver, user code, and network stack
- User settings and runtime configuration

ESP-NETIF Interaction

A) User Code, Boilerplate

Overall application interaction with a specific IO driver for communication media and configured TCP/IP network stack is abstracted using ESP-NETIF APIs and is outlined as below:

A) Initialization code

1) Initializes IO driver
2) Creates a new instance of ESP-NETIF and configure it with
   - ESP-NETIF specific options (flags, behavior, name)
   - Network stack options (netif init and input functions, not publicly available)
   - IO driver specific options (transmit, free rx buffer functions, IO driver handle)
3) Attaches the IO driver handle to the ESP-NETIF instance created in the above steps
4) Configures event handlers
   - Use default handlers for common interfaces defined in IO drivers; or define a specific handler for customized behavior or new interfaces
   - Register handlers for app-related events (such as IP lost or acquired)

B) Interaction with network interfaces using ESP-NETIF API

1) Gets and sets TCP/IP-related parameters (DHCP, IP, etc)
2) Receives IP events (connect or disconnect)
3) Controls application lifecycle (set interface up or down)

B) Communication Driver, IO Driver, and Media Driver

Communication driver plays these two important roles in relation to ESP-NETIF:

1) Event handlers: Defines behavior patterns of interaction with ESP-NETIF (e.g., ethernet link-up -> turn netif on)
2) Glue IO layer: Adapts the input or output functions to use ESP-NETIF transmit, receive, and free receive buffer
   - Installs driver_transmit to the appropriate ESP-NETIF object so that outgoing packets from the network stack are passed to the IO driver
   - Calls esp_netif_receive() to pass incoming data to the network stack
C) ESP-NETIF ESP-NETIF serves as an intermediary between an IO driver and a network stack, connecting the packet data path between the two. It provides a set of interfaces for attaching a driver to an ESP-NETIF object at runtime and configures a network stack during compiling. Additionally, a set of APIs is provided to control the network interface lifecycle and its TCP/IP properties. As an overview, the ESP-NETIF public interface can be divided into six groups:

1) Initialization APIs (to create and configure ESP-NETIF instance)
2) Input or Output API (for passing data between IO driver and network stack)
3) Event or Action API
   - Used for network interface lifecycle management
   - ESP-NETIF provides building blocks for designing event handlers
4) Setters and Getters API for basic network interface properties
5) Network stack abstraction API: enabling user interaction with TCP/IP stack
   - Set interface up or down
   - DHCP server and client API
   - DNS API
   - SNTP API
6) Driver conversion utilities API

D) Network Stack The network stack has no public interaction with application code with regard to public interfaces and shall be fully abstracted by ESP-NETIF API.

E) ESP-NETIF L2 TAP Interface The ESP-NETIF L2 TAP interface is a mechanism in ESP-IDF used to access Data Link Layer (L2 per OSI/ISO) for frame reception and transmission from the user application. Its typical usage in the embedded world might be the implementation of non-IP-related protocols, e.g., PTP, Wake on LAN. Note that only Ethernet (IEEE 802.3) is currently supported.

From a user perspective, the ESP-NETIF L2 TAP interface is accessed using file descriptors of VFS, which provides file-like interfacing (using functions like `open()`, `read()`, `write()`, etc). To learn more, refer to Virtual Filesystem Component.

There is only one ESP-NETIF L2 TAP interface device (path name) available. However multiple file descriptors with different configurations can be opened at a time since the ESP-NETIF L2 TAP interface can be understood as a generic entry point to the Layer 2 infrastructure. What is important is then the specific configuration of the particular file descriptor. It can be configured to give access to a specific Network Interface identified by `if_key` (e.g., ETH_DEF) and to filter only specific frames based on their type (e.g., Ethernet type in the case of IEEE 802.3). Filtering only specific frames is crucial since the ESP-NETIF L2 TAP needs to exist along with the IP stack and so the IP-related traffic (IP, ARP, etc.) should not be passed directly to the user application. Even though this option is still configurable, it is not recommended in standard use cases. Filtering is also advantageous from the perspective of the user’s application, as it only gets access to the frame types it is interested in, and the remaining traffic is either passed to other L2 TAP file descriptors or to the IP stack.

ESP-NETIF L2 TAP Interface Usage Manual

Initialization To be able to use the ESP-NETIF L2 TAP interface, it needs to be enabled in Kconfig by `CONFIG_ESP_NETIF_L2_TAP` first and then registered by `esp_vfs_l2tap_intf_register()` prior usage of any VFS function.

`open()` Once the ESP-NETIF L2 TAP is registered, it can be opened at path name “/dev/net/tap”. The same path name can be opened multiple times up to `CONFIG_ESP_NETIF_L2_TAP_MAX_FDS` and multiple file descriptors with a different configuration may access the Data Link Layer frames.

The ESP-NETIF L2 TAP can be opened with the `O_NONBLOCK` file status flag to make sure the `read()` does not block. Note that the `write()` may block in the current implementation when accessing a Network interface since
it is a shared resource among multiple ESP-NETIF L2 TAP file descriptors and IP stack, and there is currently no queuing mechanism deployed. The file status flag can be retrieved and modified using `fcntl()`.

On success, `open()` returns the new file descriptor (a nonnegative integer). On error, -1 is returned, and `errno` is set to indicate the error.

`ioctl()` The newly opened ESP-NETIF L2 TAP file descriptor needs to be configured prior to its usage since it is not bounded to any specific Network Interface and no frame type filter is configured. The following configuration options are available to do so:

- **L2TAP_S_INTF_DEVICE** - bounds the file descriptor to a specific Network Interface that is identified by its `if_key`. ESP-NETIF Network Interface `if_key` is passed to `ioctl()` as the third parameter. Note that default Network Interfaces `if_key`s used in ESP-IDF can be found in `esp_netif/include/esp_netif_defaults.h`.

- **L2TAP_S_DEVICE_DRV_HNDL** - is another way to bound the file descriptor to a specific Network Interface. In this case, the Network interface is identified directly by IO Driver handle (e.g., `esp_eth_handle_t` in case of Ethernet). The IO Driver handle is passed to `ioctl()` as the third parameter.

- **L2TAP_S_RCV_FILTER** - sets the filter to frames with the type to be passed to the file descriptor. In the case of Ethernet frames, the frames are to be filtered based on the Length and Ethernet type field. In case the filter value is set less than or equal to 0x05DC, the Ethernet type field is considered to represent IEEE802.3 Length Field, and all frames with values in interval <0, 0x05DC> at that field are passed to the file descriptor. The IEEE802.2 logical link control (LLC) resolution is then expected to be performed by the user’s application. In case the filter value is set greater than 0x05DC, the Ethernet type field is considered to represent protocol identification and only frames that are equal to the set value are to be passed to the file descriptor.

All above-set configuration options have a getter counterpart option to read the current settings.

**Warning:** The file descriptor needs to be firstly bounded to a specific Network Interface by `L2TAP_S_INTF_DEVICE` or `L2TAP_S_DEVICE_DRV_HNDL` to make `L2TAP_S_RCV_FILTER` option available.

**Note:** VLAN-tagged frames are currently not recognized. If the user needs to process VLAN-tagged frames, they need a set filter to be equal to the VLAN tag (i.e., 0x8100 or 0x88A8) and process the VLAN-tagged frames in the user application.

**Note:** `L2TAP_S_DEVICE_DRV_HNDL` is particularly useful when the user’s application does not require the usage of an IP stack and so ESP-NETIF is not required to be initialized too. As a result, Network Interface cannot be identified by its `if_key` and hence it needs to be identified directly by its IO Driver handle.

On success, `ioctl()` returns 0. On error, -1 is returned, and `errno` is set to indicate the error.

* EBADF - not a valid file descriptor.
* EACCES - options change is denied in this state (e.g., file descriptor has not been bounded to Network interface yet).
* EINVAL - invalid configuration argument. Ethernet type filter is already used by other file descriptors on that same Network interface.
* ENODEV - no such Network Interface which is tried to be assigned to the file descriptor exists.
* ENOSYS - unsupported operation, passed configuration option does not exist.

`fcntl()` is used to manipulate with properties of opened ESP-NETIF L2 TAP file descriptor.

The following commands manipulate the status flags associated with the file descriptor:
Chapter 2. API Reference

- **F_GETFD** - the function returns the file descriptor flags, and the third argument is ignored.
- **F_SETFD** - sets the file descriptor flags to the value specified by the third argument. Zero is returned.

On success, `ioctl()` returns 0. On error, -1 is returned, and `errno` is set to indicate the error.
* EBADF - not a valid file descriptor.
* ENOSYS - unsupported command.

**read()**  
Opened and configured ESP-NETIF L2 TAP file descriptor can be accessed by `read()` to get inbound frames. The read operation can be either blocking or non-blocking based on the actual state of the `O_NONBLOCK` file status flag. When the file status flag is set to blocking, the read operation waits until a frame is received and the context is switched to other tasks. When the file status flag is set to non-blocking, the read operation returns immediately. In such case, either a frame is returned if it was already queued or the function indicates the queue is empty. The number of queued frames associated with one file descriptor is limited by `CONFIG_ESP_NETIF_L2_TAP_RX_QUEUE_SIZE` Kconfig option. Once the number of queued frames reached a configured threshold, the newly arrived frames are dropped until the queue has enough room to accept incoming traffic (Tail Drop queue management).

On success, `read()` returns the number of bytes read. Zero is returned when the size of the destination buffer is 0. On error, -1 is returned, and `errno` is set to indicate the error.
* EBADF - not a valid file descriptor.
* EAGAIN - the file descriptor has been marked non-blocking (`O_NONBLOCK`), and the read would block.

**write()**  
A raw Data Link Layer frame can be sent to Network Interface via opened and configured ESP-NETIF L2 TAP file descriptor. The user’s application is responsible to construct the whole frame except for fields which are added automatically by the physical interface device. The following fields need to be constructed by the user’s application in case of an Ethernet link: source/destination MAC addresses, Ethernet type, actual protocol header, and user data. The length of these fields is as follows:

<table>
<thead>
<tr>
<th>Destination MAC</th>
<th>Source MAC</th>
<th>Type/Length</th>
<th>Payload (protocol header/data)</th>
</tr>
</thead>
<tbody>
<tr>
<td>6 B</td>
<td>6 B</td>
<td>2 B</td>
<td>0-1486 B</td>
</tr>
</tbody>
</table>

In other words, there is no additional frame processing performed by the ESP-NETIF L2 TAP interface. It only checks the Ethernet type of the frame is the same as the filter configured in the file descriptor. If the Ethernet type is different, an error is returned and the frame is not sent. Note that the `write()` may block in the current implementation when accessing a Network interface since it is a shared resource among multiple ESP-NETIF L2 TAP file descriptors and IP stack, and there is currently no queuing mechanism deployed.

On success, `write()` returns the number of bytes written. Zero is returned when the size of the input buffer is 0. On error, -1 is returned, and `errno` is set to indicate the error.
* EBADF - not a valid file descriptor.
* EBADMSG - The Ethernet type of the frame is different from the file descriptor configured filter.
* EIO - Network interface not available or busy.

**close()**  
Opened ESP-NETIF L2 TAP file descriptor can be closed by the `close()` to free its allocated resources. The ESP-NETIF L2 TAP implementation of `close()` may block. On the other hand, it is thread-safe and can be called from a different task than the file descriptor is actually used. If such a situation occurs and one task is blocked in the I/O operation and another task tries to close the file descriptor, the first task is unblocked. The first task read operation then ends with an error.

On success, `close()` returns zero. On error, -1 is returned, and `errno` is set to indicate the error.
* EBADF - not a valid file descriptor.

`select()`  Select is used in a standard way, just `CONFIG_VFS_SUPPORT_SELECT` needs to be enabled to make the `select()` function available.

**SNTP API**  You can find a brief introduction to SNTP in general, its initialization code, and basic modes in Section **SNTP Time Synchronization** in **System Time**.

This section provides more details about specific use cases of the SNTP service, with statically configured servers, or use the DHCP-provided servers, or both. The workflow is usually very simple:

1) Initialize and configure the service using `esp_netif_sntp_init()`.
2) Start the service via `esp_netif_sntp_start()`. This step is not needed if we auto-started the service in the previous step (default). It is useful to start the service explicitly after connecting if we want to use the DHCP-obtained NTP servers. Please note, this option needs to be enabled before connecting, but the SNTP service should be started after.
3) Wait for the system time to synchronize using `esp_netif_sntp_sync_wait()` (only if needed).
4) Stop and destroy the service using `esp_netif_sntp_deinit()`.

**Basic Mode with Statically Defined Server(s)**  Initialize the module with the default configuration after connecting to the network. Note that it is possible to provide multiple NTP servers in the configuration struct:

```c
esp_sntp_config_t config = ESP_NETIF_SNTP_DEFAULT_CONFIG_MULTIPLE(2,
  ESP_SNTP_SERVER_LIST("time.windows.com", "pool.ntp.org"),
  ESP_NETIF_SNTP_DEFAULT_CONFIG_MULTIPLE(0, \{}\ ));
esp_netif_sntp_init(&config);
```

**Note:**  If we want to configure multiple SNTP servers, we have to update the lwIP configuration `CONFIG_LWIP_SNTP_MAX_SERVERS`.

**Use DHCP-Obtained SNTP Server(s)**  First of all, we have to enable the lwIP configuration option `CONFIG_LWIP_DHCP_GET_NTP_SRV`. Then we have to initialize the SNTP module with the DHCP option and without the NTP server:

```c
esp_sntp_config_t config = ESP_NETIF_SNTP_DEFAULT_CONFIG_MULTIPLE(0, \{}\ );
config.start = false; // start the SNTP service explicitly
config.server_from_dhcp = true; // accept the NTP offer from the DHCP...
esp_netif_sntp_init(config);
```

Then, once we are connected, we could start the service using:

```c
esp_netif_sntp_start();
```

**Note:**  It is also possible to start the service during initialization (default `config.start=true`). This would likely to cause the initial SNTP request to fail (since we are not connected yet) and lead to some back-off time for subsequent requests.

**Use Both Static and Dynamic Servers**  Very similar to the scenario above (DHCP provided SNTP server), but in this configuration, we need to make sure that the static server configuration is refreshed when obtaining NTP servers by DHCP. The underlying lwIP code cleans up the rest of the list of NTP servers when the DHCP-provided information gets accepted. Thus the ESP-NETIF SNTP module saves the statically configured server(s) and reconfigures them after obtaining a DHCP lease.
The typical configuration now looks as per below, providing the specific IP_EVENT to update the config and index of the first server to reconfigure (for example setting config.index_of_first_server=1 would keep the DHCP provided server at index 0, and the statically configured server at index 1).

```c
esp_sntp_config_t config = ESP_NETIF_SNTP_DEFAULT_CONFIG("pool.ntp.org");
config.start = false;     // start the SNTP service explicitly_
                      // (after connecting)
config.server_from_dhcp = true;  // accept the NTP offers from DHCP_
config.renew_servers_after_new_IP = true;  // let esp-netif update the configured_
                  // SNTP server(s) after receiving the DHCP lease
config.index_of_first_server = 1;   // updates from server num 1, leaving_
                  // server 0 (from DHCP) intact
config.ip_event_to_renew = IP_EVENT_STA_GOT_IP;  // IP event on which we refresh_
                  // the configuration
```

Then we start the service normally with `esp_netif_sntp_start()`.

**ESP-NETIF Programmer’s Manual** Please refer to the following example to understand the initialization process of the default interface:

- Wi-Fi Station: wifi/getting_started/station/main/station_example_main.c
- Ethernet: ethernet/basic/main/ethernet_example_main.c
- L2TAP: protocols/l2tap/main/l2tap_main.c
- Wi-Fi Access Point: wifi/getting_started/softAP/main/softap_example_main.c

For more specific cases, please consult this guide: **ESP-NETIF Custom I/O Driver**.

**Wi-Fi Default Initialization** The initialization code as well as registering event handlers for default interfaces, such as softAP and station, are provided in separate APIs to facilitate simple startup code for most applications:

- `esp_netif_create_default_wifi_sta()`
- `esp_netif_create_default_wifi_ap()`

Please note that these functions return the esp_netif handle, i.e., a pointer to a network interface object allocated and configured with default settings, as a consequence, which means that:

- The created object has to be destroyed if a network de-initialization is provided by an application using `esp_netif_destroy_default_wifi()`.
- These default interfaces must not be created multiple times unless the created handle is deleted using `esp_netif_destroy()`.
- When using Wi-Fi in AP+STA mode, both these interfaces have to be created.

**API Reference**

**Header File**

- `components/esp_netif/include/esp_netif.h`
- This header file can be included with:

```c
#include "esp_netif.h"
```
- This header file is a part of the API provided by the `esp_netif` component. To declare that your component depends on `esp_netif`, add the following to your CMakeLists.txt:

```cmake
REQUIRES esp_netif
```

or
**Functions**

`esp_err_t esp_netif_init (void)`

Initializes the underlying TCP/IP stack.

**Note:** This function should be called exactly once from application code, when the application starts up.

**Returns**

- ESP_OK on success
- ESP_FAIL if initializing failed

`esp_err_t esp_netif_deinit (void)`

Deinitializes the esp-netif component (and the underlying TCP/IP stack)

**Note:** Deinitialization is not supported yet

**Returns**

- ESP_ERR_INVALID_STATE if esp_netif not initialized
- ESP_ERR_NOT_SUPPORTED otherwise

`esp_netif_t *esp_netif_new (const esp_netif_config_t *esp_netif_config)`

Creates an instance of a new esp-netif object based on provided config.

**Parameters**

- `esp_netif_config` - pointer esp-netif configuration

**Returns**

- pointer to esp-netif object on success
- NULL otherwise

`void esp_netif_destroy (esp_netif_t *esp_netif)`

Destroys the esp_netif object.

**Parameters**

- `esp_netif` - [in] pointer to the object to be deleted

`esp_err_t esp_netif_set_driver_config (esp_netif_t *esp_netif, const esp_netif_driver_ifconfig_t *driver_config)`

Configures driver related options of esp_netif object.

**Parameters**

- `esp_netif` - [inout] pointer to the object to be configured
- `driver_config` - [in] pointer esp-netif io driver related configuration

**Returns**

- ESP_OK on success
- ESP_ERR_ESP_NETIF_INVALID_PARAMS if invalid parameters provided

`esp_err_t esp_netifAttach (esp_netif_t *esp_netif, esp_netif_iodriver_handle driver_handle)`

Attachesesp_netifinstance to the ioddriver handle.

Calling this function enables connecting specific esp_netif object with already initialized io driver to update esp_netif object with driver specific configuration (i.e. calls post_attach callback, which typically sets io driver callbacks to esp_netif instance and starts the driver)

**Parameters**

- `esp_netif` - [inout] pointer to esp_netif object to be attached
- `driver_handle` - [in] pointer to the driver handle

**Returns**
• ESP_OK on success  
• ESP_ERR_ESP_NETIF_DRIVER_ATTACH_FAILED if driver’s `pot_attach` callback failed

`esp_err_t esp_netif_receive(esp_netif_t *esp_netif, void *buffer, size_t len, void *eb)`

Passes the raw packets from communication media to the appropriate TCP/IP stack.

This function is called from the configured (peripheral) driver layer. The data are then forwarded as frames to the TCP/IP stack.

**Parameters**

- `esp_netif` [in] Handle to esp-netif instance
- `buffer` [in] Received data
- `len` [in] Length of the data frame
- `eb` [in] Pointer to internal buffer (used in Wi-Fi driver)

**Returns**

- ESP_OK

`void esp_netif_action_start(void *esp_netif, esp_event_base_t base, int32_t event_id, void *data)`

Default building block for network interface action upon IO driver start event. Creates network interface, if AUTOUP enabled turns the interface on, if DHCPS enabled starts dhcp server.

**Parameters**

- `esp_netif` [in] Handle to esp-netif instance
- `base` The base type of the event
- `event_id` The specific ID of the event
- `data` Optional data associated with the event

**Note:** This API can be directly used as event handler

`void esp_netif_action_stop(void *esp_netif, esp_event_base_t base, int32_t event_id, void *data)`

Default building block for network interface action upon IO driver stop event.

**Parameters**

- `esp_netif` [in] Handle to esp-netif instance
- `base` The base type of the event
- `event_id` The specific ID of the event
- `data` Optional data associated with the event

**Note:** This API can be directly used as event handler

`void esp_netif_action_connected(void *esp_netif, esp_event_base_t base, int32_t event_id, void *data)`

Default building block for network interface action upon IO driver connected event.

**Parameters**

- `esp_netif` [in] Handle to esp-netif instance
- `base` The base type of the event
- `event_id` The specific ID of the event
- `data` Optional data associated with the event

**Note:** This API can be directly used as event handler
void esp_netif_action_disconnected (void *esp_netif, esp_event_base_t base, int32_t event_id, void *data)

Default building block for network interface action upon IO driver disconnected event.

**Note:** This API can be directly used as event handler

**Parameters**

- **esp_netif** - [in] Handle to esp-netif instance
- **base** - The base type of the event
- **event_id** - The specific ID of the event
- **data** - Optional data associated with the event

void esp_netif_action_got_ip (void *esp_netif, esp_event_base_t base, int32_t event_id, void *data)

Default building block for network interface action upon network got IP event.

**Note:** This API can be directly used as event handler

**Parameters**

- **esp_netif** - [in] Handle to esp-netif instance
- **base** - The base type of the event
- **event_id** - The specific ID of the event
- **data** - Optional data associated with the event

void esp_netif_action_join_ip6_multicast_group (void *esp_netif, esp_event_base_t base, int32_t event_id, void *data)

Default building block for network interface action upon IPv6 multicast group join.

**Note:** This API can be directly used as event handler

**Parameters**

- **esp_netif** - [in] Handle to esp-netif instance
- **base** - The base type of the event
- **event_id** - The specific ID of the event
- **data** - Optional data associated with the event

void esp_netif_action_leave_ip6_multicast_group (void *esp_netif, esp_event_base_t base, int32_t event_id, void *data)

Default building block for network interface action upon IPv6 multicast group leave.

**Note:** This API can be directly used as event handler

**Parameters**

- **esp_netif** - [in] Handle to esp-netif instance
- **base** - The base type of the event
- **event_id** - The specific ID of the event
- **data** - Optional data associated with the event

void esp_netif_action_add_ip6_address (void *esp_netif, esp_event_base_t base, int32_t event_id, void *data)

Default building block for network interface action upon IPv6 address added by the underlying stack.
Chapter 2. API Reference

**Note:** This API can be directly used as event handler

**Parameters**
- `esp_netif` - [in] Handle to esp-netif instance
- `base` - The base type of the event
- `event_id` - The specific ID of the event
- `data` - Optional data associated with the event

```c
void esp_netif_action_remove_ip6_address (void *esp_netif, esp_event_base_t base, int32_t event_id, void *data)
```

Default building block for network interface action upon IPv6 address removed by the underlying stack.

**Note:** This API can be directly used as event handler

**Parameters**
- `esp_netif` - [in] Handle to esp-netif instance
- `base` - The base type of the event
- `event_id` - The specific ID of the event
- `data` - Optional data associated with the event

```c
esp_err_t esp_netif_set_default_netif (esp_netif_t *esp_netif)
```

Manual configuration of the default netif.

This API overrides the automatic configuration of the default interface based on the route_prio. If the selected netif is set default using this API, no other interface could be set-default disregarding its route_prio number (unless the selected netif gets destroyed)

**Parameters**
- `esp_netif` - [in] Handle to esp-netif instance

**Returns**
- ESP_OK on success

```c
esp_netif_t *esp_netif_get_default_netif (void)
```

Getter function of the default netif.

This API returns the selected default netif.

**Returns**
- Handle to esp-netif instance of the default netif.

```c
esp_err_t esp_netif_join_ip6_multicast_group (esp_netif_t *esp_netif, const esp_ip6_addr_t *addr)
```

Cause the TCP/IP stack to join a IPv6 multicast group.

**Parameters**
- `esp_netif` - [in] Handle to esp-netif instance
- `addr` - [in] The multicast group to join

**Returns**
- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS
- ESP_ERR_ESP_NETIF_MLD6_FAILED
- ESP_ERR_NO_MEM

```c
esp_err_t esp_netif_leave_ip6_multicast_group (esp_netif_t *esp_netif, const esp_ip6_addr_t *addr)
```

Cause the TCP/IP stack to leave a IPv6 multicast group.

**Parameters**
- `esp_netif` - [in] Handle to esp-netif instance
- `addr` - [in] The multicast group to leave

**Returns**
### Chapter 2. API Reference

- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS
- ESP_ERR_ESP_NETIF_MLD6_FAILED
- ESP_ERR_NO_MEM

```c
esp_err_t esp_netif_set_mac(esp_netif_t *esp_netif, uint8_t mac[])
```

Set the mac address for the interface instance.

**Parameters**
- `esp_netif` - [in] Handle to esp-netif instance
- `mac` - [in] Desired mac address for the related network interface

**Returns**
- ESP_OK - success
- ESP_ERR_ESP_NETIF_IF_NOT_READY - interface status error
- ESP_ERR_NOT_SUPPORTED - mac not supported on this interface

```c
esp_err_t esp_netif_get_mac(esp_netif_t *esp_netif, uint8_t mac[])
```

Get the mac address for the interface instance.

**Parameters**
- `esp_netif` - [in] Handle to esp-netif instance
- `mac` - [out] Resultant mac address for the related network interface

**Returns**
- ESP_OK - success
- ESP_ERR_ESP_NETIF_IF_NOT_READY - interface status error
- ESP_ERR_NOT_SUPPORTED - mac not supported on this interface

```c
esp_err_t esp_netif_set_hostname(esp_netif_t *esp_netif, const char *hostname)
```

Set the hostname of an interface.

The configured hostname overrides the default configuration value `CONFIG_LWIP_LOCAL_HOSTNAME`. Please note that when the hostname is altered after interface started/connected the changes would only be reflected once the interface restarts/reconnects.

**Parameters**
- `esp_netif` - [in] Handle to esp-netif instance

**Returns**
- ESP_OK - success
- ESP_ERR_ESP_NETIF_IF_NOT_READY - interface status error
- ESP_ERR_ESP_NETIF_INVALID_PARAMS - parameter error

```c
esp_err_t esp_netif_get_hostname(esp_netif_t *esp_netif, const char **hostname)
```

Get interface hostname.

**Parameters**
- `esp_netif` - [in] Handle to esp-netif instance
- `hostname` - [out] Returns a pointer to the hostname. May be NULL if no hostname is set. If set non-NULL, pointer remains valid (and string may change if the hostname changes).

**Returns**
- ESP_OK - success
- ESP_ERR_ESP_NETIF_IF_NOT_READY - interface status error
- ESP_ERR_ESP_NETIF_INVALID_PARAMS - parameter error

```c
bool esp_netif_is_netif_up(esp_netif_t *esp_netif)
```

Test if supplied interface is up or down.

**Parameters**
- `esp_netif` - [in] Handle to esp-netif instance

**Returns**
- true - Interface is up
- false - Interface is down
esp_err_t esp_netif_get_ip_info(esp_netif_t *esp_netif, esp_netif_ip_info_t *ip_info)
Get interface’s IP address information.
If the interface is up, IP information is read directly from the TCP/IP stack. If the interface is down, IP
information is read from a copy kept in the ESP-NETIF instance

Parameters
• esp_netif – [in] Handle to esp-netif instance
• ip_info – [out] If successful, IP information will be returned in this argument.

Returns
• ESP_OK
• ESP_ERR_ESP_NETIF_INVALID_PARAMS

esp_err_t esp_netif_get_old_ip_info(esp_netif_t *esp_netif, esp_netif_ip_info_t *ip_info)
Get interface’s old IP information.
Returns an “old” IP address previously stored for the interface when the valid IP changed.
If the IP lost timer has expired (meaning the interface was down for longer than the configured interval) then
the old IP information will be zero.

Parameters
• esp_netif – [in] Handle to esp-netif instance
• ip_info – [out] If successful, IP information will be returned in this argument.

Returns
• ESP_OK
• ESP_ERR_ESP_NETIF_INVALID_PARAMS

esp_err_t esp_netif_set_ip_info(esp_netif_t *esp_netif, const esp_netif_ip_info_t *ip_info)
Set interface’s IP address information.
This function is mainly used to set a static IP on an interface.
If the interface is up, the new IP information is set directly in the TCP/IP stack.
The copy of IP information kept in the ESP-NETIF instance is also updated (this copy is returned if the IP is
queried while the interface is still down.)

Note: DHCP client/server must be stopped (if enabled for this interface) before setting new IP information.

Note: Calling this interface for may generate a SYSTEM_EVENT_STA_GOT_IP or SYS-
TEM_EVENT_ETH_GOT_IP event.

Parameters
• esp_netif – [in] Handle to esp-netif instance
• ip_info – [in] IP information to set on the specified interface

Returns
• ESP_OK
• ESP_ERR_ESP_NETIF_INVALID_PARAMS
• ESP_ERR_ESP_NETIF_DHCP_NOT_STOPPED If DHCP server or client is still run-
ing

esp_err_t esp_netif_set_old_ip_info(esp_netif_t *esp_netif, const esp_netif_ip_info_t *ip_info)
Set interface old IP information.
This function is called from the DHCP client (if enabled), before a new IP is set. It is also called from the default
handlers for the SYSTEM_EVENT_STA_CONNECTED and SYSTEM_EVENT_ETH_CONNECTED
events.
Calling this function stores the previously configured IP, which can be used to determine if the IP changes in the future.

If the interface is disconnected or down for too long, the “IP lost timer” will expire (after the configured interval) and set the old IP information to zero.

**Parameters**
- `esp_netif` [in] Handle to esp-netif instance
- `ip_info` [in] Store the old IP information for the specified interface

**Returns**
- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS

```c
int esp_netif_get_netif_impl_index(esp_netif_t *esp_netif)
```
Get net interface index from network stack implementation.

**Note:** This index could be used in `setsockopt()` to bind socket with multicast interface

**Parameters** `esp_netif` [in] Handle to esp-netif instance

**Returns** implementation specific index of interface represented with supplied `esp_netif`

```c
esp_err_t esp_netif_get_netif_impl_name(esp_netif_t *esp_netif, char *name)
```
Get net interface name from network stack implementation.

**Note:** This name could be used in `setsockopt()` to bind socket with appropriate interface

**Parameters**
- `esp_netif` [in] Handle to esp-netif instance
- `name` [out] Interface name as specified in underlying TCP/IP stack. Note that the actual name will be copied to the specified buffer, which must be allocated to hold maximum interface name size (6 characters for lwIP)

**Returns**
- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS

```c
esp_err_t esp_netif_napt_enable(esp_netif_t *esp_netif)
```
Enable NAPT on an interface.

**Note:** Enable operation can be performed only on one interface at a time. NAPT cannot be enabled on multiple interfaces according to this implementation.

**Parameters** `esp_netif` [in] Handle to esp-netif instance

**Returns**
- ESP_OK
- ESP_FAIL
- ESP_ERR_NOT_SUPPORTED

```c
esp_err_t esp_netif_napt_disable(esp_netif_t *esp_netif)
```
Disable NAPT on an interface.

**Parameters** `esp_netif` [in] Handle to esp-netif instance

**Returns**
- ESP_OK
- ESP_FAIL
- ESP_ERR_NOT_SUPPORTED
Set or Get DHCP server option.

**Parameters**
- `esp_netif` - [in] Handle to `esp-netif` instance
- `opt_op` - [in] `ESP_NETIF_OP_SET` to set an option, `ESP_NETIF_OP_GET` to get an option.
- `opt_id` - [in] Option index to get or set, must be one of the supported enum values.
- `opt_val` - [inout] Pointer to the option parameter.
- `opt_len` - [in] Length of the option parameter.

**Returns**
- `ESP_OK`
- `ESP_ERR_ESP_NETIF_INVALID_PARAMS`
- `ESP_ERR_ESP_NETIF_DHCP_ALREADY_STOPPED`
- `ESP_ERR_ESP_NETIF_DHCP_ALREADY_STARTED`

Set or Get DHCP client option.

**Parameters**
- `esp_netif` - [in] Handle to `esp-netif` instance
- `opt_op` - [in] `ESP_NETIF_OP_SET` to set an option, `ESP_NETIF_OP_GET` to get an option.
- `opt_id` - [in] Option index to get or set, must be one of the supported enum values.
- `opt_val` - [inout] Pointer to the option parameter.
- `opt_len` - [in] Length of the option parameter.

**Returns**
- `ESP_OK`
- `ESP_ERR_ESP_NETIF_INVALID_PARAMS`
- `ESP_ERR_ESP_NETIF_DHCP_ALREADY_STOPPED`
- `ESP_ERR_ESP_NETIF_DHCP_ALREADY_STARTED`

Start DHCP client (only if enabled in interface object)

**Parameters**
- `esp_netif` - [in] Handle to `esp-netif` instance

**Returns**
- `ESP_OK`
- `ESP_ERR_ESP_NETIF_INVALID_PARAMS`
- `ESP_ERR_ESP_NETIF_DHCP_ALREADY_STARTED`
- `ESP_ERR_ESP_NETIF_DHCPC_START_FAILED`

Stop DHCP client (only if enabled in interface object)

**Parameters**
- `esp_netif` - [in] Handle to `esp-netif` instance

**Returns**
- `ESP_OK`
- `ESP_ERR_ESP_NETIF_INVALID_PARAMS`

---

**Note:** The default event handlers for the `SYSTEM_EVENT_STA_CONNECTED` and `SYSTEM_EVENT_ETH_CONNECTED` events call this function.

**Note:** Calling `action_netif_stop()` will also stop the DHCP Client if it is running.
Chapter 2. API Reference

• ESP_ERR_ESP_NETIF_DHCP_ALREADY_STOPPED
• ESP_ERR_ESP_NETIF_IF_NOT_READY

```c
esp_err_t esp_netif_dhcpc_get_status (esp_netif_t *esp_netif, esp_netif_dhcp_status_t *status)
```
Get DHCP client status.

**Parameters**
  • `esp_netif` - [in] Handle to esp-netif instance
  • `status` - [out] If successful, the status of DHCP client will be returned in this argument.

**Returns**
  • ESP_OK

```c
esp_err_t esp_netif_dhcps_get_status (esp_netif_t *esp_netif, esp_netif_dhcp_status_t *status)
```
Get DHCP Server status.

**Parameters**
  • `esp_netif` - [in] Handle to esp-netif instance
  • `status` - [out] If successful, the status of the DHCP server will be returned in this argument.

**Returns**
  • ESP_OK

```c
esp_err_t esp_netif_dhcps_start (esp_netif_t *esp_netif)
```
Start DHCP server (only if enabled in interface object)

**Parameters**
  • `esp_netif` - [in] Handle to esp-netif instance

**Returns**
  • ESP_OK
  • ESP_ERR_ESP_NETIF_INVALID_PARAMS
  • ESP_ERR_ESP_NETIF_DHCP_ALREADY_STARTED

```c
esp_err_t esp_netif_dhcps_stop (esp_netif_t *esp_netif)
```
Stop DHCP server (only if enabled in interface object)

**Parameters**
  • `esp_netif` - [in] Handle to esp-netif instance

**Returns**
  • ESP_OK
  • ESP_ERR_ESP_NETIF_INVALID_PARAMS
  • ESP_ERR_ESP_NETIF_DHCP_ALREADY_STOPPED
  • ESP_ERR_ESP_NETIF_IF_NOT_READY

```c
esp_err_t esp_netif_dhcps_get_clients_by_mac (esp_netif_t *esp_netif, int num,
                                            esp_netif_pair_mac_ip_t *mac_ip_pair)
```
Populate IP addresses of clients connected to DHCP server listed by their MAC addresses.

**Parameters**
  • `esp_netif` - [in] Handle to esp-netif instance
  • `num` - [in] Number of clients with specified MAC addresses in the array of pairs
  • `mac_ip_pair` - [inout] Array of pairs of MAC and IP addresses (MAC are inputs, IP outputs)

**Returns**
  • ESP_OK on success
  • ESP_ERR_ESP_NETIF_INVALID_PARAMS on invalid params
  • ESP_ERR_NOT_SUPPORTED if DHCP server not enabled

```c
esp_err_t esp_netif_set_dns_info (esp_netif_t *esp_netif, esp_netif_dns_type_t type,
                                   esp_netif_dns_info_t *dns)
```
Set DNS Server information.

This function behaves differently if DHCP server or client is enabled
If DHCP client is enabled, main and backup DNS servers will be updated automatically from the DHCP lease if the relevant DHCP options are set. Fallback DNS Server is never updated from the DHCP lease and is designed to be set via this API. If DHCP client is disabled, all DNS server types can be set via this API only.

If DHCP server is enabled, the Main DNS Server setting is used by the DHCP server to provide a DNS Server option to DHCP clients (Wi-Fi stations).

- The default Main DNS server is typically the IP of the DHCP server itself.
- This function can override it by setting server type ESP_NETIF_DNS_MAIN.
- Other DNS Server types are not supported for the DHCP server.
- To propagate the DNS info to client, please stop the DHCP server before using this API.

**Parameters**

- `esp_netif` [in] Handle to esp-netif instance
- `type` [in] Type of DNS Server to set: ESP_NETIF_DNS_MAIN, ESP_NETIF_DNS_BACKUP, ESP_NETIF_DNS_FALLBACK
- `dns` [in] DNS Server address to set

**Returns**

- ESP_OK on success
- ESP_ERR_ESP_NETIF_INVALID_PARAMS invalid params

```c
esp_err_t esp_netif_set_dns_info(esp_netif_t *esp_netif, esp_netif_dns_type_t type, esp_netif_dns_info_t *dns)
```

Get DNS Server information.

Return the currently configured DNS Server address for the specified interface and Server type.

This may be result of a previous call to `esp_netif_set_dns_info()`. If the interface’s DHCP client is enabled, the Main or Backup DNS Server may be set by the current DHCP lease.

**Parameters**

- `esp_netif` [in] Handle to esp-netif instance
- `type` [in] Type of DNS Server to get: ESP_NETIF_DNS_MAIN, ESP_NETIF_DNS_BACKUP, ESP_NETIF_DNS_FALLBACK
- `dns` [out] DNS Server result is written here on success

**Returns**

- ESP_OK on success
- ESP_ERR_ESP_NETIF_INVALID_PARAMS invalid params

```c
esp_err_t esp_netif_get_dns_info(esp_netif_t *esp_netif, esp_netif_dns_type_t type, esp_netif_dns_info_t *dns)
```

Create interface link-local IPv6 address.

Cause the TCP/IP stack to create a link-local IPv6 address for the specified interface.

This function also registers a callback for the specified interface, so that if the link-local address becomes verified as the preferred address then a SYSTEM_EVENT_GOT_IP6 event will be sent.

**Parameters**

- `esp_netif` [in] Handle to esp-netif instance

**Returns**

- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS

```c
esp_err_t esp_netif_create_ip6_linklocal(esp_netif_t *esp_netif)
```

Get interface link-local IPv6 address.

If the specified interface is up and a preferred link-local IPv6 address has been created for the interface, return a copy of it.

**Parameters**

- `esp_netif` [in] Handle to esp-netif instance

**Returns**

- ESP_OK

```c
esp_err_t esp_netif_get_ip6_linklocal(esp_netif_t *esp_netif, esp_ip6_addr_t *if_ip6)
```
• ESP_FAIL If interface is down, does not have a link-local IPv6 address, or the link-local IPv6 address is not a preferred address.

```c
esp_err_t esp_netif_get_ip6_global (esp_netif_t *esp_netif, esp_ip6_addr_t *if_ip6)
```
Get interface global IPv6 address.

If the specified interface is up and a preferred global IPv6 address has been created for the interface, return a copy of it.

**Parameters**
- `esp_netif` - [in] Handle to esp-netif instance
- `if_ip6` - [out] IPv6 information will be returned in this argument if successful.

**Returns**
- ESP_OK
- ESP_FAIL If interface is down, does not have a global IPv6 address, or the global IPv6 address is not a preferred address.

```c
int esp_netif_get_all_ip6 (esp_netif_t *esp_netif, esp_ip6_addr_t if_ip6[])`
Get all IPv6 addresses of the specified interface.

**Parameters**
- `esp_netif` - [in] Handle to esp-netif instance
- `if_ip6` - [out] Array of IPv6 addresses will be copied to the argument

**Returns**
number of returned IPv6 addresses

```c
void esp_netif_set_ip4_addr (esp_ip4_addr_t *addr, uint8_t a, uint8_t b, uint8_t c, uint8_t d)```
Sets IPv4 address to the specified octets.

**Parameters**
- `addr` - [out] IP address to be set
- `a` - the first octet (127 for IP 127.0.0.1)
- `b`
- `c`
- `d`

```c
char *esp_ip4addr_ntoa (const esp_ip4_addr_t *addr, char *buf, int buflen)
```
Converts numeric IP address into decimal dotted ASCII representation.

**Parameters**
- `addr` - ip address in network order to convert
- `buf` - target buffer where the string is stored
- `buflen` - length of buf

**Returns**
either pointer to buf which now holds the ASCII representation of addr or NULL if buf was too small

```c
uint32_t esp_ip4addr_aton (const char *addr)
```
Ascii internet address interpretation routine The value returned is in network order.

**Parameters**
- `addr` - IP address in ascii representation (e.g. "127.0.0.1")

**Returns**
ip address in network order

```c
esp_err_t esp_netif_str_to_ip4 (const char *src, esp_ip4_addr_t *dst)```
Converts Ascii internet IPv4 address into esp_ip4_addr_t.

**Parameters**
- `src` - [in] IPv4 address in ascii representation (e.g. "127.0.0.1")
- `dst` - [out] Address of the target esp_ip4_addr_t structure to receive converted address

**Returns**
- ESP_OK on success
- ESP_FAIL if conversion failed
- ESP_ERR_INVALID_ARG if invalid parameter is passed into
**esp_err_t esp_netif_str_to_ip6**

(const char *src, esp_ip6_addr_t *dst)

Converts Ascii internet IPv6 address into esp_ip6_addr_t. Zeros in the IP address can be stripped or completely ommitted: “2001:db8:85a3:0:0:0:2:1” or “2001:db8::2:1”

**Parameters**
- src – [in] IPv6 address in ascii representation (e.g. “2001:db8:85a3:0:0:0:2:1”)
- dst – [out] Address of the target esp_ip6_addr_t structure to receive converted address

**Returns**
- ESP_OK on success
- ESP_FAIL if conversion failed
- ESP_ERR_INVALID_ARG if invalid parameter is passed into

**esp_netif_iomdriver_handle esp_netif_get_io_driver**

(esp_netif_t *esp_netif)

Gets media driver handle for this esp-netif instance.

**Parameters**
- esp_netif – [in] Handle to esp-netif instance

**Returns**
- opaque pointer of related IO driver

**esp_netif_get_ifkey**

(const char *if_key)

Searches over a list of created objects to find an instance with supplied if key.

**Parameters**
- if_key – Textual description of network interface

**Returns**
- Handle to esp-netif instance

**esp_netif_get_flags**

(esp_netif_t *esp_netif)

Returns configured flags for this interface.

**Parameters**
- esp_netif – [in] Handle to esp-netif instance

**Returns**
- Configuration flags

**esp_netif_get_route_prio**

(esp_netif_t *esp_netif)

Returns configured routing priority number.

**Parameters**
- esp_netif – [in] Handle to esp-netif instance

**Returns**
- Integer representing the instance’s route-prio, or -1 if invalid parameters

**esp_netif_get_event_id**

(esp_netif_t *esp_netif, esp_netif_ip_event_type_t event_type)

Returns configured event for this esp-netif instance and supplied event type.

**Parameters**
- esp_netif – [in] Handle to esp-netif instance
- event_type – (either get or lost IP)

**Returns**
- specific event id which is configured to be raised if the interface lost or acquired IP address
- -1 if supplied event_type is not known

**esp_netif_next**

(esp_netif_t *esp_netif)

Iterates over list of interfaces. Returns first event if NULL given as parameter.

**Note:** This API doesn’t lock the list, nor the TCPIP context, as this it’s usually required to get atomic access between iteration steps rather that within a single iteration. Therefore it is recommended to iterate over

\textbf{Note:} This API is deprecated. Please use \texttt{esp_netif_next_unsafe()} directly if all the system interfaces are under your control and you can safely iterate over them. Otherwise, iterate over interfaces using \texttt{esp_netif_tcpip_exec()}, or use \texttt{esp_netif_find_if()} to search in the list of netifs with defined predicate.
\hline

Header File

- components/esp_netif/include/esp_netif_sntp.h
- This header file can be included with:

```c
#include "esp_netif_sntp.h"
```
- This header file is a part of the API provided by the `esp_netif` component. To declare that your component depends on `esp_netif`, add the following to your CMakeLists.txt:

```cmake
REQUIRES esp_netif
```
or

```cmake
PRIV_REQUIRES esp_netif
```

Functions

- `esp_err_t esp_netif_sntp_init(const esp_sntp_config_t *config)`
  - Initialize SNTP with supplied config struct.
  - Parameters `config` — Config struct
  - Returns `ESP_OK` on success
- `esp_err_t esp_netif_sntp_start(void)`
  - Start SNTP service if it wasn’t started during init (config.start = false) or restart it if already started.
  - Returns `ESP_OK` on success
- `void esp_netif_sntp_deinit(void)`
  - Deinitialize esp_netif SNTP module.
- `esp_err_t esp_netif_sntp_sync_wait(TickType_t tout)`
  - Wait for time sync event.
  - Parameters `tout` — Specified timeout in RTOS ticks
  - Returns `ESP_OK` if sync event didn’t come within the timeout
  - `ESP_TIMEOUT` if sync event didn’t come at all
  - `ESP_ERR_NOT_FINISHED` if the sync event came, but we’re in smooth update mode and still in progress (SNTP_SYNC_STATUS_IN_PROGRESS) or `ESP_OK` if time sync’
ed

Structures

- `struct esp_sntp_config`
  - SNTP configuration struct.

Public Members

- `bool smooth_sync`
  - set to true if smooth sync required
- `bool server_from_dhcp`
  - set to true to request NTP server config from DHCP
- `bool wait_for_sync`
  - if true, we create a semaphore to signal time sync event
- `bool start`
  - set to true to automatically start the SNTP service
**esp_sntp_time_cb_t** *sync_cb*

optionally sets callback function on time sync event

*bool* **renew_servers_after_new_IP**

this is used to refresh server list if NTP provided by DHCP (which cleans other pre-configured servers)

*ip_event_t* **ip_event_to_renew**

set the IP event id on which we refresh server list (if renew_servers_after_new_IP=true)

*size_t* **index_of_first_server**

refresh server list after this server (if renew_servers_after_new_IP=true)

*size_t* **num_of_servers**

number of preconfigured NTP servers

*const char* [*servers*][1]

list of servers

**Macros**

**ESP_Sntp_SERVER_LIST**) (...)**

Utility macro for providing multiple servers in parentheses.

**ESP_NETIF_Sntp_DEFAULT_CONFIG_MULTIPLE**) (servers_in_list, list_of_servers)**

Default configuration to init SNTP with multiple servers.

**Parameters**

- **servers_in_list** – Number of servers in the list
- **list_of_servers** – List of servers (use **ESP_Sntp_SERVER_LIST**) 

**ESP_NETIF_Sntp_DEFAULT_CONFIG**) (server)**

Default configuration with a single server.

**Type Definitions**

typedef void (*esp_sntp_time_cb_t)(struct timeval *tv)

Time sync notification function.

typedef struct **esp_sntp_config** **esp_sntp_config_t**

SNTP configuration struct.

**Header File**

- **components/esp_netif/include/esp_netif_types.h**
- This header file can be included with:

  ```c
  #include "esp_netif_types.h"
  ```

- This header file is a part of the API provided by the esp_netif component. To declare that your component depends on esp_netif, add the following to your CMakeLists.txt:

  ```cmake
  Requires esp_netif
  ```
  or

  ```cmake
  Privileges Requires esp_netif
  ```
Chapter 2. API Reference

Structures

struct esp_netif_dns_info_t
    DNS server info.

    Public Members

    esp_ip_addr_t ip
        IPV4 address of DNS server

struct esp_netif_ip_info_t
    Event structure for IP_EVENT_STA_GOT_IP, IP_EVENT_ETH_GOT_IP events

    Public Members

    esp_ip4_addr_t ip
        Interface IPV4 address

    esp_ip4_addr_t netmask
        Interface IPV4 netmask

    esp_ip4_addr_t gw
        Interface IPV4 gateway address

struct esp_netif_ip6_info_t
    IPV6 IP address information.

    Public Members

    esp_ip6_addr_t ip
        Interface IPV6 address

struct ip_event_got_ip_t
    Event structure for IP_EVENT_GOT_IP event.

    Public Members

    esp_netif_t *esp_netif
        Pointer to corresponding esp-netif object

    esp_netif_ip_info_t ip_info
        IP address, netmask, gateway IP address

    bool ip_changed
        Whether the assigned IP has changed or not

struct ip_event_got_ip6_t
    Event structure for IP_EVENT_GOT_IP6 event
Public Members

```c
esp_netif_t *esp_netif
```
Pointer to corresponding esp-netif object

```c
esp_netif_ip6_info_t ip6_info
```
IPv6 address of the interface

```c
int ip_index
```
IPv6 address index

```c
struct ip_event_add_ip6_t
```
Event structure for ADD_IP6 event

Public Members

```c
esp_ip6_addr_t addr
```
The address to be added to the interface

```c
bool preferred
```
The default preference of the address

```c
struct ip_event_ap_staipassigned_t
```
Event structure for IP_EVENT_AP_STAIPASSIGNED event

Public Members

```c
esp_netif_t *esp_netif
```
Pointer to the associated netif handle

```c
esp_ip4_addr_t ip
```
IP address which was assigned to the station

```c
uint8_t mac[6]
```
MAC address of the connected client

```c
struct bridgeif_config
```
LwIP bridge configuration

Public Members

```c
uint16_t max_fdb_dyn_entries
```
maximum number of entries in dynamic forwarding database

```c
uint16_t max_fdb_sta_entries
```
maximum number of entries in static forwarding database
uint8_t \texttt{max\_ports}

maximum number of ports the bridge can consist of

struct \texttt{esp\_netif\_inherent\_config}

ESP-netif inherent config parameters.

\textbf{Public Members}

\texttt{esp\_netif\_flags\_t flags}

flags that define esp-netif behavior

uint8_t \texttt{mac}[6]

initial mac address for this interface

const \texttt{esp\_netif\_ip\_info\_t *ip\_info}

initial ip address for this interface

uint32_t \texttt{get\_ip\_event}

event id to be raised when interface gets an IP

uint32_t \texttt{lost\_ip\_event}

event id to be raised when interface losts its IP

const char *\texttt{if\_key}

string identifier of the interface

const char *\texttt{if\_desc}

textual description of the interface

int \texttt{route\_prio}

numeric priority of this interface to become a default routing if (if other netifs are up). A higher value of \texttt{route\_prio} indicates a higher priority

\texttt{bridgeif\_config\_t *bridge\_info}

LwIP bridge configuration

struct \texttt{esp\_netif\_driver\_base\_s}

ESP-netif driver base handle.

\textbf{Public Members}

\texttt{esp\_err\_t (*post\_attach)(esp\_netif\_t *netif, esp\_netif\_iodriver\_handle h)}

post attach function pointer

\texttt{esp\_netif\_t *netif}

netif handle
struct **esp_netif_driver_ifconfig**
Specific IO driver configuration.

**Public Members**

* esp_netif_iodriver_handle handle
  io-driver handle

* esp_err_t (*transmit*) (void *h, void *buffer, size_t len)
  transmit function pointer

* esp_err_t (*transmit_wrap*) (void *h, void *buffer, size_t len, void *netstack_buffer)
  transmit wrap function pointer

* void (*driver_free_rx_buffer*) (void *h, void *buffer)
  free rx buffer function pointer

struct **esp_netif_config**
Generic esp_netif configuration.

**Public Members**

* const esp_netif_inherent_config_t *base
  base config

* const esp_netif_driver_ifconfig_t *driver
  driver config

* const esp_netif_netstack_config_t *stack
  stack config

struct **esp_netif_pair_mac_ip_t**
DHCP client’s addr info (pair of MAC and IP address)

**Public Members**

* uint8_t mac[6]
  Clients MAC address

* esp_ip4_addr_t ip
  Clients IP address

**Macros**

**ESP_ERR_ESP_NETIF_BASE**
Definition of ESP-NETIF based errors.

Type Definitions

typedef struct esp_netif_obj esp_netif_t

typedef enum esp_netif_flags esp_netif_flags_t

typedef enum esp_netif_ip_event_type esp_netif_ip_event_type_t

typedef struct bridgeif_config bridgeif_config_t
   LwIP bridge configuration

typedef struct esp_netif_inherent_config esp_netif_inherent_config_t
   ESP-netif inherent config parameters.
typedef struct esp_netif_config esp_netif_config_t

typedef void *esp_netif_ioctl_driver_handle
IO driver handle type.

typedef struct esp_netif_driver_base_s esp_netif_driver_base_t
ESP-netif driver base handle.

typedef struct esp_netif_driver_ifconfig esp_netif_driver_ifconfig_t

typedef struct esp_netif_netstack_config esp_netif_netstack_config_t
Specific L3 network stack configuration.

typedef esp_err_t (*esp_netif_receive_t)(esp_netif_t *esp_netif, void *buffer, size_t len, void *eb)
ESP-NETIF Receive function type.

Enumerations

enum esp_netif_dns_type_t
Type of DNS server.

Values:

enumerator ESP_NETIF_DNS_MAIN
DNS main server address

enumerator ESP_NETIF_DNS_BACKUP
DNS backup server address (Wi-Fi STA and Ethernet only)

enumerator ESP_NETIF_DNS_FALLBACK
DNS fallback server address (Wi-Fi STA and Ethernet only)

enumerator ESP_NETIF_DNS_MAX

enum esp_netif_dhcp_status_t
Status of DHCP client or DHCP server.

Values:

enumerator ESP_NETIF_DHCP_INIT
DHCP client/server is in initial state (not yet started)

enumerator ESP_NETIF_DHCP_STARTED
DHCP client/server has been started

enumerator ESP_NETIF_DHCP_STOPPED
DHCP client/server has been stopped

enumerator ESP_NETIF_DHCP_STATUS_MAX
enum esp_netif_dhcp_option_mode_t
    Mode for DHCP client or DHCP server option functions.
    Values:
    enumerator ESP_NETIF_OP_START
    enumerator ESP_NETIF_OP_SET
        Set option
    enumerator ESP_NETIF_OP_GET
        Get option
    enumerator ESP_NETIF_OP_MAX

enum esp_netif_dhcp_option_id_t
    Supported options for DHCP client or DHCP server.
    Values:
    enumerator ESP_NETIF_SUBNET_MASK
        Network mask
    enumerator ESP_NETIF_DOMAIN_NAME_SERVER
        Domain name server
    enumerator ESP_NETIF_ROUTER_SOLICITATION_ADDRESS
        Solicitation router address
    enumerator ESP_NETIF_REQUESTED_IP_ADDRESS
        Request specific IP address
    enumerator ESP_NETIF_IP_ADDRESSLEASE_TIME
        Request IP address lease time
    enumerator ESP_NETIF_IP_REQUEST_RETRY_TIME
        Request IP address retry counter
    enumerator ESP_NETIF_VENDORCLASS_IDENTIFIER
        Vendor Class Identifier of a DHCP client
    enumerator ESP_NETIF_VENDORSPECIFIC_INFO
        Vendor Specific Information of a DHCP server

enum ip_event_t
    IP event declarations
    Values:
    enumerator IP_EVENT_STA_GOT_IP
        station got IP from connected AP
enumerator IP_EVENT_STA_LOST_IP
  station lost IP and the IP is reset to 0

enumerator IP_EVENT_AP_STAIPASSIGNED
  soft-AP assign an IP to a connected station

enumerator IP_EVENT_GOT_IP6
  station or AP or ethernet interface v6 IP addr is preferred

enumerator IP_EVENT_ETH_GOT_IP
  ethernet got IP from connected AP

enumerator IP_EVENT_ETH_LOST_IP
  ethernet lost IP and the IP is reset to 0

enumerator IP_EVENT_PPP_GOT_IP
  PPP interface got IP

enumerator IP_EVENT_PPP_LOST_IP
  PPP interface lost IP

enum esp_netif_flags
  Values:

  enumerator ESP_NETIF_DHCP_CLIENT

  enumerator ESP_NETIF_DHCP_SERVER

  enumerator ESP_NETIF_FLAG_AUTOUP

  enumerator ESP_NETIF_FLAG_GARP

  enumerator ESP_NETIF_FLAG_EVENT_IP_MODIFIED

  enumerator ESP_NETIF_FLAG_IS_PPP

  enumerator ESP_NETIF_FLAG_IS_BRIDGE

  enumerator ESP_NETIF_FLAG_MLDV6_REPORT

enum esp_netif_ip_event_type
  Values:

  enumerator ESP_NETIF_IP_EVENT_GOT_IP

  enumerator ESP_NETIF_IP_EVENT_LOST_IP
Header File

- This header file can be included with:
  ```c
  #include "esp_netif_ip_addr.h"
  ```
- This header file is a part of the API provided by the esp_netif component. To declare that your component depends on esp_netif, add the following to your CMakeLists.txt:
  ```cmake
  REQUIRE esp_netif
  ```
  or
  ```cmake
  PRIV_REQUIRES esp_netif
  ```

Functions

```c
esp_ip6_addr_type_t esp_netif_ip6_get_addr_type(esp_ip6_addr_t *ip6_addr)
```
Get the IPv6 address type.

Parameters
- `ip6_addr` - [in] IPv6 type

Returns
IPv6 type in form of enum esp_ip6_addr_type_t

```c
static inline void esp_netif_ip_addr_copy(esp_ip_addr_t *dest, const esp_ip_addr_t *src)
```
Copy IP addresses.

Parameters
- `dest` - [out] destination IP
- `src` - [in] source IP

Structures

```c
struct esp_ip6_addr
```
IPv6 address.

Public Members

- `uint32_t addr[4]`
  IPv6 address
- `uint8_t zone`
  zone ID

```c
struct esp_ip4_addr
```
IPv4 address.

Public Members

- `uint32_t addr`
  IPv4 address
- `struct _ip_addr`
  IP address.

### Functions

**esp_err_t esp_vfs_l2tap_intf_register (l2tap_vfs_config_t *config)**

Add L2 TAP virtual filesystem driver.

This function must be called prior usage of ESP-NETIF L2 TAP Interface

**Parameters config** — L2 TAP virtual filesystem driver configuration. Default base path

/dev/net/tap is used when this parameter is NULL.

**Returns** esp_err_t

- ESP_OK on success

**esp_err_t esp_vfs_l2tap_intf_unregister (const char* base_path)**

Removes L2 TAP virtual filesystem driver.

**Parameters base_path** — Base path to the L2 TAP virtual filesystem driver. Default path

/dev/net/tap is used when this parameter is NULL.

**Returns** esp_err_t

- ESP_OK on success

**esp_err_t esp_vfs_l2tap_eth_filter (l2tap_iodriver_handle driver_handle, void* buff, size_t* size)**

Filters received Ethernet L2 frames into L2 TAP infrastructure.

**Parameters**

- **driver_handle** — handle of driver at which the frame was received
- **buff** — received L2 frame
- **size** — input length of the L2 frame which is set to 0 when frame is filtered into L2 TAP

**Returns** esp_err_t

- ESP_OK is always returned

### Structures

**struct l2tap_vfs_config_t**

L2Tap VFS config parameters.

### Public Members

```c
const char *base_path
```

Wi-Fi Default API Reference

Header File

- components/esp_wifi/include/esp_wifi_default.h
- This header file can be included with:

\[
#include "esp_wifi_default.h"
\]

- This header file is a part of the API provided by the esp_wifi component. To declare that your component depends on esp_wifi, add the following to your CMakeLists.txt:

\[
REQUIRES esp_wifi
\]

or

\[
PRIV_REQUIRES esp_wifi
\]

Functions

\[
\text{esp_err_t} \ \text{esp_netif_attach_wifi_station}(\text{esp_netif_t} \ *\text{esp_netif})
\]

Attaches wifi station interface to supplied netif.

Parameters esp_netif - instance to attach the wifi station to

Returns

- ESP_OK on success
- ESP_FAIL if attach failed

\[
\text{esp_err_t} \ \text{esp_netif_attach_wifi_ap}(\text{esp_netif_t} \ *\text{esp_netif})
\]

Attaches wifi soft AP interface to supplied netif.

Parameters esp_netif - instance to attach the wifi AP to

Returns

- ESP_OK on success
- ESP_FAIL if attach failed
**Chapter 2. API Reference**

*esp_err_t* `esp_wifi_set_default_wifi_sta_handlers` (void)

Sets default wifi event handlers for STA interface.

**Returns**
- ESP_OK on success, error returned from esp_event_handler_register if failed

*esp_err_t* `esp_wifi_set_default_wifi_ap_handlers` (void)

Sets default wifi event handlers for AP interface.

**Returns**
- ESP_OK on success, error returned from esp_event_handler_register if failed

*esp_err_t* `esp_wifi_set_default_wifi_nan_handlers` (void)

Sets default wifi event handlers for NAN interface.

**Returns**
- ESP_OK on success, error returned from esp_event_handler_register if failed

*esp_err_t* `esp_wifi_clear_default_wifi_driver_and_handlers` (void *esp_netif)

Clears default wifi event handlers for supplied network interface.

**Parameters**
- `esp_netif` – instance of corresponding if object

**Returns**
- ESP_OK on success, error returned from esp_event_handler_register if failed

*esp_netif_t* `*esp_netif_create_default_wifi_ap` (void)

Creates default WIFI AP. In case of any init error this API aborts.

**Note:** The API creates esp_netif object with default WiFi access point config, attaches the netif to wifi and registers wifi handlers to the default event loop. This API uses assert() to check for potential errors, so it could abort the program. (Note that the default event loop needs to be created prior to calling this API)

**Returns**
- pointer to esp-netif instance

*esp_netif_t* `*esp_netif_create_default_wifi_sta` (void)

Creates default WIFI STA. In case of any init error this API aborts.

**Note:** The API creates esp_netif object with default WiFi station config, attaches the netif to wifi and registers wifi handlers to the default event loop. This API uses assert() to check for potential errors, so it could abort the program. (Note that the default event loop needs to be created prior to calling this API)

**Returns**
- pointer to esp-netif instance

*esp_netif_t* `*esp_netif_create_default_wifi_nan` (void)

Creates default WIFI NAN. In case of any init error this API aborts.

**Note:** The API creates esp_netif object with default WiFi station config, attaches the netif to wifi and registers wifi handlers to the default event loop. (Note that the default event loop needs to be created prior to calling this API)

**Returns**
- pointer to esp-netif instance
Chapter 2. API Reference

void esp_netif_destroy_default_wifi (void *esp_netif)

Destroys default WIFI netif created with esp_netif_create_default_wifi_l() API.

---

Note: This API unregisters wifi handlers and detaches the created object from the wifi. (this function is a
no-operation if esp_netif is NULL)

Parameters esp_netif – [in] object to detach from WiFi and destroy

Attention This API DOES NOT register default handlers!

Parameters

• wifi_if – [in] type of wifi interface
• esp_netif_config – inherent esp-netif configuration pointer

Returns pointer to esp-netif instance

---

esp_err_t esp_netif_create_default_wifi_mesh_netifs (esp_netif_t **p_netif_sta, esp_netif_t **p_netif_ap)

Creates default STA and AP network interfaces for esp-mesh.

Both netifs are almost identical to the default station and softAP, but with DHCP client and server disabled.
Please note that the DHCP client is typically enabled only if the device is promoted to a root node.

Returns created interfaces which could be ignored setting parameters to NULL if an application code does not
need to save the interface instances for further processing.

Parameters

• p_netif_sta – [out] pointer where the resultant STA interface is saved (if non NULL)
• p_netif_ap – [out] pointer where the resultant AP interface is saved (if non NULL)

Returns ESP_OK on success

2.4.5 IP Network Layer

ESP-NETIF Custom I/O Driver

This section outlines implementing a new I/O driver with ESP-NETIF connection capabilities.

By convention, the I/O driver has to register itself as an ESP-NETIF driver, and thus holds a dependency on ESP-
NETIF component and is responsible for providing data path functions, post-attach callback and in most cases, also
default event handlers to define network interface actions based on driver’s lifecycle transitions.

Packet Input/Output According to the diagram shown in the ESP-NETIF Architecture part, the following three
API functions for the packet data path must be defined for connecting with ESP-NETIF:

• esp_netif_transmit()  
• esp_netif_free_rx_buffer()  
• esp_netif_receive()  

The first two functions for transmitting and freeing the rx buffer are provided as callbacks, i.e., they get called from
ESP-NETIF (and its underlying TCP/IP stack) and I/O driver provides their implementation.
Chapter 2. API Reference

The receiving function on the other hand gets called from the I/O driver, so that the driver’s code simply calls `esp_netif_receive()` on a new data received event.

**Post Attach Callback**  A final part of the network interface initialization consists of attaching the ESP-NETIF instance to the I/O driver, by means of calling the following API:

```c
esp_err_t esp_netif_attach(esp_netif_t *esp_netif, esp_netif_iodriver_handle_t ->driver_handle);
```

It is assumed that the `esp_netif_iodriver_handle` is a pointer to driver’s object, a struct derived from `struct esp_netif_driver_base_s`, so that the first member of I/O driver structure must be this base structure with pointers to:

- post-attach function callback
- related ESP-NETIF instance

As a result, the I/O driver has to create an instance of the struct per below:

```c
typedef struct my_netif_driver_s {
    esp_netif_driver_base_t base;    /*! base structure reserved as_esp-netif driver */
    driver_impl *h;                  /*! handle of driver */
} my_netif_driver_t;
```

with actual values of `my_netif_driver_t::base.post_attach` and the actual drivers handle `my_netif_driver_t::h`.

So when the `esp_netif_attach()` gets called from the initialization code, the post-attach callback from I/O driver’s code gets executed to mutually register callbacks between ESP-NETIF and I/O driver instances. Typically the driver is started as well in the post-attach callback. An example of a simple post-attach callback is outlined below:

```c
static esp_err_t my_post_attach_start(esp_netif_t * esp_netif, void * args)
{
    my_netif_driver_t *driver = args;
    const esp_netif_driver_ifconfig_t driver_ifconfig = {
        .driver_free_rx_buffer = my_free_rx_buf,
        .transmit = my_transmit,
        .handle = driver->driver_impl
    };
    driver->base.netif = esp_netif;
    ESP_ERROR_CHECK(esp_netif_set_driver_config(esp_netif, &driver_ifconfig));
    my_driver_start(driver->driver_impl);
    return ESP_OK;
}
```

**Default Handlers**  I/O drivers also typically provide default definitions of lifecycle behavior of related network interfaces based on state transitions of I/O drivers. For example `driver start -> network start`, etc.

An example of such a default handler is provided below:

```c
esp_err_t my_driver_netif_set_default_handlers(my_netif_driver_t *driver, esp_netif_t * esp_netif)
{
    driver_set_event_handler(driver->driver_impl, esp_netif_action_start, MY_DRV_~EVENT_START, esp_netif);
    driver_set_event_handler(driver->driver_impl, esp_netif_action_stop, MY_DRV_~EVENT_STOP, esp_netif);
    return ESP_OK;
}
```
Network Stack Connection  The packet data path functions for transmitting and freeing the rx buffer (defined in the I/O driver) are called from the ESP-NETIF, specifically from its TCP/IP stack connecting layer.

Note that ESP-IDF provides several network stack configurations for the most common network interfaces, such as for the Wi-Fi station or Ethernet. These configurations are defined in `esp_netif/include/esp_netif_defaults.h` and should be sufficient for most network drivers. In rare cases, expert users might want to define custom lwIP based interface layers; it is possible, but an explicit dependency to lwIP needs to be set.

The following API reference outlines these network stack interaction with the ESP-NETIF:

**Header File**

- `components/esp_netif/include/esp_netif_net_stack.h`

  This header file can be included with:

  ```
  #include "esp_netif_net_stack.h"
  ```

  This header file is a part of the API provided by the `esp_netif` component. To declare that your component depends on `esp_netif`, add the following to your CMakeLists.txt:

  ```
  REQUIRES esp_netif
  ```

  or

  ```
  PRIV_REQUIRES esp_netif
  ```

**Functions**

- `esp_netif_t *esp_netif_get_handle_from_netif_impl(void *dev)`
  
  Returns esp-netif handle.

  **Parameters**
  - `dev` - [in] opaque ptr to network interface of specific TCP/IP stack
  
  **Returns**
  handle to related esp-netif instance

- `void *esp_netif_get_netif_impl(esp_netif_t *esp_netif)`
  
  Returns network stack specific implementation handle (if supported)

  **Parameters**
  - `esp_netif` - [in] Handle to esp-netif instance
  
  **Returns**
  handle to related network stack netif handle

- `esp_err_t esp_netif_set_link_speed(esp_netif_t *esp_netif, uint32_t speed)`
  
  Set link-speed for the specified network interface.

  **Parameters**
  - `esp_netif` - [in] Handle to esp-netif instance
  - `speed` - [in] Link speed in bit/s
  
  **Returns**
  ESP_OK on success

- `esp_err_t esp_netif_transmit(esp_netif_t *esp_netif, void *data, size_t len)`
  
  Outputs packets from the TCP/IP stack to the media to be transmitted.

  This function gets called from network stack to output packets to IO driver.

  **Parameters**
  - `esp_netif` - [in] Handle to esp-netif instance
  - `data` - [in] Data to be transmitted
  - `len` - [in] Length of the data frame
  
  **Returns**
  ESP_OK on success, an error passed from the I/O driver otherwise

- `esp_err_t esp_netif_transmit_wrap(esp_netif_t *esp_netif, void *data, size_t len, void *netstack_buf)`
  
  Outputs packets from the TCP/IP stack to the media to be transmitted.

  This function gets called from network stack to output packets to IO driver.
Parameters
  • esp_netif – [in] Handle to esp-netif instance
  • data – [in] Data to be transmitted
  • len – [in] Length of the data frame
  • netstack_buf – [in] net stack buffer

Returns
ESP_OK on success, an error passed from the I/O driver otherwise

void esp_netif_free_rx_buffer (void *esp_netif, void *buffer)

Free the rx buffer allocated by the media driver.

This function gets called from network stack when the rx buffer to be freed in IO driver context, i.e. to
deallocate a buffer owned by io driver (when data packets were passed to higher levels to avoid copying)

Parameters
  • esp_netif – [in] Handle to esp-netif instance
  • buffer – [in] Rx buffer pointer

Code examples for TCP/IP socket APIs are provided in the protocols/sockets directory of ESP-IDF examples.

2.4.6 Application Layer

Documentation for Application layer network protocols (above the IP Network layer) are provided in Application
Protocols.

2.5 Peripherals API

2.5.1 Analog to Digital Converter (ADC) Oneshot Mode Driver

Introduction

The Analog to Digital Converter is integrated on the chip and is capable of measuring analog signals from specific
analog IO pins.

ESP32-S2 has two ADC unit(s), which can be used in scenario(s) like:
  • Generate one-shot ADC conversion result
  • Generate continuous ADC conversion results

This guide introduces ADC oneshot mode conversion.

Functional Overview

The following sections of this document cover the typical steps to install and operate an ADC:
  • Resource Allocation - covers which parameters should be set up to get an ADC handle and how to recycle the
    resources when ADC finishes working.
  • Unit Configuration - covers the parameters that should be set up to configure the ADC unit, so as to get ADC
    conversion raw result.
  • Read Conversion Result - covers how to get ADC conversion raw result.
  • Hardware Limitations - describes the ADC-related hardware limitations.
  • Power Management - covers power management-related information.
  • IRAM Safe - describes tips on how to read ADC conversion raw results when the cache is disabled.
Chapter 2. API Reference

- **Thread Safety** - lists which APIs are guaranteed to be thread-safe by the driver.
- **Kconfig Options** - lists the supported Kconfig options that can be used to make a different effect on driver behavior.

**Resource Allocation**  The ADC oneshot mode driver is implemented based on ESP32-S2 SAR ADC module. Different ESP chips might have different numbers of independent ADCs. From the oneshot mode driver’s point of view, an ADC instance is represented by `adc_oneshot_unit_handle_t`.

To install an ADC instance, set up the required initial configuration structure `adc_oneshot_unit_init_cfg_t`:

- `adc_oneshot_unit_init_cfg_t::unit_id` selects the ADC. Please refer to the datasheet to know dedicated analog IOs for this ADC.
- `adc_oneshot_unit_init_cfg_t::clk_src` selects the source clock of the ADC. If set to 0, the driver will fall back to using a default clock source, see `adc_oneshot_clk_src_t` to know the details.
- `adc_oneshot_unit_init_cfg_t::ulp_mode` sets if the ADC will be working under ULP mode.

After setting up the initial configurations for the ADC, call `adc_oneshot_new_unit()` with the prepared `adc_oneshot_unit_init_cfg_t`. This function will return an ADC unit handle if the allocation is successful.

This function may fail due to various errors such as invalid arguments, insufficient memory, etc. Specifically, when the to-be-allocated ADC instance is registered already, this function will return `ESP_ERR_NOT_FOUND` error. Number of available ADC(s) is recorded by `SOC_ADC_PERIPH_NUM`.

If a previously created ADC instance is no longer required, you should recycle the ADC instance by calling `adc_oneshot_del_unit()`, related hardware and software resources will be recycled as well.

**Create an ADC Unit Handle Under Normal Oneshot Mode**

```c
adc_oneshot_unit_handle_t adcl1_handle;
adc_oneshot_unit_init_cfg_t init_config1 = {
    .unit_id = ADC_UNIT_1,
    .ulp_mode = ADC_ULP_MODE_DISABLE,
};
ESP_ERROR_CHECK(adc_oneshot_new_unit(&init_config1, &adcl1_handle));
```

**Recycle the ADC Unit**

```c
ESP_ERROR_CHECK(adc_oneshot_del_unit(adcl1_handle));
```

**Unit Configuration**  After an ADC instance is created, set up the `adc_oneshot_chan_cfg_t` to configure ADC IOs to measure analog signals:

- `adc_oneshot_chan_cfg_t::atten`, ADC attenuation. Refer to TRM > On-Chip Sensor and Analog Signal Processing.
- `adc_oneshot_chan_cfg_t::bitwidth`, the bitwidth of the raw conversion result.

**Note**: For the IO corresponding ADC channel number, check datasheet to know the ADC IOs.

Additionally, `adc_continuous_io_to_channel()` and `adc_continuous_channel_to_io()` can be used to know the ADC channels and ADC IOs.

To make these settings take effect, call `adc_oneshot_config_channel()` with the above configuration structure. You should specify an ADC channel to be configured as well. Function `adc_oneshot_config_channel()` can be called multiple times to configure different ADC channels. The Driver will save each of these channel configurations internally.
Configure Two ADC Channels

```c
adc_oneshot_chan_cfg_t config = {
  .bitwidth = ADC_BITWIDTH_DEFAULT,
  .atten = ADC_ATTEN_DB_12,
};
ESP_ERROR_CHECK(adc_oneshot_config_channel(adc1_handle, EXAMPLE_ADC1_CHAN0, &config));
ESP_ERROR_CHECK(adc_oneshot_config_channel(adc1_handle, EXAMPLE_ADC1_CHAN1, &config));
```

Read Conversion Result  

After above configurations, the ADC is ready to measure the analog signal(s) from the configured ADC channel(s). Call `adc_oneshot_read()` to get the conversion raw result of an ADC channel.

- `adc_oneshot_read()` is safe to use. ADC(s) are shared by some other drivers/peripherals, see Hardware Limitations. This function uses mutexes to avoid concurrent hardware usage. Therefore, this function should not be used in an ISR context. This function may fail when the ADC is in use by other drivers/peripherals, and return `ESP_ERR_TIMEOUT`. Under this condition, the ADC raw result is invalid.

This function will fail due to invalid arguments.

The ADC conversion results read from this function are raw data. To calculate the voltage based on the ADC raw results, this formula can be used:

\[
Vout = Dout \times \frac{V_{max}}{D_{max}} \quad (1)
\]

where:

<table>
<thead>
<tr>
<th>Vout</th>
<th>Digital output result, standing for the voltage.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Dout</td>
<td>ADC raw digital reading result.</td>
</tr>
<tr>
<td>Vmax</td>
<td>Maximum measurable input analog voltage, this is related to the ADC attenuation, please refer to TRM &gt; On-Chip Sensor and Analog Signal Processing.</td>
</tr>
<tr>
<td>Dmax</td>
<td>Maximum of the output ADC raw digital reading result, which is (2^{\text{bitwidth}}), where <code>bitwidth</code> is the <code>adc_oneshot_chan_cfg_t.bitwidth</code> configured before.</td>
</tr>
</tbody>
</table>

To do further calibration to convert the ADC raw result to voltage in mV, please refer to calibration doc Analog to Digital Converter (ADC) Calibration Driver.

Read Raw Result

```c
ESP_ERROR_CHECK(adc_oneshot_read(adc1_handle, EXAMPLE_ADC1_CHAN0, &adc_raw[0][0]));
ESP_LOGI(TAG, "ADC%d Channel[%d] Raw Data: %d", ADC_UNIT_1 + i, EXAMPLE_ADC1_CHAN0, adc_raw[0][0]);
ESP_ERROR_CHECK(adc_oneshot_read(adc1_handle, EXAMPLE_ADC1_CHAN1, &adc_raw[0][1]));
ESP_LOGI(TAG, "ADC%d Channel[%d] Raw Data: %d", ADC_UNIT_1 + i, EXAMPLE_ADC1_CHAN1, adc_raw[0][1]);
```

Hardware Limitations

- Random Number Generator (RNG) uses ADC as an input source. When ADC `adc_oneshot_read()` works, the random number generated from RNG will be less random.

- A specific ADC unit can only work under one operating mode at any one time, either continuous mode or oneshot mode. `adc_oneshot_read()` has provided the protection.

- ADC2 is also used by Wi-Fi. `adc_oneshot_read()` has provided protection between the Wi-Fi driver and ADC oneshot mode driver.
Power Management  When power management is enabled, i.e., `CONFIG_PM_ENABLE` is on, the system clock frequency may be adjusted when the system is in an idle state. However, the ADC oneshot mode driver works in a polling routine, the `adc_oneshot_read()` will poll the CPU until the function returns. During this period of time, the task in which ADC oneshot mode driver resides will not be blocked. Therefore the clock frequency is stable when reading.

IRAM Safe  By default, all the ADC oneshot mode driver APIs are not supposed to be run when the Cache is disabled. Cache may be disabled due to many reasons, such as Flash writing/erasing, OTA, etc. If these APIs execute when the Cache is disabled, you will probably see errors like `Illegal Instruction` or `Load/Store Prohibited`.

Thread Safety

- `adc_oneshot_new_unit()`  
- `adc_oneshot_config_channel()`  
- `adc_oneshot_read()`  

Above functions are guaranteed to be thread-safe. Therefore, you can call them from different RTOS tasks without protection by extra locks.

- `adc_oneshot_del_unit()` is not thread-safe. Besides, concurrently calling this function may result in failures of the above thread-safe APIs.

Kconfig Options

- `CONFIG_ADC_ONESHOT_CTRL_FUNC_IN_IRAM` controls where to place the ADC fast read function (IRAM or Flash), see IRAM Safe for more details.

Application Examples

- ADC oneshot mode example: peripherals/adc/oneshot_read.

API Reference

Header File

- `components/hal/include/hal/adc_types.h`  
- This header file can be included with:

```
#include "hal/adc_types.h"
```

Structures

struct `adc_digi_pattern_config_t`
ADC digital controller pattern configuration.

Public Members

- `uint8_t atten`
  Attenuation of this ADC channel.

- `uint8_t channel`
  ADC channel.
Chapter 2. API Reference

```c
uint8_t unit
    ADC unit.

uint8_t bit_width
    ADC output bit width.
```

```c
struct adc_digi_output_data_t
    ADC digital controller (DMA mode) output data format. Used to analyze the acquired ADC (DMA) data.
```

**Note:** ESP32: Only type1 is valid. ADC2 does not support DMA mode.

**Note:** ESP32-S2: Member channel can be used to judge the validity of the ADC data, because the role of the arbiter may get invalid ADC data.

### Public Members

```c
uint16_t data
    ADC real output data info. Resolution: 12 bit.
    ADC real output data info. Resolution: 11 bit.
```

```c
uint16_t channel
    ADC channel index info.
    ADC channel index info. For ESP32-S2: If (channel < ADC_CHANNEL_MAX), The data is valid. If (channel > ADC_CHANNEL_MAX), The data is invalid.
```

```c
struct adc_digi_output_data_t::[anonymous]::[anonymous] type1
    ADC type1
```

```c
uint16_t unit
    ADC unit index info. 0: ADC1; 1: ADC2.
```

```c
struct adc_digi_output_data_t::[anonymous]::[anonymous] type2
    When the configured output format is 11bit.
```

```c
uint16_t val
    Raw data value
```

```c
struct adc_digi_clk_t
    ADC digital controller (DMA mode) clock system setting. Calculation formula: controller_clk = (APLL or APB) / (div_num + div_a / div_b + 1).
```

**Note:** The clocks of the DAC digital controller use the ADC digital controller clock divider.
Chapter 2. API Reference

Public Members

bool use_apll
true: use APLL clock; false: use APB clock.

uint32_t div_num
Division factor. Range: 0 ~ 255. Note: When a higher frequency clock is used (the division factor is less than 9), the ADC reading value will be slightly offset.

uint32_t div_b
Division factor. Range: 1 ~ 63.

uint32_t div_a
Division factor. Range: 0 ~ 63.

Type Definitions

typedef soc_periph_adc_digi_clk_src_t adc_oneshot_clk_src_t
Clock source type of oneshot mode which uses digital controller.

typedef soc_periph_adc_digi_clk_src_t adc_continuous_clk_src_t
Clock source type of continuous mode which uses digital controller.

Enumerations

enum adc_unit_t
ADC unit.
Values:

enumerator ADC_UNIT_1
SAR ADC 1.

enumerator ADC_UNIT_2
SAR ADC 2.

enum adc_channel_t
ADC channels.
Values:

enumerator ADC_CHANNEL_0
ADC channel.

enumerator ADC_CHANNEL_1
ADC channel.

enumerator ADC_CHANNEL_2
ADC channel.

enumerator ADC_CHANNEL_3
ADC channel.
Chapter 2. API Reference

enumerator ADC_CHANNEL_4
ADC channel.

enumerator ADC_CHANNEL_5
ADC channel.

enumerator ADC_CHANNEL_6
ADC channel.

enumerator ADC_CHANNEL_7
ADC channel.

enumerator ADC_CHANNEL_8
ADC channel.

enumerator ADC_CHANNEL_9
ADC channel.

enum adc_atten_t
ADC attenuation parameter. Different parameters determine the range of the ADC.

Values:

enumerator ADC_ATTEN_DB_0
No input attenuation, ADC can measure up to approx.

enumerator ADC_ATTEN_DB_2_5
The input voltage of ADC will be attenuated extending the range of measurement by about 2.5 dB.

enumerator ADC_ATTEN_DB_6
The input voltage of ADC will be attenuated extending the range of measurement by about 6 dB.

enumerator ADC_ATTEN_DB_12
The input voltage of ADC will be attenuated extending the range of measurement by about 12 dB.

enumerator ADC_ATTEN_DB_11
This is deprecated, it behaves the same as ADC_ATTEN_DB_12

enum adc_bitwidth_t

Values:

enumerator ADC_BITWIDTH_DEFAULT
Default ADC output bits, max supported width will be selected.

enumerator ADC_BITWIDTH_9
ADC output width is 9Bit.

enumerator ADC_BITWIDTH_10
ADC output width is 10Bit.
enumerator **ADC_BITWIDTH_11**
ADC output width is 11Bit.

enumerator **ADC_BITWIDTH_12**
ADC output width is 12Bit.

enumerator **ADC_BITWIDTH_13**
ADC output width is 13Bit.

enum **adc_ulp_mode_t**
*Values:*

enumerator **ADC_ULP_MODE_DISABLE**
ADC ULP mode is disabled.

enumerator **ADC_ULP_MODE_FSM**
ADC is controlled by ULP FSM.

enumerator **ADC_ULP_MODE_RISCV**
ADC is controlled by ULP RISCV.

enum **adc_digi_convert_mode_t**
ADC digital controller (DMA mode) work mode.
*Values:*

enumerator **ADC_CONV_SINGLE_UNIT_1**
Only use ADC1 for conversion.

enumerator **ADC_CONV_SINGLE_UNIT_2**
Only use ADC2 for conversion.

enumerator **ADC_CONV_BOTH_UNIT**
Use Both ADC1 and ADC2 for conversion simultaneously.

enumerator **ADC_CONV_ALTER_UNIT**
Use both ADC1 and ADC2 for conversion by turn. e.g. ADC1 -> ADC2 -> ADC1 -> ADC2 ...

enum **adc_digi_output_format_t**
ADC digital controller (DMA mode) output data format option.
*Values:*

enumerator **ADC_DIGI_OUTPUT_FORMAT_TYPE1**
See `adc_digi_output_data_t.type1`

enumerator **ADC_DIGI_OUTPUT_FORMAT_TYPE2**
See `adc_digi_output_data_t.type2`
enum `adc_digi_iir_filter_t`
ADC IIR Filter ID.

Values:

- enumerator `ADC_DIGI_IIR_FILTER_0`
  Filter 0.
- enumerator `ADC_DIGI_IIR_FILTER_1`
  Filter 1.

enum `adc_digi_iir_filter_coeff_t`
IIR Filter Coefficient.

Values:

- enumerator `ADC_DIGI_IIR_FILTER_COEFF_2`
  The filter coefficient is 2.
- enumerator `ADC_DIGI_IIR_FILTER_COEFF_4`
  The filter coefficient is 4.
- enumerator `ADC_DIGI_IIR_FILTER_COEFF_8`
  The filter coefficient is 8.
- enumerator `ADC_DIGI_IIR_FILTER_COEFF_16`
  The filter coefficient is 16.
- enumerator `ADC_DIGI_IIR_FILTER_COEFF_64`
  The filter coefficient is 64.

enum `adc_monitor_id_t`
ADC monitor (continuous mode) ID.

Values:

- enumerator `ADC_MONITOR_0`
  The monitor index 0.
- enumerator `ADC_MONITOR_1`
  The monitor index 1.

enum `adc_monitor_mode_t`
Monitor config/event mode type.

Values:

- enumerator `ADC_MONITOR_MODE_HIGH`
  ADC raw_result > threshold value, monitor interrupt will be generated.
- enumerator `ADC_MONITOR_MODE_LOW`
  ADC raw_result < threshold value, monitor interrupt will be generated.
Header File

- components/esp_adc/include/esp_adc/adc_oneshot.h
- This header file can be included with:

```c
#include "esp_adc/adc_oneshot.h"
```
- This header file is a part of the API provided by the esp_adc component. To declare that your component depends on esp_adc, add the following to your CMakeLists.txt:

```cmake
REQUIRES esp_adc
```

or

```cmake
PRIV_REQUIRES esp_adc
```

Functions

### `esp_err_t adc_oneshot_new_unit`

(\textit{const adc_oneshot_unit_initCfg_t *init_config}, \textit{adc_oneshot_unit_handle_t *ret_unit})

Create a handle to a specific ADC unit.

**Note:** This API is thread-safe. For more details, see ADC programming guide

**Parameters**

- \textit{init_config} \textit{[in]} Driver initial configurations
- \textit{ret_unit} \textit{[out]} ADC unit handle

**Returns**

- ESP_OK: On success
- ESP_ERR_INVALID_ARG: Invalid arguments
- ESP_ERR_NO_MEM: No memory
- ESP_ERR_NOT_FOUND: The ADC peripheral to be claimed is already in use
- ESP_FAIL: Clock source isn’t initialised correctly

### `esp_err_t adc_oneshot_config_channel`

(\textit{adc_oneshot_unit_handle_t handle}, \textit{adc_channel_t channel}, \textit{const adc_oneshot_chan_cfg_t *config})

Set ADC oneshot mode required configurations.

**Note:** This API is thread-safe. For more details, see ADC programming guide

**Parameters**

- \textit{handle} \textit{[in]} ADC handle
- \textit{channel} \textit{[in]} ADC channel to be configured
- \textit{config} \textit{[in]} ADC configurations

**Returns**

- ESP_OK: On success
- ESP_ERR_INVALID_ARG: Invalid arguments

### `esp_err_t adc_oneshot_read`

(\textit{adc_oneshot_unit_handle_t handle}, \textit{adc_channel_t chan}, \textit{int *out_raw})

Get one ADC conversion raw result.

**Note:** This API should NOT be called in an ISR context
Chapter 2. API Reference

Parameters

- **handle** - [in] ADC handle
- **chan** - [in] ADC channel
- **out_raw** - [out] ADC conversion raw result

Returns

- ESP_OK: On success
- ESP_ERR_INVALID_ARG: Invalid arguments
- ESP_ERR_TIMEOUT: Timeout, the ADC result is invalid

```c
esp_err_t adc_oneshot_del_unit(adc_oneshot_unit_handle_t handle)
```

Delete the ADC unit handle.

**Note:** This API is thread-safe. For more details, see ADC programming guide.

```c
esp_err_t adc_oneshot_io_to_channel(int io_num, adc_unit_t *const unit_id, adc_channel_t *const channel)
```

Get ADC channel from the given GPIO number.

Parameters

- **io_num** - [in] GPIO number
- **unit_id** - [out] ADC unit
- **channel** - [out] ADC channel

Returns

- ESP_OK: On success
- ESP_ERR_INVALID_ARG: Invalid argument
- ESP_ERR_NOT_FOUND: The IO is not a valid ADC pad

```c
esp_err_t adc_oneshot_channel_to_io(adc_unit_t unit_id, adc_channel_t channel, int *const io_num)
```

Get GPIO number from the given ADC channel.

Parameters

- **unit_id** - [in] ADC unit
- **channel** - [in] ADC channel
- **io_num** - [out] GPIO number
- – ESP_OK: On success
- – ESP_ERR_INVALID_ARG: Invalid argument

```c
esp_err_t adc_oneshot_get_calibrated_result(adc_oneshot_unit_handle_t handle, adc_cali_handle_t cali_handle, adc_channel_t chan, int *cali_result)
```

Convenience function to get ADC calibrated result.

This is an all-in-one function which does:

- oneshot read ADC raw result
- calibrate the raw result and convert it into calibrated result (in mV)

Parameters

- **handle** - [in] ADC oneshot handle, you should call adc_oneshot_new_unit() to get this handle
- **cali_handle** - [in] ADC calibration handle, you should call adc_cali_create_scheme_x() in adc_cali_scheme.h to create a handle
• chan  - [in] ADC channel
• cali_result - [out] Calibrated ADC result (in mV)

Returns
• ESP_OK Other return errors from adc_oneshot_read() and adc_cali_raw_to_voltage()

Structures

struct adc_oneshot_unit_init_cfg_t
ADC oneshot driver initial configurations.

Public Members

adc_unit_t unit_id
ADC unit.

adc_oneshot_clk_src_t clk_src
Clock source.

adc_ulp_mode_t ulp_mode
ADC controlled by ULP, see adc_ulp_mode_t

struct adc_oneshot_chan_cfg_t
ADC channel configurations.

Public Members

adc_atten_t atten
ADC attenuation.

adc_bitwidth_t bitwidth
ADC conversion result bits.

Type Definitions
typedef struct adc_oneshot_unit_ctx_t*
adc_oneshot_unit_handle_t
Type of ADC unit handle for oneshot mode.

2.5.2 Analog to Digital Converter (ADC) Continuous Mode Driver

Introduction

The Analog to Digital Converter is integrated on the chip and is capable of measuring analog signals from specific analog IO pads. Additionally, the Direct Memory Access (DMA) functionality is utilized to efficiently retrieve ADC conversion results.

ESP32-S2 has two ADC unit(s), which can be used in scenarios like:
• Generate one-shot ADC conversion result
• Generate continuous ADC conversion results
This guide introduces ADC continuous mode conversion.

**Driver Concepts**  
ADC continuous mode conversion is made up of multiple conversion frames.

- **Conversion Frame**: One conversion frame contains multiple conversion results. Conversion frame size is configured in `adc_continuous_new_handle()` in bytes.
- **Conversion Result**: One conversion result contains multiple bytes, see `SOC_ADC_DIGI_RESULT_BYTES`. Its structure is `adc_digi_output_data_t`, including ADC unit, ADC channel, and raw data.

**Functional Overview**

The following sections of this document cover the typical steps to install the ADC continuous mode driver, and read ADC conversion results from a group of ADC channels continuously:

- **Resource Allocation**: covers which parameters should be set up to initialize the ADC continuous mode driver and how to deinitialize it.
- **ADC Configurations**: describes how to configure the ADC(s) to make it work under continuous mode.
- **ADC Control**: describes ADC control functions.
- **Register Event Callbacks**: describes how to hook user-specific code to an ADC continuous mode event callback function.
- **Read Conversion Result**: covers how to get ADC conversion result.
- **Hardware Limitations**: describes the ADC-related hardware limitations.
- **Power Management**: covers power management-related information.
- **IRAM Safe**: covers the IRAM safe functions.
- **Thread Safety**: lists which APIs are guaranteed to be thread-safe by the driver.

**Resource Allocation**  
The ADC continuous mode driver is implemented based on ESP32-S2 SAR ADC module. Different ESP targets might have different numbers of independent ADCs.

To create an ADC continuous mode driver handle, set up the required configuration structure `adc_continuous_handle_cfg_t`:

- `adc_continuous_handle_cfg_t::max_store_buf_size`: set the maximum size of the pool in bytes, and the driver saves ADC conversion result into the pool. If this pool is full, new conversion results will be lost.
- `adc_continuous_handle_cfg_t::conv_frame_size`: set the size of the ADC conversion frame, in bytes.
- `adc_continuous_handle_cfg_t::flags`: set the flags that can change the driver’s behavior.
  - `flush_pool`: auto flush the pool when it’s full.

After setting up the above configurations for the ADC, call `adc_continuous_new_handle()` with the prepared `adc_continuous_handle_cfg_t`. This function may fail due to various errors such as invalid arguments, insufficient memory, etc.

Especially, when this function returns `ESP_ERR_NOT_FOUND`, this means the SPI3 peripheral is in use. See **Hardware Limitations** for more information.

If the ADC continuous mode driver is no longer used, you should deinitialize the driver by calling `adc_continuous_deinit()`.
IIR filter Two IIR filters are available when ADC is working in continuous mode. To create an ADC IIR filter, you should set up `adc_continuous_iir_filter_config_t` and call `adc_new_continuous_iir_filter()`.

- `adc_digi_filter_config_t::unit`: ADC unit.
- `adc_digi_filter_config_t::channel`: ADC channel to be filtered.
- `adc_digi_filter_config_t::coeff`: Filter coefficient.

On ESP32-S2, the filter is per ADC unit. Once a filter is enabled, all the enabled ADC channels in this ADC unit will be filtered. However, we suggest only enabling one ADC channel per unit, when using the filter feature. Because the filtered results depend on the previous filtered result. So you should not enable multiple ADC channels, to avoid mixing the filtered results.

To recycle a filter, you should call `adc_del_continuous_iir_filter()`.

Monitor 2 monitors are available when ADC is working under continuous mode, you can set one or two threshold(s) of a monitor on a working ADC channel, then the monitor will invoke interrupts every sample loop if conversion result outranges of the threshold. To create an ADC monitor, you need to set up the `adc_monitor_config_t` and call `adc_new_continuous_monitor()`.

- `adc_monitor_config_t::adc_unit`: Configures which ADC unit the channel you want to monitor belongs to.
- `adc_monitor_config_t::channel`: The channel you want to monitor.
- `adc_monitor_config_t::h_threshold`: The high threshold, conversion result larger than this value invokes interrupt, set to -1 if do not use.
- `adc_monitor_config_t::l_threshold`: The low threshold, conversion result less than this value invokes interrupt, set to -1 if do not use.

Once a monitor is created, you can operate it by following APIs to construct your apps.

- `adc_continuous_monitor_enable()`: Enable a monitor.
- `adc_continuous_monitor_disable()`: Disable a monitor.
- `adc_monitor_register_callbacks()`: register user callbacks to take action when the ADC value exceeds of the threshold.
- `adc_del_continuous_monitor()`: Delete a created monitor and free resources.

**Note:** There are some hardware limitations on ESP32-S2: 1. Only one threshold is supported for one monitor. 2. Only one monitor is supported for one ADC unit. 3. All enabled channel(s) of a certain ADC unit in ADC continuous mode driver will be monitored. The `adc_monitor_config_t::channel` parameter will not be used.

Initialize the ADC Continuous Mode Driver

```c
adc_continuous_handle_cfg_t adc_config = {
    .max_store_buf_size = 1024,
    .conv_frame_size = 100,
};
ESP_ERROR_CHECK(adc_continuous_new_handle(&adc_config));
```

Recycle the ADC Unit

```c
ESP_ERROR_CHECK(adc_continuous_deinit());
```

ADC Configurations After the ADC continuous mode driver is initialized, set up the `adc_continuous_config_t` to configure ADC IOs to measure analog signal:

- `adc_continuous_config_t::pattern_num`: number of ADC channels that will be used.
- `adc_continuous_config_t::adc_pattern`: list of configs for each ADC channel that will be used, see the description below.
• **adc_continuous_config_t::sample_freq_hz**: expected ADC sampling frequency in Hz.
• **adc_continuous_config_t::conv_mode**: continuous conversion mode.
• **adc_continuous_config_t::format**: conversion output format.

Set **adc_digi_pattern_config_t** with the following process:

• **adc_digi_pattern_config_t::atten**: ADC attenuation. Refer to the On-Chip Sensor and Analog Signal Processing chapter in TRM.
• **adc_digi_pattern_config_t::channel**: the IO corresponding ADC channel number. See the note below.
• **adc_digi_pattern_config_t::unit**: the ADC that the IO is subordinate to.
• **adc_digi_pattern_config_t::bit_width**: the bitwidth of the raw conversion result.

**Note**: For the IO corresponding ADC channel number, check TRM to acquire the ADC IOs. Besides, **adc_continuous_io_to_channel()** and **adc_continuous_channel_to_io()** can be used to acquire the ADC channels and ADC IOs.

To make these settings take effect, call **adc_continuous_config()** with the configuration structure above. This API may fail due to reasons like **ESP_ERR_INVALID_ARG**. When it returns **ESP_ERR_INVALID_STATE**, this means the ADC continuous mode driver is started, you should not call this API at this moment.

See ADC continuous mode example **peripherals/adc/continuous_read** to see configuration codes.

To enable/disable the ADC IIR filter, you should call **adc_continuous_iir_filter_enable()** / **adc_continuous_iir_filter_disable()**.

To enable/disable the ADC monitor, you should call **adc_continuous_monitor_enable()** / **adc_continuous_monitor_disable()**.

### ADC Control

**Start and Stop**

Calling **adc_continuous_start()** makes the ADC start to measure analog signals from the configured ADC channels, and generate the conversion results. On the contrary, calling **adc_continuous_stop()** stops the ADC conversion.

```c
ESP_ERROR_CHECK(adc_continuous_stop());
```

**Register Event Callbacks**

By calling **adc_continuous_register_eventCallbacks()**, you can hook your own function to the driver ISR. Supported event callbacks are listed in **adc_continuous_evt_cbs_t**.

- **adc_continuous_evt_cbs_t::on_conv_done**: this is invoked when one conversion frame finishes.
- **adc_continuous_evt_cbs_t::on_pool_ovf**: this is invoked when the internal pool is full. Newer conversion results will be discarded.

As the above callbacks are called in an ISR context, you should always ensure the callback function is suitable for an ISR context. Blocking logic should not appear in these callbacks. The callback function prototype is declared in **adc_continuous_callback_t**.

You can also register your own context when calling **adc_continuous_register_eventCallbacks()** by the parameter **user_data**. This user data will be passed to the callback functions directly.

This function may fail due to reasons like **ESP_ERR_INVALID_ARG**. Especially, when **CONFIG_ADC_CONTINUOUS_ISR_IRAM_SAFE** is enabled, this error may indicate that the callback functions are not in the internal RAM. Check the error log for more details. Besides, when it fails due to **ESP_ERR_INVALID_STATE**, it indicates that the ADC continuous mode driver is started, and you should not add a callback at this moment.
Conversion Done Event  When the driver completes a conversion, it triggers the
`adc_continuous_evt_cbs_t::on_conv_done` event and fills the event data. Event data contains a
buffer pointer to a conversion frame buffer, together with the size. Refer to `adc_continuousEvt_data_t`
to know the event data structure.

**Note:** It is worth noting that, the data buffer `adc_continuousEvt_data_t::conv_frame_buffer` is
maintained by the driver itself. Therefore, never free this piece of memory.

**Note:** When the Kconfig option `CONFIG_ADC_CONTINUOUS_ISR_IRAM_SAFE` is enabled, the registered call-
backs and the functions called by the callbacks should be placed in IRAM. The involved variables should be placed
in internal RAM as well.

Pool Overflow Event  The ADC continuous mode driver has an internal pool to save the conversion results. When
the pool is full, a pool overflow event will emerge. Under this condition, the driver will not fill in the event data. This
usually happens because the speed to read data from the pool by calling `adc_continuous_read()` is much
slower than the ADC conversion speed.

Read Conversion Result  After calling `adc_continuous_start()`, the ADC continuous conversion starts.
Call `adc_continuous_read()` to get the conversion results of the ADC channels. You need to provide a buffer
to get the raw results.

Function `adc_continuous_read()` tries to read the expected length of conversion results each time.

- When calling `adc_continuous_read()`, you can request to read a conversion result of the specified
  length. Sometimes, however, the actual available conversion results may be less than the requested length, in
  which case the function still moves the data from the internal pool into the buffer you provided. Therefore, to
  learn the number of conversion results actually moved into the buffer, please check the value of `out_length`.
- If there is no conversion result generated in the internal pool, the function will block for `timeout_ms`
  until the conversion results are generated. If there are still no generated results, the function will return
  `ESP_ERR_TIMEOUT`.
- If the generated results fill up the internal pool, newly generated results will be lost. Next time when
  `adc_continuous_read()` is called, this function will return `ESP_ERR_INVALID_STATE` to indicate
  this situation.

This API aims to give you a chance to read all the ADC continuous conversion results.

The ADC conversion results read from the above function are raw data. To calculate the voltage based on the ADC
raw results, this formula can be used:

\[
\text{Vout} = \text{Dout} \times \text{Vmax} / \text{Dmax} \quad (1)
\]

where:

<table>
<thead>
<tr>
<th></th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Vout</td>
<td>Digital output result, standing for the voltage.</td>
</tr>
<tr>
<td>Dout</td>
<td>ADC raw digital reading result.</td>
</tr>
<tr>
<td>Vmax</td>
<td>Maximum measurable input analog voltage, this is related to the ADC attenuation, please refer to the On-Chip Sensor and Analog Signal Processing chapter in TRM.</td>
</tr>
<tr>
<td>Dmax</td>
<td>Maximum of the output ADC raw digital reading result, which is (2^{\text{bitwidth}}), where the bitwidth is the <code>adc_digi_pattern_config_t::bit_width</code> configured before.</td>
</tr>
</tbody>
</table>

To do further calibration to convert the ADC raw result to voltage in mV, please refer to *Analog to Digital Converter (ADC) Calibration Driver*. 
Hardware Limitations

- A specific ADC unit can only work under one operating mode at any one time, either continuous mode or one-shot mode. `adc_continuous_start()` has provided the protection.
- Random Number Generator (RNG) uses ADC as an input source. When ADC continuous mode driver works, the random number generated from RNG will be less random.
- ADC2 is also used by Wi-Fi. `adc_continuous_start()` has provided the protection between Wi-Fi driver and ADC continuous mode driver.
- ADC continuous mode driver uses SPI3 peripheral as hardware DMA FIFO. Therefore, if SPI3 is in use already, the `adc_continuous_new_handle()` will return `ESP_ERR_NOT_FOUND`.

Power Management When power management is enabled, i.e., `CONFIG_PM_ENABLE` is on, the APB clock frequency may be adjusted when the system is in an idle state, thus potentially changing the behavior of ADC continuous conversion.

However, the continuous mode driver can prevent this change by acquiring a power management lock of type `ESP_PM_APB_FREQ_MAX`. The lock is acquired after the continuous conversion is started by `adc_continuous_start()`. Similarly, the lock will be released after `adc_continuous_stop()`. Therefore, `adc_continuous_start()` and `adc_continuous_stop()` should appear in pairs, otherwise, the power management will be out of action.

IRAM Safe All the ADC continuous mode driver APIs are not IRAM-safe. They are not supposed to be run when the Cache is disabled. By enabling the Kconfig option `CONFIG_ADC_CONTINUOUS_ISR_IRAM_SAFE`, the driver’s internal ISR handler is IRAM-safe, which means even when the Cache is disabled, the driver will still save the conversion results into its internal pool.

Thread Safety ADC continuous mode driver APIs are not guaranteed to be thread-safe. However, the share hardware mutual exclusion is provided by the driver. See Hardware Limitations for more details.

Application Examples

- ADC continuous mode example: `peripherals/adc/continuous_read`.

API Reference

Header File

- `components/esp_adc/include/esp_adc/adc_continuous.h`
- This header file can be included with:

```c
#include "esp_adc/adc_continuous.h"
```
- This header file is a part of the API provided by the `esp_adc` component. To declare that your component depends on `esp_adc`, add the following to your CMakelists.txt:

```cmake
REQUIRES esp_adc
```
- or

```cmake
PRIV_REQUIRES esp_adc
```

Functions

```c
esp_err_t adc_continuous_new_handle(const adc_continuous_handle_cfg_t *hdl_config, adc_continuous_handle_t *ret_handle)
```

Initialize ADC continuous driver and get a handle to it.
Chapter 2. API Reference

Parameters

- **hdl_config** - [in] Pointer to ADC initialization config. Refer to `adc_continuous_handle_cfg_t`.
- **ret_handle** - [out] ADC continuous mode driver handle

Returns

- ESP_ERR_INVALID_ARG If the combination of arguments is invalid.
- ESP_ERR_NOT_FOUND No free interrupt found with the specified flags
- ESP_ERR_NO_MEM If out of memory
- ESP_OK On success

```c
esp_err_t adc_continuous_config (adc_continuous_handle_t handle, const adc_continuous_config_t *config)
```

Set ADC continuous mode required configurations.

Parameters

- **handle** - [in] ADC continuous mode driver handle
- **config** - [in] Refer to `adc_digi_config_t`.

Returns

- ESP_ERR_INVALID_STATE: Driver state is invalid, you shouldn’t call this API at this moment
- ESP_ERR_INVALID_ARG: If the combination of arguments is invalid.
- ESP_OK: On success

```c
esp_err_t adc_continuous_register_event_callbacks (adc_continuous_handle_t handle, constadc_continuous_evt_cbs_t *cbs, void *user_data)
```

Register callbacks.

**Note:** User can deregister a previously registered callback by calling this function and setting the to-be-deregistered callback member in the `cbs` structure to NULL.

**Note:** When CONFIG_ADC_CONTINUOUS_ISR_IRAM_SAFE is enabled, the callback itself and functions called by it should be placed in IRAM. Involved variables (including `user_data`) should be in internal RAM as well.

**Note:** You should only call this API when the ADC continuous mode driver isn’t started. Check return value to know this.

Parameters

- **handle** - [in] ADC continuous mode driver handle
- **cbs** - [in] Group of callback functions
- **user_data** - [in] User data, which will be delivered to the callback functions directly

Returns

- ESP_OK: On success
- ESP_ERR_INVALID_ARG: Invalid arguments
- ESP_ERR_INVALID_STATE: Driver state is invalid, you shouldn’t call this API at this moment

```c
esp_err_t adc_continuous_start (adc_continuous_handle_t handle)
```

Start the ADC under continuous mode. After this, the hardware starts working.

Parameters **handle** - [in] ADC continuous mode driver handle

Returns

- ESP_ERR_INVALID_STATE: Driver state is invalid.
- ESP_OK: On success
**esp_err_t adc_continuous_read** *(adc_continuous_handle_t handle, uint8_t *buf, uint32_t length_max, uint32_t *out_length, uint32_t timeout_ms)*

Read bytes from ADC under continuous mode.

**Parameters**
- **handle** - [in] ADC continuous mode driver handle
- **buf** - [out] Conversion result buffer to read from ADC. Suggest convert to `adc_digi_output_data_t` for ADC Conversion Results. See the subsection Driver Backgrounds in this header file to learn about this concept.
- **length_max** - [in] Expected length of the Conversion Results read from the ADC, in bytes.
- **out_length** - [out] Real length of the Conversion Results read from the ADC via this API, in bytes.
- **timeout_ms** - [in] Time to wait for data via this API, in millisecond.

**Returns**
- ESP_ERR_INVALID_STATE: Driver state is invalid. Usually it means the ADC sampling rate is faster than the task processing rate.
- ESP_ERR_TIMEOUT: Operation timed out
- ESP_OK: On success

**esp_err_t adc_continuous_stop** *(adc_continuous_handle_t handle)*

Stop the ADC. After this, the hardware stops working.

**Parameters**
- **handle** - [in] ADC continuous mode driver handle

**Returns**
- ESP_ERR_INVALID_STATE: Driver state is invalid.
- ESP_OK: On success

**esp_err_t adc_continuous_deinit** *(adc_continuous_handle_t handle)*

Deinitialize the ADC continuous driver.

**Parameters**
- **handle** - [in] ADC continuous mode driver handle

**Returns**
- ESP_ERR_INVALID_STATE: Driver state is invalid.
- ESP_OK: On success

**esp_err_t adc_continuous_flush_pool** *(adc_continuous_handle_t handle)*

Flush the driver internal pool.

**Note:** This API is not supposed to be called in an ISR context

**Parameters**
- **handle** - [in] ADC continuous mode driver handle

**Returns**
- ESP_ERR_INVALID_STATE: Driver state is invalid, you should call this API when it’s in init state
- ESP_ERR_INVALID_ARG: Invalid arguments
- ESP_OK: On success

**esp_err_t adc_continuous_io_to_channel** *(int io_num, adc_unit_t *const unit_id, adc_channel_t *const channel)*

Get ADC channel from the given GPIO number.

**Parameters**
- **io_num** - [in] GPIO number
- **unit_id** - [out] ADC unit
- **channel** - [out] ADC channel

**Returns**
- ESP_OK: On success
- ESP_ERR_INVALID_ARG: Invalid argument
• ESP_ERR_NOT_FOUND: The IO is not a valid ADC pad

```c
esp_err_t adc_continuous_channel_to_io (adc_unit_t unit_id, adc_channel_t channel, int *const io_num)
```

Get GPIO number from the given ADC channel.

**Parameters**

- **unit_id** – [in] ADC unit
- **channel** – [in] ADC channel
- **io_num** – [out] GPIO number
- – ESP_OK: On success
- – ESP_ERR_INVALID_ARG: Invalid argument

**Structures**

```c
struct adc_continuous_handle_cfg_t
```

ADC continuous mode driver initial configurations.

**Public Members**

```c
uint32_t max_store_buf_size
```
Max length of the conversion results that driver can store, in bytes.

```c
uint32_t conv_frame_size
```
Conversion frame size, in bytes. This should be in multiples of SOC_ADC_DIGI_DATA_BYTES_PER_CONV.

```c
uint32_t flush_pool
```
Flush the internal pool when the pool is full.

```c
struct adc_continuous_handle_cfg_t::[anonymous] flags
```
Driver flags.

```c
struct adc_continuous_config_t
```
ADC continuous mode driver configurations.

**Public Members**

```c
uint32_t pattern_num
```
Number of ADC channels that will be used.

```c
adc_digi_pattern_config_t *adc_pattern
```
List of configs for each ADC channel that will be used.

```c
uint32_t sample_freq_hz
```
The expected ADC sampling frequency in Hz. Please refer to soc/soc_caps.h to know available sampling frequency range.

```c
adc_digi_convert_mode_t conv_mode
```
ADC DMA conversion mode, see adc_digi_convert_mode_t.

adc_digi_output_format_t format

ADC DMA conversion output format, see adc_digi_output_format_t.

struct adc_continuous_evt_data_t

Event data structure.

**Note:** The conv_frame_buffer is maintained by the driver itself, so never free this piece of memory.

**Public Members**

uint8_t * conv_frame_buffer

Pointer to conversion result buffer for one conversion frame.

uint32_t size

Conversion frame size.

struct adc_continuous_evt_cbs_t

Group of ADC continuous mode callbacks.

**Note:** These callbacks are all running in an ISR environment.

**Note:** When CONFIG_ADC_CONTINUOUS_ISR_IRAM_SAFE is enabled, the callback itself and functions called by it should be placed in IRAM. Involved variables should be in internal RAM as well.

**Public Members**

adc_continuous_callback_t on_conv_done

Event callback, invoked when one conversion frame is done. See the subsection Driver Backgrounds in this header file to learn about the conversion frame concept.

adc_continuous_callback_t on_pool_ovf

Event callback, invoked when the internal pool is full.

**Macros**

ADC_MAX_DELAY

ADC read max timeout value, it may make the adc_continuous_read block forever if the OS supports.

**Type Definitions**

typedef struct adc_continuous_ctx_t * adc_continuous_handle_t

Type of adc continuous mode driver handle.
Prototype of ADC continuous mode event callback.

- **Param handle** [in] ADC continuous mode driver handle
- **Param edata** [in] Pointer to ADC continuous mode event data
- **Param user_data** [in] User registered context, registered when in

```c
adc_continuous_register_event_callbacks()
```

Return Whether a high priority task is woken up by this function

---

## 2.5.3 Analog to Digital Converter (ADC) Calibration Driver

### Introduction

In ESP32-S2, the digital-to-analog converter (ADC) compares the input analog voltage to the reference, and determines each bit of the output digital result. By design, the ADC reference voltage for ESP32-S2 is 1100 mV. However, the true reference voltage can range from 1000 mV to 1200 mV among different chips. This guide introduces the ADC calibration driver to minimize the effect of different reference voltages, and get more accurate output results.

### Functional Overview

The following sections of this document cover the typical steps to install and use the ADC calibration driver:

- **Calibration Scheme Creation** - covers how to create a calibration scheme handle and delete the calibration scheme handle.
- **Result Conversion** - covers how to convert ADC raw result to calibrated result.
- **Thread Safety** - lists which APIs are guaranteed to be thread-safe by the driver.
- **Minimize Noise** - describes a general way to minimize the noise.

### Calibration Scheme Creation

The ADC calibration driver provides ADC calibration scheme(s). From the calibration driver’s point of view, an ADC calibration scheme is created for an ADC calibration handle `adc_cali_handle_t`.

`adc_cali_check_scheme()` can be used to know which calibration scheme is supported on the chip. If you already know the supported schemes, this step can be skipped. Just call the corresponding function to create the scheme handle.

If you use your custom ADC calibration schemes, you could either modify this function `adc_cali_check_scheme()`, or just skip this step and call your custom creation function.

### ADC Calibration Line Fitting Scheme

ESP32-S2 supports `ADC_CALI_SCHEME_VER_LINE_FITTING` scheme. To create this scheme, set up `adc_cali_line_fitting_config_t` first.

```c
adc_cali_line_fitting_config_t::unit_id, the ADC that your ADC raw results are from.
adc_cali_line_fitting_config_t::atten, ADC attenuation that your ADC raw results use.
adc_cali_line_fitting_config_t::bitwidth, bit width of ADC raw result.
```

After setting up the configuration structure, call `adc_cali_create_scheme_line_fitting()` to create a Line Fitting calibration scheme handle.

This function may fail due to reasons such as `ESP_ERR_INVALID_ARG` or `ESP_ERR_NO_MEM`. Especially, when the function returns `ESP_ERR_NOT_SUPPORTED`, this means the calibration scheme required eFuse bits are not burned on your board.
When the ADC calibration is no longer used, please delete the calibration scheme handle by calling `adc_cali_delete_scheme_line_fitting()`.

Delete Line Fitting Scheme

```c
ESP_LOGI(TAG, "delete %s calibration scheme", "Line Fitting");
ESP_ERROR_CHECK(adc_cali_delete_scheme_line_fitting(handle));
```

Note: If you want to use your custom calibration schemes, you could provide a creation function to create your calibration scheme handle. Check the function table `adc_cali_scheme_t` in `components/esp_adc/interface/adc_cali_interface.h` to know the ESP ADC calibration interface.

Result Conversion After setting up the calibration characteristics, you can call `adc_cali_raw_toVoltage()` to convert the ADC raw result into calibrated result. The calibrated result is in the unit of mV. This function may fail due to an invalid argument. Especially, if this function returns `ESP_ERR_INVALID_STATE`, this means the calibration scheme is not created. You need to create a calibration scheme handle, use `adc_cali_check_scheme()` to know the supported calibration scheme. On the other hand, you could also provide a custom calibration scheme and create the handle.

Get Voltage

```c
ESP_ERROR_CHECK(adc_cali_raw_to_voltage(adc_cali_handle, adc_raw[0][0], &
→voltage[0][0]));
ESP_LOGI(TAG, "ADC%d Channel[%d] Cali Voltage: %d mV", ADC_UNIT_1 + 1, EXAMPLE_→ADC1_CHAN0, voltage[0][0]);
```

Thread Safety The factory function `esp_adc_cali_new_scheme()` is guaranteed to be thread-safe by the driver. Therefore, you can call them from different RTOS tasks without protection by extra locks.

Other functions that take the `adc_cali_handle_t` as the first positional parameter are not thread-safe, you should avoid calling them from multiple tasks.

Minimize Noise The ESP32-S2 ADC is sensitive to noise, leading to large discrepancies in ADC readings. Depending on the usage scenario, you may need to connect a bypass capacitor (e.g., a 100 nF ceramic capacitor) to the ADC input pad in use, to minimize noise. Besides, multisampling may also be used to further mitigate the effects of noise.

API Reference

Header File

- `components/esp_adc/include/esp_adc/adc_cali.h`
- This header file can be included with:

```c
#include "esp_adc/adc_cali.h"
```
This header file is a part of the API provided by the `esp_adc` component. To declare that your component depends on `esp_adc`, add the following to your CMakeLists.txt:

```cmake
REQUIRES esp_adc
```

or

```cmake
PRIV_REQUIRES esp_adc
```

### Functions

#### `adc_cali_check_scheme` (esp_err_t adc_cali_check_scheme (adc_cali_scheme_ver_t *scheme_mask))

Check the supported ADC calibration scheme.

**Parameters**

- `scheme_mask` -out Supported ADC calibration scheme(s)

**Returns**

- ESP_OK: On success
- ESP_ERR_INVALID_ARG: Invalid argument
- ESP_ERR_NOT_SUPPORTED: No supported calibration scheme

#### `adc_cali_raw_to_voltage` (esp_err_t adc_cali_raw_to_voltage (adc_cali_handle_t handle, int raw, int *voltage))

Convert ADC raw data to calibrated voltage.

**Parameters**

- `handle` -in ADC calibration handle
- `raw` -in ADC raw data
- `voltage` -out Calibrated ADC voltage (in mV)

**Returns**

- ESP_OK: On success
- ESP_ERR_INVALID_ARG: Invalid argument
- ESP_ERR_INVALID_STATE: Invalid state, scheme didn’t registered

### Type Definitions

```c
typedef struct adc_cali_scheme_t *adc_cali_handle_t
```

ADC calibration handle.

### Enumerations

```c
enum adc_cali_scheme_ver_t
```

ADC calibration scheme.

**Values:**

- `ADC_CALI_SCHEME_VER_LINE_FITTING` Line fitting scheme.
- `ADC_CALI_SCHEME_VER_CURVE_FITTING` Curve fitting scheme.

### Header File

- `components/esp_adc/include/esp_adc/adc_cali_scheme.h`

This header file can be included with:

```c
#include "esp_adc/adc_cali_scheme.h"
```

This header file is a part of the API provided by the `esp_adc` component. To declare that your component depends on `esp_adc`, add the following to your CMakeLists.txt:

```cmake
REQUIRES esp_adc
```
2.5.4 Clock Tree

The clock subsystem of ESP32-S2 is used to source and distribute system/module clocks from a range of root clocks. The clock tree driver maintains the basic functionality of the system clock and the intricate relationship among module clocks.

This document starts with the introduction to root and module clocks. Then it covers the clock tree APIs that can be called to monitor the status of the module clocks at runtime.

Introduction

This section lists definitions of ESP32-S2’s supported root clocks and module clocks. These definitions are commonly used in the driver configuration, to help select a proper source clock for the peripheral.

Root Clocks Root clocks generate reliable clock signals. These clock signals then pass through various gates, muxes, dividers, or multipliers to become the clock sources for every functional module: the CPU core(s), Wi-Fi, Bluetooth, the RTC, and the peripherals.

ESP32-S2’s root clocks are listed in `soc_root_clk_t`:

- **Internal 8 MHz RC Oscillator (RC_FAST)**
  This RC oscillator generates a about 8.5 MHz clock signal output as the `RC_FAST_CLK`. The about 8.5 MHz signal output is also passed into a configurable divider, which by default divides the input clock frequency by 256, to generate a `RC_FAST_D256_CLK`. The exact frequency of `RC_FAST_CLK` can be computed in runtime through calibration on the `RC_FAST_D256_CLK`.

- **External 40 MHz Crystal (XTAL)**

- **Internal 90 kHz RC Oscillator (RC_SLOW)**
  This RC oscillator generates a about 90kHz clock signal output as the `RC_SLOW_CLK`. The exact frequency of this clock can be computed in runtime through calibration.

- **External 32 kHz Crystal - optional (XTAL32K)**
  The clock source for this XTAL32K_CLK can be either a 32 kHz crystal connecting to the `XTAL_32K_P` and `XTAL_32K_N` pins or a 32 kHz clock signal generated by an external circuit. The external signal must be connected to the `XTAL_32K_P` pin. XTAL32K_CLK can also be calibrated to get its exact frequency.

Typically, the frequency of the signal generated from an RC oscillator circuit is less accurate and more sensitive to the environment compared to the signal generated from a crystal. ESP32-S2 provides several clock source options for the `RTC_SLOW_CLK`, and it is possible to make the choice based on the requirements for system time accuracy and power consumption. For more details, please refer to `RTC Timer Clock Sources`.

Module Clocks ESP32-S2’s available module clocks are listed in `soc_module_clk_t`. Each module clock has a unique ID. You can get more information on each clock by checking the documented enum value.
API Usage

The clock tree driver provides an all-in-one API to get the frequency of the module clocks, `esp_clk_tree_src_get_freq_hz()`. This function allows you to obtain the clock frequency at any time by providing the clock name `soc_module_clk_t` and specifying the desired precision level for the returned frequency value `esp_clk_tree_src_freq_precision_t`.

API Reference

Header File

- `components/soc/esp32s2/include/soc/clk_tree_defs.h`
- This header file can be included with:

```c
#include "soc/clk_tree_defs.h"
```

Macros

- **SOC_CLK_RC_FAST_FREQ_APPROX**
  Approximate RC_FAST_CLK frequency in Hz
- **SOC_CLK_RC_SLOW_FREQ_APPROX**
  Approximate RC_SLOW_CLK frequency in Hz
- **SOC_CLK_RC_FAST_D256_FREQ_APPROX**
  Approximate RC_FAST_D256_CLK frequency in Hz
- **SOC_CLK_XTAL32K_FREQ_APPROX**
  Approximate XTAL32K_CLK frequency in Hz
- **SOC_GPTIMER_CLKS**
  Array initializer for all supported clock sources of GPTimer.

The following code can be used to iterate all possible clocks:

```c
soc_periph_gptimer_clk_src_t gptimer_clks[] = (soc_periph_gptimer_clk_src_t)SOC_GPTIMER_CLKS;
for (size_t i = 0; i < sizeof(gptimer_clks) / sizeof(gptimer_clks[0]); i++) {
    soc_periph_gptimer_clk_src_t clk = gptimer_clks[i];
    // Test GPTimer with the clock 'clk'
}
```

- **SOC_LCD_CLKS**
  Array initializer for all supported clock sources of LCD.

- **SOC_RMT_CLKS**
  Array initializer for all supported clock sources of RMT.

- **SOC_TEMP_SENSOR_CLKS**
  Array initializer for all supported clock sources of Temperature Sensor.

- **SOC_I2S_CLKS**
  Array initializer for all supported clock sources of I2S.
Chapter 2. API Reference

**SOC_I2C_CLKS**
Array initializer for all supported clock sources of I2C.

**SOC_SPI_CLKS**
Array initializer for all supported clock sources of SPI.

**SOC_SDM_CLKS**
Array initializer for all supported clock sources of SDM.

**SOC_GLITCH_FILTER_CLKS**
Array initializer for all supported clock sources of Glitch Filter.

**SOC_DAC_DIGI_CLKS**
Array initializer for all supported clock sources of DAC digital controller.

**SOC_DAC_COSINE_CLKS**
Array initializer for all supported clock sources of DAC cosine wave generator.

**SOC_TWAI_CLKS**
Array initializer for all supported clock sources of TWAI.

**SOC_ADC_DIGI_CLKS**
Array initializer for all supported clock sources of ADC digital controller.

**SOC_ADC_RTC_CLKS**
Array initializer for all supported clock sources of ADC RTC controller.

**SOC_MWDT_CLKS**
Array initializer for all supported clock sources of MWDT.

**SOC_LEDC_CLKS**
Array initializer for all supported clock sources of LEDC.

**Enumerations**

```c
enum soc_root_clk_t
{
    Root clock.
    
    Values:
    
    enumerator SOC_ROOT_CLK_INT_RC_FAST
        Internal 8MHz RC oscillator
    
    enumerator SOC_ROOT_CLK_INT_RC_SLOW
        Internal 90kHz RC oscillator
    
    enumerator SOC_ROOT_CLK_EXT_XTAL
        External 40MHz crystal
}
```
Chapter 2. API Reference

enumerator **SOC_ROOT_CLK_EXT_XTAL32K**
External 32kHz crystal/clock signal

enum **soc_cpu_clk_src_t**
CPU_CLK mux inputs, which are the supported clock sources for the CPU_CLK.

**Note:** Enum values are matched with the register field values on purpose

Values:

enumerator **SOC_CPU_CLK_SRC_XTAL**
Select XTAL_CLK as CPU_CLK source

enumerator **SOC_CPU_CLK_SRC_PLL**
Select PLL_CLK as CPU_CLK source (PLL_CLK is the output of 40MHz crystal oscillator frequency multiplier, can be 480MHz or 320MHz)

enumerator **SOC_CPU_CLK_SRC_RC_FAST**
Select RC_FAST_CLK as CPU_CLK source

enumerator **SOC_CPU_CLK_SRC_APLL**
Select APLL_CLK as CPU_CLK source

enumerator **SOC_CPU_CLK_SRC_INVALID**
Invalid CPU_CLK source

enum **soc_rtc_slow_clk_src_t**
RTC_SLOW_CLK mux inputs, which are the supported clock sources for the RTC_SLOW_CLK.

**Note:** Enum values are matched with the register field values on purpose

Values:

enumerator **SOC_RTC_SLOW_CLK_SRC_RC_SLOW**
Select RC_SLOW_CLK as RTC_SLOW_CLK source

enumerator **SOC_RTC_SLOW_CLK_SRC_XTAL32K**
Select XTAL32K_CLK as RTC_SLOW_CLK source

enumerator **SOC_RTC_SLOW_CLK_SRC_RC_FAST_D256**
Select RC_FAST_D256_CLK (referred as FOSC_DIV or 8m_d256/8md256 in TRM and reg. description) as RTC_SLOW_CLK source

enumerator **SOC_RTC_SLOW_CLK_SRC_INVALID**
Invalid RTC_SLOW_CLK source

enum **soc_rtc_fast_clk_src_t**
RTC_FAST_CLK mux inputs, which are the supported clock sources for the RTC_FAST_CLK.
**Note:** Enum values are matched with the register field values on purpose

**Values:**

enumerator **SOC_RTC_FAST_CLK_SRC_XTAL_D4**  
Select XTAL\_D4\_CLK (may referred as XTAL\_CLK\_DIV\_4) as RTC\_FAST\_CLK source

enumerator **SOC_RTC_FAST_CLK_SRC_XTAL_DIV**  
Alias name for **SOC_RTC_FAST_CLK_SRC_XTAL_D4**

enumerator **SOC_RTC_FAST_CLK_SRC_RC_FAST**  
Select RC\_FAST\_CLK as RTC\_FAST\_CLK source

enumerator **SOC_RTC_FAST_CLK_SRC_INVALID**  
Invalid RTC\_FAST\_CLK source

**enum soc\_module\_clk\_t**  
Supported clock sources for modules (CPU, peripherals, RTC, etc.)

**Note:** enum starts from 1, to save 0 for special purpose

**Values:**

enumerator **SOC_MOD_CLK_CPU**  
CPU\_CLK can be sourced from XTAL, PLL, RC\_FAST, or APLL by configuring soc\_cpu\_clk\_src\_t

enumerator **SOC_MOD_CLK_RTC_FAST**  
RTC\_FAST\_CLK can be sourced from XTAL\_D4 or RC\_FAST by configuring soc\_rtc\_fast\_clk\_src\_t

enumerator **SOC_MOD_CLK_RTC_SLOW**  
RTC\_SLOW\_CLK can be sourced from RC\_SLOW, XTAL32K, or RC\_FAST\_D256 by configuring soc\_rtc\_slow\_clk\_src\_t

enumerator **SOC_MOD_CLK_APB**  
APB\_CLK is highly dependent on the CPU\_CLK source

enumerator **SOC_MOD_CLK_PLL_F160M**  
PLL\_F160M\_CLK is derived from PLL, and has a fixed frequency of 160MHz

enumerator **SOC_MOD_CLK_XTAL32K**  
XTAL32K\_CLK comes from the external 32kHz crystal, passing a clock gating to the peripherals

enumerator **SOC_MOD_CLK_RC_FAST**  
RC\_FAST\_CLK comes from the internal 8MHz rc oscillator, passing a clock gating to the peripherals

enumerator **SOC_MOD_CLK_RC_FAST_D256**  
RC\_FAST\_D256\_CLK is derived from the internal 8MHz rc oscillator, divided by 256, and passing a clock gating to the peripherals
Chapter 2. API Reference

enumerator **SOC_MOD_CLK_XTAL**
XTAL_CLK comes from the external 40MHz crystal

enumerator **SOC_MOD_CLK_REF_TICK**
REF_TICK is derived from XTAL or RC_FAST via a divider, it has a fixed frequency of 1MHz by default

enumerator **SOC_MOD_CLK_APLL**
APLL is sourced from PLL, and its frequency is configurable through APLL configuration registers

enumerator **SOC_MOD_CLK_TEMP_SENSOR**
TEMP_SENSOR_CLK comes directly from the internal 8MHz rc oscillator

enumerator **SOC_MOD_CLK_INVALID**
Indication of the end of the available module clock sources

enum **soc_periph_systimer_clk_src_t**
Type of SYSTIMER clock source.

Values:

enumerator **SYSTIMER_CLK_SRC_XTAL**
SYSTIMER source clock is XTAL

enumerator **SYSTIMER_CLK_SRC_DEFAULT**
SYSTIMER source clock default choice is XTAL

enum **soc_periph_gptimer_clk_src_t**
Type of GPTimer clock source.

Values:

enumerator **GPTIMER_CLK_SRC_APB**
Select APB as the source clock

enumerator **GPTIMER_CLK_SRC_XTAL**
Select XTAL as the source clock

enumerator **GPTIMER_CLK_SRC_DEFAULT**
Select APB as the default choice

enum **soc_periph_tg_clk_src_legacy_t**
Type of Timer Group clock source, reserved for the legacy timer group driver.

Values:

enumerator **TIMER_SRC_CLK_APB**
Timer group source clock is APB

enumerator **TIMER_SRC_CLK_XTAL**
Timer group source clock is XTAL
enumerator **TIMER_SRC_CLK_DEFAULT**
Timer group source clock default choice is APB

enum **soc_periph_lcd_clk_src_t**
Type of LCD clock source.

*Values:*

enumerator **LCD_CLK_SRC_PLL160M**
Select PLL_F160M as the source clock

enumerator **LCD_CLK_SRC_DEFAULT**
Select PLL_F160M as the default choice

enum **soc_periph_rmt_clk_src_t**
Type of RMT clock source.

*Values:*

enumerator **RMT_CLK_SRC_APB**
Select APB as the source clock

enumerator **RMT_CLK_SRC_REF_TICK**
Select REF_TICK as the source clock

enumerator **RMT_CLK_SRC_DEFAULT**
Select APB as the default choice

enum **soc_periph_rmt_clk_src_legacy_t**
Type of RMT clock source, reserved for the legacy RMT driver.

*Values:*

enumerator **RMT_BASECLK_APB**
RMT source clock is APB CLK

enumerator **RMT_BASECLK_REF**
RMT source clock is REF_TICK

enumerator **RMT_BASECLK_DEFAULT**
RMT source clock default choice is APB

enum **soc_periph_temperature_sensor_clk_src_t**
Type of Temp Sensor clock source.

*Values:*

enumerator **TEMPERATURE_SENSOR_CLK_SRC_RC_FAST**
Select RC_FAST as the source clock

enumerator **TEMPERATURE_SENSOR_CLK_SRC_DEFAULT**
Select RC_FAST as the default choice
enum `soc_periph_uart_clk_src_legacy_t`
Type of UART clock source, reserved for the legacy UART driver.

Values:

enumerator `UART_SCLK_APB`
    UART source clock is APB CLK

enumerator `UART_SCLK_REF_TICK`
    UART source clock is REF_TICK

enumerator `UART_SCLK_DEFAULT`
    UART source clock default choice is APB

enum `soc_periph_i2s_clk_src_t`
I2S clock source enum.

Values:

enumerator `I2S_CLK_SRC_DEFAULT`
    Select PLL_F160M as the default source clock

enumerator `I2S_CLK_SRC_PLL_160M`
    Select PLL_F160M as the source clock

enumerator `I2S_CLK_SRC_APLL`
    Select APLL as the source clock

enum `soc_periph_i2c_clk_src_t`
Type of I2C clock source.

Values:

enumerator `I2C_CLK_SRC_APB`

enumerator `I2C_CLK_SRC_REF_TICK`

enumerator `I2C_CLK_SRC_DEFAULT`

enum `soc_periph_spi_clk_src_t`
Type of SPI clock source.

Values:

enumerator `SPI_CLK_SRC_DEFAULT`
    Select APB as SPI source clock

enumerator `SPI_CLK_SRC_APB`
    Select XTAL as SPI source clock
enum **soc_periph_sdm_clk_src_t**
Sigma Delta Modulator clock source.

*Values:*

enumerator **SDM_CLK_SRC_APB**
Select APB as the source clock

enumerator **SDM_CLK_SRC_DEFAULT**
Select APB as the default clock choice

descend

enum **soc_periph_glitch_filter_clk_src_t**
Glitch filter clock source.

*Values:*

enumerator **GLITCH_FILTER_CLK_SRC_APB**
Select APB clock as the source clock

enumerator **GLITCH_FILTER_CLK_SRC_DEFAULT**
Select APB clock as the default clock choice

descend

enum **soc_periph_dac_digi_clk_src_t**
DAC digital controller clock source.

*Values:*

enumerator **DAC_DIGI_CLK_SRC_APB**
Select APB as the source clock

enumerator **DAC_DIGI_CLK_SRC_APLL**
Select APLL as the source clock

enumerator **DAC_DIGI_CLK_SRC_DEFAULT**
Select APB as the default source clock

descend

enum **soc_periph_dac_cosine_clk_src_t**
DAC cosine wave generator clock source.

*Values:*

enumerator **DAC_COSINE_CLK_SRC_RTC_FAST**
Select RTC FAST as the source clock

enumerator **DAC_COSINE_CLK_SRC_DEFAULT**
Select RTC FAST as the default source clock

descend

enum **soc_periph_twai_clk_src_t**
TWAI clock source.

*Values:*

enumerator TWAI_CLK_SRC_APB
   Select APB as the source clock

enumerator TWAI_CLK_SRC_DEFAULT
   Select APB as the default clock choice

enum soc_periph_adc_digi_clk_src_t
ADC digital controller clock source.
   Values:
   
   enumerator ADC_DIGI_CLK_SRC_APB
      Select APB as the source clock

   enumerator ADC_DIGI_CLK_SRC_APLL
      Select APLL as the source clock

   enumerator ADC_DIGI_CLK_SRC_DEFAULT
      Select APB as the default clock choice

enum soc_periph_adc_rtc_clk_src_t
ADC RTC controller clock source.
   Values:

   enumerator ADC_RTC_CLK_SRC_RC_FAST
      Select RC_FAST as the source clock

   enumerator ADC_RTC_CLK_SRC_DEFAULT
      Select RC_FAST as the default clock choice

enum soc_periph_mwdt_clk_src_t
MWDT clock source.
   Values:

   enumerator MWDT_CLK_SRC_APB
      Select APB as the source clock

   enumerator MWDT_CLK_SRC_DEFAULT
      Select APB as the default clock choice

enum soc_periph_ledc_clk_src_legacy_t
Type of LEDC clock source, reserved for the legacy LEDC driver.
   Values:

   enumerator LEDC_AUTO_CLK
      LEDC source clock will be automatically selected based on the giving resolution and duty parameter when init the timer
enumerator **LEDC_USE_APB_CLK**
    Select APB as the source clock

enumerator **LEDC_USE_RC_FAST_CLK**
    Select RC_FAST as the source clock

enumerator **LEDC_USE_REF.Tick**
    Select REF_Tick as the source clock

enumerator **LEDC_USE_XTAL_CLK**
    Select XTAL as the source clock

enumerator **LEDC_USE_RTC8M_CLK**
    Alias of ‘LEDC_USE_RC_FAST_CLK’

e num **soc_clkout_sig_id_t**
    Values:

enumerator **CLKOUT_SIG_PLL**
    PLL_CLK is the output of crystal oscillator frequency multiplier

enumerator **CLKOUT_SIG_RC_SLOW**
    RC slow clock, depends on the RTC_CLK_SRC configuration

enumerator **CLKOUT_SIG_XTAL**
    Main crystal oscillator clock

enumerator **CLKOUT_SIG_APLL**
    Divided by PLL, frequency is configurable

enumerator **CLKOUT_SIG_REF_Tick**
    Divided by APB clock, usually be 1MHz

enumerator **CLKOUT_SIG_PLL_F80M**
    From PLL, usually be 80MHz

enumerator **CLKOUT_SIG_RC_FAST**
    RC fast clock, about 17.5MHz

enumerator **CLKOUT_SIG_INVALID**

Header File

- components/esp_hw_support/include/esp_clk_tree.h
- This header file can be included with:

```
#include "esp_clk_tree.h"
```
Chapter 2. API Reference

Functions

```c
esp_err_t esp_clk_tree_src_get_freq_hz(soc_module_clk_t clk_src, esp_clk_tree_src_freq_precision_t precision, uint32_t *freq_value)
```

Get frequency of module clock source.

**Parameters**

- `clk_src` [in] Clock source available to modules, in soc_module_clk_t
- `precision` [in] Degree of precision, one of esp_clk_tree_src_freq_precision_t values. This arg only applies to the clock sources that their frequencies can vary: SOC_MOD_CLK_RTC_FAST, SOC_MOD_CLK_RTC_SLOW, SOC_MOD_CLK_RC_FAST, SOC_MOD_CLK_RC_FAST_D256, SOC_MOD_CLK_XTAL32K. For other clock sources, this field is ignored.
- `freq_value` [out] Frequency of the clock source, in Hz

**Returns**

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_FAIL Calibration failed

Enumerations

```c
enum esp_clk_tree_src_freq_precision_t
```

Degree of precision of frequency value to be returned by esp_clk_tree_src_get_freq_hz()

**Values:**

- `ESP_CLK_TREE_SRC_FREQ_PRECISION_CACHED`
- `ESP_CLK_TREE_SRC_FREQ_PRECISION_APPROX`
- `ESP_CLK_TREE_SRC_FREQ_PRECISION_EXACT`
- `ESP_CLK_TREE_SRC_FREQ_PRECISION_INVALID`

2.5.5 Digital To Analog Converter (DAC)

Overview

ESP32-S2 has two 8-bit DAC (digital to analog converter) channels respectively connected to GPIO17 (Channel 1) and GPIO18 (Channel 2). Each DAC channel can convert the digital value 0–255 to the analog voltage 0~Vref (The reference voltage ‘Vref’ here is input from the pin VDD3P3_RTC_IO, which ideally equals to the power supply VDD). The output voltage can be calculated as the following:

```
out_voltage = Vref * digi_val / 255
```

The DAC peripheral supports outputting analog signal in the following ways:

1. Outputting a voltage directly. The DAC channel keeps outputting a specified voltage.
2. Outputting continuous analog signal by DMA. The DAC converts the data in a buffer at a specified frequency.
3. Outputting a cosine wave by the cosine wave generator. The DAC channel can output a cosine wave with specified frequency and amplitude.

For other analog output options, see Sigma-Delta Modulation and LED Control. Both modules produce high-frequency PWM/PDM output, which can be hardware low-pass filtered in order to generate a lower frequency analog output.
Chapter 2. API Reference

DAC File Structure

Public headers that need to be included in the DAC application are listed as follows:

- **dac.h**: The top header file of the legacy DAC driver, which should be only included in the apps which use the legacy driver API.
- **dac_oneshot.h**: The top header file of the new DAC driver, which should be included in the apps which use the new driver API with one-shot mode.
- **dac_cosine.h**: The top header file of the new DAC driver, which should be included in the apps which use the new driver API with cosine mode.
- **dac_continuous.h**: The top header file of the new DAC driver, which should be included in the apps which use the new driver API with continuous mode.

**Note:** The legacy driver cannot coexist with the new driver. Include **dac.h** to use the legacy driver or **dac_oneshot.h, dac_cosine.h, and dac_continuous.h** to use the new driver. The legacy driver might be removed in the future.

Functional Overview

**Resources Management** The DAC on ESP32-S2 has two channels. The channels have separate software resources and can be managed by **dac_oneshot_handle_t**, **dac_cosine_handle_t**, or **dac_continuous_handle_t** according to the usage. Registering different modes on a same DAC channel is not allowed.

**Direct Voltage Output (One-shot/Direct Mode)** The DAC channels in the group can convert an 8-bit digital value into the analog when **dac_oneshot_output_voltage()** is called (it can be called in ISR). The analog voltage is kept on the DAC channel until the next conversion starts. To start the voltage conversion, the DAC channels need to be enabled first through registering by **dac_oneshot_new_channel()**.

**Continuous Wave Output (Continuous/DMA Mode)** DAC channels can convert digital data continuously via the DMA. There are three ways to write the DAC data:

1. Normal writing (synchronous): Data can be transmitted at one time and kept blocked until all the data has been loaded into the DMA buffer, and the voltage is kept as the last conversion value while no more data is
inputted. It is usually used to transport a long signal like an audio. To convert data continuously, the con-
tinuous channel handle need to be allocated by calling `dac_continuous_new_channels()` and the
DMA conversion should be enabled by calling `dac_continuous_enable()`. Then data can be written
by `dac_continuous_write()` synchronously. Refer to `peripherals/dac/dac_continuous/dac_audio` for
elements.

2. Cyclical writing: A piece of data can be converted cyclically without blocking, and no more operation is needed
after the data are loaded into the DMA buffer. But note that the inputted buffer size is limited by the number
of descriptors and the DMA buffer size. It is usually used to transport short signals that need to be repeated,
e.g., a sine wave. To achieve cyclical writing, call `dac_continuous_write_cyclically()` after the
DAC continuous mode is enabled. Refer to `peripherals/dac/dac_continuous/signal_generator` for
examples.

3. Asynchronous writing: Data can be transmitted asynchronously based on the event callback.
`dac_event_callbacks_t::on_convert_done` must be registered to use asynchronous
mode. Users can get the `dac_event_data_t` in the callback which contains the DMA
buffer address and length, allowing them to load the data into the buffer directly. To use the
asynchronous writing, call `dac_continuous_register_event_callback()` to reg-
ister the `dac_event_callbacks_t::on_convert_done` before enabling, and then
`dac_continuous_start_async_writing()` to start the asynchronous writing. Note that
once the asynchronous writing is started, the callback function will be triggered continuously. Call
`dac_continuous_write_asynchronously()` to load the data either in a separate task or in the
callback directly. Refer to `peripherals/dac/dac_continuous/dac_audio` for examples.

On ESP32-S2, the DAC digital controller can be connected internally to the SPI3 and use its DMA for continuous
conversion.

The clock sources of the DAC digital controller include:

- `dac_continuous_digi_clk_src_t::DAC_DIGI_CLK_SRC_APB` supports frequency
  between 77 Hz to several MHz. It is the default clock which can also be selected by
  `dac_continuous_digi_clk_src_t::DAC_DIGI_CLK_SRC_DEFAULT`.
- `dac_continuous_digi_clk_src_t::DAC_DIGI_CLK_SRC_APLL` supports frequency between 6
  Hz to several MHz. However, it might be occupied by other peripherals, thus not providing the required
  frequency. In such case, this clock source is available only if APLL still can be correctly divided into the target
  DAC DMA frequency.

Cosine Wave Output (Cosine Mode)  The DAC peripheral has a cosine wave generator, which can generate cosine
wave on the channels. Users can specify the frequency, amplitude, and phase of the cosine wave. To output the cosine
wave, please acquire the DAC to cosine mode using `dac_cosine_new_channel()`, and then start the cosine
wave generator by `dac_cosine_start()`.

Currently, the clock source of the cosine wave generator only comes from `RTC_FAST` which can be selected by
`dac_cosine_clk_src_t::DAC_COSINE_CLK_SRC_RTC_FAST`. It is also the default clock source which
is the same as `dac_cosine_clk_src_t::DAC_COSINE_CLK_SRC_RTC_DEFAULT`.

Power Management  When the power management is enabled (i.e., `CONFIG_PM_ENABLE` is on), the system will
adjust or stop the clock source of DAC before entering Light-sleep mode, thus potential influence to the DAC signals
may lead to false data conversion.

When using DAC driver in continuous mode, it can prevent the system from changing or stopping the clock source in
DMA or cosine mode by acquiring a power management lock. When the clock source is generated from APB, the lock
type will be set to `esp_pm_lock_type_t::ESP_PM_APB_FREQ_MAX`. When the clock source is APPL (only
in DMA mode), it will be set to `esp_pm_lock_type_t::ESP_PM_NO_LIGHT_SLEEP`. Whenever the DAC
is converting (i.e., DMA or cosine wave generator is working), the driver guarantees that the power management
lock is acquired after calling `dac_continuous_enable()`. Likewise, the driver will release the lock when
`dac_continuous_disable()` is called.

IRAM Safe  By default, the DAC DMA interrupt will be deferred when the cache is disabled for reasons like
writing/erasing Flash. Thus the DMA EOF interrupt will not get executed in time.
Chapter 2. API Reference

To avoid such case in real-time applications, you can enable the Kconfig option `CONFIG_DAC_ISR_IRAM_SAFE` which:

1. Enables the interrupt being serviced even when cache is disabled;
2. Places driver object into DRAM (in case it is linked to PSRAM by accident).

This allows the interrupt to run while the cache is disabled but comes at the cost of increased IRAM consumption.

**Thread Safety**  All the public DAC APIs are guaranteed to be thread safe by the driver, which means users can call them from different RTOS tasks without protection by extra locks. Notice that the DAC driver uses mutex lock to ensure the thread safety, thus the APIs except `dac_oneshot_output_voltage()` are not allowed to be used in ISR.

**Kconfig Options**

- `CONFIG_DAC_ISR_IRAM_SAFE` controls whether the default ISR handler can work when cache is disabled. See [IRAM Safe](#) for more information.
- `CONFIG_DAC_SUPPRESS_DEPRECATE_WARN` controls whether to suppress the warning message compilation while using the legacy DAC driver.
- `CONFIG_DAC_ENABLE_DEBUG_LOG` is used to enable the debug log output. Enable this option increases the firmware binary size.

**Application Example**

The basic examples for the One-shot Mode, Continuous Mode, and Cosine Mode can be found in:

- `peripherals/dac/dac_oneshot`
- `peripherals/dac/dac_continuous`
- `peripherals/dac/dac_cosine_wave`

**API Reference**

**Header File**

- `components/driver/dac/include/driver/dac_oneshot.h`
- This header file can be included with:

  ```
  #include "driver/dac_oneshot.h"
  ```

- This header file is a part of the API provided by the driver component. To declare that your component depends on driver, add the following to your CMakeLists.txt:

  ```
  REQUIRES driver
  ```

  or

  ```
  PRIV_REQUIRES driver
  ```

**Functions**

```c
esp_err_t dac_oneshot_new_channel (const dac_oneshot_config_t *oneshot_cfg, dac_oneshot_handle_t *ret_handle)
```

Allocate a new DAC oneshot channel.

**Note:** The channel will be enabled as well when the channel allocated

**Parameters**
Chapter 2  API Reference

• oneshot_cfg [in] The configuration for the oneshot channel
• ret_handle [out] The returned oneshot channel handle

Returns
• ESP_ERR_INVALID_ARG The input parameter is invalid
• ESP_ERR_INVALID_STATE The DAC channel has been registered already
• ESP_ERR_NO_MEM No memory for the DAC oneshot channel resources
• ESP_OK Allocate the new DAC oneshot channel success

dac_oneshot_del_channel (dac_oneshot_handle_t handle)
Delete the DAC oneshot channel.

Note: The channel will be disabled as well when the channel deleted

Parameters handle [in] The DAC oneshot channel handle

Returns
• ESP_ERR_INVALID_ARG The input parameter is invalid
• ESP_ERR_INVALID_STATE The channel has already been de-registered
• ESP_OK Delete the oneshot channel success

espr.ERR_dac_oneshot_output_voltage (dac_oneshot_handle_t handle, uint8_t digi_value)
Output the voltage.

Note: Generally it’ll take 7~11 us on ESP32 and 10~21 us on ESP32-S2

Parameters
• handle [in] The DAC oneshot channel handle
• digi_value [in] The digital value that need to be converted

Returns
• ESP_ERR_INVALID_ARG The input parameter is invalid
• ESP_OK Convert the digital value success

Structures

struct dac_oneshot_config_t
DAC oneshot channel configuration.

Public Members

dac_channel_t chan_id
DAC channel id

Type Definitions
typedef struct dac_oneshot_s *dac_oneshot_handle_t
DAC oneshot channel handle

Header File
• components/driver/dac/include/driver/dac_cosine.h
• This header file can be included with:
• This header file is a part of the API provided by the driver component. To declare that your component depends on driver, add the following to your CMakeLists.txt:

```c
REQUIRES driver
```

or

```c
PRIV_REQUIRES driver
```

## Functions

### `esp_err_t dac_cosine_new_channel(const dac_cosine_config_t *cos_cfg, dac_cosine_handle_t *ret_handle)`

Allocate a new DAC cosine wave channel.

**Note:** Since there is only one cosine wave generator, only the first channel can set the frequency of the cosine wave. Normally, the latter one is not allowed to set a different frequency, but the it can be forced to set by setting the bit `force_set_freq` in the configuration, notice that another channel will be affected as well when the frequency is updated.

**Parameters**

- `cos_cfg` ─ [in] The configuration of cosine wave channel
- `ret_handle` ─ [out] The returned cosine wave channel handle

**Returns**

- ESP_ERR_INVALID_ARG The input parameter is invalid
- ESP_ERR_INVALID_STATE The DAC channel has been registered already
- ESP_ERR_NO_MEM No memory for the DAC cosine wave channel resources
- ESP_OK Allocate the new DAC cosine wave channel success

### `esp_err_t dac_cosine_del_channel(dac_cosine_handle_t handle)`

Delete the DAC cosine wave channel.

**Parameters**

- `handle` ─ [in] The DAC cosine wave channel handle

**Returns**

- ESP_ERR_INVALID_ARG The input parameter is invalid
- ESP_ERR_INVALID_STATE The channel has already been deregistered
- ESP_OK Delete the cosine wave channel success

### `esp_err_t dac_cosine_start(dac_cosine_handle_t handle)`

Start outputting the cosine wave on the channel.

**Parameters**

- `handle` ─ [in] The DAC cosine wave channel handle

**Returns**

- ESP_ERR_INVALID_ARG The input parameter is invalid
- ESP_ERR_INVALID_STATE The channel has been started already
- ESP_OK Start the cosine wave success

### `esp_err_t dac_cosine_stop(dac_cosine_handle_t handle)`

Stop outputting the cosine wave on the channel.

**Parameters**

- `handle` ─ [in] The DAC cosine wave channel handle

**Returns**

- ESP_ERR_INVALID_ARG The input parameter is invalid
- ESP_ERR_INVALID_STATE The channel has been stopped already
- ESP_OK Stop the cosine wave success
Chapter 2. API Reference

Structures

struct `dac_cosine_config_t`

DAC cosine channel configurations.

Public Members

`dac_channel_t` `chan_id`

The cosine wave channel id

`uint32_t` `freq_hz`

The frequency of cosine wave, unit: Hz. The cosine wave generator is driven by RTC_FAST clock which is divide from RC_FAST. With the default RTC clock, the minimum frequency of cosine wave is about 130 Hz. Although it can support up to several MHz frequency theoretically, the waveform will distort at high frequency due to the hardware limitation. Typically not suggest to set the frequency higher than 200 KHz

`dac_cosine_clk_src_t` `clk_src`

The clock source of the cosine wave generator, currently only support `DAC_COSINE_CLK_SRC_DEFAULT`

`dac_cosine_atten_t` `atten`

The attenuation of cosine wave amplitude

`dac_cosine_phase_t` `phase`

The phase of cosine wave, can only support `DAC_COSINE_PHASE_0` or `DAC_COSINE_PHASE_180`, default as 0 while setting an unsupported phase

`int8_t` `offset`

The DC offset of cosine wave

`bool` `force_set_freq`

Force to set the cosine wave frequency

`struct dac_cosine_config_t::[anonymous]` `flags`

Flags of cosine mode

Type Definitions

typedef struct dac_cosine_s *`dac_cosine_handle_t`

DAC cosine wave channel handle

Header File

- `components/driver/dac/include/driver/dac_continuous.h`
- This header file can be included with:

  ```
  #include "driver/dac_continuous.h"
  ```

- This header file is a part of the API provided by the `driver` component. To declare that your component depends on `driver`, add the following to your CMakeLists.txt:
REQUIRES driver
or
PRIV_REQUIRES driver

Functions

**esp_err_t** **dac_continuous_new_channels**(const **dac_continuous_config_t** *cont_cfg, **dac_continuous_handle_t** *ret_handle)

Allocate new DAC channels in continuous mode.

**Note:** The DAC channels can’t be registered to continuous mode separately

**Parameters**
- **cont_cfg** [in] Continuous mode configuration
- **ret_handle** [out] The returned continuous mode handle

**Returns**
- ESP_ERR_INVALID_ARG The input parameter is invalid
- ESP_ERR_INVALID_STATE The DAC channel has been registered already
- ESP_ERR_NOT_FOUND Not found the available dma peripheral, might be occupied
- ESP_ERR_NO_MEM No memory for the DAC continuous mode resources
- ESP_OK Allocate the new DAC continuous mode success

**esp_err_t** **dac_continuous_del_channels**( **dac_continuous_handle_t** handle)

Delete the DAC continuous handle.

**Parameters** handle [in] The DAC continuous channel handle that obtained from ‘dac_continuous_new_channels’

**Returns**
- ESP_ERR_INVALID_ARG The input parameter is invalid
- ESP_ERR_INVALID_STATE The channels have already been deregistered or not disabled
- ESP_OK Delete the continuous channels success

**esp_err_t** **dac_continuous_enable**( **dac_continuous_handle_t** handle)

Enabled the DAC continuous mode.

**Note:** Must enable the channels before

**Parameters** handle [in] The DAC continuous channel handle that obtained from ‘dac_continuous_new_channels’

**Returns**
- ESP_ERR_INVALID_ARG The input parameter is invalid
- ESP_ERR_INVALID_STATE The channels have been enabled already
- ESP_OK Enable the continuous output success

**esp_err_t** **dac_continuous_disable**( **dac_continuous_handle_t** handle)

Disable the DAC continuous mode.

**Parameters** handle [in] The DAC continuous channel handle that obtained from ‘dac_continuous_new_channels’

**Returns**
- ESP_ERR_INVALID_ARG The input parameter is invalid
- ESP_ERR_INVALID_STATE The channels have been enabled already
- ESP_OK Disable the continuous output success
```c
esp_err_t dac_continuous_write (dac_continuous_handle_t handle, uint8_t*buf, size_t buf_size, size_t *bytes_loaded, int timeout_ms)
```

Write DAC data continuously.

**Note:** The data in buffer will only be converted one time. This function will be blocked until all data loaded or timeout then the DAC output will keep outputting the voltage of the last data in the buffer.

**Note:** Specially, on ESP32, the data bit width of DAC continuous data is fixed to 16 bits while only the high 8 bits are available. The driver will help to expand the inputted buffer automatically by default, you can also align the data to 16 bits manually by clearing `CONFIG_DAC_DMA_AUTO_16BIT_ALIGN` in menuconfig.

### Parameters

- **handle** – [in] The DAC continuous channel handle that obtained from `dac_continuous_new_channels`
- **buf** – [in] The digital data buffer to convert
- **buf_size** – [in] The buffer size of digital data buffer
- **bytes_loaded** – [out] The bytes that has been loaded into DMA buffer, can be NULL if don’t need it
- **timeout_ms** – [in] The timeout time in millisecond, set a minus value means will block forever

### Returns

- ESP_ERR_INVALID_ARG The input parameter is invalid
- ESP_ERR_INVALID_STATE The DAC continuous mode has not been enabled yet
- ESP_ERR_TIMEOUT Waiting for semaphore or message queue timeout
- ESP_OK Success to output the acyclic DAC data

```c
esp_err_t dac_continuous_write_cyclically (dac_continuous_handle_t handle, uint8_t*buf, size_t buf_size, size_t *bytes_loaded)
```

Write DAC continuous data cyclically.

**Note:** The data in buffer will be converted cyclically using DMA once this function is called, This function will return once the data loaded into DMA buffers.

**Note:** The buffer size of cyclically output is limited by the descriptor number and dma buffer size while initializing the continuous mode. Concretely, in order to load all the data into descriptors, the cyclic buffer size is not supposed to be greater than `desc_num * buf_size`.

**Note:** Specially, on ESP32, the data bit width of DAC continuous data is fixed to 16 bits while only the high 8 bits are available. The driver will help to expand the inputted buffer automatically by default, you can also align the data to 16 bits manually by clearing `CONFIG_DAC_DMA_AUTO_16BIT_ALIGN` in menuconfig.

### Parameters

- **handle** – [in] The DAC continuous channel handle that obtained from `dac_continuous_new_channels`
- **buf** – [in] The digital data buffer to convert
- **buf_size** – [in] The buffer size of digital data buffer
- **bytes_loaded** – [out] The bytes that has been loaded into DMA buffer, can be NULL if don’t need it

### Returns

- ESP_ERR_INVALID_ARG The input parameter is invalid
• ESP_ERR_INVALID_STATE The DAC continuous mode has not been enabled yet
• ESP_OK Success to output the acyclic DAC data

`esp_err_t dac_continuous_register_event_callback(dac_continuous_handle_t handle, const dac_event_callbacks_t *callbacks, void *user_data)`

Set event callbacks for DAC continuous mode.

**Note:** User can deregister a previously registered callback by calling this function and setting the callback member in the `callbacks` structure to NULL.

**Note:** When `CONFIG_DAC_ISR_IRAM_SAFE` is enabled, the callback itself and functions called by it should be placed in IRAM. The variables used in this function, including the `user_data`, should be in the internal RAM as well.

**Parameters**

- `handle` - [in] The DAC continuous channel handle that obtained from `dac_continuous_new_channels`
- `callbacks` - [in] Group of callback functions, input NULL to clear the former callbacks
- `user_data` - [in] User data, which will be passed to callback functions directly

**Returns**

- ESP_OK Set event callbacks successfully
- ESP_ERR_INVALID_ARG Set event callbacks failed because of invalid argument

`esp_err_t dac_continuous_start_async_writing(dac_continuous_handle_t handle)`

Start the async writing.

**Note:** When the asynchronous writing start, the DAC will keep outputting ‘0’ until the data are loaded into the DMA buffer. To loaded the data into DMA buffer, ‘on_convert_done’ callback is required, which can be registered by `dac_continuous_register_event_callback` before enabling

**Parameters**

- `handle` - [in] The DAC continuous channel handle that obtained from `dac_continuous_new_channels`

**Returns**

- ESP_OK Start asynchronous writing successfully
- ESP_ERR_INVALID_ARG The handle is NULL
- ESP_ERR_INVALID_STATE The channel is not enabled or the ‘on_convert_done’ callback is not registered

`esp_err_t dac_continuous_stop_async_writing(dac_continuous_handle_t handle)`

Stop the sync writing.

**Parameters**

- `handle` - [in] The DAC continuous channel handle that obtained from `dac_continuous_new_channels`

**Returns**

- ESP_OK Stop asynchronous writing successfully
- ESP_ERR_INVALID_ARG The handle is NULL
- ESP_ERR_INVALID_STATE Asynchronous writing has not started

`esp_err_t dac_continuous_write_asynchronously(dac_continuous_handle_t handle, uint8_t *dma_buf, size_t dma_buf_len, const uint8_t *data, size_t data_len, size_t *bytes_loaded)`

Write DAC data asynchronously.
### Parameters

- **handle** - [in] The DAC continuous channel handle that obtained from `dac_continuous_new_channels`
- **dma_buf** - [in] The DMA buffer address, it can be acquired from `dac_event_data_t` in the `on_convert_done` callback
- **dma_buf_len** - [in] The DMA buffer length, it can be acquired from `dac_event_data_t` in the `on_convert_done` callback
- **data** - [in] The data that need to be written
- **data_len** - [in] The data length the need to be written
- **bytes_loaded** - [out] The bytes number that has been loaded/written into the DMA buffer

### Returns

- **ESP_OK** Write the data into DMA buffer successfully
- **ESP_ERR_INVALID_ARG** NULL pointer
- **ESP_ERR_INVALID_STATE** The channels haven’t start the asynchronous writing
- **ESP_ERR_NOT_FOUND** The param `dam_buf` not match any existed DMA buffer

### Structures

```c
struct dac_continuous_config_t  

DAC continuous channels’ configurations.
```

#### Public Members

- **dac_channel_mask_t chan_mask**
  
  DAC channels’ mask for selecting which channels are used

- **uint32_t desc_num**
  
  The number of DMA descriptor, at least 2 descriptors are required. The number of descriptors is directly proportional to the max data buffer size while converting in cyclic output but only need to ensure it is greater than `1` in acyclic output. Typically, suggest to set the number bigger than 5, in case the DMA stopped while sending a short buffer.

- **size_t buf_size**
  
  The DMA buffer size, should be within 32~4092 bytes. Each DMA buffer will be attached to a DMA descriptor, i.e., the number of DMA buffer will be equal to the DMA descriptor number. The DMA buffer size is not allowed to be greater than 4092 bytes. The total DMA buffer size equal to `desc_num * buf_size`. Typically, suggest to set the size to the multiple of 4.

- **uint32_t freq_hz**
  
  The frequency of DAC conversion in continuous mode, unit: Hz. The supported range is related to the target and the clock source. For the clock `DAC_DIGI_CLK_SRC_DEFAULT`: the range is 19.6 KHz to several MHz on ESP32 and 77 Hz to several MHz on ESP32-S2. For the clock `DAC_DIGI_CLK_SRC_APLL`: the range is 648 Hz to several MHz on ESP32 and 6 Hz to several MHz on ESP32-S2. Typically not suggest to set the frequency higher than 2 MHz, otherwise the severe distortion will appear.
int8_t offset
The offset of the DAC digital data. Range -128~127

dac_continuous_digi_clk_src_t clk_src
The clock source of digital controller, which can affect the range of supported frequency. Currently
DAC_DIGI_CLK_SRC_DEFAULT and DAC_DIGI_CLK_SRC_APLL are available

dac_continuous_channel_mode_t chan_mode
The channel mode of continuous mode, only take effect when multiple channels enabled, depends con-
verting the buffer alternately or simultaneously

struct dac_event_data_t
Event structure used in DAC event queue.

Public Members

void *buf
The pointer of DMA buffer that just finished sending

size_t buf_size
The writable buffer size of the DMA buffer, equal to ‘dac_continuous_config_t::buf_size’

size_t write_bytes
The number of bytes that be written successfully

struct dac_event_callbacks_t
Group of DAC callbacks.

Note: The callbacks are all running under ISR environment

Note: When CONFIG_DAC_ISR_IRAM_SAFE is enabled, the callback itself and functions called by it
should be placed in IRAM. The variables used in the function should be in the SRAM as well.

Public Members

dac_isr_callback_t on_convert_done
Callback of data conversion done event. An event data buffer previously loaded to the driver has been
output and converted. The event data includes DMA buffer address and size that just finished converting.

dac_isr_callback_t on_stop
Callback of finished sending all the data. All loaded event data buffers are converted. Driver is pending
for new data buffers to be loaded. The event data will be NULL in this callback.

Type Definitions
typedef struct dac_continuous_s *dac_continuous_handle_t
DAC continuous channel handle
typedef bool (*dac_isr_callback_t)(dac_continuous_handle_t handle, const dac_event_data_t *event, void *user_data)

DAC event callback.

- **Param handle** [in] DAC channel handle, created from `dac_continuous_new_channels()`
- **Param event** [in] DAC event data
- **Param user_data** [in] User registered context, passed from `dac_continuous_register_event_callback()`
- **Return** Whether a high priority task has been waken up by this callback function

**Enumerations**

define dac_channel_mask_t

DAC channel mask.

*Values*:  

- **enumerator DAC_CHANNEL_MASK_CH0**
  
  DAC channel 0 is GPIO25(ESP32) / GPIO17(ESP32S2)

- **enumerator DAC_CHANNEL_MASK_CH1**
  
  DAC channel 1 is GPIO26(ESP32) / GPIO18(ESP32S2)

- **enumerator DAC_CHANNEL_MASK_ALL**
  
  Both DAC channel 0 and channel 1

**Header File**

- components/driver/dac/include/driver/dac_types.h

  This header file can be included with:

  ```
  #include "driver/dac_types.h"
  ```

- This header file is a part of the API provided by the driver component. To declare that your component depends on driver, add the following to your CMakeLists.txt:

  ```
  REQUIRES driver
  ```

  or

  ```
  PRIV_REQUIRES driver
  ```

**Type Definitions**

typedef soc_periph_dac_digi_clk_src_t dac_continuous_digi_clk_src_t

DAC DMA (digital controller) clock source.

typedef soc_periph_dac_cosine_clk_src_t dac_cosine_clk_src_t

DAC cosine wave generator clock source.

**Enumerations**

define dac_continuous_channel_mode_t

DAC channel work mode in dma mode.
Note: Only take effect when multiple channels enabled.

Note: Assume the data in buffer is ‘A B C D E F’

DAC_CHANNEL_MODE_SIMUL:
- channel 0: A B C D E F
- channel 1: A B C D E F

DAC_CHANNEL_MODE_ALTER:
- channel 0: A C E
- channel 1: B D F

Values:

enumerator **DAC_CHANNEL_MODE_SIMUL**
The data in the DMA buffer is simultaneously output to the enable channel of the DAC.

enumerator **DAC_CHANNEL_MODE_ALTER**
The data in the DMA buffer is alternately output to the enable channel of the DAC.

Header File

- **components/hal/include/hal/dac_types.h**
  - This header file can be included with:
    ```
    #include "hal/dac_types.h"
    ```

Enumerations

enum **dac_channel_t**

Values:

enumerator **DAC_CHAN_0**
DAC channel 0 is GPIO25(ESP32) / GPIO17(ESP32S2)

enumerator **DAC_CHAN_1**
DAC channel 1 is GPIO26(ESP32) / GPIO18(ESP32S2)

enumerator **DAC_CHANNEL_1**
Alias of ‘DAC_CHAN_0’, now the channel index start from ‘0’

enumerator **DAC_CHANNEL_2**
Alias of ‘DAC_CHAN_1’, now the channel index start from ‘0’

enum **dac_cosine_atten_t**
The attenuation of the amplitude of the cosine wave generator. The max amplitude is VDD3P3_RTC.

Values:

enumerator **DAC_COSINE_ATTEN_DEFAULT**
No attenuation to the DAC cosine wave amplitude. Default.

enumerator **DAC_COSINE_ATTEN_DB_0**
Original amplitude of the DAC cosine wave, equals to DAC_COSINE_ATTEN_DEFAULT
enumerator **DAC_COSINE_ATTEN_DB_6**
1/2 amplitude of the DAC cosine wave

enumerator **DAC_COSINE_ATTEN_DB_12**
1/4 amplitude of the DAC cosine wave

enumerator **DAC_COSINE_ATTEN_DB_18**
1/8 amplitude of the DAC cosine wave

enum **dac_cosine_phase_t**
Set the phase of the cosine wave generator output.

**Note:** Only 0 or 180 are supported, it will be set to 0 as default if configured to an unsupported phase.

**Values:**

enumerator **DAC_COSINE_PHASE_0**
Phase shift +0°

enumerator **DAC_COSINE_PHASE_180**
Phase shift +180°

### 2.5.6 GPIO & RTC GPIO

**GPIO Summary**

The ESP32-S2 chip features 43 physical GPIO pins (GPIO0 ~ GPIO21 and GPIO26 ~ GPIO46). Each pin can be used as a general-purpose I/O, or be connected to an internal peripheral signal. Through IO MUX, RTC IO MUX and the GPIO matrix, peripheral input signals can be from any IO pins, and peripheral output signals can be routed to any IO pins. Together these modules provide highly configurable I/O. For more details, see *ESP32-S2 Technical Reference Manual > IO MUX and GPIO Matrix (GPIO, IO_MUX)* [PDF].

The table below provides more information on pin usage, and please note the comments in the table for GPIOs with restrictions.

</tr>
</tbody>
</table>

Note:

- Strapping pin: GPIO0, GPIO45 and GPIO46 are strapping pins. For more information, please refer to ESP32-S2 datasheet.
- SPI0/1: GPIO26-32 are usually used for SPI flash and PSRAM and not recommended for other uses.
- JTAG: GPIO39-42 are usually used for inline debug.
- GPI: GPIO46 is fixed to pull-down and is input only.

GPIO driver offers a dump function `gpio_dump_io_configuration()` to show the configurations of the IOs at the moment, such as pull-up / pull-down, input / output enable, pin mapping etc. Below is an example dump:

```
--- IO DUMP Start -------
IO[4] -
  Pullup: 1, Pulldown: 0, DriveCap: 2
  InputEn: 1, OutputEn: 0, OpenDrain: 0
  FuncSel: 1 (GPIO)
  GPIO Matrix SigIn ID: (simple GPIO input)
  SleepSelEn: 1

IO[18] -
  Pullup: 0, Pulldown: 0, DriveCap: 2
  InputEn: 0, OutputEn: 1, OpenDrain: 0
  FuncSel: 1 (GPIO)
```

(continues on next page)
GPIO Matrix SigOut ID: 256 {simple GPIO output}
SleepSelEn: 1

IO[26] **RESERVED**
Pullup: 1, Pulldown: 0, DriveCap: 2
InputEn: 1, OutputEn: 0, OpenDrain: 0
FuncSel: 0 {IOMUX}
SleepSelEn: 1

---------------------IO DUMP End---------------------

If an IO pin is routed to a peripheral signal through the GPIO matrix, the signal ID printed in the dump information is defined in the soc/gpio_sig_map.h file. The word **RESERVED** indicates the IO is occupied by either FLASH or PSRAM. It is strongly not recommended to reconfigure them for other application purposes.

There is also separate “RTC GPIO” support, which functions when GPIOs are routed to the “RTC” low-power and analog subsystem. These pin functions can be used when:

- In Deep-sleep mode
- The Ultra Low Power co-processor is running
- Analog functions such as ADC/DAC/etc are in use

GPIO Glitch Filter

The ESP32-S2 chip features hardware filters to remove unwanted glitch pulses from the input GPIO, which can help reduce false triggering of the interrupt and prevent a noise being routed to the peripheral side.

Each GPIO can be configured with a glitch filter, which can be used to filter out pulses shorter than two sample clock cycles. The duration of the filter is not configurable. The sample clock is the clock source of the IO_MUX. In the driver, we call this kind of filter as pin glitch filter. You can create the filter handle by calling gpio_new_pin_glitch_filter(). All the configurations for a pin glitch filter are listed in the gpio_pin_glitch_filter_config_t structure.

- gpio_pin_glitch_filter_config_t::gpio_num sets the GPIO number to enable the glitch filter.

The glitch filter is disabled by default, and can be enabled by calling gpio_glitch_filter_enable(). To recycle the filter, you can call gpio_del_glitch_filter(). Please note, before deleting the filter, you should disable it first by calling gpio_glitch_filter_disable().

Application Example

- GPIO output and input interrupt example: peripherals/gpio/generic_gpio.

API Reference - Normal GPIO

Header File

- components/esp_driver_gpio/include/driver/gpio.h
- This header file can be included with:

```c
#include "driver/gpio.h"
```

- This header file is a part of the API provided by the esp_driver_gpio component. To declare that your component depends on esp_driver_gpio, add the following to your CMakeLists.txt:
REQUIRES esp_driver_gpio

or

PRIV_REQUIRES esp_driver_gpio

### Functions

**esp_err_t gpio_config (const gpio_config_t *pGPIOConfig)**

GPIO common configuration.

**Parameters** pGPIOConfig – Pointer to GPIO configure struct

**Returns**

- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error

**esp_err_t gpio_reset_pin (gpio_num_t gpio_num)**

Reset an gpio to default state (select gpio function, enable pullup and disable input and output).

**Note:** This function also configures the IOMUX for this pin to the GPIO function, and disconnects any other peripheral output configured via GPIO Matrix.

**Parameters**

- gpio_num – GPIO number.

**Returns** Always return ESP_OK.

**esp_err_t gpio_set_intr_type (gpio_num_t gpio_num, gpio_int_type_t intr_type)**

GPIO set interrupt trigger type.

**Parameters**

- gpio_num – GPIO number. If you want to set the trigger type of e.g. of GPIO16, gpio_num should be GPIO_NUM_16 (16);
- intr_type – Interrupt type, select from gpio_int_type_t

**Returns**

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**esp_err_t gpio_intr_enable (gpio_num_t gpio_num)**

Enable GPIO module interrupt signal.

**Note:** ESP32: Please do not use the interrupt of GPIO36 and GPIO39 when using ADC or Wi-Fi and Bluetooth with sleep mode enabled. Please refer to the comments of adc1_get_raw. Please refer to Section 3.11 of ESP32 ECO and Workarounds for Bugs for the description of this issue.

**Parameters**

- gpio_num – GPIO number. If you want to enable an interrupt on e.g. GPIO16, gpio_num should be GPIO_NUM_16 (16);

**Returns**

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
`esp_err_t gpio_intr_disable`\(\text{gpio_num_t } \text{gpio_num}\)

Disable GPIO module interrupt signal.

**Note:** This function is allowed to be executed when Cache is disabled within ISR context, by enabling `CONFIG_GPIO_CTRL_FUNC_IN_IRAM`

**Parameters**
- `gpio_num` - GPIO number. If you want to disable the interrupt of e.g. GPIO16, `gpio_num` should be `GPIO_NUM_16` (16);

**Returns**
- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error

`esp_err_t gpio_set_level`\(\text{gpio_num_t } \text{gpio_num}, \text{uint32_t } \text{level}\)

GPIO set output level.

**Note:** This function is allowed to be executed when Cache is disabled within ISR context, by enabling `CONFIG_GPIO_CTRL_FUNC_IN_IRAM`

**Parameters**
- `gpio_num` - GPIO number. If you want to set the output level of e.g. GPIO16, `gpio_num` should be `GPIO_NUM_16` (16);
- `level` - Output level. 0: low; 1: high

**Returns**
- ESP_OK Success
- ESP_ERR_INVALID_ARG GPIO number error

`int gpio_get_level`\(\text{gpio_num_t } \text{gpio_num}\)

GPIO get input level.

**Warning:** If the pad is not configured for input (or input and output) the returned value is always 0.

**Parameters**
- `gpio_num` - GPIO number. If you want to get the logic level of e.g. pin GPIO16, `gpio_num` should be `GPIO_NUM_16` (16);

**Returns**
- 0 the GPIO input level is 0
- 1 the GPIO input level is 1

`esp_err_t gpio_set_direction`\(\text{gpio_num_t } \text{gpio_num}, \text{gpio_mode_t } \text{mode}\)

GPIO set direction.

Configure GPIO direction, such as output_only, input_only, output_and_input

**Parameters**
- `gpio_num` - Configure GPIO pins number, it should be GPIO number. If you want to set direction of e.g. GPIO16, `gpio_num` should be `GPIO_NUM_16` (16);
- `mode` - GPIO direction

**Returns**
- ESP_OK Success
- ESP_ERR_INVALID_ARG GPIO error

`esp_err_t gpio_set_pull_mode`\(\text{gpio_num_t } \text{gpio_num}, \text{gpio_pull_mode_t } \text{pull}\)

Configure GPIO pull-up/pull-down resistors.
Note: ESP32: Only pins that support both input & output have integrated pull-up and pull-down resistors. Input-only GPIOs 34-39 do not.

Parameters
- `gpio_num` – GPIO number. If you want to set pull up or down mode for e.g. GPIO16, `gpio_num` should be `GPIO_NUM_16` (16);
- `pull` – GPIO pull up/down mode.

Returns
- ESP_OK Success
- ESP_ERR_INVALID_ARG : Parameter error

```c
esp_err_t gpio_wakeup_enable (gpio_num_t gpio_num, gpio_int_type_t intr_type)
```
Enable GPIO wake-up function.

Parameters
- `gpio_num` – GPIO number.
- `intr_type` – GPIO wake-up type. Only `GPIO_INTR_LOW_LEVEL` or `GPIO_INTR_HIGH_LEVEL` can be used.

Returns
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

```c
esp_err_t gpio_wakeup_disable (gpio_num_t gpio_num)
```
Disable GPIO wake-up function.

Parameters `gpio_num` – GPIO number

Returns
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

```c
esp_err_t gpio_isr_register (void (*)(void*), void* arg, int intr_alloc_flags, gpio_isr_handle_t* handle)
```
Register GPIO interrupt handler, the handler is an ISR. The handler will be attached to the same CPU core that this function is running on.

This ISR function is called whenever any GPIO interrupt occurs. See the alternative `gpio_install_isr_service()` and `gpio_isr_handler_add()` API in order to have the driver support per-GPIO ISRs.

To disable or remove the ISR, pass the returned handle to the `interrupt allocation functions`.

Parameters
- `fn` – Interrupt handler function.
- `arg` – Parameter for handler function
- `intr_alloc_flags` – Flags used to allocate the interrupt. One or multiple (ORred) `ESP_INTR_FLAG_*` values. See esp_intr_alloc.h for more info.
- `handle` – Pointer to return handle. If non-NULL, a handle for the interrupt will be returned here.

Returns
- ESP_OK Success ;
- ESP_ERR_INVALID_ARG GPIO error
- ESP_ERR_NOT_FOUND No free interrupt found with the specified flags

```c
esp_err_t gpio_pullup_en (gpio_num_t gpio_num)
```
Enable pull-up on GPIO.

Parameters `gpio_num` – GPIO number

Returns
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
**esp_err_t** `gpio_pullup_dis` (gpio_num_t gpio_num)

Disable pull-up on GPIO.

**Parameters**
- gpio_num - GPIO number

**Returns**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**esp_err_t** `gpio_pulldown_en` (gpio_num_t gpio_num)

Enable pull-down on GPIO.

**Parameters**
- gpio_num - GPIO number

**Returns**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**esp_err_t** `gpio_pulldown_dis` (gpio_num_t gpio_num)

Disable pull-down on GPIO.

**Parameters**
- gpio_num - GPIO number

**Returns**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**esp_err_t** `gpio_install_isr_service` (int intr_alloc_flags)

Install the GPIO driver’s ETS_GPIO_INTR_SOURCE ISR handler service, which allows per-pin GPIO interrupt handlers. This function is incompatible with `gpio_isr_register()` - if that function is used, a single global ISR is registered for all GPIO interrupts. If this function is used, the ISR service provides a global GPIO ISR and individual pin handlers are registered via the `gpio_isr_handler_add()` function.

**Parameters**
- intr_alloc_flags - Flags used to allocate the interrupt. One or multiple (ORred) ESP_INTR_FLAG_* values. See esp_intr_alloc.h for more info.

**Returns**
- ESP_OK Success
- ESP_ERR_NO_MEM Nomemory to install this service
- ESP_ERR_INVALID_STATE ISR service already installed.
- ESP_ERR_NOT_FOUND Nofree interrupt found with the specified flags
- ESP_ERR_INVALID_ARG GPIO error

void `gpio_uninstall_isr_service` (void)

Uninstall the driver’s GPIO ISR service, freeing related resources.

** esp_err_t** `gpio_isr_handler_add` (gpio_num_t gpio_num, gpio_isr_t isr_handler, void *args)

Add ISR handler for the corresponding GPIO pin.

Call this function after using `gpio_install_isr_service()` to install the driver’s GPIO ISR handler service. The pin ISR handlers no longer need to be declared with IRAM_ATTR, unless you pass the ESP_INTR_FLAG_IRAM flag when allocating the ISR in `gpio_install_isr_service()`.

This ISR handler will be called from an ISR. So there is a stack size limit (configurable as “ISR stack size” in menuconfig). This limit is smaller compared to a global GPIO interrupt handler due to the additional level of indirection.

**Parameters**
- gpio_num - GPIO number
- isr_handler - ISR handler function for the corresponding GPIO number.
- args - parameter for ISR handler.

**Returns**
- ESP_OK Success
- ESP_ERR_INVALID_STATE Wrong state, the ISR service has not been initialized.
- ESP_ERR_INVALID_ARG Parameter error
Chapter 2. API Reference

`esp_err_t gpio_isr_handler_remove(gpio_num_t gpio_num)`  
Remove ISR handler for the corresponding GPIO pin.

**Parameters**  
gpio_num - GPIO number

**Returns**  
- ESP_OK Success  
- ESP_ERR_INVALID_STATE Wrong state, the ISR service has not been initialized.  
- ESP_ERR_INVALID_ARG Parameter error

`esp_err_t gpio_set_drive_capability(gpio_num_t gpio_num, gpio_drive_cap_t strength)`  
Set GPIO pad drive capability.

**Parameters**  
- gpio_num - GPIO number, only support output GPIOs  
- strength - Drive capability of the pad

**Returns**  
- ESP_OK Success  
- ESP_ERR_INVALID_ARG Parameter error

`esp_err_t gpio_get_drive_capability(gpio_num_t gpio_num, gpio_drive_cap_t *strength)`  
Get GPIO pad drive capability.

**Parameters**  
- gpio_num - GPIO number, only support output GPIOs  
- strength - Pointer to accept drive capability of the pad

**Returns**  
- ESP_OK Success  
- ESP_ERR_INVALID_ARG Parameter error

`esp_err_t gpio_hold_en(gpio_num_t gpio_num)`  
Enable gpio pad hold function.

When a GPIO is set to hold, its state is latched at that moment and will not change when the internal signal or the IO MUX/GPIO configuration is modified (including input enable, output enable, output value, function, and drive strength values). This function can be used to retain the state of GPIOs when the chip or system is reset, for example, when watchdog time-out or Deep-sleep events are triggered.

This function works in both input and output modes, and only applicable to output-capable GPIOs. If this function is enabled: in output mode: the output level of the GPIO will be locked and can not be changed. in input mode: the input read value can still reflect the changes of the input signal.

However, on ESP32/S2/C3/S3/C2, this function cannot be used to hold the state of a digital GPIO during Deep-sleep. Even if this function is enabled, the digital GPIO will be reset to its default state when the chip wakes up from Deep-sleep. If you want to hold the state of a digital GPIO during Deep-sleep, please call `gpio_deep_sleep_hold_en`.

Power down or call `gpio_hold_dis` will disable this function.

**Parameters**  
gpio_num - GPIO number, only support output-capable GPIOs

**Returns**  
- ESP_OK Success  
- ESP_ERR_NOT_SUPPORTED Not support pad hold function

`esp_err_t gpio_hold_dis(gpio_num_t gpio_num)`  
Disable gpio pad hold function.

When the chip is woken up from Deep-sleep, the gpio will be set to the default mode, so, the gpio will output the default level if this function is called. If you don’t want the level changes, the gpio should be configured to a known state before this function is called. e.g. If you hold gpio18 high during Deep-sleep, after the chip is woken up and `gpio_hold_dis` is called, gpio18 will output low level (because gpio18 is input mode by default). If you don’t want this behavior, you should configure gpio18 as output mode and set it to hight level before calling `gpio_hold_dis`.

**Parameters**  
gpio_num - GPIO number, only support output-capable GPIOs
Returns

- ESP_OK Success
- ESP_ERR_NOT_SUPPORTED Not support pad hold function

void gpio_deep_sleep_hold_en (void)
Enable all digital gpio pads hold function during Deep-sleep.

Enabling this feature makes all digital gpio pads be at the holding state during Deep-sleep. The state of each pad holds is its active configuration (not pad’s sleep configuration!).

Note that this pad hold feature only works when the chip is in Deep-sleep mode. When the chip is in active mode, the digital gpio state can be changed freely even you have called this function.

After this API is being called, the digital gpio Deep-sleep hold feature will work during every sleep process. You should call gpio_deep_sleep_hold_dis to disable this feature.

void gpio_deep_sleep_hold_dis (void)
Disable all digital gpio pads hold function during Deep-sleep.

void gpio_iomux_in (uint32_t gpio_num, uint32_t signal_idx)
SOC_GPIO_SUPPORT_HOLD_SINGLE_IO_IN_DSLP.
Set pad input to a peripheral signal through the IOMUX.

Parameters

- gpio_num – GPIO number of the pad.
- signal_idx – Peripheral signal id to input. One of the *_IN_IDX signals in soc/gpio_sig_map.h.

void gpio_iomux_out (uint8_t gpio_num, int func, bool oen_inv)
Set peripheral output to an GPIO pad through the IOMUX.

Parameters

- gpio_num – gpio_num GPIO number of the pad.
- func – The function number of the peripheral pin to output pin. One of the FUNC_X_* of specified pin (X) in soc/io_mux_reg.h.
- oen_inv – True if the output enable needs to be inverted, otherwise False.

esp_err_t gpio_force_hold_all (void)
Force hold all digital and rtc gpio pads.

GPIO force hold, no matter the chip in active mode or sleep modes.

This function will immediately cause all pads to latch the current values of input enable, output enable, output value, function, and drive strength values.

Warning: This function will hold flash and UART pins as well. Therefore, this function, and all code run afterwards (till calling gpio_force_unhold_all to disable this feature), MUST be placed in internal RAM as holding the flash pins will halt SPI flash operation, and holding the UART pins will halt any UART logging.

esp_err_t gpio_force_unhold_all (void)
Force unhold all digital and rtc gpio pads.

esp_err_t gpio_sleep_sel_en (gpio_num_t gpio_num)
Enable SLP_SEL to change GPIO status automatically in lightsleep.

Parameters gpio_num – GPIO number of the pad.

Returns

- ESP_OK Success
esp_err_t gpio_sleep_sel_dis (gpio_num_t gpio_num)
Disable SLP_SEL to change GPIO status automatically in lightsleep.

Parameters
- gpio_num - GPIO number of the pad.

Returns
- ESP_OK Success

esp_err_t gpio_sleep_set_direction (gpio_num_t gpio_num, gpio_mode_t mode)
GPIO set direction at sleep.
Configure GPIO direction, such as output_only, input_only, output_and_input

Parameters
- gpio_num - Configure GPIO pins number, it should be GPIO number. If you want to set direction of e.g. GPIO16, gpio_num should be GPIO_NUM_16 (16);
- mode - GPIO direction

Returns
- ESP_OK Success
- ESP_ERR_INVALID_ARG GPIO error

esp_err_t gpio_sleep_set_pull_mode (gpio_num_t gpio_num, gpio_pull_mode_t pull)
Configure GPIO pull-up/pull-down resistors at sleep.

Parameters
- gpio_num - GPIO number. If you want to set pull up or down mode for e.g. GPIO16, gpio_num should be GPIO_NUM_16 (16);
- pull - GPIO pull up/down mode.

Returns
- ESP_OK Success
- ESP_ERR_INVALID_ARG : Parameter error

esp_err_t gpio_dump_io_configuration (FILE *out_stream, uint64_t io_bit_mask)
Dump IO configuration information to console.

Parameters
- out_stream - IO stream (e.g. stdout)
- io_bit_mask - IO pin bit mask, each bit maps to an IO

Returns
- ESP_OK Success
- ESP_ERR_INVALID_ARG : Parameter error

Structures

struct gpio_config_t
Configuration parameters of GPIO pad for gpio_config function.

Public Members

uint64_t pin_bit_mask
GPIO pin: set with bit mask, each bit maps to a GPIO
**gpio_mode_t mode**
> GPIO mode: set input/output mode

**gpio_pullup_t pull_up_en**
> GPIO pull-up

**gpio_pulldown_t pull_down_en**
> GPIO pull-down

Enumerations

enum gpio_port_t

    Values:

    enumerator GPIO_PORT_0

    enumerator GPIO_PORT_MAX

enum gpio_int_type_t

    Values:

    enumerator GPIO_INTR_DISABLE
        Disable GPIO interrupt

    enumerator GPIO_INTR_POSEDGE
        GPIO interrupt type: rising edge

    enumerator GPIO_INTR_NEGEDGE
        GPIO interrupt type: falling edge

    enumerator GPIO_INTR_ANYEDGE
        GPIO interrupt type: both rising and falling edge

    enumerator GPIO_INTR_LOW_LEVEL
        GPIO interrupt type: input low level trigger

    enumerator GPIO_INTR_HIGH_LEVEL
        GPIO interrupt type: input high level trigger

    enumerator GPIO_INTR_MAX

enum gpio_mode_t

    Values:
enumerator GPIO_MODE_DISABLE
    GPIO mode: disable input and output

enumerator GPIO_MODE_INPUT
    GPIO mode: input only

enumerator GPIO_MODE_OUTPUT
    GPIO mode: output only mode

enumerator GPIO_MODE_OUTPUT_OD
    GPIO mode: output only with open-drain mode

enumerator GPIO_MODE_INPUT_OUTPUT_OD
    GPIO mode: output and input with open-drain mode

enumerator GPIO_MODE_INPUT_OUTPUT
    GPIO mode: output and input mode

enum gpio_pullup_t
    Values:

    enumerator GPIO_PULLUP_DISABLE
        Disable GPIO pull-up resistor

    enumerator GPIO_PULLUP_ENABLE
        Enable GPIO pull-up resistor

enum gpio_pulldown_t
    Values:

    enumerator GPIO_PULLDOWN_DISABLE
        Disable GPIO pull-down resistor

    enumerator GPIO_PULLDOWN_ENABLE
        Enable GPIO pull-down resistor

enum gpio_pull_mode_t
    Values:

    enumerator GPIO_PULLUP_ONLY
        Pad pull up

    enumerator GPIO_PULLDOWN_ONLY
        Pad pull down

    enumerator GPIO_PULLUP_PULLDOWN
        Pad pull up + pull down
enumerator GPIO_FLOATING
    Pad floating

enum gpio_drive_cap_t
    Values:

    enumerator GPIO_DRIVE_CAP_0
        Pad drive capability: weak

    enumerator GPIO_DRIVE_CAP_1
        Pad drive capability: stronger

    enumerator GPIO_DRIVE_CAP_2
        Pad drive capability: medium

    enumerator GPIO_DRIVE_CAP_DEFAULT
        Pad drive capability: medium

    enumerator GPIO_DRIVE_CAP_3
        Pad drive capability: strongest

    enumerator GPIO_DRIVE_CAP_MAX

API Reference - RTC GPIO

Header File

- components/esp_driver_gpio/include/driver/rtc_io.h
- This header file can be included with:

        #include "driver/rtc_io.h"

- This header file is part of the API provided by the esp_driver_gpio component. To declare that your component depends on esp_driver_gpio, add the following to your CMakeLists.txt:

        REQUIRES esp_driver_gpio

        or

        PRIV_REQUIRES esp_driver_gpio

Functions

bool rtc_gpio_is_valid_gpio (gpio_num_t gpio_num)
    Determine if the specified GPIO is a valid RTC GPIO.

    Parameters gpio_num - GPIO number
    Returns true if GPIO is valid for RTC GPIO use. false otherwise.

int rtc_io_number_get (gpio_num_t gpio_num)
    Get RTC IO index number by gpio number.

    Parameters gpio_num - GPIO number
    Returns >=0: Index of rtcio. -1 : The gpio is not rtcio.
**Chapter 2. API Reference**

*esp_err_t rtc_gpio_init (gpio_num_t gpio_num)*

Init a GPIO as RTC GPIO.

This function must be called when initializing a pad for an analog function.

**Parameters**
- `gpio_num` - GPIO number (e.g. GPIO_NUM_12)

**Returns**
- ESP_OK success
- ESP_ERR_INVALID_ARG GPIO is not an RTC IO

*esp_err_t rtc_gpio_deinit (gpio_num_t gpio_num)*

Init a GPIO as digital GPIO.

**Parameters**
- `gpio_num` - GPIO number (e.g. GPIO_NUM_12)

**Returns**
- ESP_OK success
- ESP_ERR_INVALID_ARG GPIO is not an RTC IO

*uint32_t rtc_gpio_get_level (gpio_num_t gpio_num)*

Get the RTC IO input level.

**Parameters**
- `gpio_num` - GPIO number (e.g. GPIO_NUM_12)

**Returns**
- 1 High level
- 0 Low level
- ESP_ERR_INVALID_ARG GPIO is not an RTC IO

*esp_err_t rtc_gpio_set_level (gpio_num_t gpio_num, uint32_t level)*

Set the RTC IO output level.

**Parameters**
- `gpio_num` - GPIO number (e.g. GPIO_NUM_12)
- `level` - output level

**Returns**
- ESP_OK Success
- ESP_ERR_INVALID_ARG GPIO is not an RTC IO

*esp_err_t rtc_gpio_set_direction (gpio_num_t gpio_num, rtc_gpio_mode_t mode)*

RTC GPIO set direction.

Configure RTC GPIO direction, such as output only, input only, output and input.

**Parameters**
- `gpio_num` - GPIO number (e.g. GPIO_NUM_12)
- `mode` - GPIO direction

**Returns**
- ESP_OK Success
- ESP_ERR_INVALID_ARG GPIO is not an RTC IO

*esp_err_t rtc_gpio_set_direction_in_sleep (gpio_num_t gpio_num, rtc_gpio_mode_t mode)*

RTC GPIO set direction in deep sleep mode or disable sleep status (default). In some application scenarios, IO needs to have another states during deep sleep.

NOTE: ESP32 supports INPUT_ONLY mode. The rest targets support INPUT_ONLY, OUTPUT_ONLY, INPUT_OUTPUT mode.

**Parameters**
- `gpio_num` - GPIO number (e.g. GPIO_NUM_12)
- `mode` - GPIO direction

**Returns**
- ESP_OK Success
- ESP_ERR_INVALID_ARG GPIO is not an RTC IO
esp_err_t rtc_gpio_pullup_en(gpio_num_t gpio_num)

RTC GPIO pullup enable.

This function only works for RTC IOs. In general, call gpio_pullup_en, which will work both for normal GPIOs and RTC IOs.

Parameters
  gpio_num – GPIO number (e.g. GPIO_NUM_12)

Returns
  • ESP_OK Success
  • ESP_ERR_INVALID_ARG GPIO is not an RTC IO

esp_err_t rtc_gpio_pulldown_en(gpio_num_t gpio_num)

RTC GPIO pulldown enable.

This function only works for RTC IOs. In general, call gpio_pulldown_en, which will work both for normal GPIOs and RTC IOs.

Parameters
  gpio_num – GPIO number (e.g. GPIO_NUM_12)

Returns
  • ESP_OK Success
  • ESP_ERR_INVALID_ARG GPIO is not an RTC IO

esp_err_t rtc_gpio_pullup_dis(gpio_num_t gpio_num)

RTC GPIO pullup disable.

This function only works for RTC IOs. In general, call gpio_pullup_dis, which will work both for normal GPIOs and RTC IOs.

Parameters
  gpio_num – GPIO number (e.g. GPIO_NUM_12)

Returns
  • ESP_OK Success
  • ESP_ERR_INVALID_ARG GPIO is not an RTC IO

esp_err_t rtc_gpio_pulldown_dis(gpio_num_t gpio_num)

RTC GPIO pulldown disable.

This function only works for RTC IOs. In general, call gpio_pulldown_dis, which will work both for normal GPIOs and RTC IOs.

Parameters
  gpio_num – GPIO number (e.g. GPIO_NUM_12)

Returns
  • ESP_OK Success
  • ESP_ERR_INVALID_ARG GPIO is not an RTC IO

esp_err_t rtc_gpio_set_drive_capability(gpio_num_t gpio_num, gpio_drive_cap_t strength)

Set RTC GPIO pad drive capability.

Parameters
  • gpio_num – GPIO number, only support output GPIOs
  • strength – Drive capability of the pad

Returns
  • ESP_OK Success
  • ESP_ERR_INVALID_ARG Parameter error

esp_err_t rtc_gpio_get_drive_capability(gpio_num_t gpio_num, gpio_drive_cap_t *strength)

Get RTC GPIO pad drive capability.

Parameters
  • gpio_num – GPIO number, only support output GPIOs
  • strength – Pointer to accept drive capability of the pad

Returns
  • ESP_OK Success
  • ESP_ERR_INVALID_ARG Parameter error
**esp_err_t rtc_gpio_iomux_func_sel (gpio_num_t gpio_num, int func)**

Select a RTC IOMUX function for the RTC IO.

**Parameters**
- gpio_num – GPIO number
- func – Function to assign to the pin

**Returns**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**esp_err_t rtc_gpio_hold_en (gpio_num_t gpio_num)**

Enable hold function on an RTC IO pad.

Enabling HOLD function will cause the pad to latch current values of input enable, output enable, output value, function, drive strength values. This function is useful when going into light or deep sleep mode to prevent the pin configuration from changing.

**Parameters**
- gpio_num – GPIO number (e.g. GPIO_NUM_12)

**Returns**
- ESP_OK Success
- ESP_ERR_INVALID_ARG GPIO is not an RTC IO

**esp_err_t rtc_gpio_hold_dis (gpio_num_t gpio_num)**

Disable hold function on an RTC IO pad.

Disabling hold function will allow the pad receive the values of input enable, output enable, output value, function, drive strength from RTC_IO peripheral.

**Parameters**
- gpio_num – GPIO number (e.g. GPIO_NUM_12)

**Returns**
- ESP_OK Success
- ESP_ERR_INVALID_ARG GPIO is not an RTC IO

**esp_err_t rtc_gpio_force_hold_en_all (void)**

Enable force hold signal for all RTC IOs.

Each RTC pad has a “force hold” input signal from the RTC controller. If this signal is set, pad latches current values of input enable, function, output enable, and other signals which come from the RTC mux. Force hold signal is enabled before going into deep sleep for pins which are used for EXT1 wakeup.

**esp_err_t rtc_gpio_force_hold_dis_all (void)**

Disable force hold signal for all RTC IOs.

**esp_err_t rtc_gpio_wakeup_enable (gpio_num_t gpio_num, gpio_int_type_t intr_type)**

Enable wakeup from sleep mode using specific GPIO.

**Parameters**
- gpio_num – GPIO number
- intr_type – Wakeup on high level (GPIO_INTR_HIGH_LEVEL) or low level (GPIO_INTR_LOW_LEVEL)

**Returns**
- ESP_OK on success
- ESP_ERR_INVALID_ARG if gpio_num is not an RTC IO, or intr_type is not one of GPIO_INTR_HIGH_LEVEL, GPIO_INTR_LOW_LEVEL.

**esp_err_t rtc_gpio_wakeup_disable (gpio_num_t gpio_num)**

Disable wakeup from sleep mode using specific GPIO.

**Parameters**
- gpio_num – GPIO number

**Returns**
- ESP_OK on success
- ESP_ERR_INVALID_ARG if gpio_num is not an RTC IO
Chapter 2. API Reference

Enumerations

enum **rtc_gpio_mode_t**

RTCIO output/input mode type.

**Values:**

- enumerator **RTC_GPIO_MODE_INPUT_ONLY**
  
  Pad input

- enumerator **RTC_GPIO_MODE_OUTPUT_ONLY**
  
  Pad output

- enumerator **RTC_GPIO_MODE_INPUT_OUTPUT**
  
  Pad input + output

- enumerator **RTC_GPIO_MODE_DISABLED**
  
  Pad (output + input) disable

- enumerator **RTC_GPIO_MODE_OUTPUT_OD**
  
  Pad open-drain output

- enumerator **RTC_GPIO_MODE_INPUT_OUTPUT_OD**
  
  Pad input + open-drain output
API Reference - GPIO Glitch Filter

Header File

- components/esp_driver_gpio/include/driver/gpio_filter.h
- This header file can be included with:
  ```
  #include "driver/gpio_filter.h"
  ```
- This header file is a part of the API provided by the esp_driver_gpio component. To declare that your component depends on esp_driver_gpio, add the following to your CMakeLists.txt:
  ```
  REQUIRES esp_driver_gpio
  or
  PRIV_REQUIRES esp_driver_gpio
  ```

Functions

`esp_err_t gpio_new_pin_glitch_filter` (const `gpio_pin_glitch_filter_config_t` *config, 
`gpio_glitch_filter_handle_t` *ret_filter)

Create a pin glitch filter.

**Note:** Pin glitch filter parameters are fixed, pulses shorter than two sample clocks (IO-MUX’s source clock) will be filtered out. It’s independent with “flex” glitch filter. See also `gpio_new_flex_glitch_filter`.

**Note:** The created filter handle can later be deleted by `gpio_del_glitch_filter`.

**Parameters**
- `config` [in] Glitch filter configuration
- `ret_filter` [out] Returned glitch filter handle

**Returns**
- ESP_OK: Create a pin glitch filter successfully
- ESP_ERR_INVALID_ARG: Create a pin glitch filter failed because of invalid arguments (e.g. wrong GPIO number)
- ESP_ERR_NO_MEM: Create a pin glitch filter failed because of out of memory
- ESP_FAIL: Create a pin glitch filter failed because of other error

`esp_err_t gpio_new_flex_glitch_filter` (const `gpio_flex_glitch_filter_config_t` *config, 
`gpio_glitch_filter_handle_t` *ret_filter)

Allocate a flex glitch filter.

**Note:** “flex” means the filter parameters (window, threshold) are adjustable. It’s independent with pin glitch filter. See also `gpio_new_pin_glitch_filter`.

**Note:** The created filter handle can later be deleted by `gpio_del_glitch_filter`.

**Parameters**
- `config` [in] Glitch filter configuration
- `ret_filter` [out] Returned glitch filter handle

**Returns**
- ESP_OK: Allocate a flex glitch filter successfully
• ESP_ERR_INVALID_ARG: Allocate a flex glitch filter failed because of invalid arguments (e.g. wrong GPIO number, filter parameters out of range)
• ESP_ERR_NO_MEM: Allocate a flex glitch filter failed because of out of memory
• ESP_ERR_NOT_FOUND: Allocate a flex glitch filter failed because the underlying hardware resources are used up
• ESP_FAIL: Allocate a flex glitch filter failed because of other error

`esp_err_t gpio_del_glitch_filter (gpio_glitch_filter_handle_t filter)`
Delete a glitch filter.

Parameters

- `filter` — [in] Glitch filter handle returned from `gpio_new_flex_glitch_filter` or `gpio_new_pin_glitch_filter`

Returns

- ESP_OK: Delete glitch filter successfully
- ESP_ERR_INVALID_ARG: Delete glitch filter failed because of invalid arguments
- ESP_ERR_INVALID_STATE: Delete glitch filter failed because the glitch filter is still in working
- ESP_FAIL: Delete glitch filter failed because of other error

`esp_err_t gpio_glitch_filter_enable (gpio_glitch_filter_handle_t filter)`
Enable a glitch filter.

Parameters

- `filter` — [in] Glitch filter handle returned from `gpio_new_flex_glitch_filter` or `gpio_new_pin_glitch_filter`

Returns

- ESP_OK: Enable glitch filter successfully
- ESP_ERR_INVALID_ARG: Enable glitch filter failed because of invalid arguments
- ESP_ERR_INVALID_STATE: Enable glitch filter failed because the glitch filter is already enabled
- ESP_FAIL: Enable glitch filter failed because of other error

`esp_err_t gpio_glitch_filter_disable (gpio_glitch_filter_handle_t filter)`
Disable a glitch filter.

Parameters

- `filter` — [in] Glitch filter handle returned from `gpio_new_flex_glitch_filter` or `gpio_new_pin_glitch_filter`

Returns

- ESP_OK: Disable glitch filter successfully
- ESP_ERR_INVALID_ARG: Disable glitch filter failed because of invalid arguments
- ESP_ERR_INVALID_STATE: Disable glitch filter failed because the glitch filter is not enabled yet
- ESP_FAIL: Disable glitch filter failed because of other error

**Structures**

`struct gpio_pin_glitch_filter_config_t`
Configuration of GPIO pin glitch filter.

**Public Members**

- `glitch_filter_clock_source_t clk_src`
  
  Clock source for the glitch filter

- `gpio_num_t gpio_num`
  
  GPIO number
Chapter 2. API Reference

struct gpio_flex_glitch_filter_config_t
Configuration of GPIO flex glitch filter.

Public Members

glitch_filter_clock_source_t clk_src
Clock source for the glitch filter

gpio_num_t gpio_num
GPIO number

uint32_t window_width_ns
Sample window width (in ns)

uint32_t window_thres_ns
Sample window threshold (in ns), during the window_width_ns sample window, any pulse whose width < window_thres_ns will be discarded.

Type Definitions
typedef struct gpio_glitch_filter_t *gpio_glitch_filter_handle_t
typedef of GPIO glitch filter handle.

2.5.7 General Purpose Timer (GPTimer)

Introduction
GPTimer (General Purpose Timer) is the driver of ESP32-S2 Timer Group peripheral. The hardware timer features high resolution and flexible alarm action. The behavior when the internal counter of a timer reaches a specific target value is called a timer alarm. When a timer alarms, a user registered per-timer callback would be called.

Typically, a general purpose timer can be used in scenarios like:

• Free running as a wall clock, fetching a high-resolution timestamp at any time and any places
• Generate period alarms, trigger events periodically
• Generate one-shot alarm, respond in target time

Functional Overview
The following sections of this document cover the typical steps to install and operate a timer:

• Resource Allocation - covers which parameters should be set up to get a timer handle and how to recycle the resources when GPTimer finishes working.
• Set and Get Count Value - covers how to force the timer counting from a start point and how to get the count value at anytime.
• Set up Alarm Action - covers the parameters that should be set up to enable the alarm event.
• Register Event Callbacks - covers how to hook user specific code to the alarm event callback function.
• Enable and Disable Timer - covers how to enable and disable the timer.
• Start and Stop Timer - shows some typical use cases that start the timer with different alarm behavior.
• Power Management - describes how different source clock selections can affect power consumption.
**IRAM Safe** - describes tips on how to make the timer interrupt and IO control functions work better along with a disabled cache.

**Thread Safety** - lists which APIs are guaranteed to be thread safe by the driver.

**Kconfig Options** - lists the supported Kconfig options that can be used to make a different effect on driver behavior.

### Resource Allocation

Different ESP chips might have different numbers of independent timer groups, and within each group, there could also be several independent timers.\(^1\)

A GPTimer instance is represented by `gptimer_handle_t`. The driver behind manages all available hardware resources in a pool, so that you do not need to care about which timer and which group it belongs to.

To install a timer instance, there is a configuration structure that needs to be given in advance: `gptimer_config_t`:

- `gptimer_config_t::clk_src` selects the source clock for the timer. The available clocks are listed in `gptimer_clock_source_t`, you can only pick one of them. For the effect on power consumption of different clock source, please refer to Section **Power Management**.
- `gptimer_config_t::direction` sets the counting direction of the timer, supported directions are listed in `gptimer_count_direction_t`, you can only pick one of them.
- `gptimer_config_t::resolution_hz` sets the resolution of the internal counter. Each count step is equivalent to \(1 / \text{resolution_hz}\) seconds.
- `gptimer_config::intr_priority` sets the priority of the timer interrupt. If it is set to 0, the driver will allocate an interrupt with a default priority. Otherwise, the driver will use the given priority.
- Optional `gptimer_config_t::intr_shared` sets whether or not mark the timer interrupt source as a shared one. For the pros/cons of a shared interrupt, you can refer to **Interrupt Handling**.

With all the above configurations set in the structure, the structure can be passed to `gptimer_new_timer()` which will instantiate the timer instance and return a handle of the timer.

The function can fail due to various errors such as insufficient memory, invalid arguments, etc. Specifically, when there are no more free timers (i.e., all hardware resources have been used up), then `ESP_ERR_NOT_FOUND` will be returned. The total number of available timers is represented by the `SOC_TIMER_GROUP_TOTAL_TIMERS` and its value depends on the ESP chip.

If a previously created GPTimer instance is no longer required, you should recycle the timer by calling `gptimer_del_timer()`. This allows the underlying HW timer to be used for other purposes. Before deleting a GPTimer handle, please disable it by `gptimer_disable()` in advance or make sure it has not enabled yet by `gptimer_enable()`.

### Creating a GPTimer Handle with Resolution of 1 MHz

```c
// Creating a GPTimer Handle with Resolution of 1 MHz

gptimer_handle_t gptimer = NULL;
gptimer_config_t timer_config = {
    .clk_src = GPTIMER_CLK_SRC_DEFAULT,
    .direction = GPTIMER_COUNT_UP,
    .resolution_hz = 1 * 1000 * 1000, // 1MHz, 1 tick = 1us
};
ESP_ERROR_CHECK(gptimer_new_timer(&timer_config, &gptimer));
```

### Set and Get Count Value

When the GPTimer is created, the internal counter will be reset to zero by default. The counter value can be updated asynchronously by `gptimer_set_raw_count()`. The maximum count value is dependent on the bit width of the hardware timer, which is also reflected by the SOC macro `SOC_TIMER_GROUP_COUNTER_BIT_WIDTH`. When updating the raw count of an active timer, the timer will immediately start counting from the new value.

Count value can be retrieved by `gptimer_get_raw_count()`, at any time.

\(^1\) Different ESP chip series might have different numbers of GPTimer instances. For more details, please refer to [ESP32-S2 Technical Reference Manual > Chapter Timer Group (TIMG)](PDF). The driver does forbid you from applying for more timers, but it returns error when all available hardware resources are used up. Please always check the return value when doing resource allocation (e.g., `gptimer_new_timer()`).
Set up Alarm Action  For most of the use cases of GPTimer, you should set up the alarm action before starting the timer, except for the simple wall-clock scenario, where a free running timer is enough. To set up the alarm action, you should configure several members of \texttt{gptimer\_alarm\_config\_t} based on how you make use of the alarm event:

- \texttt{gptimer\_alarm\_config\_t::alar\-m\_count} sets the target count value that triggers the alarm event. You should also take the counting direction into consideration when setting the alarm value. Specially, \texttt{gptimer\_alarm\_config\_t::alarm\_count} and \texttt{gptimer\_alarm\_config\_t::reload\_count} cannot be set to the same value when \texttt{gptimer\_alarm\_config\_t::auto\_reload\_on\_alarm} is true, as keeping reload with a target alarm count is meaningless.
- \texttt{gptimer\_alarm\_config\_t::reload\_count} sets the count value to be reloaded when the alarm event happens. This configuration only takes effect when \texttt{gptimer\_alarm\_config\_t::auto\_reload\_on\_alarm} is set to true.
- \texttt{gptimer\_alarm\_config\_t::auto\_reload\_on\_alarm} flag sets whether to enable the auto-reload feature. If enabled, the hardware timer will reload the value of \texttt{gptimer\_alarm\_config\_t::reload\_count} into counter immediately when an alarm event happens.

To make the alarm configurations take effect, you should call \texttt{gptimer\_set\_alarm\_action()}. Especially, if \texttt{gptimer\_alarm\_config\_t} is set to \texttt{NULL}, the alarm function will be disabled.

\textbf{Note}: If an alarm value is set and the timer has already exceeded this value, the alarm will be triggered immediately.

Register Event Callbacks  After the timer starts up, it can generate a specific event (e.g., the “Alarm Event”) dynamically. If you have some functions that should be called when the event happens, please hook your function to the interrupt service routine by calling \texttt{gptimer\_register\_event\_callbacks()}. All supported event callbacks are listed in \texttt{gptimer\_event\_callbacks\_t}:

- \texttt{gptimer\_event\_callbacks\_t::on\_alarm} sets a callback function for alarm events. As this function is called within the ISR context, you must ensure that the function does not attempt to block (e.g., by making sure that only FreeRTOS APIs with \textit{ISR} suffix are called from within the function). The function prototype is declared in \texttt{gptimer\_alarm\_cb\_t}.

You can save your own context to \texttt{gptimer\_register\_event\_callbacks()} as well, via the parameter \texttt{user\_data}. The user data will be directly passed to the callback function.

This function lazy installs the interrupt service for the timer but not enable it. So please call this function before \texttt{gptimer\_enable()}, otherwise the \textit{ESP\_ERR\_INVALID\_STATE} error will be returned. See Section \textit{Enable and Disable Timer} for more information.

Enable and Disable Timer  Before doing IO control to the timer, you need to enable the timer first, by calling \texttt{gptimer\_enable()}. This function:

- Switches the timer driver state from \texttt{init} to \texttt{enable}.
- Enables the interrupt service if it has been lazy installed by \texttt{gptimer\_register\_event\_callbacks()}.
- Acquires a proper power management lock if a specific clock source (e.g., APB clock) is selected. See Section \textit{Power Management} for more information.

Calling \texttt{gptimer\_disable()} does the opposite, that is, put the timer driver back to the \texttt{init} state, disable the interrupts service and release the power management lock.

Start and Stop Timer  The basic IO operation of a timer is to start and stop. Calling \texttt{gptimer\_start()} can make the internal counter work, while calling \texttt{gptimer\_stop()} can make the counter stop working. The following illustrates how to start a timer with or without an alarm event.

Calling \texttt{gptimer\_start()} transits the driver state from \texttt{enable} to \texttt{run}, and vice versa. You need to make sure the start and stop functions are used in pairs, otherwise, the functions may return \textit{ESP\_ERR\_INVALID\_STATE}. Most of the time, this error means that the timer is already stopped or in the “start protection” state (i.e., \texttt{gptimer\_start()} is called but not finished).
Start Timer as a Wall Clock

```c
ESP_ERROR_CHECK(gptimer_enable(gptimer));
ESP_ERROR_CHECK(gptimer_start(gptimer));
// Retrieve the timestamp at any time
uint64_t count;
ESP_ERROR_CHECK(gptimer_get_raw_count(gptimer, &count));
```

Trigger Period Events

```c
typedef struct {
  uint64_t event_count;
} example_queue_element_t;

static bool example_timer_on_alarm_cb(gptimer_handle_t timer, const gptimer_alarm_←event_data_t *edata, void *user_ctx) {
  BaseType_t high_task_awoken = pdFALSE;
  QueueHandle_t queue = (QueueHandle_t)user_ctx;
  // Retrieve the count value from event data
  example_queue_element_t ele = {
    .event_count = edata->count_value
  };
  // Optional: send the event data to other task by OS queue
  // Do not introduce complex logics in callbacks
  // Suggest dealing with event data in the main loop, instead of in this←callback
  xQueueSendFromISR(queue, &ele, &high_task_awoken);
  // return whether we need to yield at the end of ISR
  return high_task_awoken == pdTRUE;
}

gptimer_alarm_config_t alarm_config = {
  .reload_count = 0, // counter will reload with 0 on alarm event
  .alarm_count = 1000000, // period = 1s @resolution 1MHz
  .flags.auto_reload_on_alarm = true, // enable auto-reload
};
ESP_ERROR_CHECK(gptimer_set_alarm_action(gptimer, &alarm_config));

gptimer_event_callbacks_t cbs = {
  .on_alarm = example_timer_on_alarm_cb, // register user callback
};
ESP_ERROR_CHECK(gptimer_register_event_callbacks(gptimer, &cbs, queue));
ESP_ERROR_CHECK(gptimer_enable(gptimer));
ESP_ERROR_CHECK(gptimer_start(gptimer));
```

Trigger One-Shot Event

```c
typedef struct {
  uint64_t event_count;
} example_queue_element_t;

static bool example_timer_on_alarm_cb(gptimer_handle_t timer, const gptimer_alarm_←event_data_t *edata, void *user_ctx) {
  BaseType_t high_task_awoken = pdFALSE;
  QueueHandle_t queue = (QueueHandle_t)user_ctx;
  // Stop timer the sooner the better
gptimer_stop(timer);
  // Retrieve the count value from event data
  example_queue_element_t ele = {
```
Dynamic Alarm Update  Alarm value can be updated dynamically inside the ISR handler callback, by changing
`gptimer_alarm_event_data_t::alarm_value`. Then the alarm value will be updated after the callback
function returns.

```c
typedef struct {
    uint64_t event_count;
} example_queue_element_t;

static bool example_timer_on_alarm_cb(gptimer_handle_t timer, const gptimer_alarm_event_data_t *edata, void *user_ctx)
{
    BaseType_t high_task_awoken = pdFALSE;
    QueueHandle_t queue = (QueueHandle_t)user_data;
    // Retrieve the count value from event data
    example_queue_element_t ele = {
        .event_count = edata->count_value
    };
    // Optional: send the event data to other task by OS queue
    xQueueSendFromISR(queue, &ele, &high_task_awoken);
    // return whether we need to yield at the end of ISR
    return high_task_awoken == pdTRUE;
}

gptimer_alarm_config_t alarm_config = {
    .alarm_count = 1 * 1000 * 1000, // alarm target = 1s @resolution 1MHz
};
ESP_ERROR_CHECK(gptimer_set_alarm_action(gptimer, &alarm_config));

```
Power Management  There are some power management strategies, which might turn off or change the frequency of GPTimer’s source clock to save power consumption. For example, during DFS, APB clock will be scaled down. If light-sleep is also enabled, PLL and XTAL clocks will be powered off. Both of them can result in an inaccurate time keeping.

The driver can prevent the above situation from happening by creating different power management lock according to different clock source. The driver increases the reference count of that power management lock in the `gptimer_enable()` and decrease it in the `gptimer_disable()`. So we can ensure the clock source is stable between `gptimer_enable()` and `gptimer_disable()`.

IRAM Safe  By default, the GPTimer interrupt will be deferred when the cache is disabled because of writing or erasing the flash. Thus the alarm interrupt will not get executed in time, which is not expected in a real-time application.

There is a Kconfig option `CONFIG_GPTIMER_ISR_IRAM_SAFE` that:

- Enables the interrupt being serviced even when the cache is disabled
- Places all functions that used by the ISR into IRAM
- Places driver object into DRAM (in case it is mapped to PSRAM by accident)

This allows the interrupt to run while the cache is disabled, but comes at the cost of increased IRAM consumption.

There is another Kconfig option `CONFIG_GPTIMER_CTRL_FUNC_IN_IRAM` that can put commonly used IO control functions into IRAM as well. So, these functions can also be executable when the cache is disabled. These IO control functions are as follows:

```c
* gptimer_start()
* gptimer_stop()
* gptimer_get_raw_count()
* gptimer_set_raw_count()
* gptimer_set_alarm_action()
```

Thread Safety  All the APIs provided by the driver are guaranteed to be thread safe, which means you can call them from different RTOS tasks without protection by extra locks. The following functions are allowed to run under ISR context.

```c
* gptimer_start()
* gptimer_stop()
* gptimer_get_raw_count()
* gptimer_set_raw_count()
* gptimer_get_captured_count()
* gptimer_set_alarm_action()
```

Kconfig Options

- `CONFIG_GPTIMER_CTRL_FUNC_IN_IRAM` controls where to place the GPTimer control functions (IRAM or flash).
- `CONFIG_GPTIMER_ISR_HANDLER_IN_IRAM` controls where to place the GPTimer ISR handler (IRAM or flash).
- `CONFIG_GPTIMER_ISR_IRAM_SAFE` controls whether the default ISR handler should be masked when the cache is disabled, see Section IRAM Safe for more information.
- `CONFIG_GPTIMER_ENABLE_DEBUG_LOG` is used to enabled the debug log output. Enable this option will increase the firmware binary size.

Application Examples

---

2 gptimer_event_callbacks_t::on_alarm callback and the functions invoked by the callback should also be placed in IRAM, please take care of them by yourself.
Typical use cases of GPTimer are listed in the example `peripherals/timer_group/gptimer`.

### API Reference

#### Header File

- The header file can be included with:

  ```c
  #include "driver/gptimer.h"
  ```

- This header file is a part of the API provided by the `esp_driver_gptimer` component. To declare that your component depends on `esp_driver_gptimer`, add the following to your CMakeLists.txt:

  ```cmake
  REQUIRES esp_driver_gptimer
  
  or
  
  PRIV_REQUIRES esp_driver_gptimer
  ```

#### Functions

- `esp_err_t gptimer_new_timer(const gptimer_config_t *config, gptimer_handle_t *ret_timer)`

  Create a new General Purpose Timer, and return the handle.

  **Note:** The newly created timer is put in the “init” state.

  **Parameters**
  - `config` [in] GPTimer configuration
  - `ret_timer` [out] Returned timer handle

  **Returns**
  - ESP_OK: Create GPTimer successfully
  - ESP_ERR_INVALID_ARG: Create GPTimer failed because of invalid argument
  - ESP_ERR_NO_MEM: Create GPTimer failed because out of memory
  - ESP_ERR_NOT_FOUND: Create GPTimer failed because all hardware timers are used up and no more free one
  - ESP_FAIL: Create GPTimer failed because of other error

- `esp_err_t gptimer_del_timer(gptimer_handle_t timer)`

  Delete the GPTimer handle.

  **Note:** A timer must be in the “init” state before it can be deleted.

  **Parameters**
  - `timer` [in] Timer handle created by `gptimer_new_timer`

  **Returns**
  - ESP_OK: Delete GPTimer successfully
  - ESP_ERR_INVALID_ARG: Delete GPTimer failed because of invalid argument
  - ESP_ERR_INVALID_STATE: Delete GPTimer failed because the timer is not in init state
  - ESP_FAIL: Delete GPTimer failed because of other error

- `esp_err_t gptimer_set_raw_count(gptimer_handle_t timer, uint64_t value)`

  Set GPTimer raw count value.
**Note:** When updating the raw count of an active timer, the timer will immediately start counting from the new value.

**Note:** This function is allowed to run within ISR context

**Note:** If `CONFIG_GPTIMER_CTRL_FUNC_IN_IRAM` is enabled, this function will be placed in the IRAM by linker, making it possible to execute even when the Flash Cache is disabled.

### Parameters
- `timer` - [in] Timer handle created by `gptimer_new_timer`
- `value` - [in] Count value to be set

### Returns
- ESP_OK: Set GPTimer raw count value successfully
- ESP_ERR_INVALID_ARG: Set GPTimer raw count value failed because of invalid argument
- ESP_FAIL: Set GPTimer raw count value failed because of other error

```c
esp_err_t gptimer_set_raw_count (gptimer_handle_t timer, uint64_t *value)
```

Get GPTimer raw count value.

**Note:** This function will trigger a software capture event and then return the captured count value.

**Note:** With the raw count value and the resolution returned from `gptimer_get_resolution`, you can convert the count value into seconds.

**Note:** This function is allowed to run within ISR context

**Note:** If `CONFIG_GPTIMER_CTRL_FUNC_IN_IRAM` is enabled, this function will be placed in the IRAM by linker, making it possible to execute even when the Flash Cache is disabled.

### Parameters
- `timer` - [in] Timer handle created by `gptimer_new_timer`
- `value` - [out] Returned GPTimer count value

### Returns
- ESP_OK: Get GPTimer raw count value successfully
- ESP_ERR_INVALID_ARG: Get GPTimer raw count value failed because of invalid argument
- ESP_FAIL: Get GPTimer raw count value failed because of other error

```c
esp_err_t gptimer_get_raw_count (gptimer_handle_t timer, uint32_t *out_resolution)
```

Return the real resolution of the timer.

**Note:** usually the timer resolution is same as what you configured in the `gptimer_config_t::resolution_hz`, but some unstable clock source (e.g. RC_FAST) will do a calibration, the real resolution can be different from the configured one.
Parameters
• **timer** - [in] Timer handle created by `gptimer_new_timer`
• **out_resolution** - [out] Returned timer resolution, in Hz

Returns
• ESP_OK: Get GPTimer resolution successfully
• ESP_ERR_INVALID_ARG: Get GPTimer resolution failed because of invalid argument
• ESP_FAIL: Get GPTimer resolution failed because of other error

```c
esp_err_t gptimer_get_captured_count (gptimer_handle_t timer, uint64_t *value)
```
Get GPTimer captured count value.

Note: The capture action can be issued either by ETM event or by software (see also `gptimer_get_raw_count`).

Note: This function is allowed to run within ISR context

Note: If `CONFIG_GPTIMER_CTRL_FUNC_IN_IRAM` is enabled, this function will be placed in the IRAM by linker, makes it possible to execute even when the Flash Cache is disabled.

Parameters
• **timer** - [in] Timer handle created by `gptimer_new_timer`
• **value** - [out] Returned captured count value

Returns
• ESP_OK: Get GPTimer captured count value successfully
• ESP_ERR_INVALID_ARG: Get GPTimer captured count value failed because of invalid argument
• ESP_FAIL: Get GPTimer captured count value failed because of other error

```c
esp_err_t gptimer_register_event_callbacks (gptimer_handle_t timer, const gptimer_event_callbacks_t *cbs, void *user_data)
```
Set callbacks for GPTimer.

Note: User registered callbacks are expected to be runnable within ISR context

Note: The first call to this function needs to be before the call to `gptimer_enable`

Note: User can deregister a previously registered callback by calling this function and setting the callback member in the `cbs` structure to NULL.

Parameters
• **timer** - [in] Timer handle created by `gptimer_new_timer`
• **cbs** - [in] Group of callback functions
• **user_data** - [in] User data, which will be passed to callback functions directly

Returns
• ESP_OK: Set event callbacks successfully
• ESP_ERR_INVALID_ARG: Set event callbacks failed because of invalid argument
• ESP_ERR_INVALID_STATE: Set event callbacks failed because the timer is not in init state
• ESP_FAIL: Set event callbacks failed because of other error
**esp_err_t gptimer_set_alarm_action** *(gptimer_handle_t timer, const gptimer_alarm_config_t *config)*

Set alarm event actions for GPTimer.

**Note:** This function is allowed to run within ISR context, so that user can set new alarm action immediately in the ISR callback.

**Note:** If CONFIG_GPTIMER_CTRL_FUNC_IN_IRAM is enabled, this function will be placed in the IRAM by linker, makes it possible to execute even when the Flash Cache is disabled.

**Parameters**
- `timer` *[in]* Timer handle created by `gptimer_new_timer`
- `config` *[in]* Alarm configuration, especially, set config to NULL means disabling the alarm function

**Returns**
- ESP_OK: Set alarm action for GPTimer successfully
- ESP_ERR_INVALID_ARG: Set alarm action for GPTimer failed because of invalid argument
- ESP_FAIL: Set alarm action for GPTimer failed because of other error

**esp_err_t gptimer_enable** *(gptimer_handle_t timer)*

Enable GPTimer.

**Note:** This function will transit the timer state from “init” to “enable”.

**Note:** This function will enable the interrupt service, if it’s lazy installed in `gptimer_register_event_callbacks`.

**Note:** This function will acquire a PM lock, if a specific source clock (e.g. APB) is selected in the `gptimer_config_t`, while CONFIG_PM_ENABLE is enabled.

**Note:** Enable a timer doesn’t mean to start it. See also `gptimer_start` for how to make the timer start counting.

**Parameters**
- `timer` *[in]* Timer handle created by `gptimer_new_timer`

**Returns**
- ESP_OK: Enable GPTimer successfully
- ESP_ERR_INVALID_ARG: Enable GPTimer failed because of invalid argument
- ESP_ERR_INVALID_STATE: Enable GPTimer failed because the timer is already enabled
- ESP_FAIL: Enable GPTimer failed because of other error

**esp_err_t gptimer_disable** *(gptimer_handle_t timer)*

Disable GPTimer.

**Note:** This function will transit the timer state from “enable” to “init”.
Note: This function will disable the interrupt service if it’s installed.

Note: This function will release the PM lock if it’s acquired in the `gptimer_enable`.

Note: Disable a timer doesn’t mean to stop it. See also `gptimer_stop` for how to make the timer stop counting.

**Parameters**

- `timer` [in] Timer handle created by `gptimer_new_timer`

**Returns**

- ESP_OK: Disable GPTimer successfully
- ESP_ERR_INVALID_ARG: Disable GPTimer failed because of invalid argument
- ESP_ERR_INVALID_STATE: Disable GPTimer failed because the timer is not enabled yet
- ESP_FAIL: Disable GPTimer failed because of other error

```c
esp_err_t gptimer_start (gptimer_handle_t timer)
```

Start GPTimer (internal counter starts counting)

**Note:** This function will transit the timer state from “enable” to “run”.

**Note:** This function is allowed to run within ISR context

**Note:** If `CONFIG_GPTIMER_CTRL_FUNC_IN_IRAM` is enabled, this function will be placed in the IRAM by linker, makes it possible to execute even when the Flash Cache is disabled.

**Parameters**

- `timer` [in] Timer handle created by `gptimer_new_timer`

**Returns**

- ESP_OK: Start GPTimer successfully
- ESP_ERR_INVALID_ARG: Start GPTimer failed because of invalid argument
- ESP_ERR_INVALID_STATE: Start GPTimer failed because the timer is not enabled or is already in running
- ESP_FAIL: Start GPTimer failed because of other error

```c
esp_err_t gptimer_stop (gptimer_handle_t timer)
```

Stop GPTimer (internal counter stops counting)

**Note:** This function will transit the timer state from “run” to “enable”.

**Note:** This function is allowed to run within ISR context

**Note:** If `CONFIG_GPTIMER_CTRL_FUNC_IN_IRAM` is enabled, this function will be placed in the IRAM by linker, makes it possible to execute even when the Flash Cache is disabled.
Chapter 2. API Reference

Returns

- ESP_OK: Stop GPTimer successfully
- ESP_ERR_INVALID_ARG: Stop GPTimer failed because of invalid argument
- ESP_ERR_INVALID_STATE: Stop GPTimer failed because the timer is not in running.
- ESP_FAIL: Stop GPTimer failed because of other error

Structures

struct gptimer_config_t
General Purpose Timer configuration.

Public Members

gptimer_clock_source_t clk_src
GPTimer clock source

gptimer_count_direction_t direction
Count direction

uint32_t resolution_hz
Counter resolution (working frequency) in Hz, hence, the step size of each count tick equals to (1 / resolution_hz) seconds

int intr_priority
GPTimer interrupt priority, if set to 0, the driver will try to allocate an interrupt with a relative low priority (1,2,3)

uint32_t intr_shared
Set true, the timer interrupt number can be shared with other peripherals

struct gptimer_config_t::[anonymous] flags
GPTimer config flags

struct gptimer_event_callbacks_t
Group of supported GPTimer callbacks.

Note: The callbacks are all running under ISR environment

Note: When CONFIG_GPTIMER_ISR_IRAM_SAFE is enabled, the callback itself and functions called by it should be placed in IRAM.

Public Members

gptimer_alarm_cb_t on_alarm
Timer alarm callback

struct gptimer_alarm_config_t
General Purpose Timer alarm configuration.
Public Members

uint64_t alarm_count
    Alarm target count value

uint64_t reload_count
    Alarm reload count value, effect only when auto_reload_on_alarm is set to true

uint32_t auto_reload_on_alarm
    Reload the count value by hardware, immediately at the alarm event

struct gptimer_alarm_config_t::[anonymous] flags
    Alarm config flags

Header File

- components/esp_driver_gptimer/include/driver/gptimer_etm.h
- This header file can be included with:

```
#include "driver/gptimer_etm.h"
```

- This header file is a part of the API provided by the esp_driver_gptimer component. To declare that your component depends on esp_driver_gptimer, add the following to your CMakeLists.txt:

```
PRIV_REQUIRES esp_driver_gptimer
```

Functions

`esp_err_t gptimer_new_etm_event(gptimer_handle_t timer, const gptimer_etm_event_config_t *config, esp_etm_event_handle_t*out_event)`

Get the ETM event for GPTimer.

**Note:** The created ETM event object can be deleted later by calling `esp_etm_del_event`.

Parameters

- **timer** - [in] Timer handle created by `gptimer_new_timer`
- **config** - [in] GPTimer ETM event configuration
- **out_event** - [out] Returned ETM event handle

Returns

- ESP_OK: Get ETM event successfully
- ESP_ERR_INVALID_ARG: Get ETM event failed because of invalid argument
- ESP_FAIL: Get ETM event failed because of other error

`esp_err_t gptimer_new_etm_task(gptimer_handle_t timer, const gptimer_etm_task_config_t *config, esp_etm_task_handle_t*out_task)`

Get the ETM task for GPTimer.

**Note:** The created ETM task object can be deleted later by calling `esp_etm_del_task`.

Parameters
Chapter 2. API Reference

- **timer** [in] Timer handle created by `gptimer_new_timer`
- **config** [in] GPTimer ETM task configuration
- **out_task** [out] Returned ETM task handle

**Returns**
- ESP_OK: Get ETM task successfully
- ESP_ERR_INVALID_ARG: Get ETM task failed because of invalid argument
- ESP_FAIL: Get ETM task failed because of other error

**Structures**

- **gptimer_etm_event_config_t**
  GPTimer ETM event configuration.
  
  **Public Members**
  
  `gptimer_etm_event_type_t event_type`
  GPTimer ETM event type

- **gptimer_etm_task_config_t**
  GPTimer ETM task configuration.
  
  **Public Members**
  
  `gptimer_etm_task_type_t task_type`
  GPTimer ETM task type

  REQUIRES esp_driver_gptimer
  ```
  or
  ```
  PRIV_REQUIRES esp_driver_gptimer
  ```

**Structures**

- **gptimer_alarm_event_data_t**
  GPTimer alarm event data.
  
  **Public Members**
  
  `uint64_t count_value`
  Current count value
uint64_t alarm_value
    Current alarm value

**Type Definitions**

typedef struct gptimer_t *gptimer_handle_t
    Type of General Purpose Timer handle.

typedef bool (*gptimer_alarm_cb_t)(gptimer_handle_t timer, const gptimer_alarm_event_data_t *edata,
void *user_ctx)
    Timer alarm callback prototype.

    **Param** timer [in] Timer handle created by gptimer_new_timer
    **Param** edata [in] Alarm event data, fed by driver
    **Param** user_ctx [in] User data, passed from gptimer_register_event_callbacks
    **Return** Whether a high priority task has been waken up by this function

**Header File**

- components/hal/include/hal/timer_types.h
- This header file can be included with:

```c
#include "hal/timer_types.h"
```

**Type Definitions**

typedef soc_periph_gptimer_clk_src_t gptimer_clock_source_t
    GPTimer clock source.

---

**Note:** User should select the clock source based on the power and resolution requirement

**Enumerations**

enum gptimer_count_direction_t
    GPTimer count direction.

    **Values:**

    - enumerator GPTIMER_COUNT_DOWN
      Increase count value
    - enumerator GPTIMER_COUNT_UP
      Increase count value

enum gptimer_etm_task_type_t
    GPTimer specific tasks that supported by the ETM module.

    **Values:**

    - enumerator GPTIMER_ETM_TASK_START_COUNT
      Start the counter
enumerator GPTIMER_ETM_TASK_STOP_COUNT
Stop the counter

enumerator GPTIMER_ETM_TASK_EN_ALARM
Enable the alarm

enumerator GPTIMER_ETM_TASK_RELOAD
Reload preset value into counter

enumerator GPTIMER_ETM_TASK_CAPTURE
Capture current count value into specific register

enumerator GPTIMER_ETM_TASK_MAX
Maximum number of tasks

enum gptimer_etm_event_type_t
GPTimer specific events that supported by the ETM module.
Values:

enumerator GPTIMER_ETM_EVENT_ALARM_MATCH
Count value matches the alarm target value

enumerator GPTIMER_ETM_EVENT_MAX
Maximum number of events

2.5.8 Dedicated GPIO

Overview
The dedicated GPIO is designed for CPU interaction with GPIO matrix and IO MUX. Any GPIO that is configured as “dedicated” can be accessed by CPU instructions directly, which makes it easy to achieve a high GPIO flip speed, and simulate serial/parallel interface in a bit-banging way. As toggling a GPIO in this “CPU Dedicated” way costs few overhead, it would be great for cases like performance measurement using an oscilloscope.

Create/Destroy GPIO Bundle
A GPIO bundle is a group of GPIOs, which can be manipulated at the same time in one CPU cycle. The maximal number of GPIOs that a bundle can contain is limited by each CPU. What’s more, the GPIO bundle has a strong relevance to the CPU which it derives from. Any operations on the GPIO bundle should be put inside a task which is running on the same CPU core to the GPIO bundle belongs to. Likewise, only those ISRs who are installed on the same CPU core are allowed to do operations on that GPIO bundle.

Note: Dedicated GPIO is more of a CPU peripheral, so it has a strong relationship with CPU core. It’s highly recommended to install and operate GPIO bundle in a pin-to-core task. For example, if GPIOA is connected to CPU0, and the dedicated GPIO instruction is issued from CPU1, then it’s impossible to control GPIOA.
To install a GPIO bundle, one needs to call `dedic_gpio_new_bundle()` to allocate the software resources and connect the dedicated channels to user selected GPIOs. Configurations for a GPIO bundle are covered in `dedic_gpio_bundle_config_t` structure:

- `gpio_array`: An array that contains GPIO number.
- `array_size`: Element number of `gpio_array`.
- `flags`: Extra flags to control the behavior of GPIO Bundle.
  - `in_en` and `out_en` are used to select whether to enable the input and output function (note, they can be enabled together).
  - `in_invert` and `out_invert` are used to select whether to invert the GPIO signal.

The following code shows how to install a output only GPIO bundle:

```c
// configure GPIO
const int bundleA_gpios[] = {0, 1};
gpio_config_t io_conf = {
  .mode = GPIO_MODE_OUTPUT,
};
for (int i = 0; i < sizeof(bundleA_gpios) / sizeof(bundleA_gpios[0]); i++) {
  io_conf.pin_bit_mask = 1ULL << bundleA_gpios[i];
  gpio_config(&io_conf);
}
// Create bundleA, output only
dedic_gpio_bundle_handle_t bundleA = NULL;
dedic_gpio_bundle_config_t bundleA_config = {
  .gpio_array = bundleA_gpios,
  .array_size = sizeof(bundleA_gpios) / sizeof(bundleA_gpios[0]),
  .flags = {
    .out_en = 1,
  },
};
ESP_ERROR_CHECK(dedic_gpio_new_bundle(&bundleA_config, &bundleA));
```

To uninstall the GPIO bundle, one needs to call `dedic_gpio_del_bundle()`.

**Note:** `dedic_gpio_new_bundle()` doesn’t cover any GPIO pad configuration (e.g., pull up/down, drive ability, output/input enable), so before installing a dedicated GPIO bundle, you have to configure the GPIO separately using GPIO driver API (e.g., `gpio_config()`). For more information about GPIO driver, please refer to GPIO API Reference.

### GPIO Bundle Operations

<table>
<thead>
<tr>
<th>Operations</th>
<th>Functions</th>
</tr>
</thead>
<tbody>
<tr>
<td>Write to GPIOs in the bundle by mask</td>
<td><code>dedic_gpio_bundle_write()</code></td>
</tr>
<tr>
<td>Read the value that output from the given GPIO bundle</td>
<td><code>dedic_gpio_bundle_read_out()</code></td>
</tr>
<tr>
<td>Read the value that input to the given GPIO bundle</td>
<td><code>dedic_gpio_bundle_read_in()</code></td>
</tr>
</tbody>
</table>

**Note:** Using the above functions might not get a high GPIO flip speed because of the overhead of function calls and the bit operations involved inside. Users can try Manipulate GPIOs by Writing Assembly Code instead to reduce the overhead but should take care of the thread safety by themselves.

### Manipulate GPIOs by Writing Assembly Code

For advanced users, they can always manipulate the GPIOs by writing assembly code or invoking CPU Low Level APIs. The usual procedure could be:
1. Allocate a GPIO bundle: `dedic_gpio_new_bundle()`
2. Query the mask occupied by that bundle: `dedic_gpio_get_out_mask()` or/and `dedic_gpio_get_in_mask()`
3. Call CPU LL apis (e.g., `dedic_gpio_cpu_ll_write_mask`) or write assembly code with that mask
4. The fastest way of toggling IO is to use the dedicated “set/clear” instructions:
   - Set bits of GPIO: `set_bit_gpio_out imm[7:0]`
   - Clear bits of GPIO: `clr_bit_gpio_out imm[7:0]`
   - Note: Immediate value width depends on the number of dedicated GPIO channels

For details of supported dedicated GPIO instructions, please refer to ESP32-S2 Technical Reference Manual > IO MUX and GPIO Matrix (GPIO, IO_MUX) [PDF].

Some of the dedicated CPU instructions are also wrapped inside `hal/dedic_gpio_cpu_ll.h` as helper inline functions.

**Note:** Writing assembly code in application could make your code hard to port between targets, because those customized instructions are not guaranteed to remain the same format on different targets.

### Interrupt Handling

Dedicated GPIO can also trigger interrupt on specific input event. All supported events are defined in `dedic_gpio_intr_type_t`.

One can enable and register interrupt callback by calling `dedic_gpio_bundle_set_interrupt_and_callback()`. The prototype of the callback function is defined in `dedic_gpio_isr_callback_t`. Keep in mind, the callback should return true if there’s some high priority task woken up.

```c
// user defined ISR callback
IRAM_ATTR bool dedic_gpio_isr_callback(dedic_gpio_bundle_handle_t bundle, uint32_t index, void *args)
{
    SemaphoreHandle_t sem = (SemaphoreHandle_t)args;
    BaseType_t high_task_wakeup = pdFALSE;
    xSemaphoreGiveFromISR(sem, &high_task_wakeup);
    return high_task_wakeup = pdTRUE;
}

// enable positive edge interrupt on the second GPIO in the bundle (i.e., index 1)
ESP_ERROR_CHECK(dedic_gpio_bundle_set_interrupt_and_callback(bundle, BIT(1), DEDIC_GPIO_INTR_POS_EDGE, dedic_gpio_isr_callback, sem));

// wait for done semaphore
xSemaphoreTake(sem, portMAX_DELAY);
```

### Application Example

Matrix keyboard example based on dedicated GPIO: `peripherals/gpio/matrix_keyboard`.

### API Reference

#### Header File

- `components/esp_driver_gpio/include/driver/dedic_gpio.h`
- This header file can be included with:

  ```c
  #include "driver/dedic_gpio.h"
  ```
This header file is a part of the API provided by the `esp_driver_gpio` component. To declare that your component depends on `esp_driver_gpio`, add the following to your `CMakeLists.txt`:

```c
REQUIRES esp_driver_gpio
```
or

```c
PRIV_REQUIRES esp_driver_gpio
```

### Functions

**esp_err_t dedic_gpio_get_out_mask (dedic_gpio_bundle_handle_t bundle, uint32_t* mask)**

Get allocated channel mask.

**Note:** Each bundle should have at least one mask (in or/and out), based on bundle configuration.

**Note:** With the returned mask, user can directly invoke LL function like “dedic_gpio_cpu_LL_write_mask” or write assembly code with dedicated GPIO instructions, to get better performance on GPIO manipulation.

**Parameters**

- `bundle` [in] Handle of GPIO bundle that returned from “dedic_gpio_new_bundle”
- `mask` [out] Returned mask value for on specific direction (in or out)

**Returns**

- ESP_OK: Get channel mask successfully
- ESP_ERR_INVALID_ARG: Get channel mask failed because of invalid argument
- ESP_FAIL: Get channel mask failed because of other error

**esp_err_t dedic_gpio_get_in_mask (dedic_gpio_bundle_handle_t bundle, uint32_t* mask)**

**esp_err_t dedic_gpio_get_out_offset (dedic_gpio_bundle_handle_t bundle, uint32_t* offset)**

Get the channel offset of the GPIO bundle.

A GPIO bundle maps the GPIOS of a particular direction to a consecutive set of channels within a particular GPIO bank of a particular CPU. This function returns the offset to the bundle’s first channel of a particular direction within the bank.

**Parameters**

- `bundle` [in] Handle of GPIO bundle that returned from “dedic_gpio_new_bundle”
- `offset` [out] Offset value to the first channel of a particular direction (in or out)

**Returns**

- ESP_OK: Get channel offset successfully
- ESP_ERR_INVALID_ARG: Get channel offset failed because of invalid argument
- ESP_FAIL: Get channel offset failed because of other error

**esp_err_t dedic_gpio_get_in_offset (dedic_gpio_bundle_handle_t bundle, uint32_t* offset)**

**esp_err_t dedic_gpio_new_bundle (const dedic_gpio_bundle_config_t* config, dedic_gpio_bundle_handle_t* ret_bundle)**

Create GPIO bundle and return the handle.

**Note:** One has to enable at least input or output mode in “config” parameter.
Chapter 2. API Reference

- ESP_OK: Create GPIO bundle successfully
- ESP_ERR_INVALID_ARG: Create GPIO bundle failed because of invalid argument
- ESP_ERR_NO_MEM: Create GPIO bundle failed because of no capable memory
- ESP_ERR_NOT_FOUND: Create GPIO bundle failed because of no enough continuous dedicated channels
- ESP_FAIL: Create GPIO bundle failed because of other error

```c
esp_err_t dedic_gpio_del_bundle(dedic_gpio_bundle_handle_t bundle)
```

Destroy GPIO bundle.

**Parameters**
- `bundle` - [in] Handle of GPIO bundle that returned from “dedic_gpio_new_bundle”

**Returns**
- ESP_OK: Destroy GPIO bundle successfully
- ESP_ERR_INVALID_ARG: Destroy GPIO bundle failed because of invalid argument
- ESP_FAIL: Destroy GPIO bundle failed because of other error

```c
void dedic_gpio_bundle_write(dedic_gpio_bundle_handle_t bundle, uint32_t mask, uint32_t value)
```

Write value to GPIO bundle.

**Note:** The mask is seen from the view of GPIO bundle. For example, bundleA contains [GPIO10, GPIO12, GPIO17], to set GPIO17 individually, the mask should be 0x04.

**Note:** For performance reasons, this function doesn’t check the validity of any parameters, and is placed in IRAM.

```c
uint32_t dedic_gpio_bundle_read_out(dedic_gpio_bundle_handle_t bundle)
```

Read the value that output from the given GPIO bundle.

**Note:** For performance reasons, this function doesn’t check the validity of any parameters, and is placed in IRAM.

```c
uint32_t dedic_gpio_bundle_read_in(dedic_gpio_bundle_handle_t bundle)
```

Read the value that input to the given GPIO bundle.

**Note:** For performance reasons, this function doesn’t check the validity of any parameters, and is placed in IRAM.
**esp_err_t** `dedic_gpio_bundle_set_interrupt_and_callback (dedic_gpio_bundle_handle_t bundle, uint32_t mask, dedic_gpio_intr_type_t intr_type, dedic_gpio_isr_callback_t cb_isr, void *cb_args)`

Set interrupt and callback function for GPIO bundle.

**Note:** This function is only valid for bundle with input mode enabled. See “dedic_gpio_bundle_config_t”

**Note:** The mask is seen from the view of GPIO Bundle. For example, bundle A contains [GPIO10, GPIO12, GPIO17], to set GPIO17 individually, the mask should be 0x04.

**Parameters**
- **bundle** – [in] Handle of GPIO bundle that returned from “dedic_gpio_new_bundle”
- **mask** – [in] Mask of the GPIOs in the given bundle
- **intr_type** – [in] Interrupt type, set to DEDIC_GPIO_INTR_NONE can disable interrupt
- **cb_isr** – [in] Callback function, which got invoked in ISR context. A NULL pointer here will bypass the callback
- **cb_args** – [in] User defined argument to be passed to the callback function

**Returns**
- ESP_OK: Set GPIO interrupt and callback function successfully
- ESP_ERR_INVALID_ARG: Set GPIO interrupt and callback function failed because of invalid argument
- ESP_FAIL: Set GPIO interrupt and callback function failed because of other error

**Structures**

**struct** `dedic_gpio_bundle_config_t`
Type of Dedicated GPIO bundle configuration.

**Public Members**

const int *`gpio_array`
Array of GPIO numbers, gpio_array[0] ~ gpio_array[size-1] <= low_dedic_channel_num ~ high_dedic_channel_num

`size_t array_size`
Number of GPIOs in gpio_array

unsigned int `in_en`
Enable input

unsigned int `in_invert`
Invert input signal

unsigned int `out_en`
Enable output
unsigned int out_invert
    Invert output signal

struct dedic_gpio_bundle_config_t::[anonymous] flags
    Flags to control specific behaviour of GPIO bundle

**Type Definitions**

typedef struct dedic_gpio_bundle_t * dedic_gpio_bundle_handle_t
    Type of Dedicated GPIO bundle.

typedef bool (* dedic_gpio_isr_callback_t)(dedic_gpio_bundle_handle_t bundle, uint32_t index, void *args)
    Type of dedicated GPIO ISR callback function.

    **Param bundle** Handle of GPIO bundle that returned from "dedic_gpio_new_bundle"
    **Param index** Index of the GPIO in its corresponding bundle (count from 0)
    **Param args** User defined arguments for the callback function. It’s passed through
        dedic_gpio_bundle_set_interrupt_and_callback
    **Return** If a high priority task is woken up by the callback function

**Enumerations**

enum dedic_gpio_intr_type_t
    Supported type of dedicated GPIO interrupt.
    **Values:**

    enumerator DEDIC_GPIO_INTR_NONE
        No interrupt

    enumerator DEDIC_GPIO_INTR_LOW_LEVEL
        Interrupt on low level

    enumerator DEDIC_GPIO_INTR_HIGH_LEVEL
        Interrupt on high level

    enumerator DEDIC_GPIO_INTR_NEG_EDGE
        Interrupt on negedge

    enumerator DEDIC_GPIO_INTR_POS_EDGE
        Interrupt on posedge

    enumerator DEDIC_GPIO_INTR_BOTH_EDGE
        Interrupt on both negedge and posedge

2.5.9 **Hash-Based Message Authentication Code (HMAC)**

Hash-based Message Authentication Code (HMAC) is a secure authentication technique that verifies the authenticity and integrity of a message with a pre-shared key. This module provides hardware acceleration for SHA256-HMAC generation using a key burned into an eFuse block.
For more detailed information on the application workflow and the HMAC calculation process, see [ESP32-S2 Technical Reference Manual > HMAC Accelerator (HMAC)](PDF).

**Generalized Application Scheme**

Let there be two parties, A and B. They want to verify the authenticity and integrity of messages sent between each other. Before they can start sending messages, they need to exchange the secret key via a secure channel.

To verify A’s messages, B can do the following:

- A calculates the HMAC of the message it wants to send.
- A sends the message and the HMAC to B.
- B calculates the HMAC of the received message itself.
- B checks whether the received and calculated HMACs match.

If they do match, the message is authentic.

However, the HMAC itself is not bound to this use case. It can also be used for challenge-response protocols supporting HMAC or as a key input for further security modules (see below), etc.

**HMAC on ESP32-S2**

On ESP32-S2, the HMAC module works with a secret key burnt into the eFuses. This eFuse key can be made completely inaccessible for any resources outside the cryptographic modules, thus avoiding key leakage.

Furthermore, ESP32-S2 has three different application scenarios for its HMAC module:

1. HMAC is generated for software use
2. HMAC is used as a key for the Digital Signature (DS) module
3. HMAC is used for enabling the soft-disabled JTAG interface

The first mode is called **Upstream** mode, while the last two modes are called **Downstream** modes.

**eFuse Keys for HMAC**

Six physical eFuse blocks can be used as keys for the HMAC module: block 4 ~ block 9. The enum `hmac_key_id_t` in the API maps them to `HMAC_KEY0 ~ HMAC_KEY5`.

Each key has a corresponding eFuse parameter **key purpose** determining for which of the three HMAC application scenarios (see below) the key may be used:

<table>
<thead>
<tr>
<th>Key Purpose</th>
<th>Application Scenario</th>
</tr>
</thead>
<tbody>
<tr>
<td>8</td>
<td>HMAC generated for software use</td>
</tr>
<tr>
<td>7</td>
<td>HMAC used as a key for the Digital Signature (DS) module</td>
</tr>
<tr>
<td>6</td>
<td>HMAC used for enabling the soft-disabled JTAG interface</td>
</tr>
<tr>
<td>5</td>
<td>HMAC both as a key for the DS module and for enabling JTAG</td>
</tr>
</tbody>
</table>

This is to prevent the usage of a key for a different function than originally intended.

To calculate an HMAC, the software has to provide the ID of the key block containing the secret key as well as the **key purpose** (see [ESP32-S2 Technical Reference Manual > eFuse Controller (eFuse)](PDF)).

Before the HMAC key calculation, the HMAC module looks up the purpose of the provided key block. The calculation only proceeds if the purpose of the provided key block matches the purpose stored in the eFuses of the key block provided by the ID.

**HMAC Generation for Software**

Key purpose value: 8

In this case, the HMAC is given out to the software, e.g., to authenticate a message.

The API to calculate the HMAC is `esp_hmac_calculate()`. The input arguments for the function are the message, message length, and the eFuse key block ID which contains the secret and has the efuse key purpose set to Upstream mode.
HMAC for Digital Signature  Key purpose values: 7, 5

The HMAC can be used as a key derivation function to decrypt private key parameters which are used by the Digital Signature module. A standard message is used by the hardware in that case. You only need to provide the eFuse key block and purpose on the HMAC side, additional parameters are required for the Digital Signature component in that case.

Neither the key nor the actual HMAC is ever exposed outside the HMAC module and DS component. The calculation of the HMAC and its handover to the DS component happen internally.

For more details, see ESP32-S2 Technical Reference Manual > Digital Signature (DS) [PDF].

HMAC for Enabling JTAG  Key purpose values: 6, 5

The third application is using the HMAC as a key to enable JTAG if it was soft-disabled before.

Following is the procedure to re-enable the JTAG:

Stage 1: Setup

1. Generate a 256-bit HMAC secret key to use for JTAG re-enable.
2. Write the key to an eFuse block with key purpose HMAC_DOWN_ALL (5) or HMAC_DOWN_JTAG (6). This can be done using the esp_efuse_write_key() function in the firmware or using espefuse.py from the host.
3. Configure the eFuse key block to be read-protected using the esp_efuse_set_read_protect(), so that software cannot read back the value.
4. Burn the soft JTAG disable bit/bits on ESP32-S2. This will permanently disable JTAG unless the correct key value is provided by the software.

Note: The API esp_efuse_write_field_bit(ESP_EFUSE_SOFT_DIS_JTAG) can be used to burn soft JTAG disable bit on ESP32-S2.

Note: If HARD_DIS_JTAG eFuse is set, then SOFT_DIS_JTAG functionality does not work because JTAG is permanently disabled.

JTAG enables

1. The key to re-enable JTAG is the output of the HMAC-SHA256 function using the secret key in eFuse and 32 0x00 bytes as the message.
2. Pass this key value when calling the esp_hmac_jtag_enable() function from the firmware.
3. To re-disable JTAG in the firmware, reset the system or call esp_hmac_jtag_disable().

For more details, see ESP32-S2 Technical Reference Manual > HMAC Accelerator (HMAC) [PDF].

Application Outline

The following code is an outline of how to set an eFuse key and then use it to calculate an HMAC for software usage. We use esp_efuse_write_key to set physical key block 4 in the eFuse for the HMAC module together with its purpose. ESP_EFUSE_KEY_PURPOSE_HMAC_UP (8) means that this key can only be used for HMAC generation for software usage:

```c
#include "esp_efuse.h"
const uint8_t key_data[32] = { ... };
esp_err_t status = esp_efuse_write_key(EFUSE_BLK_KEY4,
    ESP_EFUSE_KEY_PURPOSE_HMAC_UP,
    key_data, sizeof(key_data));
```
(continues on next page)
if (status == ESP_OK) {
    // written key
} else {
    // writing key failed, maybe written already
}

Now we can use the saved key to calculate an HMAC for software usage.

```c
#include "esp_hmac.h"

uint8_t hmac[32];
const char *message = "Hello, HMAC!";
const size_t msg_len = 12;

esp_err_t result = esp_hmac_calculate(HMAC_KEY4, message, msg_len, hmac);
if (result == ESP_OK) {
    // HMAC written to hmac now
} else {
    // failure calculating HMAC
}
```

API Reference

Header File

- components/esp_hw_support/include/esp_hmac.h
- This header file can be included with:

```c
#include "esp_hmac.h"
```

Functions

```c
esp_err_t esp_hmac_calculate (hmac_key_id_t key_id, const void *message, size_t message_len, uint8_t *hmac)
```

Calculate the HMAC of a given message.

Calculate the HMAC hmac of a given message message with length message_len. SHA256 is used for the calculation.

**Note:** Uses the HMAC peripheral in “upstream” mode.

**Parameters**

- **key_id** - Determines which of the 6 key blocks in the efuses should be used for the HMAC calculation. The corresponding purpose field of the key block in the efuse must be set to the HMAC upstream purpose value.
- **message** - the message for which to calculate the HMAC
- **message_len** - message length return ESP_ERR_INVALID_STATE if unsuccessful
- **hmac** - [out] the hmac result; the buffer behind the provided pointer must be a writeable buffer of 32 bytes

**Returns**

- ESP_OK, if the calculation was successful,
- ESP_ERR_INVALID_ARG if message or hmac is a nullptr or if key_id out of range
- ESP_FAIL, if the hmac calculation failed
**esp_err_t esp_hmac_jtag_enable (hmac_key_id_t key_id, const uint8_t *token)**

Use HMAC peripheral in Downstream mode to re-enable the JTAG, if it is not permanently disabled by HW. In downstream mode, HMAC calculations performed by peripheral are used internally and not provided back to user.

**Note:** Return value of the API does not indicate the JTAG status.

**Parameters**

- **key_id** - Determines which of the 6 key blocks in the efuses should be used for the HMAC calculation. The corresponding purpose field of the key block in the efuse must be set to HMAC downstream purpose.
- **token** - Pre-calculated HMAC value of the 32-byte 0x00 using SHA-256 and the known private HMAC key. The key is already programmed to a eFuse key block. The key block number is provided as the first parameter to this function.

**Returns**

- **ESP_OK**, if the key_purpose of the key_id matches to HMAC downstream mode, The API returns success even if calculated HMAC does not match with the provided token. However, The JTAG will be re-enabled only if the calculated HMAC value matches with provided token, otherwise JTAG will remain disabled.
- **ESP_FAIL**, if the key_purpose of the key_id is not set to HMAC downstream purpose or JTAG is permanently disabled by EFUSE_HARD_DIS_JTAG eFuse parameter.
- **ESP_ERR_INVALID_ARG**, invalid input arguments

**esp_err_t esp_hmac_jtag_disable (void)**

Disable the JTAG which might be enabled using the HMAC downstream mode. This function just clears the result generated by calling esp_hmac_jtag_enable() API.

**Returns**

- **ESP_OK** return ESP_OK after writing the HMAC_SET_INVALIDATE_JTAG_REG with value 1.

**Enumerations**

- **enum hmac_key_id_t**
  
The possible efuse keys for the HMAC peripheral

  **Values:**

  - **enumerator HMAC_KEY0**
  - **enumerator HMAC_KEY1**
  - **enumerator HMAC_KEY2**
  - **enumerator HMAC_KEY3**
  - **enumerator HMAC_KEY4**
  - **enumerator HMAC_KEY5**
  - **enumerator HMAC_KEY_MAX**
Chapter 2. API Reference

2.5.10 Digital Signature (DS)

The Digital Signature (DS) module provides hardware acceleration of signing messages based on RSA. It uses pre-encrypted parameters to calculate a signature. The parameters are encrypted using HMAC as a key-derivation function. In turn, the HMAC uses eFuses as the input key. The whole process happens in hardware so that neither the decryption key for the RSA parameters nor the input key for the HMAC key derivation function can be seen by the software while calculating the signature.

For more detailed information on the hardware involved in the signature calculation and the registers used, see ESP32-S2 Technical Reference Manual > Digital Signature (DS) [PDF].

Private Key Parameters

The private key parameters for the RSA signature are stored in flash. To prevent unauthorized access, they are AES-encrypted. The HMAC module is used as a key-derivation function to calculate the AES encryption key for the private key parameters. In turn, the HMAC module uses a key from the eFuses key block which can be read-protected to prevent unauthorized access as well.

Upon signature calculation invocation, the software only specifies which eFuse key to use, the corresponding eFuse key purpose, the location of the encrypted RSA parameters, and the message.

Key Generation

Both the HMAC key and the RSA private key have to be created and stored before the DS peripheral can be used. This needs to be done in software on the ESP32-S2 or alternatively on a host. For this context, ESP-IDF provides esp_efuse_write_block() to set the HMAC key and esp_hmac_calculate() to encrypt the private RSA key parameters.

You can find instructions on how to calculate and assemble the private key parameters in ESP32-S2 Technical Reference Manual > Digital Signature (DS) [PDF].

Signature Calculation with ESP-IDF

For more detailed information on the workflow and the registers used, see ESP32-S2 Technical Reference Manual > Digital Signature (DS) [PDF].

Three parameters need to be prepared to calculate the digital signature:

1. The eFuse key block ID which is used as the key for the HMAC
2. The location of the encrypted private key parameters
3. The message to be signed

Since the signature calculation takes some time, there are two possible API versions to use in ESP-IDF. The first one is esp_ds_sign() and simply blocks until the calculation is finished. If software needs to do something else during the calculation, esp_ds_start_sign() can be called, followed by periodic calls to esp_ds_is_busy() to check when the calculation has finished. Once the calculation has finished, esp_ds_finish_sign() can be called to get the resulting signature.

The APIs esp_ds_sign() and esp_ds_start_sign() calculate a plain RSA signature with the help of the DS peripheral. This signature needs to be converted to an appropriate format for further use. For example, the MbedTLS SSL stack supports PKCS#1 format. The API esp_ds_rsa_sign() can be used to obtain the signature directly in the PKCS#1 v1.5 format. It internally uses esp_ds_start_sign() and converts the signature into PKCS#1 v1.5 format.

Note: This is only the basic DS building block, the message length is fixed. To create signatures of arbitrary messages, the input is normally a hash of the actual message, padded up to the required length. An API to do this
planned in the future.

Configure the DS Peripheral for a TLS Connection

The DS peripheral on ESP32-S2 chip must be configured before it can be used for a TLS connection. The configuration involves the following steps:

1) Randomly generate a 256-bit value called the *Initialization Vector* (IV).
2) Randomly generate a 256-bit value called the *HMAC_KEY*.
3) Calculate the encrypted private key parameters from the client private key (RSA) and the parameters generated in the above steps.
4) Then burn the 256-bit *HMAC_KEY* on the eFuse, which can only be read by the DS peripheral.

For more details, see [ESP32-S2 Technical Reference Manual > Digital Signature (DS) [PDF]].

To configure the DS peripheral for development purposes, you can use the `esp-secure-cert-tool`.

The encrypted private key parameters obtained after the DS peripheral configuration are then to be kept in flash. Furthermore, they are to be passed to the DS peripheral which makes use of those parameters for the Digital Signature operation. The application then needs to read the DS data from the flash, which has been done through the APIs provided by the `esp_secure_cert_mgr` component. Please refer to the `component/README` for more details.

The process of initializing the DS peripheral and then performing the Digital Signature operation is done internally with the help of ESP-TLS. Please refer to *Digital Signature with ESP-TLS* for more details.

As mentioned in the ESP-TLS documentation, the application only needs to provide the encrypted private key parameters to the `esp_tls` context (as `ds_data`), which internally performs all necessary operations for initializing the DS peripheral and then performing the DS operation.

Example for SSL Mutual Authentication Using DS

The example `protocols/mqtt/ssl_ds` shows how to use the DS peripheral for mutual authentication. The example uses `mqtt_client` (Implemented through ESP-MQTT) to connect to broker test.mosquitto.org using SSL transport with mutual authentication. The SSL part is internally performed with ESP-TLS. See `protocols/mqtt/ssl_ds/README.md` for more details.

API Reference

Header File

- `components/esp_hw_support/include/esp_ds.h`
- This header file can be included with:

```
#include "esp_ds.h"
```

Functions

```c
esp_err_t esp_ds_sign(const void *message, const esp_ds_data_t *data, hmac_key_id_t key_id, void *signature)
```

Sign the message with a hardware key from specific key slot. The function calculates a plain RSA signature with help of the DS peripheral. The RSA encryption operation is as follows: \(Z = XY \mod M\) where, \(Z\) is the signature, \(X\) is the input message, \(Y\) and \(M\) are the RSA private key parameters.

This function is a wrapper around `esp_ds_finish_sign()` and `esp_ds_start_sign()`, so do not use them in parallel. It blocks until the signing is finished and then returns the signature.

**Note:** Please see note section of `esp_ds_start_sign()` for more details about the input parameters.
**Parameters**

- **message** – the message to be signed; its length should be \((\text{data->rsa_length} + 1)\times 4\) bytes, and those bytes must be in little endian format. It is your responsibility to apply your hash function and padding before calling this function, if required. (e.g. `message = padding(hash(inputMsg))`)
- **data** – the encrypted signing key data (AES encrypted RSA key + IV)
- **key_id** – the HMAC key ID determining the HMAC key of the HMAC which will be used to decrypt the signing key data
- **signature** – the destination of the signature, should be \((\text{data->rsa_length} + 1)\times 4\) bytes long

**Returns**

- ESP_OK if successful, the signature was written to the parameter `signature`
- ESP_ERR_INVALID_ARG if one of the parameters is NULL or data->rsa_length is too long or 0
- ESP_ERR_HW_CRYPTO_DS_HMAC_FAIL if there was an HMAC failure during retrieval of the decryption key
- ESP_ERR_NO_MEM if there hasn’t been enough memory to allocate the context object
- ESP_ERR_HW_CRYPTO_DS_INVALID_KEY if there’s a problem with passing the HMAC key to the DS component
- ESP_ERR_HW_CRYPTO_DS_INVALID_DIGEST if the message digest didn’t match; the signature is invalid.
- ESP_ERR_HWCRYPTO_DS_INVALID_PADDING if the message padding is incorrect, the signature can be read though since the message digest matches.

```c
esp_err_t esp_ds_start_sign(const void *message, const esp_ds_data_t *data, hmac_key_id_t key_id, esp_ds_context_t **esp_ds_ctx)
```

Start the signing process.

This function yields a context object which needs to be passed to `esp_ds_finish_sign()` to finish the signing process. The function calculates a plain RSA signature with help of the DS peripheral. The RSA encryption operation is as follows: \(Z = XY \mod M\) where, \(Z\) is the signature, \(X\) is the input message, \(Y\) and \(M\) are the RSA private key parameters.

**Note:** This function locks the HMAC, SHA, AES and RSA components, so the user has to ensure to call `esp_ds_finish_sign()` in a timely manner. The numbers \(Y\), \(M\), \(R_b\) which are a part of \(\text{esp_ds_data}_t\) should be provided in little endian format and should be of length equal to the RSA private key bit length. The message length in bits should also be equal to the RSA private key bit length. No padding is applied to the message automatically, Please ensure the message is appropriate padded before calling the API.

**Parameters**

- **message** – the message to be signed; its length should be \((\text{data->rsa_length} + 1)\times 4\) bytes, and those bytes must be in little endian format. It is your responsibility to apply your hash function and padding before calling this function, if required. (e.g. `message = padding(hash(inputMsg))`)
- **data** – the encrypted signing key data (AES encrypted RSA key + IV)
- **key_id** – the HMAC key ID determining the HMAC key of the HMAC which will be used to decrypt the signing key data
- **esp_ds_ctx** – the context object which is needed for finishing the signing process later

**Returns**

- ESP_OK if successful, the ds operation was started now and has to be finished with `esp_ds_finish_sign()`
- ESP_ERR_INVALID_ARG if one of the parameters is NULL or data->rsa_length is too long or 0
- ESP_ERR_HW_CRYPTO_DS_HMAC_FAIL if there was an HMAC failure during retrieval of the decryption key
- ESP_ERR_NO_MEM if there hasn’t been enough memory to allocate the context object
- ESP_ERR_HWCRYPTO_DS_INVALID_KEY if there’s a problem with passing the
HMAC key to the DS component

bool esp_ds_is_busy (void)

Return true if the DS peripheral is busy, otherwise false.

Note: Only valid if esp_ds_start_sign() was called before.

esp_err_t esp_ds_finish_sign (void *signature, esp_ds_context_t *esp_ds_ctx)

Finish the signing process.

Parameters

• signature – the destination of the signature, should be (data->rsa_length + 1)*4 bytes long, the resultant signature bytes shall be written in little endian format.
• esp_ds_ctx – the context object retrieved by esp_ds_start_sign()

Returns

• ESP_OK if successful, the ds operation has been finished and the result is written to signature.
• ESP_ERR_INVALID_ARG if one of the parameters is NULL.
• ESP_ERR_HW_CRYPTO_DS_INVALID_DIGEST if the message digest didn’t match; the signature is invalid. This means that the encrypted RSA key parameters are invalid, indicating that they may have been tampered with or indicating a flash error, etc.
• ESP_ERR_HW_CRYPTO_DS_INVALID_PADDING if the message padding is incorrect, the signature can be read though since the message digest matches (see TRM for more details).

esp_err_t esp_ds_encrypt_params (esp_ds_data_t *data, const void *iv, const esp_ds_p_data_t *p_data, const void *key)

Encrypt the private key parameters.

The encryption is a prerequisite step before any signature operation can be done. It is not strictly necessary to use this encryption function, the encryption could also happen on an external device.

Note: The numbers Y, M, Rb which are a part of esp_ds_data_t should be provided in little endian format and should be of length equal to the RSA private key bit length. The message length in bits should also be equal to the RSA private key bit length. No padding is applied to the message automatically. Please ensure the message is appropriate padded before calling the API.

Parameters

• data – Output buffer to store encrypted data, suitable for later use generating signatures.
• iv – Pointer to 16 byte IV buffer, will be copied into ‘data’. Should be randomly generated bytes each time.
• p_data – Pointer to input plaintext key data. The expectation is this data will be deleted after this process is done and ‘data’ is stored.
• key – Pointer to 32 bytes of key data. Type determined by key_type parameter. The expectation is the corresponding HMAC key will be stored to efuse and then permanently erased.

Returns

• ESP_OK if successful, the ds operation has been finished and the result is written to signature.
• ESP_ERR_INVALID_ARG if one of the parameters is NULL or p_data->rsa_length is too long

Structures

struct esp_digital_signature_data

Encrypted private key data. Recommended to store in flash in this format.
Chapter 2. API Reference

**Note:** This struct has to match to one from the ROM code! This documentation is mostly taken from there.

### Public Members

**esp_digital_signature_length_t rsa_length**

RSA LENGTH register parameters (number of words in RSA key & operands, minus one).

This value must match the length field encrypted and stored in ‘c’, or invalid results will be returned. (The DS peripheral will always use the value in ‘c’, not this value, so an attacker can’t alter the DS peripheral results this way, it will just truncate or extend the message and the resulting signature in software.)

**Note:** In IDF, the enum type length is the same as of type unsigned, so they can be used interchangably. See the ROM code for the original declaration of struct ets_ds_data_t.

uint32_t iv[ESP_DS_IV_BIT_LEN / 32]

IV value used to encrypt ‘c’

uint8_t c[ESP_DS_C_LEN]

Encrypted Digital Signature parameters. Result of AES-CBC encryption of plaintext values. Includes an encrypted message digest.

struct esp_ds_p_data_t

Plaintext parameters used by Digital Signature.

This is only used for encrypting the RSA parameters by calling esp_ds_encrypt_params(). Afterwards, the result can be stored in flash or in other persistent memory. The encryption is a prerequisite step before any signature operation can be done.

**Note:** Y, M, Rb, & M_Prime must all be in little endian format.

### Public Members

uint32_t Y[ESP_DS_SIGNATURE_MAX_BIT_LEN / 32]

RSA exponent.

uint32_t M[ESP_DS_SIGNATURE_MAX_BIT_LEN / 32]

RSA modulus.

uint32_t Rb[ESP_DS_SIGNATURE_MAX_BIT_LEN / 32]

RSA r inverse operand.

uint32_t M_prime

RSA M prime operand.

uint32_t length

RSA length in words (32 bit)
Chapter 2. API Reference

Macros

ESP_DS_IV_BIT_LEN

ESP_DS_IV_LEN

ESP_DS_SIGNATURE_MAX_BIT_LEN

ESP_DS_SIGNATURE_MD_BIT_LEN

ESP_DS_SIGNATURE_M_PRIME_BIT_LEN

ESP_DS_SIGNATURE_L_BIT_LEN

ESP_DS_SIGNATURE_PADDING_BIT_LEN

ESP_DS_C_LEN

Type Definitions

typedef struct esp_ds_context esp_ds_context_t

typedef struct esp_digital_signature_data esp_ds_data_t

Encrypted private key data. Recommended to store in flash in this format.

Note: This struct has to match to one from the ROM code! This documentation is mostly taken from there.

Enumerations

enum esp_digital_signature_length_t

Values:

enumerator ESP_DS_RSA_1024

enumerator ESP_DS_RSA_2048

enumerator ESP_DS_RSA_3072

enumerator ESP_DS_RSA_4096

2.5.11 Inter-Integrated Circuit (I2C)

Introduction

I2C is a serial, synchronous, multi-device, half-duplex communication protocol that allows co-existence of multiple masters and slaves on the same bus. I2C uses two bidirectional open-drain lines: serial data line (SDA) and serial clock line (SCL), pulled up by resistors.

ESP32-S2 has 2 I2C controller (also called port), responsible for handling communication on the I2C bus. A single I2C controller can be a master or a slave.
Typically, an I2C slave device has a 7-bit address or 10-bit address. ESP32-S2 supports both I2C Standard-mode (Sm) and Fast-mode (Fm) which can go up to 100KHz and 400KHz respectively.

**Warning:** The clock frequency of SCL in master mode should not be larger than 400 KHz

**Note:** The frequency of SCL is influenced by both the pull-up resistor and the wire capacitance. Therefore, users are strongly recommended to choose appropriate pull-up resistors to make the frequency accurate. The recommended value for pull-up resistors usually ranges from 1K Ohms to 10K Ohms.

Keep in mind that the higher the frequency, the smaller the pull-up resistor should be (but not less than 1 KOHms). Indeed, large resistors will decline the current, which will increase the clock switching time and reduce the frequency. We usually recommend a range of 2 KOHms to 5 KOHms, but users may also need to make some adjustments depending on their current draw requirements.

### I2C Clock Configuration

- `i2c_clock_source_t::I2C_CLK_SRC_DEFAULT`: Default I2C source clock.
- `i2c_clock_source_t::I2C_CLK_SRC_APB`: APB clock as I2C clock source.
- `i2c_clock_source_t::I2C_CLK_SRC_REF_TICK`: 1MHZ clock.

### I2C File Structure

**Public headers that need to be included in the I2C application**

- `i2c.h`: The header file of legacy I2C APIs (for apps using legacy driver).
• `i2c_master.h`: The header file that provides standard communication mode specific APIs (for apps using new driver with master mode).
• `i2c_slave.h`: The header file that provides standard communication mode specific APIs (for apps using new driver with slave mode).

**Note:** The legacy driver can’t coexist with the new driver. Include `i2c.h` to use the legacy driver or the other two headers to use the new driver. Please keep in mind that the legacy driver is now deprecated and will be removed in future.

**Public headers that have been included in the headers above**

- `i2c_types_legacy.h`: The legacy public types that only used in the legacy driver.
- `i2c_types.h`: The header file that provides public types.

### Functional Overview

The I2C driver offers following services:

- **Resource Allocation** - covers how to allocate I2C bus with properly set of configurations. It also covers how to recycle the resources when they finished working.
- **I2C Master Controller** - covers behavior of I2C master controller. Introduce data transmit, data receive, and data transmit and receive.
- **I2C Slave Controller** - covers behavior of I2C slave controller. Involve data transmit and data receive.
- **Power Management** - describes how different source clock will affect power consumption.
- **IRAM Safe** - describes tips on how to make the I2C interrupt work better along with a disabled cache.
- **Thread Safety** - lists which APIs are guaranteed to be thread safe by the driver.
- **Kconfig Options** - lists the supported Kconfig options that can bring different effects to the driver.

**Resource Allocation**

Both I2C master bus and I2C slave bus, when supported, are represented by `i2c_bus_handle_t` in the driver. The available ports are managed in a resource pool that allocates a free port on request.

**Install I2C master bus and device**

The I2C master is designed based on bus-device model. So `i2c_master_bus_config_t` and `i2c_device_config_t` are required separately to allocate the I2C master bus instance and I2C device instance.

I2C master bus requires the configuration that specified by `i2c_master_bus_config_t`:

- `i2c_master_bus_config_t::i2c_port` sets the I2C port used by the controller.
- `i2c_master_bus_config_t::sda_io_num` sets the GPIO number for the serial data bus (SDA).
- `i2c_master_bus_config_t::scl_io_num` sets the GPIO number for the serial clock bus (SCL).
- `i2c_master_bus_config_t::clk_source` selects the source clock for I2C bus. The available clocks are listed in `i2c_clock_source_t`. For the effect on power consumption of different clock source, please refer to **Power Management** section.
- `i2c_master_bus_config_t::glitch_ignore_cnt` sets the glitch period of master bus, if the glitch period on the line is less than this value, it can be filtered out, typically value is 7.
- `i2c_master_bus_config_t::intr_priority` Set the priority of the interrupt. If set to 0, then the driver will use a interrupt with low or medium priority (priority level may be one of 1, 2 or 3), otherwise use the priority indicated by `i2c_master_bus_config_t::intr_priority` Please use the number form (1,2,3), not the bitmask form ((1<<1),(1<<2),(1<<3)).
- `i2c_master_bus_config_t::trans_queue_depth` Depth of internal transfer queue. Only valid in asynchronous transaction.
- `i2c_master_bus_config_t::enable_internal_pullup` Enable internal pullups. Note: This is not strong enough to pullup buses under high-speed frequency. A suitable external pullup is recommended.

If the configurations in `i2c_master_bus_config_t` is specified, users can call `i2c_new_master_bus()` to allocate and initialize an I2C master bus. This function will return an I2C bus handle if it runs correctly. Specifically, when there are no more I2C port available, this function will return `ESP_ERR_NOT_FOUND` error.
I2C master device requires the configuration that specified by `i2c_device_config_t`:

- `i2c_device_config_t::dev_addr_length` configure the address bit length of the slave device. User can choose from enumerator `I2C_ADDR_BIT_LEN_7` or `I2C_ADDR_BIT_LEN_10` (if supported).
- `i2c_device_config_t::device_address` I2C device raw address. Please parse the device address to this member directly. For example, the device address is 0x28, then parse 0x28 to `i2c_device_config_t::device_address`, don’t carry a write/read bit.
- `i2c_device_config_t::scl_speed_hz` set the scl line frequency of this device.

Once the `i2c_device_config_t` structure is populated with mandatory parameters, users can call `i2c_master_bus_add_device()` to allocate an I2C device instance and mounted to the master bus then. This function will return an I2C device handle if it runs correctly. Specifically, when the I2C bus is not initialized properly, calling this function will result in a `ESP_ERR_INVALID_ARG` error.

```
#include "driver/i2c_master.h"

i2c_master_bus_config_t i2c_mst_config = {
    .clk_source = I2C_CLK_SRC_DEFAULT,
    .i2c_port = TEST_I2C_PORT,
    .scl_io_num = I2C_MASTER_SCL_IO,
    .sda_io_num = I2C_MASTER_SDA_IO,
    .glitch_ignore_cnt = 7,
    .flags.enable_internal_pullup = true,
};

i2c_master_bus_handle_t bus_handle;
ESP_ERROR_CHECK(i2c_new_master_bus(&i2c_mst_config, &bus_handle));

i2c_device_config_t dev_cfg = {
    .dev_addr_length = I2C_ADDR_BIT_LEN_7,
    .device_address = 0x58,
    .scl_speed_hz = 100000,
};

i2c_master_dev_handle_t dev_handle;
ESP_ERROR_CHECK(i2c_master_bus_add_device(bus_handle, &dev_cfg, &dev_handle));
```
Chapter 2. API Reference

Uninstall I2C master bus and device  If a previously installed I2C bus or device is no longer needed, it’s recommended to recycle the resource by calling \texttt{i2c_master_bus_rm_device()} or \texttt{i2c_del_master_bus()}, so that to release the underlying hardware.

Install I2C slave device  I2C slave requires the configuration that specified by \texttt{i2c_slave_config_t}:

- \texttt{i2c_slave_config_t::i2c_port} sets the I2C port used by the controller.
- \texttt{i2c_slave_config_t::sda_io_num} sets the GPIO number for serial data bus (SDA).
- \texttt{i2c_slave_config_t::scl_io_num} sets the GPIO number for serial clock bus (SCL).
- \texttt{i2c_slave_config_t::clk_source} selects the source clock for I2C bus. The available clocks are listed in \texttt{i2c_clock_source_t}. For the effect on power consumption of different clock source, please refer to \texttt{Power Management} section.
- \texttt{i2c_slave_config_t::send_buf_depth} sets the sending buffer length.
- \texttt{i2c_slave_config_t::slave_addr} sets the slave address
- \texttt{i2c_master_bus_config_t::intr_priority} Set the priority of the interrupt. If set to 0, then the driver will use a interrupt with low or medium priority (priority level may be one of 1, 2, or 3), otherwise use the priority indicated by \texttt{i2c_master_bus_config_t::intr_priority} Please use the number form (1,2,3) , not the bitmask form (1<<1),(1<<2),(1<<3)). Please pay attention that once the interrupt priority is set, it cannot be changed until \texttt{i2c_del_master_bus()} is called.
- \texttt{i2c_slave_config_t::addr_bit_len} sets true if you need the slave to have a 10-bit address.

Once the \texttt{i2c_slave_config_t} structure is populated with mandatory parameters, users can call \texttt{i2c_new_slave_device()} to allocate and initialize an I2C master bus. This function will return an I2C bus handle if it runs correctly. Specifically, when there are no more I2C port available, this function will return \texttt{ESP_ERR_NOT_FOUND} error.

```
i2c_slave_config_t i2c_slv_config = {
    .addr_bit_len = I2C_ADDR_BIT_LEN_7,
    .clk_source = I2C_CLK_SRC_DEFAULT,
    .i2c_port = TEST_I2C_PORT,
    .send_buf_depth = 256,
    .scl_io_num = I2C_SLAVE_SCL_IO,
    .sda_io_num = I2C_SLAVE_SDA_IO,
    .slave_addr = 0x58,
};
i2c_slave_dev_handle_t slave_handle;
ESP_ERROR_CHECK(i2c_new_slave_device(&i2c_slv_config, &slave_handle));
```

Uninstall I2C slave device  If a previously installed I2C bus is no longer needed, it’s recommended to recycle the resource by calling \texttt{i2c_del_slave_device()}, so that to release the underlying hardware.

I2C Master Controller  After installing the i2c master driver by \texttt{i2c_new_master_bus()}, ESP32-S2 is ready to communicate with other I2C devices. I2C APIs allow the standard transactions. Like the wave as follows:

![Standard I2C Transaction Timing Diagram](image)
I2C Master Write  After installing I2C master bus successfully, you can simply call \texttt{i2c_master_transmit()} to write data to the slave device. The principle of this function can be explained by following chart.

In order to organize the process, the driver uses a command link, that should be populated with a sequence of commands and then passed to I2C controller for execution.

![Fig. 7: I2C master write to slave](image)

Simple example for writing data to slave:

```c
#define DATA_LENGTH 100

i2c_master_bus_config_t i2c_mst_config = {
    .clk_source = I2C_CLK_SRC_DEFAULT,
    .i2c_port = I2C_PORT_NUM_0,
    .scl_io_num = I2C_MASTER_SCL_IO,
    .sda_io_num = I2C_MASTER_SDA_IO,
    .glitch_ignore_cnt = 7,
};

i2c_master_bus_handle_t bus_handle;
ESP_ERROR_CHECK(i2c_new_master_bus(&i2c_mst_config, &bus_handle));

i2c_device_config_t dev_cfg = {
    .dev_addr_length = I2C_ADDR_BIT_LEN_7,
    .device_address = 0x58,
    .scl_speed_hz = 100000,
};

i2c_master_dev_handle_t dev_handle;
ESP_ERROR_CHECK(i2c_master_bus_add_device(bus_handle, &dev_cfg, &dev_handle));
ESP_ERROR_CHECK(i2c_master_transmit(dev_handle, data_wr, DATA_LENGTH, -1));
```

I2C Master Read  After installing I2C master bus successfully, you can simply call \texttt{i2c_master_receive()} to read data from the slave device. The principle of this function can be explained by following chart.

![Fig. 8: I2C master read from slave](image)

Simple example for reading data from slave:

```c
#define DATA_LENGTH 100

i2c_master_bus_config_t i2c_mst_config = {
    .clk_source = I2C_CLK_SRC_DEFAULT,
    .i2c_port = I2C_PORT_NUM_0,
    .scl_io_num = I2C_MASTER_SCL_IO,
    .sda_io_num = I2C_MASTER_SDA_IO,
    .glitch_ignore_cnt = 7,
};

i2c_master_bus_handle_t bus_handle;
```

(continues on next page)
ESP_ERROR_CHECK(i2c_new_master_bus(&i2c_mst_config, &bus_handle));

i2c_device_config_t dev_cfg = {
  .dev_addr_length = I2C_ADDR_BIT_LEN_7,
  .device_address = 0x58,
  .scl_speed_hz = 100000,
};

i2c_master_dev_handle_t dev_handle;
ESP_ERROR_CHECK(i2c_master_bus_add_device(bus_handle, &dev_cfg, &dev_handle));
i2c_master_receive(dev_handle, data_rd, DATA_LENGTH, -1);

I2C Master Write and Read Some I2C device needs write configurations before reading data from it, therefore, an interface called i2c_master_transmit_receive() can help. The principle of this function can be explained by following chart.

Fig. 9: I2C master write to slave and read from slave

Simple example for writing and reading from slave:

i2c_device_config_t dev_cfg = {
  .dev_addr_length = I2C_ADDR_BIT_LEN_7,
  .device_address = 0x58,
  .scl_speed_hz = 100000,
};

i2c_master_dev_handle_t dev_handle;
ESP_ERROR_CHECK(i2c_master_bus_add_device(I2C_PORT_NUM_0, &dev_cfg, &dev_handle));
uint8_t buf[20] = {0x20};
uint8_t buffer[2];
ESP_ERROR_CHECK(i2c_master_transmit_receive(i2c_bus_handle, buf, sizeof(buf),
  buffer, 2, -1));

I2C Master Probe I2C driver can use i2c_master_probe() to detect whether the specific device has been connected on I2C bus. If this function return ESP_OK, that means the device has been detected.

Fig. 10: I2C master probe

Simple example for probing an I2C device:

i2c_master_bus_config_t i2c_mst_config_1 = {
  .clk_source = I2C_CLK_SRC_DEFAULT,
  .i2c_port = TEST_I2C_PORT,
  .scl_io_num = I2C_MASTER_SCL_IO,
  .sda_io_num = I2C_MASTER_SDA_IO,
  .glitch_ignore_cnt = 7,
  .flags.enable_internal_pullup = true,
};

(continues on next page)
I2C Master Bus

```c
i2c_master_bus_handle_t bus_handle;
ESP_ERROR_CHECK(i2c_new_master_bus(&i2c_mst_config_1, &bus_handle));
ESP_ERROR_CHECK(i2c_master_probe(bus_handle, 0x22, -1));
ESP_ERROR_CHECK(i2c_del_master_bus(bus_handle));
```

**I2C Master Bus**

After installing the i2c master driver by `i2c_new_master_device()`, ESP32-S2 is ready to communicate with other I2C master as a slave.

**I2C Slave Write**

The send buffer of the I2C slave is used as a FIFO to store the data to be sent. The data will queue up until the master requests them. You can call `i2c_slave_transmit()` to transfer data.

Simple example for writing data to FIFO:

```c
uint8_t *data_wr = (uint8_t *) malloc(DATA_LENGTH);

i2c_slave_config_t i2c_slv_config = {
    .addr_bit_len = I2C_ADDR_BIT_LEN_7,   // 7-bit address
    .clk_source = I2C_CLK_SRC_DEFAULT,   // set the clock source
    .i2c_port = 0,                        // set I2C port number
    .send_buf_depth = 256,               // set tx buffer length
    .scl_io_num = 2,                     // SCL gpio number
    .sda_io_num = 1,                     // SDA gpio number
    .slave_addr = 0x58,                  // slave address
};

i2c_bus_handle_t i2c_bus_handle;
ESP_ERROR_CHECK(i2c_new_slave_device(&i2c_slv_config, &i2c_bus_handle));
for (int i = 0; i < DATA_LENGTH; i++) {
    data_wr[i] = i;
}
ESP_ERROR_CHECK(i2c_slave_transmit(i2c_bus_handle, data_wr, DATA_LENGTH, 10000));
```

**I2C Slave Read**

Whenever the master writes data to the slave, the slave will automatically store data in the receive buffer. This allows the slave application to call the function `i2c_slave_receive()` as its own discretion. As `i2c_slave_receive()` is designed as a non-blocking interface. So the user needs to register callback `i2c_slave_register_event_callbacks()` to know when the receive has finished.

```c
static IRAM_ATTR bool i2c_slave_rxdone_callback(i2c_slave_dev_handle_t channel, _const i2c_slave_rx_done_event_data_t *edata, void *user_data)
{
    BaseType_t high_task_wakeup = pdFALSE;
    QueueHandle_t receive_queue = (QueueHandle_t)user_data;
    xQueueSendFromISR(receive_queue, edata, &high_task_wakeup);
    return high_task_wakeup == pdTRUE;
}

uint8_t *data_rd = (uint8_t *) malloc(DATA_LENGTH);
uint32_t size_rd = 0;

i2c_slave_config_t i2c_slv_config = {
    .addr_bit_len = I2C_ADDR_BIT_LEN_7,   // 7-bit address
    .clk_source = I2C_CLK_SRC_DEFAULT,   // set the clock source
    .i2c_port = TEST_I2C_PORT,           // set I2C port number
    .send_buf_depth = 256,               // set tx buffer length
    .scl_io_num = I2C_SLAVE_SCL_IO,      // SCL gpio number
    ... (continues on next page)
Register Event Callbacks

**I2C master callbacks** When an I2C master bus triggers an interrupt, a specific event will be generated and notify the CPU. If you have some functions that need to be called when those events occurred, you can hook your functions to the ISR (Interrupt Service Routine) by calling `i2c_master_register_event_callbacks()`. Since the registered callback functions are called in the interrupt context, user should ensure the callback function doesn’t attempt to block (e.g. by making sure that only FreeRTOS APIs with `ISR` suffix are called from within the function). The callback functions are required to return a boolean value, to tell the ISR whether a high priority task is woke up by it.

I2C master event callbacks are listed in the `i2c_master_event_callbacks_t`.

Although I2C is a synchronous communication protocol, we also support asynchronous behavior by registering above callback. In this way, I2C APIs will be non-blocking interface. But note that on the same bus, only one device can adopt asynchronous operation.

**Important:** I2C master asynchronous transaction is still an experimental feature. (The issue is when asynchronous transaction is very large, it will cause memory problem.)

- `i2c_master_event_callbacks_t::on_recv_done` sets a callback function for master “transaction-done” event. The function prototype is declared in `i2c_master_callback_t`.

**I2C slave callbacks** When an I2C slave bus triggers an interrupt, a specific event will be generated and notify the CPU. If you have some function that needs to be called when those events occurred, you can hook your function to the ISR (Interrupt Service Routine) by calling `i2c_slave_register_event_callbacks()`. Since the registered callback functions are called in the interrupt context, user should ensure the callback function doesn’t attempt to block (e.g. by making sure that only FreeRTOS APIs with `ISR` suffix are called from within the function). The callback function has a boolean return value, to tell the caller whether a high priority task is woke up by it.

I2C slave event callbacks are listed in the `i2c_slave_event_callbacks_t`.

- `i2c_slave_event_callbacks_t::on_recv_done` sets a callback function for “receive-done” event. The function prototype is declared in `i2c_slave_received_callback_t`. 
**Power Management** When the power management is enabled (i.e. `CONFIG_PM_ENABLE` is on), the system will adjust or stop the source clock of I2C fifo before going into light sleep, thus potentially changing the I2C signals and leading to transmitting or receiving invalid data.

However, the driver can prevent the system from changing APB frequency by acquiring a power management lock of type `ESP_PM_APB_FREQ_MAX`. Whenever user creates an I2C bus that has selected `I2C_CLK_SRC_APB` as the clock source, the driver will guarantee that the power management lock is acquired when I2C operations begin and release the lock automatically when I2C operations finish.

If the controller clock source is selected to `I2C_CLK_SRC_REF_TICK`, then the driver won’t install power management lock for it, which is more suitable for a low power application as long as the source clock can still provide sufficient resolution.

**IRAM Safe** By default, the I2C interrupt will be deferred when the Cache is disabled for reasons like writing/erasing Flash. Thus the event callback functions will not get executed in time, which is not expected in a real-time application.

There’s a Kconfig option `CONFIG_I2C_ISR_IRAM_SAFE` that will:

1. Enable the interrupt being serviced even when cache is disabled
2. Place all functions that used by the ISR into IRAM
3. Place driver object into DRAM (in case it’s mapped to PSRAM by accident)

This will allow the interrupt to run while the cache is disabled but will come at the cost of increased IRAM consumption.

**Thread Safety** The factory function `i2c_new_master_bus()` and `i2c_new_slave_device()` are guaranteed to be thread safe by the driver, which means, user can call them from different RTOS tasks without protection by extra locks. Other public I2C APIs are not thread safe. which means the user should avoid calling them from multiple tasks, if user strongly needs to call them in multiple tasks, please add extra lock.

**Kconfig Options**

- `CONFIG_I2C_ISR_IRAM_SAFE` controls whether the default ISR handler can work when cache is disabled, see also IRAM Safe for more information.
- `CONFIG_I2C_ENABLE_DEBUG_LOG` is used to enable the debug log at the cost of increased firmware binary size.

**API Reference**

**Header File**

- `components/driver/i2c/include/driver/i2c_master.h`

This header file can be included with:

```
#include "driver/i2c_master.h"
```

This header file is a part of the API provided by the driver component. To declare that your component depends on driver, add the following to your CMakeLists.txt:

```
REQUIRES driver
```

or

```
PRIV_REQUIRES driver
```

**Functions**

* `esp_err_t i2c_new_master_bus (const i2c_master_bus_config_t *bus_config, i2c_master_bus_handle_t *ret_bus_handle)`

Allocate an I2C master bus.
Chapter 2. API Reference

Parameters

- **bus_config** [in] I2C master bus configuration.
- **ret_bus_handle** [out] I2C bus handle

Returns

- ESP_OK: I2C master bus initialized successfully.
- ESP_ERR_INVALID_ARG: I2C bus initialization failed because of invalid argument.
- ESP_ERR_NO_MEM: Create I2C bus failed because of out of memory.
- ESP_ERR_NOT_FOUND: No more free bus.

```c
esp_err_t i2c_master_bus_add_device(i2c_master_bus_handle_t bus_handle, const i2c_device_config_t *dev_config, i2c_master_dev_handle_t *ret_handle)
```

Add I2C master BUS device.

Parameters

- **bus_handle** [in] I2C bus handle.
- **dev_config** [in] device config.
- **ret_handle** [out] device handle.

Returns

- ESP_OK: Create I2C master device successfully.
- ESP_ERR_INVALID_ARG: I2C bus initialization failed because of invalid argument.
- ESP_ERR_NO_MEM: Create I2C bus failed because of out of memory.

```c
esp_err_t i2c_del_master_bus(i2c_master_bus_handle_t bus_handle)
```

Deinitialize the I2C master bus and delete the handle.

Parameters **bus_handle** [in] I2C bus handle.

Returns

- ESP_OK: Delete I2C bus success, otherwise, failed.
- Otherwise: Some module delete failed.

```c
esp_err_t i2c_master_bus_rm_device(i2c_master_dev_handle_t handle)
```

I2C master bus delete device.

Parameters **handle** i2c device handle

Returns

- ESP_OK: If device is successfully deleted.

```c
esp_err_t i2c_master_transmit(i2c_master_dev_handle_t i2c_dev, const uint8_t *write_buffer, size_t write_size, int xfer_timeout_ms)
```

Perform a write transaction on the I2C bus. The transaction will be undergoing until it finishes or it reaches the timeout provided.

Note: If a callback was registered with `i2c_master_register_event_callbacks`, the transaction will be asynchronous, and thus, this function will return directly, without blocking. You will get finish information from callback. Besides, data buffer should always be completely prepared when callback is registered, otherwise, the data will get corrupt.

Parameters

- **i2c_dev** [in] I2C master device handle that created by `i2c_master_bus_add_device`.
- **write_buffer** [in] Data bytes to send on the I2C bus.
- **write_size** [in] Size, in bytes, of the write buffer.

Returns

- ESP_OK: I2C master transmit success
- ESP_ERR_INVALID_ARG: I2C master transmit parameter invalid.
- ESP_ERR_TIMEOUT: Operation timeout(larger than xfer_timeout_ms) because the bus is busy or hardware crash.
**esp_err_t** i2c_master_transmit_receive\( \) \(i2c\_master\_dev\_handle\_t\) \(i2c\_dev\), const uint8_t \(*\)write_buffer, size_t \(*\)write_size, uint8_t \(*\)read_buffer, size_t \(*\)read_size, int xfer_timeout_ms\)

Perform a write-read transaction on the I2C bus. The transaction will be undergoing until it finishes or it reaches the timeout provided.

**Note:** If a callback was registered with \( \text{i2c\_master\_register\_event\_callbacks} \), the transaction will be asynchronous, and thus, this function will return directly, without blocking. You will get finish information from callback. Besides, data buffer should always be completely prepared when callback is registered, otherwise, the data will get corrupt.

**Parameters**

- \( i2c\_dev \) -[in] I2C master device handle that created by \( \text{i2c\_master\_bus\_add\_device} \).
- \( \text{write} \_\text{buffer} \) -[in] Data bytes to send on the I2C bus.
- \( \text{write} \_\text{size} \) -[in] Size, in bytes, of the write buffer.
- \( \text{read} \_\text{buffer} \) -[out] Data bytes received from i2c bus.
- \( \text{read} \_\text{size} \) -[in] Size, in bytes, of the read buffer.
- \( \text{xfer} \_\text{timeout} \_\text{ms} \) -[in] Wait timeout, in ms. Note: -1 means wait forever.

**Returns**

- ESP_OK: I2C master transmit-receive success
- ESP_ERR_INVALID_ARG: I2C master transmit parameter invalid.
- ESP_ERR_TIMEOUT: Operation timeout(larger than xfer_timeout_ms) because the bus is busy or hardware crash.

**esp_err_t** i2c_master_receive\( \) \(i2c\_master\_dev\_handle\_t\) \(i2c\_dev\), uint8_t \(*\)read_buffer, size_t \(*\)read_size, int xfer_timeout_ms\)

Perform a read transaction on the I2C bus. The transaction will be undergoing until it finishes or it reaches the timeout provided.

**Note:** If a callback was registered with \( \text{i2c\_master\_register\_event\_callbacks} \), the transaction will be asynchronous, and thus, this function will return directly, without blocking. You will get finish information from callback. Besides, data buffer should always be completely prepared when callback is registered, otherwise, the data will get corrupt.

**Parameters**

- \( i2c\_dev \) -[in] I2C master device handle that created by \( \text{i2c\_master\_bus\_add\_device} \).
- \( \text{read} \_\text{buffer} \) -[out] Data bytes received from i2c bus.
- \( \text{read} \_\text{size} \) -[in] Size, in bytes, of the read buffer.
- \( \text{xfer} \_\text{timeout} \_\text{ms} \) -[in] Wait timeout, in ms. Note: -1 means wait forever.

**Returns**

- ESP_OK: I2C master receive success
- ESP_ERR_INVALID_ARG: I2C master receive parameter invalid.
- ESP_ERR_TIMEOUT: Operation timeout(larger than xfer_timeout_ms) because the bus is busy or hardware crash.

**esp_err_t** i2c_master_probe\( \) \(i2c\_master\_bus\_handle\_t\) \(bus\_handle\), uint16_t \(*\)address, int xfer_timeout_ms\)

Probe I2C address, if address is correct and ACK is received, this function will return ESP_OK.

**Parameters**

- \( \text{bus} \_\text{handle} \) -[in] I2C master device handle that created by \( \text{i2c\_master\_bus\_add\_device} \).
- \( \text{address} \) -[in] I2C device address that you want to probe.
Chapter 2. API Reference

- **xfer_timeout_ms - [in]** Wait timeout, in ms. Note: -1 means wait forever (Not recommended in this function).

**Returns**

- ESP_OK: I2C device probe successfully
- ESP_ERR_NOT_FOUND: I2C probe failed, doesn’t find the device with specific address you gave.
- ESP_ERR_TIMEOUT: Operation timeout(larger than xfer_timeout_ms) because the bus is busy or hardware crash.

```c
esp_err_t i2c_master_register_event_callbacks(
    i2c_master_dev_handle_t i2c_dev,
    const i2c_master_event_callbacks_t *cbs,
    void *user_data)
```

Register I2C transaction callbacks for a master device.

**Note:** User can deregister a previously registered callback by calling this function and setting the callback member in the cbs structure to NULL.

**Note:** When CONFIG_I2C_ISR_IRAM_SAFE is enabled, the callback itself and functions called by it should be placed in IRAM. The variables used in the function should be in the SRAM as well. The user_data should also reside in SRAM.

**Note:** If the callback is used for helping asynchronous transaction. On the same bus, only one device can be used for performing asynchronous operation.

**Parameters**

- **i2c_dev - [in]** I2C master device handle that created by
  i2c_master_bus_add_device.
- **cbs - [in]** Group of callback functions
- **user_data - [in]** User data, which will be passed to callback functions directly

**Returns**

- ESP_OK: Set I2C transaction callbacks successfully
- ESP_ERR_INVALID_ARG: Set I2C transaction callbacks failed because of invalid argument
- ESP_FAIL: Set I2C transaction callbacks failed because of other error

```c
esp_err_t i2c_master_bus_reset(
    i2c_master_bus_handle_t bus_handle)
```

Reset the I2C master bus.

**Parameters**

- **bus_handle - [in]** I2C bus handle.

**Returns**

- ESP_OK: Reset succeed.
- ESP_ERR_INVALID_ARG: I2C master bus handle is not initialized.
- Otherwise: Reset failed.

```c
esp_err_t i2c_master_bus_wait_all_done(
    i2c_master_bus_handle_t bus_handle, int timeout_ms)
```

Wait for all pending I2C transactions done.

**Parameters**

- **bus_handle - [in]** I2C bus handle
- **timeout_ms - [in]** Wait timeout, in ms. Specially, -1 means to wait forever.

**Returns**

- ESP_OK: Flush transactions successfully
- ESP_ERR_INVALID_ARG: Flush transactions failed because of invalid argument
- ESP_ERR_TIMEOUT: Flush transactions failed because of timeout
- ESP_FAIL: Flush transactions failed because of other error
Structures

```c
struct i2c_master_bus_config_t
```
I2C master bus specific configurations.

**Public Members**

```c
d2c_port_num_t i2c_port
```
I2C port number, –1 for auto selecting

```c
gpio_num_t sda_io_num
```
GPIO number of I2C SDA signal, pulled-up internally

```c
gpio_num_t scl_io_num
```
GPIO number of I2C SCL signal, pulled-up internally

```c
d2c_clock_source_t clk_source
```
Clock source of I2C master bus, channels in the same group must use the same clock source

```c
uint8_t glitch_ignore_cnt
```
If the glitch period on the line is less than this value, it can be filtered out, typically value is 7 (unit: I2C module clock cycle)

```c
int intr_priority
```
I2C interrupt priority, if set to 0, driver will select the default priority (1,2,3).

```c
size_t trans_queue_depth
```
Depth of internal transfer queue, increase this value can support more transfers pending in the background, only valid in asynchronous transaction. (Typically max_device_num * per_transaction)

```c
uint32_t enable_internal_pullup
```
Enable internal pullups. Note: This is not strong enough to pullup buses under high-speed frequency. Recommend proper external pull-up if possible

```c
struct i2c_master_bus_config_t::[anonymous] flags
```
I2C master config flags

```c
struct i2c_device_config_t
```
I2C device configuration.

**Public Members**

```c
d2c_addr_bit_len_t dev_addr_length
```
Select the address length of the slave device.

```c
uint16_t device_address
```
I2C device raw address. (The 7/10 bit address without read/write bit)
uint32_t scl_speed_hz
I2C SCL line frequency.

struct i2c_master_event_callbacks_t
Group of I2C master callbacks, can be used to get status during transaction or doing other small things. But take care potential concurrency issues.

Note: The callbacks are all running under ISR context

Note: When CONFIG_I2C_ISR_IRAM_SAFE is enabled, the callback itself and functions called by it should be placed in IRAM. The variables used in the function should be in the SRAM as well.

Public Members

i2c_master_callback_t on_trans_done
I2C master transaction finish callback

Header File

• components/driver/i2c/include/driver/i2c_slave.h
• This header file can be included with:

```
#include "driver/i2c_slave.h"
```

• This header file is a part of the API provided by the driver component. To declare that your component depends on driver, add the following to your CMakeLists.txt:

```cmake
REQUIRES driver
```
or

```cmake
PRIV_REQUIRES driver
```

Functions

esp_err_t i2c_new_slave_device (const i2c_slave_config_t *slave_config, i2c_slave_dev_handle_t *ret_handle)
Initialize an I2C slave device.

Parameters

• slave_config [in] I2C slave device configurations
• ret_handle [out] Return a generic I2C device handle

Returns

• ESP_OK: I2C slave device initialized successfully
• ESP_ERR_INVALID_ARG: I2C device initialization failed because of invalid argument.
• ESP_ERR_NO_MEM: Create I2C device failed because of out of memory.

esp_err_t i2c_del_slave_device (i2c_slave_dev_handle_t i2c_slave)
Deinitialize the I2C slave device.

Parameters i2c_slave [in] I2C slave device handle that created by i2c_new_slave_device.

Returns

• ESP_OK: Delete I2C device successfully.
• ESP_ERR_INVALID_ARG: I2C device initialization failed because of invalid argument.
### esp_err_t \texttt{i2c_slave_receive} (i2c_slave_dev_handle_t i2c_slave, uint8_t*data, size_t buffer_size)

Read bytes from I2C internal buffer. Start a job to receive I2C data.

**Note:** This function is non-blocking, it initiates a new receive job and then returns. User should check the received data from the on_recv_done callback that registered by \texttt{i2c_slave_register_event_callbacks()}.  

**Parameters**
- \texttt{i2c_slave} \hspace{1em} [-in] \hspace{1em} I2C slave device handle that created by \texttt{i2c_new_slave_device}.
- \texttt{data} \hspace{1em} [-out] \hspace{1em} Buffer to store data from I2C fifo. Should be valid until on_recv_done is triggered.
- \texttt{buffer_size} \hspace{1em} [-in] \hspace{1em} Buffer size of data that provided by users.

**Returns**
- ESP_OK: I2C slave receive success.
- ESP_ERR_INVALID_ARG: I2C slave receive parameter invalid.
- ESP_ERR_NOT_SUPPORTED: This function should be work in fifo mode, but I2C_SLAVE_NONFIFO mode is configured

### esp_err_t \texttt{i2c_slave_transmit} (i2c_slave_dev_handle_t i2c_slave, const uint8_t*data, int size, int xfer_timeout_ms)

Write bytes to internal ringbuffer of the I2C slave data. When the TX fifo empty, the ISR will fill the hardware FIFO with the internal ringbuffer’s data.

**Note:** If you connect this slave device to some master device, the data transaction direction is from slave device to master device.

**Parameters**
- \texttt{i2c_slave} \hspace{1em} [-in] \hspace{1em} I2C slave device handle that created by \texttt{i2c_new_slave_device}.
- \texttt{data} \hspace{1em} [-in] \hspace{1em} Buffer to write to slave fifo, can pickup by master. Can be freed after this function returns. Equal or larger than \texttt{size}.
- \texttt{size} \hspace{1em} [-in] \hspace{1em} In bytes, of \texttt{data} buffer.
- \texttt{xfer_timeout_ms} \hspace{1em} [-in] \hspace{1em} Wait timeout, in ms. Note: -1 means wait forever.

**Returns**
- ESP_OK: I2C slave transmit success.
- ESP_ERR_INVALID_ARG: I2C slave transmit parameter invalid.
- ESP_ERR_TIMEOUT: Operation timeout(larger than xfer_timeout_ms) because the device is busy or hardware crash.
- ESP_ERR_NOT_SUPPORTED: This function should be work in fifo mode, but I2C_SLAVE_NONFIFO mode is configured

### esp_err_t \texttt{i2c_slave_register_event_callbacks} (i2c_slave_dev_handle_t i2c_slave, const i2c_slave_event_callbacks_t cbs, void *user_data)

Set I2C slave event callbacks for I2C slave channel.

**Note:** User can deregister a previously registered callback by calling this function and setting the callback member in the \texttt{cbs} structure to NULL.

**Note:** When CONFIG_I2C_ISR_IRAM_SAFE is enabled, the callback itself and functions called by it should be placed in IRAM. The variables used in the function should be in the SRAM as well. The \texttt{user_data}
should also reside in SRAM.

Parameters
• `i2c_slave` -[in] I2C slave device handle that created by `i2c_new_slave_device`
• `cbs` -[in] Group of callback functions
• `user_data` -[in] User data, which will be passed to callback functions directly

Returns
• ESP_OK: Set I2C transaction callbacks successfully
• ESP_ERR_INVALID_ARG: Set I2C transaction callbacks failed because of invalid argument
• ESP_FAIL: Set I2C transaction callbacks failed because of other error

Structures
struct `i2c_slave_config_t`
I2C slave specific configurations.

Public Members

`i2c_port_num_t i2c_port`
I2C port number, -1 for auto selecting

gpio_num_t `sda_io_num`
SDA IO number used by I2C bus

gpio_num_t `scl_io_num`
SCL IO number used by I2C bus

`i2c_clock_source_t clk_source`
Clock source of I2C bus.

uint32_t `send_buf_depth`
Depth of internal transfer ringbuffer, increase this value can support more transfers pending in the background

uint16_t `slave_addr`
I2C slave address

`i2c_addr_bit_len_t addr_bit_len`
I2C slave address in bit length

int `intr_priority`
I2C interrupt priority, if set to 0, driver will select the default priority (1,2,3).

struct `i2c_slave_config_t`::[anonymous] flags
I2C slave config flags
struct `i2c_slave_event_callbacks_t`

Group of I2C slave callbacks (e.g. get i2c slave stretch cause). But take care of potential concurrency issues.

**Note:** The callbacks are all running under ISR context

**Note:** When `CONFIG_I2C_ISR_IRAM_SAFE` is enabled, the callback itself and functions called by it should be placed in IRAM. The variables used in the function should be in the SRAM as well.

**Public Members**

`i2c_slave_received_callback_t on_recv_done`

I2C slave receive done callback

**Header File**

- `components/driver/i2c/include/driver/i2c_types.h`

This header file can be included with:

```c
#include "driver/i2c_types.h"
```

- This header file is a part of the API provided by the `driver` component. To declare that your component depends on `driver`, add the following to your `CMakeLists.txt`:

```cmake
REQUIRES driver
```

or

```cmake
PRIV_REQUIRES driver
```

**Structures**

struct `i2c_master_event_data_t`

Data type used in I2C event callback.

**Public Members**

`i2c_master_event_t event`

The I2C hardware event that I2C callback is called.

struct `i2c_slave_rx_done_event_data_t`

Event structure used in I2C slave.

**Public Members**

`uint8_t *buffer`

Pointer for buffer received in callback.
Type Definitions

typedef int i2c_port_num_t
  I2C port number.

typedef struct i2c_master_bus_t *i2c_master_bus_handle_t
  Type of I2C master bus handle.

typedef struct i2c_master_dev_t *i2c_master_dev_handle_t
  Type of I2C master bus device handle.

typedef struct i2c_slave_dev_t *i2c_slave_dev_handle_t
  Type of I2C slave device handle.

typedef bool (*i2c_master_callback_t)(i2c_master_dev_handle_t i2c_dev, const i2c_master_event_data_t *evt_data, void *arg)
  An callback for I2C transaction.
    Param i2c_dev [in] Handle for I2C device.
    Param evt_data [out] I2C capture event data, fed by driver
    Param arg [in] User data, set in i2c_master_register_event_callbacks()
    Return Whether a high priority task has been waken up by this function

typedef bool (*i2c_slave_received_callback_t)(i2c_slave_dev_handle_t i2c_slave, const i2c_slave_rx_done_event_data_t *evt_data, void *arg)
  Callback signature for I2C slave.
    Param i2c_slave [in] Handle for I2C slave.
    Param evt_data [out] I2C capture event data, fed by driver
    Param user_ctx [in] User data, set in i2c_slave_register_event_callbacks()
    Return Whether a high priority task has been waken up by this function

Enumerations

enum i2c_master_status_t
  Enumeration for I2C fsm status.
  Values:
    enumerator I2C_STATUS_READ
      read status for current master command
    enumerator I2C_STATUS_WRITE
      write status for current master command
    enumerator I2C_STATUS_START
      Start status for current master command
    enumerator I2C_STATUS_STOP
      stop status for current master command
    enumerator I2C_STATUS_IDLE
      idle status for current master command
enumerator I2C_STATUS_ACK_ERROR
ack error status for current master command

enumerator I2C_STATUS_DONE
I2C command done

enumerator I2C_STATUS_TIMEOUT
I2C bus status error, and operation timeout

enum i2c_master_event_t

Values:

enumerator I2C_EVENT_ALIVE
i2c bus in alive status.

enumerator I2C_EVENT_DONE
i2c bus transaction done

enumerator I2C_EVENT_NACK
i2c bus nack

Header File

- components/hal/include/hal/i2c_types.h
- This header file can be included with:

```
#include "hal/i2c_types.h"
```

Structures

struct i2c_hal_clk_config_t

Data structure for calculating I2C bus timing.

Public Members

uint16_t clkm_div
I2C core clock devider

uint16_t scl_low
I2C scl low period

uint16_t scl_high
I2C scl hight period

uint16_t scl_wait_high
I2C scl wait_high period

uint16_t sda_hold
I2C scl low period
Chapter 2. API Reference

```c
uint16_t sda_sample
I2C sda sample time

uint16_t setup
I2C start and stop condition setup period

uint16_t hold
I2C start and stop condition hold period

uint16_t tout
I2C bus timeout period
```

**Type Definitions**

typedef `soc_periph_i2c_clk_src_t` **i2c_clock_source_t**
I2C group clock source.

**Enumerations**

```c
enum i2c_port_t
I2C port number, can be I2C_NUM_0 ~ (I2C_NUM_MAX-1).

_values:

enumerator I2C_NUM_0
I2C port 0

enumerator I2C_NUM_1
I2C port 1

enumerator I2C_NUM_MAX
I2C port max
```

```c
enum i2c_addr_bit_len_t
Enumeration for I2C device address bit length.

_values:

enumerator I2C_ADDR_BIT_LEN_7
i2c address bit length 7
```

```c
enum i2c_mode_t

_values:

enumerator I2C_MODE_SLAVE
I2C slave mode

enumerator I2C_MODE_MASTER
I2C master mode
```
enumerator **I2C_MODE_MAX**

enum **i2c_rw_t**

Values:

enumerator **I2C_MASTER_WRITE**

I2C write data

enumerator **I2C_MASTER_READ**

I2C read data

enum **i2c_trans_mode_t**

Values:

enumerator **I2C_DATA_MODE_MSB_FIRST**

I2C data msb first

enumerator **I2C_DATA_MODE_LSB_FIRST**

I2C data lsb first

enumerator **I2C_DATA_MODE_MAX**

enum **i2c_addr_mode_t**

Values:

enumerator **I2C_ADDR_BIT_7**

I2C 7bit address for slave mode

enumerator **I2C_ADDR_BIT_10**

I2C 10bit address for slave mode

enumerator **I2C_ADDR_BIT_MAX**

enum **i2c_ack_type_t**

Values:

enumerator **I2C_MASTER_ACK**

I2C ack for each byte read

enumerator **I2C_MASTER_NACK**

I2C nack for each byte read

enumerator **I2C_MASTER_LAST_NACK**

I2C nack for the last byte

enumerator **I2C_MASTER_ACK_MAX**
enum **i2c_slave_stretch_cause_t**

Enum for I2C slave stretch causes.

**Values:**

- **enumerator I2C_SLAVE_STRETCH_CAUSE_ADDRESS_MATCH**
  Stretching SCL low when the slave is read by the master and the address just matched

- **enumerator I2C_SLAVE_STRETCH_CAUSE_TX_EMPTY**
  Stretching SCL low when TX FIFO is empty in slave mode

- **enumerator I2C_SLAVE_STRETCH_CAUSE_RX_FULL**
  Stretching SCL low when RX FIFO is full in slave mode

- **enumerator I2C_SLAVE_STRETCH_CAUSE_SENDING_ACK**
  Stretching SCL low when slave sending ACK

### 2.5.12 Inter-IC Sound (I2S)

#### Introduction

I2S (Inter-IC Sound) is a synchronous serial communication protocol usually used for transmitting audio data between two digital audio devices.

ESP32-S2 contains one I2S peripheral(s). These peripherals can be configured to input and output sample data via the I2S driver.

An I2S bus that communicates in standard or TDM mode consists of the following lines:

- **MCLK:** Master clock line. It is an optional signal depending on the slave side, mainly used for offering a reference clock to the I2S slave device.
- **BCLK:** Bit clock line. The bit clock for data line.
- **WS:** Word (Slot) select line. It is usually used to identify the vocal tract except PDM mode.
- **DIN/DOUT:** Serial data input/output line. Data will loopback internally if DIN and DOUT are set to a same GPIO.

Each I2S controller has the following features that can be configured by the I2S driver:

- Operation as system master or slave
- Capable of acting as transmitter or receiver
- DMA controller that allows stream sampling of data without requiring the CPU to copy each data sample

Each controller supports single RX or TX simplex communication. As RX and TX channels share a clock, they can only be combined with the same configuration to establish a full-duplex communication.

#### I2S File Structure

Public headers that need to be included in the I2S application are as follows:

- **i2s.h:** The header file that provides legacy I2S APIs (for apps using legacy driver).
- **i2s_std.h:** The header file that provides standard communication mode specific APIs (for apps using new driver with standard mode).
- **i2s_pdm.h:** The header file that provides PDM communication mode specific APIs (for apps using new driver with PDM mode).
• **i2s_tdm.h**: The header file that provides TDM communication mode specific APIs (for apps using new driver with TDM mode).

**Note**: The legacy driver cannot coexist with the new driver. Include **i2s.h** to use the legacy driver, or include the other three headers to use the new driver. The legacy driver might be removed in future.

**Public headers that have been included in the headers above are as follows:**

• **i2s_types_legacy.h**: The header file that provides legacy public types that are only used in the legacy driver.
• **i2s_types.h**: The header file that provides public types.
• **i2s_common.h**: The header file that provides common APIs for all communication modes.

**I2S Clock**

**Clock Source**

• **i2s_clock_src_t::I2S_CLK_SRC_DEFAULT**: Default PLL clock.
• **i2s_clock_src_t::I2S_CLK_SRC_PLL_160M**: 160 MHz PLL clock.
• **i2s_clock_src_t::I2S_CLK_SRC_APLL**: Audio PLL clock, which is more precise than **I2S_CLK_SRC_PLL_160M** in high sample rate applications. Its frequency is configurable according to the sample rate. However, if APLL has been occupied by EMAC or other channels, the APLL frequency cannot be changed, and the driver will try to work under this APLL frequency. If this frequency cannot meet the requirements of I2S, the clock configuration will fail.

**Clock Terminology**

• **Sample rate**: The number of sampled data in one second per slot.
• **SCLK**: Source clock frequency. It is the frequency of the clock source.
• **MCLK**: Master clock frequency. BCLK is generated from this clock. The MCLK signal usually serves as a reference clock and is mostly needed to synchronize BCLK and WS between I2S master and slave roles.
• **BCLK**: Bit clock frequency. Every tick of this clock stands for one data bit on data pin. The slot bit width configured in `i2s_std_slot_config_t::slot_bit_width` is equal to the number of BCLK ticks, which means there will be 8/16/24/32 BCLK ticks in one slot.

• **LRCK / WS**: Left/right clock or word select clock. For non-PDM mode, its frequency is equal to the sample rate.

**Note:** Normally, MCLK should be the multiple of sample rate and BCLK at the same time. The field `i2s_std_clk_config_t::mclk_multiple` indicates the multiple of MCLK to the sample rate. In most cases, `I2S_MCLK_MULTIPLE_256` should be enough. However, if `slot_bit_width` is set to `I2S_SLOT_BIT_WIDTH_24BIT`, to keep MCLK a multiple to the BCLK, `i2s_std_clk_config_t::mclk_multiple` should be set to multiples that are divisible by 3 such as `I2S_MCLK_MULTIPLE_384`. Otherwise, WS will be inaccurate.

### I2S Communication Mode

**Overview of All Modes**

**Standard Mode** In standard mode, there are always two sound channels, i.e., the left and right channels, which are called “slots”. These slots support 8/16/24/32-bit width sample data. The communication format for the slots mainly includes the followings:

• **Philips Format**: Data signal has one-bit shift comparing to the WS signal, and the duty of WS signal is 50%.

![Standard Philips Timing Diagram](https://via.placeholder.com/150)

• **MSB Format**: Basically the same as Philips format, but without data shift.
Chapter 2. API Reference

Standard MSB Timing Diagram

- **PCM Short Format:** Data has one-bit shift and meanwhile the WS signal becomes a pulse lasting for one BCLK cycle.

Standard PCM Timing Diagram

**LCD/Camera Mode**  LCD/Camera mode is only supported on I2S0 over a parallel bus. For LCD mode, I2S0 should work at master TX mode. For camera mode, I2S0 should work at slave RX mode. These two modes are not implemented by the I2S driver. Please refer to LCD for details about the LCD implementation. For more information, see ESP32-S2 Technical Reference Manual > I2S Controller (I2S) > LCD Mode [PDF].

Functional Overview

The I2S driver offers the following services:

**Resource Management**  There are three levels of resources in the I2S driver:

- **platform level:** Resources of all I2S controllers in the current target.
- **controller level:** Resources in one I2S controller.
- **channel level:** Resources of TX or RX channel in one I2S controller.

The public APIs are all channel-level APIs. The channel handle `i2s_chan_handle_t` can help users to manage the resources under a specific channel without considering the other two levels. The other two upper levels’ resources are private and are managed by the driver automatically. Users can call `i2s_new_channel()` to allocate a channel handle and call `i2s_del_channel()` to delete it.

**Power Management**  When the power management is enabled (i.e., `CONFIG_PM_ENABLE` is on), the system will adjust or stop the source clock of I2S before entering Light-sleep, thus potentially changing the I2S signals and leading to transmitting or receiving invalid data.

The I2S driver can prevent the system from changing or stopping the source clock by acquiring a power management lock. When the source clock is generated from APB, the lock type will be set to `esp_pm_lock_type_t::ESP_PM_APB_FREQ_MAX` and when the source clock is APLL (if supported), it
will be set to `esp_pm_lock_type_t::ESP_PM_NO_LIGHT_SLEEP`. Whenever the user is reading or writing via I2S (i.e., calling `i2s_channel_read()` or `i2s_channel_write()`), the driver guarantees that the power management lock is acquired. Likewise, the driver releases the lock after the reading or writing finishes.

**Finite State Machine** There are three states for an I2S channel, namely, registered, ready, and running. Their relationship is shown in the following diagram:

![I2S Finite State Machine Diagram](image)

Fig. 12: I2S Finite State Machine

The `<mode>` in the diagram can be replaced by corresponding I2S communication modes, e.g., `std` for standard two-slot mode. For more information about communication modes, please refer to the *I2S Communication Mode* section.

**Data Transport** The data transport of the I2S peripheral, including sending and receiving, is realized by DMA. Before transporting data, please call `i2s_channel_enable()` to enable the specific channel. When the sent or received data reaches the size of one DMA buffer, the `I2S_OUT_EOF` or `I2S_IN_SUC_EOF` interrupt will be triggered. Note that the DMA buffer size is not equal to `i2s_chan_config_t::dma_frame_num`. One frame here refers to all the sampled data in one WS circle. Therefore, `dma_buffer_size = dma_frame_num * slot_num * slot_bit_width / 8`. For the data transmitting, users can input the data by calling `i2s_channel_write()`. This function helps users to copy the data from the source buffer to the DMA TX buffer and wait for the transmission to finish. Then it will repeat until the sent bytes reach the given size. For the data receiving, the function `i2s_channel_read()` waits to receive the message queue which contains the DMA buffer address. It helps users copy the data from the DMA RX buffer to the destination buffer.

Both `i2s_channel_write()` and `i2s_channel_read()` are blocking functions. They keeps waiting until the whole source buffer is sent or the whole destination buffer is loaded, unless they exceed the max blocking time, where the error code `ESP_ERR_TIMEOUT` returns. To send or receive data asynchronously, callbacks can be registered by `i2s_channel_register_event_callback()`. Users are able to access the DMA buffer directly.
in the callback function instead of transmitting or receiving by the two blocking functions. However, please be aware that it is an interrupt callback, so do not add complex logic, run floating operation, or call non-reentrant functions in the callback.

**Configuration** Users can initialize a channel by calling corresponding functions (i.e., `i2s_channel_init_std_mode()`, `i2s_channel_init_pdm_rx_mode()`, `i2s_channel_init_pdm_tx_mode()`, or `i2s_channel_init_tdm_mode()`) to a specific mode. If the configurations need to be updated after initialization, users have to first call `i2s_channel_disable()` to ensure that the channel has stopped, and then call corresponding reconfig functions, like `i2s_channel_reconfig_std_slot()`, `i2s_channel_reconfig_std_clock()`, and `i2s_channel_reconfig_std_gpio()`.

**IRAM Safe** By default, the I2S interrupt will be deferred when the cache is disabled for reasons like writing/erasing flash. Thus the EOF interrupt will not get executed in time.

To avoid such case in real-time applications, you can enable the Kconfig option `CONFIG_I2S_ISR_IRAM_SAFE` that:

1. Keeps the interrupt being serviced even when the cache is disabled.
2. Places driver object into DRAM (in case it is linked to PSRAM by accident).

This allows the interrupt to run while the cache is disabled, but comes at the cost of increased IRAM consumption.

**Thread Safety** All the public I2S APIs are guaranteed to be thread safe by the driver, which means users can call them from different RTOS tasks without protection by extra locks. Notice that the I2S driver uses mutex lock to ensure the thread safety, thus these APIs are not allowed to be used in ISR.

**Kconfig Options**

- `CONFIG_I2S_ISR_IRAM_SAFE` controls whether the default ISR handler can work when the cache is disabled. See IRAM Safe for more information.
- `CONFIG_I2S_SUPPRESS_DEPRECATE_WARN` controls whether to suppress the compiling warning message while using the legacy I2S driver.
- `CONFIG_I2S_ENABLE_DEBUG_LOG` is used to enable the debug log output. Enable this option increases the firmware binary size.

**Application Example**

The examples of the I2S driver can be found in the directory `peripherals/i2s`. Here are some simple usages of each mode:

**Standard TX/RX Usage** Different slot communication formats can be generated by the following helper macros for standard mode. As described above, there are three formats in standard mode, and their helper macros are:

- `I2S_STD_PHILIPS_SLOT_DEFAULT_CONFIG`
- `I2S_STD_PCM_SLOT_DEFAULT_CONFIG`
- `I2S_STD_MSB_SLOT_DEFAULT_CONFIG`

The clock config helper macro is:

- `I2S_STD_CLK_DEFAULT_CONFIG`

Please refer to [Standard Mode](#) for information about STD API. And for more details, please refer to `driver/i2s/include/driver/i2s_std.h`. 
Chapter 2. API Reference

**STD TX Mode**  Take 16-bit data width for example. When the data in a `uint16_t` writing buffer are:

<table>
<thead>
<tr>
<th>data 0</th>
<th>data 1</th>
<th>data 2</th>
<th>data 3</th>
<th>data 4</th>
<th>data 5</th>
<th>data 6</th>
<th>data 7</th>
<th>...</th>
</tr>
</thead>
<tbody>
<tr>
<td>0x0001</td>
<td>0x0002</td>
<td>0x0003</td>
<td>0x0004</td>
<td>0x0005</td>
<td>0x0006</td>
<td>0x0007</td>
<td>0x0008</td>
<td></td>
</tr>
</tbody>
</table>

Here is the table of the real data on the line with different `i2s_std_slot_config_t::slot_mode` and `i2s_std_slot_config_t::slot_mask`.

<table>
<thead>
<tr>
<th>data width</th>
<th>slot mode</th>
<th>slot mask</th>
<th>WS low</th>
<th>WS high</th>
<th>WS low</th>
<th>WS high</th>
<th>WS low</th>
<th>WS high</th>

<td>0x0000</td>
<td>0x0004</td>
<td>0x0000</td>
<td>0x0006</td>
<td>0x0000</td>
<td>0x0008</td>
<td>0x0000</td>
<td></td>
</tr>
<tr>
<td></td>
<td>both</td>
<td>0x0001</td>
<td>0x0002</td>
<td>0x0000</td>
<td>0x0003</td>
<td>0x0004</td>
<td>0x0005</td>
<td>0x0006</td>
<td>0x0007</td>
<td>0x0008</td>
</tr>
</tbody>
</table>

**Note:** Similar for 8-bit and 32-bit data widths, the type of the buffer is better to be `uint8_t` and `uint32_t`. But specially, when the data width is 24-bit, the data buffer should be aligned with 3-byte (i.e., every 3 bytes stands for a 24-bit data in one slot). Additionally, `i2s_chan_config_t::dma_frame_num`, `i2s_std_clk_config_t::mclk_multiple`, and the writing buffers size should be the multiple of 3, otherwise the data on the line or the sample rate will be incorrect.

```
#include "driver/i2s_std.h"
#include "driver/gpio.h"

i2s_chan_handle_t tx_handle;
/* Get the default channel configuration by the helper macro. * This helper macro is defined in `i2s_common.h` and shared by all the I2S_* → communication modes. * It can help to specify the I2S role and port ID */
i2s_chan_config_t chan_cfg = I2S_CHANNEL_DEFAULT_CONFIG(I2S_NUM_AUTO, I2S_ROLE_ → MASTER);
/* Allocate a new TX channel and get the handle of this channel */
i2s_new_channel(&chan_cfg, &tx_handle, NULL);
/* Setting the configurations, the slot configuration and clock configuration can_ → be generated by the macros * These two helper macros are defined in `i2s_std.h` which can only be used in_ → STD mode. * They can help to specify the slot and clock configurations for initialization_ → or updating */
i2s_std_config_t std_cfg = {
    .clk_cfg = I2S_STD_CLK_DEFAULT_CONFIG(48000),

/* Setting the configurations, the slot configuration and clock configuration can—
be generated by the macros.
* These two helper macros are defined in `i2s_std.h` which can only be used in—
STD mode.
* They can help to specify the slot and clock configurations for initialization—
or updating */

i2s_std_config_t std_cfg = {
    .clk_cfg = I2S_STD_CLK_DEFAULT_CONFIG(48000),
    .slot_cfg = I2S_STD_MSB_SLOT_DEFAULT_CONFIG(I2S_DATA_BIT_WIDTH_32BIT, I2S_SLOT_—MODE_STEREO),
    .gpio_cfg = {
        .mclk = I2S_GPIO_UNUSED,
        .bclk = GPIO_NUM_4,
        .ws = GPIO_NUM_5,
        .dout = I2S_GPIO_UNUSED,
        .din = GPIO_NUM_19,
        .invert_flags = {
            .mclk_inv = false,
            .bclk_inv = false,
            .ws_inv = false,
        },
    },
};

/* Initialize the channel */
i2s_channel_init_std_mode(rx_handle, &std_cfg);

/* Before reading data, start the RX channel first */
i2s_channel_enable(rx_handle);
i2s_channel_read(rx_handle, desc_buf, bytes_to_read, bytes_read, ticks_to_wait);

/* Have to stop the channel before deleting it */
i2s_channel_disable(rx_handle);
/* If the handle is not needed any more, delete it to release the channel—
resources */
i2s_del_channel(rx_handle);

Full-duplex Full-duplex mode registers TX and RX channel in an I2S port at the same time, and the channels
share the BCLK and WS signals. Currently, STD and TDM communication modes support full-duplex mode in
the following way, but PDM full-duplex is not supported because due to different PDM TX and RX clocks.

Note that one handle can only stand for one channel. Therefore, it is still necessary to configure the slot and clock for
both TX and RX channels one by one.

Here is an example of how to allocate a pair of full-duplex channels:

```c
#include "driver/i2s_std.h"
#include "driver/gpio.h"

i2s_chan_handle_t tx_handle;
 i2s_chan_handle_t rx_handle;

/* Allocate a pair of I2S channel */
i2s_chan_config_t chan_cfg = I2S_CHANNEL_DEFAULT_CONFIG(I2S_NUM_AUTO, I2S_ROLE_—MASTER);
/* Allocate for TX and RX channel at the same time, then they will work in full—
duplex mode */
i2s_new_channel(&chan_cfg, &tx_handle, &rx_handle);
/* Set the configurations for BOTH TWO channels, since TX and RX channel have to—
be same in full-duplex mode */
```
i2s_std_config_t std_cfg = {
    .clk_cfg = I2S_STD_CLK_DEFAULT_CONFIG(32000),
    .slot_cfg = I2S_STD_PHILIPS_SLOT_DEFAULT_CONFIG(I2S_DATA_BIT_WIDTH_16BIT, I2S SLOT_MODE_STEREO),
    .gpio_cfg = {
        .mclk = I2S_GPIO_UNUSED,
        .bclk = GPIO_NUM_4,
        .ws = GPIO_NUM_5,
        .dout = GPIO_NUM_18,
        .din = GPIO_NUM_19,
        .invert_flags = {
            .mclk_inv = false,
            .bclk_inv = false,
            .ws_inv = false,
        },
    },
};
i2s_channel_init_std_mode(tx_handle, &std_cfg);
i2s_channel_init_std_mode(rx_handle, &std_cfg);
i2s_channel_enable(tx_handle);
i2s_channel_enable(rx_handle);

Simplex Mode  To allocate a channel handle in simplex mode, \texttt{i2s_new_channel()} should be called for each channel. The clock and GPIO pins of TX/RX channel on ESP32-S2 are not independent, so the TX and RX channel cannot coexist on the same I2S port in simplex mode.

/** Initialize the channel */
i2s_channel_init_std_mode(tx_handle, &std_tx_cfg);
i2s_channel_enable(tx_handle);

/* RX channel will be registered on another I2S, if no other available I2S unit */

(continues on next page)
* it will return ESP_ERR_NOT_FOUND */

```c
i2s_new_channel(&chan_cfg, NULL, &rx_handle);

i2s_standard_config_t std_rx_cfg = {
    .clk_cfg = I2S_STD_CLK_DEFAULT_CONFIG(16000),
    .slot_cfg = I2S_STD_MSB_SLOT_DEFAULT_CONFIG(I2S_DATA_BIT_WIDTH_32BIT, I2S_SLOT_MODE_STEREO),
    .gpio_cfg = {
        .mclk = I2S_GPIO_UNUSED,
        .bclk = GPIO_NUM_6,
        .ws = GPIO_NUM_7,
        .dout = I2S_GPIO_UNUSED,
        .din = GPIO_NUM_19,
        .invert_flags = {
            .mclk_inv = false,
            .bclk_inv = false,
            .ws_inv = false,
        },
    },
};

i2s_channel_init_std_mode(rx_handle, &std_rx_cfg);

i2s_channel_enable(rx_handle);
```

**Application Notes**

**How to Prevent Data Lost** For applications that need a high frequency sample rate, the massive data throughput may cause data lost. Users can receive data lost event by registering the ISR callback function to receive the event queue:

```c
static IRAM_ATTR bool i2s_rx_queue_overflow_callback(i2s_chan_handle_t handle, i2s_event_data_t *event, void *user_ctx)
{
    // handle RX queue overflow event ... 
    return false;
}
```

```c
i2s_event_callbacks_t cbs = {
    .on_recv = NULL,
    .on_recv_q_ovf = i2s_rx_queue_overflow_callback,
    .on_sent = NULL,
    .on_send_q_ovf = NULL,
};

TEST_ESP_OK(i2s_channel_register_event_callback(rx_handle, &cbs, NULL));
```

Please follow these steps to prevent data lost:

1. Determine the interrupt interval. Generally, when data lost happens, the bigger the interval, the better, which helps to reduce the interrupt times. This means `dma_frame_num` should be as big as possible while the DMA buffer size is below the maximum value of 4092. The relationships are:

   ```
   interrupt_interval (unit: sec) = dma_frame_num / sample_rate
   dma_buffer_size = dma_frame_num * slot_num * data_bit_width / 8 <= 4092
   ```

2. Determine `dma_desc_num`. `dma_desc_num` is decided by the maximum time of `i2s_channel_read` polling cycle. All the received data is supposed to be stored between two `i2s_channel_read`. This cycle can be measured by a timer or an outputting GPIO signal. The relationship is:

   ```
   dma_desc_num > polling_cycle / interrupt_interval
   ```

3. Determine the receiving buffer size. The receiving buffer offered by users in `i2s_channel_read` should be able to take all the data in all DMA buffers, which means that it should be larger than the total size of all the DMA buffers:
recv_buffer_size > dma_desc_num * dma_buffer_size

For example, if there is an I2S application, and the known values are:

```
sample_rate = 144000 Hz
data_bit_width = 32 bits
slot_num = 2
polling_cycle = 10 ms
```

Then the parameters `dma_frame_num`, `dma_desc_num`, and `recv_buf_size` can be calculated as follows:

```
dma_frame_num * slot_num * data_bit_width / 8 = dma_buffer_size <= 4092
interrrupt_interval = dma_frame_num / sample_rate = 511 / 144000 = 0.003549 s = 3.549 ms
dma_desc_num > polling_cycle / interrupt_interval = ceil(10 / 3.549) = ceil(2.818) → 3
recv_buffer_size > dma_desc_num * dma_buffer_size = 3 * 4092 = 12276 bytes
```

API Reference

  or
  ```
  PRIV_REQUIREES driver
  ```

Functions

`esp_err_t i2s_channel_init_std_mode(i2s_chan_handle_t handle, const i2s_std_config_t *std_cfg)`

Initialize I2S channel to standard mode.

**Note:** Only allowed to be called when the channel state is REGISTERED, (i.e., channel has been allocated, but not initialized) and the state will be updated to READY if initialization success, otherwise the state will return to REGISTERED.

**Parameters**

- `handle` - [in] I2S channel handler
- `std_cfg` - [in] Configurations for standard mode, including clock, slot and GPIO. The clock configuration can be generated by the helper macro `I2S_STD_CLK_DEFAULT_CONFIG` The slot configuration can be generated by the helper macro `I2S_STD_PHILIPS_SLOT_DEFAULT_CONFIG`, `I2S_STD_PCM_SLOT_DEFAULT_CONFIG` or `I2S_STD_MSB_SLOT_DEFAULT_CONFIG`

**Returns**

- ESP_OK Initialize successfully
Chapter 2. API Reference

- ESP_ERR_NO_MEM No memory for storing the channel information
- ESP_ERR_INVALID_ARG NULL pointer or invalid configuration
- ESP_ERR_INVALID_STATE This channel is not registered

```c
esp_err_t i2s_channel_reconfig_std_clock(i2s_chan_handle_t handle, const i2s_std_clk_config_t *clk_cfg)
```

Reconfigure the I2S clock for standard mode.

**Note:** Only allowed to be called when the channel state is READY, i.e., channel has been initialized, but not started. This function won't change the state. `i2s_channel_disable` should be called before calling this function if I2S has started.

**Parameters**

- `handle` - [in] I2S channel handler
- `clk_cfg` - [in] Standard mode clock configuration, can be generated by `I2S_STD_CLK_DEFAULT_CONFIG`

**Returns**

- ESP_OK Set clock successfully
- ESP_ERR_INVALID_ARG NULL pointer, invalid configuration or not standard mode
- ESP_ERR_INVALID_STATE This channel is not initialized or not stopped

```c
esp_err_t i2s_channel_reconfig_std_slot(i2s_chan_handle_t handle, const i2s_std_slot_config_t *slot_cfg)
```

Reconfigure the I2S slot for standard mode.

**Note:** Only allowed to be called when the channel state is READY, i.e., channel has been initialized, but not started. This function won't change the state. `i2s_channel_disable` should be called before calling this function if I2S has started.

**Parameters**

- `handle` - [in] I2S channel handler
- `slot_cfg` - [in] Standard mode slot configuration, can be generated by `I2S_STD_PHILIPS_SLOT_DEFAULT_CONFIG`, `I2S_STD_PCM_SLOT_DEFAULT_CONFIG` and `I2S_STD_MSB_SLOT_DEFAULT_CONFIG`.

**Returns**

- ESP_OK Set clock successfully
- ESP_ERR_NO_MEM No memory for DMA buffer
- ESP_ERR_INVALID_ARG NULL pointer, invalid configuration or not standard mode
- ESP_ERR_INVALID_STATE This channel is not initialized or not stopped

```c
esp_err_t i2s_channel_reconfig_std_gpio(i2s_chan_handle_t handle, const i2s_std_gpio_config_t *gpio_cfg)
```

Reconfigure the I2S GPIO for standard mode.

**Note:** Only allowed to be called when the channel state is READY, i.e., channel has been initialized, but not
started this function won’t change the state. `i2s_channel_disable` should be called before calling this function if I2S has started.

---

Note: The input channel handle has to be initialized to standard mode, i.e., `i2s_channel_init_std_mode` has been called before reconfiguring

---

**Parameters**

- `handle`  [in] I2S channel handler
- `gpio_cfg`  [in] Standard mode GPIO configuration, specified by user

**Returns**

- **ESP_OK** Set clock successfully
- **ESP_ERR_INVALID_ARG** NULL pointer, invalid configuration or not standard mode
- **ESP_ERR_INVALID_STATE** This channel is not initialized or not stopped

**Structures**

```c
struct i2s_std_slot_config_t
I2S slot configuration for standard mode.
```

**Public Members**

```c
i2s_data_bit_width_t data_bit_width
I2S sample data bit width (valid data bits per sample)
```

```c
i2s_slot_bit_width_t slot_bit_width
I2S slot bit width (total bits per slot)
```

```c
i2s_slot_mode_t slot_mode
Set mono or stereo mode with `I2S_SLOT_MODE_MONO` or `I2S_SLOT_MODE_STEREO` In TX direction, mono means the written buffer contains only one slot data and stereo means the written buffer contains both left and right data
```

```c
i2s_std_slot_mask_t slot_mask
Select the left, right or both slot
```

```c
uint32_t ws_width
WS signal width (i.e. the number of BCLK ticks that WS signal is high)
```

```c
bool ws_pol
WS signal polarity, set true to enable high level first
```

```c
bool bit_shift
Set to enable bit shift in Philips mode
```

```c
bool msb_right
Set to place right channel data at the MSB in the FIFO
```

```c
struct i2s_std_clk_config_t
I2S clock configuration for standard mode.
```
Public Members

uint32_t sample_rate_hz
I2S sample rate

i2s_clock_src_t clk_src
Choose clock source, see soc_periph_i2s_clk_src_t for the supported clock sources. selected I2S_CLK_SRC_EXTERNAL (if supports) to enable the external source clock input via MCLK pin.

i2s_mclk_multiple_t mclk_multiple
The multiple of MCLK to the sample rate Default is 256 in the helper macro, it can satisfy most of cases, but please set this field a multiple of 3 (like 384) when using 24-bit data width, otherwise the sample rate might be inaccurate

struct i2s_std_gpio_config_t
I2S standard mode GPIO pins configuration.

Public Members

gpio_num_t mclk
MCK pin, output by default, input if the clock source is selected to I2S_CLK_SRC_EXTERNAL

gpio_num_t bclk
BCK pin, input in slave role, output in master role

gpio_num_t ws
WS pin, input in slave role, output in master role

gpio_num_t dout
DATA pin, output

gpio_num_t din
DATA pin, input

uint32_t mclk_inv
Set 1 to invert the MCLK input/output

uint32_t bclk_inv
Set 1 to invert the BCLK input/output

uint32_t ws_inv
Set 1 to invert the WS input/output

struct i2s_std_gpio_config_t::[anonymous] invert_flags
GPIO pin invert flags

struct i2s_std_config_t
I2S standard mode major configuration that including clock/slot/GPIO configuration.
Public Members

*i2s_std_clk_config_t* clk_cfg
Standard mode clock configuration, can be generated by macro `I2S_STD_CLK_DEFAULT_CONFIG`

*i2s_std_slot_config_t* slot_cfg
Standard mode slot configuration, can be generated by macros `I2S_STD_[mode]_SLOT_DEFAULT_CONFIG`, [mode] can be replaced with PHILIPS/MSB/PCM

*i2s_std_gpio_config_t* gpio_cfg
Standard mode GPIO configuration, specified by user

Macros

**I2S_STD_PHILIPS_SLOT_DEFAULT_CONFIG** (bits_per_sample, mono_or_stereo)
Philips format in 2 slots.

This file is specified for I2S standard communication mode Features:

- Philips/MSB/PCM are supported in standard mode
- Fixed to 2 slots

Parameters

- **bits_per_sample** - I2S data bit width
- **mono_or_stereo** - I2S_SLOT_MODE_MONO or I2S_SLOT_MODE_STEREO

**I2S_STD_PCM_SLOT_DEFAULT_CONFIG** (bits_per_sample, mono_or_stereo)
PCM(short) format in 2 slots.

Note: PCM(long) is same as Philips in 2 slots

Parameters

- **bits_per_sample** - I2S data bit width
- **mono_or_stereo** - I2S_SLOT_MODE_MONO or I2S_SLOT_MODE_STEREO

**I2S_STD_MSB_SLOT_DEFAULT_CONFIG** (bits_per_sample, mono_or_stereo)
MSB format in 2 slots.

Parameters

- **bits_per_sample** - I2S data bit width
- **mono_or_stereo** - I2S_SLOT_MODE_MONO or I2S_SLOT_MODE_STEREO

**I2S_STD_CLK_DEFAULT_CONFIG** (rate)
I2S default standard clock configuration.

Note: Please set the mclk_multiple to I2S_MCLK_MULTIPLE_384 while using 24 bits data width Otherwise the sample rate might be imprecise since the BCLK division is not a integer

Parameters

- **rate** - sample rate

I2S Driver
Chapter 2. API Reference

**Header File**

- components/driver/i2s/include/driver/i2s_common.h
- This header file can be included with:

  ```c
  #include "driver/i2s_common.h"
  ```

- This header file is a part of the API provided by the `driver` component. To declare that your component depends on `driver`, add the following to your CMakeLists.txt:

  ```cmake
  REQUIRE driver
  ```
  or

  ```cmake
  PRIV_REQUIRES driver
  ```

**Functions**

```c
esp_err_t i2s_new_channel(const i2s_chan_config_t *chan_cfg, i2s_chan_handle_t *ret_tx_handle, i2s_chan_handle_t *ret_rx_handle)
```

Allocate new I2S channel(s)

**Note:** The new created I2S channel handle will be REGISTERED state after it is allocated successfully.

**Note:** When the port id in channel configuration is I2S_NUM_AUTO, driver will allocate I2S port automatically on one of the I2S controller, otherwise driver will try to allocate the new channel on the selected port.

**Note:** If both tx_handle and rx_handle are not NULL, it means this I2S controller will work at full-duplex mode, the RX and TX channels will be allocated on a same I2S port in this case. Note that some configurations of TX/RX channel are shared on ESP32 and ESP32S2, so please make sure they are working at same condition and under same status(start/stop). Currently, full-duplex mode cannot guarantee TX/RX channels write/read synchronously, they can only share the clock signals for now.

**Note:** If tx_handle OR rx_handle is NULL, it means this I2S controller will work at simplex mode. For ESP32 and ESP32S2, the whole I2S controller (i.e. both RX and TX channel) will be occupied, even if only one of RX or TX channel is registered. For the other targets, another channel on this controller will still available.

**Parameters**

- `chan_cfg` [in] I2S controller channel configurations
- `ret_tx_handle` [out] I2S channel handler used for managing the sending channel(optional)
- `ret_rx_handle` [out] I2S channel handler used for managing the receiving channel(optional)

**Returns**

- ESP_OK Allocate new channel(s) success
- ESP_ERR_NOT_SUPPORTED The communication mode is not supported on the current chip
- ESP_ERR_INVALID_ARG NULL pointer or illegal parameter in i2s_chan_config_t
- ESP_ERR_NOT_FOUND No available I2S channel found

```c
esp_err_t i2s_del_channel(i2s_chan_handle_t handle)
```

Delete the I2S channel.
**Note:** Only allowed to be called when the I2S channel is at REGISTERED or READY state (i.e., it should stop before deleting it).

**Note:** Resource will be free automatically if all channels in one port are deleted.

### Parameters
- **handle** - [in] I2S channel handler
  - ESP_OK Delete successfully
  - ESP_ERR_INVALID_ARG NULL pointer

```c
esp_err_t i2s_channel_get_info(i2s_chan_handle_t handle, i2s_chan_info_t *chan_info)
```
Get I2S channel information.

#### Parameters
- **handle** - [in] I2S channel handler
- **chan_info** - [out] I2S channel basic information

#### Returns
- ESP_OK Get I2S channel information success
- ESP_ERR_NOT_FOUND The input handle doesn’t match any registered I2S channels, it may not an I2S channel handle or not available any more
- ESP_ERR_INVALID_ARG The input handle or chan_info pointer is NULL

```c
esp_err_t i2s_channel_enable(i2s_chan_handle_t handle)
```
Enable the I2S channel.

**Note:** Only allowed to be called when the channel state is READY, (i.e., channel has been initialized, but not started) the channel will enter RUNNING state once it is enabled successfully.

**Note:** Enable the channel can start the I2S communication on hardware. It will start outputting BCLK and WS signal. For MCLK signal, it will start to output when initialization is finished.

```c
esp_err_t i2s_channel_disable(i2s_chan_handle_t handle)
```
Disable the I2S channel.

**Note:** Only allowed to be called when the channel state is RUNNING, (i.e., channel has been started) the channel will enter READY state once it is disabled successfully.

**Note:** Disable the channel can stop the I2S communication on hardware. It will stop BCLK and WS signal but not MCLK signal.

```c
esp_err_t i2s_channel_disable(i2s_chan_handle_t handle)
```
Disable the I2S channel.
**esp_err_t i2s_channel_preload_data**

```c
i2s_chan_handle_t tx_handle, const void *src, size_t size, size_t *bytes_loaded)
```

Preload the data into TX DMA buffer.

**Note:** Only allowed to be called when the channel state is READY, (i.e., channel has been initialized, but not started)

**Note:** As the initial DMA buffer has no data inside, it will transmit the empty buffer after enabled the channel, this function is used to preload the data into the DMA buffer, so that the valid data can be transmitted immediately after the channel is enabled.

**Note:** This function can be called multiple times before enabling the channel, the buffer that loaded later will be concatenated behind the former loaded buffer. But when all the DMA buffers have been loaded, no more data can be preload then, please check the `bytes_loaded` parameter to see how many bytes are loaded successfully, when the `bytes_loaded` is smaller than the `size`, it means the DMA buffers are full.

**Parameters**
- `tx_handle` - [in] I2S TX channel handler
- `src` - [in] The pointer of the source buffer to be loaded
- `size` - [in] The source buffer size
- `bytes_loaded` - [out] The bytes that successfully been loaded into the TX DMA buffer

**Returns**
- ESP_OK Load data successful
- ESP_ERR_INVALID_ARG NULL pointer or not TX direction
- ESP_ERR_INVALID_STATE This channel has not stated

**esp_err_t i2s_channel_write**

```c
i2s_chan_handle_t handle, const void *src, size_t size, size_t *bytes_written,
uint32_t timeout_ms)
```

I2S write data.

**Note:** Only allowed to be called when the channel state is RUNNING, (i.e., TX channel has been started and is not writing now) but the RUNNING only stands for the software state, it doesn’t mean there is no the signal transporting on line.

**Parameters**
- `handle` - [in] I2S channel handler
- `src` - [in] The pointer of sent data buffer
- `size` - [in] Max data buffer length
- `bytes_written` - [out] Byte number that actually be sent, can be NULL if not needed
- `timeout_ms` - [in] Max block time

**Returns**
- ESP_OK Write successfully
- ESP_ERR_INVALID_ARG NULL pointer or this handle is not TX handle
- ESP_ERR_TIMEOUT Writing timeout, no writing event received from ISR within ticks_to_wait
- ESP_ERR_INVALID_STATE I2S is not ready to write

**esp_err_t i2s_channel_read**

```c
i2s_chan_handle_t handle, void *dest, size_t size, size_t *bytes_read, uint32_t timeout_ms)
```

I2S read data.
Note: Only allowed to be called when the channel state is RUNNING but the RUNNING only stands for the software state, it doesn’t mean there is no the signal transporting on line.

Parameters

- **handle** - [in] I2S channel handler
- **dest** - [in] The pointer of receiving data buffer
- **size** - [in] Max data buffer length
- **bytes_read** - [out] Byte number that actually be read, can be NULL if not needed
- **timeout_ms** - [in] Max block time

Returns

- ESP_OK Read successfully
- ESP_ERR_INVALID_ARG NULL pointer or this handle is not RX handle
- ESP_ERR_TIMEOUT Reading timeout, no reading event received from ISR within ticks_to_wait
- ESP_ERR_INVALID_STATE I2S is not ready to read

```c
esp_err_t i2s_channel_register_event_callback(i2s_chan_handle_t handle, const i2s_event_callbacks_t *callbacks, void *user_data)
```

Set event callbacks for I2S channel.

Note: Only allowed to be called when the channel state is REGISTERED / READY, (i.e., before channel starts)

Note: User can deregister a previously registered callback by calling this function and setting the callback member in the callbacks structure to NULL.

Note: When CONFIG_I2S_ISR_IRAM_SAFE is enabled, the callback itself and functions called by it should be placed in IRAM. The variables used in the function should be in the SRAM as well. The user_data should also reside in SRAM or internal RAM as well.

Parameters

- **handle** - [in] I2S channel handler
- **callbacks** - [in] Group of callback functions
- **user_data** - [in] User data, which will be passed to callback functions directly

Returns

- ESP_OK Set event callbacks successfully
- ESP_ERR_INVALID_ARG Set event callbacks failed because of invalid argument
- ESP_ERR_INVALID_STATE Set event callbacks failed because the current channel state is not REGISTERED or READY

Structures

```c
struct i2s_event_callbacks_t
```

Group of I2S callbacks.

Note: The callbacks are all running under ISR environment
Note: When CONFIG_I2S_ISR_IRAM_SAFE is enabled, the callback itself and functions called by it should be placed in IRAM. The variables used in the function should be in the SRAM as well.

Public Members

i2s_isr_callback_t on_recv
   Callback of data received event, only for RX channel The event data includes DMA buffer address and size that just finished receiving data

i2s_isr_callback_t on_recv_q_ovf
   Callback of receiving queue overflowed event, only for RX channel The event data includes buffer size that has been overwritten

i2s_isr_callback_t on_sent
   Callback of data sent event, only for TX channel The event data includes DMA buffer address and size that just finished sending data

i2s_isr_callback_t on_send_q_ovf
   Callback of sending queue overflowed event, only for TX channel The event data includes buffer size that has been overwritten

struct i2s_chan_config_t
   I2S controller channel configuration.

Public Members

i2s_port_t id
   I2S port id

i2s_role_t role
   I2S role, I2S_ROLE_MASTER or I2S_ROLE_SLAVE

uint32_t dma_desc_num
   I2S DMA buffer number, it is also the number of DMA descriptor

uint32_t dma_frame_num
   I2S frame number in one DMA buffer. One frame means one-time sample data in all slots, it should be the multiple of 3 when the data bit width is 24.

bool auto_clear
   Set to auto clear DMA TX buffer, I2S will always send zero automatically if no data to send

int intr_priority
   I2S interrupt priority, range [0, 7], if set to 0, the driver will try to allocate an interrupt with a relative low priority (1,2,3)

struct i2s_chan_info_t
   I2S channel information.
Public Members

\texttt{i2s\_port\_t} \texttt{id}

I2S port id

\texttt{i2s\_role\_t} \texttt{role}

I2S role, \texttt{I2S\_ROLE\_MASTER} or \texttt{I2S\_ROLE\_SLAVE}

\texttt{i2s\_dir\_t} \texttt{dir}

I2S channel direction

\texttt{i2s\_comm\_mode\_t} \texttt{mode}

I2S channel communication mode

\texttt{i2s\_chan\_handle\_t} \texttt{pair\_chan}

I2S pair channel handle in duplex mode, always NULL in simplex mode

Macros

\texttt{I2S\_CHANNEL\_DEFAULT\_CONFIG} (\texttt{i2s\_num}, \texttt{i2s\_role})

get default I2S property

\texttt{I2S\_GPIO\_UNUSED}

Used in \texttt{i2s\_gpio\_config\_t} for signals which are not used

I2S Types

Header File

- \texttt{components/driver/i2s/include/driver/i2s\_types.h}
- This header file can be included with:

\begin{verbatim}
#include "driver/i2s\_types.h"
\end{verbatim}

- This header file is a part of the API provided by the driver component. To declare that your component depends on driver, add the following to your CMakeLists.txt:

\begin{verbatim}
REQUIRES driver
or
PRIV_REQUIRES driver
\end{verbatim}

Structures

\texttt{struct i2s\_event\_data\_t}

Event structure used in I2S event queue.

Public Members

\texttt{void* \texttt{data}}

The pointer of DMA buffer that just finished sending or receiving for \texttt{on\_recv} and \texttt{on\_sent} callback
NULL for \texttt{on\_recv\_q\_ovf} and \texttt{on\_send\_q\_ovf} callback
size_t size

The buffer size of DMA buffer when success to send or receive, also the buffer size that dropped when queue overflow. It is related to the dma_frame_num and data_bit_width, typically it is fixed when data_bit_width is not changed.

**Type Definitions**

typedef struct i2s_channel_obj_t *i2s_chan_handle_t
I2S channel object handle, the control unit of the I2S driver

typedef bool (*i2s_isr_callback_t)(i2s_chan_handle_t handle, i2s_event_data_t *event, void *user_ctx)
I2S event callback.

Param handle [in] I2S channel handle, created from i2s_new_channel()
Param event [in] I2S event data
Param user_ctx [in] User registered context, passed from i2s_channel_register_event_callback()
Return Whether a high priority task has been waken up by this callback function

**Enumerations**

enum i2s_port_t
I2S controller port number, the max port number is (SOC_I2S_NUM -1).

Values:

enumerator I2S_NUM_0
I2S controller port 0

enumerator I2S_NUM_AUTO
Select whichever port is available

enum i2s_comm_mode_t
I2S controller communication mode.

Values:

enumerator I2S_COMM_MODE_STD
I2S controller using standard communication mode, support Philips/MSB/PCM format

enumerator I2S_COMM_MODE_NONE
Unspecified I2S controller mode

enum i2s_mclk_multiple_t
The multiple of MCLK to sample rate.

Values:

enumerator I2S_MCLK_MULTIPLE_128
MCLK = sample_rate * 128

enumerator I2S_MCLK_MULTIPLE_256
MCLK = sample_rate * 256
enumerator **I2S_MCLK_MULTIPLE_384**  
MCLK = sample_rate * 384

enumerator **I2S_MCLK_MULTIPLE_512**  
MCLK = sample_rate * 512

**Header File**
- components/hal/include/hal/i2s_types.h
- This header file can be included with:

```
#include "hal/i2s_types.h"
```

**Type Definitions**

typedef `soc_periph_i2s_clk_src_t` **i2s_clock_src_t**  
I2S clock source

**Enumerations**

defined

defined

defined

defined

defined

enumerator **I2S_SLOT_MODE_MONO**  
I2S channel slot format mono, transmit same data in all slots for tx mode, only receive the data in the first slots for rx mode.

enumerator **I2S_SLOT_MODE_STEREO**  
I2S channel slot format stereo, transmit different data in different slots for tx mode, receive the data in all slots for rx mode.

enumerator **I2S_DIR_RX**  
I2S channel direction RX

enumerator **I2S_DIR_TX**  
I2S channel direction TX

enumerator **I2S_ROLE_MASTER**  
I2S controller master role, bclk and ws signal will be set to output
enumerator **I2S_ROLE_SLAVE**
I2S controller slave role, bclk and ws signal will be set to input

enum **i2s_data_bit_width_t**
Available data bit width in one slot.

*Values:*

enumerator **I2S_DATA_BIT_WIDTH_8BIT**
I2S channel data bit-width: 8

denumerator **I2S_DATA_BIT_WIDTH_16BIT**
I2S channel data bit-width: 16

denumerator **I2S_DATA_BIT_WIDTH_24BIT**
I2S channel data bit-width: 24

denumerator **I2S_DATA_BIT_WIDTH_32BIT**
I2S channel data bit-width: 32

enum **i2s_slot_bit_width_t**
Total slot bit width in one slot.

*Values:*

enumerator **I2S_SLOT_BIT_WIDTH_AUTO**
I2S channel slot bit-width equals to data bit-width

denumerator **I2S_SLOT_BIT_WIDTH_8BIT**
I2S channel slot bit-width: 8

denumerator **I2S_SLOT_BIT_WIDTH_16BIT**
I2S channel slot bit-width: 16

denumerator **I2S_SLOT_BIT_WIDTH_24BIT**
I2S channel slot bit-width: 24

denumerator **I2S_SLOT_BIT_WIDTH_32BIT**
I2S channel slot bit-width: 32

enum **i2s_std_slot_mask_t**
I2S slot select in standard mode.

*Note:  It has different meanings in tx/rx/mono/stereo mode, and it may have different behaviors on different targets. For the details, please refer to the I2S API reference*

*Values:*

denumerator **I2S_STD SLOT LEFT**
I2S transmits or receives left slot
Chapter 2. API Reference

enumerator **I2S_STD_SLOT_RIGHT**
I2S transmits or receives right slot

enumerator **I2S_STD_SLOT_BOTH**
I2S transmits or receives both left and right slot

enum **i2s_pdm_slot_mask_t**
I2S slot select in PDM mode.
Values:

enumerator **I2S_PDM_SLOT_RIGHT**
I2S PDM only transmits or receives the PDM device whose ‘select’ pin is pulled up

enumerator **I2S_PDM_SLOT_LEFT**
I2S PDM only transmits or receives the PDM device whose ‘select’ pin is pulled down

enumerator **I2S_PDM_SLOT_BOTH**
I2S PDM transmits or receives both two slots

2.5.13 LCD

Introduction
ESP chips can generate various kinds of timings that needed by common LCDs on the market, like SPI LCD, I80 LCD (a.k.a Intel 8080 parallel LCD), RGB/SRGB LCD, I2C LCD, etc. The **esp_lcd** component is officially to support those LCDs with a group of universal APIs across chips.

Functional Overview
In **esp_lcd**, an LCD panel is represented by **esp_lcd_panel_handle_t**, which plays the role of an abstract frame buffer, regardless of the frame memory is allocated inside ESP chip or in external LCD controller. Based on the location of the frame buffer and the hardware connection interface, the LCD panel drivers are mainly grouped into the following categories:

- Controller based LCD driver involves multiple steps to get a panel handle, like bus allocation, IO device registration and controller driver install. The frame buffer is located in the controller’s internal GRAM (Graphical RAM). ESP-IDF provides only a limited number of LCD controller drivers out of the box (e.g., ST7789, SSD1306), More Controller Based LCD Drivers are maintained in the Espressif Component Registry [https://components.espressif.com/](https://components.espressif.com/).
- **SPI Interfaced LCD** describes the steps to install the SPI LCD IO driver and then get the panel handle.
- **I2C Interfaced LCD** describes the steps to install the I2C LCD IO driver and then get the panel handle.
- **I80 Interfaced LCD** describes the steps to install the I80 LCD IO driver and then get the panel handle.
- **LCD Panel Basic Operations** - provides a set of APIs to operate the LCD panel, like turning on/off the display, setting the orientation, etc. These operations are common for either controller-based LCD panel driver or RGB LCD panel driver.

SPI Interfaced LCD

1. Create an SPI bus. Please refer to **SPI Master API doc** for more details.
spi_bus_config_t buscfg = {
    .sclk_io_num = EXAMPLE_PIN_NUM_SCLK,
    .mosi_io_num = EXAMPLE_PIN_NUM_MOSI,
    .miso_io_num = EXAMPLE_PIN_NUM_MISO,
    .quadwp_io_num = -1, // Quad SPI LCD driver is not yet supported
    .quadhd_io_num = -1, // Quad SPI LCD driver is not yet supported
    .max_transfer_sz = EXAMPLE_LCD_H_RES * 80 * sizeof(uint16_t), // transfer 80 lines of pixels (assume pixel is RGB565) at most in one SPI transaction
};
ESP_ERROR_CHECK(spi_bus_initialize(LCD_HOST, &buscfg, SPI_DMA_CH_AUTO));

2. Allocate an LCD IO device handle from the SPI bus. In this step, you need to provide the following information:
   - esp_lcd_panel_io_spi_config_t::dc_gpio_num Sets the GPIO number for the DC signal line (some LCD calls this RS line). The LCD driver uses this GPIO to switch between sending command and sending data.
   - esp_lcd_panel_io_spi_config_t::cs_gpio_num Sets the GPIO number for the CS signal line. The LCD driver uses this GPIO to select the LCD chip. If the SPI bus only has one device attached (i.e., this LCD), you can set the GPIO number to -1 to occupy the bus exclusively.
   - esp_lcd_panel_io_spi_config_t::pclk_hz sets the frequency of the pixel clock, in Hz. The value should not exceed the range recommended in the LCD spec.
   - esp_lcd_panel_io_spi_config_t::spi_mode sets the SPI mode. The LCD driver uses this mode to communicate with the LCD. For the meaning of the SPI mode, please refer to the SPI Master API doc.
   - esp_lcd_panel_io_spi_config_t::lcd_cmd_bits and esp_lcd_panel_io_spi_config_t::lcd_param_bits set the bit width of the command and parameter that recognized by the LCD controller chip. This is chip specific, you should refer to your LCD spec in advance.
   - esp_lcd_panel_io_spi_config_t::trans_queue_depth sets the depth of the SPI transaction queue. A bigger value means more transactions can be queued up, but it also consumes more memory.

esp_lcd_panel_io_handle_t io_handle = NULL;
esp_lcd_panel_io_spi_config_t io_config = {
    .dc_gpio_num = EXAMPLE_PIN_NUM_LCD_DC,
    .cs_gpio_num = EXAMPLE_PIN_NUM_LCD_CS,
    .pclk_hz = EXAMPLE_LCD_PIXEL_CLOCK_HZ,
    .lcd_cmd_bits = EXAMPLE_LCD_CMD_BITS,
    .lcd_param_bits = EXAMPLE_LCD_PARAM_BITS,
    .spi_mode = 0,
    .trans_queue_depth = 10,
};
// Attach the LCD to the SPI bus
ESP_ERROR_CHECK(esp_lcd_new_panel_io_spi((esp_lcd_spi_bus_handle_t)LCD_HOST, &io_config, &io_handle));

3. Install the LCD controller driver. The LCD controller driver is responsible for sending the commands and parameters to the LCD controller chip. In this step, you need to specify the IO device handle that allocated in the last step, and some panel specific configurations:
   - esp_lcd_panel_dev_config_t::reset_gpio_num sets the LCD’s hardware reset GPIO number. If the LCD does not have a hardware reset pin, set this to -1.
   - esp_lcd_panel_dev_config_t::rgb_ele_order sets the R-G-B element order of each color data.
   - esp_lcd_panel_dev_config_t::bits_per_pixel sets the bit width of the pixel color data. The LCD driver uses this value to calculate the number of bytes to send to the LCD controller chip.
   - esp_lcd_panel_dev_config_t::data_endian specifies the data endian to be transmitted to the screen. No need to specify for color data within 1 byte, like RGB232. For drivers that do not support specifying data endian, this field would be ignored.
Chapter 2. API Reference

```c
esp_lcd_panel_handle_t panel_handle = NULL;
esp_lcd_panel_dev_config_t panel_config = {
    .reset_gpio_num = EXAMPLE_PIN_NUM_RST,
    .rgb_ele_order = LCD_RGB_ELEMENT_ORDER_BGR,
    .bits_per_pixel = 16,
};
// Create LCD panel handle for ST7789, with the SPI IO device handle
ESP_ERROR_CHECK(esp_lcd_new_panel_st7789(io_handle, &panel_config, &panel_handle));
```

I2C Interfaced LCD

1. Create I2C bus. Please refer to I2C API doc for more details.

```c
i2c_config_t i2c_conf = {
    .mode = I2C_MODE_MASTER, // I2C LCD is a master node
    .sda_io_num = EXAMPLE_PIN_NUM_SDA,
    .scl_io_num = EXAMPLE_PIN_NUM_SCL,
    .sda_pullup_en = GPIO_PULLUP_ENABLE,
    .scl_pullup_en = GPIO_PULLUP_ENABLE,
    .master.clk_speed = EXAMPLE_LCD_PIXEL_CLOCK_HZ,
};
ESP_ERROR_CHECK(i2c_param_config(I2C_HOST, &i2c_conf));
ESP_ERROR_CHECK(i2c_driver_install(I2C_HOST, I2C_MODE_MASTER, 0, 0, 0));
```

2. Allocate an LCD IO device handle from the I2C bus. In this step, you need to provide the following information:

   - `esp_lcd_panel_io_i2c_config_t::dev_addr` sets the I2C device address of the LCD controller chip. The LCD driver uses this address to communicate with the LCD controller chip.
   - `esp_lcd_panel_io_i2c_config_t::control_phase_bytes` and `esp_lcd_panel_io_i2c_config_t::control_phase_offset` set the bit width of the command and parameter that recognized by the LCD controller chip. This is chip specific, you should refer to your LCD spec in advance.

```c
esp_lcd_panel_io_handle_t io_handle = NULL;
esp_lcd_panel_io_i2c_config_t io_config = {
    .dev_addr = EXAMPLE_I2C_HW_ADDR,
    .control_phase_bytes = 1, // refer to LCD spec
    .control_phase_offset = 6, // refer to LCD spec
    .lcd_cmd_bits = EXAMPLE_LCD_CMD_BITS,
    .lcd_param_bits = EXAMPLE_LCD_CMD_BITS,
};
ESP_ERROR_CHECK(esp_lcd_new_panel_io_i2c((esp_lcd_i2c_bus_handle_t)I2C_HOST, &io_config, &io_handle));
```

3. Install the LCD controller driver. The LCD controller driver is responsible for sending the commands and parameters to the LCD controller chip. In this step, you need to specify the I2C IO device handle that allocated in the last step, and some panel specific configurations:

   - `esp_lcd_panel_dev_config_t::reset_gpio_num` sets the LCD’s hardware reset GPIO number. If the LCD does not have a hardware reset pin, set this to -1.
   - `esp_lcd_panel_dev_config_t::bits_per_pixel` sets the bit width of the pixel color data. The LCD driver uses this value to calculate the number of bytes to send to the LCD controller chip.

```c
esp_lcd_panel_handle_t panel_handle = NULL;
esp_lcd_panel_dev_config_t panel_config = {
    .bits_per_pixel = 1,
    .reset_gpio_num = EXAMPLE_PIN_NUM_RST,
};
```

(continues on next page)
I80 Interfaced LCD

1. Create I80 bus by `esp_lcd_new_i80_bus()`. You need to set up the following parameters for an Intel 8080 parallel bus:
   - `esp_lcd_i80_bus_config_t::clk_src` sets the clock source of the I80 bus. Note, the default clock source may be different between ESP targets.
   - `esp_lcd_i80_bus_config_t::wr_gpio_num` sets the GPIO number of the pixel clock (also referred as WR in some LCD spec).
   - `esp_lcd_i80_bus_config_t::dc_gpio_num` sets the GPIO number of the data/command select pin (also referred as RS in some LCD spec).
   - `esp_lcd_i80_bus_config_t::bus_width` sets the bit width of the data bus (only support 8 or 16).
   - `esp_lcd_i80_bus_config_t::data_gpio_nums` is the array of the GPIO number of the data bus. The number of GPIOs should be equal to the `esp_lcd_i80_bus_config_t::bus_width` value.
   - `esp_lcd_i80_bus_config_t::max_transfer_bytes` sets the maximum number of bytes that can be transferred in one transaction.

```c
esp_lcd_i80_bus_handle_t i80_bus = NULL;
esp_lcd_i80_bus_config_t bus_config = {
 .clk_src = LCD_CLK_SRC_DEFAULT,
 .dc_gpio_num = EXAMPLE_PIN_NUM_DC,
 .wr_gpio_num = EXAMPLE_PIN_NUM_PCLK,
 .data_gpio_nums = { EXAMPLE_PIN_NUM_DATA0,
                        EXAMPLE_PIN_NUM_DATA1,
                        EXAMPLE_PIN_NUM_DATA2,
                        EXAMPLE_PIN_NUM_DATA3,
                        EXAMPLE_PIN_NUM_DATA4,
                        EXAMPLE_PIN_NUM_DATA5,
                        EXAMPLE_PIN_NUM_DATA6,
                        EXAMPLE_PIN_NUM_DATA7,
 },
 .bus_width = 8,
 .max_transfer_bytes = EXAMPLE_LCD_H_RES * 100 * sizeof(uint16_t), /* transfer 100 lines of pixels (assume pixel is RGB565) at most in one transaction */
 .psram_trans_align = EXAMPLE_PSRAM_DATA_ALIGNMENT,
 .sram_trans_align = 4,
};
ESP_ERROR_CHECK(esp_lcd_new_i80_bus(&bus_config, &i80_bus));
```

2. Allocate an LCD IO device handle from the I80 bus. In this step, you need to provide the following information:
   - `esp_lcd_panel_io_i80_config_t::cs_gpio_num` sets the GPIO number of the chip select pin.
   - `esp_lcd_panel_io_i80_config_t::pclk_hz` sets the pixel clock frequency in Hz. Higher pixel clock frequency results in higher refresh rate, but may cause flickering if the DMA bandwidth is not sufficient or the LCD controller chip does not support high pixel clock frequency.
   - `esp_lcd_panel_io_i80_config_t::lcd_cmd_bits` and `esp_lcd_panel_io_i80_config_t::lcd_param_bits` set the bit width of the command and parameter that recognized by the LCD controller chip. This is chip specific, you should refer to your LCD spec in advance.
   - `esp_lcd_panel_io_i80_config_t::trans_queue_depth` sets the maximum number of transactions that can be queued in the LCD IO device. A bigger value means more
transactions can be queued up, but it also consumes more memory.

```c
esp_lcd_panel_io_handle_t io_handle = NULL;
esp_lcd_panel_io_i80_config_t io_config = {
  .cs_gpio_num = EXAMPLE_PIN_NUM_CS,
  .pclk_hz = EXAMPLE_LCD_PIXEL_CLOCK_HZ,
  .trans_queue_depth = 10,
  .dc_levels = {
    .dc_idle_level = 0,
    .dc_cmd_level = 0,
    .dc_dummy_level = 0,
    .dc_data_level = 1,
  },
  .lcd_cmd_bits = EXAMPLE_LCD_CMD_BITS,
  .lcd_param_bits = EXAMPLE_LCD_PARAM_BITS,
};
ESP_ERROR_CHECK(esp_lcd_new_panel_io_i80(i80_bus, &io_config, &io_→handle));
```

3. Install the LCD controller driver. The LCD controller driver is responsible for sending the commands and parameters to the LCD controller chip. In this step, you need to specify the I80 IO device handle that allocated in the last step, and some panel specific configurations:

- `esp_lcd_panel_dev_config_t::bits_per_pixel` sets the bit width of the pixel color data. The LCD driver uses this value to calculate the number of bytes to send to the LCD controller chip.
- `esp_lcd_panel_dev_config_t::reset_gpio_num` sets the GPIO number of the reset pin. If the LCD controller chip does not have a reset pin, you can set this value to -1.
- `esp_lcd_panel_dev_config_t::rgb_ele_order` sets the color order the pixel color data.

```c
esp_lcd_panel_dev_config_t panel_config = {
  .reset_gpio_num = EXAMPLE_PIN_NUM_RST,
  .rgb_ele_order = LCD_RGB_ELEMENT_ORDER_RGB,
  .bits_per_pixel = 16,
};
ESP_ERROR_CHECK(esp_lcd_new_panel_st7789(io_handle, &panel_config, &panel_handle));
```

### More Controller Based LCD Drivers

More LCD panel drivers and touch drivers are available in ESP-IDF Component Registry. The list of available and planned drivers with links is in this table.

### LCD Panel Basic Operations

- `esp_lcd_panel_reset()` can reset the LCD panel.
- `esp_lcd_panel_init()` performs a basic initialization of the panel. To perform more manufacture specific initialization, please go to Steps to Add Manufacture Specific Initialization.
- Through combined use of `esp_lcd_panel_swap_xy()` and `esp_lcd_panel_mirror()`, you can rotate the LCD screen.
- `esp_lcd_panel_disp_on_off()` can turn on or off the LCD screen by cutting down the output path from the frame buffer to the LCD screen.
- `esp_lcd_panel_disp_sleep()` can reduce the power consumption of the LCD screen by entering the sleep mode. The internal frame buffer is still retained.
- `esp_lcd_panel_draw_bitmap()` is the most significant function, which does the magic to draw the user provided color buffer to the LCD screen, where the draw window is also configurable.
**Steps to Add Manufacture Specific Initialization**

The LCD controller drivers (e.g., st7789) in ESP-IDF only provide basic initialization in the `esp_lcd_panel_init()`, leaving the vast majority of settings to the default values. Some LCD modules need to set a bunch of manufacture specific configurations before it can display normally. These configurations usually include gamma, power voltage and so on. If you want to add manufacture specific initialization, please follow the steps below:

```c
esp_lcd_panel_reset(panel_handle);
esp_lcd_panel_init(panel_handle);
// set extra configurations e.g., gamma control
// with the underlying IO handle
// please consult your manufacture for special commands and corresponding values
esp_lcd_panel_io_tx_param(io_handle, GAMMA_CMD, (uint8_t*)GAMMA_ARRAY, N);
// turn on the display
esp_lcd_panel_disp_on_off(panel_handle, true);
```

**Application Example**

LCD examples are located under: `peripherals/lcd`:

- Universal SPI LCD example with SPI touch - `peripherals/lcd/spi_lcd_touch`
- Jpeg decoding and LCD display - `peripherals/lcd/tjpgd`
- i80 controller based LCD and LVGL animation UI - `peripherals/lcd/i80_controller`
- I2C interfaced OLED display scrolling text - `peripherals/lcd/i2c_oled`

**API Reference**

**Header File**

- `components/hal/include/hal/lcd_types.h`
- This header file can be included with:

  ```
  #include "hal/lcd_types.h"
  ```

**Type Definitions**

```c
typedef soc_periph_lcd_clk_src_t lcd_clock_source_t

LCD clock source.
```

**Enumerations**

```c
enum lcd_rgb_data_endian_t

RGB data endian.

Values:

enumerator LCD_RGB_DATA_ENDIAN_BIG

RGB data endian: MSB first

enumerator LCD_RGB_DATA_ENDIAN_LITTLE

RGB data endian: LSB first
```
Chapter 2. API Reference

enum lcd_color_space_t
LCD color space.
Values:

enumerator LCD_COLOR_SPACE_RGB
Color space: RGB

enumerator LCD_COLOR_SPACE_YUV
Color space: YUV

enum lcd_color_range_t
LCD color range.
Values:

enumerator LCD_COLOR_RANGE_LIMIT
Limited color range

enumerator LCD_COLOR_RANGE_FULL
Full color range

enum lcd_yuv_sample_t
YUV sampling method.
Values:

enumerator LCD_YUV_SAMPLE_422
YUV 4:2:2 sampling

enumerator LCD_YUV_SAMPLE_420
YUV 4:2:0 sampling

enumerator LCD_YUV_SAMPLE_411
YUV 4:1:1 sampling

enum lcd_yuv_conv_std_t
The standard used for conversion between RGB and YUV.
Values:

enumerator LCD_YUV_CONV_STD_BT601
YUV<->RGB conversion standard: BT.601

enumerator LCD_YUV_CONV_STD_BT709
YUV<->RGB conversion standard: BT.709

Header File
- components/esp_lcd/include/esp_lcd_types.h
- This header file can be included with:
### Include

```
#include "esp_lcd_types.h"
```

- This header file is a part of the API provided by the `esp_lcd` component. To declare that your component depends on `esp_lcd`, add the following to your `CMakeLists.txt`:

  ```
  REQUIRES esp_lcd
  or
  PRIV_REQUIRES esp_lcd
  ```

### Type Definitions

typedef struct esp_lcd_panel_io_t *`esp_lcd_panel_io_handle_t`

Type of LCD panel IO handle

typedef struct esp_lcd_panel_t *`esp_lcd_panel_handle_t`

Type of LCD panel handle

### Enumerations

```
enum lcd_rgb_element_order_t

  LCD_RGB_ELEMENT_ORDER_RGB

  LCD_RGB_ELEMENT_ORDER_BGR
```

- **RGB element order.**
  - **Values:**
    - `LCD_RGB_ELEMENT_ORDER_RGB`: RGB element order: RGB
    - `LCD_RGB_ELEMENT_ORDER_BGR`: RGB element order: BGR

### Header File

- `components/esp_lcd/include/esp_lcd_panel_io.h`

- This header file can be included with:

  ```
  #include "esp_lcd_panel_io.h"
  ```

- This header file is a part of the API provided by the `esp_lcd` component. To declare that your component depends on `esp_lcd`, add the following to your `CMakeLists.txt`:

  ```
  REQUIRES esp_lcd
  or
  PRIV_REQUIRES esp_lcd
  ```

### Functions

```
esp_err_t esp_lcd_panel_io_rx_param(esp_lcd_panel_io_handle_t io, int lcd_cmd, void *param, size_t param_size)
```

Transmit LCD command and receive corresponding parameters.

**Note:** Commands sent by this function are short, so they are sent using polling transactions. The function does not return before the command transfer is completed. If any queued transactions sent by
esp_lcd_panel_io_tx_color() are still pending when this function is called, this function will wait until they are finished and the queue is empty before sending the command(s).

Parameters

- **io** [in] LCD panel IO handle, which is created by other factory API like esp_lcd_new_panel_io_spi()
- **lcd_cmd** [in] The specific LCD command, set to -1 if no command needed
- **param** [in] Buffer for the command data
- **param_size** [in] Size of param buffer

Returns

- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_NOT_SUPPORTED if read is not supported by transport
- ESP_OK on success

```c
esp_err_t esp_lcd_panel_io_tx_param(esp_lcd_panel_io_handle_t io, int lcd_cmd, const void* param, size_t param_size)
```

Transmit LCD command and corresponding parameters.

Note: Commands sent by this function are short, so they are sent using polling transactions. The function does not return before the command transfer is completed. If any queued transactions sent by esp_lcd_panel_io_tx_color() are still pending when this function is called, this function will wait until they are finished and the queue is empty before sending the command(s).

Parameters

- **io** [in] LCD panel IO handle, which is created by other factory API like esp_lcd_new_panel_io_spi()
- **lcd_cmd** [in] The specific LCD command, set to -1 if no command needed
- **param** [in] Buffer that holds the command specific parameters, set to NULL if no parameter is needed for the command
- **param_size** [in] Size of param in memory, in bytes, set to zero if no parameter is needed for the command

Returns

- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_OK on success

```c
esp_err_t esp_lcd_panel_io_tx_color(esp_lcd_panel_io_handle_t io, int lcd_cmd, const void* color, size_t color_size)
```

Transmit LCD RGB data.

Note: This function will package the command and RGB data into a transaction, and push into a queue. The real transmission is performed in the background (DMA+interrupt). The caller should take care of the lifecycle of the color buffer. Recycling of color buffer should be done in the callback on_color_trans_done().

Parameters

- **io** [in] LCD panel IO handle, which is created by factory API like esp_lcd_new_panel_io_spi()
- **lcd_cmd** [in] The specific LCD command, set to -1 if no command needed
- **color** [in] Buffer that holds the RGB color data
- **color_size** [in] Size of color in memory, in bytes

Returns

- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_OK on success
**esp_err_t** esp_lcd_panel_io_del***(esp_lcd_panel_io_handle_t** io***)

Destroy LCD panel IO handle (deinitialize panel and free all corresponding resource)

### Parameters

- **io**[in] LCD panel IO handle, which is created by factory API like esp_lcd_new_panel_io_spi()

### Returns

- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_OK on success

**esp_err_t** esp_lcd_panel_io_register_event_callbacks***(esp_lcd_panel_io_handle_t** io, const esp_lcd_panel_io_callbacks_t** cbs, void** user_ctx**)

Register LCD panel IO callbacks.

### Parameters

- **io**[in] LCD panel IO handle, which is created by factory API like esp_lcd_new_panel_io_spi()
- **cbs**[in] structure with all LCD panel IO callbacks
- **user_ctx**[in] User private data, passed directly to callback’s user_ctx

### Returns

- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_OK on success

**esp_err_t** esp_lcd_new_panel_io_spi***(esp_lcd_spi_bus_handle_t** bus, const esp_lcd_panel_io_spi_config_t** io_config, esp_lcd_panel_io_handle_t** ret_io**)

Create LCD panel IO handle, for SPI interface.

### Parameters

- **bus**[in] SPI bus handle
- **io_config**[in] IO configuration, for SPI interface
- **ret_io**[out] Returned IO handle

### Returns

- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_NO_MEM if out of memory
- ESP_OK on success

**esp_err_t** esp_lcd_new_panel_io_i2c_v1***(uint32_t** bus, const esp_lcd_panel_io_i2c_config_t** io_config, esp_lcd_panel_io_handle_t** ret_io**)

Create LCD panel IO handle, for I2C interface in legacy implementation.

### Parameters

- **bus**[in] I2C bus handle, (in uint32_t)
- **io_config**[in] IO configuration, for I2C interface
- **ret_io**[out] Returned IO handle

### Returns

- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_NO_MEM if out of memory
- ESP_OK on success

**esp_err_t** esp_lcd_new_panel_io_i2c_v2***(i2c_master_bus_handle_t** bus, const esp_lcd_panel_io_i2c_config_t** io_config, esp_lcd_panel_io_handle_t** ret_io**)

Create LCD panel IO handle, for I2C interface in new implementation.

### Parameters

- **bus**[in] I2C bus handle
- **io_config**[in] IO configuration, for I2C interface
- **ret_io**[out] Returned IO handle

### Returns

- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_NO_MEM if out of memory
- ESP_OK on success

---

**Note:** Please don’t call this function in your project directly. Please call esp_lcd_new_panel_to_i2c instead.
Note: Please don’t call this function in your project directly. Please call `esp_lcd_new_panel_to_i2c` instead.

### Parameters
- **bus** - [in] I2C bus handle, (in i2c_master_dev_handle_t)
- **io_config** - [in] IO configuration, for I2C interface
- **ret_io** - [out] Returned IO handle

### Returns
- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_NO_MEM if out of memory
- ESP_OK on success

```c
esp_err_t esp_lcd_new_i80_bus(const esp_lcd_i80_bus_config_t *bus_config, esp_lcd_i80_bus_handle_t *ret_bus)
```

Create Intel 8080 bus handle.

### Parameters
- **bus_config** - [in] Bus configuration
- **ret_bus** - [out] Returned bus handle

### Returns
- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_NO_MEM if out of memory
- ESP_ERR_NOT_FOUND if no free bus is available
- ESP_OK on success

```c
esp_err_t esp_lcd_del_i80_bus(esp_lcd_i80_bus_handle_t bus)
```

Destroy Intel 8080 bus handle.

### Parameters
- **bus** - [in] Intel 8080 bus handle, created by `esp_lcd_new_i80_bus()`

### Returns
- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_INVALID_STATE if there still be some device attached to the bus
- ESP_OK on success

```c
esp_err_t esp_lcd_new_panel_io_i80(const esp_lcd_i80_bus_handle_t bus, const esp_lcd_panel_io_i80_config_t *io_config, esp_lcd_panel_io_handle_t *ret_io)
```

Create LCD panel IO, for Intel 8080 interface.

### Parameters
- **bus** - [in] Intel 8080 bus handle, created by `esp_lcd_new_i80_bus()`
- **io_config** - [in] IO configuration, for i80 interface
- **ret_io** - [out] Returned panel IO handle

### Returns
- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_NOT_SUPPORTED if some configuration can’t be satisfied, e.g. pixel clock out of the range
- ESP_ERR_NO_MEM if out of memory
- ESP_OK on success

### Structures

- **struct esp_lcd_panel_io_event_data_t**
  Type of LCD panel IO event data.

- **struct esp_lcd_panel_io_callbacks_t**
  Type of LCD panel IO callbacks.
Chapter 2. API Reference

Public Members

`esp_lcd_panel_io_color_trans_done_cb_t on_color_trans_done`
Callback invoked when color data transfer has finished

struct `esp_lcd_panel_io_spi_config_t`
Panel IO configuration structure, for SPI interface.

Public Members

int `cs_gpio_num`
GPIO used for CS line

int `dc_gpio_num`
GPIO used to select the D/C line, set this to -1 if the D/C line is not used

int `spi_mode`
Traditional SPI mode (0~3)

unsigned int `pclk_hz`
Frequency of pixel clock

size_t `trans_queue_depth`
Size of internal transaction queue

`esp_lcd_panel_io_color_trans_done_cb_t on_color_trans_done`
Callback invoked when color data transfer has finished

void *`user_ctx`
User private data, passed directly to on_color_trans_done’s user_ctx

int `lcd_cmd_bits`
Bit-width of LCD command

int `lcd_param_bits`
Bit-width of LCD parameter

unsigned int `dc_low_on_data`
If this flag is enabled, DC line = 0 means transfer data, DC line = 1 means transfer command; vice versa

unsigned int `octal_mode`
Transmit with octal mode (8 data lines), this mode is used to simulate Intel 8080 timing

unsigned int `quad_mode`
Transmit with quad mode (4 data lines), this mode is useful when transmitting LCD parameters (Only use one line for command)
unsigned int **sio_mode**
Read and write through a single data line (MOSI)

unsigned int **lsb_first**
transmit LSB bit first

unsigned int **cs_high_active**
CS line is high active

struct **esp_lcd_panel_io_spi_config_t**:[anonymous]** flags**
Extra flags to fine-tune the SPI device

struct **esp_lcd_panel_io_i2c_config_t**
Panel IO configuration structure, for I2C interface.

**Public Members**

**uint32_t dev_addr**
I2C device address

**esp_lcd_panel_io_color_trans_done_cb_t on_color_trans_done**
Callback invoked when color data transfer has finished

**void **user_ctx**
User private data, passed directly to on_color_trans_done’ s user_ctx

**size_t control_phase_bytes**
I2C LCD panel will encode control information (e.g. D/C selection) into control phase, in several bytes

unsigned int **dc_bit_offset**
Offset of the D/C selection bit in control phase

**int lcd_cmd_bits**
Bit-width of LCD command

**int lcd_param_bits**
Bit-width of LCD parameter

unsigned int **dc_low_on_data**
If this flag is enabled, DC line = 0 means transfer data, DC line = 1 means transfer command; vice versa

unsigned int **disable_control_phase**
If this flag is enabled, the control phase isn’t used

struct **esp_lcd_panel_io_i2c_config_t**:[anonymous]** flags**
Extra flags to fine-tune the I2C device
uint32_t scl_speed_hz
   I2C LCD SCL frequency (hz)

struct esp_lcd_i80_bus_config_t
   LCD Intel 8080 bus configuration structure.

   **Public Members**

   int dc_gpio_num
      GPIO used for D/C line

   int wr_gpio_num
      GPIO used for WR line

   lcd_clock_source_t clk_src
      Clock source for the I80 LCD peripheral

   int data_gpio_nums[24]
      GPIOs used for data lines

   size_t bus_width
      Number of data lines, 8 or 16

   size_t max_transfer_bytes
      Maximum transfer size, this determines the length of internal DMA link

   size_t psram_trans_align
      DMA transfer alignment for data allocated from PSRAM

   size_t sram_trans_align
      DMA transfer alignment for data allocated from SRAM

struct esp_lcd_panel_io_i80_config_t
   Panel IO configuration structure, for intel 8080 interface.

   **Public Members**

   int cs_gpio_num
      GPIO used for CS line, set to -1 will declaim exclusively use of I80 bus

   uint32_t pclk_hz
      Frequency of pixel clock

   size_t trans_queue_depth
      Transaction queue size, larger queue, higher throughput

Chapter 2. API Reference

`esp_lcd_panel_io_color_trans_done_cb_t on_color_trans_done`

Callback invoked when color data was transferred done

```c
void *user_ctx
```

User private data, passed directly to on_color_trans_done’s `user_ctx`

```c
int lcd_cmd_bits
```

Bit-width of LCD command

```c
int lcd_param_bits
```

Bit-width of LCD parameter

```c
unsigned int dc_idle_level
```

Level of DC line in IDLE phase

```c
unsigned int dc_cmd_level
```

Level of DC line in CMD phase

```c
unsigned int dc_dummy_level
```

Level of DC line in DUMMY phase

```c
unsigned int dc_data_level
```

Level of DC line in DATA phase

```c
struct esp_lcd_panel_io_i80_config_t::[anonymous] dc_levels
```

Each i80 device might have its own D/C control logic

```c
unsigned int cs_active_high
```

If set, a high level of CS line will select the device, otherwise, CS line is low level active

```c
unsigned int reverse_color_bits
```

Reverse the data bits, D[N:0] -> D[0:N]

```c
unsigned int swap_color_bytes
```

Swap adjacent two color bytes

```c
unsigned int pclk_active_neg
```

The display will write data lines when there’s a falling edge on WR signal (a.k.a the PCLK)

```c
unsigned int pclk_idle_low
```

The WR signal (a.k.a the PCLK) stays at low level in IDLE phase

```c
struct esp_lcd_panel_io_i80_config_t::[anonymous] flags
```

Panel IO config flags

**Macros**

`esp_lcd_new_panel_io_i2c(bus, io_config, ret_io)`

Create LCD panel IO handle.
Parameters

- **bus** - [in] I2C bus handle
- **io_config** - [in] IO configuration, for I2C interface
- **ret_io** - [out] Returned IO handle

Returns

- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_NO_MEM if out of memory
- ESP_OK on success

Type Definitions

typedef void \***esp_lcd_spi_bus_handle_t**
Type of LCD SPI bus handle

typedef uint32_t **esp_lcd_i2c_bus_handle_t**
Type of LCD I2C bus handle

typedef struct esp_lcd_i80_bus_t \* **esp_lcd_i80_bus_handle_t**
Type of LCD intel 8080 bus handle

typedef bool (**esp_lcd_panel_io_color_trans_done_cb_t**) (esp_lcd_panel_io_handle_t panel_io, esp_lcd_panel_io_event_data_t \*edata, void \*user_ctx)
Declare the prototype of the function that will be invoked when panel IO finishes transferring color data.

- **panel_io** - [in] LCD panel IO handle, which is created by factory API like esp_lcd_new_panel_io_spi()
- **edata** - [in] Panel IO event data, fed by driver
- **user_ctx** - [in] User data, passed from esp_lcd_panel_io_XXX_config_t

Return Whether a high priority task has been waken up by this function

Header File

- components/esp_lcd/include/esp_lcd_panel_ops.h
- This header file can be included with:

```c
#include "esp_lcd_panel_ops.h"
```

- This header file is a part of the API provided by the esp_lcd component. To declare that your component depends on esp_lcd, add the following to your CMakeLists.txt:

```
REQUIRES esp_lcd
```

or

```
PRIV_REQUIRES esp_lcd
```

Functions

**esp_err_t esp_lcd_panel_reset (esp_lcd_panel_handle_t panel)**
Reset LCD panel.

Note: Panel reset must be called before attempting to initialize the panel using esp_lcd_panel_init().

Parameters **panel** - [in] LCD panel handle, which is created by other factory API like esp_lcd_new_panel_st7789()

Returns

- ESP_OK on success
Chapter 2. API Reference

```c
esp_err_t esp_lcd_panel_init(esp_lcd_panel_handle_t panel)
Initialize LCD panel.
```

**Note:** Before calling this function, make sure the LCD panel has finished the reset stage by `esp_lcd_panel_reset()`.

**Parameters**
- `panel` - [in] LCD panel handle, which is created by other factory API like `esp_lcd_new_panel_st7789()`

**Returns**
- ESP_OK on success

```c
esp_err_t esp_lcd_panel_del(esp_lcd_panel_handle_t panel)
Deinitialize the LCD panel.
```

**Parameters**
- `panel` - [in] LCD panel handle, which is created by other factory API like `esp_lcd_new_panel_st7789()`

**Returns**
- ESP_OK on success

```c
esp_err_t esp_lcd_panel_draw_bitmap(esp_lcd_panel_handle_t panel, int x_start, int y_start, int x_end, int y_end, const void* color_data)
Draw bitmap on LCD panel.
```

**Parameters**
- `panel` - [in] LCD panel handle, which is created by other factory API like `esp_lcd_new_panel_st7789()`
- `x_start` - [in] Start index on x-axis (x_start included)
- `y_start` - [in] Start index on y-axis (y_start included)
- `x_end` - [in] End index on x-axis (x_end not included)
- `y_end` - [in] End index on y-axis (y_end not included)
- `color_data` - [in] RGB color data that will be dumped to the specific window range

**Returns**
- ESP_OK on success

```c
esp_err_t esp_lcd_panel_mirror(esp_lcd_panel_handle_t panel, bool mirror_x, bool mirror_y)
Mirror the LCD panel on specific axis.
```

**Note:** Combined with `esp_lcd_panel_swap_xy()`, one can realize screen rotation

**Parameters**
- `panel` - [in] LCD panel handle, which is created by other factory API like `esp_lcd_new_panel_st7789()`
- `mirror_x` - [in] Whether the panel will be mirrored about the x axis
- `mirror_y` - [in] Whether the panel will be mirrored about the y axis

**Returns**
- ESP_OK on success
- ESP_ERR_NOT_SUPPORTED if this function is not supported by the panel

```c
esp_err_t esp_lcd_panel_swap_xy(esp_lcd_panel_handle_t panel, bool swap_axes)
Swap/Exchange x and y axis.
```

**Note:** Combined with `esp_lcd_panel_mirror()`, one can realize screen rotation

**Parameters**
Chapter 2. API Reference

- **panel** - [in] LCD panel handle, which is created by other factory API like `esp_lcd_new_panel_st7789()`
- **swap_axes** - [in] Whether to swap the x and y axis

**Returns**
- ESP_OK on success
- ESP_ERR_NOT_SUPPORTED if this function is not supported by the panel

```c
esp_err_t esp_lcd_panel_set_gap(esp_lcd_panel_handle_t panel, int x_gap, int y_gap)
```
Set extra gap in x and y axis.

The gap is the space (in pixels) between the left/top sides of the LCD panel and the first row/column respectively of the actual contents displayed.

**Note:** Setting a gap is useful when positioning or centering a frame that is smaller than the LCD.

**Parameters**
- **panel** - [in] LCD panel handle, which is created by other factory API like `esp_lcd_new_panel_st7789()`
- **x_gap** - [in] Extra gap on x axis, in pixels
- **y_gap** - [in] Extra gap on y axis, in pixels

**Returns**
- ESP_OK on success

```c
esp_err_t esp_lcd_panel_invert_color(esp_lcd_panel_handle_t panel, bool invert_color_data)
```
Invert the color (bit-wise invert the color data line)

**Parameters**
- **panel** - [in] LCD panel handle, which is created by other factory API like `esp_lcd_new_panel_st7789()`
- **invert_color_data** - [in] Whether to invert the color data

**Returns**
- ESP_OK on success

```c
esp_err_t esp_lcd_panel_disp_on_off(esp_lcd_panel_handle_t panel, bool on_off)
```
Turn on or off the display.

**Parameters**
- **panel** - [in] LCD panel handle, which is created by other factory API like `esp_lcd_new_panel_st7789()`
- **on_off** - [in] True to turns on display, False to turns off display

**Returns**
- ESP_OK on success
- ESP_ERR_NOT_SUPPORTED if this function is not supported by the panel

```c
esp_err_t esp_lcd_panel_disp_off(esp_lcd_panel_handle_t panel, bool off)
```
Turn off the display.

**Parameters**
- **panel** - [in] LCD panel handle, which is created by other factory API like `esp_lcd_new_panel_st7789()`
- **off** - [in] Whether to turn off the screen

**Returns**
- ESP_OK on success
- ESP_ERR_NOT_SUPPORTED if this function is not supported by the panel

```c
esp_err_t esp_lcd_panel_disp_sleep(esp_lcd_panel_handle_t panel, bool sleep)
```
Enter or exit sleep mode.

**Parameters**
• **panel** -[in] LCD panel handle, which is created by other factory API like `esp_lcd_new_panel_st7789()`  
• **sleep** -[in] True to enter sleep mode, False to wake up  

**Returns**  
• ESP_OK on success  
• ESP_ERR_NOT_SUPPORTED if this function is not supported by the panel

**Header File**  
• `components/esp_lcd/include/esp_lcd_panel_rgb.h`  
  This header file can be included with:  
  ```
#include "esp_lcd_panel_rgb.h"
  ```  
• This header file is a part of the API provided by the `esp_lcd` component. To declare that your component depends on `esp_lcd`, add the following to your CMakeLists.txt:  
  ```
REQUIRES esp_lcd
  ```  
  or  
  ```
PRIV_REQUIRES esp_lcd
  ```

**Header File**  
• `components/esp_lcd/include/esp_lcd_panel_vendor.h`  
  This header file can be included with:  
  ```
#include "esp_lcd_panel_vendor.h"
  ```  
• This header file is a part of the API provided by the `esp_lcd` component. To declare that your component depends on `esp_lcd`, add the following to your CMakeLists.txt:  
  ```
REQUIRES esp_lcd
  ```  
  or  
  ```
PRIV_REQUIRES esp_lcd
  ```

### 2.5.14 LED Control (LEDC)

**Introduction**  
The LED control (LEDC) peripheral is primarily designed to control the intensity of LEDs, although it can also be used to generate PWM signals for other purposes. It has 8 channels which can generate independent waveforms that can be used, for example, to drive RGB LED devices.  
The PWM controller can automatically increase or decrease the duty cycle gradually, allowing for fades without any processor interference.

**Functionality Overview**  
Setting up a channel of the LEDC is done in three steps. Note that unlike ESP32, ESP32-S2 only supports configuring channels in “low speed” mode.  
1. **Timer Configuration** by specifying the PWM signal’s frequency and duty cycle resolution.  
2. **Channel Configuration** by associating it with the timer and GPIO to output the PWM signal.
3. **Change PWM Signal** that drives the output in order to change LED’s intensity. This can be done under the full control of software or with hardware fading functions.

As an optional step, it is also possible to set up an interrupt on fade end.

![LED PWM Controller](image)

**Fig. 13: Key Settings of LED PWM Controller’s API**

**Note:** For an initial setup, it is recommended to configure for the timers first (by calling `ledc_timer_config()`) and then for the channels (by calling `ledc_channel_config()`). This ensures the PWM frequency is at the desired value since the appearance of the PWM signal from the IO pad.

**Timer Configuration** Setting the timer is done by calling the function `ledc_timer_config()` and passing the data structure `ledc_timer_config_t` that contains the following configuration settings:

- Speed mode (value must be `LEDC_LOW_SPEED_MODE`)
- Timer number `ledc_timer_t`
- PWM signal frequency in Hz
- Resolution of PWM duty
- Source clock `ledc_clk_cfg_t`

The frequency and the duty resolution are interdependent. The higher the PWM frequency, the lower the duty resolution which is available, and vice versa. This relationship might be important if you are planning to use this API for purposes other than changing the intensity of LEDs. For more details, see Section Supported Range of Frequency and Duty Resolutions.

The source clock can also limit the PWM frequency. The higher the source clock frequency, the higher the maximum PWM frequency can be configured.

<table>
<thead>

<td>Dynamic Frequency Scaling compatible, Light sleep compatible</td>
</tr>
<tr>
<td>XTAL_CLK</td>
<td>40 MHz</td>
<td>Dynamic Frequency Scaling compatible</td>
</tr>
</tbody>
</table>

Table 3: Characteristics of ESP32-S2 LEDC source clocks
Note:

1. On ESP32-S2, if RC_FAST_CLK is chosen as the LEDC clock source, an internal calibration will be performed to get the exact frequency of the clock. This ensures the accuracy of output PWM signal frequency.

The LEDC driver offers a helper function `ledc_find_suitable_duty_resolution()` to find the maximum possible resolution for the timer, given the source clock frequency and the desired PWM signal frequency.

When a timer is no longer needed by any channel, it can be deconfigured by calling the same function `ledc_timer_config()`. The configuration structure `ledc_timer_config_t` passes in should be:

- `ledc_timer_config_t::speed_mode` The speed mode of the timer which wants to be deconfigured belongs to (`ledc_mode_t`)
- `ledc_timer_config_t::timer_num` The ID of the timers which wants to be deconfigured (`ledc_timer_t`)
- `ledc_timer_config_t::deconfigure` Set this to true so that the timer specified can be deconfigured

**Channel Configuration**  When the timer is set up, configure the desired channel (one out of `ledc_channel_t`). This is done by calling the function `ledc_channel_config()`.

Similar to the timer configuration, the channel setup function should be passed a structure `ledc_channel_config_t` that contains the channel’s configuration parameters.

At this point, the channel should start operating and generating the PWM signal on the selected GPIO, as configured in `ledc_channel_config_t`, with the frequency specified in the timer settings and the given duty cycle. The channel operation (signal generation) can be suspended at any time by calling the function `ledc_stop()`.

**Change PWM Signal**  Once the channel starts operating and generating the PWM signal with the constant duty cycle and frequency, there are a couple of ways to change this signal. When driving LEDs, primarily the duty cycle is changed to vary the light intensity.

The following two sections describe how to change the duty cycle using software and hardware fading. If required, the signal’s frequency can also be changed; it is covered in Section **Change PWM Frequency**.

Note:  All the timers and channels in the ESP32-S2’s LED PWM Controller only support low speed mode. Any change of PWM settings must be explicitly triggered by software (see below).

**Change PWM Duty Cycle Using Software**  To set the duty cycle, use the dedicated function `ledc_set_duty()`. After that, call `ledc_update_duty()` to activate the changes. To check the currently set value, use the corresponding _get_ function `ledc_get_duty()`.

Another way to set the duty cycle, as well as some other channel parameters, is by calling `ledc_channel_config()` covered in Section **Channel Configuration**.

The range of the duty cycle values passed to functions depends on selected `duty_resolution` and should be from 0 to \((2^{ \text{duty_resolution}})\). For example, if the selected duty resolution is 10, then the duty cycle values can range from 0 to 1024. This provides the resolution of \(\sim 0.1\%\).

**Warning:**  On ESP32-S2, when channel’s binded timer selects its maximum duty resolution, the duty cycle value cannot be set to \((2^{ \text{duty_resolution}})\). Otherwise, the internal duty counter in the hardware will overflow and be messed up.

**Change PWM Duty Cycle Using Hardware**  The LEDC hardware provides the means to gradually transition from one duty cycle value to another. To use this functionality, enable fading with `ledc_fade_func_install()` and then configure it by calling one of the available fading functions:
• **ledc_set_fade_with_time()**
• **ledc_set_fade_with_step()**
• **ledc_set_fade()**

Start fading with **ledc_fade_start()**. A fade can be operated in blocking or non-blocking mode, please check **ledc_fade_mode_t** for the difference between the two available fade modes. Note that with either fade mode, the next fade or fixed-duty update will not take effect until the last fade finishes or is stopped. **ledc_fade_stop()** has to be called to stop a fade that is in progress.

To get a notification about the completion of a fade operation, a fade end callback function can be registered for each channel by calling **ledc_cb_register()** after the fade service being installed. The fade end callback prototype is defined in **ledc_cb_t**, where you should return a boolean value from the callback function, indicating whether a high priority task is woken up by this callback function. It is worth mentioning, the callback and the function invoked by itself should be placed in IRAM, as the interrupt service routine is in IRAM. **ledc_cb_register()** will print a warning message if it finds the addresses of callback and user context are incorrect.

If not required anymore, fading and an associated interrupt can be disabled with **ledc_fade_func_uninstall()**.

**Change PWM Frequency** The LEDC API provides several ways to change the PWM frequency “on the fly”:

1. Set the frequency by calling **ledc_set_freq()**. There is a corresponding function **ledc_get_freq()** to check the current frequency.
2. Change the frequency and the duty resolution by calling **ledc_bind_channel_timer()** to bind some other timer to the channel.
3. Change the channel’s timer by calling **ledc_channel_config()**.

**More Control Over PWM** There are several lower level timer-specific functions that can be used to change PWM settings:

• **ledc_timer_set()**
• **ledc_timer_rst()**
• **ledc_timer_pause()**
• **ledc_timer_resume()**

The first two functions are called “behind the scenes” by **ledc_channel_config()** to provide a startup of a timer after it is configured.

**Use Interrupts** When configuring an LEDC channel, one of the parameters selected within **ledc_channel_config_t** is **ledc_intr_type_t** which triggers an interrupt on fade completion.

For registration of a handler to address this interrupt, call **ledc_isr_register()**.

**Supported Range of Frequency and Duty Resolutions**

The LED PWM Controller is designed primarily to drive LEDs. It provides a large flexibility of PWM duty cycle settings. For instance, the PWM frequency of 5 kHz can have the maximum duty resolution of 13 bits. This means that the duty can be set anywhere from 0 to 100% with a resolution of ~ 0.012% (2 ** 13 = 8192 discrete levels of the LED intensity). Note, however, that these parameters depend on the clock signal clocking the LED PWM Controller timer which in turn clocks the channel (see **timer configuration** and the ESP32-S2 Technical Reference Manual > LED PWM Controller (LEDC) [PDF]).

The LEDC can be used for generating signals at much higher frequencies that are sufficient enough to clock other devices, e.g., a digital camera module. In this case, the maximum available frequency is 40 MHz with duty resolution of 1 bit. This means that the duty cycle is fixed at 50% and cannot be adjusted.

The LEDC API is designed to report an error when trying to set a frequency and a duty resolution that exceed the range of LEDC’s hardware. For example, an attempt to set the frequency to 20 MHz and the duty resolution to 3 bits results in the following error reported on a serial monitor:
In such a situation, either the duty resolution or the frequency must be reduced. For example, setting the duty resolution to 2 resolves this issue and makes it possible to set the duty cycle at 25% steps, i.e., at 25%, 50% or 75%.

The LEDC driver also captures and reports attempts to configure frequency/duty resolution combinations that are below the supported minimum, e.g.:

```
E (196) ledc: requested frequency and duty resolution cannot be achieved, try reducing freq_hz or duty_resolution. div_param=128
```

The duty resolution is normally set using `ledc_timer_bit_t`. This enumeration covers the range from 10 to 15 bits. If a smaller duty resolution is required (from 10 down to 1), enter the equivalent numeric values directly.

**Application Example**

The LEDC basic example: `peripherals/ledc/ledc_basic`.

The LEDC change duty cycle and fading control example: `peripherals/ledc/ledc_fade`.

**API Reference**

**Header File**

- `components/driver/ledc/include/driver/ledc.h`

This header file can be included with:

```
#include "driver/ledc.h"
```

- This header file is a part of the API provided by the `driver` component. To declare that your component depends on `driver`, add the following to your `CMakeLists.txt`:

```
REQUIRES driver
```

or

```
PRIV_REQUIRES driver
```

**Functions**

- `esp_err_t ledc_channel_config(const ledc_channel_config_t *ledc_conf)`

  LEDC channel configuration. Configure LEDC channel with the given channel/output gpio_num/interrupt/source timer/frequency(Hz)/LEDC duty.

  **Parameters**
  - `ledc_conf` – Pointer of LEDC channel configure struct

  **Returns**
  - ESP_OK Success
  - ESP_ERR_INVALID_ARG Parameter error

- `uint32_t ledc_find_suitable_duty_resolution(uint32_t src_clk_freq, uint32_t timer_freq)`

  Helper function to find the maximum possible duty resolution in bits for `ledc_timer_config()`.

  **Parameters**
  - `src_clk_freq` – LEDC timer source clock frequency (Hz) (See doxygen comments of `ledc_clk_cfg_t` or get from `esp_clk_tree_src_get_freq_hz`)
  - `timer_freq` – Desired LEDC timer frequency (Hz)

  **Returns**
  - 0 The timer frequency cannot be achieved
  - Others The largest duty resolution value to be set
**esp_err_t ledc_timer_config** (const ledc_timer_config_t *timer_conf)

LEDC timer configuration Configure LEDC timer with the given source timer/frequency(Hz)/duty_resolution.

**Parameters**
- **timer_conf** - Pointer of LEDC timer configure struct

**Returns**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_FAIL Can not find a proper pre-divider number base on the given frequency and the current duty_resolution.
- ESP_ERR_INVALID_STATE Timer cannot be de-configured because timer is not configured or is not paused

**esp_err_t ledc_update_duty** (ledc_mode_t speed_mode, ledc_channel_t channel)

LEDC update channel parameters.

**Note:** Call this function to activate the LEDC updated parameters. After ledc_set_duty, we need to call this function to update the settings. And the new LEDC parameters don’t take effect until the next PWM cycle.

**Note:** ledc_set_duty, ledc_set_duty_with_hpoint and ledc_update_duty are not thread-safe, do not call these functions to control one LEDC channel in different tasks at the same time. A thread-safe version of API is ledc_set_duty_and_update

**Note:** If CONFIG_LEDC_CTRL_FUNC_IN_IRAM is enabled, this function will be placed in the IRAM by linker, makes it possible to execute even when the Cache is disabled.

**Note:** This function is allowed to run within ISR context.

**Parameters**
- **speed_mode** - Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** - LEDC channel (0 - LEDC_CHANNEL_MAX-1), select from ledc_channel_t

**Returns**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**esp_err_t ledc_set_pin** (int gpio_num, ledc_mode_t speed_mode, ledc_channel_t ledc_channel)

Set LEDC output gpio.

**Note:** This function only routes the LEDC signal to GPIO through matrix, other LEDC resources initialization are not involved. Please use ledc_channel_config() instead to fully configure a LEDC channel.

**Parameters**
- **gpio_num** - The LEDC output gpio
- **speed_mode** - Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **ledc_channel** - LEDC channel (0 - LEDC_CHANNEL_MAX-1), select from ledc_channel_t

**Returns**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
Chapter 2. API Reference

```c
esp_err_t ledc_stop (ledc_mode_t speed_mode, ledc_channel_t channel, uint32_t idle_level)
LEDC stop. Disable LEDC output, and set idle level.
```

**Note:** If CONFIG_LEDC_CTRL_FUNC_IN_IRAM is enabled, this function will be placed in the IRAM by linker, makes it possible to execute even when the Cache is disabled.

**Note:** This function is allowed to run within ISR context.

**Parameters**
- `speed_mode` - Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- `channel` - LEDC channel (0 - LEDC_CHANNEL_MAX-1), select from `ledc_channel_t`
- `idle_level` - Set output idle level after LEDC stops.

**Returns**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

```c
esp_err_t ledc_set_freq (ledc_mode_t speed_mode, ledc_timer_t timer_num, uint32_t freq_hz)
LEDC set channel frequency (Hz)
```

**Parameters**
- `speed_mode` - Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- `timer_num` -LEDCC timer index (0-3), select from `ledc_timer_t`
- `freq_hz` - Set the LEDC frequency

**Returns**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_FAIL Can not find a proper pre-divider number base on the given frequency and the current duty_resolution.

```c
uint32_t ledc_get_freq (ledc_mode_t speed_mode, ledc_timer_t timer_num)
LEDC get channel frequency (Hz)
```

**Parameters**
- `speed_mode` - Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- `timer_num` -LEDCC timer index (0-3), select from `ledc_timer_t`

**Returns**
- 0 error
- Others Current LEDC frequency

```c
esp_err_t ledc_set_duty_with_hpoint (ledc_mode_t speed_mode, ledc_channel_t channel, uint32_t duty, uint32_t hpoint)
LEDC set duty and hpoint value Only after calling ledc_update_duty will the duty update.
```

**Note:** `ledc_set_duty`, `ledc_set_duty_with_hpoint` and `ledc_update_duty` are not thread-safe, do not call these functions to control one LEDC channel in different tasks at the same time. A thread-safe version of API is `ledc_set_duty_and_update`

**Note:** For ESP32, hardware does not support any duty change while a fade operation is running in progress on that channel. Other duty operations will have to wait until the fade operation has finished.
Chapter 2. API Reference

Parameters

- **speed_mode** - Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** - LEDC channel (0 - LEDC_CHANNEL_MAX-1), select from ledc_channel_t
- **duty** - Set the LEDC duty, the range of duty setting is [0, (2**duty_resolution)]
- **hpoint** - Set the LEDC hpoint value, the range is [0, (2**duty_resolution)-1]

Returns

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

int ledc_get_hpoint (ledc_mode_t speed_mode, ledc_channel_t channel)

LEDC get hpoint value, the counter value when the output is set high level.

Parameters

- **speed_mode** - Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** - LEDC channel (0 - LEDC_CHANNEL_MAX-1), select from ledc_channel_t

Returns

- LEDC_ERR_VAL if parameter error
- Others Current hpoint value of LEDC channel

esp_err_t ledc_set_duty (ledc_mode_t speed_mode, ledc_channel_t channel, uint32_t duty)

LEDC set duty This function do not change the hpoint value of this channel. if needed, please call ledc_set_duty_with_hpoint. only after calling ledc_update_duty will the duty update.

Note: ledc_set_duty, ledc_set_duty_with_hpoint and ledc_update_duty are not thread-safe, do not call these functions to control one LEDC channel in different tasks at the same time. A thread-safe version of API is ledc_set_duty_and_update.

Note: For ESP32, hardware does not support any duty change while a fade operation is running in progress on that channel. Other duty operations will have to wait until the fade operation has finished.

Parameters

- **speed_mode** - Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** - LEDC channel (0 - LEDC_CHANNEL_MAX-1), select from ledc_channel_t
- **duty** - Set the LEDC duty, the range of duty setting is [0, (2**duty_resolution)]

Returns

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

uint32_t ledc_get_duty (ledc_mode_t speed_mode, ledc_channel_t channel)

LEDC get duty This function returns the duty at the present PWM cycle. You shouldn’t expect the function to return the new duty in the same cycle of calling ledc_update_duty, because duty update doesn’t take effect until the next cycle.

Parameters

- **speed_mode** - Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** - LEDC channel (0 - LEDC_CHANNEL_MAX-1), select from ledc_channel_t

Returns

- LEDC_ERR_DUTY if parameter error
Chapter 2. API Reference

• Others Current LEDC duty

```c
esp_err_t ledc_set_fade(ledc_mode_t speed_mode, ledc_channel_t channel, uint32_t duty,
                       ledc_duty_direction_t fade_direction, uint32_t step_num, uint32_t duty_cycle_num,
                       uint32_t duty_scale)
```

LEDC set gradient Set LEDC gradient, After the function calls the ledc_update_duty function, the function can take effect.

**Note:** For ESP32, hardware does not support any duty change while a fade operation is running in progress on that channel. Other duty operations will have to wait until the fade operation has finished.

**Parameters**
- **speed_mode** – Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** – LEDC channel (0 - LEDC_CHANNEL_MAX-1), select from ledc_channel_t
- **duty** – Set the start of the gradient duty, the range of duty setting is [0, \((2^{\text{duty_resolution}})\)]
- **fade_direction** – Set the direction of the gradient
- **step_num** – Set the number of the gradient
- **duty_cycle_num** – Set how many LEDC tick each time the gradient lasts
- **duty_scale** – Set gradient change amplitude

**Returns**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

```c
esp_err_t ledc_isr_register(void (*fn)(void*), void* arg, int intr_alloc_flags,
                            ledc_isr_handle_t* handle)
```

Register LEDC interrupt handler, the handler is an ISR. The handler will be attached to the same CPU core that this function is running on.

**Parameters**
- **fn** – Interrupt handler function.
- **arg** – User-supplied argument passed to the handler function.
- **intr_alloc_flags** – Flags used to allocate the interrupt. One or multiple (ORred) ESP_INTR_FLAG_* values. See esp_intr_alloc.h for more info.
- **handle** – Pointer to return handle. If non-NULL, a handle for the interrupt will be returned here.

**Returns**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NOT_FOUND Failed to find available interrupt source

```c
esp_err_t ledc_timer_set(ledc_mode_t speed_mode, ledc_timer_t timer_sel, uint32_t clock_divider,
                         uint32_t duty_resolution, ledc_clk_src_t clk_src)
```

Configure LEDC settings.

**Parameters**
- **speed_mode** – Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **timer_sel** – Timer index (0-3), there are 4 timers in LEDC module
- **clock_divider** – Timer clock divide value, the timer clock is divided from the selected clock source
- **duty_resolution** – Resolution of duty setting in number of bits. The range is [1, SOC_LEDC_TIMER_BIT_WIDTH]
- **clk_src** – Select LEDC source clock.

**Returns**
- (-1) Parameter error
- Other Current LEDC duty
```c
esp_err_t ledc_timer_rst (ledc_mode_t speed_mode, ledc_timer_t timer_sel)

Reset LEDC timer.

Parameters

- **speed_mode** – Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **timer_sel** – LEDC timer index (0-3), select from ledc_timer_t

Returns

- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

esp_err_t ledc_timer_pause (ledc_mode_t speed_mode, ledc_timer_t timer_sel)

Pause LEDC timer counter.

Parameters

- **speed_mode** – Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **timer_sel** – LEDC timer index (0-3), select from ledc_timer_t

Returns

- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

esp_err_t ledc_timer_resume (ledc_mode_t speed_mode, ledc_timer_t timer_sel)

Resume LEDC timer.

Parameters

- **speed_mode** – Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **timer_sel** – LEDC timer index (0-3), select from ledc_timer_t

Returns

- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

esp_err_t ledc_bind_channel_timer (ledc_mode_t speed_mode, ledc_channel_t channel, ledc_timer_t timer_sel)

Bind LEDC channel with the selected timer.

Parameters

- **speed_mode** – Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** – LEDC channel index (0 - LEDC_CHANNEL_MAX-1), select from ledc_channel_t
- **timer_sel** – LEDC timer index (0-3), select from ledc_timer_t

Returns

- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

esp_err_t ledc_set.fade_with_step (ledc_mode_t speed_mode, ledc_channel_t channel, uint32_t target_duty, uint32_t scale, uint32_t cycle_num)

Set LEDC fade function.

**Note:** Call ledc_fade_func_install() once before calling this function. Call ledc_fade_start() after this to start fading.

**Note:** ledc_set.fade_with_step, ledc_set.fade_with_time and ledc.fade_start are not thread-safe, do not call these functions to control one LEDC channel in different tasks at the same time. A thread-safe version of API is ledc.set.fade_step_and_start
**Note:** For ESP32, hardware does not support any duty change while a fade operation is running in progress on that channel. Other duty operations will have to wait until the fade operation has finished.

**Parameters**
- `speed_mode` - Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- `channel` - LEDC channel index (0 - LEDC_CHANNEL_MAX-1), select from `ledc_channel_t`
- `target_duty` - Target duty of fading [0, (2**duty_resolution)]
- `scale` - Controls the increase or decrease step scale.
- `cycle_num` - Increase or decrease the duty every cycle_num cycles

**Returns**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_INVALID_STATE Channel not initialized
- ESP_FAIL Fade function init error

```c
esp_err_t ledc_set_fade_with_time(ledc_mode_t speed_mode, ledc_channel_t channel, uint32_t target_duty, int max_fade_time_ms)
```

Set LEDC fade function, with a limited time.

**Note:** Call `ledc_fade_func_install()` once before calling this function. Call `ledc_fade_start()` after this to start fading.

**Note:** `ledc_set_fade_with_step`, `ledc_set_fade_with_time` and `ledc_fade_start` are not thread-safe, do not call these functions to control one LEDC channel in different tasks at the same time. A thread-safe version of API is `ledc_set_fade_step_and_start`

**Note:** For ESP32, hardware does not support any duty change while a fade operation is running in progress on that channel. Other duty operations will have to wait until the fade operation has finished.

**Parameters**
- `speed_mode` - Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- `channel` - LEDC channel index (0 - LEDC_CHANNEL_MAX-1), select from `ledc_channel_t`
- `target_duty` - Target duty of fading [0, (2**duty_resolution)]
- `max_fade_time_ms` - The maximum time of the fading (ms).

**Returns**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_INVALID_STATE Channel not initialized
- ESP_FAIL Fade function init error

```c
esp_err_t ledc_fade_func_install (int intr_alloc_flags)
```

Install LEDC fade function. This function will occupy interrupt of LEDC module.

**Parameters**
- `intr_alloc_flags` - Flags used to allocate the interrupt. One or multiple (ORred) ESP_INTR_FLAG_* values. See esp_intr_alloc.h for more info.

**Returns**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Intr flag error
Chapter 2. API Reference

• ESP_ERR_NOT_FOUND Failed to find available interrupt source
• ESP_ERR_INVALID_STATE Fade function already installed

```
void ledc_fade_func_uninstall (void)

Uninstall LEDC fade function.
```

```
esp_err_t ledc_fade_start (ledc_mode_t speed_mode, ledc_channel_t channel, ledc_fade_mode_t fade_mode)

Start LEDC fading.
```

**Note:** Call ledc_fade_func_install() once before calling this function. Call this API right after ledc_set_fade_with_time or ledc_set_fade_with_step before to start fading.

**Note:** Starting fade operation with this API is not thread-safe, use with care.

**Note:** For ESP32, hardware does not support any duty change while a fade operation is running in progress on that channel. Other duty operations will have to wait until the fade operation has finished.

**Parameters**
- `speed_mode` - Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- `channel` - LEDC channel number
- `fade_mode` - Whether to block until fading done. See ledc_types.h ledc_fade_mode_t for more info. Note that this function will not return until fading to the target duty if LEDC_FADE_WAIT_DONE mode is selected.

**Returns**
- ESP_OK Success
- ESP_ERR_INVALID_STATE Channel not initialized or fade function not installed.
- ESP_ERR_INVALID_ARG Parameter error.

```
esp_err_t ledc_fade_stop (ledc_mode_t speed_mode, ledc_channel_t channel)

Stop LEDC fading. The duty of the channel is guaranteed to be fixed at most one PWM cycle after the function returns.
```

**Note:** This API can be called if a new fixed duty or a new fade want to be set while the last fade operation is still running in progress.

**Note:** Call this API will abort the fading operation only if it was started by calling ledc_fade_start with LEDC_FADE_NO_WAIT mode.

**Note:** If a fade was started with LEDC_FADE_WAIT_DONE mode, calling this API afterwards has no use in stopping the fade. Fade will continue until it reaches the target duty.

**Parameters**
- `speed_mode` - Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- `channel` - LEDC channel number

**Returns**
- ESP_OK Success
Chapter 2. API Reference

- ESP_ERR_INVALID_STATE Channel not initialized
- ESP_ERR_INVALID_ARG Parameter error
- ESP_FAIL Fade function init error

```c
esp_err_t ledc_set_duty_and_update(ledc_mode_t speed_mode, ledc_channel_t channel, uint32_t duty, uint32_t hpoint)
```

A thread-safe API to set duty for LEDC channel and return when duty updated.

**Note:** For ESP32, hardware does not support any duty change while a fade operation is running in progress on that channel. Other duty operations will have to wait until the fade operation has finished.

### Parameters
- `speed_mode` - Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- `channel` - LEDC channel (0 - LEDC_CHANNEL_MAX-1), select from `ledc_channel_t`
- `duty` - Set the LEDC duty, the range of duty setting is [0, (2**duty_resolution)]
- `hpoint` - Set the LEDC hpoint value, the range is [0, (2**duty_resolution)-1]

### Returns
- ESP_OK Success
- ESP_ERR_INVALID_STATE Channel not initialized
- ESP_ERR_INVALID_ARG Parameter error
- ESP_FAIL Fade function init error

```c
esp_err_t ledc_set_fade_time_and_start(ledc_mode_t speed_mode, ledc_channel_t channel, uint32_t target_duty, uint32_t max_fade_time_ms, ledc_fade_mode_t fade_mode)
```

A thread-safe API to set and start LEDC fade function, with a limited time.

**Note:** Call `ledc_fade_func_install()` once, before calling this function.

### Parameters
- `speed_mode` - Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- `channel` - LEDC channel index (0 - LEDC_CHANNEL_MAX-1), select from `ledc_channel_t`
- `target_duty` - Target duty of fading [0, (2**duty_resolution)]
- `max_fade_time_ms` - The maximum time of the fading (ms).
- `fade_mode` - Choose blocking or non-blocking mode

### Returns
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_INVALID_STATE Channel not initialized
- ESP_FAIL Fade function init error

```c
esp_err_t ledc_set_fade_step_and_start(ledc_mode_t speed_mode, ledc_channel_t channel, uint32_t target_duty, uint32_t scale, uint32_t cycle_num, ledc_fade_mode_t fade_mode)
```

A thread-safe API to set and start LEDC fade function.
Chapter 2. API Reference

Note: Call ledc_fade_func_install() once before calling this function.

Note: For ESP32, hardware does not support any duty change while a fade operation is running in progress on that channel. Other duty operations will have to wait until the fade operation has finished.

Parameters

- **speed_mode** - Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** - LEDC channel index (0 - LEDC_CHANNEL_MAX-1), select from ledc_channel_t
- **target_duty** - Target duty of fading [0, (2**duty_resolution)]
- **scale** - Controls the increase or decrease step scale.
- **cycle_num** - increase or decrease the duty every cycle_num cycles
- **fade_mode** - choose blocking or non-blocking mode

Returns

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_INVALID_STATE Channel not initialized
- ESP_FAIL Fade function init error

```c
esp_err_t ledc_cb_register (ledc_mode_t speed_mode, ledc_channel_t channel, ledc_cbs_t *cbs, void *user_arg)
```

LEDC callback registration function.

Note: The callback is called from an ISR, it must never attempt to block, and any FreeRTOS API called must be ISR capable.

Parameters

- **speed_mode** - Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel** - LEDC channel index (0 - LEDC_CHANNEL_MAX-1), select from ledc_channel_t
- **cbs** - Group of LEDC callback functions
- **user_arg** - user registered data for the callback function

Returns

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_INVALID_STATE Channel not initialized
- ESP_FAIL Fade function init error

Structures

```c
struct ledc_channel_config_t
```

Configuration parameters of LEDC channel for ledc_channel_config function.

Public Members

```c
int gpio_num
```

the LEDC output gpio_num, if you want to use gpio16, gpio_num = 16
### ledc_mode_t \( \text{speed\_mode} \)

LEDC speed speed\_mode, high-speed mode (only exists on esp32) or low-speed mode

### ledc_channel_t \( \text{channel} \)

LEDC channel (0 - LEDC\_CHANNEL\_MAX-1)

### ledc_intr_type_t \( \text{intr\_type} \)

configure interrupt, Fade interrupt enable or Fade interrupt disable

### ledc_timer_t \( \text{timer\_sel} \)

Select the timer source of channel (0 - LEDC\_TIMER\_MAX-1)

```c
uint32_t \( \text{duty} \)
```

LEDC channel duty, the range of duty setting is \([0, (2^{\text{duty\_resolution}})]\)

```c
int \( \text{hpoint} \)
```

LEDC channel hpoint value, the range is \([0, (2^{\text{duty\_resolution}})-1]\)

```c
unsigned int \( \text{output\_invert} \)
```

Enable (1) or disable (0) gpio output invert

```c
struct \( \text{ledc\_channel\_config\_t} \)\,:[anonymous] \( \text{flags} \)
```

LEDC flags

```c
struct \( \text{ledc\_timer\_config\_t} \)
```

Configuration parameters of LEDC timer for ledc\_timer\_config function.

### Public Members

#### ledc_mode_t \( \text{speed\_mode} \)

LEDC speed speed\_mode, high-speed mode (only exists on esp32) or low-speed mode

#### ledc_timer_bit_t \( \text{duty\_resolution} \)

LEDC channel duty resolution

#### ledc_timer_t \( \text{timer\_num} \)

The timer source of channel (0 - LEDC\_TIMER\_MAX-1)

```c
uint32_t \( \text{freq\_hz} \)
```

LEDC timer frequency (Hz)

```c
struct \( \text{ledc\_clk\_cfg\_t} \) \( \text{clk\_cfg} \)
```

Configure LEDC source clock from ledc\_clk\_cfg\_t. Note that LEDC\_USE\_RC\_FAST\_CLK and LEDC\_USE\_XTAL\_CLK are non-timer-specific clock sources. You can not have one LEDC timer uses RC\_FAST\_CLK as the clock source and have another LEDC timer uses XTAL\_CLK as its clock source. All chips except esp32 and esp32s2 do not have timer-specific clock sources, which means clock source for all timers must be the same one.
bool deconfigure

Set this field to de-configure a LEDC timer which has been configured before Note that it will not check whether the timer wants to be de-configured is binded to any channel. Also, the timer has to be paused first before it can be de-configured. When this field is set, duty_resolution, freq_hz, clk_cfg fields are ignored.

struct ledc_cb_param_t
LEDC callback parameter.

**Public Members**

ledec_cb_event_t event
Event name

uint32_t speed_mode
Speed mode of the LEDC channel group

uint32_t channel
LEDC channel (0 - LEDC_CHANNEL_MAX-1)

uint32_t duty
LEDC current duty of the channel, the range of duty is [0, (2**duty_resolution)]

struct ledc_cbs_t
Group of supported LEDC callbacks.

---

**Note:** The callbacks are all running under ISR environment

**Public Members**

ledec_cb_t fade_cb
LEDC fade_end callback function

**Macros**

LEDC_APB_CLK_HZ
Frequency of one of the LEDC peripheral clock sources, APB_CLK.

**Note:** This macro should have no use in your application, we keep it here only for backward compatible

LEDC_REF_CLK_HZ
Frequency of one of the LEDC peripheral clock sources, REF_TICK.

**Note:** This macro should have no use in your application, we keep it here only for backward compatible
LEDC_ERR_DUTY

LEDC_ERR_VAL

Type Definitions
typedef intr_handle_t ledc_isr_handle_t

typedef bool (*ledc_cb_t)(const ledc_cb_param_t *param, void *user_arg)
Type of LEDC event callback.

Param param LEDC callback parameter
Param user_arg User registered data
Return Whether a high priority task has been waken up by this function

Enumerations
enum ledc_cb_event_t
LEDC callback event type.

Values:

enumerator LEDC_FADE_END_EVT
LEDC fade end event

Header File

- components/hal/include/hal/ledc_types.h
This header file can be included with:

```c
#include "hal/ledc_types.h"
```

Type Definitions
typedef soc_periph_ledc_clk_src_legacy_t ledc_clk_cfg_t
LEDC clock source configuration struct.

In theory, the following enumeration shall be placed in LEDC driver’s header. However, as the next enumeration, ledc_clk_src_t, makes the use of some of these values and to avoid mutual inclusion of the headers, we must define it here.

Enumerations
enum ledc_mode_t

Values:

enumerator LEDC_LOW_SPEED_MODE
LEDC low speed speed_mode

enumerator LEDC_SPEED_MODE_MAX
LEDC speed limit
enum **ledc_intr_type_t**

*Values:*

- **LEDC_INTR_DISABLE**
  Disable LEDC interrupt

- **LEDC_INTR_FADE_END**
  Enable LEDC interrupt

- **LEDC_INTR_MAX**

enum **ledc_duty_direction_t**

*Values:*

- **LEDC_DUTY_DIR_DECREASE**
  LEDC duty decrease direction

- **LEDC_DUTY_DIR_INCREASE**
  LEDC duty increase direction

- **LEDC_DUTY_DIR_MAX**

enum **ledc_slow_clk_sel_t**

LEDC global clock sources.

*Values:*

- **LEDC_SLOW_CLK_RC_FAST**
  LEDC low speed timer clock source is RC_FAST clock

- **LEDC_SLOW_CLK_APB**
  LEDC low speed timer clock source is 80MHz APB clock

- **LEDC_SLOW_CLK_XTAL**
  LEDC low speed timer clock source XTAL clock

- **LEDC_SLOW_CLK_RTC8M**
  Alias of ‘LEDC_SLOW_CLK_RC_FAST’

enum **ledc_clk_src_t**

LEDC timer-specific clock sources.

*Note: Setting numeric values to match ledc_clk_cfg_t values are a hack to avoid collision with LEDC_AUTO_CLK in the driver, as these enums have very similar names and user may pass one of these by mistake.*

*Values:*

- **LEDC_REF_TICK**
  LEDC timer clock divided from reference tick (1MHz)
enumerator **LEDC_APB_CLK**
   LEDC timer clock divided from APB clock (80Mhz)

enumerator **LEDC_SCLK**
   Selecting this value for LEDC_TICK_SEL_TIMER let the hardware take its source clock from LEDC_APB_CLK_SEL

**enum ledc_timer_t**

*Values:*

enumerator **LEDC_TIMER_0**
   LEDC timer 0

enumerator **LEDC_TIMER_1**
   LEDC timer 1

enumerator **LEDC_TIMER_2**
   LEDC timer 2

enumerator **LEDC_TIMER_3**
   LEDC timer 3

enumerator **LEDC_TIMER_MAX**

**enum ledc_channel_t**

*Values:*

enumerator **LEDC_CHANNEL_0**
   LEDC channel 0

enumerator **LEDC_CHANNEL_1**
   LEDC channel 1

enumerator **LEDC_CHANNEL_2**
   LEDC channel 2

enumerator **LEDC_CHANNEL_3**
   LEDC channel 3

enumerator **LEDC_CHANNEL_4**
   LEDC channel 4

enumerator **LEDC_CHANNEL_5**
   LEDC channel 5

enumerator **LEDC_CHANNEL_6**
   LEDC channel 6
enumerator LEDC_CHANNEL_7
    LEDC channel 7

enumerator LEDC_CHANNEL_MAX

enum ledc_timer_bit_t
    Values:

enumerator LEDC_TIMER_1_BIT
    LEDC PWM duty resolution of 1 bits

enumerator LEDC_TIMER_2_BIT
    LEDC PWM duty resolution of 2 bits

enumerator LEDC_TIMER_3_BIT
    LEDC PWM duty resolution of 3 bits

enumerator LEDC_TIMER_4_BIT
    LEDC PWM duty resolution of 4 bits

enumerator LEDC_TIMER_5_BIT
    LEDC PWM duty resolution of 5 bits

enumerator LEDC_TIMER_6_BIT
    LEDC PWM duty resolution of 6 bits

enumerator LEDC_TIMER_7_BIT
    LEDC PWM duty resolution of 7 bits

enumerator LEDC_TIMER_8_BIT
    LEDC PWM duty resolution of 8 bits

enumerator LEDC_TIMER_9_BIT
    LEDC PWM duty resolution of 9 bits

enumerator LEDC_TIMER_10_BIT
    LEDC PWM duty resolution of 10 bits

enumerator LEDC_TIMER_11_BIT
    LEDC PWM duty resolution of 11 bits

enumerator LEDC_TIMER_12_BIT
    LEDC PWM duty resolution of 12 bits

enumerator LEDC_TIMER_13_BIT
    LEDC PWM duty resolution of 13 bits

enumerator LEDC_TIMER_14_BIT
    LEDC PWM duty resolution of 14 bits
Chapter 2. API Reference

enum ledc_fade_mode_t
Values:

enumerator LEDC_FADE_NO_WAIT
LEDC fade function will return immediately

enumerator LEDC_FADE_WAIT_DONE
LEDC fade function will block until fading to the target duty

enumerator LEDC_FADE_MAX

2.5.15 Pulse Counter (PCNT)

Introduction

The PCNT (Pulse Counter) module is designed to count the number of rising and/or falling edges of input signals. The ESP32-S2 contains multiple pulse counter units in the module.\(^1\) Each unit is in effect an independent counter with multiple channels, where each channel can increment/decrement the counter on a rising/falling edge. Furthermore, each channel can be configured separately.

PCNT channels can react to signals of edge type and level type, however for simple applications, detecting the edge signal is usually sufficient. PCNT channels can be configured react to both pulse edges (i.e., rising and falling edge), and can be configured to increase, decrease or do nothing to the unit’s counter on each edge. The level signal is the so-called control signal, which is used to control the counting mode of the edge signals that are attached to the same channel. By combining the usage of both edge and level signals, a PCNT unit can act as a quadrature decoder.

Besides that, PCNT unit is equipped with a separate glitch filter, which is helpful to remove noise from the signal.

Typically, a PCNT module can be used in scenarios like:

- Calculate periodic signal’s frequency by counting the pulse numbers within a time slice
- Decode quadrature signals into speed and direction

Functional Overview

Description of the PCNT functionality is divided into the following sections:

- Resource Allocation - covers how to allocate PCNT units and channels with properly set of configurations. It also covers how to recycle the resources when they finished working.
- Set Up Channel Actions - covers how to configure the PCNT channel to behave on different signal edges and levels.
- Watch Points - describes how to configure PCNT watch points (i.e., tell PCNT unit to trigger an event when the count reaches a certain value).
- Register Event Callbacks - describes how to hook your specific code to the watch point event callback function.
- Set Glitch Filter - describes how to enable and set the timing parameters for the internal glitch filter.
- Enable and Disable Unit - describes how to enable and disable the PCNT unit.
- Unit IO Control - describes IO control functions of PCNT unit, like enable glitch filter, start and stop unit, get and clear count value.
- Power Management - describes what functionality will prevent the chip from going into low power mode.

\(^1\) Different ESP chip series might have different number of PCNT units and channels. Please refer to the [TRM] for details. The driver does not forbid you from applying for more PCNT units and channels, but it returns error when all available hardware resources are used up. Please always check the return value when doing resource allocation (e.g., pcnt_new_unit()).
Chapter 2. API Reference

- **IRAM Safe** - describes tips on how to make the PCNT interrupt and IO control functions work better along with a disabled cache.
- **Thread Safety** - lists which APIs are guaranteed to be thread safe by the driver.
- **Kconfig Options** - lists the supported Kconfig options that can be used to make a different effect on driver behavior.

**Resource Allocation** The PCNT unit and channel are represented by `pcnt_unit_handle_t` and `pcnt_channel_handle_t` respectively. All available units and channels are maintained by the driver in a resource pool, so you do not need to know the exact underlying instance ID.

**Install PCNT Unit** To install a PCNT unit, there is a configuration structure that needs to be given in advance: `pcnt_unit_config_t`:
- `pcnt_unit_config_t::low_limit` and `pcnt_unit_config_t::high_limit` specify the range for the internal hardware counter. The counter will reset to zero automatically when it crosses either the high or low limit.
- `pcnt_unit_config_t::accum_count` sets whether to create an internal accumulator for the counter. This is helpful when you want to extend the counter’s width, which by default is 16 bit at most, defined in the hardware. See also Compensate Overflow Loss for how to use this feature to compensate the overflow loss.
- `pcnt_unit_config_t::intr_priority` sets the priority of the interrupt. If it is set to 0, the driver will allocate an interrupt with a default priority. Otherwise, the driver will use the given priority.

**Note:** Since all PCNT units share the same interrupt source, when installing multiple PCNT units make sure that the interrupt priority `pcnt_unit_config_t::intr_priority` is the same for each unit.

Unit allocation and initialization is done by calling a function `pcnt_new_unit()` with `pcnt_unit_config_t` as an input parameter. The function will return a PCNT unit handle only when it runs correctly. Specifically, when there are no more free PCNT units in the pool (i.e., unit resources have been used up), then this function will return `ESP_ERR_NOT_FOUND` error. The total number of available PCNT units is recorded by `SOC_PCNT_UNITS_PER_GROUP` for reference.

If a previously created PCNT unit is no longer needed, it is recommended to recycle the resource by calling `pcnt_del_unit()`. Which in return allows the underlying unit hardware to be used for other purposes. Before deleting a PCNT unit, one should ensure the following prerequisites:
- The unit is in the init state, in other words, the unit is either disabled by `pcnt_unit_disable()` or not enabled yet.
- The attached PCNT channels are all removed by `pcnt_del_channel()`.

```c
#define EXAMPLE_PCNT_HIGH_LIMIT 100
#define EXAMPLE_PCNT_LOW_LIMIT -100

pcnt_unit_config_t unit_config = {
    .high_limit = EXAMPLE_PCNT_HIGH_LIMIT,
    .low_limit = EXAMPLE_PCNT_LOW_LIMIT,
};

pcnt_unit_handle_t pcnt_unit = NULL;
ESP_ERROR_CHECK(pcnt_new_unit(&unit_config, &pcnt_unit));
```

**Install PCNT Channel** To install a PCNT channel, you must initialize a `pcnt_chan_config_t` structure in advance, and then call `pcnt_new_channel()`. The configuration fields of the `pcntChan_config_t` structure are described below:
- `pcnt_chan_config_t::edge_gpio_num` and `pcnt_chan_config_t::level_gpio_num` specify the GPIO numbers used by `edge` type signal and `level` type signal. Please note, either of them can be assigned to -1 if it is not actually used, and thus it will become a virtual IO. For some simple pulse counting applications where one of the level/edge signals is fixed (i.e., never changes), you can reclaim a GPIO.
by setting the signal as a virtual IO on channel allocation. Setting the level/edge signal as a virtual IO causes
that signal to be internally routed to a fixed High/Low logic level, thus allowing you to save a GPIO for other
purposes.

- `pcnt_chan_config_t::virt_edge_io_level` and `pcnt_chan_config_t::virt_level_io_level` specify the virtual IO level for `edge` and `level` input signal, to ensure a deterministic state for such control
  signal. Please note, they are only valid when either `pcnt_chan_config_t::edge_gpio_num` or
  `pcnt_chan_config_t::level_gpio_num` is assigned to `-1`.

- `pcnt_chan_config_t::invert_edge_input` and `pcnt_chan_config_t::invert_level_input` are used to decide whether to invert the input signals before they going into PCNT hardware. The invert is
done by GPIO matrix instead of PCNT hardware.

- `pcnt_chan_config_t::io_loop_back` is for debug only, which enables both the GPIO’s input and
  output paths. This can help to simulate the pulse signals by function `gpio_set_level()` on the same
  GPIO.

Channel allocating and initialization is done by calling a function `pcnt_new_channel()` with the above
`pcnt_chan_config_t` as an input parameter plus a PCNT unit handle returned from `pcnt_new_unit()`.
This function will return a PCNT channel handle if it runs correctly. Specifically, when there are no more
free PCNT channel within the unit (i.e., channel resources have been used up), then this function will return
`ESP_ERR_NOT_FOUND` error. The total number of available PCNT channels within the unit is recorded by
`SOC_PCNT_CHANNELS_PER_UNIT` for reference. Note that, when install a PCNT channel for a specific unit,
one should ensure the unit is in the init state, otherwise this function will return `ESP_ERR_INVALID_STATE`
error.

If a previously created PCNT channel is no longer needed, it is recommended to recycle the resources by calling
`pcnt_del_channel()`. Which in return allows the underlying channel hardware to be used for other purposes.

```c
#define EXAMPLE_CHAN_GPIO_A 0
#define EXAMPLE_CHAN_GPIO_B 2

pcnt_chan_config_t chan_config = {
  .edge_gpio_num = EXAMPLE_CHAN_GPIO_A,
  .level_gpio_num = EXAMPLE_CHAN_GPIO_B,
};

pcnt_channel_handle_t pcnt_chan = NULL;
ESP_ERROR_CHECK(pcnt_new_channel(pcnt_unit, &chan_config, &pcnt_chan));
```

### Set Up Channel Actions

The PCNT will increase/decrease/hold its internal count value when the input pulse signal
toggles. You can set different actions for edge signal and/or level signal.

- `pcnt_channel_set_edge_action()` function is to set specific actions for rising and falling edge of
  the signal attached to the `pcnt_chan_config_t::edge_gpio_num`. Supported actions are listed in
  `pcnt_channel_edge_action_t`.

- `pcnt_channel_set_level_action()` function is to set specific actions for high and low
  level of the signal attached to the `pcnt_chan_config_t::level_gpio_num`. Supported ac-
  tions are listed in `pcnt_channel_level_action_t`. This function is not mandatory if the
  `pcnt_chan_config_t::level_gpio_num` is set to `-1` when allocating PCNT channel by
  `pcnt_new_channel()`.

```c
// decrease the counter on rising edge, increase the counter on falling edge
ESP_ERROR_CHECK(pcnt_channel_set_edge_action(pcnt_chan, PCNT_CHANNEL_EDGE_ACTION_
  PCNT_CHANNEL_EDGE_ACTION_INCREASE));

// keep the counting mode when the control signal is high level, and reverse the_
// counting mode when the control signal is low level
ESP_ERROR_CHECK(pcnt_channel_set_level_action(pcnt_chan, PCNT_CHANNEL_LEVEL_ACTION_
  KEEP, PCNT_CHANNEL_LEVEL_ACTION_INVERSE));
```

### Watch Points

Each PCNT unit can be configured to watch several different values that you are inter-
ested in. The value to be watched is also called **Watch Point**. The watch point itself can
not exceed the range set in `pcnt_unit_config_t` by `pcnt_unit_config_t::low_limit` and
**pcnt_unit_config_t::high_limit.** When the counter reaches either watch point, a watch event will be triggered and notify you by interrupt if any watch event callback has ever registered in `pcnt_unit_register_event_callbacks()`. See **Register Event Callbacks** for how to register event callbacks.

The watch point can be added and removed by `pcnt_unit_add_watch_point()` and `pcnt_unit_remove_watch_point()`. The commonly-used watch points are: zero cross, maximum/minimum count and other threshold values. The number of available watch point is limited, `pcnt_unit_add_watch_point()` will return error `ESP_ERR_NOT_FOUND` if it can not find any free hardware resource to save the watch point. You can not add the same watch point for multiple times, otherwise it will return error `ESP_ERR_INVALID_STATE`.

It is recommended to remove the unused watch point by `pcnt_unit_remove_watch_point()` to recycle the watch point resources.

```c
// add zero across watch point
ESP_ERROR_CHECK(pcnt_unit_add_watch_point(pcnt_unit, 0));
// add high limit watch point
ESP_ERROR_CHECK(pcnt_unit_add_watch_point(pcnt_unit, EXAMPLE_PCNT_HIGH_LIMIT));
```

**Note:** Due to the hardware limitation, after adding a watch point, you should call `pcnt_unit_clear_count()` to make it take effect.

**Register Event Callbacks** When PCNT unit reaches any enabled watch point, specific event will be generated and notify the CPU by interrupt. If you have some function that want to get executed when event happens, you should hook your function to the interrupt service routine by calling `pcnt_unit_register_event_callbacks()`. All supported event callbacks are listed in the `pcnt_event_callbacks_t`:

- `pcnt_event_callbacks_t::on_reach` sets a callback function for watch point event. As this function is called within the ISR context, you must ensure that the function does not attempt to block (e.g., by making sure that only FreeRTOS APIs with `ISR` suffix are called from within the function). The function prototype is declared in `pcnt_watch_cb_t`.

You can save your own context to `pcnt_unit_register_event_callbacks()` as well, via the parameter `user_ctx`. This user data will be directly passed to the callback functions.

In the callback function, the driver will fill in the event data of specific event. For example, the watch point event data is declared as `pcnt_watch_event_data_t`:

- `pcnt_watch_event_data_t::watch_point_value` saves the watch point value that triggers the event.
- `pcnt_watch_event_data_t::zero_cross_mode` saves how the PCNT unit crosses the zero point in the latest time. The possible zero cross modes are listed in the `pcnt_unit_zero_cross_mode_t`. Usually different zero cross mode means different counting direction and counting step size.

Registering callback function results in lazy installation of interrupt service, thus this function should only be called before the unit is enabled by `pcnt_unit_enable()`. Otherwise, it can return `ESP_ERR_INVALID_STATE` error.

```c
static bool example_pcnt_on_reach(pcnt_unit_handle_t unit, const pcnt_watch_event_data_t *edata, void *user_ctx)
{
    BaseType_t high_task_wakeup;
    QueueHandle_t queue = (QueueHandle_t)user_ctx;
    // send watch point to queue, from this interrupt callback
    xQueueSendFromISR(queue, &edata->watch_point_value, &high_task_wakeup);
    // return whether a high priority task has been waken up by this function
    return (high_task_wakeup == pdTRUE);
}
```

(continues on next page)
pcnt_event_callbacks_t cbs = {
    .on_reach = example_pcnt_on_reach,
};
QueueHandle_t queue = xQueueCreate(10, sizeof(int));
ESP_ERROR_CHECK(pcnt_unit_register_event_callbacks(pcnt_unit, &cbs, queue));

Set Glitch Filter  The PCNT unit features filters to ignore possible short glitches in the signals. The parameters that can be configured for the glitch filter are listed in pcnt_glitch_filter_config_t:

• pcnt_glitch_filter_config_t::max_glitch_ns sets the maximum glitch width, in nanoseconds. If a signal pulse’s width is smaller than this value, then it will be treated as noise and will not increase/decrease the internal counter.

You can enable the glitch filter for PCNT unit by calling pcnt_unit_set_glitch_filter() with the filter configuration provided above. Particularly, you can disable the glitch filter later by calling pcnt_unit_set_glitch_filter() with a NULL filter configuration.

This function should be called when the unit is in the init state. Otherwise, it will return ESP_ERR_INVALID_STATE error.

Note: The glitch filter is clocked from APB. For the counter not to miss any pulses, the maximum glitch width should be longer than one APB_CLK cycle (usually 12.5 ns if APB equals 80 MHz). As the APB frequency would be changed after DFS (Dynamic Frequency Scaling) enabled, which means the filter does not work as expect in that case. So the driver installs a PM lock for PCNT unit during the first time you enable the glitch filter. For more information related to power management strategy used in PCNT driver, please see Power Management.

pcnt_glitch_filter_config_t filter_config = {
    .max_glitch_ns = 1000,
};
ESP_ERROR_CHECK(pcnt_unit_set_glitch_filter(pcnt_unit, &filter_config));

Enable and Disable Unit  Before doing IO control to the PCNT unit, you need to enable it first, by calling pcnt_unit_enable(). Internally, this function:

• switches the PCNT driver state from init to enable.
• enables the interrupt service if it has been lazy installed in pcnt_unit_register_event_callbacks().
• acquires a proper power management lock if it has been lazy installed in pcnt_unit_set_glitch_filter(). See also Power Management for more information.

On the contrary, calling pcnt_unit_disable() will do the opposite, that is, put the PCNT driver back to the init state, disable the interrupts service and release the power management lock.

Unit IO Control

Start/Stop and Clear  Calling pcnt_unit_start() makes the PCNT unit start to work, increase or decrease counter according to pulse signals. On the contrary, calling pcnt_unit_stop() will stop the PCNT unit but retain current count value. Instead, clearing counter can only be done by calling pcnt_unit_clear_count().

Note, pcnt_unit_start() and pcnt_unit_stop() should be called when the unit has been enabled by pcnt_unit_enable(). Otherwise, it will return ESP_ERR_INVALID_STATE error.

Get Count Value  You can read current count value at any time by calling pcnt_unit_get_count(). The returned count value is a signed integer, where the sign can be used to reflect the direction.
```c
int pulse_count = 0;
ESP_ERROR_CHECK(pcnt_unit_get_count(pcnt_unit, &pulse_count));
```

**Compensate Overflow Loss**  The internal hardware counter will be cleared to zero automatically when it reaches high or low limit. If you want to compensate for that count loss and extend the counter’s bit-width, you can:

1. Enable `pcnt_unit_config_t::accum_count` when installing the PCNT unit.
2. Add the high/low limit as the **Watch Points**.
3. Now, the returned count value from the `pcnt_unit_get_count()` function not only reflects the hardware’s count value, but also accumulates the high/low overflow loss to it.

**Note:** `pcnt_unit_clear_count()` resets the accumulated count value as well.

**Power Management**  When power management is enabled (i.e., `CONFIG_PM_ENABLE` is on), the system will adjust the APB frequency before going into light sleep, thus potentially changing the behavior of PCNT glitch filter and leading to valid signal being treated as noise.

However, the driver can prevent the system from changing APB frequency by acquiring a power management lock of type `ESP_PM_APB_FREQ_MAX`. Whenever you enable the glitch filter by `pcnt_unit_set_glitch_filter()`, the driver guarantees that the power management lock is acquired after the PCNT unit is enabled by `pcnt_unit_enable()`. Likewise, the driver releases the lock after `pcnt_unit_disable()` is called.

**IRAM Safe**  By default, the PCNT interrupt will be deferred when the Cache is disabled for reasons like writing/erasing Flash. Thus the alarm interrupt will not get executed in time, which is not expected in a real-time application.

There is a Kconfig option `CONFIG_PCNT_ISR_IRAM_SAFE` that:

1. Enables the interrupt being serviced even when cache is disabled
2. Places all functions that used by the ISR into IRAM
3. Places driver object into DRAM (in case it is mapped to PSRAM by accident)

This allows the interrupt to run while the cache is disabled but comes at the cost of increased IRAM consumption.

There is another Kconfig option `CONFIG_PCNT_CTRL_FUNC_IN_IRAM` that can put commonly used IO control functions into IRAM as well. So that these functions can also be executable when the cache is disabled. These IO control functions are as follows:

- `pcnt_unit_start()`
- `pcnt_unit_stop()`
- `pcnt_unit_clear_count()`
- `pcnt_unit_get_count()`

**Thread Safety**  The factory functions `pcnt_new_unit()` and `pcnt_new_channel()` are guaranteed to be thread safe by the driver, which means, you can call them from different RTOS tasks without protection by extra locks.

The following functions are allowed to run under ISR context, the driver uses a critical section to prevent them being called concurrently in both task and ISR.

- `pcnt_unit_start()`
- `pcnt_unit_stop()`
- `pcnt_unit_clear_count()`
- `pcnt_unit_get_count()`

2 `pcnt_event_callbacks_t::on_reach` callback and the functions invoked by itself should also be placed in IRAM, you need to take care of them by themselves.
Other functions that take the `pcnt_unit_handle_t` and `pcnt_channel_handle_t` as the first positional parameter, are not treated as thread safe. This means you should avoid calling them from multiple tasks.

Kconfig Options

- `CONFIG_PCNT_CTRL_FUNC_IN_IRAM` controls where to place the PCNT control functions (IRAM or Flash), see IRAM Safe for more information.
- `CONFIG_PCNT_ISR_IRAM_SAFE` controls whether the default ISR handler can work when cache is disabled, see IRAM Safe for more information.
- `CONFIG_PCNT_ENABLE_DEBUG_LOG` is used to enabled the debug log output. Enabling this option increases the firmware binary size.

Application Examples

- Decode the quadrature signals from rotary encoder: `peripherals/pcnt/rotary_encoder`.

API Reference

Header File

- `components/esp_driver_pcnt/include/driver/pulse_cnt.h`
- This header file can be included with:

  ```c
  #include "driver/pulse_cnt.h"
  ```

- This header file is a part of the API provided by the `esp_driver_pcnt` component. To declare that your component depends on `esp_driver_pcnt`, add the following to your CMakeLists.txt:

  ```cmake
  REQUIRES esp_driver_pcnt
  ```
  or
  ```cmake
  PRIV_REQUIRES esp_driver_pcnt
  ```

Functions

`esp_err_t pcnt_new_unit (const pcnt_unit_config_t *config, pcnt_unit_handle_t *ret_unit)`

Create a new PCNT unit, and return the handle.

**Note:** The newly created PCNT unit is put in the init state.

**Parameters**

- `config` - [in] PCNT unit configuration
- `ret_unit` - [out] Returned PCNT unit handle

**Returns**

- `ESP_OK`: Create PCNT unit successfully
- `ESP_ERR_INVALID_ARG`: Create PCNT unit failed because of invalid argument (e.g. high/low limit value out of the range)
- `ESP_ERR_NO_MEM`: Create PCNT unit failed because out of memory
- `ESP_ERR_NOT_FOUND`: Create PCNT unit failed because all PCNT units are used up and no more free one
- `ESP_FAIL`: Create PCNT unit failed because of other error

`esp_err_t pcnt_del_unit (pcnt_unit_handle_t unit)`

Delete the PCNT unit handle.
Chapter 2. API Reference

Note: A PCNT unit can’t be in the enable state when this function is invoked. See also `pcnt_unit_disable()` for how to disable a unit.

**Parameters**

- `unit` - [in] PCNT unit handle created by `pcnt_new_unit()`

**Returns**

- ESP_OK: Delete the PCNT unit successfully
- ESP_ERR_INVALID_ARG: Delete the PCNT unit failed because of invalid argument
- ESP_ERR_INVALID_STATE: Delete the PCNT unit failed because the unit is not in init state or some PCNT channel is still in working
- ESP_FAIL: Delete the PCNT unit failed because of other error

```c
esp_err_t pcnt_unit_set_glitch_filter(pcnt_unit_handle_t unit, const pcnt_glitch_filter_config_t *config)
```

Set glitch filter for PCNT unit.

Note: The glitch filter module is clocked from APB, and APB frequency can be changed during DFS, which in return make the filter out of action. So this function will lazy-install a PM lock internally when the power management is enabled. With this lock, the APB frequency won’t be changed. The PM lock can be uninstalled in `pcnt_del_unit()`.

Note: This function should be called when the PCNT unit is in the init state (i.e. before calling `pcnt_unit_enable()`)

**Parameters**

- `unit` - [in] PCNT unit handle created by `pcnt_new_unit()`
- `config` - [in] PCNT filter configuration, set config to NULL means disabling the filter function

**Returns**

- ESP_OK: Set glitch filter successfully
- ESP_ERR_INVALID_ARG: Set glitch filter failed because of invalid argument (e.g. glitch width is too big)
- ESP_ERR_INVALID_STATE: Set glitch filter failed because the unit is not in the init state
- ESP_FAIL: Set glitch filter failed because of other error

```c
esp_err_t pcnt_unit_enable(pcnt_unit_handle_t unit)
```

Enable the PCNT unit.

Note: This function will transit the unit state from init to enable.

Note: This function will enable the interrupt service, if it’s lazy installed in `pcnt_unit_register_event_callbacks()`.

Note: This function will acquire the PM lock if it’s lazy installed in `pcnt_unit_set_glitch_filter()`.

Note: Enable a PCNT unit doesn’t mean to start it. See also `pcnt_unit_start()` for how to start the
Chapter 2. API Reference

PCNT counter.

**Parameters**
- `unit` - [in] PCNT unit handle created by `pcnt_new_unit()`

**Returns**
- ESP_OK: Enable PCNT unit successfully
- ESP_ERR_INVALID_ARG: Enable PCNT unit failed because of invalid argument
- ESP_ERR_INVALID_STATE: Enable PCNT unit failed because the unit is already enabled
- ESP_FAIL: Enable PCNT unit failed because of other error

```c
esp_err_t pcnt_unit_disable(pcnt_unit_handle_t unit)
```
Disable the PCNT unit.

**Note:** This function will do the opposite work to the `pcnt_unit_enable()`

**Note:** Disable a PCNT unit doesn’t mean to stop it. See also `pcnt_unit_stop()` for how to stop the PCNT counter.

**Parameters**
- `unit` - [in] PCNT unit handle created by `pcnt_new_unit()`

**Returns**
- ESP_OK: Disable PCNT unit successfully
- ESP_ERR_INVALID_ARG: Disable PCNT unit failed because of invalid argument
- ESP_ERR_INVALID_STATE: Disable PCNT unit failed because the unit is not enabled yet
- ESP_FAIL: Disable PCNT unit failed because of other error

```c
esp_err_t pcnt_unit_start(pcnt_unit_handle_t unit)
```
Start the PCNT unit, the counter will start to count according to the edge and/or level input signals.

**Note:** This function should be called when the unit is in the enable state (i.e. after calling `pcnt_unit_enable()`)

**Note:** This function is allowed to run within ISR context

**Note:** This function will be placed into IRAM if `CONFIG_PCNT_CTRL_FUNC_IN_IRAM` is on, so that it’s allowed to be executed when Cache is disabled

**Parameters**
- `unit` - [in] PCNT unit handle created by `pcnt_new_unit()`

**Returns**
- ESP_OK: Start PCNT unit successfully
- ESP_ERR_INVALID_ARG: Start PCNT unit failed because of invalid argument
- ESP_ERR_INVALID_STATE: Start PCNT unit failed because the unit is not enabled yet
- ESP_FAIL: Start PCNT unit failed because of other error

```c
esp_err_t pcnt_unit_stop(pcnt_unit_handle_t unit)
```
Stop PCNT from counting.
Note: This function should be called when the unit is in the enable state (i.e. after calling `pcnt_unit_enable()`).

Note: The stop operation won’t clear the counter. Also see `pcnt_unit_clear_count()` for how to clear pulse count value.

Note: This function is allowed to run within ISR context.

Note: This function will be placed into IRAM if `CONFIG_PCNT_CTRL_FUNC_IN_IRAM`, so that it is allowed to be executed when Cache is disabled.

**Parameters**

- **unit** - [in] PCNT unit handle created by `pcnt_new_unit()`.

**Returns**

- ESP_OK: Stop PCNT unit successfully.
- ESP_ERR_INVALID_ARG: Stop PCNT unit failed because of invalid argument.
- ESP_ERR_INVALID_STATE: Stop PCNT unit failed because the unit is not enabled yet.
- ESP_FAIL: Stop PCNT unit failed because of other error.

```c
esp_err_t pcnt_unit_clear_count (pcnt_unit_handle_t unit)
```

Clear PCNT pulse count value to zero.

Note: It’s recommended to call this function after adding a watch point by `pcnt_unit_add_watch_point()`, so that the newly added watch point is effective immediately.

Note: This function is allowed to run within ISR context.

Note: This function will be placed into IRAM if `CONFIG_PCNT_CTRL_FUNC_IN_IRAM`, so that it’s allowed to be executed when Cache is disabled.

**Parameters**

- **unit** - [in] PCNT unit handle created by `pcnt_new_unit()`.

**Returns**

- ESP_OK: Clear PCNT pulse count successfully.
- ESP_ERR_INVALID_ARG: Clear PCNT pulse count failed because of invalid argument.
- ESP_FAIL: Clear PCNT pulse count failed because of other error.

```c
esp_err_t pcnt_unit_get_count (pcnt_unit_handle_t unit, int *value)
```

Get PCNT count value.

Note: This function is allowed to run within ISR context.

Note: This function will be placed into IRAM if `CONFIG_PCNT_CTRLFUNC_IN_IRAM`, so that it’s allowed to be executed when Cache is disabled.

**Parameters**
• **unit** - [in] PCNT unit handle created by `pcnt_new_unit()`
• **value** - [out] Returned count value

**Returns**
- ESP_OK: Get PCNT pulse count successfully
- ESP_ERR_INVALID_ARG: Get PCNT pulse count failed because of invalid argument
- ESP_FAIL: Get PCNT pulse count failed because of other error

```c
esp_err_t pcnt_unit_register_event_callbacks(pcnt_unit_handle_t unit, const pcnt_event_callbacks_t *cbs, void *user_data)
```

Set event callbacks for PCNT unit.

**Note:** User registered callbacks are expected to be runnable within ISR context

**Note:** The first call to this function needs to be before the call to `pcnt_unit_enable`

**Note:** User can deregister a previously registered callback by calling this function and setting the callback member in the `cbs` structure to NULL.

**Parameters**
- **unit** - [in] PCNT unit handle created by `pcnt_new_unit()`
- **cbs** - [in] Group of callback functions
- **user_data** - [in] User data, which will be passed to callback functions directly

**Returns**
- ESP_OK: Set event callbacks successfully
- ESP_ERR_INVALID_ARG: Set event callbacks failed because of invalid argument
- ESP_ERR_INVALID_STATE: Set event callbacks failed because the unit is not in init state
- ESP_FAIL: Set event callbacks failed because of other error

```c
esp_err_t pcnt_unit_add_watch_point(pcnt_unit_handle_t unit, int watch_point)
```

Add a watch point for PCNT unit, PCNT will generate an event when the counter value reaches the watch point value.

**Parameters**
- **unit** - [in] PCNT unit handle created by `pcnt_new_unit()`
- **watch_point** - [in] Value to be watched

**Returns**
- ESP_OK: Add watch point successfully
- ESP_ERR_INVALID_ARG: Add watch point failed because of invalid argument (e.g. the value to be watched is out of the limitation set in `pcnt_unit_config_t`)
- ESP_ERR_INVALID_STATE: Add watch point failed because the same watch point has already been added
- ESP_ERR_NOT_FOUND: Add watch point failed because no more hardware watch point can be configured
- ESP_FAIL: Add watch point failed because of other error

```c
esp_err_t pcnt_unit_remove_watch_point(pcnt_unit_handle_t unit, int watch_point)
```

Remove a watch point for PCNT unit.

**Parameters**
- **unit** - [in] PCNT unit handle created by `pcnt_new_unit()`
- **watch_point** - [in] Watch point value

**Returns**
- ESP_OK: Remove watch point successfully
Chapter 2. API Reference

- ESP_ERR_INVALID_ARG: Remove watch point failed because of invalid argument
- ESP_ERR_INVALID_STATE: Remove watch point failed because the watch point was not added by `pcnt_unit_add_watch_point()` yet
- ESP_FAIL: Remove watch point failed because of other error

```c
esp_err_t pcnt_new_channel(pcnt_unit_handle_t unit, const pcnt_chan_config_t *config, pcnt_channel_handle_t *ret_chan)
```

Create PCNT channel for specific unit, each PCNT has several channels associated with it.

**Note:** This function should be called when the unit is in init state (i.e. before calling `pcnt_unit_enable()`)

**Parameters**
- `unit` - [in] PCNT unit handle created by `pcnt_new_unit()`
- `config` - [in] PCNT channel configuration
- `ret_chan` - [out] Returned channel handle

**Returns**
- ESP_OK: Create PCNT channel successfully
- ESP_ERR_INVALID_ARG: Create PCNT channel failed because of invalid argument
- ESP_ERR_NO_MEM: Create PCNT channel failed because of insufficient memory
- ESP_ERR_NOT_FOUND: Create PCNT channel failed because all PCNT channels are used up and no more free one
- ESP_ERR_INVALID_STATE: Create PCNT channel failed because the unit is not in the init state
- ESP_FAIL: Create PCNT channel failed because of other error

```c
esp_err_t pcnt_del_channel(pcnt_channel_handle_t chan)
```

Delete the PCNT channel.

**Parameters**
- `chan` - [in] PCNT channel handle created by `pcnt_new_channel()`

**Returns**
- ESP_OK: Delete the PCNT channel successfully
- ESP_ERR_INVALID_ARG: Delete the PCNT channel failed because of invalid argument
- ESP_FAIL: Delete the PCNT channel failed because of other error

```c
esp_err_t pcnt_channel_set_edge_action(pcnt_channel_handle_t chan, pcnt_channel_edge_action_t pos_act, pcnt_channel_edge_action_t neg_act)
```

Set channel actions when edge signal changes (e.g. falling or rising edge occurred). The edge signal is input from the `edge_gpio_num` configured in `pcnt_chan_config_t`. We use these actions to control when and how to change the counter value.

**Parameters**
- `chan` - [in] PCNT channel handle created by `pcnt_new_channel()`
- `pos_act` - [in] Action on posedge signal
- `neg_act` - [in] Action on negedge signal

**Returns**
- ESP_OK: Set edge action for PCNT channel successfully
- ESP_ERR_INVALID_ARG: Set edge action for PCNT channel failed because of invalid argument
- ESP_FAIL: Set edge action for PCNT channel failed because of other error

```c
esp_err_t pcnt_channel_set_level_action(pcnt_channel_handle_t chan, pcnt_channel_level_action_t high_act, pcnt_channel_level_action_t low_act)
```

Set channel actions when level signal changes (e.g. signal level goes from high to low). The level signal is input from the `level_gpio_num` configured in `pcnt_chan_config_t`. We use these actions to control when and how to change the counting mode.

**Parameters**
• **chan**  [in] PCNT channel handle created by `pcnt_new_channel()`
• **high_act**  [in] Action on high level signal
• **low_act**  [in] Action on low level signal

**Returns**
• ESP_OK: Set level action for PCNT channel successfully
• ESP_ERR_INVALID_ARG: Set level action for PCNT channel failed because of invalid argument
• ESP_FAIL: Set level action for PCNT channel failed because of other error

**Structures**

```c
struct pcnt_watch_event_data_t

PCNT watch event data.

Public Members

    int watch_point_value

    Watch point value that triggered the event

    pcnt_unit_zero_cross_mode_t zero_cross_mode

    Zero cross mode
```

```c
struct pcnt_event_callbacks_t

Group of supported PCNT callbacks.

Note: The callbacks are all running under ISR environment

Note: When CONFIG_PCNT_ISR_IRAM_SAFE is enabled, the callback itself and functions callbed by it should be placed in IRAM.

Public Members

    pcnt_watch_cb_t on_reach

    Called when PCNT unit counter reaches any watch point

struct pcnt_unit_config_t

PCNT unit configuration.

Public Members

    int low_limit

    Low limitation of the count unit, should be lower than 0

    int high_limit

    High limitation of the count unit, should be higher than 0
```
int \texttt{intr\_priority}

PCNT interrupt priority, if set to 0, the driver will try to allocate an interrupt with a relative low priority (1,2,3)

uint32_t \texttt{accum\_count}

Whether to accumulate the count value when overflows at the high/low limit

struct \texttt{pcnt\_unit\_config\_t::[anonymous]} flags

Extra flags

struct \texttt{pcnt\_chan\_config\_t}

PCNT channel configuration.

Public Members

int \texttt{edge\_gpio\_num}

GPIO number used by the edge signal, input mode with pull up enabled. Set to -1 if unused

int \texttt{level\_gpio\_num}

GPIO number used by the level signal, input mode with pull up enabled. Set to -1 if unused

uint32_t \texttt{invert\_edge\_input}

Invert the input edge signal

uint32_t \texttt{invert\_level\_input}

Invert the input level signal

uint32_t \texttt{virt\_edge\_io\_level}

Virtual edge IO level, 0: low, 1: high. Only valid when edge\_gpio\_num is set to -1

uint32_t \texttt{virt\_level\_io\_level}

Virtual level IO level, 0: low, 1: high. Only valid when level\_gpio\_num is set to -1

uint32_t \texttt{io\_loop\_back}

For debug/test, the signal output from the GPIO will be fed to the input path as well

struct \texttt{pcnt\_chan\_config\_t::[anonymous]} flags

Channel config flags

struct \texttt{pcnt\_glitch\_filter\_config\_t}

PCNT glitch filter configuration.

Public Members

uint32_t \texttt{max\_glitch\_ns}

Pulse width smaller than this threshold will be treated as glitch and ignored, in the unit of ns
**Type Definitions**

```c
typedef struct pcnt_unit_t *pcnt_unit_handle_t
    Type of PCNT unit handle.

typedef struct pcnt_chan_t *pcnt_channel_handle_t
    Type of PCNT channel handle.

typedef bool (*pcnt_watch_cb_t)(pcnt_unit_handle_t unit, const pcnt_watch_event_data_t *edata, void *user_ctx)
    PCNT watch event callback prototype.
```

**Note:** The callback function is invoked from an ISR context, so it should meet the restrictions of not calling any blocking APIs when implementing the callback. E.g. must use ISR version of FreeRTOS APIs.

**Header File**

- components/hal/include/hal/pcnt_types.h
- This header file can be included with:

```c
#include "hal/pcnt_types.h"
```

**Enumerations**

**enum pcnt_channel_level_action_t**  
PCNT channel action on control level.  
**Values:**

- enumerator PCNT_CHANNEL_LEVEL_ACTION_KEEP
  Keep current count mode

- enumerator PCNT_CHANNEL_LEVEL_ACTION_INVERSE
  Invert current count mode (increase -> decrease, decrease -> increase)

- enumerator PCNT_CHANNEL_LEVEL_ACTION_HOLD
  Hold current count value

**enum pcnt_channel_edge_action_t**  
PCNT channel action on signal edge.  
**Values:**

- enumerator PCNT_CHANNEL_EDGE_ACTION_HOLD
  Hold current count value

- enumerator PCNT_CHANNEL_EDGE_ACTION_INCREASE
  Increase count value
Chapter 2. API Reference

enumerator `PCNT_CHANNEL_EDGE_ACTION_DECREASE`
  Decrease count value

denum `pcnt_unit_zero_cross_mode_t`
  PCNT unit zero cross mode.
  
  **Values:**
  
  enumerator `PCNT_UNIT_ZERO_CROSS_POS_ZERO`
  start from positive value, end to zero, i.e. +N->0
  
  enumerator `PCNT_UNIT_ZERO_CROSS_NEG_ZERO`
  start from negative value, end to zero, i.e. -N->0
  
  enumerator `PCNT_UNIT_ZERO_CROSS_NEG_POS`
  start from negative value, end to positive value, i.e. -N->+M
  
  enumerator `PCNT_UNIT_ZERO_CROSS_POS_NEG`
  start from positive value, end to negative value, i.e. +N->-M

2.5.16 Remote Control Transceiver (RMT)

**Introduction**

The RMT (Remote Control Transceiver) peripheral was designed to act as an infrared transceiver. However, due to the flexibility of its data format, RMT can be extended to a versatile and general-purpose transceiver, transmitting or receiving many other types of signals. From the perspective of network layering, the RMT hardware contains both the physical and data link layers. The physical layer defines the communication media and bit signal representation. The data link layer defines the format of an RMT frame. The minimal data unit in the frame is called the **RMT symbol**, which is represented by `rmt_symbol_word_t` in the driver.

ESP32-S2 contains multiple channels in the RMT peripheral\(^1\). Each channel can be independently configured as either transmitter or receiver.

Typically, the RMT peripheral can be used in the following scenarios:

- Transmit or receive infrared signals, with any IR protocols, e.g., NEC
- General-purpose sequence generator
- Transmit signals in a hardware-controlled loop, with a finite or infinite number of times
- Multi-channel simultaneous transmission
- Modulate the carrier to the output signal or demodulate the carrier from the input signal

**Layout of RMT Symbols** The RMT hardware defines data in its own pattern—the **RMT symbol**. The diagram below illustrates the bit fields of an RMT symbol. Each symbol consists of two pairs of two values. The first value in the pair is a 15-bit value representing the signal’s duration in units of RMT ticks. The second in the pair is a 1-bit value representing the signal’s logic level, i.e., high or low.

**RMT Transmitter Overview** The data path and control path of an RMT TX channel is illustrated in the figure below:

\(^1\) Different ESP chip series might have different numbers of RMT channels. Please refer to [TRM] for details. The driver does not forbid you from applying for more RMT channels, but it returns an error when there are no hardware resources available. Please always check the return value when doing Resource Allocation.
The driver encodes the user’s data into RMT data format, then the RMT transmitter can generate the waveforms according to the encoding artifacts. It is also possible to modulate a high-frequency carrier signal before being routed to a GPIO pad.

**RMT Receiver Overview** The data path and control path of an RMT RX channel is illustrated in the figure below:

The RMT receiver can sample incoming signals into RMT data format, and store the data in memory. It is also possible to tell the receiver the basic characteristics of the incoming signal, so that the signal’s stop condition can be recognized, and signal glitches and noise can be filtered out. The RMT peripheral also supports demodulating the high-frequency carrier from the base signal.

**Functional Overview**

The description of the RMT functionality is divided into the following sections:

- **Resource Allocation** - covers how to allocate and properly configure RMT channels. It also covers how to recycle channels and other resources when they are no longer used.
- **Carrier Modulation and Demodulation** - describes how to modulate and demodulate the carrier signals for TX and RX channels respectively.
- **Register Event Callbacks** - covers how to register user-provided event callbacks to receive RMT channel events.
- **Enable and Disable Channel** - shows how to enable and disable the RMT channel.
- **Initiate TX Transaction** - describes the steps to initiate a transaction for a TX channel.
- **Initiate RX Transaction** - describes the steps to initiate a transaction for an RX channel.
- **Multiple Channels Simultaneous Transmission** - describes how to collect multiple channels into a sync group so that their transmissions can be started simultaneously.
- **RMT Encoder** - focuses on how to write a customized encoder by combining multiple primitive encoders that are provided by the driver.
• **Power Management** - describes how different clock sources affects power consumption.
• **IRAM Safe** - describes how disabling the cache affects the RMT driver, and tips to mitigate it.
• **Thread Safety** - lists which APIs are guaranteed to be thread-safe by the driver.
• **Kconfig Options** - describes the various Kconfig options supported by the RMT driver.

**Resource Allocation**  Both RMT TX and RX channels are represented by `rmt_channel_handle_t` in the driver. The driver internally manages which channels are available and hands out a free channel on request.

**Install RMT TX Channel**  To install an RMT TX channel, there is a configuration structure that needs to be given in advance `rmt_tx_channel_config_t`. The following list describes each member of the configuration structure.

- `rmt_tx_channel_config_t::gpio_num` sets the GPIO number used by the transmitter.
- `rmt_tx_channel_config_t::clk_src` selects the source clock for the RMT channel. The available clocks are listed in `rmt_clock_source_t`. Note that, the selected clock is also used by other channels, which means the user should ensure this configuration is the same when allocating other channels, regardless of TX or RX. For the effect on the power consumption of different clock sources, please refer to the **Power Management** section.
- `rmt_tx_channel_config_t::resolution_hz` sets the resolution of the internal tick counter. The timing parameter of the RMT signal is calculated based on this tick.
- `rmt_tx_channel_config_t::mem_block_symbols` has a slightly different meaning based on if the DMA backend is enabled or not.
  - If the DMA is enabled via `rmt_tx_channel_config_t::with_dma`, then this field controls the size of the internal DMA buffer. To achieve a better throughput and smaller CPU overhead, you can set a larger value, e.g., 1024.
  - If DMA is not used, this field controls the size of the dedicated memory block owned by the channel, which should be at least 64.
- `rmt_tx_channel_config_t::trans_queue_depth` sets the depth of the internal transaction queue, the deeper the queue, the more transactions can be prepared in the backlog.
- `rmt_tx_channel_config_t::invert_out` is used to decide whether to invert the RMT signal before sending it to the GPIO pad.
- `rmt_tx_channel_config_t::with_dma` enables the DMA backend for the channel. Using the DMA allows a significant amount of the channel’s workload to be offloaded from the CPU. However, the DMA backend is not available on all ESP chips, please refer to [TRM] before you enable this option. Or you might encounter a **ESP_ERR_NOT_SUPPORTED** error.
- `rmt_tx_channel_config_t::io_loop_back` enables both input and output capabilities on the channel’s assigned GPIO. Thus, by binding a TX and RX channel to the same GPIO, loopback can be achieved.
- `rmt_tx_channel_config_t::io_od_mode` configures the channel’s assigned GPIO as open-drain. When combined with `rmt_tx_channel_config_t::io_loop_back`, a bi-directional bus (e.g., 1-
wire) can be achieved.

- **rmt_tx_channel_config_t::intr_priority** Set the priority of the interrupt. If set to 0, then the driver will use an interrupt with low or medium priority (priority level may be one of 1, 2 or 3), otherwise use the priority indicated by **rmt_tx_channel_config_t::intr_priority**. Please use the number form (1,2,3), not the bitmask form ((1<<1),(1<<2),(1<<3)). Please pay attention that once the interrupt priority is set, it cannot be changed until **rmt_del_channel()** is called.

Once the **rmt_tx_channel_config_t** structure is populated with mandatory parameters, users can call **rmt_new_tx_channel()** to allocate and initialize a TX channel. This function returns an RMT channel handle if it runs correctly. Specifically, when there are no more free channels in the RMT resource pool, this function returns **ESP_ERR_NOT_FOUND** error. If some feature (e.g., DMA backend) is not supported by the hardware, it returns **ESP_ERR_NOT_SUPPORTED** error.

```c
rmt_channel_handle_t tx_chan = NULL;
rmt_tx_channel_config_t tx_chan_config = {
    .clk_src = RMT_CLK_SRC_DEFAULT, // select source clock
    .gpio_num = 0, // GPIO number
    .mem_block_symbols = 64, // memory block size, 64 * 4 = 256 Bytes
    .resolution_hz = 1 * 1000 * 1000, // 1 MHz tick resolution, i.e., 1 tick = 1 µs
    .trans_queue_depth = 4, // set the number of transactions that can...->pend in the background
    .flags.invert_out = false, // do not invert output signal
    .flags.with_dma = false, // do not need DMA backend
};
ESP_ERROR_CHECK(rmt_new_tx_channel(&tx_chan_config, &tx_chan));
```

### Install RMT RX Channel
To install an RMT RX channel, there is a configuration structure that needs to be given in advance **rmt_rx_channel_config_t**. The following list describes each member of the configuration structure.

- **rmt_rx_channel_config_t::gpio_num** sets the GPIO number used by the receiver.
- **rmt_rx_channel_config_t::clk_src** selects the source clock for the RMT channel. The available clocks are listed in **rmt_clock_source_t**. Note that, the selected clock is also used by other channels, which means the user should ensure this configuration is the same when allocating other channels, regardless of TX or RX. For the effect on the power consumption of different clock sources, please refer to the Power Management section.
- **rmt_rx_channel_config_t::resolution_hz** sets the resolution of the internal tick counter. The timing parameter of the RMT signal is calculated based on this tick.
- **rmt_rx_channel_config_t::mem_block_symbols** has a slightly different meaning based on whether the DMA backend is enabled.
  - If the DMA is enabled via **rmt_rx_channel_config_t::with_dma**, this field controls the maximum size of the DMA buffer.
  - If DMA is not used, this field controls the size of the dedicated memory block owned by the channel, which should be at least 64.
- **rmt_rx_channel_config_t::invert_in** is used to invert the input signals before it is passed to the RMT receiver. The inversion is done by the GPIO matrix instead of by the RMT peripheral.
- **rmt_rx_channel_config_t::with_dma** enables the DMA backend for the channel. Using the DMA allows a significant amount of the channel’s workload to be offloaded from the CPU. However, the DMA backend is not available on all ESP chips, please refer to [TRM] before you enable this option. Or you might encounter a **ESP_ERR_NOT_SUPPORTED** error.
- **rmt_rx_channel_config_t::io_loop_back** enables both input and output capabilities on the channel’s assigned GPIO. Thus, by binding a TX and RX channel to the same GPIO, loopback can be achieved.
- **rmt_rx_channel_config_t::intr_priority** Set the priority of the interrupt. If set to 0, then the driver will use an interrupt with low or medium priority (priority level may be one of 1, 2 or 3), otherwise use the priority indicated by **rmt_rx_channel_config_t::intr_priority**. Please use the number form (1,2,3), not the bitmask form ((1<<1),(1<<2),(1<<3)). Please pay attention that once the interrupt priority is set, it cannot be changed until **rmt_del_channel()** is called.

Once the **rmt_rx_channel_config_t** structure is populated with mandatory parameters, users can call
rmt_new_rx_channel() to allocate and initialize an RX channel. This function returns an RMT channel handle if it runs correctly. Specifically, when there are no more free channels in the RMT resource pool, this function returns ESP_ERR_NOT_FOUND error. If some feature (e.g., DMA backend) is not supported by the hardware, it returns ESP_ERR_NOT_SUPPORTED error.

```c
rmt_channel_handle_t rx_chan = NULL;
rmt_rx_channel_config_t rx_chan_config = {
  .clk_src = RMT_CLK_SRC_DEFAULT, // select source clock
  .resolution_hz = 1 * 1000 * 1000, // 1 MHz tick resolution, i.e., 1 tick = 1 µs
  .mem_block_symbols = 64, // memory block size, 64 * 4 = 256 Bytes
  .gpio_num = 2, // GPIO number
  .flags.invert_in = false, // do not invert input signal
  .flags.with_dma = false, // do not need DMA backend
};
ESP_ERROR_CHECK(rmt_new_rx_channel(&rx_chan_config, &rx_chan));
```

**Note:** Due to a software limitation in the GPIO driver, when both TX and RX channels are bound to the same GPIO, ensure the RX Channel is initialized before the TX Channel. If the TX Channel was set up first, then during the RX Channel setup, the previous RMT TX Channel signal will be overridden by the GPIO control signal.

Uninstall RMT Channel If a previously installed RMT channel is no longer needed, it is recommended to recycle the resources by calling rmt_del_channel(), which in return allows the underlying software and hardware resources to be reused for other purposes.

Carrier Modulation and Demodulation The RMT transmitter can generate a carrier wave and modulate it onto the message signal. Compared to the message signal, the carrier signal’s frequency is significantly higher. In addition, the user can only set the frequency and duty cycle for the carrier signal. The RMT receiver can demodulate the carrier signal from the incoming signal. Note that, carrier modulation and demodulation are not supported on all ESP chips, please refer to [TRM] before configuring the carrier, or you might encounter a ESP_ERR_NOT_SUPPORTED error.

Carrier-related configurations lie in rmt_carrier_config_t:

- rmt_carrier_config_t::frequency_hz sets the carrier frequency, in Hz.
- rmt_carrier_config_t::duty_cycle sets the carrier duty cycle.
- rmt_carrier_config_t::polarity_active_low sets the carrier polarity, i.e., on which level the carrier is applied.
- rmt_carrier_config_t::always_on sets whether to output the carrier even when the data transmission has finished. This configuration is only valid for the TX channel.

**Note:** For the RX channel, we should not set the carrier frequency exactly to the theoretical value. It is recommended to leave a tolerance for the carrier frequency. For example, in the snippet below, we set the frequency to 25 KHz, instead of the 38 KHz configured on the TX side. The reason is that reflection and refraction occur when a signal travels through the air, leading to distortion on the receiver side.

```c
rmt_carrier_config_t tx_carrier_cfg = {
  .duty_cycle = 0.33, // duty cycle 33%
  .frequency_hz = 38000, // 38 KHz
  .flags.polarity_active_low = false, // carrier should be modulated to high level
};
// modulate carrier to TX channel
ESP_ERROR_CHECK(rmt_apply_carrier(tx_chan, &tx_carrier_cfg));
```

```c
rmt_carrier_config_t rx_carrier_cfg = {
  .duty_cycle = 0.33, // duty cycle 33%
  .frequency_hz = 25000, // 25 KHz carrier, should be smaller than...
  // the transmitter's carrier frequency
};
```

(continues on next page)
Register Event Callbacks  When an event occurs on an RMT channel (e.g., transmission or receiving is completed), the CPU is notified of this event via an interrupt. If you have some function that needs to be called when a particular events occur, you can register a callback for that event to the RMT driver’s ISR (Interrupt Service Routine) by calling `rmt_tx_register_event_callbacks()` and `rmt_rx_register_event_callbacks()` for TX and RX channel respectively. Since the registered callback functions are called in the interrupt context, the user should ensure the callback function does not block, e.g., by making sure that only FreeRTOS APIs with the FromISR suffix are called from within the function. The callback function has a boolean return value used to indicate whether a higher priority task has been unblocked by the callback.

The TX channel-supported event callbacks are listed in the `rmt_tx_event_callbacks_t`:

- `rmt_tx_event_callbacks_t::on_trans_done` sets a callback function for the “trans-done” event. The function prototype is declared in `rmt_tx_done_callback_t`.

The RX channel-supported event callbacks are listed in the `rmt_rx_event_callbacks_t`:

- `rmt_rx_event_callbacks_t::on_recv_done` sets a callback function for “receive-done” event. The function prototype is declared in `rmt_rx_done_callback_t`.

Users can save their own context in `rmt_tx_register_event_callbacks()` and `rmt_rx_register_event_callbacks()` as well, via the parameter `user_data`. The user data is directly passed to each callback function.

In the callback function, users can fetch the event-specific data that is filled by the driver in the `edata`. Note that the `edata` pointer is only valid during the callback.

The TX-done event data is defined in `rmt_tx_done_event_data_t`:

- `rmt_tx_done_event_data_t::num_symbols` indicates the number of transmitted RMT symbols. This also reflects the size of the encoding artifacts. Please note, this value accounts for the EOF symbol as well, which is appended by the driver to mark the end of one transaction.

The RX-complete event data is defined in `rmt_rx_done_event_data_t`:

- `rmt_rx_done_event_data_t::received_symbols` points to the received RMT symbols. These symbols are saved in the `buffer` parameter of the `rmt_receive()` function. Users should not free this receive buffer before the callback returns.
- `rmt_rx_done_event_data_t::num_symbols` indicates the number of received RMT symbols. This value is not larger than the `buffer_size` parameter of `rmt_receive()` function. If the `buffer_size` is not sufficient to accommodate all the received RMT symbols, the driver only keeps the maximum number of symbols that the buffer can hold, and excess symbols are discarded or ignored.

Enable and Disable Channel  `rmt_enable()` must be called in advance before transmitting or receiving RMT symbols. For TX channels, enabling a channel enables a specific interrupt and prepares the hardware to dispatch transactions. For RX channels, enabling a channel enables an interrupt, but the receiver is not started during this time, as the characteristics of the incoming signal have yet to be specified. The receiver is started in `rmt_receive()`. `rmt_disable()` does the opposite by disabling the interrupt and clearing any pending interrupts. The transmitter and receiver are disabled as well.

```
ESP_ERROR_CHECK(rmt_enable(tx_chan));
ESP_ERROR_CHECK(rmt_enable(rx_chan));
```
**Initiate TX Transaction**  RMT is a special communication peripheral, as it is unable to transmit raw byte streams like SPI and I2C. RMT can only send data in its own format `rmt_symbol_word_t`. However, the hardware does not help to convert the user data into RMT symbols, this can only be done in software by the so-called **RMT Encoder**. The encoder is responsible for encoding user data into RMT symbols and then writing to the RMT memory block or the DMA buffer. For how to create an RMT encoder, please refer to **RMT Encoder**.

Once you created an encoder, you can initiate a TX transaction by calling `rmt_transmit()`. This function takes several positional parameters like channel handle, encoder handle, and payload buffer. Besides, you also need to provide a transmission-specific configuration in `rmt_transmit_config_t`:

- `rmt_transmit_config_t::loop_count` sets the number of transmission loops. After the transmitter has finished one round of transmission, it can restart the same transmission again if this value is not set to zero. As the loop is controlled by hardware, the RMT channel can be used to generate many periodic sequences with minimal CPU intervention.
  - Setting `rmt_transmit_config_t::loop_count` to `-1` means an infinite loop transmission. In this case, the channel does not stop until `rmt_disable()` is called. The “trans-done” event is not generated as well.
  - Setting `rmt_transmit_config_t::loop_count` to a positive number means finite number of iterations. In this case, the “trans-done” event is when the specified number of iterations have completed.

  **Note:** The loop transmit feature is not supported on all ESP chips, please refer to [TRM] before you configure this option, or you might encounter `ESP_ERR_NOT_SUPPORTED` error.

- `rmt_transmit_config_t::eot_level` sets the output level when the transmitter finishes working or stops working by calling `rmt_disable()`.
- `rmt_transmit_config_t::queue_nonblocking` sets whether to wait for a free slot in the transaction queue when it is full. If this value is set to `true`, then the function will return with an error code `ESP_ERR_INVALID_STATE` when the queue is full. Otherwise, the function will block until a free slot is available in the queue.

  **Note:** There is a limitation in the transmission size if the `rmt_transmit_config_t::loop_count` is set to non-zero, i.e., to enable the loop feature. The encoded RMT symbols should not exceed the capacity of the RMT hardware memory block size, or you might see an error message like `encoding artifacts can't exceed hw memory block for loop transmission`. If you have to start a large transaction by loop, you can try either of the following methods.
  - Increase the `rmt_tx_channel_config_t::mem_block_symbols`. This approach does not work if the DMA backend is also enabled.
  - Customize an encoder and construct an infinite loop in the encoding function. See also **RMT Encoder**.

Internally, `rmt_transmit()` constructs a transaction descriptor and sends it to a job queue, which is dispatched in the ISR. So it is possible that the transaction is not started yet when `rmt_transmit()` returns. To ensure all pending transactions to complete, the user can use `rmt_tx_wait_all_done()`.

**Multiple Channels Simultaneous Transmission**  In some real-time control applications (e.g., to make two robotic arms move simultaneously), you do not want any time drift between different channels. The RMT driver can help to manage this by creating a so-called **Sync Manager**. The sync manager is represented by `rmt_sync_manager_handle_t` in the driver. The procedure of RMT sync transmission is shown as follows:

**Install RMT Sync Manager**  To create a sync manager, the user needs to tell which channels are going to be managed in the `rmt_sync_manager_config_t`:

- `rmt_sync_manager_config_t::tx_channel_array` points to the array of TX channels to be managed.
- `rmt_sync_manager_config_t::array_size` sets the number of channels to be managed.
\texttt{rmt_new_sync_manager()} can return a manager handle on success. This function could also fail due to various errors such as invalid arguments, etc. Especially, when the sync manager has been installed before, and there are no hardware resources to create another manager, this function reports \texttt{ESP\_ERR\_NOT\_FOUND} error. In addition, if the sync manager is not supported by the hardware, it reports a \texttt{ESP\_ERR\_NOT\_SUPPORTED} error. Please refer to [TRM] before using the sync manager feature.

\textbf{Start Transmission Simultaneously} For any managed TX channel, it does not start the machine until \texttt{rmt_transmit()} has been called on all channels in \texttt{rmt_sync_manager_config_t::tx_channel_array}. Before that, the channel is just put in a waiting state. TX channels will usually complete their transactions at different times due to differing transactions, thus resulting in a loss of sync. So before restarting a simultaneous transmission, the user needs to call \texttt{rmt_sync_reset()} to synchronize all channels again.

Calling \texttt{rmt_del_sync_manager()} can recycle the sync manager and enable the channels to initiate transactions independently afterward.

```c
rmt_channel_handle_t tx_channels[2] = {NULL}; // declare two channels
int tx_gpio_number[2] = {0, 2}; // install channels one by one
for (int i = 0; i < 2; i++) {
    rmt_tx_channel_config_t tx_chan_config = {
        .clk_src = RMT_CLK_SRC_DEFAULT, // select source clock
        .gpio_num = tx_gpio_number[i], // GPIO number
        .mem_block_symbols = 64, // memory block size, 64 * 4 = 256 Bytes
        .resolution_hz = 1 * 1000 * 1000, // 1 MHz resolution
        .trans_queue_depth = 1, // set the number of transactions that...
    };
    ESP_ERROR_CHECK(rmt_new_tx_channel(&tx_chan_config, &tx_channels[i]));
} // install sync manager
rmt_sync_manager_handle_t synchro = NULL;
rmt_sync_manager_config_t synchro_config = {
    .tx_channel_array = tx_channels,
    .array_size = sizeof(tx_channels) / sizeof(tx_channels[0]),
};
ESP_ERROR_CHECK(rmt_new_sync_manager(&synchro_config, &synchro));
ESP_ERROR_CHECK(rmt_transmit(tx_channels[0], led_strip_encoders[0], led_data, led_num * 3, (transmit_config)));
(continues on next page)```
// tx_channels[0] does not start transmission until call of `rmt_transmit()` for-

 ESP_ERROR_CHECK(rmt_transmit(tx_channels[1], led_strip_encoders[1], led_data, led_-
 --> num * 3, &transmit_config));

**Initiate RX Transaction**  As also discussed in the *Enable and Disable Channel*, calling `rmt_enable()` does not prepare an RX to receive RMT symbols. The user needs to specify the basic characteristics of the incoming signals in `rmt_receive_config_t`:

- `rmt_receive_config_t::signal_range_min_ns` specifies the minimal valid pulse duration in either high or low logic levels. A pulse width that is smaller than this value is treated as a glitch, and ignored by the hardware.
- `rmt_receive_config_t::signal_range_max_ns` specifies the maximum valid pulse duration in either high or low logic levels. A pulse width that is bigger than this value is treated as **Stop Signal**, and the receiver generates receive-complete event immediately.

The RMT receiver starts the RX machine after the user calls `rmt_receive()` with the provided configuration above. Note that, this configuration is transaction specific, which means, to start a new round of reception, the user needs to set the `rmt_receive_config_t` again. The receiver saves the incoming signals into its internal memory block or DMA buffer, in the format of `rmt_symbol_word_t`. Due to the limited size of the memory block, the RMT receiver can only save short frames whose length is not longer than the memory block capacity. Long frames are truncated by the hardware, and the driver reports an error message: `hw buffer too small, received symbols truncated`. The copy destination should be provided in the `buffer` parameter of `rmt_receive()` function. If this buffer overflows due to an insufficient buffer size, the receiver can continue to work, but overflowed symbols are dropped and the following error message is reported: `user buffer too small, received symbols truncated`. Please take care of the lifecycle of the `buffer` parameter, ensuring that the buffer is not recycled before the receiver is finished or stopped.

The receiver is stopped by the driver when it finishes working, i.e., receive a signal whose duration is bigger than `rmt_receive_config_t::signal_range_max_ns`. The user needs to call `rmt_receive()` again to restart the receiver, if necessary. The user can get the received data in the `rmt_rx_event_callbacks_t::on_recv_done` callback. See also *Register Event Callbacks* for more information.

```c
static bool example_rmt_rx_done_callback(rmt_channel_handle_t channel, const rmt_-
 --> rx_done_event_data_t *edata, void *user_data)
{
    BaseType_t high_task_wakeup = pdFALSE;
    QueueHandle_t receive_queue = (QueueHandle_t)user_data;
    // send the received RMT symbols to the parser task
    xQueueSendFromISR(receive_queue, edata, &high_task_wakeup);
    // return whether any task is woken up
    return high_task_wakeup == pdTRUE;
}
```

```c
QueueHandle_t receive_queue = xQueueCreate(1, sizeof(rmt_rx_done_event_data_t));
rmt_rx_eventCallbacks_t cbs = {
    .on_recv_done = example_rmt_rx_done_callback,
};
ESP_ERROR_CHECK(rmt_rx_register_eventCallbacks(rx_channel, &cbs, receive_queue));
```

// the following timing requirement is based on NEC protocol
```c
rmt_receive_config_t receive_config = {
    .signal_range_min_ns = 1250,  // the shortest duration for NEC signal is...
    ~560 µs, 1250 ns < 560 µs, valid signal is not treated as noise
    .signal_range_max_ns = 12000000, // the longest duration for NEC signal is...
    ~9000 µs, 12000000 ns > 9000 µs, the receive does not stop early
};
```
rmt_symbol_word_t raw_symbols[64]; // 64 symbols should be sufficient for a
-- standard NEC frame
// ready to receive
ESP_ERROR_CHECK(rmt_receive(rx_channel, raw_symbols, sizeof(raw_symbols), &receive_
-- config));
// wait for the RX-done signal
rmt_rx_done_event_data_t rx_data;
xQueueReceive(receive_queue, &rx_data, portMAX_DELAY);
// parse the received symbols
example_parse_nec_frame(rx_data.received_symbols, rx_data.num_symbols);

RMT Encoder  An RMT encoder is part of the RMT TX transaction, whose responsibility is to generate and write
the correct RMT symbols into hardware memory or DMA buffer at a specific time. There are some special restrictions
for an encoding function:

• During a single transaction, the encoding function may be called multiple times. This is necessary because the
target RMT memory block cannot hold all the artifacts at once. To overcome this limitation, the driver utilizes
a ping-pong approach, where the encoding session is divided into multiple parts. This means that the encoder
needs to keep track of its state to continue encoding from where it left off in the previous part.
• The encoding function is running in the ISR context. To speed up the encoding session, it is highly recom-
mended to put the encoding function into IRAM. This can also avoid the cache miss during encoding.

To help get started with the RMT driver faster, some commonly used encoders are provided out-of-the-box. They
can either work alone or be chained together into a new encoder. See also Composite Pattern for the principle behind
it. The driver has defined the encoder interface in rmt_encoder_t, it contains the following functions:

• rmt_encoder_t::encode is the fundamental function of an encoder. This is where the encoding session
happens.
  – The function might be called multiple times within a single transaction. The encode function should
return the state of the current encoding session.
  – The supported states are listed in the rmt_encode_state_t. If the result contains
    RMT_ENCODING_COMPLETE, it means the current encoder has finished work.
  – If the result contains RMT_ENCODING_MEM_FULL, the program needs to yield from the current ses-
    sion, as there is no space to save more encoding artifacts.
• rmt_encoder_t::reset should reset the encoder state back to the initial state (the RMT encoder is
  stateful).
  – If the RMT transmitter is manually stopped without resetting its corresponding encoder, subsequent en-
    coding session can be erroneous.
  – This function is also called implicitly in rmt_disable().
• rmt_encoder_t::del should free the resources allocated by the encoder.

Copy Encoder  A copy encoder is created by calling rmt_new_copy_encoder(). A copy encoder’s main
functionality is to copy the RMT symbols from user space into the driver layer. It is usually used to encode const
data, i.e., data does not change at runtime after initialization such as the leading code in the IR protocol.
A configuration structure rmt_copy_encoder_config_t should be provided in advance before calling
rmt_new_copy_encoder(). Currently, this configuration is reserved for future expansion, and has no spe-
cific use or setting items for now.

Bytes Encoder  A bytes encoder is created by calling rmt_new_bytes_encoder(). The bytes encoder’s main
functionality is to convert the user space byte stream into RMT symbols dynamically. It is usually used to
encode dynamic data, e.g., the address and command fields in the IR protocol.
A configuration structure rmt_bytes_encoder_config_t should be provided in advance before calling
rmt_new_bytes_encoder():
Chapter 2. API Reference

- `rmt_bytes_encoder_config_t::bit0` and `rmt_bytes_encoder_config_t::bit1` are necessary to specify the encoder how to represent bit zero and bit one in the format of `rmt_symbol_word_t`.
- `rmt_bytes_encoder_config_t::msb_first` sets the bit endianness of each byte. If it is set to true, the encoder encodes the Most Significant Bit first. Otherwise, it encodes the Least Significant Bit first.

Besides the primitive encoders provided by the driver, the user can implement his own encoder by chaining the existing encoders together. A common encoder chain is shown as follows:

![RMT Encoder Chain Diagram](image)

**Fig. 18: RMT Encoder Chain**

**Customize RMT Encoder for NEC Protocol**  This section demonstrates how to write an NEC encoder. The NEC IR protocol uses pulse distance encoding of the message bits. Each pulse burst is 562.5 µs in length, logical bits are transmitted as follows. It is worth mentioning that the least significant bit of each byte is sent first.

- Logical 0: a 562.5 µs pulse burst followed by a 562.5 µs space, with a total transmit time of 1.125 ms
- Logical 1: a 562.5 µs pulse burst followed by a 1.6875 ms space, with a total transmit time of 2.25 ms

When a key is pressed on the remote controller, the transmitted message includes the following elements in the specified order:

![IR NEC Frame](image)

**Fig. 19: IR NEC Frame**

- 9 ms leading pulse burst, also called the “AGC pulse”
- 4.5 ms space
- 8-bit address for the receiving device
- 8-bit logical inverse of the address
- 8-bit command
- 8-bit logical inverse of the command
- a final 562.5 µs pulse burst to signify the end of message transmission

Then you can construct the NEC `rmt_encoder_t::encode` function in the same order, for example:
// IR NEC scan code representation
typedef struct {
    uint16_t address;
    uint16_t command;
} ir_nec_scan_code_t;

// construct an encoder by combining primitive encoders
typedef struct {
    rmt_encoder_t base; // the base "class" declares the standard encoder interface
    rmt_encoder_t *copy_encoder; // use the copy_encoder to encode the leading pulse
    rmt_encoder_t *bytes_encoder; // use the bytes_encoder to encode the address
    rmt_symbol_word_t nec_leading_symbol; // NEC leading code with RMT representation
    rmt_symbol_word_t nec_ending_symbol; // NEC ending code with RMT representation
    int state; // record the current encoding state, i.e., we are in which encoding phase
} rmt_ir_nec_encoder_t;

static size_t rmt_encode_ir_nec(rmt_encoder_t *encoder, rmt_channel_handle_t channel, const void *primary_data, size_t data_size, rmt_encode_state_t *ret_state) {
    rmt_ir_nec_encoder_t *nec_encoder = __containerof(encoder, rmt_ir_nec_encoder_t, base);
    rmt_encode_state_t session_state = RMT_ENCODING_RESET;
    rmt_encode_state_t state = RMT_ENCODING_RESET;
    size_t encoded_symbols = 0;
    ir_nec_scan_code_t *scan_code = (ir_nec_scan_code_t *)primary_data;
    rmt_encoder_handle_t copy_encoder = nec_encoder->copy_encoder;
    rmt_encoder_handle_t bytes_encoder = nec_encoder->bytes_encoder;
    switch (nec_encoder->state) {
        case 0: // send leading code
            encoded_symbols += copy_encoder->encode(copy_encoder, channel, &nec_encoder->nec_leading_symbol, sizeof(rmt_symbol_word_t), &session_state);
            if (session_state & RMT_ENCODING_COMPLETE) {
                nec_encoder->state = 1; // we can only switch to the next state when the current encoder finished
            }
            if (session_state & RMT_ENCODING_MEM_FULL) {
                state |= RMT_ENCODING_MEM_FULL;
                goto out; // yield if there is no free space to put other encoding artifacts
            }
            break;
        case 1: // send address
            encoded_symbols += bytes_encoder->encode(bytes_encoder, channel, &scan_code->address, sizeof(uint16_t), &session_state);
            if (session_state & RMT_ENCODING_COMPLETE) {
                nec_encoder->state = 2; // we can only switch to the next state when the current encoder finished
            }
            if (session_state & RMT_ENCODING_MEM_FULL) {
                state |= RMT_ENCODING_MEM_FULL;
                goto out; // yield if there is no free space to put other encoding artifacts
            }
            break;
    }

    return encoded_symbols;
}

(continues on next page)
A full sample code can be found in `peripherals/rmt/ir_nec_transceiver`. In the above snippet, we use a `switch-case` and several `goto` statements to implement a **Finite-state machine**. With this pattern, users can construct much more complex IR protocols.

### Power Management

When power management is enabled, i.e., `CONFIG_PM_ENABLE` is on, the system adjusts the APB frequency before going into Light-sleep, thus potentially changing the resolution of the RMT internal counter. However, the driver can prevent the system from changing APB frequency by acquiring a power management lock of type `ESP_PM_APB_FREQ_MAX`. Whenever the user creates an RMT channel that has selected `RMT_CLK_SRC_APB` as the clock source, the driver guarantees that the power management lock is acquired after the channel enabled by `rmt_enable()`. Likewise, the driver releases the lock after `rmt_disable()` is called for the same channel. This also reveals that the `rmt_enable()` and `rmt_disable()` should appear in pairs.

If the channel clock source is selected to others like `RMT_CLK_SRC_XTAL`, then the driver does not install a power management lock for it, which is more suitable for a low-power application as long as the source clock can still provide sufficient resolution.

### IRAM Safe

By default, the RMT interrupt is deferred when the Cache is disabled for reasons like writing or erasing the main Flash. Thus the transaction-done interrupt does not get handled in time, which is not acceptable in a real-time application. What is worse, when the RMT transaction relies on `ping-pong` interrupt to successively encode or copy RMT symbols, a delayed interrupt can lead to an unpredictable result.

There is a Kconfig option `CONFIG_RMT_ISR_IRAM_SAFE` that has the following features:
1. Enable the interrupt being serviced even when the cache is disabled
2. Place all functions used by the ISR into IRAM\(^2\)
3. Place the driver object into DRAM in case it is mapped to PSRAM by accident

This Kconfig option allows the interrupt handler to run while the cache is disabled but comes at the cost of increased IRAM consumption.

Another Kconfig option CONFIG_RMT_RECV_FUNC_IN_IRAM can place `rmt_receive()` into the IRAM as well. So that the receive function can be used even when the flash cache is disabled.

**Thread Safety** The factory function `rmt_new_tx_channel()`, `rmt_newrx_channel()` and `rmt_new_sync_manager()` are guaranteed to be thread-safe by the driver, which means, user can call them from different RTOS tasks without protection by extra locks. Other functions that take the `rmt_channel_handle_t` and `rmt_sync_manager_handle_t` as the first positional parameter, are not thread-safe. which means the user should avoid calling them from multiple tasks.

The following functions are allowed to use under ISR context as well.

- `rmt_receive()`

**Kconfig Options**

- `CONFIG_RMT_ISR_IRAM_SAFE` controls whether the default ISR handler can work when cache is disabled, see also IRAM Safe for more information.
- `CONFIG_RMT_ENABLE_DEBUG_LOG` is used to enable the debug log at the cost of increased firmware binary size.
- `CONFIG_RMT_RECV_FUNC_IN_IRAM` controls where to place the RMT receive function (IRAM or Flash), see IRAM Safe for more information.

**Application Examples**

- RMT-based RGB LED strip customized encoder: peripherals/rmt/led_strip
- RMT IR NEC protocol encoding and decoding: peripherals/rmt/ir_nec_transceiver
- RMT transactions in queue: peripherals/rmt/musical_buzzer
- RMT-based stepper motor with S-curve algorithm: : peripherals/rmt/stepper_motor
- RMT infinite loop for driving DShot ESC: peripherals/rmt/dshot_esc
- RMT simulate 1-wire protocol (take DS18B20 as example): peripherals/rmt/onewire

**FAQ**

- Why the RMT encoder results in more data than expected?

The RMT encoding takes place in the ISR context. If your RMT encoding session takes a long time (e.g., by logging debug information) or the encoding session is deferred somehow because of interrupt latency, then it is possible the transmitting becomes faster than the encoding. As a result, the encoder can not prepare the next data in time, leading to the transmitter sending the previous data again. There is no way to ask the transmitter to stop and wait. You can mitigate the issue by combining the following ways:

- Increase the `rmt_tx_channel_config_t::mem_block_symbols`, in steps of 64.
- Place the encoding function in the IRAM.
- Enables the `rmt_tx_channel_config_t::with_dma` if it is available for your chip.

\(^2\) The callback function, e.g., `rmt_tx_event_callbacks_t::on_trans_done`, and the functions invoked by itself should also reside in IRAM, users need to take care of this by themselves.

Functions

`esp_err_t rmt_new_tx_channel` (const `rmt_tx_channel_config_t *config`, `rmt_channel_handle_t *ret_chan`)

Create a RMT TX channel.

**Parameters**

- `config` - [in] TX channel configurations
- `ret_chan` - [out] Returned generic RMT channel handle

**Returns**

- ESP_OK: Create RMT TX channel successfully
- ESP_ERR_INVALID_ARG: Create RMT TX channel failed because of invalid argument
- ESP_ERR_NO_MEM: Create RMT TX channel failed because of out of memory
- ESP_ERR_NOT_FOUND: Create RMT TX channel failed because all RMT channels are used up and no more free one
- ESP_ERR_NOT_SUPPORTED: Create RMT TX channel failed because some feature is not supported by hardware, e.g. DMA feature is not supported by hardware
- ESP_FAIL: Create RMT TX channel failed because of other error

`esp_err_t rmt_transmit` (rmt_channel_handle_t `tx_channel`, rmt_encoder_handle_t `encoder`, const void *`payload`, size_t `payload_bytes`, const `rmt_transmit_config_t *config`)

Transmit data by RMT TX channel.

**Note:** This function constructs a transaction descriptor then pushes to a queue. The transaction will not start immediately if there’s another one under processing. Based on the setting of `rmt_transmit_config_t::queue_nonblocking`, if there’re too many transactions pending in the queue, this function can block until it has free slot, otherwise just return quickly.

**Note:** The data to be transmitted will be encoded into RMT symbols by the specific encoder.

**Parameters**

- `tx_channel` - [in] RMT TX channel that created by `rmt_new_tx_channel()`
- `encoder` - [in] RMT encoder that created by various factory APIs like `rmt_new_bytes_encoder()`
- `payload` - [in] The raw data to be encoded into RMT symbols
- `payload_bytes` - [in] Size of the `payload` in bytes
- `config` - [in] Transmission specific configuration

**Returns**

- ESP_OK: Transmit data successfully
- ESP_ERR_INVALID_ARG: Transmit data failed because of invalid argument
- ESP_ERR_INVALID_STATE: Transmit data failed because channel is not enabled
• ESP_ERR_NOT_SUPPORTED: Transmit data failed because some feature is not supported by hardware, e.g. unsupported loop count
• ESP_FAIL: Transmit data failed because of other error

event_t rmt_tx_wait_all_done(rmt_channel_handle_t tx_channel, int timeout_ms)
Wait for all pending TX transactions done.

Note: This function will block forever if the pending transaction can’t be finished within a limited time (e.g. an infinite loop transaction). See also rmt_disable() for how to terminate a working channel.

Parameters
• tx_channel - [in] RMT TX channel that created by rmt_new_tx_channel()

Returns
• ESP_OK: Flush transactions successfully
• ESP_ERR_INVALID_ARG: Flush transactions failed because of invalid argument
• ESP_ERR_TIMEOUT: Flush transactions failed because of timeout
• ESP_FAIL: Flush transactions failed because of other error

event_t rmt_tx_register_event_callbacks(rmt_channel_handle_t tx_channel, const rmt_tx_event_callbacks_t *cbs, void *user_data)
Set event callbacks for RMT TX channel.

Note: User can deregister a previously registered callback by calling this function and setting the callback member in the cbs structure to NULL.

Note: When CONFIG_RMT_ISR_IRAM_SAFE is enabled, the callback itself and functions called by it should be placed in IRAM. The variables used in the function should be in the SRAM as well. The user_data should also reside in SRAM.

Parameters
• tx_channel - [in] RMT generic channel that created by rmt_new_tx_channel()
• cbs - [in] Group of callback functions
• user_data - [in] User data, which will be passed to callback functions directly

Returns
• ESP_OK: Set event callbacks successfully
• ESP_ERR_INVALID_ARG: Set event callbacks failed because of invalid argument
• ESP_FAIL: Set event callbacks failed because of other error

event_t rmt_new_sync_manager(const rmt_sync_manager_config_t *config, rmt_sync_manager_handle_t *ret_synchron)
Create a synchronization manager for multiple TX channels, so that the managed channel can start transmitting at the same time.

Note: All the channels to be managed should be enabled by rmt_enable() before put them into sync manager.

Parameters
• config - [in] Synchronization manager configuration
• ret_synchron - [out] Returned synchronization manager handle

Returns
• ESP_OK: Create sync manager successfully
• ESP_ERR_INVALID_ARG: Create sync manager failed because of invalid argument
• ESP_ERR_NOT_SUPPORTED: Create sync manager failed because it is not supported by hardware
• ESP_ERR_INVALID_STATE: Create sync manager failed because not all channels are enabled
• ESP_ERR_NO_MEM: Create sync manager failed because out of memory
• ESP_ERR_NOT_FOUND: Create sync manager failed because all sync controllers are used up and no more free one
• ESP_FAIL: Create sync manager failed because of other error

\textit{esp_err_t rmt_del_sync_manager}(rmt_sync_manager_handle_t \textit{synchro})

Delete synchronization manager.

\textbf{Parameters} \textit{synchro} \-[in]- Synchronization manager handle returned from \textit{rmt_new_sync_manager()}

\textbf{Returns}
• ESP_OK: Delete the synchronization manager successfully
• ESP_ERR_INVALID_ARG: Delete the synchronization manager failed because of invalid argument
• ESP_FAIL: Delete the synchronization manager failed because of other error

\textit{esp_err_t rmt_sync_reset}(rmt_sync_manager_handle_t \textit{synchro})

Reset synchronization manager.

\textbf{Parameters} \textit{synchro} \-[in]- Synchronization manager handle returned from \textit{rmt_new_sync_manager()}

\textbf{Returns}
• ESP_OK: Reset the synchronization manager successfully
• ESP_ERR_INVALID_ARG: Reset the synchronization manager failed because of invalid argument
• ESP_FAIL: Reset the synchronization manager failed because of other error

\textbf{Structures}

\textbf{struct rmt_tx_event_callbacks_t}

Group of RMT TX callbacks.

\underline{Note}: The callbacks are all running under ISR environment

\underline{Note}: When CONFIG_RMT_ISR_IRAM_SAFE is enabled, the callback itself and functions called by it should be placed in IRAM. The variables used in the function should be in the SRAM as well.

\textbf{Public Members}

\textbf{rmt_tx_done_callback_t on_trans_done}

Event callback, invoked when transmission is finished

\textbf{struct rmt_tx_channel_config_t}

RMT TX channel specific configuration.

\textbf{Public Members}
Chapter 2. API Reference

gpio_num_t gpio_num
  GPIO number used by RMT TX channel. Set to -1 if unused

rmt_clock_source_t clk_src
  Clock source of RMT TX channel, channels in the same group must use the same clock source

uint32_t resolution_hz
  Channel clock resolution, in Hz

size_t mem_block_symbols
  Size of memory block, in number of rmt_symbol_word_t, must be an even. In the DMA mode, this field controls the DMA buffer size, it can be set to a large value; In the normal mode, this field controls the number of RMT memory block that will be used by the channel.

size_t trans_queue_depth
  Depth of internal transfer queue, increase this value can support more transfers pending in the background

int intr_priority
  RMT interrupt priority, if set to 0, the driver will try to allocate an interrupt with a relative low priority (1,2,3)

uint32_t invert_out
  Whether to invert the RMT channel signal before output to GPIO pad

uint32_t with_dma
  If set, the driver will allocate an RMT channel with DMA capability

uint32_t io_loop_back
  The signal output from the GPIO will be fed to the input path as well

uint32_t io_od_mode
  Configure the GPIO as open-drain mode

struct rmt_tx_channel_config_t::[anonymous] flags
  TX channel config flags

struct rmt_transmit_config_t
  RMT transmit specific configuration.

Public Members

int loop_count
  Specify the times of transmission in a loop, -1 means transmitting in an infinite loop

uint32_t eot_level
  Set the output level for the “End Of Transmission”
Chapter 2. API Reference

```
uint32_t queue_nonblocking
If set, when the transaction queue is full, driver will not block the thread but return directly
```

```
struct rmt_transmit_config_t::[anonymous] flags
Transmit specific config flags
```

```
struct rmt_sync_manager_config_t
Synchronous manager configuration.
```

**Public Members**

```
const rmt_channel_handle_t *tx_channel_array
Array of TX channels that are about to be managed by a synchronous controller
```

```
size_t array_size
Size of the tx_channel_array
```

**Header File**

- `components/driver/rmt/include/driver/rmt_rx.h`
- This header file can be included with:

  ```
  #include "driver/rmt_rx.h"
  ```

- This header file is a part of the API provided by the `driver` component. To declare that your component depends on `driver`, add the following to your CMakeLists.txt:

  ```
  REQUIRES driver
  ```
  or
  ```
  PRIV_REQUIRES driver
  ```

**Functions**

`esp_err_t rmt_new_rx_channel` (const `rmt_rx_channel_config_t *config`, `rmt_channel_handle_t *ret_chan`)
Create a RMT RX channel.

**Parameters**

- `config` [in] RX channel configurations
- `ret_chan` [out] Returned generic RMT channel handle

**Returns**

- ESP_OK: Create RMT RX channel successfully
- ESP_ERR_INVALID_ARG: Create RMT RX channel failed because of invalid argument
- ESP_ERR_NO_MEM: Create RMT RX channel failed because out of memory
- ESP_ERR_NOT_FOUND: Create RMT RX channel failed because all RMT channels are used up and no more free one
- ESP_ERR_NOT_SUPPORTED: Create RMT RX channel failed because some feature is not supported by hardware, e.g. DMA feature is not supported by hardware
- ESP_FAIL: Create RMT RX channel failed because of other error

`esp_err_t rmt_receive` (rmt_channel_handle_t rx_channel, void *buffer, size_t buffer_size, const `rmt_receive_config_t *config`)
Initiate a receive job for RMT RX channel.
### rmt_rx_register_event_callbacks

**Description:** Set callbacks for RMT RX channel.

**Parameters**

- `rx_channel` - [in] RMT RX channel that created by `rmt_new_rx_channel()`
- `buffer` - [in] The buffer to store the received RMT symbols
- `buffer_size` - [in] size of the `buffer`, in bytes
- `config` - [in] Receive specific configurations

**Returns**

- `ESP_OK`: Initiate receive job successfully
- `ESP_ERR_INVALID_ARG`: Initiate receive job failed because of invalid argument
- `ESP_ERR_INVALID_STATE`: Initiate receive job failed because channel is not enabled
- `ESP_FAIL`: Initiate receive job failed because of other error

```c
esp_err_t rmt_rx_register_event_callbacks(rmt_channel_handle_t rx_channel, const rmt_rx_event_callbacks_t *cbs, void *user_data)
```

**Note:** User can deregister a previously registered callback by calling this function and setting the callback member in the `cbs` structure to NULL.

**Note:** When CONFIG_RMT_ISR_IRAM_SAFE is enabled, the callback itself and functions called by it should be placed in IRAM. The variables used in the function should be in the SRAM as well. The `user_data` should also reside in SRAM.

**Structures**

struct rmt_rx_event_callbacks_t

Group of RMT RX callbacks.

**Note:** The callbacks are all running under ISR environment.
Note: When CONFIG_RMT_ISR_IRAM_SAFE is enabled, the callback itself and functions called by it should be placed in IRAM. The variables used in the function should be in the SRAM as well.

**Public Members**

```c
rmt_rx_done_callback_t on_recv_done
Event callback, invoked when one RMT channel receiving transaction completes
```

```c
struct rmt_rx_channel_config_t
RMT RX channel specific configuration.
```

**Public Members**

```c
gpio_num_t gpio_num
GPIO number used by RMT RX channel. Set to -1 if unused
```

```c
rmt_clock_source_t clk_src
Clock source of RMT RX channel, channels in the same group must use the same clock source
```

```c
uint32_t resolution_hz
Channel clock resolution, in Hz
```

```c
size_t mem_block_symbols
Size of memory block, in number of rmt_symbol_word_t, must be an even. In the DMA mode, this field controls the DMA buffer size, it can be set to a large value (e.g. 1024); In the normal mode, this field controls the number of RMT memory block that will be used by the channel.
```

```c
uint32_t invert_in
Whether to invert the incoming RMT channel signal
```

```c
uint32_t with_dma
If set, the driver will allocate an RMT channel with DMA capability
```

```c
uint32_t io_loop_back
For debug/test, the signal output from the GPIO will be fed to the input path as well
```

```c
struct rmt_rx_channel_config_t::{anonymous} flags
RX channel config flags
```

```c
int intr_priority
RMT interrupt priority, if set to 0, the driver will try to allocate an interrupt with a relative low priority (1,2,3)
```

```c
struct rmt_receive_config_t
RMT receive specific configuration.
```
Public Members

```c
uint32_t signal_range_min_ns

A pulse whose width is smaller than this threshold will be treated as glitch and ignored.
```

```c
uint32_t signal_range_max_ns

RMT will stop receiving if one symbol level has kept more than signal_range_max_ns
```

Header File

- components/driver/rmt/include/driver/rmt_common.h
- This header file can be included with:
  ```
  #include "driver/rmt_common.h"
  ```
- This header file is a part of the API provided by the driver component. To declare that your component depends on driver, add the following to your CMakeLists.txt:
  ```
  REQUIRE driver
  ```
  or
  ```
  PRIV_REQUIRE driver
  ```

Functions

**esp_err_t rmt_del_channel (rmt_channel_handle_t channel)**

Delete an RMT channel.

**Parameters**

channel - [in] RMT generic channel that created by rmt_new_tx_channel() or rmt_new_rx_channel()

**Returns**

- ESP_OK: Delete RMT channel successfully
- ESP_ERR_INVALID_ARG: Delete RMT channel failed because of invalid argument
- ESP_ERR_INVALID_STATE: Delete RMT channel failed because it is still in working
- ESP_FAIL: Delete RMT channel failed because of other error

**esp_err_t rmt_apply_carrier (rmt_channel_handle_t channel, const rmt_carrier_config_t *config)**

Apply modulation feature for TX channel or demodulation feature for RX channel.

**Parameters**

- channel - [in] RMT generic channel that created by rmt_new_tx_channel() or rmt_new_rx_channel()
- config - [in] Carrier configuration. Specially, a NULL config means to disable the carrier modulation or demodulation feature

**Returns**

- ESP_OK: Apply carrier configuration successfully
- ESP_ERR_INVALID_ARG: Apply carrier configuration failed because of invalid argument
- ESP_FAIL: Apply carrier configuration failed because of other error

**esp_err_t rmt_enable (rmt_channel_handle_t channel)**

Enable the RMT channel.

**Note:** This function will acquire a PM lock that might be installed during channel allocation.

**Parameters**

- channel - [in] RMT generic channel that created by rmt_new_tx_channel() or rmt_new_rx_channel()
Returns

- ESP_OK: Enable RMT channel successfully
- ESP_ERR_INVALID_ARG: Enable RMT channel failed because of invalid argument
- ESP_ERR_INVALID_STATE: Enable RMT channel failed because it’s enabled already
- ESP_FAIL: Enable RMT channel failed because of other error

`esp_err_t rmt_disable(rmt_channel_handle_t channel)`
Disable the RMT channel.

**Note:** This function will release a PM lock that might be installed during channel allocation

**Parameters**

channel – [in] RMT generic channel that created by `rmt_new_tx_channel()` or `rmt_new_rx_channel()`

**Returns**

- ESP_OK: Disable RMT channel successfully
- ESP_ERR_INVALID_ARG: Disable RMT channel failed because of invalid argument
- ESP_ERR_INVALID_STATE: Disable RMT channel failed because it’s not enabled yet
- ESP_FAIL: Disable RMT channel failed because of other error

**Structures**

struct `rmt_carrier_config_t`

RMT carrier wave configuration (for either modulation or demodulation)

**Public Members**

`uint32_t frequency_hz`
Carrier wave frequency, in Hz, 0 means disabling the carrier

`float duty_cycle`
Carrier wave duty cycle (0-100%)

`uint32_t polarity_active_low`
Specify the polarity of carrier, by default it’s modulated to base signal’s high level

`uint32_t always_on`
If set, the carrier can always exist even there’s not transfer undergoing

struct `rmt_carrier_config_t::[anonymous] flags`
Carrier config flags

**Header File**

- `components/driver/rmt/include/driver/rmt_encoder.h`
- This header file can be included with:
  ```
  #include "driver/rmt_encoder.h"
  ```
- This header file is a part of the API provided by the `driver` component. To declare that your component depends on `driver`, add the following to your CMakeLists.txt:
Chapter 2. API Reference

REQUIRES driver

or

PRIV_REQUIRES driver

Functions

`esp_err_t rmt_new_bytes_encoder(const rmt_bytes_encoder_config_t *config, rmt_encoder_handle_t *ret_encoder)`

Create RMT bytes encoder, which can encode byte stream into RMT symbols.

**Parameters**

- config [in] Bytes encoder configuration
- ret_encoder [out] Returned encoder handle

**Returns**

- ESP_OK: Create RMT bytes encoder successfully
- ESP_ERR_INVALID_ARG: Create RMT bytes encoder failed because of invalid argument
- ESP_ERR_NO_MEM: Create RMT bytes encoder failed because out of memory
- ESP_FAIL: Create RMT bytes encoder failed because of other error

`esp_err_t rmt_new_copy_encoder(const rmt_copy_encoder_config_t *config, rmt_encoder_handle_t *ret_encoder)`

Create RMT copy encoder, which copies the given RMT symbols into RMT memory.

**Parameters**

- config [in] Copy encoder configuration
- ret_encoder [out] Returned encoder handle

**Returns**

- ESP_OK: Create RMT copy encoder successfully
- ESP_ERR_INVALID_ARG: Create RMT copy encoder failed because of invalid argument
- ESP_ERR_NO_MEM: Create RMT copy encoder failed because out of memory
- ESP_FAIL: Create RMT copy encoder failed because of other error

`esp_err_t rmt_del_encoder(rmt_encoder_handle_t encoder)`

Delete RMT encoder.

**Parameters**

- encoder [in] RMT encoder handle, created by e.g `rmt_new_bytes_encoder()`

**Returns**

- ESP_OK: Delete RMT encoder successfully
- ESP_ERR_INVALID_ARG: Delete RMT encoder failed because of invalid argument
- ESP_FAIL: Delete RMT encoder failed because of other error

`esp_err_t rmt_encoder_reset(rmt_encoder_handle_t encoder)`

Reset RMT encoder.

**Parameters**

- encoder [in] RMT encoder handle, created by e.g `rmt_new_bytes_encoder()`

**Returns**

- ESP_OK: Reset RMT encoder successfully
- ESP_ERR_INVALID_ARG: Reset RMT encoder failed because of invalid argument
- ESP_FAIL: Reset RMT encoder failed because of other error

Structures

`struct rmt_encoder_t`

Interface of RMT encoder.
Public Members

size_t(*encode)(rmt_encoder_t *encoder, rmt_channel_handle_t tx_channel, const void *primary_data, size_t data_size, rmt_encode_state_t *ret_state)

Encode the user data into RMT symbols and write into RMT memory.

Note: The encoding function will also be called from an ISR context, thus the function must not call any blocking API.

Note: It’s recommended to put this function implementation in the IRAM, to achieve a high performance and less interrupt latency.

Param encoder [in] Encoder handle
Param tx_channel [in] RMT TX channel handle, returned from rmt_new_tx_channel()
Param primary_data [in] App data to be encoded into RMT symbols
Param data_size [in] Size of primary_data, in bytes
Param ret_state [out] Returned current encoder’s state
Return Number of RMT symbols that the primary data has been encoded into

esp_err_t(*reset)(rmt_encoder_t *encoder)

Reset encoding state.

Param encoder [in] Encoder handle
Return
  • ESP_OK: reset encoder successfully
  • ESP_FAIL: reset encoder failed

esp_err_t(*del)(rmt_encoder_t *encoder)

Delete encoder object.

Param encoder [in] Encoder handle
Return
  • ESP_OK: delete encoder successfully
  • ESP_FAIL: delete encoder failed

struct rmt_bytes_encoder_config_t
Bytes encoder configuration.

Public Members

rmt_symbol_word_t bit0
How to represent BIT0 in RMT symbol

rmt_symbol_word_t bit1
How to represent BIT1 in RMT symbol

uint32_t msb_first
Whether to encode MSB bit first
struct rmt_bytes_encoder_config_t::[anonymous] flags
  Encoder config flag

struct rmt_copy_encoder_config_t
  Copy encoder configuration.

Enumerations

enum rmt_encode_state_t
  RMT encoding state.
  Values:
  
  enumerator RMT_ENCODING_RESET
    The encoding session is in reset state
  
  enumerator RMT_ENCODING_COMPLETE
    The encoding session is finished, the caller can continue with subsequent encoding
  
  enumerator RMT_ENCODING_MEM_FULL
    The encoding artifact memory is full, the caller should return from current encoding session

Header File

- components/driver/rmt/include/driver/rmt_types.h
  This header file can be included with:

  ```c
  #include "driver/rmt_types.h"
  ```
  This header file is a part of the API provided by the driver component. To declare that your component depends on driver, add the following to your CMakeLists.txt:

  ```cmake
  REQUIRES driver
  ```
  or

  ```cmake
  PRIV_REQUIRES driver
  ```

Structures

struct rmt_tx_done_event_data_t
  Type of RMT TX done event data.

Public Members

  size_t num_symbols
    The number of transmitted RMT symbols, including one EOF symbol, which is appended by the driver to mark the end of a transmission. For a loop transmission, this value only counts for one round.

struct rmt_rx_done_event_data_t
  Type of RMT RX done event data.
Public Members

```c
rmt_symbol_word_t *received_symbols
```
Point to the received RMT symbols

```c
size_t num_symbols
```
The number of received RMT symbols

Type Definitions

typedef struct rmt_channel_t *rmt_channel_handle_t
Type of RMT channel handle.

typedef struct rmt_sync_manager_t *rmt_sync_manager_handle_t
Type of RMT synchronization manager handle.

typedef struct rmt_encoder_t *rmt_encoder_handle_t
Type of RMT encoder handle.

typedef bool (*rmt_tx_done_callback_t)(rmt_channel_handle_t tx_chan, const rmt_tx_done_event_data_t *edata, void *user_ctx)
Prototype of RMT event callback.

- **Param tx_chan** [in] RMT channel handle, created from rmt_new_tx_channel()
- **Param edata** [in] Point to RMT event data. The lifecycle of this pointer memory is inside this function, user should copy it into static memory if used outside this function.
- **Param user_ctx** [in] User registered context, passed from rmt_tx_register_event_callbacks()
- **Return** Whether a high priority task has been waken up by this callback function

```c
typedef bool (*rmt_rx_done_callback_t)(rmt_channel_handle_t rx_chan, const rmt_rx_done_event_data_t *edata, void *user_ctx)
```
Prototype of RMT event callback.

- **Param rx_chan** [in] RMT channel handle, created from rmt_new_rx_channel()
- **Param edata** [in] Point to RMT event data. The lifecycle of this pointer memory is inside this function, user should copy it into static memory if used outside this function.
- **Param user_ctx** [in] User registered context, passed from rmt_rx_register_event_callbacks()
- **Return** Whether a high priority task has been waken up by this function

Header File

- components/hal/include/hal/rmt_types.h
- This header file can be included with:

```c
#include "hal/rmt_types.h"
```

Unions

```c
union rmt_symbol_word_t
```
#include <rmt_types.h>The layout of RMT symbol stored in memory, which is decided by the hardware design.
Chapter 2. API Reference

Public Members

uint16_t duration0
Duration of level0

uint16_t level0
Level of the first part

uint16_t duration1
Duration of level1

uint16_t level1
Level of the second part

struct rmt_symbol_word_t::[anonymous] [anonymous]

uint32_t val
Equivalent unsigned value for the RMT symbol

Type Definitions
typedef soc_periph_rmt_clk_src_t rmt_clock_source_t
RMT group clock source.

Note: User should select the clock source based on the power and resolution requirement

2.5.17 SD SPI Host Driver

Overview

The SD SPI host driver allows communication with one or more SD cards using the SPI Master driver, which utilizes the SPI host. Each card is accessed through an SD SPI device, represented by an SD SPI handle sdspi_dev_handle_t, which returns when the device is attached to an SPI bus by calling sdspi_host_init_device(). It is important to note that the SPI bus should be initialized beforehand by spi_bus_initialize().

With the help of SPI Master Driver the SD SPI host driver based on, the SPI bus can be shared among SD cards and other SPI devices. The SPI Master driver will handle exclusive access from different tasks.

The SD SPI driver uses software-controlled CS signal.

How to Use

Firstly, use the macro SDSPI_DEVICE_CONFIG_DEFAULT to initialize the structure sdspi_device_config_t, which is used to initialize an SD SPI device. This macro will also fill in the default pin mappings, which are the same as the pin mappings of the SDMMC host driver. Modify the host and pins of the structure to desired value. Then call sdspi_host_init_device to initialize the SD SPI device and attach to its bus.
Then use the `SDSPI_HOST_DEFAULT` macro to initialize the `sdmmc_host_t` structure, which is used to store the state and configurations of the upper layer (SD/SDIO/MMC driver). Modify the slot parameter of the structure to the SD SPI device SD SPI handle just returned from `sdspi_host_init_device`. Call `sdspi_host_init` with the `sdmmc_host_t` to probe and initialize the SD card.

Now you can use SD/SDIO/MMC driver functions to access your card!

**Other Details**

Only the following driver’s API functions are normally used by most applications:

- `sdspi_host_init()`
- `sdspi_host_init_device()`
- `sdspi_host_remove_device()`
- `sdspi_host_deinit()`

Other functions are mostly used by the protocol level SD/SDIO/MMC driver via function pointers in the `sdmmc_host_t` structure. For more details, see [SD/SDIO/MMC Driver](#).

**Note:** SD over SPI does not support speeds above `SDMMC_FREQ_DEFAULT` due to the limitations of the SPI driver.

**Warning:** If you want to share the SPI bus among SD card and other SPI devices, there are some restrictions, see [Sharing the SPI Bus Among SD Cards and Other SPI Devices](#).

**Related Docs**

[Sharing the SPI Bus Among SD Cards and Other SPI Devices](#)

The SD card has an SPI mode, enabling it to function as an SPI device, but there are some restrictions that we need to pay attention to.

**Pin Loading of Other Devices**  When adding more devices onto the same bus, the overall pin loading increases. The loading consists of AC loading (pin capacitor) and DC loading (pull-ups).

**AC Loading**  SD cards, designed for high-speed communications, have small pin capacitors (AC loading) to work until 50 MHz. However, the other attached devices will increase the pin’s AC loading.

Heavy AC loading of a pin may prevent the pin from being toggled quickly. By using an oscilloscope, you will see the edges of the pin become smoother, i.e., the gradient of the edge is smaller. The setup timing requirements of an SD card may be violated when the card is connected to a bus with a high AC load. Even worse, high AC loads may cause the SD card and other SPI devices to fail to properly resolve clock signals from the host, affecting communication stability.

This issue may be more obvious if other attached devices are not designed to work at the same frequency as the SD card, because they may have larger pin capacitors. The larger the pin capacity, the greater the pin response time, the smaller the max frequency the SD bus can work.

To see if your pin AC loading is too heavy, you can try the following tests:

**Terminology:**

- **launch edge:** at which clock edge the data starts to toggle;
- **latch edge:** at which clock edge the data is supposed to be sampled by the receiver. For SD card, it is the rising edge.

1. Use an oscilloscope to see the clock and compare the data line to the clock.
Chapter 2. API Reference

• If you see the clock is not fast enough, e.g., the rising/falling edge is longer than 1/4 of the clock cycle, it means the clock is skewed too much.
• If you see the data line unstable before the latch edge of the clock, it means the load of the data line is too large.

You may also observe the corresponding phenomenon that data delayed largely from the launching edge of the clock with logic analyzers. But it is not as obvious as with an oscilloscope.

2. Try to use a slower clock frequency.

If the lower frequency can work while the higher frequency cannot, it is an indication that the AC loading on the pins is too large.

If the AC loading of the pins is too large, you can either use other faster devices with lower pin load or slow down the clock speed.

DC Loading  The pull-ups required by SD cards are usually around 10 kOhm to 50 kOhm, which may be too strong for some other SPI devices.

Check the specification of your device about its DC output current, it should be larger than 700 μA, otherwise, the device output may not be read correctly.

Initialization Sequence

Note: If you see any problem in the following steps, please make sure the timing is correct first. You can try to slow down the clock speed, such as setting SDMMC_FREQ_PROBING to 400 kHz for SD card, to avoid the influence of pin AC loading, as discussed in the previous section.

When using an SD card with other SPI devices on the same SPI bus, due to the restrictions of the SD card startup flow, the following initialization sequence should be followed. Refer to storage/sd_card for further details.

1. Initialize the SPI bus properly by spi_bus_initialize().
2. Tie the CS lines of all other devices than the SD card to idle state (by default it’s high). This is to avoid conflicts with the SD card in the following step.
   You can do this by either:
   1. Attach devices to the SPI bus by calling spi_bus_add_device(). This function will by default initialize the GPIO that is used as CS to the idle level: high.
   2. Initialize GPIO on the CS pin that needs to be tied up before actually adding a new device.
   3. Rely on the internal/external pull-up (not recommended) to pull up all the CS pins when the GPIOs of ESP are not initialized yet. You need to check carefully the pull-up is strong enough and there are no other pull-downs that will influence the pull-up. For example, internal pull-down should be enabled.
3. Mount the card to the filesystem by calling esp_vfs_fat_sdspi_mount().
   This step will put the SD card into the SPI mode, which should be done before all other SPI communications on the same bus. Otherwise, the card will stay in the SD mode, in which mode it may randomly respond to any SPI communications on the bus, even when its CS line is not addressed.
   If you want to test this behavior, please also note that, once the card is put into SPI mode, it will not return to SD mode before the next power cycle, i.e., powered down and powered up again.
4. Now you can talk to other SPI devices freely!

API Reference

Header File

• components/driver/spi/include/driver/sdspi_host.h

REQUIRES driver

or

PRIV_REQUIRES driver

Functions

**esp_err_t sdspi_host_init**(void)

Initialize SD SPI driver.

**Note:** This function is not thread safe

**Returns**

- ESP_OK on success
- other error codes may be returned in future versions

**esp_err_t sdspi_host_init_device**(const sdspi_device_config_t *dev_config, sdspi_dev_handle_t *out_handle)

Attach and initialize an SD SPI device on the specific SPI bus.

**Note:** This function is not thread safe

**Note:** Initialize the SPI bus by *spi_bus_initialize()* before calling this function.

**Note:** The SDIO over sdspi needs an extra interrupt line. Call *gpio_install_isr_service()* before this function.

**Parameters**

- **dev_config** - pointer to device configuration structure
- **out_handle** - Output of the handle to the sdspi device.

**Returns**

- ESP_OK on success
- ESP.ERR_INVALID_ARG if sdspi_host_init_device has invalid arguments
- ESP.ERR_NO_MEM if memory can not be allocated
- other errors from the underlying spi_master and gpio drivers

**esp_err_t sdspi_host_remove_device**(sdspi_dev_handle_t handle)

Remove an SD SPI device.

**Parameters**

- **handle** - Handle of the SD SPI device

**Returns**

- Always ESP_OK

**esp_err_t sdspi_host_do_transaction**(sdspi_dev_handle_t handle, sdmmc_command_t *cmdinfo)

Send command to the card and get response.

This function returns when command is sent and response is received, or data is transferred, or timeout occurs.

**Note:** This function is not thread safe w.r.t. init/deinit functions, and bus width/clock speed configuration functions. Multiple tasks can call sdspi_host_do_transaction as long as other sdspi_host_* functions are not called.
Chapter 2. API Reference

Parameters
- **handle** - Handle of the sdspi device
- **cmdinfo** - pointer to structure describing command and data to transfer

Returns
- ESP_OK on success
- ESP_ERR_TIMEOUT if response or data transfer has timed out
- ESP_ERR_INVALID_CRC if response or data transfer CRC check has failed
- ESP_ERR_INVALID_RESPONSE if the card has sent an invalid response

```c
esp_err_t sdspi_host_set_card_clk (sdspi_dev_handle_t host, uint32_t freq_khz)
```
Set card clock frequency.

Currently only integer fractions of 40MHz clock can be used. For High Speed cards, 40MHz can be used. For Default Speed cards, 20MHz can be used.

**Note:** This function is not thread safe

Parameters
- **host** - Handle of the sdspi device
- **freq_khz** - card clock frequency, in kHz

Returns
- ESP_OK on success
- other error codes may be returned in the future

```c
esp_err_t sdspi_host_get_real_freq (sdspi_dev_handle_t handle, int *real_freq_khz)
```
Calculate working frequency for specific device.

Parameters
- **handle** - SDSPI device handle
- **real_freq_khz** - [out] output parameter to hold the calculated frequency (in kHz)

Returns
- ESP_ERR_INVALID_ARG : handle is NULL or invalid or real_freq_khz parameter is NULL
- ESP_OK : Success

```c
esp_err_t sdspi_host_deinit (void)
```
Release resources allocated using sdspi_host_init.

**Note:** This function is not thread safe

Returns
- ESP_OK on success
- ESP_ERR_INVALID_STATE if sdspi_host_init function has not been called

```c
esp_err_t sdspi_host_io_int_enable (sdspi_dev_handle_t handle)
```
Enable SDIO interrupt.

Parameters **handle** - Handle of the sdspi device

Returns
- ESP_OK on success

```c
esp_err_t sdspi_host_io_int_wait (sdspi_dev_handle_t handle, TickType_t timeout_ticks)
```
Wait for SDIO interrupt until timeout.

Parameters
- **handle** - Handle of the sdspi device
- **timeout_ticks** - Ticks to wait before timeout.
Returns

- ESP_OK on success

Structures

struct sdspi_device_config_t
Extra configuration for SD SPI device.

Public Members

spi_host_device_t host_id
SPI host to use, SPIx_HOST (see spi_types.h).

gpio_num_t gpio_cs
GPIO number of CS signal.

gpio_num_t gpio_cd
GPIO number of card detect signal.

gpio_num_t gpio_wp
GPIO number of write protect signal.

gpio_num_t gpio_int
GPIO number of interrupt line (input) for SDIO card.

bool gpio_wp_polarity
GPIO write protect polarity 0 means “active low”, i.e. card is protected when the GPIO is low; 1 means “active high”, i.e. card is protected when GPIO is high.

Macros

SDSPI_DEFAULT_HOST

SDSPI_DEFAULT_DMA

SDSPI_HOST_DEFAULT()
Default sdmmc_host_t structure initializer for SD over SPI driver.
Uses SPI mode and max frequency set to 20MHz
’slot’ should be set to an sdspi device initialized by sdspi_host_init_device().

SDSPI_SLOT_NO_CS
indicates that card select line is not used

SDSPI_SLOT_NO_CD
indicates that card detect line is not used

SDSPI_SLOT_NO_WP
indicates that write protect line is not used
SDSPI_SLOT_NO_INT

indicates that interrupt line is not used

SDSPI_IO_ACTIVE_LOW

SDSPI_DEVICE_CONFIG_DEFAULT()

Macro defining default configuration of SD SPI device.

Type Definitions

typedef int sdspi_dev_handle_t

Handle representing an SD SPI device.

2.5.18 Sigma-Delta Modulation (SDM)

Introduction

ESP32-S2 has a second-order sigma-delta modulator, which can generate independent PDM pulses to multiple channels. Please refer to the TRM to check how many hardware channels are available.¹

Delta-sigma modulation converts an analog voltage signal into a pulse frequency, or pulse density, which can be understood as pulse-density modulation (PDM) (refer to Delta-sigma modulation on Wikipedia).

The main differences comparing to I2S PDM mode and DAC peripheral are:

1. SDM has no clock signal, it is just like the DAC mode of PDM;
2. SDM has no DMA, and it can not change its output density continuously. If you have to, you can update the density in a timer’s callback;
3. Based on the former two points, unlike the DAC peripheral, an external active or passive low-pass filter is required additionally to restore the analog wave (See Convert to an Analog Signal (Optional)).

Typically, a Sigma-Delta modulated channel can be used in scenarios like:

- LED dimming
- Simple DAC (8-bit), with the help of an active RC low-pass filter
- Class D amplifier, with the help of a half-bridge or full-bridge circuit plus an LC low-pass filter

Functional Overview

The following sections of this document cover the typical steps to install and operate an SDM channel:

- Resource Allocation - covers how to initialize and configure an SDM channel and how to recycle the resources when it finishes working,
- Enable and Disable Channel - covers how to enable and disable the channel,
- Set Pulse Density - describes how to set the equivalent duty cycle of the PDM pulses,
- Power Management - describes how different source clock selections can affect power consumption,
- IRAM Safe - lists which functions are supposed to work even when the cache is disabled,
- Thread Safety - lists which APIs are guaranteed to be thread-safe by the driver.
- Kconfig Options - lists the supported Kconfig options that can be used to make a different effect on driver behavior.

¹ Different ESP chip series might have different numbers of SDM channels. Please refer to Chapter GPIO and IOMUX in ESP32-S2 Technical Reference Manual for more details. The driver does not forbid you from applying for more channels, but it will return an error when all available hardware resources are used up. Please always check the return value when doing resource allocation (e.g., sdm_new_channel()).
Resource Allocation  In ESP-IDF, the information and attributes of SDM channels are managed and accessed through specific data structures, where the data structure is called sdm_channel_handle_t. Each channel is capable to output the binary, hardware-generated signal with the sigma-delta modulation. The driver manages all available channels in a pool so that there is no need to manually assign a fixed channel to a GPIO.

To install an SDM channel, you should call sdm_new_channel() to get a channel handle. Channel-specific configurations are passed in the sdm_config_t structure:

- sdm_config_t::gpio_num sets the GPIO that the PDM pulses output from.
- sdm_config_t::clk_src selects the source clock for the SDM module. Note that, all channels should select the same clock source.
- sdm_config_t::sample_rate_hz sets the sample rate of the SDM module.
- sdm_config_t::invert_out sets whether to invert the output signal.
- sdm_config_t::io_loop_back is for debugging purposes only. It enables both the GPIO’s input and output ability through the GPIO matrix peripheral.

The function sdm_new_channel() can fail due to various errors such as insufficient memory, invalid arguments, etc. Specifically, when there are no more free channels (i.e., all hardware SDM channels have been used up), ESP_ERR_NOT_FOUND will be returned.

If a previously created SDM channel is no longer required, you should recycle it by calling sdm_del_channel(). It allows the underlying HW channel to be used for other purposes. Before deleting an SDM channel handle, you should disable it by sdm_channel_disable() in advance or make sure it has not been enabled yet by sdm_channel_enable().

Creating an SDM Channel with a Sample Rate of 1 MHz

```c
sdm_channel_handle_t chan = NULL;
sdm_config_t config = {
    .clk_src = SDM_CLK_SRC_DEFAULT,
    .sample_rate_hz = 1 * 1000 * 1000,
    .gpio_num = 0,
};
ESP_ERROR_CHECK(sdm_new_channel(&config, &chan));
```

Enable and Disable Channel  Before doing further IO control to the SDM channel, you should enable it first, by calling sdm_channel_enable(). Internally, this function:

- switches the channel state from init to enable
- acquires a proper power management lock if a specific clock source (e.g., APB clock) is selected. See also Power Management for more information.

On the contrary, calling sdm_channel_disable() does the opposite, that is, put the channel back to the init state and releases the power management lock.

Set Pulse Density  For the output PDM signals, the pulse density decides the output analog voltage that is restored by a low-pass filter. The restored analog voltage from the channel is calculated by \[ V_{out} = \frac{V_{DD_IO}}{256} \times \text{duty} + \frac{V_{DD_IO}}{2}. \] The range of the quantized density input parameter of sdm_channel_set_pulse_density() is from -128 to 127 (8-bit signed integer). Depending on the value of the density parameter, the duty cycle of the output signal will be changed accordingly. For example, if a zero value is set, then the output signal’s duty will be around 50%.

Power Management  When power management is enabled (i.e., CONFIG_PM_ENABLE is on), the system will adjust the APB frequency before going into Light-sleep, thus potentially changing the sample rate of the sigma-delta modulator.

However, the driver can prevent the system from changing APB frequency by acquiring a power management lock of type ESP_PM_APB_FREQ_MAX. Whenever the driver creates an SDM channel instance that has selected SDM_CLK_SRC_APB as its clock source, the driver guarantees that the power management lock is ac-
quired when enabling the channel by `sdm_channel_enable()`. Likewise, the driver releases the lock when `sdm_channel_disable()` is called for that channel.

**IRAM Safe** There is a Kconfig option `CONFIG_SDM_CTRL_FUNC_IN_IRAM` that can put commonly-used IO control functions into IRAM as well. So that these functions can also be executable when the cache is disabled. These IO control functions are listed as follows:

- `sdm_channel_set_pulse_density()`

**Thread Safety** The factory function `sdm_new_channel()` is guaranteed to be thread-safe by the driver, which means, the user can call it from different RTOS tasks without protection by extra locks.

The following functions are allowed to run under ISR context, the driver uses a critical section to prevent them being called concurrently in both task and ISR.

- `sdm_channel_set_pulse_density()`

Other functions that take the `sdm_channel_handle_t` as the first positional parameter, are not treated as thread-safe. This means the user should avoid calling them from multiple tasks.

**Kconfig Options**
- `CONFIG_SDM_CTRL_FUNC_IN_IRAM` controls where to place the SDM channel control functions (IRAM or Flash), see **IRAM Safe** for more information.
- `CONFIG_SDM_ENABLE_DEBUG_LOG` is used to enable the debug log output. Enabling this option increases the firmware binary size.

**Convert to an Analog Signal (Optional)**

Typically, if a Sigma-Delta signal is connected to an LED to adjust the brightness, you do not have to add any filter between them, because our eyes have their own low-pass filters for changes in light intensity. However, if you want to check the real voltage or watch the analog waveform, you need to design an analog low-pass filter. Also, it is recommended to use an active filter instead of a passive filter to gain better isolation and not lose too much voltage.

For example, you can take the following Sallen-Key topology Low Pass Filter as a reference.

**Application Example**

- 100 Hz sine wave that is modulated with Sigma-Delta: `peripherals/sigma_delta/sdm_dac`
- LED driven by a GPIO that is modulated with Sigma-Delta: `peripherals/sigma_delta/sdm_led`

**API Reference**

**Header File**
- `components/driver/sigma_delta/include/driver/sdm.h`

This header file can be included with:

```c
#include "driver/sdm.h"
```

This header file is a part of the API provided by the `driver` component. To declare that your component depends on `driver`, add the following to your `CMakeLists.txt`:

```cmake
REQUIRES driver
```

or

```cmake
PRIV_REQUIRES driver
```
Chapter 2. API Reference

Fig. 20: Sallen-Key Low Pass Filter

Functions

`esp_err_t sdm_new_channel (const sdm_config_t *config, sdm_channel_handle_t *ret_chan)`

Create a new Sigma Delta channel.

**Parameters**
- `config` [in] SDM configuration
- `ret_chan` [out] Returned SDM channel handle

**Returns**
- ESP_OK: Create SDM channel successfully
- ESP_ERR_INVALID_ARG: Create SDM channel failed because of invalid argument
- ESP_ERR_NO_MEM: Create SDM channel failed because out of memory
- ESP_ERR_NOT_FOUND: Create SDM channel failed because all channels are used up and no more free one
- ESP_FAIL: Create SDM channel failed because of other error

`esp_err_t sdm_del_channel (sdm_channel_handle_t chan)`

Delete the Sigma Delta channel.

**Parameters**
- `chan` [in] SDM channel created by `sdm_new_channel`

**Returns**
- ESP_OK: Delete the SDM channel successfully
- ESP_ERR_INVALID_ARG: Delete the SDM channel failed because of invalid argument
- ESP_ERR_INVALID_STATE: Delete the SDM channel failed because the channel is not in init state
- ESP_FAIL: Delete the SDM channel failed because of other error

`esp_err_t sdm_channel_enable (sdm_channel_handle_t chan)`

Enable the Sigma Delta channel.

**Note:** This function will transit the channel state from init to enable.

**Note:** This function will acquire a PM lock, if a specific source clock (e.g. APB) is selected in the...
sdm_config_t, while CONFIG_PM_ENABLE is enabled.

Parameters
**chan** – [in] SDM channel created by sdm_new_channel

Returns
- ESP_OK: Enable SDM channel successfully
- ESP_ERR_INVALID_ARG: Enable SDM channel failed because of invalid argument
- ESP_ERR_INVALID_STATE: Enable SDM channel failed because the channel is already enabled
- ESP_FAIL: Enable SDM channel failed because of other error

**esp_err_t sdm_channel_disable (sdm_channel_handle_t chan)**

Disable the Sigma Delta channel.

**Note:** This function will do the opposite work to the sdm_channel_enable()

Parameters
**chan** – [in] SDM channel created by sdm_new_channel

Returns
- ESP_OK: Disable SDM channel successfully
- ESP_ERR_INVALID_ARG: Disable SDM channel failed because of invalid argument
- ESP_ERR_INVALID_STATE: Disable SDM channel failed because the channel is not enabled yet
- ESP_FAIL: Disable SDM channel failed because of other error

**esp_err_t sdm_channel_set_pulse_density (sdm_channel_handle_t chan, int8_t density)**

Set the pulse density of the PDM output signal.

**Note:** The raw output signal requires a low-pass filter to restore it into analog voltage, the restored analog output voltage could be \( V_{out} = V_{DD\_IO}/256 \times \text{density} + V_{DD\_IO}/2 \)

**Note:** This function is allowed to run within ISR context

**Note:** This function will be placed into IRAM if CONFIG_SDM_CTRL_FUNC_IN_IRAM is on, so that it’s allowed to be executed when Cache is disabled

Parameters
- **chan** – [in] SDM channel created by sdm_new_channel
- **density** – [in] Quantized pulse density of the PDM output signal, ranges from -128 to 127. But the range of [-90, 90] can provide a better randomness.

Returns
- ESP_OK: Set pulse density successfully
- ESP_ERR_INVALID_ARG: Set pulse density failed because of invalid argument
- ESP_FAIL: Set pulse density failed because of other error

**esp_err_t sdm_channel_set_duty (sdm_channel_handle_t chan, int8_t duty)**

The alias function of sdm_channel_set_pulse_density, it decides the pulse density of the output signal.

**Note:** sdm_channel_set_pulse_density has a more appropriate name compare this alias function, suggest to turn to sdm_channel_set_pulse_density instead
Parameters

- **chan** - [in] SDM channel created by `sdm_new_channel`
- **duty** - [in] Actually it’s the quantized pulse density of the PDM output signal

Returns

- **ESP_OK**: Set duty cycle successfully
- **ESP_ERR_INVALID_ARG**: Set duty cycle failed because of invalid argument
- **ESP_FAIL**: Set duty cycle failed because of other error

Structures

**struct sdm_config_t**

Sigma Delta channel configuration.

Public Members

```c
int gpio_num
GPIOnumber
```

```c
sdm_clock_source_t clk_src
Clocksource
```

```c
uint32_t sample_rate_hz
Over sample rate in Hz, it determines the frequency of the carrier pulses
```

```c
uint32_t invert_out
Whether to invert the output signal
```

```c
uint32_t io_loop_back
For debug/test, the signal output from the GPIO will be fed to the input path as well
```

```c
struct sdm_config_t::[anonymous] flags
Extra flags
```

Type Definitions

```c
typedef struct sdm_channel_t *sdm_channel_handle_t
Type of Sigma Delta channel handle.
```

Header File

- `components/hal/include/hal/sdm_types.h`
- This header file can be included with:

```
#include "hal/sdm_types.h"
```

Type Definitions

```c
typedef soc_periph_sdm_clk_src_t sdm_clock_source_t
```
2.5.19  SPI Flash API

Overview

The spi_flash component contains API functions related to reading, writing, erasing, and memory mapping for data in the external flash.

For higher-level API functions which work with partitions defined in the partition table, see Partitions API

**Note:** esp_partition_* APIs are recommended to be used instead of the lower level esp_flash_* API functions when accessing the main SPI flash chip, since they conduct bounds checking and are guaranteed to calculate correct offsets in flash based on the information in the partition table. esp_flash_* functions can still be used directly when accessing an external (secondary) SPI flash chip.

Different from the API before ESP-IDF v4.0, the functionality of esp_flash_* APIs is not limited to the “main” SPI flash chip (the same SPI flash chip from which program runs). With different chip pointers, you can access external flash chips connected to not only SPI0/1 but also other SPI buses like SPI2.

**Note:** Instead of going through the cache connected to the SPI0 peripheral, most esp_flash_* APIs go through other SPI peripherals like SPI1, SPI2, etc. This makes them able to access not only the main flash, but also external (secondary) flash.

However, due to the limitations of the cache, operations through the cache are limited to the main flash. The address range limitation for these operations is also on the cache side. The cache is not able to access external flash chips or address range above its capabilities. These cache operations include: mmap, encrypted read/write, executing code or access to variables in the flash.

**Note:** Flash APIs after ESP-IDF v4.0 are no longer atomic. If a write operation occurs during another on-going read operation, and the flash addresses of both operations overlap, the data returned from the read operation may contain both old data and new data (that was updated written by the write operation).

**Note:** Encrypted flash operations are only supported with the main flash chip (and not with other flash chips, that is on SPI1 with different CS, or on other SPI buses). Reading through cache is only supported on the main flash, which is determined by the HW.

Support for Features of Flash Chips

**Quad/Dual Mode Chips** Features of different flashes are implemented in different ways and thus need special support. The fast/slow read and Dual mode (DOUT/DIO) of almost all flashes with 24-bit address are supported, because they do not need any vendor-specific commands.

Quad mode (QIO/QOUT) is supported on the following chip types:

1. ISSI
2. GD
3. MXIC
4. FM
5. Winbond
6. XMC
7. BOYA
Note: Only when one flash series listed above is supported by ESP32-S2, this flash series is supported by the chip driver by default. You can use Component config > SPI Flash driver > Auto-detect flash chips in menuconfig to enable/disable a flash series.

Optional Features

Optional Features for Flash Some features are not supported on all ESP chips and Flash chips. You can check the list below for more information.

- Auto Suspend & Resume
- Flash unique ID
- High performance mode
- OPI flash support
- 32-bit Address Flash Chips

Note: When Flash optional features listed in this page are used, aside from the capability of ESP chips, and ESP-IDF verison you are using, you will also need to make sure these features are supported by flash chips used.

- If you are using an official Espressif modules/SiP. Some of the modules/SiPs always support the feature, in this case you can see these features listed in the datasheet. Otherwise please contact Espressif’s business team to know if we can supply such products for you.
- If you are making your own modules with your own bought flash chips, and you need features listed above. Please contact your vendor if they support the those features, and make sure that the chips can be supplied continuously.

Attention: This document only shows that ESP-IDF code has supported the features of those flash chips. It is not a list of stable flash chips certified by Espressif. If you build your own hardware from flash chips with your own brought flash chips (even with flash listed in this page), you need to validate the reliability of flash chips yourself.

Auto Suspend & Resume This feature is only supported on ESP32-S3, ESP32-C2, ESP32-C3, ESP32-C6, ESP32-H2 for now.

The support for ESP32-P4 may be added in the future.

Flash Unique ID This feature is supported on all Espressif chips.

Unique ID is not flash id, which means flash has 64-Bit unique ID for each device. The instruction to read the unique ID (4Bh) accesses a factory-set read-only 64-bit number that is unique to each flash device. This ID number helps you to recognize each single device. Not all flash vendors support this feature. If you try to read the unique ID on a chip which does not have this feature, the behavior is not determined. The support list is as follows.

List of Flash chips that support this feature:

1. ISSI
2. GD
3. TH
4. FM
5. Winbond
6. XMC
7. BOYA
Chapter 2. API Reference

**High Performance Mode**  This feature is only supported on ESP32-S3 for now.
The support for ESP32-S2, ESP32-C3, ESP32-C6, ESP32-H2, ESP32-P4 may be added in the future.

**OPI flash Support**  This feature is only supported on ESP32-S3 for now.
OPI flash means that the flash chip supports octal peripheral interface, which has octal I/O pins. Different octal flash has different configurations and different commands. Hence, it is necessary to carefully check the support list.

**32-bit Address Flash Chips**  This feature is supported on all Espressif chips (with various restrictions to application).
Most NOR flash chips used by Espressif chips use 24-bits address, which can cover 16 MBytes memory. However, for larger memory (usually equal to or larger than 16 MBytes), flash uses a 32-bits address to address larger memory. Regrettably, 32-bits address chips have vendor-specific commands, so we need to support the chips one by one.

List of Flash chips that support this feature:
1. W25Q256
2. GD25Q256

**Important:** Over 16 MBytes space on flash mentioned above can be only used for **data saving**, like file system. If your data/instructions over 16 MBytes spaces need to be mapped to MMU (so as to be accessed by the CPU), please enable the config `IDF_EXPERIMENTAL_FEATURES` and `BOOTLOADER_CACHE_32BIT_ADDR_FLASH` and read the limitations following:

1. This feature is valid only for 4-line flash. Octal flash supports 32-bit-addr by default
2. This feature needs the MMU on ESP chip to be able to map to >= 16 MB physical address on the Flash. (Only ESP32S3 supports this up to now)
3. This option is experimental, which means it can not use on all flash chips stable, for more information, please contact Espressif Business support.

There are some features that are not supported by all flash chips, or not supported by all Espressif chips. These features include:

- 32-bit address flash - usually means that the flash has higher capacity (equal to or larger than 16 MB) that needs longer addresses.
- Flash unique ID - means that flash supports its unique 64-bit ID.

If you want to use these features, please ensure both ESP32-S2 and ALL flash chips in your product support these features. For more details, refer to *Optional Features for Flash*.

You may also customise your own flash chip driver. See *Overriding Default Chip Drivers* for more details.

**Warning:** Customizing SPI Flash Chip Drivers is considered an “expert” feature. Users should only do so at their own risk. (See the notes below)

**Overriding Default Chip Drivers**  During the SPI Flash driver’s initialization (i.e., `esp_flash_init()`), there is a chip detection step during which the driver iterates through a Default Chip Driver List and determine which chip driver can properly support the currently connected flash chip. The Default Chip Drivers are provided by the ESP-IDF, thus are updated in together with each ESP-IDF version. However ESP-IDF also allows users to customize their own chip drivers.

Users should note the following when customizing chip drivers:

1. You may need to rely on some non-public ESP-IDF functions, which have slight possibility to change between ESP-IDF versions. On the one hand, these changes may be useful bug fixes for your driver, on the other hand, they may also be breaking changes (i.e., breaks your code).
2. Some ESP-IDF bug fixes to other chip drivers are not automatically applied to your own custom chip drivers.
3. If the protection of flash is not handled properly, there may be some random reliability issues.
4. If you update to a newer ESP-IDF version that has support for more chips, you will have to manually add those new chip drivers into your custom chip driver list. Otherwise the driver will only search for the drivers in custom list you provided.

Steps For Creating Custom Chip Drivers and Overriding the ESP-IDF Default Driver List

1. Enable the `CONFIG_SPI_FLASH_OVERRIDE_CHIP_DRIVER_LIST` config option. This prevents compilation and linking of the Default Chip Driver List (default_registered_chips) provided by ESP-IDF. Instead, the linker searches for the structure of the same name (default_registered_chips) that must be provided by the user.
2. Add a new component in your project, e.g., `custom_chip_driver`.
3. Copy the necessary chip driver files from the `spi_flash` component in ESP-IDF. This may include:
   - `spi_flash_chip_drivers.c` (to provide the default_registered_chips structure)
   - Any of the `spi_flash_chip_*.c` files that matches your own flash model best
   - `CMakeLists.txt` and `linker.lf` files

Modify the files above properly. Including:
   - Change the `default_registered_chips` variable to non-static and remove the #ifdef logic around it.
   - Update `linker.lf` file to rename the fragment header and the library name to match the new component.
   - If reusing other drivers, some header names need prefixing with `spi_flash/` when included from outside `spi_flash` component.

**Note:**

- When writing your own flash chip driver, you can set your flash chip capabilities through `spi_flash_chip_***{vendor}_get_caps` and points the function pointer `get_chip_caps` for protection to the `spi_flash_chip_***_get_caps` function. The steps are as follows.
  1. Please check whether your flash chip have the capabilities listed in `spi_flash_caps_t` by checking the flash datasheet.
  2. Write a function named `spi_flash_chip_***{vendor}_get_caps`. Take the example below as a reference. (if the flash support suspend and read unique id).
  3. Points the pointer `get_chip_caps` (in `spi_flash_chip_t`) to the function mentioned above.

```c
spi_flash_caps_t spi_flash_chip_***{vendor}_get_caps(esp_flash_t *chip)
{
    spi_flash_caps_t caps_flags = 0;
    // 32-bit-address flash is not supported
    flash_suspend is supported
    caps_flags |= SPI_FLAHS_CHIP_CAP_SUSPEND;
    // flash read unique id.
    caps_flags |= SPI_FLASH_CHIP_CAP_UNIQUE_ID;
    return caps_flags;
}
```

```c
const spi_flash_chip_t esp_flash_chip_eon = {
    // Other function pointers
    .get_chip_caps = spi_flash_chip_eon_get_caps,
};
```

- You also can see how to implement this in the example `storage/custom_flash_driver`.

4. Write a new `CMakeLists.txt` file for the `custom_chip_driver` component, including an additional line to add a linker dependency from `spi_flash` to `custom_chip_driver`:
5. The linker.lf is used to put every chip driver that you are going to use whilst cache is disabled into internal RAM. See Linker Script Generation for more details. Make sure this file covers all the source files that you add.

6. Build your project, and you will see the new flash driver is used.

**Example**  See also storage/custom_flash_driver.

### Initializing a Flash Device

To use the `esp_flash_*` APIs, you need to initialise a flash chip on a certain SPI bus, as shown below:

1. Call `spi_bus_initialize()` to properly initialize an SPI bus. This function initializes the resources (I/O, DMA, interrupts) shared among devices attached to this bus.
2. Call `spi_bus_add_flash_device()` to attach the flash device to the bus. This function allocates memory and fills the members for the `esp_flash_t` structure. The CS I/O is also initialized here.
3. Call `esp_flash_init()` to actually communicate with the chip. This also detects the chip type, and influence the following operations.

**Note:** Multiple flash chips can be attached to the same bus now.

### SPI Flash Access API

This is the set of API functions for working with data in flash:

- `esp_flash_read()` reads data from flash to RAM
- `esp_flash_write()` writes data from RAM to flash
- `esp_flash_erase_region()` erases specific region of flash
- `esp_flash_erase_chip()` erases the whole flash
- `esp_flash_get_chip_size()` returns flash chip size, in bytes, as configured in menuconfig

Generally, try to avoid using the raw SPI flash functions to the “main” SPI flash chip in favour of partition-specific functions.

### SPI Flash Size

The SPI flash size is configured by writing a field in the software bootloader image header, flashed at offset 0x1000. By default, the SPI flash size is detected by `esptool.py` when this bootloader is written to flash, and the header is updated with the correct size. Alternatively, it is possible to generate a fixed flash size by setting `CONFIG_ESPTOOLPY_FLASHSIZE` in the project configuration.

If it is necessary to override the configured flash size at runtime, it is possible to set the `chip_size` member of the `g_rom_flashchip` structure. This size is used by `esp_flash_*` functions (in both software & ROM) to check the bounds.
Concurrent Constraints for Flash on SPI1

Concurrent Constraints for Flash on SPI1

The SPI0/1 bus is shared between the instruction & data cache (for firmware execution) and the SPI1 peripheral (controlled by the drivers including this SPI Flash driver). Hence, operations to SPI1 will cause significant influence to the whole system. This kind of operations include calling SPI Flash API or other drivers on SPI1 bus, any operations like read/write/erase or other user defined SPI operations, regardless to the main flash or other SPI slave devices.

On ESP32-S2, the config options `CONFIG_SPIRAM_FETCH_INSTRUCTIONS` (disabled by default) and `CONFIG_SPIRAM_RODATA` (disabled by default) allow the cache to read/write PSRAM concurrently with SPI1 operations. See XIP from PSRAM Feature for more details.

If these options are disabled, the caches must be disabled while reading/writing/erasing operations. There are some constraints using driver on the SPI1 bus, see When the Caches Are Disabled. These constraints will cause more IRAM/DRAM usages.

**When the Caches Are Disabled** Under this condition, all CPUs should always execute code and access data from internal RAM. The APIs documented in this file will disable the caches automatically and transparently.

**Note:** When `CONFIG_SPIRAM_FETCH_INSTRUCTIONS` and `CONFIG_SPIRAM_RODATA` are both enabled, these APIs will not disable the caches.

The way that these APIs disable the caches also disables non-IRAM-safe interrupts. These will be restored until the Flash operation completes.

See also OS Functions and SPI Bus Lock.

There are no such constraints and impacts for flash chips on other SPI buses than SPI0/1.

For differences between internal RAM (e.g., IRAM, DRAM) and flash cache, please refer to the application memory layout documentation.

**IRAM-Safe Interrupt Handlers** For interrupt handlers which need to execute when the cache is disabled (e.g., for low latency operations), set the `ESP_INTR_FLAG_IRAM` flag when the interrupt handler is registered.

You must ensure that all data and functions accessed by these interrupt handlers, including the ones that handlers call, are located in IRAM or DRAM. See How to Place Code in IRAM.

If a function or symbol is not correctly put into IRAM/DRAM, and the interrupt handler reads from the flash cache during a flash operation, it will cause a crash due to Illegal Instruction exception (for code which should be in IRAM) or garbage data to be read (for constant data which should be in DRAM).

**Note:** When working with strings in ISRs, it is not advised to use `printf` and other output functions. For debugging purposes, use `ESP_DRAM_LOGE()` and similar macros when logging from ISRs. Make sure that both `TAG` and `formatstring` are placed into DRAM in that case.

**Non-IRAM-Safe Interrupt Handlers** If the `ESP_INTR_FLAG_IRAM` flag is not set when registering, the interrupt handler will not get executed when the caches are disabled. Once the caches are restored, the non-IRAM-safe interrupts will be re-enabled. After this moment, the interrupt handler will run normally again. This means that as long as caches are disabled, users will not see the corresponding hardware event happening.

**XIP from PSRAM Feature** If `CONFIG_SPIRAM_FETCH_INSTRUCTIONS` is enabled, the flash `.text` sections (used for instructions) will be placed in PSRAM.

If `CONFIG_SPIRAM_RODATA` is enabled, the flash `.rodata` sections (used for read only data) will be placed in PSRAM.
The corresponding virtual memory range will be re-mapped to PSRAM.

If both of the above options are enabled, the Cache won’t be disabled during an SPI1 Flash operation. You don’t need to make sure ISRs, ISR callbacks and involved data are placed in internal RAM.

**Attention:** The SPI0/1 bus is shared between the instruction & data cache (for firmware execution) and the SPI1 peripheral (controlled by the drivers including this SPI flash driver). Hence, calling SPI Flash API on SPI1 bus (including the main flash) causes significant influence to the whole system. See *Concurrency Constraints for Flash on SPI1* for more details.

### SPI Flash Encryption

It is possible to encrypt the contents of SPI flash and have it transparently decrypted by hardware.

Refer to the *Flash Encryption documentation* for more details.

### Memory Mapping API

ESP32-S2 features memory hardware which allows regions of flash memory to be mapped into instruction and data address spaces. This mapping works only for read operations. It is not possible to modify contents of flash memory by writing to a mapped memory region.

Mapping happens in 64 KB pages. Memory mapping hardware can map flash into the data address space and the instruction address space. See the technical reference manual for more details and limitations about memory mapping hardware.

Note that some pages are used to map the application itself into memory, so the actual number of available pages may be less than the capability of the hardware.

Reading data from flash using a memory mapped region is the only way to decrypt contents of flash when *flash encryption* is enabled. Decryption is performed at the hardware level.

Memory mapping API are declared in *spi_flash_mmap.h* and *esp_partition.h*:

- `spi_flash_mmap()` maps a region of physical flash addresses into instruction space or data space of the CPU.
- `spi_flash_munmap()` unmaps previously mapped region.
- `esp_partition_mmap()` maps part of a partition into the instruction space or data space of the CPU.

Differences between `spi_flash_mmap()` and `esp_partition_mmap()` are as follows:

- `spi_flash_mmap()` must be given a 64 KB aligned physical address.
- `esp_partition_mmap()` may be given any arbitrary offset within the partition. It adjusts the returned pointer to mapped memory as necessary.

Note that since memory mapping happens in pages, it may be possible to read data outside of the partition provided to `esp_partition_mmap`, regardless of the partition boundary.

**Note:** mmap is supported by cache, so it can only be used on main flash.

### SPI Flash Implementation

The `esp_flash_t` structure holds chip data as well as three important parts of this API:

1. The host driver, which provides the hardware support to access the chip;
2. The chip driver, which provides compatibility service to different chips;
3. The OS functions, provide support of some OS functions (e.g., lock, delay) in different stages (1st/2nd boot, or the app).
**Host Driver** The host driver relies on an interface (spi_flash_host_driver_t) defined in the spi_flash_types.h (in the hal/include/hal folder). This interface provides some common functions to communicate with the chip.

In other files of the SPI HAL, some of these functions are implemented with existing ESP32-S2 memory-spi functionalities. However, due to the speed limitations of ESP32-S2, the HAL layer cannot provide high-speed implementations to some reading commands (so the support for it was dropped). The files (memspi_host_driver.h and .c) implement the high-speed version of these commands with the common_command function provided in the HAL, and wrap these functions as spi_flash_host_driver_t for upper layer to use.

You can also implement your own host driver, even with the GPIO. As long as all the functions in the spi_flash_host_driver_t are implemented, the esp_flash API can access the flash regardless of the low-level hardware.

**Chip Driver** The chip driver, defined in spi_flash_chip_driver.h, wraps basic functions provided by the host driver for the API layer to use.

Some operations need some commands to be sent first, or read some status afterwards. Some chips need different commands or values, or need special communication ways.

There is a type of chip called generic chip which stands for common chips. Other special chip drivers can be developed on the base of the generic chip.

The chip driver relies on the host driver.

**OS Functions** Currently the OS function layer provides entries of a lock and delay.

The lock (see SPI Bus Lock) is used to resolve the conflicts among the access of devices on the same SPI bus, and the SPI Flash chip access. E.g.

1. On SPI1 bus, the cache (used to fetch the data (code) in the Flash and PSRAM) should be disabled when the flash chip on the SPI0/1 is being accessed.
2. On the other buses, the flash driver needs to disable the ISR registered by SPI Master driver, to avoid conflicts.
3. Some devices of SPI Master driver may require to use the bus monopolized during a period (especially when the device does not have a CS wire, or the wire is controlled by software like SDSPI driver).

The delay is used by some long operations which requires the master to wait or polling periodically.

The top API wraps these the chip driver and OS functions into an entire component, and also provides some argument checking.

OS functions can also help to avoid a watchdog timeout when erasing large flash areas. During this time, the CPU is occupied with the flash erasing task. This stops other tasks from being executed. Among these tasks is the idle task to feed the watchdog timer (WDT). If the configuration option CONFIG_ESP_TASK_WDT_PANIC is selected and the flash operation time is longer than the watchdog timeout period, the system will reboot.

It is pretty hard to totally eliminate this risk, because the erasing time varies with different flash chips, making it hard to be compatible in flash drivers. Therefore, users need to pay attention to it. Please use the following guidelines:

1. It is recommended to enable the CONFIG_SPI_FLASH_YIELD_DURING_ERASE option to allow the scheduler to re-schedule during erasing flash memory. Besides, following parameters can also be used.

   • Increase CONFIG_SPI_FLASH_ERASE_YIELD_TICKS or decrease CONFIG_SPI_FLASH_ERASE_YIELD_DURATION_MS in menuconfig.
   • You can also increase CONFIG_ESP_TASK_WDT_TIMEOUT_S in menuconfig for a larger watchdog timeout period. However, with larger watchdog timeout period, previously detected timeouts may no longer be detected.

2. Please be aware of the consequences of enabling the CONFIG_ESP_TASK_WDT_PANIC option when doing long-running SPI flash operations which triggers the panic handler when it times out. However, this option can also help dealing with unexpected exceptions in your application. Please decide whether this is needed to be enabled according to actual condition.

3. During your development, please carefully review the actual flash operation according to the specific requirements and time limits on erasing flash memory of your projects. Always allow reasonable redundancy based
on your specific product requirements when configuring the flash erasing timeout threshold, thus improving the reliability of your product.

Implementation Details

In order to perform some flash operations, it is necessary to make sure that both CPUs are not running any code from flash for the duration of the flash operation:

- In a single-core setup, the SDK needs to disable interrupts or scheduler before performing the flash operation.
- In a dual-core setup, the SDK needs to make sure that both CPUs are not running any code from flash.

When SPI flash API is called on CPU A (can be PRO or APP), start the `spi_flash_op_block_func` function on CPU B using the `esp_ipc_call` API. This API wakes up a high priority task on CPU B and tells it to execute a given function, in this case, `spi_flash_op_block_func`. This function disables cache on CPU B and signals that the cache is disabled by setting the `s_flash_op_can_start` flag. Then the task on CPU A disables cache as well and proceeds to execute flash operation.

While a flash operation is running, interrupts can still run on CPUs A and B. It is assumed that all interrupt code is placed into RAM. Once the interrupt allocation API is added, a flag should be added to request the interrupt to be disabled for the duration of a flash operations.

Once the flash operation is complete, the function on CPU A sets another flag, `s_flash_op_complete`, to let the task on CPU B know that it can re-enable cache and release the CPU. Then the function on CPU A re-enables the cache on CPU A as well and returns control to the calling code.

Additionally, all API functions are protected with a mutex (`s_flash_op_mutex`).

In a single core environment (`CONFIG_FREERTOS_UNICORE` enabled), you need to disable both caches, so that no inter-CPU communication can take place.

SPI Flash API ESP-IDF Version vs Chip-ROM Version

There is a set of SPI Flash drivers in Chip-ROM which you can use by enabling `CONFIG_SPI_FLASH_ROM_IMPL`. Most of the ESP-IDF SPI Flash driver code are in internal RAM, therefore enabling this option frees some internal RAM usage. Note if you enable this option, this means some SPI Flash driver features and bugfixes that are done in ESP-IDF might not be included in the Chip-ROM version.

Feature Supported by ESP-IDF but Not in Chip-ROM

- Octal Flash chip support. See [SPI flash Support](#) for details.
- 32-bit-address support for GD25Q256. Note this feature is an optional feature, please do read [32-bit Address Flash Chips](#) for details.
- TH Flash chip support.
- Kconfig option `CONFIG_SPI_FLASH_CHECK_ERASE_TIMEOUT_DISABLED`, enabling this option helps you detect bad writing.
- `CONFIG_SPI_FLASH_LOG_FAILED_WRITE`, enabling this option prints the bad writing.
- `CONFIG_SPI_FLASH_WARN_SETTING_ZERO_TO_ONE`, enabling this option checks if you are writing zero to one.
- `CONFIG_SPI_FLASH_DANGEROUS_WRITE`, enabling this option checks for flash programming to certain protected regions like bootloader, partition table or application itself.
- `CONFIG_SPI_FLASH_ENABLE_COUNTERS`, enabling this option to collect performance data for ESP-IDF SPI Flash driver APIs.
• **CONFIG_SPI_FLASH_AUTO_SUSPEND**, enabling this option to automatically suspend / resume a long Flash operation when short Flash operation happens. Note this feature is an optional feature, please do read *Auto Suspend & Resume* for more limitations.

**Bugfixes Introduced in ESP-IDF but Not in Chip-ROM**

• Detected Flash physical size correctly, for larger than 256MBit Flash chips. (Commit ID: b4964279d44f73cce7cfdf5684567fd6569e)
• Fixed issue that only 4MB virtual address ranges can be mapped to read-only data on Flash.

**API Reference - SPI Flash**

**Header File**

• components/spi_flash/include/esp_flash_spi_init.h

This header file can be included with:

```c
#include "esp_flash_spi_init.h"
```

This header file is a part of the API provided by the *spi_flash* component. To declare that your component depends on *spi_flash*, add the following to your CMakeLists.txt:

```cmake
REQUIRES spi_flash
```
or

```cmake
PRIV_REQUIRES spi_flash
```

**Functions**

```c
esp_err_t spi_bus_add_flash_device (esp_flash_t **out_chip, const esp_flash_spi_device_config_t *config)
```

Add a SPI Flash device onto the SPI bus.

The bus should be already initialized by *spi_bus_initialization*.

**Parameters**

- `out_chip` – Pointer to hold the initialized chip.
- `config` – Configuration of the chips to initialize.

**Returns**

- ESP_ERR_INVALID_ARG: *out_chip* is NULL, or some field in the config is invalid.
- ESP_ERR_NO_MEM: failed to allocate memory for the chip structures.
- ESP_OK: success.

```c
esp_err_t spi_bus_remove_flash_device (esp_flash_t *chip)
```

Remove a SPI Flash device from the SPI bus.

**Parameters**

- `chip` – The flash device to remove.

**Returns**

- ESP_ERR_INVALID_ARG: The chip is invalid.
- ESP_OK: success.

**Structures**

```c
struct esp_flash_spi_device_config_t
```

Configurations for the SPI Flash to init.

**Public Members**
Chapter 2. API Reference

spi_host_device_t host_id
Bus to use.

int cs_io_num
GPIO pin to output the CS signal.

esp_flash_io_mode_t io_mode
IO mode to read from the Flash.

enum esp_flash_speed_s speed
Speed of the Flash clock. Replaced by freq_mhz.

int input_delay_ns
Input delay of the data pins, in ns. Set to 0 if unknown.

int cs_id
CS line ID, ignored when not host_id is not SPI1_HOST, or CONFIG_SPI_FLASH_SHARE_SPI1_BUS is enabled. In this case, the CS line used is automatically assigned by the SPI bus lock.

int freq_mhz
The frequency of flash chip(MHZ)

Header File

- components/spi_flash/include/esp_flash.h
- This header file can be included with:

```c
#include "esp_flash.h"
```

- This header file is a part of the API provided by the spi_flash component. To declare that your component depends on spi_flash, add the following to your CMakeLists.txt:

```cmake
REQUIRES spi_flash
```

or

```cmake
PRIV_REQUIRES spi_flash
```

Functions

esp_err_t esp_flash_init(esp_flash_t *chip)
Initialise SPI flash chip interface.

This function must be called before any other API functions are called for this chip.

**Note:** Only the host and read_mode fields of the chip structure must be initialised before this function is called. Other fields may be auto-detected if left set to zero or NULL.

**Note:** If the chip->drv pointer is NULL, chip chip_drv will be auto-detected based on its manufacturer & product IDs. See esp_flash_registered_flash_drivers pointer for details of this process.
Parameters chip – Pointer to SPI flash chip to use. If NULL, esp_flash_default_chip is substituted.

Returns ESP_OK on success, or a flash error code if initialisation fails.

bool esp_flash_chip_driver_initialized (const esp_flash_t *chip)
Check if appropriate chip driver is set.

Parameters chip – Pointer to SPI flash chip to use. If NULL, esp_flash_default_chip is substituted.

Returns true if set, otherwise false.

esp_err_t esp_flash_read_id (esp_flash_t *chip, uint32_t *out_id)
Read flash ID via the common “RDID” SPI flash command.

ID is a 24-bit value. Lower 16 bits of ‘id’ are the chip ID, upper 8 bits are the manufacturer ID.

Parameters
• chip – Pointer to identify flash chip. Must have been successfully initialised via esp_flash_init()
• out_id – [out] Pointer to receive ID value.

Returns ESP_OK on success, or a flash error code if operation failed.

esp_err_t esp_flash_get_size (esp_flash_t *chip, uint32_t *out_size)
Detect flash size based on flash ID.

Note: 1. Most flash chips use a common format for flash ID, where the lower 4 bits specify the size as a power of 2. If the manufacturer doesn’t follow this convention, the size may be incorrectly detected.

a. The out_size returned only stands for The out_size stands for the size in the binary image header. If you want to get the real size of the chip, please call esp_flash_get_physical_size instead.

esp_err_t esp_flash_get_physical_size (esp_flash_t *chip, uint32_t *flash_size)
Detect flash size based on flash ID.

Note: Most flash chips use a common format for flash ID, where the lower 4 bits specify the size as a power of 2. If the manufacturer doesn’t follow this convention, the size may be incorrectly detected.

Parameters
• chip – Pointer to identify flash chip. Must have been successfully initialised via esp_flash_init()
• out_size – [out] Detected size in bytes, standing for the size in the binary image header.

Returns ESP_OK on success, or a flash error code if operation failed.

esp_err_t esp_flash_read_unique_chip_id (esp_flash_t *chip, uint64_t *out_id)
Read flash unique ID via the common “RDUID” SPI flash command.

ID is a 64-bit value.
Note: This is an optional feature, which is not supported on all flash chips. READ PROGRAMMING GUIDE FIRST!

Parameters
- chip – Pointer to identify flash chip. Must have been successfully initialised via esp_flash_init().
- out_id [out] – Pointer to receive unique ID value.

Returns
- ESP_OK on success, or a flash error code if operation failed.
- ESP_ERR_NOT_SUPPORTED if the chip doesn’t support read id.

esp_err_t esp_flash_erase_chip (esp_flash_t *chip)
Erase flash chip contents.

Parameters
- chip – Pointer to identify flash chip. Must have been successfully initialised via esp_flash_init() 

Returns
- ESP_OK on success, 
- ESP_ERR_NOT_SUPPORTED if the chip is not able to perform the operation. This is indicated by WREN = 1 after the command is sent.
- ESP_ERR_NOT_ALLOWED if a read-only partition is present.
- Other flash error code if operation failed.

esp_err_t esp_flash_erase_region (esp_flash_t *chip, uint32_t start, uint32_t len)
Erase a region of the flash chip.

Sector size is specified in chip->drv->sector_size field (typically 4096 bytes.) ESP_ERR_INVALID_ARG will be returned if the start & length are not a multiple of this size.

Erase is performed using block (multi-sector) erases where possible (block size is specified in chip->drv->block_erase_size field, typically 65536 bytes). Remaining sectors are erased using individual sector erase commands.

Parameters
- chip – Pointer to identify flash chip. If NULL, esp_flash_default_chip is substituted.
- start – Address to start erasing flash. Must be sector aligned.
- len – Length of region to erase. Must also be sector aligned.

Returns
- ESP_OK on success, 
- ESP_ERR_NOT_SUPPORTED if the chip is not able to perform the operation. This is indicated by WREN = 1 after the command is sent.
- ESP_ERR_NOT_ALLOWED if the address range (start & start + len) overlaps with a read-only partition address space
- Other flash error code if operation failed.

esp_err_t esp_flash_get_chip_write_protect (esp_flash_t *chip, bool *write_protected)
Read if the entire chip is write protected.

Note: A correct result for this flag depends on the SPI flash chip model and chip_drv in use (via the ‘chip->drv’ field).

Parameters
- chip – Pointer to identify flash chip. If NULL, esp_flash_default_chip is substituted.
  Must have been successfully initialised via esp_flash_init()
• **write_protected**  – [out] Pointer to boolean, set to the value of the write protect flag.

Returns ESP_OK on success, or a flash error code if operation failed.

```c
esp_err_t esp_flash_set_chip_write_protect (esp_flash_t *chip, bool write_protect)
```

Set write protection for the SPI flash chip.

Some SPI flash chips may require a power cycle before write protect status can be cleared. Otherwise, write protection can be removed via a follow-up call to this function.

**Note:** Correct behaviour of this function depends on the SPI flash chip model and chip_drv in use (via the `chip->drv` field).

**Parameters**

- **chip** – Pointer to identify flash chip. If NULL, esp_flash_default_chip is substituted. Must have been successfully initialised via esp_flash_init()
- **write_protect** – Boolean value for the write protect flag

Returns ESP_OK on success, or a flash error code if operation failed.

```c
esp_err_t esp_flash_get_protectable_regions (const esp_flash_t *chip, const esp_flash_region_t **out_regions, uint32_t *out_num_regions)
```

Read the list of individually protectable regions of this SPI flash chip.

**Note:** Correct behaviour of this function depends on the SPI flash chip model and chip_drv in use (via the `chip->drv` field).

**Parameters**

- **chip** – Pointer to identify flash chip. Must have been successfully initialised via esp_flash_init()
- **out_regions** – [out] Pointer to receive a pointer to the array of protectable regions of the chip.
- **out_num_regions** – [out] Pointer to an integer receiving the count of protectable regions in the array returned in `out_regions`

Returns ESP_OK on success, or a flash error code if operation failed.

```c
esp_err_t esp_flash_get_protected_region (esp_flash_t *chip, const esp_flash_region_t *region, bool *out_protected)
```

Detect if a region of the SPI flash chip is protected.

**Note:** It is possible for this result to be false and write operations to still fail, if protection is enabled for the entire chip.

**Note:** Correct behaviour of this function depends on the SPI flash chip model and chip_drv in use (via the `chip->drv` field).

**Parameters**

- **chip** – Pointer to identify flash chip. Must have been successfully initialised via esp_flash_init()
- **region** – Pointer to a struct describing a protected region. This must match one of the regions returned from esp_flash_get_protectable_regions(…).
• out_protected – [out] Pointer to a flag which is set based on the protected status for this region.

Returns ESP_OK on success, or a flash error code if operation failed.

```
esp_err_t esp_flash_set_protected_region (esp_flash_t *chip, const esp_flash_region_t *region, bool protect)
```

Update the protected status for a region of the SPI flash chip.

**Note:** It is possible for the region protection flag to be cleared and write operations to still fail, if protection is enabled for the entire chip.

**Note:** Correct behaviour of this function depends on the SPI flash chip model and chip_drv in use (via the ‘chip->drv’ field).

**Parameters**
- chip – Pointer to identify flash chip. Must have been successfully initialised via esp_flash_init()
- region – Pointer to a struct describing a protected region. This must match one of the regions returned from esp_flash_get_protectable_regions(…).
- protect – Write protection flag to set.

Returns ESP_OK on success, or a flash error code if operation failed.

```
esp_err_t esp_flash_read (esp_flash_t *chip, void *buffer, uint32_t address, uint32_t length)
```

Read data from the SPI flash chip.

There are no alignment constraints on buffer, address or length.

**Note:** If on-chip flash encryption is used, this function returns raw (ie encrypted) data. Use the flash cache to transparently decrypt data.

**Parameters**
- chip – Pointer to identify flash chip. If NULL, esp_flash_default_chip is substituted. Must have been successfully initialise via esp_flash_init()
- buffer – Pointer to a buffer where the data will be read. To get better performance, this should be in the DRAM and word aligned.
- address – Address on flash to read from. Must be less than chip->size field.
- length – Length (in bytes) of data to read.

Returns
- ESP_OK: success
- ESP_ERR_NO_MEM: Buffer is in external PSRAM which cannot be concurrently accessed, and a temporary internal buffer could not be allocated.
- or a flash error code if operation failed.

```
esp_err_t esp_flash_write (esp_flash_t *chip, const void *buffer, uint32_t address, uint32_t length)
```

Write data to the SPI flash chip.

There are no alignment constraints on buffer, address or length.

**Parameters**
- chip – Pointer to identify flash chip. If NULL, esp_flash_default_chip is substituted. Must have been successfully initialised via esp_flash_init()
Chapter 2. API Reference

- **address** - Address on flash to write to. Must be previously erased (SPI NOR flash can only write bits 1->0).
- **buffer** - Pointer to a buffer with the data to write. To get better performance, this should be in the DRAM and word aligned.
- **length** - Length (in bytes) of data to write.

**Returns**
- ESP_OK on success
- ESP_FAIL, bad write, this will be detected only when CONFIG_SPI_FLASH_VERIFY_WRITE is enabled
- ESP_ERR_NOT_SUPPORTED if the chip is not able to perform the operation. This is indicated by WREN = 1 after the command is sent.
- ESP_ERR_NOT_ALLOWED if the address range (address — address + length) overlaps with a read-only partition address space
- Other flash error code if operation failed.

```
exp_err_t esp_flash_write_encrypted(esp_flash_t *chip, uint32_t address, const void *buffer, uint32_t length)
```

Encrypted and write data to the SPI flash chip using on-chip hardware flash encryption.

**Note:** Both address & length must be 16 byte aligned, as this is the encryption block size

### Parameters
- **chip** - Pointer to identify flash chip. Must be NULL (the main flash chip). For other chips, encrypted write is not supported.
- **address** - Address on flash to write to. 16 byte aligned. Must be previously erased (SPI NOR flash can only write bits 1->0).
- **buffer** - Pointer to a buffer with the data to write.
- **length** - Length (in bytes) of data to write. 16 byte aligned.

### Returns
- ESP_OK: on success
- ESP_FAIL: bad write, this will be detected only when CONFIG_SPI_FLASH_VERIFY_WRITE is enabled
- ESP_ERR_NOT_SUPPORTED: encrypted write not supported for this chip.
- ESP_ERR_INVALID_ARG: Either the address, buffer or length is invalid.
- ESP_ERR_NOT_ALLOWED if the address range (address — address + length) overlaps with a read-only partition address space

```
exp_err_t esp_flash_read_encrypted(esp_flash_t *chip, uint32_t address, void *out_buffer, uint32_t length)
```

Read and decrypt data from the SPI flash chip using on-chip hardware flash encryption.

### Parameters
- **chip** - Pointer to identify flash chip. Must be NULL (the main flash chip). For other chips, encrypted read is not supported.
- **address** - Address on flash to read from.
- **out_buffer** - Pointer to a buffer for the data to read to.
- **length** - Length (in bytes) of data to read.

### Returns
- ESP_OK: on success
- ESP_ERR_NOT_SUPPORTED: encrypted read not supported for this chip.

```
static inline bool esp_flash_is_quad_mode(const esp_flash_t *chip)
```

Returns true if chip is configured for Quad I/O or Quad Fast Read.

### Parameters
- **chip** - Pointer to SPI flash chip to use. If NULL, esp_flash_default_chip is substituted.

### Returns
- true if flash works in quad mode, otherwise false
Chapter 2. API Reference

Structures

struct esp_flash_region_t

Structure for describing a region of flash.

Public Members

uint32_t offset
Start address of this region.

uint32_t size
Size of the region.

struct esp_flash_os_functions_t

OS-level integration hooks for accessing flash chips inside a running OS.

It’s in the public header because some instances should be allocated statically in the startup code. May be updated according to hardware version and new flash chip feature requirements, shouldn’t be treated as public API.

For advanced developers, you may replace some of them with your implementations at your own risk.

Public Members

esp_err_t (*start)(void *arg)
Called before commencing any flash operation. Does not need to be recursive (ie is called at most once for each call to ‘end’).

esp_err_t (*end)(void *arg)
Called after completing any flash operation.

esp_err_t (*region_protected)(void *arg, size_t start_addr, size_t size)
Called before any erase/write operations to check whether the region is limited by the OS

esp_err_t (*delay_us)(void *arg, uint32_t us)
Delay for at least ‘us’ microseconds. Called in between ‘start’ and ‘end’.

void *(*get_temp_buffer)(void *arg, size_t request_size, size_t *out_size)
Called for get temp buffer when buffer from application cannot be directly read into/write from.

void *(*release_temp_buffer)(void *arg, void *temp_buf)
Called for release temp buffer.

esp_err_t (*check_yield)(void *arg, uint32_t chip_status, uint32_t *out_request)
Yield to other tasks. Called during erase operations.

Return ESP_OK means yield needs to be called (got an event to handle), while ESP_ERR_TIMEOUT means skip yield.

esp_err_t (*yield)(void *arg, uint32_t *out_status)
Yield to other tasks. Called during erase operations.
int64_t (*get_system_time)(void *arg)
    Called for get system time.

void (*set_flash_op_status)(uint32_t op_status)
    Call to set flash operation status

struct esp_flash_t
    Structure to describe a SPI flash chip connected to the system.
    Structure must be initialized before use (passed to esp_flash_init()). It’s in the public header because some instances should be allocated statically in the startup code. May be updated according to hardware version and new flash chip feature requirements, shouldn’t be treated as public API.
    For advanced developers, you may replace some of them with your implementations at your own risk.

Public Members

spi_flash_host_inst_t *host
    Pointer to hardware-specific “host_driver” structure. Must be initialized before used.

const spi_flash_chip_t *chip_drv
    Pointer to chip-model-specific “adapter” structure. If NULL, will be detected during initialisation.

const esp_flash_os_functions_t *os_func
    Pointer to os-specific hook structure. Call esp_flash_init_os_functions() to setup this field, after the host is properly initialized.

void *os_func_data
    Pointer to argument for os-specific hooks. Left NULL and will be initialized with os_func.

esp_flash_io_mode_t read_mode
    Configured SPI flash read mode. Set before esp_flash_init is called.

uint32_t size
    Size of SPI flash in bytes. If 0, size will be detected during initialisation. Note: this stands for the size in the binary image header. If you want to get the flash physical size, please call esp_flash_get_physical_size.

uint32_t chip_id
    Detected chip id.

uint32_t busy
    This flag is used to verify chip’s status.

uint32_t hpm_dummy_ena
    This flag is used to verify whether flash works under HPM status.

uint32_t reserved_flags
    reserved.
Macros

SPI_FLASH_YIELD_REQ_YIELD

SPI_FLASH_YIELD_REQ_SUSPEND

SPI_FLASH_YIELD_STA_RESUME

SPI_FLASH_OS_IS_ERASING_STATUS_FLAG

Type Definitions
typedef struct spi_flash_chip_t spi_flash_chip_t

Header File
- components/spi_flash/include/spi_flash_mmap.h
- This header file can be included with:
  
  #include "spi_flash_mmap.h"

- This header file is a part of the API provided by the spi_flash component. To declare that your component depends on spi_flash, add the following to your CMakeLists.txt:

  REQUIRES spi_flash

  or

  PRIV_REQUIRES spi_flash

Functions

esp_err_t spi_flash_mmap(size_t src_addr, size_t size, spi_flash_mmap_memory_t memory, const void **out_ptr, spi_flash_mmap_handle_t *out_handle)

Map region of flash memory into data or instruction address space.

This function allocates sufficient number of 64kB MMU pages and configurations them to map the requested region of flash memory into the address space. It may reuse MMU pages which already provide the required mapping.

As with any allocator, if mmap/munmap are heavily used then the address space may become fragmented. To troubleshoot issues with page allocation, use spiFlash_mmap_dump() function.

Parameters
- src_addr - Physical address in flash where requested region starts. This address must be aligned to 64kB boundary (SPI_FLASH_MMU_PAGE_SIZE)
- size - Size of region to be mapped. This size will be rounded up to a 64kB boundary
- memory - Address space where the region should be mapped (data or instruction)
- out_ptr - [out] Output, pointer to the mapped memory region
- out_handle - [out] Output, handle which should be used for spi_flash_mmap call

Returns
- ESP_OK on success, ESP_ERR_NO_MEM if pages cannot be allocated

esp_err_t spi_flash_mmap_pages(const int *pages, size_t page_count, spi_flash_mmap_memory_t memory, const void **out_ptr, spi_flash_mmap_handle_t *out_handle)

Map sequences of pages of flash memory into data or instruction address space.

This function allocates sufficient number of 64kB MMU pages and configurations them to map the indicated pages of flash memory contiguously into address space. In this respect, it works in a similar way as spi_flash_mmap() but it allows mapping a (maybe non-contiguous) set of pages into a contiguous region of memory.

Parameters
Chapter 2. API Reference

- **pages** – An array of numbers indicating the 64kB pages in flash to be mapped contiguously into memory. These indicate the indexes of the 64kB pages, not the byte-size addresses as used in other functions. Array must be located in internal memory.
- **page_count** – Number of entries in the pages array
- **memory** – Address space where the region should be mapped (instruction or data)
- **out_ptr** – [out] Output, pointer to the mapped memory region
- **out_handle** – [out] Output, handle which should be used for spi_flash_munmap call

### Returns
- ESP_OK on success
- ESP_ERR_NO_MEM if pages cannot be allocated
- ESP_ERR_INVALID_ARG if pagecount is zero or pages array is not in internal memory

```c
void spi_flash_munmap (spi_flash_mmap_handle_t handle)
```

Release region previously obtained using spi_flash_mmap.

**Note:** Calling this function will not necessarily unmmap memory region. Region will only be unmapped when there are no other handles which reference this region. In case of partially overlapping regions it is possible that memory will be unmapped partially.

### Parameters handle
- Handle obtained from spi_flash_mmap

```c
void spi_flash_mmap_dump (void)
```

Display information about mapped regions.

This function lists handles obtained using spi_flash_mmap, along with range of pages allocated to each handle. It also lists all non-zero entries of MMU table and corresponding reference counts.

```c
uint32_t spi_flash_mmap_get_free_pages (spi_flash_mmap_memory_t memory)
```

get free pages number which can be mmap

This function will return number of free pages available in mmu table. This could be useful before calling actual spi_flash_mmap (maps flash range to DCache or ICache memory) to check if there is sufficient space available for mapping.

- **Parameters memory** – memory type of MMU table free page
- **Returns** number of free pages which can be mmaped

```c
size_t spi_flash_cache2phys (const void *cached)
```

Given a memory address where flash is mapped, return the corresponding physical flash offset.

Cache address does not have have been assigned via spi_flash_mmap(), any address in memory mapped flash space can be looked up.

- **Parameters cached** – Pointer to flashed cached memory.
- **Returns**
  - SPI_FLASH_CACHE2PHYS_FAIL If cache address is outside flash cache region, or the address is not mapped.
  - Otherwise, returns physical offset in flash

```c
const void *spi_flash_phys2cache (size_t phys_offs, spi_flash_mmap_memory_t memory)
```

Given a physical offset in flash, return the address where it is mapped in the memory space.

Physical address does not have to have been assigned via spi_flash_mmap(), any address in flash can be looked up.

**Note:** Only the first matching cache address is returned. If MMU flash cache table is configured so multiple entries point to the same physical address, there may be more than one cache address corresponding to that physical address. It is also possible for a single physical address to be mapped to both the IROM and DROM regions.
Note: This function doesn’t impose any alignment constraints, but if memory argument is SPI_FLASH_MMAP_INST and phys_offs is not 4-byte aligned, then reading from the returned pointer will result in a crash.

Parameters
- **phys_offs** – Physical offset in flash memory to look up.
- **memory** – Address space type to look up a flash cache address mapping for (instruction or data)

Returns
- NULL if the physical address is invalid or not mapped to flash cache of the specified memory type.
- Cached memory address (in IROM or DROM space) corresponding to phys_offs.

Macros

ESP_ERR_FLASH_OP_FAIL

This file contains spi_flash_mmap_xx APIs, mainly for doing memory mapping to an SPI0-connected external Flash, as well as some helper functions to convert between virtual and physical address

ESP_ERR_FLASH_OP_TIMEOUT

SPI_FLASH_SEC_SIZE

SPI Flash sector size

SPI_FLASH_MMU_PAGE_SIZE

Flash cache MMU mapping page size

SPI_FLASH_CACHE2PHYS_FAIL

Type Definitions
typedef uint32_t spi_flash_mmap_handle_t

Opaque handle for memory region obtained from spi_flash_mmap.

Enumerations
genum spi_flash_mmap_memory_t

Enumeration which specifies memory space requested in an mmap call.

Values:

enumerator SPI_FLASH_MMAP_DATA

map to data memory, allows byte-aligned access

enumerator SPI_FLASH_MMAP_INST

map to instruction memory, allows only 4-byte-aligned access

Header File

- components/hal/include/hal/spi_flash_types.h
- This header file can be included with:
#include "hal/spi_flash_types.h"

**Structures**

**struct spi_flash_trans_t**

Definition of a common transaction. Also holds the return value.

**Public Members**

- `uint8_t reserved`
  - Reserved, must be 0.

- `uint8_t mosi_len`
  - Output data length, in bytes.

- `uint8_t miso_len`
  - Input data length, in bytes.

- `uint8_t address_bitlen`
  - Length of address in bits, set to 0 if command does not need an address.

- `uint32_t address`
  - Address to perform operation on.

- `const uint8_t *mosi_data`
  - Output data to salve.

- `uint8_t *miso_data`
  - [out] Input data from slave, little endian

- `uint32_t flags`
  - Flags for this transaction. Set to 0 for now.

- `uint16_t command`
  - Command to send.

- `uint8_t dummy_bitlen`
  - Basic dummy bits to use.

- `uint32_t io_mode`
  - Flash working mode when SPI_FLASH_IGNORE_BASEIO is specified.

**struct spi_flash_sus_cmd_conf**

Configuration structure for the flash chip suspend feature.

**Public Members**
Chapter 2. API Reference

uint32_t sus_mask
   SUS/SUS1/SUS2 bit in flash register.

uint32_t cmd_rdsr
   Read flash status register(2) command.

uint32_t sus_cmd
   Flash suspend command.

uint32_t res_cmd
   Flash resume command.

uint32_t reserved
   Reserved, set to 0.

struct spi_flash_encryption_t
   Structure for flash encryption operations.

Public Members

void (*flash_encryption_enable)(void)
   Enable the flash encryption.

void (*flash_encryption_disable)(void)
   Disable the flash encryption.

void (*flash_encryption_data_prepare)(uint32_t address, const uint32_t* buffer, uint32_t size)
   Prepare flash encryption before operation.

   ____________________________________________________________________________
   Note: address and buffer must be 8-word aligned.
   ____________________________________________________________________________

   Param address  The destination address in flash for the write operation.
   Param buffer   Data for programming
   Param size     Size to program.

void (*flash_encryption_done)(void)
   flash data encryption operation is done.

void (*flash_encryption_destroy)(void)
   Destroy encrypted result

bool (*flash_encryption_check)(uint32_t address, uint32_t length)
   Check if is qualified to encrypt the buffer

   Param address  the address of written flash partition.
   Param length  Buffer size.

struct spi_flash_host_inst_t
   SPI Flash Host driver instance
Public Members

const struct spi_flash_host_driver_s *driver
Pointertotheimplementationfunctiontable.

struct spi_flash_host_driver_s
Hostdriverconfigurationandcontextstructure.

Public Members

esp_err_t (*dev_config)(spi_flash_host_inst_t *host)
Configure the device-related register before transactions. This saves some time to re-configure those registers when we send continuously.

esp_err_t (*common_command)(spi_flash_host_inst_t *host, spi_flash_trans_t *t)
Sendanuser-definedspitransactiontothedevice.

esp_err_t (*read_id)(spi_flash_host_inst_t *host, uint32_t *id)
ReadflashID.

void (*erase_chip)(spi_flash_host_inst_t *host)
Erase whole flash chip.

void (*erase_sector)(spi_flash_host_inst_t *host, uint32_t start_address)
Erase aspecific sector by its start address.

void (*erase_block)(spi_flash_host_inst_t *host, uint32_t start_address)
Erase aspecific block by its start address.

esp_err_t (*read_status)(spi_flash_host_inst_t *host, uint8_t *out_sr)
Read the status of the flash chip.

esp_err_t (*set_write_protect)(spi_flash_host_inst_t *host, bool wp)
Disabl ewrite protection.

void (*program_page)(spi_flash_host_inst_t *host, const void *buffer, uint32_t address, uint32_t length)
Program a page of the flash. Check max_write_bytes for the maximum allowed writing length.

bool (*supports_direct_write)(spi_flash_host_inst_t *host, const void *p)
Check whether the SPI host supports direct write.
When cache is disabled, SPI1 doesn’t support directly write when buffer isn’t internal.

int (*write_data_slicer)(spi_flash_host_inst_t *host, uint32_t address, uint32_t len, uint32_t
*align_addr, uint32_t page_size)
Sliceforwritedata. The program_page should be called iteratively with the return value of this function.

- **Param address** Beginning flash address to write
- **Param len** Length request to write
- **Param align_addr** Output of the aligned address to write to
**Param** page_size  Physical page size of the flash chip
**Return**  Length that can be actually written in one program_page call

`esp_err_t (*read)(spi_flash_host_inst_t *host, void *buffer, uint32_t address, uint32_t read_len)`
Read data from the flash. Check max_read_bytes for the maximum allowed reading length.

`bool (*supports_direct_read)(spi_flash_host_inst_t *host, const void *p)`
Check whether the SPI host supports direct read.
When cache is disabled, SPI1 doesn’t support directly read when the given buffer isn’t internal.

`int (*read_data_slicer)(spi_flash_host_inst_t *host, uint32_t address, uint32_t len, uint32_t *align_addr, uint32_t page_size)`
Slicer for read data. The read should be called iteratively with the return value of this function.

**Param** address  Beginning flash address to read
**Param** len  Length request to read
**Param** align_addr  Output of the aligned address to read
**Param** page_size  Physical page size of the flash chip
**Return**  Length that can be actually read in one read call

`uint32_t (*host_status)(spi_flash_host_inst_t *host)`
Check the host status, 0:busy, 1:idle, 2:suspended.

`esp_err_t (*configure_host_io_mode)(spi_flash_host_inst_t *host, uint32_t command, uint32_t addr_bitlen, int dummy_bitlen_base, esp_flash_io_mode_t io_mode)`
Configure the host to work at different read mode. Responsible to compensate the timing and set IO mode.

`void (*poll_cmd_done)(spi_flash_host_inst_t *host)`
Internal use, poll the HW until the last operation is done.

`esp_err_t (*flush_cache)(spi_flash_host_inst_t *host, uint32_t addr, uint32_t size)`
For some host (SPI1), they are shared with a cache. When the data is modified, the cache needs to be flushed. Left NULL if not supported.

`void (*check_suspend)(spi_flash_host_inst_t *host)`
Suspend check erase/program operation, reserved for ESP32-C3 and ESP32-S3 spi flash ROM IMPL.

`void (*resume)(spi_flash_host_inst_t *host)`
Resume flash from suspend manually

`void (*suspend)(spi_flash_host_inst_t *host)`
Set flash in suspend status manually

`esp_err_t (*sus_setup)(spi_flash_host_inst_t *host, const spi_flash_sus_cmd_conf *sus_conf)`
Suspend feature setup for setting cmd and status register mask.

**Macros**

`SPI_FLASH_TRANS_FLAG_CMD16`
Send command of 16 bits.
Chapter 2. API Reference

SPI_FLASH_TRANS_FLAG_IGNORE_BASEIO
Not applying the basic io mode configuration for this transaction.

SPI_FLASH_TRANS_FLAG_BYTE_SWAP
Used for DTR mode, to swap the bytes of a pair of rising/falling edge.

SPI_FLASH_TRANS_FLAG_PE_CMD
Indicates that this transaction is to erase/program flash chip.

SPI_FLASH_CONFIG_CONF_BITS
OR the io_mode with this mask, to enable the dummy output feature or replace the first several dummy bits into address to meet the requirements of conf bits. (Used in DIO/QIO/OIO mode)

SPI_FLASH_OPI_FLAG
A flag for flash work in opi mode, the io mode below are opi, above are SPI/QSPI mode. DO NOT use this value in any API.

SPI_FLASH_READ_MODE_MIN
Slowest io mode supported by ESP32, currently SlowRd.

Type Definitions

typedef enum esp_flash_speed_s esp_flash_speed_t
SPI flash clock speed values, always refer to them by the enum rather than the actual value (more speed may be appended into the list).

A strategy to select the maximum allowed speed is to enumerate from the ESP_FLSH_SPEED_MAX-1 or highest frequency supported by your flash, and decrease the speed until the probing success.

typedef struct spi_flash_host_driver_s spi_flash_host_driver_t

Enumerations

enum esp_flash_speed_s
SPI flash clock speed values, always refer to them by the enum rather than the actual value (more speed may be appended into the list).

A strategy to select the maximum allowed speed is to enumerate from the ESP_FLSH_SPEED_MAX-1 or highest frequency supported by your flash, and decrease the speed until the probing success.

Values:

enumerator ESP_FLASH_5MHZ
The flash runs under 5MHz.

enumerator ESP_FLASH_10MHZ
The flash runs under 10MHz.

enumerator ESP_FLASH_20MHZ
The flash runs under 20MHz.
enumerator **ESP_FLASH_26MHZ**
   The flash runs under 26MHz.

enumerator **ESP_FLASH_40MHZ**
   The flash runs under 40MHz.

enumerator **ESP_FLASH_80MHZ**
   The flash runs under 80MHz.

enumerator **ESP_FLASH_120MHZ**
   The flash runs under 120MHz. 120MHz can only be used by main flash after timing tuning in system. Do not use this directly in any API.

enumerator **ESP_FLASH_SPEED_MAX**
   The maximum frequency supported by the host is ESP_FLASH_SPEED_MAX-1.

enum **esp_flash_io_mode_t**
   Mode used for reading from SPI flash.
   
   **Values:**

   enumerator **SPI_FLASH_SLOWRD**
      Data read using single I/O, some limits on speed.

   enumerator **SPI_FLASH_FASTRD**
      Data read using single I/O, no limit on speed.

   enumerator **SPI_FLASH_DOUT**
      Data read using dual I/O.

   enumerator **SPI_FLASH_DIO**
      Both address & data transferred using dual I/O.

   enumerator **SPI_FLASH_QOUT**
      Data read using quad I/O.

   enumerator **SPI_FLASH_QIO**
      Both address & data transferred using quad I/O.

   enumerator **SPI_FLASH_OPI_STR**
      Only support on OPI flash, flash read and write under STR mode.

   enumerator **SPI_FLASH_OPI_DTR**
      Only support on OPI flash, flash read and write under DTR mode.

   enumerator **SPI_FLASH_READ_MODE_MAX**
      The fastest io mode supported by the host is ESP_FLASH_READ_MODE_MAX-1.
Chapter 2. API Reference

Header File

- components/hal/include/hal/esp_flash_err.h
- This header file can be included with:
  
```
#include "hal/esp_flash_err.h"
```

Macros

**ESP_ERR_FLASH_NOTInicialISED**

esp_flash_chip_t structure not correctly initialised by esp_flash_init().

**ESP_ERR_FLASH_UNSUPPORTED_HOST**

Requested operation isn’t supported via this host SPI bus (chip->spi field).

**ESP_ERR_FLASH_UNSUPPORTED_CHIP**

Requested operation isn’t supported by this model of SPI flash chip.

**ESP_ERR_FLASH_PROTECTED**

Write operation failed due to chip’s write protection being enabled.

Enumerations

```
enum [anonymous]

Values:

enumerator ESP_ERR_FLASH_SIZE_NOT_MATCH

The chip doesn’t have enough space for the current partition table.

enumerator ESP_ERR_FLASH_NO_RESPONSE

Chip did not respond to the command, or timed out.
```

Header File

## Functions

**bool esp_flash_encryption_enabled (void)**

Is flash encryption currently enabled in hardware?

 flashes encryption is enabled if the FLASH_CRYPT_CNT efuse has an odd number of bits set.

Returns true if flash encryption is enabled.

**esp_err_t esp_flash_encrypt_check_and_update (void)**

**bool esp_flash_encrypt_state (void)**

Returns the Flash Encryption state and prints it.

Returns True - Flash Encryption is enabled False - Flash Encryption is not enabled

**bool esp_flash_encrypt_initialized_once (void)**

Checks if the first initialization was done.

If the first initialization was done then FLASH_CRYPT_CNT != 0

Returns true - the first initialization was done false - the first initialization was NOT done

**esp_err_t esp_flash_encrypt_init (void)**

The first initialization of Flash Encryption key and related eFuses.

Returns ESP_OK if all operations succeeded

**esp_err_t esp_flash_encrypt_contents (void)**

Encrypts flash content.

Returns ESP_OK if all operations succeeded

**esp_err_t esp_flash_encrypt_enable (void)**

Activates Flash encryption on the chip.

It burns FLASH_CRYPT_CNT eFuse based on the CONFIG_SECURE_FLASH_ENCRYPTION_MODE_RELEASE option.

Returns ESP_OK if all operations succeeded

**bool esp_flash_encrypt_is_write_protected (bool print_error)**

Returns True if the write protection of FLASH_CRYPT_CNT is set.

Parameters **print_error** – Print error if it is write protected

Returns true - if FLASH_CRYPT_CNT is write protected

**esp_err_t esp_flash_encrypt_region (uint32_t src_addr, size_t data_length)**

Encrypt-in-place a block of flash sectors.

Note: This function resets RTC_WDT between operations with sectors.

Parameters

• **src_addr** - Source offset in flash. Should be multiple of 4096 bytes.
• **data_length** – Length of data to encrypt in bytes. Will be rounded up to next multiple of 4096 bytes.

**Returns** ESP_OK if all operations succeeded, ESP_ERR_FLASH_OP_FAIL if SPI flash fails, ESP_ERR_FLASH_OP_TIMEOUT if flash times out.

```c
void esp_flash_write_protect_crypt_cnt (void)
```

Write protect FLASH_CRYPT_CNT.

Intended to be called as a part of boot process if flash encryption is enabled but secure boot is not used. This should protect against serial re-flashing of an unauthorised code in absence of secure boot.

**Note:** On ESP32 V3 only, write protecting FLASH_CRYPT_CNT will also prevent disabling UART Download Mode. If both are wanted, call esp_efuse_disable_rom_download_mode() before calling this function.

```c
esp_flash_enc_mode_t esp_get_flash_encryption_mode (void)
```

Return the flash encryption mode.

The API is called during boot process but can also be called by application to check the current flash encryption mode of ESP32.

**Returns**

```c
void esp_flash_encryption_init_checks (void)
```

Check the flash encryption mode during startup.

Verifies the flash encryption config during startup:

- Correct any insecure flash encryption settings if hardware Secure Boot is enabled.
- Log warnings if the efuse config doesn’t match the project config in any way

**Note:** This function is called automatically during app startup, it doesn’t need to be called from the app.

```c
esp_err_t esp_flash_encryption_enable_secure_features (void)
```

Set all secure eFuse features related to flash encryption.

**Returns**

```c
bool esp_flash_encryption_cfg_verify_release_mode (void)
```

Returns the verification status for all physical security features of flash encryption in release mode.

If the device has flash encryption feature configured in the release mode, then it is highly recommended to call this API in the application startup code. This API verifies the sanity of the eFuse configuration against the release (production) mode of the flash encryption feature.

**Returns**

```c
void esp_flash_encryption_set_release_mode (void)
```

Switches Flash Encryption from “Development” to “Release”.

If already in “Release” mode, the function will do nothing. If flash encryption efuse is not enabled yet then abort. It burns:

- ” disable encrypt in dl mode”
- set FLASH_CRYPT_CNT efuse to max

2.5.20 SPI Master Driver

SPI Master driver is a program that controls ESP32-S2’s General Purpose SPI (GP-SPI) peripheral(s) when it functions as a master.

For more hardware information about the GP-SPI peripheral(s), see ESP32-S2 Technical Reference Manual > SPI Controller [PDF].

Terminology

The terms used in relation to the SPI Master driver are given in the table below.
Chapter 2. API Reference

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Host</td>
<td>The SPI controller peripheral inside ESP32-S2 initiates SPI transmissions over the bus and acts as an SPI Master.</td>
</tr>
<tr>
<td>Device</td>
<td>SPI slave Device. An SPI bus may be connected to one or more Devices. Each Device shares the MOSI, MISO, and SCLK signals but is only active on the bus when the Host asserts the Device’s individual CS line.</td>
</tr>
<tr>
<td>Bus</td>
<td>A signal bus, common to all Devices connected to one Host. In general, a bus includes the following lines: MOSI, MOSI, SCLK, one or more CS lines, and, optionally, QUADWP and QUADHD. So Devices are connected to the same lines, with the exception that each Device has its own CS line. Several Devices can also share one CS line if connected in a daisy-chain manner.</td>
</tr>
<tr>
<td>MOSI</td>
<td>Master Out, Slave In, a.k.a. D. Data transmission from a Host to Device. Also data0 signal in Octal/OPI mode.</td>
</tr>
<tr>
<td>MISO</td>
<td>Master In, Slave Out, a.k.a. Q. Data transmission from a Device to Host. Also data1 signal in Octal/OPI mode.</td>
</tr>
<tr>
<td>SCLK</td>
<td>Serial Clock. The oscillating signal generated by a Host keeps the transmission of data bits in sync.</td>
</tr>
<tr>
<td>CS</td>
<td>Chip Select. Allows a Host to select individual Device(s) connected to the bus in order to send or receive data.</td>
</tr>
<tr>
<td>QUADWP</td>
<td>Write Protect signal. Used for 4-bit (qio/qout) transactions. Also for the data2 signal in Octal/OPI mode.</td>
</tr>
<tr>
<td>QUADHD</td>
<td>Hold signal. Used for 4-bit (qio/qout) transactions. Also for the data3 signal in Octal/OPI mode.</td>
</tr>
<tr>
<td>DATA4</td>
<td>Data4 signal in Octal/OPI mode.</td>
</tr>
<tr>
<td>DATA5</td>
<td>Data5 signal in Octal/OPI mode.</td>
</tr>
<tr>
<td>DATA6</td>
<td>Data6 signal in Octal/OPI mode.</td>
</tr>
<tr>
<td>DATA7</td>
<td>Data7 signal in Octal/OPI mode.</td>
</tr>
<tr>
<td>Assert</td>
<td>The action of activating a line.</td>
</tr>
<tr>
<td>De-assertion</td>
<td>The action of returning the line back to inactive (back to idle) status.</td>
</tr>
<tr>
<td>Transaction</td>
<td>One instance of a Host asserting a CS line, transferring data to and from a Device, and de-asserting the CS line. Transactions are atomic, which means they can never be interrupted by another transaction.</td>
</tr>
<tr>
<td>Launch Edge</td>
<td>Edge of the clock at which the source register launches the signal onto the line.</td>
</tr>
<tr>
<td>Latch Edge</td>
<td>Edge of the clock at which the destination register latches in the signal.</td>
</tr>
</tbody>
</table>

Driver Features

The SPI Master driver governs the communications between Hosts and Devices. The driver supports the following features:

- Multi-threaded environments
- Transparent handling of DMA transfers while reading and writing data
- Automatic time-division multiplexing of data coming from different Devices on the same signal bus, see SPI Bus Lock.

Warning: The SPI Master driver allows multiple Devices to be connected on a same SPI bus (sharing a single ESP32-S2 SPI peripheral). As long as each Device is accessed by only one task, the driver is thread-safe. However, if multiple tasks try to access the same SPI Device, the driver is not thread-safe. In this case, it is recommended to either:

- Refactor your application so that each SPI peripheral is only accessed by a single task at a time. You can use `spi_bus_config_t::isr_cpu_id` to register the SPI ISR to the same core as SPI peripheral-related tasks to ensure thread safety.
- Add a mutex lock around the shared Device using `xSemaphoreCreateMutex`. 

Espressif Systems 710 Release v5.3-dev-277-gc8243465e4

**SPI Features**

**SPI Master**

**SPI Bus Lock** To realize the multiplexing of different devices from different drivers, including SPI Master, SPI Flash, etc., an SPI bus lock is applied on each SPI bus. Drivers can attach their devices to the bus with the arbitration of the lock.

Each bus lock is initialized with a BG (background) service registered. All devices that request transactions on the bus should wait until the BG is successfully disabled.

- For the SPI1 bus, the BG is the cache. The bus lock disables the cache before device operations start, and enables it again after the device releases the lock. No devices on SPI1 are allowed to use ISR, since it is meaningless for the task to yield to other tasks when the cache is disabled. The SPI Master driver has not supported SPI1 bus. Only the SPI Flash driver can attach to the bus.
- For other buses, the driver can register the ISR as a BG. If a device task requests exclusive bus access, the bus lock will block the task, disable the ISR, and then unblock the task. After the task releases the lock, the lock will try to re-enable the ISR if there are still pending transactions in the ISR.

**SPI Transactions**

An SPI bus transaction consists of five phases which can be found in the table below. Any of these phases can be skipped.

<table>
<thead>
<tr>
<th>Phase</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command</td>
<td>In this phase, a command (0-16 bit) is written to the bus by the Host.</td>
</tr>
<tr>
<td>Address</td>
<td>In this phase, an address (0-32 bit) is transmitted over the bus by the Host.</td>
</tr>
<tr>
<td>Dummy</td>
<td>This phase is configurable and is used to meet the timing requirements.</td>
</tr>
<tr>
<td>Write</td>
<td>Host sends data to a Device. This data follows the optional command and address phases and is indistinguishable from them at the electrical level.</td>
</tr>
<tr>
<td>Read</td>
<td>Device sends data to its Host.</td>
</tr>
</tbody>
</table>

The attributes of a transaction are determined by the bus configuration structure `spi_bus_config_t`, Device configuration structure `spi_device_interface_config_t`, and transaction configuration structure `spi_transaction_t`.

An SPI Host can send full-duplex transactions, during which the Read and Write phases occur simultaneously. The total transaction length is determined by the sum of the following members:

- `spi_device_interface_config_t::command_bits`
- `spi_device_interface_config_t::address_bits`
- `spi_transaction_t::length`

While the member `spi_transaction_t::rxlength` only determines the length of data received into the buffer.

In half-duplex transactions, the Read and Write phases are not simultaneous (one direction at a time). The lengths of the Write and Read phases are determined by `spi_transaction_t::length` and `spi_transaction_t::rxlength` respectively.

The Command and Address phases are optional, as not every SPI Device requires a command and/or address. This is reflected in the Device’s configuration: if `spi_device_interface_config_t::command_bits` and/or `spi_device_interface_config_t::address_bits` are set to zero, no Command or Address phase will occur.

The Read and Write phases can also be optional, as not every transaction requires both writing and reading data. If `spi_transaction_t::rx_buffer` is NULL and `SPI_TRANS_USE_RXDATA` is not set, the Read phase is skipped. If `spi_transaction_t::tx_buffer` is NULL and `SPI_TRANS_USE_TXDATA` is not set, the Write phase is skipped.
The driver supports two types of transactions: interrupt transactions and polling transactions. The programmer can choose to use a different transaction type per Device. If your Device requires both transaction types, see Notes on Sending Mixed Transactions to the Same Device.

**Interrupt Transactions** Interrupt transactions block the transaction routine until the transaction completes, thus allowing the CPU to run other tasks.

An application task can queue multiple transactions, and the driver automatically handles them one by one in the interrupt service routine (ISR). It allows the task to switch to other procedures until all the transactions are complete.

**Polling Transactions** Polling transactions do not use interrupts. The routine keeps polling the SPI Host’s status bit until the transaction is finished.

All the tasks that use interrupt transactions can be blocked by the queue. At this point, they need to wait for the ISR to run twice before the transaction is finished. Polling transactions save time otherwise spent on queue handling and context switching, which results in smaller transaction duration. The disadvantage is that the CPU is busy while these transactions are in progress.

The `spi_device_polling_end()` routine needs an overhead of at least 1 µs to unblock other tasks when the transaction is finished. It is strongly recommended to wrap a series of polling transactions using the functions `spi_device_acquire_bus()` and `spi_device_release_bus()` to avoid the overhead. For more information, see Bus Acquiring.

**Transaction Line Mode** Supported line modes for ESP32-S2 are listed as follows, to make use of these modes, set the member flags in the struct `spi_transaction_t` as shown in the Transaction Flag column. If you want to check if corresponding IO pins are set or not, set the member flags in the `spi_bus_config_t` as shown in the Bus IO Setting Flag column.

<table>

</tr>
</tbody>
</table>

**Command and Address Phases** During the Command and Address phases, the members `spi_transaction_t::cmd` and `spi_transaction_t::addr` are sent to the bus, nothing is read at this time. The default lengths of the Command and Address phases are set in `spi_device_interface_config_t` by calling `spi_bus_add_device()`. If the flags `SPI_TRANS_VARIABLE_CMD` and `SPI_TRANS_VARIABLE_ADDR` in the member `spi_transaction_t::flags` are not set, the driver automatically sets the length of these phases to default values during Device initialization.

If the lengths of the Command and Address phases need to be variable, declare the struct `spi_transaction_ext_t`, set the flags `SPI_TRANS_VARIABLE_CMD` and/or `SPI_TRANS_VARIABLE_ADDR` in the member `spi_transaction_ext_t::base` and configure the rest
of base as usual. Then the length of each phase will be equal to `spi_transaction_ext_t::command_bits` and `spi_transaction_ext_t::address_bits` set in the struct `spi_transaction_ext_t`.

If the Command and Address phase need to have the same number of lines as the data phase, you need to set `SPI_TRANS_MULTILINE_CMD` and/or `SPI_TRANS_MULTILINE_ADDR` to the `flags` member in the struct `spi_transaction_t`. Also see Transaction Line Mode.

**Write and Read Phases** Normally, the data that needs to be transferred to or from a Device is read from or written to a chunk of memory indicated by the members `spi_transaction_t::rx_buffer` and `spi_transaction_t::tx_buffer`. If DMA is enabled for transfers, the buffers are required to be:

1. Allocated in DMA-capable internal memory (MALLOC_CAP_DMA), see DMA-Capable Memory.
2. 32-bit aligned (starting from a 32-bit boundary and having a length of multiples of 4 bytes).

If these requirements are not satisfied, the transaction efficiency will be affected due to the allocation and copying of temporary buffers.

If using more than one data line to transmit, please set `SPI_DEVICE_HALFDUPLEX` flag for the member `flags` in the struct `spi_device_interface_config_t`. And the member `flags` in the struct `spi_transaction_t` should be set as described in Transaction Line Mode.

**Bus Acquiring** Sometimes you might want to send SPI transactions exclusively and continuously so that it takes as little time as possible. For this, you can use bus acquiring, which helps to suspend transactions (both polling or interrupt) to other Devices until the bus is released. To acquire and release a bus, use the functions `spi_device_acquire_bus()` and `spi_device_release_bus()`.

**Driver Usage**

- Initialize an SPI bus by calling the function `spi_bus_initialize()`. Make sure to set the correct I/O pins in the struct `spi_bus_config_t`. Set the signals that are not needed to -1.
- Register a Device connected to the bus with the driver by calling the function `spi_bus_add_device()`. Make sure to configure any timing requirements the Device might need with the parameter `dev_config`. You should now have obtained the Device’s handle which will be used when sending a transaction to it.
- To interact with the Device, fill one or more `spi_transaction_t` structs with any transaction parameters required. Then send the structs either using a polling transaction or an interrupt transaction:
  - **Interrupt** Either queue all transactions by calling the function `spi_device_queue_trans()` and, at a later time, query the result using the function `spi_device_get_trans_result()`, or handle all requests synchronously by feeding them into `spi_device_transmit()`.
  - **Polling** Call the function `spi_device_polling_transmit()` to send polling transactions. Alternatively, if you want to insert something in between, send the transactions by using `spi_device_polling_start()` and `spi_device_polling_end()`.
- (Optional) To perform back-to-back transactions with a Device, call the function `spi_device_acquire_bus()` before sending transactions and `spi_device_release_bus()` after the transactions have been sent.
- (Optional) To remove a certain Device from the bus, call `spi_bus_remove_device()` with the Device handle as an argument.
- (Optional) To remove the driver from the bus, make sure no more devices are attached and call `spi_bus_free()`.

The example code for the SPI Master driver can be found in the `peripherals/spi_master` directory of ESP-IDF examples.

**Transactions with Data Not Exceeding 32 Bits** When the transaction data size is equal to or less than 32 bits, it will be sub-optimal to allocate a buffer for the data. The data can be directly stored in the transaction struct instead. For transmitted data, it can be achieved by using the `spi_transaction_t::tx_data` member and setting the `SPI_TRANS_USE_TXDATA` flag on the transmission. For received data, use `spi_transaction_t::rx_data` and set `SPI_TRANS_USE_RXDATA`. In both cases, do not touch the `spi_transaction_t::tx_buffer` or `spi_transaction_t::rx_buffer`
members, because they use the same memory locations as \texttt{spi\_transaction\_t::tx\_data} and \texttt{spi\_transaction\_t::rx\_data}.

**Transactions with Integers Other than uint8\_t**  
An SPI Host reads and writes data into memory byte by byte. By default, data is sent with the most significant bit (MSB) first, as LSB is first used in rare cases. If a value of fewer than 8 bits needs to be sent, the bits should be written into memory in the MSB first manner.

For example, if \texttt{0b00010} needs to be sent, it should be written into a \texttt{uint8\_t} variable, and the length for reading should be set to 5 bits. The Device will still receive 8 bits with 3 additional “random” bits, so the reading must be performed correctly.

On top of that, ESP32-S2 is a little-endian chip, which means that the least significant byte of \texttt{uint16\_t} and \texttt{uint32\_t} variables is stored at the smallest address. Hence, if \texttt{uint16\_t} is stored in memory, bits [7:0] are sent first, followed by bits [15:8].

For cases when the data to be transmitted has a size differing from \texttt{uint8\_t} arrays, the following macros can be used to transform data to the format that can be sent by the SPI driver directly:

- \texttt{SPI\_SWAP\_DATA\_TX} for data to be transmitted
- \texttt{SPI\_SWAP\_DATA\_RX} for data received

**Notes on Sending Mixed Transactions to the Same Device**  
To reduce coding complexity, send only one type of transaction (interrupt or polling) to one Device. However, you still can send both interrupt and polling transactions alternately. The notes below explain how to do this.

The polling transactions should be initiated only after all the polling and interrupt transactions are finished.

Since an unfinished polling transaction blocks other transactions, please do not forget to call the function \texttt{spi\_device\_polling\_end()} after \texttt{spi\_device\_polling\_start()} to allow other transactions or to allow other Devices to use the bus. Remember that if there is no need to switch to other tasks during your polling transaction, you can initiate a transaction with \texttt{spi\_device\_polling\_transmit()} so that it will be ended automatically.

In-flight polling transactions are disturbed by the ISR operation to accommodate interrupt transactions. Always make sure that all the interrupt transactions sent to the ISR are finished before you call \texttt{spi\_device\_polling\_start()}.

To have better control of the calling sequence of functions, send mixed transactions to the same Device only within a single task.

**GPIO Matrix and IO\_MUX**  
Most of the chip’s peripheral signals have a direct connection to their dedicated IO\_MUX pins. However, the signals can also be routed to any other available pins using the less direct GPIO matrix. If at least one signal is routed through the GPIO matrix, then all signals will be routed through it.

When an SPI Host is set to 80 MHz or lower frequencies, routing SPI pins via the GPIO matrix will behave the same compared to routing them via IOMUX.

The IO\_MUX pins for SPI buses are given below.

<table>
<thead>
<tr>
<th>Pin Name</th>
<th>GPIO Number (SPI2)</th>
</tr>
</thead>
<tbody>
<tr>
<td>CS0(^1)</td>
<td>10</td>
</tr>
<tr>
<td>SCLK</td>
<td>12</td>
</tr>
<tr>
<td>MISO</td>
<td>13</td>
</tr>
<tr>
<td>MOSI</td>
<td>11</td>
</tr>
<tr>
<td>QUADWP</td>
<td>14</td>
</tr>
<tr>
<td>QUADHD</td>
<td>9</td>
</tr>
</tbody>
</table>

\(^1\) Only the first Device attached to the bus can use the CS0 pin.
Transfer Speed Considerations

There are three factors limiting the transfer speed:

- Transaction interval
- SPI clock frequency
- Cache miss of SPI functions, including callbacks

The main parameter that determines the transfer speed for large transactions is clock frequency. For multiple small transactions, the transfer speed is mostly determined by the length of transaction intervals.

Transaction Duration

Transaction duration includes setting up SPI peripheral registers, copying data to FIFOs or setting up DMA links, and the time for SPI transactions.

Interrupt transactions allow appending extra overhead to accommodate the cost of FreeRTOS queues and the time needed for switching between tasks and the ISR.

For *interrupt transactions*, the CPU can switch to other tasks when a transaction is in progress. This saves CPU time but increases the transaction duration. See *Interrupt Transactions*. For *polling transactions*, it does not block the task but allows to do polling when the transaction is in progress. For more information, see *Polling Transactions*.

If DMA is enabled, setting up the linked list requires about 2 µs per transaction. When a master is transferring data, it automatically reads the data from the linked list. If DMA is not enabled, the CPU has to write and read each byte from the FIFO by itself. Usually, this is faster than 2 µs, but the transaction length is limited to 64 bytes for both write and read.

The typical transaction duration for one byte of data is given below.

- Interrupt Transaction via DMA: 23 µs.
- Interrupt Transaction via CPU: 22 µs.
- Polling Transaction via DMA: 9 µs.
- Polling Transaction via CPU: 8 µs.

Note that these data are tested with `CONFIG_SPI_MASTER_ISR_IN_IRAM` enabled. SPI transaction related code are placed in the internal memory. If this option is turned off (for example, for internal memory optimization), the transaction duration may be affected.

SPI Clock Frequency

The clock source of the GPSPi peripherals can be selected by setting `spi_device_handle_t::cfg::clock_source`. You can refer to `spi_clock_source_t` to know the supported clock sources.

By default driver sets `spi_device_handle_t::cfg::clock_source` to `SPI_CLK_SRC_DEFAULT`. This usually stands for the highest frequency among GPSPi clock sources. Its value is different among chips.

The actual clock frequency of a Device may not be exactly equal to the number you set, it is re-calculated by the driver to the nearest hardware-compatible number, and not larger than the clock frequency of the clock source. You can call `spi_device_get_actual_freq()` to know the actual frequency computed by the driver.

The theoretical maximum transfer speed of the Write or Read phase can be calculated according to the table below:

<table>
<thead>
<tr>
<th>Line Width of Write/Read phase</th>
<th>Speed (Bps)</th>
</tr>
</thead>
<tbody>
<tr>
<td>1-Line</td>
<td>SPI Frequency / 8</td>
</tr>
<tr>
<td>2-Line</td>
<td>SPI Frequency / 4</td>
</tr>
<tr>
<td>4-Line</td>
<td>SPI Frequency / 2</td>
</tr>
<tr>
<td>8-Line</td>
<td>SPI Frequency</td>
</tr>
</tbody>
</table>

The transfer speed calculation of other phases (Command, Address, Dummy) is similar.
Cache Missing  The default config puts only the ISR into the IRAM. Other SPI-related functions, including the driver itself and the callback, might suffer from cache misses and need to wait until the code is read from flash. Select CONFIG_SPI_MASTER_IN_IRAM to put the whole SPI driver into IRAM and put the entire callback(s) and its callee functions into IRAM to prevent cache missing.

Note: SPI driver implementation is based on FreeRTOS APIs, to use CONFIG_SPI_MASTER_IN_IRAM, you should not enable CONFIG_FREERTOS_PLACE_FUNCTIONS_INTO_FLASH.

For an interrupt transaction, the overall cost is \( 20 + \frac{8n}{F_{spi}} \) [µs] for n bytes transferred in one transaction. Hence, the transferring speed is: \( \frac{n}{20 + \frac{8n}{F_{spi}}} \). An example of transferring speed at 8 MHz clock speed is given in the following table.

<table>
<thead>
<tr>
<th>Frequency (MHz)</th>
<th>Transaction Interval (µs)</th>
<th>Transaction Length (bytes)</th>
<th>Total Time (µs)</th>
<th>Total Speed (KBps)</th>
</tr>
</thead>
<tbody>
<tr>
<td>8</td>
<td>25</td>
<td>1</td>
<td>26</td>
<td>38.5</td>
</tr>
<tr>
<td>8</td>
<td>25</td>
<td>8</td>
<td>33</td>
<td>242.4</td>
</tr>
<tr>
<td>8</td>
<td>25</td>
<td>16</td>
<td>41</td>
<td>490.2</td>
</tr>
<tr>
<td>8</td>
<td>25</td>
<td>64</td>
<td>89</td>
<td>719.1</td>
</tr>
<tr>
<td>8</td>
<td>25</td>
<td>128</td>
<td>153</td>
<td>836.6</td>
</tr>
</tbody>
</table>

When a transaction length is short, the cost of the transaction interval is high. If possible, try to squash several short transactions into one transaction to achieve a higher transfer speed.

Please note that the ISR is disabled during flash operation by default. To keep sending transactions during flash operations, enable CONFIG_SPI_MASTER_ISR_IN_IRAM and set ESP_INTR_FLAG_IRAM in the member spi_bus_config_t::intr_flags. In this case, all the transactions queued before starting flash operations are handled by the ISR in parallel. Also note that the callback of each Device and their callee functions should be in IRAM, or your callback will crash due to cache missing. For more details, see IRAM-Safe Interrupt Handlers.

Application Example

The code example for using the SPI master half duplex mode to read/write an AT93C46D EEPROM (8-bit mode) can be found in the peripherals/spi_master/hd_eeprom directory of ESP-IDF examples.

The code example for using the SPI master full duplex mode to drive a SPI_LCD (e.g. ST7789V or ILI9341) can be found in the peripherals/spi_master/lcd directory of ESP-IDF examples.

API Reference - SPI Common

Header File

- components/hal/include/hal/spi_types.h
- This header file can be included with:

```c
#include "hal/spi_types.h"
```

Structures

- struct spi_line_mode_t
  - Line mode of SPI transaction phases: CMD, ADDR, DOUT/DIN.

Public Members

```c
uint8_t cmd_lines
    The line width of command phase, e.g. 2-line-cmd-phase.

uint8_t addr_lines
    The line width of address phase, e.g. 1-line-addr-phase.

uint8_t data_lines
    The line width of data phase, e.g. 4-line-data-phase.
```

**Type Definitions**

typedef `soc_periph_spi_clk_src_t` spi_clock_source_t
    Type of SPI clock source.

**Enumerations**

enum spi_host_device_t
    Enum with the three SPI peripherals that are software-accessible in it.
    
    *Values:*

    - enumerator SPI1_HOST
      SPI1.
    - enumerator SPI2_HOST
      SPI2.
    - enumerator SPI3_HOST
      SPI3.
    - enumerator SPI_HOST_MAX
      invalid host value

enum spi_event_t
    SPI Events.
    
    *Values:*

    - enumerator SPI_EV_BUF_TX
      The buffer has sent data to master.
    - enumerator SPI_EV_BUF_RX
      The buffer has received data from master.
    - enumerator SPI_EV_SEND_DMA_READY
      Slave has loaded its TX data buffer to the hardware (DMA).
    - enumerator SPI_EV_SEND
      Master has received certain number of the data, the number is determined by Master.
enumerator **SPI_EV_RECV_DMA_READY**
Slave has loaded its RX data buffer to the hardware (DMA).

enumerator **SPI_EV_RECV**
Slave has received certain number of data from master, the number is determined by Master.

enumerator **SPI_EV_CMD9**
Received CMD9 from master.

enumerator **SPI_EV_CMDA**
Received CMDA from master.

enumerator **SPI_EV_TRANS**
A transaction has done.

enum **spi_command_t**
SPI command.

*Values:*

enumerator **SPI_CMD_HD_WRBUF**

enumerator **SPI_CMD_HD_RDBUF**

enumerator **SPI_CMD_HD_WRDMA**

enumerator **SPI_CMD_HD_RDDMA**

enumerator **SPI_CMD_HD_SEG_END**

enumerator **SPI_CMD_HD_EN_QPI**

enumerator **SPI_CMD_HD_WR_END**

enumerator **SPI_CMD_HD_INT0**

enumerator **SPI_CMD_HD_INT1**

enumerator **SPI_CMD_HD_INT2**

**Header File**

- This header file can be included with:

```
#include "driver/spi_common.h"
```

- This header file is a part of the API provided by the driver component. To declare that your component depends on driver, add the following to your CMakeLists.txt:
Chapter 2. API Reference

PRIV_REQUIRES driver

REQUIRES driver

or

Functions

*Function Name*: `spi_bus_initialize`

- **Description**: Initialize a SPI bus.
  - **Parameters**:
    - `host_id` - SPI peripheral that controls this bus
    - `bus_config` - Pointer to a `spi_bus_config_t` struct specifying how the host should be initialized
    - `dma_chan` - Selecting a DMA channel for an SPI bus allows transactions on the bus with size only limited by the amount of internal memory.
      - Selecting `SPI_DMA_DISABLED` limits the size of transactions.
      - Set to `SPI_DMA_DISABLED` if only the SPI flash uses this bus.
      - Set to `SPI_DMA_CH_AUTO` to let the driver to allocate the DMA channel.
  - **Returns**:
    - `ESP_ERR_INVALID_ARG` if configuration is invalid
    - `ESP_ERR_INVALID_STATE` if host already in use
    - `ESP_ERR_NOT_FOUND` if no available DMA channel
    - `ESP_ERR_NO_MEM` if out of memory
    - `ESP_OK` on success

*Function Name*: `spi_bus_free`

- **Description**: Free a SPI bus.
  - **Parameters**:
    - `host_id` - SPI peripheral to free
  - **Returns**:
    - `ESP_ERR_INVALID_ARG` if parameter is invalid
    - `ESP_ERR_INVALID_STATE` if bus hasn’t been initialized before, or not all devices on the bus were freed
    - `ESP_OK` on success
struct **spi_bus_config_t**

This is a configuration structure for a SPI bus.

You can use this structure to specify the GPIO pins of the bus. Normally, the driver will use the GPIO matrix to route the signals. An exception is made when all signals either can be routed through the IO_MUX or are -1. In that case, the IO_MUX is used, allowing for >40MHz speeds.

**Note:** Be advised that the slave driver does not use the quadwp/quadhd lines and fields in **spi_bus_config_t** referring to these lines will be ignored and can thus safely be left uninitialized.

### Public Members

- **int mosi_io_num**
  - GPIO pin for Master Out Slave In (=spi_d) signal, or -1 if not used.

- **int data0_io_num**
  - GPIO pin for spi data0 signal in quad/octal mode, or -1 if not used.

- **int miso_io_num**
  - GPIO pin for Master In Slave Out (=spi_q) signal, or -1 if not used.

- **int data1_io_num**
  - GPIO pin for spi data1 signal in quad/octal mode, or -1 if not used.

- **int sclk_io_num**
  - GPIO pin for SPI Clock signal, or -1 if not used.

- **int quadwp_io_num**
  - GPIO pin for WP (Write Protect) signal, or -1 if not used.

- **int data2_io_num**
  - GPIO pin for spi data2 signal in quad/octal mode, or -1 if not used.

- **int quadhd_io_num**
  - GPIO pin for HD (Hold) signal, or -1 if not used.

- **int data3_io_num**
  - GPIO pin for spi data3 signal in quad/octal mode, or -1 if not used.

- **int data4_io_num**
  - GPIO pin for spi data4 signal in octal mode, or -1 if not used.

- **int data5_io_num**
  - GPIO pin for spi data5 signal in octal mode, or -1 if not used.

- **int data6_io_num**
  - GPIO pin for spi data6 signal in octal mode, or -1 if not used.
int data7_io_num
    GPIO pin for spi data7 signal in octal mode, or -1 if not used.

int max_transfer_sz
    Maximum transfer size, in bytes. Defaults to 4092 if 0 when DMA enabled, or to
    SOC_SPI_MAXIMUM_BUFFER_SIZE if DMA is disabled.

uint32_t flags
    Abilities of bus to be checked by the driver. Or-ed value of SPICOMMON_BUSFLAG_* flags.

esp_intr_cpu_affinity_t isr_cpu_id
    Select cpu core to register SPI ISR.

int intr_flags
    Interrupt flag for the bus to set the priority, and IRAM attribute, see esp_intr_alloc.h. Note that
    the EDGE, INTRDISABLED attribute are ignored by the driver. Note that if ESP_INTR_FLAG_IRAM
    is set, ALL the callbacks of the driver, and their callee functions, should be put in the IRAM.

Macros

SPI_MAX_DMA_LEN

SPI_SWAP_DATA_TX (DATA, LEN)
    Transform unsigned integer of length <= 32 bits to the format which can be sent by the SPI driver directly.
    E.g. to send 9 bits of data, you can:

    ```
    uint16_t data = SPI_SWAP_DATA_TX(0x145, 9);
    ```

    Then points tx_buffer to &data.

    Parameters
    • DATA – Data to be sent, can be uint8_t, uint16_t or uint32_t.
    • LEN – Length of data to be sent, since the SPI peripheral sends from the MSB, this helps
      to shift the data to the MSB.

SPI_SWAP_DATA_RX (DATA, LEN)
    Transform received data of length <= 32 bits to the format of an unsigned integer.
    E.g. to transform the data of 15 bits placed in a 4-byte array to integer:

    ```
    uint16_t data = SPI_SWAP_DATA_RX((uint32_t *)rx_data, 15);
    ```

    Parameters
    • DATA – Data to be rearranged, can be uint8_t, uint16_t or uint32_t.
    • LEN – Length of data received, since the SPI peripheral writes from the MSB, this helps
      to shift the data to the LSB.

SPICOMMON_BUSFLAG_SLAVE
    Initialize I/O in slave mode.

SPICOMMON_BUSFLAG_MASTER
    Initialize I/O in master mode.
**SPICOMMON_BUSFLAG_IOMUX_PINS**
Check using iOMUX pins. Or indicates the pins are configured through the IO mux rather than GPIO matrix.

**SPICOMMON_BUSFLAG_GPIO_PINS**
Force the signals to be routed through GPIO matrix. Or indicates the pins are routed through the GPIO matrix.

**SPICOMMON_BUSFLAG_SCLK**
Check existing of SCLK pin. Or indicates CLK line initialized.

**SPICOMMON_BUSFLAG_MISO**
Check existing of MISO pin. Or indicates MISO line initialized.

**SPICOMMON_BUSFLAG_MOSI**
Check existing of MOSI pin. Or indicates MOSI line initialized.

**SPICOMMON_BUSFLAG_DUAL**
Check MOSI and MISO pins can output. Or indicates bus able to work under DIO mode.

**SPICOMMON_BUSFLAG_WPHD**
Check existing of WP and HD pins. Or indicates WP & HD pins initialized.

**SPICOMMON_BUSFLAG_QUAD**
Check existing of MOSI/MISO/WP/HD pins as output. Or indicates bus able to work under QIO mode.

**SPICOMMON_BUSFLAG_IO4_IO7**
Check existing of IO4-IO7 pins. Or indicates IO4-IO7 pins initialized.

**SPICOMMON_BUSFLAG_OCTAL**
Check existing of MOSI/MISO/WP/HD/SPIIO4/SPIIO5/SPIIO6/SPIIO7 pins as output. Or indicates bus able to work under octal mode.

**SPICOMMON_BUSFLAG_NATIVE_PINS**

**Type Definitions**

typedef spi_common_dma_t spi_dma_chan_t

**Enumerations**

eenum spi_common_dma_t
SPI DMA channels.

*Values:*

enumerator SPI_DMA_DISABLED
Do not enable DMA for SPI.

eenumerator SPI_DMA_CH_AUTO
Enable DMA, channel is automatically selected by driver.
Chapter 2. API Reference

API Reference - SPI Master

Header File

- components/driver/spi/include/driver/spi_master.h
- This header file can be included with:

```
#include "driver/spi_master.h"
```

- This header file is a part of the API provided by the driver component. To declare that your component depends on driver, add the following to your CMakeLists.txt:

```
REQUIRES driver
```

or
```
PRIV_REQUIRES driver
```

Functions

`esp_err_t spi_bus_add_device(spi_host_device_t host_id, const spi_device_interface_config_t *dev_config, spi_device_handle_t *handle)`

Allocate a device on a SPI bus.

This initializes the internal structures for a device, plus allocates a CS pin on the indicated SPI master peripheral and routes it to the indicated GPIO. All SPI master devices have three CS pins and can thus control up to three devices.

**Note:** While in general, speeds up to 80MHz on the dedicated SPI pins and 40MHz on GPIO-matrix-routed pins are supported, full-duplex transfers routed over the GPIO matrix only support speeds up to 26MHz.

**Parameters**

- `host_id` – SPI peripheral to allocate device on
- `dev_config` – SPI interface protocol config for the device
- `handle` – Pointer to variable to hold the device handle

**Returns**

- ESP_ERR_INVALID_ARG if parameter is invalid or configuration combination is not supported (e.g. dev_config->post_cb isn’t set while flag SPI_DEVICE_NO_RETURN_RESULT is enabled)
- ESP_ERR_INVALID_STATE if selected clock source is unavailable or spi bus not initialized
- ESP_ERR_NOT_FOUND if host doesn’t have any free CS slots
- ESP_ERR_NO_MEM if out of memory
- ESP_OK on success

`esp_err_t spi_bus_remove_device(spi_device_handle_t handle)`

Remove a device from the SPI bus.

**Parameters**

- `handle` – Device handle to free

**Returns**

- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_INVALID_STATE if device already is freed
- ESP_OK on success

`esp_err_t spi_device_queue_trans(spi_device_handle_t handle, spi_transaction_t *trans_desc, TickType_t ticks_to_wait)`

Queue a SPI transaction for interrupt transaction execution. Get the result by `spi_device_get_trans_result`.

**Parameters**

- `handle` – Device handle to queue
- `trans_desc` – Pointer to `spi_transaction_t` struct with transaction details
- `ticks_to_wait` – Number of ticks to wait for the transaction to complete

**Returns**

- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_INVALID_STATE if device is not initialized
- ESP_OK on success
Note: Normally a device cannot start (queue) polling and interrupt transactions simultaneously.

Parameters
- **handle** - Device handle obtained using spi_host_add_dev
- **trans_desc** - Description of transaction to execute
- **ticks_to_wait** - Ticks to wait until there’s room in the queue; use port-MAX_DELAY to never time out.

Returns
- ESP_ERR_INVALID_ARG if parameter is invalid. This can happen if SPI_TRANS_CS_KEEP_ACTIVE flag is specified while the bus was not acquired (spi_device_acquire_bus() should be called first) or set flag SPI_TRANS_DMA_BUFFER_ALIGN_MANUAL but tx or rx buffer not DMA-capable, or addr&len not align to cache line size
- ESP_ERR_TIMEOUT if there was no room in the queue before ticks_to_wait expired
- ESP_ERR_NO_MEM if allocating DMA-capable temporary buffer failed
- ESP_ERR_INVALID_STATE if previous transactions are not finished
- ESP_OK on success

```c
esp_err_t spi_device_get_trans_result(spi_device_handle_t handle, spi_transaction_t **trans_desc, TickType_t ticks_to_wait)
```

Get the result of a SPI transaction queued earlier by `spi_device_queue_trans`. This routine will wait until a transaction to the given device successfully completed. It will then return the description of the completed transaction so software can inspect the result and e.g. free the memory or re-use the buffers.

Parameters
- **handle** - Device handle obtained using spi_host_add_dev
- **trans_desc** - Pointer to variable able to contain a pointer to the description of the transaction that is executed. The descriptor should not be modified until the descriptor is returned by `spi_device_get_trans_result`.
- **ticks_to_wait** - Ticks to wait until there’s a returned item; use portMAX_DELAY to never time out.

Returns
- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_NOT_SUPPORTED if flag SPI_DEVICE_NO_RETURN_RESULT is set
- ESP_ERR_TIMEOUT if there was no completed transaction before ticks_to_wait expired
- ESP_OK on success

```c
esp_err_t spi_device_transmit(spi_device_handle_t handle, spi_transaction_t *trans_desc)
```

Send a SPI transaction, wait for it to complete, and return the result.

This function is the equivalent of calling `spi_device_queue_trans()` followed by `spi_device_get_trans_result()`. Do not use this when there is still a transaction separately queued (started) from `spi_device_queue_trans()` or polling_start/transmit that hasn’t been finalized.

Note: This function is not thread safe when multiple tasks access the same SPI device. Normally a device cannot start (queue) polling and interrupt transactions simultaneously.

Parameters
- **handle** - Device handle obtained using spi_host_add_dev
- **trans_desc** - Description of transaction to execute

Returns
- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_OK on success
### esp_err_t spi_device_polling_start (spi_device_handle_t handle, spi_transaction_t *trans_desc, TickType_t ticks_to_wait)

Immediately start a polling transaction.

**Note:** Normally a device cannot start (queue) polling and interrupt transactions simultaneously. Moreover, a device cannot start a new polling transaction if another polling transaction is not finished.

**Parameters**

- **handle** - Device handle obtained using spi_host_add_dev
- **trans_desc** - Description of transaction to execute
- **ticks_to_wait** - Ticks to wait until there’s room in the queue; currently only port_MAX_DELAY is supported.

**Returns**

- ESP_ERR_INVALID_ARG if parameter is invalid. This can happen if SPI_TRANS_CS_KEEP_ACTIVE flag is specified while the bus was not acquired (spi_device_acquire_bus() should be called first) or set flag SPI_TRANS_DMA_BUFFER_ALIGN_MANUAL but tx or rx buffer not DMA-capable, or addr&len not align to cache line size
- ESP_ERR_TIMEOUT if the device cannot get control of the bus before ticks_to_wait expired
- ESP_ERR_NO_MEM if allocating DMA-capable temporary buffer failed
- ESP_ERR_INVALID_STATE if previous transactions are not finished
- ESP_OK on success

### esp_err_t spi_device_polling_end (spi_device_handle_t handle, TickType_t ticks_to_wait)

Poll until the polling transaction ends.

This routine will not return until the transaction to the given device has successfully completed. The task is not blocked, but actively busy-spins for the transaction to be completed.

**Parameters**

- **handle** - Device handle obtained using spi_host_add_dev
- **ticks_to_wait** - Ticks to wait until there’s a returned item; use port_MAX_DELAY to never time out.

**Returns**

- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_TIMEOUT if the transaction cannot finish before ticks_to_wait expired
- ESP_OK on success

### esp_err_t spi_device_polling_transmit (spi_device_handle_t handle, spi_transaction_t *trans_desc)

Send a polling transaction, wait for it to complete, and return the result.

This function is the equivalent of calling spi_device_polling_start() followed by spi_device_polling_end(). Do not use this when there is still a transaction that hasn’t been finalized.

**Note:** This function is not thread safe when multiple tasks access the same SPI device. Normally a device cannot start (queue) polling and interrupt transactions simultaneously.

**Parameters**

- **handle** - Device handle obtained using spi_host_add_dev
- **trans_desc** - Description of transaction to execute

**Returns**

- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_TIMEOUT if the device cannot get control of the bus
- ESP_ERR_NO_MEM if allocating DMA-capable temporary buffer failed
- ESP_ERR_INVALID_STATE if previous transactions of same device are not finished
• ESP_OK on success

```c
esp_err_t spi_device_acquire_bus(spi_device_handle_t device, TickType_t wait)
```

Occupy the SPI bus for a device to do continuous transactions.

Transactions to all other devices will be put off until `spi_device_release_bus` is called.

**Note:** The function will wait until all the existing transactions have been sent.

**Parameters**
- `device` - The device to occupy the bus.
- `wait` - Time to wait before the the bus is occupied by the device. Currently MUST set to `portMAX_DELAY`.

**Returns**
- `ESP_ERR_INVALID_ARG`: `wait` is not set to `portMAX_DELAY`.
- `ESP_OK`: Success.

```c
void spi_device_release_bus(spi_device_handle_t dev)
```

Release the SPI bus occupied by the device. All other devices can start sending transactions.

**Parameters**
- `dev` - The device to release the bus.

```c
esp_err_t spi_device_get_actual_freq(spi_device_handle_t handle, int* freq_khz)
```

Calculate working frequency for specific device.

**Parameters**
- `handle` - SPI device handle
- `freq_khz` - [out] output parameter to hold calculated frequency in kHz

**Returns**
- `ESP_ERR_INVALID_ARG`: `handle` or `freq_khz` parameter is NULL
- `ESP_OK`: Success

```c
int spi_get_actual_clock(int fapb, int hz, int duty_cycle)
```

Calculate the working frequency that is most close to desired frequency.

**Parameters**
- `fapb` - The frequency of apb clock, should be `APB_CLK_FREQ`.
- `hz` - Desired working frequency
- `duty_cycle` - Duty cycle of the spi clock

**Returns** Actual working frequency that most fit.

```c
void spi_get_timing(bool gpio_is_used, int input_delay_ns, int eff_clk, int *dummy_o, int *cycles_remain_o)
```

Calculate the timing settings of specified frequency and settings.

**Note:** If **dummy_o** is not zero, it means dummy bits should be applied in half duplex mode, and full duplex mode may not work.

**Parameters**
- `gpio_is_used` - True if using GPIO matrix, or False if iomux pins are used.
- `input_delay_ns` - Input delay from SCLK launch edge to MISO data valid.
- `eff_clk` - Effective clock frequency (in Hz) from `spi_get_actual_clock()`.
- `dummy_o` - Address of dummy bits used output. Set to NULL if not needed.
- `cycles_remain_o` - Address of cycles remaining (after dummy bits are used) output.
  - -1 If too many cycles remaining, suggest to compensate half a clock.
  - 0 If no remaining cycles or dummy bits are not used.
  - positive value: cycles suggest to compensate.
int spi_get_freq_limit (bool gpio_is_used, int input_delay_ns)

Get the frequency limit of current configurations. SPI master working at this limit is OK, while above the limit, full duplex mode and DMA will not work, and dummy bits will be applied in the half duplex mode.

- **Parameters**
  - `gpio_is_used` - True if using GPIO matrix, or False if native pins are used.
  - `input_delay_ns` - Input delay from SCLK launch edge to MISO data valid.

- **Returns**
  - Frequency limit of current configurations.

esp_err_t spi_bus_get_max_transaction_len (spi_host_device_t host_id, size_t *max_bytes)

Get max length (in bytes) of one transaction.

- **Parameters**
  - `host_id` - SPI peripheral
  - `max_bytes` - [out] Max length of one transaction, in bytes

- **Returns**
  - `ESP_OK`: On success
  - `ESP_ERR_INVALID_ARG`: Invalid argument

**Structures**

struct spi_device_interface_config_t

This is a configuration for a SPI slave device that is connected to one of the SPI buses.

**Public Members**

uint8_t command_bits

Default amount of bits in command phase (0-16), used when `SPI_TRANS_VARIABLE_CMD` is not used, otherwise ignored.

uint8_t address_bits

Default amount of bits in address phase (0-64), used when `SPI_TRANS_VARIABLE_ADDR` is not used, otherwise ignored.

uint8_t dummy_bits

Amount of dummy bits to insert between address and data phase.

uint8_t mode

SPI mode, representing a pair of (CPOL, CPHA) configuration:

- 0: (0, 0)
- 1: (0, 1)
- 2: (1, 0)
- 3: (1, 1)

- **spi_clock_source_t clock_source**

  Select SPI clock source, `SPI_CLK_SRC_DEFAULT` by default.

uint16_t duty_cycle_pos

Duty cycle of positive clock, in 1/256th increments (128 = 50%/50% duty). Setting this to 0 (=not setting it) is equivalent to setting this to 128.
**Chapter 2. API Reference**

uint16_t `cs_ena_pretrans`

Amount of SPI bit-cycles the cs should be activated before the transmission (0-16). This only works on half-duplex transactions.

uint8_t `cs_ena_posttrans`

Amount of SPI bit-cycles the cs should stay active after the transmission (0-16)

int `clock_speed_hz`

SPI clock speed in Hz. Derived from `clock_source`.

int `input_delay_ns`

Maximum data valid time of slave. The time required between SCLK and MISO valid, including the possible clock delay from slave to master. The driver uses this value to give an extra delay before the MISO is ready on the line. Leave at 0 unless you know you need a delay. For better timing performance at high frequency (over 8MHz), it’s suggest to have the right value.

int `spics_io_num`

CS GPIO pin for this device, or -1 if not used.

uint32_t `flags`

Bitwise OR of SPI_DEVICE_* flags.

int `queue_size`

Transaction queue size. This sets how many transactions can be ‘in the air’ (queued using `spi_device_queue_trans` but not yet finished using `spi_device_get_trans_result`) at the same time.

`transaction_cb_t pre_cb`

Callback to be called before a transmission is started.

This callback is called within interrupt context should be in IRAM for best performance, see “Transferring Speed” section in the SPI Master documentation for full details. If not, the callback may crash during flash operation when the driver is initialized with ESP_INTR_FLAG_IRAM.

`transaction_cb_t post_cb`

Callback to be called after a transmission has completed.

This callback is called within interrupt context should be in IRAM for best performance, see “Transferring Speed” section in the SPI Master documentation for full details. If not, the callback may crash during flash operation when the driver is initialized with ESP_INTR_FLAG_IRAM.

`struct spi_transaction_t`

This structure describes one SPI transaction. The descriptor should not be modified until the transaction finishes.

**Public Members**

uint32_t `flags`

Bitwise OR of SPI_TRANS_* flags.

uint16_t `cmd`

Command data, of which the length is set in the `command_bits` of `spi_device_interface_config_t`.

---

Submit Document Feedback

Espressif Systems 728 Release v5.3-dev-277-gc8243465e4
NOTE: this field, used to be “command” in ESP-IDF 2.1 and before, is re-written to be used in a new way in ESP-IDF 3.0.

Example: write 0x0123 and command_bits=12 to send command 0x12, 0x3 (in previous version, you may have to write 0x3_12).

`uint64_t addr`

Address data, of which the length is set in the address_bits of `spi_device_interface_config_t`.

NOTE: this field, used to be “address” in ESP-IDF 2.1 and before, is re-written to be used in a new way in ESP-IDF 3.0.

Example: write 0x123400 and address_bits=24 to send address of 0x12, 0x34, 0x00 (in previous version, you may have to write 0x12340000).

`size_t length`

Total data length, in bits.

`size_t rxlength`

Total data length received, should be not greater than length in full-duplex mode (0 defaults this to the value of length).

`void *user`

User-defined variable. Can be used to store eg transaction ID.

`const void *tx_buffer`

Pointer to transmit buffer, or NULL for no MOSI phase.

`uint8_t tx_data[4]`

If SPI_TRANS_USE_TXDATA is set, data set here is sent directly from this variable.

`void *rx_buffer`

Pointer to receive buffer, or NULL for no MISO phase. Written by 4 bytes-unit if DMA is used.

`uint8_t rx_data[4]`

If SPI_TRANS_USE_RXDATA is set, data is received directly to this variable.

`struct spi_transaction_ext_t`

This struct is for SPI transactions which may change their address and command length. Please do set the flags in base to SPI_TRANS_VARIABLE_CMD_ADR to use the bit length here.

**Public Members**

`struct spi_transaction_t base`

Transaction data, so that pointer to `spi_transaction_t` can be converted into `spi_transaction_ext_t`.

`uint8_t command_bits`

The command length in this transaction, in bits.

`uint8_t address_bits`

The address length in this transaction, in bits.
uint8_t dummy_bits
    The dummy length in this transaction, in bits.

**Macros**

**SPI_MASTER_FREQ_8M**
SPI common used frequency (in Hz)

**Note:** SPI peripheral only has an integer divider, and the default clock source can be different on other targets, so the actual frequency may be slightly different from the desired frequency. 8MHz

**SPI_MASTER_FREQ_9M**
8.89MHz

**SPI_MASTER_FREQ_10M**
10MHz

**SPI_MASTER_FREQ_11M**
11.43MHz

**SPI_MASTER_FREQ_13M**
13.33MHz

**SPI_MASTER_FREQ_16M**
16MHz

**SPI_MASTER_FREQ_20M**
20MHz

**SPI_MASTER_FREQ_26M**
26.67MHz

**SPI_MASTER_FREQ_40M**
40MHz

**SPI_MASTER_FREQ_80M**
80MHz

**SPI_DEVICE_TXBIT_LSBFIRST**
Transmit command/address/data LSB first instead of the default MSB first.

**SPI_DEVICE_RXBIT_LSBFIRST**
Receive data LSB first instead of the default MSB first.

**SPI_DEVICE_BIT_LSBFIRST**
Transmit and receive LSB first.

**SPI_DEVICE_3WIRE**
Use MOSI (=spid) for both sending and receiving data.
**SPI_DEVICE_POSITIVE_CS**
Make CS positive during a transaction instead of negative.

**SPI_DEVICE_HALFDUPLEX**
Transmit data before receiving it, instead of simultaneously.

**SPI_DEVICE_CLK_AS_CS**
Output clock on CS line if CS is active.

**SPI_DEVICE_NO_DUMMY**
There are timing issue when reading at high frequency (the frequency is related to whether iomux pins are used, valid time after slave sees the clock).
- In half-duplex mode, the driver automatically inserts dummy bits before reading phase to fix the timing issue. Set this flag to disable this feature.
- In full-duplex mode, however, the hardware cannot use dummy bits, so there is no way to prevent data being read from getting corrupted. Set this flag to confirm that you’re going to work with output only, or read without dummy bits at your own risk.

**SPI_DEVICE_DDRCLK**

**SPI_DEVICE_NO_RETURN_RESULT**
Don’t return the descriptor to the host on completion (use post_cb to notify instead)

**SPI_TRANS_MODE_DIO**
Transmit/receive data in 2-bit mode.

**SPI_TRANS_MODE_QIO**
Transmit/receive data in 4-bit mode.

**SPI_TRANS_USE_RXDATA**
Receive into tx_data member of `spi_transaction_t` instead into memory at rx_buffer.

**SPI_TRANS_USE_TXDATA**
Transmit tx_data member of `spi_transaction_t` instead of data at tx_buffer. Do not set tx_buffer when using this.

**SPI_TRANS_MODE_DIOQIO_ADDR**
Also transmit address in mode selected by SPI_MODE_DIO/SPI_MODE_QIO.

**SPI_TRANS_VARIABLE_CMD**
Use the `command_bits` in `spi_transaction_ext_t` rather than default value in `spi_device_interface_config_t`.

**SPI_TRANS_VARIABLE_ADDR**
Use the `address_bits` in `spi_transaction_ext_t` rather than default value in `spi_device_interface_config_t`.

**SPI_TRANS_VARIABLE_DUMMY**
Use the `dummy_bits` in `spi_transaction_ext_t` rather than default value in `spi_device_interface_config_t`. 
**SPI_TRANS_CS_KEEP_ACTIVE**

Keep CS active after data transfer.

**SPI_TRANS_MULTILINE_CMD**

The data lines used at command phase is the same as data phase (otherwise, only one data line is used at command phase).

**SPI_TRANS_MODE_OCT**

Transmit/receive data in 8-bit mode.

**SPI_TRANS_MULTILINE_ADDR**

The data lines used at address phase is the same as data phase (otherwise, only one data line is used at address phase).

**SPI_TRANS_DMA_BUFFER_ALIGN_MANUAL**

By default driver will automatically re-alloc dma buffer if it doesn’t meet hardware alignment or dma_capable requirements, this flag is for you to disable this feature, you will need to take care of the alignment otherwise driver will return you error ESP_ERR_INVALID_ARG.

### Type Definitions

typedef void (*transaction_cb_t)(spi_transaction_t *trans)

typedef struct spi_device_t *spi_device_handle_t

Handle for a device on a SPI bus.

### 2.5.21 SPI Slave Driver

SPI Slave driver is a program that controls ESP32-S2’s General Purpose SPI (GP-SPI) peripheral(s) when it functions as a slave.

For more hardware information about the GP-SPI peripheral(s), see ESP32-S2 Technical Reference Manual > SPI Controller [PDF].

### Terminology

The terms used in relation to the SPI slave driver are given in the table below.
<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Host</td>
<td>The SPI controller peripheral external to ESP32-S2 that initiates SPI transmissions over the bus, and acts as an SPI Master.</td>
</tr>
<tr>
<td>Device</td>
<td>SPI slave device (general purpose SPI controller). Each Device shares the MOSI, MISO and SCLK signals but is only active on the bus when the Host asserts the Device’s individual CS line.</td>
</tr>
<tr>
<td>Bus</td>
<td>A signal bus, common to all Devices connected to one Host. In general, a bus includes the following lines: MISO, MOSI, SCLK, one or more CS lines, and, optionally, QUADWP and QUADHD. So Devices are connected to the same lines, with the exception that each Device has its own CS line. Several Devices can also share one CS line if connected in the daisy-chain manner.</td>
</tr>
<tr>
<td>MISO</td>
<td>Master In, Slave Out, a.k.a. Q. Data transmission from a Device to Host.</td>
</tr>
<tr>
<td>MOSI</td>
<td>Master Out, Slave In, a.k.a. D. Data transmission from a Host to Device.</td>
</tr>
<tr>
<td>SCLK</td>
<td>Serial Clock. Oscillating signal generated by a Host that keeps the transmission of data bits in sync.</td>
</tr>
<tr>
<td>CS</td>
<td>Chip Select. Allows a Host to select individual Device(s) connected to the bus in order to send or receive data.</td>
</tr>
<tr>
<td>QUADWP</td>
<td>Write Protect signal. Only used for 4-bit (qio/qout) transactions.</td>
</tr>
<tr>
<td>QUADHD</td>
<td>Hold signal. Only used for 4-bit (qio/qout) transactions.</td>

</table>

**Driver Features**

The SPI slave driver allows using the SPI peripherals as full-duplex Devices. The driver can send/receive transactions up to 72 bytes in length, or utilize DMA to send/receive longer transactions. However, there are some known issues related to DMA.

The SPI slave driver supports registering the SPI ISR to a certain CPU core. If multiple tasks try to access the same SPI Device simultaneously, it is recommended that your application be refactored so that each SPI peripheral is only accessed by a single task at a time. Please also use `spi_bus_config_t::isr_cpu_id` to register the SPI ISR to the same core as SPI peripheral related tasks to ensure thread safety.

**SPI Transactions**

A full-duplex SPI transaction begins when the Host asserts the CS line and starts sending out clock pulses on the SCLK line. Every clock pulse, a data bit is shifted from the Host to the Device on the MOSI line and back on the MISO line at the same time. At the end of the transaction, the Host de-asserts the CS line.

The attributes of a transaction are determined by the configuration structure for an SPI peripheral acting as a slave device `spi_slave_interface_config_t`, and transaction configuration structure `spi_slave_transaction_t`.

As not every transaction requires both writing and reading data, you can choose to configure the `spi_slave_transaction_t` structure for TX only, RX only, or TX and RX transactions. If `spi_slave_transaction_t::rx_buffer` is set to NULL, the read phase will be skipped. Similarly, if `spi_slave_transaction_t::tx_buffer` is set to NULL, the write phase will be skipped.

**Note:** A Host should not start a transaction before its Device is ready for receiving data. It is recommended to use another GPIO pin for a handshake signal to sync the Devices. For more details, see **Transaction Interval**.
Driver Usage

- Initialize an SPI peripheral as a Device by calling the function `spi_slave_initialize()`. Make sure to set the correct I/O pins in the struct `bus_config`. Set the unused signals to -1.

  If transactions will be longer than 32 bytes, allow a DMA channel by setting the parameter `dma_chan` to the host device. Otherwise, set `dma_chan` to 0.

- Before initiating transactions, fill one or more `spi_slave_transaction_t` structs with the transaction parameters required. Either queue all transactions by calling the function `spi_slave_queue_trans()` and, at a later time, query the result by using the function `spi_slave_get_trans_result()`, or handle all requests individually by feeding them into `spi_slave_transmit()`. The latter two functions will be blocked until the Host has initiated and finished a transaction, causing the queued data to be sent and received.

- (Optional) To unload the SPI slave driver, call `spi_slave_free()`.

Transaction Data and Master/Slave Length Mismatches

Normally, the data that needs to be transferred to or from a Device is read or written to a chunk of memory indicated by the `spi_slave_transaction_t::rx_buffer` and `spi_slave_transaction_t::tx_buffer`. The SPI driver can be configured to use DMA for transfers, in which case these buffers must be allocated in DMA-capable memory using `pvPortMallocCaps(size, MALLOC_CAP_DMA)`.

The amount of data that the driver can read or write to the buffers is limited by `spi_slave_transaction_t::length`. However, this member does not define the actual length of an SPI transaction. A transaction’s length is determined by the clock and CS lines driven by the Host. The actual length of the transmission can be read only after a transaction is finished from the member `spi_slave_transaction_t::trans_len`.

If the length of the transmission is greater than the buffer length, only the initial number of bits specified in the `spi_slave_transaction_t::length` member will be sent and received. In this case, `spi_slave_transaction_t::trans_len` is set to `spi_slave_transaction_t::length` instead of the actual transaction length. To meet the actual transaction length requirements, set `spi_slave_transaction_t::trans_len` to a value greater than the maximum `spi_slave_transaction_t::trans_len` expected. If the transmission length is shorter than the buffer length, only the data equal to the length of the buffer will be transmitted.

GPIO Matrix and IO_MUX
Most of chip’s peripheral signals have direct connection to their dedicated IO_MUX pins. However, the signals can also be routed to any other available pins using the less direct GPIO matrix. If at least one signal is routed through the GPIO matrix, then all signals will be routed through it.

When an SPI Host is set to 80 MHz or lower frequencies, routing SPI pins via GPIO matrix will behave the same compared to routing them via IO_MUX.

The IO_MUX pins for SPI buses are given below.

Speed and Timing Considerations

Transaction Interval  The ESP32-S2 SPI slave peripherals are designed as general purpose Devices controlled by a CPU. As opposed to dedicated slaves, CPU-based SPI Devices have a limited number of pre-defined registers. All
transactions must be handled by the CPU, which means that the transfers and responses are not real-time, and there might be noticeable latency.

As a solution, a Device’s response rate can be doubled by using the functions `spi_slave_queue_trans()` and then `spi_slave_get_trans_result()` instead of using `spi_slave_transmit()`.

You can also configure a GPIO pin through which the Device will signal to the Host when it is ready for a new transaction. A code example of this can be found in `peripherals/spi_slave`.

**SCLK Frequency Requirements**  The SPI slaves are designed to operate at up to 40 MHz. The data cannot be recognized or received correctly if the clock is too fast or does not have a 50% duty cycle.

**Restrictions and Known Issues**

1. If DMA is enabled, the rx buffer should be word-aligned (starting from a 32-bit boundary and having a length of multiples of 4 bytes). Otherwise, DMA may write incorrectly or not in a boundary aligned manner. The driver reports an error if this condition is not satisfied. Also, a Host should write lengths that are multiples of 4 bytes. The data with inappropriate lengths will be discarded.

**Application Example**

The code example for Device/Host communication can be found in the `peripherals/spi_slave` directory of ESP-IDF examples.

**API Reference**

**Header File**

- `components/driver/spi/include/driver/spi_slave.h`
- This header file can be included with:

  ```c
  #include "driver/spi_slave.h"
  ```

- This header file is a part of the API provided by the `driver` component. To declare that your component depends on `driver`, add the following to your `CMakeLists.txt`:

  ```c
  REQUIREES driver
  ```

  or

  ```c
  PRIV_REQUIRES driver
  ```

**Functions**

- `esp_err_t spi_slave_initialize(spi_host_device_t host, const spi_bus_config_t *bus_config, const spi_slave_interface_config_t *slave_config, spi_dma_chan_t dma_chan)`

  Initialize a SPI bus as a slave interface.

  **Warning:** SPI0/1 is not supported

  **Warning:** If a DMA channel is selected, any transmit and receive buffer used should be allocated in DMA-capable memory.
Warning: The ISR of SPI is always executed on the core which calls this function. Never starve the ISR on this core or the SPI transactions will not be handled.

Parameters
- **host** - SPI peripheral to use as a SPI slave interface
- **bus_config** – Pointer to a `spi_bus_config_t` struct specifying how the host should be initialized
- **slave_config** – Pointer to a `spi_slave_interface_config_t` struct specifying the details for the slave interface
- **dma_chan** – Selecting a DMA channel for an SPI bus allows transactions on the bus with size only limited by the amount of internal memory.
  - Selecting SPI_DMA_DISABLED limits the size of transactions.
  - Set to SPI_DMA_DISABLED if only the SPI flash uses this bus.
  - Set to SPI_DMA_CH_AUTO to let the driver to allocate the DMA channel.

Returns
- ESP_ERR_INVALID_ARG if configuration is invalid
- ESP_ERR_INVALID_STATE if host already is in use
- ESP_ERR_NOT_FOUND if there is no available DMA channel
- ESP_ERR_NO_MEM if out of memory
- ESP_OK on success

```c
esp_err_t spi_slave_free(spi_host_device_t host)
```

Free a SPI bus claimed as a SPI slave interface.

Parameters **host** – SPI peripheral to free

Returns
- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_INVALID_STATE if not all devices on the bus are freed
- ESP_OK on success

```c
esp_err_t spi_slave_queue_trans(spi_host_device_t host, const spi_slave_transaction_t *trans_desc, TickType_t ticks_to_wait)
```

Queue a SPI transaction for execution.

Queues a SPI transaction to be executed by this slave device. (The transaction queue size was specified when the slave device was initialised via `spi_slave_initilize`.) This function may block if the queue is full (depending on the `ticks_to_wait` parameter). No SPI operation is directly initiated by this function, the next queued transaction will happen when the master initiates a SPI transaction by pulling down CS and sending out clock signals.

This function hands over ownership of the buffers in `trans_desc` to the SPI slave driver; the application is not to access this memory until `spi_slave_queue_trans` is called to hand ownership back to the application.

Parameters
- **host** - SPI peripheral that is acting as a slave
- **trans_desc** – Description of transaction to execute. Not const because we may want to write status back into the transaction description,
- **ticks_to_wait** – Ticks to wait until there’s room in the queue; use port-MAX_DELAY to never time out.

Returns
- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_NO_MEM if set flag SPI_SLAVE_TRANS_DMA_BUFFER_ALIGN_AUTO but there is no free memory
- ESP_ERR_INVALID_STATE if sync data between Cache and memory failed
- ESP_OK on success

```c
esp_err_t spi_slave_get_trans_result(spi_host_device_t host, spi_slave_transaction_t **trans_desc, TickType_t ticks_to_wait)
```

Get the result of a SPI transaction queued earlier.
This routine will wait until a transaction to the given device (queued earlier with spi_slave_queue_trans) has successfully completed. It will then return the description of the completed transaction so software can inspect the result and e.g. free the memory or re-use the buffers.

It is mandatory to eventually use this function for any transaction queued by spi_slave_queue_trans.

Parameters
- **host** - SPI peripheral to that is acting as a slave
- **trans_desc** - [out] Pointer to variable able to contain a pointer to the description of the transaction that is executed
- **ticks_to_wait** - Ticks to wait until there’s a returned item; use portMAX_DELAY to never time out.

Returns
- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_OK on success

```c
esp_err_t spi_slave_transmit (spi_host_device_t host, spi_slave_transaction_t *trans_desc, TickType_t ticks_to_wait)
```

Do a SPI transaction.

Essentially does the same as spi_slave_queue_trans followed by spi_slave_get_trans_result. Do not use this when there is still a transaction queued that hasn’t been finalized using spi_slave_get_trans_result.

Parameters
- **host** - SPI peripheral to that is acting as a slave
- **trans_desc** - Pointer to variable able to contain a pointer to the description of the transaction that is executed. Not const because we may want to write status back into the transaction description.
- **ticks_to_wait** - Ticks to wait until there’s a returned item; use portMAX_DELAY to never time out.

Returns
- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_OK on success

Structures

```c
struct spi_slave_interface_config_t
```

This is a configuration for a SPI host acting as a slave device.

Public Members

```
def spics_io_num
    CS GPIO pin for this device.
```

```
def flags
    Bitwise OR of SPI_SLAVE_* flags.
```

```
def queue_size
    Transaction queue size. This sets how many transactions can be ‘in the air’ (queued using spi_slave_queue_trans but not yet finished using spi_slave_get_trans_result) at the same time.
```

```
def mode
    SPI mode, representing a pair of (CPOL, CPHA) configuration:
    - 0: (0, 0)
    - 1: (0, 1)
```
slave_transaction_cb_t post_setup_cb

Callback called after the SPI registers are loaded with new data.

This callback is called within interrupt context should be in IRAM for best performance, see “Transferring Speed” section in the SPI Master documentation for full details. If not, the callback may crash during flash operation when the driver is initialized with ESP_INTR_FLAG_IRAM.

slave_transaction_cb_t post_trans_cb

Callback called after a transaction is done.

This callback is called within interrupt context should be in IRAM for best performance, see “Transferring Speed” section in the SPI Master documentation for full details. If not, the callback may crash during flash operation when the driver is initialized with ESP_INTR_FLAG_IRAM.

struct spi_slave_transaction_t

This structure describes one SPI transaction

Public Members

uint32_t flags

Bitwise OR of SPI_SLAVE_TRANS_* flags.

size_t length

Total data length, in bits.

size_t trans_len

Transaction data length, in bits.

const void *tx_buffer

Pointer to transmit buffer, or NULL for no MOSI phase.

void *rx_buffer

Pointer to receive buffer, or NULL for no MISO phase. When the DMA is enabled, must start at WORD boundary (rx_buffer%4==0), and has length of a multiple of 4 bytes.

void *user

User-defined variable. Can be used to store eg transaction ID.

Macros

SPI_SLAVE_TXBIT_LSBFIRST

Transmit command/address/data LSB first instead of the default MSB first.

SPI_SLAVE_RXBIT_LSBFIRST

Receive data LSB first instead of the default MSB first.

SPI_SLAVE_BIT_LSBFIRST

Transmit and receive LSB first.
**SPI_SLAVE_NO_RETURN_RESULT**

Don’t return the descriptor to the host on completion (use `post_trans_cb` to notify instead)

**SPI_SLAVE_TRANS_DMA_BUFFER_ALIGN_AUTO**

Automatically re-malloc dma buffer if user buffer doesn’t meet hardware alignment or `dma_capable`, this process may loss some memory and performance.

**Type Definitions**

typedef void (*slave_transaction_cb_t)(spi_slave_transaction_t *trans)

### 2.5.22 SPI Slave Half Duplex

**Introduction**

The Half Duplex (HD) Mode is a special mode provided by ESP SPI Slave peripheral. Under this mode, the hardware provides more services than the Full Duplex (FD) Mode (the mode for general-purpose SPI transactions, see [SPI Slave Driver](#)). These services reduce the CPU load and the response time of SPI Slave. However, it is important to note that the communication format is determined by the hardware and is always in a half-duplex configuration, allowing only one-way data transfer at any given time. Hence, the mode is named Half Duplex Mode due to this characteristic.

When conducting an SPI transaction, transactions can be classified into several types based on the **command** phase of the transaction. Each transaction may consist of the following phases: command, address, dummy, and data. The command phase is mandatory, while the other phases may be determined by the command field. During the command, address, and dummy phases, the bus is always controlled by the master (usually the host), while the direction of the data phase depends on the command. The data phase can be either an input phase, where the master writes data to the slave (e.g., the host sends data to the slave), or an output phase, where the master reads data from the slave (e.g., the host receives data from the slave).

**Protocol** About the details of how master should communicate with the SPI Slave, see [ESP SPI Slave HD (Half Duplex) Mode Protocol](#).

Through these different transactions, the slave provides these services to the master:

- A DMA channel for the master to write a great amount of data to the slave.
- A DMA channel for the master to read a great amount of data from the slave.
- Several general purpose registers, shared between the master and the slave.
- Several general purpose interrupts, for the master to interrupt the SW of the slave.

**Terminology**

- Transaction
- Channel
- Sending
- Receiving
- Data Descriptor

**Driver Feature**

- Transaction read/write by master in segments
- Queues for data to send and received
Driver Usage

Slave Initialization  Call `spi_slave_hd_init()` to initialize the SPI bus as well as the peripheral and the driver. The SPI Slave exclusively uses the SPI peripheral, pins of the bus before it is deinitialized, which means other devices are unable to use the above resources during initialization. Thus, to ensure SPI resources are correctly occupied and the connections work properly, most configurations of the slave should be done as soon as the slave is initialized.

The `spi_bus_config_t` specifies how the bus should be initialized, while `spi_slave_hd_slot_config_t` specifies how the SPI Slave driver should work.

Deinitialization (Optional)  Call `spi_slave_hd_deinit()` to uninstall the driver. The resources, including the pins, SPI peripheral, internal memory used by the driver, and interrupt sources, are released by the `deinit()` function.

Send/Receive Data by DMA Channels  To send data to the master through the sending DMA channel, the application should properly wrap the data in an `spi_slave_hd_data_t` descriptor structure before calling `spi_slave_hd_queue_trans()` with the data descriptor and the channel argument of `SPI_SLAVE_CHAN_TX`. The pointers to descriptors are stored in the queue, and the data is sent to the master in the same order they are enqueued using `spi_slave_hd_queue_trans()`, upon receiving the master’s Rd_DMA command.

The application should check the result of data sending by calling `spi_slave_hd_get_trans_res()` with the channel set as `SPI_SLAVE_CHAN_TX`. This function blocks until the transaction with the command Rd_DMA from the master successfully completes (or timeout). The `out_trans` argument of the function outputs the pointer of the data descriptor which is just finished, providing information about the sending.

Receiving data from the master through the receiving DMA channel is quite similar. The application calls `spi_slave_hd_queue_trans()` with proper data descriptor and the channel argument of `SPI_SLAVE_CHAN_RX`. And the application calls the `spi_slave_hd_get_trans_res()` later to get the descriptor to the receiving buffer before it handles the data in the receiving buffer.

**Note:** This driver itself does not have an internal buffer for the data to send or just received. The application should provide data buffer for driver via data descriptors to send to the master, or to receive data from the master.

The application has to properly keep the data descriptor as well as the buffer it points, after the descriptor is successfully sent into the driver internal queue by `spi_slave_hd_queue_trans()`, and before returned by `spi_slave_hd_get_trans_res()`. During this period, the hardware as well as the driver may read or write to the buffer and the descriptor when required at any time.

Please note that, when using this driver for data transfer, the buffer does not have to be fully sent or filled before it is terminated. For example, in the segment transaction mode, the master has to send CMD7 to terminate a Wr_DMA transaction or send CMD8 to terminate an Rd_DMA transaction (in segments), no matter whether the send (receive) buffer is used up (full) or not.

Using Data Descriptor with Customized User Arguments  Sometimes you may have initiator (sending data descriptor) and closure (handling returned descriptors) functions in different places. When you get the returned data descriptor in the closure, you may need some extra information when handling the finished data descriptor. For example, you may want to know which round it is for the returned descriptor when you send the same piece of data several times.

Set the `arg` member in the data descriptor to a variable indicating the transaction by force casting, or point it to a structure that wraps all the information you may need when handling the sending/receiving data. Then you can get what you need in your closure.
Using Callbacks

**Note:** These callbacks are called in the ISR, so the required operations need to be processed quickly and returned as soon as possible to ensure that the system is functioning properly. You may need to be very careful to write the code in the ISR.

Since the interrupt handling is executed concurrently with the application, long delays or blocking may cause the system to respond slower or lead to unpredictable behavior. Therefore, when writing callback functions, avoid using operations that may cause delays or blocking, e.g., waiting, sleeping, resource locking, etc.

The `spi_slave_hd_callback_config_t` member in the `spi_slave_hd_slot_config_t` configuration structure passed when initializing the SPI Slave HD driver, allows you to have callbacks for each event you may concern.

The corresponding interrupt for each callback that is not `NULL` is enabled, so that the callbacks can be called immediately when the events happen. You do not need to provide callbacks for the unconcerned events.

The `arg` member in the configuration structure can help you pass some context to the callback or indicate the specific SPI Slave instance when using the same callbacks for multiple SPI Slave peripherals. You can set the `arg` member to a variable that indicates the SPI Slave instance by performing a forced type casting or point it to a context structure. All the callbacks are called with this `arg` argument you set when the callbacks are initialized.

There are two other arguments: the `event` and the `awoken`.

- The `event` passes the information of the current event to the callback. The `spi_slave_hd_event_t` type contains the information of the event, for example, event type, the data descriptor just finished (The `data argument` is very useful in this case!).
- The `awoken` argument serves as an output parameter. It informs the ISR that tasks have been awakened after the callback function, and the ISR should call `portYIELD_FROM_ISR()` to schedule these tasks. Simply pass the `awoken` argument to all FreeRTOS APIs that may unblock tasks, and the value of `awoken` will be returned to the ISR.

Writing/Reading Shared Registers  Call `spi_slave_hd_write_buffer()` to write the shared buffer, and `spi_slave_hd_read_buffer()` to read the shared buffer.

**Note:** On ESP32-S2, the shared registers are read/written in words by the application but read/written in bytes by the master. There is no guarantee four continuous bytes read from the master are from the same word written by the slave’s application. It is also possible that if the slave reads a word while the master is writing bytes of the word, the slave may get one word with half of them just written by the master, and the other half has not been written into.

The master can confirm that the word is not in transition by reading the word twice and comparing the values.

For the slave, it is more difficult to ensure the word is not in transition because the process of master writing four bytes can be very long (32 SPI clocks). You can put some CRC in the last (largest address) byte of a word so that when the byte is written, the word is sure to be all written.

Due to the conflicts that may be among read/write from SW (worse if there are multi-cores) and master, it is suggested that a word is only used in one direction (only written by the master or only written by the slave).

Receiving General Purpose Interrupts from the Master  When the master sends `CMD8`, `CMD9` or `CMDA`, the slave corresponding is triggered. Currently the `CMD8` is permanently used to indicate the termination of `Rd_DMA` segments. To receive general-purpose interrupts, register callbacks for `CMD9` and `CMDA` when the slave is initialized, see Using Callbacks.

Application Example

The code example for Device/Host communication can be found in the `peripherals/spi_slave_hd` directory of ESP-IDF examples.
Chapter 2. API Reference

API Reference

Header File

- components/driver/spi/include/driver/spi_slave_hd.h
  - This header file can be included with:
    ```
    #include "driver/spi_slave_hd.h"
    ```
  - This header file is a part of the API provided by the `driver` component. To declare that your component depends on `driver`, add the following to your CMakeLists.txt:
    ```cmake
    REQUIRES driver
    ```
  or
    ```cmake
    PRIV_REQUIRES driver
    ```

Functions

- `esp_err_t spi_slave_hd_init(spi_host_device_t host_id, const spi_bus_config_t *bus_config, const spi_slave_hd_slot_config_t *config)`
  - Initialize the SPI Slave HD driver.
  - **Parameters**
    - `host_id` - The host to use
    - `bus_config` - Bus configuration for the bus used
    - `config` - Configuration for the SPI Slave HD driver
  - **Returns**
    - `ESP_OK`: on success
    - `ESP_ERR_INVALID_ARG`: invalid argument given
    - `ESP_ERR_INVALID_STATE`: function called in invalid state, may be some resources are already in use
    - `ESP_ERR_NOT_FOUND` if there is no available DMA channel
    - `ESP_ERR_NO_MEM`: memory allocation failed
    - or other return value from `esp_intr_alloc`

- `esp_err_t spi_slave_hd_deinit(spi_host_device_t host_id)`
  - Deinitialize the SPI Slave HD driver.
  - **Parameters**
    - `host_id` - The host to deinitialize the driver
  - **Returns**
    - `ESP_OK`: on success
    - `ESP_ERR_INVALID_ARG`: if the `host_id` is not correct

- `esp_err_t spi_slave_hd_queue_trans(spi_host_device_t host_id, spi_slave_chan_t chan, spi_slave_hd_data_t *trans, TickType_t timeout)`
  - Queue transactions (segment mode)
  - **Parameters**
    - `host_id` - Host to queue the transaction
    - `chan` - SPI_SLAVE_CHAN_TX or SPI_SLAVE_CHAN_RX
    - `trans` - Transaction descriptors
    - `timeout` - Timeout before the data is queued
  - **Returns**
    - `ESP_OK`: on success
    - `ESP_ERR_INVALID_ARG`: The input argument is invalid. Can be the following reason:
      - The buffer given is not DMA capable
      - The length of data is invalid (not larger than 0, or exceed the max transfer length)
      - The transaction direction is invalid
    - `ESP_ERR_TIMEOUT`: Cannot queue the data before timeout. Master is still processing previous transaction.
• ESP_ERR_INVALID_STATE: Function called in invalid state. This API should be called under segment mode.

```c
esp_err_t spi_slave_hd_get_trans_res(spi_host_device_t host_id, spi_slave_chan_t chan,
                        spi_slave_hd_data_t **out_trans, TickType_t timeout)
```

Get the result of a data transaction (segment mode)

**Note:** This API should be called successfully the same times as the `spi_slave_hd_queue_trans`

### Parameters
- **host_id** – Host to queue the transaction
- **chan** – Channel to get the result, SPI_SLAVE_CHAN_TX or SPI_SLAVE_CHAN_RX
- **out_trans** – [out] Pointer to the transaction descriptor (`spi_slave_hd_data_t`)
  passed to the driver before. Hardware has finished this transaction. Member `trans_len` indicates the actual number of bytes of received data, it’s meaningless for TX.
- **timeout** – Timeout before the result is got

### Returns
- ESP_OK: on success
- ESP_ERR_INVALID_ARG: Function is not valid
- ESP_ERR_TIMEOUT: There’s no transaction done before timeout
- ESP_ERR_INVALID_STATE: Function called in invalid state. This API should be called under segment mode.

```c
void spi_slave_hd_read_buffer(spi_host_device_t host_id, int addr, uint8_t*out_data, size_t len)
```

Read the shared registers.

**Parameters**
- **host_id** – Host to read the shared registers
- **addr** – Address of register to read, 0 to SOC_SPI_MAXIMUM_BUFFER_SIZE-1
- **out_data** – [out] Output buffer to store the read data
- **len** – Length to read, not larger than SOC_SPI_MAXIMUM_BUFFER_SIZE-addr

```c
void spi_slave_hd_write_buffer(spi_host_device_t host_id, int addr, uint8_t*data, size_t len)
```

Write the shared registers.

**Parameters**
- **host_id** – Host to write the shared registers
- **addr** – Address of register to write, 0 to SOC_SPI_MAXIMUM_BUFFER_SIZE-1
- **data** – Buffer holding the data to write
- **len** – Length to write, SOC_SPI_MAXIMUM_BUFFER_SIZE-addr

```c
esp_err_t spi_slave_hd_append_trans(spi_host_device_t host_id, spi_slave_chan_t chan,
                        spi_slave_hd_data_t *trans, TickType_t timeout)
```

Load transactions (append mode)

**Note:** In this mode, user transaction descriptors will be appended to the DMA and the DMA will keep processing the data without stopping

**Parameters**
- **host_id** – Host to load transactions
- **chan** – SPI_SLAVE_CHAN_TX or SPI_SLAVE_CHAN_RX
- **trans** – Transaction descriptor
- **timeout** – Timeout before the transaction is loaded

### Returns
- ESP_OK: on success
- ESP_ERR_INVALID_ARG: The input argument is invalid. Can be the following reason:
– The buffer given is not DMA capable
– The length of data is invalid (not larger than 0, or exceed the max transfer length)
– The transaction direction is invalid
• ESP_ERR_TIMEOUT: Master is still processing previous transaction. There is no available transaction for slave to load
• ESP_ERR_INVALID_STATE: Function called in invalid state. This API should be called under append mode.

```
esp_err_t spi_slave_hd_get_append_trans_res(spi_host_device_t host_id, spi_slave_chan_t chan, spi_slave_hd_data_t **out_trans, TickType_t timeout)
```

Get the result of a data transaction (append mode)

**Note:** This API should be called the same times as the `spi_slave_hd_append_trans`

**Parameters**

• `host_id` – Host to load the transaction
• `chan` – SPI_SLAVE_CHAN_TX or SPI_SLAVE_CHAN_RX
• `out_trans` – [out] Pointer to the transaction descriptor (spi_slave_hd_data_t) passed to the driver before. Hardware has finished this transaction. Member `trans_len` indicates the actual number of bytes of received data, it’s meaningless for TX.
• `timeout` – Timeout before the result is got

**Returns**

• ESP_OK: on success
• ESP_ERR_INVALID_ARG: Function is not valid
• ESP_ERR_TIMEOUT: There’s no transaction done before timeout
• ESP_ERR_INVALID_STATE: Function called in invalid state. This API should be called under append mode.

**Structures**

struct `spi_slave_hd_data_t`

Descriptor of data to send/receive.

**Public Members**

`uint8_t *data`

Buffer to send, must be DMA capable.

`size_t len`

Len of data to send/receive. For receiving the buffer length should be multiples of 4 bytes, otherwise the extra part will be truncated.

`size_t trans_len`

For RX direction, it indicates the data actually received. For TX direction, it is meaningless.

`uint32_t flags`

Bitwise OR of SPI_SLAVE_HD_TRANS_* flags.

`void *arg`

Extra argument indicating this data.
struct **spi_slave_hd_event_t**
Information of SPI Slave HD event.

**Public Members**

*spi_event_t* `event`
Event type.

*spi_slave_hd_data_t *trans*
Corresponding transaction for SPI_EV_SEND and SPI_EV_RECV events.

struct **spi_slave_hd_callback_config_t**
Callback configuration structure for SPI Slave HD.

**Public Members**

*slave_cb_t* `cb_buffer_tx`
Callback when master reads from shared buffer.

*slave_cb_t* `cb_buffer_rx`
Callback when master writes to shared buffer.

*slave_cb_t* `cb_send_dma_ready`
Callback when TX data buffer is loaded to the hardware (DMA)

*slave_cb_t* `cb_sent`
Callback when data are sent.

*slave_cb_t* `cb_recv_dma_ready`
Callback when RX data buffer is loaded to the hardware (DMA)

*slave_cb_t* `cb_recv`
Callback when data are received.

*slave_cb_t* `cb_cmd9`
Callback when CMD9 received.

*slave_cb_t* `cb_cmdA`
Callback when CMDA received.

void *arg
Argument indicating this SPI Slave HD peripheral instance.

struct **spi_slave_hd_slot_config_t**
Configuration structure for the SPI Slave HD driver.
Public Members

uint8_t \texttt{mode}  
SPI mode, representing a pair of (CPOL, CPHA) configuration:
- 0: (0, 0)
- 1: (0, 1)
- 2: (1, 0)
- 3: (1, 1)

uint32_t \texttt{spics_io_num}  
CS GPIO pin for this device.

uint32_t \texttt{flags}  
Bitwise OR of SPI_SLAVE_HD_* flags.

uint32_t \texttt{command_bits}  
command field bits, multiples of 8 and at least 8.

uint32_t \texttt{address_bits}  
address field bits, multiples of 8 and at least 8.

uint32_t \texttt{dummy_bits}  
dummy field bits, multiples of 8 and at least 8.

uint32_t \texttt{queue_size}  
Transaction queue size. This sets how many transactions can be ‘in the air’ (queued using spi_slave_hd_queue_trans but not yet finished using spi_slave_hd_get_trans_result) at the same time.

\texttt{spi_dma_chan_t} \texttt{dma_chan}  
DMA channel to used.

\texttt{spi_slave_hd_callback_config_t} \texttt{cb_config}  
Callback configuration.

Macros

\texttt{SPI_SLAVE_HD_TRANS_DMA_BUFFER_ALIGN_AUTO}  
Automatically re-alloc dma buffer if user buffer doesn’t meet hardware alignment or dma_capable, this process may lose some memory and performance.

\texttt{SPI_SLAVE_HD_TXBIT_LSBFIRST}  
Transmit command/address/data LSB first instead of the default MSB first.

\texttt{SPI_SLAVE_HD_RXBIT_LSBFIRST}  
Receive data LSB first instead of the default MSB first.

\texttt{SPI_SLAVE_HD_BIT_LSBFIRST}  
Transmit and receive LSB first.
SPI_SLAVE_HD_APPEND_MODE

Adopt DMA append mode for transactions. In this mode, users can load(append) DMA descriptors without stopping the DMA.

Type Definitions

typedef bool (*slave_cb_t)(void *arg, spi_slave_hd_event_t *event, BaseType_t *awoken)

Callback for SPI Slave HD.

Enumerations

enum spi_slave_chan_t

Channel of SPI Slave HD to do data transaction.

Values:

enumerator SPI_SLAVE_CHAN_TX

The output channel (RDDMA)

enumerator SPI_SLAVE_CHAN_RX

The input channel (WRDMA)

2.5.23 Temperature Sensor

Introduction

The ESP32-S2 has a built-in sensor used to measure the chip’s internal temperature. The temperature sensor module contains an 8-bit Sigma-Delta analog-to-digital converter (ADC) and a digital-to-analog converter (DAC) to compensate for the temperature measurement.

Due to restrictions of hardware, the sensor has predefined measurement ranges with specific measurement errors. See the table below for details.

<table>
<thead>
<tr>
<th>Predefined Range (°C)</th>
<th>Error (°C)</th>
</tr>
</thead>
<tbody>
<tr>
<td>50 ~ 125</td>
<td>&lt; 3</td>
</tr>
<tr>
<td>20 ~ 100</td>
<td>&lt; 2</td>
</tr>
<tr>
<td>-10 ~ 80</td>
<td>&lt; 1</td>
</tr>
<tr>
<td>-30 ~ 50</td>
<td>&lt; 2</td>
</tr>
<tr>
<td>-40 ~ 20</td>
<td>&lt; 3</td>
</tr>
</tbody>
</table>

Note: The temperature sensor is designed primarily to measure the temperature changes inside the chip. The internal temperature of a chip is usually higher than the ambient temperature, and is affected by factors such as the microcontroller’s clock frequency or I/O load, and the external thermal environment.

Functional Overview

The description of the temperature sensor functionality is divided into the following sections:
• **Resource Allocation** - covers which parameters should be set up to get a temperature sensor handle and how to recycle the resources when the temperature sensor finishes working.

• **Enable and Disable Temperature Sensor** - covers how to enable and disable the temperature sensor.

• **Get Temperature Value** - covers how to get the real-time temperature value.

• **Power Management** - covers how the temperature sensor is affected when changing power mode (e.g., Light-sleep mode).

• **Thread Safety** - covers how to make the driver to be thread-safe.

**Resource Allocation**  The ESP32-S2 has just one built-in temperature sensor hardware. The temperature sensor instance is represented by `temperature_sensor_handle_t`, which is also the bond of the context. By using `temperature_sensor_handle_t`, the temperature sensor properties can be accessed and modified in different function calls to control and manage the temperature sensor. The variable would always be the parameter of the temperature APIs with the information of hardware and configurations, so you can just create a pointer of type `temperature_sensor_handle_t` and passing to APIs as needed.

In order to install a built-in temperature sensor instance, the first thing is to evaluate the temperature range in your detection environment. For example, if the testing environment is in a room, the range you evaluate might be 10°C ~ 30°C; if the testing in a lamp bulb, the range you evaluate might be 60°C ~ 110°C. Based on that, configuration structure `temperature_sensor_config_t` should be defined in advance:

- ```range_min```: The minimum value of the testing range you have evaluated.
- ```range_max```: The maximum value of the testing range you have evaluated.

After the ranges are set, the structure could be passed to `temperature_sensor_install()`, which will instantiate the temperature sensor instance and return a handle.

As mentioned above, different measure ranges have different measurement errors. You do not need to care about the measurement error because we have an internal mechanism to choose the minimum error according to the given range.

If the temperature sensor is no longer needed, you need to call `temperature_sensor_uninstall()` to free the temperature sensor resource.

**Creating a Temperature Sensor Handle**

- Step 1: Evaluate the testing range. In this example, the range is 20°C ~ 50°C.
- Step 2: Configure the range and obtain a handle.

```c

#include <esp_timer_api.h>
#include <esp_event.h>
#include <esp.pageSize

#define EXAMPLE_SENSOR_MIN 20
#define EXAMPLE_SENSOR_MAX 50

void exampleTemperatureSensorCallback(void *arg)
{
    ESP_LOGD(TAG, "Temperature changed: %f", arg);
}

void exampleTemperatureSensorRun(void)
{
    temperature_sensor_handle_t temp_handle = NULL;
    temperature_sensor_config_t temp_sensor = {
        .range_min = EXAMPLE_SENSOR_MIN,
        .range_max = EXAMPLE_SENSOR_MAX,
    };
    ESP_ERROR_CHECK(temperature_sensor_install(&temp_sensor, &temp_handle));
}
```

**Enable and Disable Temperature Sensor**

1. Enable the temperature sensor by calling `temperature_sensor_enable()`. The internal temperature sensor circuit will start to work. The driver state will transit from init to enable.

2. To Disable the temperature sensor, please call `temperature_sensor_disable()`.

**Get Temperature Value**  After the temperature sensor is enabled by `temperature_sensor_enable()`, you can get the current temperature by calling `temperature_sensor_get_celsius()`.

```c

// Enable temperature sensor
ESP_ERROR_CHECK(temperature_sensor_enable(temp_handle));

// Get converted sensor data
float tsens_out;
ESP_ERROR_CHECK(temperature_sensor_get_celsius(temp_handle, &tsens_out));
```

(continues on next page)
printf("Temperature in %f °C\n", tsens_out);
// Disable the temperature sensor if it is not needed and save the power
ESP_ERROR_CHECK(temperature_sensor_disable(temp_handle));

Power Management  As the temperature sensor does not use the APB clock, it will keep working no matter if the power management is enabled with CONFIG_PM_ENABLE.

Thread Safety  In the temperature sensor driver, we do not add any protection to ensure the thread safety, because typically this driver is only supposed to be used in one task. If you have to use this driver in different tasks, please add extra locks to protect it.

Unexpected Behaviors

1. The value you get from the chip is usually different from the ambient temperature. It is because the temperature sensor is built inside the chip. To some extent, it measures the temperature of the chip.
2. When installing the temperature sensor, the driver may print the boundary you gave cannot meet the range of internal temperature sensor. It is because the built-in temperature sensor has a testing limit. The error comes from the incorrect configuration of temperature_sensor_config_t as follow:
   (1) Totally out of range, like 200 °C ~ 300 °C.
   (2) Cross the boundary of each predefined measurement. like 40 °C ~ 110 °C.

Application Example

• Temperature sensor reading example: peripherals/temperature_sensor/temp_sensor.

API Reference

Header File

• components/driver/temperature_sensor/include/driver/temperature_sensor.h
• This header file can be included with:

```c
#include "driver/temperature_sensor.h"
```

• This header file is a part of the API provided by the driver component. To declare that your component depends on driver, add the following to your CMakeLists.txt:

```cmake
REQUIRES driver
```

or

```cmake
PRIV_REQUIRES driver
```

Functions

```c
temperature_sensor_install(esp_err_t, const temperature_sensor_config_t *tsens_config, temperature_sensor_handle_t *ret_tsens)
```

Install temperature sensor driver.

Parameters

• tsens_config – Pointer to config structure.
• ret_tsens – Return the pointer of temperature sensor handle.

Returns
• ESP_OK if succeed

```c
esp_err_t temperature_sensor_uninstall(temperature_sensor_handle_t tsens)
```
Uninstall the temperature sensor driver.

**Parameters**
- `tsens` - The handle created by `temperature_sensor_install()`.

**Returns**
- ESP_OK if succeed.

```c
esp_err_t temperature_sensor_enable(temperature_sensor_handle_t tsens)
```
Enable the temperature sensor.

**Parameters**
- `tsens` - The handle created by `temperature_sensor_install()`.

**Returns**
- ESP_OK Success
- ESP_ERR_INVALID_STATE if temperature sensor is enabled already.

```c
esp_err_t temperature_sensor_disable(temperature_sensor_handle_t tsens)
```
Disable temperature sensor.

**Parameters**
- `tsens` - The handle created by `temperature_sensor_install()`.

**Returns**
- ESP_OK Success
- ESP_ERR_INVALID_STATE if temperature sensor is not enabled yet.

```c
esp_err_t temperature_sensor_get_celsius(temperature_sensor_handle_t tsens, float*out_celsius)
```
Read temperature sensor data that is converted to degrees Celsius.

**Note:** Should not be called from interrupt.

**Parameters**
- `tsens` - The handle created by `temperature_sensor_install()`.
- `out_celsius` - The measure output value.

**Returns**
- ESP_OK Success
- ESP_ERR_INVALID_ARG invalid arguments
- ESP_ERR_INVALID_STATE Temperature sensor is not enabled yet.
- ESP_FAIL Parse the sensor data into ambient temperature failed (e.g. out of the range).

**Structures**

```c
struct temperature_sensor_config_t
```
Configuration of measurement range for the temperature sensor.

**Note:** If you see the log the boundary you gave cannot meet the range of internal temperature sensor. You may need to refer to predefined range listed doc api-reference/peripherals/Temperature sensor.

**Public Members**

```c
int range_min
```
the minimum value of the temperature you want to test

```c
int range_max
```
the maximum value of the temperature you want to test
temperature_sensor_clk_src_t \texttt{clk\_src}

\begin{verbatim}
Type of temperature sensor driver handle.
\end{verbatim}

### 2.5.24 Touch Sensor

**Introduction**

A touch sensor system is built on a substrate which carries electrodes and relevant connections under a protective flat surface. When the surface is touched, the capacitance variation is used to evaluate if the touch was valid.

The sensing pads can be arranged in different combinations (e.g., matrix, slider), so that a larger area or more points can be detected. The touch pad sensing process is under the control of a hardware-implemented finite-state machine (FSM) which is initiated by software or a dedicated hardware timer.

For design, operation, and control registers of a touch sensor, see \textit{ESP32-S2 Technical Reference Manual > On-Chip Sensors and Analog Signal Processing [PDF]}. In-depth design details of touch sensors and firmware development guidelines for ESP32-S2 are available in \textit{Touch Sensor Application Note}.

**Functionality Overview**

Description of API is broken down into groups of functions to provide a quick overview of the following features:

- Initialization of touch pad driver
- Configuration of touch pad GPIO pins
- Taking measurements
- Adjusting parameters of measurements
- Filtering measurements
- Touch detection methods
- Setting up interrupts to report touch detection
- Waking up from Sleep mode on interrupt

For detailed description of a particular function, please go to Section \textit{API Reference}. Practical implementation of this API is covered in Section \textit{Application Examples}.

**Initialization**

Before using a touch pad, you need to initialize the touch pad driver by calling the function \texttt{touch_pad_init()}. This function sets several ..\_DEFAULT driver parameters listed in \textit{API Reference} under Macros. It also removes the information about which pads have been touched before, if any, and disables interrupts. If the driver is not required anymore, deinitialize it by calling \texttt{touch_pad_deinit()}. 

---

Submit Document Feedback
**Configuration**  Enabling the touch sensor functionality for a particular GPIO is done with `touch_pad_config()`. The following 14 capacitive touch pads are supported for ESP32-S2.

<table>
<thead>
<tr>
<th>Touch Pad</th>
<th>GPIO Pin</th>
</tr>
</thead>

Use the function `touch_pad_set_fsm_mode()` to select if touch pad measurement (operated by FSM) should be started automatically by a hardware timer, or by software. If software mode is selected, use `touch_pad_sw_start()` to start the FSM.

**Touch State Measurements**  The following function come in handy to read raw measurements from the sensor:

- `touch_pad_read_raw_data()`

It can also be used, for example, to evaluate a particular touch pad design by checking the range of sensor readings when a pad is touched or released. This information can be then used to establish a touch threshold.

For the demonstration of how to read the touch pad data, check the application example `peripherals/touch_sensor/touch_sensor_v2/touch_pad_read`.

**Method of Measurements**  The touch sensor records the period of time (i.e., the number of clock cycles) over a fixed charge/discharge cycles (specified by `touch_pad_set_charge_discharge_times()`). The count result is the raw data that read from `touch_pad_read_raw_data()`. After finishing one measurement, the touch sensor sleeps until the next measurement start, this interval between two measurements can be set by `touch_pad_set_measurement_interval()`.

**Note:** If the specified charge and discharge cycles for measurement is too small, the result may be inaccurate, but increasing charge and discharge cycles will increase the power consumption as well. Additionally, the response of the touch sensor will slow down if the total time of the interval and measurement is too long.

**Optimization of Measurements**  A touch sensor has several configurable parameters to match the characteristics of a particular touch pad design. For instance, to sense smaller capacity changes, it is possible to narrow down the reference voltage range within which the touch pads are charged/discharged. The high and low reference voltages are set using the function `touch_pad_set_voltage()`.

Besides the ability to discern smaller capacity changes, a positive side effect is reduction of power consumption for low power applications. A likely negative effect is an increase in measurement noise. If the dynamic range of obtained readings is still satisfactory, then further reduction of power consumption might be done by reducing the measurement time with `touch_pad_set_charge_discharge_times()`.

The following list summarizes available measurement parameters and corresponding ‘set’ functions:

- Touch pad charge / discharge parameters:
- voltage range: `touch_pad_set_voltage()`
- speed (slope): `touch_pad_set_cnt_mode()`

- Charge and discharge times of one measurement: `touch_pad_set_charge_discharge_times()`

Relationship between the voltage range (high/low reference voltages), speed (slope), and measurement time is shown in the figure below.

![Diagram showing relationship between voltage range, speed, and measurement parameters](image)

**Fig. 21: Touch pad - relationship between measurement parameters**

The last chart **Output** represents the touch sensor reading, i.e., the time taken to accumulate the fixed number of cycles.

All functions are provided in pairs to set a specific parameter and to get the current parameter’s value, e.g., `touch_pad_set_voltage()` and `touch_pad_get_voltage()`.

**Filtering of Measurements** If measurements are noisy, you can filter them with provided API functions. The ESP32-S2’s touch functionality provide two sets of APIs for doing this.

There is an internal touch channel that is not connected to any external GPIO. The measurements from this denoise pad can be used to filters out interference introduced on all channels, such as noise introduced by the power supply and external EMI.

The denoise parameters are set with the function `touch_pad_denoise_set_config()` and started by with `touch_pad_denoise_enable()`.

There is also a configurable hardware implemented IIR-filter (infinite impulse response). This IIR-filter is configured with the function `touch_pad_filter_set_config()` and enabled by calling `touch_pad_filter_enable()`.

**Touch Detection** Touch detection is implemented in ESP32’s hardware based on the user-configured threshold and raw measurements executed by FSM. Use the functions `touch_pad_get_status()` to check which pads have been touched and `touch_pad_clear_status()` to clear the touch status information.
Hardware touch detection can also be wired to interrupts. This is described in the next section.

If measurements are noisy and capacity changes are small, hardware touch detection might be unreliable. To resolve this issue, instead of using hardware detection/provided interrupts, implement measurement filtering and perform touch detection in your own application. For sample implementation of both methods of touch detection, see peripherals/touch_sensor/touch_sensor_v2/touch_pad_interrupt.

**Touch Triggered Interrupts** Before enabling an interrupt on a touch detection, you should establish a touch detection threshold. Use the functions described in *Touch State Measurements* to read and display sensor measurements when a pad is touched and released. Apply a filter if measurements are noisy and relative capacity changes are small. Depending on your application and environment conditions, test the influence of temperature and power supply voltage changes on measured values.

Once a detection threshold is established, it can be set during initialization with `touch_pad_config()` or at the runtime with `touch_pad_set_thresh()`.

Finally, configure and manage interrupt calls using the following functions:

- `touch_pad_isr_register()` / `touch_pad_isr_deregister()`
- `touch_pad_intr_enable()` / `touch_pad_intr_disable()`

When interrupts are operational, you can obtain the information from which particular pad an interrupt came by invoking `touch_pad_get_status()` and clear the pad status with `touch_pad_clear_status()`.

**Application Examples**

- Touch sensor read example: peripherals/touch_sensor/touch_sensor_v2/touch_pad_read.
- Touch sensor interrupt example: peripherals/touch_sensor/touch_sensor_v2/touch_pad_interrupt.

**API Reference**

**Header File**

- components/driver/touch_sensor/esp32s2/include/driver/touch_sensor.h
- This header file can be included with:

  ```c
  #include "driver/touch_sensor.h"
  ```

- This header file is a part of the API provided by the *driver* component. To declare that your component depends on *driver*, add the following to your CMakeLists.txt:

  ```
  REQUIRES driver
  ```
  or

  ```
  PRIV_REQUIRES driver
  ```

**Functions**

```c
touch_pad_fsm_start (void)
```

Set touch sensor FSM start.

**Note:** Start FSM after the touch sensor FSM mode is set.

**Note:** Call this function will reset benchmark of all touch channels.

**Returns**
**Chapter 2. API Reference**

- ESP_OK on success

```c
esp_err_t touch_pad_fsm_stop (void)
```

Stop touch sensor FSM.

**Returns**
- ESP_OK on success

```c
esp_err_t touch_pad_sw_start (void)
```

Trigger a touch sensor measurement, only support in SW mode of FSM.

**Returns**
- ESP_OK on success

```c
esp_err_t touch_pad_set_charge_discharge_times (uint16_t charge_discharge_times)
```

Set charge and discharge times of each measurement.

**Note:** This function will specify the charge and discharge times in each measurement period. The clock is sourced from SOC_MOD_CLK_RTC_FAST, and its default frequency is SOC_CLK_RC_FAST_FREQ_APPROX. The touch sensor will record the total clock cycles of all the charge and discharge cycles as the final result (raw value).

**Note:** If the charge and discharge times is too small, it may lead to inaccurate results.

**Parameters**

charge_discharge_times - Charge and discharge times, range: 0~0xffff. No exact typical value can be recommended because the capacity is influenced by the hardware design and how finger touches, but suggest adjusting this value to make the measurement time around 1 ms.

**Returns**
- ESP_OK Set charge and discharge times success

```c
esp_err_t touch_pad_get_charge_discharge_times (uint16_t *charge_discharge_times)
```

Get charge and discharge times of each measurement.

**Parameters**

charge_discharge_times - Charge and discharge times

**Returns**
- ESP_OK Get charge_discharge_times success
- ESP_ERR_INVALID_ARG The input parameter is NULL

```c
esp_err_t touch_pad_set_measurement_interval (uint16_t interval_cycle)
```

Set the interval between two measurements.

**Note:** The touch sensor will sleep between two measurements. This function is to set the interval cycle. And the interval is clocked from SOC_MOD_CLK_RTC_SLOW, its default frequency is SOC_CLK_RC_SLOW_FREQ_APPROX.

**Parameters**

interval_cycle - The interval between two measurements

sleep_time = interval_cycle / SOC_CLK_RC_SLOW_FREQ_APPROX. The approximate frequency value of RTC_SLOW_CLK can be obtained using rtc_clk_slow_freq_get_hz function.

**Returns**
- ESP_OK Set interval cycle success

```c
esp_err_t touch_pad_get_measurement_interval (uint16_t *interval_cycle)
```

Get the interval between two measurements.

**Parameters**

interval_cycle - The interval between two measurements
Returns

- ESP_OK Get interval cycle success
- ESP_ERR_INVALID_ARG The input parameter is NULL

`esp_err_t touch_pad_set_meas_time(uint16_t sleep_cycle, uint16_t meas_times)`

Set touch sensor times of charge and discharge and sleep time. Excessive total time will slow down the touch response. Too small measurement time will not be sampled enough, resulting in inaccurate measurements.

**Note:** The touch sensor will measure time of a fixed number of charge/discharge cycles (specified as the second parameter). That means the time (raw value) will increase as the capacity of the touch pad is increasing. The time (raw value) here is the number of clock cycles which is sourced from SOC_MOD_CLK_RTC_FAST and at (SOC_CLK_RC_FAST_FREQ_APPROX) Hz as default.

**Note:** The greater the duty cycle of the measurement time, the more system power is consumed.

**Parameters**

- `sleep_cycle` – The touch sensor will sleep after each measurement. `sleep_cycle` decide the interval between each measurement. `t_sleep = sleep_cycle / SOC_CLK_RC_SLOW_FREQ_APPROX`. The approximate frequency value of RTC_SLOW_CLK can be obtained using `rtc_clk_slow_freq_get_hz` function.
- `meas_times` – The times of charge and discharge in each measurement of touch channels. Range: 0 ~ 0xffff. Recommended typical value: Modify this value to make the measurement time around 1 ms.

**Returns**

- ESP_OK on success

`esp_err_t touch_pad_get_meas_time(uint16_t *sleep_cycle, uint16_t *meas_times)`

Get touch sensor times of charge and discharge and sleep time.

**Parameters**

- `sleep_cycle` – Pointer to accept sleep cycle number
- `meas_times` – Pointer to accept measurement times count.

**Returns**

- ESP_OK on success

`esp_err_t touch_pad_set_idle_channel_connect(touch_pad_conn_type_t type)`

Set the connection type of touch channels in idle status. When a channel is in measurement mode, other initialized channels are in idle mode. The touch channel is generally adjacent to the trace, so the connection state of the idle channel affects the stability and sensitivity of the test channel. The `CONN_HIGHZ` (high resistance) setting increases the sensitivity of touch channels. The `CONN_GND` (grounding) setting increases the stability of touch channels.

**Parameters**

- `type` – Select idle channel connect to high resistance state or ground.

**Returns**

- ESP_OK on success

`esp_err_t touch_pad_get_idle_channel_connect(touch_pad_conn_type_t *type)`

Get the connection type of touch channels in idle status. When a channel is in measurement mode, other initialized channels are in idle mode. The touch channel is generally adjacent to the trace, so the connection state of the idle channel affects the stability and sensitivity of the test channel. The `CONN_HIGHZ` (high resistance) setting increases the sensitivity of touch channels. The `CONN_GND` (grounding) setting increases the stability of touch channels.

**Parameters**

- `type` – Pointer to connection type.

**Returns**

- ESP_OK on success
**esp_err_t touch_pad_set_thresh**(touch_pad_t touch_num, uint32_t threshold)

Set the trigger threshold of touch sensor. The threshold determines the sensitivity of the touch sensor. The threshold is the original value of the trigger state minus the benchmark value.

**Note:** If set “TOUCH_PAD_THRESHOLD_MAX”, the touch is never be triggered.

**Parameters**
- touch_num – touch pad index
- threshold – threshold of touch sensor. Should be less than the max change value of touch.

**Returns**
- ESP_OK on success

**esp_err_t touch_pad_get_thresh**(touch_pad_t touch_num, uint32_t *threshold)

Get touch sensor trigger threshold.

**Parameters**
- touch_num – touch pad index
- threshold – pointer to accept threshold

**Returns**
- ESP_OK on success
- ESP_ERR_INVALID_ARG if argument is wrong

**esp_err_t touch_pad_set_channel_mask**(uint16_t enable_mask)

Register touch channel into touch sensor scan group. The working mode of the touch sensor is cyclically scanned. This function will set the scan bits according to the given bitmask.

**Note:** If set this mask, the FSM timer should be stop firstly.

**Note:** The touch sensor that in scan map, should be deinit GPIO function firstly by **touch_pad_io_init**.

**Parameters** enable_mask – bitmask of touch sensor scan group. e.g. TOUCH_PAD_NUM14 -> BIT(14)

**Returns**
- ESP_OK on success

**esp_err_t touch_pad_get_channel_mask**(uint16_t *enable_mask)

Get the touch sensor scan group bit mask.

**Parameters** enable_mask – Pointer to bitmask of touch sensor scan group. e.g. TOUCH_PAD_NUM14 -> BIT(14)

**Returns**
- ESP_OK on success

**esp_err_t touch_pad_clear_channel_mask**(uint16_t enable_mask)

Clear touch channel from touch sensor scan group. The working mode of the touch sensor is cyclically scanned. This function will clear the scan bits according to the given bitmask.

**Note:** If clear all mask, the FSM timer should be stop firstly.

**Parameters** enable_mask – bitmask of touch sensor scan group. e.g. TOUCH_PAD_NUM14 -> BIT(14)

**Returns**
• ESP_OK on success

```c
esp_err_t touch_pad_config (touch_pad_t touch_num)
```
Configure parameter for each touch channel.

**Note:** Touch num 0 is denoise channel, please use touch_pad_denoise_enable to set denoise function.

**Parameters** touch_num – touch pad index

**Returns**
- ESP_OK Success
- ESP_ERR_INVALID_ARG if argument wrong
- ESP_FAIL if touch pad not initialized

```c
esp_err_t touch_pad_reset (void)
```
Reset the FSM of touch module.

**Note:** Call this function after touch_pad_fsm_stop.

**Returns**
- ESP_OK Success

```c
touch_pad_t touch_pad_get_current_meas_channel (void)
```
Get the current measure channel.

**Note:** Should be called when touch sensor measurement is in cyclic scan mode.

**Returns**
- touch channel number

```c
uint32_t touch_pad_read_intr_status_mask (void)
```
Get the touch sensor interrupt status mask.

**Returns**
- touch interrupt bit

```c
esp_err_t touch_pad_intr_enable (touch_pad_intr_mask_t int_mask)
```
Enable touch sensor interrupt by bitmask.

**Note:** This API can be called in ISR handler.

**Parameters** int_mask – Pad mask to enable interrupts

**Returns**
- ESP_OK on success

```c
esp_err_t touch_pad_intr_disable (touch_pad_intr_mask_t int_mask)
```
Disable touch sensor interrupt by bitmask.

**Note:** This API can be called in ISR handler.

**Parameters** int_mask – Pad mask to disable interrupts
Returns
- ESP_OK on success

```
esp_err_t touch_pad_intr_clear (touch_pad_intr_mask_t int_mask)
```
Clear touch sensor interrupt by bitmask.

**Parameters**
- **int_mask** – Pad mask to clear interrupts

**Returns**
- ESP_OK on success

```
esp_err_t touch_pad_isr_register (intr_handler_t fn, void *arg, touch_pad_intr_mask_t intr_mask)
```
Register touch-pad ISR. The handler will be attached to the same CPU core that this function is running on.

**Parameters**
- **fn** – Pointer to ISR handler
- **arg** – Parameter for ISR
- **intr_mask** – Enable touch sensor interrupt handler by bitmask.

**Returns**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Arguments error
- ESP_ERR_NO_MEM No memory

```
esp_err_t touch_pad_timeout_set (bool enable, uint32_t threshold)
```
Enable/disable the timeout check and set timeout threshold for all touch sensor channels measurements. If enable: When the touch reading of a touch channel exceeds the measurement threshold, a timeout interrupt will be generated. If disable: the FSM does not check if the channel under measurement times out.

**Note:** The threshold compared with touch readings.

**Note:** In order to avoid abnormal short circuit of some touch channels. This function should be turned on. Ensure the normal operation of other touch channels.

**Parameters**
- **enable** – true(default): Enable the timeout check; false: Disable the timeout check.
- **threshold** – For all channels, the maximum value that will not be exceeded during normal operation.

**Returns**
- ESP_OK Success

```
esp_err_t touch_pad_timeout_resume (void)
```
Call this interface after timeout to make the touch channel resume normal work. Point on the next channel to measure. If this API is not called, the touch FSM will stop the measurement after timeout interrupt.

**Note:** Call this API after finishes the exception handling by user.

**Returns**
- ESP_OK Success

```
esp_err_t touch_pad_read_raw_data (touch_pad_t touch_num, uint32_t *raw_data)
```
get raw data of touch sensor.

**Note:** After the initialization is complete, the “raw_data” is max value. You need to wait for a measurement cycle before you can read the correct touch value.
Chapter 2. API Reference

Parameters
• **touch_num** – touch pad index
• **raw_data** – pointer to accept touch sensor value

Returns
• ESP_OK Success
• ESP_FAIL Touch channel 0 haven’t this parameter.

```c
esp_err_t touch_pad_read_benchmark (touch_pad_t touch_num, uint32_t *benchmark)
```

get benchmark of touch sensor.

**Note:** After initialization, the benchmark value is the maximum during the first measurement period.

Parameters
• **touch_num** – touch pad index
• **benchmark** – pointer to accept touch sensor benchmark value

Returns
• ESP_OK Success
• ESP_ERR_INVALID_ARG Touch channel 0 haven’t this parameter.

```c
esp_err_t touch_pad_filter_read_smooth (touch_pad_t touch_num, uint32_t *smooth)
```

Get smoothed data that obtained by filtering the raw data.

Parameters
• **touch_num** – touch pad index
• **smooth** – pointer to smoothed data

```c
esp_err_t touch_pad_reset_benchmark (touch_pad_t touch_num)
```

Force reset benchmark to raw data of touch sensor.

Parameters **touch_num** – touch pad index
• TOUCH_PAD_MAX Reset baseline of all channels

Returns
• ESP_OK Success

```c
esp_err_t touch_pad_filter_set_config (const touch_filter_config_t *filter_info)
```

set parameter of touch sensor filter and detection algorithm. For more details on the detection algorithm, please refer to the application documentation.

Parameters **filter_info** – select filter type and threshold of detection algorithm

Returns
• ESP_OK Success

```c
esp_err_t touch_pad_filter_get_config (touch_filter_config_t *filter_info)
```

get parameter of touch sensor filter and detection algorithm. For more details on the detection algorithm, please refer to the application documentation.

Parameters **filter_info** – select filter type and threshold of detection algorithm

Returns
• ESP_OK Success

```c
esp_err_t touch_pad_filter_enable (void)
```

enable touch sensor filter for detection algorithm. For more details on the detection algorithm, please refer to the application documentation.

Returns
• ESP_OK Success

```c
esp_err_t touch_pad_filter_disable (void)
```

disable touch sensor filter for detection algorithm. For more details on the detection algorithm, please refer to the application documentation.
**Returns**

- ESP_OK Success

```c
esp_err_t touch_pad_denoise_set_config (const touch_pad_denoise_t *denoise)
```

Set parameter of denoise pad (TOUCH_PAD_NUM0). T0 is an internal channel that does not have a corresponding external GPIO. T0 will work simultaneously with the measured channel Tn. Finally, the actual measured value of Tn is the value after subtracting lower bits of T0. The noise reduction function filters out interference introduced simultaneously on all channels, such as noise introduced by power supplies and external EMI.

**Parameters**

denoise – parameter of denoise

**Returns**

- ESP_OK Success

```c
esp_err_t touch_pad_denoise_get_config (touch_pad_denoise_t *denoise)
```

Get parameter of denoise pad (TOUCH_PAD_NUM0).

**Parameters**

denoise – Pointer to parameter of denoise

**Returns**

- ESP_OK Success

```c
esp_err_t touch_pad_denoise_enable (void)
```

Enable denoise function. T0 is an internal channel that does not have a corresponding external GPIO. T0 will work simultaneously with the measured channel Tn. Finally, the actual measured value of Tn is the value after subtracting lower bits of T0. The noise reduction function filters out interference introduced simultaneously on all channels, such as noise introduced by power supplies and external EMI.

**Returns**

- ESP_OK Success

```c
esp_err_t touch_pad_denoise_disable (void)
```

Disable denoise function.

**Returns**

- ESP_OK Success

```c
esp_err_t touch_pad_denoise_read_data (uint32_t *data)
```

Get denoise measure value (TOUCH_PAD_NUM0).

**Parameters**

data – Pointer to receive denoise value

**Returns**

- ESP_OK Success

```c
esp_err_t touch_pad_waterproof_set_config (const touch_pad_waterproof_t *waterproof)
```

Set parameter of waterproof function.

```
The waterproof function includes a shielded channel (TOUCH_PAD_NUM14) and a
- guard channel.
 Guard pad is used to detect the large area of water covering the touch-
- panel.
 Shield pad is used to shield the influence of water droplets covering the-
- touch panel.
 It is generally designed as a grid and is placed around the touch buttons.
```

**Parameters**

waterproof – parameter of waterproof

**Returns**

- ESP_OK Success

```c
esp_err_t touch_pad_waterproof_get_config (touch_pad_waterproof_t *waterproof)
```

Get parameter of waterproof function.
Parameters `waterproof` – parameter of waterproof

**Returns**
- ESP_OK Success

```c
esp_err_t touch_pad_waterproof_enable (void)
```
Enable parameter of waterproof function. Should be called after function `touch_pad_waterproof_set_config`.

**Returns**
- ESP_OK Success

```c
esp_err_t touch_pad_waterproof_disable (void)
```
Disable parameter of waterproof function.

**Returns**
- ESP_OK Success

```c
esp_err_t touch_pad_proximity_enable (touch_pad_t touch_num, bool enabled)
```
Enable/disable proximity function of touch channels. The proximity sensor measurement is the accumulation of touch channel measurements.

**Note:** Supports up to three touch channels configured as proximity sensors.

**Parameters**
- `touch_num` – touch pad index
- `enabled` – true: enable the proximity function; false: disable the proximity function

**Returns**
- ESP_OK: Configured correctly.
- ESP_ERR_INVALID_ARG: Touch channel number error.
- ESP_ERR_NOT_SUPPORTED: Don’t support configured.

```c
esp_err_t touch_pad_proximity_set_count (touch_pad_t touch_num, uint32_t count)
```
Set measure count of proximity channel. The proximity sensor measurement is the accumulation of touch channel measurements.

**Note:** All proximity channels use the same `count` value. So please pass the parameter `TOUCH_PAD_MAX`.

**Parameters**
- `touch_num` – Touch pad index. In this version, pass the parameter `TOUCH_PAD_MAX`.
- `count` – The cumulative times of measurements for proximity pad. Range: 0 ~ 255.

**Returns**
- ESP_OK: Configured correctly.
- ESP_ERR_INVALID_ARG: Touch channel number error.

```c
esp_err_t touch_pad_proximity_get_count (touch_pad_t touch_num, uint32_t *count)
```
Get measure count of proximity channel. The proximity sensor measurement is the accumulation of touch channel measurements.

**Note:** All proximity channels use the same `count` value. So please pass the parameter `TOUCH_PAD_MAX`.

**Parameters**
- `touch_num` – Touch pad index. In this version, pass the parameter `TOUCH_PAD_MAX`.
- `count` – The cumulative times of measurements for proximity pad. Range: 0 ~ 255.

**Returns**
- ESP_OK: Configured correctly.
• ESP_ERR_INVALID_ARG: Touch channel number error.

`esp_err_t touch_pad_proximity_get_data(touch_pad_t touch_num, uint32_t *measure_out)`

Get the accumulated measurement of the proximity sensor. The proximity sensor measurement is the accumulation of touch channel measurements.

Parameters
- `touch_num` – touch pad index
- `measure_out` – If the accumulation process does not end, the `measure_out` is the process value.

Returns
- ESP_OK Success
- ESP_ERR_INVALID_ARG Touch num is not proximity

`esp_err_t touch_pad_sleep_channel_get_info(touch_pad_sleep_channel_t *slp_config)`

Get parameter of touch sensor sleep channel. The touch sensor can works in sleep mode to wake up sleep.

Note: After the sleep channel is configured, Please use special functions for sleep channel. e.g. The user should uses `touch_pad_sleep_channel_read_data` instead of `touch_pad_read_raw_data` to obtain the sleep channel reading.

Parameters
- `slp_config` – touch sleep pad config.

Returns
- ESP_OK Success

`esp_err_t touch_pad_sleep_channel_enable(touch_pad_t pad_num, bool enable)`

Enable/Disable sleep channel function for touch sensor. The touch sensor can works in sleep mode to wake up sleep.

Note: ESP32S2 only support one sleep channel.

Parameters
- `pad_num` – Set touch channel number for sleep pad. Only one touch sensor channel is supported in deep sleep mode.
- `enable` – true: enable sleep pad for touch sensor; false: disable sleep pad for touch sensor;

Returns
- ESP_OK Success

`esp_err_t touch_pad_sleep_channel_enable_proximity(touch_pad_t pad_num, bool enable)`

Enable/Disable proximity function for sleep channel. The touch sensor can works in sleep mode to wake up sleep.

Note: ESP32S2 only support one sleep channel.

Parameters
- `pad_num` – Set touch channel number for sleep pad. Only one touch sensor channel is supported in deep sleep mode.
• **enable** - true: enable proximity for sleep channel; false: disable proximity for sleep channel;

**Returns**
• ESP_OK Success

```c
esp_err_t touch_pad_sleep_set_threshold(touch_pad_t pad_num, uint32_t touch_thres)
```
Set the trigger threshold of touch sensor in deep sleep. The threshold determines the sensitivity of the touch sensor.

**Note:** In general, the touch threshold during sleep can use the threshold parameter parameters before sleep.

**Parameters**
• **pad_num** - Set touch channel number for sleep pad. Only one touch sensor channel is supported in deep sleep mode.
• **touch_thres** - touch sleep pad threshold

**Returns**
• ESP_OK Success

```c
esp_err_t touch_pad_sleep_get_threshold(touch_pad_t pad_num, uint32_t *touch_thres)
```
Get the trigger threshold of touch sensor in deep sleep. The threshold determines the sensitivity of the touch sensor.

**Note:** In general, the touch threshold during sleep can use the threshold parameter parameters before sleep.

**Parameters**
• **pad_num** - Set touch channel number for sleep pad. Only one touch sensor channel is supported in deep sleep mode.
• **touch_thres** - touch sleep pad threshold

**Returns**
• ESP_OK Success

```c
esp_err_t touch_pad_sleep_channel_read_benchmark(touch_pad_t pad_num, uint32_t *benchmark)
```
Read benchmark of touch sensor sleep channel.

**Parameters**
• **pad_num** - Set touch channel number for sleep pad. Only one touch sensor channel is supported in deep sleep mode.
• **benchmark** - pointer to accept touch sensor benchmark value

**Returns**
• ESP_OK Success
• ESP_ERR_INVALID_ARG parameter is NULL

```c
esp_err_t touch_pad_sleep_channel_read_smooth(touch_pad_t pad_num, uint32_t *smooth_data)
```
Read smoothed data of touch sensor sleep channel. Smoothed data is filtered from the raw data.

**Parameters**
• **pad_num** - Set touch channel number for sleep pad. Only one touch sensor channel is supported in deep sleep mode.
• **smooth_data** - pointer to accept touch sensor smoothed data

**Returns**
• ESP_OK Success
• ESP_ERR_INVALID_ARG parameter is NULL
`esp_err_t touch_pad_sleep_channel_read_data` *(touch_pad_t* `pad_num`, uint32_t* `raw_data`)*

Read raw data of touch sensor sleep channel.

**Parameters**
- `pad_num` - Set touch channel number for sleep pad. Only one touch sensor channel is supported in deep sleep mode.
- `raw_data` - Pointer to accept touch sensor raw data

**Returns**
- ESP_OK Success
- ESP_ERR_INVALID_ARG parameter is NULL

`esp_err_t touch_pad_sleep_channel_reset_benchmark` *(void)*

Reset benchmark of touch sensor sleep channel.

**Returns**
- ESP_OK Success

`esp_err_t touch_pad_sleep_channel_read_proximity_cnt` *(touch_pad_t* `pad_num`, uint32_t* `proximity_cnt`)*

Read proximity count of touch sensor sleep channel.

**Parameters**
- `pad_num` - Set touch channel number for sleep pad. Only one touch sensor channel is supported in deep sleep mode.
- `proximity_cnt` - Pointer to accept touch sensor proximity count value

**Returns**
- ESP_OK Success
- ESP_ERR_INVALID_ARG parameter is NULL

`esp_err_t touch_pad_sleep_channel_set_work_time` *(uint16_t* `sleep_cycle`, uint16_t* `meas_times`)*

Change the operating frequency of touch pad in deep sleep state. Reducing the operating frequency can effectively reduce power consumption. If this function is not called, the working frequency of touch in the deep sleep state is the same as that in the wake-up state.

**Parameters**
- `sleep_cycle` - The touch sensor will sleep after each measurement. `sleep_cycle` decide the interval between each measurement. `t_sleep = sleep_cycle / (RTC_SLOW_CLK frequency)`. The approximate frequency value of RTC_SLOW_CLK can be obtained using `rtc_clk_slow_freq_get_hz` function.
- `meas_times` - The times of charge and discharge in each measure process of touch channels. The timer frequency is 8Mhz. Range: 0 - 0xffff. Recommended typical value: Modify this value to make the measurement time around 1ms.

**Returns**
- ESP_OK Success

**Header File**

- `components/driver/touch_sensor/include/driver/touch_sensor_common.h`

This header file can be included with:

```
#include "driver/touch_sensor_common.h"
```

- This header file is a part of the API provided by the `driver` component. To declare that your component depends on `driver`, add the following to your CMakeLists.txt:

```cmake
REQUIRES driver
```

or

```cmake
PRIV_REQUIRES driver
```
Chapter 2. API Reference

**Functions**

`esp_err_t touch_pad_init (void)`

Initialize touch module.

**Note:** If default parameter don’t match the usage scenario, it can be changed after this function.

**Returns**

- ESP_OK Success
- ESP_ERR_NO_MEM Touch pad init error
- ESP_ERR_NOT_SUPPORTED Touch pad is providing current to external XTAL

`esp_err_t touch_pad_deinit (void)`

Un-install touch pad driver.

**Note:** After this function is called, other touch functions are prohibited from being called.

**Returns**

- ESP_OK Success
- ESP_FAIL Touch pad driver not initialized

`esp_err_t touch_pad_io_init (touch_pad_t touch_num)`

Initialize touch pad GPIO.

**Parameters**

- `touch_num` – touch pad index

**Returns**

- ESP_OK on success
- ESP_ERR_INVALID_ARG if argument is wrong

`esp_err_t touch_pad_set_voltage (touch_high_volt_t refh, touch_low_volt_t refl, touch_volt_atten_t atten)`

Set touch sensor high voltage threshold of change. The touch sensor measures the channel capacitance value by charging and discharging the channel. So the high threshold should be less than the supply voltage.

**Parameters**

- `refh` – the value of DREFH
- `refl` – the value of DREFL
- `atten` – the attenuation on DREFH

**Returns**

- ESP_OK on success
- ESP_ERR_INVALID_ARG if argument is wrong

`esp_err_t touch_pad_get_voltage (touch_high_volt_t *refh, touch_low_volt_t *refl, touch_volt_atten_t *atten)`

Get touch sensor reference voltage.

**Parameters**

- `refh` – pointer to accept DREFH value
- `refl` – pointer to accept DREFL value
- `atten` – pointer to accept the attenuation on DREFH

**Returns**

- ESP_OK on success

`esp_err_t touch_pad_set_cnt_mode (touch_pad_t touch_num, touch_cnt_slope_t slope, touch_tie_opt_t opt)`

Set touch sensor charge/discharge speed for each pad. If the slope is 0, the counter would always be zero. If the slope is 1, the charging and discharging would be slow, accordingly. If the slope is set 7, which is the maximum value, the charging and discharging would be fast.
Note: The higher the charge and discharge current, the greater the immunity of the touch channel, but it will increase the system power consumption.

Parameters

- **touch_num** – touch pad index
- **slope** – touch pad charge/discharge speed
- **opt** – the initial voltage

Returns

- ESP_OK on success
- ESP_ERR_INVALID_ARG if argument is wrong

```c
esp_err_t touch_pad_get_cnt_mode(touch_pad_t touch_num, touch_cnt_slope_t *slope, touch_tie_opt_t *opt)
```

Get touch sensor charge/discharge speed for each pad.

Parameters

- **touch_num** – touch pad index
- **slope** – pointer to accept touch pad charge/discharge slope
- **opt** – pointer to accept the initial voltage

Returns

- ESP_OK on success
- ESP_ERR_INVALID_ARG if argument is wrong

```c
esp_err_t touch_pad_isr_deregister(void (*fn)(void*), void* arg)
```

Deregister the handler previously registered using touch_pad_isr_handler_register.

Parameters

- **fn** – handler function to call (as passed to touch_pad_isr_handler_register)
- **arg** – argument of the handler (as passed to touch_pad_isr_handler_register)

Returns

- ESP_OK on success
- ESP_ERR_INVALID_STATE if a handler matching both fn and arg isn’t registered

```c
esp_err_t touch_pad_get_wakeup_status(touch_pad_t *pad_num)
```

Get the touch pad which caused wakeup from deep sleep.

Parameters **pad_num** – pointer to touch pad which caused wakeup

Returns

- ESP_OK Success
- ESP_ERR_INVALID_ARG parameter is NULL

```c
esp_err_t touch_pad_set_fsm_mode(touch_fsm_mode_t mode)
```

Set touch sensor FSM mode, the test action can be triggered by the timer, as well as by the software.

Parameters **mode** – FSM mode

Returns

- ESP_OK on success
- ESP_ERR_INVALID_ARG if argument is wrong

```c
esp_err_t touch_pad_get_fsm_mode(touch_fsm_mode_t *mode)
```

Get touch sensor FSM mode.

Parameters **mode** – pointer to accept FSM mode

Returns

- ESP_OK on success

```c
esp_err_t touch_pad_clear_status(void)
```

To clear the touch sensor channel active status.
Chapter 2. API Reference

**Note:** The FSM automatically updates the touch sensor status. It is generally not necessary to call this API to clear the status.

**Returns**
- ESP_OK on success

```c
uint32_t touch_pad_get_status (void)
```
Get the touch sensor channel active status mask. The bit position represents the channel number. The 0/1 status of the bit represents the trigger status.

**Returns**
- The touch sensor status. e.g. Touch1 trigger status is `status_mask & (BIT1)`.

```c
bool touch_pad_meas_is_done (void)
```
Check touch sensor measurement status.

**Returns**
- True measurement is under way
- False measurement done

**GPIO Lookup Macros**

Some useful macros can be used to specified the GPIO number of a touch pad channel, or vice versa. e.g.,

1. `TOUCH_PAD_NUM5_GPIO_NUM` is the GPIO number of channel 5 (12);
2. `TOUCH_PAD_GPIO4_CHANNEL` is the channel number of GPIO 4 (channel 0).

**Header File**

- `components/soc/esp32s2/include/soc/touch_sensor_channel.h`
- This header file can be included with:

```c
#include "soc/touch_sensor_channel.h"
```

**Macros**

- `TOUCH_PAD_GPIO1_CHANNEL`
- `TOUCH_PAD_NUM1_GPIO_NUM`
- `TOUCH_PAD_GPIO2_CHANNEL`
- `TOUCH_PAD_NUM2_GPIO_NUM`
- `TOUCH_PAD_GPIO3_CHANNEL`
- `TOUCH_PAD_NUM3_GPIO_NUM`
- `TOUCH_PAD_GPIO4_CHANNEL`
- `TOUCH_PAD_NUM4_GPIO_NUM`
- `TOUCH_PAD_GPIO5_CHANNEL`

• This header file can be included with:

    #include "hal/touch_sensor_types.h"
Chapter 2. API Reference

Structures

struct touch_pad_denoise

Touch sensor denoise configuration

Public Members

touch_pad_denoise_grade_t grade

Select denoise range of denoise channel. Determined by measuring the noise amplitude of the denoise channel.

touch_pad_denoise_cap_t cap_level

Select internal reference capacitance of denoise channel. Ensure that the denoise readings are closest to the readings of the channel being measured. Use touch_pad_denoise_read_data to get the reading of denoise channel. The equivalent capacitance of the shielded channel can be calculated from the reading of denoise channel.

struct touch_pad_waterproof

Touch sensor waterproof configuration

Public Members

touch_pad_t guard_ring_pad

Waterproof. Select touch channel use for guard pad. Guard pad is used to detect the large area of water covering the touch panel.

touch_pad_shield_driver_t shield_driver

Waterproof. Shield channel drive capability configuration. Shield pad is used to shield the influence of water droplets covering the touch panel. When the waterproof function is enabled, Touch14 is set as shield channel by default. The larger the parasitic capacitance on the shielding channel, the higher the drive capability needs to be set. The equivalent capacitance of the shield channel can be estimated through the reading value of the denoise channel(Touch0).

struct touch_filter_config

Touch sensor filter configuration

Public Members

touch_filter_mode_t mode

Set filter mode. The input of the filter is the raw value of touch reading, and the output of the filter is involved in the judgment of the touch state.

uint32_t debounce_cnt

Set debounce count, such as n. If the measured values continue to exceed the threshold for n+1 times, the touch sensor state changes. Range: 0 ~ 7

uint32_t noise_thr

Noise threshold coefficient. Higher = More noise resistance. The actual noise should be less than (noise coefficient * touch threshold). Range: 0 ~ 3. The coefficient is 0: 4/8; 1: 3/8; 2: 2/8; 3: 1;
uint32_t jitter_step
   Set jitter filter step size. Range: 0 ~ 15

touch_smooth_mode_t smh_lvl
   Level of filter applied on the original data against large noise interference.

struct touch_pad_sleep_channel_t
   Touch sensor channel sleep configuration

Public Members

touch_pad_t touch_num
   Set touch channel number for sleep pad. Only one touch sensor channel is supported in deep sleep mode.
   If clear the sleep channel, point this pad to TOUCH_PAD_NUM0

bool en_proximity
   enable proximity function for sleep pad

Macros

TOUCH_PAD_BIT_MASK_ALL
TOUCH_PAD_SLOPE_DEFAULT
TOUCH_PAD_TIE_OPT_DEFAULT
TOUCH_PAD_BIT_MASK_MAX
TOUCH_PAD_HIGH_VOLTAGE_THRESHOLD
TOUCH_PAD_LOW_VOLTAGE_THRESHOLD
TOUCH_PAD_ATTEN_VOLTAGE_THRESHOLD
TOUCH_PAD_IDLE_CH_CONNECT_DEFAULT
TOUCH_PAD_THRESHOLD_MAX
   If set touch threshold max value, The touch sensor can’t be in touched status
TOUCH_PAD_SLEEP_CYCLE_DEFAULT
   Excessive total time will slow down the touch response. Too small measurement time will not be sampled enough, resulting in inaccurate measurements.

Note: The greater the duty cycle of the measurement time, the more system power is consumed. The number of sleep cycle in each measure process of touch channels. The timer frequency is RTC_SLOW_CLK (can be 150k or 32k depending on the options). Range: 0 ~ 0xffff
**TOUCH_PAD_MEASURE_CYCLE_DEFAULT**

The times of charge and discharge in each measure process of touch channels. The timer frequency is 8Mhz. Recommended typical value: Modify this value to make the measurement time around 1ms. Range: 0 ~ 0xffff

**TOUCH_PAD_INTR_MASK_ALL**

All touch interrupt type enable.

**TOUCH_PROXIMITY_MEAS_NUM_MAX**

Touch sensor proximity detection configuration

**TOUCH_DEBOUNCE_CNT_MAX**

**TOUCH_NOISE_THR_MAX**

**TOUCH_JITTER_STEP_MAX**

**Type Definitions**

typedef struct touch_pad_denoise touch_pad_denoise_t

Touch sensor denoise configuration

typedef struct touch_pad_waterproof touch_pad_waterproof_t

Touch sensor waterproof configuration

typedef struct touch_filter_config touch_filter_config_t

Touch sensor filter configuration

**Enumerations**

enum touch_pad_t

Touch pad channel

Values:

enumerator TOUCH_PAD_NUM0

Touch pad channel 0 is GPIO4(ESP32)

enumerator TOUCH_PAD_NUM1

Touch pad channel 1 is GPIO0(ESP32) / GPIO1(ESP32-S2)

enumerator TOUCH_PAD_NUM2

Touch pad channel 2 is GPIO2(ESP32) / GPIO2(ESP32-S2)

enumerator TOUCH_PAD_NUM3

Touch pad channel 3 is GPIO15(ESP32) / GPIO3(ESP32-S2)

enumerator TOUCH_PAD_NUM4

Touch pad channel 4 is GPIO13(ESP32) / GPIO4(ESP32-S2)
enumerator TOUCH_PAD_NUM5
  Touch pad channel 5 is GPIO12(ESP32) / GPIO5(ESP32-S2)

enumerator TOUCH_PAD_NUM6
  Touch pad channel 6 is GPIO14(ESP32) / GPIO6(ESP32-S2)

enumerator TOUCH_PAD_NUM7
  Touch pad channel 7 is GPIO27(ESP32) / GPIO7(ESP32-S2)

enumerator TOUCH_PAD_NUM8
  Touch pad channel 8 is GPIO33(ESP32) / GPIO8(ESP32-S2)

enumerator TOUCH_PAD_NUM9
  Touch pad channel 9 is GPIO32(ESP32) / GPIO9(ESP32-S2)

enumerator TOUCH_PAD_NUM10
  Touch channel 10 is GPIO10(ESP32-S2)

enumerator TOUCH_PAD_NUM11
  Touch channel 11 is GPIO11(ESP32-S2)

enumerator TOUCH_PAD_NUM12
  Touch channel 12 is GPIO12(ESP32-S2)

enumerator TOUCH_PAD_NUM13
  Touch channel 13 is GPIO13(ESP32-S2)

enumerator TOUCH_PAD_NUM14
  Touch channel 14 is GPIO14(ESP32-S2)

enumerator TOUCH_PAD_MAX

enum touch_high_volt_t
  Touch sensor high reference voltage

  Values:

  enumerator TOUCH_HVOLT_KEEP
    Touch sensor high reference voltage, no change

  enumerator TOUCH_HVOLT_2V4
    Touch sensor high reference voltage, 2.4V

  enumerator TOUCH_HVOLT_2V5
    Touch sensor high reference voltage, 2.5V

  enumerator TOUCH_HVOLT_2V6
    Touch sensor high reference voltage, 2.6V
enumerator TOUCH_HVOLT_2V7
    Touch sensor high reference voltage, 2.7V

enumerator TOUCH_HVOLT_MAX

defined

touch_low_volt_t
    Touch sensor low reference voltage

Values:

enumerator TOUCH_LVOLT_KEEP
    Touch sensor low reference voltage, no change

enumerator TOUCH_LVOLT_0V5
    Touch sensor low reference voltage, 0.5V

enumerator TOUCH_LVOLT_0V6
    Touch sensor low reference voltage, 0.6V

enumerator TOUCH_LVOLT_0V7
    Touch sensor low reference voltage, 0.7V

enumerator TOUCH_LVOLT_0V8
    Touch sensor low reference voltage, 0.8V

enumerator TOUCH_LVOLT_MAX

defined

touch_volt_atten_t
    Touch sensor high reference voltage attenuation

Values:

enumerator TOUCH_HVOLT_ATTEN_KEEP
    Touch sensor high reference voltage attenuation, no change

enumerator TOUCH_HVOLT_ATTEN_1V5
    Touch sensor high reference voltage attenuation, 1.5V attenuation

enumerator TOUCH_HVOLT_ATTEN_1V
    Touch sensor high reference voltage attenuation, 1.0V attenuation

enumerator TOUCH_HVOLT_ATTEN_0V5
    Touch sensor high reference voltage attenuation, 0.5V attenuation

enumerator TOUCH_HVOLT_ATTEN_0V
    Touch sensor high reference voltage attenuation, 0V attenuation

enumerator TOUCH_HVOLT_ATTEN_MAX
enum `touch_cnt_slope_t`
    Touch sensor charge/discharge speed
    
    `Values:`
    
    enumerator `TOUCH_PAD_SLOPE_0`
        Touch sensor charge / discharge speed, always zero
    
    enumerator `TOUCH_PAD_SLOPE_1`
        Touch sensor charge / discharge speed, slowest
    
    enumerator `TOUCH_PAD_SLOPE_2`
        Touch sensor charge / discharge speed
    
    enumerator `TOUCH_PAD_SLOPE_3`
        Touch sensor charge / discharge speed
    
    enumerator `TOUCH_PAD_SLOPE_4`
        Touch sensor charge / discharge speed
    
    enumerator `TOUCH_PAD_SLOPE_5`
        Touch sensor charge / discharge speed
    
    enumerator `TOUCH_PAD_SLOPE_6`
        Touch sensor charge / discharge speed
    
    enumerator `TOUCH_PAD_SLOPE_7`
        Touch sensor charge / discharge speed, fast

enumerator `TOUCH_PAD_SLOPE_MAX`
    
enum `touch_tie_opt_t`
    Touch sensor initial charge level
    
    `Values:`
    
    enumerator `TOUCH_PAD_TIE_OPT_LOW`
        Initial level of charging voltage, low level
    
    enumerator `TOUCH_PAD_TIE_OPT_HIGH`
        Initial level of charging voltage, high level

enumerator `TOUCH_PAD_TIE_OPT_MAX`
    
enum `touch_fsm_mode_t`
    Touch sensor FSM mode
    
    `Values:`
    
    enumerator `TOUCH_FSM_MODE_TIMER`
        To start touch FSM by timer
enumerator TOUCH_FSM_MODE_SW
To start touch FSM by software trigger

enumerator TOUCH_FSM_MODE_MAX

enum touch_trigger_mode_t

Values:

enumerator TOUCH_TRIGGER_BELOW
Touch interrupt will happen if counter value is less than threshold.

enumerator TOUCH_TRIGGER_ABOVE
Touch interrupt will happen if counter value is larger than threshold.

enumerator TOUCH_TRIGGER_MAX

enum touch_trigger_src_t

Values:

enumerator TOUCH_TRIGGER_SOURCE_BOTH
wakeup interrupt is generated if both SET1 and SET2 are “touched”

enumerator TOUCH_TRIGGER_SOURCE_SET1
wakeup interrupt is generated if SET1 is “touched”

enumerator TOUCH_TRIGGER_SOURCE_MAX

enum touch_pad_intr_mask_t

Values:

enumerator TOUCH_PAD_INTR_MASK_DONE
Measurement done for one of the enabled channels.

enumerator TOUCH_PAD_INTR_MASK_ACTIVE
Active for one of the enabled channels.

enumerator TOUCH_PAD_INTR_MASK_INACTIVE
Inactive for one of the enabled channels.

enumerator TOUCH_PAD_INTR_MASK_SCAN_DONE
Measurement done for all the enabled channels.

enumerator TOUCH_PAD_INTR_MASK_TIMEOUT
Timeout for one of the enabled channels.

enum touch_pad_denoise_grade_t

Values:
enumerator TOUCH_PAD_DENOISE_BIT12
    Denoise range is 12bit

enumerator TOUCH_PAD_DENOISE_BIT10
    Denoise range is 10bit

enumerator TOUCH_PAD_DENOISE_BIT8
    Denoise range is 8bit

enumerator TOUCH_PAD_DENOISE_BIT4
    Denoise range is 4bit

enumerator TOUCH_PAD_DENOISE_MAX

enum touch_pad_denoise_cap_t

Values:

enumerator TOUCH_PAD_DENOISE_CAP_L0
    Denoise channel internal reference capacitance is 5pf

enumerator TOUCH_PAD_DENOISE_CAP_L1
    Denoise channel internal reference capacitance is 6.4pf

enumerator TOUCH_PAD_DENOISE_CAP_L2
    Denoise channel internal reference capacitance is 7.8pf

enumerator TOUCH_PAD_DENOISE_CAP_L3
    Denoise channel internal reference capacitance is 9.2pf

enumerator TOUCH_PAD_DENOISE_CAP_L4
    Denoise channel internal reference capacitance is 10.6pf

enumerator TOUCH_PAD_DENOISE_CAP_L5
    Denoise channel internal reference capacitance is 12.0pf

enumerator TOUCH_PAD_DENOISE_CAP_L6
    Denoise channel internal reference capacitance is 13.4pf

enumerator TOUCH_PAD_DENOISE_CAP_L7
    Denoise channel internal reference capacitance is 14.8pf

enumerator TOUCH_PAD_DENOISE_CAP_MAX

enum touch_pad_shield_driver_t

Values:

Touch sensor shield channel drive capability level
enumerator TOUCH_PAD_SHIELD_DRV_L0
    The max equivalent capacitance in shield channel is 40pf

denumerator TOUCH_PAD_SHIELD_DRV_L1
    The max equivalent capacitance in shield channel is 80pf

denumerator TOUCH_PAD_SHIELD_DRV_L2
    The max equivalent capacitance in shield channel is 120pf

denumerator TOUCH_PAD_SHIELD_DRV_L3
    The max equivalent capacitance in shield channel is 160pf

denumerator TOUCH_PAD_SHIELD_DRV_L4
    The max equivalent capacitance in shield channel is 200pf

denumerator TOUCH_PAD_SHIELD_DRV_L5
    The max equivalent capacitance in shield channel is 240pf

denumerator TOUCH_PAD_SHIELD_DRV_L6
    The max equivalent capacitance in shield channel is 280pf

denumerator TOUCH_PAD_SHIELD_DRV_L7
    The max equivalent capacitance in shield channel is 320pf

denumerator TOUCH_PAD_SHIELD_DRV_MAX

enum touch_pad_conn_type_t
    Touch channel idle state configuration
    Values:

    enumerator TOUCH_PAD_CONN_HIGHZ
        Idle status of touch channel is high resistance state

    enumerator TOUCH_PAD_CONN_GND
        Idle status of touch channel is ground connection

    enumerator TOUCH_PAD_CONN_MAX

enum touch_filter_mode_t
    Touch channel IIR filter coefficient configuration.

Note: On ESP32S2. There is an error in the IIR calculation. The magnitude of the error is twice the
filter coefficient. So please select a smaller filter coefficient on the basis of meeting the filtering requirements.
Recommended filter coefficient selection IIR_16.

Values:
enumerator **TOUCH_PAD_FILTER_IIR_4**  
The filter mode is first-order IIR filter. The coefficient is 4.

enumerator **TOUCH_PAD_FILTER_IIR_8**  
The filter mode is first-order IIR filter. The coefficient is 8.

enumerator **TOUCH_PAD_FILTER_IIR_16**  
The filter mode is first-order IIR filter. The coefficient is 16 (Typical value).

enumerator **TOUCH_PAD_FILTER_IIR_32**  
The filter mode is first-order IIR filter. The coefficient is 32.

enumerator **TOUCH_PAD_FILTER_IIR_64**  
The filter mode is first-order IIR filter. The coefficient is 64.

enumerator **TOUCH_PAD_FILTER_IIR_128**  
The filter mode is first-order IIR filter. The coefficient is 128.

enumerator **TOUCH_PAD_FILTER_IIR_256**  
The filter mode is first-order IIR filter. The coefficient is 256.

enumerator **TOUCH_PAD_FILTER_JITTER**  
The filter mode is jitter filter

enumerator **TOUCH_PAD_FILTER_MAX**

**enum** **touch_smooth_mode_t**

Level of filter applied on the original data against large noise interference.

**Note:** On ESP32S2. There is an error in the IIR calculation. The magnitude of the error is twice the filter coefficient. So please select a smaller filter coefficient on the basis of meeting the filtering requirements. Recommended filter coefficient selection **IIR_2**.

**Values:**

enumerator **TOUCH_PAD_SMOOTH_OFF**  
No filtering of raw data.

enumerator **TOUCH_PAD_SMOOTH_IIR_2**  
Filter the raw data. The coefficient is 2 (Typical value).

enumerator **TOUCH_PAD_SMOOTH_IIR_4**  
Filter the raw data. The coefficient is 4.

enumerator **TOUCH_PAD_SMOOTH_IIR_8**  
Filter the raw data. The coefficient is 8.

enumerator **TOUCH_PAD_SMOOTH_MAX**
2.5.25  Touch Element

Overview

The Touch Element Library is a highly abstracted element library designed on the basis of the touch sensor driver. The library provides a unified and user-friendly software interface to quickly build capacitive touch sensor applications. For more information about the touch sensor driver API, see Touch Sensor.

Architecture

The Touch Element library configures touch sensor peripherals via the touch sensor driver. However, some necessary hardware parameters should be passed to touch_element_install() and will be configured automatically only after calling touch_element_start(). This sequential order is essential because configuring these parameters has a significant impact on the run-time system. Therefore, they must be configured after calling the start function to ensure the system functions properly.

These parameters include touch channel threshold, driver-level of waterproof shield sensor, etc. The Touch Element library sets the touch sensor interrupt and the esp_timer routine up, and the hardware information of the touch sensor (channel state, channel number) will be obtained in the touch sensor interrupt service routine. When the specified channel event occurs, the hardware information is passed to the esp_timer callback routine, which then dispatches the touch sensor channel information to the touch elements (such as button, slider, etc.). The library then runs a specified algorithm to update the touch element’s state or calculate its position and dispatches the result accordingly.

So when using the Touch Element library, you are relieved from the implementation details of the touch sensor peripheral. The library handles most of the hardware information and passes the more meaningful messages to the event handler routine.

The workflow of the Touch Element library is illustrated in the picture below.

The features in relation to the Touch Element library in ESP32-S2 are given in the table below.

<table>
<thead>
<tr>
<th>Features</th>
<th>ESP32S2</th>
</tr>
</thead>
<tbody>
<tr>
<td>Touch Element waterproof</td>
<td>✓✓✓</td>
</tr>
<tr>
<td>Touch Element button</td>

<tr>
<td>Touch Element slider</td>
<td>✓</td>
</tr>
<tr>
<td>Touch Element matrix button</td>
<td>✓ ✓✓</td>
</tr>
</tbody>
</table>

Peripheral

ESP32-S2 integrates one touch sensor peripheral with several physical channels.

- 14 physical capacitive touch channels
- Timer or software FSM trigger mode
- Up to 5 kinds of interrupt (Upper threshold and lower threshold interrupt, measure one channel finish and measure all channels finish interrupt, measurement timeout interrupt)
- Sleep mode wakeup source
- Hardware internal de-noise
- Hardware filter
- Hardware waterproof sensor
- Hardware proximity sensor

The channels are located as follows:
Fig. 22: Touch Element architecture
Chapter 2. API Reference

<table>

Terminology

The terms used in relation to the Touch Element library are given below.

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Touch sensor</td>
<td>Touch sensor peripheral inside the chip</td>
</tr>
<tr>
<td>Touch channel</td>
<td>Touch sensor channels inside the touch sensor peripheral</td>
</tr>
<tr>
<td>Touch pad</td>
<td>Off-chip physical solder pad, generally inside the PCB</td>
</tr>
<tr>
<td>De-noise channel</td>
<td>Internal de-noise channel, which is always Channel 0 and is reserved</td>
</tr>
<tr>
<td>Shield sensor</td>
<td>One of the waterproof sensors for detecting droplets in small areas and compensating for the influence of water drops on measurements</td>
</tr>
<tr>
<td>Guard sensor</td>
<td>One of the waterproof sensors for detecting extensive wading and to temporarily disable the touch sensor</td>
</tr>
<tr>
<td>Shield channel</td>
<td>The channel that waterproof shield sensor connected to, which is always Channel 14</td>
</tr>
<tr>
<td>Guard channel</td>
<td>The channel that waterproof guard sensor connected to</td>
</tr>
<tr>
<td>Shield pad</td>
<td>Off-chip physical solder pad, generally is grids, and is connected to shield the sensor</td>
</tr>
<tr>
<td>Guard pad</td>
<td>Off-chip physical solder pad, usually a ring, and is connected to the guard sensor</td>
</tr>
</tbody>
</table>
Fig. 23: Touch sensor application system components
**Touch Sensor Signal** Each touch sensor is able to provide the following types of signals:

- **Raw**: The Raw signal is the unfiltered signal from the touch sensor.
- **Smooth**: The Smooth signal is a filtered version of the Raw signal via an internal hardware filter.
- **Benchmark**: The Benchmark signal is also a filtered signal that filters out extremely low-frequency noise.

All of these signals can be obtained using touch sensor driver API.

![Touch Sensor Signal](image)

**Fig. 24: Touch sensor signals**

**Touch Sensor Signal Threshold** The Touch Sensor Threshold value is a configurable threshold value used to determine when a touch sensor is touched or not. When the difference between the Smooth signal and the Benchmark signal becomes greater than the threshold value (i.e., \( \text{smooth} - \text{benchmark} > \text{threshold} \)), the touch channel’s state will be changed and a touch interrupt will be triggered simultaneously.

![Touch Sensor Signal Threshold](image)

**Fig. 25: Touch sensor signal threshold**

**Sensitivity** Important performance parameter of the touch sensor, the larger it is, the better touch the sensor performs. It could be calculated by the format below:

\[
\text{Sensitivity} = \frac{\text{Signal}_{\text{press}} - \text{Signal}_{\text{release}}}{\text{Signal}_{\text{release}}} = \frac{\text{Signal}_{\text{delta}}}{\text{Signal}_{\text{benchmark}}}
\]

**Waterproof** Waterproof is the hardware feature of a touch sensor which has a guard sensor and shield sensor (always connect to Channel 14) that has the ability to resist a degree of influence of water drop and detect the water stream.

**Touch Button** The touch button consumes one channel of the touch sensor, and it looks like as the picture below:
Fig. 26: Touch button
Chapter 2. API Reference

**Touch Slider**  The touch slider consumes several channels (at least three channels) of the touch sensor, the more channels consumed, the higher resolution and accuracy position it performs. The touch slider looks like as the picture below:

![Touch Slider Diagram](image)

Fig. 27: Touch slider

**Touch Matrix**  The touch matrix button consumes several channels (at least $2 + 2 = 4$ channels), and it gives a solution to use fewer channels and get more buttons. ESP32-S2 supports up to 49 buttons. The touch matrix button looks like as the picture below:

![Touch Matrix Diagram](image)

**Touch Element Library Usage**

Using this library should follow the initialization flow below:

1. To initialize the Touch Element library by calling `touch_element_install()`.
2. To initialize touch elements (button/slider etc) by calling `touch_xxxx_install()`.
3. To create a new element instance by calling `touch_xxxx_create()`.
4. To subscribe events by calling `touch_xxxx_subscribe_event()`.
5. To choose a dispatch method by calling `touch_xxxx_set_dispatch_method()` that tells the library how to notify you while the subscribed event occurs.
Fig. 28: Touch matrix
6. If dispatch by callback, call `touch_xxxx_set_callback()` to set the event handler function.
7. To start the Touch Element library by calling `touch_element_start()`.
8. If dispatch by callback, the callback will be called by the driver core when an event happens, no need to do anything; If dispatch by event task, create an event task and call `touch_element_message_receive()` to obtain messages in a loop.
9. (Optional) If you want to suspend the Touch Element run-time system or for some reason that could not obtain the touch element message, `touch_element_stop()` should be called to suspend the Touch Element system and then resume it by calling `touch_element_start()` again.

In code, the flow above may look like as follows:

```c
static touch_xxx_handle_t element_handle; //Declare a touch element handle

#define TOUCH_ELEM_EVENT_ON_PRESS
#define TOUCH_ELEM_EVENT_ON_RELEASE

//Define the subscribed event handler
void event_handler(touch_xxx_handle_t out_handle, touch_xxx_message_t out_message, ...
void *arg)
{
    //Event handler logic
}

void app_main()
{
    //Using the default initializer to config Touch Element library
    touch_elem_global_config_t global_config = TOUCH_ELEM_GLOBAL_DEFAULT_CONFIG();
    touch_element_install(&global_config);

    //Using the default initializer to config Touch elements
    touch_xxx_global_config_t elem_global_config = TOUCH_SXXX_GLOBAL_DEFAULT_CONFIG();
    touch_xxx_install(&elem_global_config);

    //Create a new instance
    touch_xxx_config_t element_config = {
        ...
        ...
    };
    touch_xxx_create(&element_config, &element_handle);

    //Subscribe the specified events by using the event mask
    touch_xxx_subscribe_event(element_handle, TOUCH_ELEM_EVENT_ON_PRESS | TOUCH_ELEM_EVENT_ON_RELEASE, NULL);

    //Choose CALLBACK as the dispatch method
    touch_xxx_set_dispatch_method(element_handle, TOUCH_ELEM_DISP_CALLBACK);

    //Register the callback routine
    touch_xxx_set_callback(element_handle, event_handler);

    //Start Touch Element library processing
    touch_element_start();
}
```

**Initialization**

1. To initialize the Touch Element library, you have to configure the touch sensor peripheral and Touch Element library by calling `touch_element_install()` with `touch_elem_global_config_t`, the default initializer is available in `TOUCH_ELEM_GLOBAL_DEFAULT_CONFIG()` and this default configuration is suitable for the most general application scene, and it is suggested not to change the default configuration before fully understanding Touch Sensor peripheral because some changes might bring several impacts to the system.
2. To initialize the specified element, all the elements will not work before its constructor `touch_xxxx_install()` is called so as to save memory, so you have to call the constructor of
each used touch element respectively, to set up the specified element.

**Touch Element Instance Startup**

1. To create a new touch element instance, call `touch_xxxx_create()`, select a channel, and provide its `Sensitivity` value for the new element instance.

2. To subscribe to events, call `touch_xxxx_subscribe_event()`. The Touch Element library offers several events, and the event mask is available in components/touch_element/include/touch_element/touch_element.h. You can use these event masks to subscribe to specific events individually or combine them to subscribe to multiple events.

3. To configure the dispatch method, use `touch_xxxx_set_dispatch_method()`. The Touch Element library provides two dispatch methods: `TOUCH_ELEM_DISP_EVENT` and `TOUCH_ELEM_DISP_CALLBACK`. These methods allow you to obtain the touch element message and handle it using different approaches.

**Events Processing** If `TOUCH_ELEM_DISP_EVENT` dispatch method is configured, you need to start up an event handler task to obtain the touch element message, all the elements’ raw message could be obtained by calling `touch_element_message_receive()`, then extract the element-class-specific message by calling the corresponding message decoder with `touch_xxxx_get_message()` to get the touch element’s extracted message; If `TOUCH_ELEM_DISP_CALLBACK` dispatch method is configured, you need to pass an event handler by calling `touch_xxxx_set_callback()` before the touch element starts working, all the element’s extracted message will be passed to the event handler function.

**Warning:** Since the event handler function runs on the core of the element library, i.e., in the esp_timer callback routine, please avoid performing operations that may cause blocking or delays, such as calling `vTaskDelay()`.

In code, the events handle procedure may look like as follows:

```c
/* ---------------------------------------------- TOUCH_ELEM_DISP_EVENT ----------- 
_------------------------------------ */ 
void element_handler_task(void *arg)
{
    touch_elem_message_t element_message;
    while(1) {
        if (touch_element_message_receive(&element_message, Timeout) == ESP_OK) {
            const touch_xxxx_message_t *extracted_message = touch_xxxx_get_message(&element_message); //Decode message
            ... //Event handler logic
        }
    }
}
void app_main()
{
    ...

    touch_xxxx_set_dispatch_method(element_handle, TOUCH_ELEM_DISP_EVENT); //Set
    xTaskCreate(element_handler_task, "element_handler_task", 2048, NULL, 5, NULL); //Create a handler task
    ...
    /* ---------------------------------------------- TOUCH_ELEM_DISP_CALLBACK -------- 
    --------------------------------------- */
}
```

(continues on next page)
void element_handler(touch_xxxx_handle_t out_handle, touch_xxxx_message_t out_message, void *arg)
{
    //Event handler logic
}

void app_main()
{
    ...
    touch_xxxx_set_dispatch_method(element_handle, TOUCH_ELEM_DISP_CALLBACK); // Set TOUCH_ELEM_DISP_CALLBACK as the dispatch method
    touch_xxxx_set_callback(element_handle, element_handler); // Register an event handler function
    ...
} /* -------------------------------------------------------------------------- */

Waterproof Usage

1. The waterproof shield sensor is always-on after Touch Element waterproof is initialized, however, the waterproof guard sensor is optional, hence if you do not need the guard sensor, TOUCH_WATERPROOF_GUARD_NOUSE has to be passed to touch_element_waterproof_install() by the configuration struct.

2. To associate the touch element with the guard sensor, pass the touch element’s handle to the Touch Element waterproof’s masked list by calling touch_element_waterproof_add(). By associating a touch element with the Guard sensor, the touch element will be disabled when the guard sensor is triggered by a stream of water so as to protect the touch element.

The Touch Element Waterproof example is available in peripherals/touch_sensor/touch_element/touch_element_waterproof directory.

In code, the waterproof configuration may look as follows:

void app_main()
{
    ...
    touch_xxxx_install(); // Initialize instance (button, slider, etc)
    touch_xxxx_create(&element_handle); // Create a new Touch element
    ...
    touch_element_waterproof_install(); // Initialize Touch Element waterproof
    touch_element_waterproof_add(element_handle); // Let an element associate with the guard sensor
    ...
}

Wakeup from Light/Deep-sleep Mode

Only Touch Button can be configured as a wake-up source.

Light- or Deep-sleep modes are both supported to be wakened up by a touch sensor. For the Light-sleep mode, any installed touch button can wake it up. But only the sleep button can wake up from Deep-sleep mode, and the touch sensor will do a calibration immediately, the reference value will be calibrated to a wrong value if our finger does not remove timely. Though the wrong reference value recovers after the finger removes away and has no effect on the
driver logic, if you do not want to see a wrong reference value while waking up from Deep-sleep mode, you can call `touch_element_sleep_enable_wakeup_calibration()` to disable the wakeup calibration.

The Touch Element Wakeup example is available in `system/light_sleep` directory.

```c
void app_main()
{
    ...
    touch_element_install();
    touch_button_install();   //Initialize the touch button
    touch_button_create(&element_handle);   //Create a new Touch element
    ...

    // ESP_ERROR_CHECK(touch_element_enable_light_sleep(&sleep_config));
    ESP_ERROR_CHECK(touch_element_enable_deep_sleep(button_handle[0], &sleep_config));
    // ESP_ERROR_CHECK(touch_element_sleep_enable_wakeup_calibration(button_handle[0], false)); // (optional) Disable wakeup calibration to prevent updating the baseline to a wrong value
    touch_element_start();
    ...
}
```

Application Example

All the Touch Element library examples could be found in the `peripherals/touch_sensor/touch_element` directory of ESP-IDF examples.

API Reference - Touch Element Core

Header File

- `components/touch_element/include/touch_element/touch_element.h`
- This header file can be included with:

```c
#include "touch_element/touch_element.h"
```
- This header file is a part of the API provided by the `touch_element` component. To declare that your component depends on `touch_element`, add the following to your `CMakeLists.txt`:

```cmake
REQUIRES touch_element
```
- or

```cmake
PRIV_REQUIRES touch_element
```

Functions

`esp_err_t touch_element_install(const touch_elem_global_config_t *global_config)`

Touch element processing initialization.

**Note:** To reinitialize the touch element object, call `touch_element_uninstall()` first

**Parameters**
- `global_config` [in] Global initialization configuration structure

**Returns**
- `ESP_OK`: Successfully initialized
• ESP_ERR_INVALID_ARG: Invalid argument
• ESP_ERR_NO_MEM: Insufficient memory
• ESP_ERR_INVALID_STATE: Touch element is already initialized
• Others: Unknown touch driver layer or lower layer error

`esp_err_t touch_element_start (void)`

Touch element processing start.

This function starts the touch element processing system

**Note:** This function must only be called after all the touch element instances finished creating

**Returns**
- ESP_OK: Successfully started to process
- Others: Unknown touch driver layer or lower layer error

`esp_err_t touch_element_stop (void)`

Touch element processing stop.

This function stops the touch element processing system

**Note:** This function must be called before changing the system (hardware, software) parameters

**Returns**
- ESP_OK: Successfully stopped to process
- Others: Unknown touch driver layer or lower layer error

`void touch_element_uninstall (void)`

Release resources allocated using touch_element_install.

**Parameters**
- `element_message` [out] Touch element event message structure
- `ticks_to_wait` [in] Number of FreeRTOS ticks to block for waiting event

**Returns**
- ESP_OK: Successfully received touch element event
- ESP_ERR_INVALID_STATE: Touch element library is not initialized
- ESP_ERR_INVALID_ARG: element_message is null
- ESP_ERR_TIMEOUT: Timed out waiting for event

`esp_err_t touch_element_message_receive (touch_elem_message_t *element_message, uint32_t ticks_to_wait)`

Get current event message of touch element instance.

This function will receive the touch element message (handle, event type, etc…) from te_event_give(). It will block until a touch element event or a timeout occurs.

**Parameters**
- `element_message` [out] Touch element event message structure
- `ticks_to_wait` [in] Number of FreeRTOS ticks to block for waiting event

**Returns**
- ESP_OK: Successfully received touch element event
- ESP_ERR_INVALID_STATE: Touch element library is not initialized
- ESP_ERR_INVALID_ARG: element_message is null
- ESP_ERR_TIMEOUT: Timed out waiting for event

`esp_err_t touch_element_waterproof_install (const touch_elem_waterproof_config_t *waterproof_config)`

Touch element waterproof initialization.

This function enables the hardware waterproof, then touch element system uses Shield-Sensor and Guard-Sensor to mitigate the influence of water-drop and water-stream.

**Note:** If the waterproof function is used, Shield-Sensor can not be disabled and it will use channel 14 as its internal channel. Hence, the user can not use channel 14 for another propose. And the Guard-Sensor is not necessary since it is optional.
Chapter 2. API Reference

**Note:** Shield-Sensor: It always uses channel 14 as the shield channel, so user must connect the channel 14 and Shield-Layer in PCB since it will generate a synchronous signal automatically.

**Note:** Guard-Sensor: This function is optional. If used, the user must connect the guard channel and Guard-Ring in PCB. Any channels user wants to protect should be added into Guard-Ring in PCB.

### Parameters

**waterproof_config** - [in] Waterproof configuration

**Returns**

- ESP_OK: Successfully initialized
- ESP_ERR_INVALID_STATE: Touch element library is not initialized
- ESP_ERR_INVALID_ARG: waterproof_config is null or invalid Guard-Sensor channel
- ESP_ERR_NO_MEM: Insufficient memory

### void touch_element_waterproof_uninstall(void)

Release resources allocated using touch_element_waterproof_install().

### esp_err_t touch_element_waterproof_add(touch_elem_handle_t element_handle)

Add a masked handle to protect while Guard-Sensor has been triggered.

This function will add an application handle (button, slider, etc …) as a masked handle. While Guard-Sensor has been triggered, waterproof function will start working and lock the application internal state. While the influence of water is reduced, the application will be unlock and reset into IDLE state.

**Note:** The waterproof protection logic must follow the real circuit in PCB, it means that all of the channels inside the input handle must be inside the Guard-Ring in real circuit.

### Parameters

**element_handle** - [in] Touch element instance handle

**Returns**

- ESP_OK: Successfully added a masked handle
- ESP_ERR_INVALID_STATE: Waterproof is not initialized
- ESP_ERR_INVALID_ARG: element_handle is null

### esp_err_t touch_element_waterproof_remove(touch_elem_handle_t element_handle)

Remove a masked handle to protect.

This function will remove an application handle from masked handle table.

**Parameters**

**element_handle** - [in] Touch element instance handle

**Returns**

- ESP_OK: Successfully removed a masked handle
- ESP_ERR_INVALID_STATE: Waterproof is not initialized
- ESP_ERR_INVALID_ARG: element_handle is null
- ESP_ERR_NOT_FOUND: Failed to search element_handle from waterproof mask_handle list

### esp_err_t touch_element_enable_light_sleep(const touch_elem_sleep_config_t *sleep_config)

Touch element light sleep initialization.

**Note:** It should be called after touch button element installed. Any of installed touch element can wake up from the light sleep.

**Parameters**

**sleep_config** - [in] Sleep configurations, set NULL to use default config

**Returns**
Chapter 2. API Reference

- ESP_OK: Successfully initialized touch sleep
- ESP_ERR_INVALID_STATE: Touch element is not installed or touch sleep has been installed
- ESP_ERR_INVALID_ARG: inputed argument is NULL
- ESP_ERR_NO_MEM: no memory for touch sleep struct
- ESP_ERR_NOT_SUPPORTED: inputed wakeup_elem_handle is not touch_button_handle_t type, currently only touch_button_handle_t supported

`esp_err_t touch_element_disable_light_sleep()`

Release the resources that allocated by touch_element_enable_deep_sleep()

This function will also disable the touch sensor to wake up the device

**Returns**

- ESP_OK: uninstall success
- ESP_ERR_INVALID_STATE: touch sleep has not been installed

`esp_err_t touch_element_enable_deep_sleep(touch_elem_handle_t wakeup_elem_handle, const touch_elem_sleep_config_t *sleep_config)`

Touch element deep sleep initialization.

This function will enable the device wake-up from deep sleep or light sleep by touch sensor

**Note:** It should be called after touch button element installed. Only one touch button can be registered as the deep sleep wake-up button

**Parameters**

- `wakeup_elem_handle` [in] Touch element instance handle for waking up the device, only support button element
- `sleep_config` [in] Sleep configurations, set NULL to use default config

**Returns**

- ESP_OK: Successfully initialized touch sleep
- ESP_ERR_INVALID_STATE: Touch element is not installed or touch sleep has been installed
- ESP_ERR_INVALID_ARG: inputed argument is NULL
- ESP_ERR_NO_MEM: no memory for touch sleep struct
- ESP_ERR_NOT_SUPPORTED: inputed wakeup_elem_handle is not touch_button_handle_t type, currently only touch_button_handle_t supported

`esp_err_t touch_element_disable_deep_sleep(void)`

Release the resources that allocated by touch_element_enable_deep_sleep()

This function will also disable the touch sensor to wake up the device

**Returns**

- ESP_OK: uninstall success
- ESP_ERR_INVALID_STATE: touch sleep has not been installed

`esp_err_t touch_element_sleep_enable_wakeup_calibration(touch_elem_handle_t element_handle, bool en)`

Touch element wake up calibrations.

This function will also disable the touch sensor to wake up the device

**Returns**

- ESP_OK: uninstall success
- ESP_ERR_INVALID_STATE: touch sleep has not been installed
Chapter 2. API Reference

Structures

```c
struct touch_elem_sw_config_t
    Touch element software configuration.

Public Members

float waterproof_threshold_divider
    Waterproof guard channel threshold divider.

uint8_t processing_period
    Processing period (ms)

uint8_t intr_message_size
    Interrupt message queue size.

uint8_t event_message_size
    Event message queue size.
```

```c
struct touch_elem_hw_config_t
    Touch element hardware configuration.

Public Members

touch_high_volt_t upper_voltage
    Touch sensor channel upper charge voltage.

touch_volt_atten_t voltage_attenuation
    Touch sensor channel upper charge voltage attenuation (Diff voltage is upper - attenuation - lower)

touch_low_volt_t lower_voltage
    Touch sensor channel lower charge voltage.

touch_pad_conn_type_t suspend_channel_polarity
    Suspend channel polarity (High Impedance State or GND)

touch_pad_denoise_grade_t denoise_level
    Internal de-noise level.

touch_pad_denoise_cap_t denoise_equivalent_cap
    Internal de-noise channel (Touch channel 0) equivalent capacitance.

touch_smooth_mode_t smooth_filter_mode
    Smooth value filter mode (This only apply to touch_pad_filter_read_smooth())

touch_filter_mode_t benchmark_filter_mode
    Benchmark filter mode.
```
# Chapter 2. API Reference

```c
uint16_t sample_count
   The count of sample in each measurement of touch sensor.
```

```c
uint16_t sleep_cycle
   The cycle (RTC slow clock) of sleep.
```

```c
uint8_t benchmark_debounce_count
   Benchmark debounce count.
```

```c
uint8_t benchmark_calibration_threshold
   Benchmark calibration threshold.
```

```c
uint8_t benchmark_jitter_step
   Benchmark jitter filter step (This only works at while benchmark filter mode is jitter filter)
```

```c
struct touch_elem_global_config_t
   Touch element global configuration passed to touch_element_install.
```

**Public Members**

```c
touch_elem_hw_config_t hardware
   Hardware configuration.
```

```c
touch_elem_sw_config_t software
   Software configuration.
```

```c
struct touch_elem_waterproof_config_t
   Touch element waterproof configuration passed to touch_element_waterproof_install.
```

**Public Members**

```c
touch_pad_t guard_channel
   Waterproof Guard-Sensor channel number (index)
```

```c
float guard_sensitivity
   Waterproof Guard-Sensor sensitivity.
```

```c
struct touch_elem_sleep_config_t
   Touch element sleep configuration passed to touch_element_enable_light_sleep or touch_element_enable_deep_sleep.
```

**Public Members**

```c
uint16_t sample_count
   scan times in every measurement, normally equal to the ‘sample_count’ field in ‘touch_elem_hw_config_t’.
```
uint16_t \texttt{sleep\_cycle} \\
sleep\_cycle decide the interval between two measurements, 
\( t_{\text{sleep}} = \text{sleep\_cycle} / (\text{RTC\_SLOW\_CLK}\ \text{frequency}) \), normally equal to the ‘sleep\_cycle’ field in ‘\text{touch\_elem\_hw\_config\_t}’.

struct \texttt{touch\_elem\_message\_t} \\
Touch element event message type from \text{touch\_element\_message\_receive()}

\textbf{Public Members}

\texttt{touch\_elem\_handle\_t handle} \\
Touch element handle.

\texttt{touch\_elem\_type\_t element\_type} \\
Touch element type.

\texttt{void *arg} \\
User input argument.

\texttt{uint8_t\ [8] child\_msg} \\
Encoded message.

\textbf{Macros}

\texttt{TOUCH\_ELEM\_GLOBAL\_DEFAULT\_CONFIG()} \\
\texttt{TOUCH\_ELEM\_EVENT\_NONE} \\
None event.

\texttt{TOUCH\_ELEM\_EVENT\_ON\_PRESS} \\
On Press event.

\texttt{TOUCH\_ELEM\_EVENT\_ON\_RELEASE} \\
On Release event.

\texttt{TOUCH\_ELEM\_EVENT\_ON\_LONGPRESS} \\
On LongPress event.

\texttt{TOUCH\_ELEM\_EVENT\_ON\_CALCULATION} \\
On Calculation event.

\texttt{TOUCH\_WATERPROOF\_GUARD\_NOUSE} \\
Waterproof no use guard sensor.

\textbf{Type Definitions}

typedef void *\texttt{touch\_elem\_handle\_t} \\
Touch element handle type.

typedef uint32_t \texttt{touch\_elem\_event\_t} \\
Touch element event type.
Chapter 2. API Reference

Enumerations

enum touch_elem_type_t
   Touch element handle type.
   Values:
   
   enumerator TOUCH_ELEM_TYPE_BUTTON
      Touch element button.
   
   enumerator TOUCH_ELEM_TYPE_SLIDER
      Touch element slider.
   
   enumerator TOUCH_ELEM_TYPE_MATRIX
      Touch element matrix button.

enum touch_elem_dispatch_t
   Touch element event dispatch methods (event queue/callback)
   Values:
   
   enumerator TOUCH_ELEM_DISP_EVENT
      Event queue dispatch.
   
   enumerator TOUCH_ELEM_DISP_CALLBACK
      Callback dispatch.
   
   enumerator TOUCH_ELEM_DISP_MAX

API Reference - Touch Button

Header File

• components/touch_element/include/touch_element/touch_button.h
• This header file can be included with:

```
#include "touch_element/touch_button.h"
```

• This header file is a part of the API provided by the touch_element component. To declare that your component depends on touch_element, add the following to your CMakeLists.txt:

```
REQUIRES touch_element
```

or

```
PRIV_REQUIRES touch_element
```

Functions

```
esp_err_t touch_button_install (const touch_button_global_config_t *global_config)
```

Touch Button initialize.

This function initializes touch button global and acts on all touch button instances.

Parameters global_config – [in] Button object initialization configuration

Returns

• ESP_OK: Successfully initialized touch button
• ESP_ERR_INVALID_STATE: Touch element library was not initialized
**Chapter 2. API Reference**

- ESP_ERR_INVALID_ARG: button_init is NULL
- ESP_ERR_NO_MEM: Insufficient memory

```c
void touch_button_uninstall (void)
```

Release resources allocated using `touch_button_install()`

```c
esp_err_t touch_button_create (const touch_button_config_t *button_config, touch_button_handle_t *button_handle)
```

Create a new touch button instance.

**Note:** The sensitivity has to be explored in experiments, Sensitivity = (Raw(touch) - Raw(release)) / Raw(release) * 100%

**Parameters**
- `button_config` - [in] Button configuration
- `button_handle` - [out] Button handle

**Returns**
- ESP_OK: Successfully create touch button
- ESP_ERR_INVALID_STATE: Touch button driver was not initialized
- ESP_ERR_NO_MEM: Insufficient memory
- ESP_ERR_INVALID_ARG: Invalid configuration struct or arguments is NULL

```c
esp_err_t touch_button_delete (touch_button_handle_t button_handle)
```

Release resources allocated using `touch_button_create()`

**Parameters**
- `button_handle` - [in] Button handle

**Returns**
- ESP_OK: Successfully released resources
- ESP_ERR_INVALID_STATE: Touch button driver was not initialized
- ESP_ERR_INVALID_ARG: button_handle is null
- ESP_ERR_NOT_FOUND: Input handle is not a button handle

```c
esp_err_t touch_button_subscribe_event (touch_button_handle_t button_handle, uint32_t event_mask, void *arg)
```

Touch button subscribes event.

This function uses event mask to subscribe to touch button events, once one of the subscribed events occurs, the event message could be retrieved by calling `touch_element_message_receive()` or input callback routine.

**Note:** Touch button only support three kind of event masks, they are TOUCH_ELEM_EVENT_ON_PRESS, TOUCH_ELEM_EVENT_ON_RELEASE, TOUCH_ELEM_EVENT_ON_LONGPRESS. You can use those event masks in any combination to achieve the desired effect.

**Parameters**
- `button_handle` - [in] Button handle
- `event_mask` - [in] Button subscription event mask
- `arg` - [in] User input argument

**Returns**
- ESP_OK: Successfully subscribed touch button event
- ESP_ERR_INVALID_STATE: Touch button driver was not initialized
- ESP_ERR_INVALID_ARG: button_handle is null or event is not supported

```c
esp_err_t touch_button_set_dispatch_method (touch_button_handle_t button_handle, touch_elem_dispatch_t dispatch_method)
```

Touch button set dispatch method.

This function sets a dispatch method that the driver core will use this method as the event notification method.
Parameters
- **button_handle** - [in] Button handle
- **dispatch_method** - [in] Dispatch method (By callback/event)

Returns
- ESP_OK: Successfully set dispatch method
- ESP_ERR_INVALID_STATE: Touch button driver was not initialized
- ESP_ERR_INVALID_ARG: button_handle is null or dispatch_method is invalid

```c
esp_err_t touch_button_set_callback (touch_button_handle_t button_handle, touch_button_callback_t button_callback)
```

Touch button set callback.

This function sets a callback routine into touch element driver core, when the subscribed events occur, the callback routine will be called.

**Note:** Button message will be passed from the callback function and it will be destroyed when the callback function return.

**Warning:** Since this input callback routine runs on driver core (esp-timer callback routine), it should not do something that attempts to Block, such as calling vTaskDelay().

Parameters
- **button_handle** - [in] Button handle
- **button_callback** - [in] User input callback

Returns
- ESP_OK: Successfully set callback
- ESP_ERR_INVALID_STATE: Touch button driver was not initialized
- ESP_ERR_INVALID_ARG: button_handle or button_callback is null

```c
esp_err_t touch_button_set_longpress (touch_button_handle_t button_handle, uint32_t threshold_time)
```

Touch button set long press trigger time.

This function sets the threshold time (ms) for a long press event. If a button is pressed and held for a period of time that exceeds the threshold time, a long press event is triggered.

Parameters
- **button_handle** - [in] Button handle
- **threshold_time** - [in] Threshold time (ms) of long press event occur

Returns
- ESP_OK: Successfully set the threshold time of long press event
- ESP_ERR_INVALID_STATE: Touch button driver was not initialized
- ESP_ERR_INVALID_ARG: button_handle is null or time (ms) is not larger than 0

```c
const touch_button_message_t *touch_button_get_message (const touch_elem_message_t *element_message)
```

Touch button get message.

This function decodes the element message from touch_element_message_receive() and return a button message pointer.

Parameters **element_message** - [in] element message

Returns Touch button message pointer

**Structures**
struct touch_button_global_config_t
   Button initialization configuration passed to touch_button_install.

   **Public Members**

   float threshold_divider
      Button channel threshold divider.

   uint32_t default_lp_time
      Button default LongPress event time (ms)

struct touch_button_config_t
   Button configuration (for new instance) passed to touch_button_create()

   **Public Members**

   touch_pad_t channel_num
      Button channel number (index)

   float channel_sens
      Button channel sensitivity.

struct touch_button_message_t
   Button message type.

   **Public Members**

   touch_button_event_t event
      Button event.

**Macros**

TOUCH_BUTTON_GLOBAL_DEFAULT_CONFIG()

**Type Definitions**

typedef touch_elem_handle_t touch_button_handle_t
   Button handle.

typedef void (*touch_button_callback_t)(touch_button_handle_t, touch_button_message_t*, void*)
   Button callback type.

**Enumerations**

enum touch_button_event_t
   Button event type.

   *Values:*
enumerator TOUCH_BUTTON_EVT_ON_PRESS
    Button Press event.

enumerator TOUCH_BUTTON_EVT_ON_RELEASE
    Button Release event.

enumerator TOUCH_BUTTON_EVT_ON_LONGPRESS
    Button LongPress event.

enumerator TOUCH_BUTTON_EVT_MAX

API Reference - Touch Slider

Header File

- components/touch_element/include/touch_element/touch_slider.h
- This header file can be included with:

```c
#include "touch_element/touch_slider.h"
```

- This header file is a part of the API provided by the touch_element component. To declare that your component depends on touch_element, add the following to your CMakeLists.txt:

```cmake
REQUIRES touch_element
```

or

```cmake
PRIV_REQUIRES touch_element
```

Functions

```c
touch_slider_install(const touch_slider_global_config_t *global_config)
```

Touch slider initialize.

This function initializes touch slider object and acts on all touch slider instances.

**Parameters**

- global_config - [in] Touch slider global initialization configuration

**Returns**

- ESP_OK: Successfully initialized touch slider
- ESP_ERR_INVALID_STATE: Touch element library was not initialized
- ESP_ERR_INVALID_ARG: slider_init is NULL
- ESP_ERR_NO_MEM: Insufficient memory

```c
touch_slider_uninstall()
```

Release resources allocated using touch_slider_install() (void)

```c
touch_slider_create(const touch_slider_config_t *slider_config, touch_slider_handle_t *slider_handle)
```

Create a new touch slider instance.

**Note:** The index of Channel array and sensitivity array must be one-one correspondence

```c
touch_slider_install(const touch_slider_global_config_t *global_config)
```

Touch slider initialize.

This function initializes touch slider object and acts on all touch slider instances.

**Parameters**

- global_config - [in] Touch slider global initialization configuration

**Returns**

- ESP_OK: Successfully initialized touch slider
- ESP_ERR_INVALID_STATE: Touch element library was not initialized
- ESP_ERR_INVALID_ARG: slider_init is NULL
- ESP_ERR_NO_MEM: Insufficient memory

```c
touch_slider_uninstall()
```

Release resources allocated using touch_slider_install() (void)

```c
touch_slider_create(const touch_slider_config_t *slider_config, touch_slider_handle_t *slider_handle)
```

Create a new touch slider instance.

**Note:** The index of Channel array and sensitivity array must be one-one correspondence

**Parameters**

- slider_config - [in] Slider configuration
- slider_handle - [out] Slider handle

**Returns**

- ESP_OK: Successfully create touch slider
Chapter 2. API Reference

- ESP_ERR_INVALID_STATE: Touch slider driver was not initialized
- ESP_ERR_INVALID_ARG: Invalid configuration struct or arguments is NULL
- ESP_ERR_NO_MEM: Insufficient memory

```c
esp_err_t touch_slider_delete (touch_slider_handle_t slider_handle)
```
Release resources allocated using touch_slider_create.

**Parameters**

- `slider_handle` - [in] Slider handle

**Returns**

- ESP_OK: Successfully released resources
- ESP_ERR_INVALID_STATE: Touch slider driver was not initialized
- ESP_ERR_INVALID_ARG: `slider_handle` is null
- ESP_ERR_NOT_FOUND: Input handle is not a slider handle

```c
esp_err_t touch_slider_subscribe_event (touch_slider_handle_t slider_handle, uint32_t event_mask, void *arg)
```
Touch slider subscribes event.

This function uses event mask to subscribe to touch slider events, once one of the subscribed events occurs, the event message could be retrieved by calling touch_element_message_receive() or input callback routine.

**Note:** Touch slider only support three kind of event masks, they are TOUCH_ELEM_EVENT_ON_PRESS, TOUCH_ELEM_EVENT_ON_RELEASE. You can use those event masks in any combination to achieve the desired effect.

**Parameters**

- `slider_handle` - [in] Slider handle
- `event_mask` - [in] Slider subscription event mask
- `arg` - [in] User input argument

**Returns**

- ESP_OK: Successfully subscribed touch slider event
- ESP_ERR_INVALID_STATE: Touch slider driver was not initialized
- ESP_ERR_INVALID_ARG: `slider_handle` is null or event is not supported

```c
esp_err_t touch_slider_set_dispatch_method (touch_slider_handle_t slider_handle, touch_elem_dispatch_t dispatch_method)
```
Touch slider set dispatch method.

This function sets a dispatch method that the driver core will use this method as the event notification method.

**Parameters**

- `slider_handle` - [in] Slider handle
- `dispatch_method` - [in] Dispatch method (By callback/event)

**Returns**

- ESP_OK: Successfully set dispatch method
- ESP_ERR_INVALID_STATE: Touch slider driver was not initialized
- ESP_ERR_INVALID_ARG: `slider_handle` is null or dispatch_method is invalid

```c
esp_err_t touch_slider_set_callback (touch_slider_handle_t slider_handle, touch_slider_callback_t slider_callback)
```
Touch slider set callback.

This function sets a callback routine into touch element driver core, when the subscribed events occur, the callback routine will be called.

**Note:** Slider message will be passed from the callback function and it will be destroyed when the callback function return.
**Warning:** Since this input callback routine runs on driver core (esp-timer callback routine), it should not do something that attempts to block, such as calling vTaskDelay().

**Parameters**
- `slider_handle` - [in] Slider handle
- `slider_callback` - [in] User input callback

**Returns**
- ESP_OK: Successfully set callback
- ESP_ERR_INVALID_STATE: Touch slider driver was not initialized
- ESP_ERR_INVALID_ARG: slider_handle or slider_callback is null

```c
const touch_slider_message_t *touch_slider_get_message(const touch_elem_message_t *element_message)
```

Touch slider get message.

This function decodes the element message from `touch_element_message_receive()` and return a slider message pointer.

**Parameters** `element_message` - [in] element message
**Returns** Touch slider message pointer

**Structures**

```c
struct touch_slider_global_config_t
```

Slider initialization configuration passed to `touch_slider_install`.

**Public Members**

- `float quantify_lower_threshold`
  Slider signal quantification threshold.

- `float threshold_divider`
  Slider channel threshold divider.

- `uint16_t filter_reset_time`
  Slider position filter reset time (Unit is esp_timer callback tick)

- `uint16_t benchmark_update_time`
  Slider benchmark update time (Unit is esp_timer callback tick)

- `uint8_t position_filter_size`
  Moving window filter buffer size.

- `uint8_t position_filter_factor`
  One-order IIR filter factor.

- `uint8_t calculate_channel_count`
  The number of channels which will take part in calculation.

```c
struct touch_slider_config_t
```

Slider configuration (for new instance) passed to `touch_slider_create()`
Chapter 2. API Reference

Public Members

const touch_pad_t *channel_array
Sliders channel array.

const float *sensitivity_array
Slider channel sensitivity array.

uint8_t channel_num
The number of slider channels.

uint8_t position_range
The right region of touch slider position range, [0, position_range (less than or equal to 255)].

struct touch_slider_message_t
Slider message type.

Public Members

touch_slider_event_t event
Slider event.

touch_slider_position_t position
Slider position.

Macros

TOUCH_SLIDER_GLOBAL_DEFAULT_CONFIG()

Type Definitions

typedef uint32_t touch_slider_position_t
Slider position data type.

typedef touch_elem_handle_t touch_slider_handle_t
Slider instance handle.

typedef void (*touch_slider_callback_t)(touch_slider_handle_t, touch_slider_message_t*, void*)
Slider callback type.

Enumerations

touch_slider_event_t
Slider event type.

Values:

enumerator TOUCH_SLIDER_EVT_ON_PRESS
Slider on Press event.
enumerator TOUCH_SLIDER_EVT_ON_RELEASE
Slider on Release event.

enumerator TOUCH_SLIDER_EVT_ON_CALCULATION
Slider on Calculation event.

enumerator TOUCH_SLIDER_EVT_MAX

Chapter 2. API Reference

API Reference - Touch Matrix

Header File

- components/touch_element/include/touch_element/touch_matrix.h
- This header file can be included with:

```c
#include "touch_element/touch_matrix.h"
```
- This header file is a part of the API provided by the touch_element component. To declare that your component depends on touch_element, add the following to your CMakeLists.txt:

```cmake
REQUIRES touch_element
```

Functions

```c
esp_err_t touch_matrix_install(const touch_matrix_global_config_t *global_config)
```
Touch matrix button initialize.

This function initializes touch matrix button object and acts on all touch matrix button instances.

- **Parameters**
  - `global_config` - [in] Touch matrix global initialization configuration
- **Returns**
  - ESP_OK: Successfully initialized touch matrix button
  - ESP_ERR_INVALID_STATE: Touch element library was not initialized
  - ESP_ERR_INVALID_ARG: matrix_init is NULL
  - ESP_ERR_NO_MEM: Insufficient memory

```c
void touch_matrix_uninstall(void)
```
Release resources allocated using touch_matrix_install()

```c
esp_err_t touch_matrix_create(const touch_matrix_config_t *matrix_config, touch_matrix_handle_t *matrix_handle)
```
Create a new touch matrix button instance.

- **Parameters**
  - `matrix_config` - [in] Matrix button configuration
  - `matrix_handle` - [out] Matrix button handle
- **Returns**
  - ESP_OK: Successfully create touch matrix button

---

**Note:** Channel array and sensitivity array must be one-one correspondence in those array

**Note:** Touch matrix button does not support Multi-Touch now
• ESP_ERR_INVALID_STATE: Touch matrix driver was not initialized
• ESP_ERR_INVALID_ARG: Invalid configuration struct or arguments is NULL
• ESP_ERR_NO_MEM: Insufficient memory

`esp_err_t touch_matrix_delete(touch_matrix_handle_t matrix_handle)`

Release resources allocated using touch_matrix_create()

Parameters
- `matrix_handle` [in] Matrix handle

Returns
- ESP_OK: Successfully released resources
- ESP_ERR_INVALID_STATE: Touch matrix driver was not initialized
- ESP_ERR_INVALID_ARG: matrix_handle is null
- ESP_ERR_NOT_FOUND: Input handle is not a matrix handle

`esp_err_t touch_matrix_subscribe_event (touch_matrix_handle_t matrix_handle, uint32_t event_mask, void *arg)`

Touch matrix button subscribes event.

This function uses event mask to subscribe to touch matrix events, once one of the subscribed events occurs, the event message could be retrieved by calling touch_element_message_receive() or input callback routine.

Note: Touch matrix button only support three kind of event masks, they are TOUCH_ELEM_EVENT_ON_PRESS, TOUCH_ELEM_EVENT_ON_RELEASE, TOUCH_ELEM_EVENT_ON_LONGPRESS. You can use those event masks in any combination to achieve the desired effect.

Parameters
- `matrix_handle` [in] Matrix handle
- `event_mask` [in] Matrix subscription event mask
- `arg` [in] User input argument

Returns
- ESP_OK: Successfully subscribed touch matrix event
- ESP_ERR_INVALID_STATE: Touch matrix driver was not initialized
- ESP_ERR_INVALID_ARG: matrix_handle is null or event is not supported

`esp_err_t touch_matrix_set_dispatch_method (touch_matrix_handle_t matrix_handle, touch_elem_dispatch_t dispatch_method)`

Touch matrix button set dispatch method.

This function sets a dispatch method that the driver core will use this method as the event notification method.

Parameters
- `matrix_handle` [in] Matrix button handle
- `dispatch_method` [in] Dispatch method (By callback/event)

Returns
- ESP_OK: Successfully set dispatch method
- ESP_ERR_INVALID_STATE: Touch matrix driver was not initialized
- ESP_ERR_INVALID_ARG: matrix_handle is null or dispatch_method is invalid

`esp_err_t touch_matrix_set_callback (touch_matrix_handle_t matrix_handle, touch_matrix_callback_t matrix_callback)`

Touch matrix button set callback.

This function sets a callback routine into touch element driver core, when the subscribed events occur, the callback routine will be called.

Note: Matrix message will be passed from the callback function and it will be destroyed when the callback function return.
**Warning:** Since this input callback routine runs on driver core (esp-timer callback routine), it should not do something that attempts to Block, such as calling vTaskDelay().

---

**Parameters**
- `matrix_handle` **[in]** Matrix button handle
- `matrix_callback` **[in]** User input callback

**Returns**
- ESP_OK: Successfully set callback
- ESP_ERR_INVALID_STATE: Touch matrix driver was not initialized
- ESP_ERR_INVALID_ARG: `matrix_handle` or `matrix_callback` is null

```c
esp_err_t touch_matrix_set_longpress(touch_matrix_handle_t matrix_handle, uint32_t threshold_time)
```

Touch matrix button set long press trigger time.

This function sets the threshold time (ms) for a long press event. If a matrix button is pressed and held for a period of time that exceeds the threshold time, a long press event is triggered.

**Parameters**
- `matrix_handle` **[in]** Matrix button handle
- `threshold_time` **[in]** Threshold time (ms) of long press event occur

**Returns**
- ESP_OK: Successfully set the time of long press event
- ESP_ERR_INVALID_STATE: Touch matrix driver was not initialized
- ESP_ERR_INVALID_ARG: `matrix_handle` is null or time (ms) is 0

```c
const touch_matrix_message_t *touch_matrix_get_message(const touch_elem_message_t *element_message)
```

Touch matrix get message.

This function decodes the element message from `touch_element_message_receive()` and return a matrix message pointer.

**Parameters**
- `element_message` **[in]** element message

**Returns**
- Touch matrix message pointer

---

**Structures**

```c
struct touch_matrix_global_config_t
```

Matrix button initialization configuration passed to `touch_matrix_install`.

**Public Members**

- float `threshold_divider`
  
  Matrix button channel threshold divider.

- uint32_t `default_lp_time`
  
  Matrix button default LongPress event time (ms)

```c
struct touch_matrix_config_t
```

Matrix button configuration (for new instance) passed to `touch_matrix_create`

**Public Members**

---
const touch_pad_t *x_channel_array
   Matrix button x-axis channels array.

const touch_pad_t *y_channel_array
   Matrix button y-axis channels array.

const float *x_sensitivity_array
   Matrix button x-axis channels sensitivity array.

const float *y_sensitivity_array
   Matrix button y-axis channels sensitivity array.

uint8_t x_channel_num
   The number of channels in x-axis.

uint8_t y_channel_num
   The number of channels in y-axis.

struct touch_matrix_position_t
   Matrix button position data type.

Public Members

uint8_t x_axis
   Matrix button x axis position.

uint8_t y_axis
   Matrix button y axis position.

uint8_t index
   Matrix button position index.

struct touch_matrix_message_t
   Matrix message type.

Public Members

touch_matrix_event_t event
   Matrix event.

touch_matrix_position_t position
   Matrix position.

Macros

TOUCH_MATRIX_GLOBAL_DEFAULT_CONFIG()
Chapter 2. API Reference

Type Definitions

typedef touch_elem_handle_t touch_matrix_handle_t
Matrix button instance handle.

typedef void (*touch_matrix_callback_t)(touch_matrix_handle_t, touch_matrix_message_t*, void*)
Matrix button callback type.

Enumerations

enum touch_matrix_event_t
Matrix button event type.

Values:

enumerator TOUCH_MATRIX_EVT_ON_PRESS
Matrix button Press event.

enumerator TOUCH_MATRIX_EVT_ON_RELEASE
Matrix button Release event.

enumerator TOUCH_MATRIX_EVT_ON_LONGPRESS
Matrix button LongPress event.

enumerator TOUCH_MATRIX_EVT_MAX

2.5.26 Two-Wire Automotive Interface (TWAI)

Overview

The Two-Wire Automotive Interface (TWAI) is a real-time serial communication protocol suited for automotive
and industrial applications. It is compatible with ISO11898-1 Classical frames, thus can support Standard Frame
Format (11-bit ID) and Extended Frame Format (29-bit ID). The ESP32-S2 contains 1 TWAI controller(s) that can
be configured to communicate on a TWAI bus via an external transceiver.

Warning: The TWAI controller is not compatible with ISO11898-1 FD Format frames, and will interpret such
frames as errors.

This programming guide is split into the following sections:

Sections

• Two-Wire Automotive Interface (TWAI)
  – Overview
  – TWAI Protocol Summary
  – Signals Lines and Transceiver
  – API Naming Conventions
  – Driver Configuration
  – Driver Operation
  – Examples
  – API Reference
TWAI Protocol Summary

The TWAI is a multi-master, multi-cast, asynchronous, serial communication protocol. TWAI also supports error detection and signalling, and inbuilt message prioritization.

**Multi-master:** Any node on the bus can initiate the transfer of a message.

**Multi-cast:** When a node transmits a message, all nodes on the bus will receive the message (i.e., broadcast) thus ensuring data consistency across all nodes. However, some nodes can selectively choose which messages to accept via the use of acceptance filtering (multi-cast).

**Asynchronous:** The bus does not contain a clock signal. All nodes on the bus operate at the same bit rate and synchronize using the edges of the bits transmitted on the bus.

**Error Detection and Signaling:** Every node constantly monitors the bus. When any node detects an error, it signals the detection by transmitting an error frame. Other nodes will receive the error frame and transmit their own error frames in response. This results in an error detection being propagated to all nodes on the bus.

**Message Priorities:** Messages contain an ID field. If two or more nodes attempt to transmit simultaneously, the node transmitting the message with the lower ID value will win arbitration of the bus. All other nodes will become receivers ensuring that there is at most one transmitter at any time.

**TWAI Messages** TWAI Messages are split into Data Frames and Remote Frames. Data Frames are used to deliver a data payload to other nodes, whereas a Remote Frame is used to request a Data Frame from other nodes (other nodes can optionally respond with a Data Frame). Data and Remote Frames have two frame formats known as **Extended Frame** and **Standard Frame** which contain a 29-bit ID and an 11-bit ID respectively. A TWAI message consists of the following fields:

- 29-bit or 11-bit ID: Determines the priority of the message (lower value has higher priority).
- Data Length Code (DLC) between 0 to 8: Indicates the size (in bytes) of the data payload for a Data Frame, or the amount of data to request for a Remote Frame.
- Up to 8 bytes of data for a Data Frame (should match DLC).

**Error States and Counters** The TWAI protocol implements a feature known as “fault confinement” where a persistently erroneous node will eventually eliminate itself from the bus. This is implemented by requiring every node to maintain two internal error counters known as the Transmit Error Counter (TEC) and the Receive Error Counter (REC). The two error counters are incremented and decremented according to a set of rules (where the counters increase on an error, and decrease on a successful message transmission/reception). The values of the counters are used to determine a node’s error state, namely **Error Active**, **Error Passive**, and **Bus-Off**.

**Error Active:** A node is Error Active when both TEC and REC are less than 128 and indicates that the node is operating normally. Error Active nodes are allowed to participate in bus communications, and will actively signal the detection of any errors by automatically transmitting an **Active Error Flag** over the bus.

**Error Passive:** A node is Error Passive when either the TEC or REC becomes greater than or equal to 128. Error Passive nodes are still able to take part in bus communications, but will instead transmit a **Passive Error Flag** upon detection of an error.

**Bus-Off:** A node becomes Bus-Off when the TEC becomes greater than or equal to 256. A Bus-Off node is unable influence the bus in any manner (essentially disconnected from the bus) thus eliminating itself from the bus. A node will remain in the Bus-Off state until it undergoes bus-off recovery.

**Signals Lines and Transceiver**

The TWAI controller does not contain an integrated transceiver. Therefore, to connect the TWAI controller to a TWAI bus, an external transceiver is required. The type of external transceiver used should depend on the application’s physical layer specification (e.g., using SN65HVD23x transceivers for ISO 11898-2 compatibility).

The TWAI controller’s interface consists of 4 signal lines known as **TX**, **RX**, **BUS-OFF**, and **CLKOUT**. These four signal lines can be routed through the GPIO Matrix to the ESP32-S2’s GPIO pads.
**TX and RX:** The TX and RX signal lines are required to interface with an external transceiver. Both signal lines represent/interpret a dominant bit as a low logic level (0 V), and a recessive bit as a high logic level (3.3 V).

**BUS-OFF:** The BUS-OFF signal line is *optional* and is set to a low logic level (0 V) whenever the TWAI controller reaches a bus-off state. The BUS-OFF signal line is set to a high logic level (3.3 V) otherwise.

**CLKOUT:** The CLKOUT signal line is *optional* and outputs a prescaled version of the controller’s source clock.

**Note:** An external transceiver must internally loopback the TX to RX such that a change in logic level to the TX signal line can be observed on the RX line. Failing to do so will cause the TWAI controller to interpret differences in logic levels between the two signal lines as a loss in arbitration or a bit error.

**API Naming Conventions**

**Note:** The TWAI driver provides two sets of API. One is handle-free and is widely used in IDF versions earlier than v5.2, but it can only support one TWAI hardware controller. The other set is with handles, and the function name is usually suffixed with “v2”, which can support any number of TWAI controllers. These two sets of API can be used at the same time, but it is recommended to use the “v2” version in your new projects.

**Driver Configuration**

This section covers how to configure the TWAI driver.

**Operating Modes** The TWAI driver supports the following modes of operations:

**Normal Mode:** The normal operating mode allows the TWAI controller to take part in bus activities such as transmitting and receiving messages/error frames. Acknowledgement from another node is required when transmitting a message.

**No Ack Mode:** The No Acknowledgement mode is similar to normal mode, however acknowledgements are not required for a message transmission to be considered successful. This mode is useful when self testing the TWAI controller (loopback of transmissions).
Listen Only Mode: This mode prevents the TWAI controller from influencing the bus. Therefore, transmission of messages/acknowledgement/error frames will be disabled. However the TWAI controller is still able to receive messages but will not acknowledge the message. This mode is suited for bus monitor applications.

Alerts  The TWAI driver contains an alert feature that is used to notify the application layer of certain TWAI controller or TWAI bus events. Alerts are selectively enabled when the TWAI driver is installed, but can be reconfigured during runtime by calling `twai_reconfigure_alerts()`. The application can then wait for any enabled alerts to occur by calling `twai_read_alerts()`. The TWAI driver supports the following alerts:

<table>
<thead>
<tr>
<th>Alert Flag</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TWAI_ALERT_TX_IDLE</td>
<td>No more messages queued for transmission</td>
</tr>
<tr>
<td>TWAI_ALERT_TX_SUCCESS</td>
<td>The previous transmission was successful</td>
</tr>
<tr>
<td>TWAI_ALERT_RX_DATA</td>
<td>A frame has been received and added to the RX queue</td>
</tr>
<tr>
<td>TWAI_ALERT_BELOW_ERR_WARN</td>
<td>Both error counters have dropped below error warning limit</td>
</tr>
<tr>
<td>TWAI_ALERT_ERR_ACTIVE</td>
<td>TWAI controller has become error active</td>
</tr>
<tr>
<td>TWAI_ALERT_RECOVERY_IN_PROGRESS</td>
<td>TWAI controller is undergoing bus recovery</td>
</tr>
<tr>
<td>TWAI_ALERT_BUS_RECOVERED</td>
<td>TWAI controller has successfully completed bus recovery</td>
</tr>
<tr>
<td>TWAI_ALERT_ARB_LOST</td>
<td>The previous transmission lost arbitration</td>
</tr>
<tr>
<td>TWAI_ALERT_ABOVE_ERR_WARN</td>
<td>One of the error counters has exceeded the error warning limit</td>
</tr>
<tr>
<td>TWAI_ALERT_BUS_ERROR</td>
<td>A (Bit, Stuff, CRC, Form, ACK) error has occurred on the bus</td>
</tr>
<tr>
<td>TWAI_ALERT_TX_FAILED</td>
<td>The previous transmission has failed</td>
</tr>
<tr>
<td>TWAI_ALERT_RX_QUEUE_FULL</td>
<td>The RX queue is full causing a received frame to be lost</td>
</tr>
<tr>
<td>TWAI_ALERT_ERR_PASS</td>
<td>TWAI controller has become error passive</td>
</tr>
<tr>
<td>TWAI_ALERT_BUS_OFF</td>
<td>Bus-off condition occurred. TWAI controller can no longer influence bus</td>
</tr>
</tbody>
</table>

Note: The TWAI controller’s error warning limit is used to preemptively warn the application of bus errors before the error passive state is reached. By default, the TWAI driver sets the error warning limit to 96. The TWAI_ALERT_ABOVE_ERR_WARN is raised when the TEC or REC becomes larger then or equal to the error warning limit. The TWAI_ALERT_BELOW_ERR_WARN is raised when both TEC and REC return back to values below 96.

Note: When enabling alerts, the TWAI_ALERT_AND_LOG flag can be used to cause the TWAI driver to log any raised alerts to UART. However, alert logging is disabled and TWAI_ALERT_AND_LOG if the CONFIG_TWAI_ISR_IN_IRAM option is enabled (see Placing ISR into IRAM).

Note: The TWAI_ALERT_ALL and TWAI_ALERT_NONE macros can also be used to enable/disable all alerts during configuration/reconfiguration.

Bit Timing  The operating bit rate of the TWAI driver is configured using the `twai_timing_config_t` structure. The period of each bit is made up of multiple time quanta, and the period of a time quantum is determined by a pre-scaled version of the TWAI controller’s source clock. A single bit contains the following segments in the following order:

1. The Synchronization Segment consists of a single time quantum
2. Timing Segment 1 consists of 1 to 16 time quanta before sample point
3. Timing Segment 2 consists of 1 to 8 time quanta after sample point

The Baudrate Prescaler is used to determine the period of each time quantum by dividing the TWAI controller’s source clock. On the ESP32-S2, the `brp` can be any even number from 2 to 32768. Alternatively, you can decide
the resolution of each quantum, by setting `twai_timing_config_t::quanta_resolution_hz` to a non-zero value. In this way, the driver can calculate the underlying `brp` value for you. It is useful when you set different clock sources but want the bit rate to keep the same.

Supported clock source for a TWAI controller is listed in the `twai_clock_source_t` and can be specified in `twai_timing_config_t::clk_src`.

![Fig. 30: Bit timing configuration for 500kbit/s given BRP = 8, clock source frequency is 80MHz](image)

The sample point of a bit is located on the intersection of Timing Segment 1 and 2. Enabling **Triple Sampling** causes 3 time quanta to be sampled per bit instead of 1 (extra samples are located at the tail end of Timing Segment 1).

The **Synchronization Jump Width** is used to determine the maximum number of time quanta a single bit time can be lengthened/shortened for synchronization purposes. `sjw` can **range from 1 to 4**.

**Note:** Multiple combinations of `brp`, `tseg_1`, `tseg_2`, and `sjw` can achieve the same bit rate. Users should tune these values to the physical characteristics of their bus by taking into account factors such as **propagation delay**, **node information processing time**, and **phase errors**.

Bit timing **macro initializers** are also available for commonly used bit rates. The following macro initializers are provided by the TWAI driver.

- `TWAI_TIMING_CONFIG_1MBITS`
- `TWAI_TIMING_CONFIG_800KBITS`
- `TWAI_TIMING_CONFIG_500KBITS`
- `TWAI_TIMING_CONFIG_250KBITS`
- `TWAI_TIMING_CONFIG_125KBITS`
- `TWAI_TIMING_CONFIG_100KBITS`
- `TWAI_TIMING_CONFIG_50KBITS`
- `TWAI_TIMING_CONFIG_25KBITS`
- `TWAI_TIMING_CONFIG_20KBITS`
- `TWAI_TIMING_CONFIG_16KBITS`
- `TWAI_TIMING_CONFIG_12_5KBITS`
- `TWAI_TIMING_CONFIG_10KBITS`
- `TWAI_TIMING_CONFIG_5KBITS`
- `TWAI_TIMING_CONFIG_1KBITS`

**Acceptance Filter** The TWAI controller contains a hardware acceptance filter which can be used to filter messages of a particular ID. A node that filters out a message **does not receive the message, but will still acknowledge it**. Acceptance filters can make a node more efficient by filtering out messages sent over the bus that are irrelevant to the node. The acceptance filter is configured using two 32-bit values within `twai_filter_config_t` known as the **acceptance code** and the **acceptance mask**.

The **acceptance code** specifies the bit sequence which a message’s ID, RTR, and data bytes must match in order for the message to be received by the TWAI controller. The **acceptance mask** is a bit sequence specifying which bits of the acceptance code can be ignored. This allows for messages of different IDs to be accepted by a single acceptance code.
Chapter 2. API Reference

The acceptance filter can be used under **Single or Dual Filter Mode**. Single Filter Mode uses the acceptance code and mask to define a single filter. This allows for the first two data bytes of a standard frame to be filtered, or the entirety of an extended frame’s 29-bit ID. The following diagram illustrates how the 32-bit acceptance code and mask are interpreted under Single Filter Mode (Note: The yellow and blue fields represent standard and extended frame formats respectively).

![Fig. 31: Bit layout of single filter mode](Right side MSBit)

**Dual Filter Mode** uses the acceptance code and mask to define two separate filters allowing for increased flexibility of ID’s to accept, but does not allow for all 29-bits of an extended ID to be filtered. The following diagram illustrates how the 32-bit acceptance code and mask are interpreted under **Dual Filter Mode** (Note: The yellow and blue fields represent standard and extended frame formats respectively).

![Fig. 32: Bit layout of dual filter mode](Right side MSBit)

**Disabling TX Queue**  The TX queue can be disabled during configuration by setting the `tx_queue_len` member of `twai_general_config_t` to 0. This allows applications that do not require message transmission to save a small amount of memory when using the TWAI driver.

**Placing ISR into IRAM**  The TWAI driver’s ISR (Interrupt Service Routine) can be placed into IRAM so that the ISR can still run whilst the cache is disabled. Placing the ISR into IRAM may be necessary to maintain the TWAI driver’s functionality during lengthy cache disabling operations (such as SPI Flash writes, OTA updates etc). Whilst the cache is disabled, the ISR continues to:

- Read received messages from the RX buffer and place them into the driver’s RX queue.
- Load messages pending transmission from the driver’s TX queue and write them into the TX buffer.

To place the TWAI driver’s ISR, users must do the following:

- Enable the `CONFIG_TWAI_ISR_IN_IRAM` option using `idf.py menuconfig`.
- When calling `twai_driver_install()`, the `intr_flags` member of `twai_general_config_t` should set the `ESP_INTR_FLAG_IRAM` set.

**Note:** When the `CONFIG_TWAI_ISR_IN_IRAM` option is enabled, the TWAI driver will no longer log any alerts (i.e., the TWAI_ALERT_AND_LOG flag will not have any effect).

**Driver Operation**

The TWAI driver is designed with distinct states and strict rules regarding the functions or conditions that trigger a state transition. The following diagram illustrates the various states and their transitions.
Fig. 33: State transition diagram of the TWAI driver (see table below)

<table>
<thead>
<tr>
<th>Label</th>
<th>Transition</th>
<th>Action/Condition</th>
</tr>
</thead>
<tbody>
<tr>
<td>A</td>
<td>Uninstalled &gt; Stopped</td>
<td><code>twai_driver_install()</code></td>
</tr>
<tr>

</tr>
<tr>
<td>H</td>
<td>Recovering &gt; Stopped</td>
<td>128 occurrences of 11 consecutive recessive bits.</td>
</tr>
</tbody>
</table>

**Driver States**

**Uninstalled**: In the uninstalled state, no memory is allocated for the driver and the TWAI controller is powered OFF.

**Stopped**: In this state, the TWAI controller is powered ON and the TWAI driver has been installed. However the TWAI controller is unable to take part in any bus activities such as transmitting, receiving, or acknowledging messages.

**Running**: In the running state, the TWAI controller is able to take part in bus activities. Therefore messages can be transmitted/received/acknowledged. Furthermore, the TWAI controller is able to transmit error frames upon detection of errors on the bus.

**Bus-Off**: The bus-off state is automatically entered when the TWAI controller’s Transmit Error Counter becomes greater than or equal to 256. The bus-off state indicates the occurrence of severe errors on the bus or in the TWAI controller. Whilst in the bus-off state, the TWAI controller is unable to take part in any bus activities. To exit the bus-off state, the TWAI controller must undergo the bus recovery process.

**Recovering**: The recovering state is entered when the TWAI controller undergoes bus recovery. The TWAI controller/TWAI driver remains in the recovering state until the 128 occurrences of 11 consecutive recessive bits is observed on the bus.

**Message Fields and Flags**

The TWAI driver distinguishes different types of messages by using the various bit field members of the `twai_message_t` structure. These bit field members determine whether a message is in standard or extended format, a remote frame, and the type of transmission to use when transmitting such a message.

These bit field members can also be toggled using the `flags` member of `twai_message_t` and the following message flags:
Message Flag | Description
---|---
TWAI_MSG_FLAG_EXTD | Message is in Extended Frame Format (29bit ID)
TWAI_MSG_FLAG_RTR | Message is a Remote Frame (Remote Transmission Request)
TWAI_MSG_FLAG_SS | Transmit message using Single Shot Transmission (Message will not be re-transmitted upon error or loss of arbitration). Unused for received message.
TWAI_MSG_FLAG_SELF | Transmit message using Self Reception Request (Transmitted message will also received by the same node). Unused for received message.
TWAI_MSG_FLAG_DLC_NON_COMP | Message’s Data length code is larger than 8. This will break compliance with TWAI
TWAI_MSG_FLAG_NONE | Clears all bit fields. Equivalent to a Standard Frame Format (11bit ID) Data Frame.

Examples

Configuration & Installation The following code snippet demonstrates how to configure, install, and start the TWAI driver via the use of the various configuration structures, macro initializers, the `twai_driver_install()` function, and the `twai_start()` function.

```c
#include "driver/gpio.h"
#include "driver/twai.h"

void app_main() {
    //Initialize configuration structures using macro initializers
    twai_general_config_t g_config = TWAIGENERALCONFIG_DEFAULT(GPIO_NUM_21, GPIO_NUM_22, TWAI_MODE_NORMAL);
    twai_timing_config_t t_config = TWAITIMINGCONFIG_500KBITS();
    twai_filter_config_t f_config = TWAFILTERCONFIG_ACCEPT_ALL();

    //Install TWAI driver
    if (twai_driver_install(&g_config, &t_config, &f_config) == ESP_OK) {
        printf("Driver installed\n");
        return;
    } else {
        printf("Failed to install driver\n");
        return;
    }

    //Start TWAI driver
    if (twai_start() == ESP_OK) {
        printf("Driver started\n");
    } else {
        printf("Failed to start driver\n");
        return;
    }

    ...
}
```

The usage of macro initializers is not mandatory and each of the configuration structures can be manually.

Install Multiple TWAI Instances The following code snippet demonstrates how to install multiple TWAI instances via the use of the `twai_driver_install_v2()` function.

```c
#include "driver/gpio.h"
#include "driver/twai.h"

void app_main() {
    //Install TWAI driver
    if (twai_driver_install_v2(&g_config, &t_config, &f_config) == ESP_OK) {
        printf("Driver installed\n");
        return;
    } else {
        printf("Failed to install driver\n");
        return;
    }

    //Start TWAI driver
    if (twai_start() == ESP_OK) {
        printf("Driver started\n");
    } else {
        printf("Failed to start driver\n");
        return;
    }

    ...
}
```

(continues on next page)
{  
  twai_handle_t twai_bus_0;
  twai_handle_t twai_bus_1;
  //Initialize configuration structures using macro initializers
  twai_general_config_t g_config = TWAI_GENERAL_CONFIG_DEFAULT(GPIO_NUM_0, GPIO_NUM_1, TWAI_MODE_NORMAL);
  twai_timing_config_t t_config = TWAI_TIMING_CONFIG_500KBITS();
  twai_filter_config_t f_config = TWAI_FILTER_CONFIG_ACCEPT_ALL();

  //Install driver for TWAI bus 0
  g_config.controller_id = 0;
  if (twai_driver_install_v2(&g_config, &t_config, &f_config, &twai_bus_0) == ESP_OK) {
    printf("Driver installed\n");
  } else {
    printf("Failed to install driver\n");
    return;
  }

  //Start TWAI driver
  if (twai_start_v2(twai_bus_0) == ESP_OK) {
    printf("Driver started\n");
  } else {
    printf("Failed to start driver\n");
    return;
  }

  //Install driver for TWAI bus 1
  g_config.controller_id = 1;
  g_config.tx_io = GPIO_NUM_2;
  g_config.rx_io = GPIO_NUM_3;
  if (twai_driver_install_v2(&g_config, &t_config, &f_config, &twai_bus_1) == ESP_OK) {
    printf("Driver installed\n");
  } else {
    printf("Failed to install driver\n");
    return;
  }

  //Start TWAI driver
  if (twai_start_v2(twai_bus_1) == ESP_OK) {
    printf("Driver started\n");
  } else {
    printf("Failed to start driver\n");
    return;
  }

  //Other Driver operations must use version 2 API as well
  ...
}

Message Transmission  The following code snippet demonstrates how to transmit a message via the usage of the
twai_message_t type and twai_transmit() function.

```
#include "driver/twai.h"

... 

//Configure message to transmit
  twai_message_t message;
  message.identifier = 0xAAAA;
```

(continues on next page)
message.extd = 1;
message.data_length_code = 4;
for (int i = 0; i < 4; i++) {
    message.data[i] = 0;
}

//Queue message for transmission
if (twai_transmit(&message, pdMS_TO_TICKS(1000)) == ESP_OK) {
    printf("Message queued for transmission\n");
} else {
    printf("Failed to queue message for transmission\n");
}

Message Reception  The following code snippet demonstrates how to receive a message via the usage of the

twai_message_t type and twai_receive() function.

```c
#include "driver/twai.h"
...
//Wait for message to be received
twai_message_t message;
if (twai_receive(&message, pdMS_TO_TICKS(10000)) == ESP_OK) {
    printf("Message received\n");
} else {
    printf("Failed to receive message\n");
    return;
}

//Process received message
if (message.extd) {
    printf("Message is in Extended Format\n");
} else {
    printf("Message is in Standard Format\n");
}
printf("ID is %d\n", message.identifier);
if (!message.rtr) {
    for (int i = 0; i < message.data_length_code; i++) {
        printf("Data byte %d = %d\n", i, message.data[i]);
    }
}
```

Reconfiguring and Reading Alerts  The following code snippet demonstrates how to reconfigure and read TWAI
driver alerts via the use of the twai_reconfigure_alerts() and twai_read_alerts() functions.

```c
#include "driver/twai.h"
...
//Reconfigure alerts to detect Error Passive and Bus-Off error states
uint32_t alerts_to_enable = TWAI_ALERT_ERR_PASS | TWAI_ALERT_BUS_OFF;
if (twai_reconfigure_alerts(alerts_to_enable, NULL) == ESP_OK) {
    printf("Alerts reconfigured\n");
} else {
    printf("Failed to reconfigure alerts\n");
}
```

(continues on next page)
Stop and Uninstall  The following code demonstrates how to stop and uninstall the TWAI driver via the use of the `twai_stop()` and `twai_driver_uninstall()` functions.

```c
#include "driver/twai.h"
...

// Stop the TWAI driver
if (twai_stop() == ESP_OK) {
    printf("Driver stopped\n");
} else {
    printf("Failed to stop driver\n");
    return;
}

// Uninstall the TWAI driver
if (twai_driver_uninstall() == ESP_OK) {
    printf("Driver uninstalled\n");
} else {
    printf("Failed to uninstall driver\n");
    return;
}
```

Multiple ID Filter Configuration  The acceptance mask in `twai_filter_config_t` can be configured such that two or more IDs are accepted for a single filter. For a particular filter to accept multiple IDs, the conflicting bit positions amongst the IDs must be set in the acceptance mask. The acceptance code can be set to any one of the IDs.

The following example shows how the calculate the acceptance mask given multiple IDs:

<table>
<thead>
<tr>
<th>ID1</th>
<th>b101 1010 0000</th>
</tr>
</thead>
<tbody>
<tr>
<td>ID2</td>
<td>b101 1010 0001</td>
</tr>
<tr>
<td>ID3</td>
<td>b101 1010 0100</td>
</tr>
<tr>
<td>ID4</td>
<td>b101 1010 1000</td>
</tr>
<tr>
<td>Acceptance Mask</td>
<td>b000 0000 1101</td>
</tr>
</tbody>
</table>

Application Examples  Network Example: The TWAI Network example demonstrates communication between two ESP32-S2s using the TWAI driver API. One TWAI node acts as a network master that initiates and ceases the transfer of a data from another node acting as a network slave. The example can be found via `peripherals/twai/twai_network`.

Alert and Recovery Example: This example demonstrates how to use the TWAI driver’s alert and bus-off recovery API. The example purposely introduces errors on the bus to put the TWAI controller into the Bus-Off state. An alert is used to detect the Bus-Off state and trigger the bus recovery process. The example can be found via `peripherals/twai/twai_alert_and_recovery`.

Self Test Example: This example uses the No Acknowledge Mode and Self Reception Request to cause the TWAI controller to send and simultaneously receive a series of messages. This example can be used to verify if the connections between the TWAI controller and the external transceiver are working correctly. The example can be found via `peripherals/twai/twai_self_test`.

API Reference

Header File
Chapter 2. API Reference

- components/hal/include/hal/twai_types.h
  - This header file can be included with:

    ```
    #include "hal/twai_types.h"
    ```

**Structures**

struct `twai_message_t`

  Structure to store a TWAI message.

  **Note:** The flags member is deprecated

**Public Members**

- `uint32_t extd`
  
  Extended Frame Format (29 bit ID)

- `uint32_t rtr`
  
  Message is a Remote Frame

- `uint32_t ss`
  
  Transmit as a Single Shot Transmission. Unused for received.

- `uint32_t self`
  
  Transmit as a Self Reception Request. Unused for received.

- `uint32_t dlc_non_comp`
  
  Message’s Data length code is larger than 8. This will break compliance with ISO 11898-1

- `uint32_t reserved`
  
  Reserved bits

- `uint32_t flags`
  
  Deprecated: Alternate way to set bits using message flags

- `uint32_t identifier`
  
  11 or 29 bit identifier

- `uint8_t data_length_code`
  
  Data length code

- `uint8_t data[TWAI_FRAME_MAX_DLC]`
  
  Data bytes (not relevant in RTR frame)

struct `twai_timing_config_t`

  Structure for bit timing configuration of the TWAI driver.

  **Note:** Macro initializers are available for this structure
Chapter 2. API Reference

Public Members

`twai_clock_source_t clk_src`

Clock source, set to 0 or TWAI_CLK_SRC_DEFAULT if you want a default clock source

`uint32_t quanta_resolution_hz`

The resolution of one timing quanta, in Hz. Note: the value of `brp` will be reflected by this field if it’s non-zero, otherwise, `brp` needs to be set manually.

`uint32_t brp`

Baudrate prescale (i.e., clock divider). Any even number from 2 to 128 for ESP32, 2 to 32768 for non-ESP32 chip. Note: For ESP32 ECO 2 or later, multiples of 4 from 132 to 256 are also supported.

`uint8_t tseg_1`

Timing segment 1 (Number of time quanta, between 1 to 16)

`uint8_t tseg_2`

Timing segment 2 (Number of time quanta, 1 to 8)

`uint8_t sjw`

Synchronization Jump Width (Max time quanta jump for synchronize from 1 to 4)

`bool triple_sampling`

Enables triple sampling when the TWAI controller samples a bit.

`struct twai_filter_config_t`

Structure for acceptance filter configuration of the TWAI driver (see documentation)

Note: Macro initializers are available for this structure

Public Members

`uint32_t acceptance_code`

32-bit acceptance code

`uint32_t acceptance_mask`

32-bit acceptance mask

`bool single_filter`

Use Single Filter Mode (see documentation)

Macros

`TWAI_EXTD_ID_MASK`

TWAI Constants.

Bit mask for 29 bit Extended Frame Format ID
**Chapter 2. API Reference**

**TWAI_STD_ID_MASK**  
Bit mask for 11 bit Standard Frame Format ID

**TWAI_FRAME_MAX_DLC**  
Max data bytes allowed in TWAI

**TWAI_FRAME_EXTD_ID_LEN_BYTES**  
EFF ID requires 4 bytes (29bit)

**TWAI_FRAME_STD_ID_LEN_BYTES**  
SFF ID requires 2 bytes (11bit)

**TWAI_ERR_PASS_THRESH**  
Error counter threshold for error passive

**Type Definitions**

typedef `soc_periph_twai_clk_src_t twai_clock_source_t`  
RMT group clock source.

**Note:** User should select the clock source based on the power and resolution requirement

**Enumerations**

enum `twai_mode_t`  
TWAI Controller operating modes.  
*Values:*  
enumerator `TWAI_MODE_NORMAL`  
Normal operating mode where TWAI controller can send/receive/acknowledge messages  
enumerator `TWAI_MODE_NO_ACK`  
Transmission does not require acknowledgment. Use this mode for self testing  
enumerator `TWAI_MODE_LISTEN_ONLY`  
The TWAI controller will not influence the bus (No transmissions or acknowledgments) but can receive messages

**Header File**

- `components/driver/twai/include/driver/twai.h`
- This header file can be included with:

  ```c
  #include "driver/twai.h"
  ```
- This header file is a part of the API provided by the `driver` component. To declare that your component depends on `driver`, add the following to your CMakeLists.txt:

  ```cmake
  Requires driver
  ```
  or
Functions

`esp_err_t twai_driver_install` (const `twai_general_config_t *g_config`, const `twai_timing_config_t *t_config`, const `twai_filter_config_t *f_config`)

Install TWAI driver.

This function installs the TWAI driver using three configuration structures. The required memory is allocated and the TWAI driver is placed in the stopped state after running this function.

**Note:** Macro initializers are available for the configuration structures (see documentation)

**Parameters**
- `g_config` [in] General configuration structure
- `t_config` [in] Timing configuration structure
- `f_config` [in] Filter configuration structure

**Returns**
- `ESP_OK`: Successfully installed TWAI driver
- `ESP_ERR_INVALID_ARG`: Arguments are invalid, e.g. invalid clock source, invalid quanta resolution
- `ESP_ERR_NO_MEM`: Insufficient memory
- `ESP_ERR_INVALID_STATE`: Driver is already installed

`esp_err_t twai_driver_install_v2` (const `twai_general_config_t *g_config`, const `twai_timing_config_t *t_config`, const `twai_filter_config_t *f_config`, `twai_handle_t *ret_twai`)

Install TWAI driver and return a handle.

**Note:** This is an advanced version of `twai_driver_install` that can return a driver handle, so that it allows you to install multiple TWAI drivers. Don’t forget to set the proper controller_id in the `twai_general_config_t` Please refer to the documentation of `twai_driver_install` for more details.

**Parameters**
- `g_config` [in] General configuration structure
- `t_config` [in] Timing configuration structure
- `f_config` [in] Filter configuration structure
- `ret_twai` [out] Pointer to a new created TWAI handle

**Returns**
- `ESP_OK`: Successfully installed TWAI driver
- `ESP_ERR_INVALID_ARG`: Arguments are invalid, e.g. invalid clock source, invalid quanta resolution, invalid controller ID
- `ESP_ERR_NO_MEM`: Insufficient memory
- `ESP_ERR_INVALID_STATE`: Driver is already installed

`esp_err_t twai_driver_uninstall` (void)

Uninstall the TWAI driver.

This function uninstalls the TWAI driver, freeing the memory utilized by the driver. This function can only be called when the driver is in the stopped state or the bus-off state.
Warning: The application must ensure that no tasks are blocked on TX/RX queues or alerts when this function is called.

Returns

- ESP_OK: Successfully uninstalled TWAI driver
- ESP_ERR_INVALID_STATE: Driver is not in stopped/bus-off state, or is not installed

`esp_err_t twai_driver_uninstall_v2 (twai_handle_t handle)`

Uninstall the TWAI driver with a given handle.

Note: This is an advanced version of `twai_driver_uninstall` that can uninstall a TWAI driver with a given handle. Please refer to the documentation of `twai_driver_uninstall` for more details.

Parameters `handle` - [in] TWAI driver handle returned by `twai_driver_install_v2`

Returns

- ESP_OK: Successfully uninstalled TWAI driver
- ESP_ERR_INVALID_STATE: Driver is not in stopped/bus-off state, or is not installed

`esp_err_t twai_start (void)`

Start the TWAI driver.

This function starts the TWAI driver, putting the TWAI driver into the running state. This allows the TWAI driver to participate in TWAI bus activities such as transmitting/receiving messages. The TX and RX queue are reset in this function, clearing any messages that are unread or pending transmission. This function can only be called when the TWAI driver is in the stopped state.

Returns

- ESP_OK: TWAI driver is now running
- ESP_ERR_INVALID_STATE: Driver is not in stopped state, or is not installed

`esp_err_t twai_start_v2 (twai_handle_t handle)`

Start the TWAI driver with a given handle.

Note: This is an advanced version of `twai_start` that can start a TWAI driver with a given handle. Please refer to the documentation of `twai_start` for more details.

Parameters `handle` - [in] TWAI driver handle returned by `twai_driver_install_v2`

Returns

- ESP_OK: TWAI driver is now running
- ESP_ERR_INVALID_STATE: Driver is not in stopped state, or is not installed

`esp_err_t twai_stop (void)`

Stop the TWAI driver.

This function stops the TWAI driver, preventing any further message from being transmitted or received until `twai_start()` is called. Any messages in the TX queue are cleared. Any messages in the RX queue should be read by the application after this function is called. This function can only be called when the TWAI driver is in the running state.

Warning: A message currently being transmitted/received on the TWAI bus will be ceased immediately. This may lead to other TWAI nodes interpreting the unfinished message as an error.

Returns
**Chapter 2. API Reference**

- ESP_OK: TWAI driver is now Stopped
- ESP_ERR_INVALID_STATE: Driver is not in running state, or is not installed

```c
esp_err_t twai_stop_v2 (twai_handle_t handle)
```

Stop the TWAI driver with a given handle.

**Note:** This is an advanced version of `twai_stop` that can stop a TWAI driver with a given handle. Please refer to the documentation of `twai_stop` for more details.

**Parameters**
- `handle` — [in] TWAI driver handle returned by `twai_driver_install_v2`

**Returns**
- ESP_OK: TWAI driver is now Stopped
- ESP_ERR_INVALID_STATE: Driver is not in running state, or is not installed

```c
esp_err_t twai_transmit (const twai_message_t *message, TickType_t ticks_to_wait)
```

Transmit a TWAI message.

This function queues a TWAI message for transmission. Transmission will start immediately if no other messages are queued for transmission. If the TX queue is full, this function will block until more space becomes available or until it times out. If the TX queue is disabled (TX queue length = 0 in configuration), this function will return immediately if another message is undergoing transmission. This function can only be called when the TWAI driver is in the running state and cannot be called under Listen Only Mode.

**Note:** This function does not guarantee that the transmission is successful. The TX_SUCCESS/TX_FAILED alert can be enabled to alert the application upon the success/failure of a transmission.

**Note:** The TX_IDLE alert can be used to alert the application when no other messages are awaiting transmission.

**Parameters**
- `message` — [in] Message to transmit
- `ticks_to_wait` — [in] Number of FreeRTOS ticks to block on the TX queue

**Returns**
- ESP_OK: Transmission successfully queued/initiated
- ESP_ERR_INVALID_ARG: Arguments are invalid
- ESP_ERR_TIMEOUT: Timed out waiting for space on TX queue
- ESP_FAIL: TX queue is disabled and another message is currently transmitting
- ESP_ERR_INVALID_STATE: TWAI driver is not in running state, or is not installed
- ESP_ERR_NOT_SUPPORTED: Listen Only Mode does not support transmissions

```c
esp_err_t twai_transmit_v2 (twai_handle_t handle, const twai_message_t *message, TickType_t ticks_to_wait)
```

Transmit a TWAI message via a given handle.

**Note:** This is an advanced version of `twai_transmit` that can transmit a TWAI message with a given handle. Please refer to the documentation of `twai_transmit` for more details.

**Parameters**
- `handle` — [in] TWAI driver handle returned by `twai_driver_install_v2`
- `message` — [in] Message to transmit
- `ticks_to_wait` — [in] Number of FreeRTOS ticks to block on the TX queue

**Returns**
Chapter 2. API Reference

- ESP_OK: Transmission successfully queued/initiated
- ESP_ERR_INVALID_ARG: Arguments are invalid
- ESP_ERR_TIMEOUT: Timed out waiting for space on TX queue
- ESP_FAIL: TX queue is disabled and another message is currently transmitting
- ESP_ERR_INVALID_STATE: TWAI driver is not in running state, or is not installed
- ESP_ERR_NOT_SUPPORTED: Listen Only Mode does not support transmissions

**esp_err_t** `twai_receive` *(twai_message_t *message, TickType_t ticks_to_wait)*

Receive a TWAI message.

This function receives a message from the RX queue. The flags field of the message structure will indicate the type of message received. This function will block if there are no messages in the RX queue.

**Warning:** The flags field of the received message should be checked to determine if the received message contains any data bytes.

**Parameters**
- `message` [out] Received message
- `ticks_to_wait` [in] Number of FreeRTOS ticks to block on RX queue

**Returns**
- ESP_OK: Message successfully received from RX queue
- ESP_ERR_TIMEOUT: Timed out waiting for message
- ESP_ERR_INVALID_ARG: Arguments are invalid
- ESP_ERR_INVALID_STATE: TWAI driver is not installed

**esp_err_t** `twai_receive_v2` *(twai_handle_t handle, twai_message_t *message, TickType_t ticks_to_wait)*

Receive a TWAI message via a given handle.

**Note:** This is an advanced version of `twai_receive` that can receive a TWAI message with a given handle. Please refer to the documentation of `twai_receive` for more details.

**Parameters**
- `handle` [in] TWAI driver handle returned by `twai_driver_install_v2`
- `message` [out] Received message
- `ticks_to_wait` [in] Number of FreeRTOS ticks to block on RX queue

**Returns**
- ESP_OK: Message successfully received from RX queue
- ESP_ERR_TIMEOUT: Timed out waiting for message
- ESP_ERR_INVALID_ARG: Arguments are invalid
- ESP_ERR_INVALID_STATE: TWAI driver is not installed

**esp_err_t** `twai_read_alerts` *(uint32_t *alerts, TickType_t ticks_to_wait)*

Read TWAI driver alerts.

This function will read the alerts raised by the TWAI driver. If no alert has been issued when this function is called, this function will block until an alert occurs or until it timeouts.

**Note:** Multiple alerts can be raised simultaneously. The application should check for all alerts that have been enabled.

**Parameters**
- `alerts` [out] Bit field of raised alerts (see documentation for alert flags)
- `ticks_to_wait` [in] Number of FreeRTOS ticks to block for alert

**Returns**
**Chapter 2. API Reference**

- **ESP_OK**: Alerts read
- **ESP_ERR_TIMEOUT**: Timed out waiting for alerts
- **ESP_ERR_INVALID_ARG**: Arguments are invalid
- **ESP_ERR_INVALID_STATE**: TWAI driver is not installed

```c
esp_err_t twai_read_alerts_v2(twai_handle_t handle, uint32_t *alerts, TickType_t ticks_to_wait)
```

Read TWAI driver alerts with a given handle.

**Note:** This is an advanced version of `twai_read_alerts` that can read TWAI driver alerts with a given handle. Please refer to the documentation of `twai_read_alerts` for more details.

**Parameters**
- `handle` - [in] TWAI driver handle returned by `twai_driver_install_v2`
- `alerts` - [out] Bit field of raised alerts (see documentation for alert flags)
- `ticks_to_wait` - [in] Number of FreeRTOS ticks to block for alert

**Returns**
- **ESP_OK**: Alerts read
- **ESP_ERR_TIMEOUT**: Timed out waiting for alerts
- **ESP_ERR_INVALID_ARG**: Arguments are invalid
- **ESP_ERR_INVALID_STATE**: TWAI driver is not installed

```c
esp_err_t twai_reconfigure_alerts(uint32_t alerts_enabled, uint32_t *current_alerts)
```

Reconfigure which alerts are enabled.

This function reconfigures which alerts are enabled. If there are alerts which have not been read whilst reconfiguring, this function can read those alerts.

**Parameters**
- `alerts_enabled` - [in] Bit field of alerts to enable (see documentation for alert flags)
- `current_alerts` - [out] Bit field of currently raised alerts. Set to NULL if unused

**Returns**
- **ESP_OK**: Alerts reconfigured
- **ESP_ERR_INVALID_STATE**: TWAI driver is not installed

```c
esp_err_t twai_reconfigure_alerts_v2(twai_handle_t handle, uint32_t alerts_enabled, uint32_t *current_alerts)
```

Reconfigure which alerts are enabled, with a given handle.

**Note:** This is an advanced version of `twai_reconfigure_alerts` that can reconfigure which alerts are enabled with a given handle. Please refer to the documentation of `twai_reconfigure_alerts` for more details.

**Parameters**
- `handle` - [in] TWAI driver handle returned by `twai_driver_install_v2`
- `alerts_enabled` - [in] Bit field of alerts to enable (see documentation for alert flags)
- `current_alerts` - [out] Bit field of currently raised alerts. Set to NULL if unused

**Returns**
- **ESP_OK**: Alerts reconfigured
- **ESP_ERR_INVALID_STATE**: TWAI driver is not installed

```c
esp_err_t twai_initiate_recovery(void)
```

Start the bus recovery process.

This function initiates the bus recovery process when the TWAI driver is in the bus-off state. Once initiated, the TWAI driver will enter the recovering state and wait for 128 occurrences of the bus-free signal on the
TWAI bus before returning to the stopped state. This function will reset the TX queue, clearing any messages pending transmission.

**Note:** The BUS_RECOVERED alert can be enabled to alert the application when the bus recovery process completes.

</table>
• ESP_OK: Transmit queue cleared
• ESP_ERR_INVALID_STATE: TWAI driver is not installed or TX queue is disabled

```
esp_err_t twai_clear_transmit_queue_v2 (twai_handle_t handle)
```

Clear the transmit queue of a given TWAI driver handle.

**Note:** This is an advanced version of `twai_clear_transmit_queue` that can clear the transmit queue of a given TWAI driver handle. Please refer to the documentation of `twai_clear_transmit_queue` for more details.

**Parameters**

- `handle` - [in] TWAI driver handle returned by `twai_driver_install_v2`

**Returns**

- ESP_OK: Transmit queue cleared
- ESP_ERR_INVALID_STATE: TWAI driver is not installed or TX queue is disabled

```
esp_err_t twai_clear_receive_queue (void)
```

Clear the receive queue.

This function will clear the receive queue of all messages.

**Note:** The receive queue is automatically cleared when `twai_start()` is called.

**Returns**

- ESP_OK: Transmit queue cleared
- ESP_ERR_INVALID_STATE: TWAI driver is not installed

```
esp_err_t twai_clear_receive_queue_v2 (twai_handle_t handle)
```

Clear the receive queue of a given TWAI driver handle.

**Note:** This is an advanced version of `twai_clear_receive_queue` that can clear the receive queue of a given TWAI driver handle. Please refer to the documentation of `twai_clear_receive_queue` for more details.

**Parameters**

- `handle` - [in] TWAI driver handle returned by `twai_driver_install_v2`

**Returns**

- ESP_OK: Transmit queue cleared
- ESP_ERR_INVALID_STATE: TWAI driver is not installed

**Structures**

struct `twai_general_config_t`

Structure for general configuration of the TWAI driver.

**Note:** Macro initializers are available for this structure

**Public Members**
Chapter 2. API Reference

```c
int controller_id
TWAI controller ID, index from 0. If you want to install TWAI driver with a non-zero controller_id, please use twai_driver_install_v2

twai_mode_t mode
Mode of TWAI controller

gpio_num_t tx_io
Transmit GPIO number

gpio_num_t rx_io
Receive GPIO number

gpio_num_t clkout_io
CLKOUT GPIO number (optional, set to -1 if unused)

gpio_num_t bus_off_io
Bus off indicator GPIO number (optional, set to -1 if unused)

uint32_t tx_queue_len
Number of messages TX queue can hold (set to 0 to disable TX Queue)

uint32_t rx_queue_len
Number of messages RX queue can hold

uint32_t alerts_enabled
Bit field of alerts to enable (see documentation)

uint32_t clkout_divider
CLKOUT divider. Can be 1 or any even number from 2 to 14 (optional, set to 0 if unused)

int intr_flags
Interrupt flags to set the priority of the driver’s ISR. Note that to use the ESP_INTR_FLAG_IRAM, the CONFIG_TWAI_ISR_IN_IRAM option should be enabled first.

struct twai_status_info_t
Structure to store status information of TWAI driver.

Public Members

twai_state_t state
Current state of TWAI controller (Stopped/Running/Bus-Off/Recovery)

uint32_t msgs_to_tx
Number of messages queued for transmission or awaiting transmission completion

uint32_t msgs_to_rx
Number of messages in RX queue waiting to be read
```
uint32_t tx_error_counter
  Current value of Transmit Error Counter

uint32_t rx_error_counter
  Current value of Receive Error Counter

uint32_t tx_failed_count
  Number of messages that failed transmissions

uint32_t rx_missed_count
  Number of messages that were lost due to a full RX queue (or errata workaround if enabled)

uint32_t rx_overrun_count
  Number of messages that were lost due to a RX FIFO overrun

uint32_t arb_lost_count
  Number of instances arbitration was lost

uint32_t bus_error_count
  Number of instances a bus error has occurred

Macros

TWAI_IO_UNUSED
  Marks GPIO as unused in TWAI configuration

Type Definitions

typedef struct twai_obj_t *twai_handle_t
  TWAI controller handle.

Enumerations

enum twai_state_t
  TWAI driver states.
  Values:

  enumerator TWAI_STATE_STOPPED
    Stopped state. The TWAI controller will not participate in any TWAI bus activities

  enumerator TWAI_STATE_RUNNING
    Running state. The TWAI controller can transmit and receive messages

  enumerator TWAI_STATE_BUS_OFF
    Bus-off state. The TWAI controller cannot participate in bus activities until it has recovered

  enumerator TWAI_STATE_RECOVERING
    Recovering state. The TWAI controller is undergoing bus recovery
2.5.27 Universal Asynchronous Receiver/Transmitter (UART)

Introduction

A Universal Asynchronous Receiver/Transmitter (UART) is a hardware feature that handles communication (i.e., timing requirements and data framing) using widely-adopted asynchronous serial communication interfaces, such as RS232, RS422, and RS485. A UART provides a widely adopted and cheap method to realize full-duplex or half-duplex data exchange among different devices.

The ESP32-S2 chip has 2 UART controllers (also referred to as port), each featuring an identical set of registers to simplify programming and for more flexibility.

Each UART controller is independently configurable with parameters such as baud rate, data bit length, bit ordering, number of stop bits, parity bit, etc. All the regular UART controllers are compatible with UART-enabled devices from various manufacturers and can also support Infrared Data Association (IrDA) protocols.

Functional Overview

The overview describes how to establish communication between an ESP32-S2 and other UART devices using the functions and data types of the UART driver. A typical programming workflow is broken down into the sections provided below:

1. Set Communication Parameters - Setting baud rate, data bits, stop bits, etc.
2. Set Communication Pins - Assigning pins for connection to a device
3. Install Drivers - Allocating ESP32-S2’s resources for the UART driver
4. Run UART Communication - Sending/receiving data
5. Use Interrupts - Triggering interrupts on specific communication events
6. Deleting a Driver - Freeing allocated resources if a UART communication is no longer required

Steps 1 to 3 comprise the configuration stage. Step 4 is where the UART starts operating. Steps 5 and 6 are optional. The UART driver’s functions identify each of the UART controllers using uart_port_t. This identification is needed for all the following function calls.

Set Communication Parameters UART communication parameters can be configured all in a single step or individually in multiple steps.

Single Step Call the function uart_param_config() and pass to it a uart_config_t structure. The uart_config_t structure should contain all the required parameters. See the example below.

```c
const uart_port_t uart_num = UART_NUM_1;
uart_config_t uart_config = {
    .baud_rate = 115200,
    .data_bits = UART_DATA_8_BITS,
    .parity = UART_PARITY_DISABLE,
    .stop_bits = UART_STOP_BITS_1,
    .flow_ctrl = UART_HW_FLOWCTRL_CTS_RTS,
    .rx_flow_ctrl_thresh = 122,
};
// Configure UART parameters
ESP_ERROR_CHECK(uart_param_config(uart_num, &uart_config));
```

For more information on how to configure the hardware flow control options, please refer to peripherals/uart/uart_echo.

Multiple Steps Configure specific parameters individually by calling a dedicated function from the table given below. These functions are also useful if re-configuring a single parameter.
Table 5: Functions for Configuring specific parameters individually

<table>
<thead>
<tr>
<th>Parameter to Configure</th>
<th>Function</th>
</tr>
</thead>
<tbody>
<tr>
<td>Baud rate</td>
<td>uart_set_baudrate()</td>
</tr>
<tr>
<td>Number of transmitted bits</td>
<td>uart_set_word_length() selected out of uart_word_length_t</td>
</tr>
<tr>
<td>Parity control</td>
<td>uart_set_parity() selected out of uart_parity_t</td>
</tr>
<tr>
<td>Number of stop bits</td>
<td>uart_set_stop_bits() selected out of uart_stop_bits_t</td>
</tr>
<tr>
<td>Hardware flow control mode</td>
<td>uart_set_hw_flow_control() selected out of uart_hw_flow_control_t</td>
</tr>
<tr>
<td>Communication mode</td>
<td>uart_set_mode() selected out of uart_mode_t</td>
</tr>
</tbody>
</table>

Each of the above functions has a _get_ counterpart to check the currently set value. For example, to check the current baud rate value, call uart_get_baudrate().

Set Communication Pins After setting communication parameters, configure the physical GPIO pins to which the other UART device will be connected. For this, call the function uart_set_pin() and specify the GPIO pin numbers to which the driver should route the TX, RX, RTS, and CTS signals. If you want to keep a currently allocated pin number for a specific signal, pass the macro UART_PIN_NO_CHANGE.

The same macro UART_PIN_NO_CHANGE should be specified for pins that will not be used.

```c
// Set UART pins (TX: IO4, RX: IO5, RTS: IO18, CTS: IO19)
ESP_ERROR_CHECK(uart_set_pin(UART_NUM_1, 4, 5, 18, 19));
```

Install Drivers Once the communication pins are set, install the driver by calling uart_driver_install() and specify the following parameters:

- Size of TX ring buffer
- Size of RX ring buffer
- Event queue handle and size
- Flags to allocate an interrupt

The function allocates the required internal resources for the UART driver.

```c
// Setup UART buffered IO with event queue
const int uart_buffer_size = (1024 * 2);
QueueHandle_t uart_queue;
// Install UART driver using an event queue here
ESP_ERROR_CHECK(uart_driver_install(UART_NUM_1, uart_buffer_size, uart_buffer_size, 10, &uart_queue, 0));
```

Once this step is complete, you can connect the external UART device and check the communication.

Run UART Communication Serial communication is controlled by each UART controller’s finite state machine (FSM).

The process of sending data involves the following steps:

1. Write data into TX FIFO buffer
2. FSM serializes the data
3. FSM sends the data out

The process of receiving data is similar, but the steps are reversed:

1. FSM processes an incoming serial stream and parallelizes it
2. FSM writes the data into RX FIFO buffer
3. Read the data from RX FIFO buffer

Therefore, an application only writes and reads data from a specific buffer using uart_write_bytes() and uart_read_bytes() respectively, and the FSM does the rest.
Transmit Data  After preparing the data for transmission, call the function `uart_write_bytes()` and pass the data buffer’s address and data length to it. The function copies the data to the TX ring buffer (either immediately or after enough space is available), and then exit. When there is free space in the TX FIFO buffer, an interrupt service routine (ISR) moves the data from the TX ring buffer to the TX FIFO buffer in the background. The code below demonstrates the use of this function.

```c
// Write data to UART.
char *test_str = "This is a test string.\n";
uart_write_bytes(uart_num, (const char*)test_str, strlen(test_str));
```

The function `uart_write_bytes_with_break()` is similar to `uart_write_bytes()` but adds a serial break signal at the end of the transmission. A ‘serial break signal’ means holding the TX line low for a period longer than one data frame.

```c
// Write data to UART, end with a break signal.
uart_write_bytes_with_break(uart_num, "test break\n", strlen("test break\n"), 100);
```

Another function for writing data to the TX FIFO buffer is `uart_tx_chars()`. Unlike `uart_write_bytes()`, this function does not block until space is available. Instead, it writes all data which can immediately fit into the hardware TX FIFO, and then return the number of bytes that were written.

Receive Data  Once the data is received by the UART and saved in the RX FIFO buffer, it needs to be retrieved using the function `uart_read_bytes()`. Before reading data, you can check the number of bytes available in the RX FIFO buffer by calling `uart_get_buffered_data_len()`. An example of using these functions is given below.

```c
// Read data from UART.
const uart_port_t uart_num = UART_NUM_1;
uint8_t data[128];
int length = 0;
ESP_ERROR_CHECK(uart_get_buffered_data_len(uart_num, (size_t*)&length));
length = uart_read_bytes(uart_num, data, length, 100);
```

If the data in the RX FIFO buffer is no longer needed, you can clear the buffer by calling `uart_flush()`.

Software Flow Control  If the hardware flow control is disabled, you can manually set the RTS and DTR signal levels by using the functions `uart_set_rts()` and `uart_set_dtr()` respectively.

Communication Mode Selection  The UART controller supports a number of communication modes. A mode can be selected using the function `uart_set_mode()`. Once a specific mode is selected, the UART driver handles the behavior of a connected UART device accordingly. As an example, it can control the RS485 driver chip using the RTS line to allow half-duplex RS485 communication.

```c
// Setup UART in rs485 half duplex mode
ESP_ERROR_CHECK(uart_set_mode(uart_num, UART_MODE_RS485_HALF_DUPLEX));
```

Use Interrupts  There are many interrupts that can be generated depending on specific UART states or detected errors. The full list of available interrupts is provided in ESP32-S2 Technical Reference Manual > UART Controller.
Chapter 2. API Reference

(UART) > UART Interrupts and UHCI Interrupts [PDF]. You can enable or disable specific interrupts by calling
uart_enable_intr_mask() or uart_disable_intr_mask() respectively.

The uart_driver_install() function installs the driver’s internal interrupt handler to manage the TX and RX ring buffers and provides high-level API functions like events (see below).

The API provides a convenient way to handle specific interrupts discussed in this document by wrapping them into dedicated functions:

- **Event detection**: There are several events defined in uart_event_type_t that may be reported to a user application using the FreeRTOS queue functionality. You can enable this functionality when calling uart_driver_install() described in Install Drivers. An example of using Event detection can be found in peripherals/uart/uart_events.

- **FIFO space threshold or transmission timeout reached**: The TX and RX FIFO buffers can trigger an interrupt when they are filled with a specific number of characters, or on a timeout of sending or receiving data. To use these interrupts, do the following:
  - Configure respective threshold values of the buffer length and timeout by entering them in the structure
    uart_intr_config_t and calling uart_intr_config()
  - Enable the interrupts using the functions uart_enable_tx_intr() and
    uart_enable_rx_intr()
  - Disable these interrupts using the corresponding functions uart_disable_tx_intr() or
    uart_disable_rx_intr()

- **Pattern detection**: An interrupt triggered on detecting a ‘pattern’ of the same character being received/sent repeatedly. This functionality is demonstrated in the example peripherals/uart/uart_events. It can be used, e.g., to detect a command string with a specific number of identical characters (the ‘pattern’) at the end. The following functions are available:
  - Configure and enable this interrupt using uart_enable_pattern_det_baud_intr()
  - Disable the interrupt using uart_disable_pattern_det_intr()

**Macros** The API also defines several macros. For example, UART_HW_FIFO_LEN defines the length of hardware FIFO buffers; UART_BITRATE_MAX gives the maximum baud rate supported by the UART controllers, etc.

Deleting a Driver If the communication established with uart_driver_install() is no longer required, the driver can be removed to free allocated resources by calling uart_driver_delete().

Overview of RS485 Specific Communication Options

**Note**: The following section uses [UART_REGISTER_NAME].[UART_FIELD_BIT] to refer to UART register fields/bits. For more information on a specific option bit, see ESP32-S2 Technical Reference Manual > UART Controller (UART) > Register Summary [PDF]. Use the register name to navigate to the register description and then find the field/bit.

- UART_RS485_CONF_REG.UART_RS485_EN: setting this bit enables RS485 communication mode support.
- UART_RS485_CONF_REG.UART_RS485TX_RX_EN: if this bit is set, the transmitter’s output signal loops back to the receiver’s input signal.
- UART_RS485_CONF_REG.UART_RS485RXBY_TX_EN: if this bit is set, the transmitter will still be sending data if the receiver is busy (remove collisions automatically by hardware).

The ESP32-S2’s RS485 UART hardware can detect signal collisions during transmission of a datagram and generate the interrupt UART_RS485_CLASH_INT if this interrupt is enabled. The term collision means that a transmitted datagram is not equal to the one received on the other end. Data collisions are usually associated with the presence of other active devices on the bus or might occur due to bus errors.

The collision detection feature allows handling collisions when their interrupts are activated and triggered. The interrupts UART_RS485_FRM_ERR_INT and UART_RS485_PARITY_ERR_INT can be used with the collision detection feature to control frame errors and parity bit errors accordingly in RS485 mode. This functionality is
supported in the UART driver and can be used by selecting the `UART_MODE_RS485_APP_CTRL` mode (see the function `uart_set_mode()`).

The collision detection feature can work with circuit A and circuit C (see Section Interface Connection Options). In the case of using circuit A or B, the RTS pin connected to the DE pin of the bus driver should be controlled by the user application. Use the function `uart_get_collision_flag()` to check if the collision detection flag has been raised.

The ESP32-S2 UART controllers themselves do not support half-duplex communication as they cannot provide automatic control of the RTS pin connected to the RE/DE input of RS485 bus driver. However, half-duplex communication can be achieved via software control of the RTS pin by the UART driver. This can be enabled by selecting the `UART_MODE_RS485_HALF_DUPLEX` mode when calling `uart_set_mode()`.

Once the host starts writing data to the TX FIFO buffer, the UART driver automatically asserts the RTS pin (logic 1); once the last bit of the data has been transmitted, the driver de-asserts the RTS pin (logic 0). To use this mode, the software would have to disable the hardware flow control function. This mode works with all the used circuits shown below.

**Interface Connection Options** This section provides example schematics to demonstrate the basic aspects of ESP32-S2’s RS485 interface connection.

**Note:**
- The schematics below do not necessarily contain all required elements.
- The analog devices ADM483 & ADM2483 are examples of common RS485 transceivers and can be replaced with other similar transceivers.

**Circuit A: Collision Detection Circuit**

![Circuit A](image)

This circuit is preferable because it allows for collision detection and is quite simple at the same time. The receiver in the line driver is constantly enabled, which allows the UART to monitor the RS485 bus. Echo suppression is performed by the UART peripheral when the bit `UART_RS485_CONF_REG.UART_RS485TX_RX_EN` is enabled.

**Circuit B: Manual Switching Transmitter/Receiver Without Collision Detection**

![Circuit B](image)

(continues on next page)
This circuit does not allow for collision detection. It suppresses the null bytes that the hardware receives when the bit \texttt{UART\_RS485\_CONF\_REG.UART\_RX\_TX\_EN} is set. The bit \texttt{UART\_RS485\_CONF\_REG.UART\_RS485\_RX\_BY\_TX\_EN} is not applicable in this case.

**Circuit C: Auto Switching Transmitter/Receiver**

![Circuit diagram]

This galvanically isolated circuit does not require RTS pin control by a software application or driver because it controls the transceiver direction automatically. However, it requires suppressing null bytes during transmission by setting \texttt{UART\_RS485\_CONF\_REG.UART\_RS485\_RX\_BY\_TX\_EN} to 1 and \texttt{UART\_RS485\_CONF\_REG.UART\_RX\_TX\_EN} to 0. This setup can work in any RS485 UART mode or even in \texttt{UART\_MODE\_UART}.

**Application Examples**

**API Reference**

**Header File**
components/driver/uart/include/driver/uart.h

This header file can be included with:

```c
#include "driver/uart.h"
```

This header file is a part of the API provided by the driver component. To declare that your component depends on driver, add the following to your CMakeLists.txt:

```cmake
REQUIRES driver
```
or

```cmake
PRIV_REQUIRES driver
```

### Functions

**`esp_err_t uart_driver_install(uart_port_t uart_num, int rx_buffer_size, int tx_buffer_size, int queue_size, QueueHandle_t *uart_queue, int intr_alloc_flags)`**

Install UART driver and set the UART to the default configuration.

UART ISR handler will be attached to the same CPU core that this function is running on.

**Note:** Rx_buffer_size should be greater than UART_HW_FIFO_LEN(uart_num). Tx_buffer_size should be either zero or greater than UART_HW_FIFO_LEN(uart_num).

**Parameters**

- **uart_num** – UART port number, the max port number is (UART_NUM_MAX -1).
- **rx_buffer_size** – UART RX ring buffer size.
- **tx_buffer_size** – UART TX ring buffer size. If set to zero, driver will not use TX buffer, TX function will block task until all data have been sent out.
- **queue_size** – UART event queue size/depth.
- **uart_queue** – UART event queue handle (out param). On success, a new queue handle is written here to provide access to UART events. If set to NULL, driver will not use an event queue.
- **intr_alloc_flags** – Flags used to allocate the interrupt. One or multiple (ORred) ESP_INTR_FLAG_* values. See esp_intr_alloc.h for more info. Do not set ESP_INTR_FLAG_IRAM here (the driver’s ISR handler is not located in IRAM)

**Returns**

- ESP_OK Success
- ESP_FAIL Parameter error

**`esp_err_t uart_driver_delete(uart_port_t uart_num)`**

Uninstall UART driver.

**Parameters**

- **uart_num** – UART port number, the max port number is (UART_NUM_MAX -1).

**Returns**

- ESP_OK Success
- ESP_FAIL Parameter error

**`bool uart_is_driver_installed(uart_port_t uart_num)`**

Checks whether the driver is installed or not.

**Parameters**

- **uart_num** – UART port number, the max port number is (UART_NUM_MAX -1).

**Returns**

- true driver is installed
- false driver is not installed

**`esp_err_t uart_set_word_length(uart_port_t uart_num, uart_word_length_t data_bit)`**

Set UART data bits.

**Parameters**
• `uart_num` - UART port number, the max port number is (UART_NUM_MAX -1).
• `data_bit` - UART data bits

**Returns**
- ESP_OK Success
- ESP_FAIL Parameter error

`esp_err_t uart_get_word_length (uart_port_t uart_num, uart_word_length_t *data_bit)`

Get the UART data bit configuration.

**Parameters**
- `uart_num` - UART port number, the max port number is (UART_NUM_MAX -1).
- `data_bit` - Pointer to accept value of UART data bits.

**Returns**
- ESP_FAIL Parameter error
- ESP_OK Success, result will be put in (*data_bit)

`esp_err_t uart_set_stop_bits (uart_port_t uart_num, uart_stop_bits_t stop_bits)`

Set UART stop bits.

**Parameters**
- `uart_num` - UART port number, the max port number is (UART_NUM_MAX -1).
- `stop_bits` - UART stop bits

**Returns**
- ESP_OK Success
- ESP_FAIL Fail

`esp_err_t uart_get_stop_bits (uart_port_t uart_num, uart_stop_bits_t *stop_bits)`

Get the UART stop bit configuration.

**Parameters**
- `uart_num` - UART port number, the max port number is (UART_NUM_MAX -1).
- `stop_bits` - Pointer to accept value of UART stop bits.

**Returns**
- ESP_FAIL Parameter error
- ESP_OK Success, result will be put in (*stop_bit)

`esp_err_t uart_set_parity (uart_port_t uart_num, uart_parity_t parity_mode)`

Set UART parity mode.

**Parameters**
- `uart_num` - UART port number, the max port number is (UART_NUM_MAX -1).
- `parity_mode` - the enum of uart parity configuration

**Returns**
- ESP_FAIL Parameter error
- ESP_OK Success

`esp_err_t uart_get_parity (uart_port_t uart_num, uart_parity_t *parity_mode)`

Get the UART parity mode configuration.

**Parameters**
- `uart_num` - UART port number, the max port number is (UART_NUM_MAX -1).
- `parity_mode` - Pointer to accept value of UART parity mode.

**Returns**
- ESP_FAIL Parameter error
- ESP_OK Success

`esp_err_t uart_get_sclk_freq (uart_sclk_t sclk, uint32_t *out_freq_hz)`

Get the frequency of a clock source for the HP UART port.

**Parameters**
- `sclk` - Clock source
- `out_freq_hz` - [out] Output of frequency, in Hz

**Returns**
• ESP_ERR_INVALID_ARG: if the clock source is not supported
  otherwise ESP_OK

`esp_err_t uart_set_baudrate(uart_port_t uart_num, uint32_t baudrate)`

Set UART baud rate.

**Parameters**
- `uart_num` - UART port number, the max port number is (UART_NUM_MAX -1).
- `baudrate` - UART baud rate.

**Returns**
- ESP_FAIL Parameter error
- ESP_OK Success

`esp_err_t uart_get_baudrate(uart_port_t uart_num, uint32_t *baudrate)`

Get the UART baud rate configuration.

**Parameters**
- `uart_num` - UART port number, the max port number is (UART_NUM_MAX -1).
- `baudrate` - Pointer to accept value of UART baud rate

**Returns**
- ESP_FAIL Parameter error
- ESP_OK Success, result will be put in (*baudrate)

`esp_err_t uart_set_line_inverse(uart_port_t uart_num, uint32_t inverse_mask)`

Set UART line inverse mode.

**Parameters**
- `uart_num` - UART port number, the max port number is (UART_NUM_MAX -1).
- `inverse_mask` - Choose the wires that need to be inverted. Using the ORred mask of `uart_signal_inv_t`

**Returns**
- ESP_OK Success
- ESP_FAIL Parameter error

`esp_err_t uart_set_hw_flow_ctrl(uart_port_t uart_num, uart_hw_flowcontrol_t flow_ctrl, uint8_t rx_thresh)`

Set hardware flow control.

**Parameters**
- `uart_num` - UART port number, the max port number is (UART_NUM_MAX -1).
- `flow_ctrl` - Hardware flow control mode
- `rx_thresh` - Threshold of Hardware RX flow control (0 ~ UART_HW_FIFO_LEN(uart_num)). Only when UART_HW_FLOWCTRL_RTS is set, will the rx_thresh value be set.

**Returns**
- ESP_OK Success
- ESP_FAIL Parameter error

`esp_err_t uart_set_sw_flow_ctrl(uart_port_t uart_num, bool enable, uint8_t rx_thresh_xon, uint8_t rx_thresh_xoff)`

Set software flow control.

**Parameters**
- `uart_num` - UART port number, the max port number is (UART_NUM_MAX -1)
- `enable` - switch on or off
- `rx_thresh_xon` - low water mark
- `rx_thresh_xoff` - high water mark

**Returns**
- ESP_OK Success
- ESP_FAIL Parameter error
**esp_err_t uart_get_hw_flow ctrl**(uart_port_t uart_num, uart_hw_flowcontrol_t *flow_ctrl)

Get the UART hardware flow control configuration.

**Parameters**
- **uart_num** – UART port number, the max port number is (UART_NUM_MAX -1).
- **flow_ctrl** – Option for different flow control mode.

**Returns**
- ESP_FAIL Parameter error
- ESP_OK Success, result will be put in (*flow_ctrl)

**esp_err_t uart_clear_intr_status**(uart_port_t uart_num, uint32_t clr_mask)

Clear UART interrupt status.

**Parameters**
- **uart_num** – UART port number, the max port number is (UART_NUM_MAX -1).
- **clr_mask** – Bit mask of the interrupt status to be cleared.

**Returns**
- ESP_OK Success
- ESP_FAIL Parameter error

**esp_err_t uart_enable_intr_mask**(uart_port_t uart_num, uint32_t enable_mask)

Set UART interrupt enable.

**Parameters**
- **uart_num** – UART port number, the max port number is (UART_NUM_MAX -1).
- **enable_mask** – Bit mask of the enable bits.

**Returns**
- ESP_OK Success
- ESP_FAIL Parameter error

**esp_err_t uart_disable_intr_mask**(uart_port_t uart_num, uint32_t disable_mask)

Clear UART interrupt enable bits.

**Parameters**
- **uart_num** – UART port number, the max port number is (UART_NUM_MAX -1).
- **disable_mask** – Bit mask of the disable bits.

**Returns**
- ESP_OK Success
- ESP_FAIL Parameter error

**esp_err_t uart_enable_rx_intr**(uart_port_t uart_num)

Enable UART RX interrupt (RX_FULL & RX_TIMEOUT INTERRUPT)

**Parameters**
- **uart_num** – UART port number, the max port number is (UART_NUM_MAX -1).

**Returns**
- ESP_OK Success
- ESP_FAIL Parameter error

**esp_err_t uart_disable_rx_intr**(uart_port_t uart_num)

Disable UART RX interrupt (RX_FULL & RX_TIMEOUT INTERRUPT)

**Parameters**
- **uart_num** – UART port number, the max port number is (UART_NUM_MAX -1).

**Returns**
- ESP_OK Success
- ESP_FAIL Parameter error

**esp_err_t uart_disable_tx_intr**(uart_port_t uart_num)

Disable UART TX interrupt (TX_FULL & TX_TIMEOUT INTERRUPT)

**Parameters**
- **uart_num** – UART port number

**Returns**
- ESP_OK Success
- ESP_FAIL Parameter error
esp_err_t uart_enable_tx_intr(uart_port_t uart_num, int enable, int thresh)
Enable UART TX interrupt (TX_FULL & TX_TIMEOUT INTERRUPT)

Parameters
• uart_num - UART port number, the max port number is (UART_NUM_MAX - 1).
• enable - 1: enable; 0: disable
• thresh - Threshold of TX interrupt, 0 ~ UART_HW_FIFO_LEN(uart_num)

Returns
• ESP_OK Success
• ESP_FAIL Parameter error

esp_err_t uart_set_pin(uart_port_t uart_num, int tx_io_num, int rx_io_num, int rts_io_num, int cts_io_num)
Assign signals of a UART peripheral to GPIO pins.

Note: If the GPIO number configured for a UART signal matches one of the IOMUX signals for that GPIO, the signal will be connected directly via the IOMUX. Otherwise the GPIO and signal will be connected via the GPIO Matrix. For example, if on an ESP32 the call uart_set_pin(0, 1, 3, -1, -1) is performed, as GPIO1 is UART0’s default TX pin and GPIO3 is UART0’s default RX pin, both will be connected to respectively U0TXD and U0RXD through the IOMUX, totally bypassing the GPIO matrix. The check is performed on a per-pin basis. Thus, it is possible to have RX pin binded to a GPIO through the GPIO matrix, whereas TX is binded to its GPIO through the IOMUX.

Note: Internal signal can be output to multiple GPIO pads. Only one GPIO pad can connect with input signal.

Parameters
• uart_num - UART port number, the max port number is (UART_NUM_MAX - 1).
• tx_io_num - UART TX pin GPIO number.
• rx_io_num - UART RX pin GPIO number.
• rts_io_num - UART RTS pin GPIO number.
• cts_io_num - UART CTS pin GPIO number.

Returns
• ESP_OK Success
• ESP_FAIL Parameter error

esp_err_t uart_set_rts(uart_port_t uart_num, int level)
Manually set the UART RTS pin level.

Note: UART must be configured with hardware flow control disabled.

Parameters
• uart_num - UART port number, the max port number is (UART_NUM_MAX - 1).
• level -1: RTS output low (active); 0: RTS output high (block)

Returns
• ESP_OK Success
• ESP_FAIL Parameter error

esp_err_t uart_set_dtr(uart_port_t uart_num, int level)
Manually set the UART DTR pin level.

Parameters
• uart_num - UART port number, the max port number is (UART_NUM_MAX - 1).
• level -1: DTR output low; 0: DTR output high

Returns
Chapter 2. API Reference

- ESP_OK Success
- ESP_FAIL Parameter error

```c
esp_err_t uart_set_tx_idle_num (uart_port_t uart_num, uint16_t idle_num)
```

Set UART idle interval after tx FIFO is empty.

**Parameters**
- `uart_num` - UART port number, the max port number is (UART_NUM_MAX -1).
- `idle_num` - idle interval after tx FIFO is empty (unit: the time it takes to send one bit under current baudrate)

**Returns**
- ESP_OK Success
- ESP_FAIL Parameter error

```c
esp_err_t uart_param_config (uart_port_t uart_num, const uart_config_t *uart_config)
```

Set UART configuration parameters.

**Parameters**
- `uart_num` - UART port number, the max port number is (UART_NUM_MAX -1).
- `uart_config` - UART parameter settings

**Returns**
- ESP_OK Success
- ESP_FAIL Parameter error

```c
esp_err_t uart_intr_config (uart_port_t uart_num, const uart_intr_config_t *intr_conf)
```

Configure UART interrupts.

**Parameters**
- `uart_num` - UART port number, the max port number is (UART_NUM_MAX -1).
- `intr_conf` - UART interrupt settings

**Returns**
- ESP_OK Success
- ESP_FAIL Parameter error

```c
esp_err_t uart_wait_tx_done (uart_port_t uart_num, TickType_t ticks_to_wait)
```

Wait until UART TX FIFO is empty.

**Parameters**
- `uart_num` - UART port number, the max port number is (UART_NUM_MAX -1).
- `ticks_to_wait` - Timeout, count in RTOS ticks

**Returns**
- ESP_OK Success
- ESP_FAIL Parameter error
- ESP_ERR_TIMEOUT Timeout

```c
int uart_tx_chars (uart_port_t uart_num, const char *buffer, uint32_t len)
```

Send data to the UART port from a given buffer and length.

This function will not wait for enough space in TX FIFO. It will just fill the available TX FIFO and return when the FIFO is full.

**Note:** This function should only be used when UART TX buffer is not enabled.

**Parameters**
- `uart_num` - UART port number, the max port number is (UART_NUM_MAX -1).
- `buffer` - data buffer address
- `len` - data length to send

**Returns**
- (-1) Parameter error
- OTHERS (>=0) The number of bytes pushed to the TX FIFO
int uart_write_bytes (uart_port_t uart_num, const void *src, size_t size)

Send data to the UART port from a given buffer and length.

If the UART driver’s parameter ‘tx_buffer_size’ is set to zero: This function will not return until all the data have been sent out, or at least pushed into TX FIFO.

Otherwise, if the ‘tx_buffer_size’ > 0, this function will return after copying all the data to tx ring buffer, UART ISR will then move data from the ring buffer to TX FIFO gradually.

Parameters
• uart_num – UART port number, the max port number is (UART_NUM_MAX -1).
• src – data buffer address
• size – data length to send

Returns
• (-1) Parameter error
• OTHERS (>=0) The number of bytes pushed to the TX FIFO

int uart_write_bytes_with_break (uart_port_t uart_num, const void *src, size_t size, int brk_len)

Send data to the UART port from a given buffer and length.

If the UART driver’s parameter ‘tx_buffer_size’ is set to zero: This function will not return until all the data and the break signal have been sent out. After all data is sent out, send a break signal.

Otherwise, if the ‘tx_buffer_size’ > 0, this function will return after copying all the data to tx ring buffer, UART ISR will then move data from the ring buffer to TX FIFO gradually. After all data sent out, send a break signal.

Parameters
• uart_num – UART port number, the max port number is (UART_NUM_MAX -1).
• src – data buffer address
• size – data length to send
• brk_len – break signal duration (unit: the time it takes to send one bit at current baudrate)

Returns
• (-1) Parameter error
• OTHERS (>=0) The number of bytes pushed to the TX FIFO

int uart_read_bytes (uart_port_t uart_num, void *buf, uint32_t length, TickType_t ticks_to_wait)

UART read bytes from UART buffer.

Parameters
• uart_num – UART port number, the max port number is (UART_NUM_MAX -1).
• buf – pointer to the buffer.
• length – data length
• ticks_to_wait – s Timeout, count in RTOS ticks

Returns
• (-1) Error
• OTHERS (>=0) The number of bytes read from UART buffer

esp_err_t uart_flush (uart_port_t uart_num)

Alias of uart_flush_input. UART ring buffer flush. This will discard all data in the UART RX buffer.

Note: Instead of waiting the data sent out, this function will clear UART rx buffer. In order to send all the data in tx FIFO, we can use uart_wait_tx_done function.

Parameters
• uart_num – UART port number, the max port number is (UART_NUM_MAX -1).

Returns
• ESP_OK Success
• ESP_FAIL Parameter error
**esp_err_t uart_flush_input (uart_port_t uart_num)**

Clear input buffer, discard all the data is in the ring-buffer.

**Note:** In order to send all the data in tx FIFO, we can use uart_wait_tx_done function.

**Parameters**: uart_num – UART port number, the max port number is (UART_NUM_MAX -1).

**Returns**:  
- ESP_OK Success  
- ESP_FAIL Parameter error

**esp_err_t uart_get_buffered_data_len (uart_port_t uart_num, size_t *size)**

UART get RX ring buffer cached data length.

**Parameters**:  
- uart_num – UART port number, the max port number is (UART_NUM_MAX -1).  
- size – Pointer of size_t to accept cached data length

**Returns**:  
- ESP_OK Success  
- ESP_FAIL Parameter error

**esp_err_t uart_get_tx_buffer_free_size (uart_port_t uart_num, size_t *size)**

UART get TX ring buffer free space size.

**Parameters**:  
- uart_num – UART port number, the max port number is (UART_NUM_MAX -1).  
- size – Pointer of size_t to accept the free space size

**Returns**:  
- ESP_OK Success  
- ESP_ERR_INVALID_ARG Parameter error

**esp_err_t uart_disable_pattern_det_intr (uart_port_t uart_num)**

UART disable pattern detect function. Designed for applications like ‘AT commands’. When the hardware detects a series of one same character, the interrupt will be triggered.

**Parameters**: uart_num – UART port number, the max port number is (UART_NUM_MAX -1).

**Returns**:  
- ESP_OK Success  
- ESP_FAIL Parameter error

**esp_err_t uart_enable_pattern_det_baud_intr (uart_port_t uart_num, char pattern_chr, uint8_t chr_num, int chr_tout, int post_idle, int pre_idle)**

UART enable pattern detect function. Designed for applications like ‘AT commands’. When the hardware detect a series of one same character, the interrupt will be triggered.

**Parameters**:  
- uart_num – UART port number.  
- pattern_chr – character of the pattern.  
- chr_num – number of the character, 8bit value.  
- chr_tout – timeout of the interval between each pattern characters, 16bit value, unit is the baud-rate cycle you configured. When the duration is more than this value, it will not take this data as at_cmd char.  
- post_idle – idle time after the last pattern character, 16bit value, unit is the baud-rate cycle you configured. When the duration is less than this value, it will not take the previous data as the last at_cmd char  
- pre_idle – idle time before the first pattern character, 16bit value, unit is the baud-rate cycle you configured. When the duration is less than this value, it will not take this data as the first at_cmd char.

**Returns**:  
- ESP_OK Success
• ESP_FAIL Parameter error

int uart_pattern_pop_pos (uart_port_t uart_num)

Return the nearest detected pattern position in buffer. The positions of the detected pattern are saved in a queue, this function will dequeue the first pattern position and move the pointer to next pattern position.

The following APIs will modify the pattern position info: uart_flush_input, uart_read_bytes, uart_driver_delete, uart_pop_pattern_pos It is the application’s responsibility to ensure atomic access to the pattern queue and the rx data buffer when using pattern detect feature.

Note: If the RX buffer is full and flow control is not enabled, the detected pattern may not be found in the rx buffer due to overflow.

Parameters uart_num – UART port number, the max port number is (UART_NUM_MAX -1).

Returns • (-1) No pattern found for current index or parameter error
• others the pattern position in rx buffer.

int uart_pattern_get_pos (uart_port_t uart_num)

Return the nearest detected pattern position in buffer. The positions of the detected pattern are saved in a queue, This function do nothing to the queue.

The following APIs will modify the pattern position info: uart_flush_input, uart_read_bytes, uart_driver_delete, uart_pop_pattern_pos It is the application’s responsibility to ensure atomic access to the pattern queue and the rx data buffer when using pattern detect feature.

Note: If the RX buffer is full and flow control is not enabled, the detected pattern may not be found in the rx buffer due to overflow.

Parameters uart_num – UART port number, the max port number is (UART_NUM_MAX -1).

Returns • (-1) No pattern found for current index or parameter error
• others the pattern position in rx buffer.

esp_err_t uart_pattern_queue_reset (uart_port_t uart_num, int queue_length)

Allocate a new memory with the given length to save record the detected pattern position in rx buffer.

Parameters

• uart_num – UART port number, the max port number is (UART_NUM_MAX -1).
• queue_length – Max queue length for the detected pattern. If the queue length is not large enough, some pattern positions might be lost. Set this value to the maximum number of patterns that could be saved in data buffer at the same time.

Returns

• ESP_ERR_NO_MEM No enough memory
• ESP_ERR_INVALID_STATE Driver not installed
• ESP_FAIL Parameter error
• ESP_OK Success

esp_err_t uart_set_mode (uart_port_t uart_num, uart_mode_t mode)

UART set communication mode.

Note: This function must be executed after uart_driver_install(), when the driver object is initialized.
Chapter 2. API Reference

Parameters
- **uart_num** - Uart number to configure, the max port number is (UART_NUM_MAX -1).
- **mode** - UART UART mode to set

Returns
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

```c
esp_err_t uart_set_rx_full_threshold (uart_port_t uart_num, int threshold)
```
Set uart threshold value for RX fifo full.

**Note:** If application is using higher baudrate and it is observed that bytes in hardware RX fifo are overwritten then this threshold can be reduced

Parameters
- **uart_num** - UART port number, the max port number is (UART_NUM_MAX -1)
- **threshold** - Threshold value above which RX fifo full interrupt is generated

Returns
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_INVALID_STATE Driver is not installed

```c
esp_err_t uart_set_tx_empty_threshold (uart_port_t uart_num, int threshold)
```
Set uart threshold values for TX fifo empty.

Parameters
- **uart_num** - UART port number, the max port number is (UART_NUM_MAX -1)
- **threshold** - Threshold value below which TX fifo empty interrupt is generated

Returns
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_INVALID_STATE Driver is not installed

```c
esp_err_t uart_set_rx_timeout (uart_port_t uart_num, const uint8_t tout_thresh)
```
UART set threshold timeout for TOUT feature.

Parameters
- **uart_num** - Uart number to configure, the max port number is (UART_NUM_MAX -1).
- **tout_thresh** - This parameter defines timeout threshold in uart symbol periods. The maximum value of threshold is 126. tout_thresh = 1, defines TOUT interrupt timeout equal to transmission time of one symbol (~11 bit) on current baudrate. If the time is expired the UART_RXFIFO_TOUT_INT interrupt is triggered. If tout_thresh == 0, the TOUT feature is disabled.

Returns
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_INVALID_STATE Driver is not installed

```c
esp_err_t uart_get_collision_flag (uart_port_t uart_num, bool *collision_flag)
```
Returns collision detection flag for RS485 mode Function returns the collision detection flag into variable pointed by collision_flag. *collision_flag = true, if collision detected else it is equal to false. This function should be executed when actual transmission is completed (after uart_write_bytes()).

Parameters
- **uart_num** - Uart number to configure the max port number is (UART_NUM_MAX -1).
- **collision_flag** - Pointer to variable of type bool to return collision flag.

Returns
Chapter 2. API Reference

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

\texttt{esp_err_t uart_set_wakeup_threshold (uart_port_t uart_num, int wakeup_threshold)}

Set the number of RX pin signal edges for light sleep wakeup.

UART can be used to wake up the system from light sleep. This feature works by counting the number of positive edges on RX pin and comparing the count to the threshold. When the count exceeds the threshold, system is woken up from light sleep. This function allows setting the threshold value.

Stop bit and parity bits (if enabled) also contribute to the number of edges. For example, letter ‘a’ with ASCII code 97 is encoded as 0100001101 on the wire (with 8n1 configuration), start and stop bits included. This sequence has 3 positive edges (transitions from 0 to 1). Therefore, to wake up the system when ‘a’ is sent, set \texttt{wakeup_threshold=3}.

The character that triggers wakeup is not received by UART (i.e., it cannot be obtained from UART FIFO). Depending on the baud rate, a few characters after that will also not be received. Note that when the chip enters and exits light sleep mode, APB frequency will be changing. To ensure that UART has correct Baud rate all the time, it is necessary to select a source clock which has a fixed frequency and remains active during sleep. For the supported clock sources of the chips, please refer to \texttt{uart_sclk_t} or \texttt{soc_periph_uart_clk_src_legacy_t}

\textbf{Note:} in ESP32, the wakeup signal can only be input via IO_MUX (i.e., GPIO3 should be configured as function_1 to wake up UART0, GPIO9 should be configured as function_5 to wake up UART1), UART2 does not support light sleep wakeup feature.

\textbf{Parameters}
- \texttt{uart_num} - UART number, the max port number is (UART_NUM_MAX - 1).
- \texttt{wakeup_threshold} - number of RX edges for light sleep wakeup, value is 3 .. 0x3ff.

\textbf{Returns}
- ESP_OK on success
- ESP_ERR_INVALID_ARG if \texttt{uart_num} is incorrect or \texttt{wakeup_threshold} is outside of [3, 0x3ff] range.

\texttt{esp_err_t uart_get_wakeup_threshold (uart_port_t uart_num, int *out_wakeup_threshold)}

Get the number of RX pin signal edges for light sleep wakeup.

See description of \texttt{uart_set_wakeup_threshold} for the explanation of UART wakeup feature.

\textbf{Parameters}
- \texttt{uart_num} - UART number, the max port number is (UART_NUM_MAX - 1).
- \texttt{out_wakeup_threshold} - [out] output, set to the current value of wakeup threshold for the given UART.

\textbf{Returns}
- ESP_OK on success
- ESP_ERR_INVALID_ARG if \texttt{out_wakeup_threshold} is NULL

\texttt{esp_err_t uart_wait_tx_idle_polling (uart_port_t uart_num)}

Wait until UART tx memory empty and the last char send ok (polling mode).

\textbf{Returns}
- ESP_OK on success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_FAIL Driver not installed

\textbf{Parameters} \texttt{uart_num} - UART number
**esp_err_t uart_set_loop_back(uart_port_t uart_num, bool loop_back_en)**

Configure TX signal loop back to RX module, just for the test usage.

- **Returns**
  - ESP_OK on success
  - ESP_ERR_INVALID_ARG Parameter error
  - ESP_FAIL Driver not installed

- **Parameters**
  - `uart_num` - UART number
  - `loop_back_en` - Set true to enable the loop back function, else set it false.

**void uart_set_always_rx_timeout(uart_port_t uart_num, bool always_rx_timeout_en)**

Configure behavior of UART RX timeout interrupt.

When `always_rx_timeout` is true, timeout interrupt is triggered even if FIFO is full. This function can cause extra timeout interrupts triggered only to send the timeout event. Call this function only if you want to ensure timeout interrupt will always happen after a byte stream.

- **Parameters**
  - `uart_num` - UART number
  - `always_rx_timeout_en` - Set to false enable the default behavior of timeout interrupt, set it to true to always trigger timeout interrupt.

**Structures**

**struct uart_config_t**

UART configuration parameters for `uart_param_config` function.

**Public Members**

- `int baud_rate`
  UART baud rate

- `uart_word_length_t data_bits`
  UART byte size

- `uart_parity_t parity`
  UART parity mode

- `uart_stop_bits_t stop_bits`
  UART stop bits

- `uart_flowcontrol_t flow_ctrl`
  UART HW flow control mode (cts/rts)

- `uint8_t rx_flow_ctrl_thresh`
  UART HW RTS threshold

- `uart_sclk_t source_clk`
  UART source clock selection
struct uart_intr_config_t
UART interrupt configuration parameters for uart_intr_config function.

Public Members

uint32_t intr_enable_mask
UART interrupt enable mask, choose from UART_XXXX_INT_ENA_M under UART_INT_ENA_REG(i), connect with bit-or operator

uint8_t rx_timeout_thresh
UART timeout interrupt threshold (unit: time of sending one byte)

uint8_t txfifo_empty_intr_thresh
UART TX empty interrupt threshold.

uint8_t rxfifo_full_thresh
UART RX full interrupt threshold.

struct uart_event_t
Event structure used in UART event queue.

Public Members

uart_event_type_t type
UART event type

size_t size
UART data size for UART_DATA event

bool timeout_flag
UART data read timeout flag for UART_DATA event (no new data received during configured RX TOUT) If the event is caused by FIFO-full interrupt, then there will be no event with the timeout flag before the next byte coming.

Macros

UART_PIN_NO_CHANGE

UART_FIFO_LEN
Length of the HP UART HW FIFO.

UART_HW_FIFO_LEN(uart_num)
Length of the UART HW FIFO.

UART_BITRATE_MAX
Maximum configurable bitrate.
Type Definitions

typedef intr_handle_t uart_isr_handle_t

Enumerations

enum uart_event_type_t
    UART event types used in the ring buffer.

    Values:

    enumerator UART_DATA
        UART data event

    enumerator UART_BREAK
        UART break event

    enumerator UART_BUFFER_FULL
        UART RX buffer full event

    enumerator UART_FIFO_OVF
        UART FIFO overflow event

    enumerator UART_FRAME_ERR
        UART RX frame error event

    enumerator UART_PARITY_ERR
        UART RX parity event

    enumerator UART_DATA_BREAK
        UART TX data and break event

    enumerator UART_PATTERN_DET
        UART pattern detected

    enumerator UART_WAKEUP
        UART wakeup event

    enumerator UART_EVENT_MAX
        UART event max index

Header File

• components/hal/include/hal/uart_types.h
• This header file can be included with:

  ```
  #include "hal/uart_types.h"
  ```

Structures

struct uart_at_cmd_t

    UART AT cmd char configuration parameters. Note that this function may differ on different chip. Please refer to the TRM at configuration.
Chapter 2. API Reference

Public Members

uint8_t \texttt{cmd\_char}
UART AT cmd char

uint8_t \texttt{char\_num}
AT cmd char repeat number

uint32_t \texttt{gap\_tout}
gap time (in baud-rate) between AT cmd char

uint32_t \texttt{pre\_idle}
the idle time (in baud-rate) between the non AT char and first AT char

uint32_t \texttt{post\_idle}
the idle time (in baud-rate) between the last AT char and the none AT char

struct \texttt{uart\_sw\_flowctrl\_t}
UART software flow control configuration parameters.

Public Members

uint8_t \texttt{xon\_char}
Xon flow control char

uint8_t \texttt{xoff\_char}
Xoff flow control char

uint8_t \texttt{xon\_thrd}
If the software flow control is enabled and the data amount in rxfifo is less than xon\_thrd, an xon\_char
will be sent

uint8_t \texttt{xoff\_thrd}
If the software flow control is enabled and the data amount in rxfifo is more than xoff\_thrd, an xoff\_char
will be sent

Type Definitions

typedef \texttt{soc\_periph\_uart\_clk\_src\_legacy\_t} \texttt{uart\_sclk\_t}
UART source clock.

Enumerations

enum \texttt{uart\_port\_t}
UART port number, can be UART\_NUM\_0 ~ (UART\_NUM\_MAX -1).

Values:

enumerator \texttt{UART\_NUM\_0}
UART port 0
Chapter 2. API Reference

enumerator UART_NUM_1
   UART port 1

enumerator UART_NUM_MAX
   UART port max

enum uart_mode_t
   UART mode selection.
   Values:

   enumerator UART_MODE_UART
      mode: regular UART mode

   enumerator UART_MODE_RS485_HALF_DUPLEX
      mode: half duplex RS485 UART mode control by RTS pin

   enumerator UART_MODE_IRDA
      mode: IRDA UART mode

   enumerator UART_MODE_RS485_COLLISION_DETECT
      mode: RS485 collision detection UART mode (used for test purposes)

   enumerator UART_MODE_RS485_APP_CTRL
      mode: application control RS485 UART mode (used for test purposes)

enum uart_word_length_t
   UART word length constants.
   Values:

   enumerator UART_DATA_5_BITS
      word length: 5bits

   enumerator UART_DATA_6_BITS
      word length: 6bits

   enumerator UART_DATA_7_BITS
      word length: 7bits

   enumerator UART_DATA_8_BITS
      word length: 8bits

   enumerator UART_DATA_BITS_MAX

enum uart_stop_bits_t
   UART stop bits number.
   Values:
enumerator UART_STOP_BITS_1
    stop bit: 1bit

enumerator UART_STOP_BITS_1_5
    stop bit: 1.5bits

enumerator UART_STOP_BITS_2
    stop bit: 2bits

enumerator UART_STOP_BITS_MAX

enum uart_parity_t
    UART parity constants.
    \n    Values:

    enumerator UART_PARITY_DISABLE
        Disable UART parity

    enumerator UART_PARITY_EVEN
        Enable UART even parity

    enumerator UART_PARITY_ODD
        Enable UART odd parity

enum uart_hw_flowcontrol_t
    UART hardware flow control modes.
    \n    Values:

    enumerator UART_HW_FLOWCTRL_DISABLE
        disable hardware flow control

    enumerator UART_HW_FLOWCTRL_RTS
        enable RX hardware flow control (rts)

    enumerator UART_HW_FLOWCTRL_CTS
        enable TX hardware flow control (cts)

    enumerator UART_HW_FLOWCTRL_CTS_RTS
        enable hardware flow control

    enumerator UART_HW_FLOWCTRL_MAX

enum uart_signal_inv_t
    UART signal bit map.
    \n    Values:

    enumerator UART_SIGNAL_INV_DISABLE
        Disable UART signal inverse
enumerator UART_SIGNAL_IRDA_TX_INV
  inverse the UART irda_tx signal

enumerator UART_SIGNAL_IRDA_RX_INV
  inverse the UART irda_rx signal

enumerator UART_SIGNAL_RXD_INV
  inverse the UART rxd signal

enumerator UART_SIGNAL_CTS_INV

**GPIO Lookup Macros**  The UART peripherals have dedicated IO_MUX pins to which they are connected directly. However, signals can also be routed to other pins using the less direct GPIO matrix. To use direct routes, you need to know which pin is a dedicated IO_MUX pin for a UART channel. GPIO Lookup Macros simplify the process of finding and assigning IO_MUX pins. You choose a macro based on either the IO_MUX pin number, or a required UART channel name, and the macro returns the matching counterpart for you. See some examples below.

**Note:** These macros are useful if you need very high UART baud rates (over 40 MHz), which means you will have to use IO_MUX pins only. In other cases, these macros can be ignored, and you can use the GPIO Matrix as it allows you to configure any GPIO pin for any UART function.

1. UART_NUM_2_TXD_DIRECT_GPIO_NUM returns the IO_MUX pin number of UART channel 2 TXD pin (pin 17)
2. UART_GPIO19_DIRECT_CHANNEL returns the UART number of GPIO 19 when connected to the UART peripheral via IO_MUX (this is UART_NUM_0)
3. UART_CTS_GPIO19_DIRECT_CHANNEL returns the UART number of GPIO 19 when used as the UART CTS pin via IO_MUX (this is UART_NUM_0). It is similar to the above macro but specifies the pin function which is also part of the IO_MUX assignment.

**Header File**

2.5.28 USB Device Driver

Overview

The driver allows you to use ESP32-S2 chips to develop USB devices on a top of TinyUSB stack. TinyUSB is integrated with ESP-IDF to provide USB features of the framework. Using this driver the chip works as simple or composite device supporting several USB devices simultaneously.

TinyUSB stack is distributed via IDF Component Registry.

Our USB-OTG implementation is limited to 6 USB endpoints (5 IN/OUT endpoints and 1 IN endpoint). Please note that enabling Secure Boot or flash encryption disables the USB-OTG USB stack in the ROM, disallowing updates via the serial emulation or Device Firmware Update (DFU) on that port. For more details, please refer to technical reference manual.

Features

- Configuration of device and string USB descriptors
- USB Serial Device (CDC-ACM)
- Input and output streams through USB Serial Device
- Other USB classes (MIDI, MSC, HID...) support directly via TinyUSB
- USB Composite Device (MSC + CDC)
- VBUS monitoring for self-powered devices

Hardware USB Connection

- Any board with the ESP32-S2 chip with USB connectors or with exposed USB’s D+ and D- (DATA+/DATA-) pins.

If the board has no USB connector but has the pins, connect pins directly to the host (e.g., with do-it-yourself cable from any USB connection cable).

On ESP32-S2, connect GPIO 20 and 19 to D+/D- respectively:

Self-powered devices must also connect VBUS through voltage divider or comparator, more details in Self-Powered Device subchapter.
Driver Structure

As the basis is used the TinyUSB stack.

On top of it the driver implements:

- Customization of USB descriptors
- Serial device support
- Redirecting of standard streams through the Serial device
- Storage Media (SPI-Flash and SD-Card) for USB Device MSC Class.
- Encapsulated driver’s task servicing the TinyUSB

Configuration

To use the component, you need to add it as a dependency via the following command. For more details, please refer to IDF Component Registry.

```
idf.py add-dependency esp_tinyusb
```

Via Menuconfig options you can specify:

- Several descriptor’s parameters (see Descriptors Configuration below)
- USB Serial low-level configuration
- The verbosity of the TinyUSB’s log
- Disable the TinyUSB main task (for the custom implementation)

Descriptors Configuration The driver’s descriptors are provided by `tinyusb_config_t` structure’s device descriptor, configuration descriptor and string descriptor members. Therefore, you should initialize `tinyusb_config_t` with your desired descriptors before calling `tinyusb_driver_install()` to install the driver.

However, the driver also provides default descriptors. You can install the driver with default device and string descriptors by setting the device descriptor and string descriptor members of `tinyusb_config_t` to `NULL` before calling `tinyusb_driver_install()`. To lower your development effort we also provide default configuration descriptor for CDC and MSC class, as these classes rarely require custom configuration. The driver’s default device descriptor is specified using Menuconfig, where the following fields should be configured:

- PID
- VID
- bcdDevice
- Manufacturer
- Product name
- Name of CDC or MSC device if it is On
- Serial number

If you want to use your own descriptors with extended modification, you can define them during the driver installation process.

Install Driver

To initialize the driver, users should call `tinyusb_driver_install()`. The driver’s configuration is specified in a `tinyusb_config_t` structure that is passed as an argument to `tinyusb_driver_install()`.

Note that the `tinyusb_config_t` structure can be zero initialized (e.g., `const tinyusb_config_t *tusb_cfg = { 0 };`) or partially (as shown below). For any member that is initialized to 0 or `NULL`, the driver will use its default configuration values for that member (see example below).
Self-Powered Device

USB specification mandates self-powered devices to monitor voltage level on USB’s VBUS signal. As opposed to bus-powered devices, a self-powered device can be fully functional even without USB connection. The self-powered device detects connection and disconnection events by monitoring the VBUS voltage level. VBUS is considered valid if it rises above 4.75 V and invalid if it falls below 4.35 V.

No ESP32-S2 pin is 5 V tolerant, so you must connect the VBUS to ESP32-S2 via a comparator with voltage thresholds as described above, or use a simple resistor voltage divider that will output \((0.75 \times V_{dd})\) if VBUS is 4.4 V (see figure below). In both cases, voltage on the sensing pin must be logic low within 3 ms after the device is unplugged from USB host.

![Simple voltage divider for VBUS monitoring](image)

To use this feature, in `tinyusb_config_t` you must set `self_powered` to `true` and `vbus_monitor_io` to GPIO number that will be used for VBUS monitoring.

USB Serial Device (CDC-ACM)

If the CDC option is enabled in Menuconfig, the USB Serial Device can be initialized with `tusb_cdc_acm_init()` according to the settings from `tinyusb_config_cdcacm_t` (see example below).
const tinyusb_config_cdcacm_t acm_cfg = {
    .usb_dev = TINYUSB_USBDEV_0,
    .cdc_port = TINYUSB_CDC_ACM_0,
    .rx_unread_buf_sz = 64,
    .callback_rx = NULL,
    .callback_rx_wanted_char = NULL,
    .callback_line_state_changed = NULL,
    .callback_line_coding_changed = NULL
};
tusb_cdc_acm_init(&acm_cfg);

To specify callbacks you can either set the pointer to your tusb_cdcacm_callback_t function in the configuration structure or call tinyusb_cdcacm_register_callback() after initialization.

**USB Serial Console** The driver allows to redirect all standard application streams (stdin, stdout, stderr) to the USB Serial Device and return them to UART using esp_tusb_init_console() / esp_tusb_deinit_console() functions.

**USB Mass Storage Device (MSC)**

If the MSC CONFIG_TINYUSB_MSC_ENABLED option is enabled in Menuconfig, the ESP Chip can be used as USB MSC Device. The storage media (spi-flash or sd-card) can be initialized as shown below (see example below).

- **SPI-Flash**

```c
static esp_err_t storage_init_spiflash(wl_handle_t *wl_handle)
{
    esp_partition_t *data_partition = esp_partition_find_first(ESP_PARTITION_TYPE_DATA,
        ESP_PARTITION_SUBTYPE_DATA_FAT, NULL);
    wl_mount(data_partition, wl_handle);
    storage_init_spiflash(*wl_handle);
}

const tinyusb_msc_spiflash_config_t config_spi = {
    .wl_handle = wl_handle
};
tinyusb_msc_storage_init_spiflash(&config_spi);
```

- **SD-Card**

```c
static esp_err_t storage_init_sdmmc(sdmmc_card_t **card)
{
    sdmmc_host_t host = SDMMC_HOST_DEFAULT();
    sdmmc_slot_config_t slot_config = SDMMC_SLOT_CONFIG_DEFAULT();
    // For SD Card, set bus width to use
    slot_config.width = 4;
    slot_config.clk = CONFIG_EXAMPLE_PIN_CLK;
    slot_config.cmd = CONFIG_EXAMPLE_PIN_CMD;
    slot_config.d0 = CONFIG_EXAMPLE_PIN_D0;
    slot_config.d1 = CONFIG_EXAMPLE_PIN_D1;
    slot_config.d2 = CONFIG_EXAMPLE_PIN_D2;
    slot_config.d3 = CONFIG_EXAMPLE_PIN_D3;
    slot_config.flags |= SDMMC_SLOT_FLAG_INTERNAL_PULLUP;
    sd_card = (sdmmc_card_t *)malloc(sizeof(sdmmc_card_t));
}
```

(continues on next page)
Chapter 2. API Reference

(continued from previous page)

```c
(*host.init)();
sdmmc_host_init_slot(host.slot, (const sdmmc_slot_config_t *) &slot_config);
sdmmc_card_init(&host, sd_card);
```

```c
storage_init_sdmmc(&card);

const tinyusb_msc_sdmmc_config_t config_sdmmc = {
    .card = card
};
tinyusb_msc_storage_init_sdmmc(&config_sdmmc);
```

2.5.29 USB Host

The document provides information regarding the USB Host Library. This document is split into the following sections:

### Sections

- **USB Host**
  - **Overview**
  - **Architecture**
  - **Usage**
  - **Examples**
  - **Host Stack Configuration**
  - **API Reference**
  - **Maintainers Notes**

### Overview

The USB Host Library (hereinafter referred to as the Host Library) is the lowest layer of the USB Host stack that exposes a public facing API. In most cases, applications that require USB Host functionality do not need to interface with the Host Library directly. Instead, most applications use the API provided by a host class driver that is implemented on top of the Host Library.

However, you may want to use the Host Library directly for some of (but not limited to) the following reasons:
• Implementation of a custom host class driver
• Usage of lower level USB Host API

Features & Limitations  The Host Library has the following features:

• Supports Full Speed (FS) and Low Speed (LS) Devices.
• Supports all four transfer types, i.e., Control, Bulk, Interrupt, and Isochronous.
• Allows multiple class drivers to run simultaneously, i.e., multiple clients of the Host Library.
• A single device can be used by multiple clients simultaneously, e.g., composite devices.
• The Host Library itself and the underlying Host Stack does not internally instantiate any OS tasks. The number of tasks is entirely controlled by how the Host Library interface is used. However, a general rule of thumb regarding the number of tasks is \((\text{number of host class drivers running} + 1)\).

Currently, the Host Library and the underlying Host Stack has the following limitations:

• Only supports a single device, but the Host Library’s API is designed for multiple device support.
• Only supports Asynchronous transfers.
• Only supports using the first configuration found. Changing to other configurations is not supported yet.
• Transfer timeouts are not supported yet.

Architecture

The diagram above shows the key entities that are involved when implementing USB Host functionality. These entities are:

• The Host Library
• Clients of the Host Library
• Devices
• Host Library Daemon Task
**Host Library**  The Host Library is the lowest public-facing API layer of the ESP-IDF USB Host Stack. Any other ESP-IDF component (such as a class driver or a user component) that needs to communicate with a connected USB device can only do so using the Host Library API either directly or indirectly.

The Host Library’s API is split into two sub-sets, namely the **Library API** and **Client API**.

- The Client API handles the communication between a client of the Host Library and one or more USB devices. The Client API should only be called by registered clients of the Host Library.
- The Library API handles all of the Host Library processing that is not specific to a single client, such as device enumeration. Usually, the library API is called by a Host Library Daemon Task.

**Clients**  A client of the Host Library is a software component, such as a host class driver or user component, which utilizes the Host Library to establish communication with a USB device. Generally, each client has a one-to-one relation with a task. This implies that all Client API calls pertaining to a specific client must originate from the context of the same task.

By organizing the software components that use the Host Library’s into clients, the Host Library can delegate the handling of all events specific to that client to the client’s task. In other words, each client task is responsible for all the required processing and event handling associated with the USB communication that the client initiates.

**Daemon Task**  Although the Host Library delegates the handling of client events to the clients themselves, there are still Library events – events that are not specific to any particular client – that need to be handled. Library event handling can include things such as:

- Handling USB device connection, enumeration, and disconnection
- Rerouting control transfers to/from clients
- Forwarding events to clients

Therefore, in addition to the client tasks, the Host Library also requires a task, which is usually the Host Library Daemon Task, to handle all of the library events.

**Devices**  The Host Library shields clients from the details of device handling, encompassing details such as connection, memory allocation, and enumeration. The clients are provided only with a list of already connected and enumerated devices to choose from. During enumeration, each device is automatically configured to use the first configuration found, namely, the first configuration descriptor returned on a Get Configuration Descriptor request. For most standard devices, the first configuration will have a bConfigurationValue of 1.

It is possible for two or more clients to simultaneously communicate with the same device as long as they are not communicating to the same interface. However, multiple clients can simultaneously communicate with the same device’s default endpoint (i.e., EP0), which will result in their control transfers being serialized.

For a client to communicate with a device, the client must:

1. Open the device using the device’s address. This lets the Host Library know that the client is using that device.
2. Claim the interface(s) that will be used for communication. This prevents other clients from claiming the same interface(s).
3. Send transfers to the endpoints of claimed interfaces. The client’s task is responsible for handling its own processing and events related to USB device communication.

**Usage**

The Host Library and the underlying Host Stack will not create any tasks. All tasks, namely the client tasks and the Daemon Task, need to be created by the class drivers or the user. Instead, the Host Library provides two event handler functions that handle all of the required Host Library processing, thus these functions should be called repeatedly from the client tasks and the Daemon Task. Therefore, the implementation of client tasks and the Daemon Task will be largely centered around the invocation of these event handler functions.

**Host Library & Daemon Task**
Basic Usage  The Host Library API provides `usb_host_lib_handle_events()` to handle library events. This function should be called repeatedly, typically from the Daemon Task. Some notable features regarding `usb_host_lib_handle_events()` are:

- The function can block until a library event needs handling.
- Event flags are returned on each invocation. These event flags are useful for knowing when the Host Library can be uninstalled.

A bare-bones Daemon Task would resemble something like the following code snippet:

```c
#include "usb/usb_host.h"

void daemon_task(void *arg) {
    ...
    bool exit = false;
    while (!exit) {
        uint32_t event_flags;
        usb_host_lib_handle_events(portMAX_DELAY, &event_flags);
        if (event_flags & USB_HOST_LIB_EVENT_FLAGS_NO_CLIENTS) {
            ...
        }
        if (event_flags & USB_HOST_LIB_EVENT_FLAGS_ALL_FREE) {
            ...
        }
        ...
    }
    ...
}
```

Note: See the peripherals/usb/host/usb_host_lib example for full implementation of the Daemon Task.

Fig. 36: Graph of Typical USB Host Library Lifecycle

Lifecycle  The graph above illustrates the typical lifecycle of the Host Library with multiple clients and devices. Specifically, the example involves:

- two registered clients (Client 1 and Client 2).
- two connected devices (Device 1 and Device 2), where Client 1 communicates with Device 1 and Client 2 communicates with Device 2.

With reference to the graph above, the typical lifecycle involves the following key stages.

1. The Host Library is installed by calling `usb_host_install()`.
• Installation must be done before any other Host Library API is called.
• Where `usb_host_install()` is called (e.g., from the Daemon Task or another task) depends on the synchronization logic between the Daemon Task, client tasks, and the rest of the system.

2. **Once the Host Library is installed, the clients can be registered by calling `usb_host_client_register()`**.
   • This is typically called from the client task, where the client task waits for a signal from the Daemon Task.
   • This can be called elsewhere if necessary as long as it is called after `usb_host_install()`.

3. **Device 1 connects and is enumerated.**
   • Each registered client (in this case Client 1 and Client 2) is notified of the new device by way of the `USB_HOST_CLIENT_EVENT_NEW_DEV` event.
   • Client 1 opens Device 1 and begins communication with it.

4. **Similarly Device 2 connects and is enumerated.**
   • Client 1 and 2 are notified of a new device via a `USB_HOST_CLIENT_EVENT_NEW_DEV` event.
   • Client 2 opens Device 2 and begins communication with it.

5. **Device 1 suddenly disconnects.**
   • Client 1 is notified by way of `USB_HOST_CLIENT_EVENT_DEV_GONE` and begins its cleanup.
   • Client 2 is not notified as it has not opened Device 1.

6. **Client 1 completes its cleanup and deregisters by calling `usb_host_client_deregister()`**.
   • This is typically called from the client task before the task exits.
   • This can be called elsewhere if necessary as long as Client 1 has already completed its cleanup.

7. **Client 2 completes its communication with Device 2. Client 2 then closes Device 2 and deregisters itself.**
   • The Daemon Task is notified of the deregistration of all clients by way the `USB_HOST_LIB_EVENT_FLAGS_NO_CLIENTS` event flag as Client 2 is the last client to deregister.
   • Device 2 is still allocated (i.e., not freed), as it is still connected albeit not currently opened by any client.

8. **The Daemon Task decides to clean up as there are no more clients.**
   • The Daemon Task must free Device 2 first by calling `usb_host_device_free_all()`.
   • If `usb_host_device_free_all()` was able to free all devices, the function will return `ESP_OK` indicating that all devices have been freed.
   • If `usb_host_device_free_all()` was unable to free all devices for reasons like the device is still opened by a client, the function will return `ESP_ERR_NOT_FINISHED`.
   • The Daemon Task must wait for `usb_host_lib_handle_events()` to return the `USB_HOST_LIB_EVENT_FLAGS_ALL_FREE` event flag in order to know when all devices have been freed.

9. Once the Daemon Task has verified that all clients have deregistered and all devices have been freed, it can now uninstall the Host Library by calling `usb_host_uninstall()`.

**Clients & Class Driver**

**Basic Usage** The Host Library API provides `usb_host_client_handle_events()` to handle a particular client’s events. This function should be called repeatedly, typically from the client’s task. Some notable features regarding `usb_host_client_handle_events()` are:

- The function can block until a client event needs handling.
- The function’s primary purpose is to call the various event handling callbacks when a client event occurs.

The following callbacks are called from within `usb_host_client_handle_events()` thus allowing the client task to be notified of events.

- The client event callback of type `usb_host_client_event_cb_t` delivers client event messages to the client. Client event messages indicate events such as the addition or removal of a device.
- The USB transfer completion callback of type `usb_transfer_cb_t` indicates that a particular USB transfer previously submitted by the client has been completed.

**Note:** Given that the callbacks are called from within `usb_host_client_handle_events()`, users should
avoid blocking from within the callbacks as this will result in `usb_host_client_handle_events()` being blocked as well, thus preventing other pending client events from being handled.

The following code snippet demonstrates a bare-bones host class driver and its client task. The code snippet contains:

- A simple client task function `client_task` that calls `usb_host_client_handle_events()` in a loop.
- Implementations of a client event callback and transfer completion callbacks.
- Implementation of a simple state machine for the class driver. The class driver simply opens a device, sends an OUT transfer to EP1, then closes the device.

```c
#include <string.h>
#include "usb/usb_host.h"

#define CLASS_DRIVER_ACTION_OPEN_DEV 0x01
#define CLASS_DRIVER_ACTION_TRANSFER 0x02
#define CLASS_DRIVER_ACTION_CLOSE_DEV 0x03

struct class_driver_control {
    uint32_t actions;
    uint8_t dev_addr;
    usb_host_client_handle_t client_hdl;
    usb_device_handle_t dev_hdl;
};

static void client_event_cb(const usb_host_client_event_msg_t *event_msg, void *arg)
{
    // This function is called from within usb_host_client_handle_events(). Do not
    // block and try to keep it short
    struct class_driver_control *class_driver_obj = (struct class_driver_control*)arg;
    switch (event_msg->event)
    {
        case USB_HOST_CLIENT_EVENT_NEW_DEV:
            class_driver_obj->actions |= CLASS_DRIVER_ACTION_OPEN_DEV;
            class_driver_obj->dev_addr = event_msg->new_dev.address; /*Store the
            //address of the new device
            break;
        case USB_HOST_CLIENT_EVENT_DEV_GONE:
            class_driver_obj->actions |= CLASS_DRIVER_ACTION_CLOSE_DEV;
            break;
        default:
            break;
    }
}

static void transfer_cb(usb_transfer_t *transfer)
{
    // This function is called from within usb_host_client_handle_events(). Do not
    // block and try to keep it short
    struct class_driver_control *class_driver_obj = (struct class_driver_control*)transfer->context;
    printf("Transfer status %d, actual number of bytes transferred %d\n", transfer->status, transfer->actual_num_bytes);
    class_driver_obj->actions |= CLASS_DRIVER_ACTION_CLOSE_DEV;
}

void client_task(void *arg)
{
    ... // Wait until Host Library is installed
    // Initialize class driver objects
    struct class_driver_control class_driver_obj = {0};
}
```

(continues on next page)
// Register the client
usb_host_client_config_t client_config = {
    .is_synchronous = false,
    .max_num_event_msg = 5,
    .async = {
        .client_event_callback = client_event_cb,
        .callback_arg = &class_driver_obj,
    }
};
usb_host_client_register(&client_config, &class_driver_obj.client_hdl);

//Allocate a USB transfer
usb_transfer_t *transfer;
usb_host_transfer_alloc(1024, 0, &transfer);

//Event handling loop
bool exit = false;
while (!exit) {
    // Call the client event handler function
    usb_host_client_handle_events(class_driver_obj.client_hdl, portMAX_DELAY);
    // Execute pending class driver actions
    if (class_driver_obj.actions & CLASS_DRIVER_ACTION_OPEN_DEV) {
        // Open the device and claim interface 1
        usb_host_device_open(class_driver_obj.client_hdl, class_driver_obj.dev_hdl);
        usb_host_interface_claim(class_driver_obj.client_hdl, class_driver_obj.dev_hdl, 1, 0);
        if (class_driver_obj.actions & CLASS_DRIVER_ACTION_TRANSFER) {
            // Send an OUT transfer to EP1
            memset(transfer->data_buffer, 0xAA, 1024);
            transfer->num_bytes = 1024;
            transfer->device_handle = class_driver_obj.dev_hdl;
            transfer->bEndpointAddress = 0x01;
            transfer->callback = transfer_cb;
            transfer->context = (void *)&class_driver_obj;
            usb_host_transfer_submit(transfer);
        }
        if (class_driver_obj.actions & CLASS_DRIVER_ACTION_CLOSE_DEV) {
            // Release the interface and close the device
            usb_host_interface_release(class_driver_obj.client_hdl, class_driver_obj.dev_hdl);
            usb_host_device_close(class_driver_obj.client_hdl, class_driver_obj.dev_hdl);
            exit = true;
        }
    } ... // Handle any other actions required by the class driver
}

//Cleanup class driver
usb_host_transfer_free(transfer);
usb_host_client_deregister(class_driver_obj.client_hdl);
... // Delete the client task. Signal the Daemon Task if necessary.

Note: An actual host class driver is likely to support many more features, thus will have a much more complex state machine. A host class driver is also likely to need to:

- Be able to open multiple devices
- Parse an opened device’s descriptors to identify if the device is of the target class
- Communicate with multiple endpoints of an interface in a particular order
- Claim multiple interfaces of a device
• Handle various errors

Lifecycle  The typical life cycle of a client task and class driver will go through the following stages:

1. Wait for some signal regarding the Host Library being installed.
2. Register the client via `usb_host_client_register()` and allocate any other class driver resources, such as allocating transfers using `usb_host_transfer_alloc()`.
3. For each new device that the class driver needs to communicate with:
   a. Check if the device is already connected via `usb_host_device_addr_list_fill()`.
   b. If the device is not already connected, wait for a `USB_HOST_CLIENT_EVENT_NEW_DEV` event from the client event callback.
   c. Open the device via `usb_host_device_open()`.
   d. Parse the device and configuration descriptors via `usb_host_get_device_descriptor()` and `usb_host_get_active_config_descriptor()` respectively.
   e. Claim the necessary interfaces of the device via `usb_host_interface_claim()`.
4. Submit transfers to the device via `usb_host_transfer_submit()` or `usb_host_transfer_submit_control()`.
5. Once an opened device is no longer needed by the class driver, or has disconnected, as indicated by a `USB_HOST_CLIENT_EVENT_DEV_GONE` event:
   a. Stop any previously submitted transfers to the device’s endpoints by calling `usb_host_endpoint_halt()` and `usb_host_endpoint_flush()` on those endpoints.
   b. Release all previously claimed interfaces via `usb_host_interface_release()`.
   c. Close the device via `usb_host_device_close()`.
6. Deregister the client via `usb_host_client_deregister()` and free any other class driver resources.
7. Delete the client task. Signal the Daemon Task if necessary.

Examples

Host Library Examples  The `peripherals/usb/host/usb_host_lib` demonstrates basic usage of the USB Host Library’s API to implement a pseudo-class driver.

Class Driver Examples  The USB Host Stack provides a number of examples that implement host class drivers using the Host Library’s API.

CDC-ACM

• A host class driver for the Communication Device Class (Abstract Control Model) is distributed as a managed component via the ESP-IDF Component Registry.
• The `peripherals/usb/host/cdc/cdc_acm_host` example uses the CDC-ACM host driver component to communicate with CDC-ACM devices.
• The `peripherals/usb/host/cdc/cdc_acm_vcp` example shows how you can extend the CDC-ACM host driver to interface Virtual COM Port devices.
• The CDC-ACM driver is also used in `esp_modem examples`, where it is used for communication with cellular modems.

MSC

• A host class driver for the Mass Storage Class (Bulk-Only Transport) is deployed to ESP-IDF Component Registry.
• The `peripherals/usb/host/msc` example demonstrates the usage of the MSC host driver to read and write to a USB flash drive.
HID
• A host class driver for the HID (Human interface device) is distributed as a managed component via the ESP-IDF Component Registry.
• The peripherals/usb/host/hid example demonstrates the possibility to receive reports from a USB HID device with several interfaces.

UVC
• A host class driver for the USB Video Device Class is distributed as a managed component via the ESP-IDF Component Registry.
• The peripherals/usb/host/uvc example demonstrates the usage of the UVC host driver to receive a video stream from a USB camera and optionally forward that stream over Wi-Fi.

Host Stack Configuration

Non-Compliant Device Support  To support USB devices that are non-compliant in various scenarios or exhibit specific behaviors it is possible to configure the USB Host stack.

As a USB device may be hot-plugged, it is essential to have the configurable delays between power switching and device attachment, and when the device’s internal power has stabilized.

Enumeration Configuration  During the process of enumerating connected USB devices, several timeout values ensure the proper functioning of the device.

Fig. 37: USB Root Hub Power-on and Connection Events Timing

The figure above shows all the timeouts associated with both turning on port power with a device connected and hot-plugging a device.
• After a port is reset or resumed, the USB System Software is expected to provide a “recovery” interval of 10 ms before the device attached to the port is expected to respond to data transfers.
• After the reset/resume recovery interval, if a device receives a SetAddress() request, the device must be able to complete processing of the request and be able to successfully complete the Status stage of the request within 50 ms.
• After successful completion of the Status stage, the device is allowed a SetAddress() recovery interval of 2 ms.
Chapter 2. API Reference

Note: For more details regarding connection event timings, please refer to the Universal Serial Bus 2.0 specification, chapter 7.1.7.3 “Connect and Disconnect Signaling”.

Configurable parameters of the USB host stack can be configured with multiple options via Menuconfig.

- For Debounce delay refer to `CONFIG_USB_HOST_DEBOUNCE_DELAY_MS`
- For Reset hold interval refer to `CONFIG_USB_HOST_RESET_HOLD_MS`
- For Reset recovery interval refer to `CONFIG_USB_HOST_RESET_RECOVERY_MS`
- For SetAddress() recovery interval refer to: `CONFIG_USB_HOST_SET_ADDR_RECOVERY_MS`

API Reference

The API of the USB Host Library is separated into the following header files. However, it is sufficient for applications to only `#include "usb/usb_host.h"` and all USB Host Library headers will also be included.

- `usb/include/usb/usb_host.h` contains the functions and types of the USB Host Library.
- `usb/include/usb/usb_helpers.h` contains various helper functions that are related to the USB protocol such as descriptor parsing.
- `usb/include/usb/usb_types_stack.h` contains types that are used across multiple layers of the USB Host stack.
- `usb/include/usb/usb_types_ch9.h` contains types and macros related to Chapter 9 of the USB2.0 specification, i.e., descriptors and standard requests.

Header File

- `components/usb/include/usb/usb_host.h`
  - This header file can be included with:
    ```
    #include "usb/usb_host.h"
    ```
  - This header file is a part of the API provided by the `usb` component. To declare that your component depends on `usb`, add the following to your CMakelists.txt:
    ```
    REQUIRES usb
    ```
    or
    ```
    PRIV_REQUIRES usb
    ```

Functions

`esp_err_t usb_host_install (const usb_host_config_t *config)`

Install the USB Host Library.

- This function should only once to install the USB Host Library
- This function should be called before any other USB Host Library functions are called

Note: If `skip_phy_setup` is set in the install configuration, the user is responsible for ensuring that the underlying Host Controller is enabled and the USB PHY (internal or external) is already setup before this function is called.

Parameters `config` – [in] USB Host Library configuration

Returns `esp_err_t`
**esp_err_t** `usb_host_uninstall` (void)
Uninstall the USB Host Library.

- This function should be called to uninstall the USB Host Library, thereby freeing its resources
- All clients must have been deregistered before calling this function
- All devices must have been freed by calling `usb_host_device_free_all()` and receiving the USB_HOST_LIB_EVENT_FLAGS_ALL_FREE event flag

**Note:** If skip Phy setup was set when the Host Library was installed, the user is responsible for disabling the underlying Host Controller and USB PHY (internal or external).

**Returns** esp_err_t

**esp_err_t** `usb_host_lib_handle_events` (TickType_t timeout_ticks, uint32_t *event_flags_ret)
Handle USB Host Library events.

- This function handles all of the USB Host Library’s processing and should be called repeatedly in a loop
- Check event_flags_ret to see if an flags are set indicating particular USB Host Library events
- This function should never be called by multiple threads simultaneously

**Note:** This function can block

**Parameters**
- *timeout_ticks* - [in] Timeout in ticks to wait for an event to occur
- *event_flags_ret* - [out] Event flags that indicate what USB Host Library event occurred.

**Returns** esp_err_t

**esp_err_t** `usb_host_lib_unblock` (void)
Unblock the USB Host Library handler.

- This function simply unblocks the USB Host Library event handling function (`usb_host_lib_handle_events()`)

**Returns** esp_err_t

**esp_err_t** `usb_host_lib_info` (usb_host_lib_info_t *info_ret)
Get current information about the USB Host Library.

**Parameters** info_ret - [out] USB Host Library Information

**Returns** esp_err_t

**esp_err_t** `usb_host_client_register` (const usb_host_client_config_t *client_config, usb_host_client_handle_t *client_hdl_ret)
Register a client of the USB Host Library.

- This function registers a client of the USB Host Library
- Once a client is registered, its processing function `usb_host_client_handle_events()` should be called repeatedly

**Parameters**
• **client_config** – [in] Client configuration
• **client_hdl_ret** – [out] Client handle

**Returns** `esp_err_t`

**esp_err_t usb_host_client_deregister**(usb_host_client_handle_t client_hdl)

Deregister a USB Host Library client.

• This function deregisters a client of the USB Host Library
• The client must have closed all previously opened devices before attempting to deregister

**Parameters**

• **client_hdl** – [in] Client handle

**Returns** `esp_err_t`

**esp_err_t usb_host_client_handle_events**(usb_host_client_handle_t client_hdl, TickType_t timeout_ticks)

USB Host Library client processing function.

• This function handles all of a client’s processing and should be called repeatedly in a loop
• For a particular client, this function should never be called by multiple threads simultaneously

**Note:** This function can block

**Parameters**

• **client_hdl** – [in] Client handle
• **timeout_ticks** – [in] Timeout in ticks to wait for an event to occur

**Returns** `esp_err_t`

**esp_err_t usb_host_client_unblock**(usb_host_client_handle_t client_hdl)

Unblock a client.

• This function simply unblocks a client if it is blocked on the usb_host_client_handle_events() function.
• This function is useful when need to unblock a client in order to deregister it.

**Parameters**

• **client_hdl** – [in] Client handle

**Returns** `esp_err_t`

**esp_err_t usb_host_device_open**(usb_host_client_handle_t client_hdl, uint8_t dev_addr,
                                            usb_device_handle_t *dev_hdl_ret)

Open a device.

• This function allows a client to open a device
• A client must open a device first before attempting to use it (e.g., sending transfers, device requests etc.)

**Parameters**

• **client_hdl** – [in] Client handle
• **dev_addr** – [in] Device’s address
• **dev_hdl_ret** – [out] Device’s handle

**Returns** `esp_err_t`
esp_err_t usb_host_device_close(usb_host_client_handle_t client_hdl, usb_device_handle_t dev_hdl)

Close a device.

- This function allows a client to close a device
- A client must close a device after it has finished using the device (claimed interfaces must also be released)
- A client must close all devices it has opened before deregistering

Note: This function can block

Parameters
- client_hdl -[in] Client handle
- dev_hdl -[in] Device handle

Returns esp_err_t

esp_err_t usb_host_device_free_all (void)

Indicate that all devices can be freed when possible.

- This function marks all devices as waiting to be freed
- If a device is not opened by any clients, it will be freed immediately
- If a device is opened by at least one client, the device will be free when the last client closes that device.
- Wait for the USB_HOST_LIB_EVENT_FLAGS_ALL_FREE flag to be set by usb_host_lib_handle_events() in order to know when all devices have been freed
- This function is useful when cleaning up devices before uninstalling the USB Host Library

Returns
- ESP_ERR_NOT_FINISHED: There are one or more devices that still need to be freed.
  Wait for USB_HOST_LIB_EVENT_FLAGS_ALL_FREE event
- ESP_OK: All devices already freed (i.e., there were no devices)
- Other: Error

esp_err_t usb_host_device_addr_list_fill (int list_len, uint8_t*dev_addr_list, int*num_dev_ret)

Fill a list of device address.

- This function fills an empty list with the address of connected devices
- The Device addresses can then used in usb_host_device_open()
- If there are more devices than the list_len, this function will only fill up to list_len number of devices.

Parameters
- list_len -[in] Length of the empty list
- dev_addr_list -[inout] Empty list to be filled
- num_dev_ret -[out] Number of devices

Returns esp_err_t

esp_err_t usb_host_device_info (usb_device_handle_t dev_hdl, usb_device_info_t *dev_info)

Get device’s information.

- This function gets some basic information of a device
- The device must be opened first before attempting to get its information

Note: This function can block
### Parameters
- **dev_hdl** [in] Device handle
- **dev_info** [out] Device information

### Returns
*esp_err_t*

#### esp_err_t usb_host_get_device_descriptor(usb_device_handle_t dev_hdl, const usb_device_desc_t **device_desc)

Get device’s device descriptor.

- A client must call `usb_host_device_open()` first
- No control transfer is sent. The device’s descriptor is cached on enumeration
- This function simply returns a pointer to the cached descriptor

---

**Note:** No control transfer is sent. The device’s descriptor is cached on enumeration

### Parameters
- **dev_hdl** [in] Device handle
- **device_desc** [out] Device descriptor

### Returns
*esp_err_t*

#### esp_err_t usb_host_get_active_config_descriptor(usb_device_handle_t dev_hdl, const usb_config_desc_t **config_desc)

Get device’s active configuration descriptor.

- A client must call `usb_host_device_open()` first
- No control transfer is sent. The device’s active configuration descriptor is cached on enumeration
- This function simply returns a pointer to the cached descriptor

---

**Note:** This function can block

**Note:** No control transfer is sent. A device’s active configuration descriptor is cached on enumeration

### Parameters
- **client_hdl** [in] Client handle
- **dev_hdl** [in] Device handle
- **alt_settings** [out] Configuration descriptor

### Returns
*esp_err_t*

#### esp_err_t usb_host_interface_claim(usb_host_client_handle_t client_hdl, usb_device_handle_t dev_hdl, uint8_t bInterfaceNumber, uint8_t bAlternateSetting)

Function for a client to claim a device’s interface.

- A client must claim a device’s interface before attempting to communicate with any of its endpoints
- Once an interface is claimed by a client, it cannot be claimed by any other client.

---

**Note:** This function can block
• dev_hdl – [in] Device handle
• bInterfaceNumber – [in] Interface number
• bAlternateSetting – [in] Interface alternate setting number

Returns esp_err_t

esp_err_t usb_host_interface_release ARISING
Function for a client to release a previously claimed interface.

• A client should release a device’s interface after it no longer needs to communicate with the interface
• A client must release all of its interfaces of a device it has claimed before being able to close the device

Note: This function can block

Parameters
• client_hdl – [in] Client handle
• dev_hdl – [in] Device handle
• bInterfaceNumber – [in] Interface number

Returns esp_err_t

esp_err_t usb_host_endpoint_halt (usb_device_handle_t dev_hdl, uint8_t bEndpointAddress)

Halt a particular endpoint.

• The device must have been opened by a client
• The endpoint must be part of an interface claimed by a client
• Once halted, the endpoint must be cleared using usb_host_endpoint_clear() before it can communicate again

Note: This function can block

Parameters
• dev_hdl – Device handle
• bEndpointAddress – Endpoint address

Returns esp_err_t

esp_err_t usb_host_endpoint_flush (usb_device_handle_t dev_hdl, uint8_t bEndpointAddress)

Flush a particular endpoint.

• The device must have been opened by a client
• The endpoint must be part of an interface claimed by a client
• The endpoint must have been halted (either through a transfer error, or usb_host_endpoint_halt())
• Flushing an endpoint will caused an queued up transfers to be canceled

Note: This function can block

Parameters
• dev_hdl – Device handle
• bEndpointAddress – Endpoint address

Returns esp_err_t
**esp_err_t** `usb_host_endpoint_clear (usb_device_handle_t dev_hdl, uint8_t bEndpointAddress)`

Clear a halt on a particular endpoint.

- The device must have been opened by a client
- The endpoint must be part of an interface claimed by a client
- The endpoint must have been halted (either through a transfer error, or `usb_host_endpoint_halt()`)  
- If the endpoint has any queued up transfers, clearing a halt will resume their execution

**Note:** This function can block

**Parameters**
- dev_hdl – Device handle
- bEndpointAddress – Endpoint address

**Returns** esp_err_t

**esp_err_t** `usb_host_transfer_alloc (size_t data_buffer_size, int num_isoc_packets, usb_transfer_t **transfer)`

Allocate a transfer object.

- This function allocates a transfer object
- Each transfer object has a fixed sized buffer specified on allocation
- A transfer object can be re-used indefinitely
- A transfer can be submitted using `usb_host_transfer_submit()` or `usb_host_transfer_submit_control()`

**Parameters**
- data_buffer_size – [in] Size of the transfer’s data buffer
- num_isoc_packets – [in] Number of isochronous packets in transfer (set to 0 for non-isochronous transfers)
- transfer – [out] Transfer object

**Returns** esp_err_t

**esp_err_t** `usb_host_transfer_free (usb_transfer_t *transfer)`

Free a transfer object.

- Free a transfer object previously allocated using `usb_host_transfer_alloc()`
- The transfer must not be in-flight when attempting to free it
- If a NULL pointer is passed, this function will simply return ESP_OK

**Parameters** transfer – [in] Transfer object

**Returns** esp_err_t

**esp_err_t** `usb_host_transfer_submit (usb_transfer_t *transfer)`

Submit a non-control transfer.

- Submit a transfer to a particular endpoint. The device and endpoint number is specified inside the transfer
- The transfer must be properly initialized before submitting
- On completion, the transfer’s callback will be called from the client’s `usb_host_client_handle_events()` function.

**Parameters** transfer – [in] Initialized transfer object

**Returns** esp_err_t
Chapter 2. API Reference

```c
esp_err_t usb_host_transfer_submit_control(usb_host_client_handle_t client_hdl, usb_transfer_t *transfer)
```

Submit a control transfer.

- Submit a control transfer to a particular device. The client must have opened the device first
- The transfer must be properly initialized before submitting. The first 8 bytes of the transfer’s data buffer should contain the control transfer setup packet
- On completion, the transfer’s callback will be called from the client’s `usb_host_client_handle_events()` function.

**Parameters**
- `client_hdl` [in] Client handle
- `transfer` [in] Initialized transfer object

**Returns** `esp_err_t`

**Structures**

```c
class usb_host_client_event_msg_t
```

Client event message.

Client event messages are sent to each client of the USB Host Library in order to notify them of various USB Host Library events such as:

- Addition of new devices
- Removal of existing devices

**Note:** The event message structure has a union with members corresponding to each particular event. Based on the event type, only the relevant member field should be accessed.

**Public Members**

```c
usb_host_client_event_t event
```

Type of event

```c
uint8_t address
```

New device’s address

```c
struct usb_host_client_event_msg_t::[anonymous]::[anonymous] new_dev
```

New device info

```c
usb_device_handle_t dev_hdl
```

The handle of the device that was gone

```c
struct usb_host_client_event_msg_t::[anonymous]::[anonymous] dev_gone
```

Gone device info

```c
struct usb_host_lib_info_t
```

Current information about the USB Host Library obtained via `usb_host_lib_info()`
Public Members

int num_devices
    Current number of connected (and enumerated) devices

int num_clients
    Current number of registered clients

struct usb_host_config_t
    USB Host Library configuration.
    Configuration structure of the USB Host Library. Provided in the usb_host_install() function

Public Members

bool skip_phy_setup
    If set, the USB Host Library will not configure the USB PHY thus allowing the user to manually configure the USB PHY before calling usb_host_install(). Users should set this if they want to use an external USB PHY. Otherwise, the USB Host Library will automatically configure the internal USB PHY

int intr_flags
    Interrupt flags for the underlying ISR used by the USB Host stack

struct usb_host_client_config_t
    USB Host Library Client configuration.
    Configuration structure for a USB Host Library client. Provided in usb_host_client_register()

Public Members

bool is_synchronous
    Whether the client is asynchronous or synchronous or not. Set to false for now.

int max_num_event_msg
    Maximum number of event messages that can be stored (e.g., 3)

usb_host_client_event_cb_t client_event_callback
    Client’s event callback function

void *callback_arg
    Event callback function argument

struct usb_host_client_config_t::[anonymous]::[anonymous] async
    Async callback config

Macros

USB_HOST_LIB_EVENT_FLAGS_NO_CLIENTS
    All clients have been deregistered from the USB Host Library
USB_HOST_LIB_EVENT_FLAGS_ALL_FREE
The USB Host Library has freed all devices

Type Definitions
typedef struct usb_host_client_handle_s *usb_host_client_handle_t
Handle to a USB Host Library asynchronous client.
An asynchronous client can be registered using usb_host_client_register()

Note: Asynchronous API

typedef void (*usb_host_client_event_cb_t)(const usb_host_client_event_msg_t *event_msg, void *arg)
Client event callback.

• Each client of the USB Host Library must register an event callback to receive event messages from the USB Host Library.
• The client event callback is run from the context of the clients usb_host_client_handle_events() function

Enumerations
enum usb_host_client_event_t
The type event in a client event message.
Values:

enumerator USB_HOST_CLIENT_EVENT_NEW_DEV
A new device has been enumerated and added to the USB Host Library

enumerator USB_HOST_CLIENT_EVENT_DEV_GONE
A device opened by the client is now gone

Header File
• components/usb/include/usb/usb_helpers.h
• This header file can be included with:

```c
#include "usb/usb_helpers.h"
```
• This header file is a part of the API provided by the usb component. To declare that your component depends on usb, add the following to your CMakeLists.txt:

```cmake
REQUIRES usb
```
or

```cmake
PRIV_REQUIRES usb
```

Functions
const usb_standard_desc_t *usb_parse_next_descriptor (const usb_standard_desc_t *cur_desc, uint16_t wTotalLength, int *offset)
Get the next descriptor.

Given a particular descriptor within a full configuration descriptor, get the next descriptor within the configuration descriptor. This is a convenience function that can be used to walk each individual descriptor within a full configuration descriptor.

**Parameters**
- `cur_desc` - [in] Current descriptor
- `wTotalLength` - [in] Total length of the configuration descriptor
- `offset` - [inout] Byte offset relative to the start of the configuration descriptor. On input, it is the offset of the current descriptor. On output, it is the offset of the returned descriptor.

**Returns** `usb_standard_desc_t` Next descriptor, NULL if end of configuration descriptor reached

```c
const usb_standard_desc_t *usb_parse_next_descriptor_of_type (const usb_standard_desc_t *cur_desc, uint16_t wTotalLength, uint8_t bDescriptorType, int *offset)
```

Get the next descriptor of a particular type.

Given a particular descriptor within a full configuration descriptor, get the next descriptor of a particular type (i.e., using the `bDescriptorType` value) within the configuration descriptor.

**Parameters**
- `cur_desc` - [in] Current descriptor
- `wTotalLength` - [in] Total length of the configuration descriptor
- `bDescriptorType` - [in] Type of the next descriptor to get
- `offset` - [inout] Byte offset relative to the start of the configuration descriptor. On input, it is the offset of the current descriptor. On output, it is the offset of the returned descriptor.

**Returns** `usb_standard_desc_t` Next descriptor, NULL if end descriptor is not found or configuration descriptor reached

```c
int usb_parse_interface_number_of_alternate (const usb_config_desc_t *config_desc, uint8_t bInterfaceNumber)
```

Get the number of alternate settings for a `bInterfaceNumber`.

Given a particular configuration descriptor, for a particular `bInterfaceNumber`, get the number of alternate settings available for that interface (i.e., the max possible value of `bAlternateSetting` for that `bInterfaceNumber`).

**Parameters**
- `config_desc` - [in] Pointer to the start of a full configuration descriptor
- `bInterfaceNumber` - [in] Interface number

**Returns** `int` The number of alternate settings that the interface has, -1 if `bInterfaceNumber` not found

```c
const usb_intf_desc_t *usb_parse_interface_descriptor (const usb_config_desc_t *config_desc, uint8_t bInterfaceNumber, uint8_t bAlternateSetting, int *offset)
```

Get a particular interface descriptor (using `bInterfaceNumber` and `bAlternateSetting`)

Given a full configuration descriptor, get a particular interface descriptor.

**Note:** To get the number of alternate settings for a particular `bInterfaceNumber`, call `usb_parse_interface_number_of_alternate()`.

**Parameters**
- `config_desc` - [in] Pointer to the start of a full configuration descriptor
- `bInterfaceNumber` - [in] Interface number
- `bAlternateSetting` - [in] Alternate setting number
• offset - [out] Byte offset of the interface descriptor relative to the start of the configuration descriptor. Can be NULL.

**Returns** const usb_intf_desc_t* Pointer to interface descriptor, NULL if not found.

```c
const usb_ep_desc_t *usb_parse_endpoint_descriptor_by_index(const usb_intf_desc_t *intf_desc, int index, uint16_t wTotalLength, int *offset)
```

Get an endpoint descriptor within an interface descriptor.

Given an interface descriptor, get the Nth endpoint descriptor of the interface. The number of endpoints in an interface is indicated by the bNumEndpoints field of the interface descriptor.

**Note:** If bNumEndpoints is 0, it means the interface uses the default endpoint only

**Parameters**

- `intf_desc` - [in] Pointer to the start of an interface descriptor
- `index` - [in] Endpoint index
- `wTotalLength` - [in] Total length of the containing configuration descriptor
- `offset` - [inout] Byte offset relative to the start of the configuration descriptor. On input, it is the offset of the interface descriptor. On output, it is the offset of the endpoint descriptor.

**Returns** const usb_ep_desc_t* Pointer to endpoint descriptor, NULL if not found.

```c
const usb_ep_desc_t *usb_parse_endpoint_descriptor_by_address(const usb_config_desc_t *config_desc, uint8_t bInterfaceNumber, uint8_t bAlternateSetting, uint8_t bEndpointAddress, int *offset)
```

Get an endpoint descriptor based on an endpoint’s address.

Given a configuration descriptor, get an endpoint descriptor based on its bEndpointAddress, bAlternateSetting, and bInterfaceNumber.

**Parameters**

- `config_desc` - [in] Pointer to the start of a full configuration descriptor
- `bInterfaceNumber` - [in] Interface number
- `bAlternateSetting` - [in] Alternate setting number
- `bEndpointAddress` - [in] Endpoint address
- `offset` - [out] Byte offset of the endpoint descriptor relative to the start of the configuration descriptor. Can be NULL

**Returns** const usb_ep_desc_t* Pointer to endpoint descriptor, NULL if not found.

```c
void usb_print_device_descriptor (const usb_device_desc_t *devc_desc)
```

Print device descriptor.

**Parameters** `devc_desc` - Device descriptor

```c
void usb_print_config_descriptor (const usb_config_desc_t *cfg_desc, print_class_descriptor_cb class_specific_cb)
```

Print configuration descriptor.

- This function prints the full contents of a configuration descriptor (including interface and endpoint descriptors)
- When a non-standard descriptor is encountered, this function will call the class_specific_cb if it is provided

**Parameters**

- `cfg_desc` - Pointer to the start of a full configuration descriptor
- `class_specific_cb` Function to call when a non-standard descriptor is encountered
• **cfg_desc** - Configuration descriptor
• **class_specific_cb** - Class specific descriptor callback. Can be NULL

```c
void usb_print_string_descriptor (const usb_str_desc_t *str_desc)
```

Print a string descriptor.

This function will only print ASCII characters of the UTF-16 encoded string

**Parameters**
- **str_desc** - String descriptor

```c
static inline int usb_round_up_to_mps (int num_bytes, int mps)
```

Round up to an integer multiple of endpoint’s MPS.

This is a convenience function to round up a size/length to an endpoint’s MPS (Maximum packet size). This is useful when calculating transfer or buffer lengths of IN endpoints.

- If MPS <= 0, this function will return 0
- If num_bytes <= 0, this function will return 0

**Parameters**
- **num_bytes** - [in] Number of bytes
- **mps** - [in] MPS

**Returns** int Round up integer multiple of MPS

**Type Definitions**

```c
typedef void (*print_class_descriptor_cb)(const usb_standard_desc_t *)
```

Print class specific descriptor callback.

Optional callback to be provided to `usb_print_config_descriptor()` function. The callback is called when when a non-standard descriptor is encountered. The callback should decode the descriptor as print it.

**Header File**

- `components/usb/include/usb/usb_types_stack.h`
- This header file can be included with:

  ```c
  #include  "usb/usb_types_stack.h"
  ```

- This header file is a part of the API provided by the `usb` component. To declare that your component depends on `usb`, add the following to your `CMakeLists.txt`:

  ```
  REQUIRES usb
  ```

  or

  ```
  PRIV_REQUIRES usb
  ```

**Structures**

```c
struct usb_device_info_t
```

Basic information of an enumerated device.

**Public Members**

```c
usb_speed_t speed
```

Device’s speed
uint8_t dev_addr
    Device’s address

uint8_t bMaxPacketSize0
    The maximum packet size of the device’s default endpoint

uint8_t bConfigurationValue
    Device’s current configuration number

const usb_str_desc_t *str_desc_manufacturer
    Pointer to Manufacturer string descriptor (can be NULL)

const usb_str_desc_t *str_desc_product
    Pointer to Product string descriptor (can be NULL)

const usb_str_desc_t *str_desc_serial_num
    Pointer to Serial Number string descriptor (can be NULL)

struct usb_isoc_packet_desc_t
    Isochronous packet descriptor.
    If the number of bytes in an Isochronous transfer is larger than the MPS of the endpoint, the transfer is split into multiple packets transmitted at the endpoint’s specified interval. An array of Isochronous packet descriptors describes how an Isochronous transfer should be split into multiple packets.

Public Members

int num_bytes
    Number of bytes to transmit/receive in the packet. IN packets should be integer multiple of MPS

int actual_num_bytes
    Actual number of bytes transmitted/received in the packet

usb_transfer_status_t status
    Status of the packet

struct usb_transfer_s
    USB transfer structure.

Public Members

uint8_t *const data_buffer
    Pointer to data buffer

const size_t data_buffer_size
    Size of the data buffer in bytes
Chapter 2. API Reference

int num_bytes
Number of bytes to transfer. Control transfers should include the size of the setup packet. Isochronous
transfer should be the total transfer size of all packets. For non-control IN transfers, num_bytes should
be an integer multiple of MPS.

int actual_num_bytes
Actual number of bytes transferred

uint32_t flags
Transfer flags

usb_device_handle_t device_handle
Device handle

uint8_t bEndpointAddress
Endpoint Address

usb_transfer_status_t status
Status of the transfer

uint32_t timeout_ms
Timeout (in milliseconds) of the packet (currently not supported yet)

usb_transfer_cb_t callback
Transfer callback

void *context
Context variable for transfer to associate transfer with something

const int num_isoc_packets
Only relevant to Isochronous. Number of service periods (i.e., intervals) to transfer data buffer over.

usb_isoc_packet_desc_t isoc_packet_desc[]
Descriptors for each Isochronous packet

Macros

USB_TRANSFER_FLAG_ZERO_PACK
Terminate Bulk/Interrupt OUT transfer with a zero length packet.

OUT transfers normally terminate when the Host has transferred the exact amount of data it needs to the device.
However, for bulk and interrupt OUT transfers, if the transfer size just happened to be a multiple of MPS, it
will be impossible to know the boundary between two consecutive transfers to the same endpoint.

Therefore, this flag will cause the transfer to automatically add a zero length packet (ZLP) at the end of the
transfer if the following conditions are met:

• The target endpoint is a Bulk/Interrupt OUT endpoint (Host to device)
• The transfer’s length (i.e., transfer.num_bytes) is a multiple of the endpoint’s MPS

Otherwise, this flag has no effect.

Users should check whether their target device’s class requires a ZLP, as not all Bulk/Interrupt OUT endpoints
require them. For example:
Chapter 2. API Reference

- For MSC Bulk Only Transport class, the Host MUST NEVER send a ZLP. Bulk transfer boundaries are determined by the CBW and CSW instead.
- For CDC Ethernet, the Host MUST ALWAYS send a ZLP if a segment (i.e., a transfer) is a multiple of MPS (See 3.3.1 Segment Delineation)

**Note:** See USB2.0 specification 5.7.3 and 5.8.3 for more details

**Note:** IN transfers normally terminate when the Host as receive the exact amount of data it needs (must be multiple of MPS) or the endpoint sends a short packet to the Host (For bulk OUT only). Indicates that a bulk OUT transfers should always terminate with a short packet, even if it means adding an extra zero length packet

### Type Definitions

typedef struct usb_device_handle_s *usb_device_handle_t
Handle of a USB Device connected to a USB Host.

typedef struct usb_transfer_s usb_transfer_t
USB transfer structure.

This structure is used to represent a transfer from a software client to an endpoint over the USB bus. Some of the fields are made const on purpose as they are fixed on allocation. Users should call the appropriate USB Host Library function to allocate a USB transfer structure instead of allocating this structure themselves.

The transfer type is inferred from the endpoint this transfer is sent to. Depending on the transfer type, users should note the following:

- **Bulk:** This structure represents a single bulk transfer. If the number of bytes exceeds the endpoint’s MPS, the transfer will be split into multiple MPS sized packets followed by a short packet.
- **Control:** This structure represents a single control transfer. This first 8 bytes of the data_buffer must be filled with the setup packet (see `usb_setup_packet_t`). The num_bytes field should be the total size of the transfer (i.e., size of setup packet + wLength).
- **Interrupt:** Represents an interrupt transfer. If num_bytes exceeds the MPS of the endpoint, the transfer will be split into multiple packets, and each packet is transferred at the endpoint’s specified interval.
- **Isochronous:** Represents a stream of bytes that should be transferred to an endpoint at a fixed rate. The transfer is split into packets according to the each isoc_packet_desc. A packet is transferred at each interval of the endpoint. If an entire ISOC URB was transferred without error (skipped packets do not count as errors), the URB’s overall status and the status of each packet descriptor will be updated, and the actual_num_bytes reflects the total bytes transferred over all packets. If the ISOC URB encounters an error, the entire URB is considered erroneous so only the overall status will updated.

**Note:** For Bulk/Control/Interrupt IN transfers, the num_bytes must be an integer multiple of the endpoint’s MPS

**Note:** This structure should be allocated via usb_host_transfer_alloc()

**Note:** Once the transfer has be submitted, users should not modify the structure until the transfer has completed

typedef void (*usb_transfer_cb_t)(usb_transfer_t *transfer)
USB transfer completion callback.

**Enumerations**

`enum usb_speed_t`  
USB Standard Speeds.  
*Values:*

enumerator **USB_SPEED_LOW**  
USB Low Speed (1.5 Mbit/s)

enumerator **USB_SPEED_FULL**  
USB Full Speed (12 Mbit/s)

`enum usb_transfer_type_t`  
The type of USB transfer.  
*Note:* The enum values need to match the bmAttributes field of an EP descriptor  
*Values:*

enumerator **USB_TRANSFER_TYPE_CTRL**

enumerator **USB_TRANSFER_TYPE_ISOCHRONOUS**

enumerator **USB_TRANSFER_TYPE_BULK**

enumerator **USB_TRANSFER_TYPE_INTR**

`enum usb_transfer_status_t`  
The status of a particular transfer.  
*Values:*

enumerator **USB_TRANSFER_STATUS_COMPLETED**  
The transfer was successful (but may be short)

enumerator **USB_TRANSFER_STATUS_ERROR**  
The transfer failed because due to excessive errors (e.g. no response or CRC error)

enumerator **USB_TRANSFER_STATUS_TIMED_OUT**  
The transfer failed due to a time out

enumerator **USB_TRANSFER_STATUS_CANCELED**  
The transfer was canceled

enumerator **USB_TRANSFER_STATUSSTALL**  
The transfer was stalled
enumerator **USB_TRANSFER_STATUS_OVERFLOW**
The transfer as more data was sent than was requested

eumerator **USB_TRANSFER_STATUS_SKIPPED**
ISOC packets only. The packet was skipped due to system latency or bus overload

eumerator **USB_TRANSFER_STATUS_NO_DEVICE**
The transfer failed because the target device is gone

**Header File**
- `components/usb/include/usb/usb_types_ch9.h`
- This header file can be included with:
  ```
  #include "usb/usb_types_ch9.h"
  ```
- This header file is a part of the API provided by the `usb` component. To declare that your component depends on `usb`, add the following to your CMakeLists.txt:
  ```
  REQUIRE usb
  ```
  or
  ```
  PRIV_REQUIRES usb
  ```

**Unions**

union **usb_setup_packet_t**
```
#include <usb_types_ch9.h> Structure representing a USB control transfer setup packet.
See Table 9-2 of USB2.0 specification for more details
```

**Public Members**

uint8_t **bmRequestType**
Characteristics of request

uint8_t **bRequest**
Specific request

uint16_t **wValue**
Word-sized field that varies according to request

uint16_t **wIndex**
Word-sized field that varies according to request; typically used to pass an index or offset

uint16_t **wLength**
Number of bytes to transfer if there is a data stage

struct **usb_setup_packet_t**::{anonymous} [anonymous]
```c
uint8_t val[USB_SETUP_PACKET_SIZE]

Descriptor value

union usb_standard_desc_t

#include <usb_types_ch9.h> USB standard descriptor.

All USB standard descriptors start with these two bytes. Use this type when traversing over configuration descriptors

Public Members

uint8_t bLength

Size of the descriptor in bytes

uint8_t bDescriptorType

Descriptor Type

struct usb_standard_desc_t:[anonymous] USB_DESC_ATTR

USB descriptor attributes

uint8_t val[USB_STANDARD_DESC_SIZE]

Descriptor value

union usb_device_desc_t

#include <usb_types_ch9.h> Structure representing a USB device descriptor.

See Table 9-8 of USB2.0 specification for more details

Public Members

uint8_t bLength

Size of the descriptor in bytes

uint8_t bDescriptorType

DEVICE Descriptor Type

uint16_t bcdUSB

USB Specification Release Number in Binary-Coded Decimal (i.e., 2.10 is 210H)

uint8_t bDeviceClass

Class code (assigned by the USB-IF)

uint8_t bDeviceSubClass

Subclass code (assigned by the USB-IF)

uint8_t bDeviceProtocol

Protocol code (assigned by the USB-IF)
```
uint8_t bMaxPacketSize0
            Maximum packet size for endpoint zero (only 8, 16, 32, or 64 are valid)

uint16_t idVendor
            Vendor ID (assigned by the USB-IF)

uint16_t idProduct
            Product ID (assigned by the manufacturer)

uint16_t bcdDevice
            Device release number in binary-coded decimal

uint8_t iManufacturer
            Index of string descriptor describing manufacturer

uint8_t iProduct
            Index of string descriptor describing product

uint8_t iSerialNumber
            Index of string descriptor describing the device’s serial number

uint8_t bNumConfigurations
            Number of possible configurations

struct usb_device_desc_t::[anonymous] USB_DESC_ATTR
            USB descriptor attributes

uint8_t val[USB_DEVICE_DESC_SIZE]
            Descriptor value

union usb_config_desc_t
            #include <usb_types_ch9.h> Structure representing a short USB configuration descriptor.
            See Table 9-10 of USB2.0 specification for more details

Note: The full USB configuration includes all the interface and endpoint descriptors of that configuration.

Public Members

uint8_t bLength
            Size of the descriptor in bytes

uint8_t bDescriptorType
            CONFIGURATION Descriptor Type

uint16_t wTotalLength
            Total length of data returned for this configuration
### Chapter 2. API Reference

```c
uint8_t bNumInterfaces
    Number of interfaces supported by this configuration

uint8_t bConfigurationValue
    Value to use as an argument to the SetConfiguration() request to select this configuration

uint8_t iConfiguration
    Index of string descriptor describing this configuration

uint8_t bmAttributes
    Configuration characteristics

uint8_t bMaxPower
    Maximum power consumption of the USB device from the bus in this specific configuration when the device is fully operational.

struct usb_config_desc_t::[anonymous] USB_DESC_ATTR
    USB descriptor attributes

uint8_t val[USB_CONFIG_DESC_SIZE]
    Descriptor value

union usb_iad_desc_t
    #include <usb_types_ch9.h> Structure representing a USB interface association descriptor.

Public Members

uint8_t bLength
    Size of the descriptor in bytes

uint8_t bDescriptorType
    INTERFACE ASSOCIATION Descriptor Type

uint8_t bFirstInterface
    Interface number of the first interface that is associated with this function

uint8_t bInterfaceCount
    Number of contiguous interfaces that are associated with this function

uint8_t bFunctionClass
    Class code (assigned by USB-IF)

uint8_t bFunctionSubClass
    Subclass code (assigned by USB-IF)

uint8_t bFunctionProtocol
    Protocol code (assigned by USB-IF)
```
### Chapter 2. API Reference

```c
uint8_t iFunction
    Index of string descriptor describing this function

struct usb_iad_desc_t::[anonymous] USB_DESC_ATTRIB
    USB descriptor attributes

uint8_t val[USB_IAD_DESC_SIZE]
    Descriptor value

union usb_intf_desc_t
#include <usb_types_ch9.h> Structure representing a USB interface descriptor.
    See Table 9-12 of USB2.0 specification for more details

**Public Members**

```c
uint8_t bLength
    Size of the descriptor in bytes

uint8_t bDescriptorType
    INTERFACE Descriptor Type

uint8_t bInterfaceNumber
    Number of this interface.

uint8_t bAlternateSetting
    Value used to select this alternate setting for the interface identified in the prior field

uint8_t bNumEndpoints
    Number of endpoints used by this interface (excluding endpoint zero).

uint8_t bInterfaceClass
    Class code (assigned by the USB-IF)

uint8_t bInterfaceSubClass
    Subclass code (assigned by the USB-IF)

uint8_t bInterfaceProtocol
    Protocol code (assigned by the USB)

uint8_t iInterface
    Index of string descriptor describing this interface

struct usb_intf_desc_t::[anonymous] USB_DESC_ATTRIB
    USB descriptor attributes

uint8_t val[USB_INTF_DESC_SIZE]
    Descriptor value
```
union usb_ep_desc_t

#include <usb_types_ch9.h> Structure representing a USB endpoint descriptor.

See Table 9-13 of USB2.0 specification for more details

**Public Members**

- **uint8_t bLength**
  Size of the descriptor in bytes

- **uint8_t bDescriptorType**
  ENDPOINT Descriptor Type

- **uint8_t bEndpointAddress**
  The address of the endpoint on the USB device described by this descriptor

- **uint8_t bmAttributes**
  This field describes the endpoint’s attributes when it is configured using the bConfigurationValue.

- **uint16_t wMaxPacketSize**
  Maximum packet size this endpoint is capable of sending or receiving when this configuration is selected.

- **uint8_t bInterval**
  Interval for polling Isochronous and Interrupt endpoints. Expressed in frames or microframes depending on the device operating speed (1 ms for Low-Speed and Full-Speed or 125 us for USB High-Speed and above).

struct usb_ep_desc_t::[anonymous] USB_DESC_ATTR

USB descriptor attributes

- **uint8_t val[USB_EP_DESC_SIZE]**
  Descriptor value

union usb_str_desc_t

#include <usb_types_ch9.h> Structure representing a USB string descriptor.

**Public Members**

- **uint8_t bLength**
  Size of the descriptor in bytes

- **uint8_t bDescriptorType**
  STRING Descriptor Type

- **uint16_t wData[]**
  UTF-16LE encoded
struct usb_str_desc_t::[anonymous] USB_DESC_ATTR
    USB descriptor attributes

uint8_t val[USB_STR_DESC_SIZE]
    Descriptor value

**Macros**

USB_DESC_ATTR

USB_B_DESCRIPTOR_TYPE_DEVICE
    Descriptor types from USB2.0 specification table 9.5.

USB_B_DESCRIPTOR_TYPE_CONFIGURATION

USB_B_DESCRIPTOR_TYPE_STRING

USB_B_DESCRIPTOR_TYPE_INTERFACE

USB_B_DESCRIPTOR_TYPE_ENDPOINT

USB_B_DESCRIPTOR_TYPE_DEVICE_QUALIFIER

USB_B_DESCRIPTOR_TYPE_OTHER_SPEED_CONFIGURATION

USB_B_DESCRIPTOR_TYPE_INTERFACE_POWER

USB_B_DESCRIPTOR_TYPE_OTG
    Descriptor types from USB 2.0 ECN.

USB_B_DESCRIPTOR_TYPE_DEBUG

USB_B_DESCRIPTOR_TYPE_INTERFACE_ASSOCIATION

USB_B_DESCRIPTOR_TYPE_SECURITY
    Descriptor types from Wireless USB spec.

USB_B_DESCRIPTOR_TYPE_KEY

USB_B_DESCRIPTOR_TYPE_ENCRYPTION_TYPE

USB_B_DESCRIPTOR_TYPE_BOS

USB_B_DESCRIPTOR_TYPE_DEVICE_CAPABILITY

USB_B_DESCRIPTOR_TYPE_WIRELESS_ENDPOINT_COMP
USB_B_DESCRIPTOR_TYPE_WIRE_ADAPTER

USB_B_DESCRIPTOR_TYPE_RPIPE

USB_B_DESCRIPTOR_TYPE_CS_RADIO_CONTROL

USB_B_DESCRIPTOR_TYPE_PIPE_USAGE
  Descriptor types from UAS specification.

USB_SETUP_PACKET_SIZE
  Size of a USB control transfer setup packet in bytes.

USB_BM_REQUEST_TYPE_DIR_OUT
  Bit masks belonging to the bmRequestType field of a setup packet.

USB_BM_REQUEST_TYPE_DIR_IN

USB_BM_REQUEST_TYPE_TYPE_STANDARD

USB_BM_REQUEST_TYPE_TYPE_CLASS

USB_BM_REQUEST_TYPE_TYPE_VENDOR

USB_BM_REQUEST_TYPE_TYPE_RESERVED

USB_BM_REQUEST_TYPE_TYPE_MASK

USB_BM_REQUEST_TYPE_RECIP_DEVICE

USB_BM_REQUEST_TYPE_RECIP_INTERFACE

USB_BM_REQUEST_TYPE_RECIP_ENDPOINT

USB_BM_REQUEST_TYPE_RECIP_OTHER

USB_BM_REQUEST_TYPE_RECIP_MASK

USB_B_REQUEST_GET_STATUS
  Bit masks belonging to the bRequest field of a packet.

USB_B_REQUEST_CLEAR_FEATURE

USB_B_REQUEST_SET_FEATURE

USB_B_REQUEST_SET_ADDRESS
Chapter 2. API Reference

USB_B_REQUEST_GET_DESCRIPTOR

USB_B_REQUEST_SET_DESCRIPTOR

USB_B_REQUEST_GET_CONFIGURATION

USB_B_REQUEST_SET_CONFIGURATION

USB_B_REQUEST_GET_INTERFACE

USB_B_REQUEST_SET_INTERFACE

USB_B_REQUEST_SYNCH_FRAME

USB_W_VALUE_DT_DEVICE
   Bit masks belonging to the wValue field of a setup packet.

USB_W_VALUE_DT_CONFIG

USB_W_VALUE_DT_STRING

USB_W_VALUE_DT_INTERFACE

USB_W_VALUE_DT_ENDPOINT

USB_W_VALUE_DT_DEVICE_QUALIFIER

USB_W_VALUE_DT_OTHER_SPEED_CONFIG

USB_W_VALUE_DT_INTERFACE_POWER

USB_SETUP_PACKET_INIT_SET_ADDR (setup_pkt_ptr, addr)
   Initializer for a SET_ADDRESS request.
   Sets the address of a connected device

USB_SETUP_PACKET_INIT_GET_DEVICE_DESC (setup_pkt_ptr)
   Initializer for a request to get a device’s device descriptor.

USB_SETUP_PACKET_INIT_GET_CONFIG (setup_pkt_ptr)
   Initializer for a request to get a device’s current configuration number.

USB_SETUP_PACKET_INIT_GET_CONFIG_DESC (setup_pkt_ptr, desc_index, desc_len)
   Initializer for a request to get one of the device’s current configuration descriptor.
   
   - desc_index indicates the configuration’s index number
   - Number of bytes of the configuration descriptor to get

USB_SETUP_PACKET_INIT_SET_CONFIG (setup_pkt_ptr, config_num)
   Initializer for a request to set a device’s current configuration number.
**Chapter 2. API Reference**

**USB_SETUP_PACKET_INIT_SET_INTERFACE**
(setup_pkt_ptr, intf_num, alt_setting_num)

Initializer for a request to set an interface’s alternate setting.

**USB_SETUP_PACKET_INIT_GET_STR_DESC**
(setup_pkt_ptr, string_index, lang_id, desc_len)

Initializer for a request to get a string descriptor.

**USB_STANDARD_DESC_SIZE**
Size of dummy USB standard descriptor.

**USB_DEVICE_DESC_SIZE**
Size of a USB device descriptor in bytes.

**USB_CLASS_PER_INTERFACE**
Possible base class values of the bDeviceClass field of a USB device descriptor.

**USB_CLASS_AUDIO**

**USB_CLASS_COMM**

**USB_CLASS_HID**

**USB_CLASS_PHYSICAL**

**USB_CLASS_STILL_IMAGE**

**USB_CLASS_PRINTER**

**USB_CLASS_MASS_STORAGE**

**USB_CLASS_HUB**

**USB_CLASS_CDC_DATA**

**USB_CLASS_CSCID**

**USB_CLASS_CONTENT_SEC**

**USB_CLASS_VIDEO**

**USB_CLASS_WIRELESS_CONTROLLER**

**USB_CLASS_PERSONAL_HEALTHCARE**

**USB_CLASS_AUDIO_VIDEO**

**USB_CLASS_BILLBOARD**
Chapter 2. API Reference

USB_CLASS_USB_TYPE_C_BRIDGE

USB_CLASS_MISC

USB_CLASS_APP_SPEC

USB_CLASS_VENDOR_SPEC

USB_SUBCLASS_VENDOR_SPEC

Vendor specific subclass code.

USB_CONFIG_DESC_SIZE

Size of a short USB configuration descriptor in bytes.

Note: The size of a full USB configuration includes all the interface and endpoint descriptors of that configuration.

USB_BM_ATTRIBUTES_ONE

Bit masks belonging to the bmAttributes field of a configuration descriptor.

Must be set

USB_BM_ATTRIBUTES_SELFPOWER

Self powered

USB_BM_ATTRIBUTES_WAKEUP

Can wake-up

USB_BM_ATTRIBUTES_BATTERY

Battery powered

USB_IAD_DESC_SIZE

Size of a USB interface association descriptor in bytes.

USB_INTF_DESC_SIZE

Size of a USB interface descriptor in bytes.

USB_EP_DESC_SIZE

Size of a USB endpoint descriptor in bytes.

USB_B_ENDPOINT_ADDRESS_EP_NUM_MASK

Bit masks belonging to the bEndpointAddress field of an endpoint descriptor.

USB_B_ENDPOINT_ADDRESS_EP_DIR_MASK

USB_BM_ATTRIBUTES_XFERTYPE_MASK

Bit masks belonging to the bmAttributes field of an endpoint descriptor.
USB_BM_ATTRIBUTES_XFER_CONTROL
USB_BM_ATTRIBUTES_XFER_ISOC
USB_BM_ATTRIBUTES_XFER_BULK
USB_BM_ATTRIBUTES_XFER_INT
USB_BM_ATTRIBUTES_SYNCTYPE_MASK
USB_BM_ATTRIBUTES_SYNC_NONE
USB_BM_ATTRIBUTES_SYNC_ASYNC
USB_BM_ATTRIBUTES_SYNC_ADAPTIVE
USB_BM_ATTRIBUTES_SYNC_SYNC
USB_BM_ATTRIBUTES_USAGETYPE_MASK
USB_BM_ATTRIBUTES_USAGE_DATA
USB_BM_ATTRIBUTES_USAGE_FEEDBACK
USB_BM_ATTRIBUTES_USAGE_IMPLICIT_FB

USB_EP_DESC_GET_XFERTYPE (desc_ptr)
    Macro helpers to get information about an endpoint from its descriptor.
USB_EP_DESC_GET_EP_NUM (desc_ptr)
USB_EP_DESC_GET_EP_DIR (desc_ptr)
USB_EP_DESC_GET_MPS (desc_ptr)

USB_STR_DESC_SIZE
    Size of a short USB string descriptor in bytes.

Enumerations
enum usb_device_state_t
    USB2.0 device states.
    See Table 9-1 of USB2.0 specification for more details

Note: The USB_DEVICE_STATE_NOT_ATTACHED is not part of the USB2.0 specification, but is a catch all state for devices that need to be cleaned up after a sudden disconnection or port error.

Values:
enumerator **USB DEVICE STATE NOT ATTACHED**

The device was previously configured or suspended, but is no longer attached (either suddenly disconnected or a port error)

enumerator **USB DEVICE STATE ATTACHED**

Device is attached to the USB, but is not powered.

enumerator **USB DEVICE STATE POWERED**

Device is attached to the USB and powered, but has not been reset.

enumerator **USB DEVICE STATE DEFAULT**

Device is attached to the USB and powered and has been reset, but has not been assigned a unique address. Device responds at the default address.

enumerator **USB DEVICE STATE ADDRESS**

Device is attached to the USB, powered, has been reset, and a unique device address has been assigned. Device is not configured.

enumerator **USB DEVICE STATE CONFIGURED**

Device is attached to the USB, powered, has been reset, has a unique address, is configured, and is not suspended. The host may now use the function provided by the device.

enumerator **USB DEVICE STATE SUSPENDED**

Device is, at minimum, attached to the USB and is powered and has not seen bus activity for 3 ms. It may also have a unique address and be configured for use. However, because the device is suspended, the host may not use the device’s function.

**Maintainers Notes**

**Note:** For more details regarding the internal implementation details of the USB Host stack, please refer to [USB Host Maintainers Notes (Introduction)](https://github.com/esp-idf/esp-idf).
The embedded nature of Host Stack means limited hardware resources (such as memory and processing power) when compared to larger host systems.

**USB2.0 Chapter 10:**

Chapter 10 of the USB 2.0 specifications specifies certain requirements of USB Host systems, in particular the required layers of the USB Host’s system software.

**Diverse Use Case Complexities:**

The embedded nature of the Host Stack also means a wide range of use cases with differing complexities. Some USB Host applications aim to only support a single vendor specific device, whereas other applications require support for a wide range of devices of different classes.

**Requirements**

Given the design considerations above, the Host Stack was designed with the following set of requirements:

- **DMA Support**
  
  Requirement: The Host Stack must support DMA.

  The Host Stack must support DMA in order to reduce CPU’s workload. DMA support allows the automatic copying of USB transfer data to/from the Host Controller without CPU intervention. This is especially critical given the embedded nature of the CPU (i.e., lower CPU frequencies) and large maximum data payloads of USB transfers (e.g., 1023 bytes for isochronous transfers).

- **Minimize Memory Copies**
  
  Requirement: The Host Stack should minimize the amount of memory copies when passing data between layers.

  Various data and objects (e.g., USB transfers) need to be passed between multiple layers of the Host Stack. The Host Stack should minimize the amount of memory copies that occur between layers by allocating the data’s/object’s memory once, and simply passing a pointer to that data/object between the layers. Therefore, the Host Stack requires some standardized data types shared across multiple layers (see USB2.0 Section 10.3.4).
**Event Driven** Requirement: The Host Stack must allow for event driven operation (i.e., the Host Stack’s API must not be polling).

The Host Stack needs to support some CPU intensive use application scenarios such as video streaming (i.e., UVC class). Therefore, the Host Stack should minimize CPU usage by allowing for completely event driven operation, thus reserving the majority of CPU time for the application itself (i.e., video encoding/decoding in this case).

The Host Stack needs to communicate events across the layers using interrupts, callbacks, and FreeRTOS synchronization primitives (e.g., queues and semaphores).

**No Task Creation** Requirement: All layers of the Host Stack below (and including) the Host Library layer must not create any tasks.

Task stacks are generally one of the most memory intensive parts of an ESP-IDF applications. Given the wide range of applications scenarios, the number of tasks created (and their stack sizes) can vary greatly. For example:

- applications that require low latency or high throughput (such as isochronous transfers) may choose to create a dedicated task to handle those transfers in order to minimize latency.
- applications that do not have strict latency requirements (such as bulk transfers) may choose to handle those transfers from a shared task in order to save some memory.

Therefore, all layers of the Host Stack below (and including) the Host Library layer **must not** create any tasks. Instead, these layers should expose handlers functions to be called from tasks created by the upper layers. Task creation will be delegated to the class driver or application layer.

**Operable at Different Layers** Given the wide range of use case complexities, the Host Stack must be operable at different layers, allowing users to use the Host Stack at a lower layer (e.g., the HCD or HAL) or at a higher layer (e.g., a class driver).

Being operable at different layers allows the users to decide on the appropriate trade-off between convenience, control, and optimization for their application when using the Host Stack. For example:

- Host Stack applications that support a dedicated custom device may want to use a lower level of abstraction for better optimization, control, and simpler API.
- Host Stack applications that need to support a wide range of device classes requires the full Host Stack so that device enumeration is automatically handled.

**Coding Conventions** The Host Stack follows the following set of coding rules/guidelines for better code readability and maintainability:

**Symbols Use Layer Name As Prefix** For each layer of the Host Stack, the symbols exposed by that layer (i.e., functions, types, macros) must be prefixed with that layer’s name. For example, the symbols exposed by the HCD layer will be prefixed hcd_.../HCD_....

However, internal symbols (e.g., static functions) **should not** be prefixed with their layer’s name. This makes it easier to differentiate between internal and external symbols when modifying that layer’s source code.

**Critical Section Functions Prefixed With _** In each layer of the Host Stack, there are various static functions that must be called inside a critical section. The names of these functions are prefixed with _ (e.g., _func_called_from_crit()) to make it easier for maintainers to differentiate which functions should be called from critical sections. For example:

```c
some_func(); // Called outside critical section
taskENTER_CRITICAL(&some_lock);
_some_func_crit(); // Called inside critical section. _ prefix makes it easier to...
~differentiate
taskEXIT_CRITICAL(&some_lock);
```
Grouping Structure Members by Locking Mechanism

Some layers of the Host Stack utilize multiple locking schemes (e.g., critical sections and task mutexes) to ensure thread safety, where each locking scheme offers a different level of protection. However, member variables of the same object can be protected by different locking scheme. Therefore, to clearly demarcate the different locking schemes and their associated variables, structure members are grouped by locking scheme as nested structures.

<table>
<thead>
<tr>
<th>Locking Scheme</th>
<th>Nested Structure</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Critical Sections</td>
<td>dyn-matic</td>
<td>Shared data accessed from both a task context and ISR context are protected by a critical section.</td>
</tr>
<tr>
<td>Task Mutexes</td>
<td>mux-protected</td>
<td>Data accessed from only a task context are protected by a FreeRTOS Mutex</td>
</tr>
<tr>
<td>Single Thread</td>
<td>single-thread</td>
<td>Data that is only ever accessed by the same task do not require the use of any locks.</td>
</tr>
<tr>
<td>Constant</td>
<td>const-ant</td>
<td>Constant data is set once during the object’s instantiation and never changed again. Thus, any task or ISR can freely the constant data without the use of locks, so long as the variable is never written to.</td>
</tr>
</tbody>
</table>

Grouping structure members by locking scheme makes the code more maintainable as it makes clear which locking scheme is required when accessing a particular member variable, as demonstrated in the code snippet below:

```c
typedef struct some_obj some_obj_t;

some_obj_t obj;

// Accessing dynamic members requires critical section
taskENTER_CRITICAL(&some_lock);
obj.dynamic.varA = 1;
taskEXIT_CRITICAL(&some_lock);

// Accessing mutex protected members requires taking the mutex
xSemaphoreTake(&some_mux, portMAX_DELAY);
obj.mux_protected.varB = 1;
xSemaphoreGive(&some_mux);

// Accessing single thread members does not require locking so long as this is the only task to access it
obj.single_thread.varC = 1;

// Accessing constant members requires no locking. But only read access is allowed
int local_var = obj.constant.varD;
```

USB Host Maintainers Notes (Architecture)

The Host Stack is roughly split into multiple layers of abstraction, with each layer representing different USB concepts and a different level of USB Host operation. For example, a higher layer may present an abstraction of devices and application data transfers, whereas a lower layer may present an abstraction of endpoints and USB transfers.

Layer Descriptions

The layers of the Host Stack are described in the following table. The layers are ordered from lowest layer (i.e., furthest away from the user) to highest layer (i.e., closest to the user).
Table 7: Host Stack Layers

<table>
<thead>
<tr>
<th>Layer</th>
<th>Files</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Host Controller (DWC_OTG)</td>
<td>N/A</td>
<td>This layer represents the USB Controller Hardware of the ESP32-S2. The API presented by this layer is the register interface of the controller.</td>
</tr>
<tr>
<td>LL</td>
<td>usbh_ll.h</td>
<td>The LL (Low Level) layer abstracts the basic register access of the USB controller according to ESP-IDF’s Hardware Abstraction API Guidelines. In other words, this layer provides APIs to access the controller’s registers and format/parse the controller’s DMA descriptors.</td>
</tr>
<tr>
<td>HAL</td>
<td>usbh_hal.h, usbh_hal.c</td>
<td>The HAL (Hardware Abstraction Layer) abstracts the operating steps of the USB controller into functions according to ESP-IDF’s Hardware Abstraction API Guidelines. This layer also abstracts the controller’s host port and host channels, and provides APIs to operate the them.</td>
</tr>
<tr>
<td>HCD</td>
<td>hcd.h, hcd.c</td>
<td>The HCD (Host Controller Driver) acts as hardware agnostic API for all USB controllers (i.e., an API that can theoretically be used with any USB controller implementation). This layer also abstracts the root port (i.e., root hub) and USB pipes.</td>
</tr>
<tr>
<td>USBH and Hub Driver</td>
<td>usbh.h, usbh.c</td>
<td>The USBH (USB Host Driver) layer is equivalent to the USBD layer described in chapter 10 of the USB2.0 specification. The USBH presents an abstraction of USB devices, internally manages a list of connected devices (i.e., device pool), and also arbitrates device sharing between clients (i.e., tracks which endpoints are in use and also presents a shared endpoint 0).</td>
</tr>
<tr>
<td>Hub Driver</td>
<td>hub.h, hub.c</td>
<td>The Hub Driver layer acts as a special client of the USBH that is responsible for handling device attachment/detachment, and notifying the USBH of such events. For device attachment, the Hub Driver also handles the enumeration process as well.</td>
</tr>
<tr>
<td>USB Host Library</td>
<td>usb_host.h, usb_host.c</td>
<td>The USB Host Library layer is the lowest public API layer of the Host Stack and presents the concept of USB Host Clients. The abstraction of clients allows for multiple class drivers to coexist simultaneously (where each class roughly maps to a single client) and also acts as a mechanism for division of labor (where each client is responsible for its own processing and event handling).</td>
</tr>
<tr>
<td>Host Class Drivers</td>
<td>See the ESP-IDF Extra Components repository or the USB Host examples in ESP-IDF (via peripherals/usb/host)</td>
<td>The Host Class Drivers implement the host side of a particular device class (e.g., CDC, MSC, HID). The exposed API is specific to each class driver.</td>
</tr>
</tbody>
</table>

Layer Dependencies  The Host Stack roughly follows a top to bottom hierarchy with inter-layer dependencies. Given layers A (highest), B, and C (lowest), the Host Stack has the following inter-layer dependency rules:

- a particular layer can use the API of any layer directly below (Layer A using layer B is allowed)
- a particular layer can use the API of any layer indirectly below (Layer A using layer C is allowed) i.e., skipping layers.
- a particular layer must not use the API of any layer above (Layer C using layer A/B is forbidden)
**Note:** Layer skipping is permitted in order to circumvent the need to repeat the same abstraction across multiple layers. For example, the abstraction of pipes are presented at the HCD layer but are used by multiple layers above.

**USB Host Maintainers Notes (DWC_OTG Controller)** The ESP32-S2 uses a DesignWare USB 2.0 On-the-Go Controller (henceforth referred to as DWC_OTG in this document) as its underlying hardware controller, where the DWC_OTG operates in Host Mode with Scatter/Gather DMA enabled.

**Note:** This section only summarizes the operation of the DWC_OTG operation in Host Mode at a high level. For full details of the DWC_OTG, refer to the DWC_OTG Databook and Programming Guide.

**Host Mode Operating Model** A simplified version of the operating model of the DWC_OTG in Host Mode is illustrated in the diagram below. The diagram contains some of the key concepts and terms regarding DWC_OTG Host Mode.

**Host Port** The Host Port represents the single USB port provided by the DWC_OTG (in USB terms, this can be thought a single USB port of the root hub of the bus). The Host Port can only connect to a single device, though more devices can be connected via hub devices.

The Host Port is responsible for:

- detecting direct device connections/disconnections
- detecting the speed of the directly connected device
- issuing various bus signals (such as suspend, resume, reset)

**Host Channels** In Host Mode, the DWC_OTG uses channels to communicate with device endpoints, where one channel maps to a particular endpoint (in USB terms, channels are the hardware representation of pipes). For example, a channel will map to EP 1 OUT. Each channel has its own set of CSRs (Control and Status Registers) so that they can independently configured and controlled independently. A channel’s CSRs are used to:

- specify the details of the channel’s target endpoint (e.g., device address, EP number, transfer type, direction)
- start a transfer on the channel (e.g., by setting up DMA descriptors)

When using Scatter/Gather DMA, transfers on Host Channels are completely event driven. Users simply fill out the appropriate DMA descriptors, fill in the channel’s CSRs, then enable the channel. The channel will then generate an interrupt when the transfer completes.
Data FIFOs  In Host Mode, the DWC_OTG uses multiple FIFOs as a staging area for the data payloads of USB transfers. When using DMA, the DMA engine will copy data between the TX/RX FIFOs and ESP32-S2’s internal memory:

- For an OUT transfer, the transfer’s data payload is copied from main memory to one of the TX FIFOs by DMA. The MAC Layer will then transmit that data payload in accordance to USB packet formatting.
- For an IN transfer, the MAC Layer will parse the received USB packet and store the received data payload in the RX FIFO. The data is then copied to main memory by DMA.

The destination FIFO depends on the direction and transfer type of the channel:

- All IN channel data goes to the RX FIFO
- All non-periodic (i.e., Control and Bulk) OUT channel data goes to the Non-periodic TX (NPTX) FIFO
- All periodic (i.e., Interrupt and Isochronous) OUT channel data goes to the Periodic TX (PTX) FIFO

Note: The separation of non-periodic and periodic OUT channels to the NPTX and PTX FIFOs is due to the periodic nature of Interrupt and Isochronous endpoints (specified by the bInterval value of the endpoint). The DWC_OTG automatically schedules these periodic transfers, thus a separate PTX FIFO allows these periodic transfers to be staged separately.

DMA Engine  The DMA engine is responsible for copying data between the FIFOs and main memory. In Host Mode Scatter/Gather DMA, a particular channel can carry out multiple transfers automatically without software intervention. The following diagram illustrates the DWC_OTG Host Mode Scatter/Gather DMA Memory Structures.

- Each USB transfer is described by a Queue Transfer Descriptor (QTD). Each QTD consists of:
  - A 32-bit Buffer Status Quadlet specifying details of the transfer, and also reports the status of the transfer on completion. The Buffer Status Quadlet has bits to specify whether the QTD should generate an interrupt and/or halt the channel on completion.
  - A 32-bit pointer to the data buffer containing the data payload for OUT transfers, or an empty buffer used to store the data payload for IN transfers.
- The data payload of each QTD can be larger than the MPS (Maximum Packet Size) of its target endpoint. The DWC_OTG hardware automatically handles splitting of the transfer into multiple transactions.
- Multiple QTDs can be placed into a single QTD List. A channel will then execute each QTD in the list automatically, and optionally loop back around if configured to do so.
- Before a channel starts data transfer, it is configured with a QTD list (and QTD list length). Once the channel is enabled, USB transfers are executed automatically by the hardware.
- A channel can generate interrupts (configurable) on completion of a particular QTD, or an entire QTD list.
**Hardware Configuration**  The DWC_OTG IP is configurable. The notable Host related configurations of the ESP32-S2’s DWC_OTG are listed below:

<table>
<thead>
<tr>
<th>Description</th>
<th>Configuration</th>
</tr>
</thead>
<tbody>
<tr>
<td>Host and Device Mode support with OTG</td>
<td>OTG_MODE = 0</td>
</tr>
<tr>
<td>Full Speed (FS) and Low Speed (LS) support</td>
<td>OTG_FSPHY_INTERFACE = 1,</td>
</tr>
<tr>
<td></td>
<td>OTG_HSPHY_INTERFACE = 0</td>
</tr>
<tr>
<td>Internal DMA controller with Scatter/Gather DMA</td>
<td>OTG_ARCHITECTURE = 2,</td>
</tr>
<tr>
<td></td>
<td>OTG_EN_DESC_DMA = 1</td>
</tr>
<tr>
<td>FS Hubs are supported but HS Hub are not (i.e., split transfers not supported)</td>
<td>OTG_SINGLE_POINT = 0</td>
</tr>
<tr>
<td>8 Host Mode channels</td>
<td>OTG_NUM_HOST_CHAN = 8</td>
</tr>
<tr>
<td>All transfer types supported, including ISOC and INTR OUT transfers</td>
<td>OTG_EN_PERIO_HOST = 1</td>
</tr>
<tr>
<td>Dynamically sized Data FIFO of 1024 bytes (256 lines)</td>
<td>OTG_DFIFO_DYNAMIC = 1,</td>
</tr>
<tr>
<td></td>
<td>OTG_DFIFO_DEPTH = 256</td>
</tr>
</tbody>
</table>

**Scatter/Gather DMA Transfer**  The basic operating procedure for Host channels transfers consists of the following steps:

1. Prepare data buffers, QTDs, and QTD list. In particular, which QTDs should halt the channel (and generate an interrupt) on completion.
2. Set channel/endpoint characteristics via CSRs (such as EP address, transfer type, EP MPS etc).
3. Set channel’s QTD list related CSRs (such as QTD list pointer and QTD list length) and channel interrupt CSRs.
4. Enable the channel. Transfers are now handled automatically by hardware using DMA.
5. The Channel generates an interrupt on a channel event (e.g., QTD completion or channel error).
6. Parse the channel interrupt to determine what event occurred.
7. Parse the QTDs to determine the result of each individual transfer.

However, there are some minor differences in channel operation and QTD list usage depending on the transfer type.

**Bulk**  Bulk transfers are a simplest. Each QTD represents a bulk transfer of a particular direction, where the DWC_OTG automatically splits a particular QTD into multiple MPS sized transactions. Thus it is possible to fill a QTD list with multiple bulk transfers, and have the entire list executed automatically (i.e., only interrupt on completion of the last QTD).

**Control**  Control transfers are more complicated as they are bi-directional (i.e., each control transfer stage can have a different direction). Thus, a separate QTD is required for each stage, and each QTD must halt the channel on completion. Halting the channel after each QTD allows changing the channel’s direction to be changed by reconfiguring the channel’s CSRs. Thus a typical control transfer consists of 3 QTDs (one for each stage).

**Interrupt**  In accordance with the USB2.0 specification, interrupt transfers executes transactions at the endpoints specified service period (i.e., bInterval). A particular interrupt endpoint may not execute more than one interrupt transaction within a service period. The service period is specified in number of microframes/frames, thus a particular interrupt endpoint will generally execute one transaction every Nth microframe/frame until the transfer is complete. For interrupt channels, the service period of a particular channel (i.e., bInterval) is specified via the Host Frame List (see section 6.5 of programming guide for more details).
Note: HS USB allows an interrupt endpoint to have 3 interrupt transactions in a single microframe. See USB2.0 specification section 5.7.3 (Interrupt Transfer Packet Size Constraints) for more details.

Thus, interrupt transfers in Host Mode Scatter/Gather DMA have the following peculiarities:

- If a QTD payload is larger than the endpoint’s MPS, the channel will automatically split the transfer into multiple MPS sized transactions (similar to bulk transfers). However, each transaction is executed at endpoint’s specified service period (i.e., one transaction per bInterval) until the transfer completes.
- For Interrupt IN transfers, if a short packet is received (i.e., transaction’s data payload is < MPS), this indicates that the endpoint has no more data to send. In this case:
  - the channel generates an extra channel interrupt even if the transfer’s QTD did not set the IOC (interrupt on complete) bit.
  - however, the channel is not halted even if this extra channel interrupt is generated.
  - software must then use this extra interrupt to manually halt the interrupt channel (thus canceling any remaining QTDs in the QTD list).

Note: Due to the interrupt transfer peculiarities, it may be easier for software allocate a QTD for each transaction instead of an entire transfer.

Isochronous In accordance with the USB2.0 specification, isochronous transfers execute transactions at the endpoints specified service period (i.e., bInterval) in order to achieve a constant rate of data transfer. A particular isochronous endpoint may not execute more than one isochronous transaction within a service period. The service period is specified in number of microframes/frames, thus a particular isochronous endpoint will generally execute one transaction every Nth microframe/frame until the transfer is complete. For isochronous channels, the service period of a particular channel (i.e., bInterval) is specified via the Host Frame List (see section 6.5 of programming guide for more details).

However, unlike interrupt transactions, isochronous transactions are not retried on failure (or NAK), due to the need to maintain the constant data rate.

Note: HS USB allows an isochronous endpoint to have 3 interrupt transactions in a single microframe. See USB2.0 specification section 5.6.3 (Isochronous Transfer Packet Size Constraints) for more details.

Thus, isochronous transfers in Host Mode Scatter/Gather DMA have the following peculiarities:

- A QTD must be allocated for each microframe/frame. However, non-service service period QTDs should be left blank (i.e., only ever Nth QTD should be filled if the channel’s service period is every Nth microframe/frame).
- Each filled QTD must represent a single transaction instead of a transfer.
- Because isochronous transactions are not retried on failure, the status each completed QTD must be checked.

Supplemental Notes Some of the DWC_OTG’s behaviors are not mentioned in the Databook or Programming Guide. This section describes some of those behaviors that are relevant to the Host stack’s implementation.

Port Errors Do Not Trigger a Channel Interrupt If a port error occurs (such as a sudden disconnection or port over-current) while there are one or more active channels—

- The active channels remains active (i.e., HCCHAR.ChEna remains set) and no channel interrupts are generated.
- Channels could in theory be disabled by setting HCCHAR.ChDis, but this does not work for Isochronous channels as the channel disabled interrupt is never generated.

Therefore, on port errors, a controller soft reset should be used to ensure all channels are disabled.
Port Reset Interrupts

- When the DWC_OTG issues a reset signal on its port, and during the reset signal the device disconnects, the disconnection interrupt (i.e., HPRT.PrtConnDet) is not generated until the reset is deasserted.
- When resetting an already enabled port (i.e., HPRT.PrtEna) such as a second reset during enumeration or a run-time reset, a Port Enable/Disable Change interrupt (i.e., HPRT.PrtEnChng) is generated both on the assertion and deassertion of the reset signal.

Introduction

The ESP-IDF USB Host Stack allows the ESP32-S2 to operate as a USB Host. Operating as a USB Host allows the ESP32-S2 to communicate with a wide range of USB devices. However, most USB Host Stack implementations do not run on embedded hardware (i.e., runs on PCs and smartphones), thus have comparatively more resources (i.e., memory and CPU speed).

The implementation of the ESP-IDF USB Host Stack (henceforth referred to as the Host Stack) takes into account the embedded nature of the ESP32-S2 which is reflected in various aspects of the Host Stack’s design.

Features & Limitations

The Host Stack currently supports the following notable features:

- Support FS (Full Speed) and LS (Low Speed) devices
- Support all transfer types (Control, Bulk, Isochronous, and Interrupt)
- Automatically enumerates connected devices
- Allows multiple class drivers (i.e., Clients of the USB Host Library) to run simultaneously and share the same device (i.e., composite devices).

The Host Stack currently has the following notable limitations:

- No HS (High Speed) support
- No Hub support (currently only supports a single device)

Code examples for this API section are provided in the peripherals directory of ESP-IDF examples.

2.6 Project Configuration

2.6.1 Introduction

The esp-idf-kconfig package that ESP-IDF uses is based on kconfiglib, which is a Python extension to the Kconfig system. Kconfig provides a compile-time project configuration mechanism and offers configuration options of several types (e.g., integers, strings, and booleans). Kconfig files specify dependencies between options, default values of options, the way options are grouped together, etc.

For the full list of available features, please see Kconfig and kconfiglib extentions.

2.6.2 Project Configuration Menu

Application developers can open a terminal-based project configuration menu with the idf.py menuconfig build target.
Chapter 2. API Reference

After being updated, this configuration is saved in the `sdkconfig` file under the project root directory. Based on `sdkconfig`, application build targets will generate the `sdkconfig.h` file under the build directory, and will make the `sdkconfig` options available to the project build system and source files.

### 2.6.3 Using `sdkconfig.defaults`

In some cases, for example, when the `sdkconfig` file is under revision control, it may be inconvenient for the build system to change the `sdkconfig` file. The build system offers a solution to prevent it from happening, which is to create the `sdkconfig.defaults` file. This file is never touched by the build system, and can be created manually or automatically. It contains all the options which matter to the given application and are different from the default ones. The format is the same as that of the `sdkconfig` file. `sdkconfig.defaults` can be created manually when one remembers all the changed configuration, or it can be generated automatically by running the `idf.py save-defconfig` command.

Once `sdkconfig.defaults` is created, `sdkconfig` can be deleted or added to the ignore list of the revision control system (e.g., the `.gitignore` file for git). Project build targets will automatically create the `sdkconfig` file, populate it with the settings from the `sdkconfig.defaults` file, and configure the rest of the settings to their default values. Note that during the build process, settings from `sdkconfig.defaults` will not override those already in `sdkconfig`. For more information, see *CustomSdkconfig Defaults*.

### 2.6.4 Kconfig Format Rules

Format rules for Kconfig files are as follows:

- Option names in any menus should have consistent prefixes. The prefix currently should have at least 3 characters.
- The unit of indentation should be 4 spaces. All sub-items belonging to a parent item are indented by one level deeper. For example, `menu` is indented by 0 spaces, `config menu` by 4 spaces, `help` in `config` by 8 spaces, and the text under `help` by 12 spaces.
- No trailing spaces are allowed at the end of the lines.
- The maximum length of options is 40 characters.
- The maximum length of lines is 120 characters.

**Note:** The `help` section of each config in the menu is treated as reStructuredText to generate the reference documentation for each option.

#### Format Checker

`kconfcheck` tool in `esp-idf-kconfig` package is provided for checking Kconfig files against the above format rules. The checker checks all Kconfig and Kconfig.projbuild files given as arguments, and generates a new file with suffix `.new` with some suggestions about how to fix issues (if there are any). Please note that the checker cannot correct all format issues and the responsibility of the developer is to final check and make corrections in order to pass the tests. For example, indentations will be corrected if there is not any misleading formatting, but it cannot come up with a common prefix for options inside a menu.

The `esp-idf-kconfig` package is available in ESP-IDF environments, where the checker tool can be invoked by running command `python -m kconfcheck <path_to_kconfig_file>`. For more information, please refer to `esp-idf-kconfig` package documentation.

### 2.6.5 Backward Compatibility of Kconfig Options

The standard Kconfig tools ignore unknown options in `sdkconfig`. So if a developer has custom settings for options which are renamed in newer ESP-IDF releases, then the given setting for the option would be silently ignored. Therefore, several features have been adopted to avoid this:
Chapter 2. API Reference

1. *kconfgen* is used by the tool chain to pre-process *sdkconfig* files before anything else. For example, *menuconfig* would read them, so the settings for old options is kept and not ignored.

2. *kconfgen* recursively finds all *sdkconfig.rename* files in ESP-IDF directory which contain old and new Kconfig option names. Old options are replaced by new ones in the *sdkconfig* file. Renames that should only appear for a single target can be placed in a target-specific rename file *sdkconfig.rename.TARGET*, where TARGET is the target name, eg., *sdkconfig.rename.esp32s2*.

3. *kconfgen* post-processes *sdkconfig* files and generates all build outputs (*sdkconfig.h*, *sdkconfig.cmake*, and *auto.conf*) by adding a list of compatibility statements, i.e., the values of old options are set for new options after modification. If users still use old options in their code, this will prevent it from breaking.

4. Deprecated options and their replacements are automatically generated by *kconfgen*.

2.6.6 Configuration Options Reference

Subsequent sections contain the list of available ESP-IDF options automatically generated from Kconfig files. Note that due to dependencies between options, some options listed here may not be visible by default in *menuconfig*.

By convention, all option names are upper-case letters with underscores. When Kconfig generates *sdkconfig* and *sdkconfig.h* files, option names are prefixed with CONFIG_. So if an option ENABLE_FOO is defined in a Kconfig file and selected in *menuconfig*, then the *sdkconfig* and *sdkconfig.h* files will have CONFIG_ENABLE_FOO defined. In the following sections, option names are also prefixed with CONFIG_, same as in the source code.

**Build type**

Contains:

- **CONFIG_APP_BUILD_TYPE**
- **CONFIG_APP_BUILD_TYPEPURE_RAM_APP**
- **CONFIG_APP_REPRODUCIBLE_BUILD**
- **CONFIG_APP_NO_BLOBS**

**CONFIG_APP_BUILD_TYPE**

Application build type

*Found in: Build type*

Select the way the application is built.

By default, the application is built as a binary file in a format compatible with the ESP-IDF bootloader. In addition to this application, 2nd stage bootloader is also built. Application and bootloader binaries can be written into flash and loaded/executed from there.

Another option, useful for only very small and limited applications, is to only link the .elf file of the application, such that it can be loaded directly into RAM over JTAG or UART. Note that since IRAM and DRAM sizes are very limited, it is not possible to build any complex application this way. However for some kinds of testing and debugging, this option may provide faster iterations, since the application does not need to be written into flash.

Note: when APP_BUILD_TYPE_RAM is selected and loaded with JTAG, ESP-IDF does not contain all the startup code required to initialize the CPUs and ROM memory (data/bss). Therefore it is necessary to execute a bit of ROM code prior to executing the application. A gdbinit file may look as follows (for ESP32):

```bash
# Connect to a running instance of OpenOCD target remote:3333 # Reset and halt the target
mon reset halt # Run to a specific point in ROM code, # where most of initialization is complete. thb *0x40007d54 c # Load the application into RAM load # Run till app_main tb app_main c
```

Execute this gdbinit file as follows:
xtensa-esp32-elf-gdbbuild/app-name.elf -x gdbinit

Example gdbinit files for other targets can be found in tools/test_apps/system/gdb_loadable_elf/

When loading the BIN with UART, the ROM will jump to ram and run the app after finishing the
ROM startup code, so there’s no additional startup initialization required. You can use the load_ram
in esptool.py to load the generated .bin file into ram and execute.

Example: esptool.py –chip {chip} -p {port} -b {baud} –no-stub load_ram {app.bin}

Recommended sdkconfig.defaults for building loadable ELF files is as follows. CONFIG_APP_BUILD_TYPE_RAM is required, other options help reduce application memory footprint.

CONFIG_APP_BUILD_TYPE_RAM=y CONFIG_VFS_SUPPORT_TERMIOS=y CONFIG_NEWLIB_NANO_FORMAT=y CONFIG_ESP_SYSTEM_PANIC_PRINT_HALT=y CONFIG_ESP_DEBUG_STUBS_ENABLE=y

Available options:

- Default (binary application + 2nd stage bootloader) (CONFIG_APP_BUILD_TYPE_APP_2NDBOOT)
- Build app runs entirely in RAM (EXPERIMENTAL) (CONFIG_APP_BUILD_TYPE_RAM)

CONFIG_APP_BUILD_TYPEPURE_RAM_APP

Build app without SPI_FLASH/PSRAM support (saves ram)

Found in: Build type

If this option is enabled, external memory and related peripherals, such as Cache, MMU, Flash and
PSRAM, won’t be initialized. Corresponding drivers won’t be introduced either. Components that
depend on the spi_flash component will also be unavailable, such as app_update, etc. When this option
is enabled, about 26KB of RAM space can be saved.

CONFIG_APP_REPRODUCIBLE_BUILD

Enable reproducible build

Found in: Build type

If enabled, all date, time, and path information would be eliminated. A .gdbinit file would be create
automatically. (or will be append if you have one already)

Default value:
- No (disabled)

CONFIG_APP_NO_BLOBS

No Binary Blobs

Found in: Build type

If enabled, this disables the linking of binary libraries in the application build. Note that after enabling
this Wi-Fi/Bluetooth will not work.

Default value:
- No (disabled)
Bootloader config

Contains:

- CONFIG_BOOTLOADER_LOG_LEVEL
- Bootloader manager
- CONFIG_BOOTLOADER_COMPILER_OPTIMIZATION
- CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE
- CONFIG_BOOTLOADER_REGION_PROTECTION_ENABLE
- CONFIG_BOOTLOADER_APP_TEST
- CONFIG_BOOTLOADER_FACTORY_RESET
- CONFIG_BOOTLOADER_HOLD_TIME_GPIO
- CONFIG_BOOTLOADER_CUSTOM_RESERVE_RTC
- Serial Flash Configurations
- CONFIG_BOOTLOADER_SKIP_VALIDATE_ALWAYS
- CONFIG_BOOTLOADER_SKIP_VALIDATE_ON_POWER_ON
- CONFIG_BOOTLOADER_SKIP_VALIDATE_IN_DEEP_SLEEP
- CONFIG_BOOTLOADER_WDT_ENABLE
- CONFIG_BOOTLOADER_VDDSDIO_boost

Bootloader manager

Contains:

- CONFIG_BOOTLOADER_PROJECT_VER
- CONFIG_BOOTLOADER_COMPILE_TIME_DATE

CONFIG_BOOTLOADER_COMPILE_TIME_DATE

Use time/date stamp for bootloader

*Found in: Bootloader config > Bootloader manager*

If set, then the bootloader will be built with the current time/date stamp. It is stored in the bootloader description structure. If not set, time/date stamp will be excluded from bootloader image. This can be useful for getting the same binary image files made from the same source, but at different times.

CONFIG_BOOTLOADER_PROJECT_VER

Project version

*Found in: Bootloader config > Bootloader manager*

Project version. It is placed in “version” field of the esp_bootloader_desc structure. The type of this field is `uint32_t`.

*Range:*
- from 0 to 4294967295

*Default value:*
- 1

CONFIG_BOOTLOADER_COMPILER_OPTIMIZATION

Bootloader optimization Level

*Found in: Bootloader config*

This option sets compiler optimization level (gcc -O argument) for the bootloader.

- The default “Size” setting will add the -Os flag to CFLAGS.
- The “Debug” setting will add the -Og flag to CFLAGS.
- The “Performance” setting will add the -O2 flag to CFLAGS.
- The “None” setting will add the -O0 flag to CFLAGS.
Note that custom optimization levels may be unsupported.

Available options:

- Size (-O3) (`CONFIG_BOOTLOADER_COMPILER_OPTIMIZATION_SIZE`)
- Debug (-Og) (`CONFIG_BOOTLOADER_COMPILER_OPTIMIZATION_DEBUG`)
- Optimize for performance (-O2) (`CONFIG_BOOTLOADER_COMPILER_OPTIMIZATION_PERF`)
- Debug without optimization (-O0) (`CONFIG_BOOTLOADER_COMPILER_OPTIMIZATION_NONE`)

**CONFIG_BOOTLOADER_LOG_LEVEL**

Bootloader log verbosity

*Found in: Bootloader config*

Specify how much output to see in bootloader logs.

Available options:

- No output (`CONFIG_BOOTLOADER_LOG_LEVEL_NONE`)
- Error (`CONFIG_BOOTLOADER_LOG_LEVEL_ERROR`)
- Warning (`CONFIG_BOOTLOADER_LOG_LEVEL_WARN`)
- Info (`CONFIG_BOOTLOADER_LOG_LEVEL_INFO`)
- Debug (`CONFIG_BOOTLOADER_LOG_LEVEL_DEBUG`)
- Verbose (`CONFIG_BOOTLOADER_LOG_LEVEL_VERBOSE`)

**Serial Flash Configurations**

Contains:

- `CONFIG_BOOTLOADER_FLASH_DC_AWARE`
- `CONFIG_BOOTLOADER_FLASH_XMC_SUPPORT`

**CONFIG_BOOTLOADER_FLASH_DC_AWARE**

Allow app adjust Dummy Cycle bits in SPI Flash for higher frequency (READ HELP FIRST)

*Found in: Bootloader config > Serial Flash Configurations*

This will force 2nd bootloader to be loaded by DOUT mode, and will restore Dummy Cycle setting by resetting the Flash

**CONFIG_BOOTLOADER_FLASH_XMC_SUPPORT**

Enable the support for flash chips of XMC (READ DOCS FIRST)

*Found in: Bootloader config > Serial Flash Configurations*

Perform the startup flow recommended by XMC. Please consult XMC for the details of this flow. XMC chips will be forbidden to be used, when this option is disabled.

**DON’T DISABLE THIS UNLESS YOU KNOW WHAT YOU ARE DOING.**

*Comment: “Features below require specific hardware (READ DOCS FIRST!”

**Default value:**

- Yes (enabled)
CONFIG_BOOTLOADER_VDDSDIO_BOOST

VDDSDIO LDO voltage

*Found in: Bootloader config*

If this option is enabled, and VDDSDIO LDO is set to 1.8V (using eFuse or MTDI bootstrapping pin), bootloader will change LDO settings to output 1.9V instead. This helps prevent flash chip from browning out during flash programming operations.

This option has no effect if VDDSDIO is set to 3.3V, or if the internal VDDSDIO regulator is disabled via eFuse.

Available options:

- 1.8V (CONFIG_BOOTLOADER_VDDSDIO_BOOST_1_8V)
- 1.9V (CONFIG_BOOTLOADER_VDDSDIO_BOOST_1_9V)

CONFIG_BOOTLOADER_FACTORY_RESET

GPIO triggers factory reset

*Found in: Bootloader config*

Allows to reset the device to factory settings: - clear one or more data partitions; - boot from “factory” partition. The factory reset will occur if there is a GPIO input held at the configured level while device starts up. See settings below.

*Default value:*

- No (disabled)

CONFIG_BOOTLOADER_NUM_PIN_FACTORY_RESET

Number of the GPIO input for factory reset

*Found in: Bootloader config > CONFIG_BOOTLOADER_FACTORY_RESET*

The selected GPIO will be configured as an input with internal pull-up enabled (note that on some SoCs, not all pins have an internal pull-up, consult the hardware datasheet for details.) To trigger a factory reset, this GPIO must be held high or low (as configured) on startup.

*Range:*

- from 0 to 44 if CONFIG_BOOTLOADER_FACTORY_RESET

*Default value:*

- 4 if CONFIG_BOOTLOADER_FACTORY_RESET

CONFIG_BOOTLOADER_FACTORY_RESET_PIN_LEVEL

Factory reset GPIO level

*Found in: Bootloader config > CONFIG_BOOTLOADER_FACTORY_RESET*

Pin level for factory reset, can be triggered on low or high.

Available options:

- Reset on GPIO low (CONFIG_BOOTLOADER_FACTORY_RESET_PIN_LOW)
- Reset on GPIO high (CONFIG_BOOTLOADER_FACTORY_RESET_PIN_HIGH)
CONFIG_BOOTLOADER OTA_DATA_ERASE

Clear OTA data on factory reset (select factory partition)

*Found in: Bootloader config > CONFIG_BOOTLOADER_FACTORY_RESET*

The device will boot from “factory” partition (or OTA slot 0 if no factory partition is present) after a factory reset.

CONFIG_BOOTLOADER_DATA_FACTORY_RESET

Comma-separated names of partitions to clear on factory reset

*Found in: Bootloader config > CONFIG_BOOTLOADER_FACTORY_RESET*

Allows customers to select which data partitions will be erased while factory reset.

Specify the names of partitions as a comma-delimited with optional spaces for readability. (Like this: “nvs, phy_init, …”) Make sure that the name specified in the partition table and here are the same. Partitions of type “app” cannot be specified here.

**Default value:**
- “nvs” if CONFIG_BOOTLOADER_FACTORY_RESET

CONFIG_BOOTLOADER_APP_TEST

GPIO triggers boot from test app partition

*Found in: Bootloader config*

Allows to run the test app from “TEST” partition. A boot from “test” partition will occur if there is a GPIO input pulled low while device starts up. See settings below.

CONFIG_BOOTLOADER_NUM_PIN_APP_TEST

Number of the GPIO input to boot TEST partition

*Found in: Bootloader config > CONFIG_BOOTLOADER_APP_TEST*

The selected GPIO will be configured as an input with internal pull-up enabled. To trigger a test app, this GPIO must be pulled low on reset. After the GPIO input is deactivated and the device reboots, the old application will boot. (factory or OTA[x]). Note that GPIO34-39 do not have an internal pullup and an external one must be provided.

**Range:**
- from 0 to 39 if CONFIG_BOOTLOADER_APP_TEST

**Default value:**
- 18 if CONFIG_BOOTLOADER_APP_TEST

CONFIG_BOOTLOADER_APP_TEST_PIN_LEVEL

App test GPIO level

*Found in: Bootloader config > CONFIG_BOOTLOADER_APP_TEST*

Pin level for app test, can be triggered on low or high.

Available options:

- Enter test app on GPIO low (CONFIG_BOOTLOADER_APP_TEST_PIN_LOW)
- Enter test app on GPIO high (CONFIG_BOOTLOADER_APP_TEST_PIN_HIGH)
**CONFIG_BOOTLOADER_HOLD_TIME_GPIO**

Hold time of GPIO for reset/test mode (seconds)

*Found in:* Bootloader config

The GPIO must be held low continuously for this period of time after reset before a factory reset or test partition boot (as applicable) is performed.

*Default value:*

- 5 if `CONFIG_BOOTLOADER_FACTORY_RESET` || `CONFIG_BOOTLOADER_APP_TEST`

**CONFIG_BOOTLOADER_REGION_PROTECTION_ENABLE**

Enable protection for unmapped memory regions

*Found in:* Bootloader config

Protects the unmapped memory regions of the entire address space from unintended accesses. This will ensure that an exception will be triggered whenever the CPU performs a memory operation on unmapped regions of the address space.

*Default value:*

- Yes (enabled)

**CONFIG_BOOTLOADER_WDT_ENABLE**

Use RTC watchdog in start code

*Found in:* Bootloader config

Tracks the execution time of startup code. If the execution time is exceeded, the RTC_WDT will restart system. It is also useful to prevent a lock up in start code caused by an unstable power source. NOTE: Tracks the execution time starts from the bootloader code - re-set timeout, while selecting the source for slow_clk - and ends calling app_main. Re-set timeout is needed due to WDT uses a SLOW_CLK clock source. After changing a frequency slow_clk a time of WDT needs to re-set for new frequency. slow_clk depends on RTC_CLK_SRC (INTERNAL_RC or EXTERNALCRYSTAL).

*Default value:*

- Yes (enabled)

**CONFIG_BOOTLOADER_WDT_DISABLE_IN_USER_CODE**

Allows RTC watchdog disable in user code

*Found in:* Bootloader config > `CONFIG_BOOTLOADER_WDT_ENABLE`

If this option is set, the ESP-IDF app must explicitly reset, feed, or disable the rtc_wdt in the app’s own code. If this option is not set (default), then rtc_wdt will be disabled by ESP-IDF before calling the app_main() function.

Use function rtc_wdt_feed() for resetting counter of rtc_wdt. Use function rtc_wdt_disable() for disabling rtc_wdt.

*Default value:*

- No (disabled)

**CONFIG_BOOTLOADER_WDT_TIME_MS**

Timeout for RTC watchdog (ms)

*Found in:* Bootloader config > `CONFIG_BOOTLOADER_WDT_ENABLE`
Chapter 2. API Reference

Verify that this parameter is correct and more than the execution time. Pay attention to options such as reset to factory, trigger test partition and encryption on boot - these options can increase the execution time. Note: RTC_WDT will reset while encryption operations will be performed.

**Range:**
- from 0 to 120000

**Default value:**
- 9000

**CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE**

Enable app rollback support

*Found in: Bootloader config*

After updating the app, the bootloader runs a new app with the “ESP_OOTA_IMG_PENDING_VERIFY” state set. This state prevents the re-run of this app. After the first boot of the new app in the user code, the function should be called to confirm the operability of the app or vice versa about its non-operability. If the app is working, then it is marked as valid. Otherwise, it is marked as not valid and rolls back to the previous working app. A reboot is performed, and the app is booted before the software update. Note: If during the first boot a new app the power goes out or the WDT works, then roll back will happen. Rollback is possible only between the apps with the same security versions.

**Default value:**
- No (disabled)

**CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK**

Enable app anti-rollback support

*Found in: Bootloader config > CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE*

This option prevents rollback to previous firmware/application image with lower security version.

**Default value:**
- No (disabled) if CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE

**CONFIG_BOOTLOADER_APP_SECURE_VERSION**

eFuse secure version of app

*Found in: Bootloader config > CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE > CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK*

The secure version is the sequence number stored in the header of each firmware. The security version is set in the bootloader, version is recorded in the eFuse field as the number of set ones. The allocated number of bits in the efuse field for storing the security version is limited (see BOOTLOADER_APP_SEC_VER_SIZE_EFUSE_FIELD option).

Bootloader: When bootloader selects an app to boot, an app is selected that has a security version greater or equal that recorded in eFuse field. The app is booted with a higher (or equal) secure version.

The security version is worth increasing if in previous versions there is a significant vulnerability and their use is not acceptable.

Your partition table should has a scheme with ota_0 + ota_1 (without factory).

**Default value:**
- 0 if CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK
**CONFIG_BOOTLOADER_APP_SEC_VER_SIZE_EFUSE_FIELD**

Size of the efuse secure version field

*Found in:*  `Bootloader config > CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE > CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK`

The size of the efuse secure version field. Its length is limited to 32 bits for ESP32 and 16 bits for ESP32-S2. This determines how many times the security version can be increased.

**Range:**
- from 1 to 16 if `CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK`

**Default value:**
- 16 if `CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK`

**CONFIG_BOOTLOADER_EFUSE_SECURE_VERSION_EMULATE**

Emulate operations with efuse secure version (only test)

*Found in:*  `Bootloader config > CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE > CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK`

This option allows to emulate read/write operations with all eFuses and efuse secure version. It allows to test anti-rollback implementation without permanent write eFuse bits. There should be an entry in partition table with following details: `emul_efuse, data, efuse, , 0x2000`.

This option enables: EFUSE_VIRTUAL and EFUSE_VIRTUAL_KEEP_IN_FLASH.

**Default value:**
- No (disabled) if `CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK`

**CONFIG_BOOTLOADER_SKIP_VALIDATE_IN_DEEP_SLEEP**

Skip image validation when exiting deep sleep

*Found in:*  `Bootloader config`

This option disables the normal validation of an image coming out of deep sleep (checksums, SHA256, and signature). This is a trade-off between wakeup performance from deep sleep, and image integrity checks.

Only enable this if you know what you are doing. It should not be used in conjunction with using deep_sleep(entry and changing the active OTA partition as this would skip the validation upon first load of the new OTA partition.

It is possible to enable this option with Secure Boot if “allow insecure options” is enabled, however it’s strongly recommended to NOT enable it as it may allow a Secure Boot bypass.

**Default value:**
- No (disabled) if `CONFIG_SECURE_BOOT && CONFIG_SECURE_BOOT_INSECURE`

**CONFIG_BOOTLOADER_SKIP_VALIDATE_ON_POWER_ON**

Skip image validation from power on reset (READ HELP FIRST)

*Found in:*  `Bootloader config`

Some applications need to boot very quickly from power on. By default, the entire app binary is read from flash and verified which takes up a significant portion of the boot time.

Enabling this option will skip validation of the app when the SoC boots from power on. Note that in this case it’s not possible for the bootloader to detect if an app image is corrupted in the flash, therefore it’s not possible to safely fall back to a different app partition. Flash corruption of this kind is unlikely but can happen if there is a serious firmware bug or physical damage.
Following other reset types, the bootloader will still validate the app image. This increases the chances that flash corruption resulting in a crash can be detected following soft reset, and the bootloader will fall back to a valid app image. To increase the chances of successfully recovering from a flash corruption event, keep the option `BOOTLOADER_WDT_ENABLE` enabled and consider also enabling `BOOTLOADER_WDT_DISABLE_IN_USER_CODE` - then manually disable the RTC Watchdog once the app is running. In addition, enable both the Task and Interrupt watchdog timers with reset options set.

**Default value:**
- No (disabled)

**CONFIG_BOOTLOADER_SKIP_VALIDATE_ALWAYS**

Skip image validation always (READ HELP FIRST)

*Found in: Bootloader config*

Selecting this option prevents the bootloader from ever validating the app image before booting it. Any flash corruption of the selected app partition will make the entire SoC unbootable.

Although flash corruption is a very rare case, it is not recommended to select this option. Consider selecting “Skip image validation from power on reset” instead. However, if boot time is the only important factor then it can be enabled.

**Default value:**
- No (disabled)

**CONFIG_BOOTLOADER_CUSTOM_RESERVE_RTC**

Reserve RTC FAST memory for custom purposes

*Found in: Bootloader config*

This option allows the customer to place data in the RTC FAST memory, this area remains valid when rebooted, except for power loss. This memory is located at a fixed address and is available for both the bootloader and the application. (The application and bootloader must be compiled with the same option). The RTC FAST memory has access only through PRO_CPU.

**Default value:**
- No (disabled)

**CONFIG_BOOTLOADER_CUSTOM_RESERVE_RTC_SIZE**

Size in bytes for custom purposes

*Found in: Bootloader config > CONFIG_BOOTLOADER_CUSTOM_RESERVE_RTC*

This option reserves in RTC FAST memory the area for custom purposes. If you want to create your own bootloader and save more information in this area of memory, you can increase it. It must be a multiple of 4 bytes. This area (rtc_retain_mem_t) is reserved and has access from the bootloader and an application.

**Default value:**
- 0 if `CONFIG_BOOTLOADER_CUSTOM_RESERVE_RTC`

**Security features**

Contains:
- `CONFIG_SECURE_BOOT_INSECURE`
- `CONFIG_SECURE_SIGNED_APPS_SCHEME`
- `CONFIG_SECURE_SIGNED_ON_BOOT_NO_SECURE_BOOT`
- `CONFIG_SECURE_FLASH_CHECK_ENC_EN_IN_APP`
- `CONFIG_SECURE_BOOT_ECDSA_KEY_LEN_SIZE`
• CONFIG_SECURE_BOOT_ENABLE_AGGRESSIVE_KEY_REVOKE
• CONFIG_SECURE_FLASH_ENC_ENABLED
• CONFIG_SECURE_BOOT
• CONFIG_SECURE_BOOT_FLASH_BOOTLOADER_DEFAULT
• CONFIG_SECURE_BOOTLOADER_KEY_ENCODING

Potentially insecure options
• CONFIG_SECURE_SIGNED_APPS_NO_SECURE_BOOT
• CONFIG_SECURE_BOOT_VERIFICATION_KEY
• CONFIG_SECURE_BOOTLOADER_MODE
• CONFIG_SECURE_BOOT_BUILD_SIGNED_BINARIES
• CONFIG_SECURE_UART_ROM_DL_MODE
• CONFIG_SECURE_SIGNED_ON_UPDATE_NO_SECURE_BOOT

CONFIG_SECURE_SIGNED_APPS_NO_SECURE_BOOT

Require signed app images

Found in: Security features

Require apps to be signed to verify their integrity.

This option uses the same app signature scheme as hardware secure boot, but unlike hardware secure boot it does not prevent the bootloader from being physically updated. This means that the device can be secured against remote network access, but not physical access. Compared to using hardware Secure Boot this option is much simpler to implement.

CONFIG_SECURE_SIGNED_APPS_SCHEME

App Signing Scheme

Found in: Security features

Select the Secure App signing scheme. Depends on the Chip Revision. There are two secure boot versions:

1. Secure boot V1
   • Legacy custom secure boot scheme. Supported in ESP32 SoC.
2. Secure boot V2
   • RSA based secure boot scheme. Supported in ESP32-ECO3 (ESP32 Chip Revision 3 onwards), ESP32-S2, ESP32-C3, ESP32-S3 SoCs.
   • ECDSA based secure boot scheme. Supported in ESP32-C2 SoC.

Available options:

• ECDSA (CONFIG_SECURE_SIGNED_APPS_ECDSA_SCHEME)
  Embeds the ECDSA public key in the bootloader and signs the application with an ECDSA key. Refer to the documentation before enabling.
• RSA (CONFIG_SECURE_SIGNED_APPS_RSA_SCHEME)
  Appends the RSA-3072 based Signature block to the application. Refer to <Secure Boot Version 2 documentation link> before enabling.
• ECDSA (V2) (CONFIG_SECURE_SIGNED_APPS_ECDSA_V2_SCHEME)
  For Secure boot V2 (e.g., ESP32-C2 SoC), appends ECDSA based signature block to the application. Refer to documentation before enabling.

CONFIG_SECURE_BOOT_ECDSA_KEY_LEN_SIZE

ECDSA key size

Found in: Security features

Select the ECDSA key size. Two key sizes are supported
• 192 bit key using NISTP192 curve
• 256 bit key using NISTP256 curve (Recommended)

The advantage of using 256 bit key is the extra randomness which makes it difficult to be bruteforced compared to 192 bit key. At present, both key sizes are practically implausible to bruteforce.

Available options:

• Using ECC curve NISTP192 (CONFIG_SECURE_BOOT_ECDSA_KEY_LEN_192_BITS)
• Using ECC curve NISTP256 (Recommended) (CONFIG_SECURE_BOOT_ECDSA_KEY_LEN_256_BITS)

CONFIG_SECURE_SIGNED_ON_BOOT_NO_SECURE_BOOT

Bootloader verifies app signatures

*Found in: Security features*

If this option is set, the bootloader will be compiled with code to verify that an app is signed before booting it.

If hardware secure boot is enabled, this option is always enabled and cannot be disabled. If hardware secure boot is not enabled, this option doesn’t add significant security by itself so most users will want to leave it disabled.

**Default value:**

• No (disabled) if CONFIG_SECURE_SIGNED_APPS_NO_SECURE_BOOT && CONFIG_SECURE_SIGNED_APPS_ECDSA_SCHEME

CONFIG_SECURE_SIGNED_ON_UPDATE_NO_SECURE_BOOT

Verify app signature on update

*Found in: Security features*

If this option is set, any OTA updated apps will have the signature verified before being considered valid.

When enabled, the signature is automatically checked whenever the esp_ota_ops.h APIs are used for OTA updates, or esp_image_format.h APIs are used to verify apps.

If hardware secure boot is enabled, this option is always enabled and cannot be disabled. If hardware secure boot is not enabled, this option still adds significant security against network-based attackers by preventing spoofing of OTA updates.

**Default value:**

• Yes (enabled) if CONFIG_SECURE_SIGNED_APPS_NO_SECURE_BOOT

CONFIG_SECURE_BOOT

Enable hardware Secure Boot in bootloader (READ DOCS FIRST)

*Found in: Security features*

Build a bootloader which enables Secure Boot on first boot.

Once enabled, Secure Boot will not boot a modified bootloader. The bootloader will only load a partition table or boot an app if the data has a verified digital signature. There are implications for reflashing updated apps once secure boot is enabled.

When enabling secure boot, JTAG and ROM BASIC Interpreter are permanently disabled by default.

**Default value:**

• No (disabled)
CONFIG_SECURE_BOOT_VERSION

Select secure boot version

*Found in:* Security features > CONFIG_SECURE_BOOT

Select the Secure Boot Version. Depends on the Chip Revision. Secure Boot V2 is the new RSA / ECDSA based secure boot scheme.

- RSA based scheme is supported in ESP32 (Revision 3 onwards), ESP32-S2, ESP32-C3 (ECO3), ESP32-S3.
- ECDSA based scheme is supported in ESP32-C2 SoC.

Please note that, RSA or ECDSA secure boot is property of specific SoC based on its HW design, supported crypto accelerators, die-size, cost and similar parameters. Please note that RSA scheme has requirement for bigger key sizes but at the same time it is comparatively faster than ECDSA verification.

Secure Boot V1 is the AES based (custom) secure boot scheme supported in ESP32 SoC.

Available options:

- Enable Secure Boot version 1 (CONFIG_SECURE_BOOT_V1_ENABLED)
  Build a bootloader which enables secure boot version 1 on first boot. Refer to the Secure Boot section of the ESP-IDF Programmer’s Guide for this version before enabling.

- Enable Secure Boot version 2 (CONFIG_SECURE_BOOT_V2_ENABLED)
  Build a bootloader which enables Secure Boot version 2 on first boot. Refer to Secure Boot V2 section of the ESP-IDF Programmer’s Guide for this version before enabling.

CONFIG_SECURE_BOOTLOADER_MODE

Secure bootloader mode

*Found in:* Security features

Available options:

- One-time flash (CONFIG_SECURE_BOOTLOADER_ONE_TIME_FLASH)
  On first boot, the bootloader will generate a key which is not readable externally or by software. A digest is generated from the bootloader image itself. This digest will be verified on each subsequent boot. Enabling this option means that the bootloader cannot be changed after the first time it is booted.

- Reflashable (CONFIG_SECURE_BOOTLOADER_REFLASHABLE)
  Generate a reusable secure bootloader key, derived (via SHA-256) from the secure boot signing key. This allows the secure bootloader to be re-flashed by anyone with access to the secure boot signing key. This option is less secure than one-time flash, because a leak of the digest key from one device allows reflash of any device that uses it.

CONFIG_SECURE_BOOT_BUILD_SIGNED_BINARIES

Sign binaries during build

*Found in:* Security features

Once secure boot or signed app requirement is enabled, app images are required to be signed.

If enabled (default), these binary files are signed as part of the build process. The file named “Secure boot private signing key” will be used to sign the image.
If disabled, unsigned app/partition data will be built. They must be signed manually using espsecure.py. Version 1 to enable ECDSA Based Secure Boot and Version 2 to enable RSA based Secure Boot. (for example, on a remote signing server.)

**CONFIG_SECURE_BOOT_SIGNING_KEY**

Secure boot private signing key

*Found in: Security features > CONFIG_SECURE_BOOT_BUILD_SIGNED_BINARIES*

Path to the key file used to sign app images.

Key file is an ECDSA private key (NIST256p curve) in PEM format for Secure Boot V1. Key file is an RSA private key in PEM format for Secure Boot V2.

Path is evaluated relative to the project directory.

You can generate a new signing key by running the following command: espsecure.py generate_signing_key secure_boot_signing_key.pem

See the Secure Boot section of the ESP-IDF Programmer’s Guide for this version for details.

*Default value:*

- “secure_boot_signing_key.pem” if `CONFIG_SECURE_BOOT_BUILD_SIGNED_BINARIES`

**CONFIG_SECURE_BOOT_VERIFICATION_KEY**

Secure boot public signature verification key

*Found in: Security features*

Path to a public key file used to verify signed images. Secure Boot V1: This ECDSA public key is compiled into the bootloader and/or app, to verify app images.

Key file is in raw binary format, and can be extracted from a PEM formatted private key using the espsecure.py extract_public_key command.

Refer to the Secure Boot section of the ESP-IDF Programmer’s Guide for this version before enabling.

**CONFIG_SECURE_BOOT_ENABLE_AGGRESSIVE_KEY_REVOKE**

Enable Aggressive key revoke strategy

*Found in: Security features*

If this option is set, ROM bootloader will revoke the public key digest burned in efuse block if it fails to verify the signature of software bootloader with it. Revocation of keys does not happen when enabling secure boot. Once secure boot is enabled, key revocation checks will be done on subsequent boot-up, while verifying the software bootloader.

This feature provides a strong resistance against physical attacks on the device.

*NOTE:* Once a digest slot is revoked, it can never be used again to verify an image. This can lead to permanent bricking of the device, in case all keys are revoked because of signature verification failure.

*Default value:*

- No (disabled) if `CONFIG_SECURE_BOOT`

**CONFIG_SECURE_BOOT_FLASH_BOOTLOADER_DEFAULT**

Flash bootloader along with other artifacts when using the default flash command

*Found in: Security features*

When Secure Boot V2 is enabled, by default the bootloader is not flashed along with other artifacts like the application and the partition table images, i.e. bootloader has to be separately flashed using the
command `idf.py bootloader flash`, whereas, the application and partition table can be flashed using the command `idf.py flash` itself. Enabling this option allows flashing the bootloader along with the other artifacts by invocation of the command `idf.py flash`.

If this option is enabled make sure that even the bootloader is signed using the correct secure boot key, otherwise the bootloader signature verification would fail, as hash of the public key which is present in the bootloader signature would not match with the digest stored into the efuses and thus the device will not be able to boot up.

**Default value:**
- No (disabled) if `CONFIG_SECURE_BOOT_V2_ENABLED` && `CONFIG_SECURE_BOOT_BUILD_SIGNED_BINARIES`

---

**CONFIG_SECURE_BOOTLOADER_KEY_ENCODING**

Hardware Key Encoding

*Found in: Security features*

In reflashable secure bootloader mode, a hardware key is derived from the signing key (with SHA-256) and can be written to eFuse with `esptool.py`.

Normally this is a 256-bit key, but if 3/4 Coding Scheme is used on the device then the eFuse key is truncated to 192 bits.

This configuration item doesn’t change any firmware code, it only changes the size of key binary which is generated at build time.

Available options:

- No encoding (256 bit key) (CONFIG_SECURE_BOOTLOADER_KEY_ENCODING_256BIT)
- 3/4 encoding (192 bit key) (CONFIG_SECURE_BOOTLOADER_KEY_ENCODING_192BIT)

---

**CONFIG_SECURE_BOOT_INSECURE**

Allow potentially insecure options

*Found in: Security features*

You can disable some of the default protections offered by secure boot, in order to enable testing or a custom combination of security features.

Only enable these options if you are very sure.

Refer to the Secure Boot section of the ESP-IDF Programmer’s Guide for this version before enabling.

**Default value:**
- No (disabled) if `CONFIG_SECURE_BOOT`

---

**CONFIG_SECURE_FLASH_ENC_ENABLED**

Enable flash encryption on boot (READ DOCS FIRST)

*Found in: Security features*

If this option is set, flash contents will be encrypted by the bootloader on first boot.

Note: After first boot, the system will be permanently encrypted. Re-flashing an encrypted system is complicated and not always possible.

Read *Flash Encryption* before enabling.

**Default value:**
- No (disabled)
CONFIG_SECURE_FLASH_ENCRYPTION_KEYSIZE

Size of generated XTS-AES key

*Found in:* Security features > CONFIG_SECURE_FLASH_ENC_ENABLED

Size of generated XTS-AES key.

- AES-128 uses a 256-bit key (32 bytes) derived from 128 bits (16 bytes) burned in half Efuse key block. Internally, it calculates SHA256(128 bits)
- AES-128 uses a 256-bit key (32 bytes) which occupies one Efuse key block.
- AES-256 uses a 512-bit key (64 bytes) which occupies two Efuse key blocks.

This setting is ignored if either type of key is already burned to Efuse before the first boot. In this case, the pre-burned key is used and no new key is generated.

Available options:

- AES-128 key derived from 128 bits (SHA256(128 bits)) (CONFIG_SECURE_FLASH_ENCRYPTION_AES128_DERIVED)
- AES-128 (256-bit key) (CONFIG_SECURE_FLASH_ENCRYPTION_AES128)
- AES-256 (512-bit key) (CONFIG_SECURE_FLASH_ENCRYPTION_AES256)

CONFIG_SECURE_FLASH_ENCRYPTION_MODE

Enable usage mode

*Found in:* Security features > CONFIG_SECURE_FLASH_ENC_ENABLED

By default Development mode is enabled which allows ROM download mode to perform flash encryption operations (plaintext is sent to the device, and it encrypts it internally and writes ciphertext to flash.) This mode is not secure, it’s possible for an attacker to write their own chosen plaintext to flash.

Release mode should always be selected for production or manufacturing. Once enabled it’s no longer possible for the device in ROM Download Mode to use the flash encryption hardware.

When EFUSE_VIRTUAL is enabled, SECURE_FLASH_ENCRYPTION_MODE_RELEASE is not available. For CI tests we use IDF_CI_BUILD to bypass it (“export IDF_CI_BUILD=1”). We do not recommend bypassing it for other purposes.

Refer to the Flash Encryption section of the ESP-IDF Programmer’s Guide for details.

Available options:

- Development (NOT SECURE) (CONFIG_SECURE_FLASH_ENCRYPTION_MODE_DEVELOPMENT)
- Release (CONFIG_SECURE_FLASH_ENCRYPTION_MODE_RELEASE)

Potentially insecure options

Contains:

- CONFIG_SECURE_BOOT_V2_ALLOW_EFUSE_RD_DIS
- CONFIG_SECURE_BOOT_ALLOW_SHORT_APP_PARTITION
- CONFIG_SECURE_BOOT_ALLOW_JTAG
- CONFIG_SECURE_FLASH_UART_BOOTLOADER_ALLOW_ENC
- CONFIG_SECURE_FLASH_UART_BOOTLOADER_ALLOW_CACHE
- CONFIG_SECURE_BOOT_ALLOW_UNUSED_DIGEST_SLOTS
- CONFIG_SECURE_FLASH_REQUIRE_ALREADY_ENABLED
- CONFIG_SECURE_FLASH_SKIP_WRITE_PROTECTION_CACHE
CONFIG_SECURE_BOOT_ALLOW_JTAG
Allow JTAG Debugging

*Found in:* Security features > Potentially insecure options

If not set (default), the bootloader will permanently disable JTAG (across entire chip) on first boot when either secure boot or flash encryption is enabled.

Setting this option leaves JTAG on for debugging, which negates all protections of flash encryption and some of the protections of secure boot.

Only set this option in testing environments.

**Default value:**
- No (disabled) if CONFIG_SECURE_BOOT_INSECURE || CONFIG_SECURE_FLASH_ENCRYPTION_MODE_DEVELOPMENT

CONFIG_SECURE_BOOT_ALLOW_SHORT_APP_PARTITION
Allow app partition length not 64KB aligned

*Found in:* Security features > Potentially insecure options

If not set (default), app partition size must be a multiple of 64KB. App images are padded to 64KB length, and the bootloader checks any trailing bytes after the signature (before the next 64KB boundary) have not been written. This is because flash cache maps entire 64KB pages into the address space. This prevents an attacker from appending unverified data after the app image in the flash, causing it to be mapped into the address space.

Setting this option allows the app partition length to be unaligned, and disables padding of the app image to this length. It is generally not recommended to set this option, unless you have a legacy partitioning scheme which doesn’t support 64KB aligned partition lengths.

CONFIG_SECURE_BOOT_V2_ALLOW_EFUSE_RD_DIS
Allow additional read protecting of eFuses

*Found in:* Security features > Potentially insecure options

If not set (default, recommended), on first boot the bootloader will burn the WR_DIS_RD_DIS efuse when Secure Boot is enabled. This prevents any more eFuses from being read protected.

If this option is set, it will remain possible to write the EFUSE_RD_DIS efuse field after Secure Boot is enabled. This may allow an attacker to read-protect the BLK2 efuse (for ESP32) and BLOCK4-BLOCK10 (i.e. BLOCK_KEY0-BLOCK_KEY5)(for other chips) holding the public key digest, causing an immediate denial of service and possibly allowing an additional fault injection attack to bypass the signature protection.

**NOTE:** Once a BLOCK is read-protected, the application will read all zeros from that block

**NOTE:** If “UART ROM download mode (Permanently disabled (recommended))” or “UART ROM download mode (Permanently switch to Secure mode (recommended))” is set, then it is **NOT** possible to read/write eFuses using espfuse.py utility. However, eFuse can be read/written from the application

CONFIG_SECURE_BOOT_ALLOW_UNUSED_DIGEST_SLOTS
Leave unused digest slots available (not revoke)

*Found in:* Security features > Potentially insecure options

If not set (default), during startup in the app all unused digest slots will be revoked. To revoke unused slot will be called esp_efuse_set_digest_revoke(num_digest) for each digest. Revoking unused digest slots makes ensures that no trusted keys can be added later by an attacker. If set, it means that you have a plan to use unused digests slots later.
Default value:
• No (disabled) if `CONFIG_SECURE_BOOT_INSECURE`

**CONFIG_SECURE_FLASH_UART_BOOTLOADER_ALLOW_ENC**

Leave UART bootloader encryption enabled

*Found in: Security features > Potentially insecure options*

If not set (default), the bootloader will permanently disable UART bootloader encryption access on first boot. If set, the UART bootloader will still be able to access hardware encryption.

It is recommended to only set this option in testing environments.

Default value:
• No (disabled) if `CONFIG_SECURE_FLASH_ENCRYPTION_MODE_DEVELOPMENT`

**CONFIG_SECURE_FLASH_UART_BOOTLOADER_ALLOW_CACHE**

Leave UART bootloader flash cache enabled

*Found in: Security features > Potentially insecure options*

If not set (default), the bootloader will permanently disable UART bootloader flash cache access on first boot. If set, the UART bootloader will still be able to access the flash cache.

Only set this option in testing environments.

Default value:
• No (disabled) if `CONFIG_SECURE_FLASH_ENCRYPTION_MODE_DEVELOPMENT`

**CONFIG_SECURE_FLASH_REQUIRE_ALREADY_ENABLED**

Require flash encryption to be already enabled

*Found in: Security features > Potentially insecure options*

If not set (default), and flash encryption is not yet enabled in eFuses, the 2nd stage bootloader will enable flash encryption: generate the flash encryption key and program eFuses. If this option is set, and flash encryption is not yet enabled, the bootloader will error out and reboot. If flash encryption is enabled in eFuses, this option does not change the bootloader behavior.

Only use this option in testing environments, to avoid accidentally enabling flash encryption on the wrong device. The device needs to have flash encryption already enabled using espfuse.py.

Default value:
• No (disabled) if `CONFIG_SECURE_FLASH_ENCRYPTION_MODE_DEVELOPMENT`

**CONFIG_SECURE_FLASH_SKIP_WRITE_PROTECTION_CACHE**

Skip write-protection of DIS_CACHE (DIS_ICACHE, DIS_DCACHE)

*Found in: Security features > Potentially insecure options*

If not set (default, recommended), on the first boot the bootloader will burn the write-protection of DIS_CACHE (for ESP32) or DIS_ICACHE/DIS_DCACHE (for other chips) eFuse when Flash Encryption is enabled. Write protection for cache disable efuse prevents the chip from being blocked if it is set by accident. App and bootloader use cache so disabling it makes the chip useless for IDF. Due to other eFuses are linked with the same write protection bit (see the list below) then write-protection will not be done if these `SECURE_FLASH_UART_BOOTLOADER_ALLOW_ENC`, `SECURE_BOOT_ALLOW_JTAG` or `SECURE_FLASH_UART_BOOTLOADER_ALLOW_CACHE` options are selected to give a chance to turn on the chip into the release mode later.

List of eFuses with the same write protection bit: ESP32: MAC, MAC_CRC, DISABLE_APP_CPU, DISABLE_BT, DIS_CACHE, VOL_LEVEL_HP_INV.
ESP32-C3: DIS_ICACHE, DIS_USB_JTAG, DIS_DOWNLOAD_ICACHE, DIS_USB_SERIAL_JTAG, DIS_FORCE_DOWNLOAD, DIS_TWAI, JTAG_SEL_ENABLE, DIS_PAD_JTAG, DIS_DOWNLOAD_MANUAL_ENCRYPT.

ESP32-C6: SWAP_UART_SDIO_EN, DIS_ICACHE, DIS_USB_JTAG, DIS_DOWNLOAD_ICACHE, DIS_USB_SERIAL_JTAG, DIS_FORCE_DOWNLOAD, DIS_TWAI, JTAG_SEL_ENABLE, DIS_PAD_JTAG, DIS_DOWNLOAD_MANUAL_ENCRYPT.

ESP32-H2: DIS_ICACHE, DIS_USB_JTAG, POWERGLITCH_EN, DIS_FORCE_DOWNLOAD, SPI_DOWNLOAD_MSPI_DIS, DIS_TWAI, JTAG_SEL_ENABLE, DIS_PAD_JTAG, DIS_DOWNLOAD_MANUAL_ENCRYPT.

ESP32-S2: DIS_ICACHE, DIS_DCACHE, DIS_DOWNLOAD_ICACHE, DIS_DOWNLOAD_DCACHE, DIS_FORCE_DOWNLOAD, DIS_USB, DIS_TWAI, DIS_BOOT_REMAP, SOFT_DIS_JTAG, HARD_DIS_JTAG, DIS_DOWNLOAD_MANUAL_ENCRYPT.

ESP32-S3: DIS_ICACHE, DIS_DCACHE, DIS_DOWNLOAD_ICACHE, DIS_DOWNLOAD_DCACHE, DIS_FORCE_DOWNLOAD, DIS_USB_OTG, DIS_TWAI, DIS_APP_CPU, DIS_PAD_JTAG, DIS_DOWNLOAD_MANUAL_ENCRYPT, DIS_USB_JTAG, DIS_USB_SERIAL_JTAG, STRAP_JTAG_SEL, USB_PHY_SEL.

**CONFIG_SECURE_FLASH_CHECK_ENC_EN_IN_APP**

Check Flash Encryption enabled on app startup

Found in: Security features

If set (default), in an app during startup code, there is a check of the flash encryption eFuse bit is on (as the bootloader should already have set it). The app requires this bit is on to continue work otherwise abort.

If not set, the app does not care if the flash encryption eFuse bit is set or not.

Default value:

- Yes (enabled) if `CONFIG_SECURE_FLASH_ENC_ENABLED`

**CONFIG_SECURE_UART_ROM_DL_MODE**

UART ROM download mode

Found in: Security features

Available options:

- UART ROM download mode (Permanently disabled (recommended)) (CONFIG_SECURE_DISABLE_ROM_DL_MODE)
  
  If set, during startup the app will burn an eFuse bit to permanently disable the UART ROM Download Mode. This prevents any future use of esptool.py, espefuse.py and similar tools.
  
  Once disabled, if the SoC is booted with strapping pins set for ROM Download Mode then an error is printed instead.
  
  It is recommended to enable this option in any production application where Flash Encryption and/or Secure Boot is enabled and access to Download Mode is not required.
  
  It is also possible to permanently disable Download Mode by calling esp_efuse_disable_rom_download_mode() at runtime.

- UART ROM download mode (Permanently switch to Secure mode (recommended)) (CONFIG_SECURE_ENABLE_SECURE_ROM_DL_MODE)
  
  If set, during startup the app will burn an eFuse bit to permanently switch the UART ROM Download Mode into a separate Secure Download mode. This option can only work if Download Mode is not already disabled by eFuse.
Secure Download mode limits the use of Download Mode functions to update SPI config, changing baud rate, basic flash write and a command to return a summary of currently enabled security features (get_security_info).

Secure Download mode is not compatible with the esptool.py flasher stub feature, espefuse.py, read/writing memory or registers, encrypted download, or any other features that interact with unsupported Download Mode commands.

Secure Download mode should be enabled in any application where Flash Encryption and/or Secure Boot is enabled. Disabling this option does not immediately cancel the benefits of the security features, but it increases the potential “attack surface” for an attacker to try and bypass them with a successful physical attack.

It is also possible to enable secure download mode at runtime by calling esp_efuse_enable_rom_secure_download_mode()

Note: Secure Download mode is not available for ESP32 (includes revisions till ECO3).

UART ROM download mode (Enabled (not recommended)) (CONFIG_SECURE_INSECURE_ALLOW_DL_MODE)

This is a potentially insecure option. Enabling this option will allow the full UART download mode to stay enabled. This option SHOULD NOT BE ENABLED for production use cases.

Application manager

Contains:

- CONFIG_APP_EXCLUDE_PROJECT_NAME_VAR
- CONFIG_APP_EXCLUDE_PROJECT_VER_VAR
- CONFIG_APP_PROJECT_VER_FROM_CONFIG
- CONFIG_APP RETRIEVE_LEN_ELF_SHA
- CONFIG_APP_COMPILE_TIME_DATE

CONFIG_APP_COMPILE_TIME_DATE

Use time/date stamp for app

Found in: Application manager

If set, then the app will be built with the current time/date stamp. It is stored in the app description structure. If not set, time/date stamp will be excluded from app image. This can be useful for getting the same binary image files made from the same source, but at different times.

CONFIG_APP_EXCLUDE_PROJECT_VER_VAR

Exclude PROJECT_VER from firmware image

Found in: Application manager

The PROJECT_VER variable from the build system will not affect the firmware image. This value will not be contained in the esp_app_desc structure.

Default value:

- No (disabled)

CONFIG_APP_EXCLUDE_PROJECT_NAME_VAR

Exclude PROJECT_NAME from firmware image

Found in: Application manager

The PROJECT_NAME variable from the build system will not affect the firmware image. This value will not be contained in the esp_app_desc structure.

Default value:
Chapter 2. API Reference

- No (disabled)

**CONFIG_APP_PROJECT_VER_FROM_CONFIG**

Get the project version from Kconfig

*Found in: Application manager*

If this is enabled, then config item APP_PROJECT_VER will be used for the variable PROJECT_VER. Other ways to set PROJECT_VER will be ignored.

*Default value:*
- No (disabled)

**CONFIG_APP_PROJECT_VER**

Project version

*Found in: Application manager > CONFIG_APP_PROJECT_VER_FROM_CONFIG*

Project version

*Default value:*
- 1 if CONFIG_APP_PROJECT_VER_FROM_CONFIG

**CONFIG_APP_RETRIEVE_LEN_ELF_SHA**

The length of APP ELF SHA is stored in RAM (chars)

*Found in: Application manager*

At startup, the app will read the embedded APP ELF SHA-256 hash value from flash and convert it into a string and store it in a RAM buffer. This ensures the panic handler and core dump will be able to print this string even when cache is disabled. The size of the buffer is APP_RETRIEVE_LEN_ELF_SHA plus the null terminator. Changing this value will change the size of this buffer, in bytes.

*Range:*
- from 8 to 64

*Default value:*
- 9

Boots ROM Behavior

Contains:
- **CONFIG_BOOT_ROM_LOG_SCHEME**

**CONFIG_BOOT_ROM_LOG_SCHEME**

Permanently change Boot ROM output

*Found in: Boot ROM Behavior*

Controls the Boot ROM log behavior. The rom log behavior can only be changed for once, specific eFuse bit(s) will be burned at app boot stage.

Available options:

- Always Log (CONFIG_BOOT_ROM_LOG_ALWAYS_ON)
  Always print ROM logs, this is the default behavior.
- Permanently disable logging (CONFIG_BOOT_ROM_LOG_ALWAYS_OFF)
  Don’t print ROM logs.
Chapter 2. API Reference

- Log on GPIO High (CONFIG_BOOT_ROM_LOG_ON_GPIO_HIGH)
  Print ROM logs when GPIO level is high during start up. The GPIO number is chip dependent, e.g. on ESP32-S2, the control GPIO is GPIO46.
- Log on GPIO Low (CONFIG_BOOT_ROM_LOG_ON_GPIO_LOW)
  Print ROM logs when GPIO level is low during start up. The GPIO number is chip dependent, e.g. on ESP32-S2, the control GPIO is GPIO46.

Serial flasher config

Contains:

- CONFIG_ESPTOOLPY_AFTER
- CONFIG_ESPTOOLPY_BEFORE
- CONFIG_ESPTOOLPY_HEADER_FLASHSIZE_UPDATE
- CONFIG_ESPTOOLPY_NO_STUB
- CONFIG_ESPTOOLPY_FLASH_SAMPLE_MODE
- CONFIG_ESPTOOLPY_FLASHSIZE
- CONFIG_ESPTOOLPY_FLASHMODE
- CONFIG_ESPTOOLPY_FLASHFREQ

CONFIG_ESPTOOLPY_NO_STUB

Disable download stub

*Found in: Serial flasher config*

The flasher tool sends a precompiled download stub first by default. That stub allows things like compressed downloads and more. Usually you should not need to disable that feature.

CONFIG_ESPTOOLPY_FLASHMODE

Flash SPI mode

*Found in: Serial flasher config*

Mode the flash chip is flashed in, as well as the default mode for the binary to run in.

Available options:

- QIO (CONFIG_ESPTOOLPY_FLASHMODE_QIO)
- QOUT (CONFIG_ESPTOOLPY_FLASHMODE_QOUT)
- DIO (CONFIG_ESPTOOLPY_FLASHMODE_DIO)
- DOUT (CONFIG_ESPTOOLPY_FLASHMODE_DOUT)
- OPI (CONFIG_ESPTOOLPY_FLASHMODE_OPI)

CONFIG_ESPTOOLPY_FLASH_SAMPLE_MODE

Flash Sampling Mode

*Found in: Serial flasher config*

Available options:

- STR Mode (CONFIG_ESPTOOLPY_FLASH_SAMPLE_MODE_STR)
- DTR Mode (CONFIG_ESPTOOLPY_FLASH_SAMPLE_MODE_DTR)
**CONFIG_ESPTOOLPY_FLASHFREQ**

Flash SPI speed

*Found in: Serial flasher config*

Available options:

- 120 MHz (READ DOCS FIRST) (CONFIG_ESPTOOLPY_FLASHFREQ_120M)
  - Optional feature for QSPI Flash. Read docs and enable CONFIG_SPI_FLASH_HPM_ENA first!
  - Flash 120 MHz SDR mode is stable.
  - Flash 120 MHz DDR mode is an experimental feature, it works when the temperature is stable.
  - **Risks:** If your chip powers on at a certain temperature, then after the temperature increases or decreases by approximately 20 Celsius degrees (depending on the chip), the program will crash randomly.
  - 80 MHz (CONFIG_ESPTOOLPY_FLASHFREQ_80M)
  - 64 MHz (CONFIG_ESPTOOLPY_FLASHFREQ_64M)
  - 60 MHz (CONFIG_ESPTOOLPY_FLASHFREQ_60M)
  - 48 MHz (CONFIG_ESPTOOLPY_FLASHFREQ_48M)
  - 40 MHz (CONFIG_ESPTOOLPY_FLASHFREQ_40M)
  - 32 MHz (CONFIG_ESPTOOLPY_FLASHFREQ_32M)
  - 30 MHz (CONFIG_ESPTOOLPY_FLASHFREQ_30M)
  - 26 MHz (CONFIG_ESPTOOLPY_FLASHFREQ_26M)
  - 24 MHz (CONFIG_ESPTOOLPY_FLASHFREQ_24M)
  - 20 MHz (CONFIG_ESPTOOLPY_FLASHFREQ_20M)
  - 16 MHz (CONFIG_ESPTOOLPY_FLASHFREQ_16M)
  - 15 MHz (CONFIG_ESPTOOLPY_FLASHFREQ_15M)

**CONFIG_ESPTOOLPY_FLASHSIZE**

Flash size

*Found in: Serial flasher config*

SPI flash size, in megabytes

Available options:

- 1 MB (CONFIG_ESPTOOLPY_FLASHSIZE_1MB)
- 2 MB (CONFIG_ESPTOOLPY_FLASHSIZE_2MB)
- 4 MB (CONFIG_ESPTOOLPY_FLASHSIZE_4MB)
- 8 MB (CONFIG_ESPTOOLPY_FLASHSIZE_8MB)
- 16 MB (CONFIG_ESPTOOLPY_FLASHSIZE_16MB)
- 32 MB (CONFIG_ESPTOOLPY_FLASHSIZE_32MB)
- 64 MB (CONFIG_ESPTOOLPY_FLASHSIZE_64MB)
- 128 MB (CONFIG_ESPTOOLPY_FLASHSIZE_128MB)

**CONFIG_ESPTOOLPY_HEADER_FLASHSIZE_UPDATE**

Detect flash size when flashing bootloader

*Found in: Serial flasher config*

If this option is set, flashing the project will automatically detect the flash size of the target chip and update the bootloader image before it is flashed.

Enabling this option turns off the image protection against corruption by a SHA256 digest. Updating the bootloader image before flashing would invalidate the digest.
CONFIG_ESPTOOLPY_BEFORE

Before flashing

*Found in: Serial flasher config*

Configure whether esptool.py should reset the ESP32 before flashing.

Automatic resetting depends on the RTS & DTR signals being wired from the serial port to the ESP32. Most USB development boards do this internally.

Available options:

- Reset to bootloader (CONFIG_ESPTOOLPY_BEFORE_RESET)
- No reset (CONFIG_ESPTOOLPY_BEFORE_NORESET)

CONFIG_ESPTOOLPY_AFTER

After flashing

*Found in: Serial flasher config*

Configure whether esptool.py should reset the ESP32 after flashing.

Automatic resetting depends on the RTS & DTR signals being wired from the serial port to the ESP32. Most USB development boards do this internally.

Available options:

- Reset after flashing (CONFIG_ESPTOOLPY_AFTER_RESET)
- Stay in bootloader (CONFIG_ESPTOOLPY_AFTER_NORESET)

Partition Table

Contains:

- CONFIG_PARTITION_TABLE_CUSTOM_FILENAME
- CONFIG_PARTITION_TABLE_MD5
- CONFIG_PARTITION_TABLE_OFFSET
- CONFIG_PARTITION_TABLE_TYPE

CONFIG_PARTITION_TABLE_TYPE

Partition Table

*Found in: Partition Table*

The partition table to flash to the ESP32. The partition table determines where apps, data and other resources are expected to be found.

The predefined partition table CSV descriptions can be found in the components/partition_table directory. These are mostly intended for example and development use, it’s expect that for production use you will copy one of these CSV files and create a custom partition CSV for your application.

Available options:

- Single factory app, no OTA (CONFIG_PARTITION_TABLE_SINGLE_APP)
  This is the default partition table, designed to fit into a 2MB or larger flash with a single 1MB app partition.
  The corresponding CSV file in the IDF directory is components/partition_table/partitions_singleapp.csv
This partition table is not suitable for an app that needs OTA (over the air update) capability.

- Single factory app (large), no OTA (CONFIG_PARTITION_TABLE_SINGLE_APP_LARGE)
  This is a variation of the default partition table, that expands the 1MB app partition size to 1.5MB to fit more code.
  The corresponding CSV file in the IDF directory is components/partition_table/partitions_singleapp_large.csv
  This partition table is not suitable for an app that needs OTA (over the air update) capability.

- Factory app, two OTA definitions (CONFIG_PARTITION_TABLE_TWO_OTA)
  This is a basic OTA-enabled partition table with a factory app partition plus two OTA app partitions. All are 1MB, so this partition table requires 4MB or larger flash size.
  The corresponding CSV file in the IDF directory is components/partition_table/partitions_two_ota.csv

- Custom partition table CSV (CONFIG_PARTITION_TABLE_CUSTOM)
  Specify the path to the partition table CSV to use for your project.
  Consult the Partition Table section in the ESP-IDF Programmers Guide for more information.

- Single factory app, no OTA, encrypted NVS (CONFIG_PARTITION_TABLE_SINGLE_APP_ENCRYPTED_NVS)
  This is a variation of the default “Single factory app, no OTA” partition table that supports encrypted NVS when using flash encryption. See the Flash Encryption section in the ESP-IDF Programmers Guide for more information.
  The corresponding CSV file in the IDF directory is components/partition_table/partitions_singleapp_encr_nvs.csv

- Single factory app (large), no OTA, encrypted NVS (CONFIG_PARTITION_TABLE_SINGLE_APP_LARGE_ENC_NVS)
  This is a variation of the “Single factory app (large), no OTA” partition table that supports encrypted NVS when using flash encryption. See the Flash Encryption section in the ESP-IDF Programmers Guide for more information.
  The corresponding CSV file in the IDF directory is components/partition_table/partitions_singleapp_large_encr_nvs.csv

- Factory app, two OTA definitions, encrypted NVS (CONFIG_PARTITION_TABLE_TWO_OTA_ENCRYPTED_NVS)
  This is a variation of the “Factory app, two OTA definitions” partition table that supports encrypted NVS when using flash encryption. See the Flash Encryption section in the ESP-IDF Programmers Guide for more information.
  The corresponding CSV file in the IDF directory is components/partition_table/partitions_two_ota_encr_nvs.csv

**CONFIG_PARTITION_TABLE_CUSTOM_FILENAME**

Custom partition CSV file

*Found in: Partition Table*

Name of the custom partition CSV filename. This path is evaluated relative to the project root directory.

**Default value:**

- “partitions.csv”

**CONFIG_PARTITION_TABLE_OFFSET**

Offset of partition table

*Found in: Partition Table*

The address of partition table (by default 0x8000). Allows you to move the partition table, it gives more space for the bootloader. Note that the bootloader and app will both need to be compiled with the same PARTITION_TABLE_OFFSET value.
This number should be a multiple of 0x1000.

Note that partition offsets in the partition table CSV file may need to be changed if this value is set to a higher value. To have each partition offset adapt to the configured partition table offset, leave all partition offsets blank in the CSV file.

**Default value:**
- “0x8000”

**CONFIG_PARTITION_TABLE_MD5**

Generate an MD5 checksum for the partition table

*Found in: Partition Table*

Generate an MD5 checksum for the partition table for protecting the integrity of the table. The generation should be turned off for legacy bootloaders which cannot recognize the MD5 checksum in the partition table.

**Default value:**
- Yes (enabled)

**Compiler options**

Contains:

- `CONFIG_COMPILER_OPTIMIZATION_ASSERTION_LEVEL`
- `CONFIG_COMPILER_FLOAT_LIB_FROM`
- `CONFIG_COMPILER_RT_LIB`
- `CONFIG_COMPILER_OPTIMIZATION_CHECKS_SILENT`
- `CONFIG_COMPILER_DISABLE_GCC12_WARNINGS`
- `CONFIG_COMPILER_DISABLE_GCC13_WARNINGS`
- `CONFIG_COMPILER_DUMPRTL_FILES`
- `CONFIG_COMPILER_WARN_WRITE_STRINGS`
- `CONFIG_COMPILER_CXX_EXCEPTIONS`
- `CONFIG_COMPILER_CXX_RTTI`
- `CONFIG_COMPILER_OPTIMIZATION`
- `CONFIG_COMPILER_HIDE_PATHS_MACROS`
- `CONFIG_COMPILER_STACK_CHECK_MODE`

**CONFIG_COMPILER_OPTIMIZATION**

Optimization Level

*Found in: Compiler options*

This option sets compiler optimization level (gcc -O argument) for the app.

- The “Debug” setting will add the -Og flag to CFLAGS.
- The “Size” setting will add the -Os flag to CFLAGS.
- The “Performance” setting will add the -O2 flag to CFLAGS.
- The “None” setting will add the -O0 flag to CFLAGS.

The “Size” setting cause the compiled code to be smaller and faster, but may lead to difficulties of correlating code addresses to source file lines when debugging.

The “Performance” setting causes the compiled code to be larger and faster, but will be easier to correlated code addresses to source file lines.

“None” with -O0 produces compiled code without optimization.

Note that custom optimization levels may be unsupported.
Compiler optimization for the IDF bootloader is set separately, see the BOOTLOADER_COMPILER_OPTIMIZATION setting.

Available options:

- Debug (-Og) (CONFIG_COMPILER_OPTIMIZATION_DEBUG)
- Optimize for size (-Os) (CONFIG_COMPILER_OPTIMIZATION_SIZE)
- Optimize for performance (-O2) (CONFIG_COMPILER_OPTIMIZATION_PERF)
- Debug without optimization (-O0) (CONFIG_COMPILER_OPTIMIZATION_NONE)

CONFIG_COMPILER_OPTIMIZATION_ASSERTION_LEVEL

Assertion level

*Found in: Compiler options*

Assertions can be:

- Enabled. Failure will print verbose assertion details. This is the default.
- Set to “silent” to save code size (failed assertions will abort() but user needs to use the aborting address to find the line number with the failed assertion.)
- Disabled entirely (not recommended for most configurations.) -DNDEBUG is added to CPPFLAGS in this case.

Available options:

- Enabled (CONFIG_COMPILER_OPTIMIZATION_ASSERTIONS_ENABLE)
  Enable assertions. Assertion content and line number will be printed on failure.
- Silent (saves code size) (CONFIG_COMPILER_OPTIMIZATION_ASSERTIONS_SILENT)
  Enable silent assertions. Failed assertions will abort(), user needs to use the aborting address to find the line number with the failed assertion.
- Disabled entirely (not recommended for most configurations.) -DNDEBUG is added to CPPFLAGS.

CONFIG_COMPILER_FLOAT_LIB_FROM

Compiler float lib source

*Found in: Compiler options*

In the soft-fp part of libgcc, riscv version is written in C, and handles all edge cases in IEEE754, which makes it larger and performance is slow.

RVfplib is an optimized RISC-V library for FP arithmetic on 32-bit integer processors, for single and double-precision FP. RVfplib is “fast”, but it has a few exceptions from IEEE 754 compliance.

Available options:

- libgcc (CONFIG_COMPILER_FLOAT_LIB_FROM_GCCLIB)
- librvfp (CONFIG_COMPILER_FLOAT_LIB_FROM_RVFPLIB)

CONFIG_COMPILER_OPTIMIZATION_CHECKS_SILENT

Disable messages in ESP_RETURN_ON_* and ESP_EXIT_ON_* macros

*Found in: Compiler options*

If enabled, the error messages will be discarded in following check macros: -ESP_RETURN_ON_ERROR - ESP_EXIT_ON_ERROR - ESP_RETURN_ON_FALSE - ESP_EXIT_ON_FALSE
Default value:
  • No (disabled)

**CONFIG_COMPILER_HIDE_PATHS_MACROS**

Replace ESP-IDF and project paths in binaries

*Found in: Compiler options*

When expanding the `__FILE__` and `__BASE_FILE__` macros, replace paths inside ESP-IDF with paths relative to the placeholder string “IDF”, and convert paths inside the project directory to relative paths.

This allows building the project with assertions or other code that embeds file paths, without the binary containing the exact path to the IDF or project directories.

This option passes `-fmacro-prefix-map` options to the GCC command line. To replace additional paths in your binaries, modify the project CMakeLists.txt file to pass custom `-fmacro-prefix-map` or `-ffile-prefix-map` arguments.

**Default value:**
  • Yes (enabled)

**CONFIG_COMPILER_CXX_EXCEPTIONS**

Enable C++ exceptions

*Found in: Compiler options*

Enabling this option compiles all IDF C++ files with exception support enabled.

Disabling this option disables C++ exception support in all compiled files, and any libstdc++ code which throws an exception will abort instead.

Enabling this option currently adds an additional ~500 bytes of heap overhead when an exception is thrown in user code for the first time.

**Default value:**
  • No (disabled)

Contains:
  • **CONFIG_COMPILER_CXX_EXCEPTIONS_EMG_POOL_SIZE**

**CONFIG_COMPILER_CXX_EXCEPTIONS_EMG_POOL_SIZE**

Emergency Pool Size

*Found in: Compiler options > CONFIG_COMPILER_CXX_EXCEPTIONS*

Size (in bytes) of the emergency memory pool for C++ exceptions. This pool will be used to allocate memory for thrown exceptions when there is not enough memory on the heap.

**Default value:**
  • 0 if **CONFIG_COMPILER_CXX_EXCEPTIONS**

**CONFIG_COMPILER_CXX_RTTI**

Enable C++ run-time type info (RTTI)

*Found in: Compiler options*

Enabling this option compiles all C++ files with RTTI support enabled. This increases binary size (typically by tens of kB) but allows using dynamic_cast conversion and typeid operator.

**Default value:**
  • No (disabled)
**CONFIG_COMPILER_STACK_CHECK_MODE**

Stack smashing protection mode

*Found in: Compiler options*

Stack smashing protection mode. Emit extra code to check for buffer overflows, such as stack smashing attacks. This is done by adding a guard variable to functions with vulnerable objects. The guards are initialized when a function is entered and then checked when the function exits. If a guard check fails, program is halted. Protection has the following modes:

- In **NORMAL** mode (GCC flag: -fstack-protector) only functions that call alloca, and functions with buffers larger than 8 bytes are protected.
- **STRONG** mode (GCC flag: -fstack-protector-strong) is like **NORMAL**, but includes additional functions to be protected - those that have local array definitions, or have references to local frame addresses.
- In **OVERALL** mode (GCC flag: -fstack-protector-all) all functions are protected.

Modes have the following impact on code performance and coverage:

- performance: **NORMAL > STRONG > OVERALL**
- coverage: **NORMAL < STRONG < OVERALL**

The performance impact includes increasing the amount of stack memory required for each task.

**Available options:**

- None (CONFIG_COMPILER_STACK_CHECK_MODE_NONE)
- Normal (CONFIG_COMPILER_STACK_CHECK_MODE_NORM)
- Strong (CONFIG_COMPILER_STACK_CHECK_MODE_STRONG)
- Overall (CONFIG_COMPILER_STACK_CHECK_MODE_ALL)

**CONFIG_COMPILER_WARN_WRITE_STRINGS**

Enable -Wwrite-strings warning flag

*Found in: Compiler options*

Adds -Wwrite-strings flag for the C/C++ compilers.

For C, this gives string constants the type `const char []` so that copying the address of one into a non-const `char *` pointer produces a warning. This warning helps to find at compile time code that tries to write into a string constant.

For C++, this warns about the deprecated conversion from string literals to `char *`.

**Default value:**

- No (disabled)

**CONFIG_COMPILER_DISABLE_GCC12_WARNINGS**

Disable new warnings introduced in GCC 12

*Found in: Compiler options*

Enable this option if use GCC 12 or newer, and want to disable warnings which don’t appear with GCC 11.

**Default value:**

- No (disabled)
### CONFIG_COMPILER_DISABLE_GCC13WARNINGS

Disable new warnings introduced in GCC 13

*Found in: Compiler options*

Enable this option if use GCC 13 or newer, and want to disable warnings which don’t appear with GCC 12.

**Default value:**
- No (disabled)

### CONFIG_COMPILER_DUMP_RTL_FILES

Dump RTL files during compilation

*Found in: Compiler options*

If enabled, RTL files will be produced during compilation. These files can be used by other tools, for example to calculate call graphs.

### CONFIG_COMPILER_RT_LIB

Compiler runtime library

*Found in: Compiler options*

Select runtime library to be used by compiler. - GCC toolchain supports libgcc only. - Clang allows to choose between libgcc or libclang_rt. - For host builds (“linux” target), uses the default library.

**Available options:**
- libgcc (CONFIG_COMPILER_RT_LIB_GCCLIB)
- libclang_rt (CONFIG_COMPILER_RT_LIB_CLANGRT)
- Host (CONFIG_COMPILER_RT_LIB_HOST)

### Component config

Contains:
- ADC and ADC Calibration
- Application Level Tracing
- Bluetooth
- Common ESP-related
- Core dump
- Driver Configurations
- eFuse Bit Manager
- CONFIG_BLE_MESH
- ESP HTTP client
- ESP HTTPS OTA
- ESP HTTPS server
- ESP NETIF Adapter
- ESP PSRAM
- ESP Ringbuf
- ESP System Settings
- ESP-Driven:GPIO Configurations
- ESP-Driven:GPTimer Configurations
- ESP-Driven:PCNT Configurations
- ESP-MQTT Configurations
- ESP-TLS
- Ethernet
Chapter 2. API Reference

- Event Loop Library
- FAT Filesystem support
- FreeRTOS
- GDB Stub
- Hardware Abstraction Layer (HAL) and Low Level (LL)
- Hardware Settings
- Heap memory debugging
- High resolution timer (esp_timer)
- HTTP Server
- IEEE 802.15.4
- IPC (Inter-Processor Call)
- LCD and Touch Panel
- Log output
- LWIP
- Main Flash configuration
- mbedtls
- Newlib
- NVS
- NVS Security Provider
- OpenThread
- Partition API Configuration
- PHY
- Power Management
- Protocomm
- PThreads
- SoC Settings
- SPI Flash driver
- SPIFFS Configuration
- TCP Transport
- Ultra Low Power (ULP) Co-processor
- Unity unit testing library
- USB-OTG
- Virtual file system
- Wear Levelling
- Wi-Fi
- Wi-Fi Provisioning Manager
- Wireless Coexistence

Application Level Tracing  Contains:

- CONFIG_APPTRACE_DESTINATION1
- CONFIG_APPTRACE_DESTINATION2
- FreeRTOS SystemView Tracing
- CONFIG_APPTRACE_GCOV_ENABLE
- CONFIG_APPTRACE_BUF_SIZE
- CONFIG_APPTRACE_PENDING_DATA_SIZE_MAX
- CONFIG_APPTRACE_POSTMORTEM_FLUSH_THRESH
- CONFIG_APPTRACE_ONPANIC_HOST_FLUSH_TMO
- CONFIG_APPTRACE_UART_BAUDRATE
- CONFIG_APPTRACE_UART_RX_GPIO
- CONFIG_APPTRACE_UART_RX_BUFF_SIZE
- CONFIG_APPTRACE_UART_TASK_PRIO
- CONFIG_APPTRACE_UART_TX_MSG_SIZE
- CONFIG_APPTRACE_UART_TX_GPIO
- CONFIG_APPTRACE_UART_TX_BUFF_SIZE

CONFIG_APPTRACE_DESTINATION1
Data Destination 1

*Found in: Component config > Application Level Tracing*

Select destination for application trace: JTAG or none (to disable).

Available options:

- JTAG (CONFIG_APTRACE_DEST_JTAG)
- None (CONFIG_APTRACE_DEST_NONE)

**CONFIG_APTRACE_DESTINATION2**

Data Destination 2

*Found in: Component config > Application Level Tracing*

Select destination for application trace: UART(XX) or none (to disable).

Available options:

- UART0 (CONFIG_APTRACE_DEST_UART0)
- UART1 (CONFIG_APTRACE_DEST_UART1)
- UART2 (CONFIG_APTRACE_DEST_UART2)
- USB_CDC (CONFIG_APTRACE_DEST_USB_CDC)
- None (CONFIG_APTRACE_DEST_UART_NONE)

**CONFIG_APTRACE_UART_TX_GPIO**

UART TX on GPIO#

*Found in: Component config > Application Level Tracing*

This GPIO is used for UART TX pin.

**CONFIG_APTRACE_UART_RX_GPIO**

UART RX on GPIO#

*Found in: Component config > Application Level Tracing*

This GPIO is used for UART RX pin.

**CONFIG_APTRACE_UART_BAUDRATE**

UART baud rate

*Found in: Component config > Application Level Tracing*

This baud rate is used for UART.

The app’s maximum baud rate depends on the UART clock source. If Power Management is disabled, the UART clock source is the APB clock and all baud rates in the available range will be sufficiently accurate. If Power Management is enabled, REF_TICK clock source is used so the baud rate is divided from 1MHz. Baud rates above 1Mbps are not possible and values between 500Kbps and 1Mbps may not be accurate.
**CONFIG_APPTRACE_UART_RX_BUFF_SIZE**

UART RX ring buffer size

*Found in: Component config > Application Level Tracing*

Size of the UART input ring buffer. This size related to the baudrate, system tick frequency and amount of data to transfer. The data placed to this buffer before sent out to the interface.

**CONFIG_APPTRACE_UART_TX_BUFF_SIZE**

UART TX ring buffer size

*Found in: Component config > Application Level Tracing*

Size of the UART output ring buffer. This size related to the baudrate, system tick frequency and amount of data to transfer.

**CONFIG_APPTRACE_UART_TX_MSG_SIZE**

UART TX message size

*Found in: Component config > Application Level Tracing*

Maximum size of the single message to transfer.

**CONFIG_APPTRACE_UART_TASK_PRIO**

UART Task Priority

*Found in: Component config > Application Level Tracing*

UART task priority. In case of high events rate, this parameter could be changed up to (config-MAX_PRIORITIES-1).

*Range:*
  * from 1 to 32

*Default value:*
  * 1

**CONFIG_APPTRACE_ONPANIC_HOST_FLUSH_TMO**

Timeout for flushing last trace data to host on panic

*Found in: Component config > Application Level Tracing*

Timeout for flushing last trace data to host in case of panic. In ms. Use -1 to disable timeout and wait forever.

**CONFIG_APPTRACE_POSTMORTEM_FLUSH_THRESH**

Threshold for flushing last trace data to host on panic

*Found in: Component config > Application Level Tracing*

Threshold for flushing last trace data to host on panic in post-mortem mode. This is minimal amount of data needed to perform flush. In bytes.

**CONFIG_APPTRACE_BUF_SIZE**

Size of the apptrace buffer

*Found in: Component config > Application Level Tracing*

Size of the memory buffer for trace data in bytes.
**CONFIG_APPTRACE_PENDING_DATA_SIZE_MAX**

Size of the pending data buffer

*Found in: Component config > Application Level Tracing*

Size of the buffer for events in bytes. It is useful for buffering events from the time critical code (scheduler, ISRs etc.). If this parameter is 0 then events will be discarded when main HW buffer is full.

**FreeRTOS SystemView Tracing**

Contains:

- `CONFIG_APPTRACE_SV_CPU`
- `CONFIG_APPTRACE_SV_EVT_ISR_ENTER_ENABLE`
- `CONFIG_APPTRACE_SV_EVT_ISR_EXIT_ENABLE`
- `CONFIG_APPTRACE_SV_EVT_ISR_TO_SCHED_ENABLE`
- `CONFIG_APPTRACE_SV_MAX_TASKS`
- `CONFIG_APPTRACE_SV_EVT_IDLE_ENABLE`
- `CONFIG_APPTRACE_SV_ENABLE`
- `CONFIG_APPTRACE_SV_EVT_TASK_CREATE_ENABLE`
- `CONFIG_APPTRACE_SV_EVT_TASK_START_EXEC_ENABLE`
- `CONFIG_APPTRACE_SV_EVT_TASK_START_READY_ENABLE`
- `CONFIG_APPTRACE_SV_EVT_TASK_STOP_EXEC_ENABLE`
- `CONFIG_APPTRACE_SV_EVT_TASK_STOP_READY_ENABLE`
- `CONFIG_APPTRACE_SV_EVT_TASK_TERMINATE_ENABLE`
- `CONFIG_APPTRACE_SV_EVT_TIMER_ENTER_ENABLE`
- `CONFIG_APPTRACE_SV_EVT_TIMER_EXIT_ENABLE`
- `CONFIG_APPTRACE_SV_TS_SOURCE`
- `CONFIG_APPTRACE_SV_EVT_OVERFLOW_ENABLE`
- `CONFIG_APPTRACE_SV_BUF_WAIT_TMO`

**CONFIG_APPTRACE_SV_ENABLE**

SystemView Tracing Enable

*Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing*

Enables support for SEGGER SystemView tracing functionality.

**CONFIG_APPTRACE_SV_DEST**

SystemView destination

*Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing > CONFIG_APPTRACE_SV_ENABLE*

SystemView with transfer data through defined interface.

Available options:

- Data destination JTAG (CONFIG_APPTRACE_SV_DEST_JTAG)
  Send SEGGER SystemView events through JTAG interface.
- Data destination UART (CONFIG_APPTRACE_SV_DEST_UART)
  Send SEGGER SystemView events through UART interface.

**CONFIG_APPTRACE_SV_CPU**

CPU to trace

*Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing*

Define the CPU to trace by SystemView.
Available options:

- CPU0 (CONFIG_APPTRACE документов_SV_DEST_CPU_0)
  Send SEGGER SystemView events for Pro CPU.
- CPU1 (CONFIG_APPTRACE документов_SV_DEST_CPU_1)
  Send SEGGER SystemView events for App CPU.

**CONFIG_APPTRACE документов_SV_TS_SOURCE**

Timer to use as timestamp source

*Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing*

SystemView needs to use a hardware timer as the source of timestamps when tracing. This option selects the timer for it.

Available options:

- CPU cycle counter (CCOUNT) (CONFIG_APPTRACE документов_SV_TS_SOURCE_CCOUNT)
- General Purpose Timer (Timer Group) (CONFIG_APPTRACE документов_SV_TS_SOURCE_GPTIMER)
- esp_timer high resolution timer (CONFIG_APPTRACE документов_SV_TS_SOURCE_ESP_TIMER)

**CONFIG_APPTRACE документов_SV_MAX_TASKS**

Maximum supported tasks

*Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing*

Configures maximum supported tasks in sysview debug

**CONFIG_APPTRACE документов_SV_BUF_WAIT_TMO**

Trace buffer wait timeout

*Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing*

Configures timeout (in us) to wait for free space in trace buffer. Set to -1 to wait forever and avoid lost events.

**CONFIG_APPTRACE документов_SV_EVT_OVERFLOW_ENABLE**

Trace Buffer Overflow Event

*Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing*

Enables “Trace Buffer Overflow” event.

**CONFIG_APPTRACE документов_SV_EVT_ISR_ENTER_ENABLE**

ISR Enter Event

*Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing*

Enables “ISR Enter” event.
CONFIG_APPTRACE_SV_EVT_ISR_EXIT_ENABLE
ISR Exit Event
*Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing*
Enables “ISR Exit” event.

CONFIG_APPTRACE_SV_EVT_ISR_TO_SCHED_ENABLE
ISR Exit to Scheduler Event
*Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing*
Enables “ISR to Scheduler” event.

CONFIG_APPTRACE_SV_EVT_TASK_START_EXEC_ENABLE
Task Start Execution Event
*Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing*
Enables “Task Start Execution” event.

CONFIG_APPTRACE_SV_EVT_TASK_STOP_EXEC_ENABLE
Task Stop Execution Event
*Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing*
Enables “Task Stop Execution” event.

CONFIG_APPTRACE_SV_EVT_TASK_START_READY_ENABLE
Task Start Ready State Event
*Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing*
Enables “Task Start Ready State” event.

CONFIG_APPTRACE_SV_EVT_TASK_STOP_READY_ENABLE
Task Stop Ready State Event
*Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing*
Enables “Task Stop Ready State” event.

CONFIG_APPTRACE_SV_EVT_TASK_CREATE_ENABLE
Task Create Event
*Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing*
Enables “Task Create” event.

CONFIG_APPTRACE_SV_EVT_TASK_TERMINATE_ENABLE
Task Terminate Event
*Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing*
Enables “Task Terminate” event.
CONFIG_APPTRACE_SV_EVT_IDLE_ENABLE
System Idle Event
Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing
Enables “System Idle” event.

CONFIG_APPTRACE_SV_EVT_TIMER_ENTER_ENABLE
Timer Enter Event
Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing
Enables “Timer Enter” event.

CONFIG_APPTRACE_SV_EVT_TIMER_EXIT_ENABLE
Timer Exit Event
Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing
Enables “Timer Exit” event.

CONFIG_APPTRACE_GCOV_ENABLE
GCOV to Host Enable
Found in: Component config > Application Level Tracing
Enables support for GCOV data transfer to host.

CONFIG_APPTRACE_GCOV_DUMP_TASK_STACK_SIZE
Gcov dump task stack size
Found in: Component config > Application Level Tracing > CONFIG_APPTRACE_GCOV_ENABLE
Configures stack size of Gcov dump task
Default value:
  • 2048 if CONFIG_APPTRACE_GCOV_ENABLE

Bluetooth
Contains:
  • Blueedroid Options
  • CONFIG_BT_ENABLED
  • Controller Options
  • NimBLE Options
  • CONFIG_BT_RELEASE_IRAM

CONFIG_BT_ENABLED
Bluetooth
Found in: Component config > Bluetooth
Select this option to enable Bluetooth and show the submenu with Bluetooth configuration choices.
**CONFIG_BT_HOST**

Host

*Found in: Component config > Bluetooth > CONFIG_BT_ENABLED*

This helps to choose Bluetooth host stack

Available options:

- **Bluedroid - Dual-mode (CONFIG_BT_BLUEDROID_ENABLED)**
  - This option is recommended for classic Bluetooth or for dual-mode usecases
- **NimBLE - BLE only (CONFIG_BT_NIMBLE_ENABLED)**
  - This option is recommended for BLE only usecases to save on memory
- **Disabled (CONFIG_BT_CONTROLLER_ONLY)**
  - This option is recommended when you want to communicate directly with the controller (without any host) or when you are using any other host stack not supported by Espressif (not mentioned here).

**CONFIG_BT_CONTROLLER**

Controller

*Found in: Component config > Bluetooth > CONFIG_BT_ENABLED*

This helps to choose Bluetooth controller stack

Available options:

- **Enabled (CONFIG_BT_CONTROLLER_ENABLED)**
  - This option is recommended for Bluetooth controller usecases
- **Disabled (CONFIG_BT_CONTROLLER_DISABLED)**
  - This option is recommended for Bluetooth Host only usecases

**Bluedroid Options**  Contains:

- `CONFIG_BT_BLE_HOST_QUEUE_CONG_CHECK`
- `CONFIG_BT_BLUEDROID_MEM_DEBUG`
- `CONFIG_BT_BTU_TASK_STACK_SIZE`
- `CONFIG_BT_BTU_TASK_STACK_SIZE`
- `CONFIG_BT_BLE_ENABLED`
- `BT DEBUG LOG LEVEL`
- `CONFIG_BT_ACL_CONNECTIONS`
- `CONFIG_BT_ALLOCATION_FROM_SPIRAM_FIRST`
- `CONFIG_BT_CLASSIC_ENABLED`
- `CONFIG_BT_HID_ENABLED`
- `CONFIG_BT_STACK_NO_LOG`
- `CONFIG_BT_BLE_42_FEATURES_SUPPORTED`
- `CONFIG_BT_BLE_50_FEATURES_SUPPORTED`
- `CONFIG_BT_BLE_HIGH_DUTY_ADV_INTERVAL`
- `CONFIG_BT_MULTI_CONNECTION_ENBALE`
- `CONFIG_BT_BLE_FEAT_PERIODIC_ADV_SYNC_TRANSFER`
- `CONFIG_BT_BLUEDROID_ESP_COEX_VSC`
- `CONFIG_BT_BLE_FEAT_PERIODIC_ADV_ENH`
- `CONFIG_BT_MAX_DEVICE_NAME_LEN`
- `CONFIG_BT_BLE_ACT_SCAN_REP_ADV_SCAN`
- `CONFIG_BT_BLE_FEAT_PERIODIC_ADV_SCAN`
- `CONFIG_BT_BLE_PPA_UNPA_PPA_CP_WAKE`
- `CONFIG_BT_BLE_RPA_TIMEOUT`
Chapter 2. API Reference

- `CONFIG_BT_BLE_RPA_SUPPORTED`
- `CONFIG_BT_BLE_DYNAMIC_ENV_MEMORY`
- `CONFIG_BT_HFP_WBS_ENABLE`

**CONFIG_BT_BT_TASK_STACK_SIZE**

Bluetooth event (callback to application) task stack size

*Found in: Component config > Bluetooth > Bluedroid Options*

This select btc task stack size

**Default value:**
- 3072 if `CONFIG_BT_BLUEDROID_ENABLED` && `CONFIG_BT_BLUEDROID_ENABLED`

**CONFIG_BT_BLUEDROID_PINNED_TO_CORE_CHOICE**

The cpu core which Bluedroid run

*Found in: Component config > Bluetooth > Bluedroid Options*

Which the cpu core to run Bluedroid. Can choose core0 and core1. Can not specify no-affinity.

Available options:

- Core 0 (PRO CPU) (CONFIG_BT_BLUEDROID_PINNED_TO_CORE_0)
- Core 1 (APP CPU) (CONFIG_BT_BLUEDROID_PINNED_TO_CORE_1)

**CONFIG_BT_BTU_TASK_STACK_SIZE**

Bluetooth Bluedroid Host Stack task stack size

*Found in: Component config > Bluetooth > Bluedroid Options*

This select btu task stack size

**Default value:**
- 4096 if `CONFIG_BT_BLUEDROID_ENABLED` && `CONFIG_BT_BLUEDROID_ENABLED`

**CONFIG_BT_BLUEDROID_MEM_DEBUG**

Bluedroid memory debug

*Found in: Component config > Bluetooth > Bluedroid Options*

Bluedroid memory debug

**Default value:**
- No (disabled) if `CONFIG_BT_BLUEDROID_ENABLED` && `CONFIG_BT_BLUEDROID_ENABLED`

**CONFIG_BT_BLUEDROID_ESP_COEX_VSC**

Enable Espressif Vendor-specific HCI commands for coexist status configuration

*Found in: Component config > Bluetooth > Bluedroid Options*

Enable Espressif Vendor-specific HCI commands for coexist status configuration

**Default value:**
- Yes (enabled) if `CONFIG_BT_BLUEDROID_ENABLED` && `CONFIG_BT_BLUEDROID_ENABLED`
CONFIG_BT_CLASSIC_ENABLED

Classic Bluetooth

*Found in: Component config > Bluetooth > Bluedroid Options*

For now this option needs “SMP_ENABLE” to be set to yes

**Default value:**
- No (disabled) if `CONFIG_BT_BLUEDROID_ENABLED` && (`CONFIG_BT_CONTROLLER_ENABLED` && `SOC_BT_CLASSIC_SUPPORTED`) || `CONFIG_BT_CONTROLLER_DISABLED`) && `CONFIG_BT_BLUEDROID_ENABLED`

CONFIG_BT_CLASSIC_BQB_ENABLED

Host Qualification support for Classic Bluetooth

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_CLASSIC_ENABLED*

This enables functionalities of Host qualification for Classic Bluetooth.

**Default value:**
- No (disabled) if `CONFIG_BT_CLASSIC_ENABLED` && `CONFIG_BT_BLUEDROID_ENABLED`

CONFIG_BT_A2DP_ENABLE

A2DP

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_CLASSIC_ENABLED*

Advanced Audio Distribution Profile

**Default value:**
- No (disabled) if `CONFIG_BT_CLASSIC_ENABLED` && `CONFIG_BT_BLUEDROID_ENABLED`

CONFIG_BT_SPP_ENABLED

SPP

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_CLASSIC_ENABLED*

This enables the Serial Port Profile

**Default value:**
- No (disabled) if `CONFIG_BT_CLASSIC_ENABLED` && `CONFIG_BT_BLUEDROID_ENABLED`

CONFIG_BT_L2CAP_ENABLED

BT L2CAP

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_CLASSIC_ENABLED*

This enables the Logical Link Control and Adaptation Layer Protocol. Only supported classic bluetooth.

**Default value:**
- No (disabled) if `CONFIG_BT_CLASSIC_ENABLED` && `CONFIG_BT_BLUEDROID_ENABLED`
**CONFIG_BT_HFP_ENABLE**

Hands Free/Handset Profile

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_CLASSIC_ENABLED*

Hands Free Unit and Audio Gateway can be included simultaneously but they cannot run simultaneously due to internal limitations.

**Default value:**
- No (disabled) if CONFIG_BT_CLASSIC_ENABLED && CONFIG_BT_BLUEDROID_ENABLED

**Contains:**
- CONFIG_BT_HFP_AG_ENABLE
- CONFIG_BT_HFP_AUDIO_DATA_PATH
- CONFIG_BT_HFP_CLIENT_ENABLE

**CONFIG_BT_HFP_CLIENT_ENABLE**

Hands Free Unit

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_CLASSIC_ENABLED > CONFIG_BT_HFP_ENABLE*

**Default value:**
- Yes (enabled) if CONFIG_BT_HFP_ENABLE && CONFIG_BT_BLUEDROID_ENABLED

**CONFIG_BT_HFP_AG_ENABLE**

Audio Gateway

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_CLASSIC_ENABLED > CONFIG_BT_HFP_ENABLE*

**Default value:**
- Yes (enabled) if CONFIG_BT_HFP_ENABLE && CONFIG_BT_BLUEDROID_ENABLED

**CONFIG_BT_HFP_AUDIO_DATA_PATH**

audio(SCO) data path

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_CLASSIC_ENABLED > CONFIG_BT_HFP_ENABLE*

SCO data path, i.e. HCI or PCM. This option is set using API `esp_bredr_sco_datapath_set` in Bluetooth host. Default SCO data path can also be set in Bluetooth Controller.

**Available options:**
- PCM (CONFIG_BT_HFP_AUDIO_DATA_PATH_PCM)
- HCI (CONFIG_BT_HFP_AUDIO_DATA_PATH_HCI)

**CONFIG_BT_HFP_WBS_ENABLE**

Wide Band Speech

*Found in: Component config > Bluetooth > Bluedroid Options*

This enables Wide Band Speech. Should disable it when SCO data path is PCM. Otherwise there will be no data transmitted via GPIOs.

**Default value:**
• Yes (enabled) if \( \text{CONFIG\_BT\_HFP\_AUDIO\_DATA\_PATH\_HCI} \) && \( \text{CONFIG\_BT\_BLUEDROID\_ENABLED} \)

**CONFIG\_BT\_HID\_ENABLED**

Classic BT HID

*Found in: Component config > Bluetooth > Blueid Options*

This enables the BT HID Host

**Default value:**

• No (disabled) if \( \text{CONFIG\_BT\_CLASSIC\_ENABLED} \) && \( \text{CONFIG\_BT\_BLUEDROID\_ENABLED} \)

Contains:

• \( \text{CONFIG\_BT\_HID\_DEVICE\_ENABLED} \)
• \( \text{CONFIG\_BT\_HID\_HOST\_ENABLED} \)

**CONFIG\_BT\_HID\_HOST\_ENABLED**

Classic BT HID Host

*Found in: Component config > Bluetooth > Blueid Options > CONFIG\_BT\_HID\_ENABLED*

This enables the BT HID Host

**Default value:**

• No (disabled) if \( \text{CONFIG\_BT\_HID\_ENABLED} \) && \( \text{CONFIG\_BT\_BLUEDROID\_ENABLED} \)

**CONFIG\_BT\_HID\_DEVICE\_ENABLED**

Classic BT HID Device

*Found in: Component config > Bluetooth > Blueid Options > CONFIG\_BT\_HID\_ENABLED*

This enables the BT HID Device

**CONFIG\_BT\_BLE\_ENABLED**

Bluetooth Low Energy

*Found in: Component config > Bluetooth > Blueid Options*

This enables Bluetooth Low Energy

**Default value:**

• Yes (enabled) if \( \text{CONFIG\_BT\_BLUEDROID\_ENABLED} \) && \( \text{CONFIG\_BT\_BLUEDROID\_ENABLED} \)

**CONFIG\_BT\_GATTS\_ENABLE**

Include GATT server module(GATTS)

*Found in: Component config > Bluetooth > Blueid Options > CONFIG\_BT\_BLE\_ENABLED*

This option can be disabled when the app work only on gatt client mode

**Default value:**

• Yes (enabled) if \( \text{CONFIG\_BT\_BLE\_ENABLED} \) && \( \text{CONFIG\_BT\_BLUEDROID\_ENABLED} \)
**CONFIG_BT_GATTS_PPCP_CHAR_GAP**

Enable Peripheral Preferred Connection Parameters characteristic in GAP service

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_BLE_ENABLED > CONFIG_BT_GATTS_ENABLE*

This enables “Peripheral Preferred Connection Parameters” characteristic (UUID: 0x2A04) in GAP service that has connection parameters like min/max connection interval, slave latency and supervision timeout multiplier

**Default value:**
- No (disabled) if CONFIG_BT_GATTS_ENABLE && CONFIG_BT_BLUEDROID_ENABLED

**CONFIG_BT_BLE_BLUFI_ENABLE**

Include blufi function

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_BLE_ENABLED > CONFIG_BT_GATTS_ENABLE*

This option can be close when the app does not require blufi function.

**Default value:**
- No (disabled) if CONFIG_BT_GATTS_ENABLE && CONFIG_BT_BLUEDROID_ENABLED

**CONFIG_BT_GATT_MAX_SR_PROFILES**

Max GATT Server Profiles

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_BLE_ENABLED > CONFIG_BT_GATTS_ENABLE*

Maximum GATT Server Profiles Count

**Range:**
- from 1 to 32 if CONFIG_BT_GATTS_ENABLE && CONFIG_BT_BLUEDROID_ENABLED && CONFIG_BT_BLUEDROID_ENABLED

**Default value:**
- 8 if CONFIG_BT_GATTS_ENABLE && CONFIG_BT_BLUEDROID_ENABLED && CONFIG_BT_BLUEDROID_ENABLED

**CONFIG_BT_GATT_MAX_SR_ATTRIBUTES**

Max GATT Service Attributes

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_BLE_ENABLED > CONFIG_BT_GATTS_ENABLE*

Maximum GATT Service Attributes Count

**Range:**
- from 1 to 500 if CONFIG_BT_GATTS_ENABLE && CONFIG_BT_BLUEDROID_ENABLED && CONFIG_BT_BLUEDROID_ENABLED

**Default value:**
- 100 if CONFIG_BT_GATTS_ENABLE && CONFIG_BT_BLUEDROID_ENABLED && CONFIG_BT_BLUEDROID_ENABLED

**CONFIG_BT_GATTS_SEND_SERVICE_CHANGE_MODE**

GATT Service Change Mode

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_BLE_ENABLED > CONFIG_BT_GATTS_ENABLE*
Service change indication mode for GATT Server.

Available options:

- GATTS manually send service change indication (CONFIG_BT_GATTS_SEND_SERVICE_CHANGE_MANUAL)
  Manually send service change indication through API esp_ble_gatts_send_service_change_indication()
- GATTS automatically send service change indication (CONFIG_BT_GATTS_SEND_SERVICE_CHANGE_AUTO)
  Let Bluedroid handle the service change indication internally

**CONFIG_BT_GATTS_ROBUST_CACHING_ENABLED**

Enable Robust Caching on Server Side

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_BLE_ENABLED > CONFIG_BT_GATTS_ENABLE*

This option enable gatt robust caching feature on server

**Default value:**
- No (disabled) if CONFIG_BT_GATTS_ENABLE && CONFIG_BT_BLUEDROID_ENABLED

**CONFIG_BT_GATTS_DEVICE_NAME_WRITABLE**

Allow to write device name by GATT clients

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_BLE_ENABLED > CONFIG_BT_GATTS_ENABLE*

Enabling this option allows remote GATT clients to write device name

**Default value:**
- No (disabled) if CONFIG_BT_GATTS_ENABLE && CONFIG_BT_BLUEDROID_ENABLED

**CONFIG_BT_GATTS_APPEARANCE_WRITABLE**

Allow to write appearance by GATT clients

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_BLE_ENABLED > CONFIG_BT_GATTS_ENABLE*

Enabling this option allows remote GATT clients to write appearance

**Default value:**
- No (disabled) if CONFIG_BT_GATTS_ENABLE && CONFIG_BT_BLUEDROID_ENABLED

**CONFIG_BT_GATTC_ENABLE**

Include GATT client module(GATTC)

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_BLE_ENABLED*

This option can be close when the app work only on gatt server mode

**Default value:**
- Yes (enabled) if CONFIG_BT_BLE_ENABLED && CONFIG_BT_BLUEDROID_ENABLED
CONFIG_BT_GATTC_MAX_CACHE_CHAR
Max gattc cache characteristic for discover

Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_BLE_ENABLED > CONFIG_BT_GATTC_ENABLE

Maximum GATT cache characteristic count

Range:
• from 1 to 500 if CONFIG_BT_GATTC_ENABLE && CONFIG_BT_BLUEDROID_ENABLED

Default value:
• 40 if CONFIG_BT_GATTC_ENABLE && CONFIG_BT_BLUEDROID_ENABLED

CONFIG_BT_GATTC_NOTIF_REG_MAX
Max gattc notify(indication) register number

Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_BLE_ENABLED > CONFIG_BT_GATTC_ENABLE

Maximum GATT notify(indication) register number

Range:
• from 1 to 64 if CONFIG_BT_GATTC_ENABLE && CONFIG_BT_BLUEDROID_ENABLED

Default value:
• 5 if CONFIG_BT_GATTC_ENABLE && CONFIG_BT_BLUEDROID_ENABLED

CONFIG_BT_GATTC_CACHE_NVS_FLASH
Save gattc cache data to nvs flash

Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_BLE_ENABLED > CONFIG_BT_GATTC_ENABLE

This select can save gattc cache data to nvs flash

Default value:
• No (disabled) if CONFIG_BT_GATTC_ENABLE && CONFIG_BT_BLUEDROID_ENABLED

CONFIG_BT_GATTC_CONNECT_RETRY_COUNT
The number of attempts to reconnect if the connection establishment failed

Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_BLE_ENABLED > CONFIG_BT_GATTC_ENABLE

The number of attempts to reconnect if the connection establishment failed

Range:
• from 0 to 7 if CONFIG_BT_GATTC_ENABLE && CONFIG_BT_BLUEDROID_ENABLED

Default value:
• 3 if CONFIG_BT_GATTC_ENABLE && CONFIG_BT_BLUEDROID_ENABLED

CONFIG_BT_BLE_SMP_ENABLE
Include BLE security module(SMP)

Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_BLE_ENABLED

This option can be close when the app not used the ble security connect.

Default value:
• Yes (enabled) if CONFIG_BT_BLE_ENABLED && CONFIG_BT_BLUEDROID_ENABLED
CONFIG_BT_SMP_SLAVE_CON_PARAMS_UPD_ENABLE

Slave enable connection parameters update during pairing

*Found in:* Component config > Bluetooth > Bluedroid Options > CONFIG_BT_BLE_ENABLED > CONFIG_BT_BLE_SMP_ENABLE

In order to reduce the pairing time, slave actively initiates connection parameters update during pairing.

**Default value:**

- No (disabled) if CONFIG_BT_BLE_SMP_ENABLE && CONFIG_BT_BLUEDROID_ENABLED

CONFIG_BT_STACK_NO_LOG

Disable BT debug logs (minimize bin size)

*Found in:* Component config > Bluetooth > Bluedroid Options

This select can save the rodata code size

**Default value:**

- No (disabled) if CONFIG_BT_BLUEDROID_ENABLED && CONFIG_BT_BLUEDROID_ENABLED

**BT DEBUG LOG LEVEL**

Contains:

- CONFIG_BT_LOG_A2D_TRACE_LEVEL

**CONFIG_BT_LOG_HCI_TRACE_LEVEL**

HCI layer

*Found in:* Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL

Define BT trace level for HCI layer

Available options:

- NONE (CONFIG_BT_LOG_HCI_TRACE_LEVEL_NONE)
- ERROR (CONFIG_BT_LOG_HCI_TRACE_LEVEL_ERROR)
Chapter 2. API Reference

- WARNING (CONFIG_BT_LOG_HCI_TRACE_LEVEL_WARNING)
- API (CONFIG_BT_LOG_HCI_TRACE_LEVEL_API)
- EVENT (CONFIG_BT_LOG_HCI_TRACE_LEVEL_EVENT)
- DEBUG (CONFIG_BT_LOG_HCI_TRACE_LEVEL_DEBUG)
- VERBOSE (CONFIG_BT_LOG_HCI_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_BTM_TRACE_LEVEL

BTM layer

*Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL*

Define BT trace level for BTM layer

Available options:

- NONE (CONFIG_BT_LOG_BTM_TRACE_LEVEL_NONE)
- ERROR (CONFIG_BT_LOG_BTM_TRACE_LEVEL_ERROR)
- WARNING (CONFIG_BT_LOG_BTM_TRACE_LEVEL_WARNING)
- API (CONFIG_BT_LOG_BTM_TRACE_LEVEL_API)
- EVENT (CONFIG_BT_LOG_BTM_TRACE_LEVEL_EVENT)
- DEBUG (CONFIG_BT_LOG_BTM_TRACE_LEVEL_DEBUG)
- VERBOSE (CONFIG_BT_LOG_BTM_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_L2CAP_TRACE_LEVEL

L2CAP layer

*Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL*

Define BT trace level for L2CAP layer

Available options:

- NONE (CONFIG_BT_LOG_L2CAP_TRACE_LEVEL_NONE)
- ERROR (CONFIG_BT_LOG_L2CAP_TRACE_LEVEL_ERROR)
- WARNING (CONFIG_BT_LOG_L2CAP_TRACE_LEVEL_WARNING)
- API (CONFIG_BT_LOG_L2CAP_TRACE_LEVEL_API)
- EVENT (CONFIG_BT_LOG_L2CAP_TRACE_LEVEL_EVENT)
- DEBUG (CONFIG_BT_LOG_L2CAP_TRACE_LEVEL_DEBUG)
- VERBOSE (CONFIG_BT_LOG_L2CAP_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_RFCOMM_TRACE_LEVEL

RFCOMM layer

*Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL*

Define BT trace level for RFCOMM layer

Available options:

- NONE (CONFIG_BT_LOG_RFCOMM_TRACE_LEVEL_NONE)
- ERROR (CONFIG_BT_LOG_RFCOMM_TRACE_LEVEL_ERROR)
- WARNING (CONFIG_BT_LOG_RFCOMM_TRACE_LEVEL_WARNING)
- API (CONFIG_BT_LOG_RFCOMM_TRACE_LEVEL_API)
- EVENT (CONFIG_BT_LOG_RFCOMM_TRACE_LEVEL_EVENT)
- DEBUG (CONFIG_BT_LOG_RFCOMM_TRACE_LEVEL_DEBUG)
- VERBOSE (CONFIG_BT_LOG_RFCOMM_TRACE_LEVEL_VERBOSE)
**CONFIG_BT_LOG_SDP_TRACE_LEVEL**

SDP layer

*Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL*

Define BT trace level for SDP layer

Available options:

- NONE (CONFIG_BT_LOG_SDP_TRACE_LEVEL_NONE)
- ERROR (CONFIG_BT_LOG_SDP_TRACE_LEVEL_ERROR)
- WARNING (CONFIG_BT_LOG_SDP_TRACE_LEVEL_WARNING)
- API (CONFIG_BT_LOG_SDP_TRACE_LEVEL_API)
- EVENT (CONFIG_BT_LOG_SDP_TRACE_LEVEL_EVENT)
- DEBUG (CONFIG_BT_LOG_SDP_TRACE_LEVEL_DEBUG)
- VERBOSE (CONFIG_BT_LOG_SDP_TRACE_LEVEL_VERBOSE)

**CONFIG_BT_LOG_GAP_TRACE_LEVEL**

GAP layer

*Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL*

Define BT trace level for GAP layer

Available options:

- NONE (CONFIG_BT_LOG_GAP_TRACE_LEVEL_NONE)
- ERROR (CONFIG_BT_LOG_GAP_TRACE_LEVEL_ERROR)
- WARNING (CONFIG_BT_LOG_GAP_TRACE_LEVEL_WARNING)
- API (CONFIG_BT_LOG_GAP_TRACE_LEVEL_API)
- EVENT (CONFIG_BT_LOG_GAP_TRACE_LEVEL_EVENT)
- DEBUG (CONFIG_BT_LOG_GAP_TRACE_LEVEL_DEBUG)
- VERBOSE (CONFIG_BT_LOG_GAP_TRACE_LEVEL_VERBOSE)

**CONFIG_BT_LOG_BNEP_TRACE_LEVEL**

BNEP layer

*Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL*

Define BT trace level for BNEP layer

Available options:

- NONE (CONFIG_BT_LOG_BNEP_TRACE_LEVEL_NONE)
- ERROR (CONFIG_BT_LOG_BNEP_TRACE_LEVEL_ERROR)
- WARNING (CONFIG_BT_LOG_BNEP_TRACE_LEVEL_WARNING)
- API (CONFIG_BT_LOG_BNEP_TRACE_LEVEL_API)
- EVENT (CONFIG_BT_LOG_BNEP_TRACE_LEVEL_EVENT)
- DEBUG (CONFIG_BT_LOG_BNEP_TRACE_LEVEL_DEBUG)
- VERBOSE (CONFIG_BT_LOG_BNEP_TRACE_LEVEL_VERBOSE)

**CONFIG_BT_LOG_PAN_TRACE_LEVEL**

PAN layer

*Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL*
Define BT trace level for PAN layer
Available options:

- NONE (CONFIG_BT_LOG_PAN_TRACE_LEVEL_NONE)
- ERROR (CONFIG_BT_LOG_PAN_TRACE_LEVEL_ERROR)
- WARNING (CONFIG_BT_LOG_PAN_TRACE_LEVEL_WARNING)
- API (CONFIG_BT_LOG_PAN_TRACE_LEVEL_API)
- EVENT (CONFIG_BT_LOG_PAN_TRACE_LEVEL_EVENT)
- DEBUG (CONFIG_BT_LOG_PAN_TRACE_LEVEL_DEBUG)
- VERBOSE (CONFIG_BT_LOG_PAN_TRACE_LEVEL_VERBOSE)

**CONFIG_BT_LOG_A2D_TRACE_LEVEL**
A2D layer

*Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL*
Define BT trace level for A2D layer
Available options:

- NONE (CONFIG_BT_LOG_A2D_TRACE_LEVEL_NONE)
- ERROR (CONFIG_BT_LOG_A2D_TRACE_LEVEL_ERROR)
- WARNING (CONFIG_BT_LOG_A2D_TRACE_LEVEL_WARNING)
- API (CONFIG_BT_LOG_A2D_TRACE_LEVEL_API)
- EVENT (CONFIG_BT_LOG_A2D_TRACE_LEVEL_EVENT)
- DEBUG (CONFIG_BT_LOG_A2D_TRACE_LEVEL_DEBUG)
- VERBOSE (CONFIG_BT_LOG_A2D_TRACE_LEVEL_VERBOSE)

**CONFIG_BT_LOG_AVDT_TRACE_LEVEL**
AVDT layer

*Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL*
Define BT trace level for AVDT layer
Available options:

- NONE (CONFIG_BT_LOG_AVDT_TRACE_LEVEL_NONE)
- ERROR (CONFIG_BT_LOG_AVDT_TRACE_LEVEL_ERROR)
- WARNING (CONFIG_BT_LOG_AVDT TRACE_LEVEL WARNING)
- API (CONFIG_BT_LOG_AVDT_TRACE_LEVEL_API)
- EVENT (CONFIG_BT_LOG_AVDT_TRACE_LEVEL_EVENT)
- DEBUG (CONFIG_BT_LOG_AVDT_TRACE_LEVEL_DEBUG)
- VERBOSE (CONFIG_BT_LOG_AVDT_TRACE_LEVEL_VERBOSE)

**CONFIG_BT_LOG_AVCCT TRACE_LEVEL**
AVCT layer

*Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL*
Define BT trace level for AVCT layer
Available options:
Chapter 2. API Reference

- NONE (CONFIG_BT_LOG_AVCT_TRACE_LEVEL_NONE)
- ERROR (CONFIG_BT_LOG_AVCT_TRACE_LEVEL_ERROR)
- WARNING (CONFIG_BT_LOG_AVCT_TRACE_LEVEL_WARNING)
- API (CONFIG_BT_LOG_AVCT_TRACE_LEVEL_API)
- EVENT (CONFIG_BT_LOG_AVCT_TRACE_LEVEL_EVENT)
- DEBUG (CONFIG_BT_LOG_AVCT_TRACE_LEVEL_DEBUG)
- VERBOSE (CONFIG_BT_LOG_AVCT_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_AVRC_TRACE_LEVEL

AVRC layer

*Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL*

Define BT trace level for AVRC layer

Available options:

- NONE (CONFIG_BT_LOG_AVRC_TRACE_LEVEL_NONE)
- ERROR (CONFIG_BT_LOG_AVRC_TRACE_LEVEL_ERROR)
- WARNING (CONFIG_BT_LOG_AVRC_TRACE_LEVEL_WARNING)
- API (CONFIG_BT_LOG_AVRC_TRACE_LEVEL_API)
- EVENT (CONFIG_BT_LOG_AVRC_TRACE_LEVEL_EVENT)
- DEBUG (CONFIG_BT_LOG_AVRC_TRACE_LEVEL_DEBUG)
- VERBOSE (CONFIG_BT_LOG_AVRC_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_MCA_TRACE_LEVEL

MCA layer

*Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL*

Define BT trace level for MCA layer

Available options:

- NONE (CONFIG_BT_LOG_MCA_TRACE_LEVEL_NONE)
- ERROR (CONFIG_BT_LOG_MCA_TRACE_LEVEL_ERROR)
- WARNING (CONFIG_BT_LOG_MCA_TRACE_LEVEL_WARNING)
- API (CONFIG_BT_LOG_MCA_TRACE_LEVEL_API)
- EVENT (CONFIG_BT_LOG_MCA_TRACE_LEVEL_EVENT)
- DEBUG (CONFIG_BT_LOG_MCA_TRACE_LEVEL_DEBUG)
- VERBOSE (CONFIG_BT_LOG_MCA_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_HID_TRACE_LEVEL

HID layer

*Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL*

Define BT trace level for HID layer

Available options:

- NONE (CONFIG_BT_LOG_HID_TRACE_LEVEL_NONE)
- ERROR (CONFIG_BT_LOG_HID_TRACE_LEVEL_ERROR)
- WARNING (CONFIG_BT_LOG_HID_TRACE_LEVEL_WARNING)
- API (CONFIG_BT_LOG_HID_TRACE_LEVEL_API)
- EVENT (CONFIG_BT_LOG_HID_TRACE_LEVEL_EVENT)
Chapter 2. API Reference

- DEBUG (CONFIG_BT_LOG_HID_TRACE_LEVEL_DEBUG)
- VERBOSE (CONFIG_BT_LOG_HID_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_APPL_TRACE_LEVEL

APPL layer

*Found in:* Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL

Define BT trace level for APPL layer

Available options:

- NONE (CONFIG_BT_LOG_APPL_TRACE_LEVEL_NONE)
- ERROR (CONFIG_BT_LOG_APPL_TRACE_LEVEL_ERROR)
- WARNING (CONFIG_BT_LOG_APPL_TRACE_LEVEL_WARNING)
- API (CONFIG_BT_LOG_APPL_TRACE_LEVEL_API)
- EVENT (CONFIG_BT_LOG_APPL_TRACE_LEVEL_EVENT)
- DEBUG (CONFIG_BT_LOG_APPL_TRACE_LEVEL_DEBUG)
- VERBOSE (CONFIG_BT_LOG_APPL_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_GATT_TRACE_LEVEL

GATT layer

*Found in:* Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL

Define BT trace level for GATT layer

Available options:

- NONE (CONFIG_BT_LOG_GATT_TRACE_LEVEL_NONE)
- ERROR (CONFIG_BT_LOG_GATT_TRACE_LEVEL_ERROR)
- WARNING (CONFIG_BT_LOG_GATT_TRACE_LEVEL_WARNING)
- API (CONFIG_BT_LOG_GATT_TRACE_LEVEL_API)
- EVENT (CONFIG_BT_LOG_GATT_TRACE_LEVEL_EVENT)
- DEBUG (CONFIG_BT_LOG_GATT_TRACE_LEVEL_DEBUG)
- VERBOSE (CONFIG_BT_LOG_GATT_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_SMP_TRACE_LEVEL

SMP layer

*Found in:* Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL

Define BT trace level for SMP layer

Available options:

- NONE (CONFIG_BT_LOG_SMP_TRACE_LEVEL_NONE)
- ERROR (CONFIG_BT_LOG_SMP_TRACE_LEVEL_ERROR)
- WARNING (CONFIG_BT_LOG_SMP_TRACE_LEVEL_WARNING)
- API (CONFIG_BT_LOG_SMP_TRACE_LEVEL_API)
- EVENT (CONFIG_BT_LOG_SMP_TRACE_LEVEL_EVENT)
- DEBUG (CONFIG_BT_LOG_SMP_TRACE_LEVEL_DEBUG)
- VERBOSE (CONFIG_BT_LOG_SMP_TRACE_LEVEL_VERBOSE)
CONFIG_BT_LOG_BTIF_TRACE_LEVEL

BTIF layer

*Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL*

Define BT trace level for BTIF layer

Available options:

- NONE (CONFIG_BT_LOG_BTIF_TRACE_LEVEL_NONE)
- ERROR (CONFIG_BT_LOG_BTIF_TRACE_LEVEL_ERROR)
- WARNING (CONFIG_BT_LOG_BTIF_TRACE_LEVEL_WARNING)
- API (CONFIG_BT_LOG_BTIF_TRACE_LEVEL_API)
- EVENT (CONFIG_BT_LOG_BTIF_TRACE_LEVEL_EVENT)
- DEBUG (CONFIG_BT_LOG_BTIF_TRACE_LEVEL_DEBUG)
- VERBOSE (CONFIG_BT_LOG_BTIF_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_BTC_TRACE_LEVEL

BTC layer

*Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL*

Define BT trace level for BTC layer

Available options:

- NONE (CONFIG_BT_LOG_BTC_TRACE_LEVEL_NONE)
- ERROR (CONFIG_BT_LOG_BTC_TRACE_LEVEL_ERROR)
- WARNING (CONFIG_BT_LOG_BTC_TRACE_LEVEL_WARNING)
- API (CONFIG_BT_LOG_BTC_TRACE_LEVEL_API)
- EVENT (CONFIG_BT_LOG_BTC_TRACE_LEVEL_EVENT)
- DEBUG (CONFIG_BT_LOG_BTC_TRACE_LEVEL_DEBUG)
- VERBOSE (CONFIG_BT_LOG_BTC_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_OSI_TRACE_LEVEL

OSI layer

*Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL*

Define BT trace level for OSI layer

Available options:

- NONE (CONFIG_BT_LOG_OSI_TRACE_LEVEL_NONE)
- ERROR (CONFIG_BT_LOG_OSI_TRACE_LEVEL_ERROR)
- WARNING (CONFIG_BT_LOG_OSI_TRACE_LEVEL_WARNING)
- API (CONFIG_BT_LOG_OSI_TRACE_LEVEL_API)
- EVENT (CONFIG_BT_LOG_OSI_TRACE_LEVEL_EVENT)
- DEBUG (CONFIG_BT_LOG_OSI_TRACE_LEVEL_DEBUG)
- VERBOSE (CONFIG_BT_LOG_OSI_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_BLUFI_TRACE_LEVEL

BLUFI layer

*Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL*
Define BT trace level for BLUFI layer

Available options:

- NONE (CONFIG_BT_LOG_BLUFI_TRACE_LEVEL_NONE)
- ERROR (CONFIG_BT_LOG_BLUFI_TRACE_LEVEL_ERROR)
- WARNING (CONFIG_BT_LOG_BLUFI_TRACE_LEVEL_WARNING)
- API (CONFIG_BT_LOG_BLUFI_TRACE_LEVEL_API)
- EVENT (CONFIG_BT_LOG_BLUFI_TRACE_LEVEL_EVENT)
- DEBUG (CONFIG_BT_LOG_BLUFI_TRACE_LEVEL_DEBUG)
- VERBOSE (CONFIG_BT_LOG_BLUFI_TRACE_LEVEL_VERBOSE)

**CONFIG_BT_ACL_CONNECTIONS**

**BT/BLE MAX ACL CONNECTIONS (1-9)**

*Found in: Component config > Bluetooth > Bluedroid Options*

Maximum BT/BLE connection count. The ESP32-C3/S3 chip supports a maximum of 10 instances, including ADV, SCAN and connections. The ESP32-C3/S3 chip can connect up to 9 devices if ADV or SCAN uses only one. If ADV and SCAN are both used, the ESP32-C3/S3 chip is connected to a maximum of 8 devices. Because Bluetooth cannot reclaim used instances once ADV or SCAN is used.

*Range:*
  - from 1 to 9 if CONFIG_BT_BLUEDROID_ENABLED && CONFIG_BT_BLUEDROID_ENABLED

*Default value:*  
  - 4 if CONFIG_BT_BLUEDROID_ENABLED && CONFIG_BT_BLUEDROID_ENABLED

**CONFIG_BT_MULTI_CONNECTION_ENABLE**

Enable BLE multi-conections

*Found in: Component config > Bluetooth > Bluedroid Options*

Enable this option if there are multiple connections

*Default value:*  
  - Yes (enabled) if CONFIG_BT_BLUEDROID_ENABLED && CONFIG_BT_BLUEDROID_ENABLED

**CONFIG_BT_ALLOCATION_FROM_SPIRAM_FIRST**

BT/BLE will first malloc the memory from the PSRAM

*Found in: Component config > Bluetooth > Bluedroid Options*

This select can save the internal RAM if there have the PSRAM

*Default value:*  
  - No (disabled) if CONFIG_BT_BLUEDROID_ENABLED && CONFIG_BT_BLUEDROID_ENABLED

**CONFIG_BT_BLE_DYNAMIC_ENV_MEMORY**

Use dynamic memory allocation in BT/BLE stack

*Found in: Component config > Bluetooth > Bluedroid Options*

This select can make the allocation of memory will become more flexible

*Default value:*
• No (disabled) if \texttt{CONFIG_BT_BLUEDROID_ENABLED} \&\& \texttt{CONFIG_BT_BLUEDROID_ENABLED}

\textbf{CONFIG_BT_BLE_HOST_QUEUE_CONG_CHECK}

BLE queue congestion check

\textit{Found in: Component config > Bluetooth > Bluedroid Options}

When scanning and scan duplicate is not enabled, if there are a lot of adv packets around or application layer handling adv packets is slow, it will cause the controller memory to run out. If enabled, adv packets will be lost when host queue is congested.

\textbf{Default value:}

• No (disabled) if \texttt{CONFIG_BT_BLUEDROID_ENABLED} \&\& \texttt{CONFIG_BT_BLUEDROID_ENABLED}

\textbf{CONFIG_BT_BLE_ACT_SCAN_REP_ADV_SCAN}

Report adv data and scan response individually when BLE active scan

\textit{Found in: Component config > Bluetooth > Bluedroid Options}

Originally, when doing BLE active scan, Bluedroid will not report adv to application layer until receive scan response. This option is used to disable the behavior. When enable this option, Bluedroid will report adv data or scan response to application layer immediately.

\# Memory reserved at start of DRAM for Bluetooth stack

\textbf{Default value:}

• No (disabled) if \texttt{CONFIG_BT_BLUEDROID_ENABLED} \&\& \texttt{CONFIG_BT_BLE_ENABLED} \&\& \texttt{CONFIG_BT_BLUEDROID_ENABLED}

\textbf{CONFIG_BT_BLE_ESTAB_LINK_CONN_TOUT}

Timeout of BLE connection establishment

\textit{Found in: Component config > Bluetooth > Bluedroid Options}

Bluetooth Connection establishment maximum time, if connection time exceeds this value, the connection establishment fails, ESP_GATTC_OPEN_EVT or ESP_GATTS_OPEN_EVT is triggered.

\textbf{Range:}

• from 1 to 60 if \texttt{CONFIG_BT_BLUEDROID_ENABLED} \&\& \texttt{CONFIG_BT_BLUEDROID_ENABLED}

\textbf{Default value:}

• 30 if \texttt{CONFIG_BT_BLUEDROID_ENABLED} \&\& \texttt{CONFIG_BT_BLUEDROID_ENABLED}

\textbf{CONFIG_BT_MAX_DEVICE_NAME_LEN}

length of bluetooth device name

\textit{Found in: Component config > Bluetooth > Bluedroid Options}

Bluetooth Device name length shall be no larger than 248 octets, If the broadcast data cannot contain the complete device name, then only the shortname will be displayed, the rest parts that can’t fit in will be truncated.

\textbf{Range:}

• from 32 to 248 if \texttt{CONFIG_BT_BLUEDROID_ENABLED} \&\& \texttt{CONFIG_BT_BLUEDROID_ENABLED}

\textbf{Default value:}

• 32 if \texttt{CONFIG_BT_BLUEDROID_ENABLED} \&\& \texttt{CONFIG_BT_BLUEDROID_ENABLED}
**CONFIG_BT_BLE_RPA_SUPPORTED**

Update RPA to Controller

*Found in: Component config > Bluetooth > Bluedroid Options*

This enables controller RPA list function. For ESP32, ESP32 only support network privacy mode. If this option is enabled, ESP32 will only accept advertising packets from peer devices that contain private address, HW will not receive the advertising packets contain identity address after IRK changed. If this option is disabled, address resolution will be performed in the host, so the functions that require controller to resolve address in the white list cannot be used. This option is disabled by default on ESP32, please enable or disable this option according to your own needs.

For other BLE chips, devices support network privacy mode and device privacy mode, users can switch the two modes according to their own needs. So this option is enabled by default.

*Default value:*

- Yes (enabled) if `CONFIG_BT_CONTROLLER_DISABLED` && `CONFIG_BT_BLUEDROID_ENABLED` && `CONFIG_BT_CONTROLLER_DISABLED` && `CONFIG_BT_BLUEDROID_ENABLED`

**CONFIG_BT_BLE_RPA_TIMEOUT**

Timeout of resolvable private address

*Found in: Component config > Bluetooth > Bluedroid Options*

This set RPA timeout of Controller and Host. Default is 900 s (15 minutes). Range is 1 s to 1 hour (3600 s).

*Range:*

- from 1 to 3600 if `CONFIG_BT_BLUEDROID_ENABLED` && `CONFIG_BT_BLUEDROID_ENABLED`

*Default value:*

- 900 if `CONFIG_BT_BLUEDROID_ENABLED` && `CONFIG_BT_BLUEDROID_ENABLED`

**CONFIG_BT_BLE_50_FEATURES_SUPPORTED**

Enable BLE 5.0 features

*Found in: Component config > Bluetooth > Bluedroid Options*

This enables BLE 5.0 features, this option only support esp32c3/esp32s3 chip

*Default value:*

- Yes (enabled) if `CONFIG_BT_BLUEDROID_ENABLED` && (`CONFIG_BT_CONTROLLER_ENABLED` && `SOC_BLE_50_SUPPORTED`) || `CONFIG_BT_CONTROLLER_DISABLED` && `CONFIG_BT_BLUEDROID_ENABLED`

**CONFIG_BT_BLE_42_FEATURES_SUPPORTED**

Enable BLE 4.2 features

*Found in: Component config > Bluetooth > Bluedroid Options*

This enables BLE 4.2 features.

*Default value:*

- No (disabled) if `CONFIG_BT_BLUEDROID_ENABLED` && (`CONFIG_BT_CONTROLLER_ENABLED` && `SOC_BLE_SUPPORTED`) || `CONFIG_BT_CONTROLLER_DISABLED` && `CONFIG_BT_BLUEDROID_ENABLED`
CONFIG_BT_BLE_FEAT_PERIODIC_ADV_SYNC_TRANSFER

Enable BLE periodic advertising sync transfer feature

*Found in: Component config > Bluetooth > Bluedroid Options*

This enables BLE periodic advertising sync transfer feature

**Default value:**
- **No** (disabled) if
  
  \[
  \text{CONFIG_BT_BLE_FEAT_PERIODIC_ADV_SYNC_TRANSFER} \quad \text{\&\&} \quad \text{CONFIG_BT_BLE_50_FEATURES_SUPPORTED} \quad \text{\&\&} \quad ((\text{CONFIG_BT_CONTROLLER_ENABLED} \quad \text{\&\&} \quad \text{SOC_ESP_NIMBLE_CONTROLLER}) \quad \text{\textbar} \quad \text{CONFIG_BT_CONTROLLER_DISABLED}) \quad \text{\&\&} \quad \text{CONFIG_BT_BLUEDROID_ENABLED}
  \]

CONFIG_BT_BLE_FEAT_PERIODIC_ADV_ENH

Enable periodic adv enhancements(adi support)

*Found in: Component config > Bluetooth > Bluedroid Options*

Enable the periodic advertising enhancements

**Default value:**
- **No** (disabled) if
  
  \[
  \text{CONFIG_BT_BLE_FEAT_PERIODIC_ADV_ENH} \quad \text{\&\&} \quad \text{CONFIG_BT_BLE_50_FEATURES_SUPPORTED} \quad \text{\&\&} \quad ((\text{CONFIG_BT_CONTROLLER_ENABLED} \quad \text{\&\&} \quad \text{SOC_ESP_NIMBLE_CONTROLLER}) \quad \text{\textbar} \quad \text{CONFIG_BT_CONTROLLER_DISABLED}) \quad \text{\&\&} \quad \text{CONFIG_BT_BLUEDROID_ENABLED}
  \]

CONFIG_BT_BLE_HIGH_DUTY_ADV_INTERVAL

Enable BLE high duty advertising interval feature

*Found in: Component config > Bluetooth > Bluedroid Options*

This enable BLE high duty advertising interval feature

**Default value:**
- **No** (disabled) if
  
  \[
  \text{CONFIG_BT_BLE_HIGH_DUTY_ADV_INTERVAL} \quad \text{\&\&} \quad \text{CONFIG_BT_BLUEDROID_ENABLED}
  \]

NimBLE Options  Contains:

- `CONFIG_BT_NIMBLE_SVC_GAP_DEVICE_NAME`
- `CONFIG_BT_NIMBLE_HS_STOP_TIMEOUT_MS`
- `CONFIG_BT_NIMBLE_HOST_QUEUE_CONFIG_CHECK`
- `CONFIG_BT_NIMBLE_WHITELIST_SIZE`

CONFIG_BT_NIMBLE_MEM_ALLOC_MODE

Memory allocation strategy

Found in: Component config > Bluetooth > NimBLE Options

Allocation strategy for NimBLE host stack, essentially provides ability to allocate all required dynamic allocations from,

- Internal DRAM memory only
- External SPIRAM memory only
- Either internal or external memory based on default malloc() behavior in ESP-IDF
- Internal IRAM memory wherever applicable else internal DRAM

Available options:

- Internal memory (CONFIG_BT_NIMBLE_MEM_ALLOC_MODE_INTERNAL)
- External SPIRAM (CONFIG_BT_NIMBLE_MEM_ALLOC_MODE_EXTERNAL)
- Default alloc mode (CONFIG_BT_NIMBLE_MEM_ALLOC_MODE_DEFAULT)
- Internal IRAM (CONFIG_BT_NIMBLE_MEM_ALLOC_MODE_IRAM_8BIT)
  Allows to use IRAM memory region as 8bit accessible region.
  Every unaligned (8bit or 16bit) access will result in an exception and incur penalty of certain clock cycles per unaligned read/write.

CONFIG_BT_NIMBLE_LOG_LEVEL

NimBLE Host log verbosity

Found in: Component config > Bluetooth > NimBLE Options

Select NimBLE log level. Please make a note that the selected NimBLE log verbosity can not exceed the level set in "Component config > Log output > Default log verbosity".

Available options:

- No logs (CONFIG_BT_NIMBLE_LOG_LEVEL_NONE)
- Error logs (CONFIG_BT_NIMBLE_LOG_LEVEL_ERROR)
- Warning logs (CONFIG_BT_NIMBLE_LOG_LEVEL_WARNING)
• Info logs (CONFIG_BT_NIMBLE_LOG_LEVEL_INFO)
• Debug logs (CONFIG_BT_NIMBLE_LOG_LEVEL_DEBUG)

**CONFIG_BT_NIMBLE_MAX_CONNECTIONS**

Maximum number of concurrent connections

*Found in: Component config > Bluetooth > NimBLE Options*

Defines maximum number of concurrent BLE connections. For ESP32, user is expected to configure BTDM_CTRL_BLE_MAX_CONN from controller menu along with this option. Similarly for ESP32-C3 or ESP32-S3, user is expected to configure BT_CTRL_BLE_MAX_ACT from controller menu. For ESP32C2, ESP32C6 and ESP32H2, each connection will take about 1k DRAM.

*Range:*
• from 1 to 9 if **CONFIG_BT_NIMBLE_ENABLED** && **CONFIG_BT_NIMBLE_ENABLED**

*Default value:*
• 3 if **CONFIG_BT_NIMBLE_ENABLED** && **CONFIG_BT_NIMBLE_ENABLED**

**CONFIG_BT_NIMBLE_MAX_BONDS**

Maximum number of bonds to save across reboots

*Found in: Component config > Bluetooth > NimBLE Options*

Defines maximum number of bonds to save for peer security and our security

*Default value:*
• 3 if **CONFIG_BT_NIMBLE_ENABLED** && **CONFIG_BT_NIMBLE_ENABLED**

**CONFIG_BT_NIMBLE_MAX_CCCDS**

Maximum number of CCC descriptors to save across reboots

*Found in: Component config > Bluetooth > NimBLE Options*

Defines maximum number of CCC descriptors to save

*Default value:*
• 8 if **CONFIG_BT_NIMBLE_ENABLED** && **CONFIG_BT_NIMBLE_ENABLED**

**CONFIG_BT_NIMBLE_L2CAP_COC_MAX_NUM**

Maximum number of connection oriented channels

*Found in: Component config > Bluetooth > NimBLE Options*

Defines maximum number of BLE Connection Oriented Channels. When set to (0), BLE COC is not compiled in

*Range:*
• from 0 to 9 if **CONFIG_BT_NIMBLE_ENABLED** && **CONFIG_BT_NIMBLE_ENABLED**

*Default value:*
• 0 if **CONFIG_BT_NIMBLE_ENABLED** && **CONFIG_BT_NIMBLE_ENABLED**

**CONFIG_BT_NIMBLE_PINNED_TO_CORE_CHOICE**

The CPU core on which NimBLE host will run

*Found in: Component config > Bluetooth > NimBLE Options*

The CPU core on which NimBLE host will run. You can choose Core 0 or Core 1. Cannot specify no-affinity

*Available options:*

Submit Document Feedback
• Core 0 (PRO CPU) (CONFIG_BT_NIMBLE_PINNED_TO_CORE_0)
• Core 1 (APP CPU) (CONFIG_BT_NIMBLE_PINNED_TO_CORE_1)

CONFIG_BT_NIMBLE_HOST_TASK_STACK_SIZE

NimBLE Host task stack size

*Found in: Component config > Bluetooth > NimBLE Options*

This configures stack size of NimBLE host task

**Default value:**
- 5120 if `CONFIG_BLE_MESH` && `CONFIG_BT_NIMBLE_ENABLED` && `CONFIG_BT_NIMBLE_ENABLED`
- 4096 if `CONFIG_BT_NIMBLE_ENABLED` && `CONFIG_BT_NIMBLE_ENABLED`

CONFIG_BT_NIMBLE_ROLE_CENTRAL

Enable BLE Central role

*Found in: Component config > Bluetooth > NimBLE Options*

Enables central role

**Default value:**
- Yes (enabled) if `CONFIG_BT_NIMBLE_ENABLED` && `CONFIG_BT_NIMBLE_ENABLED`

CONFIG_BT_NIMBLE_ROLE_PERIPHERAL

Enable BLE Peripheral role

*Found in: Component config > Bluetooth > NimBLE Options*

Enable peripheral role

**Default value:**
- Yes (enabled) if `CONFIG_BT_NIMBLE_ENABLED` && `CONFIG_BT_NIMBLE_ENABLED`

CONFIG_BT_NIMBLE_ROLE_BROADCASTER

Enable BLE Broadcaster role

*Found in: Component config > Bluetooth > NimBLE Options*

Enables broadcaster role

**Default value:**
- Yes (enabled) if `CONFIG_BT_NIMBLE_ENABLED` && `CONFIG_BT_NIMBLE_ENABLED`

CONFIG_BT_NIMBLE_ROLE_OBSERVER

Enable BLE Observer role

*Found in: Component config > Bluetooth > NimBLE Options*

Enables observer role

**Default value:**
- Yes (enabled) if `CONFIG_BT_NIMBLE_ENABLED` && `CONFIG_BT_NIMBLE_ENABLED`
**CONFIG_BT_NIMBLE_NVS_PERSIST**

Persist the BLE Bonding keys in NVS

*Found in: Component config > Bluetooth > NimBLE Options*

Enable this flag to make bonding persistent across device reboots

**Default value:**

- No (disabled) if `CONFIG_BT_NIMBLE_ENABLED` && `CONFIG_BT_NIMBLE_ENABLED`

**CONFIG_BT_NIMBLE_SECURITY_ENABLE**

Enable BLE SM feature

*Found in: Component config > Bluetooth > NimBLE Options*

Enable BLE sm feature

**Default value:**

- Yes (enabled) if `CONFIG_BT_NIMBLE_ENABLED` && `CONFIG_BT_NIMBLE_ENABLED`

Contains:

- `CONFIG_BT_NIMBLE_LL_CFG_FEAT_LE_ENCRYPTION`
- `CONFIG_BT_NIMBLE_SM_LEGACY`
- `CONFIG_BT_NIMBLE_SM_SC`

**CONFIG_BT_NIMBLE_SM_LEGACY**

Security manager legacy pairing

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_SECURITY_ENABLE*

Enable security manager legacy pairing

**Default value:**

- Yes (enabled) if `CONFIG_BT_NIMBLE_SECURITY_ENABLE` && `CONFIG_BT_NIMBLE_ENABLED`

**CONFIG_BT_NIMBLE_SM_SC**

Security manager secure connections (4.2)

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_SECURITY_ENABLE*

Enable security manager secure connections

**Default value:**

- Yes (enabled) if `CONFIG_BT_NIMBLE_SECURITY_ENABLE` && `CONFIG_BT_NIMBLE_ENABLED`

**CONFIG_BT_NIMBLE_SM_SC_DEBUG_KEYS**

Use predefined public-private key pair

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_SECURITY_ENABLE > CONFIG_BT_NIMBLE_SM_SC*

If this option is enabled, SM uses predefined DH key pair as described in Core Specification, Vol. 3, Part H, 2.3.5.6.1. This allows to decrypt air traffic easily and thus should only be used for debugging.

**Default value:**

- Use predefined public-private key pair
• No (disabled) if CONFIG_BT_NIMBLE_SECURITY_ENABLE && CONFIG_BT_NIMBLE_SM_SC && CONFIG_BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_LL_CFG_FEAT_LE_ENCRYPTION
Enable LE encryption

*Found in:* Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_SECURITY_ENABLE

Enable encryption connection

**Default value:**
• Yes (enabled) if CONFIG_BT_NIMBLE_SECURITY_ENABLE && CONFIG_BT_NIMBLE_ENABLED 

CONFIG_BT_NIMBLE_DEBUG
Enable extra runtime asserts and host debugging

*Found in:* Component config > Bluetooth > NimBLE Options

This enables extra runtime asserts and host debugging

**Default value:**
• No (disabled) if CONFIG_BT_NIMBLE_ENABLED && CONFIG_BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_DYNAMIC_SERVICE
Enable dynamic services

*Found in:* Component config > Bluetooth > NimBLE Options

This enables user to add/remove Gatt services at runtime

CONFIG_BT_NIMBLE_SVC_GAP_DEVICE_NAME
BLE GAP default device name

*Found in:* Component config > Bluetooth > NimBLE Options

The Device Name characteristic shall contain the name of the device as an UTF-8 string. This name can be changed by using API ble_svc_gap_device_name_set()

**Default value:**
• “nimble” if CONFIG_BT_NIMBLE_ENABLED && CONFIG_BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_GAP_DEVICE_NAME_MAX_LEN
Maximum length of BLE device name in octets

*Found in:* Component config > Bluetooth > NimBLE Options

Device Name characteristic value shall be 0 to 248 octets in length

**Default value:**
• 31 if CONFIG_BT_NIMBLE_ENABLED && CONFIG_BT_NIMBLE_ENABLED
**CONFIG_BT_NIMBLE_ATT_PREFERRED_MTU**

Preferred MTU size in octets

*Found in: Component config > Bluetooth > NimBLE Options*

This is the default value of ATT MTU indicated by the device during an ATT MTU exchange. This value can be changed using API ble_att_set_preferred_mtu()  

**Default value:**  
- 256 if `CONFIG_BT_NIMBLE_ENABLED` && `CONFIG_BT_NIMBLE_ENABLED`

**CONFIG_BT_NIMBLE_SVC_GAP_APPEARANCE**

External appearance of the device

*Found in: Component config > Bluetooth > NimBLE Options*

Standard BLE GAP Appearance value in HEX format e.g. 0x02C0  

**Default value:**  
- 0 if `CONFIG_BT_NIMBLE_ENABLED` && `CONFIG_BT_NIMBLE_ENABLED`

**Memory Settings**

Contains:

- `CONFIG_BT_NIMBLE_TRANSPORT_ACL_FROM_LL_COUNT`
- `CONFIG_BT_NIMBLE_TRANSPORT_EVT_DISCARD_COUNT`
- `CONFIG_BT_NIMBLE_MSYS_BUF_FROM_HEAP`
- `CONFIG_BT_NIMBLE_MSYS_1_BLOCK_COUNT`
- `CONFIG_BT_NIMBLE_MSYS_1_BLOCK_SIZE`
- `CONFIG_BT_NIMBLE_MSYS_2_BLOCK_COUNT`
- `CONFIG_BT_NIMBLE_MSYS_2_BLOCK_SIZE`
- `CONFIG_BT_NIMBLE_TRANSPORT_ACL_SIZE`
- `CONFIG_BT_NIMBLE_TRANSPORT_EVT_COUNT`
- `CONFIG_BT_NIMBLE_TRANSPORT_EVT_SIZE`

**CONFIG_BT_NIMBLE_MSYS_1_BLOCK_COUNT**

MSYS_1 Block Count  

*Found in: Component config > Bluetooth > NimBLE Options > Memory Settings*

MSYS is a system level mbuf registry. For prepare write & prepare responses MBUFs are allocated out of msys_1 pool. For NIMBLE_MESH enabled cases, this block count is increased by 8 than user defined count.  

**Default value:**  
- 24 if `SOC_ESP_NIMBLE_CONTROLLER` && `CONFIG_BT_NIMBLE_ENABLED`

**CONFIG_BT_NIMBLE_MSYS_1_BLOCK_SIZE**

MSYS_1 Block Size  

*Found in: Component config > Bluetooth > NimBLE Options > Memory Settings*

Dynamic memory size of block 1  

**Default value:**  
- 128 if `SOC_ESP_NIMBLE_CONTROLLER` && `CONFIG_BT_NIMBLE_ENABLED`
CONFIG_BT_NIMBLE_MSYS_2_BLOCK_COUNT
MSYS_2 Block Count

*Found in: Component config > Bluetooth > NimBLE Options > Memory Settings*
Dynamic memory count

**Default value:**
- 24 if `CONFIG_BT_NIMBLE_ENABLED`

CONFIG_BT_NIMBLE_MSYS_2_BLOCK_SIZE
MSYS_2 Block Size

*Found in: Component config > Bluetooth > NimBLE Options > Memory Settings*
Dynamic memory size of block 2

**Default value:**
- 320 if `CONFIG_BT_NIMBLE_ENABLED`

CONFIG_BT_NIMBLE_MSYS_BUF_FROM_HEAP
Get Msys Mbuf from heap

*Found in: Component config > Bluetooth > NimBLE Options > Memory Settings*
This option sets the source of the shared msys mbuf memory between the Host and the Controller. Allocate the memory from the heap if this option is set, from the mempool otherwise.

**Default value:**
- Yes (enabled) if `BT_LE_MSYS_INIT_IN_CONTROLLER` && `CONFIG_BT_NIMBLE_ENABLED`

CONFIG_BT_NIMBLE_TRANSPORT_ACL_FROM_LL_COUNT
ACL Buffer count

*Found in: Component config > Bluetooth > NimBLE Options > Memory Settings*
The number of ACL data buffers allocated for host.

**Default value:**
- 24 if `CONFIG_BT_NIMBLE_ENABLED` && `CONFIG_BT_NIMBLE_ENABLED`

CONFIG_BT_NIMBLE_TRANSPORT_ACL_SIZE
Transport ACL Buffer size

*Found in: Component config > Bluetooth > NimBLE Options > Memory Settings*
This is the maximum size of the data portion of HCI ACL data packets. It does not include the HCI data header (of 4 bytes)

**Default value:**
- 255 if `CONFIG_BT_NIMBLE_ENABLED` && `CONFIG_BT_NIMBLE_ENABLED`

CONFIG_BT_NIMBLE_TRANSPORT_EVT_SIZE
Transport Event Buffer size

*Found in: Component config > Bluetooth > NimBLE Options > Memory Settings*
This is the size of each HCI event buffer in bytes. In case of extended advertising, packets can be fragmented. 257 bytes is the maximum size of a packet.
**Chapter 2. API Reference**

**Default value:**
- 257 if `CONFIG_BT_NIMBLE_EXT_ADV` && `CONFIG_BT_NIMBLE_ENABLED` && `CONFIG_BT_NIMBLE_ENABLED`
- 70 if `CONFIG_BT_NIMBLE_ENABLED` && `CONFIG_BT_NIMBLE_ENABLED`

**CONFIG_BT_NIMBLE_TRANSPORT_EVT_COUNT**

Transport Event Buffer count

*Found in: Component config > Bluetooth > NimBLE Options > Memory Settings*

This is the high priority HCI events’ buffer size. High-priority event buffers are for everything except advertising reports. If there are no free high-priority event buffers then host will try to allocate a low-priority buffer instead.

**Default value:**
- 30 if `CONFIG_BT_NIMBLE_ENABLED` && `CONFIG_BT_NIMBLE_ENABLED`

**CONFIG_BT_NIMBLE_TRANSPORT_EVT_DISCARD_COUNT**

Discardable Transport Event Buffer count

*Found in: Component config > Bluetooth > NimBLE Options > Memory Settings*

This is the low priority HCI events’ buffer size. Low-priority event buffers are only used for advertising reports. If there are no free low-priority event buffers, then an incoming advertising report will get dropped.

**Default value:**
- 8 if `CONFIG_BT_NIMBLE_ENABLED` && `CONFIG_BT_NIMBLE_ENABLED`

**CONFIG_BT_NIMBLE_GATT_MAX_PROCS**

Maximum number of GATT client procedures

*Found in: Component config > Bluetooth > NimBLE Options*

Maximum number of GATT client procedures that can be executed.

**Default value:**
- 4 if `CONFIG_BT_NIMBLE_ENABLED` && `CONFIG_BT_NIMBLE_ENABLED`

**CONFIG_BT_NIMBLE_HS_FLOW_CTRL**

Enable Host Flow control

*Found in: Component config > Bluetooth > NimBLE Options*

Enable Host Flow control

**Default value:**
- No (disabled) if `CONFIG_BT_NIMBLE_ENABLED` && `CONFIG_BT_NIMBLE_ENABLED`

**CONFIG_BT_NIMBLE_HS_FLOW_CTRL_ITVL**

Host Flow control interval

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_HS_FLOW_CTRL*

Host flow control interval in msecs

**Default value:**
- 1000 if `CONFIG_BT_NIMBLE_HS_FLOW_CTRL` && `CONFIG_BT_NIMBLE_ENABLED`
**CONFIG_BT_NIMBLE_HS_FLOW_CTRL_THRESH**

Host Flow control threshold

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_HS_FLOW_CTRL*

Host flow control threshold, if the number of free buffers are at or below this threshold, send an immediate number-of-completed-packets event

*Default value:*

- 2 if `CONFIG_BT_NIMBLE_HS_FLOW_CTRL && CONFIG_BT_NIMBLE_ENABLED`

**CONFIG_BT_NIMBLE_HS_FLOW_CTRL_TX_ON_DISCONNECT**

Host Flow control on disconnect

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_HS_FLOW_CTRL*

Enable this option to send number-of-completed-packets event to controller after disconnection

*Default value:*

- Yes (enabled) if `CONFIG_BT_NIMBLE_HS_FLOW_CTRL && CONFIG_BT_NIMBLE_ENABLED`

**CONFIG_BT_NIMBLE_RPA_TIMEOUT**

RPA timeout in seconds

*Found in: Component config > Bluetooth > NimBLE Options*

Time interval between RPA address change. This is applicable in case of Host based RPA

*Range:*

- from 1 to 41400 if `CONFIG_BT_NIMBLE_ENABLED && CONFIG_BT_NIMBLE_ENABLED`

*Default value:*

- 900 if `CONFIG_BT_NIMBLE_ENABLED && CONFIG_BT_NIMBLE_ENABLED`

**CONFIG_BT_NIMBLE_MESH**

Enable BLE mesh functionality

*Found in: Component config > Bluetooth > NimBLE Options*

Enable BLE Mesh example present in upstream mynewt-nimble and not maintained by Espressif.

IDF maintains ESP-BLE-MESH as the official Mesh solution. Please refer to ESP-BLE-MESH guide at: `:doc:`../esp32/api-guides/esp-ble-mesh/ble-mesh-index`

*Default value:*

- No (disabled) if `CONFIG_BT_NIMBLE_ENABLED && CONFIG_BT_NIMBLE_ENABLED`

*Contains:*

- `CONFIG_BT_NIMBLE_MESH_PROVISIONER`
- `CONFIG_BT_NIMBLE_MESH_PROV`
- `CONFIG_BT_NIMBLE_MESH_GATT_PROXY`
- `CONFIG_BT_NIMBLE_MESH_FRIEND`
- `CONFIG_BT_NIMBLE_MESH_LOW_POWER`
- `CONFIG_BT_NIMBLE_MESH_PROXY`
- `CONFIG_BT_NIMBLE_MESH_RELAY`
- `CONFIG_BT_NIMBLE_MESH_DEVICE_NAME`
- `CONFIG_BT_NIMBLE_MESH_NODE_COUNT`
CONFIG_BT_NIMBLE_MESH_PROXY
Enable mesh proxy functionality

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_MESH*

Enable proxy. This is automatically set whenever NIMBLE_MESH_PB_GATT or NIMBLE_MESH_GATT_PROXY is set

**Default value:**
- No (disabled) if CONFIG_BT_NIMBLE_MESH && CONFIG_BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_MESH_PROV
Enable BLE mesh provisioning

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_MESH*

Enable mesh provisioning

**Default value:**
- Yes (enabled) if CONFIG_BT_NIMBLE_MESH && CONFIG_BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_MESH_PB_ADV
Enable mesh provisioning over advertising bearer

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_MESH > CONFIG_BT_NIMBLE_MESH_PROV*

Enable this option to allow the device to be provisioned over the advertising bearer

**Default value:**
- Yes (enabled) if CONFIG_BT_NIMBLE_MESH_PROV && CONFIG_BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_MESH_PB_GATT
Enable mesh provisioning over GATT bearer

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_MESH > CONFIG_BT_NIMBLE_MESH_PROV*

Enable this option to allow the device to be provisioned over the GATT bearer

**Default value:**
- Yes (enabled) if CONFIG_BT_NIMBLE_MESH_PROV && CONFIG_BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_MESH_GATT_PROXY
Enable GATT Proxy functionality

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_MESH*

This option enables support for the Mesh GATT Proxy Service, i.e. the ability to act as a proxy between a Mesh GATT Client and a Mesh network

**Default value:**
- Yes (enabled) if CONFIG_BT_NIMBLE_MESH && CONFIG_BT_NIMBLE_ENABLED
CONFIG_BT_NIMBLE_MESH_RELAY
Enable mesh relay functionality

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_MESH*

Support for acting as a Mesh Relay Node

**Default value:**
* No (disabled) if CONFIG_BT_NIMBLE_MESH & & CONFIG_BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_MESH_LOW_POWER
Enable mesh low power mode

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_MESH*

Enable this option to be able to act as a Low Power Node

**Default value:**
* No (disabled) if CONFIG_BT_NIMBLE_MESH & & CONFIG_BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_MESH_FRIEND
Enable mesh friend functionality

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_MESH*

Enable this option to be able to act as a Friend Node

**Default value:**
* No (disabled) if CONFIG_BT_NIMBLE_MESH & & CONFIG_BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_MESH_DEVICE_NAME
Set mesh device name

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_MESH*

This value defines Bluetooth Mesh device/node name

**Default value:**
* “nimble-mesh-node” if CONFIG_BT_NIMBLE_MESH & & CONFIG_BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_MESH_NODE_COUNT
Set mesh node count

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_MESH*

Defines mesh node count.

**Default value:**
* 1 if CONFIG_BT_NIMBLE_MESH & & CONFIG_BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_MESH_PROVISIONER
Enable BLE mesh provisioner

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_MESH*

Enable mesh provisioner.

**Default value:**
* 0 if CONFIG_BT_NIMBLE_MESH & & CONFIG_BT_NIMBLE_ENABLED
CONFIG_BT_NIMBLE_CRYPTO_STACK_MBEDTLS
Override TinyCrypt with mbedTLS for crypto computations

*Found in: Component config > Bluetooth > NimBLE Options*
Enable this option to choose mbedTLS instead of TinyCrypt for crypto computations.

**Default value:**
- Yes (enabled) if `CONFIG_BT_NIMBLE_ENABLED` && `CONFIG_BT_NIMBLE_ENABLED`

CONFIG_BT_NIMBLE_HS_STOP_TIMEOUT_MS
BLE host stop timeout in msec

*Found in: Component config > Bluetooth > NimBLE Options*
BLE Host stop procedure timeout in milliseconds.

**Default value:**
- 2000 if `CONFIG_BT_NIMBLE_ENABLED` && `CONFIG_BT_NIMBLE_ENABLED`

CONFIG_BT_NIMBLE_ENABLE_CONN_REATTEMPT
Enable connection reattempts on connection establishment error

*Found in: Component config > Bluetooth > NimBLE Options*
Enable to make the NimBLE host to reattempt GAP connection on connection establishment failure.

**Default value:**
- Yes (enabled) if `SOC_ESP_NIMBLE_CONTROLLER` && `CONFIG_BT_NIMBLE_ENABLED`

CONFIG_BT_NIMBLE_MAX_CONN_REATTEMPT
Maximum number connection reattempts

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_ENABLE_CONN_REATTEMPT*
Defines maximum number of connection reattempts.

**Range:**
- from 1 to 7 if `CONFIG_BT_NIMBLE_ENABLED` && `CONFIG_BT_NIMBLE_ENABLE_CONN_REATTEMPT` && `CONFIG_BT_NIMBLE_ENABLED`

**Default value:**
- 3 if `CONFIG_BT_NIMBLE_ENABLED` && `CONFIG_BT_NIMBLE_ENABLE_CONN_REATTEMPT` && `CONFIG_BT_NIMBLE_ENABLED`

CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT
Enable BLE 5 feature

*Found in: Component config > Bluetooth > NimBLE Options*
Enable BLE 5 feature

**Default value:**
- Yes (enabled) if `CONFIG_BT_NIMBLE_ENABLED` && `SOC_BLE_50_SUPPORTED` && `CONFIG_BT_NIMBLE_ENABLED`

Contains:
- `CONFIG_BT_NIMBLE_LL_CFG_FEAT_LE_2M_PHY`
- `CONFIG_BT_NIMBLE_LL_CFG_FEAT_LE_CODED_PHY`
• CONFIG_BT_NIMBLE_EXT_ADV
• CONFIG_BT_NIMBLE_BLE_POWER_CONTROL
• CONFIG_BT_NIMBLE_MAX_PERIODIC_ADVERTISER_LIST
• CONFIG_BT_NIMBLE_MAX_PERIODIC_SYNCS
• CONFIG_BT_NIMBLE_PERIODIC_ADV_ENH

CONFIG_BT_NIMBLE_LL_CFG_FEAT_LE_2M_PHY

Enable 2M Phy

*Found in:* Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT

Enable 2M-PHY

*Default value:*
  • Yes (enabled) if CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT && CONFIG_BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_LL_CFG_FEAT_LE_CODED_PHY

Enable coded Phy

*Found in:* Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT

Enable coded-PHY

*Default value:*
  • Yes (enabled) if CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT && CONFIG_BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_EXT_ADV

Enable extended advertising

*Found in:* Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT

Enable this option to do extended advertising. Extended advertising will be supported from BLE 5.0 onwards.

*Default value:*
  • No (disabled) if CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT && CONFIG_BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_MAX_EXT_ADV_INSTANCES

Maximum number of extended advertising instances.

*Found in:* Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT > CONFIG_BT_NIMBLE_EXT_ADV

Change this option to set maximum number of extended advertising instances. Minimum there is always one instance of advertising. Enter how many more advertising instances you want. For ESP32C2, ESP32C6 and ESP32H2, each extended advertising instance will take about 0.5k DRAM.

*Range:*
  • from 0 to 4 if CONFIG_BT_NIMBLE_EXT_ADV && CONFIG_BT_NIMBLE_EXT_ADV && CONFIG_BT_NIMBLE_ENABLED

*Default value:*
  • 1 if CONFIG_BT_NIMBLE_EXT_ADV && CONFIG_BT_NIMBLE_EXT_ADV && CONFIG_BT_NIMBLE_ENABLED
Chapter 2. API Reference

- 0 if `CONFIG_BT_NIMBLE_EXT_ADV` && `CONFIG_BT_NIMBLE_EXT_ADV` && `CONFIG_BT_NIMBLE_ENABLED`

**CONFIG_BT_NIMBLE_EXT_ADV_MAX_SIZE**

Maximum length of the advertising data.

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT > CONFIG_BT_NIMBLE_EXT_ADV*

Defines the length of the extended adv data. The value should not exceed 1650.

**Range:**
- from 0 to 1650 if `CONFIG_BT_NIMBLE_EXT_ADV` && `CONFIG_BT_NIMBLE_EXT_ADV` && `CONFIG_BT_NIMBLE_ENABLED`

**Default value:**
- 1650 if `CONFIG_BT_NIMBLE_EXT_ADV` && `CONFIG_BT_NIMBLE_EXT_ADV` && `CONFIG_BT_NIMBLE_ENABLED`
- 0 if `CONFIG_BT_NIMBLE_EXT_ADV` && `CONFIG_BT_NIMBLE_EXT_ADV` && `CONFIG_BT_NIMBLE_ENABLED`

**CONFIG_BT_NIMBLE_ENABLE_PERIODIC_ADV**

Enable periodic advertisement.

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT > CONFIG_BT_NIMBLE_EXT_ADV*

Enable this option to start periodic advertisement.

**Default value:**
- Yes (enabled) if `CONFIG_BT_NIMBLE_EXT_ADV` && `CONFIG_BT_NIMBLE_EXT_ADV` && `CONFIG_BT_NIMBLE_ENABLED`

**CONFIG_BT_NIMBLE_PERIODIC_ADV_SYNC_TRANSFER**

Enable Transer Sync Events

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT > CONFIG_BT_NIMBLE_EXT_ADV > CONFIG_BT_NIMBLE_ENABLE_PERIODIC_ADV*

This enables controller transfer periodic sync events to host

**Default value:**
- Yes (enabled) if `CONFIG_BT_NIMBLE_ENABLE_PERIODIC_ADV` && `CONFIG_BT_NIMBLE_EXT_ADV` && `CONFIG_BT_NIMBLE_ENABLED`

**CONFIG_BT_NIMBLE_MAX_PERIODIC_SYNCS**

Maximum number of periodic advertising syncs

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT*

Set this option to set the upper limit for number of periodic sync connections. This should be less than maximum connections allowed by controller.

**Range:**
- from 0 to 8 if `CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT` && `CONFIG_BT_NIMBLE_ENABLED`

**Default value:**
• 1 if CONFIG_BT_NIMBLE_ENABLE_PERIODIC_ADV && CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT && CONFIG_BT_NIMBLE_ENABLED
• 0 if CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT && CONFIG_BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_MAX_PERIODIC_ADVERTISER_LIST

Maximum number of periodic advertiser list

Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT

Set this option to set the upper limit for number of periodic advertiser list.

Range:
• from 1 to 5 if CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT && SOC_ESP_NIMBLE_CONTROLLER && CONFIG_BT_NIMBLE_ENABLED

Default value:
• 5 if CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT && CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT && SOC_ESP_NIMBLE_CONTROLLER && CONFIG_BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_BLE_POWER_CONTROL

Enable support for BLE Power Control

Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT

Set this option to enable the Power Control feature

Default value:
• No (disabled) if CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT && SOC_BLE_POWER_CONTROL_SUPPORTED && CONFIG_BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_PERIODIC_Adv_ENH

Periodic adv enhancements(adi support)

Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT

Enable the periodic advertising enhancements

CONFIG_BT_NIMBLE_WHITELIST_SIZE

BLE white list size

Found in: Component config > Bluetooth > NimBLE Options

BLE list size

Range:
• from 1 to 15 if CONFIG_BT_NIMBLE_ENABLED && CONFIG_BT_NIMBLE_ENABLED

Default value:
• 12 if CONFIG_BT_NIMBLE_ENABLED && CONFIG_BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_TEST_THROUGHPUT_TEST

Throughput Test Mode enable

Found in: Component config > Bluetooth > NimBLE Options

Enable the throughput test mode
Default value:
- No (disabled) if `CONFIG_BT_NIMBLE_ENABLED`
CONFIG_BT_NIMBLE_SVC_GAP_APPEAR_WRITE_ENC

Write with encryption

*Found in: Component config > Bluetooth > NimBLE Options > GAP Service > GAP Appearance write permissions > CONFIG_BT_NIMBLE_SVC_GAP_APPEAR_WRITE*

Enable write with encryption permission (BLE_GATT_CHR_F_WRITE_ENC)

**Default value:**
- No (disabled) if CONFIG_BT_NIMBLE_SVC_GAP_APPEAR_WRITE && CONFIG_BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_SVC_GAP_APPEAR_WRITE_AUTHEN

Write with authentication

*Found in: Component config > Bluetooth > NimBLE Options > GAP Service > GAP Appearance write permissions > CONFIG_BT_NIMBLE_SVC_GAP_APPEAR_WRITE*

Enable write with authentication permission (BLE_GATT_CHR_F_WRITE_AUTHEN)

**Default value:**
- No (disabled) if CONFIG_BT_NIMBLE_SVC_GAP_APPEAR_WRITE && CONFIG_BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_SVC_GAP_APPEAR_WRITE_AUTHOR

Write with authorisation

*Found in: Component config > Bluetooth > NimBLE Options > GAP Service > GAP Appearance write permissions > CONFIG_BT_NIMBLE_SVC_GAP_APPEAR_WRITE*

Enable write with authorisation permission (BLE_GATT_CHR_F_WRITE_AUTHOR)

**Default value:**
- No (disabled) if CONFIG_BT_NIMBLE_SVC_GAP_APPEAR_WRITE && CONFIG_BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_SVC_GAP_CENT_ADDR_RESOLUTION

GAP Characteristic - Central Address Resolution

*Found in: Component config > Bluetooth > NimBLE Options > GAP Service*

Weather or not Central Address Resolution characteristic is supported on the device, and if supported, weather or not Central Address Resolution is supported.

- Central Address Resolution characteristic not supported
- Central Address Resolution not supported
- Central Address Resolution supported

Available options:

- Characteristic not supported (CONFIG_BT_NIMBLE_SVC_GAP_CAR_CHAR_NOT_SUPP)
- Central Address Resolution not supported (CONFIG_BT_NIMBLE_SVC_GAP_CAR_NOT_SUPP)
- Central Address Resolution supported (CONFIG_BT_NIMBLE_SVC_GAP_CAR_SUPP)

GAP device name write permissions

Contains:
- CONFIG_BT_NIMBLE_SVC_GAP_NAME_WRITE
CONFIG_BT_NIMBLE_SVC_GAP_NAME_WRITE

Write

Found in: Component config > Bluetooth > NimBLE Options > GAP Service > GAP device name write permissions

Enable write permission (BLE_GATT_CHR_F_WRITE)

Default value:
• No (disabled) if CONFIG_BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_SVC_GAP_NAME_WRITE_ENC

Write with encryption

Found in: Component config > Bluetooth > NimBLE Options > GAP Service > GAP device name write permissions > CONFIG_BT_NIMBLE_SVC_GAP_NAME_WRITE

Enable write with encryption permission (BLE_GATT_CHR_F_WRITE_ENC)

Default value:
• No (disabled) if CONFIG_BT_NIMBLE_SVC_GAP_NAME_WRITE & CONFIG_BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_SVC_GAP_NAME_WRITE_AUTHEN

Write with authentication

Found in: Component config > Bluetooth > NimBLE Options > GAP Service > GAP device name write permissions > CONFIG_BT_NIMBLE_SVC_GAP_NAME_WRITE

Enable write with authentication permission (BLE_GATT_CHR_F_WRITE_AUTHEN)

Default value:
• No (disabled) if CONFIG_BT_NIMBLE_SVC_GAP_NAME_WRITE & CONFIG_BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_SVC_GAP_NAME_WRITE_AUTHOR

Write with authorisation

Found in: Component config > Bluetooth > NimBLE Options > GAP Service > GAP device name write permissions > CONFIG_BT_NIMBLE_SVC_GAP_NAME_WRITE

Enable write with authorisation permission (BLE_GATT_CHR_F_WRITE_AUTHOR)

Default value:
• No (disabled) if CONFIG_BT_NIMBLE_SVC_GAP_NAME_WRITE & CONFIG_BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_SVC_GAP_PPCP_MAX_CONN_INTERVAL

PPCP Connection Interval Max (Unit: 1.25 ms)

Found in: Component config > Bluetooth > NimBLE Options > GAP Service

Peripheral Preferred Connection Parameter: Connection Interval maximum value Interval Max = value * 1.25 ms

Default value:
• 0 if CONFIG_BT_NIMBLE_ROLE_PERIPHERAL & CONFIG_BT_NIMBLE_ENABLED
Chapter 2. API Reference

**CONFIG_BT_NIMBLE_SVC_GAP_PPCP_MIN_CONN_INTERVAL**

PPCP Connection Interval Min (Unit: 1.25 ms)

*Found in: Component config > Bluetooth > NimBLE Options > GAP Service*

Peripheral Preferred Connection Parameter: Connection Interval minimum value Interval Min = value * 1.25 ms

*Default value:*

  • 0 if `CONFIG_BT_NIMBLE_ROLE_PERIPHERAL` && `CONFIG_BT_NIMBLE_ENABLED`

**CONFIG_BT_NIMBLE_SVC_GAP_PPCP_SLAVE_LATENCY**

PPCP Slave Latency

*Found in: Component config > Bluetooth > NimBLE Options > GAP Service*

Peripheral Preferred Connection Parameter: Slave Latency

*Default value:*

  • 0 if `CONFIG_BT_NIMBLE_ENABLED`

**CONFIG_BT_NIMBLE_SVC_GAP_PPCP_SUPERVISION_TMO**

PPCP Supervision Timeout (Uint: 10 ms)

*Found in: Component config > Bluetooth > NimBLE Options > GAP Service*

Peripheral Preferred Connection Parameter: Supervision Timeout Timeout = Value * 10 ms

*Default value:*

  • 0 if `CONFIG_BT_NIMBLE_ENABLED`

**CONFIG_BT_NIMBLE_VS_SUPPORT**

Enable support for VSC and VSE

*Found in: Component config > Bluetooth > NimBLE Options*

This option is used to enable support for sending Vendor Specific HCI commands and handling Vendor Specific HCI Events.

**CONFIG_BT_NIMBLE_OPTIMIZE_MULTI_CONN**

Enable the optimization of multi-connection

*Found in: Component config > Bluetooth > NimBLE Options*

This option enables the use of vendor-specific APIs for multi-connections, which can greatly enhance the stability of coexistence between numerous central and peripheral devices. It will prohibit the usage of standard APIs.

*Default value:*

  • No (disabled) if `SOC_BLE_MULTI_CONN_OPTIMIZATION` && `CONFIG_BT_NIMBLE_ENABLED`

**CONFIG_BT_NIMBLE_ENC_ADV_DATA**

Encrypted Advertising Data

*Found in: Component config > Bluetooth > NimBLE Options*

This option is used to enable encrypted advertising data.
**CONFIG_BT_NIMBLE_MAX_EADS**

Maximum number of EAD devices to save across reboots

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_ENC_ADV_DATA*

Defines maximum number of encrypted advertising data key material to save

*Default value:*

- 10 if `CONFIG_BT_NIMBLE_ENABLED` && `CONFIG_BT_NIMBLE_ENC_ADV_DATA` && `CONFIG_BT_NIMBLE_ENABLED`

**CONFIG_BT_NIMBLE_HIGH_DUTY_ADV_ITVL**

Enable BLE high duty advertising interval feature

*Found in: Component config > Bluetooth > NimBLE Options*

This enable BLE high duty advertising interval feature

**CONFIG_BT_NIMBLE_HOST_QUEUE_CONG_CHECK**

BLE queue congestion check

*Found in: Component config > Bluetooth > NimBLE Options*

When scanning and scan duplicate is not enabled, if there are a lot of adv packets around or application layer handling adv packets is slow, it will cause the controller memory to run out. if enabled, adv packets will be lost when host queue is congested.

*Default value:*

- No (disabled) if `CONFIG_BT_NIMBLE_ENABLED` && `CONFIG_BT_NIMBLE_ENABLED`

**Controller Options**

**CONFIG_BT_RELEASE_IRAM**

Release Bluetooth text (READ DOCS FIRST)

*Found in: Component config > Bluetooth*

This option release Bluetooth text section and merge Bluetooth data, bss & text into a large free heap region when esp_bt_mem_release is called, total saving ~21kB or more of IRAM. ESP32-C2 only 3 configurable PMP entries available, rest of them are hard-coded. We cannot split the memory into 3 different regions (IRAM, BLE-IRAM, DRAM). So this option will disable the PMP (ESP_SYSTEM_PMP_IDRAM_SPLIT)

*Default value:*

- No (disabled) if `CONFIG_BT_ENABLED` && `BT_LE_RELEASE_IRAM_SUPPORTED`

**CONFIG_BLE_MESH**

ESP BLE Mesh Support

*Found in: Component config*

This option enables ESP BLE Mesh support. The specific features that are available may depend on other features that have been enabled in the stack, such as Bluetooth Support, Bluedroid Support & GATT support.

Contains:

- **BLE Mesh and BLE coexistence support**
- `CONFIG_BLE_MESH_GATT_PROXY_CLIENT`
- `CONFIG_BLE_MESH_GATT_PROXY_SERVER`
- `BLE Mesh NET BUF DEBUG LOG LEVEL`
- `CONFIG_BLE_MESH_PROV`
- `CONFIG_BLE_MESH_PROXY`
- `BLE Mesh specific test option`
- `BLE Mesh STACK DEBUG LOG LEVEL`
- `CONFIG_BLE_MESH_NO_LOG`
- `CONFIG_BLE_MESH_IVU_DIVIDER`
- `CONFIG_BLE_MESH_FAST_PROV`
- `CONFIG_BLE_MESH_FREERTOS_STATIC_ALLOC`
- `CONFIG_BLE_MESH_CRPL`
- `CONFIG_BLE_MESH_RX_SDU_MAX`
- `CONFIG_BLE_MESH_MODEL_KEY_COUNT`
- `CONFIG_BLE_MESH_APP_KEY_COUNT`
- `CONFIG_BLE_MESH_MODEL_GROUP_COUNT`
- `CONFIG_BLE_MESH_LABEL_COUNT`
- `CONFIG_BLE_MESH_SUBNET_COUNT`
- `CONFIG_BLE_MESH_TX_SEG_MAX`
- `CONFIG_BLE_MESH_RX_SEG_MSG_COUNT`
- `CONFIG_BLE_MESH_TX_SEG_MSG_COUNT`
- `CONFIG_BLE_MESH_MEM_ALLOC_MODE`
- `CONFIG_BLE_MESH_MSG_CACHE_SIZE`
- `CONFIG_BLE_MESH_ADV_BUF_COUNT`

- `CONFIG_BLE_MESH_PB_ADV`
- `CONFIG_BLE_MESH_IVU_RECOVERY_IVI`
- `CONFIG_BLE_MESH_RELAY`
- `CONFIG_BLE_MESH_SAR_ENHANCEMENT`
- `CONFIG_BLE_MESH_SETTINGS`
- `CONFIG_BLE_MESH_ACTIVE_SCAN`
- `CONFIG_BLE_MESH_DEINIT`
- `CONFIG_BLE_MESH_USE_DUPLICATE_SCAN`
- Support for BLE Mesh Client/Server models
- Support for BLE Mesh Foundation models
- `CONFIG_BLE_MESH_NODE`
- `CONFIG_BLE_MESH_PROVISIONER`
- `CONFIG_BLE_MESH_FRIEND`
- `CONFIG_BLE_MESH_LOW_POWER`
- `CONFIG_BLE_MESH_HCI_5_0`
- `CONFIG_BLE_MESH_IV_UPDATE_TEST`
- `CONFIG_BLE_MESH_CLIENT_MSG_TIMEOUT`

**CONFIG_BLE_MESH_HCI_5_0**

Support sending 20ms non-connectable adv packets

*Found in: Component config > CONFIG_BLE_MESH*

It is a temporary solution and needs further modifications.

**Default value:**
- Yes (enabled) if `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_USE_DUPLICATE_SCAN**

Support Duplicate Scan in BLE Mesh

*Found in: Component config > CONFIG_BLE_MESH*

Enable this option to allow using specific duplicate scan filter in BLE Mesh, and Scan Duplicate Type must be set by choosing the option in the Bluetooth Controller section in menuconfig, which is “Scan
Duplicate By Device Address and Advertising Data”.

**Default value:**
- Yes (enabled) if `CONFIG_BLE_MESH

**CONFIG_BLE_MESH_ACTIVE_SCAN**
Support Active Scan in BLE Mesh

*Found in: Component config > CONFIG_BLE_MESH*

Enable this option to allow using BLE Active Scan for BLE Mesh.

**CONFIG_BLE_MESH_MEM_ALLOC_MODE**
Memory allocation strategy

*Found in: Component config > CONFIG_BLE_MESH*

Allocation strategy for BLE Mesh stack, essentially provides ability to allocate all required dynamic allocations from,

- Internal DRAM memory only
- External SPIRAM memory only
- Either internal or external memory based on default malloc() behavior in ESP-IDF
- Internal IRAM memory wherever applicable else internal DRAM

Recommended mode here is always internal (*), since that is most preferred from security perspective. But if application requirement does not allow sufficient free internal memory then alternate mode can be selected.

(*) In case of ESP32-S2/ESP32-S3, hardware allows encryption of external SPIRAM contents provided hardware flash encryption feature is enabled. In that case, using external SPIRAM allocation strategy is also safe choice from security perspective.

Available options:

- Internal DRAM (CONFIG_BLE_MESH_MEM_ALLOC_MODE_INTERNAL)
- External SPIRAM (CONFIG_BLE_MESH_MEM_ALLOC_MODE_EXTERNAL)
- Default alloc mode (CONFIG_BLE_MESH_MEM_ALLOC_MODE_DEFAULT)
- Internal IRAM (CONFIG_BLE_MESH_MEM_ALLOC_MODE_IRAM_8BIT)

Allows to use IRAM memory region as 8bit accessible region. Every unaligned (8bit or 16bit) access will result in an exception and incur penalty of certain clock cycles per unaligned read/write.

**CONFIG_BLE_MESH_FREERTOS_STATIC_ALLOC**
Enable FreeRTOS static allocation

*Found in: Component config > CONFIG_BLE_MESH*

Enable this option to use FreeRTOS static allocation APIs for BLE Mesh, which provides the ability to use different dynamic memory (i.e. SPIRAM or IRAM) for FreeRTOS objects. If this option is disabled, the FreeRTOS static allocation APIs will not be used, and internal DRAM will be allocated for FreeRTOS objects.

**Default value:**
- No (disabled) if ESP32_IRAM_AS_8BIT_ACCESSIBLE_MEMORY && CONFIG_BLE_MESH
CONFIG_BLE_MESH_FREERTOS_STATIC_ALLOC_MODE
Memory allocation for FreeRTOS objects

Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_FREERTOS_STATIC_ALLOC

Choose the memory to be used for FreeRTOS objects.

Available options:

- External SPIRAM (CONFIG_BLE_MESH_FREERTOS_STATIC_ALLOC_EXTERNAL)
  If enabled, BLE Mesh allocates dynamic memory from external SPIRAM for FreeRTOS objects, i.e. mutex, queue, and task stack. External SPIRAM can only be used for task stack when SPIRAM_ALLOW_STACK_EXTERNAL_MEMORY is enabled. See the SPIRAM options for more details.
- Internal IRAM (CONFIG_BLE_MESH_FREERTOS_STATIC_ALLOC_IRAM_8BIT)
  If enabled, BLE Mesh allocates dynamic memory from internal IRAM for FreeRTOS objects, i.e. mutex, queue. Note: IRAM region cannot be used as task stack.

CONFIG_BLE_MESH_DEINIT
Support de-initialize BLE Mesh stack

Found in: Component config > CONFIG_BLE_MESH

If enabled, users can use the function esp_ble_mesh_deinit() to de-initialize the whole BLE Mesh stack.

Default value:

- Yes (enabled) if CONFIG_BLE_MESH

BLE Mesh and BLE coexistence support
Contains:

- CONFIG_BLE_MESH_SUPPORT_BLE_SCAN
- CONFIG_BLE_MESH_SUPPORT_BLE_ADV

CONFIG_BLE_MESH_SUPPORT_BLE_ADV
Support sending normal BLE advertising packets

Found in: Component config > CONFIG_BLE_MESH > BLE Mesh and BLE coexistence support

When selected, users can send normal BLE advertising packets with specific API.

Default value:

- No (disabled) if CONFIG_BLE_MESH

CONFIG_BLE_MESH_BLE_ADV_BUF_COUNT
Number of advertising buffers for BLE advertising packets

Found in: Component config > CONFIG_BLE_MESH > BLE Mesh and BLE coexistence support > CONFIG_BLE_MESH_SUPPORT_BLE_ADV

Number of advertising buffers for BLE packets available.

Range:

- from 1 to 255 if CONFIG_BLE_MESH_SUPPORT_BLE_ADV && CONFIG_BLE_MESH

Default value:

- 3 if CONFIG_BLE_MESH_SUPPORT_BLE_ADV && CONFIG_BLE_MESH
CONFIG_BLE_MESH_SUPPORT_BLE_SCAN
Support scanning normal BLE advertising packets

*Found in: Component config > CONFIG_BLE_MESH > BLE Mesh and BLE coexistence support*

When selected, users can register a callback and receive normal BLE advertising packets in the application layer.

**Default value:**
- No (disabled) if CONFIG_BLE_MESH

CONFIG_BLE_MESH_FAST_PROV
Enable BLE Mesh Fast Provisioning

*Found in: Component config > CONFIG_BLE_MESH*

Enable this option to allow BLE Mesh fast provisioning solution to be used. When there are multiple unprovisioned devices around, fast provisioning can greatly reduce the time consumption of the whole provisioning process. When this option is enabled, and after an unprovisioned device is provisioned into a node successfully, it can be changed to a temporary Provisioner.

**Default value:**
- No (disabled) if CONFIG_BLE_MESH

CONFIG_BLE_MESH_NODE
Support for BLE Mesh Node

*Found in: Component config > CONFIG_BLE_MESH*

Enable the device to be provisioned into a node. This option should be enabled when an unprovisioned device is going to be provisioned into a node and communicate with other nodes in the BLE Mesh network.

CONFIG_BLE_MESH_PROVISIONER
Support for BLE Mesh Provisioner

*Found in: Component config > CONFIG_BLE_MESH*

Enable the device to be a Provisioner. The option should be enabled when a device is going to act as a Provisioner and provision unprovisioned devices into the BLE Mesh network.

CONFIG_BLE_MESH_WAIT_FOR_PROV_MAX_DEV_NUM
Maximum number of unprovisioned devices that can be added to device queue

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_PROVISIONER*

This option specifies how many unprovisioned devices can be added to device queue for provisioning. Users can use this option to define the size of the queue in the bottom layer which is used to store unprovisioned device information (e.g. Device UUID, address).

**Range:**
- from 1 to 100 if CONFIG_BLE_MESH_PROVISIONER && CONFIG_BLE_MESH

**Default value:**
- 10 if CONFIG_BLE_MESH_PROVISIONER && CONFIG_BLE_MESH
CONFIG_BLE_MESH_MAX_PROV_NODES

Maximum number of devices that can be provisioned by Provisioner

Found in: `Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_PROVISIONER`

This option specifies how many devices can be provisioned by a Provisioner. This value indicates the maximum number of unprovisioned devices which can be provisioned by a Provisioner. For instance, if the value is 6, it means the Provisioner can provision up to 6 unprovisioned devices. Theoretically a Provisioner without the limitation of its memory can provision up to 32766 unprovisioned devices, here we limit the maximum number to 100 just to limit the memory used by a Provisioner. The bigger the value is, the more memory it will cost by a Provisioner to store the information of nodes.

Range:

- from 1 to 1000 if `CONFIG_BLE_MESH_PROVISIONER` && `CONFIG_BLE_MESH`

Default value:

- 10 if `CONFIG_BLE_MESH_PROVISIONER` && `CONFIG_BLE_MESH`

CONFIG_BLE_MESH_PBA_SAME_TIME

Maximum number of PB-ADV running at the same time by Provisioner

Found in: `Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_PROVISIONER`

This option specifies how many devices can be provisioned at the same time using PB-ADV. For example, if the value is 2, it means a Provisioner can provision two unprovisioned devices with PB-ADV at the same time.

Range:

- from 1 to 10 if `CONFIG_BLE_MESH_PB_ADV` && `CONFIG_BLE_MESH_PROVISIONER` && `CONFIG_BLE_MESH`

Default value:

- 2 if `CONFIG_BLE_MESH_PB_ADV` && `CONFIG_BLE_MESH_PROVISIONER` && `CONFIG_BLE_MESH`

CONFIG_BLE_MESH_PBG_SAME_TIME

Maximum number of PB-GATT running at the same time by Provisioner

Found in: `Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_PROVISIONER`

This option specifies how many devices can be provisioned at the same time using PB-GATT. For example, if the value is 2, it means a Provisioner can provision two unprovisioned devices with PB-GATT at the same time.

Range:

- from 1 to 5 if `CONFIG_BLE_MESH_PB_GATT` && `CONFIG_BLE_MESH_PROVISIONER` && `CONFIG_BLE_MESH`

Default value:

- 1 if `CONFIG_BLE_MESH_PB_GATT` && `CONFIG_BLE_MESH_PROVISIONER` && `CONFIG_BLE_MESH`

CONFIG_BLE_MESH_PROVISIONER_SUBNET_COUNT

Maximum number of mesh subnets that can be created by Provisioner

Found in: `Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_PROVISIONER`

This option specifies how many subnets per network a Provisioner can create. Indeed, this value decides the number of network keys which can be added by a Provisioner.

Range:

- from 1 to 4096 if `CONFIG_BLE_MESH_PROVISIONER` && `CONFIG_BLE_MESH`

Default value:
• 3 if CONFIG_BLE_MESH_PROVISIONER && CONFIG_BLE_MESH

**CONFIG_BLE_MESH_PROVISIONER_APP_KEY_COUNT**

Maximum number of application keys that can be owned by Provisioner

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_PROVISIONER*

This option specifies how many application keys the Provisioner can have. Indeed, this value decides the number of the application keys which can be added by a Provisioner.

*Range:* from 1 to 4096 if CONFIG_BLE_MESH_PROVISIONER && CONFIG_BLE_MESH

*Default value:* 3 if CONFIG_BLE_MESH_PROVISIONER && CONFIG_BLE_MESH

**CONFIG_BLE_MESH_PROVISIONER_RECV_HB**

Support receiving Heartbeat messages

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_PROVISIONER*

When this option is enabled, Provisioner can call specific functions to enable or disable receiving Heartbeat messages and notify them to the application layer.

*Default value:* No (disabled) if CONFIG_BLE_MESH_PROVISIONER && CONFIG_BLE_MESH

**CONFIG_BLE_MESH_PROVISIONER_RECV_HB_FILTER_SIZE**

Maximum number of filter entries for receiving Heartbeat messages

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_PROVISIONER > CONFIG_BLE_MESH_PROVISIONER_RECV_HB*

This option specifies how many heartbeat filter entries Provisioner supports. The heartbeat filter (acceptlist or rejectlist) entries are used to store a list of SRC and DST which can be used to decide if a heartbeat message will be processed and notified to the application layer by Provisioner. Note: The filter is an empty rejectlist by default.

*Range:* from 1 to 1000 if CONFIG_BLE_MESH_PROVISIONER_RECV_HB && CONFIG_BLE_MESH_PROVISIONER && CONFIG_BLE_MESH

*Default value:* 3 if CONFIG_BLE_MESH_PROVISIONER_RECV_HB && CONFIG_BLE_MESH_PROVISIONER && CONFIG_BLE_MESH

**CONFIG_BLE_MESH_PROV**

BLE Mesh Provisioning support

*Found in: Component config > CONFIG_BLE_MESH*

Enable this option to support BLE Mesh Provisioning functionality. For BLE Mesh, this option should be always enabled.

*Default value:* Yes (enabled) if CONFIG_BLE_MESH
CONFIG_BLE_MESH_PROV_EPA
BLE Mesh enhanced provisioning authentication

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_PROV*

Enable this option to support BLE Mesh enhanced provisioning authentication functionality. This option can increase the security level of provisioning. It is recommended to enable this option.

**Default value:**
- Yes (enabled) if `CONFIG_BLE_MESH_PROV` && `CONFIG_BLE_MESH`

CONFIG_BLE_MESH_CERT_BASED_PROV
Support Certificate-based provisioning

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_PROV*

Enable this option to support BLE Mesh Certificate-Based Provisioning.

**Default value:**
- No (disabled) if `CONFIG_BLE_MESH_PROV` && `CONFIG_BLE_MESH`

CONFIG_BLE_MESH_RECORD_FRAG_MAX_SIZE
Maximum size of the provisioning record fragment that Provisioner can receive

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_PROV > CONFIG_BLE_MESH_CERT_BASED_PROV*

This option sets the maximum size of the provisioning record fragment that the Provisioner can receive. The range depends on provisioning bearer.

**Range:**
- from 1 to 57 if `CONFIG_BLE_MESH_CERT_BASED_PROV` && `CONFIG_BLE_MESH`

**Default value:**
- 56 if `CONFIG_BLE_MESH_CERT_BASED_PROV` && `CONFIG_BLE_MESH`

CONFIG_BLE_MESH_PB_ADV
Provisioning support using the advertising bearer (PB-ADV)

*Found in: Component config > CONFIG_BLE_MESH*

Enable this option to allow the device to be provisioned over the advertising bearer. This option should be enabled if PB-ADV is going to be used during provisioning procedure.

**Default value:**
- Yes (enabled) if `CONFIG_BLE_MESH`

CONFIG_BLE_MESH_UNPROVISIONED_BEACON_INTERVAL
Interval between two consecutive Unprovisioned Device Beacon

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_PB_ADV*

This option specifies the interval of sending two consecutive unprovisioned device beacon, users can use this option to change the frequency of sending unprovisioned device beacon. For example, if the value is 5, it means the unprovisioned device beacon will send every 5 seconds. When the option of BLE_MESH_FAST_PROV is selected, the value is better to be 3 seconds, or less.

**Range:**
- from 1 to 100 if `CONFIG_BLE_MESH_NODE` && `CONFIG_BLE_MESH_PB_ADV` && `CONFIG_BLE_MESH`

**Default value:**
CONFIG_BLE_MESH_PB_GATT

Provisioning support using GATT (PB-GATT)

*Found in: Component config > CONFIG_BLE_MESH*

Enable this option to allow the device to be provisioned over GATT. This option should be enabled if PB-GATT is going to be used during provisioning procedure.

*# Virtual option enabled whenever any Proxy protocol is needed*

CONFIG_BLE_MESH_PROXY

BLE Mesh Proxy protocol support

*Found in: Component config > CONFIG_BLE_MESH*

Enable this option to support BLE Mesh Proxy protocol used by PB-GATT and other proxy pdu transmission.

**Default value:**
- Yes (enabled) if CONFIG_BLE_MESH

CONFIG_BLE_MESH_GATT_PROXY_SERVER

BLE Mesh GATT Proxy Server

*Found in: Component config > CONFIG_BLE_MESH*

This option enables support for Mesh GATT Proxy Service, i.e. the ability to act as a proxy between a Mesh GATT Client and a Mesh network. This option should be enabled if a node is going to be a Proxy Server.

**Default value:**
- Yes (enabled) if CONFIG_BLE_MESH_NODE && CONFIG_BLE_MESH

CONFIG_BLE_MESH_NODE_ID_TIMEOUT

Node Identity advertising timeout

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_GATT_PROXY_SERVER*

This option determines for how long the local node advertises using Node Identity. The given value is in seconds. The specification limits this to 60 seconds and lists it as the recommended value as well. So leaving the default value is the safest option. When an unprovisioned device is provisioned successfully and becomes a node, it will start to advertise using Node Identity during the time set by this option. And after that, Network ID will be advertised.

**Range:**
- from 1 to 60 if CONFIG_BLE_MESH_GATT_PROXY_SERVER && CONFIG_BLE_MESH

**Default value:**
- 60 if CONFIG_BLE_MESH_GATT_PROXY_SERVER && CONFIG_BLE_MESH
CONFIG_BLE_MESH_PROXY_FILTER_SIZE

Maximum number of filter entries per Proxy Client

Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_GATT_PROXY_SERVER

This option specifies how many Proxy Filter entries the local node supports. The entries of Proxy filter (whitelist or blacklist) are used to store a list of addresses which can be used to decide which messages will be forwarded to the Proxy Client by the Proxy Server.

Range:
- from 1 to 32767 if CONFIG_BLE_MESH_GATT_PROXY_SERVER && CONFIG_BLE_MESH

Default value:
- 4 if CONFIG_BLE_MESH_GATT_PROXY_SERVER && CONFIG_BLE_MESH

CONFIG_BLE_MESH_PROXY_PRIVACY

Support Proxy Privacy

Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_GATT_PROXY_SERVER

The Proxy Privacy parameter controls the privacy of the Proxy Server over the connection. The value of the Proxy Privacy parameter is controlled by the type of proxy connection, which is dependent on the bearer used by the proxy connection.

Default value:
- Yes (enabled) if CONFIG_BLE_MESH_PRB_SRV && CONFIG_BLE_MESH_GATT_PROXY_SERVER && CONFIG_BLE_MESH

CONFIG_BLE_MESH_PROXY_SOLIC_PDU_RX

Support receiving Proxy Solicitation PDU

Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_GATT_PROXY_SERVER

Enable this option to support receiving Proxy Solicitation PDU.

CONFIG_BLE_MESH_PROXY_SOLIC_RX_CRPL

Maximum capacity of solicitation replay protection list

Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_GATT_PROXY_SERVER > CONFIG_BLE_MESH_PROXY_SOLIC_PDU_RX

This option specifies the maximum capacity of the solicitation replay protection list. The solicitation replay protection list is used to reject Solicitation PDUs that were already processed by a node, which will store the solicitation src and solicitation sequence number of the received Solicitation PDU message.

Range:
- from 1 to 255 if CONFIG_BLE_MESH_PROXY_SOLIC_PDU_RX && CONFIG_BLE_MESH

Default value:
- 2 if CONFIG_BLE_MESH_PROXY_SOLIC_PDU_RX && CONFIG_BLE_MESH

CONFIG_BLE_MESH_GATT_PROXY_CLIENT

BLE Mesh GATT Proxy Client

Found in: Component config > CONFIG_BLE_MESH

This option enables support for Mesh GATT Proxy Client. The Proxy Client can use the GATT bearer to send mesh messages to a node that supports the advertising bearer.

Default value:
- No (disabled) if CONFIG_BLE_MESH
CONFIG_BLE_MESH_PROXY_SOLIC_PDU_TX

Support sending Proxy Solicitation PDU

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_GATT_PROXY_CLIENT*

Enable this option to support sending Proxy Solicitation PDU.

CONFIG_BLE_MESH_PROXY_SOLIC_TX_SRC_COUNT

Maximum number of SSRC that can be used by Proxy Client

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_GATT_PROXY_CLIENT > CONFIG_BLE_MESH_PROXY_SOLIC_PDU_TX*

This option specifies the maximum number of Solicitation Source (SSRC) that can be used by Proxy Client for sending a Solicitation PDU. A Proxy Client may use the primary address or any of the secondary addresses as the SSRC for a Solicitation PDU. So for a Proxy Client, it’s better to choose the value based on its own element count.

**Range:**
- from 1 to 16 if CONFIG_BLE_MESH_PROXY_SOLIC_PDU_TX && CONFIG_BLE_MESH

**Default value:**
- 2 if CONFIG_BLE_MESH_PROXY_SOLIC_PDU_TX && CONFIG_BLE_MESH

CONFIG_BLE_MESH_SETTINGS

Store BLE Mesh configuration persistently

*Found in: Component config > CONFIG_BLE_MESH*

When selected, the BLE Mesh stack will take care of storing/restoring the BLE Mesh configuration persistently in flash. If the device is a BLE Mesh node, when this option is enabled, the configuration of the device will be stored persistently, including unicast address, NetKey, AppKey, etc. And if the device is a BLE Mesh Provisioner, the information of the device will be stored persistently, including the information of provisioned nodes, NetKey, AppKey, etc.

**Default value:**
- No (disabled) if CONFIG_BLE_MESH

CONFIG_BLE_MESH_STORE_TIMEOUT

Delay (in seconds) before storing anything persistently

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_SETTINGS*

This value defines in seconds how soon any pending changes are actually written into persistent storage (flash) after a change occurs. The option allows nodes to delay a certain period of time to save proper information to flash. The default value is 0, which means information will be stored immediately once there are updates.

**Range:**
- from 0 to 1000000 if CONFIG_BLE_MESH_SETTINGS && CONFIG_BLE_MESH

**Default value:**
- 0 if CONFIG_BLE_MESH_SETTINGS && CONFIG_BLE_MESH

CONFIG_BLE_MESH_SEQ_STORE_RATE

How often the sequence number gets updated in storage

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_SETTINGS*

This value defines how often the local sequence number gets updated in persistent storage (i.e. flash), e.g. a value of 100 means that the sequence number will be stored to flash on every 100th increment.
If the node sends messages very frequently a higher value makes more sense, whereas if the node sends infrequently a value as low as 0 (update storage for every increment) can make sense. When the stack gets initialized it will add sequence number to the last stored one, so that it starts off with a value that’s guaranteed to be larger than the last one used before power off.

Range:
- from 0 to 1000000 if CONFIG_BLE_MESH_SETTINGS && CONFIG_BLE_MESH

Default value:
- 0 if CONFIG_BLE_MESH_SETTINGS && CONFIG_BLE_MESH

**CONFIG_BLE_MESH_RPL_STORE_TIMEOUT**

Minimum frequency that the RPL gets updated in storage

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_SETTINGS*

This value defines in seconds how soon the RPL (Replay Protection List) gets written to persistent storage after a change occurs. If the node receives messages frequently, then a large value is recommended. If the node receives messages rarely, then the value can be as low as 0 (which means the RPL is written into the storage immediately). Note that if the node operates in a security-sensitive case, and there is a risk of sudden power-off, then a value of 0 is strongly recommended. Otherwise, a power loss before RPL being written into the storage may introduce message replay attacks and system security will be in a vulnerable state.

Range:
- from 0 to 1000000 if CONFIG_BLE_MESH_SETTINGS && CONFIG_BLE_MESH

Default value:
- 0 if CONFIG_BLE_MESH_SETTINGS && CONFIG_BLE_MESH

**CONFIG_BLE_MESH_SETTINGS_BACKWARD_COMPATIBILITY**

A specific option for settings backward compatibility

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_SETTINGS*

This option is created to solve the issue of failure in recovering node information after mesh stack updates. In the old version mesh stack, there is no key of “mesh/role” in nvs. In the new version mesh stack, key of “mesh/role” is added in nvs, recovering node information needs to check “mesh/role” key in nvs and implements selective recovery of mesh node information. Therefore, there may be failure in recovering node information during node restarting after OTA.

The new version mesh stack adds the option of “mesh/role” because we have added the support of storing Provisioner information, while the old version only supports storing node information.

If users are updating their nodes from old version to new version, we recommend enabling this option, so that system could set the flag in advance before recovering node information and make sure the node information recovering could work as expected.

Default value:
- No (disabled) if CONFIG_BLE_MESH_NODE && CONFIG_BLE_MESH_SETTINGS && CONFIG_BLE_MESH

**CONFIG_BLE_MESH_SPECIFIC_PARTITION**

Use a specific NVS partition for BLE Mesh

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_SETTINGS*

When selected, the mesh stack will use a specified NVS partition instead of default NVS partition. Note that the specified partition must be registered with NVS using nvs_flash_init_partition() API, and the partition must exists in the csv file. When Provisioner needs to store a large amount of nodes’ information in the flash (e.g. more than 20), this option is recommended to be enabled.
Default value:
• No (disabled) if `CONFIG_BLE_MESH_SETTINGS` && `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_PARTITION_NAME**

Name of the NVS partition for BLE Mesh

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_SETTINGS > CONFIG_BLE_MESH_SPECIFIC_PARTITION*

This value defines the name of the specified NVS partition used by the mesh stack.

Default value:
• “ble_mesh” if `CONFIG_BLE_MESH_SPECIFIC_PARTITION` && `CONFIG_BLE_MESH_SETTINGS` && `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_USE_MULTIPLE_NAMESPACE**

Support using multiple NVS namespaces by Provisioner

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_SETTINGS*

When selected, Provisioner can use different NVS namespaces to store different instances of mesh information. For example, if in the first room, Provisioner uses NetKey A, AppKey A and provisions three devices, these information will be treated as mesh information instance A. When the Provisioner moves to the second room, it uses NetKey B, AppKey B and provisions two devices, then the information will be treated as mesh information instance B. Here instance A and instance B will be stored in different namespaces. With this option enabled, Provisioner needs to use specific functions to open the corresponding NVS namespace, restore the mesh information, release the mesh information or erase the mesh information.

Default value:
• No (disabled) if `CONFIG_BLE_MESH_PROVISIONER` && `CONFIG_BLE_MESH_SETTINGS` && `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_MAX_NVS_NAMESPACE**

Maximum number of NVS namespaces

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_SETTINGS > CONFIG_BLE_MESH_USE_MULTIPLE_NAMESPACE*

This option specifies the maximum NVS namespaces supported by Provisioner.

Range:
• from 1 to 255 if `CONFIG_BLE_MESH_USE_MULTIPLE_NAMESPACE` && `CONFIG_BLE_MESH_SETTINGS` && `CONFIG_BLE_MESH`

Default value:
• 2 if `CONFIG_BLE_MESH_USE_MULTIPLE_NAMESPACE` && `CONFIG_BLE_MESH_SETTINGS` && `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_SUBNET_COUNT**

Maximum number of mesh subnets per network

*Found in: Component config > CONFIG_BLE_MESH*

This option specifies how many subnets a Mesh network can have at the same time. Indeed, this value decides the number of the network keys which can be owned by a node.

Range:
• from 1 to 4096 if `CONFIG_BLE_MESH`

Default value:
• 3 if CONFIG_BLE_MESH

**CONFIG_BLE_MESH_APP_KEY_COUNT**

Maximum number of application keys per network

*Found in: Component config > CONFIG_BLE_MESH*

This option specifies how many application keys the device can store per network. Indeed, this value decides the number of the application keys which can be owned by a node.

*Range:*
  • from 1 to 4096 if CONFIG_BLE_MESH

*Default value:*
  • 3 if CONFIG_BLE_MESH

**CONFIG_BLE_MESH_MODEL_KEY_COUNT**

Maximum number of application keys per model

*Found in: Component config > CONFIG_BLE_MESH*

This option specifies the maximum number of application keys to which each model can be bound.

*Range:*
  • from 1 to 4096 if CONFIG_BLE_MESH

*Default value:*
  • 3 if CONFIG_BLE_MESH

**CONFIG_BLE_MESH_MODEL_GROUP_COUNT**

Maximum number of group address subscriptions per model

*Found in: Component config > CONFIG_BLE_MESH*

This option specifies the maximum number of addresses to which each model can be subscribed.

*Range:*
  • from 1 to 4096 if CONFIG_BLE_MESH

*Default value:*
  • 3 if CONFIG_BLE_MESH

**CONFIG_BLE_MESH_LABEL_COUNT**

Maximum number of Label UUIDs used for Virtual Addresses

*Found in: Component config > CONFIG_BLE_MESH*

This option specifies how many Label UUIDs can be stored. Indeed, this value decides the number of the Virtual Addresses can be supported by a node.

*Range:*
  • from 0 to 4096 if CONFIG_BLE_MESH

*Default value:*
  • 3 if CONFIG_BLE_MESH

**CONFIG_BLE_MESH_CRPL**

Maximum capacity of the replay protection list

*Found in: Component config > CONFIG_BLE_MESH*

This option specifies the maximum capacity of the replay protection list. It is similar to Network message cache size, but has a different purpose. The replay protection list is used to prevent a node from replaying a transmitted message.
attack, which will store the source address and sequence number of the received mesh messages. For Provisioner, the replay protection list size should not be smaller than the maximum number of nodes whose information can be stored. And the element number of each node should also be taken into consideration. For example, if Provisioner can provision up to 20 nodes and each node contains two elements, then the replay protection list size of Provisioner should be at least 40.

**Range:**
- from 2 to 65535 if `CONFIG_BLE_MESH`

**Default value:**
- 10 if `CONFIG_BLE_MESH`

### CONFIG_BLE_MESH_MSG_CACHE_SIZE

Network message cache size

*Found in: Component config > CONFIG_BLE_MESH*

Number of messages that are cached for the network. This helps prevent unnecessary decryption operations and unnecessary relays. This option is similar to Replay protection list, but has a different purpose. A node is not required to cache the entire Network PDU and may cache only part of it for tracking, such as values for SRC/SEQ or others.

**Range:**
- from 2 to 65535 if `CONFIG_BLE_MESH`

**Default value:**
- 10 if `CONFIG_BLE_MESH`

### CONFIG_BLE_MESH_ADV_BUF_COUNT

Number of advertising buffers

*Found in: Component config > CONFIG_BLE_MESH*

Number of advertising buffers available. The transport layer reserves ADV_BUF_COUNT - 3 buffers for outgoing segments. The maximum outgoing SDU size is 12 times this value (out of which 4 or 8 bytes are used for the Transport Layer MIC). For example, 5 segments means the maximum SDU size is 60 bytes, which leaves 56 bytes for application layer data using a 4-byte MIC, or 52 bytes using an 8-byte MIC.

**Range:**
- from 6 to 256 if `CONFIG_BLE_MESH`

**Default value:**
- 60 if `CONFIG_BLE_MESH`

### CONFIG_BLE_MESH_IVU_DIVIDER

Divider for IV Update state refresh timer

*Found in: Component config > CONFIG_BLE_MESH*

When the IV Update state enters Normal operation or IV Update in Progress, we need to keep track of how many hours has passed in the state, since the specification requires us to remain in the state at least for 96 hours (Update in Progress has an additional upper limit of 144 hours).
