This is the documentation for Espressif IoT Development Framework (esp-idf). ESP-IDF is the official development framework for the ESP32, ESP32-S and ESP32-C Series SoCs.

This document describes using ESP-IDF with the ESP32-S3 SoC.
Chapter 1

Get Started

This document is intended to help you set up the software development environment for the hardware based on the ESP32-S3 chip by Espressif. After that, a simple example will show you how to use ESP-IDF (Espressif IoT Development Framework) for menu configuration, then for building and flashing firmware onto an ESP32-S3 board.

Note: This is documentation for the master branch (latest version) of ESP-IDF. This version is under continual development. Stable version documentation is available, as well as other ESP-IDF Versions.

1.1 Introduction

ESP32-S3 is a system on a chip that integrates the following features:

- Wi-Fi (2.4 GHz band)
- Bluetooth Low Energy
- Dual high performance Xtensa® 32-bit LX7 CPU cores
- Ultra Low Power co-processor running either RISC-V or FSM core
- Multiple peripherals
- Built-in security hardware
- USB OTG interface
- USB Serial/JTAG Controller

Powered by 40 nm technology, ESP32-S3 provides a robust, highly integrated platform, which helps meet the continuous demands for efficient power usage, compact design, security, high performance, and reliability.

Espressif provides basic hardware and software resources to help application developers realize their ideas using the ESP32-S3 series hardware. The software development framework by Espressif is intended for development of Internet-of-Things (IoT) applications with Wi-Fi, Bluetooth, power management and several other system features.

1.2 What You Need

1.2.1 Hardware

- An ESP32-S3 board.
- USB cable - USB A / micro USB B.
- Computer running Windows, Linux, or macOS.

Note: Currently, some of the development boards are using USB Type C connectors. Be sure you have the correct cable to connect your board!
Chapter 1. Get Started

If you have one of ESP32-S3 official development boards listed below, you can click on the link to learn more about the hardware.

**ESP32-S3-DevKitC-1**

This user guide will help you get started with ESP32-S3-DevKitC-1 and will also provide more in-depth information. The ESP32-S3-DevKitC-1 is an entry-level development board equipped with either ESP32-S3-WROOM-1 or ESP32-S3-WROOM-1U, a general-purpose Wi-Fi + Bluetooth® LE MCU module that integrates complete Wi-Fi and Bluetooth LE functions.

Most of the I/O pins on the module are broken out to the pin headers on both sides of this board for easy interfacing. Developers can either connect peripherals with jumper wires or mount ESP32-S3-DevKitC-1 on a breadboard.

Fig. 1: ESP32-S3-DevKitC-1 with ESP32-S3-WROOM-1 Module

The document consists of the following major sections:

- **Getting started**: Overview of the board and hardware/software setup instructions to get started.
- **Hardware Reference**: More detailed information about the board’s hardware.
- **Hardware Revision Details**: Revision history, known issues, and links to user guides for previous versions (if any) of the board.
- **Related Documents**: Links to related documentation.

**Getting Started**  This section provides a brief introduction of ESP32-S3-DevKitC-1, instructions on how to do the initial hardware setup and how to flash firmware onto it.

![ESP32-S3-DevKitC-1 diagram](Figure 2)

**Description of Components**  The key components of the board are described in a counter-clockwise direction.
## Key Component

<table>
<thead>
<tr>
<th>Key Component</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ESP32-S3-WROOM-1/1U</td>
<td>ESP32-S3-WROOM-1 and ESP32-S3-WROOM-1U are two powerful, generic Wi-Fi+Bluetooth LE MCU modules that have a rich set of peripherals. They provide acceleration for neural network computing and signal processing workloads. ESP32-S3-WROOM-1 comes with a PCB antenna. ESP32-S3-WROOM-1U comes with an external antenna connector.</td>
</tr>
<tr>
<td>5 V to 3.3 V LDO</td>
<td>Power regulator that converts a 5 V supply into a 3.3 V output.</td>
</tr>
<tr>
<td>Pin Headers</td>
<td>All available GPIO pins (except for the SPI bus for flash) are broken out to the pin headers on the board for easy interfacing and programming. For details, please see Header Block.</td>
</tr>
<tr>
<td>USB-to-UART Port</td>
<td>A Micro-USB port used for power supply to the board, for flashing applications to the chip, as well as for communication with the chip via the on-board USB-to-UART bridge.</td>
</tr>
<tr>
<td>Boot Button</td>
<td>Download button. Holding down <strong>Boot</strong> and then pressing <strong>Reset</strong> initiates Firmware Download mode for downloading firmware through the serial port.</td>
</tr>
<tr>
<td>Reset Button</td>
<td>Press this button to restart the system.</td>
</tr>
<tr>
<td>ESP32-S3 USB Port</td>
<td>ESP32-S3 full-speed USB OTG interface, compliant with the USB 1.1 specification. The interface is used for power supply to the board, for flashing applications to the chip, for communication with the chip using USB 1.1 protocols, as well as for JTAG debugging.</td>
</tr>
<tr>
<td>USB-to-UART Bridge</td>
<td>Single USB-to-UART bridge chip provides transfer rates up to 3 Mbps.</td>
</tr>
<tr>
<td>RGB LED</td>
<td>Addressable RGB LED, driven by GPIO48.</td>
</tr>
<tr>
<td>3.3 V Power On LED</td>
<td>Turns on when the USB power is connected to the board.</td>

</tbody>
</table>

### Start Application Development

Before powering up your board, please make sure that it is in good condition with no obvious signs of damage.

### Required Hardware

- ESP32-S3-DevKitC-1
- USB 2.0 cable (Standard-A to Micro-B)
- Computer running Windows, Linux, or macOS

**Note:** Be sure to use an appropriate USB cable. Some cables are for charging only and do not provide the needed data lines nor work for programming the boards.

### Hardware Setup

Connect the board with the computer using **USB-to-UART Port**. Connection using **ESP32-S3 USB Port** is not fully implemented in software. In subsequent steps, **USB-to-UART Port** will be used by default.

### Software Setup

Please proceed to **Get Started**, where Section **Installation** will quickly help you set up the development environment and then flash an application example onto your board.

### Contents and Packaging

#### Retail orders

If you order a few samples, each board comes in an individual package in either antistatic bag or any packaging depending on your retailer.

#### Wholesale Orders

If you order in bulk, the boards come in large cardboard boxes.

Hardware Reference

Block Diagram The block diagram below shows the components of ESP32-S3-DevKitC-1 and their interconnections.

![Block Diagram](image)

Fig. 3: ESP32-S3-DevKitC-1 (click to enlarge)

Power Supply Options There are three mutually exclusive ways to provide power to the board:

- USB-to-UART Port and ESP32-S3 USB Port (either one or both), default power supply (recommended)
- 5V and G (GND) pins
- 3V3 and G (GND) pins

Header Block The two tables below provide the Name and Function of the pins on both sides of the board (J1 and J3). The pin names are shown in ESP32-S3-DevKitC-1 - front. The numbering is the same as in the Board Schematic (PDF).

ESP32-S3-DevKitM-1

This user guide will help you get started with ESP32-S3-DevKitM-1 and will also provide more in-depth information.

The ESP32-S3-DevKitM-1 is an entry-level development board equipped with either ESP32-S3-MINI-1 or ESP32-S3-MINI-1U, a module named for its small size. This board integrates complete Wi-Fi and Bluetooth Low Energy functions.

Most of the I/O pins on the module are broken out to the pin headers on both sides of this board for easy interfacing. Developers can either connect peripherals with jumper wires or mount ESP32-S3-DevKitM-1 on a breadboard.

The document consists of the following major sections:
- Getting Started: Overview of the board and hardware/software setup instructions to get started.

For further design documentation for the board, please contact us at sales@espressif.com.

1.2.2 Software

To start using ESP-IDF on ESP32-S3 you’ll need the following software installed:

- **Toolchain** to compile code for ESP32-S3
- **Build tools** - CMake and Ninja to build a full Application for ESP32-S3
- **ESP-IDF** that essentially contains API (software libraries and source code) for ESP32-S3 and scripts to operate the Toolchain
1.3 Installation

To install all the required software, we offer some different ways to facilitate this task. Choose from one of the available options.

1.3.1 IDE

Note: We highly recommend installing the ESP-IDF through your favorite IDE.

Build and Flash with Eclipse IDE

ESP-IDF V4.0 has a new CMake-based build system as the default build system.

There is a new ESP-IDF Eclipse Plugin that works with the CMake-based build system. Please refer to Espressif IDF Eclipse Plugins IDF for further instructions.

Note: In Espressif IDF Eclipse Plugins, though screenshots are captured from macOS, installation instructions are applicable for Windows, Linux and macOS.

Getting Started with VS Code IDE

We have official support for VS Code and we aim to provide complete end to end support for all actions related to ESP-IDF namely build, flash, monitor, debug, tracing, core-dump, System Trace Viewer, etc.
Quick Install Guide  Recommended way to install ESP-IDF Visual Studio Code Extension is by downloading it from VS Code Marketplace or following Quick Installation Guide.

Supported Features

- Setup, will help you to quickly install ESP-IDF and its relevant toolchain with just few clicks.
- Build, with one click build and multi target build, you can easily build and deploy your applications.
- Flash, with both UART and JTAG flash out of the box.
- Monitoring comes with built-in terminal where you can trigger IDF Monitor Commands from within VS Code as you are used to in traditional terminals.
- Debugging <https://github.com/espressif/vscode-esp-idf-extension/blob/master/docs/tutorial/debugging.md>, with out of box hardware debugging and also support for postmortem debugging like core-dump, you can analyze the bugs with convenience.
- GUI Menu Config, provides with simplified UI for configuring your chip.
- App & Heap Tracing, provides support for collecting traces from your application and simplified UI for analyzing them.
- System View Tracing Viewer, aims to read and display the .svdat files into trace UI, we also support multiple core tracing views.
- IDF Size Analysis Overview presents an UI for binary size analysis.
- Rainmaker Cloud, we have inbuilt Rainmaker Cloud support where you can edit/read state of your connected IoT devices easily.
- Code Coverage, we have inbuilt code coverage support which shall highlight in color which line have been covered. We also render the existing HTML report directly inside the IDE.

Bugs & Feature Requests  If you face an issue with certain feature of VS Code or VS Code in general we recommend to ask your question in the forum, or open a github issue for our dev teams to review.

We also welcome new feature request, most of the features we have today is result of people asking it to implement, or improve certain aspect of the extension, raise your feature request on github.

1.3.2 Manual Installation

For the manual procedure, please select according to your operating system.

Standard Setup of Toolchain for Windows

Introduction  ESP-IDF requires some prerequisite tools to be installed so you can build firmware for supported chips. The prerequisite tools include Python, Git, cross-compilers, CMake and Ninja build tools.

For this Getting Started we’re going to use the Command Prompt, but after ESP-IDF is installed you can use Eclipse or another graphical IDE with CMake support instead.

Note:  Limitations: - The installation path of ESP-IDF and ESP-IDF Tools must not be longer than 90 characters. Too long installation paths might result in a failed build. - The installation path of Python or ESP-IDF must not contain white spaces or parentheses. - The installation path of Python or ESP-IDF should not contain special characters (non-ASCII) unless the operating system is configured with “Unicode UTF-8” support.

System Administrator can enable the support via Control Panel - Change date, time, or number formats - Administrative tab - Change system locale - check the option “Beta: Use Unicode UTF-8 for worldwide language support” - Ok and reboot the computer.
ESP-IDF Tools Installer  The easiest way to install ESP-IDF’s prerequisites is to download one of ESP-IDF Tools Installers.

Windows Installer Download

What is the usecase for Online and Offline Installer  Online Installer is very small and allows the installation of all available releases of ESP-IDF. The installer will download only necessary dependencies including Git For Windows during the installation process. The installer stores downloaded files in the cache directory `%userprofile%\espressif`.

Offline Installer does not require any network connection. The installer contains all required dependencies including Git For Windows.

Components of the installation  The installer deploys the following components:

- Embedded Python
- Cross-compilers
- OpenOCD
- CMake and Ninja build tools
- ESP-IDF

The installer also allows reusing the existing directory with ESP-IDF. The recommended directory is `%userprofile%\Desktop\esp-idf` where `%userprofile%` is your home directory.

Launching ESP-IDF Environment  At the end of the installation process you can check out option Run ESP-IDF PowerShell Environment or Run ESP-IDF Command Prompt (cmd.exe). The installer will launch ESP-IDF environment in selected prompt.

Run ESP-IDF PowerShell Environment:

Run ESP-IDF Command Prompt (cmd.exe):

Using the Command Prompt  For the remaining Getting Started steps, we’re going to use the Windows Command Prompt.

ESP-IDF Tools Installer also creates a shortcut in the Start menu to launch the ESP-IDF Command Prompt. This shortcut launches the Command Prompt (cmd.exe) and runs `export.bat` script to set up the environment variables (PATH, IDF_PATH and others). Inside this command prompt, all the installed tools are available.

Note that this shortcut is specific to the ESP-IDF directory selected in the ESP-IDF Tools Installer. If you have multiple ESP-IDF directories on the computer (for example, to work with different versions of ESP-IDF), you have two options to use them:

1. Create a copy of the shortcut created by the ESP-IDF Tools Installer, and change the working directory of the new shortcut to the ESP-IDF directory you wish to use.
2. Alternatively, run `cmd.exe`, then change to the ESP-IDF directory you wish to use, and run `export.bat`. Note that unlike the previous option, this way requires Python and Git to be present in PATH. If you get errors related to Python or Git not being found, use the first option.
Chapter 1. Get Started

Fig. 9: Completing the ESP-IDF Tools Setup Wizard with Run ESP-IDF PowerShell Environment

Fig. 10: ESP-IDF PowerShell
Fig. 11: Completing the ESP-IDF Tools Setup Wizard with Run ESP-IDF Command Prompt (cmd.exe)
Fig. 12: ESP-IDF Command Prompt
First Steps on ESP-IDF  Now you have all requirements met, the next topic will guide you on how to start your first project.

This guide will help you on the first steps using ESP-IDF. Follow this guide to start a new project on the ESP32-S3 and build, flash, and monitor the device output.

**Note:** If you haven’t yet installed the ESP-IDF, please go to Installation and follow the instruction in order to get all the software needed to use this guide.

Start a Project  Now you are ready to prepare your application for ESP32-S3. You can start with get-started/hello_world project from examples directory in IDF.

**Important:** The ESP-IDF build system does not support spaces in the paths to either ESP-IDF or to projects.

Copy the project get-started/hello_world to ~/esp directory:

**Windows**

```bash
cd %userprofile%\esp
xcopy /e /i %IDF_PATH%\examples\get-started\hello_world hello_world
```

**Linux/macOS**

```bash
 cd ~/esp
 cp -r $IDF_PATH/examples/get-started/hello_world .
```

**Note:** There is a range of example projects in the examples directory in ESP-IDF. You can copy any project in the same way as presented above and run it. It is also possible to build examples in-place, without copying them first.

Connect Your Device  Now connect your ESP32-S3 board to the computer and check under what serial port the board is visible.

Serial ports have the following patterns in their names:

- **Windows:** names like COM1
- **Linux:** starting with /dev/tty
- **macOS:** starting with /dev/cu.

If you are not sure how to check the serial port name, please refer to Establish Serial Connection with ESP32-S3 for full details.

**Note:** Keep the port name handy as you will need it in the next steps.

Configure your Project  Navigate to your hello_world directory, set ESP32-S3 chip as the target and run the project configuration utility menuconfig.

**Windows**

```bash
 cd %userprofile%\esp\hello_world
 idf.py set-target esp32s3
 idf.py menuconfig
```
Linux/macOS

```bash
cd ~/esp/hello_world
idf.py set-target esp32s3
idf.py menuconfig
```

Setting the target with `idf.py set-target esp32s3` should be done once after opening a new project. If the project contains some existing builds and configurations, they will be cleared and initialized. The target may be saved in the environment variable to skip this step at all. See Selecting the Target for additional information.

If the previous steps have been done correctly, the following menu appears:

![Menu configuration](image)

Fig. 13: Project configuration - Home window

You are using this menu to set up project specific variables, e.g. Wi-Fi network name and password, the processor speed, etc. Setting up the project with menuconfig may be skipped for “hello_word”. This example will run with default configuration.

**Note:** The colors of the menu could be different in your terminal. You can change the appearance with the option `--style`. Please run `idf.py menuconfig --help` for further information.

**Build the Project**  Build the project by running:

```bash
idf.py build
```

This command will compile the application and all ESP-IDF components, then it will generate the bootloader, partition table, and application binaries.

```
$ idf.py build
Running cmake in directory /path/to/hello_world/build
Executing "cmake -G Ninja --warn-uninitialized /path/to/hello_world"...
Warn about uninitialized values.
-- Found Git: /usr/bin/git (found version "2.17.0")
-- Building empty aws_iot component due to configuration
-- Component names: ...
-- Component paths: ...
... (more lines of build system output)
```
Generating hello_world.bin
esptool.py v2.3.1

Project build complete. To flash, run this command:
```
../../../components/esptool_py/esptool/esptool.py -p (PORT) -b 921600 write_flash --flash_mode dio --flash_size detect --flash_freq 40m
0x10000 build/hello_world.
0x01000 build/partition_table/partition-table.bin
or run 'idf.py -p PORT flash'
```

If there are no errors, the build will finish by generating the firmware binary .bin files.

**Flash onto the Device**  Flash the binaries that you just built (bootloader.bin, partition-table.bin and hello_world.bin) onto your ESP32-S3 board by running:
```
idf.py -p PORT [-b BAUD] flash
```

Replace PORT with your ESP32-S3 board’s serial port name.

You can also change the flasher baud rate by replacing BAUD with the baud rate you need. The default baud rate is 460800.

For more information on idf.py arguments, see [*idf.py*](#).

**Note:** The option `flash` automatically builds and flashes the project, so running `idf.py build` is not necessary.

**Encountered Issues While Flashing?**  If you run the given command and see errors such as “Failed to connect”, there might be several reasons for this. One of the reasons might be issues encountered by `esptool.py`, the utility that is called by the build system to reset the chip, interact with the ROM bootloader, and flash firmware. One simple solution to try is manual reset described below, and if it does not help you can find more details about possible issues in [*Troubleshooting*](#).

`esptool.py` resets ESP32-S3 automatically by asserting DTR and RTS control lines of the USB to serial converter chip, i.e., FTDI or CP210x (for more information, see [*Establish Serial Connection with ESP32-S3*](#)). The DTR and RTS control lines are in turn connected to GPIO0 and CHIP_PU (EN) pins of ESP32-S3, thus changes in the voltage levels of DTR and RTS will boot ESP32-S3 into Firmware Download mode. As an example, check the schematic for the ESP32 DevKitC development board.

In general, you should have no problems with the official esp-idf development boards. However, `esptool.py` is not able to reset your hardware automatically in the following cases:

- Your hardware does not have the DTR and RTS lines connected to GPIO0 and CHIP_PU
- The DTR and RTS lines are configured differently
- There are no such serial control lines at all

Depending on the kind of hardware you have, it may also be possible to manually put your ESP32-S3 board into Firmware Download mode (reset).

- For development boards produced by Espressif, this information can be found in the respective getting started guides or user guides. For example, to manually reset an ESP-IDF development board, hold down the **Boot button** (GPIO0) and press the **EN button** (CHIP_PU).
- For other types of hardware, try pulling GPIO0 down.

**Normal Operation**  When flashing, you will see the output log similar to the following:
... 
esptool.py esp32s3 -p /dev/ttyUSB0 -b 460800 --before=default_reset --after=hard_reset 
--reset write_flash --flash_mode dio --flash_freq 80m --flash_size 2MB 0x0
--bootloader/bootloader.bin 0x10000 hello_world.bin 0x8000 partition_table/
--partition-table.bin
esptool.py v3.2-dev

Done

If there are no issues by the end of the flash process, the board will reboot and start up the “hello_world” application.

If you’d like to use the Eclipse or VS Code IDE instead of running idf.py, check out the Eclipse guide, VS Code guide.

**Monitor the Output** To check if “hello_world” is indeed running, type idf.py -p PORT monitor (Do not forget to replace PORT with your serial port name).

This command launches the **IDF Monitor** application:

```
$ idf.py -p <PORT> monitor
Running idf_monitor in directory [...]/esp/hello_world/build
Executing "python [...]/esp-idf/tools/idf_monitor.py -b 115200 [...]/esp/hello_
→world/build/hello_world.elf"
--- idf_monitor on <PORT> 115200 ---
```

(continues on next page)
Chapter 1. Get Started

After startup and diagnostic logs scroll up, you should see "Hello world!" printed out by the application.

```
... Hello world!
    Restarting in 10 seconds...
    This is esp32s3 chip with 2 CPU core(s), This is esp32s3 chip with 2 CPU_
    core(s), WiFi/BLE, silicon revision 0, 2MB external flash
    Minimum free heap size: 390684 bytes
    Restarting in 9 seconds...
    Restarting in 8 seconds...
    Restarting in 7 seconds...
```

To exit IDF monitor use the shortcut Ctrl+].

**Note:** You can combine building, flashing and monitoring into one step by running:

```
idf.py -p PORT flash monitor
```

See also:

- **IDF Monitor** for handy shortcuts and more details on using IDF monitor.
- **idf.py** for a full reference of idf.py commands and options.

That’s all that you need to get started with ESP32-S3!

Now you are ready to try some other examples, or go straight to developing your own applications.

**Important:** Some of examples do not support ESP32-S3 because required hardware is not included in ESP32-S3 so it cannot be supported.

If building an example, please check the README file for the **Supported Targets** table. If this is present including ESP32-S3 target, or the table does not exist at all, the example will work on ESP32-S3.

**Additional Tips**

**Permission issues** `/dev/ttyUSB0` With some Linux distributions, you may get the `Failed to open port /dev/ttyUSB0` error message when flashing the ESP32-S3. *This can be solved by adding the current user to the dialout group.*

**Python compatibility** ESP-IDF supports Python 3.6 or newer. It is recommended to upgrade your operating system to a recent version satisfying this requirement. Other options include the installation of Python from sources or the use of a Python version management system such as pyenv.

**Related Documents** For advanced users who want to customize the install process:

**Updating ESP-IDF tools on Windows**
**Install ESP-IDF tools using a script** From the Windows Command Prompt, change to the directory where ESP-IDF is installed. Then run:

```bash
install.bat
```

For Powershell, change to the directory where ESP-IDF is installed. Then run:

```bash
install.ps1
```

This will download and install the tools necessary to use ESP-IDF. If the specific version of the tool is already installed, no action will be taken. The tools are downloaded and installed into a directory specified during ESP-IDF Tools Installer process. By default, this is `C:\Users\username\espressif`

**Add ESP-IDF tools to PATH using an export script** ESP-IDF tools installer creates a Start menu shortcut for “ESP-IDF Command Prompt”. This shortcut opens a Command Prompt window where all the tools are already available.

In some cases, you may want to work with ESP-IDF in a Command Prompt window which wasn’t started using that shortcut. If this is the case, follow the instructions below to add ESP-IDF tools to PATH.

In the command prompt where you need to use ESP-IDF, change to the directory where ESP-IDF is installed, then execute `export.bat`:

```bash
cd %userprofile%\esp\esp-idf
export.bat
```

Alternatively in the Powershell where you need to use ESP-IDF, change to the directory where ESP-IDF is installed, then execute `export.ps1`:

```bash
cd ~/esp/esp-idf
export.ps1
```

When this is done, the tools will be available in this command prompt.

**Establish Serial Connection with ESP32-S3** This section provides guidance how to establish serial connection between ESP32-S3 and PC.

**Connect ESP32-S3 to PC** Connect the ESP32-S3 board to the PC using the USB cable. If device driver does not install automatically, identify USB to serial converter chip on your ESP32-S3 board (or external converter dongle), search for drivers in internet and install them.

Below is the list of USB to serial converter chips installed on most of the ESP32-S3 boards produced by Espressif together with links to the drivers:

- CP210x: [CP210x USB to UART Bridge VCP Drivers](#)
- FTDI: [FTDI Virtual COM Port Drivers](#)

Please check the board user guide for specific USB to serial converter chip used. The drivers above are primarily for reference. Under normal circumstances, the drivers should be bundled with an operating system and automatically installed upon connecting the board to the PC.

**Check port on Windows** Check the list of identified COM ports in the Windows Device Manager. Disconnect ESP32-S3 and connect it back, to verify which port disappears from the list and then shows back again.

Figures below show serial port for ESP32 DevKitC and ESP32 WROVER KIT
Chapter 1. Get Started

Fig. 14: USB to UART bridge of ESP32-DevKitC in Windows Device Manager
Fig. 15: Two USB Serial Ports of ESP-WROVER-KIT in Windows Device Manager
Chapter 1. Get Started

Check port on Linux and macOS  To check the device name for the serial port of your ESP32-S3 board (or external converter dongle), run this command two times, first with the board/dongle unplugged, then with plugged in. The port which appears the second time is the one you need:

Linux

```
ls /dev/tty*
```

macOS

```
ls /dev/cu.*
```

Note: macOS users: if you don’t see the serial port then check you have the USB/serial drivers installed as shown in the Getting Started guide for your particular development board. For macOS High Sierra (10.13), you may also have to explicitly allow the drivers to load. Open System Preferences -> Security & Privacy -> General and check if there is a message shown here about “System Software from developer …” where the developer name is Silicon Labs or FTDI.

Adding user to dialout on Linux  The currently logged user should have read and write access the serial port over USB. On most Linux distributions, this is done by adding the user to dialout group with the following command:

```
sudo usermod -a -G dialout $USER
```

on Arch Linux this is done by adding the user to uucp group with the following command:

```
sudo usermod -a -G uucp $USER
```

Make sure you re-login to enable read and write permissions for the serial port.

Verify serial connection  Now verify that the serial connection is operational. You can do this using a serial terminal program by checking if you get any output on the terminal after resetting ESP32-S3.

Windows and Linux  In this example we will use PuTTY SSH Client that is available for both Windows and Linux. You can use other serial program and set communication parameters like below.

Run terminal, set identified serial port, baud rate = 115200, data bits = 8, stop bits = 1, and parity = N. Below are example screen shots of setting the port and such transmission parameters (in short described as 115200-8-1-N) on Windows and Linux. Remember to select exactly the same serial port you have identified in steps above.

Then open serial port in terminal and check, if you see any log printed out by ESP32-S3. The log contents will depend on application loaded to ESP32-S3, see Example Output.

Note: Close the serial terminal after verification that communication is working. If you keep the terminal session open, the serial port will be inaccessible for uploading firmware later.

macOS  To spare you the trouble of installing a serial terminal program, macOS offers the screen command.

- As discussed in Check port on Linux and macOS, run:

  ```
  ls /dev/cu.*
  ```

- You should see similar output:

  ```
  /dev/cu.Bluetooth-Incoming-Port /dev/cu.SLAB_USBtoUART /dev/cu.SLAB_USBtoUART
  ```
Fig. 16: Setting Serial Communication in PuTTY on Windows
Fig. 17: Setting Serial Communication in PuTTY on Linux
Chapter 1. Get Started

- The output will vary depending on the type and the number of boards connected to your PC. Then pick the device name of your board and run:

```
screen /dev/cu.device_name 115200
```

Replace `device_name` with the name found running `ls /dev/cu.*`.
- What you are looking for is some log displayed by the `screen`. The log contents will depend on application loaded to ESP32-S3, see Example Output. To exit the `screen` session type Ctrl-A + \

**Note:** Do not forget to exit the `screen` session after verifying that the communication is working. If you fail to do it and just close the terminal window, the serial port will be inaccessible for uploading firmware later.

**Example Output**  
An example log by ESP32-S3 is shown below. Reset the board if you do not see anything.

```
ets Jun 8 2016 00:22:57
rst:0x5 (DEEPSLEEP_RESET),boot:0x13 (SPI_FAST_FLASH_BOOT)
ets Jun 8 2016 00:22:57
rst:0x7 (TG0WDT_SYS_RESET),boot:0x13 (SPI_FAST_FLASH_BOOT)
configspi: 0, SPIWP:0x00
clk_drv:0x00,q_drv:0x00,d_drv:0x00,cs0_drv:0x00,hd_drv:0x00,wp_drv:0x00
mode:DIO, clock div:2
load:0x3fff0008,len:8
load:0x3fff0010,len:3464
load:0x40078000,len:7828
load:0x40080000,len:252
entry 0x40080034
I (44) boot: ESP-IDF v2.0-rc1-401-gf9fba35 2nd stage bootloader
I (45) boot: compile time 18:48:10
...
```

If you can see readable log output, it means serial connection is working and you are ready to proceed with installation and finally upload of application to ESP32-S3.

**Note:** For some serial port wiring configurations, the serial RTS & DTR pins need to be disabled in the terminal program before the ESP32-S3 will boot and produce serial output. This depends on the hardware itself, most development boards (including all Espressif boards) do not have this issue. The issue is present if RTS & DTR are wired directly to the EN & GPIO0 pins. See the esptool documentation for more details.

If you got here from *Step 5. First Steps on ESP-IDF* when installing s/w for ESP32-S3 development, then you can continue with *Step 5. First Steps on ESP-IDF*.

**IDF Monitor**  
The IDF monitor tool is mainly a serial terminal program which relays serial data to and from the target device’s serial port. It also provides some IDF-specific features.

This tool can be launched from an IDF project by running `idf.py monitor`.

**Keyboard Shortcuts**  
For easy interaction with IDF Monitor, use the keyboard shortcuts given in the table.
Keyboard Shortcut | Action | Description
--- | --- | ---
Ctrl+J | Exit the program | Press and follow it by one of the keys given below.
Ctrl+T | Menu escape key | Send the menu character itself to remote
• Ctrl+T | Send the menu character itself to remote | Press and follow it by one of the keys given below.
• Ctrl+J | Send the exit character itself to remote | Resets the target, into bootloader via the RTS line (if connected), so that the board runs nothing. Useful when you need to wait for another device to startup.
• Ctrl+P | Reset target into bootloader to pause app via RTS line | Resets the target board and re-starts the application via the RTS line (if connected).
• Ctrl+R | Reset target board via RTS | Reset target board via RTS line (if connected).
• Ctrl+F | Build and flash the project | Build and flash the project. Pauses idf_monitor to run the project flash target, then resumes idf_monitor. Any changed source files are recompiled and then re-flashed. Target encrypted-flash is run if idf_monitor was started with argument -E.
• Ctrl+A (or A) | Build and flash the app only | Build and flash the app only. Pauses idf_monitor to run the app-flash target, then resumes idf_monitor. Similar to the flash target, but only the main app is built and re-flashed. Target encrypted-app-flash is run if idf_monitor was started with argument -E.
• Ctrl+Y | Stop/resume log output printing on screen | Stop/resume log output printing on screen. Discards all incoming serial data while activated. Allows to quickly pause and examine log output without quitting the monitor.
• Ctrl+L | Stop/resume log output saved to file | Stop/resume log output saved to file. Creates a file in the project directory and the output is written to that file until this is disabled with the same keyboard shortcut (or IDF Monitor exits).
• Ctrl+I (or I) | Stop/resume printing timestamps | IDF Monitor can print a timestamp in the beginning of each line. The timestamp format can be changed by the --timestamp-format command line argument.
• Ctrl+H (or H) | Display all keyboard shortcuts | Display all keyboard shortcuts.
• Ctrl+X (or X) | Exit the program | Exit the program.
Ctrl+C | Interrupt running application | Pauses IDF monitor and run GDB project debugger to debug the application at runtime. This requires :ref:CONFIG_ESP_SYSTEM_GDBSTUB_RUNTIME option to be enabled.

Any keys pressed, other than Ctrl-] and Ctrl-T, will be sent through the serial port.

**IDF-specific features**

**Automatic Address Decoding** Whenever ESP-IDF outputs a hexadecimal code address of the form 0x4_______, IDF Monitor uses addr2line to look up the location in the source code and find the function name.

If an ESP-IDF app crashes and panics, a register dump and backtrace is produced, such as the following:
Chapter 1. Get Started

Guru Meditation Error of type StoreProhibited occurred on core 0. Exception was unhandled.
Register dump:

-0x400dbf82:0x3ffb7e60 0x400d071d:0x3ffbe90

To decode each address, IDF Monitor runs the following command in the background:

xtensa-esp32s3-elf-addr2line -pfiaC -e build/PROJECT.elf ADDRESS

Note: Set environment variable ESP_MONITOR_DECODE to 0 or call idf_monitor.py with specific command line
**Chapter 1. Get Started**

option: `idf_monitor.py --disable-address-decoding` to disable address decoding.

**Launching GDB with GDBStub**

By default, if esp-idf crashes, the panic handler prints relevant registers and the stack dump (similar to the ones above) over the serial port. Then it resets the board.

Furthermore, the application can be configured to run GDBStub in the background and handle the Ctrl+C event from the monitor.

Optionally, the panic handler can be configured to run GDBStub, the tool which can communicate with **GDB** project debugger. GDBStub allows to read memory, examine call stack frames and variables, etc. It is not as versatile as JTAG debugging, but this method does not require any special hardware.

To enable GDBStub on panic, open the project configuration menu (`idf.py menuconfig`) and set `CONFIG_ESP_SYSTEM_PANIC` to `GDBStub on panic` or set `CONFIG_ESP_SYSTEM_PANIC` to `GDBStub on runtime`.

In this case, if the panic handler or Ctrl+C command is triggered, as soon as IDF Monitor sees that GDBStub has loaded, it automatically pauses serial monitoring and runs GDB with necessary arguments. After GDB exits, the board is reset via the RTS serial line. If this line is not connected, please reset the board manually by pressing its Reset button.

In the background, IDF Monitor runs the following command:

```
x tenga-esp32s3-elf-gdb -ex "set serial baud BAUD" -ex "target remote PORT" -ex...
```

**Output Filtering**

IDF monitor can be invoked as `idf.py monitor --print-filter="xyz"`, where `--print-filter` is the parameter for output filtering. The default value is an empty string, which means that everything is printed.

Restrictions on what to print can be specified as a series of `<tag>:<log_level>` items where `<tag>` is the tag string and `<log_level>` is a character from the set `{N, E, W, I, D, V, *}` referring to a level for logging.

For example, `PRINT_FILTER="tag1:W"` matches and prints only the outputs written with `ESP_LOGW("tag1", ...)` or at lower verbosity level, i.e. `ESP_LOGE("tag1", ...)`. Not specifying `tag1` prints nothing. Using `*:V` defaults to verbose level.

**Note:** Use primary logging to disable at compilation the outputs you do not need through the **logging library**. Output filtering with IDF monitor is a secondary solution which can be useful for adjusting the filtering options without recompiling the application.

Your app tags must not contain spaces, asterisks `*`, or colons `:` to be compatible with the output filtering feature.

If the last line of the output in your app is not followed by a carriage return, the output filtering might get confused, i.e., the monitor starts to print the line and later finds out that the line should not have been written. This is a known issue and can be avoided by always adding a carriage return (especially when no output follows immediately afterwards).

**Examples Of Filtering Rules:**

- `*` can be used to match any tags. However, the string `PRINT_FILTER="*:I tag1:E"` with regards to `tag1` prints errors only, because the rule for `tag1` has a higher priority over the rule for `*`.
- The default (empty) rule is equivalent to `*:V` because matching every tag at the Verbose level or lower means matching everything.
- `"*:N"` suppresses not only the outputs from logging functions, but also the prints made by `printf`, etc. To avoid this, use `*:E` or a higher verbosity level.
- Rules `"tag1:V","tag1:v","tag1:","tag1:*"`, and `"tag1:V"` are equivalent.
- Rule `"tag1:W tag1:E"` is equivalent to `"tag1:E"` because any consequent occurrence of the same tag name overwrites the previous one.
Chapter 1. Get Started

- Rule "tag1:I tag2:W" only prints tag1 at the Info verbosity level or lower and tag2 at the Warning verbosity level or lower.
- Rule "tag1:I tag2:W tag3:N" is essentially equivalent to the previous one because tag3:N specifies that tag3 should not be printed.
- tag3:N in the rule "tag1:I tag2:W tag3:N *:V" is more meaningful because without tag3:N the tag3 messages could have been printed; the errors for tag1 and tag2 will be printed at the specified (or lower) verbosity level and everything else will be printed by default.

A More Complex Filtering Example  The following log snippet was acquired without any filtering options:

```
load:0x40078000,len:13564
entry 0x40078d4c
E (31) esp_image: image at 0x30000 has invalid magic byte
W (31) esp_image: image at 0x30000 has invalid SPI mode 255
E (39) boot: Factory app partition is not bootable
I (568) cpu_start: Pro cpu up.
I (569) heap_init: Initializing. RAM available for dynamic allocation:
I (603) cpu_start: Pro cpu start user code
D (309) light_driver: [light_init, 74]:status: 1, mode: 2
D (318) vfs: esp_vfs_register_fd_range is successful for range <54; 64) and VFS ID...
I (328) wifi: wifi driver task: 3ffdbf84, prio:23, stack:4096, core=0
```

The captured output for the filtering options `PRINT_FILTER="wifi esp_image:E light_driver:I"` is given below:

```
E (31) esp_image: image at 0x30000 has invalid magic byte
I (328) wifi: wifi driver task: 3ffdbf84, prio:23, stack:4096, core=0
```

The options ```PRINT_FILTER="light_driver:D esp_image:N boot:N cpu_start:N vfs:N wifi:N *:V"` show the following output:

```
load:0x40078000,len:13564
entry 0x40078d4c
I (569) heap_init: Initializing. RAM available for dynamic allocation:
D (309) light_driver: [light_init, 74]:status: 1, mode: 2
```

Known Issues with IDF Monitor

Issues Observed on Windows
- Arrow keys, as well as some other keys, do not work in GDB due to Windows Console limitations.
- Occasionally, when “idf.py” exits, it might stall for up to 30 seconds before IDF Monitor resumes.
- When “gdb” is run, it might stall for a short time before it begins communicating with the GDBStub.

Standard Toolchain Setup for Linux and macOS

Installation Step by Step  This is a detailed roadmap to walk you through the installation process.

Setting up Development Environment  These are the steps for setting up the ESP-IDF for your ESP32-S3.

- **Step 1. Install Prerequisites**
- **Step 2. Get ESP-IDF**
- **Step 3. Set up the tools**
- **Step 4. Set up the environment variables**
- **Step 5. First Steps on ESP-IDF**
Step 1. Install Prerequisites  In order to use ESP-IDF with the ESP32-S3, you need to install some software packages based on your Operating System. This setup guide will help you on getting everything installed on Linux and macOS based systems.

For Linux Users  To compile using ESP-IDF you will need to get the following packages. The command to run depends on which distribution of Linux you are using:

• Ubuntu and Debian:

```
sudo apt-get install git wget flex bison gperf python3 python3-pip python3-setuptools cmake ninja-build ccache libffi-dev libssl-dev dfu-util libusb1.0-0
```

• CentOS 7 & 8:

```
sudo yum -y update && sudo yum install git wget flex bison gperf python3-pip python3-setuptools cmake ninja-build ccache dfu-util libusb1
```

CentOS 7 is still supported but CentOS version 8 is recommended for a better user experience.

• Arch:

```
sudo pacman -S --needed gcc git make flex bison gperf python-pip cmake ninja --ccache dfu-util libusb
```

Note:

• CMake version 3.5 or newer is required for use with ESP-IDF. Older Linux distributions may require updating, enabling of a “backports” repository, or installing of a “cmake3” package rather than “cmake”.
• If you do not see your Linux distribution in the above list then please check its documentation to find out which command to use for package installation.

For macOS Users  ESP-IDF will use the version of Python installed by default on macOS.

• Install pip:

```
sudo easy_install pip
```

• Install CMake & Ninja build:

  – If you have HomeBrew, you can run:

```
brew install cmake ninja dfu-util
```

  – If you have MacPorts, you can run:

```
sudo port install cmake ninja dfu-util
```

  – Otherwise, consult the CMake and Ninja home pages for macOS installation downloads.

• It is strongly recommended to also install ccache for faster builds. If you have HomeBrew, this can be done via brew install ccache or sudo port install ccache on MacPorts.

Note:  If an error like this is shown during any step:

```
```

Then you will need to install the XCode command line tools to continue. You can install these by running xcode-select --install.
Chapter 1. Get Started

**Installing Python 3**  Based on macOS Catalina 10.15 release notes, use of Python 2.7 is not recommended and Python 2.7 will not be included by default in future versions of macOS. Check what Python you currently have:

```
python --version
```

If the output is like `Python 2.7.17`, your default interpreter is Python 2.7. If so, also check if Python 3 isn’t already installed on your computer:

```
python3 --version
```

If the above command returns an error, it means Python 3 is not installed.

Below is an overview of the steps to install Python 3.

- Installing with HomeBrew can be done as follows:

```
brew install python3
```

- If you have MacPorts, you can run:

```
sudo port install python38
```

**Step 2. Get ESP-IDF**  To build applications for the ESP32-S3, you need the software libraries provided by Espressif in ESP-IDF repository.

To get ESP-IDF, navigate to your installation directory and clone the repository with git clone, following instructions below specific to your operating system.

Open Terminal, and run the following commands:

```
mkdir -p ~/esp
cd ~/esp
git clone --recursive https://github.com/espressif/esp-idf.git
```

ESP-IDF will be downloaded into `~/esp/esp-idf`.

Consult ESP-IDF Versions for information about which ESP-IDF version to use in a given situation.

**Step 3. Set up the tools**  Aside from the ESP-IDF, you also need to install the tools used by ESP-IDF, such as the compiler, debugger, Python packages, etc.

```
cd ~/esp/esp-idf
./install.sh esp32s3
```

or with Fish shell

```
cd ~/esp/esp-idf
./install.fish esp32s3
```

**Note:** To install tools for multiple targets you can specify those targets at once. For example: `./install.sh esp32,esp32c3,esp32s3`. To install tools for all supported targets, run the script without specifying targets `./install.sh all`.

**Alternative File Downloads**  The tools installer downloads a number of files attached to GitHub Releases. If accessing GitHub is slow then it is possible to set an environment variable to prefer Espressif’s download server for GitHub asset downloads.
Chapter 1. Get Started

Note: This setting only controls individual tools downloaded from GitHub releases, it doesn’t change the URLs used to access any Git repositories.

To prefer the Espressif download server when installing tools, use the following sequence of commands when running install.sh:

```
cd ~/esp/esp-idf
export IDF_GITHUB_ASSETS="dl.espressif.com/github_assets"
./install.sh
```

Customizing the tools installation path The scripts introduced in this step install compilation tools required by ESP-IDF inside the user home directory: `$HOME/.espressif` on Linux. If you wish to install the tools into a different directory, set the environment variable `IDF_TOOLS_PATH` before running the installation scripts. Make sure that your user account has sufficient permissions to read and write this path.

If changing the `IDF_TOOLS_PATH`, make sure it is set to the same value every time the Install script (install.bat, install.ps1 or install.sh) and an Export script (export.bat, export.ps1 or export.sh) are executed.

Step 4. Set up the environment variables The installed tools are not yet added to the PATH environment variable. To make the tools usable from the command line, some environment variables must be set. ESP-IDF provides another script which does that.

In the terminal where you are going to use ESP-IDF, run:

```
. $HOME/esp/esp-idf/export.sh
```

or for fish (supported only since fish version 3.0.0):

```
. $HOME/esp/esp-idf/export.fish
```

Note the space between the leading dot and the path!

If you plan to use esp-idf frequently, you can create an alias for executing export.sh:

1. Copy and paste the following command to your shell’s profile (.profile, .bashrc, .zprofile, etc.)

   ```
   alias get_idf=' $HOME/esp/esp-idf/export.sh'
   ```

2. Refresh the configuration by restarting the terminal session or by running `source [path to profile]`, for example, `source ~/.bashrc`.

Now you can run get_idf to set up or refresh the esp-idf environment in any terminal session.

Technically, you can add export.sh to your shell’s profile directly; however, it is not recommended. Doing so activates IDF virtual environment in every terminal session (including those where IDF is not needed), defeating the purpose of the virtual environment and likely affecting other software.

Step 5. First Steps on ESP-IDF Now you have all requirements met, the next topic will guide you on how to start your first project.

This guide will help you on the first steps using ESP-IDF. Follow this guide to start a new project on the ESP32-S3 and build, flash, and monitor the device output.

Note: If you haven’t yet installed the ESP-IDF, please go to Installation and follow the instruction in order to get all the software needed to use this guide.
**Start a Project**  Now you are ready to prepare your application for ESP32-S3. You can start with `get-started/hello_world` project from `examples` directory in IDF.

**Important:** The ESP-IDF build system does not support spaces in the paths to either ESP-IDF or to projects.

Copy the project `get-started/hello_world` to `~/esp` directory:

**Windows**
```
cd %userprofile%\esp
xcopy /e /i %IDF_PATH%\examples\get-started\hello_world hello_world
```

**Linux/macOS**
```
cd ~/esp
cp -r $IDF_PATH/examples/get-started/hello_world .
```

**Note:** There is a range of example projects in the `examples` directory in ESP-IDF. You can copy any project in the same way as presented above and run it. It is also possible to build examples in-place, without copying them first.

**Connect Your Device**  Now connect your ESP32-S3 board to the computer and check under what serial port the board is visible.

Serial ports have the following patterns in their names:

- **Windows:** names like COM1
- **Linux:** starting with /dev/tty
- **macOS:** starting with /dev/cu.

If you are not sure how to check the serial port name, please refer to *Establish Serial Connection with ESP32-S3* for full details.

**Note:** Keep the port name handy as you will need it in the next steps.

**Configure your Project**  Navigate to your `hello_world` directory, set ESP32-S3 chip as the target and run the project configuration utility `menuconfig`.

**Windows**
```
cd %userprofile%\esp\hello_world
idf.py set-target esp32s3
idf.py menuconfig
```

**Linux/macOS**
```
cd ~/esp/hello_world
idf.py set-target esp32s3
idf.py menuconfig
```

Setting the target with `idf.py set-target esp32s3` should be done once after opening a new project. If the project contains some existing builds and configurations, they will be cleared and initialized. The target may be saved in the environment variable to skip this step at all. See *Selecting the Target* for additional information.

If the previous steps have been done correctly, the following menu appears:
You are using this menu to set up project specific variables, e.g. Wi-Fi network name and password, the processor speed, etc. Setting up the project with menuconfig may be skipped for “hello_world”. This example will run with default configuration.

**Note:** The colors of the menu could be different in your terminal. You can change the appearance with the option

```
--style
```

Please run `idf.py menuconfig --help` for further information.

### Build the Project

Build the project by running:

```
idf.py build
```

This command will compile the application and all ESP-IDF components, then it will generate the bootloader, partition table, and application binaries.

```
$ idf.py build
Running cmake in directory /path/to/hello_world/build
Executing "cmake -G Ninja --warn-uninitialized /path/to/hello_world"...
Warn about uninitialized values.
-- Found Git: /usr/bin/git (found version "2.17.0")
-- Building empty aws_iot component due to configuration
-- Component names: ...
-- Component paths: ...
... (more lines of build system output)
[527/527] Generating hello_world.bin
esptool.py v2.3.1
Project build complete. To flash, run this command:
.../../components/esptool_py/esptool/esptool.py -p (PORT) -b 921600 write_flash
--flash_mode dio --flash_size detect --flash_freq 40m 0x10000 build/hello_world.
--bin build 0x10000 build/bootloader/bootloader.bin 0x8000 build/partition_table/
--partition-table.bin
or run 'idf.py -p PORT flash'
```

If there are no errors, the build will finish by generating the firmware binary .bin files.
**Flash onto the Device**   Flash the binaries that you just built (bootloader.bin, partition-table.bin and hello_world.bin) onto your ESP32-S3 board by running:

```
idf.py -p PORT [-b BAUD] flash
```

Replace PORT with your ESP32-S3 board’s serial port name.

You can also change the flasher baud rate by replacing BAUD with the baud rate you need. The default baud rate is 460800.

For more information on `idf.py` arguments, see [idf.py](#).

**Note:** The option `flash` automatically builds and flashes the project, so running `idf.py build` is not necessary.

**Encountered Issues While Flashing?**   If you run the given command and see errors such as “Failed to connect”, there might be several reasons for this. One of the reasons might be issues encountered by `esptool.py`, the utility that is called by the build system to reset the chip, interact with the ROM bootloader, and flash firmware. One simple solution to try is manual reset described below, and if it does not help you can find more details about possible issues in Troubleshooting.

`esptool.py` resets ESP32-S3 automatically by asserting DTR and RTS control lines of the USB to serial converter chip, i.e., FTDI or CP210x (for more information, see *Establish Serial Connection with ESP32-S3*). The DTR and RTS control lines are in turn connected to GPIO0 and CHIP_PU (EN) pins of ESP32-S3, thus changes in the voltage levels of DTR and RTS will boot ESP32-S3 into Firmware Download mode. As an example, check the schematic for the ESP32 DevKitC development board.

In general, you should have no problems with the official esp-idf development boards. However, `esptool.py` is not able to reset your hardware automatically in the following cases:

- Your hardware does not have the DTR and RTS lines connected to GPIO0 and CHIP_PU
- The DTR and RTS lines are configured differently
- There are no such serial control lines at all

Depending on the kind of hardware you have, it may also be possible to manually put your ESP32-S3 board into Firmware Download mode (reset).

- For development boards produced by Espressif, this information can be found in the respective getting started guides or user guides. For example, to manually reset an ESP-IDF development board, hold down the Boot button (GPIO0) and press the EN button (CHIP_PU).
- For other types of hardware, try pulling GPIO0 down.

**Normal Operation**   When flashing, you will see the output log similar to the following:

```bash
... esptool.py esp32s3 -p /dev/ttyUSB0 -b 460800 --before=default_reset --after=hard_
  → reset write_flash --flash_mode dio --flash_freq 80m --flash_size 2MB 0x0_
  → bootloader/bootloader.bin 0x10000 hello_world.bin 0x8000 partition_table/
  → partition-table.bin
  esptool.py v3.2-dev
  Serial port /dev/ttyUSB0

If there are no issues by the end of the flash process, the board will reboot and start up the “hello_world” application.

If you’d like to use the Eclipse or VS Code IDE instead of running idf.py, check out the Eclipse guide, VS Code guide.

Monitor the Output To check if “hello_world” is indeed running, type idf.py -p PORT monitor (Do not forget to replace PORT with your serial port name).

This command launches the IDF Monitor application:

```
$ idf.py -p <PORT> monitor
Running idf_monitor in directory [...]/esp/hello_world/build
Executing "python [...]/esp-idf/tools/idf_monitor.py -b 115200 [...]/esp/hello_
→world/build/hello_world.elf"...
... idf_monitor on <PORT> 115200 ---
--- Quit: Ctrl+] | Menu: Ctrl+T | Help: Ctrl+T followed by Ctrl+H ---
ets Jun 8 2016 00:22:57
rst:0x1 (POWERON_RESET),boot:0x13 (SPI_FAST_FLASH_BOOT)
ets Jun 8 2016 00:22:57
...
```

After startup and diagnostic logs scroll up, you should see “Hello world!” printed out by the application.

```
... Hello world!
  Restarting in 10 seconds...
  This is esp32s3 chip with 2 CPU core(s), This is esp32s3 chip with 2 CPU_
→core(s), WiFi/BLE, silicon revision 0, 2MB external flash
Minimum free heap size: 390684 bytes
  Restarting in 9 seconds...
```

(continues on next page)
Restarting in 8 seconds...
Restarting in 7 seconds...

To exit IDF monitor use the shortcut Ctrl+]..

**Note:** You can combine building, flashing and monitoring into one step by running:

```
idf.py -p PORT flash monitor
```

See also:
- *IDF Monitor* for handy shortcuts and more details on using IDF monitor.
- *idf.py* for a full reference of *idf.py* commands and options.

That’s all that you need to get started with ESP32-S3!

Now you are ready to try some other examples, or go straight to developing your own applications.

**Important:** Some of examples do not support ESP32-S3 because required hardware is not included in ESP32-S3 so it cannot be supported.

If building an example, please check the README file for the **Supported Targets** table. If this is present including ESP32-S3 target, or the table does not exist at all, the example will work on ESP32-S3.

**Additional Tips**

**Permission issues */dev/ttyUSB0** With some Linux distributions, you may get the *Failed to open port /dev/ttyUSB0* error message when flashing the ESP32-S3. *This can be solved by adding the current user to the dialout group.*

**Python compatibility** ESP-IDF supports Python 3.6 or newer. It is recommended to upgrade your operating system to a recent version satisfying this requirement. Other options include the installation of Python from sources or the use of a Python version management system such as *pyenv*.

**Tip: Updating ESP-IDF** It is recommended to update ESP-IDF from time to time, as newer versions fix bugs and/or provide new features. Please note that each ESP-IDF major and minor release version has an associated support period, and when one release branch is approaching end of life (EOL), all users are encouraged to upgrade their projects to more recent ESP-IDF releases, to find out more about support periods, see *ESP-IDF Versions*.

The simplest way to do the update is to delete the existing esp-idf folder and clone it again, as if performing the initial installation described in **Step 2. Get ESP-IDF**.

Another solution is to update only what has changed. *The update procedure depends on the version of ESP-IDF you are using.*

After updating ESP-IDF, execute the Install script again, in case the new ESP-IDF version requires different versions of tools. See instructions at **Step 3. Set up the tools**.

Once the new tools are installed, update the environment using the Export script. See instructions at **Step 4. Set up the environment variables**.

**Related Documents**
1.4 **Build Your First Project**

If you already have the ESP-IDF installed and not using IDE, you can build your first project from the command line following *Step 5. First Steps on ESP-IDF*. 
Chapter 2

API Reference

2.1 Bluetooth API

2.1.1 Controller && VHCI

Overview

Instructions

Application Example

Check `bluetooth/hci` folder in ESP-IDF examples, which contains the following application:

- This is a BLE advertising demo with virtual HCI interface. Send Re-set/ADV_PARAM/ADV_DATA/ADV_ENABLE HCI command for BLE advertising - `bluetooth/hci/controller_vhci_ble_adv`.

API Reference

Header File

- components/bt/include/esp32/include/esp_bt.h

Functions

```c
esp_err_t esp_ble_tx_power_set (esp_ble_power_type_t power_type, esp_power_level_t power_level)
```

Set BLE TX power Connection Tx power should only be set after connection created.

Return

- ESP_OK - success, other - failed

Parameters

- power_type: The type of which tx power, could set Advertising/Connection/Default and etc
- power_level: Power level(index) corresponding to absolute value(dbm)

```c
esp_power_level_t esp_ble_tx_power_get (esp_ble_power_type_t power_type)
```

Get BLE TX power Connection Tx power should only be get after connection created.

Return

- >= 0 - Power level, < 0 - Invalid

Parameters

- power_type: The type of which tx power, could set Advertising/Connection/Default and etc

```c
esp_err_t esp_bredr_tx_power_set (esp_power_level_t min_power_level, esp_power_level_t max_power_level)
```

Set BR/EDR TX power BR/EDR power control will use the power in range of minimum value and maximum value. The power level will effect the global BR/EDR TX power, such inquire, page, connection and so on.
Please call the function after `esp_bt_controller_enable` and before any function which cause RF do TX. So you can call the function before doing discovery, profile init and so on. For example, if you want BR/EDR use the new TX power to do inquire, you should call this function before inquire. Another word, If call this function when BR/EDR is in inquire(ING), please do inquire again after call this function. Default minimum power level is `ESP_PWR_LVL_N0`, and maximum power level is `ESP_PWR_LVL_P3`.

Return ESP_OK - success, other - failed

Parameters
  - min_power_level: The minimum power level
  - max_power_level: The maximum power level

`esp_err_t esp_bredr_tx_power_get(esp_power_level_t *min_power_level, esp_power_level_t *max_power_level)`

Get BR/EDR TX power If the argument is not NULL, then store the corresponding value.

Return ESP_OK - success, other - failed

Parameters
  - min_power_level: The minimum power level
  - max_power_level: The maximum power level

`esp_err_t esp_bredr_sco_datapath_set(esp_sco_data_path_t data_path)`

Set default SCO data path Should be called after controller is enabled, and before (e)SCO link is established.

Return ESP_OK - success, other - failed

Parameters
  - data_path: SCO data path

`esp_err_t esp_bt_controller_init(esp_bt_controller_config_t *cfg)`

Initialize BT controller to allocate task and other resource. This function should be called only once, before any other BT functions are called.

Return ESP_OK - success, other - failed

Parameters
  - cfg: Initial configuration of BT controller. Different from previous version, there’s a mode and some connection configuration in “cfg” to configure controller work mode and allocate the resource which is needed.

`esp_err_t esp_bt_controller_deinit(void)`

De-initialize BT controller to free resource and delete task.

This function should be called only once, after any other BT functions are called.

Return ESP_OK - success, other - failed

`esp_err_t esp_bt_controller_enable(esp_bt_mode_t mode)`

Enable BT controller. Due to a known issue, you cannot call `esp_bt_controller_enable()` a second time to change the controller mode dynamically. To change controller mode, call `esp_bt_controller_disable()` and then call `esp_bt_controller_enable()` with the new mode.

Return ESP_OK - success, other - failed

Parameters
  - mode: the mode(BLE/BT/BTDM) to enable. For compatible of API, retain this argument. This mode must be equal as the mode in “cfg” of `esp_bt_controller_init()`.

`esp_err_t esp_bt_controller_disable(void)`

Disable BT controller.

Return ESP_OK - success, other - failed

`esp_bt_controller_status_t esp_bt_controller_get_status(void)`

Get BT controller is initialised/de-initialised/enabled/disabled.

Return status value

`bool esp_vhci_host_check_send_available(void)`

`esp_vhci_host_check_send_available` used for check actively if the host can send packet to controller or not.
**Return** true for ready to send, false means cannot send packet

```c
void esp_vhci_host_send_packet (uint8_t *data, uint16_t len)
```

Should not call this function from within a critical section or when the scheduler is suspended.

**Parameters**
- **data**: the packet point
- **len**: the packet length

```c
esp_err_t esp_vhci_host_register_callback (const esp_vhci_host_callback_t *callback)
```

Register the vhci reference callback struct defined by vhci_host_callback structure.

**Return** ESP_OK - success, ESP_FAIL - failed

**Parameters**
- **callback**: esp_vhci_host_callback type variable

```c
esp_err_t esp_bt_controller_mem_release (esp_bt_mode_t mode)
```

Release the controller memory as per the mode

This function releases the BSS, data and other sections of the controller to heap. The total size is about 70k bytes.

esp_bt_controller_mem_release(mode) should be called only before esp_bt_controller_init() or after esp_bt_controller_deinit().

Note that once BT controller memory is released, the process cannot be reversed. It means you cannot use the bluetooth mode which you have released by this function.

If your firmware will later upgrade the Bluetooth controller mode (BLE -> BT Classic or disabled -> enabled) then do not call this function.

If the app calls esp_bt_controller_enable(ESP_BT_MODE_BLE) to use BLE only then it is safe to call esp_bt_controller_mem_release(ESP_BT_MODE_CLASSIC_BT) at initialization time to free unused BT Classic memory.

If the mode is ESP_BT_MODE_BTDM, then it may be useful to call API esp_bt_mem_release(ESP_BT_MODE_BTDM) instead, which internally calls esp_bt_controller_mem_release(ESP_BT_MODE_BTDM) and additionally releases the BSS and data consumed by the BT/BLE host stack to heap. For more details about usage please refer to the documentation of esp_bt_mem_release() function.

**Return** ESP_OK - success, other - failed

**Parameters**
- **mode**: the mode want to release memory

```c
esp_err_t esp_bt_mem_release (esp.bt_mode_t mode)
```

Release controller memory and BSS and data section of the BT/BLE host stack as per the mode

This function first releases controller memory by internally calling esp_bt_controller_mem_release(). Additionally, if the mode is set to ESP_BT_MODE_BTDM, it also releases the BSS and data consumed by the BT/BLE host stack to heap.

Note that once BT memory is released, the process cannot be reversed. It means you cannot use the bluetooth mode which you have released by this function.

If your firmware will later upgrade the Bluetooth controller mode (BLE -> BT Classic or disabled -> enabled) then do not call this function.

If you never intend to use bluetooth in a current boot-up cycle, you can call esp_bt_mem_release(ESP_BT_MODE_BTDM) before esp_bt_controller_init or after esp_bt_controller_deinit.
For example, if a user only uses Bluetooth for setting the WiFi configuration, and does not use Bluetooth in the rest of the product operation”. In such cases, after receiving the WiFi configuration, you can disable/deinit Bluetooth and release its memory. Below is the sequence of APIs to be called for such scenarios:

```c
esp_bluedroid_disable();
esp_bluedroid_deinit();
esp_bt_controller_disable();
esp_bt_controller_deinit();
esp_bt_mem_release(ESP_BT_MODE_BTDM);
```

**Note** In case of NimBLE host, to release BSS and data memory to heap, the mode needs to be set to ESP_BT_MODE_BTDM as controller is dual mode.

**Return**  ESP_OK - success, other - failed

**Parameters**

- `mode`: the mode whose memory is to be released

```c
esp_err_t esp_bt_sleep_enable(void)
```

enable Bluetooth to enter modem sleep

Note that this function shall not be invoked before esp_bt_controller_enable()

There are currently two options for Bluetooth modem sleep, one is ORIG mode, and another is EVED Mode. EVED Mode is intended for BLE only.

For ORIG mode: Bluetooth modem sleep is enabled in controller start up by default if CONFIG_CTRL_BTDM_MODEM_SLEEP is set and “ORIG mode” is selected. In ORIG modem sleep mode, Bluetooth controller will switch off some components and pause to work every now and then, if there is no event to process; and wakeup according to the scheduled interval and resume the work. It can also wakeup earlier upon external request using function “esp_bt_controller_wakeup_request”.

**Return**

- ESP_OK : success
- other : failed

```c
esp_err_t esp_bt_sleep_disable(void)
```

disable Bluetooth modem sleep

Note that this function shall not be invoked before esp_bt_controller_enable()

If esp_bt_sleep_disable() is called, Bluetooth controller will not be allowed to enter modem sleep;

If ORIG modem sleep mode is in use, if this function is called, Bluetooth controller may not immediately wake up if it is dormant then. In this case, esp_bt_controller_wakeup_request() can be used to shorten the time for wakeup.

**Return**

- ESP_OK : success
- other : failed

```c
esp_err_t esp_ble_scan_duplicate_list_flush(void)
```

Manually clear scan duplicate list.

Note that scan duplicate list will be automatically cleared when the maximum amount of device in the filter is reached the amount of device in the filter can be configured in menuconfig.

**Note** This function name is incorrectly spelled, it will be fixed in release 5.x version.

**Return**

- ESP_OK : success
- other : failed

```c
void esp_wifi_bt_power_domain_on(void)
```

bt Wi-Fi power domain power on

```c
void esp_wifi_bt_power_domain_off(void)
```

bt Wi-Fi power domain power off
Structures

struct esp_bt_controller_config_t
Controller config options, depend on config mask. Config mask indicate which functions enabled, this means some options or parameters of some functions enabled by config mask.

Public Members

uint16_t controller_task_stack_size
Bluetooth controller task stack size

uint8_t controller_task_prio
Bluetooth controller task priority

uint8_t hci_uart_no
If use UART1/2 as HCI IO interface, indicate UART number

uint32_t hci_uart_baudrate
If use UART1/2 as HCI IO interface, indicate UART baudrate

uint8_t scan_duplicate_mode
scan duplicate mode

uint8_t scan_duplicate_type
scan duplicate type

uint16_t normal_adv_size
Normal adv size for scan duplicate

uint16_t mesh_adv_size
Mesh adv size for scan duplicate

uint16_t send_adv_reserved_size
Controller minimum memory value

uint8_t controller_debug_flag
Controller debug log flag

uint8_t mode
Controller mode: BR/EDR, BLE or Dual Mode

uint8_t ble_max_conn
BLE maximum connection numbers

uint8_t bt_max_acl_conn
BR/EDR maximum ACL connection numbers

uint8_t bt_sco_datapath
SCO data path, i.e. HCI or PCM module

bool auto_latency
BLE auto latency, used to enhance classic BT performance

bool bt_legacy_auth_vs_evt
BR/EDR Legacy auth complete event required to protect from BIAS attack

uint8_t bt_max_sync_conn
BR/EDR maximum ACL connection numbers. Effective in menuconfig

uint8_t ble_sca
BLE low power crystal accuracy index

uint8_t pcm_role
PCM role (master & slave)

uint8_t pcm_polar
PCM polar trig (falling clk edge & rising clk edge)
bool hli
Using high level interrupt or not

uint32_t magic
Magic number

struct esp_vhci_host_callback
esp_vhci_host_callback used for vhci call host function to notify what host need to do

Public Members

void (*notify_host_send_available)(void)
callback used to notify that the host can send packet to controller

int (*notify_host_recv)(uint8_t *data, uint16_t len)
callback used to notify that the controller has a packet to send to the host

Macros

ESP_BT_CONTROLLER_CONFIG_MAGIC_VAL
BT_CONTROLLER_INIT_CONFIG_DEFAULT

Type Definitions

typedef struct esp_vhci_host_callback esp_vhci_host_callback_t

esp_vhci_host_callback used for vhci call host function to notify what host need to do

Enumerations

enum esp_bt_mode_t
Bluetooth mode for controller enable/disable.

Values:

ESP_BT_MODE_IDLE = 0x00
Bluetooth is not running

ESP_BT_MODE_BLE = 0x01
Run BLE mode

ESP_BT_MODE_CLASSIC_BT = 0x02
Run Classic BT mode

ESP_BT_MODE_BTDM = 0x03
Run dual mode

enum [anonymous]
BLE sleep clock accuracy(SCA), values for ble_sca field in esp_bt_controller_config_t, currently only
ESP_BLE_SCA_500PPM and ESP_BLE_SCA_250PPM are supported.

Values:

ESP_BLE_SCA_500PPM = 0
BLE SCA at 500ppm

ESP_BLE_SCA_250PPM
BLE SCA at 250ppm

ESP_BLE_SCA_150PPM
BLE SCA at 150ppm

ESP_BLE_SCA_100PPM
BLE SCA at 100ppm

ESP_BLE_SCA_75PPM
BLE SCA at 75ppm
Chapter 2. API Reference

ESP_BLE_SCA_50PPM
BLE SCA at 50ppm

ESP_BLE_SCA_30PPM
BLE SCA at 30ppm

ESP_BLE_SCA_20PPM
BLE SCA at 20ppm

enum esp_bt_controller_status_t
Bluetooth controller enable/disable/initiated/de-initialised status.
Values:

ESP_BT_CONTROLLER_STATUS_IDLE = 0
ESP_BT_CONTROLLER_STATUS_INITED
ESP_BT_CONTROLLER_STATUS_ENABLED
ESP_BT_CONTROLLER_STATUS_NUM

enum esp_ble_power_type_t
BLE tx power type ESP_BLE_PWR_TYPE_CONN_HDL0-8: for each connection, and only be
set after connection completed. when disconnect, the correspond TX power is not effected.
ESP_BLE_PWR_TYPE_DEFAULT: if each connection’s TX power is not set, it will use this default value.
if neither in scan mode nor in adv mode, it will use this default value. If none of power type is set, system will
use ESP_PWR_LVL_P3 as default for ADV/SCAN/CONN0-9.

Values:

ESP_BLE_PWR_TYPE_CONN_HDL0 = 0
For connection handle 0
ESP_BLE_PWR_TYPE_CONN_HDL1 = 1
For connection handle 1
ESP_BLE_PWR_TYPE_CONN_HDL2 = 2
For connection handle 2
ESP_BLE_PWR_TYPE_CONN_HDL3 = 3
For connection handle 3
ESP_BLE_PWR_TYPE_CONN_HDL4 = 4
For connection handle 4
ESP_BLE_PWR_TYPE_CONN_HDL5 = 5
For connection handle 5
ESP_BLE_PWR_TYPE_CONN_HDL6 = 6
For connection handle 6
ESP_BLE_PWR_TYPE_CONN_HDL7 = 7
For connection handle 7
ESP_BLE_PWR_TYPE_CONN_HDL8 = 8
For connection handle 8
ESP_BLE_PWR_TYPE_ADV = 9
For advertising
ESP_BLE_PWR_TYPE_SCAN = 10
For scan
ESP_BLE_PWR_TYPE_DEFAULT = 11
For default, if not set other, it will use default value
ESP_BLE_PWR_TYPE_NUM = 12
TYPE numbers
enum esp_power_level_t

Bluetooth TX power level(index), it’s just a index corresponding to power(dbm).

Values:

ESP_PWR_LVL_N12 = 0
Corresponding to -12dbm

ESP_PWR_LVL_N9 = 1
Corresponding to -9dbm

ESP_PWR_LVL_N6 = 2
Corresponding to -6dbm

ESP_PWR_LVL_N3 = 3
Corresponding to -3dbm

ESP_PWR_LVL_N0 = 4
Corresponding to 0dbm

ESP_PWR_LVL_P3 = 5
Corresponding to +3dbm

ESP_PWR_LVL_P6 = 6
Corresponding to +6dbm

ESP_PWR_LVL_P9 = 7
Corresponding to +9dbm

ESP_PWR_LVL_N14 = ESP_PWR_LVL_N12
Backward compatibility! Setting to -14dbm will actually result to -12dbm

ESP_PWR_LVL_N11 = ESP_PWR_LVL_N9
Backward compatibility! Setting to -11dbm will actually result to -9dbm

ESP_PWR_LVL_N8 = ESP_PWR_LVL_N6
Backward compatibility! Setting to -8dbm will actually result to -6dbm

ESP_PWR_LVL_N5 = ESP_PWR_LVL_N3
Backward compatibility! Setting to -5dbm will actually result to -3dbm

ESP_PWR_LVL_N2 = ESP_PWR_LVL_N0
Backward compatibility! Setting to -2dbm will actually result to 0dbm

ESP_PWR_LVL_P1 = ESP_PWR_LVL_P3
Backward compatibility! Setting to +1dbm will actually result to +3dbm

ESP_PWR_LVL_P4 = ESP_PWR_LVL_P6
Backward compatibility! Setting to +4dbm will actually result to +6dbm

ESP_PWR_LVL_P7 = ESP_PWR_LVL_P9
Backward compatibility! Setting to +7dbm will actually result to +9dbm

enum esp_sco_data_path_t

Bluetooth audio data transport path.

Values:

ESP_SCO_DATA_PATH_HCI = 0
data over HCI transport

ESP_SCO_DATA_PATH_PCM = 1
data over PCM interface

Functions

`esp_bluedroid_status_t esp_bluedroid_get_status (void)`
Get bluetooth stack status.

Return: Bluetooth stack status

`esp_err_t esp_bluedroid_enable (void)`
Enable bluetooth, must after esp_bluedroid_init().

Return:
- ESP_OK : Succeed
- Other : Failed

`esp_err_t esp_bluedroid_disable (void)`
Disable bluetooth, must prior to esp_bluedroid_deinit().

Return:
- ESP_OK : Succeed
- Other : Failed

`esp_err_t esp_bluedroid_init (void)`
Init and alloc the resource for bluetooth, must be prior to every bluetooth stuff.

Return:
- ESP_OK : Succeed
- Other : Failed

`esp_err_t esp_bluedroid_deinit (void)`
Deinit and free the resource for bluetooth, must be after every bluetooth stuff.

Return:
- ESP_OK : Succeed
- Other : Failed

Enumerations

`enum esp_bluedroid_status_t`
Bluetooth stack status type, to indicate whether the bluetooth stack is ready.

Values:

- `ESP_BLUEDROID_STATUS_UNINITIALIZED = 0`
  Bluetooth not initialized

- `ESP_BLUEDROID_STATUS_INITIALIZED`
  Bluetooth initialized but not enabled

- `ESP_BLUEDROID_STATUS_ENABLED`
  Bluetooth initialized and enabled

BT DEVICE APIs

Overview: Bluetooth device reference APIs.

Instructions

Application Example: Instructions

API Reference

Header File
- components/bt/host/bluedroid/api/include/api/esp_bt_device.h
Chapter 2. API Reference

Functions

const uint8_t* esp_bt_dev_get_address (void)
Get bluetooth device address. Must use after “esp_bluedroid_enable”.

Return bluetooth device address (six bytes), or NULL if bluetooth stack is not enabled

esp_err_t esp_bt_dev_set_device_name(const char* name)
Set bluetooth device name. This function should be called after esp_bluedroid_enable() completes successfully.

A BR/EDR/LE device type shall have a single Bluetooth device name which shall be identical irrespective of the physical channel used to perform the name discovery procedure.

Return

• ESP_OK : Succeed
• ESP_ERR_INVALID_ARG : if name is NULL pointer or empty, or string length out of limit
• ESP_ERR_INVALID_STATE : if bluetooth stack is not yet enabled
• ESP_FAIL : others

Parameters

• [in] name: device name to be set

2.1.3 BT LE

GAP API

Overview

Instructions

Application Example

Check bluetooth/bluedroid/ble folder in ESP-IDF examples, which contains the following demos and their tutorials:

• This is a SMP security client demo and its tutorial. This demo initiates its security parameters and acts as a GATT client, which can send a security request to the peer device and then complete the encryption procedure.
  – bluetooth/bluedroid/ble/gatt_security_client
  – GATT Security Client Example Walkthrough

• This is a SMP security server demo and its tutorial. This demo initiates its security parameters and acts as a GATT server, which can send a pair request to the peer device and then complete the encryption procedure.
  – bluetooth/bluedroid/ble/gatt_security_server
  – GATT Security Server Example Walkthrough

API Reference

Header File

• components/bt/host/bluedroid/api/include/api/esp_gap_ble_api.h

Functions

esp_err_t esp_ble_gap_register_callback(esp_gap_ble_cb_t callback)
This function is called to occur gap event, such as scan result.

Return

• ESP_OK : success
• other : failed

Parameters

• [in] callback: callback function

esp_err_t esp_ble_gap_config_adv_data (esp_ble_adv_data_t *adv_data)
This function is called to override the BTA default ADV parameters.

Return

• ESP_OK : success
• other : failed
Parameters
  • [in] adv_data: Pointer to User defined ADV data structure. This memory space can not be freed until callback of config_adv_data is received.

  \texttt{esp_err_t esp_ble_gap_set_scan_params(esp_ble_scan_params_t \*scan_params)}

  This function is called to set scan parameters.

  Return
  • ESP_OK : success
  • other : failed

Parameters
  • [in] scan_params: Pointer to User defined scan_params data structure. This memory space can not be freed until callback of set_scan_params

  \texttt{esp_err_t esp_ble_gap_start_scanning(uint32_t duration)}

  This procedure keep the device scanning the peer device which advertising on the air.

  Return
  • ESP_OK : success
  • other : failed

Parameters
  • [in] duration: Keeping the scanning time, the unit is second.

  \texttt{esp_err_t esp_ble_gap_stop_scanning(void)}

  This function call to stop the device scanning the peer device which advertising on the air.

  Return
  • ESP_OK : success
  • other : failed

  \texttt{esp_err_t esp_ble_gap_start_advertising(esp_ble_adv_params_t \*adv_params)}

  This function is called to start advertising.

  Return
  • ESP_OK : success
  • other : failed

Parameters
  • [in] adv_params: pointer to User defined adv_params data structure.

  \texttt{esp_err_t esp_ble_gap_stop_advertising(void)}

  This function is called to stop advertising.

  Return
  • ESP_OK : success
  • other : failed

  \texttt{esp_err_t esp_ble_gap_update_conn_params(esp_ble_conn_update_params_t \*params)}

  Update connection parameters, can only be used when connection is up.

  Return
  • ESP_OK : success
  • other : failed

Parameters
  • [in] params: - connection update parameters

  \texttt{esp_err_t esp_ble_gap_set_pkt_data_len(esp_bd_addr_t remote_device, uint16_t tx_data_length)}

  This function is to set maximum LE data packet size.

  Return
  • ESP_OK : success
  • other : failed

  \texttt{esp_err_t esp_ble_gap_set_rand_addr(esp_bd_addr_t rand_addr)}

  This function sets the static Random Address and Non-Resolvable Private Address for the application.
Return
• ESP_OK : success
• other : failed

Parameters
• [in] rand_addr: the random address which should be setting

esp_err_t esp_ble_gap_clear_rand_addr (void)
This function clears the random address for the application.

Return
• ESP_OK : success
• other : failed

Parameters
• [in] privacy_enable: - enable/disable privacy on remote device.

esp_err_t esp_ble_gap_config_local_icon (uint16_t icon)
Set local gap appearance icon

Return
• ESP_OK : success
• other : failed

Parameters
• [in] icon: - External appearance value, these values are defined by the Bluetooth SIG, please refer to https://www.bluetooth.com/specifications/gatt/viewer?attributeXmlFile=org.bluetooth.characteristic.gap.appearance.xml

esp_err_t esp_ble_gap_update_whitelist (bool add_remove, esp_bd_addr_t remote_bda, esp_ble_wl_addr_type_t wl_addr_type)
Add or remove device from white list.

Return
• ESP_OK : success
• other : failed

Parameters
• [in] add_remove: the value is true if added the ble device to the white list, and false remove to the white list.
• [in] remote_bda: the remote device address add/remove from the white list.
• [in] wl_addr_type: whitelisted device type

esp_err_t esp_ble_gap_clear_whitelist (void)
Clear all white list.

Return
• ESP_OK : success
• other : failed

esp_err_t esp_ble_gap_get_whitelist_size (uint16_t *length)
Get the white list size in the controller.

Return
• ESP_OK : success
• other : failed

Parameters
• [out] length: the white list length.
Chapter 2. API Reference

```c
esp_err_t esp_ble_gap_set_prefer_conn_params(esp_bd_addr_t bd_addr, uint16_t min_conn_int, uint16_t max_conn_int, uint16_t slave_latency, uint16_t supervision_tout)
```

This function is called to set the preferred connection parameters when default connection parameter is not desired before connecting. This API can only be used in the master role.

**Return**
- ESP_OK : success
- other : failed

**Parameters**
- [in] bd_addr: BD address of the peripheral
- [in] min_conn_int: minimum preferred connection interval
- [in] max_conn_int: maximum preferred connection interval
- [in] slave_latency: preferred slave latency
- [in] supervision_tout: preferred supervision timeout

```c
esp_err_t esp_ble_gap_set_device_name(const char *name)
```

Set device name to the local device.

**Return**
- ESP_OK : success
- other : failed

**Parameters**
- [in] name: device name.

```c
esp_err_t esp_ble_gap_get_local_used_addr(esp_bd_addr_t local_used_addr, uint8_t *addr_type)
```

This function is called to get local used address and address type. `uint8_t *esp_bt_dev_get_address(void)` get the public address.

**Return**
- ESP_OK : success
- other : failed

**Parameters**
- [in] local_used_addr: current local used ble address (six bytes)
- [in] addr_type: ble address type

```c
uint8_t *esp_ble_resolve_adv_data(uint8_t *adv_data, uint8_t type, uint8_t *length)
```

This function is called to get ADV data for a specific type.

**Return**
pointer of ADV data

**Parameters**
- [in] adv_data: pointer of ADV data which to be resolved
- [in] type: finding ADV data type
- [out] length: return the length of ADV data not including type

```c
esp_err_t esp_ble_gap_config_adv_data_raw(uint8_t *raw_data, uint32_t raw_data_len)
```

This function is called to set raw advertising data. User need to fill ADV data by self.

**Return**
- ESP_OK : success
- other : failed

**Parameters**
- [in] raw_data: raw advertising data
- [in] raw_data_len: raw advertising data length, less than 31 bytes

```c
esp_err_t esp_ble_gap_config_scan_rsp_data_raw(uint8_t *raw_data, uint32_t raw_data_len)
```

This function is called to set raw scan response data. User need to fill scan response data by self.

**Return**
- ESP_OK : success
- other : failed

**Parameters**
• [in] raw_data: raw scan response data
• [in] raw_data_len: raw scan response data length, less than 31 bytes

`esp_err_t esp_ble_gap_read_rssi(esp_bd_addr_t remote_addr)`

This function is called to read the RSSI of remote device. The address of link policy results are returned in the gap callback function with ESP_GAP_BLE_READ_RSSI_COMPLETE_EVT event.

Return
• ESP_OK: success
• other: failed

Parameters
• [in] remote_addr: The remote connection device address.

`esp_err_t esp_ble_gap_add_duplicate_scan_exceptional_device(esp_ble_duplicate_exceptional_info_type_t type,
                                                         esp_duplicate_info_t device_info)`

This function is called to add a device info into the duplicate scan exceptional list.

Return
• ESP_OK: success
• other: failed

Parameters
• [in] type: device info type, it is defined in esp_ble_duplicate_exceptional_info_type_t when type is MESH_BEACON_TYPE, MESH_PROV_SRV_ADV or MESH_PROXY_SRV_ADV, device_info is invalid.
• [in] device_info: the device information.

`esp_err_t esp_ble_gap_remove_duplicate_scan_exceptional_device(esp_ble_duplicate_exceptional_info_type_t type,
                                                              esp_duplicate_info_t device_info)`

This function is called to remove a device info from the duplicate scan exceptional list.

Return
• ESP_OK: success
• other: failed

Parameters
• [in] type: device info type, it is defined in esp_ble_duplicate_exceptional_info_type_t when type is MESH_BEACON_TYPE, MESH_PROV_SRV_ADV or MESH_PROXY_SRV_ADV, device_info is invalid.
• [in] device_info: the device information.

`esp_err_t esp_ble_gap_clean_duplicate_scan_exceptional_list(esp_duplicate_scan_exceptional_list_type_t list_type)`

This function is called to clean the duplicate scan exceptional list. This API will delete all device information in the duplicate scan exceptional list.

Return
• ESP_OK: success
• other: failed

Parameters
• [in] list_type: duplicate scan exceptional list type, the value can be one or more of esp_duplicate_scan_exceptional_list_type_t.

`esp_err_t esp_ble_gap_set_security_param(esp_ble_sm_param_t param_type, void *value,
                                          uint8_t len)`

Set a GAP security parameter value. Overrides the default value.

Secure connection is highly recommended to avoid some major vulnerabilities like 'Impersonation in the Pin Pairing Protocol' (CVE-2020-26555) and 'Authentication of the LE Legacy Pairing Protocol'.

(continues on next page)
To accept only 'secure connection mode', it is necessary to do as:

1. Set bit 'ESP_LE_AUTH_REQ_SC_ONLY' (param_type is 'ESP_BLE_SM_AUTHEN_REQ_MODE'), bit 'ESP_LE_AUTH:BOND' and bit 'ESP_LE_AUTH_REQ_MITM' is optional as required.

2. Set to 'ESP_BLE_ONLY_ACCEPT_SPECIFIED_AUTH_ENABLE' (param_type is 'ESP_BLE_SM_ONLY_ACCEPT_SPECIFIED_SEC_AUTH').

Return:
- ESP_OK: success
- other: failed

Parameters:
- [in] param_type: the type of the param which to be set
- [in] value: the param value
- [in] len: the length of the param value

```c
esp_err_t esp_ble_gap_security_rsp(esp_bd_addr_t bd_addr, bool accept)
```

Grant security request access.

Return:
- ESP_OK: success
- other: failed

Parameters:
- [in] bd_addr: BD address of the peer
- [in] accept: accept the security request or not

```c
esp_err_t esp_ble_set_encryption(esp_bd_addr_t bd_addr, esp_ble_sec_act_t sec_act)
```

Set a gap parameter value. Use this function to change the default GAP parameter values.

Return:
- ESP_OK: success
- other: failed

Parameters:
- [in] bd_addr: the address of the peer device need to encryption
- [in] sec_act: This is the security action to indicate what kind of BLE security level is required for the BLE link if the BLE is supported

```c
esp_err_t esp_ble_passkey_reply(esp_bd_addr_t bd_addr, bool accept, uint32_t passkey)
```

Reply the key value to the peer device in the legacy connection stage.

Return:
- ESP_OK: success
- other: failed

Parameters:
- [in] bd_addr: BD address of the peer
- [in] accept: passkey entry successful or declined.
- [in] passkey: passkey value, must be a 6 digit number, can be lead by 0.

```c
esp_err_t esp_ble_confirm_reply(esp_bd_addr_t bd_addr, bool accept)
```

Reply the confirm value to the peer device in the secure connection stage.

Return:
- ESP_OK: success
- other: failed

Parameters:
- [in] bd_addr: BD address of the peer device
- [in] accept: numbers to compare are the same or different.

```c
esp_err_t esp_ble_remove_bond_device(esp_bd_addr_t bd_addr)
```

Removes a device from the security database list of peer device. It manages unpairing event while connected.

Return:
- ESP_OK: success
- other: failed

Parameters
Chapter 2. API Reference

- [in] bd_addr: BD address of the peer device

int esp_ble_get_bond_device_num (void)
Get the device number from the security database list of peer device. It will return the device bonded number immediately.

Return
- >= 0: bonded devices number.
- ESP_FAIL: failed

esp_err_t esp_ble_get_bond_device_list (int *dev_num, esp_ble_bond_dev_t *dev_list)
Get the device from the security database list of peer device. It will return the device bonded information immediately.

Return
- ESP_OK: success
- other: failed

Parameters
- [inout] dev_num: Indicate the dev_list array(buffer) size as input. If dev_num is large enough, it means the actual number as output. Suggest that dev_num value equal to esp_ble_get_bond_device_num().
- [out] dev_list: an array(buffer) of esp_ble_bond_dev_t type. Use for storing the bonded devices address. The dev_list should be allocated by who call this API.

esp_err_t esp_ble_oob_req_reply (esp_bd_addr_t bd_addr, uint8_t* TK, uint8_t len)
This function is called to provide the OOB data for SMP in response to ESP_GAP_BLE_OOB_REQ_EVT.

Return
- ESP_OK: success
- other: failed

Parameters
- [in] bd_addr: BD address of the peer device.
- [in] TK: TK value, the TK value shall be a 128-bit random number
- [in] len: length of tk, should always be 128-bit

esp_err_t esp_ble_gap_disconnect (esp_bd_addr_t remote_device)
This function is to disconnect the physical connection of the peer device gattc may have multiple virtual GATT server connections when multiple app_id registered. esp_ble_gattc_close (esp_gatt_if_t gattc_if, uint16_t conn_id) only close one virtual GATT server connection. if there exist other virtual GATT server connections, it does not disconnect the physical connection. esp_ble_gap_disconnect(esp_bd_addr_t remote_device) disconnect the physical connection directly.

Return
- ESP_OK: success
- other: failed

Parameters
- [in] remote_device: BD address of the peer device

esp_err_t esp_ble_get_current_conn_params (esp_bd_addr_t bd_addr, esp_gap_conn_params_t *conn_params)
This function is called to read the connection parameters information of the device.

Return
- ESP_OK: success
- other: failed

Parameters
- [in] bd_addr: BD address of the peer device.
- [out] conn_params: the connection parameters information

esp_err_t esp_gap_ble_set_channels (esp_gap_ble_channels channels)
BLE set channels.

Return
- ESP_OK: success
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- other: failed

Parameters
- [in] channels: The n-th such field (in the range 0 to 36) contains the value for the link layer channel index n. 0 means channel n is bad. 1 means channel n is unknown. The most significant bits are reserved and shall be set to 0. At least one channel shall be marked as unknown.
**Chapter 2. API Reference**

**esp_err_t esp_gap_ble_set_authorization(esp_bd_addr_t bd_addr, bool authorize)**

This function is called to authorize a link after Authentication (MITM protection).

**Return**
- ESP_OK: success
- other: failed

**Parameters**
- [in] bd_addr: BD address of the peer device.
- [out] authorize: Authorized the link or not.

**esp_err_t esp_ble_gap_read_phy(esp_bd_addr_t bd_addr)**

This function is used to read the current transmitter PHY and receiver PHY on the connection identified by remote address.

**Return**
- ESP_OK: success
- other: failed

**Parameters**
- [in] bd_addr: BD address of the peer device

**esp_err_t esp_ble_gap_set_preferred_default_phy(esp_ble_gap_phy_mask_t tx_phy_mask, esp_ble_gap_phy_mask_t rx_phy_mask)**

This function is used to allow the Host to specify its preferred values for the transmitter PHY and receiver PHY to be used for all subsequent connections over the LE transport.

**Return**
- ESP_OK: success
- other: failed

**Parameters**
- [in] tx_phy_mask: : indicates the transmitter PHYs that the Host prefers the Controller to use
- [in] rx_phy_mask: : indicates the receiver PHYs that the Host prefers the Controller to use

**esp_err_t esp_ble_gap_set_preferred_phy(esp_bd_addr_t bd_addr, esp_ble_gap_all_phys_t all_phys_mask, esp_ble_gap_phy_mask_t tx_phy_mask, esp_ble_gap_phy_mask_t rx_phy_mask, esp_ble_gap_prefer_phy_options_t phy_options)**

This function is used to set the PHY preferences for the connection identified by the remote address. The Controller might not be able to make the change (e.g. because the peer does not support the requested PHY) or may decide that the current PHY is preferable.

**Return**
- ESP_OK: success
- other: failed

**Parameters**
- [in] bd_addr: : remote address
- [in] all_phys_mask: : a bit field that allows the Host to specify
- [in] tx_phy_mask: : a bit field that indicates the transmitter PHYs that the Host prefers the Controller to use
- [in] rx_phy_mask: : a bit field that indicates the receiver PHYs that the Host prefers the Controller to use
- [in] phy_options: : a bit field that allows the Host to specify options for PHYs

**esp_err_t esp_ble_gap_ext_adv_set_rand_addr(uint8_t instance, esp_bd_addr_t rand_addr)**

This function is used by the Host to set the random device address specified by the Random_Address parameter.

**Return**
- ESP_OK: success
- other: failed

**Parameters**
- [in] instance: : Used to identify an advertising set
- [in] rand_addr: : Random Device Address

**esp_err_t esp_ble_gap_ext_adv_set_params(uint8_t instance, const esp_ble_gap_ext_adv_params_t *params)**

This function is used by the Host to set the advertising parameters.

**Return**
- ESP_OK: success
- other: failed
Parameters
• [in] instance: identifies the advertising set whose parameters are being configured.
• [in] params: advertising parameters

`esp_err_t esp_ble_gap_config_ext_adv_data_raw(uint8_t instance, uint16_t length, const uint8_t *data)`

This function is used to set the data used in advertising PDUs that have a data field.

Return - ESP_OK : success
• other : failed

Parameters
• [in] instance: identifies the advertising set whose data are being configured
• [in] length: data length
• [in] data: data information

`esp_err_t esp_ble_gap_config_ext_scan_rsp_data_raw(uint8_t instance, uint16_t length, const uint8_t *scan_rsp_data)`

This function is used to provide scan response data used in scanning response PDUs.

Return - ESP_OK : success
• other : failed

Parameters
• [in] instance: identifies the advertising set whose response data are being configured.
• [in] length: responsedata length
• [in] scan_rsp_data: response data information

`esp_err_t esp_ble_gap_ext_adv_start(uint8_t num_adv, const esp_ble_gap_ext_adv_t *ext_adv)`

This function is used to request the Controller to enable one or more advertising sets using the advertising sets identified by the instance parameter.

Return - ESP_OK : success
• other : failed

Parameters
• [in] num_adv: Number of advertising sets to enable or disable
• [in] ext_adv: adv parameters

`esp_err_t esp_ble_gap_ext_adv_stop(uint8_t num_adv, const uint8_t *ext_adv_inst)`

This function is used to request the Controller to disable one or more advertising sets using the advertising sets identified by the instance parameter.

Return - ESP_OK : success
• other : failed

Parameters
• [in] num_adv: Number of advertising sets to enable or disable
• [in] ext_adv_inst: ext adv instance

`esp_err_t esp_ble_gap_ext_adv_set_remove(uint8_t instance)`

This function is used to remove an advertising set from the Controller.

Return - ESP_OK : success
• other : failed

Parameters
• [in] instance: Used to identify an advertising set

`esp_err_t esp_ble_gap_ext_adv_set_clear(void)`

This function is used to remove all existing advertising sets from the Controller.

Return - ESP_OK : success
• other : failed

`esp_err_t esp_ble_gap_periodic_adv_set_params(uint8_t instance, const esp_ble_gap_periodic_adv_params_t *params)`

This function is used by the Host to set the parameters for periodic advertising.
Return  - ESP_OK : success  
  • other : failed  

Parameters  
  • [in] instance: : identifies the advertising set whose periodic advertising parameters are being configured.  
  • [in] params: : periodic adv parameters

`esp_err_t esp_ble_gap_config_periodic_adv_data_raw(uint8_t instance, uint16_t length, const uint8_t *data)`  
This function is used to set the data used in periodic advertising PDUs.

Return  - ESP_OK : success  
  • other : failed  

Parameters  
  • [in] instance: : identifies the advertising set whose periodic advertising parameters are being configured.  
  • [in] length: : the length of periodic data  
  • [in] data:: periodic data information

`esp_err_t esp_ble_gap_periodic_adv_start(uint8_t instance)`  
This function is used to request the Controller to enable the periodic advertising for the advertising set specified.

Return  - ESP_OK : success  
  • other : failed  

Parameters  
  • [in] instance: : Used to identify an advertising set

`esp_err_t esp_ble_gap_periodic_adv_stop(uint8_t instance)`  
This function is used to request the Controller to disable the periodic advertising for the advertising set specified.

Return  - ESP_OK : success  
  • other : failed  

Parameters  
  • [in] instance: : Used to identify an advertising set

`esp_err_t esp_ble_gap_set_ext_scan_params(const esp_ble_ext_scan_params_t *params)`  
This function is used to set the extended scan parameters to be used on the advertising channels.

Return  - ESP_OK : success  
  • other : failed  

Parameters  
  • [in] params:: scan parameters

`esp_err_t esp_ble_gap_start_ext_scan(uint32_t duration, uint16_t period)`  
This function is used to enable scanning.

Return  - ESP_OK : success  
  • other : failed  

Parameters  
  • [in] duration: : Scan duration  
  • [in] period: : Time interval from when the Controller started its last Scan Duration until it begins the subsequent Scan Duration.

`esp_err_t esp_ble_gap_stop_ext_scan(void)`  
This function is used to disable scanning.

Return  - ESP_OK : success  
  • other : failed

`esp_err_t esp_ble_gap_periodic_adv_create_sync(const esp_ble_gap_periodic_adv_sync_params_t *params)`  
This function is used to synchronize with periodic advertising from an advertiser and begin receiving periodic advertising packets.

Return  - ESP_OK : success
• other : failed

**Parameters**

• [in] params: : sync parameters

```c
esp_err_t esp_ble_gap_periodic_adv_sync_cancel (void)
```

This function is used to cancel the LE_Periodic_Advertising_Create_Sync command while it is pending.

**Return**

- ESP_OK : success
- other : failed

```c
esp_err_t esp_ble_gap_periodic_adv_sync_terminate (uint16_t sync_handle)
```

This function is used to stop reception of the periodic advertising identified by the Sync Handle parameter.

**Return**

- ESP_OK : success
- other : failed

**Parameters**

• [in] sync_handle: : identify the periodic advertiser

```c
esp_err_t esp_ble_gap_periodic_adv_add_dev_to_list (esp_ble_addr_type_t addr_type,
                                                esp_bd_addr_t addr,
                                                uint8_t sid)
```

This function is used to add a single device to the Periodic Advertiser list stored in the Controller.

**Return**

- ESP_OK : success
- other : failed

**Parameters**

• [in] addr_type: : address type
• [in] addr:: Device Address
• [in] sid:: Advertising SID subfield in the ADI field used to identify the Periodic Advertising

```c
esp_err_t esp_ble_gap_periodic_adv_remove_dev_from_list (esp_ble_addr_type_t addr_type,
                                                          esp_bd_addr_t addr,
                                                          uint8_t sid)
```

This function is used to remove one device from the list of Periodic Advertisers stored in the Controller. Removals from the Periodic Advertisers List take effect immediately.

**Return**

- ESP_OK : success
- other : failed

**Parameters**

• [in] addr_type: : address type
• [in] addr:: Device Address
• [in] sid:: Advertising SID subfield in the ADI field used to identify the Periodic Advertising

```c
esp_err_t esp_ble_gap_periodic_adv_clear_dev (void)
```

This function is used to remove all devices from the list of Periodic Advertisers in the Controller.

**Return**

- ESP_OK : success
- other : failed

```c
esp_err_t esp_ble_gap_prefer_ext_connect_params_set (esp_bd_addr_t addr,
                                                     esp_ble_gap_phy_mask_t phy_mask,
                                                     const esp_ble_gap_conn_params_t *phy_1m_conn_params,
                                                     const esp_ble_gap_conn_params_t *phy_2m_conn_params,
                                                     const esp_ble_gap_conn_params_t *phy_coded_conn_params)
```

This function is used to set aux connection parameters.

**Return**

- ESP_OK : success
- other : failed

**Parameters**

• [in] addr:: device address
• [in] phy_mask:: indicates the PHY(s) on which the advertising packets should be received on the primary advertising channel and the PHYs for which connection parameters have been specified.

---

Espressif Systems 69 Release v5.0-dev-1648-g94089edbc3 Submit Document Feedback
• [in] phy_1m_conn_params: Scan connectable advertisements on the LE 1M PHY. Connection parameters for the LE 1M PHY are provided.
• [in] phy_2m_conn_params: Connection parameters for the LE 2M PHY are provided.
• [in] phy_coded_conn_params: Scan connectable advertisements on the LE Coded PHY. Connection parameters for the LE Coded PHY are provided.

- `esp_gap_search_evt_t search_evt`
  - Search event type

- `esp_bd_addr_t bda`
  - Bluetooth device address which has been searched

- `esp_bt_dev_type_t dev_type`
  - Device type

- `esp_ble_addr_type_t ble_addr_type`
  - Ble device address type

- `esp_ble_evt_type_t ble_evt_type`
  - Ble scan result event type

- `int rssi`
  - Searched device’s RSSI

- `uint8_t ble_adv[ESP_BLE_ADV_DATA_LEN_MAX + ESP_BLE_SCAN_RSP_DATA_LEN_MAX]`
  - Received EIR

- `int flag`
  - Advertising data flag bit

- `int num_resps`
  - Scan result number

- `uint8_t adv_data_len`
  - Adv data length

- `uint8_t scan_rsp_len`
  - Scan response length

- `uint32_t num_dis`
  - The number of discard packets
struct ble_scan_rsp_data_cmpl_evt_param
#include <esp_gap_ble_api.h> ESP_GAP_BLE_SCAN_RSP_DATA_SET_COMPLETE_EVT.

Public Members

esp_bt_status_t status
Indicate the set scan response data operation success status

struct ble_scan_rsp_data_raw_cmpl_evt_param
#include <esp_gap_ble_api.h> ESP_GAP_BLE_SCAN_RSP_DATA_RAW_SET_COMPLETE_EVT.

Public Members

esp_bt_status_t status
Indicate the set raw advertising data operation success status

struct ble_scan_start_cmpl_evt_param
#include <esp_gap_ble_api.h> ESP_GAP_BLE_SCAN_START_COMPLETE_EVT.

Public Members

esp_bt_status_t status
Indicate scan start operation success status

struct ble_scan_stop_cmpl_evt_param
#include <esp_gap_ble_api.h> ESP_GAP_BLE_SCAN_STOP_COMPLETE_EVT.

Public Members

esp_bt_status_t status
Indicate scan stop operation success status

struct ble_set_channels_evt_param
#include <esp_gap_ble_api.h> ESP_GAP_BLE_SET_CHANNELS_EVT.

Public Members

esp_bt_status_t stat
BLE set channel status

struct ble_set_ext_scan_params_cmpl_param
#include <esp_gap_ble_api.h> ESP_GAP_BLE_SET_EXT_SCAN_PARAMS_COMPLETE_EVT.

Public Members

esp_bt_status_t status
Indicate extend advertising parameters set status

struct ble_set_perf_def_phy_cmpl_evt_param
#include <esp_gap_ble_api.h> ESP_GAP_BLE_SET_PREFERED_DEFAULT_PHY_COMPLETE_EVT.
Chapter 2. API Reference

Public Members

```c
typedef enum esp_bt_status_t
{
    ESP_BT_SUCCESS = 0,
    ESP_BT_ERROR = 1
} esp_bt_status_t;
```

Indicate perf default phy set status

```c
struct ble_set_perf_phy_cmpl_evt_param
{
    #include <esp_gap_ble_api.h> ESP_GAP_BLE_SET_PREFERED_PHY_COMPLETE_EVT.
}
```

Public Members

```c
typedef enum esp_bt_status_t
{
    ESP_BT_SUCCESS = 0,
    ESP_BT_ERROR = 1
} esp_bt_status_t;
```

Indicate perf phy set status

```c
struct ble_set_rand_cmpl_evt_param
{
    #include <esp_gap_ble_api.h> ESP_GAP_BLE_SET_STATIC_RAND_ADDR_EVT.
}
```

Public Members

```c
typedef enum esp_bt_status_t
{
    ESP_BT_SUCCESS = 0,
    ESP_BT_ERROR = 1
} esp_bt_status_t;
```

Indicate set static rand address operation success status

```c
struct ble_update_conn_params_evt_param
{
    #include <esp_gap_ble_api.h> ESP_GAP_BLE_UPDATE_CONN_PARAMS_EVT.
}
```

Public Members

```c
typedef enum esp_bt_status_t
{
    ESP_BT_SUCCESS = 0,
    ESP_BT_ERROR = 1
} esp_bt_status_t;
```

Indicate update connection parameters success status

```c
esp_bd_addr_t bda
```

Bluetooth device address

```c
uint16_t min_int
```

Min connection interval

```c
uint16_t max_int
```

Max connection interval

```c
uint16_t latency
```

Slave latency for the connection in number of connection events. Range: 0x0000 to 0x01F3

```c
uint16_t conn_int
```

Current connection interval

```c
uint16_t timeout
```

Supervision timeout for the LE Link. Range: 0x000A to 0x0C80. Mandatory Range: 0x000A to 0x0C80 Time = N * 10 msec

```c
struct ble_update_duplicate_exceptional_list_cmpl_evt_param
{
    #include <esp_gap_ble_api.h> ESP_GAP_BLE_UPDATE_DUPLICATE_EXCEPTIONAL_LIST_COMPLETE_EVT.
}
```

Public Members

```c
typedef enum esp_bt_status_t
{
    ESP_BT_SUCCESS = 0,
    ESP_BT_ERROR = 1
} esp_bt_status_t;
```

Indicate update duplicate scan exceptional list operation success status

```c
uint8_t subcode
```

Define in esp_bt_duplicate_exceptional_subcode_type_t
uint16_t length
The length of device_info

```c
esp_duplicate_info / device_info
```
device information, when subcode is ESP_BLE_DUPLICATE_EXCEPTIONAL_LIST_CLEAN, the value is invalid

```c
struct ble_update_whitelist_cmpl_evt_param
```
#include <esp_gap_ble_api.h> ESP_GAP_BLE_UPDATE_WHITELIST_COMPLETE_EVT.

**Public Members**

```c
esp_bt_status_t status
```
Indicate the add or remove whitelist operation success status

```c
esp_ble_wl_opration_t wl_opration
```
The value is ESP_BLE_WHITELIST_ADD if add address to whitelist operation success, ESP_BLE_WHITELIST_REMOVE if remove address from the whitelist operation success

**Structures**

```c
struct esp_ble_adv_params_t
```
Advertising parameters.

**Public Members**

```c
uint16_t adv_int_min
```
Minimum advertising interval for undirected and low duty cycle directed advertising. Range: 0x0020 to 0x4000 Default: N = 0x0800 (1.28 second) Time = N * 0.625 msec Time Range: 20 ms to 10.24 sec

```c
uint16_t adv_int_max
```
Maximum advertising interval for undirected and low duty cycle directed advertising. Range: 0x0020 to 0x4000 Default: N = 0x0800 (1.28 second) Time = N * 0.625 msec Time Range: 20 ms to 10.24 sec

Advertising max interval

```c
esp_ble_adv_type_t adv_type
```
Advertising type

```c
esp_ble_addr_type_t own_addr_type
```
Owner bluetooth device address type

```c
esp_bd_addr_t peer_addr
```
Peer device bluetooth device address

```c
esp_ble_addr_type_t peer_addr_type
```
Peer device bluetooth device address type, only support public address type and random address type

```c
esp_ble_adv_channel_t channel_map
```
Advertising channel map

```c
esp_ble_adv_filter_t adv_filter_policy
```
Advertising filter policy

```c
struct esp_ble_adv_data_t
```
Advertising data content, according to “Supplement to the Bluetooth Core Specification”.

**Public Members**

```c
bool set_scan_rsp
```
Set this advertising data as scan response or not
bool include_name
   Advertising data include device name or not

bool include_txpower
   Advertising data include TX power

int min_interval
   Advertising data show slave preferred connection min interval. The connection interval in the following manner: connIntervalMin = Conn_Interval_Min * 1.25 ms Conn_Interval_Min range: 0x0006 to 0x0C80 Value of 0xFFFF indicates no specific minimum. Values not defined above are reserved for future use.

int max_interval
   Advertising data show slave preferred connection max interval. The connection interval in the following manner: connIntervalMax = Conn_Interval_Max * 1.25 ms Conn_Interval_Max range: 0x0006 to 0x0C80 Conn_Interval_Max shall be equal to or greater than the Conn_Interval_Min. Value of 0xFFFF indicates no specific maximum. Values not defined above are reserved for future use.

int appearance
   External appearance of device

uint16_t manufacturer_len
   Manufacturer data length

uint8_t *p_manufacturer_data
   Manufacturer data point

uint16_t service_data_len
   Service data length

uint8_t *p_service_data
   Service data point

uint16_t service_uuid_len
   Service uuid length

uint8_t *p_service_uuid
   Service uuid array point

uint8_t flag
   Advertising flag of discovery mode, see BLE_ADV_DATA_FLAG detail

struct esp_ble_scan_params_t
   Ble scan parameters.

Public Members

exp_ble_scan_type_t scan_type
   Scan type

exp_ble_addr_type_t own_addr_type
   Owner address type

exp_ble_scan_filter_t scan_filter_policy
   Scan filter policy

uint16_t scan_interval
   Scan interval. This is defined as the time interval from when the Controller started its last LE scan until it begins the subsequent LE scan. Range: 0x0004 to 0x4000 Default: 0x0010 (10 ms) Time = N * 0.625 msec Time Range: 2.5 msec to 10.24 seconds

uint16_t scan_window
   Scan window. The duration of the LE scan. LE_Scan_Window shall be less than or equal to LE_Scan_Interval Range: 0x0004 to 0x4000 Default: 0x0010 (10 ms) Time = N * 0.625 msec Time Range: 2.5 msec to 10240 msec
**esp_ble_scan_duplicate_t scan_duplicate**

The `Scan_Duplicates` parameter controls whether the Link Layer should filter out duplicate advertising reports (BLE_SCAN_DUPLICATE_ENABLE) to the Host, or if the Link Layer should generate advertising reports for each packet received.

**struct esp_gap_conn_params_t**

Connection parameters information

**Public Members**

- `uint16_t interval`
  - connection interval
- `uint16_t latency`
  - Slave latency for the connection in number of connection events. Range: 0x0000 to 0x01F3
- `uint16_t timeout`
  - Supervision timeout for the LE Link. Range: 0x000A to 0x0C80. Mandatory Range: 0x000A to 0x0C80
  
  \[\text{Time} = N \times 10 \text{ msec} \]
  
  Time Range: 100 msec to 32 seconds

**struct esp_ble_conn_update_params_t**

Connection update parameters.

**Public Members**

- `esp_bd_addr_t bda`
  - Bluetooth device address
- `uint16_t min_int`
  - Min connection interval
- `uint16_t max_int`
  - Max connection interval
- `uint16_t latency`
  - Slave latency for the connection in number of connection events. Range: 0x0000 to 0x01F3
- `uint16_t timeout`
  - Supervision timeout for the LE Link. Range: 0x000A to 0x0C80. Mandatory Range: 0x000A to 0x0C80
  
  \[\text{Time} = N \times 10 \text{ msec} \]
  
  Time Range: 100 msec to 32 seconds

**struct esp_ble_pkt_data_length_params_t**

BLE pkt data length keys.

**Public Members**

- `uint16_t rx_len`
  -(pkt rx data length value
- `uint16_t tx_len`
  -(pkt tx data length value

**struct esp_ble_penc_keys_t**

BLE encryption keys.

**Public Members**

- `esp_bt_octet16_t ltk`
  - The long term key
esp_bt_octet8_t rand
The random number

uint16_t ediv
The ediv value

uint8_t sec_level
The security level of the security link

uint8_t key_size
The key size(7~16) of the security link

struct esp_ble_pcsrk_keys_t
BLE CSRK keys.

Public Members

uint32_t counter
The counter

esp_bt_octet16_t csrk
The csrk key

uint8_t sec_level
The security level

struct esp_ble_pid_keys_t
BLE pid keys.

Public Members

esp_bt_octet16_t irk
The irk value

esp_ble_addr_type_t addr_type
The address type

esp_bd_addr_t static_addr
The static address

struct esp_ble_lenc_keys_t
BLE Encryption reproduction keys.

Public Members

esp_bt_octet16_t ltk
The long term key

uint16_t div
The div value

uint8_t key_size
The key size of the security link

uint8_t sec_level
The security level of the security link

struct esp_ble_lcsrk_keys
BLE SRK keys.
Chapter 2. API Reference

Public Members

uint32_t counter
   The counter value

uint16_t div
   The div value

uint8_t sec_level
   The security level of the security link

esp_bt_octet16_t csrk
   The csrk key value

struct esp_ble_sec_key_notif_t
   Structure associated with ESP_KEY_NOTIF_EVT.

Public Members

esp_bd_addr_t bd_addr
   peer address

uint32_t passkey
   the numeric value for comparison. If just_works, do not show this number to UI

struct esp_ble_sec_req_t
   Structure of the security request.

Public Members

esp_bd_addr_t bd_addr
   peer address

struct esp_ble_bond_key_info_t
   struct type of the bond key information value

Public Members

esp_ble_key_mask_t key_mask
   the key mask to indicate witch key is present

esp_ble_penc_keys_t penc_key
   received peer encryption key

esp_ble_pcsrk_keys_t pcsrk_key
   received peer device SRK

esp_ble_pid_keys_t pid_key
   peer device ID key

struct esp_ble_bond_dev_t
   struct type of the bond device value

Public Members

esp_bd_addr_t bd_addr
   peer address

esp_ble_bond_key_info_t bond_key
   the bond key information
struct esp_ble_key_t
union type of the security key value

**Public Members**

- esp_bd_addr_t bd_addr
  peer address
- esp_ble_key_type_t key_type
  key type of the security link
- esp_ble_key_value_t p_key_value
  the pointer to the key value

struct esp_ble_local_id_keys_t
structure type of the ble local id keys value

**Public Members**

- esp_bt_octet16_t ir
  the 16 bits of the ir value
- esp_bt_octet16_t irk
  the 16 bits of the ir key value
- esp_bt_octet16_t dhk
  the 16 bits of the dh key value

struct esp_ble_auth_cmpl_t
Structure associated with ESP_AUTH_CMPL_EVT.

**Public Members**

- esp_bd_addr_t bd_addr
  BD address peer device.
- bool key_present
  Valid link key value in key element
- esp_link_key key
  Link key associated with peer device.
- uint8_t key_type
  The type of Link Key
- bool success
  TRUE of authentication succeeded, FALSE if failed.
- uint8_t fail_reason
  The HCI reason/error code for when success=FALSE
- esp_ble_addr_type_t addr_type
  Peer device address type
- esp_bit_dev_type_t dev_type
  Device type
- esp_ble_auth_req_t auth_mode
  authentication mode

struct esp_ble_gap_ext_adv_params_t
ext adv parameters

typedef uint8_t esp_ble_gap_adv_type_t
typedef void (*esp_gap_ble_cb_t)(esp_gap_ble_cb_event_t event, esp_ble_gap_cb_param_t *param)

GAP callback function type.

Parameters
• event: Event type
• param: Point to callback parameter, currently is union type

Enumerations
enum esp_gap_ble_cb_event_t
GAP BLE callback event type.

Values:

ESP_GAP_BLE_ADV_DATA_SET_COMPLETE_EVT = 0
When advertising data set complete, the event comes

ESP_GAP_BLE_SCAN_RSP_DATA_SET_COMPLETE_EVT
When scan response data set complete, the event comes

ESP_GAP_BLE_SCAN_PARAM_SET_COMPLETE_EVT
When scan parameters set complete, the event comes

ESP_GAP_BLE_SCAN_RESULT_EVT
When one scan result ready, the event comes each time

ESP_GAP_BLE_ADV_DATA_RAW_SET_COMPLETE_EVT
When raw advertising data set complete, the event comes

ESP_GAP_BLE_SCAN_RSP_DATA_RAW_SET_COMPLETE_EVT
When raw advertising data set complete, the event comes

ESP_GAP_BLE_ADV_START_COMPLETE_EVT
When start advertising complete, the event comes

ESP_GAP_BLE_SCAN_START_COMPLETE_EVT
When start scan complete, the event comes

ESP_GAP_BLE_AUTH_CMPL_EVT = 8

ESP_GAP_BLE_KEY_EVT
ESP_GAP_BLE_SEC_REQ_EVT
ESP_GAP_BLE_PASSKEY_NOTIF_EVT
ESP_GAP_BLE_PASSKEY_REQ_EVT
ESP_GAP_BLE_OOB_REQ_EVT
ESP_GAP_BLE_LOCAL_IR_EVT
ESP_GAP_BLE_LOCAL_ER_EVT
ESP_GAP_BLE_NC_REQ_EVT
ESP_GAP_BLE_ADV_STOP_COMPLETE_EVT
When stop adv complete, the event comes

ESP_GAP_BLE_SCAN_STOP_COMPLETE_EVT
When stop scan complete, the event comes
ESP_GAP_BLE_SET_STATIC_RAND_ADDR_EVT = 19
When set the static rand address complete, the event comes

ESP_GAP_BLE_UPDATE_CONN_PARAMS_EVT
When update connection parameters complete, the event comes

ESP_GAP_BLE_SET_PKT_LENGTH_COMPLETE_EVT
When set pkt length complete, the event comes

ESP_GAP_BLE_SET_LOCAL_PRIVACY_COMPLETE_EVT
When Enable/disable privacy on the local device complete, the event comes

ESP_GAP_BLE_REMOVE_BOND_DEV_COMPLETE_EVT
When remove the bond device complete, the event comes

ESP_GAP_BLE_CLEAR_BOND_DEV_COMPLETE_EVT
When clear the bond device clear complete, the event comes

ESP_GAP_BLE_GET_BOND_DEV_COMPLETE_EVT
When get the bond device list complete, the event comes

ESP_GAP_BLE_READ_RSSI_COMPLETE_EVT
When read the rssi complete, the event comes

ESP_GAP_BLE_UPDATE_WHITELIST_COMPLETE_EVT
When add or remove whitelist complete, the event comes

ESP_GAP_BLE_UPDATE_DUPLICATE_EXCEPTIONAL_LIST_COMPLETE_EVT
When update duplicate exceptional list complete, the event comes

ESP_GAP_BLE_SET_CHANNELS_EVT = 29
When setting BLE channels complete, the event comes

ESP_GAP_BLE_READ_PHY_COMPLETE_EVT
ESP_GAP_BLE_SET_PREFERED_DEFAULT_PHY_COMPLETE_EVT
ESP_GAP_BLE_SET_PREFERED_PHY_COMPLETE_EVT

enum esp_ble_adv_type_t
Advertising mode.
Values:
ADV_TYPE_IND = 0x00
ADV_TYPE_DIRECT_IND_HIGH = 0x01
ADV_TYPE_SCAN_IND = 0x02
ADV_TYPE_NONCONN_IND = 0x03
ADV_TYPE_DIRECT_IND_LOW = 0x04

enum esp_ble_adv_channel_t
Advertising channel mask.
Values:
ADV_CHNL_37 = 0x01
ADV_CHNL_38 = 0x02
ADV_CHNL_39 = 0x04
ADV_CHNL_ALL = 0x07

enum esp_ble_adv_filter_t
Values:
ADV_FILTER_ALLOW_SCAN_ANY_CON_ANY = 0x00
  Allow both scan and connection requests from anyone.
ADV_FILTER_ALLOW_SCAN_WLST_CON_ANY
  Allow both scan req from White List devices only and connection req from anyone.
ADV_FILTER_ALLOW_SCAN_ANY_CON_WLST
  Allow both scan req from anyone and connection req from White List devices only.
ADV_FILTER_ALLOW_SCAN_WLST_CON_WLST
  Allow scan and connection requests from White List devices only.

enum esp_ble_sec_act_t
Values:
ESP_BLE_SEC_ENCRYPT = 1
ESP_BLE_SEC_ENCRYPT_NO_MITM

```c
#define ESP_BLE_SEC_ENCRYPT_MITM

enum esp_ble_sm_param_t
{
    ESP_BLE_SM_PASSKEY = 0,
    ESP_BLE_SM_AUTHEN_REQ_MODE,

    BLE_SCAN_FILTER_ALLOW_WLIST_RPA_DIR = 0x3
};
```
enum esp_ble_scan_duplicate_t
Ble scan duplicate type.

Values:

BLE_SCAN_DUPLICATE_DISABLE = 0x0
the Link Layer should generate advertising reports to the host for each packet received

BLE_SCAN_DUPLICATE_ENABLE = 0x1
the Link Layer should filter out duplicate advertising reports to the Host

BLE_SCAN_DUPLICATE_MAX = 0x2
0x02 –0xFF, Reserved for future use

enum esp_gap_search_evt_t
Sub Event of ESP_GAP_BLE_SCAN_RESULT_EVT.

Values:

ESP_GAP_SEARCH_INQ_RES_EVT = 0
Inquiry result for a peer device.

ESP_GAP_SEARCH_INQ_CMPL_EVT = 1
Inquiry complete.

ESP_GAP_SEARCH_DISC_RES_EVT = 2
Discovery result for a peer device.

ESP_GAP_SEARCH_DISC_BLE_RES_EVT = 3
Discovery result for BLE GATT based service on a peer device.

ESP_GAP_SEARCH_DISC_CMPL_EVT = 4
Discovery complete.

ESP_GAP_SEARCH_DISC_CMPL_EVT = 5
Discovery complete.

ESP_GAP_SEARCH_SEARCH_CANCEL_CMPL_EVT = 6
Search cancelled

ESP_GAP_SEARCH_INQ_DISCARD_NUM_EVT = 7
The number of pkt discarded by flow control

enum esp_ble_evt_type_t
Ble scan result event type, to indicate the result is scan response or advertising data or other.

Values:

ESP_BLE_EVT_CONN_ADV = 0x00
Connectable undirected advertising (ADV_IND)

ESP_BLE_EVT_CONN_DIR_ADV = 0x01
Connectable directed advertising (ADV_DIRECT_IND)

ESP_BLE_EVT_DISC_ADV = 0x02
Scannable undirected advertising (ADV_SCAN_IND)

ESP_BLE_EVT_NON_CONN_ADV = 0x03
Non connectable undirected advertising (ADV_NONCONN_IND)

ESP_BLE_EVT_SCAN_RSP = 0x04
Scan Response (SCAN_RSP)

enum esp_ble_wl_opration_t

Values:

ESP_BLE_WHITELIST_REMOVE = 0X00
remove mac from whitelist
ESP_BLE_WHITELIST_ADD = 0x01
add address to whitelist

enum esp_bt_duplicate_exceptional_subcode_type_t
Values:
ESP_BLE_DUPLICATE_EXCEPTIONAL_LIST_ADD = 0
Add device info into duplicate scan exceptional list
ESP_BLE_DUPLICATE_EXCEPTIONAL_LIST_REMOVE
Remove device info from duplicate scan exceptional list
ESP_BLE_DUPLICATE_EXCEPTIONAL_LIST_CLEAN
Clean duplicate scan exceptional list

enum esp_ble_duplicate_exceptional_info_type_t
Values:
ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_INFO_ADV_ADDR = 0
BLE advertising address, device info will be added into ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_ADDR_LIST
ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_INFO_MESH_LINK_ID
BLE mesh link ID, it is for BLE mesh, device info will be added into ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_MESH_LINK_ID_LIST
ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_INFO_MESH_BEACON_TYPE
BLE mesh beacon AD type, the format is \| Len \| 0x2B \| Beacon Type \| Beacon Data \|
ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_INFO_MESH_PROV_SRV_ADV
BLE mesh provisioning service uuid, the format is \| 0x02 \| 0x01 \| flags \| 0x03 \| 0x03 \| 0x1827 \| … \|
ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_INFO_MESH_PROXY_SRV_ADV
BLE mesh adv with proxy service uuid, the format is \| 0x02 \| 0x01 \| flags \| 0x03 \| 0x03 \| 0x1828 \| … \|

enum esp_duplicate_scan_exceptional_list_type_t
Values:
ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_ADDR_LIST = BLE_BIT(0)
duplicate scan exceptional addr list
ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_MESH_LINK_ID_LIST = BLE_BIT(1)
duplicate scan exceptional mesh link ID list
ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_MESH_BEACON_TYPE_LIST = BLE_BIT(2)
duplicate scan exceptional mesh beacon type list
ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_MESH_PROV_SRV_ADV_LIST = BLE_BIT(3)
duplicate scan exceptional mesh adv with provisioning service uuid
ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_MESH_PROXY_SRV_ADV_LIST = BLE_BIT(4)
duplicate scan exceptional mesh adv with provisioning service uuid
ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_ALL_LIST = 0xFFFF
duplicate scan exceptional all list

GATT DEFINES

Overview   Instructions

Application Example   Instructions

API Reference
Chapter 2. API Reference

Header File

- components/bt/host/bluedroid/api/include/api/esp_gatt_defs.h

Unions

union esp_gatt_rsp_t

  #include <esp_gatt_defs.h> GATT remote read request response type.

  Public Members

    esp_gatt_value_t attr_value
    Gatt attribute structure

    uint16_t handle
    Gatt attribute handle

Structures

struct esp_gatt_id_t

  Gatt id, include uuid and instance id.

  Public Members

    esp_bt_uuid_t uuid
    UUID

    uint8_t inst_id
    Instance id

struct esp_gatt_srvc_id_t

  Gatt service id, include id (uuid and instance id) and primary flag.

  Public Members

    esp_gatt_id_t id
    Gatt id, include uuid and instance

    bool is_primary
    This service is primary or not

struct esp_attr_desc_t

  Attribute description (used to create database)

  Public Members

    uint16_t uuid_length
    UUID length

    uint8_t *uuid_p
    UUID value

    uint16_t perm
    Attribute permission

    uint16_t max_length
    Maximum length of the element

    uint16_t length
    Current length of the element
Chapter 2. API Reference

```c
uint8_t *value
Element value array

struct esp_attr_control_t
attribute auto response flag

Public Members

uint8_t auto_rsp
if autorsp set to ESP_GATT_RSP_BY_APP, means the response of Write/Read operation will be replied by application. if auto_rsp set to ESP_GATT_AUTO_RSP, means the response of Write/Read operation will be replied by GATT stack automatically.

struct esp_gatts_attr_db_t
attribute type added to the gatt server database

Public Members

esp_attr_control_t attr_control
The attribute control type

esp_attr_desc_t att_desc
The attribute type

struct esp_attr_value_t
set the attribute value type

Public Members

uint16_t attr_max_len
attribute max value length

uint16_t attr_len
attribute current value length

uint8_t *attr_value
the pointer to attribute value

struct esp_gatts_incl_svc_desc_t
Gatt includes service entry element.

Public Members

uint16_t start_hdl
Gatt start handle value of included service

uint16_t end_hdl
Gatt end handle value of included service

uint16_t uuid
Gatt attribute value UUID of included service

struct esp_gatts_incl128_svc_desc_t
Gatt include 128 bit service entry element.
```
Public Members

uint16_t start_hdl
    Gatt start handle value of included 128 bit service

uint16_t end_hdl
    Gatt end handle value of included 128 bit service

struct esp_gatt_value_t
    Gatt attribute value.

Public Members

uint8_t value[ESP_GATT_MAX_ATTR_LEN]
    Gatt attribute value

uint16_t handle
    Gatt attribute handle

uint16_t offset
    Gatt attribute value offset

uint16_t len
    Gatt attribute value length

uint8_t auth_req
    Gatt authentication request

struct esp_gatt_conn_params_t
    Connection parameters information.

Public Members

uint16_t interval
    Connection interval

uint16_t latency
    Slave latency for the connection in number of connection events. Range: 0x0000 to 0x01F3

uint16_t timeout
    Supervision timeout for the LE Link. Range: 0x000A to 0x0C80. Mandatory Range: 0x000A to 0x0C80
    Time = N * 10 msec Time Range: 100 msec to 32 seconds

struct esp_gattc_multi_t
    read multiple attribute

Public Members

uint8_t num_attr
    The number of the attribute

uint16_t handles[ESP_GATT_MAX_READ_MULTI_HANDLES]
    The handles list

struct esp_gattc_db_elem_t
    data base attribute element
Chapter 2. API Reference

Public Members

`esp_gatt_db_attr_type_t` type
The attribute type

`uint16_t attribute_handle`
The attribute handle, it’s valid for all of the type

`uint16_t start_handle`
The service start handle, it’s valid only when the type = ESP_GATT_DB_PRIMARY_SERVICE or ESP_GATT_DB_SECONDARY_SERVICE

`uint16_t end_handle`
The service end handle, it’s valid only when the type = ESP_GATT_DB_PRIMARY_SERVICE or ESP_GATT_DB_SECONDARY_SERVICE

`esp_gatt_char_prop_t` properties
The characteristic properties, it’s valid only when the type = ESP_GATT_DB_CHARACTERISTIC

`esp_bt_uuid_t` uuid
The attribute uuid, it’s valid for all of the type

`struct esp_gattc_service_elem_t`
Service element

Public Members

`bool is_primary`
The service flag, true if the service is primary service, else is secondary service

`uint16_t start_handle`
The start handle of the service

`uint16_t end_handle`
The end handle of the service

`esp_bt_uuid_t` uuid
The uuid of the service

`struct esp_gattc_char_elem_t`
Characteristic element

Public Members

`uint16_t char_handle`
The characteristic handle

`esp_gatt_char_prop_t` properties
The characteristic properties

`esp_bt_uuid_t` uuid
The characteristic uuid

`struct esp_gattc_descr_elem_t`
Descriptor element

Public Members

`uint16_t handle`
The characteristic descriptor handle

`esp_bt_uuid_t` uuid
The characteristic descriptor uuid
**struct esp_gattc_incl_svc_elem_t**

include service element

**Public Members**

- `uint16_t handle`
  The include service current attribute handle

- `uint16_t incl_srvc_s_handle`
  The start handle of the service which has been included

- `uint16_t incl_srvc_e_handle`
  The end handle of the service which has been included

- `esp_bt_uuid_t uuid`
  The include service uuid

**Macros**

- `ESP_GATT_UUID_IMMEDIATE_ALERT_SVC`
  All “ESP_GATT_UUID_xxx” is attribute types

- `ESP_GATT_UUID_LINK_LOSS_SVC`
- `ESP_GATT_UUID_TX_POWER_SVC`
- `ESP_GATT_UUID_CURRENT_TIME_SVC`
- `ESP_GATT_UUID_REF_TIME_UPDATE_SVC`

ESP_GATT_CHAR_PROP_BIT_INDICATE
ESP_GATT_CHAR_PROP_BIT_AUTH
ESP_GATT_CHAR_PROP_BIT_EXT_PROP
ESP_GATT_MAX_ATTR_LEN
GATT maximum attribute length.
ESP_GATT_RSP_BY_APP
ESP_GATT_AUTO_RSP
ESP_GATT_IF_NONE
If callback report gatte_if/gatts_if as this macro, means this event is not correspond to any app
```

Type Definitions
```c
typedef uint16_t esp_gatt_perm_t
typedef uint8_t esp_gatt_char_prop_t
typedef uint8_t esp_gatt_if_t
Gatt interface type, different application on GATT client use different gatt_if
```

Enumerations
```c
enum esp_gatt_prep_write_type
Attribute write data type from the client.
Values:
ESP_GATT_PREP_WRITE_CANCEL = 0x00
Prepare write cancel
ESP_GATT_PREP_WRITE_EXEC = 0x01
Prepare write execute
```
```c
enum esp_gatt_status_t
GATT success code and error codes.
Values:
ESP_GATT_OK = 0x0
ESP_GATT_INVALID_HANDLE = 0x01
ESP_GATT_READ_NOT_PERMIT = 0x02
```

GATT maximum attribute length.
ESP_GATT_WRITE_NOT_PERMIT = 0x03

**ESP_GATT_PRC_IN_PROGRESS** = 0xfe

**ESP_GATT_OUT_OF_RANGE** = 0xff

**enum esp_gatt_conn_reason_t**

Gatt Connection reason enum.

*Values:*

**ESP_GATT_CONN_UNKNOWN** = 0

Gatt connection unknown

**ESP_GATT_CONN_L2C_FAILURE** = 1

General L2cap failure

**ESP_GATT_CONN_TIMEOUT** = 0x08

Connection timeout

**ESP_GATT_CONN_TERMINATE_PEER_USER** = 0x13

Connection terminate by peer user

**ESP_GATT_CONN_TERMINATE_LOCAL_HOST** = 0x16

Connection terminated by local host

**ESP_GATT_CONN_FAIL_ESTABLISH** = 0x3e

Connection fail to establish

**ESP_GATT_CONN_LMP_TIMEOUT** = 0x22

Connection fail for LMP response tout

**ESP_GATT_CONN_CONN_CANCEL** = 0x0100

L2CAP connection cancelled

**ESP_GATT_CONN_NONE** = 0x0101

No connection to cancel

**enum esp_gatt_auth_req_t**

Gatt authentication request type.

*Values:*

**ESP_GATT_AUTH_REQ_NONE** = 0

**ESP_GATT_AUTH_REQ_NO_MITM** = 1

**ESP_GATT_AUTH_REQ_MITM** = 2

**ESP_GATT_AUTH_REQ_SIGNED_NO_MITM** = 3

**ESP_GATT_AUTH_REQ_SIGNED_MITM** = 4

**enum esp_service_source_t**

Values:

**ESP_GATT_SERVICE_FROM_REMOTE_DEVICE** = 0

**ESP_GATT_SERVICE_FROM_NVS_FLASH** = 1

**ESP_GATT_SERVICE_FROM_UNKNOWN** = 2

**enum esp_gatt_write_type_t**

Gatt write type.

*Values:*

**ESP_GATT_WRITE_TYPE_NO_RSP** = 1

Gatt write attribute need no response

**ESP_GATT_WRITE_TYPE_RSP**

Gatt write attribute need remote response
enum esp_gatt_db_attr_type_t
    the type of attribute element

Values:

ESP_GATT_DB_PRIMARY_SERVICE
    Gattc primary service attributetype in the cache

ESP_GATT_DB_SECONDARY_SERVICE
    Gattc secondary service attributetype in the cache

ESP_GATT_DB_CHARACTERISTIC
    Gattc characteristic attributetype in the cache

ESP_GATT_DB_DESCRIPTOR
    Gattc characteristic descriptor attributetype in the cache

ESP_GATT_DB_INCLUDED_SERVICE
    Gattc include service attributetype in the cache

ESP_GATT_DB_ALL
    Gattc all the attribute (primary service & secondary service & include service & char & descriptor) type
    in the cache

GATT SERVER API

Overview

Application Example
    Check bluetooth/bluedroid/ble folder in ESP-IDF examples, which contains the following demos and their tutorials:
    • This is a GATT sever demo and its tutorial. This demo creates a GATT service with an attribute table, which
      releases the user from adding attributes one by one. This is the recommended method of adding attributes.
      – bluetooth/bluedroid/ble/gatt_server_service_table
      – GATT Server Service Table Example Walkthrough
    • This is a GATT server demo and its tutorial. This demo creates a GATT service by adding attributes one by
      one as defined by Bluedroid. The recommended method of adding attributes is presented in example above.
      – bluetooth/bluedroid/ble/gatt_server
      – GATT Server Example Walkthrough
    • This is a BLE SPP-Like demo. This demo, which acts as a GATT server, can receive data from UART and
      then send the data to the peer device automatically.
      – bluetooth/bluedroid/ble/ble_spp_server

API Reference

Header File
    • components/bt/host/bluedroid/api/include/api/esp_gatts_api.h

Functions

esp_err_t esp_ble_gatts_register_callback (esp_gatts_cb_t callback)
    This function is called to register application callbacks with BTA GATTS module.

    Return
        • ESP_OK : success
        • other : failed

esp_err_t esp_ble_gatts_app_register (uint16_t app_id)
    This function is called to register application identifier.

    Return
Chapter 2. API Reference

- ESP_OK: success
- other: failed

`esp_err_t esp_ble_gatts_app_unregister (esp_gatt_if_t gatts_if)`

unregister with GATT Server.

**Return**
- ESP_OK: success
- other: failed

**Parameters**
- [in] gatts_if: GATT server access interface

`esp_err_t esp_ble_gatts_create_service (esp_gatt_if_t gatts_if, esp_gatt_svc_id_t *service_id, uint16_t num_handle)`

Create a service. When service creation is done, a callback event ESP_GATTS_CREATE_EVT is called to report status and service ID to the profile. The service ID obtained in the callback function needs to be used when adding included service and characteristics/descriptors into the service.

**Return**
- ESP_OK: success
- other: failed

**Parameters**
- [in] gatts_if: GATT server access interface
- [in] service_id: service ID.
- [in] num_handle: number of handle requested for this service.

`esp_err_t esp_ble_gatts_create_attr_tab (const esp_gatts_attr_db_t *gatts_attr_db, esp_gatt_if_t gatts_if, uint8_t max_nb_attr, uint8_t svc_inst_id)`

Create a service attribute tab.

**Return**
- ESP_OK: success
- other: failed

**Parameters**
- [in] gatts_attr_db: the pointer to the service attr tab
- [in] gatts_if: GATT server access interface
- [in] max_nb_attr: the number of attribute to be added to the service database.
- [in] svc_inst_id: the instance id of the service

`esp_err_t esp_ble_gatts_add_included_service (uint16_t service_handle, uint16_t included_service_handle)`

This function is called to add an included service. This function have to be called between ‘esp_ble_gatts_create_service’ and ‘esp_ble_gatts_add_char’. After included service is included, a callback event ESP_GATTS_ADD_INCL_SRVC_EVT is reported the included service ID.

**Return**
- ESP_OK: success
- other: failed

**Parameters**
- [in] service_handle: service handle to which this included service is to be added.
- [in] included_service_handle: the service ID to be included.

`esp_err_t esp_ble_gatts_add_char (uint16_t service_handle, esp_bt_uuid_t *char_uuid, esp_gatt_perm_t perm, esp_gatt_char_prop_t property, esp_attr_value_t *char_val, esp_attr_control_t *control)`

This function is called to add a characteristic into a service.

**Return**
- ESP_OK: success
- other: failed

**Parameters**
- [in] service_handle: service handle to which this included service is to be added.
- [in] char_uuid: Characteristic UUID.
Chapter 2. API Reference

- [in] perm: Characteristic value declaration attribute permission.
- [in] property: Characteristic Properties
- [in] char_val: Characteristic value
- [in] control: attribute response control byte

**esp_err_t esp_ble_gatts_add_char_descr** (uint16_t service_handle, esp_bt_uuid_t *descr_uuid, esp_gatt_perm_t perm, esp_attr_value_t *char_descr_val, esp_attr_control_t *control)

This function is called to add characteristic descriptor. When it’s done, a callback event ESP_GATTS_ADD_DESCR_EVT is called to report the status and an ID number for this descriptor.

**Return**
- ESP_OK: success
- other: failed

**Parameters**
- [in] service_handle: service handle to which this characteristic descriptor is to be added.
- [in] perm: descriptor access permission.
- [in] descr_uuid: descriptor UUID.
- [in] char_descr_val: Characteristic descriptor value
- [in] control: attribute response control byte

**esp_err_t esp_ble_gatts_delete_service** (uint16_t service_handle)

This function is called to delete a service. When this is done, a callback event ESP_GATTS_DELETE_EVT is report with the status.

**Return**
- ESP_OK: success
- other: failed

**Parameters**
- [in] service_handle: service_handle to be deleted.

**esp_err_t esp_ble_gatts_start_service** (uint16_t service_handle)

This function is called to start a service.

**Return**
- ESP_OK: success
- other: failed

**Parameters**
- [in] service_handle: the service handle to be started.

**esp_err_t esp_ble_gatts_stop_service** (uint16_t service_handle)

This function is called to stop a service.

**Return**
- ESP_OK: success
- other: failed

**Parameters**
- [in] service_handle: - service to be topped.

**esp_err_t esp_ble_gatts_send_indicate** (esp_gatt_if_t gatts_if, uint16_t conn_id, uint16_t attr_handle, uint16_t value_len, uint8_t *value, bool need_confirm)

Send indicate or notify to GATT client. Set param need_confirm as false will send notification, otherwise indication.

**Return**
- ESP_OK: success
- other: failed

**Parameters**
- [in] gatts_if: GATT server access interface
- [in] conn_id: - connection id to indicate.
- [in] attr_handle: - attribute handle to indicate.
- [in] value_len: - indicate value length.
Chapter 2. API Reference

- [in] value: value to indicate.
- [in] need_confirm: Whether a confirmation is required. false sends a GATT notification, true sends a GATT indication.

```c
esp_err_t esp_ble_gatts_send_response(esp_gatt_if_t gatts_if, uint16_t conn_id, uint32_t trans_id, esp_gatt_status_t status, esp_gatt_rsp_t *rsp)
```

This function is called to send a response to a request.

Return
- ESP_OK : success
- other : failed

Parameters
- [in] gatts_if: GATT server access interface
- [in] trans_id: transfer id
- [in] status: response status

```c
esp_err_t esp_ble_gatts_set_attr_value(uint16_t attr_handle, uint16_t length, const uint8_t *value)
```

This function is called to set the attribute value by the application.

Return
- ESP_OK : success
- other : failed

Parameters
- [in] attr_handle: the attribute handle which to be set
- [in] length: the value length
- [in] value: the pointer to the attribute value

```c
esp_gatt_status_t esp_ble_gatts_get_attr_value(uint16_t attr_handle, uint16_t *length, const uint8_t **value)
```

Retrieve attribute value.

Return
- ESP_GATT_OK : success
- other : failed

Parameters
- [in] attr_handle: Attribute handle.
- [out] length: pointer to the attribute value length
- [out] value: Pointer to attribute value payload, the value cannot be modified by user

```c
esp_err_t esp_ble_gatts_open(esp_gatt_if_t gatts_if, esp_bd_addr_t remote_bda, bool is_direct)
```

Open a direct open connection or add a background auto connection.

Return
- ESP_OK : success
- other : failed

Parameters
- [in] gatts_if: GATT server access interface
- [in] remote_bda: remote device bluetooth device address.
- [in] is_direct: direct connection or background auto connection

```c
esp_err_t esp_ble_gatts_close(esp_gatt_if_t gatts_if, uint16_t conn_id)
```

Close a connection a remote device.

Return
- ESP_OK : success
- other : failed

Parameters
- [in] gatts_if: GATT server access interface
- [in] conn_id: connection ID to be closed.
**`esp_err_t esp_ble_gatts_send_service_change_indication`**

Send service change indication.

**Return**
- ESP_OK: success
- other: failed

**Parameters**
- `[in] gatts_if`: GATT server access interface
- `[in] remote_bda`: remote device Bluetooth device address. If `remote_bda` is NULL, then it will send service change indication to all the connected devices and if not then to a specific device

**Unions**

```c
union esp_ble_gatts_cb_param_t
    #include <esp_gatts_api.h> Gatt server callback parameters union.
```

**Public Members**

```c
struct esp_ble_gatts_cb_param_t::gatts_reg_evt_param reg
    Gatt server callback param of ESP_GATTS_REG_EVT

struct esp_ble_gatts_cb_param_t::gatts_read_evt_param read
    Gatt server callback param of ESP_GATTS_READ_EVT

struct esp_ble_gatts_cb_param_t::gatts_write_evt_param write
    Gatt server callback param of ESP_GATTS_WRITE_EVT

struct esp_ble_gatts_cb_param_t::gatts_exec_write_evt_param exec_write
    Gatt server callback param of ESP_GATTS_EXEC_WRITE_EVT

struct esp_ble_gatts_cb_param_t::gatts_mtu_evt_param mtu
    Gatt server callback param of ESP_GATTS_MTU_EVT

struct esp_ble_gatts_cb_param_t::gatts_conf_evt_param conf
    Gatt server callback param of ESP_GATTS_CONF_EVT (confirm)

struct esp_ble_gatts_cb_param_t::gatts_create_evt_param create
    Gatt server callback param of ESP_GATTS_CREATE_EVT

struct esp_ble_gatts_cb_param_t::gatts_add_incl_srvc_evt_param add_incl_srvc
    Gatt server callback param of ESP_GATTS_ADD_INCL_SRVC_EVT

struct esp_ble_gatts_cb_param_t::gatts_add_char_evt_param add_char
    Gatt server callback param of ESP_GATTS_ADD_CHAR_EVT

struct esp_ble_gatts_cb_param_t::gatts_add_char_descr_evt_param add_char descr
    Gatt server callback param of ESP_GATTS_ADD_CHAR_DESCR_EVT

struct esp_ble_gatts_cb_param_t::gatts_delete_evt_param del
    Gatt server callback param of ESP_GATTS_DELETE_EVT

struct esp_ble_gatts_cb_param_t::gatts_start_evt_param start
    Gatt server callback param of ESP_GATTS_START_EVT

struct esp_ble_gatts_cb_param_t::gatts_stop_evt_param stop
    Gatt server callback param of ESP_GATTS_STOP_EVT

struct esp_ble_gatts_cb_param_t::gatts_connect_evt_param connect
    Gatt server callback param of ESP_GATTS_CONNECT_EVT

struct esp_ble_gatts_cb_param_t::gatts_disconnect_evt_param disconnect
    Gatt server callback param of ESP_GATTS_DISCONNECT_EVT

struct esp_ble_gatts_cb_param_t::gatts_open_evt_param open
    Gatt server callback param of ESP_GATTS_OPEN_EVT
```
struct esp_ble_gatts_cb_param_t::gatts_cancel_open_evt_param cancel_open
   Gatt server callback param of ESP_GATTS_CANCEL_OPEN_EVT

struct esp_ble_gatts_cb_param_t::gatts_close_evt_param close
   Gatt server callback param of ESP_GATTS_CLOSE_EVT

struct esp_ble_gatts_cb_param_t::gatts_congest_evt_param congest
   Gatt server callback param of ESP_GATTS_CONGEST_EVT

struct esp_ble_gatts_cb_param_t::gatts_rsp_evt_param rsp
   Gatt server callback param of ESP_GATTS_RESPONSE_EVT

struct esp_ble_gatts_cb_param_t::gatts_add_attr_tab_evt_param add_attr_tab
   Gatt server callback param of ESP_GATTS_CREAT_ATTR_TAB_EVT

struct esp_ble_gatts_cb_param_t::gatts_set_attr_val_evt_param set_attr_val
   Gatt server callback param of ESP_GATTS_SET_ATTR_VAL_EVT

struct esp_ble_gatts_cb_param_t::gatts_send_service_change_evt_param service_change
   Gatt server callback param of ESP_GATTS_SEND_SERVICE_CHANGE_EVT

struct gatts_add_attr_tab_evt_param
   #include <esp_gatts_api.h> ESP_GATTS_CREAT_ATTR_TAB_EVT.

    The value is too long or not

bool need_rsp
    The read operation need to do response
```

```c
struct gatts_reg_evt_param
    #include <esp_gatts_api.h> ESP_GATTS_REG_EVT.
```

**Public Members**

```c
esp_gatt_status_t status
    Operation status

uint16_t app_id
    Application id which input in register API
```

```c
struct gatts_rsp_evt_param
    #include <esp_gatts_api.h> ESP_GATTS_RESPONSE_EVT.
```

**Public Members**

```c
esp_gatt_status_t status
    Operation status

uint16_t handle
    Attribute handle which send response
```

```c
struct gatts_send_service_change_evt_param
    #include <esp_gatts_api.h> ESP_GATTS_SEND_SERVICE_CHANGE_EVT.
```

**Public Members**

```c
esp_gatt_status_t status
    Operation status
```

```c
struct gatts_set_attr_val_evt_param
    #include <esp_gatts_api.h> ESP_GATTS_SET_ATTR_VAL_EVT.
```
Chapter 2. API Reference

Public Members

\texttt{uint16_t srvc\_handle}

The service handle

Connection id

\texttt{uint32_t trans\_id}

Transfer id

\texttt{esp\_bd\_addr t bda}

The bluetooth device address which been written

\texttt{uint16_t handle}

The attribute handle

\texttt{uint16_t offset}

Offset of the value, if the value is too long

\texttt{bool need\_rsp}

The write operation need to do response

\texttt{bool is\_prep}

This write operation is prepare write

\texttt{uint16_t len}

The write attribute value length
uint8_t *value
    The write attribute value

Macros
ESP_GATT_PREP_WRITE_CANCEL
    Prepare write flag to indicate cancel prepare write
ESP_GATT_PREP_WRITE_EXEC
    Prepare write flag to indicate execute prepare write

Type Definitions
typedef void (*esp_gatts_cb_t)(esp_gatts_cb_event_t event, esp_gatt_if_t gatts_if, esp_ble_gatts_cb_param_t *param)
    GATT Server callback function type.

Parameters
    • event:: Event type
    • gatts_if: : GATT server access interface, normally different gatts_if correspond to different profile
    • param: : Point to callback parameter, currently is union type

Enumerations
eenum esp_gatts_cb_event_t
    GATT Server callback function events.
Values:
ESP_GATTS_REG_EVT = 0
    When register application id, the event comes
ESP_GATTS_READ_EVT = 1
    When gatt client request read operation, the event comes
ESP_GATTS_WRITE_EVT = 2
    When gatt client request write operation, the event comes
ESP_GATTS_EXEC_WRITE_EVT = 3
    When gatt client request execute write, the event comes
ESP_GATTS_MTU_EVT = 4
    When set mtu complete, the event comes
ESP_GATTS_CONF_EVT = 5
    When receive confirm, the event comes
ESP_GATTS_UNREG_EVT = 6
    When unregister application id, the event comes
ESP_GATTS_CREATE_EVT = 7
    When create service complete, the event comes
ESP_GATTS_ADD_INCL_SRVC_EVT = 8
    When add included service complete, the event comes
ESP_GATTS_ADD_CHAR_EVT = 9
    When add characteristic complete, the event comes
ESP_GATTS_ADD_CHAR_DESCR_EVT = 10
    When add descriptor complete, the event comes
ESP_GATTS_DELETE_EVT = 11
    When delete service complete, the event comes
ESP_GATTS_START_EVT = 12
    When start service complete, the event comes
**Chapter 2. API Reference**

```c
ESP_GATTS_STOP_EVT = 13
    When stop service complete, the event comes

ESP_GATTS_CONNECT_EVT = 14
    When gatt client connect, the event comes

ESP_GATTS_DISCONNECT_EVT = 15
    When gatt client disconnect, the event comes

ESP_GATTS_OPEN_EVT = 16
    When connect to peer, the event comes

ESP_GATTS_CANCEL_OPEN_EVT = 17
    When disconnect from peer, the event comes

ESP_GATTS_CLOSE_EVT = 18
    When gatt server close, the event comes

ESP_GATTS_LISTEN_EVT = 19
    When gatt listen to be connected the event comes

ESP_GATTS_CONGEST_EVT = 20
    When congest happen, the event comes

ESP_GATTS_RESPONSE_EVT = 21
    When gatt send response complete, the event comes

ESP_GATTS_CREAT_ATTR_TAB_EVT = 22
    When gatt create table complete, the event comes

ESP_GATTS_SET_ATTR_VAL_EVT = 23
    When gatt set attr value complete, the event comes

ESP_GATTS_SEND_SERVICE_CHANGE_EVT = 24
    When gatt send service change indication complete, the event comes
```

**GATT CLIENT API**

**Overview**

**Instructions**

**Application Example** Check bluetooth/bluedroid/ble folder in ESP-IDF examples, which contains the following demos and their tutorials:

- This is a GATT client demo and its tutorial. This demo can scan for devices, connect to the GATT server and discover its services.
  - bluetooth/bluedroid/ble/gatt_client
  - GATT Client Example Walkthrough

- This is a multiple connection demo and its tutorial. This demo can connect to multiple GATT server devices and discover their services.
  - bluetooth/bluedroid/ble/gattc_multi_connect
  - GATT Client Multi-connection Example Walkthrough

- This is a BLE SPP-Like demo. This demo, which acts as a GATT client, can receive data from UART and then send the data to the peer device automatically.
  - bluetooth/bluedroid/ble/ble_spp_client

**API Reference**

**Header File**

- components/bt/host/bluedroid/api/include/api/esp_gattc_api.h
Functions

**esp_err_t esp_ble_gattc_register_callback (esp_gattc_cb_t callback)**

This function is called to register application callbacks with GATTC module.

**Return**

- ESP_OK: success
- other: failed

**Parameters**

- [in] callback: pointer to the application callback function.

**esp_err_t esp_ble_gattc_app_register (uint16_t app_id)**

This function is called to register application callbacks with GATTC module.

**Return**

- ESP_OK: success
- other: failed

**Parameters**

- [in] app_id: Application Identify (UUID), for different application

**esp_err_t esp_ble_gattc_app_unregister (esp_gattc_if_t gattc_if)**

This function is called to un register an application from GATTC module.

**Return**

- ESP_OK: success
- other: failed

**Parameters**

- [in] gattc_if: Gatt client access interface.

**esp_err_t esp_ble_gattc_open (esp_gattc_if_t gattc_if, esp_bd_addr_t remote_bda, esp_ble_addr_type_t remote_addr_type, bool is_direct)**

Open a direct connection or add a background auto connection.

**Return**

- ESP_OK: success
- other: failed

**Parameters**

- [in] gattc_if: Gatt client access interface.
- [in] remote_bda: remote device bluetooth device address.
- [in] remote_addr_type: remote device bluetooth device the address type.
- [in] is_direct: direct connection or background auto connection(by now, background auto connection is not supported).

**esp_err_t esp_ble_gattc_aux_open (esp_gattc_if_t gattc_if, esp_bd_addr_t remote_bda, esp_ble_addr_type_t remote_addr_type, bool is_direct)**

**esp_err_t esp_ble_gattc_close (esp_gattc_if_t gattc_if, uint16_t conn_id)**

Close the virtual connection to the GATT server. gattc may have multiple virtual GATT server connections when multiple app_id registered, this API only close one virtual GATT server connection. if there exist other virtual GATT server connections, it does not disconnect the physical connection. if you want to disconnect the physical connection directly, you can use esp_ble_gap_disconnect(esp_bd_addr_t remote_device).

**Return**

- ESP_OK: success
- other: failed

**Parameters**

- [in] gattc_if: Gatt client access interface.
- [in] conn_id: connection ID to be closed.

**esp_err_t esp_ble_gattc_send_mtu_req (esp_gattc_if_t gattc_if, uint16_t conn_id)**

Configure the MTU size in the GATT channel. This can be done only once per connection. Before using, use esp_ble_gatt_set_local_mtu() to configure the local MTU size.

**Return**

- ESP_OK: success
- other: failed
Parameters
- [in] gattc_if: Gatt client access interface.
- [in] conn_id: connection ID.

`esp_err_t esp_ble_gattc_search_service (esp_gatt_if_t gattc_if, uint16_t conn_id, esp_bt_uuid_t *filter_uuid)`

This function is called to get service from local cache. This function reports service search result by a callback event, and followed by a service search complete event.

Return
- ESP_OK: success
- other: failed

Parameters
- [in] gattc_if: Gatt client access interface.
- [in] conn_id: connection ID.
- [in] filter_uuid: a UUID of the service application is interested in. If Null, discover for all services.

`esp_gatt_status_t esp_ble_gattc_get_service (esp_gatt_if_t gattc_if, uint16_t conn_id, esp_bt_uuid_t *svc_uuid, esp_gattc_service_elem_t *result, uint16_t *count, uint16_t offset)`

Find all the service with the given service uuid in the gattc cache, if the svc_uuid is NULL, find all the service. Note: It just get service from local cache, won’t get from remote devices. If want to get it from remote device, need to used the esp_ble_gattc_cache_refresh, then call esp_ble_gattc_get_service again.

Return
- ESP_OK: success
- other: failed

Parameters
- [in] gattc_if: Gatt client access interface.
- [in] conn_id: connection ID which identify the server.
- [in] svc_uuid: the pointer to the service uuid.
- [inout] result: The pointer to the service which has been found in the gattc cache.
- [inout] count: input the number of service want to find, it will output the number of service has been found in the gattc cache with the given service uuid.
- [in] offset: Offset of the service position to get.

`esp_gatt_status_t esp_ble_gattc_get_all_char (esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t start_handle, uint16_t end_handle, esp_gattc_char_elem_t *result, uint16_t *count, uint16_t offset)`

Find all the characteristic with the given service in the gattc cache Note: It just get characteristic from local cache, won’t get from remote devices.

Return
- ESP_OK: success
- other: failed

Parameters
- [in] gattc_if: Gatt client access interface.
- [in] conn_id: connection ID which identify the server.
- [in] start_handle: the attribute start handle.
- [in] end_handle: the attribute end handle
- [inout] result: The pointer to the characteristic in the service.
- [inout] count: input the number of characteristic want to find, it will output the number of characteristic has been found in the gattc cache with the given service.
- [in] offset: Offset of the characteristic position to get.

`esp_gatt_status_t esp_ble_gattc_get_all_descr (esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t char_handle, esp_gattc_descr_elem_t *result, uint16_t *count, uint16_t offset)`

Find all the descriptor with the given characteristic in the gattc cache Note: It just get descriptor from local cache, won’t get from remote devices.
### Return
- ESP_OK: success
- other: failed

### Parameters
- **[in]** `gattc_if`: Gatt client access interface.
- **[in]** `conn_id`: connection ID which identify the server.
- **[in]** `char_handle`: the given characteristic handle
- **[out]** `result`: The pointer to the descriptor in the characteristic.
- **[inout]** `count`: input the number of descriptor want to find, it will output the number of descriptor has been found in the gattc cache with the given characteristic.
- **[in]** `offset`: offset of the descriptor position to get.

```c
esp_gatt_status_t esp_ble_gattc_get_char_by_uuid(esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t conn_id, uint16_t start_handle, uint16_t end_handle, esp_bt_uuid_t char_uuid, esp_gattc_char_elem_t *result, uint16_t *count)
```

Find the characteristic with the given characteristic uuid in the gattc cache. Note: It just get characteristic from local cache, won’t get from remote devices.

### Return
- ESP_OK: success
- other: failed

### Parameters
- **[in]** `gattc_if`: Gatt client access interface.
- **[in]** `conn_id`: connection ID which identify the server.
- **[in]** `start_handle`: the attribute start handle
- **[in]** `end_handle`: the attribute end handle
- **[in]** `char_uuid`: the characteristic uuid
- **[out]** `result`: The pointer to the characteristic in the service.
- **[inout]** `count`: input the number of characteristic want to find, it will output the number of characteristic has been found in the gattc cache with the given service.

```c
esp_gatt_status_t esp_ble_gattc_get_descr_by_uuid(esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t start_handle, uint16_t end_handle, esp_bt_uuid_t char_uuid, esp_bt_uuid_t descr_uuid, esp_gattc_descr_elem_t *result, uint16_t *count)
```

Find the descriptor with the given characteristic uuid in the gattc cache. Note: It just get descriptor from local cache, won’t get from remote devices.

### Return
- ESP_OK: success
- other: failed

### Parameters
- **[in]** `gattc_if`: Gatt client access interface.
- **[in]** `conn_id`: connection ID which identify the server.
- **[in]** `start_handle`: the attribute start handle
- **[in]** `end_handle`: the attribute end handle
- **[in]** `char_uuid`: the characteristic uuid.
- **[in]** `descr_uuid`: the descriptor uuid.
- **[out]** `result`: The pointer to the descriptor in the given characteristic.
- **[inout]** `count`: input the number of descriptor want to find, it will output the number of descriptor has been found in the gattc cache with the given characteristic.

```c
esp_gatt_status_t esp_ble_gattc_get_descr_by_char_handle(esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t char_handle, esp_bt_uuid_t descr_uuid, esp_gattc_descr_elem_t *result, uint16_t *count)
```
Find the descriptor with the given characteristic handle in the gattc cache. Note: It just get descriptor from local cache, won’t get from remote devices.

**Return**
- ESP_OK: success
- other: failed

**Parameters**
- [in] gattc_if: Gatt client access interface.
- [in] conn_id: connection ID which identify the server.
- [in] char_handle: the characteristic handle.
- [out] result: The pointer to the descriptor in the given characteristic.
- [inout] count: input the number of descriptor want to find, it will output the number of descriptor has been found in the gattc cache with the given characteristic.

```c
esp_gatt_status_t esp_ble_gattc_get_include_service(esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t start_handle, uint16_t end_handle, esp_bt_uuid_t *incl_uuid, esp_gattc_incl_svc_elem_t *result, uint16_t *count)
```

Find the include service with the given service handle in the gattc cache. Note: It just get include service from local cache, won’t get from remote devices.

**Return**
- ESP_OK: success
- other: failed

**Parameters**
- [in] gattc_if: Gatt client access interface.
- [in] conn_id: connection ID which identify the server.
- [in] start_handle: the attribute start handle
- [in] end_handle: the attribute end handle
- [in] incl_uuid: the include service uuid
- [out] result: The pointer to the include service in the given service.
- [inout] count: input the number of include service want to find, it will output the number of include service has been found in the gattc cache with the given service.

```c
esp_gatt_status_t esp_ble_gattc_get_attr_count(esp_gatt_if_t gattc_if, uint16_t conn_id, esp_gatt_db_attr_type_t type, uint16_t start_handle, uint16_t end_handle, esp_gattc_dbElementType_t char_handle, uint16_t *count)
```

Find the attribute count with the given service or characteristic in the gattc cache.

**Return**
- ESP_OK: success
- other: failed

**Parameters**
- [in] gattc_if: Gatt client access interface.
- [in] conn_id: connection ID which identify the server.
- [in] type: the attribute type.
- [in] start_handle: the attribute start handle, if the type is ESP_GATT_DB_DESCRIPTOR, this parameter should be ignore
- [in] end_handle: the attribute end handle, if the type is ESP_GATT_DB_DESCRIPTOR, this parameter should be ignore
- [in] char_handle: the characteristic handle, this parameter valid when the type is ESP_GATT_DB_DESCRIPTOR. If the type isn’t ESP_GATT_DB_DESCRIPTOR, this parameter should be ignore.
- [out] count: output the number of attribute has been found in the gattc cache with the given attribute type.

```c
esp_gatt_status_t esp_ble_gattc_get_db(esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t start_handle, uint16_t end_handle, esp_gattc_dbElementType_t *db, uint16_t *count)
```
This function is called to get the GATT database. Note: It just get attribute data base from local cache, won’t get from remote devices.

**Return**
- ESP_OK: success
- other: failed

**Parameters**
- [in] `gattc_if`: Gatt client access interface.
- [in] `start_handle`: the attribute start handle
- [in] `end_handle`: the attribute end handle
- [in] `conn_id`: connection ID which identify the server.
- [in] `db`: output parameter which will contain the GATT database copy. Caller is responsible for freeing it.
- [in] `count`: number of elements in database.

```c
esp_err_t esp_ble_gattc_read_char(esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t handle,
                                esp_gatt_auth_req_t auth_req)
```

This function is called to read a service’s characteristics of the given characteristic handle.

**Return**
- ESP_OK: success
- other: failed

**Parameters**
- [in] `gattc_if`: Gatt client access interface.
- [in] `conn_id`: connection ID.
- [in] `handle`: characteristic handle to read.
- [in] `auth_req`: authenticate request type

```c
esp_err_t esp_ble_gattc_read_by_type(esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t
                                     start_handle, uint16_t end_handle, esp_bt_uuid_t *uuid,
                                     esp_gatt_auth_req_t auth_req)
```

This function is called to read a service’s characteristics of the given characteristic UUID.

**Return**
- ESP_OK: success
- other: failed

**Parameters**
- [in] `gattc_if`: Gatt client access interface.
- [in] `conn_id`: connection ID.
- [in] `start_handle`: the attribute start handle.
- [in] `end_handle`: the attribute end handle
- [in] `uuid`: The UUID of attribute which will be read.
- [in] `auth_req`: authenticate request type

```c
esp_err_t esp_ble_gattc_read_multiple(esp_gatt_if_t gattc_if, uint16_t conn_id,
                                     esp_gattc_multi_t *read_multi, esp_gatt_auth_req_t auth_req)
```

This function is called to read multiple characteristic or characteristic descriptors.

**Return**
- ESP_OK: success
- other: failed

**Parameters**
- [in] `gattc_if`: Gatt client access interface.
- [in] `conn_id`: connection ID.
- [in] `auth_req`: authenticate request type

```c
esp_err_t esp_ble_gattc_read_char_descr(esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t handle,
                                       esp_gatt_auth_req_t auth_req)
```

This function is called to read a characteristics descriptor.

**Return**
- ESP_OK: success
- other: failed

**Parameters**
- [in] gattc_if: Gatt client access interface.
- [in] conn_id: connection ID.
- [in] handle: descriptor handle to read.
- [in] auth_req: authenticate request type

```c
esp_err_t esp_ble_gattc_write_char (esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t handle,
uint16_t value_len, uint8_t *value,
esp_gatt_write_type_t write_type, esp_gatt_auth_req_t auth_req)
```

This function is called to write characteristic value.

**Return**
- ESP_OK: success
- other: failed

**Parameters**
- [in] gattc_if: Gatt client access interface.
- [in] conn_id: connection ID.
- [in] handle: characteristic handle to write.
- [in] value_len: length of the value to be written.
- [in] value: the value to be written.
- [in] write_type: the type of attribute write operation.
- [in] auth_req: authentication request.

```c
esp_err_t esp_ble_gattc_write_char_descr (esp_gatt_if_t gattc_if, uint16_t conn_id,
uint16_t handle, uint16_t value_len, uint8_t *value,
esp_gatt_write_type_t write_type,
esp_gatt_auth_req_t auth_req)
```

This function is called to write characteristic descriptor value.

**Return**
- ESP_OK: success
- other: failed

**Parameters**
- [in] gattc_if: Gatt client access interface.
- [in] conn_id: connection ID.
- [in] handle: characteristic handle to prepare write.
- [in] offset: offset of the write value.
- [in] value_len: length of the value to be written.
- [in] value: the value to be written.
- [in] auth_req: authentication request.

```c
esp_err_t esp_ble_gattc_prepare_write (esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t handle,
uint16_t offset, uint16_t value_len, uint8_t *value,
esp_gatt_auth_req_t auth_req)
```

This function is called to prepare write a characteristic value.

**Return**
- ESP_OK: success
- other: failed

**Parameters**
- [in] gattc_if: Gatt client access interface.
- [in] conn_id: connection ID.
- [in] handle: characteristic handle to prepare write.

```c
esp_err_t esp_ble_gattc_prepare_write_char_descr(esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t handle, uint16_t offset, uint16_t value_len, uint8_t *value, esp_gatt_auth_req_t auth_req)
```

This function is called to prepare write a characteristic descriptor value.

**Return**
- ESP_OK: success
- other: failed

**Parameters**
- [in] gattc_if: Gatt client access interface.
- [in] conn_id: connection ID.
- [in] handle: characteristic descriptor handle to prepare write.
- [in] offset: offset of the write value.
- [in] value_len: length of the value to be written.
- [in] value: the value to be written.
- [in] auth_req: authentication request.

```c
esp_err_t esp_ble_gattc_execute_write(esp_gatt_if_t gattc_if, uint16_t conn_id, bool is_execute)
```

This function is called to execute write a prepare write sequence.

**Return**
- ESP_OK: success
- other: failed

**Parameters**
- [in] gattc_if: Gatt client access interface.
- [in] conn_id: connection ID.
- [in] is_execute: execute or cancel.

```c
esp_err_t esp_ble_gattc_register_for_notify(esp_gatt_if_t gattc_if, esp_bd_addr_t server_bda, uint16_t handle)
```

This function is called to register for notification of a service.

**Return**
- ESP_OK: registration succeeds
- other: failed

**Parameters**
- [in] gattc_if: Gatt client access interface.
- [in] handle: GATT characteristic handle.

```c
esp_err_t esp_ble_gattc_unregister_for_notify(esp_gatt_if_t gattc_if, esp_bd_addr_t server_bda, uint16_t handle)
```

This function is called to de-register for notification of a service.

**Return**
- ESP_OK: unregister succeeds
- other: failed

**Parameters**
- [in] gattc_if: Gatt client access interface.
- [in] handle: GATT characteristic handle.

```c
esp_err_t esp_ble_gattc_cache_refresh(esp_bd_addr_t remote_bda)
```

Refresh the server cache store in the gattc stack of the remote device. If the device is connected, this API will restart the discovery of service information of the remote device.

**Return**
- ESP_OK: success
- other: failed

**Parameters**
- [in] remote_bda: remote device BD address.
`esp_err_t esp_ble_gattc_cache_assoc(esp_gatt_if_t gattc_if, esp_bd_addr_t src_addr, esp_bd_addr_t assoc_addr, bool is_assoc)`

Add or delete the associated address with the source address. Note: The role of this API is mainly when the client side has stored a server-side database, when it needs to connect another device, but the device’s attribute database is the same as the server database stored on the client-side, calling this API can use the database that the device has stored used as the peer server database to reduce the attribute database search and discovery process and speed up the connection time. The associated address main that device want to used the database has stored in the local cache. The source address main that device want to share the database to the associated address device.

Return
- ESP_OK: success
- other: failed

Parameters
- [in] gattc_if: Gatt client access interface.
- [in] src_addr: the source address which provide the attribute table.
- [in] assoc_addr: the associated device address which went to share the attribute table with the source address.
- [in] is_assoc: true add the associated device address, false remove the associated device address.

`esp_err_t esp_ble_gattc_cache_get_addr_list(esp_gatt_if_t gattc_if)`

Get the address list which has store the attribute table in the gattc cache. There will callback ESP_GATTC_GET_ADDR_LIST_EVT event when get address list complete.

Return
- ESP_OK: success
- other: failed

Parameters
- [in] gattc_if: Gatt client access interface.

`esp_err_t esp_ble_gattc_cache_clean(esp_bd_addr_t remote_bda)`

Clean the service cache of this device in the gattc stack.

Return
- ESP_OK: success
- other: failed

Parameters
- [in] remote_bda: remote device BD address.

Unions

```
union esp_ble_gattc_cb_param_t
#include <esp_gattc_api.h> Gatt client callback parameters union.

Public Members
```

```
struct esp_ble_gattc_cb_param_t::gatte_reg_evt_param reg
Gatt client callback param of ESP_GATTC_REG_EVT
```

```
struct esp_ble_gattc_cb_param_t::gattc_open_evt_param open
Gatt client callback param of ESP_GATTC_OPEN_EVT
```

```
struct esp_ble_gattc_cb_param_t::gattc_close_evt_param close
Gatt client callback param of ESP_GATTC_CLOSE_EVT
```

```
struct esp_ble_gattc_cb_param_t::gattc_cfg_mtu_evt_param cfg_mtu
Gatt client callback param of ESP_GATTC_CFG_MTU_EVT
```

```
struct esp_ble_gattc_cb_param_t::gattc_search_cmpl_evt_param search_cmpl
Gatt client callback param of ESP_GATTC_SEARCH_CMPL_EVT
```

Connection id

```c
uint16_t handle
```
The Characteristic or descriptor handle

```c
uint16_t offset
```
The prepare write offset, this value is valid only when prepare write

Type Definitions

```c
typedef void (*esp_gattc_cb_t)(esp_gattc_cb_event_t event, esp_gatt_if_t gatc_if, esp_ble_gattc_cb_param_t *param)
```
GATT Client callback function type.

Parameters

- **event**: Event type
- **gatc_if**: GATT client access interface, normally different gatc_if correspond to different profile
- **param**: Point to callback parameter, currently is union type

Enumerations

```c
enum esp_gattc_cb_event_t
```
GATT Client callback function events.

Values:

```c
ESP_GATTC_REG_EVT = 0
```
When GATT client is registered, the event comes

```c
ESP_GATTC_UNREG_EVT = 1
```
When GATT client is unregistered, the event comes

```c
ESP_GATTC_OPEN_EVT = 2
```
When GATT virtual connection is set up, the event comes

```c
ESP_GATTC_READ_CHAR_EVT = 3
```
When GATT characteristic is read, the event comes

```c
ESP_GATTC_WRITE_CHAR_EVT = 4
```
When GATT characteristic write operation completes, the event comes

```c
ESP_GATTC_CLOSE_EVT = 5
```
When GATT virtual connection is closed, the event comes

```c
ESP_GATTC_SEARCH_CMPL_EVT = 6
```
When GATT service discovery is completed, the event comes

When the ble characteristic or descriptor multiple complete, the event comes

ESP_GATTC_QUEUE_FULL_EVT = 43
When the gattc command queue full, the event comes

ESP_GATTC_SET_ASSOC_EVT = 44
When the ble gattc set the associated address complete, the event comes

ESP_GATTC_GET_ADDR_LIST_EVT = 45
When the ble get gattc address list in cache finish, the event comes

ESP_GATTC_DIS_SRVĆ_CMPL_EVT = 46
When the ble discover service complete, the event comes

BLUFI API

Overview
BLUFI is a profile based GATT to config ESP32 WIFI to connect/disconnect AP or setup a softap and etc. Use should concern these things:

1. The event sent from profile. Then you need to do something as the event indicate.
2. Security reference. You can write your own Security functions such as symmetrical encryption/decryption and checksum functions. Even you can define the “Key Exchange/Negotiation” procedure.

Application Example
Check bluetooth folder in ESP-IDF examples, which contains the following application:

- This is the BLUFI demo. This demo can set ESP32’s wifi to softap/station/softap&station mode and config wifi connections - bluetooth/blufi

Chapter 2. API Reference

Functions

```c
esp_err_t esp_blufi_register_callbacks(esp_blufi_callbacks_t *callbacks)
This function is called to receive blufi callback event.
```

**Parameters**

- **callbacks**: callback functions

```c
esp_err_t esp_blufi_profile_init()
This function is called to initialize blufi_profile.
```

**Parameters**

```c
esp_err_t esp_blufi_profile_deinit()
This function is called to de-initialize blufi_profile.
```

**Parameters**

- **extra_info**: extra information, such as sta_ssid, softap_ssid and etc.

```c
esp_err_t esp_blufi_send_wifi_conn_report(wifi_mode_t opmode, esp_blufi_sta_conn_state_t sta_conn_state, uint8_t softap_conn_num, esp_blufi_extra_info_t *extra_info)
This function is called to send wifi connection report.
```

**Parameters**

- **opmode**: wifi opmode
- **sta_conn_state**: station is already in connection or not
- **softap_conn_num**: softap connection number
- **extra_info**: extra information, such as sta_ssid, softap_ssid and etc.

```c
esp_err_t esp_blufi_send_wifi_list(uint16_t apCount, esp_blufi_ap_record_t *list)
This function is called to send wifi list.
```

**Parameters**

- **apCount**: wifi list count
- **list**: wifi list

```c
uint16_t esp_blufi_get_version()
Get BLUFI profile version.
```

**Parameters**

- **state**: error state

```c
esp_err_t esp_blufi_send_custom_data(uint8_t* data, uint32_t data_len)
This function is called to send custom data.
```

**Parameters**

- **data**: custom data value
- **data_len**: the length of custom data

Unions

```c
union esp_blufi_cb_param_t
#include <esp_blufi_api.h> BLUFI callback parameters union.
```
Public Members

```c

BLUFU check sum function (FCS)
Macros

ESP_BD_ADDR_LEN

Bluetooth address length.

Type Definitions

typedef uint8_t esp_bd_addr_t[ESP_BD_ADDR_LEN]

Bluetooth device address.

typedef void(*esp_blufi_event_cb_t)(esp_blufi_event_t event, esp_blufi_cb_param_t *param)

BLUFI event callback function type.

Parameters

• event:: Event type
• param:: Point to callback parameter, currently is union type

typedef void(*esp_blufi_negotiate_data_handler_t)(uint8_t *data, int len, uint8_t **output_data, int *output_len, bool *need_free)

BLUFI negotiate data handler.

Parameters

• data:: data from phone
• len:: length of data from phone
• output_data:: data want to send to phone
• output_len:: length of data want to send to phone
• need_free:: output reporting if memory needs to be freed or not *

typedef int(*esp_blufi_encrypt_func_t)(uint8_t iv8, uint8_t *crypt_data, int crypt_len)

BLUFI encrypt the data after negotiate a share key.

Return Nonnegative number is encrypted length, if error, return negative number;

Parameters

• iv8:: initial vector(8bit), normally, blufi core will input packet sequence number
• crypt_data:: plain text and encrypted data, the encrypt function must support autochthonous encrypt
• crypt_len:: length of plain text

typedef int(*esp_blufi_decrypt_func_t)(uint8_t iv8, uint8_t *crypt_data, int crypt_len)

BLUFI decrypt the data after negotiate a share key.

Return Nonnegative number is decrypted length, if error, return negative number;

Parameters

• iv8:: initial vector(8bit), normally, blufi core will input packet sequence number
• crypt_data:: encrypted data and plain text, the encrypt function must support autochthonous decrypt
• crypt_len:: length of encrypted text

typedef uint16_t(*esp_blufi_checksum_func_t)(uint8_t iv8, uint8_t *data, int len)

BLUFI checksum.

Parameters

• iv8:: initial vector(8bit), normally, blufi core will input packet sequence number
• data:: data need to checksum
• len:: length of data

Enumerations

enum esp_blufi_cb_event_t

}
```

2.1.4 NimBLE-based host APIs

Overview

Apache MyNewt NimBLE is a highly configurable and BT SIG qualifiable BLE stack providing both host and controller functionalities. ESP-IDF supports NimBLE host stack which is specifically ported for ESP32 platform and FreeRTOS. The underlying controller is still the same (as in case of Bluedroid) providing VHCI interface. Refer to NimBLE user guide for a complete list of features and additional information on NimBLE stack. Most features of NimBLE including BLE Mesh are supported by ESP-IDF. The porting layer is kept cleaner by maintaining all the existing APIs of NimBLE along with a single ESP-NimBLE API for initialization, making it simpler for the application developers.

Architecture

Currently, NimBLE host and controller support different transports such as UART and RAM between them. However, RAM transport cannot be used as is in case of ESP as ESP controller supports VHCI interface and buffering schemes used by NimBLE host is incompatible with that used by ESP controller. Therefore, a new transport between NimBLE host and ESP controller has been added. This is depicted in the figure below. This layer is responsible for maintaining pool of transport buffers and formatting buffers exchanges between host and controller as per the requirements.

![ESP NimBLE Stack](image)

Fig. 1: ESP NimBLE Stack

Threading Model

The NimBLE host can run inside the application thread or can have its own independent thread. This flexibility is inherently provided by NimBLE design. By default, a thread is spawned by the porting function `nimble_port_freertos_init`. This behavior can be changed by overriding the same function. For BLE Mesh, additional thread (advertising thread) is used which keeps on feeding advertisement events to the main thread.
Programming Sequence

To begin with, make sure that the NimBLE stack is enabled from menuconfig choose NimBLE for the Bluetooth host.

Typical programming sequence with NimBLE stack consists of the following steps:

• Initialize NVS flash using `nvs_flash_init()` API. This is because ESP controller uses NVS during initialization.
• Call `esp_nimble_hci_and_controller_init()` to initialize ESP controller as well as transport layer. This will also link the host and controller modules together. Alternatively, if ESP controller is already initialized, then `esp_nimble_hci_init()` can be called for the remaining initialization.
• Initialize the host stack using `nimble_port_init`.
• Initialize the required NimBLE host configuration parameters and callbacks
• Perform application specific tasks/initialization
• Run the thread for host stack using `nimble_port_freertos_init`

This documentation does not cover NimBLE APIs. Refer to NimBLE tutorial for more details on the programming sequence/NimBLE APIs for different scenarios.

API Reference

Header File

• components/bt/host/nimble/esp-hci/include/esp_nimble_hci.h

Functions

`esp_err_t esp_nimble_hci_init(void)`
Initialize VHCI transport layer between NimBLE Host and ESP Bluetooth controller.

This function initializes the transport buffers to be exchanged between NimBLE host and ESP controller. It also registers required host callbacks with the controller.

Return

• ESP_OK if the initialization is successful
• Appropriate error code from esp_err_t in case of an error

`esp_err_t esp_nimble_hci_and_controller_init(void)`
Initialize ESP Bluetooth controller(link layer) and VHCI transport layer between NimBLE Host and ESP Bluetooth controller.

This function initializes ESP controller in BLE only mode and the transport buffers to be exchanged between NimBLE host and ESP controller. It also registers required host callbacks with the controller.

Below is the sequence of APIs to be called to init/enable NimBLE host and ESP controller:

```c
void ble_host_task(void *param)
{
    nimble_port_run(); //This function will return only when nimble_port->stop() is executed.
    nimble_port_freertos_deinit();
}

int ret = esp_nimble_hci_and_controller_init();
if (ret != ESP_OK) {
    ESP_LOGE(TAG, "esp_nimble_hci_and_controller_init() failed with error: %d", ret);
    return;
}

nimble_port_init();

//Initialize the NimBLE Host configuration
```

(continues on next page)
nimble_port_freertos_init(ble_host_task);

nimble_port_freertos_init() is an optional call that creates a new task in which the NimBLE host will run. The task function should have a call to nimble_port_run(). If a separate task is not required, calling nimble_port_run() will run the NimBLE host in the current task.

**Return**
- ESP_OK if the initialization is successful
- Appropriate error code from esp_err_t in case of an error

```c
esp_err_t esp_nimble_hci_deinit (void)
```
Deinitialize VHCI transport layer between NimBLE Host and ESP Bluetooth controller.

**Note** This function should be called after the NimBLE host is deinitialized.

**Return**
- ESP_OK if the deinitialization is successful
- Appropriate error codes from esp_err_t in case of an error

```c
esp_err_t esp_nimble_hci_and_controller_deinit (void)
```
Deinitialize VHCI transport layer between NimBLE Host and ESP Bluetooth controller and disable and deinitialize the controller.

Below is the sequence of APIs to be called to disable/deinit NimBLE host and ESP controller:

**Note** This function should not be executed in the context of Bluetooth host task.

**Note** This function should be called after the NimBLE host is deinitialized.

```c
int ret = nimble_port_stop();
if (ret == 0) {
    nimble_port_deinit();
    ret = esp_nimble_hci_and_controller_deinit();
    if (ret != ESP_OK) {
        ESP_LOGE(TAG, "esp_nimble_hci_and_controller_deinit() failed with_:\n        " error: %d", ret);
    }
}
```

If nimble_port_freertos_init() is used during initialization, then nimble_port_freertos_deinit() should be called in the host task after nimble_port_run().

**Return**
- ESP_OK if the deinitialization is successful
- Appropriate error codes from esp_err_t in case of an error

### 2.1.5 ESP-BLE-MESH

With various features of ESP-BLE-MESH, users can create a managed flooding mesh network for several scenarios, such as lighting, sensor and etc.
For an ESP32 to join and work on a ESP-BLE-MESH network, it must be provisioned firstly. By provisioning, the ESP32, as an unprovisioned device, will join the ESP-BLE-MESH network and become a ESP-BLE-MESH node, communicating with other nodes within or beyond the radio range.

Apart from ESP-BLE-MESH nodes, inside ESP-BLE-MESH network, there is also ESP32 that works as ESP-BLE-MESH Provisioner, which could provision unprovisioned devices into ESP-BLE-MESH nodes and configure the nodes with various features.

For information how to start using ESP32 and ESP-BLE-MESH, please see the Section Getting Started with ESP-BLE-MESH. If you are interested in information on ESP-BLE-MESH architecture, including some details of software implementation, please see Section ESP-BLE-MESH Architecture.

Application Examples and Demos

Please refer to Sections ESP-BLE-MESH Examples and ESP-BLE-MESH Demo Videos.

API Reference

ESP-BLE-MESH APIs are divided into the following parts:

- ESP-BLE-MESH Definitions
- ESP-BLE-MESH Core API Reference
- ESP-BLE-MESH Models API Reference

ESP-BLE-MESH Definitions

This section contains only one header file, which lists the following items of ESP-BLE-MESH.

- ID of all the models and related message opcodes
- Structs of model, element and Composition Data
- Structs of used by ESP-BLE-MESH Node/Provisioner for provisioning
- Structs used to transmit/receive messages
- Event types and related event parameters

Header File

- components/bt/esp_ble_mesh/api/esp_ble_mesh_defs.h

Unions

union esp_ble_mesh_prov_cb_param_t

Event parameter of ESP_BLE_MESH_PROVISIONER_UPDATE_LOCAL_NET_KEY_COMP_EVT

int err_code
Indicate the result of enabling/disabling to receive heartbeat messages by the Provisioner
Indicate the result of setting the heartbeat filter type by the Provisioner
Indicate the result of setting the heartbeat filter address by the Provisioner
Indicate the result of directly erasing settings by the Provisioner
Indicate the result of opening settings with index by the Provisioner
Indicate the result of opening settings with user id by the Provisioner
Indicate the result of closing settings with index by the Provisioner
Indicate the result of closing settings with user id by the Provisioner
Indicate the result of deleting settings with index by the Provisioner
Indicate the result of deleting settings with user id by the Provisioner

bool enable
Indicate enabling or disabling receiving heartbeat messages

struct esp_ble_mesh_prov_cb_param_t::[anonymous] provisioner_enable_heartbeat_recv_comp
ESP_BLE_MESH_PROVISIONER_ENABLE_HEARTBEAT_RECV_COMP_EVT.
Event parameters of ESP_BLE_MESH_PROVISIONER_ENABLE_HEARTBEAT_RECV_COMP_EVT

uint8_t type
Type of the filter used for receiving heartbeat messages

struct esp_ble_mesh_prov_cb_param_t::[anonymous] provisioner_set_heartbeat_filter_type_comp
ESP_BLE_MESH_PROVISIONER_SET_HEARTBEAT_FILTER_TYPE_COMP_EVT.
Event parameters of ESP_BLE_MESH_PROVISIONER_SET_HEARTBEAT_FILTER_TYPE_COMP_EVT

uint8_t op
Operation (add, remove, clean)

uint16_t hb_src
Heartbeat source address

uint16_t hb_dst
Heartbeat destination address

struct esp_ble_mesh_prov_cb_param_t::[anonymous] provisioner_set_heartbeat_filter_info_comp
ESP_BLE_MESH_PROVISIONER_SET_HEARTBEAT_FILTER_INFO_COMP_EVT.
Event parameters of ESP_BLE_MESH_PROVISIONER_SET_HEARTBEAT_FILTER_INFO_COMP_EVT

uint8_t init_ttl
Heartbeat InitTTL

uint8_t rx_ttl
Heartbeat RxTTL

uint8_t hops
Heartbeat hops (InitTTL - RxTTL + 1)

uint16_t feature
Bit field of currently active features of the node

int8_t rssi
RSSI of the heartbeat message

struct esp_ble_mesh_prov_cb_param_t::[anonymous] provisioner_recv_heartbeat
ESP_BLE_MESH_PROVISIONER_RECV_HEARTBEAT_MESSAGE_EVT.
Event parameters of ESP_BLE_MESH_PROVISIONER_RECV_HEARTBEAT_MESSAGE_EVT

struct esp_ble_mesh_prov_cb_param_t::[anonymous] provisioner_direct_erase_settings_comp
ESP_BLE_MESH_PROVISIONER_DRIECT_ERASE_SETTINGS_COMP_EVT.
Event parameters of ESP_BLE_MESH_PROVISIONER_DRIECT_ERASE_SETTINGS_COMP_EVT

uint8_t index
Index of Provisioner settings

struct esp_ble_mesh_prov_cb_param_t::[anonymous] provisioner_open_settings_with_index_comp
ESP_BLE_MESH_PROVISIONER_OPEN_SETTINGS_WITH_INDEX_COMP_EVT.
Event parameter of ESP_BLE_MESH_PROVISIONER_OPEN_SETTINGS_WITH_INDEX_COMP_EVT
Chapter 2. API Reference

char uid[ESP_BLE_MESH_SETTINGS_UID_SIZE + 1]
Provisioner settings user id

struct esp_ble_mesh_prov_cb_param_t::{anonymous} provisioner_open_settings_with_uid_comp
ESP_BLE_MESH_PROVISIONER_OPEN_SETTINGS_WITH_UID_COMP_EVT.
Event parameters of ESP_BLE_MESH_PROVISIONER_OPEN_SETTINGS_WITH_UID_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::{anonymous} provisioner_close_settings_with_index_comp
ESP_BLE_MESH_PROVISIONER_CLOSE_SETTINGS_WITH_INDEX_COMP_EVT.
Event parameter of ESP_BLE_MESH_PROVISIONER_CLOSE_SETTINGS_WITH_INDEX_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::{anonymous} provisioner_close_settings_with_uid_comp
ESP_BLE_MESH_PROVISIONER_CLOSE_SETTINGS_WITH_UID_COMP_EVT.
Event parameters of ESP_BLE_MESH_PROVISIONER_CLOSE_SETTINGS_WITH_UID_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::{anonymous} provisioner_delete_settings_with_index_comp
ESP_BLE_MESH_PROVISIONER_DELETE_SETTINGS_WITH_INDEX_COMP_EVT.
Event parameter of ESP_BLE_MESH_PROVISIONER_DELETE_SETTINGS_WITH_INDEX_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::{anonymous} provisioner_delete_settings_with_uid_comp
ESP_BLE_MESH_PROVISIONER_DELETE_SETTINGS_WITH_UID_COMP_EVT.
Event parameters of ESP_BLE_MESH_PROVISIONER_DELETE_SETTINGS_WITH_UID_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::{anonymous} ble_mesh_set_fast_prov_info_comp_param
set_fast_prov_info_comp
Event parameter of ESP_BLE_MESH_SET_FAST_PROV_INFO_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::{anonymous} ble_mesh_set_fast_prov_action_comp_param
set_fast_prov_action_comp
Event parameter of ESP_BLE_MESH_SET_FAST_PROV_ACTION_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::{anonymous} ble_mesh_heartbeat_msg_recv
heartbeat_msg_recv
Event parameter of ESP_BLE_MESH_HEARTBEAT_MESSAGE_RECV_EVT

struct esp_ble_mesh_prov_cb_param_t::{anonymous} ble_mesh_lpn_enable_comp_param
lpn_enable_comp
Event parameter of ESP_BLE_MESH_LPN_ENABLE_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::{anonymous} ble_mesh_lpn_disable_comp_param
lpn_disable_comp
Event parameter of ESP_BLE_MESH_LPN_DISABLE_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::{anonymous} ble_mesh_lpn_poll_comp_param
lpn_poll_comp
Event parameter of ESP_BLE_MESH_LPN_POLL_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::{anonymous} ble_mesh_lpn_friendship_establish_param
lpn_friendship_establish
Event parameter of ESP_BLE_MESH_LPN_FRIENDSHIP_ESTABLISH_EVT

struct esp_ble_mesh_prov_cb_param_t::{anonymous} ble_mesh_lpn_friendship_terminate_param
lpn_friendship_terminate
Event parameter of ESP_BLE_MESH_LPN_FRIENDSHIP_TERMINATE_EVT

struct esp_ble_mesh_prov_cb_param_t::{anonymous} ble_mesh_friend_friendship_establish_param
frnd_friendship_establish
Event parameter of ESP_BLE_MESH_FRIEND_FRIENDSHIP_ESTABLISH_EVT

struct esp_ble_mesh_prov_cb_param_t::{anonymous} ble_mesh_friend_friendship_terminate_param
frnd_friendship_terminate
Event parameter of ESP_BLE_MESH_FRIEND_FRIENDSHIP_TERMINATE_EVT

struct esp_ble_mesh_prov_cb_param_t::{anonymous} ble_mesh_proxy_client_recv_adv_pkt_param
proxy_client_recv_adv_pkt
Event parameter of ESP_BLE_MESH_PROXY_CLIENT_RECV_ADV_PKT_EVT

struct esp_ble_mesh_prov_cb_param_t::{anonymous} ble_mesh_proxy_client_connected_param
proxy_client_connected
Event parameter of ESP_BLE_MESH_PROXY_CLIENT_CONNECTED_EVT

struct esp_ble_mesh_prov_cb_param_t::{anonymous} ble_mesh_proxy_clientDisconnected_param
proxy_clientDisconnected
Event parameter of ESP_BLE_MESH_PROXY_CLIENT_DISCONNECTED_EVT

struct esp_ble_mesh_prov_cb_param_t::{anonymous} ble_mesh_proxy_client_recv_filter_status_param
proxy_client_recv_filter
Event parameter of ESP_BLE_MESH_PROXY_CLIENT_RECV_FILTER_STATUS_EVT
**Public Members**

```c
int err_code
```

Indicate the result of BLE Mesh deinitialization

**Public Types**

```c
enum [anonymous]
```

This enum value is the reason of friendship termination on the friend node side

**Values:**

```c
ESP_BLE_MESH_FRND_FRIENDSHIP_TERMINATE_ESTABLISH_FAIL
```

Friend Offer has been sent, but Friend Offer is not received within 1 second, friendship fails to be established

```c
ESP_BLE_MESH_FRND_FRIENDSHIP_TERMINATE_POLL_TIMEOUT
```

Friendship is established, PollTimeout timer expires and no Friend Poll/Sub Add/Sub Remove is received

```c
ESP_BLE_MESH_FRND_FRIENDSHIP_TERMINATE_RECV_FRND_REQ
```

Receive Friend Request from existing Low Power Node

```c
ESP_BLE_MESH_FRND_FRIENDSHIP_TERMINATE_RECV_FRND_CLEAR
```

Receive Friend Clear from other friend node
ESP_BLE_MESH_FRND_FRIENDSHIP_TERMINATE_DISABLE
Friend feature disabled or corresponding NetKey is deleted

Public Members

uint16_t lpn_addr
Low Power Node unicast address

esp_ble_mesh_prov_cb_param_t::ble_mesh_friend_friendship_terminate_param::[anonymous] reason
This enum value is the reason of friendship termination on the friend node side Friendship terminated reason

struct ble_mesh_heartbeat_msg_recv_param
#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_HEARTBEAT_MESSAGE_RECV_EVT.

Public Members

uint8_t hops
Heartbeat hops (InitTTL - RxTTL + 1)

uint16_t feature
Bit field of currently active features of the node

struct ble_mesh_input_evt_param
#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_NODE_PROV_INPUT_EVT.

Public Members

esp_ble_mesh_input_action_t action
Action of Input OOB Authentication

uint8_t size
Size of Input OOB Authentication

struct ble_mesh_input_number_comp_param
#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_NODE_PROV_INPUT_NUM_COMP_EVT.

Public Members

int err_code
Indicate the result of inputting number

struct ble_mesh_input_string_comp_param
#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_NODE_PROV_INPUT_STR_COMP_EVT.

Public Members

int err_code
Indicate the result of inputting string

struct ble_mesh_link_close_evt_param
#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_NODE_PROV_LINK_CLOSE_EVT.
Public Members

```c
struct ble_mesh_link_open_evt_param
#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_NODE_PROV_LINK_OPEN_EVT.
```

Public Members

```c
struct ble_mesh_lpn_disable_comp_param

```

Public Members

`uint8_t conn_handle`
Proxy connection handle

`uint16_t server_addr`
Proxy Server primary element address

`uint16_t net_idx`
Corresponding NetKey Index
Chapter 2. API Reference

```
uint8_t filter_type
    Proxy Server filter type (whitelist or blacklist)

uint16_t list_size
    Number of addresses in the Proxy Server filter list

struct ble_mesh_proxy_client_remove_filter_addr_comp_param
    #include <esp_ble_mesh_defs.h> ESP_BLE_MESH_PROXY_CLIENT_REMOVE_FILTER_ADDR_COMP_EVT.

Public Members

int err_code
    Indicate the result of Proxy Client remove filter address

uint8_t conn_handle
    Proxy connection handle

uint16_t net_idx
    Corresponding NetKey Index

struct ble_mesh_proxy_client_set_filter_type_comp_param
    #include <esp_ble_mesh_defs.h> ESP_BLE_MESH_PROXY_CLIENT_SET_FILTER_TYPE_COMP_EVT.

Public Members

int err_code
    Indicate the result of Proxy Client set filter type

uint8_t conn_handle
    Proxy connection handle

uint16_t net_idx
    Corresponding NetKey Index

struct ble_mesh_proxy_gatt_disable_comp_param
    #include <esp_ble_mesh_defs.h> ESP_BLE_MESH_NODE_PROXY_GATT_DISABLE_COMP_EVT.

Public Members

int err_code
    Indicate the result of disabling Mesh Proxy Service

struct ble_mesh_proxy_gatt_enable_comp_param
    #include <esp_ble_mesh_defs.h> ESP_BLE_MESH_NODE_PROXY_GATT_ENABLE_COMP_EVT.

Public Members

int err_code
    Indicate the result of enabling Mesh Proxy Service

struct ble_mesh_proxy_identity_enable_comp_param
    #include <esp_ble_mesh_defs.h> ESP_BLE_MESH_NODE_PROXY_IDENTITY_ENABLE_COMP_EVT.

Public Members

int err_code
    Indicate the result of enabling Mesh Proxy advertising
```

```c
struct ble_mesh_set_fast_prov_action_comp_param
#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_SET_FAST_PROV_ACTION_COMP_EVT.

Public Members

uint8_t status_action
Indicate the result of setting action of fast provisioning
```

```c
struct ble_mesh_set_fast_prov_info_comp_param
#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_SET_FAST_PROV_INFO_COMP_EVT.

Public Members

uint8_t statusunicast
Indicate the result of setting unicast address range of fast provisioning
uint8_t statusnet_idx
Indicate the result of setting NetKey Index of fast provisioning
uint8_t statusmatch
Indicate the result of setting matching Device UUID of fast provisioning
```

```c
struct ble_mesh_set_oob_pub_key_comp_param
#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_NODE_PROV_SET_OOB_PUB_KEY_COMP_EVT.

Public Members

int err_code
Indicate the result of setting OOB Public Key
```

```c
struct ble_mesh_set_unprov_dev_name_comp_param
#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_NODE_SET_UNPROV_DEV_NAME_COMP_EVT.

Public Members

int err_code
Indicate the result of setting BLE Mesh device name
```

```c
union esp_ble_mesh_server_state_value_t
#include <esp_ble_mesh_defs.h> Server model state value union.

Public Members

uint8_t onoff
The value of the Generic OnOff state
The value of the Light LC Light OnOff state
```

```c
struct esp_ble_mesh_server_state_value_t::[anonymous] gen_onoff
The Generic OnOff state
```

```c
int16_t level
The value of the Generic Level state
```

```c
struct esp_ble_mesh_server_state_value_t::[anonymous] gen_level
The Generic Level state
```

```c
uint8_t onpowerup
The value of the Generic OnPowerUp state
```
struct esp_ble_mesh_server_state_value_t::[anonymous] gen_onpowerup
    The Generic OnPowerUp state

uint16_t power
    The value of the Generic Power Actual state

struct esp_ble_mesh_server_state_value_t::[anonymous] gen_power_actual
    The Generic Power Actual state

uint16_t lightness
    The value of the Light Lightness Actual state
    The value of the Light Lightness Linear state
    The value of the Light CTL Lightness state
    The value of the Light HSL Lightness state
    The value of the Light xyl Lightness state

struct esp_ble_mesh_server_state_value_t::[anonymous] light_lightness_actual
    The Light Lightness Actual state

struct esp_ble_mesh_server_state_value_t::[anonymous] light_lightness_linear
    The Light Lightness Linear state

struct esp_ble_mesh_server_state_value_t::[anonymous] light_ctl_lightness
    The Light CTL Lightness state

uint16_t temperature
    The value of the Light CTL Temperature state

int16_t delta_uv
    The value of the Light CTL Delta UV state

struct esp_ble_mesh_server_state_value_t::[anonymous] light_ctl_temp_delta_uv
    The Light CTL Temperature & Delta UV states

uint16_t hue
    The value of the Light HSL Hue state

uint16_t saturation
    The value of the Light HSL Saturation state

struct esp_ble_mesh_server_state_value_t::[anonymous] light_hsl
    The Light HSL composite state

struct esp_ble_mesh_server_state_value_t::[anonymous] light_hsl_lightness
    The Light HSL Lightness state

struct esp_ble_mesh_server_state_value_t::[anonymous] light_hsl_hue
    The Light HSL Hue state

struct esp_ble_mesh_server_state_value_t::[anonymous] light_hsl_saturation
    The Light HSL Saturation state

struct esp_ble_mesh_server_state_value_t::[anonymous] light_xyl_lightness
    The Light xyl Lightness state

struct esp_ble_mesh_server_state_value_t::[anonymous] light_lc_light_onoff
    The Light LC Light OnOff state

union esp_ble_mesh_model_cb_param_t
    #include <esp_ble_mesh_defs.h> BLE Mesh model callback parameters union.
Public Members

```c
struct esp_ble_mesh_model_cb_param_t::ble_mesh_model_operation_evt_param model_operation
    Event parameter of ESP_BLE_MESH_MODEL_OPERATION_EVT

struct esp_ble_mesh_model_cb_param_t::ble_mesh_model_send_comp_param model_send_comp
    Event parameter of ESP_BLE_MESH_MODEL_SEND_COMP_EVT

struct esp_ble_mesh_model_cb_param_t::ble_mesh_model_publish_comp_param model_publish_comp
    Event parameter of ESP_BLE_MESH_MODEL_PUBLISH_COMP_EVT

struct esp_ble_mesh_model_cb_param_t::ble_mesh_mod_recv_publish_msg_param client_recv_publish_msg
    Event parameter of ESP_BLE_MESH_CLIENT_MODEL_RECV_PUBLISH_MSG_EVT

struct esp_ble_mesh_model_cb_param_t::ble_mesh_client_model_send_timeout_param client_send_timeout
    Event parameter of ESP_BLE_MESH_CLIENT_MODEL_SEND_TIMEOUT_EVT

struct esp_ble_mesh_model_cb_param_t::ble_mesh_model_publish_update_evt_param model_publish_update
    Event parameter of ESP_BLE_MESH_MODEL_PUBLISH_UPDATE_EVT

struct esp_ble_mesh_model_cb_param_t::ble_mesh_server_model_update_state_comp_param server_model_update_state
    Event parameter of ESP_BLE_MESH_SERVER_MODEL_UPDATE_STATE_COMP_EVT
```

```c
struct ble_mesh_client_model_send_timeout_param
    #include <esp_ble_mesh_defs.h> ESP_BLE_MESH_CLIENT_MODEL_SEND_TIMEOUT_EVT.
```

Public Members

```c
uint32_t opcode
    Opcode of the previously sent message

esp_ble_mesh_model_t *model
    Pointer to the model which sends the previous message

esp_ble_mesh_msg_ctx_t *ctx
    Pointer to the context of the previous message
```

```c
struct ble_mesh_mod_recv_publish_msg_param
    #include <esp_ble_mesh_defs.h> ESP_BLE_MESH_CLIENT_MODEL_RECV_PUBLISH_MSG_EVT.
```

Public Members

```c
uint32_t opcode
    Opcode of the unsolicited received message

esp_ble_mesh_model_t *model
    Pointer to the model which receives the message

esp_ble_mesh_msg_ctx_t *ctx
    Pointer to the context of the message

uint16_t length
    Length of the received message

uint8_t *msg
    Value of the received message
```

```c
struct ble_mesh_model_operation_evt_param
    #include <esp_ble_mesh_defs.h> ESP_BLE_MESH_MODEL_OPERATION_EVT.
```
Chapter 2. API Reference

Public Members

uint32_t opcode
  Opcode of the received message

esp_ble_mesh_model_t *model
  Pointer to the model which receives the message

esp_ble_mesh_msg_ctx_t *ctx
  Pointer to the context of the received message

uint16_t length
  Length of the received message

uint8_t *msg
  Value of the received message

struct ble_mesh_model_publish_comp_param
  #include <esp_ble_mesh_defs.h> ESP_BLE_MESH_MODEL_PUBLISH_COMP_EVT.

Public Members

int err_code
  Indicate the result of publishing a message

esp_ble_mesh_model_t *model
  Pointer to the model which publishes the message

struct ble_mesh_model_publish_update_evt_param
  #include <esp_ble_mesh_defs.h> ESP_BLE_MESH_MODEL_PUBLISH_UPDATE_EVT.

Public Members

esp_ble_mesh_model_t *model
  Pointer to the model which is going to update its publish message

struct ble_mesh_model_send_comp_param
  #include <esp_ble_mesh_defs.h> ESP_BLE_MESH_MODEL_SEND_COMP_EVT.

Public Members

int err_code
  Indicate the result of sending a message

uint32_t opcode
  Opcode of the message

esp_ble_mesh_model_t *model
  Pointer to the model which sends the message

esp_ble_mesh_msg_ctx_t *ctx
  Context of the message

struct ble_mesh_server_model_update_state_comp_param
  #include <esp_ble_mesh_defs.h> ESP_BLE_MESH_SERVER_MODEL_UPDATE_STATE_COMP_EVT.
Public Members

```c
int err_code
```
Indicate the result of updating server model state

```c
esp_ble_mesh_model_t *model
```
Pointer to the server model which state value is updated

```c
esp_ble_mesh_server_state_type_t type
```
Type of the updated server state

Structures

```c
struct esp_ble_mesh_deinit_param_t
```
BLE Mesh deinit parameters

Public Members

```c
bool erase_flash
```
Indicate if erasing flash when deinit mesh stack

```c
struct esp_ble_mesh_elem_t
```
Abstraction that describes a BLE Mesh Element. This structure is associated with struct bt_mesh_elem in mesh_access.h

Public Members

```c
uint16_t element_addr
```
Element Address, assigned during provisioning.

```c
const uint16_t location
```
Location Descriptor (GATT Bluetooth Namespace Descriptors)

```c
const uint8_t sig_model_count
```
SIG Model count

```c
const uint8_t vnd_model_count
```
Vendor Model count

```c
esp_ble_mesh_model_t *sig_models
```
SIG Models

```c
esp_ble_mesh_model_t *vnd_models
```
Vendor Models

```c
struct esp_ble_mesh_model_pub_t
```
Abstraction that describes a model publication context. This structure is associated with struct bt_mesh_model_pub in mesh_access.h

Public Members

```c
esp_ble_mesh_model_t *model
```
Pointer to the model to which the context belongs. Initialized by the stack.

```c
uint16_t publish_addr
```
Publish Address.

```c
uint16_t app_idx : 12
```
Publish AppKey Index.

```c
uint16_t cred : 1
```
Friendship Credentials Flag.
uint16_t send_rel : 1
    Force reliable sending (segment acks)
uint8_t ttl
    Publish Time to Live.
uint8_t retransmit
    Retransmit Count & Interval Steps.
uint8_t period
    Publish Period.
uint8_t period_div : 4
    Divisor for the Period.
uint8_t fast_period : 1
    Use FastPeriodDivisor
uint8_t count : 3
    Retransmissions left.
uint32_t period_start
    Start of the current period.

struct net_buf_simple *msg
    Publication buffer, containing the publication message.
    This will get correctly created when the publication context has been defined using the
    ESP_BLE_MESH_MODEL_PUB_DEFINE macro.
    ESP_BLE_MESH_MODEL_PUB_DEFINE(name, size);

esp_ble_mesh_cb_t update
    Callback used to update publish message. Initialized by the stack.

struct k_delayed_work timer
    Publish Period Timer. Initialized by the stack.

uint8_t dev_role
    Role of the device that is going to publish messages

struct esp_ble_mesh_model_op_t
    Abstraction that describes a model operation context. This structure is associated with struct
    bt_mesh_model_op in mesh_access.h

Public Members

const uint32_t opcode
    Message opcode
const size_t min_len
    Message minimum length

esp_ble_mesh_cb_t param_cb
    Callback used to handle message. Initialized by the stack.

struct esp_ble_mesh_model_cbs_t
    Abstraction that describes a model callback structure. This structure is associated with struct
    bt_mesh_model_cb in mesh_access.h.

Public Members

esp_ble_mesh_cb_t init_cb
    Callback used during model initialization. Initialized by the stack.
struct esp_ble_mesh_model
Abstraction that describes a Mesh Model instance. This structure is associated with struct bt_mesh_model in mesh_access.h

Public Members

cons uint16_t model_id
16-bit model identifier

c uint16_t company_id
16-bit company identifier

c uint16_t model_id
16-bit model identifier

struct esp_ble_mesh_model::[anonymous]:[anonymous]::[anonymous]
Structure encapsulating a model ID with a company ID

union esp_ble_mesh_model::[anonymous] [anonymous]
Model ID

uint8_t element_idx
Internal information, mainly for persistent storage Belongs to Nth element

uint8_t model_idx
Is the Nth model in the element

uint16_t flags
Information about what has changed

esp_ble_mesh_elem_t *element
The Element to which this Model belongs

esp_ble_mesh_model_pub_t *const pub
Model Publication

uint16_t keys[CONFIG_BLE_MESH_MODEL_KEY_COUNT]
AppKey List

uint16_t groups[CONFIG_BLE_MESH_MODEL_GROUP_COUNT]
Subscription List (group or virtual addresses)

esp_ble_mesh_model_op_t *op
Model operation context

esp_ble_mesh_model_cbs_t *cb
Model callback structure

void *user_data
Model-specific user data

struct esp_ble_mesh_msg_ctx_t
Message sending context. This structure is associated with struct bt_mesh_msg_ctx in mesh_access.h

Public Members

uint16_t net_idx
NetKey Index of the subnet through which to send the message.

uint16_t app_idx
AppKey Index for message encryption.

uint16_t addr
Remote address.
uint16_t recv_dst
    Destination address of a received message. Not used for sending.

int8_t recv_rssi
    RSSI of received packet. Not used for sending.

uint8_t recv_ttl : 7
    Received TTL value. Not used for sending.

uint8_t send_rel : 1
    Force sending reliably by using segment acknowledgement

uint8_t send_ttl
    TTL, or ESP_BLE_MESH_TTL_DEFAULT for default TTL.

uint32_t recv_op
    Opcode of a received message. Not used for sending message.

esp_ble_mesh_model_t *model
    Model corresponding to the message, no need to be initialized before sending message

bool srv_send
    Indicate if the message is sent by a node server model, no need to be initialized before sending message

struct esp_ble_mesh_prov_t
    Provisioning properties & capabilities. This structure is associated with struct bt_mesh_prov in mesh_access.h

struct esp_ble_mesh_comp_t
    Node Composition data context. This structure is associated with struct bt_mesh_comp in mesh_access.h

**Public Members**

uint16_t cid
    16-bit SIG-assigned company identifier

uint16_t pid
    16-bit vendor-assigned product identifier

uint16_t vid
    16-bit vendor-assigned product version identifier

size_t element_count
    Element count

esp_ble_mesh_elem_t *elements
    A sequence of elements

struct esp_ble_mesh_unprov_dev_add_t
    Information of the device which is going to be added for provisioning.

**Public Members**

esp_ble_mesh_bd_addr_t addr
    Device address

esp_ble_mesh_addr_type_t addr_type
    Device address type

uint8_t uuid[16]
    Device UUID

uint16_t oob_info
    Device OOB Info ADD_DEV_START_PROV_NOW_FLAG shall not be set if the bearer has both PB-ADV and PB-GATT enabled
**struct esp_ble_mesh_prov_bearer_t**
Provisioning Bearer

**Public Members**

- `esp_ble_mesh_bd_addr_t addr`
  Device address

- `esp_ble_mesh_addr_type_t addr_type`
  Device address type

- `uint8_t uuid[16]`
  Device UUID

- `uint8_t flag`
  BIT0: device address; BIT1: device UUID

**struct esp_ble_mesh_device_delete_t**
Information of the device which is going to be deleted.

**Public Members**

- `esp_ble_mesh_bd_addr_t addr`
  Device address

- `esp_ble_mesh_addr_type_t addr_type`
  Device address type

- `uint8_t uuid[16]`
  Device UUID

- `uint8_t flag`
  BIT0: device address; BIT1: device UUID

**struct esp_ble_mesh_prov_data_info_t**
Information of the provisioner which is going to be updated.

**Public Members**

- `uint16_t net_idx`
  NetKey Index

- `uint8_t flags`
  Flags

- `uint32_t iv_index`
  IV Index

- `uint8_t flag`
  BIT0: net_idx; BIT1: flags; BIT2: iv_index

**struct esp_ble_mesh_node_t**
Information of the provisioned node

**Public Members**

- `esp_ble_mesh_bd_addr_t addr`
  Node device address

- `esp_ble_mesh_addr_type_t addr_type`
  Node device address type

- `uint8_t dev_uuid[16]`
  Device UUID

- `uint16_t oob_info`
  Node OOB information

- `uint16_t unicast_addr`
  Node unicast address

- `uint8_t element_num`
  Node element number

- `uint16_t net_idx`
  Node NetKey Index
uint8_t flags
    Node key refresh flag and iv update flag

tuint32_t iv_index
    Node IV Index

tuint8_t dev_key[16]
    Node device key

tchar name[ESP_BLE_MESH_NODE_NAME_MAX_LEN + 1]
    Node name

tuint16_t comp_length
    Length of Composition Data

tuint8_t *comp_data
    Value of Composition Data

struct esp_ble_mesh_fast_prov_info_t
    Context of fast provisioning which need to be set.

Public Members

uint16_t unicast_min
    Minimum unicast address used for fast provisioning

uint16_t unicast_max
    Maximum unicast address used for fast provisioning

uint16_t net_idx
    Netkey index used for fast provisioning

uint8_t flags
    Flags used for fast provisioning

uint32_t iv_index
    IV Index used for fast provisioning

uint8_t offset
    Offset of the UUID to be compared

uint8_t match_len
    Length of the UUID to be compared

uint8_t match_val[16]
    Value of UUID to be compared

struct esp_ble_mesh_heartbeat_filter_info_t
    Context of Provisioner heartbeat filter information to be set

Public Members

uint16_t hb_src
    Heartbeat source address (unicast address)

uint16_t hb_dst
    Heartbeat destination address (unicast address or group address)

struct esp_ble_mesh_client_op_pair_t
    BLE Mesh client models related definitions.

    Client model Get/Set message opcode and corresponding Status message opcode
Public Members

uint32_t cli_op
The client message opcode

uint32_t status_op
The server status opcode corresponding to the client message opcode

struct esp_ble_mesh_client_t
Client Model user data context.

Public Members

esp_ble_mesh_model_t *model
Pointer to the client model. Initialized by the stack.

int op_pair_size
Size of the op_pair

const esp_ble_mesh_client_op_pair_t *op_pair
Table containing get/set message opcode and corresponding status message opcode

uint32_t publish_status
Callback used to handle the received unsolicited message. Initialized by the stack.

void *internal_data
Pointer to the internal data of client model

uint8_t msg_role
Role of the device (Node/Provisioner) that is going to send messages

struct esp_ble_mesh_client_common_param_t
Common parameters of the messages sent by Client Model.

Public Members

esp_ble_mesh_opcode_t opcode
Message opcode

esp_ble_mesh_model_t *model
Pointer to the client model structure

esp_ble_mesh_msg_ctx_t *ctx
The context used to send message

int32_t msg_timeout
Timeout value (ms) to get response to the sent message Note: if using default timeout value in menuconfig, make sure to set this value to 0

uint8_t msg_role
Role of the device - Node/Provisioner

struct esp_ble_mesh_state_transition_t
Parameters of the server model state transition

Public Functions

BLE_MESH_ATOMIC_DEFINE (flag, ESP_BLE_MESH_SERVER_FLAG_MAX)
Flag used to indicate if the transition timer has been started internally.

If the model which contains esp_ble_mesh_state_transition_t sets “set_auto_rsp” to ESP_BLE_MESH_SERVER_RSP_BY_APP, the handler of the timer shall be initialized by the users.
And users can use this flag to indicate whether the timer is started or not.

**Public Members**

bool just_started
Indicate if the state transition has just started

uint8_t trans_time
State transition time

uint8_t remain_time
Remaining time of state transition

uint8_t delay
Delay before starting state transition

uint32_t quo_tt
Duration of each divided transition step

uint32_t counter
Number of steps which the transition duration is divided

uint32_t total_duration
State transition total duration

int64_t start_timestamp
Time when the state transition is started

**struct k_delayed_work timer**
Timer used for state transition

**struct esp_ble_mesh_last_msg_info_t**
Parameters of the server model received last same set message.

**Public Members**

uint8_t tid
Transaction number of the last message

uint16_t src
Source address of the last message

uint16_t dst
Destination address of the last message

int64_t timestamp
Time when the last message is received

**struct esp_ble_mesh_server_rsp_ctrl_t**
Parameters of the Server Model response control

**Public Members**

uint8_t get_auto_rsp : 1
BLE Mesh Server Response Option.

1. If get_auto_rsp is set to ESP_BLE_MESH_SERVER_RSP_BY_APP, then the response of Client Get messages need to be replied by the application;
2. If get_auto_rsp is set to ESP_BLE_MESH_SERVER_AUTO_RSP, then the response of Client Get messages will be replied by the server models;
3. If set_auto_rsp is set to ESP_BLE_MESH_SERVER_RSP_BY_APP, then the response of Client Set messages need to be replied by the application;
4. If set_auto_rsp is set to ESP_BLE_MESH_SERVER_AUTO_RSP, then the response of Client Set messages will be replied by the server models;
5. If status_auto_rsp is set to ESP_BLE_MESH_SERVER_RSP_BY_APP, then the response of Server Status messages need to be replied by the application;
6. If status_auto_rsp is set to ESP_BLE_MESH_SERVER_AUTO_RSP, then the response of Server Status messages will be replied by the server models; Response control for Client Get messages

```
uint8_t set_auto_rsp : 1
   Response control for Client Set messages

uint8_t status_auto_rsp : 1
   Response control for Server Status messages
```

**Macros**

**ESP_BLE_MESH_SDU_MAX_LEN**
< The maximum length of a BLE Mesh message, including Opcode, Payload and TransMIC Length of a short Mesh MIC.

**ESP_BLE_MESH_MIC_SHORT**
Length of a long Mesh MIC.

**ESP_BLE_MESH_MIC_LONG**
The maximum length of a BLE Mesh provisioned node name

**ESP_BLE_MESH_NODE_NAME_MAX_LEN**
The maximum length of a BLE Mesh unprovisioned device name

**ESP_BLE_MESH_DEVICE_NAME_MAX_LEN**
The maximum length of settings user id

**ESP_BLE_MESH_SETTINGS_UID_SIZE**
Invalid settings index

**ESP_BLE_MESH_INVALID_SETTINGS_IDX**
Define the BLE Mesh octet 16 bytes size

**ESP_BLE_MESH_OCTET16_LEN**

**ESP_BLE_MESH_OCTET8_LEN**

**ESP_BLE_MESH_CID_NVAL**
Special TTL value to request using configured default TTL

**ESP_BLE_MESH_TTL_DEFAULT**
Maximum allowed TTL value

**ESP_BLE_MESH_TTL_MAX**

**ESP_BLE_MESH_ADDR_UNASSIGNED**

**ESP_BLE_MESH_ADDR_ALL_NODES**

**ESP_BLE_MESH_ADDR_PROXIES**

**ESP_BLE_MESH_ADDR_FRIENDS**

**ESP_BLE_MESH_ADDR_RELAYS**

**ESP_BLE_MESH_KEY_UNUSED**

**ESP_BLE_MESH_KEY_DEV**

**ESP_BLE_MESH_KEY_PRIMARY**
Primary Network Key index

**ESP_BLE_MESH_KEY_ANY**
Relay state value

ESP_BLE_MESH_ADDR_IS_VIRTUAL(addr)
ESP_BLE_MESH_ADDR_IS_RFU(addr)
ESP_BLE_MESH_INVALID_NODE_INDEX
ESP_BLE_MESH_TRANSMIT(count, int_ms)
Encode transmission count & interval steps.
Note For example, ESP_BLE_MESH_TRANSMIT(2, 20) means that the message will be sent about
90ms (count is 3, step is 1, interval is 30 ms which includes 10ms of advertising interval random de-
lay).
Return BLE Mesh transmit value that can be used e.g. for the default values of the Configuration Model data.
Parameters
• count: Number of retransmissions (first transmission is excluded).
• int_ms: Interval steps in milliseconds. Must be greater than 0 and a multiple of 10.
ESP_BLE_MESH_GET_TRANSMIT_COUNT(transmit)
Decode transmit count from a transmit value.
Return Transmission count (actual transmissions equal to N + 1).
Parameters
• transmit: Encoded transmit count & interval value.
Chapter 2. API Reference

ESP_BLE_MESH_GET_TRANSMIT_INTERVAL (transmit)
Decodes transmit interval from a transmit value.

Return Transmission interval in milliseconds.

Parameters
• transmit: Encoded transmit count & interval value.

ESP_BLE_MESH_PUBLISH_TRANSMIT (count, int_ms)
Encode Publish Retransmit count & interval steps.

Return BLE Mesh transmit value that can be used e.g. for the default values of the Configuration Model data.

Parameters
• count: Number of retransmissions (first transmission is excluded).
• int_ms: Interval steps in milliseconds. Must be greater than 0 and a multiple of 50.

ESP_BLE_MESH_GET_PUBLISH_TRANSMIT_COUNT (transmit)
Decode Publish Retransmit count from a given value.

Return Retransmission count (actual transmissions equal to N + 1).

Parameters
• transmit: Encoded Publish Retransmit count & interval value.

ESP_BLE_MESH_GET_PUBLISH_TRANSMIT_INTERVAL (transmit)
Decode Publish Retransmit interval from a given value.

Callbacks which are not needed to be initialized by users (set with 0 and will be initialized internally)

Return Transmission interval in milliseconds.

Parameters
• transmit: Encoded Publish Retransmit count & interval value.

ESP_BLE_MESH_PROV_STATIC_OOB_MAX_LEN
Maximum length of string used by Output OOB authentication

ESP_BLE_MESH_PROV_OUTPUT_OOB_MAX_LEN
Maximum length of string used by Output OOB authentication

ESP_BLE_MESH_PROV_INPUT_OOB_MAX_LEN
Macros used to define message opcode

ESP_BLE_MESH_MODEL_OP_1 (b0)
ESP_BLE_MESH_MODEL_OP_2 (b0, b1)
ESP_BLE_MESH_MODEL_OP_3 (b0, cid)
This macro is associated with BLE_MESH_MODEL_CB in mesh_access.h

ESP_BLE_MESH_SIG_MODEL (_id, _op, _pub, _user_data)
This macro is associated with BLE_MESH_MODEL_VND_CB in mesh_access.h

ESP_BLE_MESH_VENDOR_MODEL (_company, _id, _op, _pub, _user_data)

ESP_BLE_MESH_ELEMENT (_loc, _mods, _vnd_mods)
Helper to define a BLE Mesh element within an array.

In case the element has no SIG or Vendor models, the helper macro ESP_BLE_MESH_MODEL_NONE can be given instead.

Note This macro is associated with BLE_MESH_ELEM in mesh_access.h

Parameters
• _loc: Location Descriptor.
• _mods: Array of SIG models.
• _vnd_mods: Array of vendor models.

ESP_BLE_MESH_PROV (uuid, sta_val, sta_val_len, out_size, out_act, in_size, in_act)

BT_OCTET32_LEN

BD_ADDR_LEN
Chapter 2. API Reference

ESP_BLE_MESH_ADDR_TYPE_PUBLIC
ESP_BLE_MESH_ADDR_TYPE_RANDOM
ESP_BLE_MESH_ADDR_TYPE_RPA_PUBLIC
ESP_BLE_MESH_ADDR_TYPE_RPA_RANDOM

ESP_BLE_MESH_MODEL_PUB_DEFINE (_name, _msg_len, _role)
Define a model publication context.
Parameters
• _name: Variable name given to the context.
• _msg_len: Length of the publication message.
• _role: Role of the device which contains the model.

ESP_BLE_MESH_MODEL_OP (_opcode, _min_len)
Define a model operation context.
Parameters
• _opcode: Message opcode.
• _min_len: Message minimum length.

ESP_BLE_MESH_MODEL_OP_END
Define the terminator for the model operation table. Each model operation struct array must use this terminator as the end tag of the operation unit.

ESP_BLE_MESH_MODEL_NONE
Helper to define an empty model array. This structure is associated with BLE_MESH_MODEL_NONE in mesh_access.h

ADD_DEV_RM_AFTER_PROV_FLAG
Device will be removed from queue after provisioned successfully

ADD_DEV_START_PROV_NOW_FLAG
Start provisioning device immediately

ADD_DEV_FLUSHABLE_DEV_FLAG
Device can be remove when queue is full and new device is going to added

DEL_DEV_ADDR_FLAG
DEL_DEV_UUID_FLAG
PROV_DATA_NET_IDX_FLAG
PROV_DATA_FLAGS_FLAG
PROV_DATA_IV_INDEX_FLAG
ESP_BLE_MESH_HEARTBEAT_FILTER_ACCEPTLIST
ESP_BLE_MESH_HEARTBEAT_FILTER_REJECTLIST
Provisioner heartbeat filter operation

ESP_BLE_MESH_HEARTBEAT_FILTER_ADD
ESP_BLE_MESH_HEARTBEAT_FILTER_REMOVE

Type Definitions

typedef u\_8_t esp\_ble\_mesh\_octet16\_t[ESP\_BLE\_MESH\_OCTET16\_LEN]
Define the BLE Mesh octet 8 bytes size
typedef u\_8_t esp\_ble\_mesh\_octet8\_t[ESP\_BLE\_MESH\_OCTET8\_LEN]
Invalid Company ID
typedef u\_32_t esp\_ble\_mesh\_cb\_t
typedef u\_8_t \_UIN\_T8
typedef u\_16_t \_UIN\_T16
typedef u\_32_t \_UIN\_T32
typedef u\_64_t \_UIN\_T64
typedef \_UIN\_T8 BT\_OCTET32[BT\_OCTET32\_LEN]
typedef u\_8_t BD\_ADDR[BD\_ADDR\_LEN]
typedef u\_8_t esp\_ble\_mesh\_bd\_addr\_t[BD\_ADDR\_LEN]
typedef u\_8_t esp\_ble\_mesh\_addr\_type\_t
BLE device address type.
typedef struct esp_ble_mesh_model esp_ble_mesh_model_t

typedef uint8_t esp_ble_mesh_dev_add_flag_t

typedef uint32_t esp_ble_mesh_opcode_config_client_get_t
esp_ble_mesh_opcode_config_client_get_t belongs to esp_ble_mesh_opcode_t, this typedef is only used to locate the opcodes used by esp_ble_mesh_config_client_get_state. The following opcodes will only be used in the esp_ble_mesh_config_client_get_state function.

typedef uint32_t esp_ble_mesh_opcode_config_client_set_t
esp_ble_mesh_opcode_config_client_set_t belongs to esp_ble_mesh_opcode_t, this typedef is only used to locate the opcodes used by esp_ble_mesh_config_client_set_state. The following opcodes will only be used in the esp_ble_mesh_config_client_set_state function.

typedef uint32_t esp_ble_mesh_opcode_config_status_t
esp_ble_mesh_opcode_config_status_t belongs to esp_ble_mesh_opcode_t, this typedef is only used to locate the opcodes used by esp_ble_mesh_config_client_get_state. The following opcodes will only be used in the esp_ble_mesh_config_client_set_state function.

typedef uint32_t esp_ble_mesh_opcode_config_client_get_t
This typedef is only used to indicate the status code contained in some of the Configuration Server Model status message.

typedef uint32_t esp_ble_mesh_opcode_health_client_get_t
esp_ble_mesh_opcode_health_client_get_t belongs to esp_ble_mesh_opcode_t, this typedef is only used to locate the opcodes used by esp_ble_mesh_health_client_get_state. The following opcodes will only be used in the esp_ble_mesh_health_client_get_state function.

typedef uint32_t esp_ble_mesh_opcode_health_client_set_t
esp_ble_mesh_opcode_health_client_set_t belongs to esp_ble_mesh_opcode_t, this typedef is only used to locate the opcodes used by esp_ble_mesh_health_client_set_state. The following opcodes will only be used in the esp_ble_mesh_health_client_set_state function.

typedef uint32_t esp_ble_mesh_health_model_status_t
This typedef is only used to indicate the status code contained in some of the server models (e.g. Generic Server Model) status message.

typedef uint32_t esp_ble_mesh_generic_message_opcode_t
This typedef is only used to indicate the status code contained in some of the server models (e.g. Generic Server Model) status message.

typedef uint32_t esp_ble_mesh_sensor_message_opcode_t
This typedef is only used to indicate the status code contained in some of the server models (e.g. Generic Server Model) status message.

typedef uint32_t esp_ble_mesh_time_scene_message_opcode_t
This typedef is only used to indicate the status code contained in some of the server models (e.g. Generic Server Model) status message.

typedef uint32_t esp_ble_mesh_light_message_opcode_t
This typedef is only used to indicate the status code contained in some of the server models (e.g. Generic Server Model) status message.
Enumerations

enum esp_ble_mesh_cb_type_t

Values:

- ESP_BLE_MESH_TYPE_PROV_CB

Values:
ROLE_NODE = 0
ROLE_PROVISIONER
ROLE_FAST_PROV

enum esp_ble_mesh_fast_prov_action_t
Values:
FAST_PROV_ACT_NONE
FAST_PROV_ACT_ENTER
FAST_PROV_ACT_SUSPEND
FAST_PROV_ACT_EXIT
FAST_PROV_ACT_MAX

enum esp_ble_mesh_proxy_filter_type_t
Values:
PROXY_FILTER_WHITELIST
PROXY_FILTER_BLACKLIST

enum esp_ble_mesh_prov_cb_event_t
Values:
ESP_BLE_MESH_PROV.Register.COMP.EVT
  Initialize BLE Mesh provisioning capabilities and internal data information completion event
ESP_BLE_MESH_NODE_SET_UNPROV_DEV_NAME.COMP.EVT
  Set the unprovisioned device name completion event
ESP_BLE_MESH_NODE_PROV_ENABLE.COMP.EVT
  Enable node provisioning functionality completion event
ESP_BLE_MESH_NODE_PROV_DISABLE.COMP.EVT
  Disable node provisioning functionality completion event
ESP_BLE_MESH_NODE_PROV_LINK.OPEN.EVT
  Establish a BLE Mesh link event
ESP_BLE_MESH_NODE_PROV_LINK.CLOSE.EVT
  Close a BLE Mesh link event
ESP_BLE_MESH_NODE_PROV_OOB_PUB_KEY.EVT
  Generate Node input OOB public key event
ESP_BLE_MESH_NODE_PROV_OUTPUT.NUMBER.EVT
  Generate Node Output Number event
Chapter 2. API Reference

ESP_BLE_MESH_NODE_PROV_OUTPUT_STRING_EVT
Generate Node Output String event

ESP_BLE_MESH_NODE_PROV_INPUT_EVT
Event requiring the user to input a number or string

ESP_BLE_MESH_NODE_PROV_COMPLETE_EVT
Provisioning done event

ESP_BLE_MESH_NODE_PROV_RESET_EVT
Provisioning reset event

ESP_BLE_MESH_NODE_PROV_SET_OOB_PUB_KEY_COMP_EVT
Node set oob public key completion event

ESP_BLE_MESH_NODE_PROV_INPUT_NUMBER_COMP_EVT
Node input number completion event

ESP_BLE_MESH_NODE_PROV_INPUT_STRING_COMP_EVT
Node input string completion event

ESP_BLE_MESH_NODE_PROXY_IDENTITY_ENABLE_COMP_EVT
Enable BLE Mesh Proxy Identity advertising completion event

ESP_BLE_MESH_NODE_PROXY_GATT_ENABLE_COMP_EVT
Enable BLE Mesh GATT Proxy Service completion event

ESP_BLE_MESH_NODE_PROXY_GATT_DISABLE_COMP_EVT
Disable BLE Mesh GATT Proxy Service completion event

ESP_BLE_MESH_NODE_ADD_LOCAL_NET_KEY_COMP_EVT
Node add NetKey locally completion event

ESP_BLE_MESH_NODE_ADD_LOCAL_APP_KEY_COMP_EVT
Node add AppKey locally completion event

ESP_BLE_MESH_NODE_BIND_APP_KEY_TO_MODEL_COMP_EVT
Node bind AppKey to model locally completion event

ESP_BLE_MESH_PROVISIONER_PROV_ENABLE_COMP_EVT
Provisioner enable provisioning functionality completion event

ESP_BLE_MESH_PROVISIONER_PROV_DISABLE_COMP_EVT
Provisioner disable provisioning functionality completion event

ESP_BLE_MESH_PROVISIONER_PROV_RECV_UNPROV_ADV_PKT_EVT
Provisioner receives unprovisioned device beacon event

ESP_BLE_MESH_PROVISIONER_PROV_READ_OOB_PUB_KEY_EVT
Provisioner read unprovisioned device OOB public key event

ESP_BLE_MESH_PROVISIONER_PROV_INPUT_EVT
Provisioner input value for provisioning procedure event

ESP_BLE_MESH_PROVISIONER_PROV_OUTPUT_EVT
Provisioner output value for provisioning procedure event

ESP_BLE_MESH_PROVISIONER_PROV_LINK_OPEN_EVT
Provisioner establish a BLE Mesh link event

ESP_BLE_MESH_PROVISIONER_PROV_LINK_CLOSE_EVT
Provisioner close a BLE Mesh link event

ESP_BLE_MESH_PROVISIONER_PROV_COMPLETE_EVT
Provisioner provisioning done event

ESP_BLE_MESH_PROVISIONER_ADD_UNPROV_DEV_COMP_EVT
Provisioner add a device to the list which contains devices that are waiting/going to be provisioned completion event
**Chapter 2. API Reference**

- **ESP_BLE_MESH_PROVISIONER_PROV_DEV_WITH_ADDR_COMP_EVT**
  Provisioner start to provision an unprovisioned device completion event

- **ESP_BLE_MESH_PROVISIONER_DELETE_DEV_COMP_EVT**
  Provisioner delete a device from the list, close provisioning link with the device completion event

- **ESP_BLE_MESH_PROVISIONER_SET_DEV_UUID_MATCH_COMP_EVT**
  Provisioner set the value to be compared with part of the unprovisioned device UUID completion event

- **ESP_BLE_MESH_PROVISIONER_SET_PROV_DATA_INFO_COMP_EVT**
  Provisioner set net_idx(flags)/iv_index used for provisioning completion event

- **ESP_BLE_MESH_PROVISIONER_SET_STATIC_OOB_VALUE_COMP_EVT**
  Provisioner set static oob value used for provisioning completion event

- **ESP_BLE_MESH_PROVISIONER_SET_PRIMARY_ELEM_ADDR_COMP_EVT**
  Provisioner set unicast address of primary element completion event

- **ESP_BLE_MESH_PROVISIONER_PROV_READ_OOB_PUB_KEY_COMP_EVT**
  Provisioner read unprovisioned device OOB public key completion event

- **ESP_BLE_MESH_PROVISIONER_PROV_INPUT_NUMBER_COMP_EVT**
  Provisioner input number completion event

- **ESP_BLE_MESH_PROVISIONER_PROV_INPUT_STRING_COMP_EVT**
  Provisioner input string completion event

- **ESP_BLE_MESH_PROVISIONER_SET_NODE_NAME_COMP_EVT**
  Provisioner set node name completion event

- **ESP_BLE_MESH_PROVISIONER_ADD_LOCAL_APP_KEY_COMP_EVT**
  Provisioner add local app key completion event

- **ESP_BLE_MESH_PROVISIONER_UPDATE_LOCAL_APP_KEY_COMP_EVT**
  Provisioner update local app key completion event

- **ESP_BLE_MESH_PROVISIONER_BIND_APP_KEY_TO_MODEL_COMP_EVT**
  Provisioner bind local model with local app key completion event

- **ESP_BLE_MESH_PROVISIONER_ADD_LOCAL_NET_KEY_COMP_EVT**
  Provisioner add local network key completion event

- **ESP_BLE_MESH_PROVISIONER_UPDATE_LOCAL_NET_KEY_COMP_EVT**
  Provisioner update local network key completion event

- **ESP_BLE_MESH_PROVISIONER_STORE_NODE_COMP_DATA_COMP_EVT**
  Provisioner store node composition data completion event

- **ESP_BLE_MESH_PROVISIONER_DELETE_NODE_WITH_UUID_COMP_EVT**
  Provisioner delete node with uuid completion event

- **ESP_BLE_MESH_PROVISIONER_DELETE_NODE_WITH_ADDR_COMP_EVT**
  Provisioner delete node with unicast address completion event

- **ESP_BLE_MESH_PROVISIONER_ENABLE_HEARTBEAT_RECV_COMP_EVT**
  Provisioner start to receive heartbeat message completion event

- **ESP_BLE_MESH_PROVISIONER_SET_HEARTBEAT_FILTER_TYPE_COMP_EVT**
  Provisioner set the heartbeat filter type completion event

- **ESP_BLE_MESH_PROVISIONER_SET_HEARTBEAT_FILTER_INFO_COMP_EVT**
  Provisioner set the heartbeat filter information completion event

- **ESP_BLE_MESH_PROVISIONER_RECV_HEARTBEAT_MESSAGE_EVT**
  Provisioner receive heartbeat message event

- **ESP_BLE_MESH_PROVISIONER_DRIECT_ERASE_SETTINGS_COMP_EVT**
  Provisioner directly erase settings completion event
ESP_BLE_MESH_PROVISIONER_OPEN_SETTINGS_WITH_INDEX_COMP_EVT
Provisioner open settings with index completion event

ESP_BLE_MESH_PROVISIONER_OPEN_SETTINGS_WITH_UID_COMP_EVT
Provisioner open settings with user id completion event

ESP_BLE_MESH_PROVISIONER_CLOSESETTINGS_WITH_INDEX_COMP_EVT
Provisioner close settings with index completion event

ESP_BLE_MESH_PROVISIONER_CLOSE_SETTINGS_WITH_UID_COMP_EVT
Provisioner close settings with user id completion event

ESP_BLE_MESH_PROVISIONER_DELETE_SETTINGS_WITH_INDEX_COMP_EVT
Provisioner delete settings with index completion event

ESP_BLE_MESH_PROVISIONER_DELETE_SETTINGS_WITH_UID_COMP_EVT
Provisioner delete settings with user id completion event

ESP_BLE_MESH_SET_FAST_PROV_INFO_COMP_EVT
Set fast provisioning information (e.g. unicast address range, net_idx, etc.) completion event

ESP_BLE_MESH_SET_FAST_PROV_ACTION_COMP_EVT
Set fast provisioning action completion event

ESP_BLE_MESH_HEARTBEAT_MESSAGE_RECV_EVT
Receive Heartbeat message event

ESP_BLE_MESH_LPN_ENABLE_COMP_EVT
Enable Low Power Node completion event

ESP_BLE_MESH_LPN_DISABLE_COMP_EVT
Disable Low Power Node completion event

ESP_BLE_MESH_LPN_POLL_COMP_EVT
Low Power Node send Friend Poll completion event

ESP_BLE_MESH_LPN_FRIENDSHIP_ESTABLISH_EVT
Low Power Node establishes friendship event

ESP_BLE_MESH_LPN_FRIENDSHIP_TERMINATE_EVT
Low Power Node terminates friendship event

ESP_BLE_MESH_FRIEND_FRIENDSHIP_ESTABLISH_EVT
Friend Node establishes friendship event

ESP_BLE_MESH_FRIEND_FRIENDSHIP_TERMINATE_EVT
Friend Node terminates friendship event

ESP_BLE_MESH_PROXY_CLIENT_RECV_ADV_PKT_EVT
Proxy Client receives Network ID advertising packet event

ESP_BLE_MESH_PROXY_CLIENT_CONNECTED_EVT
Proxy Client establishes connection successfully event

ESP_BLE_MESH_PROXY_CLIENT_DISCONNECTED_EVT
Proxy Client terminates connection successfully event

ESP_BLE_MESH_PROXY_CLIENT_RECV_FILTER_STATUS_EVT
Proxy Client receives Proxy Filter Status event

ESP_BLE_MESH_PROXY_CLIENT_CONNECT_COMP_EVT
Proxy Client connect completion event

ESP_BLE_MESH_PROXY_CLIENT_DISCONNECT_COMP_EVT
Proxy Client disconnect completion event

ESP_BLE_MESH_PROXY_CLIENT_SET_FILTER_TYPE_COMP_EVT
Proxy Client set filter type completion event
Chapter 2. API Reference

**ESP_BLE_MESH_PROXY_CLIENT_ADD_FILTER_ADDR_COMP_EVT**
Proxy Client add filter address completion event

**ESP_BLE_MESH_PROXY_CLIENT_REMOVE_FILTER_ADDR_COMP_EVT**
Proxy Client remove filter address completion event

**ESP_BLE_MESH_MODEL_SUBSCRIBE_GROUP_ADDR_COMP_EVT**
Local model subscribes group address completion event

**ESP_BLE_MESH_MODEL_UNSUBSCRIBE_GROUP_ADDR_COMP_EVT**
Local model unsubscribes group address completion event

**ESP_BLE_MESH_DEINIT_MESH_COMP_EVT**
De-initialize BLE Mesh stack completion event

**ESP_BLE_MESH_PROV_EVT_MAX**

```c
enum [anonymous]
BLE Mesh server models related definitions.

This enum value is the flag of transition timer operation

*Values:*

ESP_BLE_MESH_SERVER_TRANS_TIMER_START
ESP_BLE_MESH_SERVER_FLAG_MAX
```

**enum esp_ble_mesh_server_state_type_t**
This enum value is the type of server model states

*Values:*

ESP_BLE_MESH_GENERIC_ONOFF_STATE
ESP_BLE_MESH_GENERIC_LEVEL_STATE
ESP_BLE_MESH_GENERIC_ONPOWERUP_STATE
ESP_BLE_MESH_GENERIC_POWER_ACTUAL_STATE
ESP_BLE_MESH_LIGHT_LIGHTNESS_ACTUAL_STATE
ESP_BLE_MESH_LIGHT_LIGHTNESS_LINEAR_STATE
ESP_BLE_MESH_LIGHT_CTL_LIGHTNESS_STATE
ESP_BLE_MESH_LIGHT_CTL_TEMP_DELTA_UV_STATE
ESP_BLE_MESH_LIGHT_HSL_STATE
ESP_BLE_MESH_LIGHT_HSL_LIGHTNESS_STATE
ESP_BLE_MESH_LIGHT_HSL_HUE_STATE
ESP_BLE_MESH_LIGHT_HSL_SATURATION_STATE
ESP_BLE_MESH_LIGHT_XYL_LIGHTNESS_STATE
ESP_BLE_MESH_LIGHT_LC_LIGHT_ONOFF_STATE
ESP_BLE_MESH_SERVER_MODEL_STATE_MAX

**enum esp_ble_mesh_model_cb_event_t**

*Values:*

ESP_BLE_MESH_MODEL_OPERATION_EVT
User-defined models receive messages from peer devices (e.g. get, set, status, etc) event

ESP_BLE_MESH_MODEL_SEND_COMP_EVT
User-defined models send messages completion event

ESP_BLE_MESH_MODEL_PUBLISH_COMP_EVT
User-defined models publish messages completion event
ESP_BLE_MESH_CLIENT_MODEL_RECV_PUBLISH_MSG_EVT
User-defined client models receive publish messages event

ESP_BLE_MESH_CLIENT_MODEL_SEND_TIMEOUT_EVT
Timeout event for the user-defined client models that failed to receive response from peer server models

ESP_BLE_MESH_MODEL_PUBLISH_UPDATE_EVT
When a model is configured to publish messages periodically, this event will occur during every publish period

ESP_BLE_MESH_SERVER_MODEL_UPDATE_STATE_COMP_EVT
Server models update state value completion event

ESP_BLE_MESH_MODEL_EVT_MAX

ESP-BLE-MESH Core API Reference

This section contains ESP-BLE-MESH Core related APIs, which can be used to initialize ESP-BLE-MESH stack, provision, send/publish messages, etc.

This API reference covers six components:

• ESP-BLE-MESH Stack Initialization
• Reading of Local Data Information
• Low Power Operation (Updating)
• Send/Publish Messages, add Local AppKey, etc.
• ESP-BLE-MESH Node/Provisioner Provisioning
• ESP-BLE-MESH GATT Proxy Server

ESP-BLE-MESH Stack Initialization

Header File

• components/bt/esp_ble_mesh/api/core/include/esp_ble_mesh_common_api.h

Functions

esp_err_t esp_ble_mesh_init (esp_ble_mesh_prov_t *prov, esp_ble_mesh_comp_t *comp)
Initialize BLE Mesh module. This API initializes provisioning capabilities and composition data information.

Note After calling this API, the device needs to call esp_ble_mesh_prov_enable() to enable provisioning functionality again.

Return ESP_OK on success or error code otherwise.

Parameters

• [in] prov: Pointer to the device provisioning capabilities. This pointer must remain valid during the lifetime of the BLE Mesh device.
• [in] comp: Pointer to the device composition data information. This pointer must remain valid during the lifetime of the BLE Mesh device.

esp_err_t esp_ble_mesh_deinit (esp_ble_mesh_deinit_param_t *param)
De-initialize BLE Mesh module.

Note This function shall be invoked after esp_ble_mesh_client_model_deinit().

Return ESP_OK on success or error code otherwise.

Parameters

• [in] param: Pointer to the structure of BLE Mesh deinit parameters.

Reading of Local Data Information
**Header File**

- components/bt/esp_ble_mesh/api/core/include/esp_ble_mesh_local_data_operation_api.h

**Functions**

```c
int32_t esp_ble_mesh_get_model_publish_period (esp_ble_mesh_model_t *model)
```

Get the model publish period, the unit is ms.

**Return**
Publish period value on success, 0 or (negative) error code from errno.h on failure.

**Parameters**

```c
uint16_t esp_ble_mesh_get_primary_element_address (void)
```

Get the address of the primary element.

**Return**
Address of the primary element on success, or ESP_BLE_MESH_ADDR_UNASSIGNED on failure which means the device has not been provisioned.

```c
uint16_t* esp_ble_mesh_is_model_subscribed_to_group (esp_ble_mesh_model_t *model,
                                                  uint16_t group_addr)
```

Check if the model has subscribed to the given group address. Note: E.g., once a status message is received and the destination address is a group address, the model uses this API to check if it is successfully subscribed to the given group address.

**Return**
Pointer to the group address within the Subscription List of the model on success, or NULL on failure which means the model has not subscribed to the given group address. Note: With the pointer to the group address returned, you can reset the group address to 0x0000 in order to unsubscribe the model from the group.

**Parameters**
- [in] model: Pointer to the model.
- [in] group_addr: Group address.

```c
esp_ble_mesh_elem_t* esp_ble_mesh_find_element (uint16_t element_addr)
```

Find the BLE Mesh element pointer via the element address.

**Return**
Pointer to the element on success, or NULL on failure.

**Parameters**
- [in] element_addr: Element address.

```c
uint8_t esp_ble_mesh_get_element_count (void)
```

Get the number of elements that have been registered.

**Return**
Number of elements.

```c
esp_ble_mesh_model_t* esp_ble_mesh_find_vendor_model (const esp_ble_mesh_elem_t *
                                                       element,
                                                       esp_ble_mesh_model_t *model,
                                                       uint16_t company_id,
                                                       uint16_t model_id)
```

Find the Vendor specific model with the given element, the company ID and the Vendor Model ID.

**Return**
Pointer to the Vendor Model on success, or NULL on failure which means the Vendor Model is not found.

**Parameters**
- [in] element: Element to which the model belongs.
- [in] company_id: A 16-bit company identifier assigned by the Bluetooth SIG.

```c
esp_ble_mesh_model_t* esp_ble_mesh_find_sig_model (const esp_ble_mesh_elem_t *
                                                      element,
                                                      uint16_t model_id)
```

Find the SIG model with the given element and Model id.

**Return**
Pointer to the SIG Model on success, or NULL on failure which means the SIG Model is not found.

**Parameters**
- [in] element: Element to which the model belongs.
```c
const esp_ble_mesh_comp_t* esp_ble_mesh_get_composition_data (void)
Get the Composition data which has been registered.
Return Pointer to the Composition data on success, or NULL on failure which means the Composition data
is not initialized.
```

```c
esp_err_t esp_ble_mesh_model_subscribe_group_addr (uint16_t element_addr, uint16_t company_id, uint16_t model_id, uint16_t group_addr)
A local model of node or Provisioner subscribes a group address.
Note This function shall not be invoked before node is provisioned or Provisioner is enabled.
Return ESP_OK on success or error code otherwise.
Parameters
• [in] element_addr: Unicast address of the element to which the model belongs.
• [in] group_addr: The group address to be subscribed.
```

```c
esp_err_t esp_ble_mesh_model_unsubscribe_group_addr (uint16_t element_addr, uint16_t company_id, uint16_t model_id, uint16_t group_addr)
A local model of node or Provisioner unsubscribes a group address.
Note This function shall not be invoked before node is provisioned or Provisioner is enabled.
Return ESP_OK on success or error code otherwise.
Parameters
• [in] element_addr: Unicast address of the element to which the model belongs.
• [in] group_addr: The subscribed group address.
```

```c
const uint8_t* esp_ble_mesh_node_get_local_net_key (uint16_t net_idx)
This function is called by Node to get the local NetKey.
Return NetKey on success, or NULL on failure.
Parameters
• [in] net_idx: NetKey index.
```

```c
const uint8_t* esp_ble_mesh_node_get_local_app_key (uint16_t app_idx)
This function is called by Node to get the local AppKey.
Return AppKey on success, or NULL on failure.
Parameters
• [in] app_idx: AppKey index.
```

```c
esp_err_t esp_ble_mesh_node_add_local_net_key (const uint8_t net_key[16], uint16_t net_idx)
This function is called by Node to add a local NetKey.
Note This function can only be called after the device is provisioned.
Return ESP_OK on success or error code otherwise.
Parameters
• [in] net_key: NetKey to be added.
• [in] net_idx: NetKey Index.
```

```c
esp_err_t esp_ble_mesh_node_add_local_app_key (const uint8_t app_key[16], uint16_t net_idx, uint16_t app_idx)
This function is called by Node to add a local AppKey.
Note The net_idx must be an existing one. This function can only be called after the device is provisioned.
Return ESP_OK on success or error code otherwise.
Parameters
• [in] app_key: AppKey to be added.
• [in] net_idx: NetKey Index.
```
Chapter 2. API Reference

* [in] **app_idx**: AppKey Index.

```c
esp_err_t esp_ble_mesh_node_bind_app_key_to_local_model(uint16_t element_addr, uint16_t company_id, uint16_t model_id, uint16_t app_idx)
```

This function is called by Node to bind AppKey to model locally.

**Note** If going to bind app_key with local vendor model, the company_id shall be set to 0xFFFF. This function can only be called after the device is provisioned.

**Return** ESP_OK on success or error code otherwise.

**Parameters**

* [in] **element_addr**: Node local element address
* [in] **company_id**: Node local company id
* [in] **model_id**: Node local model id
* [in] **app_idx**: Node local appkey index

### Low Power Operation (Updating)

**Header File**

* components/bt/esp_ble_mesh/api/core/include/esp_ble_mesh_low_power_api.h

**Functions**

* **esp_err_t esp_ble_mesh_lpn_enable**(void)
  
  Enable BLE Mesh device LPN functionality.

  **Note** This API enables LPN functionality. Once called, the proper Friend Request will be sent.

  **Return** ESP_OK on success or error code otherwise.

* **esp_err_t esp_ble_mesh_lpn_disable**(bool force)
  
  Disable BLE Mesh device LPN functionality.

  **Return** ESP_OK on success or error code otherwise.

  **Parameters**

  * [in] **force**: when disabling LPN functionality, use this flag to indicate whether directly clear corresponding information or just send friend clear to disable it if friendship has already been established.

* **esp_err_t esp_ble_mesh_lpn_poll**(void)
  
  LPN tries to poll messages from the Friend Node.

  **Note** The Friend Poll message is sent by a Low Power node to ask the Friend node to send a message that it has stored for the Low Power node. Users can call this API to send Friend Poll message manually. If this API is not invoked, the bottom layer of the Low Power node will send Friend Poll before the PollTimeout timer expires. If the corresponding Friend Update is received and MD is set to 0, which means there are no messages for the Low Power node, then the Low Power node will stop scanning.

  **Return** ESP_OK on success or error code otherwise.

### Send/Publish Messages, add Local AppKey, etc.

**Header File**

* components/bt/esp_ble_mesh/api/core/include/esp_ble_mesh_networking_api.h

**Functions**
**esp_err_t esp_ble_mesh_register_custom_model_callback (esp_ble_mesh_model_cb_t callback)**

Register BLE Mesh callback for user-defined models’ operations. This callback can report the following events generated for the user-defined models:

- Call back the messages received by user-defined client and server models to the application layer;
- If users call esp_ble_mesh_server/client_model_send, this callback notifies the application layer of the send_complete event;
- If user-defined client model sends a message that requires response, and the response message is received after the timer expires, the response message will be reported to the application layer as published by a peer device;
- If the user-defined client model fails to receive the response message during a specified period of time, a timeout event will be reported to the application layer.

**Note** The client models (i.e. Config Client model, Health Client model, Generic Client models, Sensor Client model, Scene Client model and Lighting Client models) that have been realized internally have their specific register functions. For example, esp_ble_mesh_register_config_client_callback is the register function for Config Client Model.

**Return** ESP_OK on success or error code otherwise.

**Parameters**

- **in** callback: Pointer to the callback function.

**esp_err_t esp_ble_mesh_model_msg_opcode_init (uint8_t *data, uint32_t opcode)**

Add the message opcode to the beginning of the model message before sending or publishing the model message.

**Note** This API is only used to set the opcode of the message.

**Return** ESP_OK on success or error code otherwise.

**Parameters**

- **in** data: Pointer to the message data.
- **in** opcode: The message opcode.

**esp_err_t esp_ble_mesh_client_model_init (esp_ble_mesh_model_t *model)**

Initialize the user-defined client model. All user-defined client models shall call this function to initialize the client model internal data. Node: Before calling this API, the op_pair_size and op_pair variabled within the user_data defined using esp_ble_mesh_client_t of the client model need to be initialized.

**Return** ESP_OK on success or error code otherwise.

**Parameters**

- **in** model: BLE Mesh Client model to which the message belongs.

**esp_err_t esp_ble_mesh_client_model_deinit (esp_ble_mesh_model_t *model)**

De-initialize the user-defined client model.

**Note** This function shall be invoked before esp_ble_mesh_deinit() is called.

**Return** ESP_OK on success or error code otherwise.

**Parameters**

- **in** model: Pointer of the Client model.

**esp_err_t esp_ble_mesh_server_model_send_msg (esp_ble_mesh_model_t *model, esp_ble_mesh_msg_ctx_t *ctx, uint32_t opcode, uint16_t length, uint8_t *data)**

Send server model messages (such as server model status messages).

**Return** ESP_OK on success or error code otherwise.

**Parameters**

- **in** model: BLE Mesh Server Model to which the message belongs.
- **in** ctx: Message context, includes keys, TTL, etc.
- **in** opcode: Message opcode.
- **in** length: Message length (exclude the message opcode).
- **in** data: Parameters of Access Payload (exclude the message opcode) to be sent.
Send client model message (such as model get, set, etc).

**Return** ESP_OK on success or error code otherwise.

**Parameters**

- [in] `model`: BLE Mesh Client Model to which the message belongs.
- [in] `ctx`: Message context, includes keys, TTL, etc.
- [in] `length`: Message length (include the message opcode).
- [in] `data`: Parameters of the Access Payload (exclude the message opcode) to be sent.
- [in] `msg_timeout`: Time to get response to the message (in milliseconds).
- [in] `need_rsp`: TRUE if the opcode requires the peer device to reply, FALSE otherwise.
- [in] `device_role`: Role of the device (Node/Provisioner) that sends the message.

Send a model publication message.

**Note** Before calling this function, the user needs to ensure that the model publication message (`esp_ble_mesh_model_pub_t::msg`) contains a valid message to be sent. And if users want to update the publishing message, this API should be called in `ESP_BLE_MESH_MODEL_PUBLISH_UPDATE_EVT` with the message updated.

**Return** ESP_OK on success or error code otherwise.

**Parameters**

- [in] `length`: Message length (include the message opcode).
- [in] `data`: Parameters of the Access Payload (exclude the message opcode) to be sent.
- [in] `device_role`: Role of the device (node/provisioner) publishing the message of the type `esp_ble_mesh_dev_role_t`.

Update a server model state value. If the model publication state is set properly (e.g. publish address is set to a valid address), it will publish corresponding status message.

**Note** Currently this API is used to update bound state value, not for all server model states.

**Return** ESP_OK on success or error code otherwise.

**Parameters**

- [in] `model`: Server model which is going to update the state.
- [in] `value`: Server model state value.

Reset the provisioning procedure of the local BLE Mesh node.

**Note** All provisioning information in this node will be deleted and the node needs to be re-provisioned. The API function `esp_ble_mesh_node_prov_enable()` needs to be called to start a new provisioning procedure.

**Return** ESP_OK on success or error code otherwise.

This function is called to set the node (provisioned device) name.

**Note** index is obtained from the parameters of ESP_BLE_MESH_PROVISIONER_PROV_COMPLETE_EVT.

**Return** ESP_OK on success or error code otherwise.

**Parameters**
• [in] index: Index of the node in the node queue.
• [in] name: Name (end by ‘\0’) to be set for the node.

const char *esp_ble_mesh_provisioner_get_node_name(uint16_t index)
This function is called to get the node (provisioned device) name.

Note index is obtained from the parameters of ESP_BLE_MESH_PROVISIONER_PROV_COMPLETE_EVT.
Return Node name on success, or NULL on failure.
Parameters
• [in] index: Index of the node in the node queue.

uint16_t esp_ble_mesh_provisioner_get_node_index(const char *name)
This function is called to get the node (provisioned device) index.

Return Node index on success, or an invalid value (0xFFFF) on failure.
Parameters
• [in] name: Name of the node (end by ‘\0’).

esp_err_t esp_ble_mesh_provisioner_store_node_comp_data(uint16_t unicast_addr, uint8_t *data, uint16_t length)
This function is called to store the Composition Data of the node.

Return ESP_OK on success or error code otherwise.
Parameters
• [in] unicast_addr: Element address of the node
• [in] data: Pointer of Composition Data
• [in] length: Length of Composition Data

esp_ble_mesh_node_t *esp_ble_mesh_provisioner_get_node_with_uuid(const uint8_t uuid[16])
This function is called to get the provisioned node information with the node device uuid.

Return Pointer of the node info struct or NULL on failure.
Parameters
• [in] uuid: Device UUID of the node

esp_ble_mesh_node_t *esp_ble_mesh_provisioner_get_node_with_addr(uint16_t unicast_addr)
This function is called to get the provisioned node information with the node unicast address.

Return Pointer of the node info struct or NULL on failure.
Parameters
• [in] unicast_addr: Unicast address of the node

esp_ble_mesh_node_t *esp_ble_mesh_provisioner_get_node_with_name(const char *name)
This function is called to get the provisioned node information with the node name.

Return Pointer of the node info struct or NULL on failure.
Parameters
• [in] name: Name of the node (end by ‘\0’).

uint16_t esp_ble_mesh_provisioner_get_prov_node_count(void)
This function is called by Provisioner to get provisioned node count.

Return Number of the provisioned nodes.

const esp_ble_mesh_node_t **esp_ble_mesh_provisioner_get_node_table_entry(void)
This function is called by Provisioner to get the entry of the node table.

Note After invoking the function to get the entry of nodes, users can use the “for” loop combined with the macro CONFIG_BLE_MESH_MAX_PROV_NODES to get each node’s information. Before trying to read the node’s information, users need to check if the node exists, i.e., if the *esp_ble_mesh_node_t **node) is NULL. For example: ``` const esp_ble_mesh_node_t **entry = esp_ble_mesh_provisioner_get_node_table_entry(); for (int i = 0; i <
CONFIG_BLE_MESH_MAX_PROV_NODES; i++) { const esp_ble_mesh_node_t *node = entry[i];
    if (node) { ⋯ } } 

Return Pointer to the start of the node table.

esp_err_t esp_ble_mesh_provisioner_delete_node_with_uuid(const uint8_t uuid[16])
This function is called to delete the provisioned node information with the node device uuid.

Return ESP_OK on success or error code otherwise.

Parameters
• [in] uuid: Device UUID of the node

esp_err_t esp_ble_mesh_provisioner_delete_node_with_addr(uint16_t unicast_addr)
This function is called to delete the provisioned node information with the node unicast address.

Return ESP_OK on success or error code otherwise.

Parameters
• [in] unicast_addr: Unicast address of the node

esp_err_t esp_ble_mesh_provisioner_add_local_app_key(const uint8_t app_key[16], uint16_t net_idx, uint16_t app_idx)
This function is called to add a local AppKey for Provisioner.

Note app_key: If set to NULL, app_key will be generated internally. net_idx: Should be an existing one. app_idx: If it is going to be generated internally, it should be set to 0xFFFF, and the new app_idx will be reported via an event.

Return ESP_OK on success or error code otherwise.

Parameters
• [in] app_key: The app key to be set for the local BLE Mesh stack.
• [in] net_idx: The network key index.
• [in] app_idx: The app key index.

esp_err_t esp_ble_mesh_provisioner_update_local_app_key(const uint8_t app_key[16], uint16_t net_idx, uint16_t app_idx)
This function is used to update a local AppKey for Provisioner.

Return ESP_OK on success or error code otherwise.

Parameters
• [in] app_key: Value of the AppKey.
• [in] net_idx: Corresponding NetKey Index.
• [in] app_idx: The AppKey Index

const uint8_t *esp_ble_mesh_provisioner_get_local_app_key(uint16_t net_idx, uint16_t app_idx)
This function is called by Provisioner to get the local app key value.

Return App key on success, or NULL on failure.

Parameters
• [in] app_idx: Application key index.

esp_err_t esp_ble_mesh_provisioner_bind_app_key_to_local_model(uint16_t element_addr, uint16_t app_idx, uint16_t model_id, uint16_t company_id)
This function is called by Provisioner to bind own model with proper app key.

Note company_id: If going to bind app_key with local vendor model, company_id should be set to 0xFFFF.

Return ESP_OK on success or error code otherwise.

Parameters
• [in] element_addr: Provisioner local element address
Chapter 2. API Reference

- [in] app_idx: Provisioner local app key index
- [in] model_id: Provisioner local model id
- [in] company_id: Provisioner local company id

`esp_err_t esp_ble_mesh_provisioner_add_local_net_key(const uint8_t net_key[16], uint16_t net_idx)`

This function is called by Provisioner to add local network key.

**Note** net_key: If set to NULL, net_key will be generated internally. net_idx: If it is going to be generated internally, it should be set to 0xFFFF, and the new net_idx will be reported via an event.

**Return** ESP_OK on success or error code otherwise.

**Parameters**
- [in] net_key: The network key to be added to the Provisioner local BLE Mesh stack.

`esp_err_t esp_ble_mesh_provisioner_update_local_net_key(const uint8_t net_key[16], uint16_t net_idx)`

This function is called by Provisioner to update a local network key.

**Return** ESP_OK on success or error code otherwise.

**Parameters**
- [in] net_key: Value of the NetKey.

`const uint8_t* esp_ble_mesh_provisioner_get_local_net_key(uint16_t net_idx)`

This function is called by Provisioner to get the local network key value.

**Return** Network key on success, or NULL on failure.

**Parameters**

`esp_err_t esp_ble_mesh_provisioner_recv_heartbeat(bool enable)`

This function is called by Provisioner to enable or disable receiving heartbeat messages.

**Note** If enabling receiving heartbeat message successfully, the filter will be an empty rejectlist by default, which means all heartbeat messages received by the Provisioner will be reported to the application layer.

**Return** ESP_OK on success or error code otherwise.

**Parameters**
- [in] enable: Enable or disable receiving heartbeat messages.

`esp_err_t esp_ble_mesh_provisioner_set_heartbeat_filter_type(uint8_t type)`

This function is called by Provisioner to set the heartbeat filter type.

**Note** 1. If the filter type is not the same with the current value, then all the filter entries will be cleaned.
   1. If the previous type is rejectlist, and changed to acceptlist, then the filter will be an empty acceptlist, which means no heartbeat messages will be reported. Users need to add SRC or DST into the filter entry, then heartbeat messages from the SRC or to the DST will be reported.

**Return** ESP_OK on success or error code otherwise.

**Parameters**
- [in] type: Heartbeat filter type (acceptlist or rejectlist).

`esp_err_t esp_ble_mesh_provisioner_set_heartbeat_filter_info(uint8_t op, esp_ble_mesh_heartbeat_filter_info_t *info)`

This function is called by Provisioner to add or remove a heartbeat filter entry.

1. If the operation is “REMOVE”, the “hb_src” can be set to the SRC (can only be a unicast address) of heartbeat messages, and the “hb_dst” can be set to the DST (unicast address or group address), at least one of them needs to be set.
   - The filter entry with the same SRC or DST will be removed.

**Note** 1. If the operation is “ADD”, the “hb_src” can be set to the SRC (can only be a unicast address) of heartbeat messages, and the “hb_dst” can be set to the DST (unicast address or group address), at least one of them needs to be set.
• If only one of them is set, the filter entry will only use the configured SRC or DST to filter heartbeat messages.
• If both of them are set, the SRC and DST will both be used to decide if a heartbeat message will be handled.
• If SRC or DST already exists in some filter entry, then the corresponding entry will be cleaned firstly, then a new entry will be allocated to store the information.

Return: ESP_OK on success or error code otherwise.
Parameters:
- [in] op: Add or REMOVE
- [in] info: Heartbeat filter entry information, including: hb_src - Heartbeat source address; hb_dst - Heartbeat destination address;

**esp_err_t esp_ble_mesh_provisioner_direct_erase_settings**(void)
This function is called by Provisioner to directly erase the mesh information from nvs namespace.

Note: This function can be invoked when the mesh stack is not initialized or has been de-initialized.
Return: ESP_OK on success or error code otherwise.

**esp_err_t esp_ble_mesh_provisioner_open_settings_with_index**(uint8_t index)
This function is called by Provisioner to open a nvs namespace for storing mesh information.

Note: Before open another nvs namespace, the previously opened nvs namespace must be closed firstly.
Return: ESP_OK on success or error code otherwise.
Parameters:
- [in] index: Settings index.

**esp_err_t esp_ble_mesh_provisioner_open_settings_with_uid**(const char* uid)
This function is called by Provisioner to open a nvs namespace for storing mesh information.

Note: Before open another nvs namespace, the previously opened nvs namespace must be closed firstly.
Return: ESP_OK on success or error code otherwise.
Parameters:
- [in] uid: Settings user id.

**esp_err_t esp_ble_mesh_provisioner_close_settings_with_index**(uint8_t index, bool erase)
This function is called by Provisioner to close a nvs namespace which is opened previously for storing mesh information.

Note: 1. Before closing the nvs namespace, it must be open.
   1. When the function is invoked, the Provisioner functionality will be disabled firstly, and: a) If the “erase” flag is set to false, the mesh information will be cleaned (e.g. removing NetKey, AppKey, nodes, etc) from the mesh stack. b) If the “erase” flag is set to true, the mesh information stored in the nvs namespace will also be erased besides been cleaned from the mesh stack.
   2. If Provisioner tries to work properly again, we can invoke the open function to open a new nvs namespace or a previously added one, and restore the mesh information from it if not erased.
   3. The working process shall be as following: a) Open settings A b) Start to provision and control nodes c) Close settings A d) Open settings B e) Start to provision and control other nodes f) Close settings B g) ……

Return: ESP_OK on success or error code otherwise.
Parameters:
- [in] index: Settings index.
- [in] erase: Indicate if erasing mesh information.

**esp_err_t esp_ble_mesh_provisioner_close_settings_with_uid**(const char* uid, bool erase)
This function is called by Provisioner to close a nvs namespace which is opened previously for storing mesh information.

Note: 1. Before closing the nvs namespace, it must be open.
   1. When the function is invoked, the Provisioner functionality will be disabled firstly, and: a) If the “erase” flag is set to false, the mesh information will be cleaned (e.g. removing NetKey, AppKey,
nodes, etc) from the mesh stack. b) If the “erase” flag is set to true, the mesh information stored in the nvs namespace will also be erased besides been cleaned from the mesh stack.

2. If Provisioner tries to work properly again, we can invoke the open function to open a new nvs namespace or a previously added one, and restore the mesh information from it if not erased.

3. The working process shall be as following: a) Open settings A b) Start to provision and control nodes c) Close settings A d) Open settings B e) Start to provision and control other nodes f) Close settings B g) ……

Return ESP_OK on success or error code otherwise.

Parameters

- [in] uid: Settings user id.
- [in] erase: Indicate if erasing mesh information.

```c
esp_err_t esp_ble_mesh_provisioner_delete_settings_with_index(uint8_t index)
```

This function is called by Provisioner to erase the mesh information and settings user id from a nvs namespace.

Note When this function is called, the nvs namespace must not be open. This function is used to erase the mesh information and settings user id which are not used currently.

Return ESP_OK on success or error code otherwise.

Parameters

- [in] index: Settings index.

```c
esp_err_t esp_ble_mesh_provisioner_delete_settings_with_uid(const char* uid)
```

This function is called by Provisioner to erase the mesh information and settings user id from a nvs namespace.

Note When this function is called, the nvs namespace must not be open. This function is used to erase the mesh information and settings user id which are not used currently.

Return ESP_OK on success or error code otherwise.

Parameters

- [in] uid: Settings user id.

```c
const char* esp_ble_mesh_provisioner_get_settings_uid(uint8_t index)
```

This function is called by Provisioner to get settings user id.

Return Setting user id on success or NULL on failure.

Parameters

- [in] index: Settings index.

```c
uint8_t esp_ble_mesh_provisioner_get_settings_index(const char* uid)
```

This function is called by Provisioner to get settings index.

Return Settings index.

Parameters

- [in] uid: Settings user id.

```c
uint8_t esp_ble_mesh_provisioner_get_free_settings_count(void)
```

This function is called by Provisioner to get the number of free settings user id.

Return Number of free settings user id.

```c
const uint8_t* esp_ble_mesh_get_fast_prov_app_key(uint16_t net_idx, uint16_t app_idx)
```

This function is called to get fast provisioning application key.

Return Application key on success, or NULL on failure.

Parameters

- [in] app_idx: Application key index.

**Type Definitions**

typedef void (*esp_ble_mesh_model_cb_t)(esp_ble_mesh_model_cb_event_t event, esp_ble_mesh_model_cb_param_t *param)

Espressif Systems 218 Release v5.0-dev-1648-g94089edbc3

Submit Document Feedback
Header File

- components/bt.esp_ble_mesh/api/core/include/esp_ble_mesh_provisioning_api.h

Functions

**esp_err_t esp_ble_mesh_register_prov_callback (esp_ble_mesh_prov_cb_t callback)**

Register BLE Mesh provisioning callback.

Return ESP_OK on success or error code otherwise.

Parameters

- [in] callback: Pointer to the callback function.

**bool esp_ble_mesh_node_is_provisioned (void)**

Check if a device has been provisioned.

Return TRUE if the device is provisioned, FALSE if the device is unprovisioned.

**esp_err_t esp_ble_mesh_node_prov_enable (esp_ble_mesh_prov_bearer_t bearers)**

Enable specific provisioning bearers to get the device ready for provisioning.

Note PB-ADV: send unprovisioned device beacon. PB-GATT: send connectable advertising packets.

Return ESP_OK on success or error code otherwise.

Parameters

**esp_err_t esp_ble_mesh_node_prov_disable (esp_ble_mesh_prov_bearer_t bearers)**

Disable specific provisioning bearers to make a device inaccessible for provisioning.

Return ESP_OK on success or error code otherwise.

Parameters

**esp_err_t esp_ble_mesh_node_set_oob_pub_key (uint8_t pub_key_x[32], uint8_t pub_key_y[32], uint8_t private_key[32])**

Unprovisioned device set own oob public key & private key pair.

Note In order to avoid suffering brute-forcing attack (CVE-2020-26559). The Bluetooth SIG recommends that potentially vulnerable mesh provisioners use an out-of-band mechanism to exchange the public keys. So as an unprovisioned device, it should use this function to input the Public Key exchanged through the out-of-band mechanism.

Return ESP_OK on success or error code otherwise.

Parameters

- [in] pub_key_x: Unprovisioned device’s Public Key X
- [in] pub_key_y: Unprovisioned device’s Public Key Y
- [in] private_key: Unprovisioned device’s Private Key

**esp_err_t esp_ble_mesh_node_input_number (uint32_t number)**

Provide provisioning input OOB number.

Note This is intended to be called if the user has received ESP_BLE_MESH_NODE_PROV_INPUT_EVT with ESP_BLE_MESH_ENTER_NUMBER as the action.

Return ESP_OK on success or error code otherwise.

Parameters

- [in] number: Number input by device.

**esp_err_t esp_ble_mesh_node_input_string (const char *string)**

Provide provisioning input OOB string.

Note This is intended to be called if the user has received ESP_BLE_MESH_NODE_PROV_INPUT_EVT with ESP_BLE_MESH_ENTER_STRING as the action.

Return ESP_OK on success or error code otherwise.

Parameters

- [in] string: String input by device.
### esp_err_t esp_ble_mesh_set_unprovisioned_device_name (const char *name)

Using this function, an unprovisioned device can set its own device name, which will be broadcasted in its advertising data.

**Note** This API applicable to PB-GATT mode only by setting the name to the scan response data, it doesn’t apply to PB-ADV mode.

**Return** ESP_OK on success or error code otherwise.

**Parameters**

- **[in]** `name`: Unprovisioned device name

### esp_err_t esp_ble_mesh_provisioner_read_oob_pub_key (uint8_t link_idx, uint8_t pub_key_x[32], uint8_t pub_key_y[32])

Provisioner inputs unprovisioned device’s oob public key.

**Note** In order to avoid suffering brute-forcing attack (CVE-2020-26559). The Bluetooth SIG recommends that potentially vulnerable mesh provisioners use an out-of-band mechanism to exchange the public keys.

**Return** ESP_OK on success or error code otherwise.

**Parameters**

- **[in]** `link_idx`: The provisioning link index
- **[in]** `pub_key_x`: Unprovisioned device’s Public Key X
- **[in]** `pub_key_y`: Unprovisioned device’s Public Key Y

### esp_err_t esp_ble_mesh_provisioner_input_string (const char *string, uint8_t link_idx)

Provide provisioning input OOB string.

**Return** ESP_OK on success or error code otherwise.

**Parameters**

- **[in]** `string`: String input by Provisioner.
- **[in]** `link_idx`: The provisioning link index.

### esp_err_t esp_ble_mesh_provisioner_input_number (uint32_t number, uint8_t link_idx)

Provide provisioning input OOB number.

**Return** ESP_OK on success or error code otherwise.

**Parameters**

- **[in]** `number`: Number input by Provisioner.
- **[in]** `link_idx`: The provisioning link index.

### esp_err_t esp_ble_mesh_provisioner_prov_enable (esp_ble_mesh_prov_bearer_t bearers)

Enable one or more provisioning bearers.

**Note** PB-ADV: Enable BLE scan. PB-GATT: Initialize corresponding BLE Mesh Proxy info.

**Return** ESP_OK on success or error code otherwise.

**Parameters**

- **[in]** `bearers`: Bit-wise OR of provisioning bearers.

### esp_err_t esp_ble_mesh_provisioner_prov_disable (esp_ble_mesh_prov_bearer_t bearers)

Disable one or more provisioning bearers.

**Note** PB-ADV: Disable BLE scan. PB-GATT: Break any existing BLE Mesh Provisioning connections.

**Return** ESP_OK on success or error code otherwise.

**Parameters**

- **[in]** `bearers`: Bit-wise OR of provisioning bearers.
**esp_err_t esp_ble_mesh_provisioner_add_unprov_dev** *(esp_ble_mesh_unprov_dev_add_t *add_dev, esp_ble_mesh_dev_add_flag_t flags)*

Add unprovisioned device info to the unprov_dev queue.

**Return** ESP_OK on success or error code otherwise.

**Note**:
1. Currently address type only supports public address and static random address.
2. For example, if the Provisioner wants to add an unprovisioned device info before receiving its unprovisioned device beacon or Mesh Provisioning advertising packets, the Provisioner can use this API to add the device info with each one or both of device UUID and device address added. When the Provisioner gets the device’s advertising packets, it will start provisioning the device internally.
   - In this situation, the Provisioner can set bearers with each one or both of ESP_BLE_MESH_PROV_ADV and ESP_BLE_MESH_PROV_GATT enabled, and cannot set flags with ADD_DEV_START_PROV_NOW_FLAG enabled.
3. Another example is when the Provisioner receives the unprovisioned device’s beacon or Mesh Provisioning advertising packets, the advertising packets will be reported on to the application layer using the callback registered by the function esp_ble_mesh_register_prov_callback. And in the callback, the Provisioner can call this API to start provisioning the device.
   - If the Provisioner uses PB-ADV to provision, either one or both of device UUID and device address can be added, bearers shall be set with ESP_BLE_MESH_PROV_ADV enabled and the flags shall be set with ADD_DEV_START_PROV_NOW_FLAG enabled.
   - If the Provisioner uses PB-GATT to provision, both the device UUID and device address need to be added, bearers shall be set with ESP_BLE_MESH_PROV_GATT enabled, and the flags shall be set with ADD_DEV_START_PROV_NOW_FLAG enabled.
   - If the Provisioner just wants to store the unprovisioned device info when receiving its advertising packets and start to provision it the next time (e.g. after receiving its advertising packets again), then it can add the device info with either one or both of device UUID and device address included. Bearers can be set with either one or both of ESP_BLE_MESH_PROV_ADV and ESP_BLE_MESH_PROV_GATT enabled (recommend to enable the bearer which will receive its advertising packets, because if the other bearer is enabled, the Provisioner is not aware if the device supports the bearer), and flags cannot be set with ADD_DEV_START_PROV_NOW_FLAG enabled.
   - Note: ESP_BLE_MESH_PROV_ADV, ESP_BLE_MESH_PROV_GATT and ADD_DEV_START_PROV_NOW_FLAG can not be enabled at the same time.

**Parameters**
- [in] add_dev: Pointer to a struct containing the device information
- [in] flags: Flags indicate several operations on the device information
  - Remove device information from queue after device has been provisioned (BIT0)
  - Start provisioning immediately after device is added to queue (BIT1)
  - Device can be removed if device queue is full (BIT2)

**esp_err_t esp_ble_mesh_provisioner_prov_device_with_addr** *(const uint8_t uuid[16], esp_ble_mesh_bd_addr_t addr, esp_ble_mesh_addr_type_t addr_type, esp_ble_mesh_prov_bearer_t bearer, uint16_t oob_info, uint16_t unicast_addr)*

Provision an unprovisioned device and assign a fixed unicast address for it in advance.

**Return** Zero on success or (negative) error code otherwise.

**Note**:
1. Currently address type only supports public address and static random address.
2. Bearer must be equal to ESP_BLE_MESH_PROV_ADV or ESP_BLE_MESH_PROV_GATT, since Provisioner will start to provision a device immediately once this function is invoked. And the input bearer must be identical with the one within the parameters of the ESP_BLE_MESH_PROVISIONER_RECV_UNPROV_ADV_PKT_EVT event.
2. If this function is used by a Provisioner to provision devices, the application should take care of the assigned unicast address and avoid overlap of the unicast addresses of different nodes.

3. Recommend to use only one of the functions “esp_ble_mesh_provisioner_add_unprov_dev” and “esp_ble_mesh_provisioner_prov_device_with_addr” by a Provisioner.

**Parameters**

- **[in] uuid**: Device UUID of the unprovisioned device
- **[in] addr**: Device address of the unprovisioned device
- **[in] addr_type**: Device address type of the unprovisioned device
- **[in] bearer**: Provisioning bearer going to be used by Provisioner
- **[in] oob_info**: OOB info of the unprovisioned device
- **[in] unicast_addr**: Unicast address going to be allocated for the unprovisioned device

```c
esp_err_t esp_ble_mesh_provisioner_delete_dev(esp_ble_mesh_device_delete_t *del_dev)
```

Delete device from queue, and reset current provisioning link with the device.

**Note** If the device is in the queue, remove it from the queue; if the device is being provisioned, terminate the provisioning procedure. Either one of the device address or device UUID can be used as input.

**Return** ESP_OK on success or error code otherwise.

**Parameters**

- **[in] del_dev**: Pointer to a struct containing the device information.

```c
esp_err_t esp_ble_mesh_provisioner_set_dev_uuid_match(const uint8_t *match_val, uint8_t match_len, uint8_t offset, bool prov_after_match)
```

This function is called by Provisioner to set the part of the device UUID to be compared before starting to provision.

**Return** ESP_OK on success or error code otherwise.

**Parameters**

- **[in] match_val**: Value to be compared with the part of the device UUID.
- **[in] match_len**: Length of the compared match value.
- **[in] offset**: Offset of the device UUID to be compared (based on zero).
- **[in] prov_after_match**: Flag used to indicate whether provisioner should start to provision the device immediately if the part of the UUID matches.

```c
esp_err_t esp_ble_mesh_provisioner_set_prov_data_info(esp_ble_mesh_prov_data_info_t *prov_data_info)
```

This function is called by Provisioner to set provisioning data information before starting to provision.

**Return** ESP_OK on success or error code otherwise.

**Parameters**

- **[in] prov_data_info**: Pointer to a struct containing net_idx or flags or iv_index.

```c
esp_err_t esp_ble_mesh_provisioner_set_static_oob_value(const uint8_t *value, uint8_t length)
```

This function is called by Provisioner to set static oob value used for provisioning.

AuthValues selected using a cryptographically secure random or pseudorandom number generator and having the maximum permitted entropy (128-bits) will be most difficult to brute-force. AuthValues with reduced entropy or generated in a predictable manner will not grant the same level of protection against this vulnerability. Selecting a new AuthValue with each provisioning attempt can also make it more difficult to launch a brute-force attack by requiring the attacker to restart the search with each provisioning attempt (CVE-2020-26556).

**Note** The Bluetooth SIG recommends that mesh implementations enforce a randomly selected AuthValue using all of the available bits, where permitted by the implementation. A large entropy helps ensure that a brute-force of the AuthValue, even a static AuthValue, cannot normally be completed in a reasonable time (CVE-2020-26557).

**Return** ESP_OK on success or error code otherwise.

**Parameters**

- **[in] value**: Pointer to the static oob value.
- **[in] length**: Length of the static oob value.
**esp_err_t** esp_ble_mesh_provisioner_set_primary_elem_addr(uint16_t addr)

This function is called by Provisioner to set own Primary element address.

**Note** This API must be invoked when BLE Mesh initialization is completed successfully, and can be invoked before Provisioner functionality is enabled. Once this API is invoked successfully, the provunicast_addr value in the struct *esp_ble_mesh_prov_t* will be ignored, and Provisioner will use this address as its own primary element address. And if the unicast address going to assigned for the next unprovisioned device is smaller than the input address + element number of Provisioner, then the address for the next unprovisioned device will be recalculated internally.

**Return** ESP_OK on success or error code otherwise.

**Parameters**
- **[in]** addr: Unicast address of the Primary element of Provisioner.

**esp_err_t** esp_ble_mesh_set_fast_prov_info(esp_ble_mesh_fast_prov_info_t *fast_prov_info)

This function is called to set provisioning data information before starting fast provisioning.

**Return** ESP_OK on success or error code otherwise.

**Parameters**
- **[in]** fast_prov_info: Pointer to a struct containing unicast address range, net_idx, etc.

**esp_err_t** esp_ble_mesh_set_fast_prov_action(esp_ble_mesh_fast_prov_action_t action)

This function is called to start/suspend/exit fast provisioning.

**Return** ESP_OK on success or error code otherwise.

**Parameters**
- **[in]** action: Fast provisioning action (i.e. enter, suspend, exit).

**Type Definitions**

```c
typedef void(*esp_ble_mesh_prov_cb_t)(esp_ble_mesh_prov_cb_event_t event, esp_ble_mesh_prov_cb_param_t *param)

typedef void(*esp_ble_mesh_prov_adv_cb_t)(const esp_ble_mesh_bd_addr_t addr, const esp_ble_mesh_addr_type_t addr_type, const uint8_t adv_type, const uint8_t *dev_uuid, uint16_t oob_info, esp_ble_mesh_prov_bearer_t bearer)
```

Callback for Provisioner that received advertising packets from unprovisioned devices which are not in the unprovisioned device queue.

Report on the unprovisioned device beacon and mesh provisioning service adv data to application.

**Parameters**
- **[in]** addr: Pointer to the unprovisioned device address.
- **[in]** addr_type: Unprovisioned device address type.
- **[in]** adv_type: Adv packet type(ADV_IND or ADV_NONCONN_IND).
- **[in]** dev_uuid: Unprovisioned device UUID pointer.
- **[in]** oob_info: OOB information of the unprovisioned device.
- **[in]** bearer: Adv packet received from PB-GATT or PB-ADV bearer.

**ESP-BLE-MESH GATT Proxy Server**

**Header File**

- components/bt/esp_ble_mesh/api/core/include/esp_ble_mesh_proxy_api.h

**Functions**

```c
esp_err_t esp_ble_mesh_proxy_identity_enable(void)
```

Enable advertising with Node Identity.
Note: This API requires that GATT Proxy support be enabled. Once called, each subnet starts advertising using Node Identity for the next 60 seconds, and after 60s Network ID will be advertised. Under normal conditions, the BLE Mesh Proxy Node Identity and Network ID advertising will be enabled automatically by BLE Mesh stack after the device is provisioned.

Return ESP_OK on success or error code otherwise.

```c
esp_err_t esp_ble_mesh_proxy_gatt_enable (void)
Enable BLE Mesh GATT Proxy Service.
Return ESP_OK on success or error code otherwise.
```

```c
esp_err_t esp_ble_mesh_proxy_gatt_disable (void)
Disconnect the BLE Mesh GATT Proxy connection if there is any, and disable the BLE Mesh GATT Proxy Service.
Return ESP_OK on success or error code otherwise.
```

```c
esp_err_t esp_ble_mesh_proxy_gatt_client_connect (esp_ble_mesh_bd_addr_t addr,
                                  esp_ble_mesh_addr_type_t addr_type, uint16_t net_idx)
Proxy Client creates a connection with the Proxy Server.
Return ESP_OK on success or error code otherwise.
Parameters
• [in] addr: Device address of the Proxy Server.
• [in] addr_type: Device address type (public or static random).
• [in] net_idx: NetKey Index relates with Network ID in the Mesh Proxy advertising packet.
```

```c
esp_err_t esp_ble_mesh_proxy_gatt_client_disconnect (uint8_t conn_handle)
Proxy Client terminates a connection with the Proxy Server.
Return ESP_OK on success or error code otherwise.
Parameters
• [in] conn_handle: Proxy connection handle.
```

```c
esp_err_t esp_ble_mesh_proxy_gatt_client_set_filter_type (uint8_t conn_handle,
                                            uint16_t net_idx,
                                            esp_ble_mesh_proxy_filter_type_t filter_type)
Proxy Client sets the filter type of the Proxy Server.
Return ESP_OK on success or error code otherwise.
Parameters
• [in] conn_handle: Proxy connection handle.
• [in] net_idx: Corresponding NetKey Index.
• [in] filter_type: whitelist or blacklist.
```

```c
esp_err_t esp_ble_mesh_proxy_gatt_client_add_filter_addr (uint8_t conn_handle, uint16_t net_idx,
                                           uint16_t *addr, uint16_t addr_num)
Proxy Client adds address to the Proxy Server filter list.
Return ESP_OK on success or error code otherwise.
Parameters
• [in] conn_handle: Proxy connection handle.
• [in] net_idx: Corresponding NetKey Index.
• [in] addr: Pointer to the filter address.
• [in] addr_num: Number of the filter address.
```

```c
esp_err_t esp_ble_mesh_proxy_gatt_client_remove_filter_addr (uint8_t conn_handle, uint16_t net_idx,
                                           uint16_t *addr, uint16_t addr_num)
Proxy Client removes address from the Proxy Server filter list.
Return ESP_OK on success or error code otherwise.
Parameters
```
• [in] conn_handle: Proxy connection handle.
• [in] net_idx: Corresponding NetKey Index.
• [in] addr: Pointer to the filter address.
• [in] addr_num: Number of the filter address.

ESP-BLE-MESH Models API Reference

This section contains ESP-BLE-MESH Model related APIs, event types, event parameters, etc.

There are six categories of models:

• Configuration Client/Server Models
• Health Client/Server Models
• Generic Client/Server Models
• Sensor Client/Server Models
• Time and Scenes Client/Server Models
• Lighting Client/Server Models

Note: Definitions related to Server Models are being updated, and will be released soon.

Configuration Client/Server Models

Header File

• components/bt/esp_ble_mesh/api/models/include/esp_ble_mesh_config_model_api.h

Functions

```c
esp_err_t esp_ble_mesh_register_config_client_callback(esp_ble_mesh_cfg_client_cb_t callback)
```

Register BLE Mesh Config Client Model callback.

Return ESP_OK on success or error code otherwise.

Parameters

• [in] callback: Pointer to the callback function.

```c
esp_err_t esp_ble_mesh_register_config_server_callback(esp_ble_mesh_cfg_server_cb_t callback)
```

Register BLE Mesh Config Server Model callback.

Return ESP_OK on success or error code otherwise.

Parameters

• [in] callback: Pointer to the callback function.

```c
esp_err_t esp_ble_mesh_config_client_get_state(esp_ble_mesh_client_common_param_t *params, esp_ble_mesh_cfg_client_get_state_t *get_state)
```

Get the value of Config Server Model states using the Config Client Model get messages.

Note If you want to find the opcodes and corresponding meanings accepted by this API, please refer to esp_ble_mesh_opcode_config_client_get_t in esp_ble_mesh_defs.h

Return ESP_OK on success or error code otherwise.

Parameters

• [in] params: Pointer to BLE Mesh common client parameters.
• [in] get_state: Pointer to a union, each kind of opcode corresponds to one structure inside.
  Shall not be set to NULL.

```c
esp_err_t esp_ble_mesh_config_client_set_state(esp_ble_mesh_client_common_param_t *params, esp_ble_mesh_cfg_client_set_state_t *set_state)
```

Set the value of the Configuration Server Model states using the Config Client Model set messages.
Note If you want to find the opcodes and corresponding meanings accepted by this API, please refer to esp_ble_mesh_opcode_config_client_set.h in esp_ble_mesh_defs.h

Return ESP_OK on success or error code otherwise.

Parameters

- [in] set_state: Pointer to a union, each kind of opcode corresponds to one structure inside. Shall not be set to NULL.

  Config Model App Bind

- **esp_ble_mesh_state_change_cfg_model_app_unbind_t mod_app_unbind**
  
  Config Model App Unbind

- **esp_ble_mesh_state_change_cfg_kr_phase_set_t kr_phase_set**
  
  Config Key Refresh Phase Set

#### union esp_ble_mesh_cfg_server_state_change_t

```c
#include <esp_ble_mesh_config_model_api.h>
```

Configuration Server model callback value union.

#### Public Members

- **esp_ble_mesh_cfg_server_state_change_t state_change**

  ESP_BLE_MESH_CFG_SERVER_STATE_CHANGE_EVT
Structures

```
*struct esp_ble_mesh_cfg_srv
  Configuration Server Model context
```

Public Members

```
*esp_ble_mesh_model_t *model
  Pointer to Configuration Server Model

uint8_t net_transmit
  Network Transmit state

uint8_t relay
  Relay Mode state

uint8_t relay_retransmit
  Relay Retransmit state

uint8_t beacon
  Secure Network Beacon state

uint8_t gatt_proxy
  GATT Proxy state

uint8_t friend_state
  Friend state

uint8_t default_ttl
  Default TTL

struct k_delayed_work timer
  Heartbeat Publication timer

uint16_t dst
  Destination address for Heartbeat messages

uint16_t count
  Number of Heartbeat messages to be sent
  Number of Heartbeat messages received

uint8_t period
  Period for sending Heartbeat messages

uint8_t ttl
  TTL to be used when sending Heartbeat messages

uint16_t feature
  Bit field indicating features that trigger Heartbeat messages when changed

uint16_t net_idx
  NetKey Index used by Heartbeat Publication

```

```c
struct esp_ble_mesh_cfg_srv::[anonymous] heartbeat_pub
  Heartbeat Publication

int64_t expiry
  Timestamp when Heartbeat subscription period is expired

uint16_t src
  Source address for Heartbeat messages

uint8_t min_hops
  Minimum hops when receiving Heartbeat messages

uint8_t max_hops
  Maximum hops when receiving Heartbeat messages
```
**esp_ble_mesh_cb_t heartbeat_recv_cb**  
Optional heartbeat subscription tracking function

**struct esp_ble_mesh_cfg_srv::[anonymous] heartbeat_sub**  
Heartbeat Subscription

**struct esp_ble_mesh_cfg_composition_data_get_t**  
Parameters of Config Composition Data Get.

**Public Members**

- **uint8_t page**  
  Page number of the Composition Data.

**struct esp_ble_mesh_cfg_model_pub_get_t**  
Parameters of Config Model Publication Get.

**Public Members**

- **uint16_t element_addr**  
  The element address

- **uint16_t model_id**  
  The model id

- **uint16_t company_id**  
  The company id, if not a vendor model, shall set to 0xFFFF

**struct esp_ble_mesh_cfgSig_model_sub_get_t**  
Parameters of Config SIG Model Subscription Get.

**Public Members**

- **uint16_t element_addr**  
  The element address

- **uint16_t model_id**  
  The model id

**struct esp_ble_mesh_cfg_vnd_model_sub_get_t**  
Parameters of Config Vendor Model Subscription Get.

**Public Members**

- **uint16_t element_addr**  
  The element address

- **uint16_t model_id**  
  The model id

- **uint16_t company_id**  
  The company id, if not a vendor model, shall set to 0xFFFF

**struct esp_ble_mesh_cfg_app_key_get_t**  
Parameters of Config AppKey Get.
Public Members

`uint16_t net_idx`
The network key index

`struct esp_ble_mesh_cfg_node_identity_get_t`
Parameters of Config Node Identity Get.

Public Members

`uint16_t net_idx`
The network key index

`struct esp_ble_mesh_cfg_sig_model_app_get_t`
Parameters of Config SIG Model App Get.

Public Members

`uint16_t element_addr`
The element address

`uint16_t model_id`
The model id

`uint16_t company_id`
The company id, if not a vendor model, shall set to 0xFFFF

`struct esp_ble_mesh_cfg_vnd_model_app_get_t`
Parameters of Config Vendor Model App Get.

Public Members

`uint16_t net_idx`
The network key index

`struct esp_ble_mesh_cfg_kr_phase_get_t`
Parameters of Config Key Refresh Phase Get.

Public Members

`uint16_t lpn_addr`
The unicast address of the Low Power node

`struct esp_ble_mesh_cfg_lpn_polltimeout_get_t`
Parameters of Config Low Power Node PollTimeout Get.

Public Members
Public Members

uint8_t beacon
    New Secure Network Beacon state

struct esp_ble_mesh_cfg_default_ttl_set_t
    Parameters of Config Default TTL Set.

Public Members

uint8_t ttl
    The default TTL state value

struct esp_ble_mesh_cfg_friend_set_t
    Parameters of Config Friend Set.

Public Members

uint8_t friend_state
    The friend state value

struct esp_ble_mesh_cfg_gatt_proxy_set_t
    Parameters of Config GATT Proxy Set.

Public Members

uint8_t gatt_proxy
    The GATT Proxy state value

struct esp_ble_mesh_cfg_relay_set_t
    Parameters of Config Relay Set.

Public Members

uint8_t relay
    The relay value

uint8_t relay_retransmit
    The relay retransmit value

struct esp_ble_mesh_cfg_net_key_add_t
    Parameters of Config NetKey Add.

Public Members

uint16_t net_idx
    The network key index

uint8_t net_key[16]
    The network key value

struct esp_ble_mesh_cfg_app_key_add_t
    Parameters of Config AppKey Add.
Public Members

uint16_t net_idx
The network key index

uint16_t app_idx
The app key index

uint8_t app_key[16]
The app key value

struct esp_ble_mesh_cfg_model_app_bind_t
Parameters of Config Model App Bind.

Public Members

uint16_t element_addr
The element address

uint16_t model_app_idx
Index of the app key to bind with the model

uint16_t model_id
The model id

uint16_t company_id
The company id, if not a vendor model, shall set to 0xFFFF

struct esp_ble_mesh_cfg_model_pub_set_t
Parameters of Config Model Publication Set.

Public Members

uint16_t element_addr
The element address

uint16_t publish_addr
Value of the publish address

uint16_t publish_app_idx
Index of the application key

bool cred_flag
Value of the Friendship Credential Flag

uint8_t publish_ttl
Default TTL value for the publishing messages

uint8_t publish_period
Period for periodic status publishing

uint8_t publish_retransmit
Number of retransmissions and number of 50-millisecond steps between retransmissions

uint16_t model_id
The model id

uint16_t company_id
The company id, if not a vendor model, shall set to 0xFFFF

struct esp_ble_mesh_cfg_model_sub_add_t
Parameters of Config Model Subscription Add.
Public Members

uint16_t `element_addr`
The element address

uint16_t `sub_addr`
The address to be added to the Subscription List

uint16_t `model_id`
The model id

uint16_t `company_id`
The company id, if not a vendor model, shall set to 0xFFFF

`struct esp_ble_mesh_cfg_model_sub_delete_t`
Parameters of Config Model Subscription Delete.

Public Members

uint16_t `element_addr`
The element address

uint16_t `sub_addr`
The address to be removed from the Subscription List

uint16_t `model_id`
The model id

uint16_t `company_id`
The company id, if not a vendor model, shall set to 0xFFFF

`struct esp_ble_mesh_cfg_model_sub_overwrite_t`
Parameters of Config Model Subscription Overwrite.

Public Members

uint16_t `element_addr`
The element address

uint16_t `sub_addr`
The address to be added to the Subscription List

uint16_t `model_id`
The model id

uint16_t `company_id`
The company id, if not a vendor model, shall set to 0xFFFF

`struct esp_ble_mesh_cfg_model_sub_va_add_t`
Parameters of Config Model Subscription Virtual Address Add.

Public Members

uint16_t `element_addr`
The element address

uint8_t `label_uuid[16]`
The Label UUID of the virtual address to be added to the Subscription List

uint16_t `model_id`
The model id
uint16_t company_id
  The company id, if not a vendor model, shall set to 0xFFFF

struct esp_ble_mesh_cfg_model_sub_va_delete_t
Parameters of Config Model Subscription Virtual Address Delete.

Public Members

uint16_t element_addr
  The element address

uint8_t label_uuid[16]
  The Label UUID of the virtual address to be removed from the Subscription List

uint16_t model_id
  The model id

uint16_t company_id
  The company id, if not a vendor model, shall set to 0xFFFF

struct esp_ble_mesh_cfg_model_sub_va_overwrite_t
Parameters of Config Model Subscription Virtual Address Overwrite.

Public Members

uint16_t element_addr
  The element address

uint8_t label_uuid[16]
  The Label UUID of the virtual address to be added to the Subscription List

uint16_t model_id
  The model id

uint16_t company_id
  The company id, if not a vendor model, shall set to 0xFFFF

struct esp_ble_mesh_cfg_model_pub_va_set_t
Parameters of Config Model Publication Virtual Address Set.

Public Members

uint16_t element_addr
  The element address

uint8_t label_uuid[16]
  Value of the Label UUID publish address

uint16_t publish_app_idx
  Index of the application key

bool cred_flag
  Value of the Friendship Credential Flag

uint8_t publish_ttl
  Default TTL value for the publishing messages

uint8_t publish_period
  Period for periodic status publishing

uint8_t publish_retransmit
  Number of retransmissions and number of 50-millisecond steps between retransmissions
uint16_t model_id
    The model id

uint16_t company_id
    The company id, if not a vendor model, shall set to 0xFFFF

struct esp_ble_mesh_cfg_model_sub_delete_all_t
Parameters of Config Model Subscription Delete All.

Public Members

uint16_t element_addr
    The element address

uint16_t model_id
    The model id

uint16_t company_id
    The company id, if not a vendor model, shall set to 0xFFFF

struct esp_ble_mesh_cfg_net_key_update_t
Parameters of Config NetKey Update.

Public Members

uint16_t net_idx
    The network key index

uint8_t net_key[16]
    The network key value

struct esp_ble_mesh_cfg_net_key_delete_t
Parameters of Config NetKey Delete.

Public Members

uint16_t net_idx
    The network key index

struct esp_ble_mesh_cfg_app_key_update_t
Parameters of Config AppKey Update.

Public Members

uint16_t net_idx
    The network key index

uint16_t app_idx
    The app key index

uint8_t app_key[16]
    The app key value

struct esp_ble_mesh_cfg_app_key_delete_t
Parameters of Config AppKey Delete.
Chapter 2. API Reference

**Public Members**

```c
uint16_t net_idx  // The network key index
```

```c
uint16_t app_idx  // The app key index
```

**struct esp_ble_mesh_cfg_node_identity_set_t**

Parameters of Config Node Identity Set.

**Public Members**

```c
uint16_t net_idx  // The network key index
```

```c
uint8_t identity  // New Node Identity state
```

**struct esp_ble_mesh_cfg_model_app_unbind_t**

Parameters of Config Model App Unbind.

**Public Members**

```c
uint16_t element_addr  // The element address
```

```c
uint16_t model_app_idx  // Index of the app key to bind with the model
```

```c
uint16_t model_id  // The model id
```

```c
uint16_t company_id  // The company id, if not a vendor model, shall set to 0xFFFF
```

**struct esp_ble_mesh_cfg_kr_phase_set_t**

Parameters of Config Key Refresh Phase Set.

**Public Members**

```c
uint16_t net_idx  // The network key index
```

```c
uint8_t transition  // New Key Refresh Phase Transition
```

**struct esp_ble_mesh_cfg_net_transmit_set_t**

Parameters of Config Network Transmit Set.

**Public Members**

```c
uint8_t net_transmit  // Network Transmit State
```

**struct esp_ble_mesh_cfg_heartbeat_pub_set_t**

Parameters of Config Model Heartbeat Publication Set.
**Public Members**

`uint16_t dst`
Destination address for Heartbeat messages

`uint8_t count`
Number of Heartbeat messages to be sent

`uint8_t period`
Period for sending Heartbeat messages

`uint8_t ttl`
TTL to be used when sending Heartbeat messages

`uint16_t feature`
Bit field indicating features that trigger Heartbeat messages when changed

`uint16_t net_idx`
NetKey Index

`struct esp_ble_mesh_cfg_heartbeat_sub_set_t`
Parameters of Config Model Heartbeat Subscription Set.

**Public Members**

`uint16_t src`
Source address for Heartbeat messages

`uint16_t dst`
Destination address for Heartbeat messages

`uint8_t period`
Period for receiving Heartbeat messages

`struct esp_ble_mesh_cfg_beacon_status_cb_t`
Parameter of Config Beacon Status

**Public Members**

`uint8_t beacon`
Secure Network Beacon state value

`struct esp_ble_mesh_cfg_comp_data_status_cb_t`
Parameters of Config Composition Data Status

**Public Members**

`uint8_t page`
Page number of the Composition Data

`struct net_buf_simple *composition_data`
Pointer to Composition Data for the identified page

`struct esp_ble_mesh_cfg_default_ttl_status_cb_t`
Parameter of Config Default TTL Status

**Public Members**

`uint8_t default_ttl`
Default TTL state value
struct esp_ble_mesh_cfg_gatt_proxy_status_cb_t
Parameter of Config GATT Proxy Status

Public Members

uint8_t gatt_proxy
GATT Proxy state value

struct esp_ble_mesh_cfg_relay_status_cb_t
Parameters of Config Relay Status

Public Members

uint8_t relay
Relay state value

uint8_t retransmit
Relay retransmit value (number of retransmissions and number of 10-millisecond steps between retransmissions)

struct esp_ble_mesh_cfg_model_pub_status_cb_t
Parameters of Config Model Publication Status

Public Members

uint8_t status
Status Code for the request message

uint16_t element_addr
Address of the element

uint16_t publish_addr
Value of the publish address

uint16_t app_idx
Index of the application key

bool cred_flag
Value of the Friendship Credential Flag

uint8_t ttl
Default TTL value for the outgoing messages

uint8_t period
Period for periodic status publishing

uint8_t transmit
Number of retransmissions and number of 50-millisecond steps between retransmissions

uint16_t company_id
Company ID

uint16_t model_id
Model ID

struct esp_ble_mesh_cfg_model_sub_status_cb_t
Parameters of Config Model Subscription Status
Chapter 2. API Reference

Public Members

uint8_t status
Status Code for the request message

uint16_t element_addr
Address of the element

uint16_t sub_addr
Value of the address

uint16_t company_id
Company ID

uint16_t model_id
Model ID

struct esp_ble_mesh_cfg_net_key_status_cb_t
Parameters of Config NetKey Status

Public Members

uint8_t status
Status Code for the request message

uint16_t net_idx
Index of the NetKey

struct esp_ble_mesh_cfg_app_key_status_cb_t
Parameters of Config AppKey Status

Public Members

uint8_t status
Status Code for the request message

uint16_t net_idx
Index of the NetKey

uint16_t app_idx
Index of the application key

struct esp_ble_mesh_cfg_mod_app_status_cb_t
Parameters of Config Model App Status

Public Members

uint8_t status
Status Code for the request message

uint16_t element_addr
Address of the element

uint16_t app_idx
Index of the application key

uint16_t company_id
Company ID

uint16_t model_id
Model ID
struct esp_ble_mesh_cfg_friend_status_cb_t
    Parameter of Config Friend Status

Public Members

uint8_t friend_state
    Friend state value

struct esp_ble_mesh_cfg_hb_pub_status_cb_t
    Parameters of Config Heartbeat Publication Status

Public Members

uint8_t status
    Status Code for the request message
uint16_t dst
    Destination address for Heartbeat messages
uint8_t count
    Number of Heartbeat messages remaining to be sent
uint8_t period
    Period for sending Heartbeat messages
uint8_t ttl
    TTL to be used when sending Heartbeat messages
uint16_t features
    Features that trigger Heartbeat messages when changed
uint16_t net_idx
    Index of the NetKey

struct esp_ble_mesh_cfg_hb_sub_status_cb_t
    Parameters of Config Heartbeat Subscription Status

Public Members

uint8_t status
    Status Code for the request message
uint16_t src
    Source address for Heartbeat messages
uint16_t dst
    Destination address for Heartbeat messages
uint8_t period
    Remaining Period for processing Heartbeat messages
uint8_t count
    Number of Heartbeat messages received
uint8_t min_hops
    Minimum hops when receiving Heartbeat messages
uint8_t max_hops
    Maximum hops when receiving Heartbeat messages

struct esp_ble_mesh_cfg_net_trans_status_cb_t
    Parameters of Config Network Transmit Status
Public Members

```c
uint8_t net_trans_count : 3
    Number of transmissions for each Network PDU originating from the node
```

```c
uint8_t net_trans_step : 5
    Maximum hops when receiving Heartbeat messages
```

```c
struct esp_ble_mesh_cfg_model_sub_list_cb_t
    Parameters of Config SIG/Vendor Subscription List
```

Public Members

```c
uint8_t status
    Status Code for the request message
```

```c
uint16_t element_addr
    Address of the element
```

```c
uint16_t company_id
    Company ID
```

```c
uint16_t model_id
    Model ID
```

```c
struct net_buf_simple *sub_addr
    A block of all addresses from the Subscription List
```

```c
struct esp_ble_mesh_cfg_net_key_list_cb_t
    Parameter of Config NetKey List
```

Public Members

```c
struct net_buf_simple *net_idx
    A list of NetKey Indexes known to the node
```

```c
struct esp_ble_mesh_cfg_app_key_list_cb_t
    Parameters of Config AppKey List
```

Public Members

```c
uint8_t status
    Status Code for the request message
```

```c
uint16_t net_idx
    NetKey Index of the NetKey that the AppKeys are bound to
```

```c
struct net_buf_simple *app_idx
    A list of AppKey indexes that are bound to the NetKey identified by NetKeyId
```

```c
struct esp_ble_mesh_cfg_node_id_status_cb_t
    Parameters of Config Node Identity Status
```

Public Members

```c
uint8_t status
    Status Code for the request message
```

```c
uint16_t net_idx
    Index of the NetKey
```
uint8_t identity
   Node Identity state

struct esp_ble_mesh_cfg_model_app_list_cb_t
   Parameters of Config SIG/Vendor Model App List

Public Members

uint8_t status
   Status Code for the request message

uint16_t element_addr
   Address of the element

uint16_t company_id
   Company ID

uint16_t model_id
   Model ID

struct net_buf_simple *app_idx
   All AppKey indexes bound to the Model

struct esp_ble_mesh_cfg_kr_phase_status_cb_t
   Parameters of Config Key Refresh Phase Status

Public Members

uint8_t status
   Status Code for the request message

uint16_t net_idx
   Index of the NetKey

uint8_t phase
   Key Refresh Phase state

struct esp_ble_mesh_cfg_lpn_pollto_status_cb_t
   Parameters of Config Low Power Node PollTimeout Status

Public Members

uint16_t lpn_addr
   The unicast address of the Low Power node

int32_t poll_timeout
   The current value of the PollTimeout timer of the Low Power node

struct esp_ble_mesh_cfg_client_cb_param_t
   Configuration Client Model callback parameters

Public Members

int error_code
   Appropriate error code

esp_ble_mesh_client_common_param_t *params
   The client common parameters

esp_ble_mesh_cfg_client_common_cb_param_t status_cb
   The config status message callback values
struct esp_ble_mesh_state_change_cfg_mod_pub_set_t
Configuration Server model related context.

Public Members

uint16_t element_addr
   Element Address

uint16_t pub_addr
   Publish Address

uint16_t app_idx
   AppKey Index

bool cred_flag
   Friendship Credential Flag

uint8_t pub_ttl
   Publish TTL

uint8_t pub_period
   Publish Period

uint8_t pub_retransmit
   Publish Retransmit

uint16_t company_id
   Company ID

uint16_t model_id
   Model ID

struct esp_ble_mesh_state_change_cfg_model_sub_add_t
Parameters of Config Model Subscription Add

Public Members

uint16_t element_addr
   Element Address

uint16_t sub_addr
   Subscription Address

uint16_t company_id
   Company ID

uint16_t model_id
   Model ID

struct esp_ble_mesh_state_change_cfg_model_sub_delete_t
Parameters of Config Model Subscription Delete

Public Members

uint16_t element_addr
   Element Address

uint16_t sub_addr
   Subscription Address

uint16_t company_id
   Company ID

```c
uint16_t model_id
   Model ID

struct esp_ble_mesh_state_change_cfg_netkey_add_t
   Parameters of Config NetKey Add

   Public Members

   uint16_t net_idx
      NetKey Index
   uint8_t net_key[16]
      NetKey

struct esp_ble_mesh_state_change_cfg_netkey_update_t
   Parameters of Config NetKey Update

   Public Members

   uint16_t net_idx
      NetKey Index
   uint8_t net_key[16]
      NetKey

struct esp_ble_mesh_state_change_cfg_netkey_delete_t
   Parameter of Config NetKey Delete

   Public Members

   uint16_t net_idx
      NetKey Index

struct esp_ble_mesh_state_change_cfg_appkey_add_t
   Parameters of Config AppKey Add

   Public Members

   uint16_t net_idx
      NetKey Index
   uint16_t app_idx
      AppKey Index
   uint8_t app_key[16]
      AppKey

struct esp_ble_mesh_state_change_cfg_appkey_update_t
   Parameters of Config AppKey Update

   Public Members

   uint16_t net_idx
      NetKey Index
   uint16_t app_idx
      AppKey Index
   uint8_t app_key[16]
      AppKey
```

Chapter 2. API Reference
struct esp_ble_mesh_state_change_cfg_appkey_delete_t
Parameters of Config AppKey Delete

Public Members

uint16_t net_idx
NetKey Index

uint16_t app_idx
AppKey Index

struct esp_ble_mesh_state_change_cfg_model_app_bind_t
Parameters of Config Model App Bind

Public Members

uint16_t element_addr
Element Address

uint16_t app_idx
AppKey Index

uint16_t company_id
Company ID

uint16_t model_id
Model ID

struct esp_ble_mesh_state_change_cfg_model_app_unbind_t
Parameters of Config Model App Unbind

Public Members

uint16_t element_addr
Element Address

uint16_t app_idx
AppKey Index

uint16_t company_id
Company ID

uint16_t model_id
Model ID

struct esp_ble_mesh_state_change_cfg_kr_phase_set_t
Parameters of Config Key Refresh Phase Set

Public Members

uint16_t net_idx
NetKey Index

uint8_t kr_phase
New Key Refresh Phase Transition

struct esp_ble_mesh_cfg_server_cb_param_t
Configuration Server model callback parameters
Public Members

```c
esp_ble_mesh_model_t *model
```
Pointer to the server model structure

```c
esp_ble_mesh_msg_ctx_t ctx
```
Context of the received message

```c
esp_ble_mesh_cfg_server_cb_value_t value
```
Value of the received configuration messages

Macros

```c
ESP_BLE_MESH_MODEL_CFG_SRV(srv_data)
```
Define a new Config Server Model.

**Note** The Config Server Model can only be included by a Primary Element.

**Return** New Config Server Model instance.

**Parameters**
- `srv_data`: Pointer to a unique Config Server Model user_data.

```c
ESP_BLE_MESH_MODEL_CFG_CLI(cli_data)
```
Define a new Config Client Model.

**Note** The Config Client Model can only be included by a Primary Element.

**Return** New Config Client Model instance.

**Parameters**
- `cli_data`: Pointer to a unique struct `esp_ble_mesh_client_t`.

Type Definitions

```c
typedef struct esp_ble_mesh_cfg_srv esp_ble_mesh_cfg_srv_t
```
Configuration Server Model context

```c
typedef void (*esp_ble_mesh_cfg_client_cb_t)(esp_ble_mesh_cfg_client_cb_event_t event,
                                         esp_ble_mesh_cfg_client_cb_param_t *param)
```
Bluetooth Mesh Config Client and Server Model functions.

**Configuration Client Model callback function type**

**Parameters**
- `event`: Event type
- `param`: Pointer to callback parameter

```c
typedef void (*esp_ble_mesh_cfg_server_cb_t)(esp_ble_mesh_cfg_server_cb_event_t event,
                                         esp_ble_mesh_cfg_server_cb_param_t *param)
```
Configuration Server Model callback function type.

**Parameters**
- `event`: Event type
- `param`: Pointer to callback parameter

Enumerations

```c
enum esp_ble_mesh_cfg_client_cb_event_t
```
This enum value is the event of Configuration Client Model

**Values:**

- `ESP_BLE_MESH_CFG_CLIENT_GET_STATE_EVT`
- `ESP_BLE_MESH_CFG_CLIENT_SET_STATE_EVT`
- `ESP_BLE_MESH_CFG_CLIENT_PUBLISH_EVT`
- `ESP_BLE_MESH_CFG_CLIENT_TIMEOUT_EVT`
ESP_BLE_MESH_CFG_CLIENT_EVT_MAX
enum esp_ble_mesh_cfg_server_cb_event_t
This enum value is the event of Configuration Server model

Values:
ESP_BLE_MESH_CFG_SERVER_STATE_CHANGE_EVT
ESP_BLE_MESH_CFG_SERVER_EVT_MAX

Health Client/Server Models

Header File

- components/bt/esp_ble_mesh/api/models/include/esp_ble_mesh_health_model_api.h

Functions

esp_err_t esp_ble_mesh_register_health_client_callback(esp_ble_mesh_health_client_cb_t callback)
Register BLE Mesh Health Model callback, the callback will report Health Client & Server Model events.
Return ESP_OK on success or error code otherwise.
Parameters
• [in] callback: Pointer to the callback function.

esp_err_t esp_ble_mesh_register_health_server_callback(esp_ble_mesh_health_server_cb_t callback)
Register BLE Mesh Health Server Model callback.
Return ESP_OK on success or error code otherwise.
Parameters
• [in] callback: Pointer to the callback function.

esp_err_t esp_ble_mesh_health_client_get_state(esp_ble_mesh_client_common_param_t *params, esp_ble_mesh_health_client_get_state_t *get_state)
This function is called to get the Health Server states using the Health Client Model get messages.
Note If you want to find the opcodes and corresponding meanings accepted by this API, please refer to esp_ble_mesh_opcode_health_client_get_t in esp_ble_mesh_defs.h
Return ESP_OK on success or error code otherwise.
Parameters
• [in] params: Pointer to BLE Mesh common client parameters.
• [in] get_state: Pointer to a union, each kind of opcode corresponds to one structure inside. Shall not be set to NULL.

esp_err_t esp_ble_mesh_health_client_set_state(esp_ble_mesh_client_common_param_t *params, esp_ble_mesh_health_client_set_state_t *set_state)
This function is called to set the Health Server states using the Health Client Model set messages.
Note If you want to find the opcodes and corresponding meanings accepted by this API, please refer to esp_ble_mesh_opcode_health_client_set_t in esp_ble_mesh_defs.h
Return ESP_OK on success or error code otherwise.
Parameters
• [in] params: Pointer to BLE Mesh common client parameters.
• [in] set_state: Pointer to a union, each kind of opcode corresponds to one structure inside. Shall not be set to NULL.

esp_err_t esp_ble_mesh_health_server_fault_update(esp_ble_mesh_elem_t *element)
This function is called by the Health Server Model to update the context of its Health Current status.
Return ESP_OK on success or error code otherwise.
Parameters
Unions

union esp_ble_mesh_health_client_get_state_t
#include <esp_ble_mesh_health_model_api.h> For ESP_BLE_MESH_MODEL_OP_HEALTH_FAULT_GET
ESP_BLE_MESH_MODEL_OP_ATTENTION_GET ESP_BLE_MESH_MODEL_OP_HEALTH_PERIOD_GET
the get_state parameter in the esp_ble_mesh_health_client_get_state function should not be set to NULL.

Public Members

esp_ble_mesh_health_fault_get_t fault_get
For ESP_BLE_MESH_MODEL_OP_HEALTH_FAULT_GET.

union esp_ble_mesh_health_client_set_state_t
#include <esp_ble_mesh_health_model_api.h> For ESP_BLE_MESH_MODEL_OP_HEALTH_FAULT_CLEAR
ESP_BLE_MESH_MODEL_OP_HEALTH_FAULT_CLEAR_UNACK ESP_BLE_MESH_MODEL_OP_HEALTH_FAULT tested
ESP_BLE_MESH_MODEL_OP_HEALTH_FAULT_TEST_UNACK ESP_BLE_MESH_MODEL_OP_HEALTH_FAULT_PERIOD
ESP_BLE_MESH_MODEL_OP_HEALTH_PERIOD_SET_UNACK ESP_BLE_MESH_MODEL_OP_ATTENTION_SET
ESP_BLE_MESH_MODEL_OP_ATTENTION_SET_UNACK the set_state parameter in the
esp_ble_mesh_health_client_set_state function should not be set to NULL.

Public Members

esp_ble_mesh_health_attention_set_t attention_set
For ESP_BLE_MESH_MODEL_OP_ATTENTION_SET or ESP_BLE_MESH_MODEL_OP_ATTENTION_SET_UNACK.

esp_ble_mesh_health_period_set_t period_set
For ESP_BLE_MESH_MODEL_OP_HEALTH_PERIOD_SET or
ESP_BLE_MESH_MODEL_OP_HEALTH_PERIOD_SET_UNACK.

esp_ble_mesh_health_fault_test_t fault_test
For ESP_BLE_MESH_MODEL_OP_HEALTH_FAULT_TEST or
ESP_BLE_MESH_MODEL_OP_HEALTH_FAULT_TEST_UNACK.

esp_ble_mesh_health_fault_clear_t fault_clear
For ESP_BLE_MESH_MODEL_OP_HEALTH_FAULT_CLEAR or
ESP_BLE_MESH_MODEL_OP_HEALTH_FAULT_CLEAR_UNACK.

union esp_ble_mesh_health_client_common_cb_param_t
#include <esp_ble_mesh_health_model_api.h> Health Client Model received message union.

Public Members

esp_ble_mesh_health_current_status_cb_t current_status
The health current status value

esp_ble_mesh_health_fault_status_cb_t fault_status
The health fault status value

esp_ble_mesh_health_period_status_cb_t period_status
The health period status value

esp_ble_mesh_health_attention_status_cb_t attention_status
The health attention status value

union esp_ble_mesh_health_server_cb_param_t
#include <esp_ble_mesh_health_model_api.h> Health Server Model callback parameters union.
**Public Members**

*esp_ble_mesh_health_fault_update_comp_cb_t* `fault_update_comp`
ESP_BLE_MESH_HEALTH_SERVER_FAULT_UPDATE_COMP_EVT

*esp_ble_mesh_health_fault_clear_cb_t* `fault_clear`
ESP_BLE_MESH_HEALTH_SERVER_FAULT_CLEAR_EVT

*esp_ble_mesh_health_fault_test_cb_t* `fault_test`
ESP_BLE_MESH_HEALTH_SERVER_FAULT_TEST_EVT

*esp_ble_mesh_health_attention_on_cb_t* `attention_on`
ESP_BLE_MESH_HEALTH_SERVER_ATTENTION_ON_EVT

*esp_ble_mesh_health_attention_off_cb_t* `attention_off`
ESP_BLE_MESH_HEALTH_SERVER_ATTENTION_OFF_EVT

**Structures**

`struct esp_ble_mesh_health_srv_cb_t`
ESP BLE Mesh Health Server callback

**Public Members**

*esp_ble_mesh_cb_t* `fault_clear`
Clear health registered faults. Initialized by the stack.

*esp_ble_mesh_cb_t* `fault_test`
Run a specific health test. Initialized by the stack.

*esp_ble_mesh_cb_t* `attention_on`
Health attention on callback. Initialized by the stack.

*esp_ble_mesh_cb_t* `attention_off`
Health attention off callback. Initialized by the stack.

`struct esp_ble_mesh_health_test_t`
ESP BLE Mesh Health Server test Context

**Public Members**

`uint8_t id_count`
Number of Health self-test ID

`const uint8_t* test_ids`
Array of Health self-test IDs

`uint16_t company_id`
Company ID used to identify the Health Fault state

`uint8_t prev_test_id`
Current test ID of the health fault test

`uint8_t current_faults[ESP_BLE_MESH_HEALTH_FAULT_ARRAY_SIZE]`
Array of current faults

`uint8_t registered_faults[ESP_BLE_MESH_HEALTH_FAULT_ARRAY_SIZE]`
Array of registered faults

`struct esp_ble_mesh_health_srv_t`
ESP BLE Mesh Health Server Model Context
Chapter 2. API Reference

Public Members

`esp_ble_mesh_model_t *model`
Pointer to Health Server Model

`esp_ble_mesh_health_srv_cb_t health_cb`
Health callback struct

`struct k_delayed_work attention_timer`
Attention Timer state

`bool attention_timer_start`
Attention Timer start flag

`esp_ble_mesh_health_test_t health_test`
Health Server fault test

`struct esp_ble_mesh_health_fault_get_t`
Parameter of Health Fault Get

Public Members

`uint16_t company_id`
Bluetooth assigned 16-bit Company ID

`struct esp_ble_mesh_health_attention_set_t`
Parameter of Health Attention Set

Public Members

`uint8_t attention`
Value of the Attention Timer state

`struct esp_ble_mesh_health_period_set_t`
Parameter of Health Period Set

Public Members

`uint8_t fast_period_divisor`
Divider for the Publish Period

`struct esp_ble_mesh_health_fault_test_t`
Parameter of Health Fault Test

Public Members

`uint16_t company_id`
Bluetooth assigned 16-bit Company ID

`uint8_t test_id`
ID of a specific test to be performed

`struct esp_ble_mesh_health_fault_clear_t`
Parameter of Health Fault Clear
Public Members

```c
uint16_t company_id
    Bluetooth assigned 16-bit Company ID
```

```c
struct esp_ble_mesh_health_current_status_cb_t
    Parameters of Health Current Status
```

Public Members

```c
uint8_t test_id
    ID of a most recently performed test
```

```c
uint16_t company_id
    Bluetooth assigned 16-bit Company ID
```

```c
struct net_buf_simple *fault_array
    FaultArray field contains a sequence of 1-octet fault values
```

```c
struct esp_ble_mesh_health_fault_status_cb_t
    Parameters of Health Fault Status
```

Public Members

```c
uint8_t test_id
    ID of a most recently performed test
```

```c
uint16_t company_id
    Bluetooth assigned 16-bit Company ID
```

```c
struct net_buf_simple *fault_array
    FaultArray field contains a sequence of 1-octet fault values
```

```c
struct esp_ble_mesh_health_period_status_cb_t
    Parameter of Health Period Status
```

Public Members

```c
uint8_t fast_period_divisor
    Divider for the Publish Period
```

```c
struct esp_ble_mesh_health_attention_status_cb_t
    Parameter of Health Attention Status
```

Public Members

```c
uint8_t attention
    Value of the Attention Timer state
```

```c
struct esp_ble_mesh_health_client_cb_param_t
    Health Client Model callback parameters
```

Public Members

```c
int error_code
    Appropriate error code
```

```c
esp_ble_mesh_client_common_param_t *params
    The client common parameters.
```
The health message status callback values

The parameter of publishing Health Current Status completion event.

*Public Members*

- `error_code`: The result of publishing Health Current Status
- `element`: Pointer to the element which contains the Health Server Model

Parameters of Health Fault Clear event

*Public Members*

- `model`: Pointer to the Health Server Model
- `company_id`: Bluetooth assigned 16-bit Company ID

Parameters of Health Fault Test event

*Public Members*

- `model`: Pointer to the Health Server Model
- `test_id`: ID of a specific test to be performed
- `company_id`: Bluetooth assigned 16-bit Company ID

Parameters of Health Attention On event

*Public Members*

- `model`: Pointer to the Health Server Model
- `time`: Duration of attention timer on (in seconds)

Parameters of Health Attention Off event

*Public Members*

- `model`: Pointer to the Health Server Model
 Macros

**ESP_BLE_MESH_MODEL_HEALTH_SRV**(srv, pub)
Define a new Health Server Model.

*Note* The Health Server Model can only be included by a Primary Element.

*Return* New Health Server Model instance.

*Parameters*
- `srv`: Pointer to the unique struct `esp_ble_mesh_health_srv_t`.
- `pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.

**ESP_BLE_MESH_MODEL_HEALTH_CLI**(cli_data)
Define a new Health Client Model.

*Note* This API needs to be called for each element on which the application needs to have a Health Client Model.

*Return* New Health Client Model instance.

*Parameters*
- `cli_data`: Pointer to the unique struct `esp_ble_mesh_client_t`.

**ESP_BLE_MESH_HEALTH_PUB_DEFINE**(name, max, role)
A helper to define a health publication context

*Parameters*
- `name`: Name given to the publication context variable.
- `max`: Maximum number of faults the element can have.
- `role`: Role of the device which contains the model.

**ESP_BLE_MESH_HEALTH_STANDARD_TEST**
SIG identifier of Health Fault Test. 0x01~0xFF: Vendor Specific Test.

**ESP_BLE_MESH_NO_FAULT**
Fault values of Health Fault Test. 0x01~0xFF: Vendor Specific Warning/Error.

**ESP_BLE_MESH_BATTERY_LOW_WARNING**
**ESP_BLE_MESH_BATTERY_LOW_ERROR**

**ESP_BLE_MESH_SUPPLY_VOLTAGE_TOO_LOW_WARNING**

Type Definitions
typedef void (*esp_ble_mesh_health_client_cb_t)(esp_ble_mesh_health_client_cb_event_t event, esp_ble_mesh_health_client_cb_param_t *param)

Bluetooth Mesh Health Client and Server Model function.
Health Client Model callback function type

Parameters
• event: Event type
• **param**: Pointer to callback parameter

typedef void (*esp_ble_mesh_health_server_cb_t)(
esp_ble_mesh_health_server_cb_event_t event,
esp_ble_mesh_health_server_cb_param_t
*param)

Health Server Model callback function type.

**Parameters**

• **event**: Event type
• **param**: Pointer to callback parameter

**Enumerations**

enum esp_ble_mesh_health_client_cb_event_t

This enum value is the event of Health Client Model

Values:

ESP_BLE_MESH_HEALTH_CLIENT_GET_STATE_EVT
ESP_BLE_MESH_HEALTH_CLIENT_SET_STATE_EVT
ESP_BLE_MESH_HEALTH_CLIENT_PUBLISH_EVT
ESP_BLE_MESH_HEALTH_CLIENT_TIMEOUT_EVT
ESP_BLE_MESH_HEALTH_CLIENT_EVT_MAX

enum esp_ble_mesh_health_server_cb_event_t

This enum value is the event of Health Server Model

Values:

ESP_BLE_MESH_HEALTH_SERVER_FAULT_UPDATE_COMP_EVT
ESP_BLE_MESH_HEALTH_SERVER_FAULT_CLEAR_EVT
ESP_BLE_MESH_HEALTH_SERVER_FAULT_TEST_EVT
ESP_BLE_MESH_HEALTH_SERVER_ATTENTION_ON_EVT
ESP_BLE_MESH_HEALTH_SERVER_ATTENTION_OFF_EVT
ESP_BLE_MESH_HEALTH_SERVER_EVT_MAX

**Generic Client/Server Models**

**Header File**

• components/bt/esp_ble_mesh/api/models/include/esp_ble_mesh_generic_model_api.h

**Functions**

`esp_err_t esp_ble_mesh_register_generic_client_callback(esp_ble_mesh_generic_client_cb_t callback)`

Register BLE Mesh Generic Client Model callback.

**Return** ESP_OK on success or error code otherwise.

**Parameters**

• **[in]** callback: Pointer to the callback function.

`esp_err_t esp_ble_mesh_generic_client_get_state(esp_ble_mesh_client_common_param_t
*params,
esp_ble_mesh_generic_client_get_state_t
*get_state)`

Get the value of Generic Server Model states using the Generic Client Model get messages.

**Note** If you want to find the opcodes and corresponding meanings accepted by this API, please refer to esp_ble_mesh_generic_message_opcode_t in esp_ble_mesh_defs.h
Return ESP_OK on success or error code otherwise.

Parameters
- [in] get_state: Pointer to generic get message value. Shall not be set to NULL.

```c
esp_err_t esp_ble_mesh_generic_client_set_state(esp_ble_mesh_client_common_param_t *params,
                                                esp_ble_mesh_generic_client_set_state_t *set_state)
```

Set the value of Generic Server Model states using the Generic Client Model set messages.

Note If you want to find the opcodes and corresponding meanings accepted by this API, please refer to esp_ble_mesh_generic_message_opcode_t in esp_ble_mesh_defs.h

Return ESP_OK on success or error code otherwise.

Parameters
- [in] set_state: Pointer to generic set message value. Shall not be set to NULL.

```c
esp_err_t esp_ble_mesh_register_generic_server_callback(esp_ble_mesh_generic_server_cb_t *callback)
```

Register BLE Mesh Generic Server Model callback.

Return ESP_OK on success or error code otherwise.

Parameters
- [in] callback: Pointer to the callback function.

Unions

```c

Public Members

```c
struct esp_ble_mesh_gen_onoff_set_t
    Bluetooth Mesh Generic Client Model Get and Set parameters structure.
    Parameters of Generic OnOff Set.
```

Public Members

```c
bool op_en
    Indicate if optional parameters are included

uint8_t onoff
    Target value of Generic OnOff state

uint8_t tid
    Transaction ID

uint8_t trans_time
    Time to complete state transition (optional)

uint8_t delay
    Indicate message execution delay (C.1)
```

Structures

```c
struct esp_ble_mesh_gen_level_set_t
    Parameters of Generic Level Set.
```

Public Members

```c
bool op_en
    Indicate if optional parameters are included

int16_t level
    Target value of Generic Level state

uint8_t tid
    Transaction ID

uint8_t trans_time
    Time to complete state transition (optional)
```
```c
uint8_t delay
   Indicate message execution delay (C.1)

struct esp_ble_mesh_gen_delta_set_t
   Parameters of Generic Delta Set.
   
   Public Members
   
   bool op_en
       Indicate if optional parameters are included
   int32_t level
       Delta change of Generic Level state
   uint8_t tid
       Transaction ID
   uint8_t trans_time
       Time to complete state transition (optional)
   uint8_t delay
       Indicate message execution delay (C.1)

struct esp_ble_mesh_gen_move_set_t
   Parameters of Generic Move Set.
   
   Public Members
   
   bool op_en
       Indicate if optional parameters are included
   int16_t delta_level
       Delta Level step to calculate Move speed for Generic Level state
   uint8_t tid
       Transaction ID
   uint8_t trans_time
       Time to complete state transition (optional)
   uint8_t delay
       Indicate message execution delay (C.1)

struct esp_ble_mesh_gen_def_trans_time_set_t
   Parameter of Generic Default Transition Time Set.
   
   Public Members
   
   uint8_t trans_time
       The value of the Generic Default Transition Time state

struct esp_ble_mesh_gen_onpowerup_set_t
   Parameter of Generic OnPowerUp Set.
   
   Public Members
   
   uint8_t onpowerup
       The value of the Generic OnPowerUp state

struct esp_ble_mesh_gen_power_level_set_t
   Parameters of Generic Power Level Set.
```
Chapter 2. API Reference

Public Members

bool op_en
   Indicate if optional parameters are included

uint16_t power
   Target value of Generic Power Actual state

uint8_t tid
   Transaction ID

uint8_t trans_time
   Time to complete state transition (optional)

uint8_t delay
   Indicate message execution delay (C.1)

struct esp_ble_mesh_gen_power_default_set_t
   Parameter of Generic Power Default Set.

Public Members

uint16_t power
   The value of the Generic Power Default state

struct esp_ble_mesh_gen_power_range_set_t
   Parameters of Generic Power Range Set.

Public Members

uint16_t range_min
   Value of Range Min field of Generic Power Range state

uint16_t range_max
   Value of Range Max field of Generic Power Range state

struct esp_ble_mesh_gen_loc_global_set_t
   Parameters of Generic Location Global Set.

Public Members

int32_t global_latitude
   Global Coordinates (Latitude)

int32_t global_longitude
   Global Coordinates (Longitude)

int16_t global_altitude
   Global Altitude

struct esp_ble_mesh_gen_loc_local_set_t
   Parameters of Generic Location Local Set.

Public Members

int16_t local_north
   Local Coordinates (North)

int16_t local_east
   Local Coordinates (East)
int16_t local_altitude
Local Altitude

uint8_t floor_number
Floor Number

uint16_t uncertainty
Uncertainty

```c
struct esp_ble_mesh_gen_user_property_get_t
Parameter of Generic User Property Get.
```

**Public Members**

```c
uint16_t property_id
Property ID identifying a Generic User Property
```

```c
struct esp_ble_mesh_gen_user_property_set_t
Parameters of Generic User Property Set.
```

**Public Members**

```c
uint16_t property_id
Property ID identifying a Generic User Property
```

```c
struct net_buf_simple *property_value
Raw value for the User Property
```

```c
struct esp_ble_mesh_gen_admin_property_get_t
Parameter of Generic Admin Property Get.
```

**Public Members**

```c
uint16_t property_id
Property ID identifying a Generic Admin Property
```

```c
struct esp_ble_mesh_gen_admin_property_set_t
Parameters of Generic Admin Property Set.
```

**Public Members**

```c
uint16_t property_id
Property ID identifying a Generic Admin Property
```

```c
uint8_t user_access
Enumeration indicating user access
```

```c
struct net_buf_simple *property_value
Raw value for the Admin Property
```

```c
struct esp_ble_mesh_gen_manufacturer_property_get_t
Parameter of Generic Manufacturer Property Get.
```

**Public Members**

```c
uint16_t property_id
Property ID identifying a Generic Manufacturer Property
```

```c
struct esp_ble_mesh_gen_manufacturer_property_set_t
Parameters of Generic Manufacturer Property Set.
```
Public Members

uint16_t property_id
Property ID identifying a Generic Manufacturer Property

uint8_t user_access
Enumeration indicating user access

struct esp_ble_mesh_gen_client_properties_get_t
Parameter of Generic Client Properties Get.

Public Members

uint16_t property_id
A starting Client Property ID present within an element

struct esp_ble_mesh_gen_onoff_status_cb_t
Bluetooth Mesh Generic Client Model Get and Set callback parameters structure.
Parameters of Generic OnOff Status.

Public Members

bool op_en
Indicate if optional parameters are included

uint8_t present_onoff
Current value of Generic OnOff state

uint8_t target_onoff
Target value of Generic OnOff state (optional)

uint8_t remain_time
Time to complete state transition (C.1)

struct esp_ble_mesh_gen_level_status_cb_t
Parameters of Generic Level Status.

Public Members

bool op_en
Indicate if optional parameters are included

int16_t present_level
Current value of Generic Level state

int16_t target_level
Target value of the Generic Level state (optional)

uint8_t remain_time
Time to complete state transition (C.1)

struct esp_ble_mesh_gen_def_trans_time_status_cb_t
Parameter of Generic Default Transition Time Status.

Public Members

uint8_t trans_time
The value of the Generic Default Transition Time state

struct esp_ble_mesh_gen_onpowerup_status_cb_t
Public Members

uint8_t onpowerup
The value of the Generic OnPowerUp state

struct esp_ble_mesh_gen_power_level_status_cb_t
Parameters of Generic Power Level Status.

Public Members

bool op_en
Indicate if optional parameters are included

uint16_t present_power
Current value of Generic Power Actual state

uint16_t target_power
Target value of Generic Power Actual state (optional)

uint8_t remain_time
Time to complete state transition (C.1)

struct esp_ble_mesh_gen_power_last_status_cb_t
Parameter of Generic Power Last Status.

Public Members

uint16_t power
The value of the Generic Power Last state

struct esp_ble_mesh_gen_power_default_status_cb_t
Parameter of Generic Power Default Status.

Public Members

uint16_t power
The value of the Generic Default Last state

struct esp_ble_mesh_gen_power_range_status_cb_t
Parameters of Generic Power Range Status.

Public Members

uint8_t status_code
Status Code for the request message

uint16_t range_min
Value of Range Min field of Generic Power Range state

uint16_t range_max
Value of Range Max field of Generic Power Range state

struct esp_ble_mesh_gen_battery_status_cb_t
Parameters of Generic Battery Status.
Public Members

uint32_t \texttt{battery_level} : 8
Value of Generic Battery Level state

uint32_t \texttt{time_to_discharge} : 24
Value of Generic Battery Time to Discharge state

uint32_t \texttt{time_to_charge} : 24
Value of Generic Battery Time to Charge state

uint32_t \texttt{flags} : 8
Value of Generic Battery Flags state

\texttt{struct esp_ble_mesh_gen_loc_global_status_cb_t}
Parameters of Generic Location Global Status.

Public Members

int32_t \texttt{global_latitude}
Global Coordinates (Latitude)

int32_t \texttt{global_longitude}
Global Coordinates (Longitude)

int16_t \texttt{global_altitude}
Global Altitude

\texttt{struct esp_ble_mesh_gen_loc_local_status_cb_t}
Parameters of Generic Location Local Status.

Public Members

int16_t \texttt{local_north}
Local Coordinates (North)

int16_t \texttt{local_east}
Local Coordinates (East)

int16_t \texttt{local_altitude}
Local Altitude

uint8_t \texttt{floor_number}
Floor Number

uint16_t \texttt{uncertainty}
Uncertainty

\texttt{struct esp_ble_mesh_gen_user_properties_status_cb_t}
Parameter of Generic User Properties Status.

Public Members

\texttt{struct net_buf_simple *property_ids}
Buffer contains a sequence of N User Property IDs

\texttt{struct esp_ble_mesh_gen_user_property_status_cb_t}
Parameters of Generic User Property Status.
Public Members

bool op_en
   Indicate if optional parameters are included

uint16_t property_id
   Property ID identifying a Generic User Property

uint8_t user_access
   Enumeration indicating user access (optional)

struct net_buf_simple *property_value
   Raw value for the User Property (C.1)

struct esp_ble_mesh_gen_admin_properties_status_cb_t
   Parameter of Generic Admin Properties Status.

Public Members

struct net_buf_simple *property_ids
   Buffer contains a sequence of N Admin Property IDs

struct esp_ble_mesh_gen_admin_property_status_cb_t
   Parameters of Generic Admin Property Status.

Public Members

bool op_en
   Indicate if optional parameters are included

uint16_t property_id
   Property ID identifying a Generic Admin Property

uint8_t user_access
   Enumeration indicating user access (optional)

struct net_buf_simple *property_value
   Raw value for the Admin Property (C.1)

struct esp_ble_mesh_gen_admin_manufacturer_properties_status_cb_t
   Parameter of Generic Manufacturer Properties Status.

Public Members

struct net_buf_simple *property_ids
   Buffer contains a sequence of N Manufacturer Property IDs

struct esp_ble_mesh_gen_manufacturer_property_status_cb_t
   Parameters of Generic Manufacturer Property Status.

Public Members

bool op_en
   Indicate if optional parameters are included

uint16_t property_id
   Property ID identifying a Generic Manufacturer Property

uint8_t user_access
   Enumeration indicating user access (optional)
struct net_buf_simple *property_value
    Raw value for the Manufacturer Property (C.1)

struct esp_ble_mesh_gen_client_properties_status_cb_t
    Parameter of Generic Client Properties Status.

**Public Members**

struct net_buf_simple *property_ids
    Buffer contains a sequence of N Client Property IDs

struct esp_ble_mesh_generic_client_cb_param_t
    Generic Client Model callback parameters

**Public Members**

int error_code
    Appropriate error code

esp_ble_mesh_client_common_param_t *params
    The client common parameters.

esp_ble_mesh_gen_client_status_cb_t status_cb
    The generic status message callback values

struct esp_ble_mesh_gen_onoff_state_t
    Parameters of Generic OnOff state

**Public Members**

uint8_t onoff
    The present value of the Generic OnOff state

uint8_t target_onoff
    The target value of the Generic OnOff state

struct esp_ble_mesh_gen_onoff_srv_t
    User data of Generic OnOff Server Model

**Public Members**

esp_ble_mesh_model_t *model
    Pointer to the Generic OnOff Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl
    Response control of the server model received messages

esp_ble_mesh_gen_onoff_state_t state
    Parameters of the Generic OnOff state

esp_ble_mesh_last_msg_info_t last
    Parameters of the last received set message

esp_ble_mesh_state_transition_t transition
    Parameters of state transition

struct esp_ble_mesh_gen_level_state_t
    Parameters of Generic Level state
Public Members

int16_t level
The present value of the Generic Level state

int16_t target_level
The target value of the Generic Level state

int16_t last_level
When a new transaction starts, level should be set to last_last, and use “level + incoming delta” to calculate the target level. In another word, “last_level” is used to record “level” of the last transaction, and “last_delta” is used to record the previously received delta_level value. The last value of the Generic Level state

int32_t last_delta
The last delta change of the Generic Level state

bool move_start
Indicate if the transition of the Generic Level state has been started

bool positive
Indicate if the transition is positive or negative

struct esp_ble_mesh_gen_level_srv_t
User data of Generic Level Server Model

Public Members

esp_ble_mesh_model_t *model
Pointer to the Generic Level Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t rsp_ctrl
Response control of the server model received messages

esp_ble_mesh_gen_level_state_t state
Parameters of the Generic Level state

esp_ble_mesh_last_msg_info_t last
Parameters of the last received set message

esp_ble_mesh_state_transition_t transition
Parameters of state transition

int32_t tt_delta_level
Delta change value of level state transition

struct esp_ble_mesh_gen_def_trans_time_state_t
Parameter of Generic Default Transition Time state

Public Members

uint8_t trans_time
The value of the Generic Default Transition Time state

struct esp_ble_mesh_gen_def_trans_time_srv_t
User data of Generic Default Transition Time Server Model

Public Members

esp_ble_mesh_model_t *model
Pointer to the Generic Default Transition Time Server Model. Initialized internally.
### Chapter 2. API Reference

#### esp_ble_mesh_server_rsp_ctrl_t
Response control of the server model received messages

#### esp_ble_mesh_gen_def_trans_time_state_t
Parameters of the Generic Default Transition Time state

#### struct esp_ble_mesh_gen_onpowerup_state_t
Parameter of Generic OnPowerUp state

**Public Members**

- `uint8_t onpowerup`
  The value of the Generic OnPowerUp state

#### struct esp_ble_mesh_gen_power_onoff_srv_t
User data of Generic Power OnOff Server Model

**Public Members**

- `esp_ble_mesh_model_t *model`
  Pointer to the Generic Power OnOff Server Model. Initialized internally.

- `esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl`
  Response control of the server model received messages

- `esp_ble_mesh_gen_onpowerup_state_t *state`
  Parameters of the Generic OnPowerUp state

#### struct esp_ble_mesh_gen_power_onoff_setup_srv_t
User data of Generic Power OnOff Setup Server Model

**Public Members**

- `esp_ble_mesh_model_t *model`
  Pointer to the Generic Power OnOff Setup Server Model. Initialized internally.

- `esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl`
  Response control of the server model received messages

- `esp_ble_mesh_gen_onpowerup_state_t *state`
  Parameters of the Generic OnPowerUp state

#### struct esp_ble_mesh_gen_power_level_state_t
Parameters of Generic Power Level state

**Public Members**

- `uint16_t power_actual`
  The present value of the Generic Power Actual state

- `uint16_t target_power_actual`
  The target value of the Generic Power Actual state

- `uint16_t power_last`
  The value of the Generic Power Last state

- `uint16_t power_default`
  The value of the Generic Power Default state

- `uint8_t status_code`
  The status code of setting Generic Power Range state
Chapter 2. API Reference

```c
uint16_t power_range_min
The minimum value of the Generic Power Range state

uint16_t power_range_max
The maximum value of the Generic Power Range state

struct esp_ble_mesh_gen_power_level_srv_t
User data of Generic Power Level Server Model

Public Members

esp_ble_mesh_model_t *model
Pointer to the Generic Power Level Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl
Response control of the server model received messages

esp_ble_mesh_gen_power_level_state_t *state
Parameters of the Generic Power Level state

esp_ble_mesh_last_msg_info_t last
Parameters of the last received set message

esp_ble_mesh_state_transition_t *transition
Parameters of state transition

int32_t tt_delta_level
Delta change value of level state transition

struct esp_ble_mesh_gen_power_level_setup_srv_t
User data of Generic Power Level Setup Server Model

Public Members

esp_ble_mesh_model_t *model
Pointer to the Generic Power Level Setup Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl
Response control of the server model received messages

esp_ble_mesh_gen_power_level_state_t *state
Parameters of the Generic Power Level state

struct esp_ble_mesh_gen_battery_state_t
Parameters of Generic Battery state

Public Members

uint32_t battery_level : 8
The value of the Generic Battery Level state

uint32_t time_to_discharge : 24
The value of the Generic Battery Time to Discharge state

uint32_t time_to_charge : 24
The value of the Generic Battery Time to Charge state

uint32_t battery_flags : 8
The value of the Generic Battery Flags state

struct esp_ble_mesh_gen_battery_srv_t
User data of Generic Battery Server Model
```
Public Members

*esp_ble_mesh_model_t* model
Pointer to the Generic Battery Server Model. Initialized internally.

*esp_ble_mesh_server_rsp_ctrl_t* rsp_ctrl
Response control of the server model received messages

*esp_ble_mesh_gen_battery_state_t* state
Parameters of the Generic Battery state

struct esp_ble_mesh_gen_location_state_t
Parameters of Generic Location state

Public Members

int32_t global_latitude
The value of the Global Latitude field

int32_t global_longitude
The value of the Global Longitude field

int16_t global_altitude
The value of the Global Altitude field

int16_t local_north
The value of the Local North field

int16_t local_east
The value of the Local East field

int16_t local_altitude
The value of the Local Altitude field

uint8_t floor_number
The value of the Floor Number field

uint16_t uncertainty
The value of the Uncertainty field

struct esp_ble_mesh_gen_location_srv_t
User data of Generic Location Server Model

Public Members

*esp_ble_mesh_model_t* model
Pointer to the Generic Location Server Model. Initialized internally.

*esp_ble_mesh_server_rsp_ctrl_t* rsp_ctrl
Response control of the server model received messages

*esp_ble_mesh_gen_location_state_t* state
Parameters of the Generic Location state

struct esp_ble_mesh_gen_location_setup_srv_t
User data of Generic Location Setup Server Model

Public Members

*esp_ble_mesh_model_t* model
Pointer to the Generic Location Setup Server Model. Initialized internally.
Chapter 2. API Reference

```c
esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl
    Response control of the server model received messages

esp_ble_mesh_gen_location_state_t *state
    Parameters of the Generic Location state

struct esp_ble_mesh_generic_property_t
    Parameters of Generic Property states

Public Members

uint16_t id
    The value of User/Admin/Manufacturer Property ID

uint8_t user_access
    The value of User Access field

uint8_t admin_access
    The value of Admin Access field

uint8_t manu_access
    The value of Manufacturer Access field

struct net_buf_simple *val
    The value of User/Admin/Manufacturer Property

struct esp_ble_mesh_gen_user_prop_srv_t
    User data of Generic User Property Server Model

Public Members

esp_ble_mesh_model_t *model
    Pointer to the Generic User Property Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl
    Response control of the server model received messages

uint8_t property_count
    Generic User Property count

esp_ble_mesh_generic_property_t *properties
    Parameters of the Generic User Property state

struct esp_ble_mesh_gen_user_prop_srv_t
    User data of Generic User Property Server Model

Public Members

esp_ble_mesh_model_t *model
    Pointer to the Generic Admin Property Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl
    Response control of the server model received messages

uint8_t property_count
    Generic Admin Property count

esp_ble_mesh_generic_property_t *properties
    Parameters of the Generic Admin Property state

struct esp_ble_mesh_gen_admin_prop_srv_t
    User data of Generic Admin Property Server Model

Public Members

esp_ble_mesh_model_t *model
    Pointer to the Generic Manufacturer Property Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl
    Response control of the server model received messages

uint8_t property_count
    Generic Manufacturer Property count

esp_ble_mesh_generic_property_t *properties
    Parameters of the Generic Manufacturer Property state

struct esp_ble_mesh_gen_manu_prop_srv_t
    User data of Generic Manufacturer Property Server Model
```
Public Members

`esp_ble_mesh_model_t *model`
Pointer to the Generic Manufacturer Property Server Model. Initialized internally.

`esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl`
Response control of the server model received messages

`uint8_t property_count`
Generic Manufacturer Property count

`esp_ble_mesh_generic_property_t *properties`
Parameters of the Generic Manufacturer Property state

`struct esp_ble_mesh_gen_client_prop_srv_t`
User data of Generic Client Property Server Model

Public Members

`esp_ble_mesh_model_t *model`
Pointer to the Generic Client Property Server Model.Initialized internally.

`esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl`
Response control of the server model received messages

`uint8_t id_count`
Generic Client Property ID count

`uint16_t *property_ids`
Parameters of the Generic Client Property state

`struct esp_ble_mesh_state_change_gen_onoff_set_t`
Parameter of Generic OnOff Set state change event

Public Members

`uint8_t onoff`
The value of Generic OnOff state

`struct esp_ble_mesh_state_change_gen_level_set_t`
Parameter of Generic Level Set state change event

Public Members

`int16_t level`
The value of Generic Level state

`struct esp_ble_mesh_state_change_gen_delta_set_t`
Parameter of Generic Delta Set state change event

Public Members

`int16_t level`
The value of Generic Level state

`struct esp_ble_mesh_state_change_gen_move_set_t`
Parameter of Generic Move Set state change event
Chapter 2. API Reference

Public Members

int16_t level
The value of Generic Level state

struct esp_ble_mesh_state_change_gen_def_trans_time_set_t
Parameter of Generic Default Transition Time Set state change event

Public Members

uint8_t trans_time
The value of Generic Default Transition Time state

struct esp_ble_mesh_state_change_gen_onpowerup_set_t
Parameter of Generic OnPowerUp Set state change event

Public Members

uint8_t onpowerup
The value of Generic OnPowerUp state

struct esp_ble_mesh_state_change_gen_power_level_set_t
Parameter of Generic Power Level Set state change event

Public Members

uint16_t power
The value of Generic Power Actual state

struct esp_ble_mesh_state_change_gen_power_default_set_t
Parameter of Generic Power Default Set state change event

Public Members

uint16_t power
The value of Generic Power Default state

struct esp_ble_mesh_state_change_gen_power_range_set_t
Parameters of Generic Power Range Set state change event

Public Members

uint16_t range_min
The minimum value of Generic Power Range state

uint16_t range_max
The maximum value of Generic Power Range state

struct esp_ble_mesh_state_change_gen_loc_global_set_t
Parameters of Generic Location Global Set state change event

Public Members

int32_t latitude
The Global Latitude value of Generic Location state
int32_t longitude
    The Global Longitude value of Generic Location state

int16_t altitude
    The Global Altitude value of Generic Location state

struct esp_ble_mesh_state_change_gen_loc_local_set_t
Parameters of Generic Location Local Set state change event

Public Members

int16_t north
    The Local North value of Generic Location state

int16_t east
    The Local East value of Generic Location state

int16_t altitude
    The Local Altitude value of Generic Location state

uint8_t floor_number
    The Floor Number value of Generic Location state

uint16_t uncertainty
    The Uncertainty value of Generic Location state

struct esp_ble_mesh_state_change_gen_user_property_set_t
Parameters of Generic User Property Set state change event

Public Members

uint16_t id
    The property id of Generic User Property state

struct net_buf_simple *value
    The property value of Generic User Property state

struct esp_ble_mesh_state_change_gen_admin_property_set_t
Parameters of Generic Admin Property Set state change event

Public Members

uint16_t id
    The property id of Generic Admin Property state

uint8_t access
    The property access of Generic Admin Property state

struct net_buf_simple *value
    The property value of Generic Admin Property state

struct esp_ble_mesh_state_change_gen_manu_property_set_t
Parameters of Generic Manufacturer Property Set state change event

Public Members

uint16_t id
    The property id of Generic Manufacturer Property state

uint8_t access
    The property value of Generic Manufacturer Property state
struct esp_ble_mesh_server_recv_gen_user_property_get_t
Context of the received Generic User Property Get message

Public Members

uint16_t property_id
Property ID identifying a Generic User Property

struct esp_ble_mesh_server_recv_gen_admin_property_get_t
Context of the received Generic Admin Property Get message

Public Members

uint16_t property_id
Property ID identifying a Generic Admin Property

struct esp_ble_mesh_server_recv_gen_manufacturer_property_get_t
Context of the received Generic Manufacturer Property message

Public Members

uint16_t property_id
Property ID identifying a Generic Manufacturer Property

struct esp_ble_mesh_server_recv_gen_client_properties_get_t
Context of the received Generic Client Properties Get message

Public Members

uint16_t property_id
A starting Client Property ID present within an element

struct esp_ble_mesh_server_recv_gen_onoff_set_t
Context of the received Generic OnOff Set message

Public Members

bool op_en
Indicate if optional parameters are included

uint8_t onoff
Target value of Generic OnOff state

uint8_t tid
Transaction ID

uint8_t trans_time
Time to complete state transition (optional)

uint8_t delay
Indicate message execution delay (C.1)

struct esp_ble_mesh_server_recv_gen_level_set_t
Context of the received Generic Level Set message

Public Members
Public Members

bool op_en
Indicate if optional parameters are included

int16_t level
Target value of Generic Level state

uint8_t tid
Transaction ID

uint8_t trans_time
Time to complete state transition (optional)

uint8_t delay
Indicate message execution delay (C.1)

struct esp_ble_mesh_server_recv_gen_delta_set_t
Context of the received Generic Delta Set message

Public Members

bool op_en
Indicate if optional parameters are included

int32_t delta_level
Delta change of Generic Level state

uint8_t tid
Transaction ID

uint8_t trans_time
Time to complete state transition (optional)

uint8_t delay
Indicate message execution delay (C.1)

struct esp_ble_mesh_server_recv_gen_move_set_t
Context of the received Generic Move Set message

Public Members

bool op_en
Indicate if optional parameters are included

int16_t delta_level
Delta Level step to calculate Move speed for Generic Level state

uint8_t tid
Transaction ID

uint8_t trans_time
Time to complete state transition (optional)

uint8_t delay
Indicate message execution delay (C.1)

struct esp_ble_mesh_server_recv_gen_def_trans_time_set_t
Context of the received Generic Default Transition Time Set message
Public Members

`uint8_t trans_time`  
The value of the Generic Default Transition Time state

`struct esp_ble_mesh_server_recv_gen_onpowerup_set_t`  
Context of the received Generic OnPowerUp Set message

Public Members

`uint8_t onpowerup`  
The value of the Generic OnPowerUp state

`struct esp_ble_mesh_server_recv_gen_power_level_set_t`  
Context of the received Generic Power Level Set message

Public Members

`bool op_en`  
Indicate if optional parameters are included

`uint16_t power`  
Target value of Generic Power Actual state

`uint8_t tid`  
Transaction ID

`uint8_t trans_time`  
Time to complete state transition (optional)

`uint8_t delay`  
Indicate message execution delay (C.1)

`struct esp_ble_mesh_server_recv_gen_power_default_set_t`  
Context of the received Generic Power Default Set message

Public Members

`uint16_t power`  
The value of the Generic Power Default state

`struct esp_ble_mesh_server_recv_gen_power_range_set_t`  
Context of the received Generic Power Range Set message

Public Members

`uint16_t range_min`  
Value of Range Min field of Generic Power Range state

`uint16_t range_max`  
Value of Range Max field of Generic Power Range state

`struct esp_ble_mesh_server_recv_gen_loc_global_set_t`  
Context of the received Generic Location Global Set message
Public Members

```c
int32_t global_latitude
Global Coordinates (Latitude)

int32_t global_longitude
Global Coordinates (Longitude)

int16_t global_altitude
Global Altitude
```

```c
struct esp_ble_mesh_server_recv_gen_loc_local_set_t
Context of the received Generic Location Local Set message
```

Public Members

```c
int16_t local_north
Local Coordinates (North)

int16_t local_east
Local Coordinates (East)

int16_t local_altitude
Local Altitude

uint8_t floor_number
Floor Number

uint16_t uncertainty
Uncertainty
```

```c
struct esp_ble_mesh_server_recv_gen_user_property_set_t
Context of the received Generic User Property Set message
```

Public Members

```c
uint16_t property_id
Property ID identifying a Generic User Property

struct net_buf_simple *property_value
Raw value for the User Property
```

```c
struct esp_ble_mesh_server_recv_gen_admin_property_set_t
Context of the received Generic Admin Property Set message
```

Public Members

```c
uint16_t property_id
Property ID identifying a Generic Admin Property

uint8_t user_access
Enumeration indicating user access

struct net_buf_simple *property_value
Raw value for the Admin Property
```

```c
struct esp_ble_mesh_server_recv_gen_manufacturer_property_set_t
Context of the received Generic Manufacturer Property Set message
```
Public Members

\texttt{uint16_t\ property_id}
Property ID identifying a Generic Manufacturer Property

\texttt{uint8_t\ user_access}
Enumeration indicating user access

\texttt{struct\ esp\_ble\_mesh\_generic\_server\_cb\_param\_t}
Generic Server Model callback parameters

Public Members

\texttt{esp\_ble\_mesh\_model\_t\ *model}
Pointer to Generic Server Models

\texttt{esp\_ble\_mesh\_msg\_ctx\_t\ ctx}
Context of the received messages

\texttt{esp\_ble\_mesh\_generic\_server\_cb\_value\_t\ value}
Value of the received Generic Messages

Macros

\texttt{ESP\_BLE\_MESH\_MODEL\_GEN\_ONOFF\_CLI (cli_pub, cli_data)}
Define a new Generic OnOff Client Model.

\textbf{Note} This API needs to be called for each element on which the application needs to have a Generic OnOff Client Model.

\textbf{Return} New Generic OnOff Client Model instance.

\textbf{Parameters}

\begin{itemize}
  \item \texttt{cli_pub}: Pointer to the unique struct \texttt{esp\_ble\_mesh\_model\_pub\_t}.
  \item \texttt{cli_data}: Pointer to the unique struct \texttt{esp\_ble\_mesh\_client\_t}.
\end{itemize}

\texttt{ESP\_BLE\_MESH\_MODEL\_GEN\_LEVEL\_CLI (cli_pub, cli_data)}
Define a new Generic Level Client Model.

\textbf{Note} This API needs to be called for each element on which the application needs to have a Generic Level Client Model.

\textbf{Return} New Generic Level Client Model instance.

\textbf{Parameters}

\begin{itemize}
  \item \texttt{cli_pub}: Pointer to the unique struct \texttt{esp\_ble\_mesh\_model\_pub\_t}.
  \item \texttt{cli_data}: Pointer to the unique struct \texttt{esp\_ble\_mesh\_client\_t}.
\end{itemize}

\texttt{ESP\_BLE\_MESH\_MODEL\_GEN\_DEF\_TRANS\_TIME\_CLI (cli_pub, cli_data)}
Define a new Generic Default Transition Time Client Model.

\textbf{Note} This API needs to be called for each element on which the application needs to have a Generic Default Transition Time Client Model.

\textbf{Return} New Generic Default Transition Time Client Model instance.

\textbf{Parameters}

\begin{itemize}
  \item \texttt{cli_pub}: Pointer to the unique struct \texttt{esp\_ble\_mesh\_model\_pub\_t}.
  \item \texttt{cli_data}: Pointer to the unique struct \texttt{esp\_ble\_mesh\_client\_t}.
\end{itemize}

\texttt{ESP\_BLE\_MESH\_MODEL\_GEN\_POWER\_ONOFF\_CLI (cli_pub, cli_data)}
Define a new Generic Power OnOff Client Model.

\textbf{Note} This API needs to be called for each element on which the application needs to have a Generic Power OnOff Client Model.

\textbf{Return} New Generic Power OnOff Client Model instance.

\textbf{Parameters}

\begin{itemize}
  \item \texttt{cli_pub}: Pointer to the unique struct \texttt{esp\_ble\_mesh\_model\_pub\_t}.
  \item \texttt{cli_data}: Pointer to the unique struct \texttt{esp\_ble\_mesh\_client\_t}.
\end{itemize}
**ESP_BLE_MESH_MODEL_GEN_POWER_LEVEL_CLI** (cli_pub, cli_data)

Define a new Generic Power Level Client Model.

**Note** This API needs to be called for each element on which the application needs to have a Generic Power Level Client Model.

**Return** New Generic Power Level Client Model instance.

**Parameters**
- cli_pub: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- cli_data: Pointer to the unique struct `esp_ble_mesh_client_t`.

**ESP_BLE_MESH_MODEL_GEN_BATTERY_CLI** (cli_pub, cli_data)

Define a new Generic Battery Client Model.

**Note** This API needs to be called for each element on which the application needs to have a Generic Battery Client Model.

**Return** New Generic Battery Client Model instance.

**Parameters**
- cli_pub: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- cli_data: Pointer to the unique struct `esp_ble_mesh_client_t`.

**ESP_BLE_MESH_MODEL_GEN_LOCATION_CLI** (cli_pub, cli_data)

Define a new Generic Location Client Model.

**Note** This API needs to be called for each element on which the application needs to have a Generic Location Client Model.

**Return** New Generic Location Client Model instance.

**Parameters**
- cli_pub: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- cli_data: Pointer to the unique struct `esp_ble_mesh_client_t`.

**ESP_BLE_MESH_MODEL_GEN_PROPERTY_CLI** (cli_pub, cli_data)

Define a new Generic Property Client Model.

**Note** This API needs to be called for each element on which the application needs to have a Generic Property Client Model.

**Return** New Generic Location Client Model instance.

**Parameters**
- cli_pub: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- cli_data: Pointer to the unique struct `esp_ble_mesh_client_t`.

**ESP_BLE_MESH_MODEL_GEN_ONOFF_SRV** (srv_pub, srv_data)

Generic Server Models related context.

Define a new Generic OnOff Server Model.

**Note** 1. The Generic OnOff Server Model is a root model. 1. This model shall support model publication and model subscription.

**Return** New Generic OnOff Server Model instance.

**Parameters**
- srv_pub: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- srv_data: Pointer to the unique struct `esp_ble_mesh_gen_onoff_srv_t`.

**ESP_BLE_MESH_MODEL_GEN_LEVEL_SRV** (srv_pub, srv_data)

Define a new Generic Level Server Model.

**Note** 1. The Generic Level Server Model is a root model. 1. This model shall support model publication and model subscription.

**Return** New Generic Level Server Model instance.

**Parameters**
- srv_pub: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- srv_data: Pointer to the unique struct `esp_ble_mesh_gen_level_srv_t`.

**ESP_BLE_MESH_MODEL_GEN_DEF_TRANS_TIME_SRV** (srv_pub, srv_data)

Define a new Generic Default Transition Time Server Model.
Note 1. The Generic Default Transition Time Server Model is a root model.
2. This model shall support model publication and model subscription.

Return New Generic Default Transition Time Server Model instance.

Parameters

• srv_pub: Pointer to the unique struct esp_ble_mesh_model_pub_t.
• srv_data: Pointer to the unique struct esp_ble_mesh_gen_def_trans_time_srv_t.

ESP_BLE_MESH_MODEL_GEN_POWER_ONOFF_SRV (srv_pub, srv_data)
Define a new Generic Power OnOff Server Model.

Note 1. The Generic Power OnOff Server model extends the Generic OnOff Server model. When this model is present on an element, the corresponding Generic Power OnOff Setup Server model shall also be present.
2. This model may be used to represent a variety of devices that do not fit any of the model descriptions that have been defined but support the generic properties of On/Off.

Parameters

• srv_pub: Pointer to the unique struct esp_ble_mesh_model_pub_t.
• srv_data: Pointer to the unique struct esp_ble_mesh_gen_power_onoff_srv_t.

ESP_BLE_MESH_MODEL_GEN_POWER_ONOFF_SETUP_SRV (srv_pub, srv_data)
Define a new Generic Power OnOff Setup Server Model.

2. This model shall support model publication and model subscription.

Parameters

• srv_pub: Pointer to the unique struct esp_ble_mesh_model_pub_t.
• srv_data: Pointer to the unique struct esp_ble_mesh_gen_power_onoff_setup_srv_t.

ESP_BLE_MESH_MODEL_GEN_POWER_LEVEL_SRV (srv_pub, srv_data)
Define a new Generic Power Level Server Model.

Note 1. The Generic Power Level Server model extends the Generic Power OnOff Server model and the Generic Level Server model. When this model is present on an Element, the corresponding Generic Power Level Setup Server model shall also be present.
2. This model shall support model publication and model subscription.

Return New Generic Power Level Server Model instance.

Parameters

• srv_pub: Pointer to the unique struct esp_ble_mesh_model_pub_t.
• srv_data: Pointer to the unique struct esp_ble_mesh_gen_power_level_srv_t.

ESP_BLE_MESH_MODEL_GEN_POWER_LEVEL_SETUP_SRV (srv_pub, srv_data)
Define a new Generic Power Level Setup Server Model.

2. This model shall support model subscription.

Return New Generic Power Level Setup Server Model instance.

Parameters

• srv_pub: Pointer to the unique struct esp_ble_mesh_model_pub_t.
• srv_data: Pointer to the unique struct esp_ble_mesh_gen_power_level_setup_srv_t.

ESP_BLE_MESH_MODEL_GEN_BATTERY_SRV (srv_pub, srv_data)
Define a new Generic Battery Server Model.

Note 1. The Generic Battery Server Model is a root model.
2. The model may be used to represent an element that is powered by a battery.

Return New Generic Battery Server Model instance.

Parameters
Chapter 2. API Reference

• `srv_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
• `srv_data`: Pointer to the unique struct `esp_ble_mesh_gen_battery_srv_t`.

**ESP_BLE_MESH_MODEL_GEN_LOCATION_SRV (srv_pub, srv_data)**
Define a new Generic Location Server Model.

**Note**
1. The Generic Location Server model is a root model. When this model is present on an Element, the corresponding Generic Location Setup Server model shall also be present.
2. This model shall support model publication and model subscription.
3. The model may be used to represent an element that knows its location (global or local).

**Return**
New Generic Location Server Model instance.

**Parameters**
• `srv_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
• `srv_data`: Pointer to the unique struct `esp_ble_mesh_gen_location_srv_t`.

**ESP_BLE_MESH_MODEL_GEN_LOCATION_SETUP_SRV (srv_pub, srv_data)**
Define a new Generic Location Setup Server Model.

**Note**
1. The Generic Location Setup Server model extends the Generic Location Server model.
2. This model shall support model subscription.

**Return**
New Generic Location Setup Server Model instance.

**Parameters**
• `srv_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
• `srv_data`: Pointer to the unique struct `esp_ble_mesh_gen_location_setup_srv_t`.

**ESP_BLE_MESH_MODEL_GEN_USER_PROP_SRV (srv_pub, srv_data)**
Define a new Generic User Property Server Model.

**Note**
1. The Generic User Property Server model is a root model.
2. This model shall support model publication and model subscription.

**Return**
New Generic User Property Server Model instance.

**Parameters**
• `srv_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
• `srv_data`: Pointer to the unique struct `esp_ble_mesh_gen_user_prop_srv_t`.

**ESP_BLE_MESH_MODEL_GEN_ADMIN_PROP_SRV (srv_pub, srv_data)**
Define a new Generic Admin Property Server Model.

**Note**
1. The Generic Admin Property Server model extends the Generic User Property Server model.
2. This model shall support model publication and model subscription.

**Return**
New Generic Admin Property Server Model instance.

**Parameters**
• `srv_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
• `srv_data`: Pointer to the unique struct `esp_ble_mesh_gen_admin_prop_srv_t`.

**ESP_BLE_MESH_MODEL_GEN_MANUFACTURER_PROP_SRV (srv_pub, srv_data)**
Define a new Generic Manufacturer Property Server Model.

**Note**
1. The Generic Manufacturer Property Server model extends the Generic User Property Server model.
2. This model shall support model publication and model subscription.

**Return**
New Generic Manufacturer Property Server Model instance.

**Parameters**
• `srv_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
• `srv_data`: Pointer to the unique struct `esp_ble_mesh_gen_manu_prop_srv_t`.

**ESP_BLE_MESH_MODEL_GEN_CLIENT_PROP_SRV (srv_pub, srv_data)**
Define a new Generic Client Property Server Model.

**Note**
1. The Generic Client Property Server model is a root model.
2. This model shall support model publication and model subscription.

**Return**
New Generic Client Property Server Model instance.

**Parameters**
• `srv_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
• `srv_data`: Pointer to the unique struct `esp_ble_mesh_gen_client_prop_srv_t`.
Type Definitions

typedef void (*esp_ble_mesh_generic_client_cb_t)(
esp_ble_mesh_generic_client_cb_event_t event,
esp_ble_mesh_generic_client_cb_param_t *param)

Bluetooth Mesh Generic Client Model function.

Generic Client Model callback function type

Parameters

• event: Event type
• param: Pointer to callback parameter

typedef void (*esp_ble_mesh_generic_server_cb_t)(
esp_ble_mesh_generic_server_cb_event_t event,
esp_ble_mesh_generic_server_cb_param_t *param)

Bluetooth Mesh Generic Server Model function.

Generic Server Model callback function type

Parameters

• event: Event type
• param: Pointer to callback parameter

Enumerations

enum esp_ble_mesh_generic_client_cb_event_t

This enum value is the event of Generic Client Model

Values:

ESP_BLE_MESH_GENERIC_CLIENT_GET_STATE_EVT
ESP_BLE_MESH_GENERIC_CLIENT_SET_STATE_EVT
ESP_BLE_MESH_GENERIC_CLIENT_PUBLISH_EVT
ESP_BLE_MESH_GENERIC_CLIENT_TIMEOUT_EVT
ESP_BLE_MESH_GENERIC_CLIENT_EVT_MAX

enum esp_ble_mesh_gen_user_prop_access_t

This enum value is the access value of Generic User Property

Values:

ESP_BLE_MESH_GEN_USER_ACCESS_PROHIBIT
ESP_BLE_MESH_GEN_USER_ACCESS_READ
ESP_BLE_MESH_GEN_USER_ACCESS_WRITE
ESP_BLE_MESH_GEN_USER_ACCESS_READ_WRITE

enum esp_ble_mesh_gen_admin_prop_access_t

This enum value is the access value of Generic Admin Property

Values:

ESP_BLE_MESH_GEN_ADMIN_NOT_USER_PROP
ESP_BLE_MESH_GEN_ADMIN_ACCESS_READ
ESP_BLE_MESH_GEN_ADMIN_ACCESS_WRITE
ESP_BLE_MESH_GEN_ADMIN_ACCESS_READ_WRITE

enum esp_ble_mesh_gen_manu_prop_access_t

This enum value is the access value of Generic Manufacturer Property

Values:
Chapter 2. API Reference

ESP_BLE_MESH_GEN_MANU_NOT_USER_PROP
ESP_BLE_MESH_GEN_MANU_ACCESS_READ

enum esp_ble_mesh_generic_server_cb_event_t

This enum value is the event of Generic Server Model

Values:

ESP_BLE_MESH_GENERIC_SERVER_STATE_CHANGE_EVT
1. When get_auto_rsp is set to ESP_BLE_MESH_SERVER_AUTO_RSP, no event will be callback
to the application layer when Generic Get messages are received.
2. When set_auto_rsp is set to ESP_BLE_MESH_SERVER_AUTO_RSP, this event will be callback
to the application layer when Generic Set/Set Unack messages are received.

ESP_BLE_MESH_GENERIC_SERVER_RECV_GET_MSG_EVT
When get_auto_rsp is set to ESP_BLE_MESH_SERVER_RSP_BY_APP, this event will be callback
to the application layer when Generic Get messages are received.

ESP_BLE_MESH_GENERIC_SERVER_RECV_SET_MSG_EVT
When set_auto_rsp is set to ESP_BLE_MESH_SERVER_RSP_BY_APP, this event will be callback
to the application layer when Generic Set/Set Unack messages are received.

ESP_BLE_MESH_GENERIC_SERVER_EVT_MAX

Sensor Client/Server Models

Header File

- components/bt/esp_ble_mesh/api/models/include/esp_ble_mesh_sensor_model_api.h

Functions

esp_err_t esp_ble_mesh_register_sensor_client_callback(esp_ble_mesh_sensor_client_cb_t callback)

Register BLE Mesh Sensor Client Model callback.

Return ESP_OK on success or error code otherwise.

Parameters

- [in] callback: Pointer to the callback function.

esp_err_t esp_ble_mesh_sensor_client_get_state(esp_ble_mesh_client_common_param_t *params, esp_ble_mesh_sensor_client_get_state_t *get_state)

Get the value of Sensor Server Model states using the Sensor Client Model get messages.

Note If you want to know the opcodes and corresponding meanings accepted by this API, please refer to esp_ble_mesh_sensor_message_opcode_t in esp_ble_mesh_defs.h

Return ESP_OK on success or error code otherwise.

Parameters

- [in] get_state: Pointer to sensor get message value. Shall not be set to NULL.

esp_err_t esp_ble_mesh_sensor_client_set_state(esp_ble_mesh_client_common_param_t *params, esp_ble_mesh_sensor_client_set_state_t *set_state)

Set the value of Sensor Server Model states using the Sensor Client Model set messages.

Note If you want to know the opcodes and corresponding meanings accepted by this API, please refer to esp_ble_mesh_sensor_message_opcode_t in esp_ble_mesh_defs.h

Return ESP_OK on success or error code otherwise.

Parameters

- [in] set_state: Pointer to sensor set message value. Shall not be set to NULL.
esp_err_t esp_ble_mesh_register_sensor_server_callback(esp_ble_mesh_sensor_server_cb_t callback)

Register BLE Mesh Sensor Server Model callback.

Return ESP_OK on success or error code otherwise.

Parameters

• [in] callback: Pointer to the callback function.

Unions

union esp_ble_mesh_sensor_client_get_state_t

  Bluetooth Mesh Sensor Client Model Get and Set parameters structure.
  Parameters of Sensor Descriptor Get

Public Members

bool op_en
  Indicate if optional parameters are included

`uint16_t` property_id
  Property ID of a sensor (optional)

`struct esp_ble_mesh_sensor_cadence_get_t`
  Parameter of Sensor Cadence Get

Public Members

`uint16_t` property_id
  Property ID of a sensor

`struct esp_ble_mesh_sensor_cadence_set_t`
  Parameters of Sensor Cadence Set

Public Members

`uint16_t` property_id
  Property ID for the sensor

`uint8_t` fast_cadence_period_divisor: 7
  Divisor for the publish period

`uint8_t` status_trigger_type: 1
  The unit and format of the Status Trigger Delta fields

`struct net_buf_simple*` status_trigger_delta_down
  Delta down value that triggers a status message

`struct net_buf_simple*` status_trigger_delta_up
  Delta up value that triggers a status message

`uint8_t` status_min_interval
  Minimum interval between two consecutive Status messages

`struct net_buf_simple*` fast_cadence_low
  Low value for the fast cadence range

`struct net_buf_simple*` fast_cadence_high
  Fast value for the fast cadence range
**struct esp_ble_mesh_sensor_settings_get_t**
Parameter of Sensor Settings Get

```
uint16_t sensor_property_id
Property ID of a sensor
```

```
uint16_t sensor_setting_property_id
Setting ID identifying a setting within a sensor
```

**struct esp_ble_mesh_sensor_setting_set_t**
Parameters of Sensor Setting Set

**Public Members**

```
uint16_t sensor_property_id
Property ID identifying a sensor
```

```
uint16_t sensor_setting_property_id
Setting ID identifying a setting within a sensor
```

```
struct net_buf_simple* sensor_setting_raw
Raw value for the setting
```

**struct esp_ble_mesh_sensor_get_t**
Parameters of Sensor Get

**Public Members**

```
bool op_en
Indicate if optional parameters are included
```

```
uint16_t property_id
Property ID for the sensor (optional)
```

**struct esp_ble_mesh_sensor_column_get_t**
Parameters of Sensor Column Get

**Public Members**

```
uint16_t property_id
Property identifying a sensor
```

```
struct net_buf_simple* raw_value_x
Raw value identifying a column
```

**struct esp_ble_mesh_sensor_series_get_t**
Parameters of Sensor Series Get

**Public Members**

```
uint16_t property_id
Property identifying a sensor
```

```
struct net_buf_simple* raw_value_x
Raw value identifying a column
```
Chapter 2. API Reference

Public Members

bool op_en
   Indicate if optional parameters are included

uint16_t property_id
   Property identifying a sensor

struct net_buf_simple *raw_value_x1
   Raw value identifying a starting column (optional)

struct net_buf_simple *raw_value_x2
   Raw value identifying an ending column (C.1)

struct esp_ble_mesh_sensor_descriptor_status_cb_t
   Bluetooth Mesh Sensor Client Model Get and Set callback parameters structure.
   Parameter of Sensor Descriptor Status

Public Members

struct net_buf_simple *descriptor
   Sequence of 8-octet sensor descriptors (optional)

struct esp_ble_mesh_sensor_cadence_status_cb_t
   Parameters of Sensor Cadence Status

Public Members

uint16_t property_id
   Property for the sensor

struct net_buf_simple *sensor_cadence_value
   Value of sensor cadence state

struct esp_ble_mesh_sensor_settings_status_cb_t
   Parameters of Sensor Settings Status

Public Members

uint16_t sensor_property_id
   Property ID identifying a sensor

struct net_buf_simple *sensor_setting_property_ids
   A sequence of N sensor setting property IDs (optional)

struct esp_ble_mesh_sensor_setting_status_cb_t
   Parameters of Sensor Setting Status

Public Members

bool op_en
   Indicate if optional parameters are included

uint16_t sensor_property_id
   Property ID identifying a sensor

uint16_t sensor_setting_property_id
   Setting ID identifying a setting within a sensor
**Public Members**

```c
void sensor_setting_access
```

Read/Write access rights for the setting (optional)

```c
struct net_buf_simple *sensor_setting_raw
```

Raw value for the setting

```c
struct esp_ble_mesh_sensor_status_cb_t
```

Parameter of Sensor Status

**Public Members**

```c
struct net_buf_simple *marshalled_sensor_data
```

Value of sensor data state (optional)

```c
struct esp_ble_mesh_sensor_column_status_cb_t
```

Parameters of Sensor Column Status

**Public Members**

```c
uint16_t property_id
```

Property identifying a sensor and the Y axis

```c
struct net_buf_simple *sensor_column_value
```

Left values of sensor column status

```c
struct esp_ble_mesh_sensor_series_status_cb_t
```

Parameters of Sensor Series Status

**Public Members**

```c
uint16_t property_id
```

Property identifying a sensor and the Y axis

```c
struct net_buf_simple *sensor_series_value
```

Left values of sensor series status

```c
struct esp_ble_mesh_sensor_client_cb_param_t
```

Sensor Client Model callback parameters

**Public Members**

```c
int error_code
```

0: success, otherwise failure. For the error code values please refer to errno.h file. A negative sign is added to the standard error codes in errno.h.

```c
esp_ble_mesh_client_common_param_t *params
```

The client common parameters.

```c
esp_ble_mesh_sensor_client_status_cb_t *status_cb
```

The sensor status message callback values

```c
struct esp_ble_mesh_sensor_descriptor_t
```

Parameters of Sensor Descriptor state

**Public Members**

```c
uint32_t positive_tolerance : 12
```

The value of Sensor Positive Tolerance field
uint32_t negative_tolerance : 12
The value of Sensor Negative Tolerance field

uint32_t sampling_function : 8
The value of Sensor Sampling Function field

uint8_t measure_period
The value of Sensor Measurement Period field

uint8_t update_interval
The value of Sensor Update Interval field

struct esp_ble_mesh_sensor_setting_t
Parameters of Sensor Setting state

Public Members

uint16_t property_id
The value of Sensor Setting Property ID field

uint8_t access
The value of Sensor Setting Access field

struct net_buf_simple *raw
The value of Sensor Setting Raw field

struct esp_ble_mesh_sensor_cadence_t
Parameters of Sensor Cadence state

Public Members

uint8_t period_divisor : 7
The value of Fast Cadence Period Divisor field

uint8_t trigger_type : 1
The value of Status Trigger Type field

struct net_buf_simple *trigger_delta_down
Note: The parameter "size" in trigger_delta_down, trigger_delta_up, fast_cadence_low &
fast_cadence_high indicates the exact length of these four parameters, and they are associated with the
Sensor Property ID. Users need to initialize the "size" precisely. The value of Status Trigger Delta
Down field

struct net_buf_simple *trigger_delta_up
The value of Status Trigger Delta Up field

uint8_t min_interval
The value of Status Min Interval field

struct net_buf_simple *fast_cadence_low
The value of Fast Cadence Low field

struct net_buf_simple *fast_cadence_high
The value of Fast Cadence High field

struct esp_ble_mesh_sensor_data_t
Parameters of Sensor Data state

Public Members

uint8_t format : 1
Format A: The Length field is a 1-based uint4 value (valid range 0x0–0xF, representing range of 1–16).
Format B: The Length field is a 1-based uint7 value (valid range 0x0–0x7F, representing range of 1 – 127). The value 0x7F represents a length of zero. The value of the Sensor Data format

```c
uint8_t length : 7
    The value of the Sensor Data length
```

```c
struct net_buf_simple *raw_value
    The value of Sensor Data raw value
```

```c
struct esp_ble_mesh_sensor_series_column_t
    Parameters of Sensor Series Column state
```

**Public Members**

```c
struct net_buf_simple *raw_value_x
    The value of Sensor Raw Value X field
```

```c
struct net_buf_simple *column_width
    The value of Sensor Column Width field
```

```c
struct net_buf_simple *raw_value_y
    The value of Sensor Raw Value Y field
```

```c
struct esp_ble_mesh_sensor_state_t
    Parameters of Sensor states
```

**Public Members**

```c
uint16_t sensor_property_id
    The value of Sensor Property ID field
```

```c
esp_ble_mesh_sensor_descriptor_t descriptor
    Parameters of the Sensor Descriptor state
```

```c
const uint8_t setting_count
    Multiple Sensor Setting states may be present for each sensor. The Sensor Setting Property ID values shall be unique for each Sensor Property ID that identifies a sensor within an element.
```

```c
esp_ble_mesh_sensor_setting_t *settings
    Parameters of the Sensor Setting state
```

```c
esp_ble_mesh_sensor_cadence_t *cadence
    The Sensor Cadence state may be not supported by sensors based on device properties referencing “non-scalar characteristics” such as “histograms” or “composite characteristics”. Parameters of the Sensor Cadence state
```

```c
esp_ble_mesh_sensor_data_t sensor_data
    Parameters of the Sensor Data state
```

```c
esp_ble_mesh_sensor_series_column_t *series_column
    Parameters of the Sensor Series Column state
```

```c
struct esp_ble_mesh_sensor_srv_t
    User data of Sensor Server Model
```

**Public Members**

```c
esp_ble_mesh_model_t *model
    Pointer to the Sensor Server Model. Initialized internally.
```

```c
esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl
    Response control of the server model received messages
```
**Chapter 2. API Reference**

```c
const uint8_t state_count
  Sensor state count

esp_ble_mesh_sensor_state_t *states
  Parameters of the Sensor states

struct esp_ble_mesh_sensor_setup_srv_t
  User data of Sensor Setup Server Model

Public Members

esp_ble_mesh_model_t *model
  Pointer to the Sensor Setup Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl
  Response control of the server model received messages

const uint8_t state_count
  Sensor state count

esp_ble_mesh_sensor_state_t *states
  Parameters of the Sensor states

struct esp_ble_mesh_state_change_sensor_cadence_set_t
  Parameters of Sensor Cadence Set state change event

Public Members

uint16_t property_id
  The value of Sensor Property ID state

uint8_t period_divisor : 7
  The value of Fast Cadence Period Divisor state

uint8_t trigger_type : 1
  The value of Status Trigger Type state

struct net_buf_simple *trigger_delta_down
  The value of Status Trigger Delta Down state

struct net_buf_simple *trigger_delta_up
  The value of Status Trigger Delta Up state

uint8_t min_interval
  The value of Status Min Interval state

struct net_buf_simple *fast_cadence_low
  The value of Fast Cadence Low state

struct net_buf_simple *fast_cadence_high
  The value of Fast Cadence High state

struct esp_ble_mesh_state_change_sensor_setting_set_t
  Parameters of Sensor Setting Set state change event

Public Members

uint16_t property_id
  The value of Sensor Property ID state

uint16_t setting_property_id
  The value of Sensor Setting Property ID state
```
struct net_buf_simple *setting_value
    The value of Sensor Property Value state

struct esp_ble_mesh_server_recv_sensor_descriptor_get_t
    Context of the received Sensor Descriptor Get message

Public Members

bool op_en
    Indicate if optional parameters are included

uint16_t property_id
    Property ID of a sensor (optional)

struct esp_ble_mesh_server_recv_sensor_cadence_get_t
    Context of the received Sensor Cadence Get message

Public Members

uint16_t property_id
    Property ID of a sensor

struct esp_ble_mesh_server_recv_sensor_settings_get_t
    Context of the received Sensor Settings Get message

Public Members

uint16_t property_id
    Property ID of a sensor

uint16_t setting_property_id
    Setting ID identifying a setting within a sensor

struct esp_ble_mesh_server_recv_sensor_setting_get_t
    Context of the received Sensor Setting Get message

Public Members

bool op_en
    Indicate if optional parameters are included

uint16_t property_id
    Property ID for the sensor (optional)

struct esp_ble_mesh_server_recv_sensor_column_get_t
    Context of the received Sensor Column Get message

Public Members

uint16_t property_id
    Property ID of a sensor (optional)
Chapter 2. API Reference

**Public Members**

*uint16_t property_id*
Property identifying a sensor

*struct net_buf_simple *raw_value_x*
Raw value identifying a column

**struct esp_ble_mesh_server_recv_sensor_series_get_t**
Context of the received Sensor Series Get message

**Public Members**

*bool op_en*
Indicate if optional parameters are included

*uint16_t property_id*
Property identifying a sensor

*struct net_buf_simple *raw_value*
Raw value containing X1 and X2 (optional)

**struct esp_ble_mesh_server_recv_sensor_cadence_set_t**
Context of the received Sensor Cadence Set message

**Public Members**

*uint16_t property_id*
Property ID for the sensor

*struct net_buf_simple *cadence*
Value of Sensor Cadence state

**struct esp_ble_mesh_server_recv_sensor_setting_set_t**
Context of the received Sensor Setting Set message

**Public Members**

*uint16_t property_id*
Property ID identifying a sensor

*uint16_t setting_property_id*
Setting ID identifying a setting within a sensor

*struct net_buf_simple *setting_raw*
Raw value for the setting

**struct esp_ble_mesh_sensor_server_cb_param_t**
Sensor Server Model callback parameters

**Public Members**

*esp_ble_mesh_model_t *model*
Pointer to Sensor Server Models

*esp_ble_mesh_msg_ctx_t ctx*
Context of the received messages

*esp_ble_mesh_sensor_server_cb_value_t value*
Value of the received Sensor Messages
Chapter 2. API Reference

Macros

ESP_BLE_MESH_MODEL_SENSOR_CLI (cli_pub, cli_data)
Define a new Sensor Client Model.

Note This API needs to be called for each element on which the application needs to have a Sensor Client Model.

Return New Sensor Client Model instance.

Parameters
- cli_pub: Pointer to the unique struct esp_ble_mesh_model_pub_t.
- cli_data: Pointer to the unique struct esp_ble_mesh_client_t.

ESP_BLE_MESH_MODEL_SENSOR_SRV (srv_pub, srv_data)
Sensor Server Models related context.

Define a new Sensor Server Model.

Note 1. The Sensor Server model is a root model. When this model is present on an element, the corresponding Sensor Setup Server model shall also be present.
   1. This model shall support model publication and model subscription.

Return New Sensor Server Model instance.

Parameters
- srv_pub: Pointer to the unique struct esp_ble_mesh_model_pub_t.
- srv_data: Pointer to the unique struct esp_ble_mesh_sensor_srv_t.

ESP_BLE_MESH_MODEL_SENSOR_SETUP_SRV (srv_pub, srv_data)
Define a new Sensor Setup Server Model.

Note 1. The Sensor Setup Server model extends the Sensor Server model.
   1. This model shall support model publication and model subscription.

Return New Sensor Setup Server Model instance.

Parameters
- srv_pub: Pointer to the unique struct esp_ble_mesh_model_pub_t.
- srv_data: Pointer to the unique struct esp_ble_mesh_sensor_setup_srv_t.

ESP_BLE_MESH_INVALID_SENSOR_PROPERTY_ID
Invalid Sensor Property ID

ESP_BLE_MESH_SENSOR_PROPERTY_ID_LEN
Length of Sensor Property ID

ESP_BLE_MESH_SENSOR_DESCRIPTOR_LEN
Length of Sensor Descriptor state

ESP_BLE_MESH_SENSOR_UNSPECIFIED_POS_TOLERANCE
Unspecified Sensor Positive Tolerance

ESP_BLE_MESH_SENSOR_UNSPECIFIED_NEG_TOLERANCE
Unspecified Sensor Negative Tolerance

ESP_BLE_MESH_SENSOR_NOT_APPL_MEASURE_PERIOD
Not applicable Sensor Measurement Period

ESP_BLE_MESH_SENSOR_NOT_APPL_UPDATE_INTERVAL
Not applicable Sensor Update Interval

ESP_BLE_MESH_INVALID_SENSOR_SETTING_PROPERTY_ID
Invalid Sensor Setting Property ID

ESP_BLE_MESH_SENSOR_SETTING_PROPERTY_ID_LEN
Length of Sensor Setting Property ID

ESP_BLE_MESH_SENSOR_SETTING_ACCESS_LEN
Length of Sensor Setting Access

ESP_BLE_MESH_SENSOR_SETTING_ACCESS_READ
Sensor Setting Access - Read
Chapter 2. API Reference

**ESP_BLE_MESH_SENSOR_SETTING_ACCESS_READ_WRITE**
Sensor Setting Access - Read & Write

**ESP_BLE_MESH_SENSOR_DIVISOR_TRIGGER_TYPE_LEN**
Length of Sensor Divisor Trigger Type

**ESP_BLE_MESH_SENSOR_STATUS_MIN_INTERVAL_LEN**
Length of Sensor Status Min Interval

**ESP_BLE_MESH_SENSOR_PERIOD_DIVISOR_MAX_VALUE**
Maximum value of Sensor Period Divisor

**ESP_BLE_MESH_SENSOR_STATUS_MIN_INTERVAL_MAX**
Maximum value of Sensor Status Min Interval

**ESP_BLE_MESH_SENSOR_STATUS_TRIGGER_TYPE_CHAR**
Sensor Status Trigger Type - Format Type of the characteristic that the Sensor Property ID state references

**ESP_BLE_MESH_SENSOR_STATUS_TRIGGER_TYPE_UINT16**
Sensor Status Trigger Type - Format Type “uint16”

**ESP_BLE_MESH_SENSOR_DATA_FORMAT_A**
Sensor Data Format A

**ESP_BLE_MESH_SENSOR_DATA_FORMAT_B**
Sensor Data Format B

**ESP_BLE_MESH_SENSOR_DATA_FORMAT_A_MPID_LEN**
MPID length of Sensor Data Format A

**ESP_BLE_MESH_SENSOR_DATA_FORMAT_B_MPID_LEN**
MPID length of Sensor Data Format B

**ESP_BLE_MESHSENSOR_DATA_ZERO_LEN**
Zero length of Sensor Data.

Note: The Length field is a 1-based uint7 value (valid range 0x0-0x7F, representing range of 1-127). The value 0x7F represents a length of zero.

**ESP_BLE_MESH_GET_SENSOR_DATA_FORMAT (_data)**
Get format of the sensor data.

Note Multiple sensor data may be concatenated. Make sure the _data pointer is updated before getting the format of the corresponding sensor data.

**Return** Format of the sensor data.

**Parameters**
- _data: Pointer to the start of the sensor data.

**ESP_BLE_MESH_GET_SENSOR_DATA_LENGTH (_data, _fmt)**
Get length of the sensor data.

Note Multiple sensor data may be concatenated. Make sure the _data pointer is updated before getting the length of the corresponding sensor data.

**Return** Length (zero-based) of the sensor data.

**Parameters**
- _data: Pointer to the start of the sensor data.
- _fmt: Format of the sensor data.

**ESP_BLE_MESH_GET_SENSOR_DATA_PROPERTY_ID (_data, _fmt)**
Get Sensor Property ID of the sensor data.

Note Multiple sensor data may be concatenated. Make sure the _data pointer is updated before getting Sensor Property ID of the corresponding sensor data.

**Return** Sensor Property ID of the sensor data.

**Parameters**
- _data: Pointer to the start of the sensor data.
- _fmt: Format of the sensor data.
Chapter 2. API Reference

ESP_BLE_MESH_SENSOR_DATA_FORMAT_A_MPID (len, id)
Generate a MPID value for sensor data with Format A.

Note
1. The Format field is 0b0 and indicates that Format A is used.
2. The Length field is a 1-based uint4 value (valid range 0x0–0xF, representing range of 1–16).
3. The Property ID is an 11-bit bit field representing 11 LSB of a Property ID.
4. This format may be used for Property Values that are not longer than 16 octets and for Property IDs less than 0x0800.

Return 2-octet MPID value for sensor data with Format A.

Parameters
• len: Length of Sensor Raw value.
• id: Sensor Property ID.

ESP_BLE_MESH_SENSOR_DATA_FORMAT_B_MPID (len, id)
Generate a MPID value for sensor data with Format B.

Note
1. The Format field is 0b1 and indicates Format B is used.
2. The Length field is a 1-based uint7 value (valid range 0x0–0x7F, representing range of 1–127). The value 0x7F represents a length of zero.
3. The Property ID is a 16-bit bit field representing a Property ID.
4. This format may be used for Property Values not longer than 128 octets and for any Property IDs.
5. Property values longer than 128 octets are not supported by the Sensor Status message.
6. Exclude the generated 1-octet value, the 2-octet Sensor Property ID.

Return 3-octet MPID value for sensor data with Format B.

Parameters
• len: Length of Sensor Raw value.
• id: Sensor Property ID.

Type Definitions
typedef void (*esp_ble_mesh_sensor_client_cb_t)(esp_ble_mesh_sensor_client_cb_event_t event, esp_ble_mesh_sensor_client_cb_param_t *param)
Bluetooth Mesh Sensor Client Model function.
Sensor Client Model callback function type

Parameters
• event: Event type
• param: Pointer to callback parameter

typedef void (*esp_ble_mesh_sensor_server_cb_t)(esp_ble_mesh_sensor_server_cb_event_t event, esp_ble_mesh_sensor_server_cb_param_t *param)
Bluetooth Mesh Sensor Server Model function.
Sensor Server Model callback function type

Parameters
• event: Event type
• param: Pointer to callback parameter

Enumerations
enum esp_ble_mesh_sensor_client_cb_event_t
This enum value is the event of Sensor Client Model

Values:
ESP_BLE_MESH_SENSOR_CLIENT_GET_STATE_EVT
ESP_BLE_MESH_SENSOR_CLIENT_SET_STATE_EVT
ESP_BLE_MESH_SENSOR_CLIENT_PUBLISH_EVT
ESP_BLE_MESH_SENSOR_CLIENT_TIMEOUT_EVT
ESP_BLE_MESH_SENSOR_CLIENT_EVT_MAX

enum esp_ble_mesh_sensor_sample_func
This enum value is value of Sensor Sampling Function

Values:
ESP_BLE_MESH_SAMPLE_FUNC_UNSPECIFIED
ESP_BLE_MESH_SAMPLE_FUNC_INSTANTANEOUS
ESP_BLE_MESH_SAMPLE_FUNC_ARITHMETIC_MEAN
ESP_BLE_MESH_SAMPLE_FUNC_RMS
ESP_BLE_MESH_SAMPLE_FUNC_MAXIMUM
ESP_BLE_MESH_SAMPLE_FUNC_MINIMUM
ESP_BLE_MESH_SAMPLE_FUNC_ACCUMULATED
ESP_BLE_MESH_SAMPLE_FUNC_COUNT

enum esp_ble_mesh_sensor_server_cb_event_t
This enum value is the event of Sensor Server Model

Values:
ESP_BLE_MESH_SENSOR_SERVER_STATE_CHANGE_EVT
1. When get_auto_rsp is set to ESP_BLE_MESH_SERVER_AUTO_RSP, no event will be callback
to the application layer when Sensor Get messages are received.
2. When set_auto_rsp is set to ESP_BLE_MESH_SERVER_AUTO_RSP, this event will be callback
to the application layer when Sensor Set/Set Unack messages are received.

ESP_BLE_MESH_SENSOR_SERVER_RECV_GET_MSG_EVT
When get_auto_rsp is set to ESP_BLE_MESH_SERVER_RSP_BY_APP, this event will be callback to
the application layer when Sensor Get messages are received.

ESP_BLE_MESH_SENSOR_SERVER_RECV_SET_MSG_EVT
When set_auto_rsp is set to ESP_BLE_MESH_SERVER_RSP_BY_APP, this event will be callback to
the application layer when Sensor Set/Set Unack messages are received.

ESP_BLE_MESH_SENSOR_SERVER_EVT_MAX

Time and Scenes Client/Server Models

Header File
- components/bt/esp_ble_mesh/api/models/include/esp_ble_mesh_time_scene_model_api.h

Functions

esp_err_t esp_ble_mesh_register_time_scene_client_callback(esp_ble_mesh_time_scene_client_cb_t callback)
Register BLE Mesh Time Scene Client Model callback.

Return ESP_OK on success or error code otherwise.

Parameters
- [in] callback: Pointer to the callback function.

esp_err_t esp_ble_mesh_time_scene_client_get_state(esp_ble_mesh_client_common_param_t *params,
esp_ble_mesh_time_scene_client_get_state_t *get_state)
Get the value of Time Scene Server Model states using the Time Scene Client Model get messages.

Note If you want to know the opcodes and corresponding meanings accepted by this API, please refer to
esp_ble_mesh_time_scene_message_opcode_t in esp_ble_mesh_defs.h
Return ESP_OK on success or error code otherwise.

Parameters
• [in] params: Pointer to BLE Mesh common client parameters.
• [in] get_state: Pointer to time scene get message value. Shall not be set to NULL.

```c
esp_err_t esp_ble_mesh_time_scene_client_set_state(esp_ble_mesh_client_common_param_t *params,
                                                esp_ble_mesh_time_scene_client_set_state_t *set_state)
```

Set the value of Time Scene Server Model states using the Time Scene Client Model set messages.

Note If you want to know the opcodes and corresponding meanings accepted by this API, please refer to esp_ble_mesh_time_scene_message_opcode_t in esp_ble_mesh_defs.h

Return ESP_OK on success or error code otherwise.

Parameters
• [in] params: Pointer to BLE Mesh common client parameters.
• [in] set_state: Pointer to time scene set message value. Shall not be set to NULL.

```c
esp_err_t esp_ble_mesh_register_time_scene_server_callback(esp_ble_mesh_time_scene_server_cb_t callback)
```

Register BLE Mesh Time and Scenes Server Model callback.

Return ESP_OK on success or error code otherwise.

Parameters
• [in] callback: Pointer to the callback function.

Unions
```c
union esp_ble_mesh_time_scene_client_get_state_t

Structures

**struct esp_ble_mesh_time_set_t**
Bluetooth Mesh Time Scene Client Model Get and Set parameters structure.

Parameters of Time Set

**Public Members**

- `uint8_t tai_seconds[5]`:
The current TAI time in seconds
- `uint8_t sub_second`:
The sub-second time in units of 1/256 second
- `uint8_t uncertainty`:
The estimated uncertainty in 10-millisecond steps
- `uint16_t time_authority : 1`
  - 0 = No Time Authority, 1 = Time Authority
- `uint16_t tai_utc_delta : 15`
  - Current difference between TAI and UTC in seconds
- `uint8_t time_zone_offset`:
The local time zone offset in 15-minute increments

**struct esp_ble_mesh_time_zone_set_t**
Parameters of Time Zone Set

**Public Members**

- `uint8_t time_zone_offset_new`:
  - Upcoming local time zone offset
- `uint8_t tai_zone_change[5]`:
  - TAI Seconds time of the upcoming Time Zone Offset change

**struct esp_ble_mesh_tai_utc_delta_set_t**
Parameters of TAI-UTC Delta Set

**Public Members**

- `uint16_t tai_utc_delta_new : 15`
  - Upcoming difference between TAI and UTC in seconds
- `uint16_t padding : 1`
  - Always 0b0. Other values are Prohibited.
- `uint8_t tai_delta_change[5]`:
  - TAI Seconds time of the upcoming TAI-UTC Delta change

**struct esp_ble_mesh_time_role_set_t**
Parameter of Time Role Set

**Public Members**

- `uint8_t time_role`:
  - The Time Role for the element

**struct esp_ble_mesh_scene_store_t**
Parameter of Scene Store
Public Members

```
uint16_t scene_number
  The number of scenes to be stored
```

```
struct esp_ble_mesh_scene_recall_t
Parameters of Scene Recall
```

Public Members

```
bool op_en
  Indicate if optional parameters are included
```

```
uint16_t scene_number
  The number of scenes to be recalled
```

```
uint8_t tid
  Transaction ID
```

```
uint8_t trans_time
  Time to complete state transition (optional)
```

```
uint8_t delay
  Indicate message execution delay (C.1)
```

```
struct esp_ble_mesh_scene_delete_t
Parameter of Scene Delete
```

Public Members

```
uint16_t scene_number
  The number of scenes to be deleted
```

```
struct esp_ble_mesh_scheduler_act_get_t
Parameter of Scheduler Action Get
```

Public Members

```
uint8_t index
  Index of the Schedule Register entry to get
```

```
struct esp_ble_mesh_scheduler_act_set_t
Parameters of Scheduler Action Set
```

Public Members

```
uint64_t index: 4
  Index of the Schedule Register entry to set
```

```
uint64_t year: 7
  Scheduled year for the action
```

```
uint64_t month: 12
  Scheduled month for the action
```

```
uint64_t day: 5
  Scheduled day of the month for the action
```

```
uint64_t hour: 5
  Scheduled hour for the action
```
Chapter 2. API Reference

uint64_t minute: 6
Scheduled minute for the action

uint64_t second: 6
Scheduled second for the action

uint64_t day_of_week: 7
Schedule days of the week for the action

uint64_t action: 4
Action to be performed at the scheduled time

uint64_t trans_time: 8
Transition time for this action

uint16_t scene_number
Transition time for this action

struct esp_ble_mesh_time_status_cb_t
Bluetooth Mesh Time Scene Client Model Get and Set callback parameters structure.

Parameters of Time Status

Public Members

uint8_t tai_seconds[5]
The current TAI time in seconds

uint8_t sub_second
The sub-second time in units of 1/256 second

uint8_t uncertainty
The estimated uncertainty in 10-millisecond steps

uint16_t time_authority: 1
0 = No Time Authority, 1 = Time Authority

uint16_t tai_utc_delta: 15
Current difference between TAI and UTC in seconds

uint8_t time_zone_offset
The local timezone offset in 15-minute increments

struct esp_ble_mesh_time_zone_status_cb_t
Parameters of Time Zone Status

Public Members

uint8_t time_zone_offset_curr
Current local time zone offset

uint8_t time_zone_offset_new
Upcoming local time zone offset

uint8_t tai_zone_change[5]
TAI Seconds time of the upcoming Time Zone Offset change

struct esp_ble_mesh_tai_utc_delta_status_cb_t
Parameters of TAI-UTC Delta Status

Public Members

uint16_t tai_utc_delta_curr: 15
Current difference between TAI and UTC in seconds
Chapter 2. API Reference

uint16_t padding_1: 1
Always 0b0. Other values are Prohibited.

uint16_t tai_utc_delta_new: 15
Upcoming difference between TAI and UTC in seconds

uint16_t padding_2: 1
Always 0b0. Other values are Prohibited.

uint8_t tai_delta_change[5]
TAI Seconds time of the upcoming TAI-UTC Delta change

struct esp_ble_mesh_time_role_status_cb_t
Parameter of Time Role Status

Public Members

uint8_t time_role
The Time Role for the element

struct esp_ble_mesh_scene_status_cb_t
Parameters of Scene Status

Public Members

bool op_en
Indicate if optional parameters are included

uint8_t status_code
Status code of the last operation

uint16_t current_scene
Scene Number of the current scene

uint16_t target_scene
Scene Number of the target scene (optional)

uint8_t remain_time
Time to complete state transition (C.1)

struct esp_ble_mesh_scene_register_status_cb_t
Parameters of Scene Register Status

Public Members

uint8_t status_code
Status code for the previous operation

uint16_t current_scene
Scene Number of the current scene

struct net_buf_simple *scenes
A list of scenes stored within an element

struct esp_ble_mesh_scheduler_status_cb_t
Parameter of Scheduler Status

Public Members

uint16_t schedules
Bit field indicating defined Actions in the Schedule Register
struct esp_ble_mesh_scheduler_act_status_cb_t
Parameters of Scheduler Action Status

Public Members

uint64_t index: 4
Enumerates (selects) a Schedule Register entry

uint64_t year: 7
Scheduled year for the action

uint64_t month: 12
Scheduled month for the action

uint64_t day: 5
Scheduled day of the month for the action

uint64_t hour: 5
Scheduled hour for the action

uint64_t minute: 6
Scheduled minute for the action

uint64_t second: 6
Scheduled second for the action

uint64_t day_of_week: 7
Scheduled days of the week for the action

uint64_t action: 4
Action to be performed at the scheduled time

uint64_t trans_time: 8
Transition time for this action

uint16_t scene_number
Transition time for this action

struct esp_ble_mesh_time_scene_client_cb_param_t
Time Scene Client Model callback parameters

Public Members

int error_code
Appropriate error code

esp_ble_mesh_client_common_param_t *params
The client common parameters.

esp_ble_mesh_time_scene_client_status_cb_t status_cb
The scene status message callback values

struct esp_ble_mesh_time_state_t
Parameters of Time state

Public Members

uint8_t tai_seconds[5]
The value of the TAI Seconds state

uint8_t subsecond
The value of the Subsecond field
```c
uint8_t uncertainty
  The value of the Uncertainty field

uint8_t timezone_offset_curr
  The value of the Time Zone Offset Current field

uint8_t timezone_offset_new
  The value of the Time Zone Offset New state

uint8_t tai_zone_change[5]
  The value of the TAI of Zone Chaneg field

uint16_t time_authority : 1
  The value of the Time Authority bit

uint16_t tai_utc_delta_curr : 15
  The value of the TAI-UTC Delta Current state

uint16_t tai_utc_delta_new : 15
  The value of the TAI-UTC Delta New state

uint8_t tai_delta_change[5]
  The value of the TAI of Delta Change field

struct esp_ble_mesh_time_state_t::[anonymous] time
  Parameters of the Time state

uint8_t time_role
  The value of the Time Role state

struct esp_ble_mesh_time_srv_t
  User data of Time Server Model

Public Members

esp_ble_mesh_model_t *model
  Pointer to the Time Server Model. Initialized internally.
esp_ble_mesh_server_rsp_ctrl_t * rsp_ctrl
  Response control of the server model received messages

struct esp_ble_mesh_time_state_t *state
  Parameters of the Time state

struct esp_ble_mesh_time_setup_srv_t
  User data of Time Setup Server Model

Public Members

esp_ble_mesh_model_t *model
  Pointer to the Time Setup Server Model. Initialized internally.
esp_ble_mesh_server_rsp_ctrl_t * rsp_ctrl
  Response control of the server model received messages

struct esp_ble_mesh_time_state_t *state
  Parameters of the Time state

struct esp_ble_mesh_scene_register_t
  1. Scene Store is an operation of storing values of a present state of an element.
  2. The structure and meaning of the stored state is determined by a model. States to be stored are specified
     by each model.
  3. The Scene Store operation shall persistently store all values of all states marked as Stored with Scene for
     all models present on all elements of a node.
```
4. If a model is extending another model, the extending model shall determine the Stored with Scene behavior of that model. Parameters of Scene Register state

**Public Members**

`uint16_t scene_number`
The value of the Scene Number

`uint8_t scene_type`
The value of the Scene Type

`struct net_buf_simple *scene_value`
Scene value may use a union to represent later, the union contains structures of all the model states which can be stored in a scene. The value of the Scene Value

`struct esp_ble_mesh_scenes_state_t`
Parameters of Scenes state.

Scenes serve as memory banks for storage of states (e.g., a power level or a light level/color). Values of states of an element can be stored as a scene and can be recalled later from the scene memory.

A scene is represented by a Scene Number, which is a 16-bit non-zero, mesh-wide value. (There can be a maximum of 65535 scenes in a mesh network.) The meaning of a scene, as well as the state storage container associated with it, are determined by a model.

The Scenes state change may start numerous parallel model transitions. In that case, each individual model handles the transition internally.

The scene transition is defined as a group of individual model transitions started by a Scene Recall operation. The scene transition is in progress when at least one transition from the group of individual model transitions is in progress.

**Public Members**

`const uint16_t scene_count`
The Scenes state’s scene count

`esp_ble_mesh_scene_register_t *scenes`
Parameters of the Scenes state

`uint16_t current_scene`
The Current Scene state is a 16-bit value that contains either the Scene Number of the currently active scene or a value of 0x0000 when no scene is active.

When a Scene Store operation or a Scene Recall operation completes with success, the Current Scene state value shall be to the Scene Number used during that operation.

When the Current Scene Number is deleted from a Scene Register state as a result of Scene Delete operation, the Current Scene state shall be set to 0x0000.

When any of the element’s state that is marked as “Stored with Scene” has changed not as a result of a Scene Recall operation, the value of the Current Scene state shall be set to 0x0000.

When a scene transition is in progress, the value of the Current Scene state shall be set to 0x0000. The value of the Current Scene state

`uint16_t target_scene`
The Target Scene state is a 16-bit value that contains the target Scene Number when a scene transition is in progress.

When the scene transition is in progress and the target Scene Number is deleted from a Scene Register state as a result of Scene Delete operation, the Target Scene state shall be set to 0x0000.

When the scene transition is in progress and a new Scene Number is stored in the Scene Register as a result of Scene Store operation, the Target Scene state shall be set to the new Scene Number.
When the scene transition is not in progress, the value of the Target Scene state shall be set to 0x0000.
The value of the Target Scene state

```c
uint8_t status_code
    The status code of the last scene operation

bool in_progress
    Indicate if the scene transition is in progress
```

### struct esp_ble_mesh_scene_srv_t

User data of Scene Server Model

#### Public Members

- `esp_ble_mesh_model_t *model`
  Pointer to the Scene Server Model. Initialized internally.
- `esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl`
  Response control of the server model received messages
- `esp_ble_mesh_scenes_state_t *state`
  Parameters of the Scenes state
- `esp_ble_mesh_last_msg_info_t last`
  Parameters of the last received set message
- `esp_ble_mesh_state_transition_t *transition`
  Parameters of state transition

### struct esp_ble_mesh_scene_setup_srv_t

User data of Scene Setup Server Model

#### Public Members

- `esp_ble_mesh_model_t *model`
  Pointer to the Scene Setup Server Model. Initialized internally.
- `esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl`
  Response control of the server model received messages
- `esp_ble_mesh_scenes_state_t *state`
  Parameters of the Scenes state

### struct esp_ble_mesh_schedule_register_t

Parameters of Scheduler Register state

#### Public Members

- `bool in_use`
  Indicate if the registered schedule is in use
- `uint64_t year : 7`
  The value of Scheduled year for the action
- `uint64_t month : 12`
  The value of Scheduled month for the action
- `uint64_t day : 5`
  The value of Scheduled day of the month for the action
- `uint64_t hour : 5`
  The value of Scheduled hour for the action
uint64_t minute : 6
    The value of Scheduled minute for the action

tuint64_t second : 6
    The value of Scheduled second for the action

tuint64_t day_of_week : 7
    The value of Schedule days of the week for the action

uint64_t action : 4
    The value of Action to be performed at the scheduled time

uint64_t trans_time : 8
    The value of Transition time for this action

uint16_t scene_number
    The value of Scene Number to be used for some actions

struct esp_ble_mesh_scheduler_state_t
    Parameters of Scheduler state

    Public Members

    const uint8_t schedule_count
        Scheduler count

    esp_ble_mesh_schedule_register_t *schedules
        Up to 16 scheduled entries

struct esp_ble_mesh_scheduler_srv_t
    User data of Scheduler Server Model

    Public Members

    esp_ble_mesh_model_t *model
        Pointer to the Scheduler Server Model. Initialized internally.

    esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl
        Response control of the server model received messages

    esp_ble_mesh_scheduler_state_t *state
        Parameters of the Scheduler state

struct esp_ble_mesh_scheduler_setup_srv_t
    User data of Scheduler Setup Server Model

    Public Members

    esp_ble_mesh_model_t *model
        Pointer to the Scheduler Setup Server Model. Initialized internally.

    esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl
        Response control of the server model received messages

    esp_ble_mesh_scheduler_state_t *state
        Parameters of the Scheduler state

struct esp_ble_mesh_state_change_time_set_t
    Parameters of Time Set state change event
Public Members

- `uint8_t tai_seconds[5]`
  - The current TAI time in seconds

- `uint8_t subsecond`
  - The sub-second time in units of 1/256 second

- `uint8_t uncertainty`
  - The estimated uncertainty in 10-millisecond steps

- `uint16_t time_authority`
  - 0 = No Time Authority, 1 = Time Authority

- `uint16_t tai_utc_delta_curr`
  - Current difference between TAI and UTC in seconds

- `uint8_t time_zone_offset_curr`
  - The local timezone offset in 15-minute increments

**struct esp_ble_mesh_state_change_time_status_t**
Parameters of Time Status state change event

Public Members

- `uint8_t tai_seconds[5]`
  - The current TAI time in seconds

- `uint8_t subsecond`
  - The sub-second time in units of 1/256 second

- `uint8_t uncertainty`
  - The estimated uncertainty in 10-millisecond steps

- `uint16_t time_authority`
  - 0 = No Time Authority, 1 = Time Authority

- `uint16_t tai_utc_delta_curr`
  - Current difference between TAI and UTC in seconds

- `uint8_t time_zone_offset_curr`
  - The local timezone offset in 15-minute increments

**struct esp_ble_mesh_state_change_time_zone_set_t**
Parameters of Time Zone Set state change event

Public Members

- `uint8_t time_zone_offset_new`
  - Upcoming local time zone offset

- `uint8_t tai_zone_change[5]`
  - TAI Second time of the upcoming Time Zone Offset change

**struct esp_ble_mesh_state_change_tai_utc_delta_set_t**
Parameters of TAI UTC Delta Set state change event

Public Members

- `uint16_t tai_utc_delta_new`
  - Upcoming difference between TAI and UTC in seconds
uint8_t tai_delta_change[5]
    TAI Seconds time of the upcoming TAI-UTC Delta change

struct esp_ble_mesh_state_change_time_role_set_t
    Parameter of Time Role Set state change event

Public Members

uint8_t time_role
    The Time Role for the element

struct esp_ble_mesh_state_change_scene_store_t
    Parameter of Scene Store state change event

Public Members

uint16_t scene_number
    The number of scenes to be stored

struct esp_ble_mesh_state_change_scene_recall_t
    Parameter of Scene Recall state change event

Public Members

uint16_t scene_number
    The number of scenes to be recalled

struct esp_ble_mesh_state_change_scene_delete_t
    Parameter of Scene Delete state change event

Public Members

uint16_t scene_number
    The number of scenes to be deleted

struct esp_ble_mesh_state_change_scheduler_act_set_t
    Parameter of Scheduler Action Set state change event

Public Members

uint64_t index: 4
    Index of the Schedule Register entry to set

uint64_t year: 7
    Scheduled year for the action

uint64_t month: 12
    Scheduled month for the action

uint64_t day: 5
    Scheduled day of the month for the action

uint64_t hour: 5
    Scheduled hour for the action

uint64_t minute: 6
    Scheduled minute for the action

uint64_t second: 6
    Scheduled second for the action
Chapter 2. API Reference

uint64_t day_of_week : 7
    Schedule days of the week for the action

uint64_t action : 4
    Action to be performed at the scheduled time

uint64_t trans_time : 8
    Transition time for this action

uint16_t scene_number
    Scene number to be used for some actions

**struct esp_ble_mesh_server_recv_scheduler_act_get_t**
    Context of the received Scheduler Action Get message

**Public Members**

uint8_t index
    Index of the Schedule Register entry to get

**struct esp_ble_mesh_server_recv_time_set_t**
    Context of the received Time Set message

**Public Members**

uint8_t tai_seconds[5]
    The current TAI time in seconds

uint8_t subsecond
    The sub-second time in units of 1/256 second

uint8_t uncertainty
    The estimated uncertainty in 10-millisecond steps

uint16_t time_authority : 1
    0 = No Time Authority, 1 = Time Authority

uint16_t tai_utc_delta : 15
    Current difference between TAI and UTC in seconds

uint8_t time_zone_offset
    The local timezone offset in 15-minute increments

**struct esp_ble_mesh_server_recv_time_zone_set_t**
    Context of the received Time Zone Set message

**Public Members**

uint8_t time_zone_offset_new
    Upcoming local time zone offset

uint8_t tai_zone_change[5]
    TAI Seconds time of the upcoming Time Zone Offset change

**struct esp_ble_mesh_server_recv_tai_utc_delta_set_t**
    Context of the received TAI UTC Delta Set message

**Public Members**

uint16_t tai_utc_delta_new : 15
    Upcoming difference between TAI and UTC in seconds
uint16_t padding: 1
    Always 0b0. Other values are Prohibited.

uint8_t tai_delta_change[5]
    TAI Seconds time of the upcoming TAI-UTC Delta change

struct esp_ble_mesh_server_recv_time_role_set_t
    Context of the received Time Role Set message

Public Members

uint8_t time_role
    The Time Role for the element

struct esp_ble_mesh_server_recv_scene_store_t
    Context of the received Scene Store message

Public Members

uint16_t scene_number
    The number of scenes to be stored

struct esp_ble_mesh_server_recv_scene_recall_t
    Context of the received Scene Recall message

Public Members

bool op_en
    Indicate if optional parameters are included

uint16_t scene_number
    The number of scenes to be recalled

uint8_t tid
    Transaction ID

uint8_t trans_time
    Time to complete state transition (optional)

uint8_t delay
    Indicate message execution delay (C.1)

struct esp_ble_mesh_server_recv_scene_delete_t
    Context of the received Scene Delete message

Public Members

uint16_t scene_number
    The number of scenes to be deleted

struct esp_ble_mesh_server_recv_scheduler_act_set_t
    Context of the received Scheduler Action Set message

Public Members

uint64_t index: 4
    Index of the Schedule Register entry to set

uint64_t year: 7
    Scheduled year for the action
uint64_t \textit{month}: 12
Scheduled month for the action

uint64_t \textit{day}: 5
Scheduled day of the month for the action

uint64_t \textit{hour}: 5
Scheduled hour for the action

uint64_t \textit{minute}: 6
Scheduled minute for the action

uint64_t \textit{second}: 6
Scheduled second for the action

uint64_t \textit{day_of_week}: 7
Scheduled days of the week for the action

uint64_t \textit{action}: 4
Action to be performed at the scheduled time

uint64_t \textit{trans_time}: 8
Transition time for this action

uint16_t \textit{scene_number}
Scene number to be used for some actions

\textbf{struct esp_ble_mesh_server_recv_time_status_t}
Context of the received Time Status message

\textbf{Public Members}

uint8_t \textit{tai_seconds}[5]
The current TAI time in seconds

uint8_t \textit{subsecond}
The sub-second time in units of 1/256 second

uint8_t \textit{uncertainty}
The estimated uncertainty in 10-millisecond steps

uint16_t \textit{time_authority}: 1
0 = No Time Authority, 1 = Time Authority

uint16_t \textit{tai_utc_delta}: 15
Current difference between TAI and UTC in seconds

uint8_t \textit{time_zone_offset}
The local time zone offset in 15-minute increments

\textbf{struct esp_ble_mesh_time_scene_server_cb_param_t}
Time Scene Server Model callback parameters

\textbf{Public Members}

\textit{esp_ble_mesh_model_t} \*\textit{model}
Pointer to Time and Scenes Server Models

\textit{esp_ble_mesh_msg_ctx_t} \textit{ctx}
Context of the received messages

\textit{esp_ble_mesh_time_scene_server_cb_value_t} \textit{value}
Value of the received Time and Scenes Messages
Macros

ESP_BLE_MESH_MODEL_TIME_CLI (cli_pub, cli_data)
Define a new Time Client Model.

Note: This API needs to be called for each element on which the application needs to have a Time Client Model.

Parameters:
- cli_pub: Pointer to the unique struct esp_ble_mesh_model_pub_t.
- cli_data: Pointer to the unique struct esp_ble_mesh_client_t.

ESP_BLE_MESH_MODEL_SCENE_CLI (cli_pub, cli_data)
Define a new Scene Client Model.

Note: This API needs to be called for each element on which the application needs to have a Scene Client Model.

Return: New Scene Client Model instance.

Parameters:
- cli_pub: Pointer to the unique struct esp_ble_mesh_model_pub_t.
- cli_data: Pointer to the unique struct esp_ble_mesh_client_t.

ESP_BLE_MESH_MODEL_SCHEDULER_CLI (cli_pub, cli_data)
Define a new Scheduler Client Model.

Note: This API needs to be called for each element on which the application needs to have a Scheduler Client Model.

Return: New Scheduler Client Model instance.

Parameters:
- cli_pub: Pointer to the unique struct esp_ble_mesh_model_pub_t.
- cli_data: Pointer to the unique struct esp_ble_mesh_client_t.

ESP_BLE_MESH_MODEL_TIME_SRV (srv_pub, srv_data)
Time Scene Server Models related context.

Define a new Time Server Model.

Note: 1. The Time Server model is a root model. When this model is present on an Element, the corresponding Time Setup Server model shall also be present.
   1. This model shall support model publication and model subscription.

Parameters:
- srv_pub: Pointer to the unique struct esp_ble_mesh_model_pub_t.
- srv_data: Pointer to the unique struct esp_ble_mesh_time_srv_t.

ESP_BLE_MESH_MODEL_TIME_SETUP_SRV (srv_data)
Define a new Time Setup Server Model.

Note: 1. The Time Setup Server model extends the Time Server model. Time is sensitive information that is propagated across a mesh network.
   1. Only an authorized Time Client should be allowed to change the Time and Time Role states. A dedicated application key Bluetooth SIG Proprietary should be used on the Time Setup Server to restrict access to the server to only authorized Time Clients.
   2. This model does not support subscribing nor publishing.

Parameters:
- srv_data: Pointer to the unique struct esp_ble_mesh_time_setup_srv_t.

ESP_BLE_MESH_MODEL_SCENE_SRV (srv_pub, srv_data)
Define a new Scene Server Model.

Note: 1. The Scene Server model is a root model. When this model is present on an Element, the corresponding Scene Setup Server model shall also be present.
   1. This model shall support model publication and model subscription.
   2. The model may be present only on the Primary element of a node.

Return: New Scene Server Model instance.
Parameters
• `srv_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
• `srv_data`: Pointer to the unique struct `esp_ble_mesh_scene_srv_t`.

`ESP_BLE_MESH_MODEL_SCENE_SETUP_SRV (srv_pub, srv_data)`
Define a new Scene Setup Server Model.

**Note**
1. The Scene Setup Server model extends the Scene Server model and the Generic Default Transition Time Server model.
2. This model shall support model subscription.
3. The model may be present only on the Primary element of a node.

**Return**
New Scene Setup Server Model instance.

Parameters
• `srv_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
• `srv_data`: Pointer to the unique struct `esp_ble_mesh_scene_setup_srv_t`.

`ESP_BLE_MESH_MODEL_SCHEDULER_SRV (srv_pub, srv_data)`
Define a new Scheduler Server Model.

**Note**
1. The Scheduler Server model extends the Scene Server model. When this model is present on an Element, the corresponding Scheduler Setup Server model shall also be present.
2. This model shall support model publication and model subscription.
3. The model may be present only on the Primary element of a node.
4. The model requires the Time Server model shall be present on the element.

**Return**
New Scheduler Server Model instance.

Parameters
• `srv_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
• `srv_data`: Pointer to the unique struct `esp_ble_mesh_scheduler_srv_t`.

`ESP_BLE_MESH_MODEL_SCHEDULER_SETUP_SRV (srv_pub, srv_data)`
Define a new Scheduler Setup Server Model.

**Note**
1. The Scheduler Setup Server model extends the Scheduler Server and the Scene Setup Server models.
2. This model shall support model subscription.
3. The model may be present only on the Primary element of a node.

**Return**
New Scheduler Setup Server Model instance.

Parameters
• `srv_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
• `srv_data`: Pointer to the unique struct `esp_ble_mesh_scheduler_setup_srv_t`.

`ESP_BLE_MESH_UNKNOWN_TAI_SECONDS`  
Unknown TAI Seconds

`ESP_BLE_MESH_UNKNOWN_TAI_ZONE_CHANGE`  
Unknown TAI of Zone Change

`ESP_BLE_MESH_UNKNOWN_TAI_DELTA_CHANGE`  
Unknown TAI of Delta Change

`ESP_BLE_MESH_TAI_UTC_DELTA_MAX_VALUE`  
Maximum TAI-UTC Delta value

`ESP_BLE_MESH_TAI_SECONDS_LEN`  
Length of TAI Seconds

`ESP_BLE_MESH_TAI_OF_ZONE_CHANGE_LEN`  
Length of TAI of Zone Change

`ESP_BLE_MESH_TAI_OF_DELTA_CHANGE_LEN`  
Length of TAI of Delta Change

`ESP_BLE_MESH_INVALID_SCENE_NUMBER`  
Invalid Scene Number

`ESP_BLE_MESH_SCENE_NUMBER_LEN`  
Length of the Scene Number
ESP_BLE_MESH_SCHEDULE_YEAR_ANY_YEAR
  Any year of the Scheduled year

ESP_BLE_MESH_SCHEDULE_DAY_ANY_DAY
  Any day of the Scheduled day

ESP_BLE_MESH_SCHEDULE_HOUR_ANY_HOUR
  Any hour of the Scheduled hour

ESP_BLE_MESH_SCHEDULE_HOUR_ONCE_A_DAY
  Any hour of the Scheduled Day

ESP_BLE_MESH_SCHEDULE_SEC_ANY_OF_HOUR
  Any minute of the Scheduled hour

ESP_BLE_MESH_SCHEDULE_SEC_EVERY_15_MIN
  Every 15 minutes of the Scheduled hour

ESP_BLE_MESH_SCHEDULE_SEC_EVERY_20_MIN
  Every 20 minutes of the Scheduled hour

ESP_BLE_MESH_SCHEDULE_SEC_ONCE_AN_HOUR
  Once of the Scheduled hour

ESP_BLE_MESH_SCHEDULE_SEC_ANY_OF_MIN
  Any second of the Scheduled minute

ESP_BLE_MESH_SCHEDULE_SEC_EVERY_15_SEC
  Every 15 seconds of the Scheduled minute

ESP_BLE_MESH_SCHEDULE_SEC_EVERY_20_SEC
  Every 20 seconds of the Scheduled minute

ESP_BLE_MESH_SCHEDULE_SEC_ONCE_AN_MIN
  Once of the Scheduled minute

ESP_BLE_MESH_SCHEDULE_ACT_TURN_OFF
  Scheduled Action - Turn Off

ESP_BLE_MESH_SCHEDULE_ACT_TURN_ON
  Scheduled Action - Turn On

ESP_BLE_MESH_SCHEDULE_ACT_SCENE_RECALL
  Scheduled Action - Scene Recall

ESP_BLE_MESH_SCHEDULE_ACT_NO_ACTION
  Scheduled Action - No Action

ESP_BLE_MESH_SCHEDULE_SCENE_NO_SCENE
  Scheduled Scene - No Scene

ESP_BLE_MESH_SCHEDULE_ENTRY_MAX_INDEX
  Maximum number of Scheduled entries

ESP_BLE_MESH_TIME_NONE
  Time Role - None

ESP_BLE_MESH_TIME_AUTHORITY
  Time Role - Mesh Time Authority

ESP_BLE_MESH_TIME_RELAY
  Time Role - Mesh Time Relay

ESP_BLE_MESH_TIME_CLIENT
  Time Role - Mesh Time Client

ESP_BLE_MESH_SCENE_SUCCESS
  Scene operation - Success
ESP_BLE_MESH_SCENE_REG_FULL
Scene operation - Scene Register Full

ESP_BLE_MESH_SCENE_NOT_FOUND
Scene operation - Scene Not Found

Type Definitions

typedef void(*esp_ble_mesh_time_scene_client_cb_t)(
    esp_ble_mesh_time_scene_client_cb_event_t event,
    esp_ble_mesh_time_scene_client_cb_param_t *param)

Bluetooth Mesh Time Scene Client Model function.

Time Scene Client Model callback function type

Parameters
• event: Event type
• param: Pointer to callback parameter

typedef void(*esp_ble_mesh_time_scene_server_cb_t)(
    esp_ble_mesh_time_scene_server_cb_event_t event,
    esp_ble_mesh_time_scene_server_cb_param_t *param)

Bluetooth Mesh Time and Scenes Server Model function.

Time Scene Server Model callback function type

Parameters
• event: Event type
• param: Pointer to callback parameter

Enumerations

denum esp_ble_mesh_time_scene_client_cb_event_t
This enum value is the event of Time Scene Client Model

Values:

ESP_BLE_MESH_TIME_SCENE_CLIENT_GET_STATE_EVT
ESP_BLE_MESH_TIME_SCENE_CLIENT_SET_STATE_EVT
ESP_BLE_MESH_TIME_SCENE_CLIENT_PUBLISH_EVT
ESP_BLE_MESH_TIME_SCENE_CLIENT_TIMEOUT_EVT
ESP_BLE_MESH_TIME_SCENE_CLIENT_EVT_MAX

denum esp_ble_mesh_time_scene_server_cb_event_t
This enum value is the event of Time Scene Server Model

Values:

ESP_BLE_MESH_TIME_SCENE_SERVER_STATE_CHANGE_EVT
1. When get_auto_rsp is set to ESP_BLE_MESH_SERVER_AUTO_RSP, no event will be callback to the application layer when Time Scene Get messages are received.
2. When set_auto_rsp is set to ESP_BLE_MESH_SERVER_AUTO_RSP, this event will be callback to the application layer when Time Scene Set/Set Unack messages are received.

ESP_BLE_MESH_TIME_SCENE_SERVER_RECV_GET_MSG_EVT
When get_auto_rsp is set to ESP_BLE_MESH_SERVER_RSP_BY_APP, this event will be callback to the application layer when Time Scene Get messages are received.

ESP_BLE_MESH_TIME_SCENE_SERVER_RECV_SET_MSG_EVT
When set_auto_rsp is set to ESP_BLE_MESH_SERVER_RSP_BY_APP, this event will be callback to the application layer when Time Scene Set/Set Unack messages are received.
ESP_BLE_MESH_TIME_SCENE_SERVER_RECV_STATUS_MSG_EVT
When status_auto_rsp is set to ESP_BLE_MESH_SERVER_RSP_BY_APP, this event will be callback
to the application layer when Time Status message is received.

ESP_BLE_MESH_TIME_SCENE_SERVER_EVT_MAX

Lighting Client/Server Models

Header File
- components/bt/esp_ble_mesh/api/models/include/esp_ble_mesh_lighting_model_api.h

Functions

esp_err_t esp_ble_mesh_register_light_client_callback (esp_ble_mesh_light_client_cb_t callback)
Register BLE Mesh Light Client Model callback.
Return ESP_OK on success or error code otherwise.
Parameters
  • [in] callback: pointer to the callback function.

esp_err_t esp_ble_mesh_light_client_get_state (esp_ble_mesh_client_common_param_t *params,
                                           esp_ble_mesh_light_client_get_state_t *get_state)
Get the value of Light Server Model states using the Light Client Model get messages.
Note If you want to know the opcodes and corresponding meanings accepted by this API, please refer to
esp_ble_mesh_light_message_opcode_t in esp_ble_mesh_defs.h
Return ESP_OK on success or error code otherwise.
Parameters
  • [in] params: Pointer to BLE Mesh common client parameters,
  • [in] get_state: Pointer of light get message value. Shall not be set to NULL.

esp_err_t esp_ble_mesh_light_client_set_state (esp_ble_mesh_client_common_param_t *params,
                                              esp_ble_mesh_light_client_set_state_t *set_state)
Set the value of Light Server Model states using the Light Client Model set messages.
Note If you want to know the opcodes and corresponding meanings accepted by this API, please refer to
esp_ble_mesh_light_message_opcode_t in esp_ble_mesh_defs.h
Return ESP_OK on success or error code otherwise.
Parameters
  • [in] params: Pointer to BLE Mesh common client parameters.
  • [in] set_state: Pointer of light set message value. Shall not be set to NULL.

esp_err_t esp_ble_mesh_register_lighting_server_callback (esp_ble_mesh_lighting_server_cb_t callback)
Register BLE Mesh Lighting Server Model callback.
Return ESP_OK on success or error code otherwise.
Parameters
  • [in] callback: Pointer to the callback function.

Target value of light hsl hue state

uint16_t hsl_saturation
Target value of light hsl saturation state

uint8_t tid
Transaction ID

uint8_t trans_time
Time to complete state transition (optional)

uint8_t delay
Indicate message execution delay (C.1)

**struct esp_ble_mesh_light_hsl_hue_set_t**

Parameters of Light HSL Hue Set

**Public Members**

bool op_en
Indicate if optional parameters are included

uint16_t hue
Target value of light hsl hue state

uint8_t tid
Transaction ID

uint8_t trans_time
Time to complete state transition (optional)

uint8_t delay
Indicate message execution delay (C.1)

**struct esp_ble_mesh_light_hsl_saturation_set_t**

Parameters of Light HSL Saturation Set

**Public Members**

bool op_en
Indicate if optional parameters are included

uint16_t saturation
Target value of light hsl hue state

uint8_t tid
Transaction ID

uint8_t trans_time
Time to complete state transition (optional)
Chapter 2. API Reference

```c
uint8_t delay
   Indicate message execution delay (C.1)
```

```c
struct esp_ble_mesh_light_hsl_default_set_t
Parameters of Light HSL Default Set

Public Members

uint16_t lightness
   Value of light lightness default state

uint16_t hue
   Value of light hue default state

uint16_t saturation
   Value of light saturation default state
```

```c
struct esp_ble_mesh_light_hsl_range_set_t
Parameters of Light HSL Range Set

Public Members

uint16_t hue_range_min
   Value of hue range min field of light hsl hue range state

uint16_t hue_range_max
   Value of hue range max field of light hsl hue range state

uint16_t saturation_range_min
   Value of saturation range min field of light hsl saturation range state

uint16_t saturation_range_max
   Value of saturation range max field of light hsl saturation range state
```

```c
struct esp_ble_mesh_light_xyl_set_t
Parameters of Light xyL Set

Public Members

bool op_en
   Indicate whether optional parameters included

uint16_t xyl_lightness
   The target value of the Light xyL Lightness state

uint16_t xyl_x
   The target value of the Light xyL x state

uint16_t xyl_y
   The target value of the Light xyL y state

uint8_t tid
   Transaction Identifier

uint8_t trans_time
   Time to complete state transition (optional)

uint8_t delay
   Indicate message execution delay (C.1)
```

```c
struct esp_ble_mesh_light_xyl_default_set_t
Parameters of Light xyL Default Set
```
Public Members

uint16_t lightness
   The value of the Light Lightness Default state

uint16_t xyl_x
   The value of the Light xyL x Default state

uint16_t xyl_y
   The value of the Light xyL y Default state

struct esp_ble_mesh_light_xyl_range_set_t
   Parameters of Light xyL Range Set

Public Members

uint16_t xyl_x_range_min
   The value of the xyL x Range Min field of the Light xyL x Range state

uint16_t xyl_x_range_max
   The value of the xyL x Range Max field of the Light xyL x Range state

uint16_t xyl_y_range_min
   The value of the xyL y Range Min field of the Light xyL y Range state

uint16_t xyl_y_range_max
   The value of the xyL y Range Max field of the Light xyL y Range state

struct esp_ble_mesh_light_lc_mode_set_t
   Parameter of Light LC Mode Set

Public Members

uint8_t mode
   The target value of the Light LC Mode state

struct esp_ble_mesh_light_lc_om_set_t
   Parameter of Light LC OM Set

Public Members

uint8_t mode
   The target value of the Light LC Occupancy Mode state

struct esp_ble_mesh_light_lc_light_onoff_set_t
   Parameters of Light LC Light OnOff Set

Public Members

bool op_en
   Indicate whether optional parameters included

uint8_t light_onoff
   The target value of the Light LC Light OnOff state

uint8_t tid
   Transaction Identifier

uint8_t trans_time
   Time to complete state transition (optional)
uint8_t delay
Indicate message execution delay (C.1)

**struct esp_ble_mesh_light_lc_property_get_t**
Parameter of Light LC Property Get

**Public Members**

uint16_t property_id
Property ID identifying a Light LC Property

**struct esp_ble_mesh_light_lc_property_set_t**
Parameters of Light LC Property Set

**Public Members**

uint16_t property_id
Property ID identifying a Light LC Property

**struct net_buf_simple **property_value
Raw value for the Light LC Property

**struct esp_ble_mesh_light_lightness_status_cb_t**
Bluetooth Mesh Light Lightness Client Model Get and Set callback parameters structure.
Parameters of Light Lightness Status

**Public Members**

bool op_en
Indicate if optional parameters are included

uint16_t present_lightness
Current value of light lightness actual state

uint16_t target_lightness
Target value of light lightness actual state (optional)

uint8_t remain_time
Time to complete state transition (C.1)

**struct esp_ble_mesh_light_lightness_linear_status_cb_t**
Parameters of Light Lightness Linear Status

**Public Members**

bool op_en
Indicate if optional parameters are included

uint16_t present_lightness
Current value of light lightness linear state

uint16_t target_lightness
Target value of light lightness linear state (optional)

uint8_t remain_time
Time to complete state transition (C.1)

**struct esp_ble_mesh_light_lightness_last_status_cb_t**
Parameter of Light Lightness Last Status

**Public Members**

bool op_en
Indicate if optional parameters are included

uint16_t present_lightness
Current value of light lightness last state

uint16_t target_lightness
Target value of light lightness last state (optional)

uint8_t remain_time
Time to complete state transition (C.1)
Public Members

uint16_t lightness
The value of the Light Lightness Last state

struct esp_ble_mesh_light_lightness_default_status_cb_t
Parameter of Light Lightness Default Status

Public Members

uint16_t lightness
The value of the Light Lightness default State

struct esp_ble_mesh_light_lightness_range_status_cb_t
Parameters of Light Lightness Range Status

Public Members

uint8_t status_code
Status Code for the request message

uint16_t range_min
Value of range min field of light lightness range state

uint16_t range_max
Value of range max field of light lightness range state

struct esp_ble_mesh_light_ctl_status_cb_t
Parameters of Light CTL Status

Public Members

bool op_en
Indicate if optional parameters are included

uint16_t present_ctl_lightness
Current value of light ctl lightness state

uint16_t present_ctl_temperature
Current value of light ctl temperature state

uint16_t target_ctl_lightness
Target value of light ctl lightness state (optional)

uint16_t target_ctl_temperature
Target value of light ctl temperature state (C.1)

uint8_t remain_time
Time to complete state transition (C.1)

struct esp_ble_mesh_light_ctl_temperature_status_cb_t
Parameters of Light CTL Temperature Status

Public Members

bool op_en
Indicate if optional parameters are included

uint16_t present_ctl_temperature
Current value of light ctl temperature state

uint16_t `present_ctl_delta_uv`
Current value of light ctl delta UV state

uint16_t `target_ctl_temperature`
Target value of light ctl temperature state (optional)

uint16_t `target_ctl_delta_uv`
Target value of light ctl delta UV state (C.1)

uint8_t `remain_time`
Time to complete state transition (C.1)

`struct esp_ble_mesh_light_ctl_temperature_range_status_cb_t`
Parameters of Light CTL Temperature Range Status

**Public Members**

uint8_t `status_code`
Status code for the request message

uint16_t `range_min`
Value of temperature range min field of light ctl temperature range state

uint16_t `range_max`
Value of temperature range max field of light ctl temperature range state

`struct esp_ble_mesh_light_ctl_default_status_cb_t`
Parameters of Light CTL Default Status

**Public Members**

uint16_t `lightness`
Value of light lightness default state

uint16_t `temperature`
Value of light temperature default state

int16_t `delta_uv`
Value of light delta UV default state

`struct esp_ble_mesh_light_hsl_status_cb_t`
Parameters of Light HSL Status

**Public Members**

`bool op_en`
Indicate if optional parameters are included

uint16_t `hsl_lightness`
Current value of light hsl lightness state

uint16_t `hsl_hue`
Current value of light hsl hue state

uint16_t `hsl_saturation`
Current value of light hsl saturation state

uint8_t `remain_time`
Time to complete state transition (optional)

`struct esp_ble_mesh_light_hsl_target_status_cb_t`
Parameters of Light HSL Target Status

**Public Members**

Public Members

bool op_en
   Indicate if optional parameters are included

uint16_t hsl_lightness_target
   Target value of light hsl lightness state

uint16_t hsl_hue_target
   Target value of light hsl hue state

uint16_t hsl_saturation_target
   Target value of light hsl saturation state

uint8_t remain_time
   Time to complete state transition (optional)

struct esp_ble_mesh_light_hsl_hue_status_cb_t
   Parameters of Light HSL Hue Status

Public Members

bool op_en
   Indicate if optional parameters are included

uint16_t present_hue
   Current value of light hsl hue state

uint16_t target_hue
   Target value of light hsl hue state (optional)

uint8_t remain_time
   Time to complete state transition (C.1)

struct esp_ble_mesh_light_hsl_saturation_status_cb_t
   Parameters of Light HSL Saturation Status

Public Members

bool op_en
   Indicate if optional parameters are included

uint16_t present_saturation
   Current value of light hsl saturation state

uint16_t target_saturation
   Target value of light hsl saturation state (optional)

uint8_t remain_time
   Time to complete state transition (C.1)

struct esp_ble_mesh_light_hsl_default_status_cb_t
   Parameters of Light HSL Default Status

Public Members

uint16_t lightness
   Value of light lightness default state

uint16_t hue
   Value of light hue default state
uint16_t saturation
   Value of light saturation default state

struct esp_ble_mesh_light_hsl_range_status_cb_t
   Parameters of Light HSL Range Status

Public Members

uint8_t status_code
   Status code for the request message

uint16_t hue_range_min
   Value of hue range min field of light hsl hue range state

uint16_t hue_range_max
   Value of hue range max field of light hsl hue range state

uint16_t saturation_range_min
   Value of saturation range min field of light hsl saturation range state

uint16_t saturation_range_max
   Value of saturation range max field of light hsl saturation range state

struct esp_ble_mesh_light_xyl_status_cb_t
   Parameters of Light xyL Status

Public Members

bool op_en
   Indicate whether optional parameters included

uint16_t xyl_lightness
   The present value of the Light xyL Lightness state

uint16_t xyl_x
   The present value of the Light xyL x state

uint16_t xyl_y
   The present value of the Light xyL y state

uint8_t remain_time
   Time to complete state transition (optional)

struct esp_ble_mesh_light_xyl_target_status_cb_t
   Parameters of Light xyL Target Status

Public Members

bool op_en
   Indicate whether optional parameters included

uint16_t target_xyl_lightness
   The target value of the Light xyL Lightness state

uint16_t target_xyl_x
   The target value of the Light xyL x state

uint16_t target_xyl_y
   The target value of the Light xyL y state

uint8_t remain_time
   Time to complete state transition (optional)
**struct esp_ble_mesh_light_xyl_default_status_cb_t**  
Parameters of Light xyl Default Status

**Public Members**

uint16_t **lightness**  
The value of the Light Lightness Default state

uint16_t **xyl_x**  
The value of the Light xyl x Default state

uint16_t **xyl_y**  
The value of the Light xyl y Default state

**struct esp_ble_mesh_light_xyl_range_status_cb_t**  
Parameters of Light xyl Range Status

**Public Members**

uint8_t **status_code**  
Status Code for the requesting message

uint16_t **xyl_x_range_min**  
The value of the xyl x Range Min field of the Light xyl x Range state

uint16_t **xyl_x_range_max**  
The value of the xyl x Range Max field of the Light xyl x Range state

uint16_t **xyl_y_range_min**  
The value of the xyl y Range Min field of the Light xyl y Range state

uint16_t **xyl_y_range_max**  
The value of the xyl y Range Max field of the Light xyl y Range state

**struct esp_ble_mesh_light_lc_mode_status_cb_t**  
Parameter of Light LC Mode Status

**Public Members**

uint8_t **mode**  
The present value of the Light LC Mode state

**struct esp_ble_mesh_light_lc_om_status_cb_t**  
Parameter of Light LC OM Status

**Public Members**

uint8_t **mode**  
The present value of the Light LC Occupancy Mode state

**struct esp_ble_mesh_light_lc_light_onoff_status_cb_t**  
Parameters of Light LC Light OnOff Status

**Public Members**

bool **op_en**  
Indicate whether optional parameters included

uint8_t **present_light_onoff**  
The present value of the Light LC Light OnOff state
Chapter 2. API Reference

```c
uint8_t target_light_onoff
    The target value of the Light LC LightOnOff state (Optional)

uint8_t remain_time
    Time to complete state transition (C.1)

struct esp_ble_mesh_light_lc_property_status_cb_t
    Parameters of Light LC Property Status

Public Members

uint16_t property_id
    Property ID identifying a Light LC Property

struct net_buf_simple *property_value
    Raw value for the Light LC Property

struct esp_ble_mesh_light_client_cb_param_t
    Lighting Client Model callback parameters

Public Members

int error_code
    Appropriate error code

esp_ble_mesh_client_common_param_t *params
    The client common parameters.

esp_ble_mesh_light_client_status_cb_t status_cb
    The light status message callback values

struct esp_ble_mesh_light_lightness_state_t
    Parameters of Light Lightness state

Public Members

uint16_t lightness_linear
    The present value of Light Lightness Linear state

uint16_t target_lightness_linear
    The target value of Light Lightness Linear state

uint16_t lightness_actual
    The present value of Light Lightness Actual state

uint16_t target_lightness_actual
    The target value of Light Lightness Actual state

uint16_t lightness_last
    The value of Light Lightness Last state

uint16_t lightness_default
    The value of Light Lightness Default state

uint8_t status_code
    The status code of setting Light Lightness Range state

uint16_t lightness_range_min
    The minimum value of Light Lightness Range state

uint16_t lightness_range_max
    The maximum value of Light Lightness Range state
```
struct esp_ble_mesh_light_lightness_srv_t
User data of Light Lightness Server Model

Public Members

*esp_ble_mesh_model_t* model
Point to the Lighting Lightness Server Model. Initialized internally.

*esp_ble_mesh_server_rsp_ctrl_t* rsp_ctrl
Response control of the server model received messages

*esp_ble_mesh_light_lightness_state_t* state
Parameters of the Light Lightness state

*esp_ble_mesh_last_msg_info_t* last
Parameters of the last received set message

*esp_ble_mesh_state_transition_t* actual_transition
Parameters of state transition

*esp_ble_mesh_state_transition_t* linear_transition
Parameters of state transition

int32_t tt_delta_lightness_actual
Delta change value of lightness actual state transition

int32_t tt_delta_lightness_linear
Delta change value of lightness linear state transition

struct esp_ble_mesh_light_lightness_setup_srv_t
User data of Light Lightness Setup Server Model

Public Members

*esp_ble_mesh_model_t* model
Point to the Lighting Lightness Setup Server Model. Initialized internally.

*esp_ble_mesh_server_rsp_ctrl_t* rsp_ctrl
Response control of the server model received messages

*esp_ble_mesh_light_lightness_state_t* state
Parameters of the Light Lightness state

struct esp_ble_mesh_light_ctl_state_t
Parameters of Light CTL state

Public Members

uint16_t lightness
The present value of Light CTL Lightness state

uint16_t target_lightness
The target value of Light CTL Lightness state

uint16_t temperature
The present value of Light CTL Temperature state

uint16_t target_temperature
The target value of Light CTL Temperature state

int16_t delta_uv
The present value of Light CTL Delta UV state
int16_t **target_delta_uv
The target value of Light CTL Delta UV state

uint8_t **status_code
The status code of setting Light CTL Temperature Range state

uint16_t **temperature_range_min
The minimum value of Light CTL Temperature Range state

uint16_t **temperature_range_max
The maximum value of Light CTL Temperature Range state

uint16_t **lightness_default
The value of Light Lightness Default state

uint16_t **temperature_default
The value of Light CTL Temperature Default state

int16_t **delta_uv_default
The value of Light CTL Delta UV Default state

struct esp_ble_mesh_light_ctl_srv_t
User data of Light CTL Server Model

Public Members

esp_ble_mesh_model_t **model
Pointer to the Lighting CTL Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t **rsp_ctrl
Response control of the server model received messages

esp_ble_mesh_light_ctl_state_t **state
Parameters of the Light CTL state

esp_ble_mesh_last_msg_info_t **last
Parameters of the last received set message

esp_ble_mesh_state_transition_t **transition
Parameters of state transition

int32_t **tt_delta_lightness
Delta change value of lightness state transition

int32_t **tt_delta_temperature
Delta change value of temperature state transition

int32_t **tt_delta_delta_uv
Delta change value of delta uv state transition

struct esp_ble_mesh_light_ctl_setup_srv_t
User data of Light CTL Setup Server Model

Public Members

esp_ble_mesh_model_t **model
Pointer to the Lighting CTL Setup Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t **rsp_ctrl
Response control of the server model received messages

esp_ble_mesh_light_ctl_state_t **state
Parameters of the Light CTL state

struct esp_ble_mesh_light_ctl_temp_srv_t
User data of Light CTL Temperature Server Model
**Public Members**

`esp_ble_mesh_model_t *model`
  Pointer to the Lighting CTL Temperature Server Model. Initialized internally.

`esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl`
  Response control of the server model received messages

`esp_ble_mesh_light_ctl_state_t *state`
  Parameters of the Light CTL state

`esp_ble_mesh_last_msg_info_t *last`
  Parameters of the last received set message

`esp_ble_mesh_state_transition_t *transition`
  Parameters of state transition

`int32_t tt_delta_temperature`
  Delta change value of temperature state transition

`int32_t tt_delta_delta_uv`
  Delta change value of delta uv state transition

`struct esp_ble_mesh_light_hsl_state_t`
  Parameters of Light HSL state

**Public Members**

`uint16_t lightness`
  The present value of Light HSL Lightness state

`uint16_t target_lightness`
  The target value of Light HSL Lightness state

`uint16_t hue`
  The present value of Light HSL Hue state

`uint16_t target_hue`
  The target value of Light HSL Hue state

`uint16_t saturation`
  The present value of Light HSL Saturation state

`uint16_t target_saturation`
  The target value of Light HSL Saturation state

`uint16_t lightness_default`
  The value of Light Lightness Default state

`uint16_t hue_default`
  The value of Light HSL Hue Default state

`uint16_t saturation_default`
  The value of Light HSL Saturation Default state

`uint8_t status_code`
  The status code of setting Light HSL Hue & Saturation Range state

`uint16_t hue_range_min`
  The minimum value of Light HSL Hue Range state

`uint16_t hue_range_max`
  The maximum value of Light HSL Hue Range state

`uint16_t saturation_range_min`
  The minimum value of Light HSL Saturation state
uint16_t saturation_range_max
The maximum value of Light HSL Saturation state

struct esp_ble_mesh_light_hsl_srv_t
User data of Light HSL Server Model

Public Members

esp_ble_mesh_model_t *model
Pointer to the Lighting HSL Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t * rsp_ctrl
Response control of the server model received messages

esp_ble_mesh_light_hsl_state_t *state
Parameters of the Light HSL state

esp_ble_mesh_last_msg_info_t last
Parameters of the last received set message

esp_ble_mesh_state_transition_t transition
Parameters of state transition

int32_t tt_delta_lightness
Delta change value of lightness state transition

int32_t tt_delta_hue
Delta change value of hue state transition

int32_t tt_delta_saturation
Delta change value of saturation state transition

struct esp_ble_mesh_light_hsl_setup_srv_t
User data of Light HSL Setup Server Model

Public Members

esp_ble_mesh_model_t *model
Pointer to the Lighting HSL Setup Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t * rsp_ctrl
Response control of the server model received messages

esp_ble_mesh_light_hsl_state_t *state
Parameters of the Light HSL state

struct esp_ble_mesh_light_hsl_hue_srv_t
User data of Light HSL Hue Server Model

Public Members

esp_ble_mesh_model_t *model
Pointer to the Lighting HSL Hue Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t * rsp_ctrl
Response control of the server model received messages

esp_ble_mesh_light_hsl_state_t *state
Parameters of the Light HSL state

esp_ble_mesh_last_msg_info_t last
Parameters of the last received set message
Chapter 2. API Reference

`esp_ble_mesh_state_transition_t transition`  
Parameters of state transition

`int32_t tt_delta_hue`  
Delta change value of hue state transition

`struct esp_ble_mesh_light_hsl_sat_srv_t`  
User data of Light HSL Saturation Server Model

**Public Members**

`esp_ble_mesh_model_t *model`  
Pointer to the Lighting HSL Saturation Server Model. Initialized internally.

`esp_ble_mesh_server_rsp_ctrl_t/rsp_ctrl`  
Response control of the server model received messages

`esp_ble_mesh_light_hsl_state_t *state`  
Parameters of the Light HSL state

`esp_ble_mesh_last_msg_info_t last`  
Parameters of the last received set message

`esp_ble_mesh_state_transition_t/transition`  
Parameters of state transition

`int32_t tt_delta_saturation`  
Delta change value of saturation state transition

`struct esp_ble_mesh_light_xyl_state_t`  
Parameters of Light xyL state

**Public Members**

`uint16_t lightness`  
The present value of Light xyL Lightness state

`uint16_t target_lightness`  
The target value of Light xyL Lightness state

`uint16_t x`  
The present value of Light xyL x state

`uint16_t target_x`  
The target value of Light xyL x state

`uint16_t y`  
The present value of Light xyL y state

`uint16_t target_y`  
The target value of Light xyL y state

`uint16_t lightness_default`  
The value of Light Lightness Default state

`uint16_t x_default`  
The value of Light xyL x Default state

`uint16_t y_default`  
The value of Light xyL y Default state

`uint8_t status_code`  
The status code of setting Light xyL x & y Range state

`uint16_t x_range_min`  
The minimum value of Light xyL x Range state
uint16_t \textbf{x\_range\_max}
  The maximum value of Light \textit{xyL x Range state}

uint16_t \textbf{y\_range\_min}
  The minimum value of Light \textit{xyL y Range state}

uint16_t \textbf{y\_range\_max}
  The maximum value of Light \textit{xyL y Range state}

\textbf{struct esp\_ble\_mesh\_light\_xyl\_srv\_t}
User data of Light \textit{xyL Server Model}

\textbf{Public Members}

\textit{esp\_ble\_mesh\_model\_t *model}
  Pointer to the Lighting \textit{xyL Server Model}. Initialized internally.

\textit{esp\_ble\_mesh\_server\_rsp\_ctrl\_t *rsp\_ctrl}
  Response control of the server model received messages

\textit{esp\_ble\_mesh\_light\_xyl\_state\_t *state}
  Parameters of the Light \textit{xyL state}

\textit{esp\_ble\_mesh\_last\_msg\_info\_t last}
  Parameters of the last received set message

\textit{esp\_ble\_mesh\_state\_transition\_t *transition}
  Parameters of state transition

int32_t \textbf{tt\_delta\_lightness}
  Delta change value of lightness state transition

int32_t \textbf{tt\_delta\_x}
  Delta change value of \textit{x} state transition

int32_t \textbf{tt\_delta\_y}
  Delta change value of \textit{y} state transition

\textbf{struct esp\_ble\_mesh\_light\_xyl\_setup\_srv\_t}
User data of Light \textit{xyL Setup Server Model}

\textbf{Public Members}

\textit{esp\_ble\_mesh\_model\_t *model}
  Pointer to the Lighting \textit{xyL Setup Server Model}. Initialized internally.

\textit{esp\_ble\_mesh\_server\_rsp\_ctrl\_t *rsp\_ctrl}
  Response control of the server model received messages

\textit{esp\_ble\_mesh\_light\_xyl\_state\_t *state}
  Parameters of the Light \textit{xyL state}

\textit{struct esp\_ble\_mesh\_light\_lc\_state\_t}
Parameters of Light \textit{LC states}

\textbf{Public Members}

uint32_t \textbf{mode} : 1
  0b0 The controller is turned off.

  • The binding with the Light Lightness state is disabled. 0b1 The controller is turned on.
  • The binding with the Light Lightness state is enabled. The value of Light LC Mode state
uint32_t occupancy_mode : 1
    The value of Light LC Occupancy Mode state

uint32_t light_onoff : 1
    The present value of Light LC Light OnOff state

uint32_t target_light_onoff : 1
    The target value of Light LC Light OnOff state

uint32_t occupancy : 1
    The value of Light LC Occupancy state

uint32_t ambient_luxlevel : 24
    The value of Light LC Ambient LuxLevel state

uint16_t linear_output

1. Light LC Linear Output = max((Lightness Out)^2/65535, Regulator Output)
2. If the Light LC Mode state is set to 0b1, the binding is enabled and upon a change of the Light LC Linear Output state, the following operation shall be performed: Light Lightness Linear = Light LC Linear Output
3. If the Light LC Mode state is set to 0b0, the binding is disabled (i.e., upon a change of the Light LC Linear Output state, no operation on the Light Lightness Linear state is performed). The value of Light LC Linear Output state

struct esp_ble_mesh_light_lc_property_state_t

Parameters of Light Property states. The Light LC Property states are read / write states that determine the configuration of a Light Lightness Controller. Each state is represented by a device property and is controlled by Light LC Property messages.

**Public Members**

uint32_t time_occupancy_delay
    A timing state that determines the delay for changing the Light LC Occupancy state upon receiving a Sensor Status message from an occupancy sensor. The value of Light LC Time Occupancy Delay state

uint32_t time_fade_on
    A timing state that determines the time the controlled lights fade to the level determined by the Light LC Lightness On state. The value of Light LC Time Fade On state

uint32_t time_run_on
    A timing state that determines the time the controlled lights stay at the level determined by the Light LC Lightness On state. The value of Light LC Time Run On state

uint32_t time_fade
    A timing state that determines the time the controlled lights fade from the level determined by the Light LC Lightness On state to the level determined by the Light Lightness Prolong state. The value of Light LC Time Fade state

uint32_t time_prolong
    A timing state that determines the time the controlled lights stay at the level determined by the Light LC Lightness Prolong state. The value of Light LC Time Prolong state

uint32_t time_fade_standby_auto
    A timing state that determines the time the controlled lights fade from the level determined by the Light LC Lightness Prolong state to the level determined by the Light LC Lightness Standby state when the transition is automatic. The value of Light LC Time Fade Standby Auto state

uint32_t time_fade_standby_manual
    A timing state that determines the time the controlled lights fade from the level determined by the Light LC Lightness Prolong state to the level determined by the Light LC Lightness Standby state when the transition is triggered by a change in the Light LC Light OnOff state. The value of Light LC Time Fade Standby Manual state
uint16_t lightness_on
A lightness state that determines the perceptive light lightness at the Occupancy and Run internal controller states. The value of Light LC Lightness On state

uint16_t lightness_prolong
A lightness state that determines the light lightness at the Prolong internal controller state. The value of Light LC Lightness Prolong state

uint16_t lightness_standby
A lightness state that determines the light lightness at the Standby internal controller state. The value of Light LC Lightness Standby state

uint16_t ambient_luxlevel_on
A uint16 state representing the Ambient LuxLevel level that determines if the controller transitions from the Light Control Standby state. The value of Light LC Ambient LuxLevel On state

uint16_t ambient_luxlevel_prolong
A uint16 state representing the required Ambient LuxLevel level in the Prolong state. The value of Light LC Ambient LuxLevel Prolong state

uint16_t ambient_luxlevel_standby
A uint16 state representing the required Ambient LuxLevel level in the Standby state. The value of Light LC Ambient LuxLevel Standby state

float regulator_kiu
A float32 state representing the integral coefficient that determines the integral part of the equation defining the output of the Light LC PI Feedback Regulator, when Light LC Ambient LuxLevel is less than LuxLevel Out. Valid range: 0.0 ~ 1000.0. The default value is 250.0. The value of Light LC Regulator Kiu state

float regulator_kid
A float32 state representing the integral coefficient that determines the integral part of the equation defining the output of the Light LC PI Feedback Regulator, when Light LC Ambient LuxLevel is greater than or equal to the value of the LuxLevel Out state. Valid range: 0.0 ~ 1000.0. The default value is 25.0. The value of Light LC Regulator Kid state

float regulator_kpu
A float32 state representing the proportional coefficient that determines the proportional part of the equation defining the output of the Light LC PI Feedback Regulator, when Light LC Ambient LuxLevel is less than the value of the LuxLevel Out state. Valid range: 0.0 ~ 1000.0. The default value is 80.0. The value of Light LC Regulator Kpu state

float regulator_kpd
A float32 state representing the proportional coefficient that determines the proportional part of the equation defining the output of the Light LC PI Feedback Regulator, when Light LC Ambient LuxLevel is greater than or equal to the value of the LuxLevel Out state. Valid range: 0.0 ~ 1000.0. The default value is 80.0. The value of Light LC Regulator Kpd state

int8_t regulator_accuracy
A int8 state representing the percentage accuracy of the Light LC PI Feedback Regulator. Valid range: 0.0 ~ 100.0. The default value is 2.0. The value of Light LC Regulator Accuracy state

uint32_t set_occupancy_to_1_delay
If the message Raw field contains a Raw Value for the Time Since Motion Sensed device property, which represents a value less than or equal to the value of the Light LC Occupancy Delay state, it shall delay setting the Light LC Occupancy state to 0b1 by the difference between the value of the Light LC Occupancy Delay state and the received Time Since Motion value. The value of the difference between value of the Light LC Occupancy Delay state and the received Time Since Motion value

struct esp_ble_mesh_light_lc_state_machine_t
Parameters of Light LC state machine
Public Members

```
uint8_t fade_on
The value of transition time of Light LC Time Fade On

uint8_t fade
The value of transition time of Light LC Time Fade

uint8_t fade_standby_auto
The value of transition time of Light LC Time Fade Standby Auto

uint8_t fade_standby_manual
The value of transition time of Light LC Time Fade Standby Manual
```

```
struct esp_ble_mesh_light_lc_state_machine_t::[anonymous] trans_time
The Fade On, Fade, Fade Standby Auto, and Fade Standby Manual states are transition states that define the transition of the Lightness Out and LuxLevel Out states. This transition can be started as a result of the Light LC State Machine change or as a result of receiving the Light LC Light OnOff Set or Light LC Light Set Unacknowledged message. The value of transition time
```

```
esp_ble_mesh_lc_state_t state
The value of Light LC state machine state
```

```
struct k_delayed_work timer
Timer of Light LC state machine
```

```
struct esp_ble_mesh_light_control_t
Parameters of Light Lightness controller
```

Public Members

```
esp_ble_mesh_light_lc_state_t state
Parameters of Light LC state

esp_ble_mesh_light_lc_property_state_t prop_state
Parameters of Light LC Property state

esp_ble_mesh_light_lc_state_machine_t state_machine
Parameters of Light LC state machine
```

```
struct esp_ble_mesh_light_lc_srv_t
User data of Light LC Server Model
```

Public Members

```
esp_ble_mesh_model_t *model
Pointer to the Lighting LC Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t * rsp_ctrl
Response control of the server model received messages

esp_ble_mesh_light_control_t *lc
Parameters of the Light controller

esp_ble_mesh_last_msg_info_t last
Parameters of the last received set message

esp_ble_mesh_state_transition_t transition
Parameters of state transition
```

```
struct esp_ble_mesh_light_lc_setup_srv_t
User data of Light LC Setup Server Model
```
Public Members

*esp_ble_mesh_model_t* model
  Pointer to the Lighting LC Setup Server Model. Initialized internally.

*esp_ble_mesh_server_rsp_ctrl_t* rsp_ctrl
  Response control of the server model received messages

*esp_ble_mesh_light_control_t* lc
  Parameters of the Light controller

*struct esp_ble_mesh_state_change_light_lightness_set_t*
  Parameter of Light Lightness Actual state change event

Public Members

uint16_t lightness
  The value of Light Lightness Actual state

*struct esp_ble_mesh_state_change_light_lightness_linear_set_t*
  Parameter of Light Lightness Linear state change event

Public Members

uint16_t lightness
  The value of Light Lightness Linear state

*struct esp_ble_mesh_state_change_light_lightness_default_set_t*
  Parameter of Light Lightness Default state change event

Public Members

uint16_t lightness
  The value of Light Lightness Default state

*struct esp_ble_mesh_state_change_light_lightness_range_set_t*
  Parameters of Light Lightness Range state change event

Public Members

uint16_t range_min
  The minimum value of Light Lightness state

uint16_t range_max
  The maximum value of Light Lightness state

*struct esp_ble_mesh_state_change_light_ctl_set_t*
  Parameters of Light CTL state change event

Public Members

uint16_t lightness
  The value of Light CTL Lightness state

uint16_t temperature
  The value of Light CTL Temperature state

int16_t delta_uv
  The value of Light CTL Delta UV state
struct esp_ble_mesh_state_change_light_ctl_temperature_set_t
Parameters of Light CTL Temperature state change event

Public Members

uint16_t temperature
The value of Light CTL Temperature state

int16_t delta_uv
The value of Light CTL Delta UV state

struct esp_ble_mesh_state_change_light_ctl_temperature_range_set_t
Parameters of Light CTL Temperature Range state change event

Public Members

uint16_t range_min
The minimum value of Light CTL Temperature Range state

uint16_t range_max
The maximum value of Light CTL Temperature Range state

struct esp_ble_mesh_state_change_light_ctl_default_set_t
Parameters of Light CTL Default state change event

Public Members

uint16_t lightness
The value of Light Lightness Default state

uint16_t temperature
The value of Light CTL Temperature Default state

int16_t delta_uv
The value of Light CTL Delta UV Default state

struct esp_ble_mesh_state_change_light_hsl_set_t
Parameters of Light HSL state change event

Public Members

uint16_t lightness
The value of Light HSL Lightness state

uint16_t hue
The value of Light HSL Hue state

uint16_t saturation
The value of Light HSL Saturation state

struct esp_ble_mesh_state_change_light_hsl_hue_set_t
Parameter of Light HSL Hue state change event

Public Members

uint16_t hue
The value of Light HSL Hue state

struct esp_ble_mesh_state_change_light_hsl_saturation_set_t
Parameter of Light HSL Saturation state change event
Public Members

uint16_t saturation
The value of Light HSL Saturation state

struct esp_ble_mesh_state_change_light_hsl_default_set_t
Parameters of Light HSL Default state change event

Public Members

uint16_t lightness
The value of Light HSL Lightness Default state

uint16_t hue
The value of Light HSL Hue Default state

uint16_t saturation
The value of Light HSL Saturation Default state

struct esp_ble_mesh_state_change_light_hsl_range_set_t
Parameters of Light HSL Range state change event

Public Members

uint16_t hue_range_min
The minimum hue value of Light HSL Range state

uint16_t hue_range_max
The maximum hue value of Light HSL Range state

uint16_t saturation_range_min
The minimum saturation value of Light HSL Range state

uint16_t saturation_range_max
The maximum saturation value of Light HSL Range state

struct esp_ble_mesh_state_change_light_xyl_set_t
Parameters of Light xyL state change event

Public Members

uint16_t lightness
The value of Light xyL Lightness state

uint16_t x
The value of Light xyL x state

uint16_t y
The value of Light xyL y state

struct esp_ble_mesh_state_change_light_xyl_default_set_t
Parameters of Light xyL Default state change event

Public Members

uint16_t lightness
The value of Light Lightness Default state

uint16_t x
The value of Light xyL x Default state
uint16_t y
The value of Light xyL y Default state

struct esp_ble_mesh_state_change_light_xyl_range_set_t
Parameters of Light xyL Range state change event

Public Members

uint16_t x_range_min
The minimum value of Light xyL x Range state

uint16_t x_range_max
The maximum value of Light xyL x Range state

uint16_t y_range_min
The minimum value of Light xyL y Range state

uint16_t y_range_max
The maximum value of Light xyL y Range state

struct esp_ble_mesh_state_change_light_lc_mode_set_t
Parameter of Light LC Mode state change event

Public Members

uint8_t mode
The value of Light LC Mode state

struct esp_ble_mesh_state_change_light_lc_om_set_t
Parameter of Light LC Occupancy Mode state change event

Public Members

uint8_t mode
The value of Light LC Occupancy Mode state

struct esp_ble_mesh_state_change_light_lc_light_onoff_set_t
Parameter of Light LC Light OnOff state change event

Public Members

uint8_t onoff
The value of Light LC Light OnOff state

struct esp_ble_mesh_state_change_light_lc_property_set_t
Parameters of Light LC Property state change event

Public Members

uint16_t property_id
The property id of Light LC Property state

struct net_buf_simple *property_value
The property value of Light LC Property state

struct esp_ble_mesh_state_change_sensor_status_t
Parameters of Sensor Status state change event
Public Members

uint16_t property_id
   The value of Sensor Property ID

uint8_t occupancy
   The value of Light LC Occupancy state

uint32_t set_occupancy_to_1_delay
   The value of Light LC Set Occupancy to 1 Delay state

uint32_t ambient_luxlevel
   The value of Light LC Ambient Luxlevel state

union esp_ble_mesh_state_change_sensor_status_t::[anonymous] state
   Parameters of Sensor Status related state

struct esp_ble_mesh_server_recv_light_lc_property_get_t
   Context of the received Light LC Property Get message

Public Members

uint16_t property_id
   Property ID identifying a Light LC Property

struct esp_ble_mesh_server_recv_light_lightness_set_t
   Context of the received Light Lightness Set message

Public Members

bool op_en
   Indicate if optional parameters are included

uint16_t lightness
   Target value of light lightness actual state

uint8_t tid
   Transaction ID

uint8_t trans_time
   Time to complete state transition (optional)

uint8_t delay
   Indicate message execution delay (C.1)

struct esp_ble_mesh_server_recv_light_lightness_linear_set_t
   Context of the received Light Lightness Linear Set message

Public Members

bool op_en
   Indicate if optional parameters are included

uint16_t lightness
   Target value of light lightness linear state

uint8_t tid
   Transaction ID

uint8_t trans_time
   Time to complete state transition (optional)
uint8_t delay
Indicate message execution delay (C.1)

struct esp_ble_mesh_server_recv_light_lightness_default_set_t
Context of the received Light Lightness Default Set message

Public Members

uint16_t lightness
The value of the Light Lightness Default state

struct esp_ble_mesh_server_recv_light_lightness_range_set_t
Context of the received Light Lightness Range Set message

Public Members

uint16_t range_min
Value of range min field of light lightness range state

uint16_t range_max
Value of range max field of light lightness range state

struct esp_ble_mesh_server_recv_light_ctl_set_t
Context of the received Light CTL Set message

Public Members

bool op_en
Indicate if optional parameters are included

uint16_t lightness
Target value of light ctl lightness state

uint16_t temperature
Target value of light ctl temperature state

int16_t delta_uv
Target value of light ctl delta UV state

uint8_t tid
Transaction ID

uint8_t trans_time
Time to complete state transition (optional)

uint8_t delay
Indicate message execution delay (C.1)

struct esp_ble_mesh_server_recv_light_ctl_temperature_set_t
Context of the received Light CTL Temperature Set message

Public Members

bool op_en
Indicate if optional parameters are included

uint16_t temperature
Target value of light ctl temperature state

int16_t delta_uv
Target value of light ctl delta UV state
Chapter 2. API Reference

uint8_t tid
Transaction ID

uint8_t trans_time
Time to complete state transition (optional)

uint8_t delay
Indicate message execution delay (C.1)

struct esp_ble_mesh_server_recv_light_ctl_temperature_range_set_t
Context of the received Light CTL Temperature Range Set message

Public Members

uint16_t range_min
Value of temperature range min field of light ctl temperature range state

uint16_t range_max
Value of temperature range max field of light ctl temperature range state

struct esp_ble_mesh_server_recv_light_ctl_default_set_t
Context of the received Light CTL Default Set message

Public Members

uint16_t lightness
Value of light lightness default state

uint16_t temperature
Value of light temperature default state

int16_t delta_uv
Value of light delta UV default state

struct esp_ble_mesh_server_recv_light_hsl_set_t
Context of the received Light HSL Set message

Public Members

bool op_en
Indicate if optional parameters are included

uint16_t lightness
Target value of light hsl lightness state

uint16_t hue
Target value of light hsl hue state

uint16_t saturation
Target value of light hsl saturation state

uint8_t tid
Transaction ID

uint8_t trans_time
Time to complete state transition (optional)

uint8_t delay
Indicate message execution delay (C.1)

struct esp_ble_mesh_server_recv_light_hsl_hue_set_t
Context of the received Light HSL Hue Set message
Public Members

bool `op_en`
Indicate if optional parameters are included

`uint16_t hue`
Target value of light hsl hue state

`uint8_t tid`
Transaction ID

`uint8_t trans_time`
Time to complete state transition (optional)

`uint8_t delay`
Indicate message execution delay (C.1)

```c
struct esp_ble_mesh_server_recv_light_hsl_saturation_set_t
```
Context of the received Light HSL Saturation Set message

Public Members

bool `op_en`
Indicate if optional parameters are included

`uint16_t saturation`
Target value of light hsl hue state

`uint8_t tid`
Transaction ID

`uint8_t trans_time`
Time to complete state transition (optional)

`uint8_t delay`
Indicate message execution delay (C.1)

```c
struct esp_ble_mesh_server_recv_light_hsl_default_set_t
```
Context of the received Light HSL Default Set message

Public Members

`uint16_t lightness`
Value of light lightness default state

`uint16_t hue`
Value of light hue default state

`uint16_t saturation`
Value of light saturation default state

```c
struct esp_ble_mesh_server_recv_light_hsl_range_set_t
```
Context of the received Light HSL Range Set message

Public Members

`uint16_t hue_range_min`
Value of hue range min field of light hsl hue range state

`uint16_t hue_range_max`
Value of hue range max field of light hsl hue range state
uint16_t saturation_range_min
    Value of saturation range min field of light hsl saturation range state

uint16_t saturation_range_max
    Value of saturation range max field of light hsl saturation range state

struct esp_ble_mesh_server_recv_light_xyl_set_t
    Context of the received Light xyl Set message

    Public Members

    bool op_en
        Indicate whether optional parameters included

    uint16_t lightness
        The target value of the Light xyl Lightness state

    uint16_t x
        The target value of the Light xyl x state

    uint16_t y
        The target value of the Light xyl y state

    uint8_t tid
        Transaction Identifier

    uint8_t trans_time
        Time to complete state transition (optional)

    uint8_t delay
        Indicate message execution delay (C.1)

struct esp_ble_mesh_server_recv_light_xyl_default_set_t
    Context of the received Light xyl Default Set message

    Public Members

    uint16_t lightness
        The value of the Light Lightness Default state

    uint16_t x
        The value of the Light xyl x Default state

    uint16_t y
        The value of the Light xyl y Default state

struct esp_ble_mesh_server_recv_light_xyl_range_set_t
    Context of the received Light xyl Range Set message

    Public Members

    uint16_t x_range_min
        The value of the xyl x Range Min field of the Light xyl x Range state

    uint16_t x_range_max
        The value of the xyl x Range Max field of the Light xyl x Range state

    uint16_t y_range_min
        The value of the xyl y Range Min field of the Light xyl y Range state

    uint16_t y_range_max
        The value of the xyl y Range Max field of the Light xyl y Range state
struct esp_ble_mesh_server_recv_light_lc_mode_set_t
Context of the received Light LC Mode Set message

**Public Members**

uint8_t mode
The target value of the Light LC Mode state

---

struct esp_ble_mesh_server_recv_light_lc_om_set_t
Context of the received Light OM Set message

**Public Members**

uint8_t mode
The target value of the Light LC Occupancy Mode state

---

struct esp_ble_mesh_server_recv_light_lc_light_onoff_set_t
Context of the received Light LC Light OnOff Set message

**Public Members**

bool op_en
Indicate whether optional parameters included

uint8_t light_onoff
The target value of the Light LC Light OnOff state

uint8_t tid
Transaction Identifier

uint8_t trans_time
Time to complete state transition (optional)

uint8_t delay
Indicate message execution delay (C.1)

---

struct esp_ble_mesh_server_recv_light_lc_property_set_t
Context of the received Light LC Property Set message

**Public Members**

uint16_t property_id
Property ID identifying a Light LC Property

struct net_buf_simple *property_value
Raw value for the Light LC Property

---

struct esp_ble_mesh_server_recv_sensor_status_t
Context of the received Sensor Status message

**Public Members**

struct net_buf_simple *data
Value of sensor data state (optional)

---

struct esp_ble_mesh_lighting_server_cb_param_t
Lighting Server Model callback parameters
Public Members

```c
esp_ble_mesh_model_t *model
```
Pointer to Lighting Server Models

```c
esp_ble_mesh_msg_ctx_t ctx
```
Context of the received messages

```c
esp_ble_mesh_lighting_server_cb_value_t value
```
Value of the received Lighting Messages

Macros

```c
ESP_BLE_MESH_MODEL_LIGHT_LIGHTNESS_CLI(cli_pub, cli_data)
```
Define a new Light Lightness Client Model.

**Note** This API needs to be called for each element on which the application needs to have a Light Lightness Client Model.

**Return** New Light Lightness Client Model instance.

**Parameters**
- `cli_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `cli_data`: Pointer to the unique struct `esp_ble_mesh_client_t`.

```c
ESP_BLE_MESH_MODEL_LIGHT_CTL_CLI(cli_pub, cli_data)
```
Define a new Light CTL Client Model.

**Note** This API needs to be called for each element on which the application needs to have a Light CTL Client Model.

**Return** New Light CTL Client Model instance.

**Parameters**
- `cli_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `cli_data`: Pointer to the unique struct `esp_ble_mesh_client_t`.

```c
ESP_BLE_MESH_MODEL_LIGHT_HSL_CLI(cli_pub, cli_data)
```
Define a new Light HSL Client Model.

**Note** This API needs to be called for each element on which the application needs to have a Light HSL Client Model.

**Return** New Light HSL Client Model instance.

**Parameters**
- `cli_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `cli_data`: Pointer to the unique struct `esp_ble_mesh_client_t`.

```c
ESP_BLE_MESH_MODEL_LIGHT_XYL_CLI(cli_pub, cli_data)
```
Define a new Light xyL Client Model.

**Note** This API needs to be called for each element on which the application needs to have a Light xyL Client Model.

**Return** New Light xyL Client Model instance.

**Parameters**
- `cli_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `cli_data`: Pointer to the unique struct `esp_ble_mesh_client_t`.

```c
ESP_BLE_MESH_MODEL_LIGHT_LC_CLI(cli_pub, cli_data)
```
Define a new Light LC Client Model.

**Note** This API needs to be called for each element on which the application needs to have a Light LC Client Model.

**Return** New Light LC Client Model instance.

**Parameters**
- `cli_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `cli_data`: Pointer to the unique struct `esp_ble_mesh_client_t`.

```c
ESP_BLE_MESH_MODEL_LIGHT_LIGHTNESS_SRV(srv_pub, srv_data)
```
Lighting Server Models related context.
Define a new Light Lightness Server Model.

**Note** 1. The Light Lightness Server model extends the Generic Power OnOff Server model and the Generic Level Server model. When this model is present on an Element, the corresponding Light Lightness Setup Server model shall also be present.

1. This model shall support model publication and model subscription.

**Return** New Light Lightness Server Model instance.

**Parameters**
- `srv_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data`: Pointer to the unique struct `esp_ble_mesh_light_lightness_srv_t`.

**ESP_BLE_MESH_MODEL_LIGHT_LIGHTNESS_SETUP_SRV** (`srv_pub`, `srv_data`)

Define a new Light Lightness Setup Server Model.

**Note** 1. The Light Lightness Setup Server model extends the Light Lightness Server model and the Generic Power OnOff Setup Server model.

1. This model shall support model subscription.

**Return** New Light Lightness Setup Server Model instance.

**Parameters**
- `srv_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data`: Pointer to the unique struct `esp_ble_mesh_light_lightness_setup_srv_t`.

**ESP_BLE_MESH_MODEL_LIGHT_CTL_SRV** (`srv_pub`, `srv_data`)

Define a new Light CTL Server Model.

**Note** 1. The Light CTL Server model extends the Light Lightness Server model. When this model is present on an Element, the corresponding Light CTL Temperature Server model and the corresponding Light CTL Setup Server model shall also be present.

1. This model shall support model publication and model subscription.

2. The model requires two elements: the main element and the Temperature element. The Temperature element contains the corresponding Light CTL Temperature Server model and an instance of a Generic Level state bound to the Light CTL Temperature state on the Temperature element. The Light CTL Temperature state on the Temperature element is bound to the Light CTL state on the main element.

**Return** New Light CTL Server Model instance.

**Parameters**
- `srv_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data`: Pointer to the unique struct `esp_ble_mesh_light_ctl_srv_t`.

**ESP_BLE_MESH_MODEL_LIGHT_CTL_SETUP_SRV** (`srv_pub`, `srv_data`)

Define a new Light CTL Setup Server Model.

**Note** 1. The Light CTL Setup Server model extends the Light CTL Server and the Light Lightness Setup Server.

1. This model shall support model subscription.

**Return** New Light CTL Setup Server Model instance.

**Parameters**
- `srv_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data`: Pointer to the unique struct `esp_ble_mesh_light_ctl_setup_srv_t`.

**ESP_BLE_MESH_MODEL_LIGHT_CTL_TEMP_SRV** (`srv_pub`, `srv_data`)

Define a new Light CTL Temperature Server Model.

**Note** 1. The Light CTL Temperature Server model extends the Generic Level Server model.

1. This model shall support model publication and model subscription.

**Return** New Light CTL Temperature Server Model instance.

**Parameters**
- `srv_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data`: Pointer to the unique struct `esp_ble_mesh_light_ctl_temp_srv_t`.

**ESP_BLE_MESH_MODEL_LIGHT_HSL_SRV** (`srv_pub`, `srv_data`)

Define a new Light HSL Server Model.
Note 1. The Light HSL Server model extends the Light Lightness Server model. When this model is present on an Element, the corresponding Light HSL Hue Server model and the corresponding Light HSL Saturation Server model and the corresponding Light HSL Setup Server model shall also be present.

1. This model shall support model publication and model subscription.

2. The model requires three elements: the main element and the Hue element and the Saturation element. The Hue element contains the corresponding Light HSL Hue Server model and an instance of a Generic Level state bound to the Light HSL Hue state on the Hue element. The Saturation element contains the corresponding Light HSL Saturation Server model and an instance of a Generic Level state bound to the Light HSL Saturation state on the Saturation element. The Light HSL Hue state on the Hue element is bound to the Light HSL state on the main element and the Light HSL Saturation state on the Saturation element is bound to the Light HSL state on the main element.

Return New Light HSL Server Model instance.

Parameters
- `srv_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data`: Pointer to the unique struct `esp_ble_mesh_light_hsl_srv_t`.

ESP_BLE_MESH_MODEL_LIGHT_HSL_SETUP_SRV (srv_pub, srv_data)
Define a new Light HSL Setup Server Model.

Note 1. The Light HSL Setup Server model extends the Light HSL Server and the Light Lightness Setup Server.

Return New Light HSL Setup Server Model instance.

Parameters
- `srv_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data`: Pointer to the unique struct `esp_ble_mesh_light_hsl_setup_srv_t`.

ESP_BLE_MESH_MODEL_LIGHT_HSL_HUE_SRV (srv_pub, srv_data)
Define a new Light HSL Hue Server Model.

Note 1. The Light HSL Hue Server model extends the Generic Level Server model. This model is associated with the Light HSL Server model.

Return New Light HSL Hue Server Model instance.

Parameters
- `srv_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data`: Pointer to the unique struct `esp_ble_mesh_light_hsl_hue_srv_t`.

ESP_BLE_MESH_MODEL_LIGHT_HSL_SAT_SRV (srv_pub, srv_data)
Define a new Light HSL Saturation Server Model.

Note 1. The Light HSL Saturation Server model extends the Generic Level Server model. This model is associated with the Light HSL Server model.

Return New Light HSL Saturation Server Model instance.

Parameters
- `srv_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data`: Pointer to the unique struct `esp_ble_mesh_light_hsl_sat_srv_t`.

ESP_BLE_MESH_MODEL_LIGHT_XYL_SRV (srv_pub, srv_data)
Define a new Light xYL Server Model.

Note 1. The Light xYL Server model extends the Light Lightness Server model. When this model is present on an Element, the corresponding Light xYL Setup Server model shall also be present.

1. This model shall support model publication and model subscription.

Return New Light xYL Server Model instance.

Parameters
- `srv_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data`: Pointer to the unique struct `esp_ble_mesh_light_xyl_srv_t`.

ESP_BLE_MESH_MODEL_LIGHT_XYL_SETUP_SRV (srv_pub, srv_data)
Define a new Light xYL Setup Server Model.
Note 1. The Light xyL Setup Server model extends the Light xyL Server and the Light Lightness Setup Server.
1. This model shall support model subscription.

Return New Light xyL Setup Server Model instance.

Parameters
- `srv_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data`: Pointer to the unique struct `esp_ble_mesh_light_xyL_setup_srv_t`.

**ESP_BLE_MESH_MODEL_LIGHT_LC_SRV**(srv_pub, srv_data)
Define a new Light LC Server Model.

Note 1. The Light LC (Lightness Control) Server model extends the Light Lightness Server model and the
Generic OnOff Server model. When this model is present on an Element, the corresponding Light LC
Setup Server model shall also be present.
1. This model shall support model publication and model subscription.
2. This model may be used to represent an element that is a client to a Sensor Server model and controls
the Light Lightness Actual state via defined state bindings.

Return New Light LC Server Model instance.

Parameters
- `srv_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data`: Pointer to the unique struct `esp_ble_mesh_light_lc_srv_t`.

**ESP_BLE_MESH_MODEL_LIGHT_LC_SETUP_SRV**(srv_pub, srv_data)
Define a new Light LC Setup Server Model.

Note 1. The Light LC (Lightness Control) Setup model extends the Light LC Server model.
1. This model shall support model publication and model subscription.
2. This model may be used to configure setup parameters for the Light LC Server model.

Return New Light LC Setup Server Model instance.

Parameters
- `srv_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data`: Pointer to the unique struct `esp_ble_mesh_light_lc_setup_srv_t`.

**Type Definitions**

```cpp
typedef void (*esp_ble_mesh_light_client_cb_t)(
    esp_ble_mesh_light_client_cb_event_t event,
    esp_ble_mesh_light_client_cb_param_t *param)
```

Bluetooth Mesh Light Client Model function.
Lighting Client Model callback function type

Parameters
- `event`: Event type
- `param`: Pointer to callback parameter

```cpp
typedef void (*esp_ble_mesh_lighting_server_cb_t)(
    esp_ble_mesh_lighting_server_cb_event_t event,
    esp_ble_mesh_lighting_server_cb_param_t *param)
```

Bluetooth Mesh Lighting Server Model function.
Lighting Server Model callback function type

Parameters
- `event`: Event type
- `param`: Pointer to callback parameter

**Enumerations**

*esp_ble_mesh_light_client_cb_event_t*

This enum value is the event of Lighting Client Model

Values:

```
ESP_BLE_MESH_LIGHT_CLIENT_GET_STATE_EVT
```
ESP_BLE_MESH_LIGHT_CLIENT_SET_STATE_EVT
ESP_BLE_MESH_LIGHT_CLIENT_PUBLISH_EVT
ESP_BLE_MESH_LIGHT_CLIENT_TIMEOUT_EVT
ESP_BLE_MESH_LIGHT_CLIENT_EVT_MAX

c enum esp_ble_mesh_lc_state_t
This enum value is the Light LC State Machine states

Values:

ESP_BLE_MESH_LC_OFF
ESP_BLE_MESH_LC_STANDBY
ESP_BLE_MESH_LC_FADE_ON
ESP_BLE_MESH_LC_RUN
ESP_BLE_MESH_LC_FADE
ESP_BLE_MESH_LC_PROLONG
ESP_BLE_MESH_LC_FADE_STANDBY_AUTO
ESP_BLE_MESH_LC_FADE_STANDBY_MANUAL

c enum esp_ble_mesh_lighting_server_cb_event_t
This enum value is the event of Lighting Server Model

Values:

ESP_BLE_MESH_LIGHTING_SERVER_STATE_CHANGE_EVT
1. When get_auto_rsp is set to ESP_BLE_MESH_SERVER_AUTO_RSP, no event will be callback
to the application layer when Lighting Get messages are received.
2. When set_auto_rsp is set to ESP_BLE_MESH_SERVER_AUTO_RSP, this event will be callback
to the application layer when Lighting Set/Set Unack messages are received.

ESP_BLE_MESH_LIGHTING_SERVER_RECV_GET_MSG_EVT
When get_auto_rsp is set to ESP_BLE_MESH_SERVER_RSP_BY_APP, this event will be callback to
the application layer when Lighting Get messages are received.

ESP_BLE_MESH_LIGHTING_SERVER_RECV_SET_MSG_EVT
When set_auto_rsp is set to ESP_BLE_MESH_SERVER_RSP_BY_APP, this event will be callback to
the application layer when Lighting Set/Set Unack messages are received.

ESP_BLE_MESH_LIGHTING_SERVER_RECV_STATUS_MSG_EVT
When status_auto_rsp is set to ESP_BLE_MESH_SERVER_RSP_BY_APP, this event will be callback
to the application layer when Sensor Status message is received.

ESP_BLE_MESH_LIGHTING_SERVER_EVT_MAX

ESP-IDF currently supports two host stacks. The Bluedroid based stack (default) supports classic Bluetooth as well
as BLE. On the other hand, Apache NimBLE based stack is BLE only. For users to make a choice:

• For usecases involving classic Bluetooth as well as BLE, Bluedroid should be used.
• For BLE-only usecases, using NimBLE is recommended. It is less demanding in terms of code footprint and
run time memory, making it suitable for such scenarios.

Code examples for this API section are provided in the bluetooth/bluedroid directory of ESP-IDF examples.

The following examples contain detailed walkthroughs:

• GATT Client Example Walkthrough
• GATT Server Service Table Example Walkthrough
• GATT Server Example Walkthrough
• GATT Security Client Example Walkthrough
• GATT Security Server Example Walkthrough
• GATT Client Multi-connection Example Walkthrough
Chapter 2. API Reference

2.2 Networking APIs

2.2.1 Wi-Fi

Wi-Fi

Introduction The Wi-Fi libraries provide support for configuring and monitoring the ESP32-S3 Wi-Fi networking functionality. This includes configuration for:

- Station mode (aka STA mode or Wi-Fi client mode). ESP32-S3 connects to an access point.
- AP mode (aka Soft-AP mode or Access Point mode). Stations connect to the ESP32-S3.
- Station/AP-coexistence mode (ESP32-S3 is concurrently an access point and a station connected to another access point).
- Various security modes for the above (WPA, WPA2, WEP, etc.)
- Scanning for access points (active & passive scanning).
- Promiscuous mode for monitoring of IEEE802.11 Wi-Fi packets.

Application Examples The wifi directory of ESP-IDF examples contains the following applications:

- Code examples for Wi-Fi.
- A simple esp-idf-template application to demonstrate a minimal IDF project structure.

API Reference

Header File

- components/esp_wifi/include/esp_wifi.h

Functions

esp_err_t esp_wifi_init (const wifi_init_config_t *config)

Initialize WiFi Allocate resource for WiFi driver, such as WiFi control structure, RX/TX buffer, WiFi NVS structure etc. This WiFi also starts WiFi task.

Attention 1. This API must be called before all other WiFi API can be called
Attention 2. Always use WIFI_INIT_CONFIG_DEFAULT macro to initialize the configuration to default values, this can guarantee all the fields get correct value when more fields are added into wifi_init_config_t in future release. If you want to set your own initial values, overwrite the default values which are set by WIFI_INIT_CONFIG_DEFAULT. Please be notified that the field ‘magic’ of wifi_init_config_t should always be WIFI_INIT_CONFIG_MAGIC!

Return

- ESP_OK: succeed
- ESP_ERR_NO_MEM: out of memory
- others: refer to error code esp_err.h

Parameters

- config: pointer to WiFi initialized configuration structure; can point to a temporary variable.

esp_err_t esp_wifi_deinit (void)

Deinit WiFi Free all resource allocated in esp_wifi_init and stop WiFi task.

Attention 1. This API should be called if you want to remove WiFi driver from the system

Return

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init

esp_err_t esp_wifi_set_mode (wifi_mode_t mode)

Set the WiFi operating mode.

Set the WiFi operating mode as station, soft-AP or station+soft-AP, The default mode is station mode.
Return
• ESP_OK: succeed
• ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
• ESP_ERR_INVALID_ARG: invalid argument
• others: refer to error code in esp_err.h

Parameters
• mode: WiFi operating mode

\textbf{esp_err_t esp_wifi_get_mode(wifi_mode_t \_mode)}

Get current operating mode of WiFi.

Return
• ESP_OK: succeed
• ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
• ESP_ERR_INVALID_ARG: invalid argument

Parameters
• \textbf{[out]} \_mode: store current WiFi mode

\textbf{esp_err_t esp_wifi_start(void)}

Start WiFi according to current configuration If mode is WIFI_MODE_STA, it create station control block and start station If mode is WIFI_MODE_AP, it create soft-AP control block and start soft-AP If mode is WIFI_MODE_APSTA, it creates soft-AP and station control block and start soft-AP and station.

Return
• ESP_OK: succeed
• ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
• ESP_ERR_INVALID_ARG: invalid argument
• ESP_ERR_NO_MEM: out of memory
• ESP_ERR_WIFI_CONN: WiFi internal error, station or soft-AP control block wrong
• ESP_FAIL: other WiFi internal errors

\textbf{esp_err_t esp_wifi_stop(void)}

Stop WiFi If mode is WIFI_MODE_STA, it stop station and free station control block If mode is WIFI_MODE_AP, it stop soft-AP and free soft-AP control block If mode is WIFI_MODE_APSTA, it stop station/soft-AP and free station/soft-AP control block.

Return
• ESP_OK: succeed
• ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init

\textbf{esp_err_t esp_wifi_restore(void)}

Restore WiFi stack persistent settings to default values.

This function will reset settings made using the following APIs:
• esp_wifi_set_bandwidth,
• esp_wifi_set_protocol,
• esp_wifi_set_config related
• esp_wifi_set_mode

Return
• ESP_OK: succeed
• ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init

\textbf{esp_err_t esp_wifi_connect(void)}

Connect the ESP32 WiFi station to the AP.

Attention 1. This API only impact WIFI_MODE_STA or WIFI_MODE_APSTA mode
Attention 2. If the ESP32 is connected to an AP, call esp_wifi_disconnect to disconnect.
Attention 3. The scanning triggered by esp_wifi_start_scan() will not be effective until connection between ESP32 and the AP is established. If ESP32 is scanning and connecting at the same time, ESP32 will abort scanning and return a warning message and error number ESP_ERR_WIFI_STATE. If you want to do reconnection after ESP32 received disconnect event, remember to add the maximum retry time, otherwise
the called scan will not work. This is especially true when the AP doesn’t exist, and you still try reconnection after ESP32 received disconnect event with the reason code WIFI_REASON_NO_AP_FOUND.

Return
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_NOT_STARTED: WiFi is not started by esp_wifi_start
- ESP_ERR_WIFI_CONN: WiFi internal error, station or soft-AP control block wrong
- ESP_ERR_WIFI SSID: SSID of AP which station connects is invalid

*esp_err_t esp_wifi_disconnect (void)*

Disconnect the ESP32 WiFi station from the AP.

Return
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi was not initialized by esp_wifi_init
- ESP_ERR_WIFI_NOT_STARTED: WiFi was not started by esp_wifi_start
- ESP_FAIL: other WiFi internal errors

*esp_err_t esp_wifi_clear_fast_connect (void)*

Currently this API is just a stub API.

Return
- ESP_OK: succeed
- others: fail

*esp_err_t esp_wifi_deauth_sta (uint16_t aid)*

deauthenticate all stations or associated id equals to aid

Return
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_NOT_STARTED: WiFi was not started by esp_wifi_start
- ESP_ERR_INVALID_ARG: invalid argument
- ESP_ERR_WIFI_MODE: WiFi mode is wrong

Parameters
- aid: when aid is 0, deauthenticate all stations, otherwise deauthenticate station whose associated id is aid

*esp_err_t esp_wifi_scan_start (const wifi_scan_config_t *config, bool block)*

Scan all available APs.

Attention If this API is called, the found APs are stored in WiFi driver dynamic allocated memory and the will be freed in esp_wifi_scan_get_ap_records, so generally, call esp_wifi_scan_get_ap_records to cause the memory to be freed once the scan is done.

Attention The values of maximum active scan time and passive scan time per channel are limited to 1500 milliseconds. Values above 1500ms may cause station to disconnect from AP and are not recommended.

Return
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_NOT_STARTED: WiFi was not started by esp_wifi_start
- ESP_ERR_WIFI_TIMEOUT: blocking scan is timeout
- ESP_ERR_WIFI STATE: wifi still connecting when invoke esp_wifi_scan_start
- others: refer to error code in esp_err.h

Parameters
- config: configuration of scanning
- block: if block is true, this API will block the caller until the scan is done, otherwise it will return immediately

*esp_err_t esp_wifi_scan_stop (void)*

Stop the scan in process.

Return
- ESP_OK: succeed
• ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
• ESP_ERR_WIFI_NOT_STARTED: WiFi is not started by esp_wifi_start

`esp_err_t esp_wifi_scan_get_ap_num (uint16_t *number)`

Get number of APs found in last scan.

**Attention** This API can only be called when the scan is completed, otherwise it may get wrong value.

**Return**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_NOT_STARTED: WiFi is not started by esp_wifi_start
- ESP_ERR_INVALID_ARG: invalid argument

**Parameters**
- [out] number: store number of APs found in last scan

`esp_err_t esp_wifi_scan_get_ap_records (uint16_t *number, wifi_ap_record_t *ap_records)`

Get AP list found in last scan.

**Return**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_NOT_STARTED: WiFi is not started by esp_wifi_start
- ESP_ERR_INVALID_ARG: invalid argument
- ESP_ERR_NO_MEM: out of memory

**Parameters**
- [inout] number: As input param, it stores max AP number ap_records can hold. As output param, it receives the actual AP number this API returns.
- ap_records: wifi_ap_record_t array to hold the found APs

`esp_err_t esp_wifi_sta_get_ap_info (wifi_ap_record_t *ap_info)`

Get information of AP which the ESP32 station is associated with.

**Attention** When the obtained country information is empty, it means that the AP does not carry country information.

**Return**
- ESP_OK: succeed
- ESP_ERR_WIFI_CONN: The station interface not initialized
- ESP_ERR_WIFI_NOT_CONNECT: The station is in disconnect status

**Parameters**
- ap_info: the wifi_ap_record_t to hold AP information sta can get the connected ap’s phy mode info through the struct member phy_11b, phy_11g, phy_11n, phy_l in the wifi_ap_record_t struct.
  For example, phy_11b = 1 imply that ap support 802.11b mode

`esp_err_t esp_wifi_set_ps (wifi_ps_type_t type)`

Set current WiFi power save type.

**Attention** Default power save type is WIFI_PS_MIN_MODEM.

**Return** ESP_OK: succeed

**Parameters**
- type: power save type

`esp_err_t esp_wifi_get_ps (wifi_ps_type_t *type)`

Get current WiFi power save type.

**Attention** Default power save type is WIFI_PS_MIN_MODEM.

**Return** ESP_OK: succeed

**Parameters**
- [out] type: store current power save type

`esp_err_t esp_wifi_set_protocol (wifi_interface_t ifx, uint8_t protocol_bitmap)`

Set protocol type of specified interface The default protocol is (WIFI_PROTOCOL_11B|WIFI_PROTOCOL_11G|WIFI_PROTOCOL_11N) for the interface.

**Attention** Currently we only support 802.11b or 802.11bg or 802.11bgn mode

**Return**
Chapter 2. API Reference

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_IF: invalid interface
- others: refer to error codes in esp_err.h

**Parameters**
- ifx: interfaces
- protocol_bitmap: WiFi protocol bitmap

```c
esp_err_t esp_wifi_get_protocol (wifi_interface_t ifx, uint8_t* protocol_bitmap)
```
Get the current protocol bitmap of the specified interface.

**Return**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_IF: invalid interface
- ESP_ERR_INVALID_ARG: invalid argument
- others: refer to error codes in esp_err.h

**Parameters**
- ifx: interface
- protocol_bitmap: store current WiFi protocol bitmap of interface ifx

```c
esp_err_t esp_wifi_set_bandwidth (wifi_interface_t ifx, wifi_bandwidth_t bw)
```
Set the bandwidth of ESP32 specified interface.

**Attention** 1. API return false if try to configure an interface that is not enabled
2. WIFI_BW_HT40 is supported only when the interface support 11N

**Return**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_IF: invalid interface
- ESP_ERR_INVALID_ARG: invalid argument
- others: refer to error codes in esp_err.h

**Parameters**
- ifx: interface to be configured
- bw: bandwidth

```c
esp_err_t esp_wifi_set_channel (uint8_t primary, wifi_second_chan_t second)
```
Set primary/secondary channel of ESP32.

**Attention**
1. This API should be called after esp_wifi_start()
2. When ESP32 is in STA mode, this API should not be called when STA is scanning or connecting to an external AP
3. When ESP32 is in softAP mode, this API should not be called when softAP has connected to external STAs
4. When ESP32 is in STA+softAP mode, this API should not be called when in the scenarios described above

**Return**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
Chapter 2. API Reference

- ESP_ERR_WIFI_IF: invalid interface
- ESP_ERR_INVALID_ARG: invalid argument

**Parameters**

- **primary**: for HT20, primary is the channel number, for HT40, primary is the primary channel
- **second**: for HT20, second is ignored, for HT40, second is the second channel

```c
esp_err_t esp_wifi_get_channel(uint8_t* primary, wifi_second_chan_t* second)
```

Get the primary/secondary channel of ESP32.

**Attention** 1. API return false if try to get a interface that is not enable

**Return**

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument

**Parameters**

- **primary**: store current primary channel
- **[out]** second: store current second channel

```c
esp_err_t esp_wifi_set_country(const wifi_country_t* country)
```

Configure country info

**Attention** 1. It is discouraged to call this API since this doesn’t validate the per-country rules, it’s up to the user to fill in all fields according to local regulations. Please use esp_wifi_set_country_code instead.

**Attention** 2. The default country is CHINA { .cc="CN", .schan=1, .nchan=13, policy=WIFI_COUNTRY_POLICY_AUTO }

**Attention** 3. When the country policy is WIFI_COUNTRY_POLICY_AUTO, the country info of the AP to which the station is connected is used. E.g. if the configured country info is { .cc="US", .schan=1, .nchan=11 } and the country info of the AP to which the station is connected is { .cc="JP", .schan=1, .nchan=14 } then the country info that will be used is { .cc="JP", .schan=1, .nchan=14 }. If the station disconnected from the AP the country info is set back to the country info of the station automatically, { .cc="US", .schan=1, .nchan=11 } in the example.

**Attention** 4. When the country policy is WIFI_COUNTRY_POLICY_MANUAL, then the configured country info is used always.

**Attention** 5. When the country info is changed because of configuration or because the station connects to a different external AP, the country IE in probe response/beacon of the soft-AP is also changed.

**Attention** 6. The country configuration is stored into flash.

**Attention** 7. When this API is called, the PHY init data will switch to the PHY init data type corresponding to the country info.

**Return**

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument

**Parameters**

- **country**: the configured country info

```c
esp_err_t esp_wifi_get_country(wifi_country_t* country)
```

Get the current country info

**Return**

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument

**Parameters**

- **country**: country info

```c
esp_err_t esp_wifi_set_mac(wifi_interface_t ifx, const uint8_t mac[6])
```

Set MAC address of the ESP32 WiFi station or the soft-AP interface.

**Attention** 1. This API can only be called when the interface is disabled

**Attention** 2. ESP32 soft-AP and station have different MAC addresses, do not set them to be the same.

**Attention** 3. The bit 0 of the first byte of ESP32 MAC address can not be 1. For example, the MAC address can set to be “1a:XX:XX:XX:XX:XX”, but can not be “15:XX:XX:XX:XX:XX”.
Return

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument
- ESP_ERR_WIFI_IF: invalid interface
- ESP_ERR_WIFI_MAC: invalid mac address
- ESP_ERR_WIFI_MODE: WiFi mode is wrong
- others: refer to error codes in esp_err.h

Parameters

- ifx: interface
- mac: the MAC address

```c
esp_err_t esp_wifi_get_mac(wifi_interface_t ifx, uint8_t mac[6])
```

Get mac of specified interface.

Return

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument

Parameters

- ifx: interface

```c
esp_err_t esp_wifi_set_promiscuous_rx_cb(wifi_promiscuous_cb_t cb)
```

Register the RX callback function in the promiscuous mode.

Each time a packet is received, the registered callback function will be called.

Return

- ESP_OK: succeed

Parameters

- cb: callback

```c
esp_err_t esp_wifi_set_promiscuous(bool en)
```

Enable the promiscuous mode.

Return

- ESP_OK: succeed

Parameters

- en: false - disable, true - enable

```c
esp_err_t esp_wifi_get_promiscuous(bool *en)
```

Get the promiscuous mode.

Return

- ESP_OK: succeed

Parameters

- [out] en: store the current status of promiscuous mode

```c
esp_err_t esp_wifi_set_promiscuous_filter(const wifi_promiscuous_filter_t *filter)
```

Enable the promiscuous mode packet type filter.

Note: The default filter is to filter all packets except WIFI_PKT_MISC

Return

- ESP_OK: succeed

Parameters

- filter: the packet type filtered in promiscuous mode.
esp_err_t esp_wifi_get_promiscuous_filter(wifi_promiscuous_filter_t *filter)
Get the promiscuous filter.

Return
• ESP_OK: succeed
• ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
• ESP_ERR_INVALID_ARG: invalid argument

Parameters
• [out] filter: store the current status of promiscuous filter

esp_err_t esp_wifi_set_promiscuous_ctrl_filter(const wifi_promiscuous_filter_t *filter)
Enable subtype filter of the control packet in promiscuous mode.

Note The default filter is to filter none control packet.

Return
• ESP_OK: succeed
• ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init

Parameters
• filter: the subtype of the control packet filtered in promiscuous mode.

esp_err_t esp_wifi_get_promiscuous_ctrl_filter(wifi_promiscuous_filter_t *filter)
Get the subtype filter of the control packet in promiscuous mode.

Return
• ESP_OK: succeed
• ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init

Parameters
• [out] filter: store the current status of subtype filter of the control packet in promiscuous mode

esp_err_t esp_wifi_set_config(wifi_interface_t interface, wifi_config_t *conf)
Set the configuration of the ESP32 STA or AP.

Attention 1. This API can be called only when specified interface is enabled, otherwise, API fail
Attention 2. For station configuration, bssid_set needs to be 0; and it needs to be 1 only when users need to
check the MAC address of the AP.
Attention 3. ESP32 is limited to only one channel, so when in the soft-AP+station mode, the soft-AP will
adjust its channel automatically to be the same as the channel of the ESP32 station.

Return
• ESP_OK: succeed
• ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
• ESP_ERR_INVALID_ARG: invalid argument
• ESP_ERR_WIFI_IF: invalid interface
• ESP_ERR_WIFI_MODE: invalid mode
• ESP_ERR_WIFI_PASSWORD: invalid password
• ESP_ERR_WIFI_NVS: WiFi internal NVS error
• others: refer to the erro code in esp_err.h

Parameters
• interface: interface
• conf: station or soft-AP configuration

esp_err_t esp_wifi_get_config(wifi_interface_t interface, wifi_config_t *conf)
Get configuration of specified interface.

Return
• ESP_OK: succeed
• ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
• ESP_ERR_INVALID_ARG: invalid argument
• ESP_ERR_WIFI_IF: invalid interface

Parameters
• interface: interface
• [out] conf: station or soft-AP configuration
**esp_err_t esp_wifi_ap_get_sta_list (wifi_sta_list_t *sta)**

Get STAs associated with soft-AP.

**Attention**  SSC only API

**Return**

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument
- ESP_ERR_WIFI_MODE: WiFi mode is wrong
- ESP_ERR_WIFI_CONN: WiFi internal error, the station/soft-AP control block is invalid

**Parameters**

- **[out]** sta: station list ap can get the connected sta’s phy mode info through the struct member phy_11b, phy_11g, phy_11n, phy_lr in the wifi_sta_info_t struct. For example, phy_11b = 1 imply that sta support 802.11b mode

**esp_err_t esp_wifi_ap_get_sta_aid (const uint8_t mac[6], uint16_t *aid)**

Get AID of STA connected with soft-AP.

**Return**

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument
- ESP_ERR_NOT_FOUND: Requested resource not found
- ESP_ERR_WIFI_MODE: WiFi mode is wrong
- ESP_ERR_WIFI_CONN: WiFi internal error, the station/soft-AP control block is invalid

**Parameters**

- mac: STA’s mac address
- **[out]** aid: Store the AID corresponding to STA mac

**esp_err_t esp_wifi_set_storage (wifi_storage_t storage)**

Set the WiFi API configuration storage type.

**Attention** 1. The default value is WIFI_STORAGE_FLASH

**Return**

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument

**Parameters**

- **storage**:: storage type

**esp_err_t esp_wifi_set_vendor_ie (bool enable, wifi_vendor_ie_type_t type, wifi_vendor_ie_id_t idx, void *vnd_ie)**

Set 802.11 Vendor-Specific Information Element.

**Return**

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init()
- ESP_ERR_INVALID_ARG: invalid argument, including if first byte of vnd_ie is not WIFI_VENDOR_IE_ELEMENT_ID (0xDD) or second byte is an invalid length.
- ESP_ERR_NO_MEM: Out of memory

**Parameters**

- enable: If true, specified IE is enabled. If false, specified IE is removed.
- type: Information Element type. Determines the frame type to associate with the IE.
- idx: Index to set or clear. Each IE type can be associated with up to two elements (indices 0 & 1).
- vnd_ie: Pointer to vendor specific element data. First 6 bytes should be a header with fields matching vendor_ie_data_t. If enable is false, this argument is ignored and can be NULL. Data does not need to remain valid after the function returns.

**esp_err_t esp_wifi_set_vendor_ie_cb (esp_vendor_ie_cb_t cb, void *ctx)**

Register Vendor-Specific Information Element monitoring callback.

**Return**

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init

**Parameters**
- **cb**: Callback function
- **ctx**: Context argument, passed to callback function.

`esp_err_t esp_wifi_set_max_tx_power(int8_t power)`
Set maximum transmitting power after WiFi start.

**Attention** 1. Maximum power before wifi startup is limited by PHY init data bin.
**Attention** 2. The value set by this API will be mapped to the max_tx_power of the structure `wifi_country_t` variable.
**Attention** 3. Mapping Table \{Power, max_tx_power\} = \{(8, 2), (20, 5), (28, 7), (34, 8), (44, 11), (52, 13), (56, 14), (60, 15), (66, 16), (72, 18), (80, 20)\}.
**Attention** 4. Param power unit is 0.25dBm, range is [8, 84] corresponding to 2dBm - 20dBm.
**Attention** 5. Relationship between set value and actual value. As follows: \{set value range, actual value\} = \{(8, 8), (20, 20), (28, 28), (34, 34), (44, 44), (52, 52), (56, 56), (60, 60), (66, 66), (72, 72), (80, 80)\}.

**Return**
- **ESP_OK**: succeed
- **ESP_ERR_WIFI_NOT_INIT**: WiFi is not initialized by esp_wifi_init
- **ESP_ERR_WIFI_NOT_START**: WiFi is not started by esp_wifi_start
- **ESP_ERR_WIFI_ARG**: invalid argument, e.g. parameter is out of range

**Parameters**
- **power**: Maximum WiFi transmitting power.

`esp_err_t esp_wifi_get_max_tx_power(int8_t *power)`
Get maximum transmitting power after WiFi start.

**Return**
- **ESP_OK**: succeed
- **ESP_ERR_WIFI_NOT_INIT**: WiFi is not initialized by esp_wifi_init
- **ESP_ERR_WIFI_NOT_START**: WiFi is not started by esp_wifi_start
- **ESP_ERR_WIFI_ARG**: invalid argument

**Parameters**
- **power**: Maximum WiFi transmitting power, unit is 0.25dBm.

`esp_err_t esp_wifi_set_event_mask(uint32_t mask)`
Set mask to enable or disable some WiFi events.

**Attention** 1. Mask can be created by logical OR of various WIFI_EVENT_MASK_constants. Events which have corresponding bit set in the mask will not be delivered to the system event handler.
**Attention** 2. Default WiFi event mask is WIFIEVENTMASKAPPROBEREQRECEIVED.
**Attention** 3. There may be lots of stations sending probe request data around. Don't unmask this event unless you need to receive probe request data.

**Return**
- **ESP_OK**: succeed
- **ESP_ERR_WIFI_NOT_INIT**: WiFi is not initialized by esp_wifi_init

**Parameters**
- **mask**: WiFi event mask.

`esp_err_t esp_wifi_get_event_mask(uint32_t *mask)`
Get mask of WiFi events.

**Return**
- **ESP_OK**: succeed
- **ESP_ERR_WIFI_NOT_INIT**: WiFi is not initialized by esp_wifi_init
- **ESP_ERR_WIFI_ARG**: invalid argument

**Parameters**
- **mask**: WiFi event mask.

`esp_err_t esp_wifi_80211_tx(wifi_interface_t ifx, const void *buffer, int len, bool en_sys_seq)`
Send raw ieee80211 data.
**Attention** Currently only support for sending beacon/probe request/probe response/action and non-QoS data frame

**Return**
- ESP_OK: success
- ESP_ERR_WIFI_IF: Invalid interface
- ESP_ERR_INVALID_ARG: Invalid parameter
- ESP_ERR_WIFI_NO_MEM: out of memory

**Parameters**
- ifx: interface if the Wi-Fi mode is Station, the ifx should be WIFI_IF_STA. If the Wi-Fi mode is SoftAP, the ifx should be WIFI_IF_AP. If the Wi-Fi mode is Station+SoftAP, the ifx should be WIFI_IF_STA or WIFI_IF_AP. If the ifx is wrong, the API returns ESP_ERR_WIFI_IF.
- buffer: raw ieee80211 buffer
- len: the length of raw buffer, the len must be <= 1500 Bytes and >= 24 Bytes
- en_sys_seq: indicate whether use the internal sequence number. If en_sys_seq is false, the sequence in raw buffer is unchanged, otherwise it will be overwritten by WiFi driver with the system sequence number. Generally, if esp_wifi_80211_tx is called before the Wi-Fi connection has been set up, both en_sys_seq==true and en_sys_seq==false are fine. However, if the API is called after the Wi-Fi connection has been set up, en_sys_seq must be true, otherwise ESP_ERR_WIFI_ARG is returned.

```c
esp_err_t esp_wifi_set_csi_rx_cb (wifi_csi_cb_t cb, void *ctx)
```

Register the RX callback function of CSI data.

Each time a CSI data is received, the callback function will be called.

**Return**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init

**Parameters**
- cb: callback
- ctx: context argument, passed to callback function

```c
esp_err_t esp_wifi_set_csi_config (const wifi_csi_config_t *config)
```

Set CSI data configuration.

**Return**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_NOT_START: WiFi is not started by esp_wifi_start or promiscuous mode is not enabled
- ESP_ERR_INVALID_ARG: invalid argument

**Parameters**
- config: configuration

```c
esp_err_t esp_wifi_set_csi (bool en)
```

Enable or disable CSI.

**Return**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_NOT_START: WiFi is not started by esp_wifi_start or promiscuous mode is not enabled
- ESP_ERR_INVALID_ARG: invalid argument

**Parameters**
- en: true - enable, false - disable

```c
esp_err_t esp_wifi_set_ant_gpio (const wifi_ant_gpio_config_t *config)
```

Set antenna GPIO configuration.

**Return**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_NOT_START: WiFi is not started by esp_wifi_start or promiscuous mode is not enabled
- ESP_ERR_INVALID_ARG: invalid argument

**Parameters**
- en: true - enable, false - disable
• ESP_OK: succeed
• ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
• ESP_ERR_WIFI_ARG: Invalid argument, e.g. parameter is NULL, invalid GPIO number etc

Parameters
• config: Antenna GPIO configuration.

`esp_err_t esp_wifi_get_ant_gpio(wifi_ant_gpio_config_t *config)`
Get current antenna GPIO configuration.

Return
• ESP_OK: succeed
• ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
• ESP_ERR_WIFI_ARG: invalid argument, e.g. parameter is NULL

Parameters
• config: Antenna GPIO configuration.

`esp_err_t esp_wifi_set_ant(const wifi_ant_config_t *config)`
Set antenna configuration.

Return
• ESP_OK: succeed
• ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
• ESP_ERR_WIFI_ARG: invalid argument, e.g. parameter is NULL, invalid antenna mode or invalid GPIO number

Parameters
• config: Antenna configuration.

`int64_t esp_wifi_get_tsf_time(wifi_interface_t interface)`
Get the TSF time. In Station mode or SoftAP+Station mode if station is not connected or station doesn’t receive at least one beacon after connected, will return 0.

Attention
Enabling power save may cause the return value inaccurate, except WiFi modem sleep

Return
0 or the TSF time

Parameters
• interface: The interface whose tsf_time is to be retrieved.

`esp_err_t esp_wifi_set_inactive_time(wifi_interface_t ifx, uint16_t sec)`
Set the inactive time of the ESP32 STA or AP.

Attention
1. For Station, If the station does not receive a beacon frame from the connected SoftAP during the inactive time, disconnect from SoftAP. Default 6s.

Attention
2. For SoftAP, If the softAP doesn’t receive any data from the connected STA during inactive time, the softAP will force deauth the STA. Default is 300s.

Attention
3. The inactive time configuration is not stored into flash

Return
• ESP_OK: succeed
• ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
• ESP_ERR_WIFI_NOT_STARTED: WiFi is not started by esp_wifi_start
• ESP_ERR_WIFI_ARG: invalid argument, For Station, if sec is less than 3. For SoftAP, if sec is less than 10.

Parameters
• ifx: interface to be configured.
• sec: Inactive time. Unit seconds.
esp_err_t esp_wifi_get_inactive_time (wifi_interface_t ifx, uint16_t* sec)
Get inactive time of specified interface.
Return
• ESP_OK: succeed
• ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
• ESP_ERR_WIFI_ARG: invalid argument
Parameters
• ifx: Interface to be configured.
• sec: Inactive time. Unit seconds.

esp_err_t esp_wifi_stats_dump (uint32_t modules)
Dump WiFi statistics.
Return
• ESP_OK: succeed
• others: failed
Parameters
• modules: statistic modules to be dumped

esp_err_t esp_wifi_set_rssi_threshold (int32_t rssi)
Set RSSI threshold below which APP will get an event.
Attention This API needs to be called every time after WIFI_EVENT_STA_BSS_RSSI_LOW event is received.
Return
• ESP_OK: succeed
• ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
• ESP_ERR_WIFI_ARG: invalid argument
Parameters
• rssi: threshold value in dbm between -100 to 0

esp_err_t esp_wifi_ftm_initiate_session (wifi_ftm_initiator_cfg_t *cfg)
Start an FTM Initiator session by sending FTM request If successful, event WIFI_EVENT_FTM_REPORT
is generated with the result of the FTM procedure.
Attention Use this API only in Station mode
Return
• ESP_OK: succeed
• others: failed
Parameters
• cfg: FTM Initiator session configuration

esp_err_t esp_wifi_ftm_end_session (void)
End the ongoing FTM Initiator session.
Attention This API works only on FTM Initiator
Return
• ESP_OK: succeed
• others: failed

esp_err_t esp_wifi_ftm_resp_set_offset (int16_t offset_cm)
Set offset in cm for FTM Responder. An equivalent offset is calculated in picoseconds and added in TOD of
FTM Measurement frame (T1).
Attention Use this API only in AP mode before performing FTM as responder
Return
• ESP_OK: succeed
• others: failed
Parameters
• offset_cm: T1 Offset to be added in centimeters

esp_err_t esp_wifi_config_11b_rate (wifi_interface_t ifx, bool disable)
Enable or disable 11b rate of specified interface.
**Attention** 1. This API should be called after esp_wifi_init() and before esp_wifi_start().

**Attention** 2. Only when really need to disable 11b rate call this API otherwise don’t call this.

**Return**
- ESP_OK: succeed
- others: failed

**Parameters**
- *ifx*: Interface to be configured.
- *disable*: true means disable 11b rate while false means enable 11b rate.

```c
esp_err_t esp_wifi_config_espnow_rate(wifi_interface_t ifx, wifi_phy_rate_t rate)
```
Config ESPNOW rate of specified interface.

**Attention** 1. This API should be called after esp_wifi_init() and before esp_wifi_start().

**Return**
- ESP_OK: succeed
- others: failed

**Parameters**
- *ifx*: Interface to be configured.
- *rate*: Phy rate to be configured.

```c
esp_err_t esp_wifi_set_connectionless_wake_interval(uint16_t interval)
```
Set interval for station to wake up periodically at disconnected.

**Attention** 1. Only when ESP_WIFI_STA_DISCONNECTED_PM_ENABLE is enabled, this configuration could work

**Attention** 2. This configuration only work for station mode and disconnected status

**Attention** 3. This configuration would influence nothing until some module configure wake_window

**Attention** 4. A sensible interval which is not too small is recommended (e.g. 100ms)

**Parameters**
- *interval*: how much microsecond would the chip wake up, from 1 to 65535.

```c
esp_err_t esp_wifi_set_country_code(const char* country, bool ieee80211d_enabled)
```
configure country

**Attention** 1. When ieee80211d_enabled, the country info of the AP to which the station is connected is used. E.g. if the configured country is US and the country info of the AP to which the station is connected is JP then the country info that will be used is JP. If the station disconnected from the AP the country info is set back to the country info of the station automatically, US in the example.

**Attention** 2. When ieee80211d_enabled is disabled, then the configured country info is used always.

**Attention** 3. When the country info is changed because of configuration or because the station connects to a different external AP, the country IE in probe response/beacon of the soft-AP is also changed.

**Attention** 4. The country configuration is stored into flash.

**Attention** 5. When this API is called, the PHY init data will switch to the PHY init data type corresponding to the country info.

**Attention** 7. When country code “01” (world safe mode) is set, SoftAP mode won’t contain country IE.

**Attention** 8. The default country is “CN” and ieee80211d_enabled is TRUE.

**Return**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument

**Parameters**
- *country*: the configured country ISO code
- *ieee80211d_enabled*: 802.11d is enabled or not

```c
esp_err_t esp_wifi_get_country_code(char *country)
```
get the current country code
Chapter 2. API Reference

Return
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument

Parameters
- country: country code

```
esp_err_t esp_wifi_config_80211_tx_rate(wifi_interface_t ifx, wifi_phy_rate_t rate)
```
Config 80211 tx rate of specified interface.

Attention
1. This API should be called after esp_wifi_init() and before esp_wifi_start().

Return
- ESP_OK: succeed
- others: failed

Parameters
- ifx: Interface to be configured.
- rate: Phy rate to be configured.

Structures
```
struct wifi_init_config_t
```
WiFi stack configuration parameters passed to esp_wifi_init call.

Public Members

```
const system_event_handler_t event_handler
```
WiFi event handler

```
wifi_osi_funcs_t *osi_funcs
```
WiFi OS functions

```
wpa_crypto_funcs_t wpa_crypto_funcs
```
WiFi station crypto functions when connect

```
int static_rx_buf_num
```
WiFi static RX buffer number

```

```
WiFi AMPDU TX feature enable flag

```
int amsdu_tx_enable
```
WiFi AMSDU TX feature enable flag
int `nvs_enable`
   WiFi NVS flash enable flag

int `nano_enable`
   Nano option for printf/scan family enable flag

int `rx_ba_win`
   WiFi Block Ack RX window size

int `wifi_task_core_id`
   WiFi Task Core ID

int `beacon_max_len`
   WiFi softAP maximum length of the beacon

int `mgmt_sbuf_num`
   WiFi management short buffer number, the minimum value is 6, the maximum value is 32

uint64_t `feature_caps`
   Enables additional WiFi features and capabilities

bool `sta_disconnected_pm`
   WiFi Power Management for station at disconnected status

int `magic`
   WiFi init magic number, it should be the last field

**Macros**

ESP_ERR_WIFI_NOT_INIT
   WiFi driver was not installed by esp_wifi_init

ESP_ERR_WIFI_NOT_STARTED
   WiFi driver was not started by esp_wifi_start

ESP_ERR_WIFI_NOT_STOPPED
   WiFi driver was not stopped by esp_wifi_stop

ESP_ERR_WIFI_IF
   WiFi interface error

ESP_ERR_WIFI_MODE
   WiFi mode error

ESP_ERR_WIFI_STATE
   WiFi internal state error

ESP_ERR_WIFI_CONN
   WiFi internal control block of station or soft-AP error

ESP_ERR_WIFI_NVS
   WiFi internal NVS module error

ESP_ERR_WIFI_MAC
   MAC address is invalid

ESP_ERR_WIFI_SSID
   SSID is invalid

ESP_ERR_WIFI_PASSWORD
   Password is invalid

ESP_ERR_WIFI_TIMEOUT
   Timeout error

ESP_ERR_WIFI_WAKE_FAIL
   WiFi is in sleep state(RF closed) and wakeup fail
ESP_ERR_WIFI_WOULD_BLOCK
The caller would block

ESP_ERR_WIFI_NOT_CONNECT
Station still in disconnect status

ESP_ERR_WIFI_POST
Failed to post the event to WiFi task

ESP_ERR_WIFI_INIT_STATE
Invalid WiFi state when init/deinit is called

ESP_ERR_WIFI_STOP_STATE
Returned when WiFi is stopping

ESP_ERR_WIFI_NOT_ASSOC
The WiFi connection is not associated

ESP_ERR_WIFI_TX_DISALLOW
The WiFi TX is disallowed

Type Definitions
typedef void (*wifi_promiscuous_cb_t) (void *buf, wifi_promiscuous_pkt_type_t type)
The RX callback function in the promiscuous mode. Each time a packet is received, the callback function will be called.

Parameters
• buf: Data received. Type of data in buffer (wifi_promiscuous_pkt_t or wifi_pkt_rx_ctrl_t) indicated by ‘type’ parameter.
• type: promiscuous packet type.
typedef void (*esp_vendor_ie_cb_t)(void *ctx, wifi_vendor_ie_type_t type, const uint8_t *sa[6], const vendor_ie_data_t *vnd_ie, int rssi)

Function signature for received Vendor-Specific Information Element callback.

Parameters
- ctx: Context argument, as passed to esp_wifi_set_vendor_ie_cb() when registering callback.
- type: Information element type, based on frame type received.
- sa: Source 802.11 address.
- vnd_ie: Pointer to the vendor specific element data received.
- rssi: Received signal strength indication.

typedef void (*wifi_csi_cb_t)(void *ctx, wifi_csi_info_t *data)
The RX callback function of Channel State Information(CSI) data.

Each time a CSI data is received, the callback function will be called.

Parameters
- ctx: context argument, passed to esp_wifi_set_csi_rx_cb() when registering callback function.
- data: CSI data received. The memory that it points to will be deallocated after callback function returns.

Header File
- components/esp_wifi/include/esp_wifi_types.h

Unions
union wifi_config_t

#include <esp_wifi_types.h> Configuration data for ESP32 AP or STA.

The usage of this union (for ap or sta configuration) is determined by the accompanying interface argument passed to esp_wifi_set_config() or esp_wifi_get_config()

Public Members

wifi_ap_config_t ap
configuration of AP

wifi_sta_config_t sta
configuration of STA

Structures
struct wifi_country_t

Structure describing WiFi country-based regional restrictions.

Public Members

char cc[3]
country code string

uint8_t schan
start channel

uint8_t nchan
total channel number

int8_t max_tx_power
This field is used for getting WiFi maximum transmitting power, call esp_wifi_set_max_tx_power to set the maximum transmitting power.
Chapter 2. API Reference

**wifi_country_policy_t**

Country policy

**struct wifi_active_scan_time_t**

Range of active scan times per channel.

**Public Members**

- `uint32_t min`
  - Minimum active scan time per channel, units: millisecond.
- `uint32_t max`
  - Maximum active scan time per channel, units: millisecond, values above 1500ms may cause the station to disconnect from AP and are not recommended.

**struct wifi_scan_time_t**

Aggregate of active & passive scan time per channel.

**Public Members**

- `wifi_active_scan_time_t active`
  - Active scan time per channel, units: millisecond.
- `uint32_t passive`
  - Passive scan time per channel, units: millisecond, values above 1500ms may cause the station to disconnect from AP and are not recommended.

**struct wifi_scan_config_t**

Parameters for an SSID scan.

**Public Members**

- `uint8_t * ssid`
  - SSID of AP.
- `uint8_t * bssid`
  - MAC address of AP.
- `uint8_t channel`
  - Channel, scan the specific channel.
- `bool show_hidden`
  - Enable to scan AP whose SSID is hidden.
- `wifi_scan_type_t scan_type`
  - Scan type, active or passive.
- `wifi_scan_time_t scan_time`
  - Scan time per channel.

**struct wifi_ap_record_t**

Description of a WiFi AP.

**Public Members**

- `uint8_t bssid[6]`
  - MAC address of AP.
- `uint8_t ssid[33]`
  - SSID of AP.
Chapter 2. API Reference

```c
uint8_t primary
channel of AP

wifi_second_chan_t second
secondary channel of AP

int8_t rssi
signal strength of AP

wifi_auth_mode_t authmode
authmode of AP

wifi_cipher_type_t pairwise_cipher
pairwise cipher of AP

wifi_cipher_type_t group_cipher
group cipher of AP

wifi_ant_t ant
antenna used to receive beacon from AP

uint32_t phy_11b : 1
bit: 0 flag to identify if 11b mode is enabled or not

uint32_t phy_11g : 1
bit: 1 flag to identify if 11g mode is enabled or not

uint32_t phy_11n : 1
bit: 2 flag to identify if 11n mode is enabled or not

uint32_t phy_lr : 1
bit: 3 flag to identify if low rate is enabled or not

uint32_t wps : 1
bit: 4 flag to identify if WPS is supported or not

uint32_t ftm_responder : 1
bit: 5 flag to identify if FTM is supported in responder mode

uint32_t ftm_initiator : 1
bit: 6 flag to identify if FTM is supported in initiator mode

uint32_t reserved : 25
bit: 7..31 reserved

wifi_country_t country
country information of AP
```

**struct wifi_scan_threshold_t**
Structure describing parameters for a WiFi fast scan.

**Public Members**

- **int8_t rssi**
The minimum rssi to accept in the fast scan mode

- **wifi_auth_mode_t authmode**
The weakest authmode to accept in the fast scan mode

**struct wifi_pmf_config_t**
Configuration structure for Protected Management Frame

**Public Members**

- **bool capable**
Device will always connect in PMF mode if other device also advertizes PMF capability.
bool **required**
Advertizes that Protected Management Frame is required. Device will not associate to non-PMF capable devices.

**struct wifi_ap_config_t**
Soft-AP configuration settings for the ESP32.

**Public Members**

uint8_t **ssid**[32]
SSID of ESP32 soft-AP. If ssid_len field is 0, this must be a Null terminated string. Otherwise, length is set according to ssid_len.

uint8_t **password**[64]
Password of ESP32 soft-AP.

uint8_t **ssid_len**
Optional length of SSID field.

uint8_t **channel**
Channel of ESP32 soft-AP

**wifi_auth_mode_t authmode**
Auth mode of ESP32 soft-AP. Do not support AUTH_WEP in soft-AP mode

uint8_t **ssid_hidden**
Broadcast SSID or not, default 0, broadcast the SSID

uint8_t **max_connection**
Max number of stations allowed to connect in, default 4, max 10

uint16_t **beacon_interval**
Beacon interval which should be multiples of 100. Unit: TU(time unit, 1 TU = 1024 us). Range: 100 ~ 60000. Default value: 100

**wifi_cipher_type_t pairwise_cipher**
pairwise cipher of SoftAP, group cipher will be derived using this. cipher values are valid starting from WIFI_CIPHER_TYPE_TKIP, enum values before that will be considered as invalid and default cipher suites(TKIP+CCMP) will be used. Valid cipher suites in softAP mode are WIFI_CIPHER_TYPE_TKIP, WIFI_CIPHER_TYPE_CCMP and WIFI_CIPHER_TYPE_TKIP_CCMP.

bool **ftm_responder**
Enable FTM Responder mode

**wifi_pmf_config_t pmf_cfg**
Configuration for Protected Management Frame

**struct wifi_sta_config_t**
STA configuration settings for the ESP32.

**Public Members**

uint8_t **ssid**[32]
SSID of target AP.

uint8_t **password**[64]
Password of target AP.

**wifi_scan_method_t scan_method**
do all channel scan or fast scan
bool bssid_set
whether set MAC address of target AP or not. Generally, station_config.bssid_set needs to be 0; and it
needs to be 1 only when users need to check the MAC address of the AP.

uint8_t bssid[6]
MAC address of target AP

uint8_t channel
channel of target AP. Set to 1~13 to scan starting from the specified channel before connecting to AP. If
the channel of AP is unknown, set it to 0.

uint16_t listen_interval
Listen interval for ESP32 station to receive beacon when WIFI_PS_MAX_MODEM is set. Units: AP
beacon intervals. Defaults to 3 if set to 0.

wifi_sort_method_t sort_method
sort the connect AP in the list by rssi or security mode

wifi_scan_threshold_t threshold
When sort_method is set, only APs which have an auth mode that is more secure than the selected auth
mode and a signal stronger than the minimum RSSI will be used.

wifi_pmf_config_t pmf_cfg
Configuration for Protected Management Frame. Will be advertised in RSN Capabilities in RSN IE.

uint32_t rm_enabled : 1
Whether Radio Measurements are enabled for the connection

uint32_t btm_enabled : 1
Whether BSS Transition Management is enabled for the connection

uint32_t mbo_enabled : 1
Whether MBO is enabled for the connection

uint32_t reserved : 29
Reserved for future feature set

struct wifi_sta_info_t
Description of STA associated with AP.

Public Members

uint8_t mac[6]
cmac address

int8_t rssi
current average rssi of sta connected

uint32_t phy_11b : 1
bit: 0 flag to identify if 11b mode is enabled or not

uint32_t phy_11g : 1
bit: 1 flag to identify if 11g mode is enabled or not

uint32_t phy_11n : 1
bit: 2 flag to identify if 11n mode is enabled or not

uint32_t phy_lr : 1
bit: 3 flag to identify if low rate is enabled or not

uint32_t is_mesh_child : 1
bit: 4 flag to identify mesh child

uint32_t reserved : 27
bit: 5..31 reserved
struct wifi_sta_list_t
List of stations associated with the ESP32 Soft-AP.

Public Members

wifi_sta_info_t sta[ESP_WIFI_MAX_CONN_NUM]  
station list
int num
number of stations in the list (other entries are invalid)

struct vendor_ie_data_t
Vendor Information Element header.
The first bytes of the Information Element will match this header. Payload follows.

Public Members

uint8_t element_id
Should be set to WIFI_VENDOR_IE_ELEMENT_ID (0xDD)
uint8_t length
Length of all bytes in the element data following this field. Minimum 4.
uint8_t vendor_oui[3]
Vendor identifier (OUI).
uint8_t vendor_oui_type
Vendor-specific OUI type.
uint8_t payload[0]
Payload. Length is equal to value in ‘length’ field, minus 4.

struct wifi_pkt_rx_ctrl_t
Received packet radio metadata header, this is the common header at the beginning of all promiscuous mode RX callback buffers.

Public Members

signed rssi : 8
Received Signal Strength Indicator (RSSI) of packet. unit: dBm
unsigned rate : 5
PHY rate encoding of the packet. Only valid for non HT(11bg) packet
unsigned __pad0__ : 1
reserved
unsigned sig_mode : 2
0: non HT(11bg) packet; 1: HT(11n) packet; 3: VHT(11ac) packet
unsigned __pad1__ : 16
reserved
unsigned mcs : 7
Modulation Coding Scheme. If is HT(11n) packet, shows the modulation, range from 0 to 76(MCS0 ~ MCS76)
unsigned cwb : 1
Channel Bandwidth of the packet. 0: 20MHz; 1: 40MHz
unsigned __pad2__ : 16
reserved
unsigned smoothing : 1
    reserved
unsigned not_sounding : 1
    reserved
unsigned __pad3__ : 1
    reserved
unsigned aggregation : 1
    Aggregation. 0: MPDU packet; 1: AMPDU packet
unsigned stbc : 2
    Space Time Block Code(STBC). 0: non STBC packet; 1: STBC packet
unsigned fec_coding : 1
    Flag is set for 11n packets which are LDPC
unsigned sgi : 1
    Short Guide Interval(SGI). 0: Long GI; 1: Short GI
unsigned __pad4__ : 8
    reserved
unsigned ampdu_cnt : 8
    ampdu cnt
unsigned channel : 4
    primary channel on which this packet is received
unsigned secondary_channel : 4
    secondary channel on which this packet is received. 0: none; 1: above; 2: below
unsigned __pad5__ : 8
    reserved
unsigned timestamp : 32
    timestamp. The local time when this packet is received. It is precise only if modem sleep or light sleep
    is not enabled. unit: microsecond
unsigned __pad6__ : 32
    reserved
signed noise_floor : 8
    noise floor of Radio Frequency Module(RF). unit: 0.25dBm
unsigned __pad7__ : 24
    reserved
unsigned __pad8__ : 32
    reserved
unsigned __pad9__ : 31
    reserved
unsigned ant : 1
    antenna number from which this packet is received. 0: WiFi antenna 0; 1: WiFi antenna 1
unsigned __pad10__ : 32
    reserved
unsigned __pad11__ : 32
    reserved
unsigned __pad12__ : 32
    reserved
unsigned sig_len : 12
    length of packet including Frame Check Sequence(FCS)
unsigned __pad13__: 12
    reserved
unsigned rx_state: 8
    state of the packet. 0: no error; others: error numbers which are not public

**struct wifi_promiscuous_pkt_t**
Payload passed to ‘buf’ parameter of promiscuous mode RX callback.

**Public Members**

*wifi_pkt_rx_ctrl_t rx_ctrl*
    metadata header

*uint8_t payload[0]*
    Data or management payload. Length of payload is described by rx_ctrl.sig_len. Type of content determined by packet type argument of callback.

**struct wifi_promiscuous_filter_t**
Mask for filtering different packet types in promiscuous mode.

**Public Members**

*uint32_t filter_mask*
    OR of one or more filter values WIFI_PROMIS_FILTER_*

**struct wifi_csi_config_t**
Channel state information(CSI) configuration type.

**Public Members**

*bool lltf_en*
    enable to receive legacy long training field(lltf) data. Default enabled

*bool htltf_en*
    enable to receive HT long training field(htltf) data. Default enabled

*bool stbc_htltf2_en*
    enable to receive space time block code HT long training field(stbc-htltf2) data. Default enabled

*bool ltf_merge_en*
    enable to generate htltf data by averaging lltf and ht_ltf data when receiving HT packet. Otherwise, use ht_ltf data directly. Default enabled

*bool channel_filter_en*
    enable to turn on channel filter to smooth adjacent sub-carrier. Disable it to keep independence of adjacent sub-carrier. Default enabled

*bool manu_scale*
    manually scale the CSI data by left shifting or automatically scale the CSI data. If set true, please set the shift bits. false: automatically. true: manually. Default false

*uint8_t shift*
    manually left shift bits of the scale of the CSI data. The range of the left shift bits is 0~15

**struct wifi_csi_info_t**
CSI data type.
Public Members

`wifi_pkt_rx_ctrl_t rx_ctrl`
- received packet radio metadata header of the CSI data

`uint8_t [6] mac`
- source MAC address of the CSI data

`bool first_word_invalid`
- first four bytes of the CSI data is invalid or not

`int8_t *buf`
- buffer of CSI data

`uint16_t len`
- length of CSI data

**struct wifi_ant_gpio_t**
- WiFi GPIO configuration for antenna selection.

Public Members

`uint8_t gpio_select`: 1
- Whether this GPIO is connected to external antenna switch

`uint8_t gpio_num`: 7
- The GPIO number that connects to external antenna switch

**struct wifi_ant_gpio_config_t**
- WiFi GPIOs configuration for antenna selection.

Public Members

`wifi_ant_gpio_t gpio_cfg[4]`
- The configurations of GPIOs that connect to external antenna switch

**struct wifi_ant_config_t**
- WiFi antenna configuration.

Public Members

`wifi_ant_mode_t rx_ant_mode`
- WiFi antenna mode for receiving

`wifi_ant_t rx_ant_default`
- Default antenna mode for receiving, it’s ignored if rx_ant_mode is not WIFI_ANT_MODE_AUTO

`wifi_ant_mode_t tx_ant_mode`
- WiFi antenna mode for transmission, it can be set to WIFI_ANT_MODE_AUTO only if rx_ant_mode is set to WIFI_ANT_MODE_AUTO

`uint8_t enabled_ant0`: 4
- Index (in antenna GPIO configuration) of enabled WIFI_ANT_MODE_ANT0

`uint8_t enabled_ant1`: 4
- Index (in antenna GPIO configuration) of enabled WIFI_ANT_MODE_ANT1

**struct wifi_action_tx_req_t**
- Action Frame Tx Request.
Public Members

\texttt{wifi\_interface\_t ifx}

WiFi interface to send request to

\texttt{uint8\_t dest\_mac[6]}

Destination MAC address

\texttt{bool no\_ack}

Indicates no ack required

\texttt{wifi\_action\_rx\_cb\_t rx\_cb}

Rx Callback to receive any response

\texttt{uint32\_t data\_len}

Length of the appended Data

\texttt{uint8\_t data[0]}

Appended Data payload

\texttt{struct wifi\_ftm\_initiator\_cfg\_t}

FTM Initiator configuration.

Public Members

\texttt{uint8\_t resp\_mac[6]}

MAC address of the FTM Responder

\texttt{uint8\_t channel}

Primary channel of the FTM Responder

\texttt{uint8\_t frm\_count}

No. of FTM frames requested in terms of 4 or 8 bursts (allowed values - 0 (No pref), 16, 24, 32, 64)

\texttt{uint16\_t burst\_period}

Requested time period between consecutive FTM bursts in 100’s of milliseconds (0 - No pref)

\texttt{struct wifi\_event\_sta\_scan\_done\_t}

Argument structure for WIFI\_EVENT\_SCAN\_DONE event

Public Members

\texttt{uint32\_t status}

status of scanning APs: 0 — success, 1 - failure

\texttt{uint8\_t number}

number of scan results

\texttt{uint8\_t scan\_id}

scan sequence number, used for block scan

\texttt{struct wifi\_event\_sta\_connected\_t}

Argument structure for WIFI\_EVENT\_STA\_CONNECTED event

Public Members

\texttt{uint8\_t ssid[32]}

SSID of connected AP

\texttt{uint8\_t ssid\_len}

SSID length of connected AP
Chapter 2. API Reference

uint8_t bssid[6]
    BSSID of connected AP

uint8_t channel
    channel of connected AP

wifi_auth_mode_t authmode
    authentication mode used by AP

struct wifi_event_sta_disconnected_t
    Argument structure for WIFI_EVENT_STA_DISCONNECTED event

Public Members

uint8_t ssid[32]
    SSID of disconnected AP

uint8_t ssid_len
    SSID length of disconnected AP

uint8_t bssid[6]
    BSSID of disconnected AP

uint8_t reason
    reason of disconnection

struct wifi_event_sta_authmode_change_t
    Argument structure for WIFI_EVENT_STA_AUTHMODE_CHANGE event

Public Members

wifi_auth_mode_t old_mode
    the old auth mode of AP

wifi_auth_mode_t new_mode
    the new auth mode of AP

struct wifi_event_sta_wps_er_pin_t
    Argument structure for WIFI_EVENT_STA_WPS_ER_PIN event

Public Members

uint8_t pin_code[8]
    PIN code of station in enrollee mode

struct wifi_event_sta_wps_er_success_t
    Argument structure for WIFI_EVENT_STA_WPS_ER_SUCCESS event

Public Members

uint8_t ap_cred_cnt
    Number of AP credentials received

uint8_t ssid[MAX_SSID_LEN]
    SSID of AP

uint8_t passphrase[MAX_PASSPHRASE_LEN]
    Passphrase for the AP

struct wifi_event_sta_wps_er_success_t::[anonymous] ap_cred[MAX_WPS_AP_CRED]
    All AP credentials received from WPS handshake
struct wifi_event_ap_staconnected_t
Argument structure for WIFI_EVENT_AP_STACONNECTED event

Public Members

uint8_t mac[6]
   MAC address of the station connected to ESP32 soft-AP

uint8_t aid
   the aid that ESP32 soft-AP gives to the station connected to

bool is_mesh_child
   flag to identify mesh child

struct wifi_event_ap_stadisconnected_t
Argument structure for WIFI_EVENT_AP_STADISCONNECTED event

Public Members

uint8_t mac[6]
   MAC address of the station disconnects to ESP32 soft-AP

uint8_t aid
   the aid that ESP32 soft-AP gave to the station disconnects to

bool is_mesh_child
   flag to identify mesh child

struct wifi_event_ap_probe_req_rx_t
Argument structure for WIFI_EVENT_AP_PROBEREQRECVED event

Public Members

int rssi
   Received probe request signal strength

uint8_t mac[6]
   MAC address of the station which send probe request

struct wifi_event_bss_rssi_low_t
Argument structure for WIFI_EVENT_STA_BSS_RSSI_LOW event

Public Members

int32_t rssi
   RSSI value of bss

struct wifi_ftm_report_entry_t
Argument structure for

Public Members

uint8_t dlog_token
   Dialog Token of the FTM frame

int8_t rssi
   RSSI of the FTM frame received

uint32_t rtt
   Round Trip Time in pSec with a peer
uint64_t t1
   Time of departure of FTM frame from FTM Responder in pSec
uint64_t t2
   Time of arrival of FTM frame at FTM Initiator in pSec
uint64_t t3
   Time of departure of ACK from FTM Initiator in pSec
uint64_t t4
   Time of arrival of ACK at FTM Responder in pSec

`struct wifi_event_ftm_report_t`
Argument structure for WIFI_EVENT_FTM_REPORT event

**Public Members**

uint8_t peer_mac[6]
   MAC address of the FTM Peer

`wifi_ftm_status_t` status
   Status of the FTM operation

uint32_t rtt_raw
   Raw average Round-Trip-Time with peer in Nano-Seconds

uint32_t rtt_est
   Estimated Round-Trip-Time with peer in Nano-Seconds

uint32_t dist_est
   Estimated one-way distance in Centi-Meters

`wifi_ftm_report_entry_t` *ftm_report_data
   Pointer to FTM Report with multiple entries, should be freed after use

uint8_t ftm_report_num_entries
   Number of entries in the FTM Report data

`struct wifi_event_action_tx_status_t`
Argument structure for WIFI_EVENT_ACTION_TX_STATUS event

**Public Members**

`wifi_interface_t` ifx
   WiFi interface to send request to

uint32_t context
   Context to identify the request

uint8_t da[6]
   Destination MAC address

uint8_t status
   Status of the operation

`struct wifi_event_roc_done_t`
Argument structure for WIFI_EVENT_ROC_DONE event

**Public Members**

uint32_t context
   Context to identify the request
Chapter 2  API Reference

Macros
WIFI_OFFCHAN_TX_REQ
WIFI_OFFCHAN_TX_CANCEL
WIFI_ROC_REQ
WIFI_ROC_CANCEL
WIFI_PROTOCOL_11B
WIFI_PROTOCOL_11G
WIFI_PROTOCOL_11N
WIFI_PROTOCOL_LR
ESP_WIFI_MAX_CONN_NUM
  max number of stations which can connect to ESP32 soft-AP
WIFI_VENDOR_IE_ELEMENT_ID
WIFI_PROMIS_FILTER_MASK_ALL
  filter all packets
WIFI_PROMIS_FILTER_MASK_MGMT
  filter the packets with type of WIFI_PKT_MGMT
WIFI_PROMIS_FILTER_MASK_CTRL
  filter the packets with type of WIFI_PKT_CTRL
WIFI_PROMIS_FILTER_MASK_DATA
  filter the packets with type of WIFI_PKT_DATA
WIFI_PROMIS_FILTER_MASK_MISC
  filter the packets with type of WIFI_PKT_MISC
WIFI_PROMIS_FILTER_MASK_DATA_MPDU
  filter the MPDU which is a kind of WIFI_PKT_DATA
WIFI_PROMIS_FILTER_MASK_DATA_AMPDU
  filter the AMPDU which is a kind of WIFI_PKT_DATA
WIFI_PROMIS_FILTER_MASK_FCSFAIL
  filter the FCS failed packets, do not open it in general
WIFI_PROMIS_CTRL_FILTER_MASK_ALL
  filter all control packets
WIFI_PROMIS_CTRL_FILTER_MASK_WRAPPER
  filter the control packets with subtype of Control Wrapper
WIFI_PROMIS_CTRL_FILTER_MASK_BAR
  filter the control packets with subtype of Block Ack Request
WIFI_PROMIS_CTRL_FILTER_MASK_BA
  filter the control packets with subtype of Block Ack
WIFI_PROMIS_CTRL_FILTER_MASK_PSPOLL
  filter the control packets with subtype of PS-Poll
WIFI_PROMIS_CTRL_FILTER_MASK_RTS
  filter the control packets with subtype of RTS
WIFI_PROMIS_CTRL_FILTER_MASK_CTS
  filter the control packets with subtype of CTS
WIFI_PROMIS_CTRL_FILTER_MASK_ACK
  filter the control packets with subtype of ACK
WIFI_PROMIS_CTRL_FILTER_MASK_CFEND
  filter the control packets with subtype of CF-END
WIFI_PROMIS_CTRL_FILTER_MASK_CFENDACK
    filter the control packets with subtype of CF-END+CF-ACK
WIFI_EVENT_MASK_ALL
    mask all WiFi events
WIFI_EVENT_MASK_NONE
    mask none of the WiFi events
WIFI_EVENT_MASK_AP_PROBEREQRECVED
    mask SYSTEM_EVENT_AP_PROBEREQRECVED event
MAX_SSID_LEN
MAX_PASSPHRASE_LEN
MAX_WPS_AP_CRED

WIFI_STATIS_PS
WIFI_STATIS_ALL

Type Definitions
typedef int (*wifi_action_rx_cb_t) (uint8_t *hdr, uint8_t *payload, size_t len, uint8_t channel)
The Rx callback function of Action Tx operations.
    Parameters
    • hdr: pointer to the IEEE 802.11 Header structure
    • payload: pointer to the Payload following 802.11 Header
    • len: length of the Payload
    • channel: channel number the frame is received on

Enumerations
enum wifi_mode_t
    Values:
    WiFi_MODE_NULL = 0
    null mode
    WiFi_MODE_STA
    WiFi station mode
    WiFi_MODE_AP
    WiFi soft-AP mode
    WiFi_MODE_APSTA
    WiFi station + soft-AP mode
    WiFi_MODE_MAX
enum wifi_interface_t
    Values:
    WiFi_IF_STA = ESP_IF_WIFI_STA
    WiFi_IF_AP = ESP_IF_WIFI_AP
enum wifi_country_policy_t
    Values:
WIFI_COUNTRY_POLICY_AUTO
Country policy is auto, use the country info of AP to which the station is connected

WIFI_COUNTRY_POLICY_MANUAL
Country policy is manual, always use the configured country info

enum wifi_auth_mode_t
Values:

WIFI_AUTH_OPEN = 0
authenticate mode : open

WIFI_AUTH_WEP
authenticate mode : WEP

WIFI_AUTH_WPA_PSK
authenticate mode : WPA_PSK

WIFI_AUTH_WPA2_PSK
authenticate mode : WPA2_PSK

WIFI_AUTH_WPA_WPA2_PSK
authenticate mode : WPA_WPA2_PSK

WIFI_AUTH_WPA2_ENTERPRISE
authenticate mode : WPA2_ENTERPRISE

WIFI_AUTH_WPA3_PSK
authenticate mode : WPA3_PSK

WIFI_AUTH_WPA2_WPA3_PSK
authenticate mode : WPA2_WPA3_PSK

WIFI_AUTH_WAPI_PSK
authenticate mode : WAPI_PSK

WIFI_AUTH_MAX

enum wifi_err_reason_t
Values:

WIFI_REASON_UNSPECIFIED = 1

WIFI_REASON_AUTH_EXPIRE = 2

WIFI_REASON_ASSOC_EXPIRE = 4

WIFI_REASON_ASSOC_TOOMANY = 5

WIFI_REASON_NOT_AUTHED = 6

WIFI_REASON_NOT_ASSOCED = 7

WIFI_REASON_ASSOC_LEAVE = 8

WIFI_REASON_ASSOC_NOT_AUTHED = 9

WIFI_REASON_DISASSOC_PWRCAP_BAD = 10

WIFI_REASON_DISASSOC_SUPCHAN_BAD = 11

WIFI_REASON_BSS_TRANSITION_DISASSOC = 12

WIFI_REASON_IE_INVALID = 13

WIFI_REASON_MIC_FAILURE = 14

WIFI_REASON_4WAY_HANDSHAKE_TIMEOUT = 15

WIFI_REASON_GROUP_KEY_UPDATE_TIMEOUT = 16
WIFI_REASON_IE_IN_4WAY_DIFFERS = 17

WIFI_REASON_ASSOC_FAIL = 203
WIFI_REASON_HANDSHAKE_TIMEOUT = 204
WIFI_REASON_CONNECTION_FAIL = 205
WIFI_REASON_AP_TSF_RESET = 206
WIFI_REASON_ROAMING = 207

enum wifi_second_chan_t

Values:

WIFI_SECOND_CHAN_NONE = 0
the channel width is HT20

WIFI_SECOND_CHAN_ABOVE
the channel width is HT40 and the secondary channel is above the primary channel

WIFI_SECOND_CHAN_BELOW
the channel width is HT40 and the secondary channel is below the primary channel

enum wifi_scan_type_t

Values:

WIFI_SCAN_TYPE_ACTIVE = 0
active scan

WIFI_SCAN_TYPE_PASSIVE
passive scan

enum wifi_cipher_type_t

Values:

WIFI_CIPHER_TYPE_NONE = 0
the cipher type is none

WIFI_CIPHER_TYPE_WEP40
the cipher type is WEP40

WIFI_CIPHER_TYPE_WEP104
the cipher type is WEP104

WIFI_CIPHER_TYPE_TKIP
the cipher type is TKIP

WIFI_CIPHER_TYPE_CCMP
the cipher type is CCMP
WIFI_CIPHER_TYPE_TKIP_CCMP
the cipher type is TKIP and CCMP

WIFI_CIPHER_TYPE_AES_CMAC128
the cipher type is AES-CMAC-128

WIFI_CIPHER_TYPE_SMS4
the cipher type is SMS4

WIFI_CIPHER_TYPE_GCMP
the cipher type is GCMP

WIFI_CIPHER_TYPE_GCMP256
the cipher type is GCMP-256

WIFI_CIPHER_TYPE_AES_GMAC128
the cipher type is AES-GMAC-128

WIFI_CIPHER_TYPE_AES_GMAC256
the cipher type is AES-GMAC-256

WIFI_CIPHER_TYPE_UNKNOWN
the cipher type is unknown

enum wifi_ant_t
WiFi antenna.
Values:

WIFI_ANT_ANT0
WiFi antenna 0

WIFI_ANT_ANT1
WiFi antenna 1

WIFI_ANT_MAX
Invalid WiFi antenna

enum wifi_scan_method_t
Values:

WIFI_FAST.Scan = 0
Do fast scan, scan will end after find SSID match AP

WIFI_ALL_CHANNEL.Scan
All channel scan, scan will end after scan all the channel

enum wifi_sort_method_t
Values:

WIFI_CONNECT.AP_BY_SIGNAL = 0
Sort match AP in scan list by RSSI

WIFI_CONNECT.AP_BY_SECURITY
Sort match AP in scan list by security mode

enum wifi_ps_type_t
Values:

WIFI_PS_NONE
No power save

WIFI_PS_MIN_MODEM
Minimum modem power saving. In this mode, station wakes up to receive beacon every DTIM period

WIFI_PS_MAX_MODEM
Maximum modem power saving. In this mode, interval to receive beacons is determined by the listen_interval parameter in wifi_sta_config_t
enum wifi_bandwidth_t

Values:

WIFI_BW_HT20 = 1
WIFI_BW_HT40

enum wifi_storage_t

Values:

WIFI_STORAGE_FLASH
  all configuration will store in both memory and flash
WIFI_STORAGE_RAM
  all configuration will only store in the memory

enum wifi_vendor_ie_type_t

Vendor Information Element type.

Determines the frame type that the IE will be associated with.

Values:

WIFI_VND_IE_TYPE_BEACON
WIFI_VND_IE_TYPE_PROBE_REQ
WIFI_VND_IE_TYPE_PROBE_RESP
WIFI_VND_IE_TYPE_ASSOC_REQ
WIFI_VND_IE_TYPE_ASSOC_RESP

enum wifi_vendor_ie_id_t

Vendor Information Element index.

Each IE type can have up to two associated vendor ID elements.

Values:

WIFI_VND_IE_ID_0
WIFI_VND_IE_ID_1

enum wifi_promiscuous_pkt_type_t

Promiscuous frame type.

Passed to promiscuous mode RX callback to indicate the type of parameter in the buffer.

Values:

WIFI_PKT_MGMT
  Management frame, indicates ‘buf’ argument is wifi_promiscuous_pkt_t
WIFI_PKT_CTRL
  Control frame, indicates ‘buf’ argument is wifi_promiscuous_pkt_t
WIFI_PKT_DATA
  Data frame, indicates ‘buf’ argument is wifi_promiscuous_pkt_t
WIFI_PKT_MISC
  Other type, such as MIMO etc. ‘buf’ argument is wifi_promiscuous_pkt_t but the payload is zero length.

enum wifi_ant_mode_t

WiFi antenna mode.

Values:

WIFI_ANT_MODE_ANT0
  Enable WiFi antenna 0 only
WIFI_ANT_MODE_ANT1
  Enable WiFi antenna 1 only
**WIFI_ANT_MODE_AUTO**
Enable WiFi antenna 0 and 1, automatically select an antenna

**WIFI_ANT_MODE_MAX**
Invalid WiFi enabled antenna

```c
enum wifi_phy_rate_t
```

WiFi PHY rate encodings.

*Values:*

```c
WIFI_PHY_RATE_1M_L = 0x00
  1 Mbps with long preamble
WIFI_PHY_RATE_2M_L = 0x01
  2 Mbps with long preamble
WIFI_PHY_RATE_5M_L = 0x02
  5.5 Mbps with long preamble
WIFI_PHY_RATE_11M_L = 0x03
  11 Mbps with long preamble
WIFI_PHY_RATE_2M_S = 0x05
  2 Mbps with short preamble
WIFI_PHY_RATE_5M_S = 0x06
  5.5 Mbps with short preamble
WIFI_PHY_RATE_11M_S = 0x07
  11 Mbps with short preamble
WIFI_PHY_RATE_48M = 0x08
  48 Mbps
WIFI_PHY_RATE_24M = 0x09
  24 Mbps
WIFI_PHY_RATE_12M = 0x0A
  12 Mbps
WIFI_PHY_RATE_6M = 0x0B
  6 Mbps
WIFI_PHY_RATE_54M = 0x0C
  54 Mbps
WIFI_PHY_RATE_36M = 0x0D

MCS4 with short GI, 43.3 Mbps for 20MHz, 90 Mbps for 40MHz

**WIFI_PHY_RATE_MCS5_SGI** = 0x1D
MCS5 with short GI, 57.8 Mbps for 20MHz, 120 Mbps for 40MHz

**WIFI_PHY_RATE_MCS6_SGI** = 0x1E
MCS6 with short GI, 65 Mbps for 20MHz, 135 Mbps for 40MHz

**WIFI_PHY_RATE_MCS7_SGI** = 0x1F
MCS7 with short GI, 72.2 Mbps for 20MHz, 150 Mbps for 40MHz

**WIFI_PHY_RATE_LORA_250K** = 0x29
250 Kbps

**WIFI_PHY_RATE_LORA_500K** = 0x2A
500 Kbps

**WIFI_PHY_RATE_MAX**

```c
enum wifi_event_t
{
    WIFI_EVENT_WIFI_READY = 0,
    ESP32 WiFi ready
    WIFI_EVENT_SCAN_DONE,
    ESP32 finish scanning AP
    WIFI_EVENT_STA_START,
    ESP32 station start
    WIFI_EVENT_STA_STOP,
    ESP32 station stop
    WIFI_EVENT_STA_CONNECTED,
    ESP32 station connected to AP
    WIFI_EVENT_STA_DISCONNECTED,
    ESP32 station disconnected from AP
    WIFI_EVENT_STA_AUTHMODE_CHANGE,
    the auth mode of AP connected by ESP32 station changed
    WIFI_EVENT_STA_WPS_ER_SUCCESS,
    ESP32 station wps succeeds in enrollee mode
};
```
WIFI_EVENT_STA_WPS_ER_FAILED
ESP32 station wps fails in enrollee mode

WIFI_EVENT_STA_WPS_ER_TIMEOUT
ESP32 station wps timeout in enrollee mode

WIFI_EVENT_STA_WPS_ER_PIN
ESP32 station wps pin code in enrollee mode

WIFI_EVENT_STA_WPS_ER_PBC_OVERLAP
ESP32 station wps overlap in enrollee mode

WIFI_EVENT_AP_START
ESP32 soft-AP start

WIFI_EVENT_AP_STOP
ESP32 soft-AP stop

WIFI_EVENT_AP_STACONNECTED
a station connected to ESP32 soft-AP

WIFI_EVENT_AP_STADISCONNECTED
a station disconnected from ESP32 soft-AP

WIFI_EVENT_AP_PROBEREQRECVED
Receive probe request packet in soft-AP interface

WIFI_EVENT_FTM_REPORT
Receive report of FTM procedure

WIFI_EVENT_STA_BSS_RSSI_LOW
AP’s RSSI crossed configured threshold

WIFI_EVENT_ACTION_TX_STATUS
Status indication of Action Tx operation

WIFI_EVENT_ROC_DONE
Remain-on-Channel operation complete

WIFI_EVENT_STA_BEACON_TIMEOUT
ESP32 station beacon timeout

WIFI_EVENT_MAX
Invalid WiFi event ID

typedef enum wifi_event_sta_wps_fail_reason_t
Argument structure for WIFI_EVENT_STA_WPS_ER_FAILED event

Values:

WPS_FAIL_REASON_NORMAL = 0
ESP32 WPS normal fail reason

WPS_FAIL_REASON_RECV_M2D
ESP32 WPS receive M2D frame

WPS_FAIL_REASON_MAX

typedef enum wifi_ftm_status_t
FTM operation status types.

Values:

FTM_STATUS_SUCCESS = 0
FTM exchange is successful

FTM_STATUS_UNSUPPORTED
Peer does not support FTM
Chapter 2. API Reference

FTM_STATUS_CONF_REJECTED
Peer rejected FTM configuration in FTM Request

FTM_STATUS_NO_RESPONSE
Peer did not respond to FTM Requests

FTM_STATUS_FAIL
Unknown error during FTM exchange

SmartConfig

The SmartConfig™ is a provisioning technology developed by TI to connect a new Wi-Fi device to a Wi-Fi network. It uses a mobile app to broadcast the network credentials from a smartphone, or a tablet, to an un-provisioned Wi-Fi device.

The advantage of this technology is that the device does not need to directly know SSID or password of an Access Point (AP). This information is provided using the smartphone. This is particularly important to headless device and systems, due to their lack of a user interface.

If you are looking for other options to provision your ESP32-S3 devices, check Provisioning API.

Application Example  Connect ESP32-S3 to target AP using SmartConfig: wifi/smart_config.

API Reference

Header File

- components/esp_wifi/include/esp_smartconfig.h

Functions

const char *esp_smartconfig_get_version (void)
Get the version of SmartConfig.

Return
- SmartConfig version const char.

esp_err_t esp_smartconfig_start (const smartconfig_start_config_t *config)
Start SmartConfig, config ESP device to connect AP. You need to broadcast information by phone APP. Device sniff special packets from the air that containing SSID and password of target AP.

Attention 1. This API can be called in station or softAP-station mode.
Attention 2. Can not call esp_smartconfig_start twice before it finish, please call esp_smartconfig_stop first.

Return
- ESP_OK: succeed
- others: fail

Parameters
- config: pointer to smartconfig start configure structure

esp_err_t esp_smartconfig_stop (void)
Stop SmartConfig, free the buffer taken by esp_smartconfig_start.

Attention Whether connect to AP succeed or not, this API should be called to free memory taken by smartconfig_start.

Return
- ESP_OK: succeed
- others: fail

esp_err_t esp_esptouch_set_timeout (uint8_t time_s)
Set timeout of SmartConfig process.

Attention Timing starts from SC_STATUS_FIND_CHANNEL status. SmartConfig will restart if timeout.
Chapter 2. API Reference

Return
- ESP_OK: succeed
- others: fail

Parameters
- time_s: range 15s~255s, offset:45s.

```c
esp_err_t esp_smartconfig_set_type(smartconfig_type_t type)
```
Set protocol type of SmartConfig.

Attention If users need to set the SmartConfig type, please set it before calling esp_smartconfig_start.

Return
- ESP_OK: succeed
- others: fail

Parameters
- type: Choose from the smartconfig_type_t.

```c
esp_err_t esp_smartconfig_fast_mode(bool enable)
```
Set mode of SmartConfig. default normal mode.

Attention 1. Please call it before API esp_smartconfig_start.
Attention 2. Fast mode have corresponding APP(phone).
Attention 3. Two mode is compatible.

Return
- ESP_OK: succeed
- others: fail

Parameters
- enable: false-disable(default); true-enable;

```c
esp_err_t esp_smartconfig_get_rvd_data(uint8_t *rvd_data, uint8_t len)
```
Get reserved data of ESPTouch v2.

Return
- ESP_OK: succeed
- others: fail

Parameters
- rvd_data: reserved data
- len: length of reserved data

Structures

```c
struct smartconfig_event_got_ssid_pswd_t
```
Argument structure for SC_EVENT_GOT_SSID_PSWD event

Public Members

```c
uint8_t ssid[32]
```
SSID of the AP. Null terminated string.

```c
uint8_t password[64]
```
Password of the AP. Null terminated string.

```c
bool bssid_set
```
whether set MAC address of target AP or not.

```c
uint8_t bssid[6]
```
MAC address of target AP.

```c
smartconfig_type_t type
```
Type of smartconfig(ESPTouch or AirKiss).

```c
uint8_t token
```
Token from cellphone which is used to send ACK to cellphone.
Chapter 2. API Reference

```c
uint8_t cellphone_ip[4]
IP address of cellphone.
```

```c
struct smartconfig_start_config_t
Configure structure for esp_smartconfig_start
```

Public Members

```c
bool enable_log
Enable smartconfig logs.
```

```c
bool esp_touch_v2_enable_crypt
Enable ESPTouch v2 crypt.
```

```c
char* esp_touch_v2_key
ESPTouch v2 crypt key, len should be 16.
```

Macros

```c
SMARTCONFIG_START_CONFIG_DEFAULT ()
```

Enumerations

```c
enum smartconfig_type_t
Values:

SC_TYPE_ESPTOUCH = 0
protocol: ESPTouch
```

```c
SC_TYPE_AIRKISS
protocol: AirKiss
```

```c
SC_TYPE_ESPTOUCH_AIRKISS
protocol: ESPTouch and AirKiss
```

```c
SC_TYPE_ESPTOUCH_V2
protocol: ESPTouch v2
```

```c
enum smartconfig_event_t
Smartconfig event declarations
Values:

SC_EVENT_SCAN_DONE
ESP32 station smartconfig has finished to scan for APs
```

```c
SC_EVENT_FOUND_CHANNEL
ESP32 station smartconfig has found the channel of the target AP
```

```c
SC_EVENT_GOT_SSID_PSWD
ESP32 station smartconfig got the SSID and password
```

```c
SC_EVENT_SEND_ACK_DONE
ESP32 station smartconfig has sent ACK to cellphone
```

ESP-NOW

Overview

ESP-NOW is a kind of connectionless Wi-Fi communication protocol that is defined by Espressif. In ESP-NOW, application data is encapsulated in a vendor-specific action frame and then transmitted from one Wi-Fi device to another without connection. CTR with CBC-MAC Protocol (CCMP) is used to protect the action frame for security. ESP-NOW is widely used in smart light, remote controlling, sensor, etc.
Frame Format  ESP-NOW uses a vendor-specific action frame to transmit ESP-NOW data. The default ESP-NOW bit rate is 1 Mbps. The format of the vendor-specific action frame is as follows:

<table>
<thead>
<tr>
<th>MAC Header</th>
<th>Category Code</th>
<th>Organization Identifier</th>
<th>Random Values</th>
<th>Vendor Specific Content</th>
<th>FCS</th>
</tr>
</thead>
<tbody>
<tr>
<td>24 bytes</td>
<td>1 byte</td>
<td>3 bytes</td>
<td>4 bytes</td>
<td>7-255 bytes</td>
<td>4 bytes</td>
</tr>
</tbody>
</table>

- **Category Code**: The Category Code field is set to the value (127) indicating the vendor-specific category.
- **Organization Identifier**: The Organization Identifier contains a unique identifier (0x18fe34), which is the first three bytes of MAC address applied by Espressif.
- **Random Value**: The Random Value field is used to prevent relay attacks.
- **Vendor Specific Content**: The Vendor Specific Content contains vendor-specific fields as follows:

<table>
<thead>
<tr>
<th>Element ID</th>
<th>Length</th>
<th>Organization Identifier</th>
<th>Type</th>
<th>Version</th>
<th>Body</th>
</tr>
</thead>
<tbody>
<tr>
<td>1 byte</td>
<td>1 byte</td>
<td>3 bytes</td>
<td>1 byte</td>
<td>1 byte</td>
<td>0~250 bytes</td>
</tr>
</tbody>
</table>

- **Element ID**: The Element ID field is set to the value (221), indicating the vendor-specific element.
- **Length**: The length is the total length of Organization Identifier, Type, Version and Body.
- **Organization Identifier**: The Organization Identifier contains a unique identifier (0x18fe34), which is the first three bytes of MAC address applied by Espressif.
- **Type**: The Type field is set to the value (4) indicating ESP-NOW.
- **Version**: The Version field is set to the version of ESP-NOW.
- **Body**: The Body contains the ESP-NOW data.

As ESP-NOW is connectionless, the MAC header is a little different from that of standard frames. The FromDS and ToDS bits of FrameControl field are both 0. The first address field is set to the destination address. The second address field is set to the source address. The third address field is set to broadcast address (0xff:0xff:0xff:0xff:0xff:0xff).

Security

ESP-NOW uses the CCMP method, which is described in IEEE Std. 802.11-2012, to protect the vendor-specific action frame. ESP-NOW maintains a Primary Master Key (PMK) and several Local Master Keys (LMK). The lengths of both PMK and LMK are 16 bytes.

- **PMK**: is used to encrypt LMK with the AES-128 algorithm. Call esp_now_set_pmk() to set PMK. If PMK is not set, a default PMK will be used.
- **LMK of the paired device**: is used to encrypt the vendor-specific action frame with the CCMP method. The maximum number of different LMKs is six. If the LMK of the paired device is not set, the vendor-specific action frame will not be encrypted.

Encrypting multicast vendor-specific action frame is not supported.

Initialization and De-initialization  Call esp_now_init() to initialize ESP-NOW and esp_now_deinit() to de-initialize ESP-NOW. ESP-NOW data must be transmitted after Wi-Fi is started, so it is recommended to start Wi-Fi before initializing ESP-NOW and stop Wi-Fi after de-initializing ESP-NOW. When esp_now_deinit() is called, all of the information of paired devices will be deleted.

Add Paired Device  Call esp_now_add_peer() to add the device to the paired device list before you send data to this device. The maximum number of paired devices is twenty. If security is enabled, the LMK must be set. You can send ESP-NOW data via both the Station and the SoftAP interface. Make sure that the interface is enabled before sending ESP-NOW data. A device with a broadcast MAC address must be added before sending broadcast data. The range of the channel of paired devices is from 0 to 14. If the channel is set to 0, data will be sent on the current channel. Otherwise, the channel must be set as the channel that the local device is on.
Send ESP-NOW Data  Call `esp_now_send()` to send ESP-NOW data and `esp_now_register_send_cb` to register sending callback function. It will return `ESP_NOW_SEND_SUCCESS` in sending callback function if the data is received successfully on the MAC layer. Otherwise, it will return `ESP_NOW_SEND_FAIL`. Several reasons can lead to ESP-NOW fails to send data. For example, the destination device doesn’t exist; the channels of the devices are not the same; the action frame is lost when transmitting on the air, etc. It is not guaranteed that application layer can receive the data. If necessary, send back ack data when receiving ESP-NOW data. If receiving ack data timeouts, retransmit the ESP-NOW data. A sequence number can also be assigned to ESP-NOW data to drop the duplicate data.

If there is a lot of ESP-NOW data to send, call `esp_now_send()` to send less than or equal to 250 bytes of data once a time. Note that too short interval between sending two ESP-NOW data may lead to disorder of sending callback function. So, it is recommended that sending the next ESP-NOW data after the sending callback function of the previous sending has returned. The sending callback function runs from a high-priority Wi-Fi task. So, do not do lengthy operations in the callback function. Instead, post the necessary data to a queue and handle it from a lower priority task.

Receiving ESP-NOW Data  Call `esp_now_register_recv_cb` to register receiving callback function. Call the receiving callback function when receiving ESP-NOW. The receiving callback function also runs from the Wi-Fi task. So, do not do lengthy operations in the callback function. Instead, post the necessary data to a queue and handle it from a lower priority task.

Application Examples
- Example of sending and receiving ESP-NOW data between two devices: `wifi/espnow`.
- For more application examples of how to use ESP-NOW, please visit ESP-NOW repository.

API Reference

Header File
- `components/esp_wifi/include/esp_now.h`

Functions
- `esp_err_t esp_now_init(void)`  
  Initialize ESPNOW function.
  
  Return
  - `ESP_OK` : succeed
  - `ESP_ERR_ESPNOW_INTERNAL` : Internal error

- `esp_err_t esp_now_deinit(void)`  
  De-initialize ESPNOW function.
  
  Return
  - `ESP_OK` : succeed

- `esp_err_t esp_now_get_version(uint32_t *version)`  
  Get the version of ESPNOW.
  
  Return
  - `ESP_OK` : succeed
  - `ESP_ERR_ESPNOW_ARG` : invalid argument

  Parameters
  - `version`: ESPNOW version

- `esp_err_t esp_now_register_recv_cb(esp_now_recv_cb_t cb)`  
  Register callback function of receiving ESPNOW data.
  
  Return
  - `ESP_OK` : succeed
**Chapter 2. API Reference**

### ESP_ERR_ESPNOW_NOT_INIT
- ESPNOW is not initialized

### ESP_ERR_ESPNOW_INTERNAL
- Internal error

#### Parameters
- cb: callback function of receiving ESPNOW data

**esp_err_t esp_now_unregister_recv_cb (void)**
Unregister callback function of receiving ESPNOW data.

**Return**
- ESP_OK: succeed
- ESP_ERR_ESPNOW_NOT_INIT: ESPNOW is not initialized

**esp_err_t esp_now_register_send_cb (esp_now_send_cb_t cb)**
Register callback function of sending ESPNOW data.

**Return**
- ESP_OK: succeed
- ESP_ERR_ESPNOW_NOT_INIT: ESPNOW is not initialized
- ESP_ERR_ESPNOW_INTERNAL: internal error

#### Parameters
- cb: callback function of sending ESPNOW data

**esp_err_t esp_now_unregister_send_cb (void)**
Unregister callback function of sending ESPNOW data.

**Return**
- ESP_OK: succeed
- ESP_ERR_ESPNOW_NOT_INIT: ESPNOW is not initialized

**esp_err_t esp_now_send (const uint8_t *peer_addr, const uint8_t *data, size_t len)**
Send ESPNOW data.

**Attention**
1. If peer_addr is not NULL, send data to the peer whose MAC address matches peer_addr
2. If peer_addr is NULL, send data to all of the peers that are added to the peer list
3. The maximum length of data must be less than ESP_NOW_MAX_DATA_LEN
4. The buffer pointed to by data argument does not need to be valid after esp_now_send returns

**Return**
- ESP_OK: succeed
- ESP_ERR_ESPNOW_NOT_INIT: ESPNOW is not initialized
- ESP_ERR_ESPNOW_ARG: invalid argument
- ESP_ERR_ESPNOW_INTERNAL: internal error
- ESP_ERR_ESPNOW_NO_MEM: out of memory
- ESP_ERR_ESPNOW_NOT_FOUND: peer is not found
- ESP_ERR_ESPNOW_IF: current WiFi interface doesn’t match that of peer

#### Parameters
- peer_addr: peer MAC address
- data: data to send
- len: length of data

**esp_err_t esp_now_add_peer (const esp_now_peer_info_t *peer)**
Add a peer to peer list.

**Return**
- ESP_OK: succeed
- ESP_ERR_ESPNOW_NOT_INIT: ESPNOW is not initialized
- ESP_ERR_ESPNOW_ARG: invalid argument
- ESP_ERR_ESPNOW_INTERNAL: internal error
- ESP_ERR_ESPNOW_FULL: peer list is full
- ESP_ERR_ESPNOW_NO_MEM: out of memory
- ESP_ERR_ESPNOW_EXIST: peer has existed

#### Parameters
- peer: peer information

**esp_err_t esp_now_del_peer (const uint8_t *peer_addr)**
Delete a peer from peer list.
Return
• ESP_OK: succeed
• ESP_ERR_ESPNOW_NOT_INIT: ESPNOW is not initialized
• ESP_ERR_ESPNOW_ARG: invalid argument
• ESP_ERR_ESPNOW_NOT_FOUND: peer is not found

Parameters
• peer_addr: peer MAC address

`esp_err_t esp_now_mod_peer(const esp_now_peer_info_t *peer)`
Modify a peer.

Return
• ESP_OK: succeed
• ESP_ERR_ESPNOW_NOT_INIT: ESPNOW is not initialized
• ESP_ERR_ESPNOW_ARG: invalid argument
• ESP_ERR_ESPNOW_FULL: peer list is full

Parameters
• peer: peer information

`esp_err_t esp_now_get_peer(const uint8_t *peer_addr, esp_now_peer_info_t *peer)`
Get a peer whose MAC address matches peer_addr from peer list.

Return
• ESP_OK: succeed
• ESP_ERR_ESPNOW_NOT_INIT: ESPNOW is not initialized
• ESP_ERR_ESPNOW_ARG: invalid argument
• ESP_ERR_ESPNOW_NOT_FOUND: peer is not found

Parameters
• peer_addr: peer MAC address
• peer: peer information

`esp_err_t esp_now_fetch_peer(bool from_head, esp_now_peer_info_t *peer)`
Fetch a peer from peer list. Only return the peer which address is unicast, for the multicast/broadcast address, the function will ignore and try to find the next in the peer list.

Return
• ESP_OK: succeed
• ESP_ERR_ESPNOW_NOT_INIT: ESPNOW is not initialized
• ESP_ERR_ESPNOW_ARG: invalid argument
• ESP_ERR_ESPNOW_NOT_FOUND: peer is not found

Parameters
• from_head: fetch from head of list or not
• peer: peer information

`bool esp_now_is_peer_exist(const uint8_t *peer_addr)`
Peer exists or not.

Return
• true: peer exists
• false: peer not exists

Parameters
• peer_addr: peer MAC address

`esp_err_t esp_now_get_peer_num(esp_now_peer_num_t *num)`
Get the number of peers.

Return
• ESP_OK: succeed
• ESP_ERR_ESPNOW_NOT_INIT: ESPNOW is not initialized
• ESP_ERR_ESPNOW_ARG: invalid argument

Parameters
• num: number of peers
**esp_err_t esp_now_set_pmk(const uint8_t *pmk)**

Set the primary master key.

**Attention** 1. primary master key is used to encrypt local master key

**Return**
- ESP_OK: succeed
- ESP_ERR_ESPNOW_NOT_INIT: ESPNOW is not initialized
- ESP_ERR_ESPNOW_ARG: invalid argument

**Parameters**
- pmk: primary master key

**esp_err_t esp_now_set_wake_window(uint16_t window)**

Set esp_now wake window for sta_disconnected power management.

**Attention** 1. Only when ESP_WIFI_STA_DISCONNECTED_PM_ENABLE is enabled, this configuration could work

**Attention** 2. This configuration only work for station mode and disconnected status

**Attention** 3. If more than one module has configured its wake_window, chip would choose the largest one to stay waked

**Attention** 4. If the gap between interval and window is smaller than 5ms, the chip would keep waked all the time

**Attention** 5. If never configured wake_window, the chip would keep waked at disconnected once it uses esp_now

**Return**
- ESP_OK: succeed
- ESP_ERR_ESPNOW_NOT_INIT: ESPNOW is not initialized

**Parameters**
- window: how much microsecond would the chip keep waked each interval, vary from 0 to 65535

**Structures**

**struct esp_now_peer_info**

ESPNOW peer information parameters.

**Public Members**

```c
uint8_t peer_addr[ESP_NOW_ETH_ALEN]
    ESPNOW peer MAC address that is also the MAC address of station or softap
uint8_t lmk[ESP_NOW_KEY_LEN]
    ESPNOW peer local master key that is used to encrypt data
uint8_t channel
    Wi-Fi channel that peer uses to send/receive ESPNOW data. If the value is 0, use the current channel which station or softap is on. Otherwise, it must be set as the channel that station or softap is on.

wifi_interface_t ifidx
    Wi-Fi interface that peer uses to send/receive ESPNOW data

bool encrypt
    ESPNOW data that this peer sends/receives is encrypted or not

void *priv
    ESPNOW peer private data
```

**struct esp_now_peer_num**

Number of ESPNOW peers which exist currently.

**Public Members**

```c
int total_num
    Total number of ESPNOW peers, maximum value is ESP_NOW_MAX_TOTAL_PEER_NUM
```
int encrypt_num
   Number of encrypted ESPNOW peers, maximum value is ESP_NOW_MAX_ENCRYPT_PEER_NUM

Macros
ESP_ERR_ESPNOW_BASE
   ESPNOW error number base.
ESP_ERR_ESPNOW_NOT_INIT
   ESPNOW is not initialized.
ESP_ERR_ESPNOW_ARG
   Invalid argument
ESP_ERR_ESPNOW_NO_MEM
   Out of memory
ESP_ERR_ESPNOW_FULL
   ESPNOW peer list is full
ESP_ERR_ESPNOW_NOT_FOUND
   ESPNOW peer is not found
ESP_ERR_ESPNOW_INTERNAL
   Internal error
ESP_ERR_ESPNOW_EXIST
   ESPNOW peer has existed
ESP_ERR_ESPNOW_IF
   Interface error
ESP_NOW_ETH_ALEN
   Length of ESPNOW peer MAC address
ESP_NOW_KEY_LEN
   Length of ESPNOW peer local master key
ESP_NOW_MAX_TOTAL_PEER_NUM
   Maximum number of ESPNOW total peers
ESP_NOW_MAX_ENCRYPT_PEER_NUM
   Maximum number of ESPNOW encrypted peers
ESP_NOW_MAX_DATA_LEN
   Maximum length of ESPNOW data which is sent very time

Type Definitions
typedef struct esp_now_peer_info esp_now_peer_info_t
   ESPNOW peer information parameters.
typedef struct esp_now_peer_num esp_now_peer_num_t
   Number of ESPNOW peers which exist currently.
typedef void (*esp_now_recv_cb_t)(const uint8_t *mac_addr, const uint8_t *data, int data_len)
   Callback function of receiving ESPNOW data.
   Parameters
      • mac_addr: peer MAC address
      • data: received data
      • data_len: length of received data
typedef void (*esp_now_send_cb_t)(const uint8_t *mac_addr, esp_now_send_status_t status)
   Callback function of sending ESPNOW data.
   Parameters
      • mac_addr: peer MAC address
Chapter 2. API Reference

- **status**: status of sending ESPNOW data (succeed or fail)

**Enumerations**

```c
enum esp_now_send_status_t
{
    ESP_NOW_SEND_SUCCESS = 0,  // Send ESPNOW data successfully
    ESP_NOW_SEND_FAIL         // Send ESPNOW data fail
};
```

**ESP-WIFI-MESH Programming Guide**

This is a programming guide for ESP-WIFI-MESH, including the API reference and coding examples. This guide is split into the following parts:

1. **ESP-WIFI-MESH Programming Model**
2. **Writing an ESP-WIFI-MESH Application**
3. **Self Organized Networking**
4. **Application Examples**
5. **API Reference**

For documentation regarding the ESP-WIFI-MESH protocol, please see the **ESP-WIFI-MESH API Guide**. For more information about ESP-WIFI-MESH Development Framework, please see **ESP-WIFI-MESH Development Framework**.

**ESP-WIFI-MESH Programming Model**

**Software Stack** The ESP-WIFI-MESH software stack is built atop the Wi-Fi Driver/FreeRTOS and may use the LwIP Stack in some instances (i.e. the root node). The following diagram illustrates the ESP-WIFI-MESH software stack.

![ESP-WIFI-MESH Software Stack](image)

**System Events** An application interfaces with ESP-WIFI-MESH via **ESP-WIFI-MESH Events**. Since ESP-WIFI-MESH is built atop the Wi-Fi stack, it is also possible for the application to interface with the Wi-Fi driver via the **Wi-Fi Event Task**. The following diagram illustrates the interfaces for the various System Events in an ESP-WIFI-MESH application.
The `mesh_event_id_t` defines all possible ESP-WIFI-MESH events and can indicate events such as the connection/disconnection of parent/child. Before ESP-WIFI-MESH events can be used, the application must register a Mesh Events handler via `esp_event_handler_register()` to the default event task. The Mesh Events handler that is registered contain handlers for each ESP-WIFI-MESH event relevant to the application.

Typical use cases of mesh events include using events such as `MESH_EVENT_PARENT_CONNECTED` and `MESH_EVENT_CHILD_CONNECTED` to indicate when a node can begin transmitting data upstream and downstream respectively. Likewise, `IP_EVENT_STA_GOT_IP` and `IP_EVENT_STA_LOST_IP` can be used to indicate when the root node can and cannot transmit data to the external IP network.

**Warning:** When using ESP-WIFI-MESH under self-organized mode, users must ensure that no calls to Wi-Fi API are made. This is due to the fact that the self-organizing mode will internally make Wi-Fi API calls to connect/disconnect/scan etc. **Any Wi-Fi calls from the application (including calls from callbacks and handlers of Wi-Fi events) may interfere with ESP-WIFI-MESH’s self-organizing behavior.** Therefore, user’s should not call Wi-Fi APIs after `esp_mesh_start()` is called, and before `esp_mesh_stop()` is called.

**LwIP & ESP-WIFI-MESH** The application can access the ESP-WIFI-MESH stack directly without having to go through the LwIP stack. The LwIP stack is only required by the root node to transmit/receive data to/from an external IP network. However, since every node can potentially become the root node (due to automatic root node selection), each node must still initialize the LwIP stack.

**Each node is required to initialize LwIP by calling** `tcpip_adapter_init()`. In order to prevent non-root node access to LwIP, the application should stop the following services after LwIP initialization:

- DHCP server service on the softAP interface.
- DHCP client service on the station interface.

The following code snippet demonstrates how to initialize LwIP for ESP-WIFI-MESH applications.

```c
/* tcpip initialization */
tcpip_adapter_init();
/*
 * for mesh
 * stop DHCP server on softAP interface by default
 * stop DHCP client on station interface by default
 */
ESP_ERROR_CHECK(tcpip_adapter_dhcps_stop(TCPIP_ADAPTER_IF_AP));
ESP_ERROR_CHECK(tcpip_adapter_dhcpc_stop(TCPIP_ADAPTER_IF_STA));
```

**Note:** ESP-WIFI-MESH requires a root node to be connected with a router. Therefore, in the event that a node becomes the root, the corresponding handler must start the DHCP client service and immediately obtain an
**IP address.** Doing so will allow other nodes to begin transmitting/receiving packets to/from the external IP network. However, this step is unnecessary if static IP settings are used.

**Writing an ESP-WIFI-MESH Application** The prerequisites for starting ESP-WIFI-MESH is to initialize LwIP and Wi-Fi. The following code snippet demonstrates the necessary prerequisite steps before ESP-WIFI-MESH itself can be initialized.

```c
#include <tcpip_adapter.h>
#include <lwip/dhcp.h>
#include <lwip/netif.h>
#include <lwip/sockets.h>
#include <lwip/wifi.h>

void tcpip_adapter_init()
{
    tcpip_adapter_dhcps_stop(TCPIP_ADAPTER_IF_AP);
    tcpip_adapter_dhcpc_stop(TCPIP_ADAPTER_IF_STA);
    wifi_init_config_t config = WIFI_INIT_CONFIG_DEFAULT();
    esp_wifi_init(&config);
    esp_event_handler_register(IP_EVENT, IP_EVENT_STA_GOT_IP, &ip_event_handler, NULL);
    esp_wifi_set_storage(WIFI_STORAGE_FLASH);
    esp_wifi_start();
}
```

After initializing LwIP and Wi-Fi, the process of getting an ESP-WIFI-MESH network up and running can be summarized into the following three steps:

1. **Initialize Mesh**
2. **Configuring an ESP-WIFI-MESH Network**
3. **Start Mesh**

**Initialize Mesh** The following code snippet demonstrates how to initialize ESP-WIFI-MESH

```c
#include <esp_mesh_api.h>

void mesh_init()
{
    esp_event_handler_register(MESH_EVENT, ESP_EVENT_ANY_ID, &mesh_event_handler, NULL);
}
```

**Configuring an ESP-WIFI-MESH Network** ESP-WIFI-MESH is configured via `esp_mesh_set_config()` which receives its arguments using the `mesh_cfg_t` structure. The structure contains the following parameters used to configure ESP-WIFI-MESH:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Channel</td>
<td>Range from 1 to 14</td>
</tr>
<tr>
<td>Mesh ID</td>
<td>ID of ESP-WIFI-MESH Network, see <code>mesh_addr_t</code></td>
</tr>
<tr>
<td>Router</td>
<td>Router Configuration, see <code>mesh_router_t</code></td>
</tr>
<tr>
<td>Mesh AP</td>
<td>Mesh AP Configuration, see <code>mesh_ap_cfg_t</code></td>
</tr>
<tr>
<td>Crypto Functions</td>
<td>Crypto Functions for Mesh IE, see <code>mesh_crypto_funcs_t</code></td>
</tr>
</tbody>
</table>

The following code snippet demonstrates how to configure ESP-WIFI-MESH.
/* Enable the Mesh IE encryption by default */
mesh_cfg_t cfg = MESH_INIT_CONFIG_DEFAULT();
/* mesh ID */
memcpy((uint8_t *)&cfg.mesh_id, MESH_ID, 6);
/* channel (must match the router’s channel) */
cfg.channel = CONFIG_MESH_CHANNEL;
/* router */
cfg.router.ssid_len = strlen(CONFIG_MESH_ROUTER_SSID);
memcpy((uint8_t *)&cfg.router.ssid, CONFIG_MESH_ROUTER_SSID,
cfg.router.ssid_len);
memcpy((uint8_t *)&cfg.router.password, CONFIG_MESH_ROUTER_PASSWD,
strlen(CONFIG_MESH_ROUTER_PASSWD));
/* mesh softAP */
cfg.mesh_ap.max_connection = CONFIG_MESH_AP_CONNECTIONS;
memcpy((uint8_t *)&cfg.mesh_ap.password, CONFIG_MESH_AP_PASSWD,
strlen(CONFIG_MESH_AP_PASSWD));
ESP_ERROR_CHECK(esp_mesh_set_config(&cfg));

Start Mesh The following code snippet demonstrates how to start ESP-WIFI-MESH.

/* mesh start */
ESP_ERROR_CHECK(esp_mesh_start());

After starting ESP-WIFI-MESH, the application should check for ESP-WIFI-MESH events to determine when it has connected to the network. After connecting, the application can start transmitting and receiving packets over the ESP-WIFI-MESH network using esp_mesh_send() and esp_mesh_recv().

Self Organized Networking Self organized networking is a feature of ESP-WIFI-MESH where nodes can autonomously scan/select/connect/reconnect to other nodes and routers. This feature allows an ESP-WIFI-MESH network to operate with high degree of autonomy by making the network robust to dynamic network topologies and conditions. With self organized networking enabled, nodes in an ESP-WIFI-MESH network are able to carry out the following actions without autonomously:

- Selection or election of the root node (see Automatic Root Node Selection in Building a Network)
- Selection of a preferred parent node (see Parent Node Selection in Building a Network)
- Automatic reconnection upon detecting a disconnection (see Intermediate Parent Node Failure in Managing a Network)

When self organized networking is enabled, the ESP-WIFI-MESH stack will internally make calls to Wi-Fi APIs. Therefore, the application layer should not make any calls to Wi-Fi APIs whilst self organized networking is enabled as doing so would risk interfering with ESP-WIFI-MESH.

Toggling Self Organized Networking Self organized networking can be enabled or disabled by the application at runtime by calling the esp_mesh_set_self_organized() function. The function has the two following parameters:

- bool enable specifies whether to enable or disable self organized networking.
- bool select_parent specifies whether a new parent node should be selected when enabling self organized networking. Selecting a new parent has different effects depending the node type and the node’s current state. This parameter is unused when disabling self organized networking.

Disabling Self Organized Networking The following code snippet demonstrates how to disable self organized networking.

//Disable self organized networking
esp_mesh_set_self_organized(false, false);

ESP-WIFI-MESH will attempt to maintain the node’s current Wi-Fi state when disabling self organized networking.
• If the node was previously connected to other nodes, it will remain connected.
• If the node was previously disconnected and was scanning for a parent node or router, it will stop scanning.
• If the node was previously attempting to reconnect to a parent node or router, it will stop reconnecting.

Enabling Self Organized Networking  ESP-WIFI-MESH will attempt to maintain the node’s current Wi-Fi state when enabling self organized networking. However, depending on the node type and whether a new parent is selected, the Wi-Fi state of the node can change. The following table shows effects of enabling self organized networking.

<table>
<thead>
<tr>
<th>Select Parent</th>
<th>Is Root Node</th>
<th>Effects</th>
</tr>
</thead>
</table>
| N             | N            | • Nodes already connected to a parent node will remain connected.  
|               |              | • Nodes previously scanning for a parent node will stop scanning. Call \texttt{esp\_mesh\_connect()} to restart. |
| Y             |              | • A root node already connected to router will stay connected.  
|               |              | • A root node disconnected from router will need to call \texttt{esp\_mesh\_connect()} to reconnect. |
| Y             | N            | • Nodes without a parent node will automatically select a preferred parent and connect.  
|               |              | • Nodes already connected to a parent node will disconnect, reselect a preferred parent node, and connect. |
| Y             |              | • For a root node to connect to a parent node, it must give up its role as root. Therefore, a root node will disconnect from the router and all child nodes, select a preferred parent node, and connect. |

The following code snippet demonstrates how to enable self organized networking.

```c
//Enable self organized networking and select a new parent
esp_mesh_set_self_organized(true, true);
...

//Enable self organized networking and manually reconnect
esp_mesh_set_self_organized(true, false);
esp_mesh_connect();
```
Calling Wi-Fi API  There can be instances in which an application may want to directly call Wi-Fi API whilst using ESP-WIFI-MESH. For example, an application may want to manually scan for neighboring APs. However, self organized networking must be disabled before the application calls any Wi-Fi APIs. This will prevent the ESP-WIFI-MESH stack from attempting to call any Wi-Fi APIs and potentially interfering with the application’s calls.

Therefore, application calls to Wi-Fi APIs should be placed in between calls of `esp_mesh_set_self_organized()` which disable and enable self organized networking. The following code snippet demonstrates how an application can safely call `esp_wifi_scan_start()` whilst using ESP-WIFI-MESH.

```c
//Disable self organized networking
esp_mesh_set_self_organized(0, 0);

//Stop any scans already in progress
esp_wifi_scan_stop();

//Manually start scan. Will automatically stop when run to completion
esp_wifi_scan_start();

//Process scan results
...

//Re-enable self organized networking if still connected
esp_mesh_set_self_organized(1, 0);
...

//Re-enable self organized networking if non-root and disconnected
esp_mesh_set_self_organized(1, 1);
...

//Re-enable self organized networking if root and disconnected
esp_mesh_set_self_organized(1, 0); //Don't select new parent
esp_mesh_connect(); //Manually reconnect to router
```

Application Examples  ESP-IDF contains these ESP-WIFI-MESH example projects:

The Internal Communication Example demonstrates how to set up a ESP-WIFI-MESH network and have the root node send a data packet to every node within the network.

The Manual Networking Example demonstrates how to use ESP-WIFI-MESH without the self-organizing features. This example shows how to program a node to manually scan for a list of potential parent nodes and select a parent node based on custom criteria.

API Reference

Header File

- `components/esp_wifi/include/esp_mesh.h`

Functions

- `esp_err_t esp_mesh_init (void)`
  Mesh initialization.
  
  - Check whether Wi-Fi is started.
  - Initialize mesh global variables with default values.

  **Attention** This API shall be called after Wi-Fi is started.
**Chapter 2. API Reference**

**Return**
- ESP_OK
- ESP_FAIL

`esp_err_t esp_mesh_deinit(void)`
Mesh de-initialization.
- Release resources and stop the mesh

**Return**
- ESP_OK
- ESP_FAIL

`esp_err_t esp_mesh_start(void)`
Start mesh.
- Initialize mesh IE.
- Start mesh network management service.
- Create TX and RX queues according to the configuration.
- Register mesh packets receive callback.

**Attention**
This API shall be called after mesh initialization and configuration.

**Return**
- ESP_OK
- ESP_FAIL
- ESP_ERR_MESH_NOT_INIT
- ESP_ERR_MESH_NOT_CONFIG
- ESP_ERR_MESH_NO_MEMORY

`esp_err_t esp_mesh_stop(void)`
Stop mesh.
- Deinitialize mesh IE.
- Disconnect with current parent.
- Disassociate all currently associated children.
- Stop mesh network management service.
- Unregister mesh packets receive callback.
- Delete TX and RX queues.
- Release resources.
- Restore Wi-Fi softAP to default settings if Wi-Fi dual mode is enabled.
- Set Wi-Fi Power Save type to WIFI_PS_NONE.

**Return**
- ESP_OK
- ESP_FAIL

`esp_err_t esp_mesh_send(const mesh_addr_t *to, const mesh_data_t *data, int flag, const mesh_opt_t opt[], int opt_count)`
Send a packet over the mesh network.
- Send a packet to any device in the mesh network.
- Send a packet to external IP network.

**Attention**
This API is not reentrant.

**Return**
- ESP_OK
- ESP_FAIL
- ESP_ERR_MESH_ARGUMENT
- ESP_ERR_MESH_NOT_START
- ESP_ERR_MESH_DISCONNECTED
- ESP_ERR_MESH_OPT_UNKNOWN
- ESP_ERR_MESH_EXCEED_MTU
- ESP_ERR_MESH_NO_MEMORY
- ESP_ERR_MESH_TIMEOUT
Chapter 2. API Reference

- ESP_ERR_MESH_QUEUE_FULL
- ESP_ERR_MESH_NO_ROUTE_FOUND
- ESP_ERR_MESH_DISCARD

**Parameters**

- **[in]** `to`: the address of the final destination of the packet
  - If the packet is to the root, set this parameter to NULL.
  - If the packet is to an external IP network, set this parameter to the IPv4:PORT combination.
    This packet will be delivered to the root firstly, then the root will forward this packet to the final IP server address.
- **[in]** `data`: pointer to a sending mesh packet
  - Field size should not exceed MESH_MPS. Note that the size of one mesh packet should not exceed MESH_MTU.
  - Field proto should be set to data protocol in use (default is MESH_PROTO_BIN for binary).
  - Field tos should be set to transmission tos (type of service) in use (default is MESH_TOS_P2P for point-to-point reliable).
- **[in]** `flag`: bitmap for data sent
  - Speed up the route search
    - If the packet is to the root and “to” parameter is NULL, set this parameter to 0.
    - If the packet is to an internal device, MESH_DATA_P2P should be set.
    - If the packet is to the root (“to” parameter isn’t NULL) or to external IP network, MESH_DATA_TODS should be set.
    - If the packet is from the root to an internal device, MESH_DATA_FROMDS should be set.
  - Specify whether this API is block or non-block, block by default
    - If needs non-blocking, MESH_DATA_NONBLOCK should be set. Otherwise, may use esp_mesh_send_block_time() to specify a blocking time.
  - In the situation of the root change, MESH_DATA_DROP identifies this packet can be dropped by the new root for upstream data to external IP network, we try our best to avoid data loss caused by the root change, but there is a risk that the new root is running out of memory because most of memory is occupied by the pending data which isn’t read out in time by esp_mesh_recv_toDS(). Generally, we suggest esp_mesh_recv_toDS() is called after a connection with IP network is created. Thus data outgoing to external IP network via socket is just from reading esp_mesh_recv_toDS() which avoids unnecessary memory copy.
- **[in]** `opt`: options
  - In case of sending a packet to a certain group, MESH_OPT_SEND_GROUP is a good choice. In this option, the value field should be set to the target receiver addresses in this group.
  - Root sends a packet to an internal device, this packet is from external IP network in case the receiver device responds this packet, MESH_OPT_RECV_DS_ADDR is required to attach the target DS address.
- **[in]** `opt_count`: option count
  - Currently, this API only takes one option, so `opt_count` is only supported to be 1.

```c
esp_err_t esp_mesh_send_block_time (uint32_t time_ms)
```

Set blocking time of esp_mesh_send()

**Attention** This API shall be called before mesh is started.

**Return**

- ESP_OK

**Parameters**

- **[in]** `time_ms`: blocking time of esp_mesh_send(), unit: ms

```c
esp_err_t esp_mesh_recv (mesh_addr_t *from, mesh_data_t *data, int timeout_ms, int *flag, mesh_opt_t opt[], int opt_count)
```

Receive a packet targeted to self over the mesh network.

**flag** could be MESH_DATA_FROMDS or MESH_DATA_TODS.

**Attention** Mesh RX queue should be checked regularly to avoid running out of memory.

- Use esp_mesh_get_rx_pending() to check the number of packets available in the queue waiting to be received by applications.

**Return**

- ESP_OK
• ESP_ERR_MESH_ARGUMENT
• ESP_ERR_MESH_NOT_START
• ESP_ERR_MESH_TIMEOUT
• ESP_ERR_MESH_DISCARD

Parameters

• [out] from: the address of the original source of the packet
• [out] data: pointer to the received mesh packet
  – Field proto is the data protocol in use. Should follow it to parse the received data.
  – Field tos is the transmission tos (type of service) in use.
• [in] timeout_ms: wait time if a packet isn’t immediately available (0: no wait, port-MAX_DELAY: wait forever)
• [out] flag: bitmap for data received
  – MESH_DATA_FROMDS represents data from external IP network
  – MESH_DATA_TODS represents data directed upward within the mesh network

Parameters

• [out] opt: options desired to receive
  – MESH_OPT_RECV_DS_ADDR attaches the DS address
• [in] opt_count: option count desired to receive
  – Currently, this API only takes one option, so opt_count is only supported to be 1.

 esp_err_t esp_mesh_recv_toDS(mesh_addr_t *from, mesh_addr_t *to, mesh_data_t *data, int timeout_ms, int* flag, mesh_opt_t opt[], int opt_count)

Receive a packet targeted to external IP network.

• Root uses this API to receive packets destined to external IP network
• Root forwards the received packets to the final destination via socket.
• If no socket connection is ready to send out the received packets and this esp_mesh_recv_toDS() hasn’t been called by applications, packets from the whole mesh network will be pending in toDS queue.

Use esp_mesh_get_rx_pending() to check the number of packets available in the queue waiting to be received by applications in case of running out of memory in the root.

Using esp_mesh_set_xon_qsize() users may configure the RX queue size, default:32. If this size is too large, and esp_mesh_recv_toDS() isn’t called in time, there is a risk that a great deal of memory is occupied by the pending packets. If this size is too small, it will impact the efficiency on upstream. How to decide this value depends on the specific application scenarios.

flag could be MESH_DATA_TODS.

Attention  This API is only called by the root.

Return

• ESP_OK
• ESP_ERR_MESH_ARGUMENT
• ESP_ERR_MESH_NOT_START
• ESP_ERR_MESH_TIMEOUT
• ESP_ERR_MESH_DISCARD
• ESP_ERR_MESH_RECV_RELEASE

Parameters

• [out] from: the address of the original source of the packet
• [out] to: the address contains remote IP address and port (IPv4:PORT)
• [out] data: pointer to the received packet
  – Contain the protocol and applications should follow it to parse the data.
• [in] timeout_ms: wait time if a packet isn’t immediately available (0: no wait, port-MAX_DELAY: wait forever)
• [out] flag: bitmap for data received
  – MESH_DATA_TODS represents the received data target to external IP network. Root shall forward this data to external IP network via the association with router.

Parameters

• [out] opt: options desired to receive
• [in] opt_count: option count desired to receive

 esp_err_t esp_mesh_set_config(const mesh_cfg_t *config)
Set mesh stack configuration.

- Use MESH_INIT_CONFIG_DEFAULT() to initialize the default values, mesh IE is encrypted by default.
- Mesh network is established on a fixed channel (1-14).
- Mesh event callback is mandatory.
- Mesh ID is an identifier of an MBSS. Nodes with the same mesh ID can communicate with each other.
- Regarding to the router configuration, if the router is hidden, BSSID field is mandatory.

If BSSID field isn’t set and there exists more than one router with same SSID, there is a risk that more roots than one connected with different BSSID will appear. It means more than one mesh network is established with the same mesh ID.

Root conflict function could eliminate redundant roots connected with the same BSSID, but couldn’t handle roots connected with different BSSID. Because users might have such requirements of setting up routers with same SSID for the future replacement. But in that case, if the above situations happen, please make sure applications implement forward functions on the root to guarantee devices in different mesh networks can communicate with each other. max_connection of mesh softAP is limited by the max number of Wi-Fi softAP supported (max:10).

**Attention** This API shall be called before mesh is started after mesh is initialized.

**Return**
- ESP_OK
- ESP_ERR_MESH_ARGUMENT
- ESP_ERR_MESH_NOT_ALLOWED

**Parameters**
- `[in] config`: pointer to mesh stack configuration

```c
esp_err_t esp_mesh_get_config(mesh_cfg_t *config)
```
Get mesh stack configuration.

**Return**
- ESP_OK
- ESP_ERR_MESH_ARGUMENT

**Parameters**
- `[out] config`: pointer to mesh stack configuration

```c
esp_err_t esp_mesh_set_router(const mesh_router_t *router)
```
Get router configuration.

**Attention** This API is used to dynamically modify the router configuration after mesh is configured.

**Return**
- ESP_OK
- ESP_ERR_MESH_ARGUMENT

**Parameters**
- `[in] router`: pointer to router configuration

```c
esp_err_t esp_mesh_get_router(mesh_router_t *router)
```
Get router configuration.

**Return**
- ESP_OK
- ESP_ERR_MESH_ARGUMENT

**Parameters**
- `[out] router`: pointer to router configuration

```c
esp_err_t esp_mesh_set_id(const mesh_addr_t *id)
```
Set mesh network ID.

**Attention** This API is used to dynamically modify the mesh network ID.

**Return**
- ESP_OK
- ESP_ERR_MESH_ARGUMENT: invalid argument

**Parameters**
- `[in] id`: pointer to mesh network ID
Chapter 2. API Reference

• [in] id: pointer to mesh network ID

```
esp_err_t esp_mesh_get_id(mesh_addr_t *id)
```

Get mesh network ID.

Return
• ESP_OK
• ESP_ERR_MESH_ARGUMENT

Parameters
• [out] id: pointer to mesh network ID

```
esp_err_t esp_mesh_set_type(mesh_type_t type)
```

Designate device type over the mesh network.

• MESH_IDLE: designates a device as a self-organized node for a mesh network
• MESH_ROOT: designates the root node for a mesh network
• MESH_LEAF: designates a device as a standalone Wi-Fi station that connects to a parent
• MESH_STA: designates a device as a standalone Wi-Fi station that connects to a router

Return
• ESP_OK
• ESP_ERR_MESH_NOT_ALLOWED

Parameters
• [in] type: device type

```
mesh_type_t esp_mesh_get_type(void)
```

Get device type over mesh network.

Attention This API shall be called after having received the event MESH_EVENT_PARENT_CONNECTED.

Return mesh type

```
esp_err_t esp_mesh_set_max_layer(int max_layer)
```

Set network max layer value.

• for tree topology, the max is 25.
  • for chain topology, the max is 1000.
  • Network max layer limits the max hop count.

Attention This API shall be called before mesh is started.

Return
• ESP_OK
• ESP_ERR_MESH_ARGUMENT
• ESP_ERR_MESH_NOT_ALLOWED

Parameters
• [in] max_layer: max layer value

```
int esp_mesh_get_max_layer(void)
```

Get max layer value.

Return max layer value

```
esp_err_t esp_mesh_set_ap_password(const uint8_t *pwd, int len)
```

Set mesh softAP password.

Attention This API shall be called before mesh is started.

Return
• ESP_OK
• ESP_ERR_MESH_ARGUMENT
• ESP_ERR_MESH_NOT_ALLOWED

Parameters
• [in] pwd: pointer to the password
• [in] len: password length

```
esp_err_t esp_mesh_set_ap_authmode(wifi_auth_mode_t authmode)
```

Set mesh softAP authentication mode.
Attention This API shall be called before mesh is started.

**Return**

- ESP_OK
- ESP_ERR_MESH_ARGUMENT
- ESP_ERR_MESH_NOT_ALLOWED

**Parameters**

- ![in] authmode: authentication mode

```c
wifi_auth_mode_t esp_mesh_get_ap_authmode (void)
```

Get mesh softAP authentication mode.

**Return** authentication mode

```c
esp_err_t esp_mesh_set_ap_connections (int connections)
```

Set mesh max connection value.

- Set mesh softAP max connection = mesh max connection + non-mesh max connection

Attention This API shall be called before mesh is started.

**Return**

- ESP_OK
- ESP_ERR_MESH_ARGUMENT

**Parameters**

- ![in] connections: the number of max connections

```c
int esp_mesh_get_ap_connections (void)
```

Get mesh max connection configuration.

**Return** the number of mesh max connections

```c
int esp_mesh_get_non_mesh_connections (void)
```

Get non-mesh max connection configuration.

**Return** the number of non-mesh max connections

```c
int esp_mesh_get_layer (void)
```

Get current layer value over the mesh network.

Attention This API shall be called after having received the event MESH_EVENT_PARENT_CONNECTED.

**Return** layer value

```c
esp_err_t esp_mesh_get_parent_bssid (mesh_addr_t *bssid)
```

Get the parent BSSID.

Attention This API shall be called after having received the event MESH_EVENT_PARENT_CONNECTED.

**Return**

- ESP_OK
- ESP_FAIL

**Parameters**

- ![out] bssid: pointer to parent BSSID

```c
bool esp_mesh_is_root (void)
```

Return whether the device is the root node of the network.

**Return** true/false

```c
esp_err_t esp_mesh_set_self_organized (bool enable, bool select_parent)
```

Enable/disable self-organized networking.

- Self-organized networking has three main functions: select the root node; find a preferred parent; initiate reconnection if a disconnection is detected.
- Self-organized networking is enabled by default.
- If self-organized is disabled, users should set a parent for the device via esp_mesh_set_parent().

Attention This API is used to dynamically modify whether to enable the self organizing.
Return
• ESP_OK
• ESP_FAIL

Parameters
• [in] enable: enable or disable self-organized networking
• [in] select_parent: Only valid when self-organized networking is enabled.
  – if select_parent is set to true, the root will give up its mesh root status and search for a new
    parent like other non-root devices.

bool esp_mesh_get_self_organized (void)
Return whether enable self-organized networking or not.

Return true/false

esp_err_t esp_mesh_waive_root (const mesh_vote_t *vote, int reason)
Cause the root device to give up (waive) its mesh root status.

• A device is elected root primarily based on RSSI from the external router.
• If external router conditions change, users can call this API to perform a root switch.
• In this API, users could specify a desired root address to replace itself or specify an attempts value to
  ask current root to initiate a new round of voting. During the voting, a better root candidate would be
  expected to find to replace the current one.
• If no desired root candidate, the vote will try a specified number of attempts (at least 15). If no better
  root candidate is found, keep the current one. If a better candidate is found, the new better one will send
  a root switch request to the current root, current root will respond with a root switch acknowledgment.
• After that, the new candidate will connect to the router to be a new root, the previous root will disconnect
  with the router and choose another parent instead.

Root switch is completed with minimal disruption to the whole mesh network.

Attention This API is only called by the root.

Return
• ESP_OK
• ESP_FAIL

Parameters
• [in] vote: vote configuration
  – If this parameter is set NULL, the vote will perform the default 15 times.
  – Field percentage threshold is 0.9 by default.
  – Field is_rc_specified shall be false.
  – Field attempts shall be at least 15 times.
• [in] reason: only accept MESH_VOTE_REASON_ROOT_INITIATED for now

esp_err_t esp_mesh_set_vote_percentage (float percentage)
Set vote percentage threshold for approval of being a root (default:0.9)

• During the networking, only obtaining vote percentage reaches this threshold, the device could be a root.

Attention This API shall be called before mesh is started.

Return
• ESP_OK
• ESP_FAIL

Parameters
• [in] percentage: vote percentage threshold

float esp_mesh_get_vote_percentage (void)
Get vote percentage threshold for approval of being a root.

Return percentage threshold

esp_err_t esp_mesh_set_ap_assoc_expire (int seconds)
Set mesh softAP associate expired time (default:10 seconds)
• If mesh softAP hasn’t received any data from an associated child within this time, mesh softAP will take this child inactive and disassociate it.
• If mesh softAP is encrypted, this value should be set a greater value, such as 30 seconds.

Return
• ESP_OK
• ESP_FAIL

Parameters
• [in] seconds: the expired time

int esp_mesh_get_ap_assoc_expire (void)
Get mesh softAP associate expired time.

Return seconds

int esp_mesh_get_total_node_num (void)
Get total number of devices in current network (including the root)

Attention The returned value might be incorrect when the network is changing.
Return total number of devices (including the root)

int esp_mesh_get_routing_table_size (void)
Get the number of devices in this device’s sub-network (including self)

Return the number of devices over this device’s sub-network (including self)

esp_err_t esp_mesh_get_routing_table (mesh_addr_t *mac, int len, int *size)
Get routing table of this device’s sub-network (including itself)

Return
• ESP_OK
• ESP_ERR_MESH_ARGUMENT

Parameters
• [out] mac: pointer to routing table
• [in] len: routing table size (in bytes)
• [out] size: pointer to the number of devices in routing table (including itself)

esp_err_t esp_mesh_post_toDS_state (bool reachable)
Post the toDS state to the mesh stack.

Attention This API is only for the root.
Return
• ESP_OK
• ESP_FAIL

Parameters
• [in] reachable: this state represents whether the root is able to access external IP network

esp_err_t esp_mesh_get_tx_pending (mesh_tx_pending_t *pending)
Return the number of packets pending in the queue waiting to be sent by the mesh stack.

Return
• ESP_OK
• ESP_FAIL

Parameters
• [out] pending: pointer to the TX pending

esp_err_t esp_mesh_get_rx_pending (mesh_rx_pending_t *pending)
Return the number of packets available in the queue waiting to be received by applications.

Return
• ESP_OK
• ESP_FAIL

Parameters
• [out] pending: pointer to the RX pending

```c
int esp_mesh_available_txupQ_num(const mesh_addr_t *addr, uint32_t *xseqno_in)

Return the number of packets could be accepted from the specified address.

Parameters
- [in] addr: self address or an associate children address
- [out] xseqno_in: sequence number of the last received packet from the specified address
```

```c
esp_err_t esp_mesh_set_xon_qsize(int qsize)

Set the number of queue.

Attention This API shall be called before mesh is started.

Return
- ESP_OK
- ESP_FAIL

Parameters
- [in] qsize: default:32 (min:16)
```

```c
int esp_mesh_get_xon_qsize(void)

Get queue size.

Return the number of queue
```

```c
esp_err_t esp_mesh_set_root_conlicts(bool allowed)

Set whether allow more than one root existing in one network.

Return
- ESP_OK
- ESP_WIFI_ERR_NOT_INIT
- ESP_WIFI_ERR_NOT_START

Parameters
- [in] allowed: allow or not
```

```c
bool esp_mesh_is_root_conlicts_allowed(void)

Check whether allow more than one root to exist in one network.

Return true/false
```

```c
esp_err_t esp_mesh_set_group_id(const mesh_addr_t *addr, int num)

Set group ID addresses.

Return
- ESP_OK
- ESP_MESH_ERR_ARGUMENT

Parameters
- [in] addr: pointer to new group ID addresses
- [in] num: the number of group ID addresses
```

```c
esp_err_t esp_mesh_delete_group_id(const mesh_addr_t *addr, int num)

Delete group ID addresses.

Return
- ESP_OK
- ESP_MESH_ERR_ARGUMENT

Parameters
- [in] addr: pointer to deleted group ID address
- [in] num: the number of group ID addresses
```

```c
int esp_mesh_get_group_num(void)

Get the number of group ID addresses.

Return the number of group ID addresses
```

```c
esp_err_t esp_mesh_get_group_list(mesh_addr_t *addr, int num)

Get group ID addresses.

Return
```
### esp_mesh_is_my_group

Check whether the specified group address is my group.

**Return**
- true
- false

**Parameters**

- `[out] addr`: pointer to group ID addresses
- `[in] num`: the number of group ID addresses

### esp_mesh_set_capacity_num

Set mesh network capacity (max:1000, default:300)

**Attention**
This API shall be called before mesh is started.

**Return**

- ESP_OK
- ESP_ERR_MESH_NOT_ALLOWED
- ESP_MESH_ERR_ARGUMENT

**Parameters**

- `[in] num`: mesh network capacity

### esp_mesh_get_capacity_num

Get mesh network capacity.

**Return**

- mesh network capacity

### esp_mesh_set_ie_crypto_funcs

Set mesh IE crypto functions.

**Attention**
This API can be called at any time after mesh is initialized.

**Return**

- ESP_OK

**Parameters**

- `[in] crypto_funcs`: crypto functions for mesh IE
  - If crypto_funcs is set to NULL, mesh IE is no longer encrypted.

### esp_mesh_set_ie_crypto_key

Set mesh IE crypto key.

**Attention**
This API can be called at any time after mesh is initialized.

**Return**

- ESP_OK
- ESP_MESH_ERR_ARGUMENT

**Parameters**

- `[in] key`: ASCII crypto key
- `[in] len`: length in bytes, range:8-64

### esp_mesh_get_ie_crypto_key

Get mesh IE crypto key.

**Return**

- ESP_OK
- ESP_MESH_ERR_ARGUMENT

**Parameters**

- `[out] key`: ASCII crypto key
- `[in] len`: length in bytes, range:8-64

### esp_mesh_set_root_healing_delay

Set delay time before starting root healing.

**Return**

- ESP_OK

**Parameters**

- `[in] delay_ms`: delay time in milliseconds
```plaintext
int esp_mesh_get_root_healing_delay(void)
Get delay time before network starts root healing.

Return delay time in milliseconds

esp_err_t esp_mesh_fix_root(bool enable)
Enable network Fixed Root Setting.
- Enabling fixed root disables automatic election of the root node via voting.
- All devices in the network shall use the same Fixed Root Setting (enabled or disabled).
- If Fixed Root is enabled, users should make sure a root node is designated for the network.

Return
- ESP_OK

Parameters
- [in] enable: enable or not

bool esp_mesh_is_root_fixed(void)
Check whether network Fixed Root Setting is enabled.
- Enable/disable network Fixed Root Setting by API esp_mesh_fix_root().
- Network Fixed Root Setting also changes with the “flag” value in parent networking IE.

Return true/false

esp_err_t esp_mesh_set_parent(const wifi_config_t *parent, const mesh_addr_t *parent_mesh_id, mesh_type_t my_type, int my_layer)
Set a specified parent for the device.

Attention This API can be called at any time after mesh is configured.

Return
- ESP_OK
- ESP_ERR_ARGUMENT
- ESP_ERR_MESH_NOT_CONFIG

Parameters
- [in] parent: parent configuration, the SSID and the channel of the parent are mandatory.
  - If the BSSID is set, make sure that the SSID and BSSID represent the same parent, otherwise
    the device will never find this specified parent.
- [in] parent_mesh_id: parent mesh ID,
  - If this value is not set, the original mesh ID is used.
- [in] my_type: mesh type
  - MESH_STA is not supported.
  - If the parent set for the device is the same as the router in the network configuration, then
    my_type shall set MESH_ROOT and my_layer shall set MESH_ROOT_LAYER.
- [in] my_layer: mesh layer
  - my_layer of the device may change after joining the network.
  - If my_type is set MESH_NODE, my_layer shall be greater than MESH_ROOT_LAYER.
  - If my_type is set MESH_LEAF, the device becomes a standalone Wi-Fi station and no longer
    has the ability to extend the network.

esp_err_t esp_mesh_scan_get_ap_ie_len(int *len)
Get mesh networking IE length of one AP.

Return
- ESP_OK
- ESP_ERR_WIFI_NOT_INIT
- ESP_ERR_WIFI_ARG
- ESP_ERR_WIFI_FAIL

Parameters
- [out] len: mesh networking IE length

esp_err_t esp_mesh_scan_get_ap_record(wifi_ap_record_t *ap_record, void *buffer)
Get AP record.
```
Attention Different from esp_wifi_scan_get_ap_records(), this API only gets one of APs scanned each time. See “manual_networking” example.

Return

- ESP_OK
- ESP_ERR_WIFI_NOT_INIT
- ESP_ERR_WIFI_ARG
- ESP_ERR_WIFI_FAIL

Parameters

- [out] ap_record: pointer to one AP record
- [out] buffer: pointer to the mesh networking IE of this AP

esp_err_t esp_mesh_flush_upstream_packets (void)
Flush upstream packets pending in to_parent queue and to_parent_p2p queue.

Return

- ESP_OK

esp_err_t esp_mesh_get_subnet_nodes_num (const mesh_addr_t *child_mac, int *nodes_num)
Get the number of nodes in the subnet of a specific child.

Return

- ESP_OK
- ESP_ERR_MESH_NOT_START
- ESP_ERR_MESH_ARGUMENT

Parameters

- [in] child_mac: an associated child address of this device
- [out] nodes_num: pointer to the number of nodes in the subnet of a specific child

esp_err_t esp_mesh_get_subnet_nodes_list (const mesh_addr_t *child_mac, mesh_addr_t *nodes, int nodes_num)
Get nodes in the subnet of a specific child.

Return

- ESP_OK
- ESP_ERR_MESH_NOT_START
- ESP_ERR_MESH_ARGUMENT

Parameters

- [in] child_mac: an associated child address of this device
- [out] nodes: pointer to nodes in the subnet of a specific child
- [in] nodes_num: the number of nodes in the subnet of a specific child

esp_err_t esp_mesh_disconnect (void)
Disconnect from current parent.

Return

- ESP_OK

esp_err_t esp_mesh_connect (void)
Connect to current parent.

Return

- ESP_OK

esp_err_t esp_mesh_flush_scan_result (void)
Flush scan result.

Return

- ESP_OK

esp_err_t esp_mesh_switch_channel (const uint8_t *new_hssid, int csa_newchan, int csa_count)
Cause the root device to add Channel Switch Announcement Element (CSA IE) to beacon.

- Set the new channel
- Set how many beacons with CSA IE will be sent before changing a new channel
- Enable the channel switch function
### API Reference

**Attention** This API is only called by the root.

**Return**
- ESP_OK

**Parameters**
- `[in] new_bssid`: the new router BSSID if the router changes
- `[in] csa_newchan`: the new channel number to which the whole network is moving
- `[in] csa_count`: channel switch period (beacon count), unit is based on beacon interval of its softAP, the default value is 15.

#### esp_err_t esp_mesh_get_router_bssid(uint8_t* router_bssid)
Get the router BSSID.

**Return**
- ESP_OK
- ESP_ERR_WIFI_NOT_INIT
- ESP_ERR_WIFI_ARG

**Parameters**
- `[out] router_bssid`: pointer to the router BSSID

#### int64_t esp_mesh_get_tsf_time(void)
Get the TSF time.

**Return** the TSF time

#### esp_err_t esp_mesh_set_topology(esp_mesh_topology_t topo)
Set mesh topology. The default value is MESH_TOPO_TREE.

- MESH_TOPO_CHAIN supports up to 1000 layers

**Attention** This API shall be called before mesh is started.

**Return**
- ESP_OK
- ESP_MESH_ERR_ARGUMENT
- ESP_ERR_MESH_NOT_ALLOWED

**Parameters**
- `[in] topo`: MESH_TOPO_TREE or MESH_TOPO_CHAIN

#### esp_mesh_topology_t esp_mesh_get_topology(void)
Get mesh topology.

**Return** MESH_TOPO_TREE or MESH_TOPO_CHAIN

#### esp_err_t esp_mesh_enable_ps(void)
Enable mesh Power Save function.

**Attention** This API shall be called before mesh is started.

**Return**
- ESP_OK
- ESP_ERR_WIFI_NOT_INIT
- ESP_ERR_MESH_NOT_ALLOWED

#### esp_err_t esp_mesh_disable_ps(void)
Disable mesh Power Save function.

**Attention** This API shall be called before mesh is started.

**Return**
- ESP_OK
- ESP_ERR_WIFI_NOT_INIT
- ESP_ERR_MESH_NOT_ALLOWED

#### bool esp_mesh_is_ps_enabled(void)
Check whether the mesh Power Save function is enabled.

**Return** true/false
bool esp_mesh_is_device_active (void)
Check whether the device is in active state.

- If the device is not in active state, it will neither transmit nor receive frames.

**Return** true/false

**esp_err_t esp_mesh_set_active_duty_cycle** (int dev_duty, int dev_duty_type)
Set the device duty cycle and type.

- The range of dev_duty values is 1 to 100. The default value is 10.
- dev_duty = 100, the PS will be stopped.
- dev_duty is better to not less than 5.
- dev_duty_type could be MESH_PS_DEVICE_DUTY_REQUEST or MESH_PS_DEVICE_DUTY_DEMAND.
- If dev_duty_type is set to MESH_PS_DEVICE_DUTY_REQUEST, the device will use a nwk_duty provided by the network.
- If dev_duty_type is set to MESH_PS_DEVICE_DUTY_DEMAND, the device will use the specified dev_duty.

**Attention** This API can be called at any time after mesh is started.

**Return**
- ESP_OK
- ESP_FAIL

**Parameters**

- [in] dev_duty: device duty cycle
- [in] dev_duty_type: device PS duty cycle type, not accept MESH_PS_NETWORK_DUTY_MASTER

**esp_err_t esp_mesh_get_active_duty_cycle** (int *dev_duty, int *dev_duty_type)
Get device duty cycle and type.

**Return**
- ESP_OK

**Parameters**

- [out] dev_duty: device duty cycle
- [out] dev_duty_type: device PS duty cycle type

**esp_err_t esp_mesh_set_network_duty_cycle** (int nwk_duty, int duration_mins, int applied_rule)
Set the network duty cycle, duration and rule.

- The range of nwk_duty values is 1 to 100. The default value is 10.
- nwk_duty is the network duty cycle the entire network or the up-link path will use. A device that successfully sets the nwk_duty is known as a NWK-DUTY-MASTER.
- duration_mins specifies how long the specified nwk_duty will be used. Once duration_mins expires, the root will take over as the NWK-DUTY-MASTER. If an existing NWK-DUTY-MASTER leaves the network, the root will take over as the NWK-DUTY-MASTER again.
- duration_mins = (-1) represents nwk_duty will be used until a new NWK-DUTY-MASTER with a different nwk_duty appears.
- Only the root can set duration_mins to (-1).
- If applied_rule is set to MESH_PS_NETWORK_DUTY_APPLIED_ENTIRE, the nwk_duty will be used by the entire network.
- If applied_rule is set to MESH_PS_NETWORK_DUTY_APPLIED_UPLINK, the nwk_duty will only be used by the up-link path nodes.
- The root does not accept MESH_PS_NETWORK_DUTY_APPLIED_UPLINK.
- A nwk_duty with duration_mins(-1) set by the root is the default network duty cycle used by the entire network.

**Attention** This API can be called at any time after mesh is started.

- In self-organized network, if this API is called before mesh is started in all devices, (1)nwk_duty shall be set to the same value for all devices; (2)duration_mins shall be set to (-1); (3)applied_rule shall be set to MESH_PS_NETWORK_DUTY_APPLIED_ENTIRE; after the voted root appears,
the root will become the NWK-DUTY-MASTER and broadcast the nwk_duty and its identity of NWK-DUTY-MASTER.

- If the root is specified (FIXED-ROOT), call this API in the root to provide a default nwk_duty for the entire network.
- After joins the network, any device can call this API to change the nwk_duty, duration_mins or applied_rule.

Return
- ESP_OK
- ESP_FAIL

Parameters
- [in] nwk_duty: network duty cycle
- [in] duration_mins: duration (unit: minutes)
- [in] applied_rule: only support MESH_PS_NETWORK_DUTY_APPLIED_ENTIRE

`esp_err_t esp_mesh_get_network_duty_cycle(int *nwk_duty, int *duration_mins, int *dev_duty_type, int *applied_rule)`

Get the network duty cycle, duration, type and rule.

Return
- ESP_OK

Parameters
- [out] nwk_duty: current network duty cycle
- [out] duration_mins: the duration of current nwk_duty
- [out] dev_duty_type: if it includes MESH_PS_DEVICE_DUTY_MASTER, this device is the current NWK-DUTY-MASTER.
- [out] applied_rule: MESH_PS_NETWORK_DUTY_APPLIED_ENTIRE

`int esp_mesh_get_running_active_duty_cycle(void)`

Get the running active duty cycle.

- The running active duty cycle of the root is 100.
- If duty type is set to MESH_PS_DEVICE_DUTY_REQUEST, the running active duty cycle is nwk_duty provided by the network.
- If duty type is set to MESH_PS_DEVICE_DUTY_DEMAND, the running active duty cycle is dev_duty specified by the users.
- In a mesh network, devices are typically working with a certain duty-cycle (transmitting, receiving and sleep) to reduce the power consumption. The running active duty cycle decides the amount of awake time within a beacon interval. At each start of beacon interval, all devices wake up, broadcast beacons, and transmit packets if they do have pending packets for their parents or for their children. Note that Low-duty-cycle means devices may not be active in most of the time, the latency of data transmission might be greater.

Return the running active duty cycle

`esp_err_t esp_mesh_ps_duty_signaling(int fwd_times)`

Duty signaling.

Return
- ESP_OK

Parameters
- [in] fwd_times: the times of forwarding duty signaling packets

Unions

`union mesh_addr_t`

`#include <esp_mesh.h>` Mesh address.

Public Members

`uint8_t addr[6]`

mac address
mip_t mip
    mip address
union mesh_event_info_t
    #include <esp_mesh.h> Mesh event information.

Public Members

mesh_event_channel_switch_t channel_switch
    channel switch
mesh_event_child_connected_t child_connected
    child connected
mesh_event_child_disconnected_t child_disconnected
    child disconnected
mesh_event_routing_table_change_t routing_table
    routing table change
mesh_event_connected_t connected
    parent connected
mesh_event_disconnected_t disconnected
    parent disconnected
mesh_event_no_parent_found_t no_parent
    no parent found
mesh_event_layer_change_t layer_change
    layer change
mesh_event_toDS_state_t toDS_state
    toDS state, devices shall check this state firstly before trying to send packets to external IP network. This state indicates right now whether the root is capable of sending packets out. If not, devices had better to wait until this state changes to be MESH_TODS_REACHABLE.
mesh_event_vote_started_t vote_started
    vote started
mesh_event_root_address_t root_addr
    root address
mesh_event_root_switch_req_t switch_req
    root switch request
mesh_event_root_conflict_t root_conflict
    other powerful root
mesh_event_root_fixed_t root_fixed
    fixed root
mesh_event_scan_done_t scan_done
    scan done
mesh_event_network_state_t network_state
    network state, such as whether current mesh network has a root.
mesh_event_find_network_t find_network
    network found that can join
mesh_event_router_switch_t router_switch
    new router information
mesh_event_ps_duty_t ps_duty
    PS duty information
union mesh_rc_config_t
#include <esp_mesh.h> Vote address configuration.

Public Members

int attempts
max vote attempts before a new root is elected automatically by mesh network. (min:15, 15 by default)
mesh_addr_t rc_addr
a new root address specified by users for API esp_mesh_waive_root()

Structures
struct mip_t
IP address and port.

Public Members

ip4_addr_t ip4
IP address
uint16_t port
port

struct mesh_event_channel_switch_t
Channel switch information.

Public Members

uint8_t channel
new channel

struct mesh_event_connected_t
Parent connected information.

Public Members

wifi_event_sta_connected_t connected
parent information, same as Wi-Fi event SYSTEM_EVENT_STA_CONNECTED does
uint16_t self_layer
layer
uint8_t duty
parent duty

struct mesh_event_no_parent_found_t
No parent found information.

Public Members

int scan_times
scan times being through

struct mesh_event_layer_change_t
Layer change information.
Chapter 2. API Reference

Public Members

```c
uint16_t new_layer
    new layer
```

```c
struct mesh_event_vote_started_t
    vote started information
```

Public Members

```c
int reason
    vote reason, vote could be initiated by children or by the root itself
```

```c
int attempts
    max vote attempts before stopped
```

```c
mesh_addr_t rc_addr
    root address specified by users via API esp_mesh_waive_root()
```

```c
struct mesh_event_find_network_t
    find a mesh network that this device can join
```

Public Members

```c
uint8_t channel
    channel number of the new found network
```

```c
uint8_t router_bssid[6]
    router BSSID
```

```c
struct mesh_event_root_switch_req_t
    Root switch request information.
```

Public Members

```c
int reason
    root switch reason, generally root switch is initialized by users via API esp_mesh_waive_root()
```

```c
mesh_addr_t rc_addr
    the address of root switch requester
```

```c
struct mesh_event_root_conflict_t
    Other powerful root address.
```

Public Members

```c
int8_t rssi
    rssi with router
```

```c
uint16_t capacity
    the number of devices in current network
```

```c
uint8_t addr[6]
    other powerful root address
```

```c
struct mesh_event_routing_table_change_t
    Routing table change.
```
Chapter 2. API Reference

Public Members

```c
uint16_t rt_size_new
    the new value
uint16_t rt_size_change
    the changed value
```

```c
struct mesh_event_root_fixed_t
    Root fixed.
```

Public Members

```c
bool is_fixed
    status
```

```c
struct mesh_event_scan_done_t
    Scan done    event information.
```

Public Members

```c
uint8_t number
    the number of APs scanned
```

```c
struct mesh_event_network_state_t
    Network state information.
```

Public Members

```c
bool is_rootless
    whether current mesh network has a root
```

```c
struct mesh_event_ps_duty_t
    PS duty information.
```

Public Members

```c
uint8_t duty
    parent or child duty
```

```c
mesh_event_child_connected_t child_connected
    child info
```

```c
struct mesh_opt_t
    Mesh option.
```

Public Members

```c
uint8_t type
    option type
uint16_t len
    option length
uint8_t *val
    option value
```

```c
struct mesh_data_t
    Mesh data for esp_mesh_send() and esp_mesh_recv()
```
Chapter 2. API Reference

Public Members

- `data` (uint8_t*)
  - data

- `size` (uint16_t)
  - data size

- `proto` (mesh_proto_t)
  - data protocol

- `tos` (mesh_tos_t)
  - data type of service

**struct mesh_router_t**

Router configuration.

Public Members

- `ssid` (uint8_t[32])
  - SSID

- `ssid_len` (uint8_t)
  - length of SSID

- `bssid` (uint8_t[6])
  - BSSID, if this value is specified, users should also specify “allow_router_switch”.

- `password` (uint8_t[64])
  - password

- `allow_router_switch` (bool)
  - if the BSSID is specified and this value is also set, when the router of this specified BSSID fails to be found after “fail” (mesh_attempts_t) times, the whole network is allowed to switch to another router with the same SSID. The new router might also be on a different channel. The default value is false. There is a risk that if the password is different between the new switched router and the previous one, the mesh network could be established but the root will never connect to the new switched router.

**struct mesh_ap_cfg_t**

Mesh softAP configuration.

Public Members

- `password` (uint8_t[64])
  - mesh softAP password

- `max_connection` (uint8_t)
  - max number of stations allowed to connect in, default 6, max 10 = max_connection + non-mesh_max_connection max mesh connections

- `nonmesh_max_connection` (uint8_t)
  - max non-mesh connections

**struct mesh_cfg_t**

Mesh initialization configuration.

Public Members

- `channel` (uint8_t)
  - channel, the mesh network on
bool allow_channel_switch
    if this value is set, when “fail” (mesh_attempts_t) times is reached, device will change to a full channel
    scan for a network that could join. The default value is false.

mesh_addr_t mesh_id
    mesh network identification

mesh_router_t router
    router configuration

mesh_op_cfg_t mesh_ap
    mesh softAP configuration

const mesh_crypto_funcs_t *crypto_funcs
    crypto functions

struct mesh_vote_t
    Vote.

Public Members

float percentage
    vote percentage threshold for approval of being a root

bool is_rc_specified
    if true, rc_addr shall be specified (Unimplemented). if false, attempts value shall be specified to make
    network start root election.

mesh_rc_config_t config
    vote address configuration

struct mesh_tx_pending_t
    The number of packets pending in the queue waiting to be sent by the mesh stack.

Public Members

int to_parent
    to parent queue

int to_parent_p2p
    to parent (P2P) queue

int to_child
    to child queue

int to_child_p2p
    to child (P2P) queue

int mgmt
    management queue

int broadcast
    broadcast and multicast queue

struct mesh_rx_pending_t
    The number of packets available in the queue waiting to be received by applications.

Public Members

int toDS
    to external DS
int toSelf
to self

**Macros**

**MESH_ROOT_LAYER**
root layer value

**MESH_MTU**
max transmit unit (in bytes)

**MESH_MPS**
max payload size (in bytes)

**ESP_ERR_MESH_WIFI_NOT_START**
Mesh error code definition.
Wi-Fi isn’t started

**ESP_ERR_MESH_NOT_INIT**
mesh isn’t initialized

**ESP_ERR_MESH_NOT_CONFIG**
mesh isn’t configured

**ESP_ERR_MESH_NOT_START**
mesh isn’t started

**ESP_ERR_MESH_NOT_SUPPORT**
not supported yet

**ESP_ERR_MESH_NOT_ALLOWED**
operation is not allowed

**ESP_ERR_MESH_NO_MEMORY**
out of memory

**ESP_ERR_MESH_ARGUMENT**
illegal argument

**ESP_ERR_MESH_EXCEED_MTU**
packet size exceeds MTU

**ESP_ERR_MESH_TIMEOUT**
timeout

**ESP_ERR_MESH_DISCONNECTED**
disconnected with parent on station interface

**ESP_ERR_MESH_QUEUE_FAIL**
queue fail

**ESP_ERR_MESH_QUEUE_FULL**
queue full

**ESP_ERR_MESH_NO_PARENT_FOUND**
no parent found to join the mesh network

**ESP_ERR_MESH_NO_ROUTE_FOUND**
no route found to forward the packet

**ESP_ERR_MESH_OPTION_NULL**
no option found

**ESP_ERR_MESH_OPTION_UNKNOWN**
unknown option

**ESP_ERR_MESH_XON_NO_WINDOW**
no window for software flow control on upstream
Chapter 2. API Reference

ESP_ERR_MESH_INTERFACE
low-level Wi-Fi interface error

ESP_ERR_MESH_DISCARD_DUPLICATE
discard the packet due to the duplicate sequence number

ESP_ERR_MESH_DISCARD
discard the packet

ESP_ERR_MESH_VOTING
vote in progress

ESP_ERR_MESH_XMIT
XMIT

ESP_ERR_MESH_QUEUE_READ
error in reading queue

ESP_ERR_MESH_PS
mesh PS is not specified as enable or disable

ESP_ERR_MESH_RECV_RELEASE
release esp_mesh_recv_toDS

MESH_DATA_ENC
Flags bitmap for esp_mesh_send() and esp_mesh_recv()
data encrypted (Unimplemented)

MESH_DATA_P2P
point-to-point delivery over the mesh network

MESH_DATA_FROMDS
receive from external IP network

MESH_DATA_TODS
identify this packet is target to external IP network

MESH_DATA_NONBLOCK
esp_mesh_send() non-block

MESH_DATA_DROP
in the situation of the root having been changed, identify this packet can be dropped by new root

MESH_DATA_GROUP
identify this packet is target to a group address

MESH_OPT_SEND_GROUP
Option definitions for esp_mesh_send() and esp_mesh_recv()
data transmission by group; used with esp_mesh_send() and shall have payload

MESH_OPT_RECV_DS_ADDR
return a remote IP address; used with esp_mesh_send() and esp_mesh_recv()

MESH_ASSOC_FLAG_VOTE_IN_PROGRESS
Flag of mesh networking IE.
vote in progress

MESH_ASSOC_FLAG_NETWORK_FREE
no root in current network

MESH_ASSOC_FLAG_ROOTS_FOUND
root conflict is found

MESH_ASSOC_FLAG_ROOT_FIXED
fixed root
MESH_PS_DEVICE_DUTY_REQUEST
Mesh PS (Power Save) duty cycle type.
requests to join a network PS without specifying a device duty cycle. After the device joins the network, a network duty cycle will be provided by the network

MESH_PS_DEVICE_DUTY_DEMAND
requests to join a network PS and specifies a demanded device duty cycle

MESH_PS_NETWORK_DUTY_MASTER
indicates the device is the NWK-DUTY-MASTER (network duty cycle master)

MESH_PS_NETWORK_DUTY_APPLIED_ENTIRE
Mesh PS (Power Save) duty cycle applied rule.

MESH_PS_NETWORK_DUTY_APPLIED_UPLINK

Type Definitions
typedef mesh_addr_t mesh_event_root_address_t
Root address.
typedef wifi_event_sta_disconnected_t mesh_event_disconnected_t
Parent disconnected information.
typedef wifi_event_ap_sta_connected_t mesh_event_child_connected_t
Child connected information.
typedef wifi_event_ap_stadisconnected_t mesh_event_child_disconnected_t
Child disconnected information.
typedef wifi_event_sta_connected_t mesh_event_router_switch_t
New router information.

Enumerations
typedef enum mesh_event_id_t
Enumerated list of mesh event id.
Values:

MESH_EVENT_STARTED
mesh is started
MESH_EVENT_STOPPED
mesh is stopped
MESH_EVENT_CHANNEL_SWITCH
channel switch
MESH_EVENT_CHILD_CONNECTED
a child is connected on softAP interface
MESH_EVENT_CHILD_DISCONNECTED
a child is disconnected on softAP interface
MESH_EVENT_ROUTING_TABLE_ADD
routing table is changed by adding newly joined children
MESH_EVENT_ROUTING_TABLE_REMOVE
routing table is changed by removing leave children
MESH_EVENT_PARENT_CONNECTED
parent is connected on station interface
MESH_EVENT_PARENT_DISCONNECTED
parent is disconnected on station interface
MESH_EVENT_NO_PARENT_FOUND
no parent found

MESH_EVENT_LAYER_CHANGE
layer changes over the mesh network

MESH_EVENT_TODS_STATE
state represents whether the root is able to access external IP network

MESH_EVENT_VOTE_STARTED
the process of voting a new root is started either by children or by the root

MESH_EVENT_VOTE_STOPPED
the process of voting a new root is stopped

MESH_EVENT_ROOT_ADDRESS
the root address is obtained. It is posted by mesh stack automatically.

MESH_EVENT_ROOT_SWITCH_REQ
root switch request sent from a new voted root candidate

MESH_EVENT_ROOT_SWITCH_ACK
root switch acknowledgment responds the above request sent from current root

MESH_EVENT_ROOT_ASKED_YIELD
the root is asked yield by a more powerful existing root. If self organized is disabled and this device is specified to be a root by users, users should set a new parent for this device. if self organized is enabled, this device will find a new parent by itself, users could ignore this event.

MESH_EVENT_ROOT_FIXED
when devices join a network, if the setting of Fixed Root for one device is different from that of its parent, the device will update the setting the same as its parent’s. Fixed Root Setting of each device is variable as that setting changes of the root.

MESH_EVENT_SCAN_DONE
if self-organized networking is disabled, user can call esp_wifi_scan_start() to trigger this event, and add the corresponding scan done handler in this event.

MESH_EVENT_NETWORK_STATE
network state, such as whether current mesh network has a root.

MESH_EVENT_STOP_RECONNECTION
the root stops reconnecting to the router and non-root devices stop reconnecting to their parents.

MESH_EVENT_FIND_NETWORK
when the channel field in mesh configuration is set to zero, mesh stack will perform a full channel scan to find a mesh network that can join, and return the channel value after finding it.

MESH_EVENT_ROUTER_SWITCH
if users specify BSSID of the router in mesh configuration, when the root connects to another router with the same SSID, this event will be posted and the new router information is attached.

MESH_EVENT_PS_PARENT_DUTY
parent duty

MESH_EVENT_PS_CHILD_DUTY
child duty

MESH_EVENT_PS_DEVICE_DUTY
device duty

MESH_EVENT_MAX

enum mesh_type_t
Device type.

Values:
MESH_IDLE
hasn’t joined the mesh network yet

MESH_ROOT
the only sink of the mesh network. Has the ability to access external IP network

MESH_NODE
intermediate device. Has the ability to forward packets over the mesh network

MESH_LEAF
has no forwarding ability

MESH_STA
connect to router with a standalone Wi-Fi station mode, no network expansion capability

enum mesh_proto_t
Protocol of transmitted application data.

Values:

MESH_PROTO_BIN
binary

MESH_PROTO_HTTP
HTTP protocol

MESH_PROTO_JSON
JSON format

MESH_PROTO_MQTT
MQTT protocol

MESH_PROTO_AP
IP network mesh communication of node’s AP interface

MESH_PROTO_STA
IP network mesh communication of node’s STA interface

enum mesh_tos_t
For reliable transmission, mesh stack provides three type of services.

Values:

MESH_TOS_P2P
provide P2P (point-to-point) retransmission on mesh stack by default

MESH_TOS_E2E
provide E2E (end-to-end) retransmission on mesh stack (Unimplemented)

MESH_TOS_DEF
no retransmission on mesh stack

enum mesh_vote_reason_t
Vote reason.

Values:

MESH_VOTE_REASON_ROOT_INITIATED = 1
vote is initiated by the root

MESH_VOTE_REASON_CHILD_INITIATED
vote is initiated by children

enum mesh_disconnect_reason_t
Mesh disconnect reason code.

Values:

MESH_REASON_CYCLIC = 100
cyclic is detected
**Chapter 2. API Reference**

```c
enum esp_mesh_topology_t
Mesh topology.
Values:

MESH_TOPO_TREE
tree topology

MESH_TOPO_CHAIN
chain topology
```

```c
enum mesh_event_toDS_state_t
The reachability of the root to a DS (distribute system)
Values:

MESH_TODS_UNREACHABLE
the root isn’t able to access external IP network

MESH_TODS_REACHABLE
the root is able to access external IP network
```

**Wi-Fi Easy Connect™ (DPP)**

Wi-Fi Easy Connect™, also known as Device Provisioning Protocol (DPP) or Easy Connect, is a provisioning protocol certified by Wi-Fi Alliance. It is a secure and standardized provisioning protocol for configuration of Wi-Fi Devices. With Easy Connect adding a new device to a network is as simple as scanning a QR Code. This reduces complexity and enhances user experience while onboarding devices without UI like Smart Home and IoT products. Unlike old protocols like WiFi Protected Setup (WPS), Wi-Fi Easy Connect incorporates strong encryption through public key cryptography to ensure networks remain secure as new devices are added. Easy Connect brings many benefits in the User Experience:

- Simple and intuitive to use; no lengthy instructions to follow for new device setup
- No need to remember and enter passwords into the device being provisioned

---

**MESH_REASON_PARENT_IDLE**
parent is idle

**MESH_REASON_LEAF**
the connected device is changed to a leaf

**MESH_REASON_DIFF_ID**
in different mesh ID

**MESH_REASON_ROOTS**
root conflict is detected

**MESH_REASON_PARENT_STOPPED**
parent has stopped the mesh

**MESH_REASON_SCAN_FAIL**
scan fail

**MESH_REASON_IE_UNKNOWN**
unknown IE

**MESH_REASON_WAIVE_ROOT**
waive root

**MESH_REASON_PARENT_WORSE**
pARENT with very poor RSSI

**MESH_REASON_EMPTY_PASSWORD**
use an empty password to connect to an encrypted parent

**MESH_REASON_PARENT_UNENCRYPTED**
connect to an unencrypted parent/router
• Works with electronic or printed QR codes, or human-readable strings
• Supports both WPA2 and WPA3 networks

Please refer to Wi-Fi Alliance’s official page on Easy Connect for more information.

ESP32-S3 supports Enrollee mode of Easy Connect with QR Code as the provisioning method. A display is required to display this QR Code. Users can scan this QR Code using their capable device and provision the ESP32-S3 to their Wi-Fi network. The provisioning device needs to be connected to the AP which need not support Wi-Fi Easy Connect™. Easy Connect is still an evolving protocol. Of known platforms that support the QR Code method are some Android smartphones with Android 10 or higher. To use Easy Connect no additional App needs to be installed on the supported smartphone.

**Application Example** Example on how to provision ESP32-S3 using a supported smartphone:

`wifi/wifi_easy_connect/dpp-enrollee`

**API Reference**

**Header File**

- components/wpa_supplicant/esp_supplicant/include/esp_dpp.h

**Functions**

`esp_err_t esp_supp_dpp_init(esp_supp_dpp_event_cb_t evt_cb)`

Initialize DPP Supplicant.

- Starts DPP Supplicant and initializes related Data Structures.

  return
  • ESP_OK: Success
  • ESP_FAIL: Failure

  Parameters
  • `evt_cb`: Callback function to receive DPP related events

`void esp_supp_dpp_deinit(void)`

De-initialize DPP Supplicant.

- Frees memory from DPP Supplicant Data Structures.

`esp_err_t esp_supp_dpp_bootstrap_gen(const char *chan_list, esp_supp_dpp_bootstrap_t type, const char *key, const char *info)`

Generates Bootstrap Information as an Enrollee.

- Generates Out Of Band Bootstrap information as an Enrollee which can be used by a DPP Configurator to provision the Enrollee.

  Return
  • ESP_OK: Success
  • ESP_FAIL: Failure

  Parameters
  • `chan_list`: List of channels device will be available on for listening
  • `type`: Bootstrap method type, only QR Code method is supported for now.
  • `key`: (Optional) Private Key used to generate a Bootstrapping Public Key
  • `info`: (Optional) Ancilliary Device Information like Serial Number

`esp_err_t esp_supp_dpp_start_listen(void)`

Start listening on Channels provided during `esp_supp_dpp_bootstrap_gen`. 
Listens on every Channel from Channel List for a pre-defined wait time.

Return

- ESP_OK: Success
- ESP_FAIL: Generic Failure
- ESP_ERR_INVALID_STATE: ROC attempted before WiFi is started
- ESP_ERR_NO_MEM: Memory allocation failed while posting ROC request

void esp_supp_dpp_stop_listen (void)
Stop listening on Channels.

Stops listening on Channels and cancels ongoing listen operation.

Macros

ESP_ERR_DPP_FAILURE
Generic failure during DPP Operation

ESP_ERR_DPP_TX_FAILURE
DPP Frame Tx failed OR not Acked

ESP_ERR_DPP_INVALID_ATTR
Encountered invalid DPP Attribute

Type Definitions

typedef enum dpp_bootstrap_type esp_supp_dpp_bootstrap_t
Types of Bootstrap Methods for DPP.

typedef void (*esp_supp_dpp_event_cb_t)(esp_supp_dpp_event_t evt, void *data)
Callback function for receiving DPP Events from Supplicant.

Parameters

- \( \text{evt} \): DPP event ID
- \( \text{data} \): Event data payload

Enumerations

class dpp_bootstrap_type
Types of Bootstrap Methods for DPP.

Values:

DPP_BOOTSTRAP_QR_CODE
QR Code Method

DPP_BOOTSTRAP_PKEX
Proof of Knowledge Method

DPP_BOOTSTRAP_NFC_URI
NFC URI record Method

class esp_supp_dpp_event_t
Types of Callback Events received from DPP Supplicant.

Values:

ESP_SUPP_DPP_URI_READY
URI is ready through Bootstrapping

ESP_SUPP_DPP_CFG_RECVD
Config received via DPP Authentication

ESP_SUPP_DPP_FAIL
DPP Authentication failure
Code examples for the Wi-Fi API are provided in the `wifi` directory of ESP-IDF examples.
Code examples for ESP-WIFI-MESH are provided in the `mesh` directory of ESP-IDF examples.

## 2.2.2 Ethernet

### Ethernet

**Overview**  ESP-IDF provides a set of consistent and flexible APIs to support both internal Ethernet MAC (EMAC) controller and external SPI-Ethernet modules.

This programming guide is split into the following sections:

1. Basic Ethernet Concepts
2. Configure MAC and PHY
3. Connect Driver to TCP/IP Stack
4. Misc control of Ethernet driver

### Basic Ethernet Concepts

Ethernet is an asynchronous Carrier Sense Multiple Access with Collision Detect (CSMA/CD) protocol/interface. It is generally not well suited for low power applications. However, with ubiquitous deployment, internet connectivity, high data rates and limitless range expandability, Ethernet can accommodate nearly all wired communications.

Normal IEEE 802.3 compliant Ethernet frames are between 64 and 1518 bytes in length. They are made up of five or six different fields: a destination MAC address (DA), a source MAC address (SA), a type/length field, data payload, an optional padding field and a Cyclic Redundancy Check (CRC). Additionally, when transmitted on the Ethernet medium, a 7-byte preamble field and Start-of-Frame (SOF) delimiter byte are appended to the beginning of the Ethernet packet.

Thus the traffic on the twist-pair cabling will appear as shown below:

**Fig. 4: Ethernet Data Frame Format**

| 1 | Preamble (7 Bytes) |
| 2 | Start-of-Frame Delimiter (1 Byte) |
| 3 | Destination Address (6 Bytes) |
| 4 | Source Address (6 Bytes) |
| 5 | Type / Length (2 Bytes) |
| 5 | Payload (0 ~ 1500 Bytes) |
| 7 | Pad (if necessary) |
| 8 | Frame Check Sequence (4 Bytes) |

---

Submit Document Feedback  Release v5.0-dev-1648-g94089edbc3
**Preamble and Start-of-Frame Delimiter**  The preamble contains seven bytes of 55H, it allows the receiver to lock onto the stream of data before the actual frame arrives. The Start-of-Frame Delimiter (SFD) is a binary sequence 10101011 (as seen on the physical medium). It is sometimes considered to be part of the preamble.

When transmitting and receiving data, the preamble and SFD bytes will automatically be generated or stripped from the packets.

**Destination Address**  The destination address field contains a 6-byte length MAC address of the device that the packet is directed to. If the Least Significant bit in the first byte of the MAC address is set, the address is a multi-cast destination. For example, 01-00-00-00-F0-00 and 33-45-67-89-AB-CD are multi-cast addresses, while 00-00-00-00-F0-00 and 32-45-67-89-AB-CD are not. Packets with multi-cast destination addresses are designed to arrive and be important to a selected group of Ethernet nodes. If the destination address field is the reserved multi-cast address, i.e. FF-FF-FF-FF-FF-FF, the packet is a broadcast packet and it will be directed to everyone sharing the network. If the Least Significant bit in the first byte of the MAC address is clear, the address is a uni-cast address and will be designed for usage by only the addressed node.

Normally the EMAC controller incorporates receive filters which can be used to discard or accept packets with multi-cast, broadcast and/or uni-cast destination addresses. When transmitting packets, the host controller is responsible for writing the desired destination address into the transmit buffer.

**Source Address**  The source address field contains a 6-byte length MAC address of the node which created the Ethernet packet. Users of Ethernet must generate a unique MAC address for each controller used. MAC addresses consist of two portions. The first three bytes are known as the Organizationally Unique Identifier (OUI). OUIs are distributed by the IEEE. The last three bytes are address bytes at the discretion of the company that purchased the OUI. More information about MAC Address used in ESP-IDF, please see [MAC Address Allocation](https://docs.espressif.com/zh-cn/esp-idf/1.16/esp-idf_api.html). When transmitting packets, the assigned source MAC address must be written into the transmit buffer by the host controller.

**Type/Length**  The type/length field is a 2-byte field, if the value in this field is <= 1500 (decimal), it is considered a length field and it specifies the amount of non-padding data which follows in the data field. If the value is >= 1536, it represents the protocol the following packet data belongs to. The following are the most common type values:

- IPv4 = 0800H
- IPv6 = 86DDH
- ARP = 0806H

Users implementing proprietary networks may choose to treat this field as a length field, while applications implementing protocols such as the Internet Protocol (IP) or Address Resolution Protocol (ARP), should program this field with the appropriate type defined by the protocol’s specification when transmitting packets.

**Payload**  The payload field is a variable length field, anywhere from 0 to 1500 bytes. Larger data packets will violate Ethernet standards and will be dropped by most Ethernet nodes. This field contains the client data, such as an IP datagram.

**Padding and FCS**  The padding field is a variable length field added to meet IEEE 802.3 specification requirements when small data payloads are used. The DA, SA, type, payload and padding of an Ethernet packet must be no smaller than 60 bytes. Adding the required 4-byte FCS field, packets must be no smaller than 64 bytes. If the data field is less than 46 bytes long, a padding field is required.

The FCS field is a 4-byte field which contains an industry standard 32-bit CRC calculated with the data from the DA, SA, type, payload and padding fields. Given the complexity of calculating a CRC, the hardware normally will automatically generate a valid CRC and transmit it. Otherwise, the host controller must generate the CRC and place it in the transmit buffer.

Normally, the host controller does not need to concern itself with padding and the CRC which the hardware EMAC will also be able to automatically generate when transmitting and verify when receiving. However, the padding and
CRC fields will be written into the receive buffer when packets arrive, so they may be evaluated by the host controller if needed.

**Note:** Besides the basic data frame described above, there are two other common frame types in 10/100 Mbps Ethernet: control frames and VLAN tagged frames. They’re not supported in ESP-IDF.

---

**Configure MAC and PHY**  Ethernet driver is composed of two parts: MAC and PHY.

We need to setup necessary parameters for MAC and PHY respectively based on your Ethernet board design and then combine the two together, completing the driver installation.

**Configuration for MAC** is described in `eth_mac_config_t`, including:

- `sw_reset_timeout_ms`: software reset timeout value, in milliseconds, typically MAC reset should be finished within 100ms.
- `rx_task_stack_size` and `rx_task_prio`: the MAC driver creates a dedicated task to process incoming packets, these two parameters are used to set the stack size and priority of the task.
- `flags`: specifying extra features that the MAC driver should have, it could be useful in some special situations. The value of this field can be OR'd with macros prefixed with `ETH_MAC_FLAG_`. For example, if the MAC driver should work when cache is disabled, then you should configure this field with `ETH_MAC_FLAG_WORK_WITH_CACHE_DISABLE`.

**Configuration for PHY** is described in `eth_phy_config_t`, including:

- `phy_addr`: multiple PHY device can share the same SMI bus, so each PHY needs a unique address. Usually this address is configured during hardware design by pulling up/down some PHY strapping pins. You can set the value from 0 to 15 based on your Ethernet board. Especially, if the SMI bus is shared by only one PHY device, setting this value to -1 can enable the driver to detect the PHY address automatically.
- `reset_timeout_ms`: reset timeout value, in milliseconds, typically PHY reset should be finished within 100ms.
- `autonego_timeout_ms`: auto-negotiation timeout value, in milliseconds. Ethernet driver will start negotiation with the peer Ethernet node automatically, to determine to duplex and speed mode. This value usually depends on the ability of the PHY device on your board.
- `reset_GPIO_num`: if your board also connect the PHY reset pin to one of the GPIO, then set it here. Otherwise, set this field to -1.

ESP-IDF provides a default configuration for MAC and PHY in macro `ETH_MAC_DEFAULT_CONFIG` and `ETH_PHY_DEFAULT_CONFIG`.

---

**Create MAC and PHY Instance**  Ethernet driver is implemented in an Object-Oriented style. Any operation on MAC and PHY should be based on the instance of them two.

**SPI-Ethernet Module**

```c
eth_mac_config_t mac_config = ETH_MAC_DEFAULT_CONFIG(); // apply default MAC configuration
eth_phy_config_t phy_config = ETH_PHY_DEFAULT_CONFIG(); // apply default PHY configuration
phy_config.phy_addr = CONFIG_EXAMPLE_ETH_PHY_ADDR; // alter the PHY address according to your board design
phy_config.reset_GPIO_num = CONFIG_EXAMPLE_ETH_PHY_RST_GPIO; // alter the GPIO used for PHY reset
// Install GPIO interrupt service (as the SPI-Ethernet module is interrupt driven)
gpio_install_isr_service(0);
// SPI bus configuration
spi_device_handle_t spi_handle = NULL;
spi_bus_config_t buscfg = {
    .miso_io_num = CONFIG_EXAMPLE_ETH_SPI_MISO_GPIO,
    .mosi_io_num = CONFIG_EXAMPLE_ETH_SPI_MOSI_GPIO,
};
```
.sclk_io_num = CONFIG_EXAMPLE_ETH_SPI_SCLK_GPIO,
.quadwp_io_num = -1,
.quadhd_io_num = -1,
);
ESP_ERROR_CHECK(spi_bus_initialize(CONFIG_EXAMPLE_ETH_SPI_HOST, &buscfg, 1));
// Allocate SPI device from the bus
spi_device_interface_config_t devcfg = {
.command_bits = 1,
.address_bits = 7,
.mode = 0,
.clock_speed_hz = CONFIG_EXAMPLE_ETH_SPI_CLOCK_MHZ * 1000 * 1000,
.spics_io_num = CONFIG_EXAMPLE_ETH_SPI_CS_GPIO,
.queue_size = 20,
};
ESP_ERROR_CHECK(spi_bus_add_device(CONFIG_EXAMPLE_ETH_SPI_HOST, &devcfg, &spi_,
handle));
/* dm9051 ethernet driver is based on spi driver */
eth_dm9051_config_t dm9051_config = ETH_DM9051_DEFAULT_CONFIG(spi_handle);
dm9051_config.int_gpio_num = CONFIG_EXAMPLE_ETH_SPI_INT_GPIO;
esp_eth_mac_t *mac = esp_eth_mac_new_dm9051(&dm9051_config, &mac_config);
esp_eth_phy_t *phy = esp_eth_phy_new_dm9051(sphy);

Note:
• When creating MAC and PHY instance for SPI-Ethernet modules (e.g. DM9051), the constructor function
must have the same suffix (e.g. esp_eth_mac_new_dm9051 and esp_eth_phy_new_dm9051). This is because
we don’t have other choices but the integrated PHY.
• We have to create an SPI device handle firstly and then pass it to the MAC constructor function. More instructions
on creating SPI device handle, please refer to SPI Master.
• The SPI device configuration (i.e. spi_device_interface_config_t) can be different for other Ethernet modules.
Please check out your module’s spec and the examples in esp-idf.

Install Driver To install the Ethernet driver, we need to combine the instance of MAC and PHY and set some
additional high-level configurations (i.e. not specific to either MAC or PHY) in esp_eth_config_t:
• mac: instance that created from MAC generator (e.g. esp_eth_mac_new_esp32()).
• phy: instance that created from PHY generator (e.g. esp_eth_phy_new_ip101()).
• check_link_period_ms: Ethernet driver starts an OS timer to check the link status periodically, this
field is used to set the interval, in milliseconds.
• stack_input: In most of Ethernet IoT applications, any Ethernet frame that received by driver
should be passed to upper layer (e.g. TCP/IP stack). This field is set to a function which is re-
 sponsible to deal with the incoming frames. You can even update this field at runtime via function
esp_eth_update_input_path() after driver installation.
• on_lowlevel_init_done and on_lowlevel_deinit_done: These two fields are used to specify
the hooks which get invoked when low level hardware has been initialized or de-initialized.
ESP-IDF provides a default configuration for driver installation in macro ETH_DEFAULT_CONFIG.

```
estp_eth_config_t config = ETH_DEFAULT_CONFIG(mac, phy); // apply default driver--
configuration
esp_eth_handle_t eth_handle = NULL; // after driver installed, we will get the--
handle of the driver
esp_eth_driver_install(&config, &eth_handle); // install driver
```

Ethernet driver also includes event-driven model, which will send useful and important event to user space. We need to
initialize the event loop before installing the Ethernet driver. For more information about event-driven programming,
please refer to ESP Event.
/** Event handler for Ethernet events */
static void eth_event_handler(void *arg, esp_event_base_t event_base, int32_t event_id, void *event_data)
{
  uint8_t mac_addr[6] = {0};
  /* we can get the ethernet driver handle from event data */
  esp_eth_handle_t eth_handle = *(esp_eth_handle_t *)event_data;

  switch (event_id) {
  case ETHERNET_EVENT_CONNECTED:
    esp_eth_ioctl(eth_handle, ETH_CMD_G_MAC_ADDR, mac_addr);
    ESP_LOGI(TAG, "Ethernet Link Up");
    ESP_LOGI(TAG, "Ethernet HW Addr %02x:%02x:%02x:%02x:%02x:%02x",
             mac_addr[0], mac_addr[1], mac_addr[2], mac_addr[3], mac_addr[4], mac_addr[5]);
    break;
  case ETHERNET_EVENT_DISCONNECTED:
    ESP_LOGI(TAG, "Ethernet Link Down");
    break;
  case ETHERNET_EVENT_START:
    ESP_LOGI(TAG, "Ethernet Started");
    break;
  case ETHERNET_EVENT_STOP:
    ESP_LOGI(TAG, "Ethernet Stopped");
    break;
  default:
    break;
  }
}

esp_event_loop_create_default(); // create a default event loop that running in __background
esp_event_handler_register(ETH_EVENT, ESP_EVENT_ANY_ID, &eth_event_handler, NULL);
// register Ethernet event handler (to deal with user specific stuffs when event__like link up/down happened)

Start Ethernet Driver After driver installation, we can start Ethernet immediately.

esp_eth_start(eth_handle); // start Ethernet driver state machine

Connect Driver to TCP/IP Stack Up until now, we have installed the Ethernet driver. From the view of OSI (Open System Interconnection), we’re still on level 2 (i.e. Data Link Layer). We can detect link up and down event, we can gain MAC address in user space, but we can’t obtain IP address, let alone send HTTP request. The TCP/IP stack used in ESP-IDF is called LwIP, for more information about it, please refer to LwIP.

To connect Ethernet driver to TCP/IP stack, these three steps need to follow:
1. Create network interface for Ethernet driver
2. Attach the network interface to Ethernet driver
3. Register IP event handlers

More information about network interface, please refer to Network Interface.

/** Event handler for IP_EVENT_ETH_GOT_IP */
static void got_ip_event_handler(void *arg, esp_event_base_t event_base, int32_t event_id, void *event_data)
{
  ip_event_got_ip_t *event = (ip_event_got_ip_t *)event_data;
  const esp_netif_ip_info_t *ip_info = &event->ip_info;

(continues on next page)
Chapter 2. API Reference

(continued from previous page)

```c
ESP_LOGI(TAG, "Ethernet Got IP Address");
ESP_LOGI(TAG, "~~~~~~~~~~~~" );
ESP_LOGI(TAG, "ETHIP: IPSTR, IP2STR(ip_info->ip));
ESP_LOGI(TAG, "ETHMASK: IPSTR, IP2STR(ip_info->netmask));
ESP_LOGI(TAG, "ETHGW: IPSTR, IP2STR(ip_info->gw));
ESP_LOGI(TAG, "~~~~~~~~~~~~");
```

```c
esp_netif_init(); // Initialize TCP/IP network interface (should be called only
~ once in application)
esp_netif_config_t cfg = ESP_NETIF_DEFAULT_ETH(); // apply default network
~ interface configuration for Ethernet
esp_netif_t *eth_netif = esp_netif_new(&cfg); // create network interface for
~ Ethernet driver

esp_netif_attach(eth_netif, esp_eth_new_netif_glue(eth_handle)); // attach
~ Ethernet driver to TCP/IP stack
esp_event_handler_register(IP_EVENT, IP_EVENT_ETH_GOT_IP, &got_ip_event_handler,
~ NULL); // register user defined IP event handlers
esp_eth_start(eth_handle); // start Ethernet driver state machine
```

**Warning:** It is recommended to fully initialize the Ethernet driver and network interface prior registering user’s Ethernet/IP event handlers, i.e. register the event handlers as the last thing prior starting the Ethernet driver. Such approach ensures that Ethernet/IP events get executed first by the Ethernet driver or network interface and so the system is in expected state when executing user’s handlers.

---

**Misc control of Ethernet driver** The following functions should only be invoked after the Ethernet driver has been installed.

- Stop Ethernet driver: `esp_eth_stop()`
- Update Ethernet data input path: `esp_eth_update_input_path()`
- Misc get/set of Ethernet driver attributes: `esp_eth_ioctl()`

```c
/* get MAC address */
uint8_t mac_addr[6];
memset(mac_addr, 0, sizeof(mac_addr));
esp_eth_ioctl(eth_handle, ETH_CMD_G_MAC_ADDR, mac_addr);
ESP_LOGI(TAG, "Ethernet MAC Address: %02x:%02x:%02x:%02x:%02x:%02x",
~ Mac_addr[0], mac_addr[1], mac_addr[2], mac_addr[3], mac_addr[4], mac_~ addr[5]);

/* get PHY address */
int phy_addr = -1;
esp_eth_ioctl(eth_handle, ETH_CMD_G_PHY_ADDR, &phy_addr);
ESP_LOGI(TAG, "Ethernet PHY Address: %d", phy_addr);
```

**Flow control** Ethernet on MCU usually has a limitation in the number of frames it can handle during network congestion, because of the limitation in RAM size. A sending station might be transmitting data faster than the peer end can accept it. Ethernet flow control mechanism allows the receiving node to signal the sender requesting suspension of transmissions until the receiver catches up. The magic behind that is the pause frame, which was defined in IEEE 802.3x.

Pause frame is a special Ethernet frame used to carry the pause command, whose EtherType field is 0x8808, with the Control opcode set to 0x0001. Only stations configured for full-duplex operation may send pause frames. When a station wishes to pause the other end of a link, it sends a pause frame to the 48-bit reserved multicast address of 01-80-C2-00-00-01. The pause frame also includes the period of pause time being requested, in the form of a two-byte integer, ranging from 0 to 65535.
After Ethernet driver installation, the flow control feature is disabled by default. You can enable it by:

```c
bool flow_ctrl_enable = true;
esp_eth_ioctl(eth_handle, ETH_CMD_S_FLOW_CTRL, &flow_ctrl_enable);
```

One thing should be kept in mind, is that the pause frame ability will be advertised to peer end by PHY during auto negotiation. Ethernet driver sends pause frame only when both sides of the link support it.

### Application Example

- Ethernet basic example: `ethernet/basic`
- Ethernet iperf example: `ethernet/iperf`
- Ethernet to Wi-Fi AP “router” : `ethernet/eth2ap`
- Most of protocol examples should also work for Ethernet: `protocols`

### API Reference

#### Header File

- `components/esp_eth/include/esp_eth.h`

#### Functions

**esp_err_t esp_eth_driver_install(const esp_eth_config_t *config, esp_eth_handle_t *out_hdl)**

Install Ethernet driver.

**Return**

- `ESP_OK`: install esp_eth driver successfully
- `ESP_ERR_INVALID_ARG`: install esp_eth driver failed because of some invalid argument
- `ESP_ERR_NO_MEM`: install esp_eth driver failed because there’s no memory for driver
- `ESP_FAIL`: install esp_eth driver failed because some other error occurred

**Parameters**

- `[in] config`: configuration of the Ethernet driver
- `[out] out_hdl`: handle of Ethernet driver

**esp_err_t esp_eth_driver_uninstall(esp_eth_handle_t hdl)**

Uninstall Ethernet driver.

**Note** It’s not recommended to uninstall Ethernet driver unless it won’t get used any more in application code. To uninstall Ethernet driver, you have to make sure, all references to the driver are released. Ethernet driver can only be uninstalled successfully when reference counter equals to one.

**Return**

- `ESP_OK`: uninstall esp_eth driver successfully
- `ESP_ERR_INVALID_ARG`: uninstall esp_eth driver failed because of some invalid argument
- `ESP_ERR_INVALID_STATE`: uninstall esp_eth driver failed because it has more than one reference
- `ESP_FAIL`: uninstall esp_eth driver failed because some other error occurred

**Parameters**

- `[in] hdl`: handle of Ethernet driver

**esp_err_t esp_eth_start(esp_eth_handle_t hdl)**

Start Ethernet driver ONLY in standalone mode (i.e. without TCP/IP stack)

**Note** This API will start driver state machine and internal software timer (for checking link status).

**Return**

- `ESP_OK`: start esp_eth driver successfully
- `ESP_ERR_INVALID_ARG`: start esp_eth driver failed because of some invalid argument
- `ESP_ERR_INVALID_STATE`: start esp_eth driver failed because driver has started already
- `ESP_FAIL`: start esp_eth driver failed because some other error occurred

**Parameters**

- `[in] hdl`: handle of Ethernet driver
**esp_err_t esp_eth_stop(esp_eth_handle_t hdl)**

Stop Ethernet driver.

**Note** This function does the opposite operation of esp_eth_start.

**Return**
- ESP_OK: stop esp_eth driver successfully
- ESP_ERR_INVALID_ARG: stop esp_eth driver failed because of some invalid argument
- ESP_ERR_INVALID_STATE: stop esp_eth driver failed because driver has not started yet
- ESP_FAIL: stop esp_eth driver failed because some other error occurred

**Parameters**
- [in] hdl: handle of Ethernet driver

```c
esp_err_t esp_eth_update_input_path(esp_eth_handle_t hdl, esp_eth_handle_t (*stack_input)(esp_eth_handle_t hdl, uint8_t *buffer, uint32_t length, void *priv), void *priv)
```

Update Ethernet data input path (i.e. specify where to pass the input buffer)

**Note** After install driver, Ethernet still don’t know where to deliver the input buffer. In fact, this API registers a callback function which get invoked when Ethernet received new packets.

**Return**
- ESP_OK: update input path successfully
- ESP_ERR_INVALID_ARG: update input path failed because of some invalid argument
- ESP_FAIL: update input path failed because some other error occurred

**Parameters**
- [in] hdl: handle of Ethernet driver
- [in] stack_input: function pointer, which does the actual process on incoming packets
- [in] priv: private resource, which gets passed to stack_input callback without any modification

```c
esp_err_t esp_eth_transmit(esp_eth_handle_t hdl, void *buf, size_t length)
```

General Transmit.

**Return**
- ESP_OK: transmit frame buffer successfully
- ESP_ERR_INVALID_ARG: transmit frame buffer failed because of some invalid argument
- ESP_FAIL: transmit frame buffer failed because some other error occurred

**Parameters**
- [in] hdl: handle of Ethernet driver
- [in] buf: buffer of the packet to transfer
- [in] length: length of the buffer to transfer

```c
esp_err_t esp_eth_receive(esp_eth_handle_t hdl, uint8_t *buf, uint32_t *length)
```

General Receive is deprecated and shall not be accessed from app code, as polling is not supported by Ethernet.

**Note** Before this function got invoked, the value of “length” should set by user, equals the size of buffer. After the function returned, the value of “length” means the real length of received data.

**Note** This API was exposed by accident, users should not use this API in their applications. Ethernet driver is interrupt driven, and doesn’t support polling mode. Instead, users should register input callback with esp_eth_update_input_path.

**Return**
- ESP_OK: receive frame buffer successfully
- ESP_ERR_INVALID_ARG: receive frame buffer failed because of some invalid argument
- ESP_ERR_INVALID_SIZE: input buffer size is not enough to hold the incoming data. in this case, value of returned “length” indicates the real size of incoming data.
- ESP_FAIL: receive frame buffer failed because some other error occurred

**Parameters**
- [in] hdl: handle of Ethernet driver
- [out] buf: buffer to preserve the received packet
- [out] length: length of the received packet

```c
esp_err_t esp_eth_ioctl(esp_eth_handle_t hdl, esp_eth_ioctl_cmd cmd, void *data)
```

Misc IO function of Ethernet driver.
The following IO control commands are supported:

- **ETH_CMD_S_MAC_ADDR** sets Ethernet interface MAC address. `data` argument is pointer to MAC address buffer with expected size of 6 bytes.
- **ETH_CMD_G_MAC_ADDR** gets Ethernet interface MAC address. `data` argument is pointer to a buffer to which MAC address is to be copied. The buffer size must be at least 6 bytes.
- **ETH_CMD_S_PHY_ADDR** sets PHY address in range of <0-31>. `data` argument is pointer to memory of `uint32_t` datatype from where the configuration option is read.
- **ETH_CMD_G_PHY_ADDR** gets PHY address. `data` argument is pointer to memory of `uint32_t` datatype to which the PHY address is to be stored.
- **ETH_CMD_S_AUTONEGO** enables or disables Ethernet link speed and duplex mode autonegotiation. `data` argument is pointer to memory of `bool` datatype from which the configuration option is read. Preconditions: Ethernet driver needs to be stopped.
- **ETH_CMD_G_AUTONEGO** gets current configuration of the Ethernet link speed and duplex mode autonegotiation. `data` argument is pointer to memory of `bool` datatype to which the current configuration is to be stored.
- **ETH_CMD_S_SPEED** sets the Ethernet link speed. `data` argument is pointer to memory of `eth_speed_t` datatype from which the configuration option is read. Preconditions: Ethernet driver needs to be stopped and auto-negotiation disabled.
- **ETH_CMD_G_SPEED** gets current Ethernet link speed. `data` argument is pointer to memory of `eth_speed_t` datatype to which the speed is to be stored.
- **ETH_CMD_S_PROMISCUOUS** sets/resets Ethernet interface promiscuous mode. `data` argument is pointer to memory of `bool` datatype from which the configuration option is read.
- **ETH_CMD_S_FLOW_CTRL** sets/resets Ethernet interface flow control. `data` argument is pointer to memory of `bool` datatype from which the configuration option is read.
- **ETH_CMD_S_DUPLEX_MODE** sets the Ethernet duplex mode. `data` argument is pointer to memory of `eth_duplex_t` datatype from which the configuration option is read. Preconditions: Ethernet driver needs to be stopped and auto-negotiation disabled.
- **ETH_CMD_G_DUPLEX_MODE** gets current Ethernet link duplex mode. `data` argument is pointer to memory of `eth_duplex_t` datatype to which the duplex mode is to be stored.
- **ETH_CMD_S_PHY_LOOPBACK** sets/resets PHY to/from loopback mode. `data` argument is pointer to memory of `bool` datatype from which the configuration option is read.

Return

- ESP_OK: process io command successfully
- ESP_ERR_INVALID_ARG: process io command failed because of some invalid argument
- ESP_FAIL: process io command failed because some other error occurred
- ESP_ERR_NOT_SUPPORTED: requested feature is not supported

Parameters

```c
[in] hdl: handle of Ethernet driver
[in] cmd: IO control command
[inout] data: address of data for set command or address where to store the data when used with get command
```

```c
esp_err_t esp_eth_increase_reference (esp_eth_handle_t hdl)
```

Increase Ethernet driver reference.

**Note** Ethernet driver handle can be obtained by os timer, netif, etc. It’s dangerous when thread A is using Ethernet but thread B uninstall the driver. Using reference counter can prevent such risk, but care should be taken, when you obtain Ethernet driver, this API must be invoked so that the driver won’t be uninstalled during your using time.

Return

- ESP_OK: increase reference successfully
- ESP_ERR_INVALID_ARG: increase reference failed because of some invalid argument

Parameters

```c
[in] hdl: handle of Ethernet driver
```

```c
esp_err_t esp_eth_decrease_reference (esp_eth_handle_t hdl)
```

Decrease Ethernet driver reference.

Return
• ESP_OK: increase reference successfully
• ESP_ERR_INVALID_ARG: increase reference failed because of some invalid argument

**Parameters**

- [in] hdl: handle of Ethernet driver

**Structures**

```c
struct esp_eth_config_t
```

Configuration of Ethernet driver.

**Public Members**

```c
esp_eth_mac_t *mac
```
Ethernet MAC object.

```c
esp_eth_phy_t *phy
```
Ethernet PHY object.

```c
uint32_t check_link_period_ms
```
Period time of checking Ethernet link status.

```c
esp_err_t (*stack_input)(esp_eth_handle_t eth_handle, uint8_t *buffer, uint32_t length, void *priv)
```
Input frame buffer to user’s stack.

**Return**

- ESP_OK: input frame buffer to upper stack successfully
- ESP_FAIL: error occurred when inputting buffer to upper stack

**Parameters**

- [in] eth_handle: handle of Ethernet driver
- [in] buffer: frame buffer that will get input to upper stack
- [in] length: length of the frame buffer

```c
esp_err_t (*on_lowlevel_init_done)(esp_eth_handle_t eth_handle)
```
Callback function invoked when lowlevel initialization is finished.

**Return**

- ESP_OK: process extra lowlevel initialization successfully
- ESP_FAIL: error occurred when processing extra lowlevel initialization

**Parameters**

- [in] eth_handle: handle of Ethernet driver

```c
esp_err_t (*on_lowlevel_deinit_done)(esp_eth_handle_t eth_handle)
```
Callback function invoked when lowlevel deinitialization is finished.

**Return**

- ESP_OK: process extra lowlevel deinitialization successfully
- ESP_FAIL: error occurred when processing extra lowlevel deinitialization

**Parameters**

- [in] eth_handle: handle of Ethernet driver

```c
esp_err_t (*read_phy_reg)(esp_eth_handle_t eth_handle, uint32_t phy_addr, uint32_t phy_reg, uint32_t *reg_value)
```
Read PHY register.

**Note**

Usually the PHY register read/write function is provided by MAC (SMI interface), but if the PHY device is managed by other interface (e.g. I2C), then user needs to implement the corresponding read/write. Setting this to NULL means your PHY device is managed by MAC’s SMI interface.

**Return**

- ESP_OK: read PHY register successfully
- ESP_ERR_INVALID_ARG: read PHY register failed because of invalid argument
- ESP_ERR_TIMEOUT: read PHY register failed because of timeout
- ESP_FAIL: read PHY register failed because some other error occurred
Parameters
• [in] eth_handle: handle of Ethernet driver
• [in] phy_addr: PHY chip address (0~31)
• [in] phy_reg: PHY register index code
• [out] reg_value: PHY register value

```c
esp_err_t (*write_phy_reg)(esp_eth_handle_t eth_handle, uint32_t phy_addr, uint32_t phy_reg,
                          uint32_t reg_value)
```

Write PHY register.

Note Usually the PHY register read/write function is provided by MAC (SMI interface), but if the PHY device is managed by other interface (e.g. I2C), then user needs to implement the corresponding read/write. Setting this to NULL means your PHY device is managed by MAC’s SMI interface.

Return
• ESP_OK: write PHY register successfully
• ESP_ERR_INVALID_ARG: read PHY register failed because of invalid argument
• ESP_ERR_TIMEOUT: write PHY register failed because of timeout
• ESP_FAIL: write PHY register failed because some other error occurred

Parameters
• [in] eth_handle: handle of Ethernet driver
• [in] phy_addr: PHY chip address (0~31)
• [in] phy_reg: PHY register index code
• [in] reg_value: PHY register value

Macros
ETH_DEFAULT_CONFIG (emac, ephy)
Default configuration for Ethernet driver.

Type Definitions
typedef void *esp_eth_handle_t
Handle of Ethernet driver.

Enumerations
defined esp_eth_io_cmd_t
Command list for ioctl API.

Values:

- ETH_CMD_G_MAC_ADDR
  Get MAC address
- ETH_CMD_S_MAC_ADDR
  Set MAC address
- ETH_CMD_G_PHY_ADDR
  Get PHY address
- ETH_CMD_S_PHY_ADDR
  Set PHY address
- ETH_CMD_G_AUTONEGO
  Get PHY Auto Negotiation
- ETH_CMD_S_AUTONEGO
  Set PHY Auto Negotiation
- ETH_CMD_G_SPEED
  Get Speed
- ETH_CMD_S_SPEED
  Set Speed
Chapter 2. API Reference

ETH_CMD_S_PROMISCUOUS
    Set promiscuous mode

ETH_CMD_S_FLOW_CTRL
    Set flow control

ETH_CMD_G_DUPLEX_MODE
    Get Duplex mode

ETH_CMD_S_DUPLEX_MODE
    Set Duplex mode

ETH_CMD_S_PHY_LOOPBACK
    Set PHY loopback

Header File

- components/esp_eth/include/esp_eth_com.h

Functions

esp_err_t esp_eth_detect_phy_addr(esp_eth_mediator_t *eth, int *detected_addr)
    Detect PHY address.

    Return
    - ESP_OK: detect phy address successfully
    - ESP_ERR_INVALID_ARG: invalid parameter
    - ESP_ERR_NOT_FOUND: can’t detect any PHY device
    - ESP_FAIL: detect phy address failed because some error occurred

    Parameters
    - [in] eth: mediator of Ethernet driver
    - [out] detected_addr: a valid address after detection

Structures

struct esp_eth_mediator_s
    Ethernet mediator.

Public Members

esp_err_t (*phy_reg_read)(esp_eth_mediator_t *eth, uint32_t phy_addr, uint32_t phy_reg, uint32_t *reg_value)
    Read PHY register.

    Return
    - ESP_OK: read PHY register successfully
    - ESP_FAIL: read PHY register failed because some error occurred

    Parameters
    - [in] eth: mediator of Ethernet driver
    - [in] phy_addr: PHY Chip address (0~31)
    - [in] phy_reg: PHY register index code
    - [out] reg_value: PHY register value

esp_err_t (*phy_reg_write)(esp_eth_mediator_t *eth, uint32_t phy_addr, uint32_t phy_reg, uint32_t reg_value)
    Write PHY register.

    Return
    - ESP_OK: write PHY register successfully
    - ESP_FAIL: write PHY register failed because some error occurred

    Parameters
    - [in] eth: mediator of Ethernet driver
Chapter 2. API Reference

- [in] phy_addr: PHY Chip address (0~31)
- [in] phy_reg: PHY register index code
- [in] reg_value: PHY register value

```c
esp_err_t (*stack_input)(esp_eth_mediator_t *eth, uint8_t *buffer, uint32_t length)
```
Deliver packet to upper stack.

**Return**
- ESP_OK: deliver packet to upper stack successfully
- ESP_FAIL: deliver packet failed because some error occurred

**Parameters**
- [in] eth: mediator of Ethernet driver
- [in] buffer: packet buffer
- [in] length: length of the packet

```c
esp_err_t (*on_state_changed)(esp_eth_mediator_t *eth, esp_eth_state_t state, void *args)
```
Callback on Ethernet state changed.

**Return**
- ESP_OK: process the new state successfully
- ESP_FAIL: process the new state failed because some error occurred

**Parameters**
- [in] eth: mediator of Ethernet driver
- [in] state: new state
- [in] args: optional argument for the new state

**Type Definitions**

```c
typedef struct esp_eth_mediator_s esp_eth_mediator_t
```
Ethernet mediator.

**Enumerations**

```c
enum esp_eth_state_t
```
Ethernet driver state.

**Values:**

- ETH_STATE_LLINE_INIT
  Lowlevel init done
- ETH_STATE_DEINIT
  Deinit done
- ETH_STATE_LINK
  Link status changed
- ETH_STATE_SPEED
  Speed updated
- ETH_STATE_DUPLEX
  Duplex updated
- ETH_STATE_PAUSE
  Pause ability updated

```c
enum eth_event_t
```
Ethernet event declarations.

**Values:**

- ETHERNET_EVENT_START
  Ethernet driver start
- ETHERNET_EVENT_STOP
  Ethernet driver stop
**Chapter 2. API Reference**

**ETHERNET_EVENT_CONNECTED**
Ethernet got a valid link

**ETHERNET_EVENT_DISCONNECTED**
Ethernet lost a valid link

**Header File**
- components/esp_eth/include/esp_eth_mac.h

**Unions**

union eth_mac_clock_config_t

```c
#include <esp_eth_mac.h>
```
EthernetMACClockConfiguration.

**Public Members**

```c
struct eth_mac_clock_config_t::[anonymous] mii
```
EMAC MII Clock Configuration

```c
t_enum emac_rmii_clock_mode_t clock_mode
```
RMII Clock Mode Configuration

```c
t_enum emac_rmii_clock_gpio_t clock_gpio
```
RMII Clock GPIO Configuration

```c
struct eth_mac_clock_config_t::[anonymous] rmii
```
EMAC RMII Clock Configuration

**Structures**

```c
struct esp Eth_mac_s
```
Ethernet MAC.

**Public Members**

```c
esp_err_t (*set_mediator)(esp Eth_mac_t *mac, esp Eth_mediator_t *eth)
```
Set mediator for Ethernet MAC.

**Return**
- ESP_OK: set mediator for Ethernet MAC successfully
- ESP_ERR_INVALID_ARG: set mediator for Ethernet MAC failed because of invalid argument

**Parameters**
- [in] mac: Ethernet MAC instance
- [in] eth: Ethernet mediator

```c
esp_err_t (*init)(esp Eth_mac_t *mac)
```
Initialize Ethernet MAC.

**Return**
- ESP_OK: initialize Ethernet MAC successfully
- ESP_ERR_TIMEOUT: initialize Ethernet MAC failed because of timeout
- ESP_FAIL: initialize Ethernet MAC failed because some other error occurred

**Parameters**
- [in] mac: Ethernet MAC instance

```c
esp_err_t (*deinit)(esp Eth_mac_t *mac)
```
Deinitialize Ethernet MAC.

**Return**
• ESP_OK: deinitialize Ethernet MAC successfully
• ESP_FAIL: deinitialize Ethernet MAC failed because some error occurred

### Parameters

- `[in] mac`: Ethernet MAC instance

```c
esp_err_t (*start)(esp_eth_mac_t *mac)
```

Start Ethernet MAC.

#### Return

- ESP_OK: start Ethernet MAC successfully
- ESP_FAIL: start Ethernet MAC failed because some other error occurred

#### Parameters

- `[in] mac`: Ethernet MAC instance

```c
esp_err_t (*stop)(esp_eth_mac_t *mac)
```

Stop Ethernet MAC.

#### Return

- ESP_OK: stop Ethernet MAC successfully
- ESP_FAIL: stop Ethernet MAC failed because some other error occurred

#### Parameters

- `[in] mac`: Ethernet MAC instance

```c
esp_err_t (*transmit)(esp_eth_mac_t *mac, uint8_t* buf, uint32_t length)
```

Transmit packet from Ethernet MAC.

#### Return

- ESP_OK: transmit packet successfully
- ESP_ERR_INVALID_ARG: transmit packet failed because of invalid argument
- ESP_ERR_INVALID_STATE: transmit packet failed because of wrong state of MAC
- ESP_FAIL: transmit packet failed because some other error occurred

#### Parameters

- `[in] mac`: Ethernet MAC instance
- `[in] buf`: packet buffer to transmit
- `[in] length`: length of packet

```c
esp_err_t (*receive)(esp_eth_mac_t *mac, uint8_t* buf, uint32_t* length)
```

Receive packet from Ethernet MAC.

#### Note

- Memory of `buf` is allocated in the Layer2, make sure it get free after process.
- Before this function got invoked, the value of “length” should set by user, equals the size of buffer.
- After the function returned, the value of “length” means the real length of received data.

#### Return

- ESP_OK: receive packet successfully
- ESP_ERR_INVALID_ARG: receive packet failed because of invalid argument
- ESP_ERR_INVALID_SIZE: input buffer size is not enough to hold the incoming data. in this case, value of returned “length” indicates the real size of incoming data.
- ESP_FAIL: receive packet failed because some other error occurred

#### Parameters

- `[in] mac`: Ethernet MAC instance
- `[out] buf`: packet buffer which will preserve the received frame
- `[out] length`: length of the received packet

```c
esp_err_t (*read_phy_reg)(esp_eth_mac_t *mac, uint32_t phy_addr, uint32_t phy_reg, uint32_t *reg_value)
```

Read PHY register.

#### Return

- ESP_OK: read PHY register successfully
- ESP_ERR_INVALID_ARG: read PHY register failed because of invalid argument
- ESP_ERR_INVALID_STATE: read PHY register failed because of wrong state of MAC
- ESP_ERR_TIMEOUT: read PHY register failed because of timeout
- ESP_FAIL: read PHY register failed because some other error occurred
Parameters
- [in] mac: Ethernet MAC instance
- [in] phy_addr: PHY chip address (0-31)
- [in] phy_reg: PHY register index code
- [out] reg_value: PHY register value

```
esp_err_t (*write_phy_reg)(esp_eth_mac_t *mac, uint32_t phy_addr, uint32_t phy_reg, uint32_t reg_value)
```

Write PHY register.

Return
- ESP_OK: write PHY register successfully
- ESP_ERR_INVALID_STATE: write PHY register failed because of wrong state of MAC
- ESP_ERR_TIMEOUT: write PHY register failed because of timeout
- ESP_FAIL: write PHY register failed because some other error occurred

Parameters
- [in] mac: Ethernet MAC instance
- [in] phy_addr: PHY chip address (0-31)
- [in] phy_reg: PHY register index code
- [in] reg_value: PHY register value

```
esp_err_t (*set_addr)(esp_eth_mac_t *mac, uint8_t *addr)
```

Set MAC address.

Return
- ESP_OK: set MAC address successfully
- ESP_ERR_INVALID_ARG: set MAC address failed because of invalid argument
- ESP_FAIL: set MAC address failed because some other error occurred

Parameters
- [in] mac: Ethernet MAC instance
- [in] addr: MAC address

```
esp_err_t (*get_addr)(esp_eth_mac_t *mac, uint8_t *addr)
```

Get MAC address.

Return
- ESP_OK: get MAC address successfully
- ESP_ERR_INVALID_ARG: get MAC address failed because of invalid argument
- ESP_FAIL: get MAC address failed because some other error occurred

Parameters
- [in] mac: Ethernet MAC instance
- [out] addr: MAC address

```
esp_err_t (*set_speed)(esp_eth_mac_t *mac, eth_speed_t speed)
```

Set speed of MAC.

Return
- ESP_OK: set MAC speed successfully
- ESP_ERR_INVALID_ARG: set MAC speed failed because of invalid argument
- ESP_FAIL: set MAC speed failed because some other error occurred

Parameters
- [in] mac: Ethernet MAC instance
- [in] speed: MAC speed

```
esp_err_t (*set_duplex)(esp_eth_mac_t *mac, eth_duplex_t duplex)
```

Set duplex mode of MAC.

Return
- ESP_OK: set MAC duplex mode successfully
- ESP_ERR_INVALID_ARG: set MAC duplex failed because of invalid argument
- ESP_FAIL: set MAC duplex failed because some other error occurred

Parameters
- [in] mac: Ethernet MAC instance
Chapter 2. API Reference

- [in] duplex: MAC duplex

```c
esp_err_t (*set_link)(esp_eth_mac_t *mac, eth_link_t link)
```
Set link status of MAC.

**Return**
- ESP_OK: set link status successfully
- ESP_ERR_INVALID_ARG: set link status failed because of invalid argument
- ESP_FAIL: set link status failed because some other error occurred

**Parameters**
- [in] mac: Ethernet MAC instance
- [in] link: Link status

```c
esp_err_t (*set_promiscuous)(esp_eth_mac_t *mac, bool enable)
```
Set promiscuous of MAC.

**Return**
- ESP_OK: set promiscuous mode successfully
- ESP_FAIL: set promiscuous mode failed because some error occurred

**Parameters**
- [in] mac: Ethernet MAC instance
- [in] enable: set true to enable promiscuous mode; set false to disable promiscuous mode

```c
esp_err_t (*enable_flow_ctrl)(esp_eth_mac_t *mac, bool enable)
```
Enable flow control on MAC layer or not.

**Return**
- ESP_OK: set flow control successfully
- ESP_FAIL: set flow control failed because some error occurred

**Parameters**
- [in] mac: Ethernet MAC instance
- [in] enable: set true to enable flow control; set false to disable flow control

```c
esp_err_t (*set_peer_pause_ability)(esp_eth_mac_t *mac, uint32_t ability)
```
Set the PAUSE ability of peer node.

**Return**
- ESP_OK: set peer pause ability successfully
- ESP_FAIL: set peer pause ability failed because some error occurred

**Parameters**
- [in] mac: Ethernet MAC instance
- [in] ability: zero indicates that pause function is supported by link partner; non-zero indicates that pause function is not supported by link partner

```c
esp_err_t (*del)(esp_eth_mac_t *mac)
```
Free memory of Ethernet MAC.

**Return**
- ESP_OK: free Ethernet MAC instance successfully
- ESP_FAIL: free Ethernet MAC instance failed because some error occurred

**Parameters**
- [in] mac: Ethernet MAC instance

```c
struct eth_mac_config_t
```
Configuration of Ethernet MAC object.

### Public Members

- `uint32_t sw_reset_timeout_ms`
  Software reset timeout value (Unit: ms)

- `uint32_t rx_task_stack_size`
  Stack size of the receive task
uint32_t rx_task_prio
    Priority of the receive task

uint32_t flags
    Flags that specify extra capability for mac driver

**Macros**

ETH_MAC_FLAG_WORK_WITH_CACHE_DISABLE
    MAC driver can work when cache is disabled

ETH_MAC_FLAG_PIN_TO_CORE
    Pin MAC task to the CPU core where driver installation happened

ETH_MAC_DEFAULT_CONFIG()
    Default configuration for Ethernet MAC object.

**Type Definitions**

typedef struct esp_eth_mac_s esp_eth_mac_t
    Ethernet MAC.

**Enumerations**

define emac_rmii_clock_mode_t
    RMII Clock Mode Options.
    Values:

    EMAC_CLK_DEFAULT
        Default values configured using Kconfig are going to be used when “Default” selected.

    EMAC_CLK_EXT_IN
        Input RMII Clock from external. EMAC Clock GPIO number needs to be configured when this option is selected.
        Note MAC will get RMII clock from outside. Note that ESP32 only supports GPIO0 to input the RMII clock.

    EMAC_CLK_OUT
        Output RMII Clock from internal APLL Clock. EMAC Clock GPIO number needs to be configured when this option is selected.

define emac_rmii_clock_gpio_t
    RMII Clock GPIO number Options.
    Values:

    EMAC_CLK_IN_GPIO = 0
        MAC will get RMII clock from outside at this GPIO.
        Note ESP32 only supports GPIO0 to input the RMII clock.

    EMAC_CLK_OUT_GPIO = 0
        Output RMII Clock from internal APLL Clock available at GPIO0.
        Note GPIO0 can be set to output a pre-divided PLL clock (test only!). Enabling this option will configure GPIO0 to output a 50MHz clock. In fact this clock doesn’t have directly relationship with EMAC peripheral. Sometimes this clock won’t work well with your PHY chip. You might need to add some extra devices after GPIO0 (e.g. inverter). Note that outputting RMII clock on GPIO0 is an experimental practice. If you want the Ethernet to work with WiFi, don’t select GPIO0 output mode for stability.

    EMAC_CLK_OUT_GPIO = 16
        Output RMII Clock from internal APLL Clock available at GPIO16.

    EMAC_CLK_OUT_180_GPIO = 17
        Inverted Output RMII Clock from internal APLL Clock available at GPIO17.
Header File

- components/esp_eth/include/esp_eth_phy.h

Functions

`esp_eth_phy_t* esp_eth_phy_new_ip101(const eth_phy_config_t *config)`
Create a PHY instance of IP101.

Return
- instance: create PHY instance successfully
- NULL: create PHY instance failed because some error occurred

Parameters
- [in] config: configuration of PHY

`esp_eth_phy_t* esp_eth_phy_new_rtl8201(const eth_phy_config_t *config)`
Create a PHY instance of RTL8201.

Return
- instance: create PHY instance successfully
- NULL: create PHY instance failed because some error occurred

Parameters
- [in] config: configuration of PHY

`esp_eth_phy_t* esp_eth_phy_new_lan87xx(const eth_phy_config_t *config)`
Create a PHY instance of LAN87xx.

Return
- instance: create PHY instance successfully
- NULL: create PHY instance failed because some error occurred

Parameters
- [in] config: configuration of PHY

`esp_eth_phy_t* esp_eth_phy_new_dp83848(const eth_phy_config_t *config)`
Create a PHY instance of DP83848.

Return
- instance: create PHY instance successfully
- NULL: create PHY instance failed because some error occurred

Parameters
- [in] config: configuration of PHY

`esp_eth_phy_t* esp_eth_phy_new_ksz80xx(const eth_phy_config_t *config)`
Create a PHY instance of KSZ80xx.

The phy model from the KSZ80xx series is detected automatically. If the driver is unable to detect a supported
model, NULL is returned.

Currently, the following models are supported: KSZ8001, KSZ8021, KSZ8031, KSZ8041, KSZ8051, KSZ8061, KSZ8081, KSZ8091

Return
- instance: create PHY instance successfully
- NULL: create PHY instance failed because some error occurred

Parameters
- [in] config: configuration of PHY

Structures

`struct esp_eth_phy_s`
Ethernet PHY.
Public Members

```c
esp_err_t (*set_mediator)(esp_eth_phy_t *phy, esp_eth_mediator_t *mediator)
```
Set mediator for PHY.

**Return**
- ESP_OK: set mediator for Ethernet PHY instance successfully
- ESP_ERR_INVALID_ARG: set mediator for Ethernet PHY instance failed because of some invalid arguments

**Parameters**
- [in] phy: Ethernet PHY instance
- [in] mediator: mediator of Ethernet driver

```c
esp_err_t (*reset)(esp_eth_phy_t *phy)
```
Software Reset Ethernet PHY.

**Return**
- ESP_OK: reset Ethernet PHY successfully
- ESP_FAIL: reset Ethernet PHY failed because some error occurred

**Parameters**
- [in] phy: Ethernet PHY instance

```c
esp_err_t (*reset_hw)(esp_eth_phy_t *phy)
```
Hardware Reset Ethernet PHY.

**Note** Hardware reset is mostly done by pull down and up PHY’s nRST pin

**Return**
- ESP_OK: reset Ethernet PHY successfully
- ESP_FAIL: reset Ethernet PHY failed because some error occurred

**Parameters**
- [in] phy: Ethernet PHY instance

```c
esp_err_t (*init)(esp_eth_phy_t *phy)
```
Initialize Ethernet PHY.

**Return**
- ESP_OK: initialize Ethernet PHY successfully
- ESP_FAIL: initialize Ethernet PHY failed because some error occurred

**Parameters**
- [in] phy: Ethernet PHY instance

```c
esp_err_t (*deinit)(esp_eth_phy_t *phy)
```
Deinitialize Ethernet PHY.

**Return**
- ESP_OK: deinitialize Ethernet PHY successfully
- ESP_FAIL: deinitialize Ethernet PHY failed because some error occurred

**Parameters**
- [in] phy: Ethernet PHY instance

```c
esp_err_t (*autonego_ctrl)(esp_eth_phy_t *phy, eth_phy_autoneg_cmd_t cmd, bool *autonego_en_stat)
```
Configure auto negotiation.

**Return**
- ESP_OK: restart auto negotiation successfully
- ESP_FAIL: restart auto negotiation failed because some error occurred
- ESP_ERR_INVALID_ARG: invalid command

**Parameters**
- [in] phy: Ethernet PHY instance
- [in] cmd: Configuration command, it is possible to Enable (restart), Disable or get current status of PHY auto negotiation
- [out] autonego_en_stat: Address where to store current status of auto negotiation configuration
esp_err_t (*get_link)(esp_eth_phy_t *phy)
Get Ethernet PHY link status.

Return
• ESP_OK: get Ethernet PHY link status successfully
• ESP_FAIL: get Ethernet PHY link status failed because some error occurred

Parameters
• [in] phy: Ethernet PHY instance

esp_err_t (*pwrctl)(esp_eth_phy_t *phy, bool enable)
Power control of Ethernet PHY.

Return
• ESP_OK: control Ethernet PHY power successfully
• ESP_FAIL: control Ethernet PHY power failed because some error occurred

Parameters
• [in] phy: Ethernet PHY instance
• [in] enable: set true to power on Ethernet PHY; set false to power off Ethernet PHY

esp_err_t (*set_addr)(esp_eth_phy_t *phy, uint32_t addr)
Set PHY chip address.

Return
• ESP_OK: set Ethernet PHY address successfully
• ESP_FAIL: set Ethernet PHY address failed because some error occurred

Parameters
• [in] phy: Ethernet PHY instance
• [in] addr: PHY chip address

esp_err_t (*get_addr)(esp_eth_phy_t *phy, uint32_t *addr)
Get PHY chip address.

Return
• ESP_OK: get Ethernet PHY address successfully
• ESP_ERR_INVALID_ARG: get Ethernet PHY address failed because of invalid argument

Parameters
• [in] phy: Ethernet PHY instance
• [out] addr: PHY chip address

esp_err_t (*advertise_pause_ability)(esp_eth_phy_t *phy, uint32_t ability)
Advertise pause function supported by MAC layer.

Return
• ESP_OK: Advertise pause ability successfully
• ESP_ERR_INVALID_ARG: Advertise pause ability failed because of invalid argument

Parameters
• [in] phy: Ethernet PHY instance
• [out] addr: Pause ability

esp_err_t (*loopback)(esp_eth_phy_t *phy, bool enable)
Sets the PHY to loopback mode.

Return
• ESP_OK: PHY instance loopback mode has been configured successfully
• ESP_FAIL: PHY instance loopback configuration failed because some error occurred

Parameters
• [in] phy: Ethernet PHY instance
• [in] enable: enables or disables PHY loopback

esp_err_t (*set_speed)(esp_eth_phy_t *phy, eth_speed_t speed)
Sets PHY speed mode.

Note Autonegotiation feature needs to be disabled prior to calling this function for the new setting to be applied

Return
- ESP_OK: PHY instance speed mode has been configured successfully
- ESP_FAIL: PHY instance speed mode configuration failed because some error occurred

**Parameters**
- [in] phy: Ethernet PHY instance
- [in] speed: Speed mode to be set

```c
esp_err_t (*set_duplex)(esp_eth_phy_t *phy, eth_duplex_t duplex)
```
Sets PHY duplex mode.

**Note** Autonegotiation feature needs to be disabled prior to calling this function for the new setting to be applied

**Return**
- ESP_OK: PHY instance duplex mode has been configured successfully
- ESP_FAIL: PHY instance duplex mode configuration failed because some error occurred

**Parameters**
- [in] phy: Ethernet PHY instance
- [in] duplex: Duplex mode to be set

```c
esp_err_t (*del)(esp_eth_phy_t *phy)
```
Free memory of Ethernet PHY instance.

**Return**
- ESP_OK: free PHY instance successfully
- ESP_FAIL: free PHY instance failed because some error occurred

**Parameters**
- [in] phy: Ethernet PHY instance

```c
struct eth_phy_config_t
```
Ethernet PHY configuration.

**Public Members**

```c
int32_t phy_addr
```
PHY address, set -1 to enable PHY address detection at initialization stage

```c
uint32_t reset_timeout_ms
```
Reset timeout value (Unit: ms)

```c
uint32_t autonego_timeout_ms
```
Auto-negotiation timeout value (Unit: ms)

```c
int reset_gpio_num
```
Reset GPIO number, -1 means no hardware reset

**Macros**

```c
ESP_ETH_PHY_ADDR_AUTO
ETH_PHY_DEFAULT_CONFIG()
```
Default configuration for Ethernet PHY object.

**Type Definitions**

```c
typedef struct esp_eth_phy_s esp_eth_phy_t
```
Ethernet PHY.

**Enumerations**

```c
enum eth_phy_autoneg_cmd_t
```
Auto-negotiation control commands.

**Values**

```c
ESP_ETH_PHY_AUTONEGO_RESTART
```
Chapter 2. API Reference

ESP_ETH_PHY_AUTONEGO_EN
ESP_ETH_PHY_AUTONEGO_DIS
ESP_ETH_PHY_AUTONEGO_G_STAT

Header File

• components/esp_eth/include/esp_eth_netif_glue.h

Functions

esp_eth_netif_glue_handle_t esp_eth_new_netif_glue(esp_eth_handle_t eth_hdl)
Create a netif glue for Ethernet driver.

Note  netif glue is used to attach io driver to TCP/IP netif
Return  glue object, which inherits esp_netif_driver_base_t
Parameters
• eth_hdl: Ethernet driver handle

esp_err_t esp_eth_del_netif_glue(esp_eth_netif_glue_handle_t eth_netif_glue)
Delete netif glue of Ethernet driver.

Return  -ESP_OK: delete netif glue successfully
Parameters
• eth_netif_glue: netif glue

Type Definitions

typedef struct esp_eth_netif_glue_t* esp_eth_netif_glue_handle_t
Handle of netif glue - an intermediate layer between netif and Ethernet driver.

Code examples for the Ethernet API are provided in the ethernet directory of ESP-IDF examples.

2.2.3  Thread

Thread

Introduction  Thread is a IP-based mesh networking protocol. It’s based on the 802.15.4 physical and MAC layer.

Application Examples  The openthread directory of ESP-IDF examples contains the following applications:

• The OpenThread interactive shell openthread/ot-cli.
• The Thread border router openthread/ot_br.
• The Thread radio co-processor openthread/ot_rcp.

API Reference  For manipulating the Thread network, the OpenThread api shall be used. The OpenThread api docs can be found at the OpenThread official website.

ESP-IDF provides extra apis for launching and managing the OpenThread stack, binding to network interfaces and border routing features.

Header File

• components/openthread/include/esp_openthread.h
Functions

**esp_err_t esp_openthread_init(const esp_openthread_platform_config_t *init_config)**

Initializes the full OpenThread stack.

**Note** The OpenThread instance will also be initialized in this function.

**Return**
- ESP_OK on success
- ESP_ERR_NO_MEM if allocation has failed
- ESP_ERR_INVALID_ARG if radio or host connection mode not supported
- ESP_ERR_INVALID_STATE if already initialized

**Parameters**
- **[in] init_config**: The initialization configuration.

**esp_err_t esp_openthread_launch_mainloop (void)**

Launches the OpenThread main loop.

**Note** The function will not return unless error happens when running the OpenThread stack.

**Return**
- ESP_OK on success
- ESP_ERR_NO_MEM if allocation has failed
- ESP_FAIL on other failures

**esp_err_t esp_openthread_deinit (void)**

This function performs OpenThread stack and platform driver deinitialization.

**Return**
- ESP_OK on success
- ESP_ERR_INVALID_STATE if not initialized

**otInstance *esp_openthread_get_instance (void)**

This function acquires the underlying OpenThread instance.

**Note** This function can be called on other tasks without lock.

**Return** The OpenThread instance pointer

Header File

- components/openthread/include/esp_openthread_types.h

Structures

**struct esp_openthread_mainloop_context_t**

This structure represents a context for a select() based mainloop.

**Public Members**

- **fd_set read_fds**
  The read file descriptors

- **fd_set write_fds**
  The write file descriptors

- **fd_set error_fds**
  The error file descriptors

- **int max_fd**
  The max file descriptor

- **struct timeval timeout**
  The timeout

**struct esp_openthread_uart_config_t**

The uart port config for OpenThread.
Public Members

*`uart_port_t port`*
  UART port number

*`uart_config_t uart_config`*
  UART configuration, see `uart_config_t` docs

*int rx_pin*
  UART RX pin

*int tx_pin*
  UART TX pin

*struct esp_openthread_radio_config_t*
  The OpenThread radio configuration.

Public Members

*`esp_openthread_radio_mode_t radio_mode`*
  The radio mode

*`esp_openthread_uart_config_t radio_uart_config`*
  The uart configuration to RCP

*struct esp_openthread_host_connection_config_t*
  The OpenThread host connection configuration.

Public Members

*`esp_openthread_host_connection_mode_t host_connection_mode`*
  The host connection mode

*`esp_openthread_uart_config_t host_uart_config`*
  The uart configuration to host

*struct esp_openthread_port_config_t*
  The OpenThread port specific configuration.

Public Members

*const char *storage_partition_name*
  The partition for storing OpenThread dataset

*uint8_t netif_queue_size*
  The packet queue size for the network interface

*uint8_t task_queue_size*
  The task queue size

*struct esp_openthread_platform_config_t*
  The OpenThread platform configuration.

Public Members

*`esp_openthread_radio_config_t radio_config`*
  The radio configuration

*`esp_openthread_host_connection_config_t host_config`*
  The host connection configuration
Chapter 2. API Reference

**esp_openthread_port_config_t** `port_config`

The port configuration

**Enumerations**

**enum esp_openthread_event_t**

OpenThread event declarations.

Values:

- **OPENTHREAD_EVENT_START**
  OpenThread stack start

- **OPENTHREAD_EVENT_STOP**
  OpenThread stack stop

- **OPENTHREAD_EVENT_IF_UP**
  OpenThread network interface up

- **OPENTHREAD_EVENT_IF_DOWN**
  OpenThread network interface down

- **OPENTHREAD_EVENT_GOT_IP6**
  OpenThread stack added IPv6 address

- **OPENTHREAD_EVENT_LOST_IP6**
  OpenThread stack removed IPv6 address

- **OPENTHREAD_EVENT_MULTICAST_GROUP_JOIN**
  OpenThread stack joined IPv6 multicast group

- **OPENTHREAD_EVENT_MULTICAST_GROUP_LEAVE**
  OpenThread stack left IPv6 multicast group

- **OPENTHREAD_EVENT_TREL_ADD_IP6**
  OpenThread stack added TREL IPv6 address

- **OPENTHREAD_EVENT_TREL_REMOVE_IP6**
  OpenThread stack removed TREL IPv6 address

**enum esp_openthread_radio_mode_t**

The radio mode of OpenThread.

Values:

- **RADIO_MODE_NATIVE** = 0x0
  Use the native 15.4 radio

- **RADIO_MODE_UART_RCP** = 0x1
  UART connection to a 15.4 capable radio co-processor (RCP)

- **RADIO_MODE_SPI_RCP** = 0x2
  SPI connection to a 15.4 capable radio co-processor (RCP)

**enum esp_openthread_host_connection_mode_t**

How OpenThread connects to the host.

Values:

- **HOST_CONNECTION_MODE_NONE** = 0x0
  Disable host connection

- **HOST_CONNECTION_MODE_CLI_UART** = 0x1
  CLI UART connection to the host

- **HOST_CONNECTION_MODE_RCP_UART** = 0x2
  RCP UART connection to the host
Chapter 2. API Reference

Header File

- components/openthread/include/esp_openthread_lock.h

Functions

`esp_err_t esp_openthread_lock_init(void)`
This function initializes the OpenThread API lock.

Return

- ESP_OK on success
- ESP_ERR_NO_MEM if allocation has failed
- ESP_ERR_INVALID_STATE if already initialized

void `esp_openthread_lock_deinit(void)`
This function deinitializes the OpenThread API lock.

bool `esp_openthread_lock_acquire(TickType_t block_ticks)`
This function acquires the OpenThread API lock.

Note Every OT APIs that takes an otInstance argument MUST be protected with this API lock except that the call site is in OT callbacks.

Return

- True on lock acquired
- False on failing to acquire the lock with the timeout.

Parameters

- [in] block_ticks: The maximum number of RTOS ticks to wait for the lock.

void `esp_openthread_lock_release(void)`
This function releases the OpenThread API lock.

Header File

- components/openthread/include/esp_openthread_netif_glue.h

Functions

void `esp_openthread_netif_glue_init(const esp_openthread_platform_config_t *config)`
This function initializes the OpenThread network interface glue.

Return

- glue pointer on success
- NULL on failure

Parameters

- [in] config: The platform configuration.

void `esp_openthread_netif_glue_deinit(void)`
This function deinitializes the OpenThread network interface glue.

esp_netif_t *`esp_openthread_get_netif(void)`
This function acquires the OpenThread netif.

Return The OpenThread netif or NULL if not initialized.

Header File

- components/openthread/include/esp_openthread_border_router.h

Functions

void `esp_openthread_set_backbone_netif(esp_netif_t *backbone_netif)`
Sets the backbone interface used for border routing.

Note This function must be called before esp_openthread_init

Parameters

• [in] backbone_netif: The backbone network interface (WiFi or ethernet)

**esp_err_t esp_openthread_border_router_init**(void)
Initializes the border router features of OpenThread.

**Note** Calling this function will make the device behave as an OpenThread border router. Kconfig option CONFIG_OPENTHREAD_BORDER_ROUTER is required.

**Return**
- ESP_OK on success
- ESP_ERR_NOT_SUPPORTED if feature not supported
- ESP_ERR_INVALID_STATE if already initialized
- ESP_FAIL on other failures

**esp_err_t esp_openthread_border_router_deinit**(void)
Deinitializes the border router features of OpenThread.

**Return**
- ESP_OK on success
- ESP_ERR_INVALID_STATE if not initialized
- ESP_FAIL on other failures

**esp_netif_t* esp_openthread_get_backbone_netif**(void)
Gets the backbone interface of OpenThread border router.

**Return** The backbone interface or NULL if border router not initialized.

Thread is an IPv6-based mesh networking technology for IoT. Code examples for the Thread API are provided in the openthread directory of ESP-IDF examples.

### 2.2.4 ESP-NETIF

**ESP-NETIF**

The purpose of ESP-NETIF library is twofold:

- It provides an abstraction layer for the application on top of the TCP/IP stack. This will allow applications to choose between IP stacks in the future.
- The APIs it provides are thread safe, even if the underlying TCP/IP stack APIs are not.

ESP-IDF currently implements ESP-NETIF for the lwIP TCP/IP stack only. However, the adapter itself is TCP/IP implementation agnostic and different implementations are possible.

Some ESP-NETIF API functions are intended to be called by application code, for example to get/set interface IP addresses, configure DHCP. Other functions are intended for internal ESP-IDF use by the network driver layer.

In many cases, applications do not need to call ESP-NETIF APIs directly as they are called from the default network event handlers.

ESP-NETIF component is a successor of the tcpip_adapter, former network interface abstraction, which has become deprecated since IDF v4.1. Please refer to the TCP/IP Adapter Migration Guide section in case existing applications to be ported to use the esp-netif API instead.

**ESP-NETIF architecture**

(continues on next page)
Data and event flow in the diagram

- . . . . . . Initialization line from user code to ESP-NETIF and communication driver
- --<--->-- Data packets going from communication media to TCP/IP stack and back
- ........ Events aggregated in ESP-NETIF propagates to driver, user code and network stack
- | | User settings and runtime configuration

ESP-NETIF interaction

A) User code, boiler plate  Overall application interaction with a specific IO driver for communication media and configured TCP/IP network stack is abstracted using ESP-NETIF APIs and outlined as below:

A) Initialization code

1) Initializes IO driver
2) Creates a new instance of ESP-NETIF and configure with
   - ESP-NETIF specific options (flags, behaviour, name)
   - Network stack options (netif init and input functions, not publicly available)
   - IO driver specific options (transmit, free rx buffer functions, IO driver handle)
3) Attaches the IO driver handle to the ESP-NETIF instance created in the above steps
4) Configures event handlers
   - use default handlers for common interfaces defined in IO drivers; or define a specific handlers for customised behaviour/new interfaces
   - register handlers for app related events (such as IP lost/acquired)

B) Interaction with network interfaces using ESP-NETIF API

- Getting and setting TCP/IP related parameters (DHCP, IP, etc)
- Receiving IP events (connect/disconnect)
• Controlling application lifecycle (set interface up/down)

B) Communication driver, IO driver, media driver  Communication driver plays these two important roles in relation with ESP-NETIF:

1) Event handlers: Define behaviour patterns of interaction with ESP-NETIF (for example: ethernet link-up -> turn netif on)
2) Glue IO layer: Adapts the input/output functions to use ESP-NETIF transmit, receive and free receive buffer
   • Installs driver_transmit to appropriate ESP-NETIF object, so that outgoing packets from network stack are passed to the IO driver
   • Calls esp_netif_receive() to pass incoming data to network stack

C) ESP-NETIF, former tcpip_adapter  ESP-NETIF is an intermediary between an IO driver and a network stack, connecting packet data path between these two. As that it provides a set of interfaces for attaching a driver to ESP-NETIF object (runtime) and configuring a network stack (compile time). In addition to that a set of API is provided to control network interface lifecycle and its TCP/IP properties. As an overview, the ESP-NETIF public interface could be divided into these 6 groups:

1) Initialization APIs (to create and configure ESP-NETIF instance)
2) Input/Output API (for passing data between IO driver and network stack)
3) Event or Action API
   • Used for network interface lifecycle management
   • ESP-NETIF provides building blocks for designing event handlers
4) Setters and Getters for basic network interface properties
5) Network stack abstraction: enabling user interaction with TCP/IP stack
   • Set interface up or down
   • DHCP server and client API
   • DNS API
6) Driver conversion utilities

D) Network stack  Network stack has no public interaction with application code with regard to public interfaces and shall be fully abstracted by ESP-NETIF API.

E) ESP-NETIF L2 TAP Interface  The ESP-NETIF L2 TAP interface is ESP-IDF mechanism utilized to access Data Link Layer (L2 per OSI/ISO) for frame reception and transmission from user application. Its typical usage in embedded world might be implementation of non-IP related protocols such as PTP, Wake on LAN and others. Note that only Ethernet (IEEE 802.3) is currently supported.

From user perspective, the ESP-NETIF L2 TAP interface is accessed using file descriptors of VFS which provides a file-like interfacing (using functions like open(), read(), write(), etc). Refer to Virtual filesystem component to learn more.

There is only one ESP-NETIF L2 TAP interface device (path name) available. However multiple file descriptors with different configuration can be opened at a time since the ESP-NETIF L2 TAP interface can be understood as generic entry point to the NETIF internal structure. Important is then specific configuration of particular file descriptor. It can be configured to give an access to specific Network Interface identified by if_key (e.g. ETH_DEF) and to filter only specific frames based on their type (e.g. Ethernet type in case of IEEE 802.3). Filtering only specific frames is crucial since the ESP-NETIF L2 TAP needs to work along with IP stack and so the IP related traffic (IP, ARP, etc.) should not be passed directly to the user application. Even though such option is still configurable, it is not recommended in standard use cases. Filtering is also advantageous from a perspective the user’s application gets access only to frame types it is interested in and the remaining traffic is either passed to other L2 TAP file descriptors or to IP stack.

ESP-NETIF L2 TAP Interface Usage Manual
**Initialization**  
To be able to use the ESP-NETIF L2 TAP interface, it needs to be enabled in Kconfig by `CONFIG_ESP_NETIF_L2_TAP` first and then registered by `esp_vfs_l2tap_intf_register()` prior usage of any VFS function.

**open()**  
Once the ESP-NETIF L2 TAP is registered, it can be opened at path name `/dev/net/tap`. The same path name can be opened multiple times up to `CONFIG_ESP_NETIF_L2_TAP_MAX_FDS` and multiple file descriptors with with different configuration may access the Data Link Layer in the NETIF.

The ESP-NETIF L2 TAP can be opened with `O_NONBLOCK` file status flag to the `read()` does not block. Note that the `write()` may block in current implementation when accessing a Network interface since it is a shared resource among multiple ESP-NETIF L2 TAP file descriptors and IP stack, and there is currently no queuing mechanism deployed. The file status flag can be retrieved and modified using `fcntl()`.

On success, `open()` returns the new file descriptor (a nonnegative integer). On error, -1 is returned and `errno` is set to indicate the error.

**ioctl()**  
The newly opened ESP-NETIF L2 TAP file descriptor needs to be configured prior its usage since it is not bounded to any specific Network Interface and no frame type filter is configured. The following configuration options are available to do so:

- **L2TAP_S_INTF_DEVICE** - bounds the file descriptor to specific Network Interface which is identified by its `if_key`. Network Interface `if_key` is passed to `ioctl()` as the third parameter. Note that default Network Interfaces `if_key`’s used in ESP-IDF can be found in `esp_netif/include/esp_netif_defaults.h`.
- **L2TAP_S_RCV_FILTER** - sets the filter to frames with this type to be passed to the file descriptor. In case of Ethernet frames, the frames are to be filtered based on Length/Ethernet type field. In case the filter value is set less than or equal to 0x05DC, the Ethernet type field is considered to represent IEEE802.3 Length Field and all frames with values in interval <0, 0x05DC> at that field are to be passed to the file descriptor. The IEEE802.2 logical link control (LLC) resolution is then expected to be performed by user’s application. In case the filter value is set greater than 0x05DC, the Ethernet type field is considered to represent protocol identification and only frames which are equal to the set value are to be passed to the file descriptor.

All set configuration options have getter counterpart option to read the current settings.

**Note:**  
VLAN tagged frames are currently not recognized. If user needs to process VLAN tagged frames, they need set filter to be equal to VLAN tag (i.e. 0x8100 or 0x88A8) and process the VLAN tagged frames in user application.

On success, `ioctl()` returns 0. On error, -1 is returned, and `errno` is set to indicate the error.

- **EBADF** - not a valid file descriptor.
- **EINVAL** - invalid configuration argument. Ethernet type filter is already used by other file descriptor.
- **ENODEV** - no such Network Interface which is tried to be assigned to the file descriptor exists.
- **ENOSPC** - NETIF L2 receive hook is already taken by other function when trying to assign Network Interface to the file descriptor.
- **ENOSYS** - unsupported operation, passed configuration option does not exists.

**read()**  
Opened and configured ESP-NETIF L2 TAP file descriptor can be accessed by `read()` to get inbound frames. The read operation can be either blocking or non-blocking based on actual state of `O_NONBLOCK` file status flag. When the file status flag is set blocking, the read operation waits until a frame is received and context is switched to other task. When the file status flag is set non-blocking, the read operation returns immediately. In such case, either a frame is returned if it was already queued or the function indicates the queue is empty. The number of queued frames associated with one file descriptor is limited by `CONFIG_ESP_NETIF_L2_TAP_RX_QUEUE_SIZE` Kconfig option. Once the number of queued frames reach configured threshold, the newly arriving frames are dropped until the queue has enough room to accept incoming traffic (Tail Drop queue management).
On success, `read()` returns the number of bytes read. Zero is returned when size of the destination buffer is 0. On error, -1 is returned, and `errno` is set to indicate the error.

**EBADF** - not a valid file descriptor.

**EAGAIN** - the file descriptor has been marked non-blocking (O_NONBLOCK), and the read would block.

### write()
A raw Data Link Layer frame can be sent to Network Interface via opened and configured ESP-NETIF L2 TAP file descriptor. User’s application is responsible to construct the whole frame except for fields which are added automatically by the physical interface device. The following fields need to be constructed by the user’s application in case of Ethernet link: source/destination MAC addresses, Ethernet type, actual protocol header and user data. See below for more information about Ethernet frame structure.

| +-------------------+-------------------+-------------+---------------------------- |
| | Destination MAC   | Source MAC        | Type/Length | Payload (protocol header/  |
| |                   |                   |             | data) ...                  |
| +-------------------+-------------------+-------------+---------------------------- |
| -                 | 6B                | 6B          | 2B                        | 0-1486B                   |

In other words, there is no additional frame processing performed by the ESP-NETIF L2 TAP interface. It only checks the Ethernet type of the frame is the same as the filter configured in the file descriptor. If the Ethernet type is different, an error is returned and the frame is not sent. Note that the `write()` may block in current implementation when accessing a Network interface since it is a shared resource among multiple ESP-NETIF L2 TAP file descriptors and IP stack, and there is currently no queuing mechanism deployed.

On success, `write()` returns the number of bytes written. Zero is returned when size of the input buffer is 0. On error, -1 is returned, and `errno` is set to indicate the error.

**EBADF** - not a valid file descriptor.

**EBADMSG** - Ethernet type of the frame is different then file descriptor configured filter.

**EIO** - Network interface not available or busy.

### close()
Opened ESP-NETIF L2 TAP file descriptor can be closed by the `close()` to free its allocated resources. The ESP-NETIF L2 TAP implementation of `close()` may block. On the other hand, it is thread safe and can be called from different task than the file descriptor is actually used. If such situation occurs and one task is blocked in I/O operation and another task tries to close the file descriptor, the first task is unblocked. The first’s task read operation then ends with error.

On success, `close()` returns zero. On error, -1 is returned, and `errno` is set to indicate the error.

**EBADF** - not a valid file descriptor.

### select()
Select is used in a standard way, just `CONFIG_VFS_SUPPORT_SELECT` needs to be enabled to be the `select()` function available.

### ESP-NETIF programmer’s manual
Please refer to the example section for basic initialization of default interfaces:

- WiFi Station: `wifi/getting_started/station/main/station_example_main.c`
- Ethernet: `ethernet/basic/main/ethernet_example_main.c`
- WiFi Access Point: `wifi/getting_started/softAP/main/softap_example_main.c`

For more specific cases please consult this guide: *ESP-NETIF Custom I/O Driver*. 
Chapter 2. API Reference

**WiFi default initialization**  The initialization code as well as registering event handlers for default interfaces, such as softAP and station, are provided in separate APIs to facilitate simple startup code for most applications:

- `esp_netif_create_default_wifi_sta()`
- `esp_netif_create_default_wifi_ap()`

Please note that these functions return the `esp_netif` handle, i.e. a pointer to a network interface object allocated and configured with default settings, which as a consequence, means that:

- The created object has to be destroyed if a network de-initialization is provided by an application using `esp_netif_destroy_default_wifi()`.
- These default interfaces must not be created multiple times, unless the created handle is deleted using `esp_netif_destroy()`.
- When using Wifi in AP+STA mode, both these interfaces has to be created.

**API Reference**

**Header File**
- `components/esp_netif/include/esp_netif.h`

**Functions**

- `esp_err_t esp_netif_init (void)`
  Initialize the underlying TCP/IP stack.
  
  **Return**
  - ESP_OK on success
  - ESP_FAIL if initializing failed

  **Note** This function should be called exactly once from application code, when the application starts up.

- `esp_err_t esp_netif_deinit (void)`
  Deinitialize the esp-netif component (and the underlying TCP/IP stack)
  
  **Return**
  - ESP_ERR_INVALID_STATE if esp_netif not initialized
  - ESP_ERR_NOT_SUPPORTED otherwise

- `esp_netif_t* esp_netif_new(const esp_netif_config_t *esp_netif_config)`
  Creates an instance of new esp-netif object based on provided config.
  
  **Return**
  - pointer to esp-netif object on success
  - NULL otherwise

  **Parameters**
  - [in] `esp_netif_config`: pointer esp-netif configuration

- `void esp_netif_destroy (esp_netif_t* esp_netif)`
  Destroys the esp_netif object.

  **Parameters**
  - [in] `esp_netif`: pointer to the object to be deleted

- `esp_err_t esp_netif_set_driver_config (esp_netif_t *esp_netif, const esp_netif_driver_ifconfig_t *driver_config)`
  Configures driver related options of esp_netif object.

  **Return**
  - ESP_OK on success
  - ESP_ERR_ESP_NETIF_INVALID_PARAMS if invalid parameters provided

  **Parameters**
  - [in] `esp_netif`: pointer esp_netif object
  - [in] `driver_config`: pointer to driver config
Chapter 2. API Reference

- [inout] esp_netif: pointer to the object to be configured
- [in] driver_config: pointer esp_netif io driver related configuration

`esp_err_t esp_netif_attach (esp_netif_t *esp_netif, esp_netif_iodriver_handle driver_handle)`
Attaches esp_netif instance to the io driver handle.

Calling this function enables connecting specific esp_netif object with already initialized io driver to update esp_netif object with driver specific configuration (i.e. calls post_attach callback, which typically sets io driver callbacks to esp_netif instance and starts the driver).

**Return**
- ESP_OK on success
- ESP_ERR_ESP_NETIF_DRIVER_ATTACH_FAILED if driver’s post_attach callback failed

**Parameters**
- [inout] esp_netif: pointer to esp_netif object to be attached
- [in] driver_handle: pointer to the driver handle

`esp_err_t esp_netif_receive (esp_netif_t *esp_netif, void* buffer, size_t len, void* eb)`

Passes the raw packets from communication media to the appropriate TCP/IP stack.

This function is called from the configured (Peripheral) driver layer. The data are then forwarded as frames to the TCP/IP stack.

**Return**
- ESP_OK

**Parameters**
- [in] esp_netif: Handle to esp-netif instance
- [in] buffer: Received data
- [in] len: Length of the data frame
- [in] eb: Pointer to internal buffer (used in Wi-Fi driver)

`esp_err_t esp_netif_transmit_hook_attach (esp_netif_t *esp_netif, void* hook_fn)`

Add transmit hook callback function reference into ESP-NETIF. This callback function is then called just prior the ESP-NETIF passes data to network driver.

**Return**
- ESP_OK - success
- ESP_ERR_INVALID_ARG

**Parameters**
- [in] esp_netif: Handle to esp-netif instance
- [in] hook_fn: reference to transmit hook call-back function

`esp_err_t esp_netif_post_transmit_hook_attach (esp_netif_t *esp_netif, void* hook_fn)`

Add post transmit hook callback function reference into ESP-NETIF. This callback function is then called just after the ESP-NETIF passes data to network driver.

**Note** Intention of this function is either to release resources allocated by transmit hook function or for other use cases such as time stamping, etc.

**Return**
- ESP_OK - success
- ESP_ERR_INVALID_ARG

**Parameters**
- [in] esp_netif: Handle to esp-netif instance
- [in] hook_fn: reference to post transmit hook call-back function

`esp_err_t esp_netif_recv_hook_attach (esp_netif_t *esp_netif, void* hook_fn)`

Add receive hook callback function reference into ESP-NETIF. This callback function is then called when network driver receives data.

**Return**
- ESP_OK - success
- ESP_ERR_INVALID_ARG

**Parameters**
- [in] esp_netif: Handle to esp-netif instance
• [in] hook_fn: reference to receive hook callback function

`esp_err_t esp_netif_transmit_hook_detach(esp_netif_t *esp_netif)`

Removes reference to previously attached transmit hook callback function.

**Return**
- ESP_OK - success
- ESP_ERR_INVALID_ARG

**Parameters**
- [in] esp_netif: Handle to esp-netif instance

`esp_err_t esp_netif_post_transmit_hook_detach(esp_netif_t *esp_netif)`

Removes reference to previously attached posttransmit hook callback function.

**Return**
- ESP_OK - success
- ESP_ERR_INVALID_ARG

**Parameters**
- [in] esp_netif: Handle to esp-netif instance

`esp_err_t esp_netif_recv_hook_detach(esp_netif_t *esp_netif)`

Removes reference to previously attached receive hook callback function.

**Return**
- ESP_OK - success
- ESP_ERR_INVALID_ARG

**Parameters**
- [in] esp_netif: Handle to esp-netif instance

`void esp_netif_action_start(void *esp_netif, esp_event_base_t base, int32_t event_id, void *data)`

Default building block for network interface action upon IO driver start event. Creates network interface, if AUTOUP enabled turns the interface on, if DHCPS enabled starts dhcp server.

**Note** This API can be directly used as event handler

**Parameters**
- [in] esp_netif: Handle to esp-netif instance
- base:
- event_id:
- data:

`void esp_netif_action_stop(void *esp_netif, esp_event_base_t base, int32_t event_id, void *data)`

Default building block for network interface action upon IO driver stop event.

**Note** This API can be directly used as event handler

**Parameters**
- [in] esp_netif: Handle to esp-netif instance
- base:
- event_id:
- data:

`void esp_netif_action_connected(void *esp_netif, esp_event_base_t base, int32_t event_id, void *data)`

Default building block for network interface action upon IO driver connected event.

**Note** This API can be directly used as event handler

**Parameters**
- [in] esp_netif: Handle to esp-netif instance
- base:
- event_id:
- data:

`void esp_netif_action_disconnected(void *esp_netif, esp_event_base_t base, int32_t event_id, void *data)`

Default building block for network interface action upon IO driver disconnected event.

**Note** This API can be directly used as event handler
Chapter 2. API Reference

Parameters
- [in] esp_netif: Handle to esp-netif instance
- base:
- event_id:
- data:

void **esp_netif_action_got_ip** *(void *)esp_netif, esp_event_base_t base, int32_t event_id, void *data)*

Default building block for network interface action upon network got IP event.

**Note** This API can be directly used as an event handler

Parameters
- [in] esp_netif: Handle to esp-netif instance
- base:
- event_id:
- data:

void **esp_netif_action_join_ip6_multicast_group** *(void *)esp_netif, esp_event_base_t base, int32_t event_id, void *data)*

Default building block for network interface action upon IPv6 multicast group join.

**Note** This API can be directly used as an event handler

Parameters
- [in] esp_netif: Handle to esp-netif instance
- base:
- event_id:
- data:

void **esp_netif_action_leave_ip6_multicast_group** *(void *)esp_netif, esp_event_base_t base, int32_t event_id, void *data)*

Default building block for network interface action upon IPv6 multicast group leave.

**Note** This API can be directly used as an event handler

Parameters
- [in] esp_netif: Handle to esp-netif instance
- base:
- event_id:
- data:

void **esp_netif_action_add_ip6_address** *(void *)esp_netif, esp_event_base_t base, int32_t event_id, void *data)*

Default building block for network interface action upon IPv6 address added by the underlying stack.

**Note** This API can be directly used as an event handler

Parameters
- [in] esp_netif: Handle to esp-netif instance
- base:
- event_id:
- data:

void **esp_netif_action_remove_ip6_address** *(void *)esp_netif, esp_event_base_t base, int32_t event_id, void *data)*

Default building block for network interface action upon IPv6 address removed by the underlying stack.

**Note** This API can be directly used as an event handler

Parameters
- [in] esp_netif: Handle to esp-netif instance
- base:
- event_id:
- data:

**esp_err_t esp_netif_set_mac** *(esp_netif_t *)esp_netif, uint8_t mac[])*

Set the mac address for the interface instance.

**Return**
- ESP_OK - success
- ESP_ERR_ESP_NETIF_IF_NOT_READY - interface status error
- ESP_ERR_NOT_SUPPORTED - mac not supported on this interface

**Parameters**
- [in] esp_netif: Handle to esp-netif instance
- [in] mac: Desired mac address for the related network interface

**esp_err_t esp_netif_get_mac**(esp_netif_t *esp_netif, uint8_t mac[])
Get the mac address for the interface instance.

**Return**
- ESP_OK - success
- ESP_ERR_ESP_NETIF_IF_NOT_READY - interface status error
- ESP_ERR_NOT_SUPPORTED - mac not supported on this interface

**Parameters**
- [in] esp_netif: Handle to esp-netif instance
- [out] mac: Resultant mac address for the related network interface

**esp_err_t esp_netif_set_hostname**(esp_netif_t *esp_netif, const char *hostname)
Set the hostname of an interface.

The configured hostname overrides the default configuration value CONFIG_LWIP_LOCAL_HOSTNAME. Please note that when the hostname is altered after interface started/connected the changes would only be reflected once the interface restarts/reconnects

**Return**
- ESP_OK - success
- ESP_ERR_ESP_NETIF_IF_NOT_READY - interface status error
- ESP_ERR_ESP_NETIF_INVALID_PARAMS - parameter error

**Parameters**
- [in] esp_netif: Handle to esp-netif instance

**esp_err_t esp_netif_get_hostname**(esp_netif_t *esp_netif, const char **hostname)
Get interface hostname.

**Return**
- ESP_OK - success
- ESP_ERR_ESP_NETIF_IF_NOT_READY - interface status error
- ESP_ERR_ESP_NETIF_INVALID_PARAMS - parameter error

**Parameters**
- [in] esp_netif: Handle to esp-netif instance
- [out] hostname: Returns a pointer to the hostname. Maybe NULL if no hostname is set. If set non-NULL, pointer remains valid (and string may change if the hostname changes).

**bool esp_netif_is_netif_up**(esp_netif_t *esp_netif)
Test if supplied interface is up or down.

**Return**
- true - Interface is up
- false - Interface is down

**Parameters**
- [in] esp_netif: Handle to esp-netif instance

**esp_err_t esp_netif_get_ip_info**(esp_netif_t *esp_netif, esp_netif_ip_info_t *ip_info)
Get interface’s IP address information.

If the interface is up, IP information is read directly from the TCP/IP stack. If the interface is down, IP information is read from a copy kept in the ESP-NETIF instance

**Return**
- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS
**esp_err_t esp_netif_get_old_ip_info (esp_netif_t *esp_netif, esp_netif_ip_info_t *ip_info)**

Get interface’s old IP information.

Returns an “old” IP address previously stored for the interface when the valid IP changed.

If the IP lost timer has expired (meaning the interface was down for longer than the configured interval) then the old IP information will be zero.

**Return**

- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS

**Parameters**

- **[in]** esp_netif: Handle to esp-netif instance
- **[out]** ip_info: If successful, IP information will be returned in this argument.

**esp_err_t esp_netif_set_ip_info (esp_netif_t *esp_netif, const esp_netif_ip_info_t *ip_info)**

Set interface’s IP address information.

This function is mainly used to set a static IP on an interface.

If the interface is up, the new IP information is set directly in the TCP/IP stack.

The copy of IP information kept in the ESP-NETIF instance is also updated (this copy is returned if the IP is queried while the interface is still down.)

**Note** DHCP client/server must be stopped (if enabled for this interface) before setting new IP information.

**Note** Calling this interface for may generate a SYSTEM_EVENT_STA_GOT_IP or SYSTEM_EVENT_ETH_GOT_IP event.

**Return**

- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS
- ESP_ERR_ESP_NETIF_DHCP_NOT_STOPPED If DHCP server or client is still running

**Parameters**

- **[in]** esp_netif: Handle to esp-netif instance
- **[in]** ip_info: IP information to set on the specified interface

**esp_err_t esp_netif_set_old_ip_info (esp_netif_t *esp_netif, const esp_netif_ip_info_t *ip_info)**

Set interface old IP information.

This function is called from the DHCP client (if enabled), before a new IP is set. It is also called from the default handlers for the SYSTEM_EVENT_STA_CONNECTED and SYSTEM_EVENT_ETH_CONNECTED events.

Calling this function stores the previously configured IP, which can be used to determine if the IP changes in the future.

If the interface is disconnected or down for too long, the “IP lost timer” will expire (after the configured interval) and set the old IP information to zero.

**Return**

- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS

**Parameters**

- **[in]** esp_netif: Handle to esp-netif instance
- **[in]** ip_info: Store the old IP information for the specified interface

**int esp_netif_get_netif_impl_index (esp_netif_t *esp_netif)**

Get net interface index from network stack implementation.

**Note** This index could be used in setsockopt() to bind socket with multicast interface

**Return** implementation specific index of interface represented with supplied esp_netif

**Parameters**

- **[in]** esp_netif: Handle to esp-netif instance
Chapter 2. API Reference

- [in] esp_netif: Handle to esp-netif instance

`esp_err_t esp_netif_get_netif_impl_name(esp_netif_t *esp_netif, char *name)`

Get net interface name from network stack implementation.

**Note** This name could be used in `setsockopt()` to bind socket with appropriate interface

**Return**
- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS

**Parameters**
- [in] esp_netif: Handle to esp-netif instance
- [out] name: Interface name as specified in underlying TCP/IP stack. Note that the actual name will be copied to the specified buffer, which must be allocated to hold maximum interface name size (6 characters for lwIP)

`esp_err_t esp_netif_dhcps_option(esp_netif_t *esp_netif, esp_netif_dhcp_option_mode_t opt_op, esp_netif_dhcp_option_id_t opt_id, void *opt_val, uint32_t opt_len)`

Set or Get DHCP server option.

**Return**
- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS
- ESP_ERR_ESP_NETIF_DHCP_ALREADY_STOPPED
- ESP_ERR_ESP_NETIF_DHCP_ALREADY_STARTED

**Parameters**
- [in] esp_netif: Handle to esp-netif instance
- [in] opt_op: ESP_NETIF_OP_SET to set an option, ESP_NETIF_OP_GET to get an option.
- [in] opt_id: Option index to get or set, must be one of the supported enum values.
- [inout] opt_val: Pointer to the option parameter.
- [in] opt_len: Length of the option parameter.

`esp_err_t esp_netif_dhcpc_option(esp_netif_t *esp_netif, esp_netif_dhcp_option_mode_t opt_op, esp_netif_dhcp_option_id_t opt_id, void *opt_val, uint32_t opt_len)`

Set or Get DHCP client option.

**Return**
- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS
- ESP_ERR_ESP_NETIF_DHCP_ALREADY_STOPPED
- ESP_ERR_ESP_NETIF_DHCP_ALREADY_STARTED

**Parameters**
- [in] esp_netif: Handle to esp-netif instance
- [in] opt_op: ESP_NETIF_OP_SET to set an option, ESP_NETIF_OP_GET to get an option.
- [in] opt_id: Option index to get or set, must be one of the supported enum values.
- [inout] opt_val: Pointer to the option parameter.
- [in] opt_len: Length of the option parameter.

`esp_err_t esp_netif_dhcpc_start(esp_netif_t *esp_netif)`

Start DHCP client (only if enabled in interface object)

**Note** The default event handlers for the SYSTEM_EVENT_STA_CONNECTED and SYSTEM_EVENT_ETH_CONNECTED events call this function.

**Return**
- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS
- ESP_ERR_ESP_NETIF_DHCP_ALREADY_STARTED
- ESP_ERR_ESP_NETIF_DHCP_START_FAILED

**Parameters**
- [in] esp_netif: Handle to esp-netif instance
**esp_err_t** **esp_netif_dhcpc_stop**(esp_netif_t *esp_netif)
Stop DHCP client (only if enabled in interface object)

**Note** Calling action_netif_stop() will also stop the DHCP Client if it is running.

**Return**
- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS
- ESP_ERR_ESP_NETIF_DHCP_ALREADY_STOPPED
- ESP_ERR_ESP_NETIF_IF_NOT_READY

**Parameters**
- [in] esp_netif: Handle to esp-netif instance

**esp_err_t** **esp_netif_dhcpc_get_status**(esp_netif_t *esp_netif, esp_netif_dhcp_status_t *status)
Get DHCP client status.

**Return**
- ESP_OK

**Parameters**
- [in] esp_netif: Handle to esp-netif instance
- [out] status: If successful, the status of DHCP client will be returned in this argument.

**esp_err_t** **esp_netif_dhcps_get_status**(esp_netif_t *esp_netif, esp_netif_dhcp_status_t *status)
Get DHCP Server status.

**Return**
- ESP_OK

**Parameters**
- [in] esp_netif: Handle to esp-netif instance
- [out] status: If successful, the status of the DHCP server will be returned in this argument.

**esp_err_t** **esp_netif_dhcps_start**(esp_netif_t *esp_netif)
Start DHCP server (only if enabled in interface object)

**Return**
- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS
- ESP_ERR_ESP_NETIF_DHCP_ALREADY_STARTED

**Parameters**
- [in] esp_netif: Handle to esp-netif instance

**esp_err_t** **esp_netif_dhcps_stop**(esp_netif_t *esp_netif)
Stop DHCP server (only if enabled in interface object)

**Return**
- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS
- ESP_ERR_ESP_NETIF_DHCP_ALREADY_STOPPED
- ESP_ERR_ESP_NETIF_IF_NOT_READY

**Parameters**
- [in] esp_netif: Handle to esp-netif instance

**esp_err_t** **esp_netif_set_dns_info**(esp_netif_t *esp_netif, esp_netif_dns_type_t type, esp_netif_dns_info_t *dns)
Set DNS Server information.

This function behaves differently if DHCP server or client is enabled

If DHCP client is enabled, main and backup DNS servers will be updated automatically from the DHCP lease if the relevant DHCP options are set. Fallback DNS Server is never updated from the DHCP lease and is designed to be set via this API. If DHCP client is disabled, all DNS server types can be set via this API only.

If DHCP server is enabled, the Main DNS Server setting is used by the DHCP server to provide a DNS Server option to DHCP clients (Wi-Fi stations).

- The default Main DNS server is typically the IP of the Wi-Fi AP interface itself.
This function can override it by setting server type ESP_NETIF_DNS_MAIN.
Other DNS Server types are not supported for the Wi-Fi AP interface.

Return
- ESP_OK on success
- ESP_ERR_ESP_NETIF_INVALID_PARAMS invalid params

Parameters
- [in] esp_netif: Handle to esp-netif instance
- [in] type: Type of DNS Server to set: ESP_NETIF_DNS_MAIN, ESP_NETIF_DNS_BACKUP, ESP_NETIF_DNS_FALLBACK
- [in] dns: DNS Server address to set

Get DNS Server information.

Return
- ESP_OK on success
- ESP_ERR_ESP_NETIF_INVALID_PARAMS invalid params

Parameters
- [in] esp_netif: Handle to esp-netif instance
- [in] type: Type of DNS Server to get: ESP_NETIF_DNS_MAIN, ESP_NETIF_DNS_BACKUP, ESP_NETIF_DNS_FALLBACK
- [out] dns: DNS Server result is written here on success

Create interface link-local IPv6 address.

Return
- ESP_OK
- ESP_FAIL If interface is down, does not have a link-local IPv6 address, or the link-local IPv6 address is not a preferred address.

Parameters
- [in] esp_netif: Handle to esp-netif instance
- [out] if_ip6: IPv6 information will be returned in this argument if successful.

Get interface global IPv6 address.

Return
- ESP_OK

Other DNS Server types are not supported for the Wi-Fi AP interface.
• ESP_FAIL If interface is down, does not have a global IPv6 address, or the global IPv6 address is not a preferred address.

Parameters
• [in] esp_netif: Handle to esp-netif instance
• [out] if_ip6: IPv6 information will be returned in this argument if successful.

int esp_netif_get_all_ip6 (esp_netif_t *esp_netif, esp_ip6_addr_t *if_ip6[]) Get all IPv6 addresses of the specified interface.

Return number of returned IPv6 addresses

Parameters
• [in] esp_netif: Handle to esp-netif instance
• [out] if_ip6: Array of IPv6 addresses will be copied to the argument

void esp_netif_set_ip4_addr (esp_ip4_addr_t *addr, uint8_t a, uint8_t b, uint8_t c, uint8_t d) Sets IPv4 address to the specified octets.

Parameters
• [out] addr: IP address to be set
• a: the first octet (127 for IP 127.0.0.1)
• b:
• c:
• d:

cchar *esp_ip4addr_ntoa (const esp_ip4_addr_t *addr, char *buf, int buflen) Converts numeric IP address into decimal dotted ASCII representation.

Return either pointer to buf which now holds the ASCII representation of addr or NULL if buf was too small

Parameters
• addr: IP address in network order to convert
• buf: target buffer where the string is stored
• buflen: length of buf

uint32_t esp_ip4addr_aton (const char *addr) Ascii internet address interpretation routine The value returned is in network order.

Return ip address in network order

Parameters
• addr: IP address in ascii representation (e.g. “127.0.0.1”)

esp_err_t esp_netif_str_to_ip4 (const char *src, esp_ip4_addr_t *dst) Converts Ascii internet IPv4 address into esp_ip4_addr_t.

Return
• ESP_OK on success
• ESP_FAIL if conversion failed
• ESP_ERR_INVALID_ARG if invalid parameter is passed into

Parameters
• [in] src: IPv4 address in ascii representation (e.g. “127.0.0.1”)
• [out] dst: Address of the target esp_ip4_addr_t structure to receive converted address

esp_err_t esp_netif_str_to_ip6 (const char *src, esp_ip6_addr_t *dst) Converts Ascii internet IPv6 address into esp_ip6_addr_t Zeros in the IP address can be stripped or completely ommitted: “2001:db8:85a3:0:0:0:2:1” or “2001:db8::2:1”

Return
• ESP_OK on success
• ESP_FAIL if conversion failed
• ESP_ERR_INVALID_ARG if invalid parameter is passed into

Parameters
• [in] src: IPv6 address in ascii representation (e.g. “2001:db8:85a3:0:0:0:2:1”)
• [out] dst: Address of the target esp_ip6_addr_t structure to receive converted address
esp_netif_iodriver_handle esp_netif_get_io_driver (esp_netif_t *esp_netif)
Gets media driver handle for this esp-netif instance.

Return opaque pointer of related IO driver
Parameters
• [in] esp_netif: Handle to esp-netif instance

esp_netif_t *esp_netif_get_handle_from_ifkey (const char *if_key)
Searches over a list of created objects to find an instance with supplied if key.

Return Handle to esp-netif instance
Parameters
• if_key: Textual description of network interface

esp_netif_flags_t esp_netif_get_flags (esp_netif_t *esp_netif)
Returns configured flags for this interface.

Return Configuration flags
Parameters
• [in] esp_netif: Handle to esp-netif instance

const char *esp_netif_get_ifkey (esp_netif_t *esp_netif)
Returns configured interface key for this esp-netif instance.

Return Textual description of related interface
Parameters
• [in] esp_netif: Handle to esp-netif instance

const char *esp_netif_get_desc (esp_netif_t *esp_netif)
Returns configured interface type for this esp-netif instance.

Return Enumerated type of this interface, such as station, AP, ethernet
Parameters
• [in] esp_netif: Handle to esp-netif instance

int esp_netif_get_route_prio (esp_netif_t *esp_netif)
Returns configured routing priority number.

Return Integer representing the instance’s route-prio, or -1 if invalid parameters
Parameters
• [in] esp_netif: Handle to esp-netif instance

int32_t esp_netif_get_event_id (esp_netif_t *esp_netif, esp_netif_ip_event_type_t event_type)
Returns configured event for this esp-netif instance and supplied event type.

Return specific event id which is configured to be raised if the interface lost or acquired IP address -1 if supplied event_type is not known
Parameters
• [in] esp_netif: Handle to esp-netif instance
• event_type: (either get or lost IP)

esp_netif_t *esp_netif_next (esp_netif_t *esp_netif)
Iterates over list of interfaces. Returns first netif if NULL given as parameter.

Return First netif from the list if supplied parameter is NULL, next one otherwise
Parameters
• [in] esp_netif: Handle to esp-netif instance

size_t esp_netif_get_nr_of_ifs (void)
Returns number of registered esp_netif objects.

Return Number of esp_netifs

void esp_netif_netstack_buf_ref (void *netstack_buf)
increase the reference counter of net stack buffer

Parameters
• [in] netstack_buf: the net stack buffer
void esp_netif_netstack_buf_free (void *netstack_buf)
    free the netstack buffer

Parameters
    • [in] netstack_buf: the net stack buffer

Macros
    _ESP_NETIF.Suppress.LEGACY.WARNING_

WiFi default API reference

Header File
    • components/esp_wifi/include/esp_wifi_default.h

Functions
    esp_err_t esp_netif_attach_wifi_station (esp_netif_t *esp_netif)
        Attaches wifi station interface to supplied netif.
            Return
                • ESP_OK on success
                • ESP_FAIL if attach failed
            Parameters
                • esp_netif: instance to attach the wifi station to
    esp_err_t esp_netif_attach_wifi_ap (esp_netif_t *esp_netif)
        Attaches wifi soft AP interface to supplied netif.
            Return
                • ESP_OK on success
                • ESP_FAIL if attach failed
            Parameters
                • esp_netif: instance to attach the wifi AP to
    esp_err_t esp_wifi_set_default_wifi_sta_handlers (void)
        Sets default wifi event handlers for STA interface.
            Return
                • ESP_OK on success, error returned from esp_event_handler_register if failed
    esp_err_t esp_wifi_set_default_wifi_ap_handlers (void)
        Sets default wifi event handlers for AP interface.
            Return
                • ESP_OK on success, error returned from esp_event_handler_register if failed
    esp_err_t esp_wifi_clear_default_wifi_driver_and_handlers (void *esp_netif)
        Clears default wifi event handlers for supplied network interface.
            Return
                • ESP_OK on success, error returned from esp_event_handler_register if failed
            Parameters
                • esp_netif: instance of corresponding if object
    esp_netif_t *esp_netif_create_default_wifi_ap (void)
        Creates default WIFI AP. In case of any init error this API aborts.
            Note
                The API creates esp_netif object with default WiFi access point config, attaches the netif to wifi and registers default wifi handlers.
            Return
                pointer to esp-netif instance
    esp_netif_t *esp_netif_create_default_wifi_sta (void)
        Creates default WIFI STA. In case of any init error this API aborts.
Chapter 2. API Reference

**Note** The API creates esp_netif object with default WiFi station config, attaches the netif to wifi and registers default wifi handlers.

**Return** pointer to esp-netif instance

```c
void esp_netif_destroy_default_wifi(void *esp_netif)
```

Destroys default WIFI netif created with esp_netif_create_default_wifi() API.

**Note** This API unregisters wifi handlers and detaches the created object from the wifi. (this function is a no-operation if esp_netif is NULL)

**Parameters**
- [in] esp_netif: object to detach from WiFi and destroy

```c
esp_netif_t *esp_netif_create_wifi(wifi_interface_t wifi_if, esp_netif_inherent_config_t *esp_netif_config)
```

Creates esp_netif WiFi object based on the custom configuration.

**Attention** This API DOES NOT register default handlers!

**Return** pointer to esp-netif instance

**Parameters**
- [in] wifi_if: type of wifi interface
- [in] esp_netif_config: inherent esp-netif configuration pointer

```c
esp_err_t esp_netif_create_default_wifi_mesh_netifs(esp_netif_t **p_netif_sta, esp_netif_t **p_netif_ap)
```

Creates default STA and AP network interfaces for esp-mesh.

Both netifs are almost identical to the default station and softAP, but with DHCP client and server disabled. Please note that the DHCP client is typically enabled only if the device is promoted to a root node.

Returns created interfaces which could be ignored setting parameters to NULL if an application code does not need to save the interface instances for further processing.

**Return** ESP_OK on success

**Parameters**
- [out] p_netif_sta: pointer where the resultant STA interface is saved (if non NULL)
- [out] p_netif_ap: pointer where the resultant AP interface is saved (if non NULL)

### 2.2.5 IP Network Layer

**TCP/IP Adapter Migration Guide**

TCP/IP Adapter is a network interface abstraction component used in IDF prior to v4.1. This page outlines migration from tcpip_adapter API to its successor ESP-NETIF.

**Updating network connection code**

**Network stack initialization** Simply replace tcpip_adapter_init() with esp_netif_init(). Please note that the ESP-NETIF initialization API returns standard error code and the esp_netif_deinit() for un-initialization is available.

Also replace #include "tcpip_adapter.h" with #include "esp_netif.h".

**Network interface creation** TCP/IP Adapter defined these three interfaces statically:

- WiFi Station
- WiFi Access Point
- Ethernet

Network interface instance shall be explicitly constructed for the ESP-NETIF to enable its connection to the TCP/IP stack. For example initialization code for WiFi has to explicitly call esp_netif_create_default_wifi_sta(); or esp_netif_create_default_wifi_ap();
Chapter 2. API Reference

after the TCP/IP stack and the event loop have been initialized. Please consult an example initialization code for these three interfaces:

- **WiFi Station:** wifi/getting_started/station/main/station_example_main.c
- **WiFi Access Point:** wifi/getting_started/softAP/main/softap_example_main.c
- **Ethernet:** ethernet/basic/main/ethernet_example_main.c

**Replacing other tcpip_adapter API**  All the tcpip_adapter functions have their esp-netif counter-part. Please refer to the esp_netif.h grouped into these sections:

- Setters/Getters
- DHCP
- DNS
- IP address

**Default event handlers**  Event handlers are moved from tcpip_adapter to appropriate driver code. There is no change from application code perspective, all events shall be handled in the same way. Please note that within IP related event handlers, application code usually receives IP addresses in a form of esp-netif specific struct (not the LwIP structs, but binary compatible). This is the preferred way of printing the address:

```c
ESP_LOGI(TAG, "got ip:", IP2STR(&event->ip_info.ip));
```

Instead of

```c
ESP_LOGI(TAG, "got ip:%s", ip4addr_ntoa(&event->ip_info.ip));
```

Since `ip4addr_ntoa()` is a LwIP API, the esp-netif provides `esp_ip4addr_ntoa()` as a replacement, but the above method is generally preferred.

**IP addresses**  It is preferred to use esp-netif defined IP structures. Please note that the LwIP structs will still work when default compatibility enabled. * esp-netif IP address definitions

**Next steps**  Additional step in porting an application to fully benefit from the ESP-NETIF is to disable the tcpip_adapter compatibility layer in the component configuration: ESP NETIF Adapter -> Enable backward compatible tcpip_adapter interface and check if the project compiles. TCP/IP adapter brings many include dependencies and this step might help in decoupling the application from using specific TCP/IP stack API directly.

**ESP-NETIF Custom I/O Driver**

This section outlines implementing a new I/O driver with esp-netif connection capabilities. By convention the I/O driver has to register itself as an esp-netif driver and thus holds a dependency on esp-netif component and is responsible for providing data path functions, post-attach callback and in most cases also default event handlers to define network interface actions based on driver’s lifecycle transitions.

**Packet input/output**  As shown in the diagram, the following three API functions for the packet data path must be defined for connecting with esp-netif:

- `esp_netif_transmit()`
- `esp_netif_free_rx_buffer()`  
- `esp_netif_receive()`

The first two functions for transmitting and freeing the rx buffer are provided as callbacks, i.e. they get called from esp-netif (and its underlying TCP/IP stack) and I/O driver provides their implementation.

The receiving function on the other hand gets called from the I/O driver, so that the driver’s code simply calls `esp_netif_receive()` on a new data received event.
**Post attach callback**  A final part of the network interface initialization consists of attaching the esp-netif instance to the I/O driver, by means of calling the following API:

```c
esp_err_t esp_netif_attach(esp_netif_t *esp_netif, esp_netif_iodriver_handle_t *driver_handle);
```

It is assumed that the `esp_netif_iodriver_handle` is a pointer to driver’s object, a struct derived from `struct esp_netif_driver_base_s`, so that the first member of I/O driver structure must be this base structure with pointers to

- post-attach function callback
- related esp-netif instance

As a consequence the I/O driver has to create an instance of the struct per below:

```c
typedef struct my_netif_driver_s {
    esp_netif_driver_base_t base; /* base structure reserved as...
    esp_netif_driver */
    driver_impl *h; /* handle of driver */
    /* implementation */
} my_netif_driver_t;
```

with actual values of `my_netif_driver_t::base.post_attach` and the actual drivers handle `my_netif_driver_t::h`. So when the `esp_netif_attach()` gets called from the initialization code, the post-attach callback from I/O driver’s code gets executed to mutually register callbacks between esp-netif and I/O driver instances. Typically the driver is started as well in the post-attach callback. An example of a simple post-attach callback is outlined below:

```c
static esp_err_t my_post_attach_start(esp_netif_t *esp_netif, void *args)
{
    my_netif_driver_t *driver = args;
    const esp_netif_driver_ifconfig_t driver_ifconfig = {
        .driver_free_rx_buffer = my_free_rx_buf,
        .transmit = my_transmit,
        .handle = driver->driver_impl
    };
    driver->base.netif = esp_netif;
    ESP_ERROR_CHECK(esp_netif_set_driver_config(esp_netif, &driver_ifconfig));
    my_driver_start(driver->driver_impl);
    return ESP_OK;
}
```

**Default handlers**  I/O drivers also typically provide default definitions of lifecycle behaviour of related network interfaces based on state transitions of I/O drivers. For example `driver start -> network start`, etc. An example of such a default handler is provided below:

```c
esp_err_t my_driver_netif_set_default_handlers(my_netif_driver_t *driver, esp_netif_t *esp_netif)
{
    driver_set_event_handler(driver->driver_impl, esp_netif_action_start, MY_DRV__EVENT_START, esp_netif);
    driver_set_event_handler(driver->driver_impl, esp_netif_action_stop, MY_DRV__EVENT_STOP, esp_netif);
    return ESP_OK;
}
```

**Network stack connection**  The packet data path functions for transmitting and freeing the rx buffer (defined in the I/O driver) are called from the esp-netif, specifically from its TCP/IP stack connecting layer. The following API reference outlines these network stack interaction with the esp-netif.
Header File

- components/esp_netif/include/esp_netif_net_stack.h

Functions

esp_netif_t *esp_netif_get_handle_from_netif_impl (void *dev)
Returns esp-netif handle.

Return handle to related esp-netif instance

Parameters
• [in] dev: opaque ptr to network interface of specific TCP/IP stack

void *esp_netif_get_netif_impl (esp_netif_t *esp_netif)
Returns network stack specific implementation handle (if supported)

Note that it is not supported to acquire PPP netif impl pointer and this function will return NULL for esp_netif instances configured to PPP mode

Return handle to related network stack netif handle

Parameters
• [in] esp_netif: Handle to esp-netif instance

esp_err_t esp_netif_transmit (esp_netif_t *esp_netif, void *data, size_t len)
Outputs packets from the TCP/IP stack to the media to be transmitted.

This function gets called from network stack to output packets to IO driver.

Return ESP_OK on success, an error passed from the I/O driver otherwise

Parameters
• [in] esp_netif: Handle to esp-netif instance
• [in] data: Data to be transmitted
• [in] len: Length of the data frame

esp_err_t esp_netif_transmit_wrap (esp_netif_t *esp_netif, void *data, size_t len, void *netstack_buf)
Outputs packets from the TCP/IP stack to the media to be transmitted.

This function gets called from network stack to output packets to IO driver.

Return ESP_OK on success, an error passed from the I/O driver otherwise

Parameters
• [in] esp_netif: Handle to esp-netif instance
• [in] data: Data to be transmitted
• [in] len: Length of the data frame
• [in] netstack_buf: net stack buffer

void esp_netif_free_rx_buffer (void *esp_netif, void *buffer)
Free the rx buffer allocated by the media driver.

This function gets called from network stack when the rx buffer to be freed in IO driver context, i.e. to deallocate a buffer owned by io driver (when data packets were passed to higher levels to avoid copying)

Parameters
• [in] esp_netif: Handle to esp-netif instance
• [in] buffer: Rx buffer pointer

Code examples for TCP/IP socket APIs are provided in the protocols/sockets directory of ESP-IDF examples.

The TCP/IP Adapter (legacy network interface library) has been deprecated, please consult the TCP/IP Adapter Migration Guide to update existing IDF applications.

2.2.6 Application Layer

Documentation for Application layer network protocols (above the IP Network layer) are provided in Application Protocols.
2.3 Peripherals API

2.3.1 Analog to Digital Converter (ADC)

ADC Channels

The ESP32-S3 integrates 2 SAR (Successive Approximation Register) ADCs, supporting a total of 20 measurement channels (analog enabled pins).

These channels are supported:

ADC1:
- 10 channels: GPIO1 - GPIO10

ADC2:
- 10 channels: GPIO11 - GPIO20

ADC Attenuation

Vref is the reference voltage used internally by ESP32-S3 ADCs for measuring the input voltage. The ESP32-S3 ADCs can measure analog voltages from 0 V to Vref. Among different chips, the Vref varies, the median is 1.1 V. In order to convert voltages larger than Vref, input voltages can be attenuated before being input to the ADCs. There are 4 available attenuation options, the higher the attenuation is, the higher the measurable input voltage could be.

<table>
<thead>
<tr>
<th>Attenuation</th>
<th>Measurable input voltage range</th>
</tr>
</thead>
<tbody>
<tr>
<td>ADC_ATTEN_DB_0</td>
<td>0 mV ~ 950 mV</td>
</tr>
<tr>
<td>ADC_ATTEN_DB_2_5</td>
<td>0 mV ~ 1250 mV</td>
</tr>
<tr>
<td>ADC_ATTEN_DB_6</td>
<td>0 mV ~ 1750 mV</td>
</tr>
<tr>
<td>ADC_ATTEN_DB_11</td>
<td>0 mV ~ 3100 mV</td>
</tr>
</tbody>
</table>

ADC Conversion

An ADC conversion is to convert the input analog voltage to a digital value. The ADC conversion results provided by the ADC driver APIs are raw data. Resolution of ESP32-S3 ADC raw results under Single Read mode is 12-bit.

- `adc1_get_raw()`
- `adc2_get_raw()`

To calculate the voltage based on the ADC raw results, this formula can be used:

\[ V_{out} = D_{out} \times \frac{V_{max}}{D_{max}} \]  \hspace{1cm} (1)

where:

<table>
<thead>
<tr>
<th>Vout</th>
<th>Digital output result, standing for the voltage.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Dout</td>
<td>ADC raw digital reading result.</td>
</tr>
<tr>
<td>Vmax</td>
<td>Maximum measurable input analog voltage, see ADC Attenuation.</td>
</tr>
<tr>
<td>Dmax</td>
<td>Maximum of the output ADC raw digital reading result, which is 4095 under Single Read mode, 8191 under Continuous Read mode.</td>
</tr>
</tbody>
</table>

For boards with eFuse ADC calibration bits, `esp_adc_cal_raw_to_voltage()` can be used to get the calibrated conversion results. These results stand for the actual voltage (in mV). No need to transform these data via the formula (1). If ADC calibration APIs are used on boards without eFuse ADC calibration bits, warnings will be generated. See ADC Calibration.
Chapter 2. API Reference

ADC Limitations

Note:
- Since the ADC2 module is also used by the Wi-Fi, reading operation of `adc2_get_raw()` may fail between `esp_wifi_start()` and `esp_wifi_stop()`. Use the return code to see whether the reading is successful.

Driver Usage

Both of the ADC units support single read mode, which is suitable for low-frequency sampling operations.

Note: ADC readings from a pin not connected to any signal are random.

ADC Single Read mode
The ADC should be configured before reading is taken.
- For ADC1, configure desired precision and attenuation by calling functions `adc1_config_width()` and `adc1_config_channel_atten()`.
- For ADC2, configure the attenuation by `adc2_config_channel_atten()`. The reading width of ADC2 is configured every time you take the reading.

Attenuation configuration is done per channel, see `adc1_channel_t` and `adc2_channel_t`, set as a parameter of above functions.

Then it is possible to read ADC conversion result with `adc1_get_raw()` and `adc2_get_raw()`. Reading width of ADC2 should be set as a parameter of `adc2_get_raw()` instead of in the configuration functions.

Single Read mode ADC example can be found in peripherals/adc/single_read directory of ESP-IDF examples.

This API provides convenient way to configure ADC1 for reading from ULP. To do so, call function `adc1_ulp_enable()` and then set precision and attenuation as discussed above.

Note: See **ADC Limitations** for the limitation of using ADC single read mode.

Minimizing Noise

The ESP32-S3 ADC can be sensitive to noise leading to large discrepancies in ADC readings. Depending on the usage scenario, users may connect a bypass capacitor (e.g. a 100 nF ceramic capacitor) to the ADC input pad in use, to minimize noise. Besides, multisampling may also be used to further mitigate the effects of noise.

ADC Calibration

ESP32-S3 ADC Calibration contains 2 steps: Hardware Calibration and Software Calibration.

Hardware Calibration
Based on series of comparisons with the reference voltage, ESP32-S3 ADC determines each bit of the output digital result. Per design the ESP32-S3 ADC reference voltage is 1100 mV, however the true reference voltage can range from 1000 mV to 1200 mV among different chips. To minimize this difference, hardware calibration is introduced.

Hardware calibration contains 2 steps:
1. Set an auto-calibration parameter of bandgap voltage reference. In this way, the difference mentioned above can be minimized.
2. Correct the offset of the ADC Vin-Dout characteristics. ADC characteristics is generally a function: \( f(x) = A \cdot x + B \), where \( B \) is the offset.

An uncalibrated ADC characteristics is as follows:

The offset in the uncalibrated characteristics is significant. Step 2 is to correct the offset to 0.

After hardware calibration, the ADC characteristics would be like:

Hardware calibration is done internally by the ADC driver. The consequent results are raw data. A transformation is needed to get the final result, see \textit{ADC Conversion}.

**Software Calibration** To convert ADC raw data to calibrated digital data, following steps should be followed:

1. Check the eFuse to know if the software calibration is supported via \texttt{esp_adc_cal_check_efuse()}. 
2. Calculate the ADC calibration characteristics via \texttt{esp_adc_cal_characterize()}. The ADC software calibration characteristics are per ADC module and per attenuation. For example, characteristics of ADC1 channel 0 under 11 dB attenuation are the same as characteristics of ADC1 channel 2 under 11 dB attenuation. But characteristics of ADC1 channel 0 under 11 dB attenuation are different with characteristics of ADC2 channel 0 under 11 dB attenuation. Also characteristics of ADC1 channel 0 under 11 dB attenuation are different with characteristics of ADC1 channel 0 under 6 dB attenuation. 
3. Get the actual voltage value via \texttt{esp_adc_cal_raw_to_voltage()}. 

After software calibration, the ADC characteristics would be like:

The results provided by the ADC calibration APIs indicate the actual voltage values. ADC software calibration example can be found in \texttt{peripherals/adc/single_read} directory of ESP-IDF examples.

**GPIO Lookup Macros**

There are macros available to specify the GPIO number of a ADC channel, or vice versa. e.g.

1. \texttt{ADC1\_CHANNEL\_0\_GPIO\_NUM} is the GPIO number of ADC1 channel 0.
2. \texttt{ADC1\_GPIO\_n\_CHANNEL} is the ADC1 channel number of GPIO n.
API Reference

This reference covers three components:

- **ADC driver**
- **ADC Calibration**
- **GPIO Lookup Macros**

## ADC driver

### Header File

- components/driver/include/driver/adc.h

### Functions

- **void adc_power_on (void)**
  
  Enable ADC power.

- **void adc_power_off (void)**
  
  Power off SAR ADC.

- **void adc_power_acquire (void)**
  
  Increment the usage counter for ADC module. ADC will stay powered on while the counter is greater than 0. Call adc_power_release when done using the ADC.

- **void adc_power_release (void)**
  
  Decrement the usage counter for ADC module. ADC will stay powered on while the counter is greater than 0. Call this function when done using the ADC.

- **esp_err_t adc1_pad_get_io_num (adc1_channel_t channel, gpio_num_t *gpio_num)**
  
  Get the GPIO number of a specific ADC1 channel.

  **Return**

  - ESP_OK if success
  - ESP_ERR_INVALID_ARG if channel not valid

  **Parameters**

  - **channel**: Channel to get the GPIO number
  - **gpio_num**: output buffer to hold the GPIO number

- **esp_err_t adc1_config_channel_atten (adc1_channel_t channel, adc_atten_t atten)**
  
  Set the attenuation of a particular channel on ADC1, and configure its associated GPIO pin mux.

  The default ADC voltage is for attenuation 0 dB and listed in the table below. By setting higher attenuation it is possible to read higher voltages.

  Due to ADC characteristics, most accurate results are obtained within the “suggested range” shown in the following table.

<table>
<thead>
<tr>
<th>SoC</th>
<th>attenuation (dB)</th>
<th>suggested range (mV)</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>0</td>
<td>100 ~ 950</td>
</tr>
<tr>
<td>ESP32</td>
<td>2.5</td>
<td>100 ~ 1250</td>
</tr>
<tr>
<td></td>
<td>6</td>
<td>150 ~ 1750</td>
</tr>
<tr>
<td></td>
<td>11</td>
<td>150 ~ 2450</td>
</tr>
<tr>
<td></td>
<td>0</td>
<td>0 ~ 750</td>
</tr>
</tbody>
</table>

(continues on next page)
For maximum accuracy, use the ADC calibration APIs and measure voltages within these recommended ranges.

**Note** For any given channel, this function must be called before the first time `adc1_get_raw()` is called for that channel.

**Note** This function can be called multiple times to configure multiple ADC channels simultaneously. You may call `adc1_get_raw()` only after configuring a channel.

**Return**
- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- `channel`: ADC1 channel to configure
- `atten`: Attenuation level

```c
esp_err_t adc1_config_width(adc_bits_width_t width_bit)
```
Configure ADC1 capture width, meanwhile enable output invert for ADC1. The configuration is for all channels of ADC1.

**Return**
- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- `width_bit`: Bit capture width for ADC1

```c
int adc1_get_raw(adc1_channel_t channel)
```
Take an ADC1 reading from a single channel.

**Note** ESP32: When the power switch of SARADC1, SARADC2, HALL sensor and AMP sensor is turned on, the input of GPIO36 and GPIO39 will be pulled down for about 80ns. When enabling power for any of these peripherals, ignore input from GPIO36 and GPIO39. Please refer to section 3.11 of ‘ECO_and_Workarounds_for_Bugs_in_ESP32’ for the description of this issue. As a workaround, call `adc_power_acquire()` in the app. This will result in higher power consumption (by ~1mA), but will remove the glitches on GPIO36 and GPIO39.

**Note** Call `adc1_config_width()` before the first time this function is called.

**Note** For any given channel, `adc1_config_channel_atten(channel)` must be called before the first time this function is called. Configuring a new channel does not prevent a previously configured channel from being read.

**Return**
- -1: Parameter error
- Other: ADC1 channel reading.

**Parameters**
- `channel`: ADC1 channel to read

```c
esp_err_t adc_set_data_inv(adc_unit_t adc_unit, bool inv_en)
```
Set ADC data invert.

**Return**
- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- `adc_unit`: ADC unit index
- `inv_en`: whether enable data invert

```c
esp_err_t adc_set_clk_div(uint8_t clk_div)
```

---

<table>
<thead>
<tr>
<th></th>
<th>2.5</th>
<th>6</th>
<th>11</th>
</tr>
</thead>
<tbody>
<tr>
<td>ESP32-S2</td>
<td>0 ~ 1050</td>
<td>0 ~ 1300</td>
<td>0 ~ 2500</td>
</tr>
</tbody>
</table>
Set ADC source clock.

Return
- ESP_OK success

Parameters
- clk_div: ADC clock divider, ADC clock is divided from APB clock

`esp_err_t adc_set_data_width (adc_unit_t adc_unit, adc_bits_width_t width_bit)` Configure ADC capture width.

Return
- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error

Parameters
- adc_unit: ADC unit index
- width_bit: Bit capture width for ADC unit.

`void adc1_ulp_enable (void)`
Configure ADC1 to be usable by the ULP.

This function reconfigures ADC1 to be controlled by the ULP. Effect of this function can be reverted using adc1_get_raw() function.

Note that adc1_config_channel_atten, adc1_config_width() functions need to be called to configure ADC1 channels, before ADC1 is used by the ULP.

`esp_err_t adc2_pad_get_io_num (adc2_channel_t channel, gpio_num_t *gpio_num)`
Get the GPIO number of a specific ADC2 channel.

Return
- ESP_OK if success
- ESP_ERR_INVALID_ARG if channel not valid

Parameters
- channel: Channel to get the GPIO number
- gpio_num: output buffer to hold the GPIO number

`esp_err_t adc2_config_channel_atten (adc2_channel_t channel, adc_atten_t atten)`
Configure the ADC2 channel, including setting attenuation.

The default ADC voltage is for attenuation 0 dB and listed in the table below. By setting higher attenuation it is possible to read higher voltages.

Due to ADC characteristics, most accurate results are obtained within the “suggested range” shown in the following table.

<table>
<thead>
<tr>
<th>SoC</th>
<th>attenuation (dB)</th>
<th>suggested range (mV)</th>
</tr>
</thead>
<tbody>
<tr>

<td></td>
</tr>
</tbody>
</table>
For maximum accuracy, use the ADC calibration APIs and measure voltages within these recommended ranges.

**Note** This function also configures the input GPIO pin mux to connect it to the ADC2 channel. It must be called before calling `adc2_get_raw()` for this channel.

**Note** For any given channel, this function must be called before the first time `adc2_get_raw()` is called for that channel.

**Return**
- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- `channel`: ADC2 channel to configure
- `atten`: Attenuation level

```c
esp_err_t adc2_get_raw(adc2_channel_t channel, adc_bits_width_t width_bit, int *raw_out)
```
Take an ADC2 reading on a single channel.

**Note** ESP32: When the power switch of SARADC1, SARADC2, HALL sensor and AMP sensor is turned on, the input of GPIO36 and GPIO39 will be pulled down for about 80ns. When enabling power for any of these peripherals, ignore input from GPIO36 and GPIO39. Please refer to section 3.11 of `ECO_and_Workarounds_for_Bugs_in_ESP32` for the description of this issue. As a workaround, call `adc_power_acquire()` in the app. This will result in higher power consumption (by ~1mA), but will remove the glitches on GPIO36 and GPIO39.

**Note** ESP32: For a given channel, `adc2_config_channel_atten()` must be called before the first time this function is called. If Wi-Fi is started via `esp_wifi_start()`, this function will always fail with ESP_ERR_TIMEOUT.

**Note** ESP32-S2: ADC2 supports hardware arbiter. The arbiter is to improve the usage efficiency of ADC2. After the control right is robbed by the high priority, the low priority controller will read the invalid ADC2 data.

**Default priority**: Wi-Fi > RTC > Digital;

**Return**
- ESP_OK if success
- ESP_ERR_TIMEOUT ADC2 is being used by other controller and the request timed out.
- ESP_ERR_INVALID_STATE The controller status is invalid. Please try again.

**Parameters**
- `channel`: ADC2 channel to read
- `width_bit`: Bit capture width for ADC2
- `raw_out`: the variable to hold the output data.

```c
esp_err_t adc_vref_to_gpio(adc_unit_t adc_unit, gpio_num_t gpio)
```
Output ADC1 or ADC2’s reference voltage to ADC2 channel’s IO.

This function routes the internal reference voltage of ADCn to one of ADC2’s channels. This reference voltage can then be manually measured for calibration purposes.

**Note** ESP32 only supports output of ADC2’s internal reference voltage.

**Return**
- ESP_OK: v_ref successfully routed to selected GPIO
- ESP_ERR_INVALID_ARG: Unsupported GPIO

**Parameters**
- `[in]` `adc_unit`: ADC unit index
- `[in]` `gpio`: GPIO number (Only ADC2’s channels IO are supported)

```c
esp_err_t adc2_vref_to_gpio(gpio_num_t gpio)
```
Output ADC2 reference voltage to ADC2 channel’s IO.

This function routes the internal reference voltage of ADCn to one of ADC2’s channels. This reference voltage can then be manually measured for calibration purposes.

**Return**
- ESP_OK: v_ref successfully routed to selected GPIO
- ESP_ERR_INVALID_ARG: Unsupported GPIO

**Parameters**
- `[in]` `gpio`: GPIO number (ADC2’s channels are supported)
**esp_err_t adc_digi_initialize(const adc_digi_init_config_t *init_config)**

Initialize the Digital ADC.

**Return**

- ESP_ERR_INVALID_ARG If the combination of arguments is invalid.
- ESP_ERR_NOT_FOUND No free interrupt found with the specified flags
- ESP_ERR_NO_MEM If out of memory
- ESP_OK On success

**Parameters**

- `init_config`: Pointer to Digital ADC initialization config. Refer to `adc_digi_init_config_t`.

**esp_err_t adc_digi_read_bytes(uint8_t *buf, uint32_t length_max, uint32_t *out_length, uint32_t timeout_ms)**

Read bytes from Digital ADC through DMA.

**Return**

- ESP_ERR_INVALID_STATE Driver state is invalid. Usually it means the ADC sampling rate is faster than the task processing rate.
- ESP_ERR_TIMEOUT Operation timed out
- ESP_OK On success

**Parameters**

- `buf`: Buffer to read from ADC.
- `length_max`: Expected length of data read from the ADC.
- `out_length`: Real length of data read from the ADC via this API.
- `timeout_ms`: Time to wait for data via this API, in millisecond.

**esp_err_t adc_digi_start(void)**

Start the Digital ADC and DMA peripherals. After this, the hardware starts working.

**Return**

- ESP_ERR_INVALID_STATE Driver state is invalid.
- ESP_OK On success

**esp_err_t adc_digi_stop(void)**

Stop the Digital ADC and DMA peripherals. After this, the hardware stops working.

**Return**

- ESP_ERR_INVALID_STATE Driver state is invalid.
- ESP_OK On success

**esp_err_t adc_digi_deinitialize(void)**

Deinitialize the Digital ADC.

**Return**

- ESP_ERR_INVALID_STATE Driver state is invalid.
- ESP_OK On success

**esp_err_t adc_digi_controller_configure(const adc_digi_configuration_t *config)**

Setting the digital controller.

**Return**

- ESP_ERR_INVALID_STATE Driver state is invalid.
- ESP_ERR_INVALID_ARG If the combination of arguments is invalid.
- ESP_OK On success

**Parameters**

- `config`: Pointer to digital controller parameter. Refer to `adc_digi_config_t`.

**Structures**

**struct adc_digi_init_config_s**

ADC DMA driver configuration.
Public Members

uint32_t max_store_buf_size
Max length of the converted data that driver can store before they are processed.

uint32_t conv_num_each_intr
Bytes of data that can be converted in 1 interrupt.

uint32_t adc1_chan_mask
Channel list of ADC1 to be initialized.

uint32_t adc2_chan_mask
Channel list of ADC2 to be initialized.

struct adc_digi_configuration_t
ADC digital controller settings.

Public Members

bool conv_limit_en
To limit ADC conversion times. Conversion stops after finishing conv_limit_num times conversion.

uint32_t conv_limit_num
Set the upper limit of the number of ADC conversion triggers. Range: 1 ~ 255.

uint32_t pattern_num
Number of ADC channels that will be used.

adc_digi_pattern_config_t *adc_pattern
List of configs for each ADC channel that will be used.

uint32_t sample_freq_hz
The expected ADC sampling frequency in Hz. Range: 611Hz ~ 83333Hz Fs = Fd / interval / 2 Fs: sampling frequency; Fd: digital controller frequency, no larger than 5M for better performance interval: interval between 2 measurement trigger signal, the smallest interval should not be smaller than the ADC measurement period, the largest interval should not be larger than 4095

adc_digi_convert_mode_t conv_mode
ADC DMA conversion mode, see adc_digi_convert_mode_t.

adc_digi_output_format_t format
ADC DMA conversion output format, see adc_digi_output_format_t.

Macros

ADC_ATTEN_0db
ADC rtc controller attenuation option.

Note This definitions are only for being back-compatible

ADC_ATTEN_2_5db
ADC_ATTEN_6db
ADC_ATTEN_11db
ADC_WIDTH_BIT_DEFAULT
The default (max) bit width of the ADC of current version. You can also get the maximum bitwidth by SOC_ADC_MAX_BITWIDTH defined in soc_caps.h.

ADC_WIDTH_9Bit
ADC_WIDTH_10Bit
ADC_WIDTH_11Bit
ADC_WIDTH_12Bit
ADC_MAX_DELAY
Digital ADC DMA read max timeout value, it may make the adc_digi_read_bytes block forever if the OS supports.

Type Definitions
typedef struct adc_digi_init_config_s adc_digi_init_config_t
ADC DMA driver configuration.

Enumerations
enum adc1_channel_t
Values:
ADC1_CHANNEL_0 = 0
ADC1 channel 0 is GPIO1
ADC1_CHANNEL_1
ADC1 channel 1 is GPIO2
ADC1_CHANNEL_2
ADC1 channel 2 is GPIO3
ADC1_CHANNEL_3
ADC1 channel 3 is GPIO4
ADC1_CHANNEL_4
ADC1 channel 4 is GPIO5
ADC1_CHANNEL_5
ADC1 channel 5 is GPIO6
ADC1_CHANNEL_6
ADC1 channel 6 is GPIO7
ADC1_CHANNEL_7
ADC1 channel 7 is GPIO8
ADC1_CHANNEL_8
ADC1 channel 8 is GPIO9
ADC1_CHANNEL_9
ADC1 channel 9 is GPIO10
ADC1_CHANNEL_MAX

enum adc2_channel_t
Values:
ADC2_CHANNEL_0 = 0
ADC2 channel 0 is GPIO4 (ESP32), GPIO11 (ESP32-S2)
ADC2_CHANNEL_1
ADC2 channel 1 is GPIO0 (ESP32), GPIO12 (ESP32-S2)
ADC2_CHANNEL_2
ADC2 channel 2 is GPIO2 (ESP32), GPIO13 (ESP32-S2)
ADC2_CHANNEL_3
ADC2 channel 3 is GPIO15 (ESP32), GPIO14 (ESP32-S2)
ADC2_CHANNEL_4
ADC2 channel 4 is GPIO13 (ESP32), GPIO15 (ESP32-S2)
ADC2_CHANNEL_5
ADC2 channel 5 is GPIO12 (ESP32), GPIO16 (ESP32-S2)
ADC2_CHANNEL_6
ADC2 channel 6 is GPIO14 (ESP32), GPIO17 (ESP32-S2)
ADC2_CHANNEL_7
ADC2 channel 7 is GPIO27 (ESP32), GPIO18 (ESP32-S2)

ADC2_CHANNEL_8
ADC2 channel 8 is GPIO25 (ESP32), GPIO19 (ESP32-S2)

ADC2_CHANNEL_9
ADC2 channel 9 is GPIO26 (ESP32), GPIO20 (ESP32-S2)

ADC2_CHANNEL_MAX

enum adc_i2s_encode_t
ADC digital controller encode option.
Values:

ADC_ENCODE_12BIT
ADC to DMA data format, [15:12]-channel[11:0]-12 bits ADC data

ADC_ENCODE_11BIT
ADC to DMA data format, [15]-unit, [14:11]-channel[10:0]-11 bits ADC data

ADC_ENCODE_MAX

Header File
- components/hal/include/hal/adc_types.h

Structures

struct adc_digi_pattern_config_t
ADC digital controller pattern configuration.

Public Members

uint8_t atten
Attenuation of this ADC channel.

uint8_t channel
ADC channel.

uint8_t unit
ADC unit.

uint8_t bit_width
ADC output bit width.

struct adc_digi_output_data_t
ADC digital controller (DMA mode) output data format. Used to analyze the acquired ADC (DMA) data.

Public Members

uint32_t data: 13
ADC real output data info. Resolution: 13 bit.

uint32_t channel: 4
ADC channel index info. If (channel < ADC_CHANNEL_MAX), The data is valid. If (channel > ADC_CHANNEL_MAX), The data is invalid.

uint32_t unit: 1
ADC unit index info. 0: ADC1; 1: ADC2.

uint32_t reserved17_31: 14
Reserved17.
struct adc_digi_output_data_t:

When the configured output format is 12bit. ADC_DIGI_FORMAT_11BIT

uint32_t val
Raw data value

struct adc_arbiter_t
ADC arbiter work mode and priority setting.

Note ESP32-S2: Only ADC2 support arbiter.

Public Members

adc_arbiter_mode_t mode
Refer to adc_arbiter_mode_t. Note: only support ADC2.

uint8_t rtc_pri
RTC controller priority. Range: 0 ~ 2.

uint8_t dig_pri
Digital controller priority. Range: 0 ~ 2.

uint8_t pwdet_pri
Wi-Fi controller priority. Range: 0 ~ 2.

struct adc_digi_filter_t
ADC digital controller (DMA mode) filter configuration.

Note For ESP32-S2, The filter object of the ADC is fixed.
Note For ESP32-S2, The filter object is always all enabled channels.

Public Members

adc_unit_t adc_unit
Set adc unit number for filter. For ESP32-S2, Filter IDX0/IDX1 can only be used to filter all enabled channels of ADC1/ADC2 unit at the same time.

adc_channel_t channel
Set adc channel number for filter. For ESP32-S2, it’s always ADC_CHANNEL_MAX

adc_digi_filter_mode_t mode
Set adc filter mode for filter. See adc_digi_filter_mode_t.

struct adc_digi_monitor_t
ADC digital controller (DMA mode) monitor configuration.

Note For ESP32-S2, The monitor object of the ADC is fixed.
Note For ESP32-S2, The monitor object is always all enabled channels.

Public Members

adc_unit_t adc_unit
Set adc unit number for monitor. For ESP32-S2, monitor IDX0/IDX1 can only be used to monitor all enabled channels of ADC1/ADC2 unit at the same time.

adc_channel_t channel
Set adc channel number for monitor. For ESP32-S2, it’s always ADC_CHANNEL_MAX

adc_digi_monitor_mode_t mode
Set adc monitor mode. See adc_digi_monitor_mode_t.

uint32_t threshold
Set monitor threshold of adc digital controller.
Chapter 2. API Reference

Macros

ADC_ARBITER_CONFIG_DEFAULT ()
ADC arbiter default configuration.

Note ESP32S2: Only ADC2 supports (needs) an arbiter.

Enumerations

enum adc_unit_t
ADC unit enumeration.

Note For ADC digital controller (DMA mode), ESP32 doesn’t support ADC_UNIT_2, ADC_UNIT_BOTH, ADC_UNIT_ALTER.

Values:

ADC_UNIT_1 = 1
SAR ADC 1.
ADC_UNIT_2 = 2
SAR ADC 2.
ADC_UNIT_BOTH = 3
SAR ADC 1 and 2.
ADC_UNIT_ALTER = 7
SAR ADC 1 and 2 alternative mode.
ADC_UNIT_MAX
enum adc_channel_t
ADC channels handle. See adc1_channel_t, adc2_channel_t.

Note For ESP32 ADC1, don’t use ADC_CHANNEL_8, ADC_CHANNEL_9. See adc1_channel_t.

Values:

ADC_CHANNEL_0 = 0
ADC channel
ADC_CHANNEL_1
ADC channel
ADC_CHANNEL_2
ADC channel
ADC_CHANNEL_3
ADC channel
ADC_CHANNEL_4
ADC channel
ADC_CHANNEL_5
ADC channel
ADC_CHANNEL_6
ADC channel
ADC_CHANNEL_7
ADC channel
ADC_CHANNEL_8
ADC channel
ADC_CHANNEL_9
ADC channel
ADC_CHANNEL_MAX
Chapter 2. API Reference

enum adc_atten_t
ADC attenuation parameter. Different parameters determine the range of the ADC. See adc1_config_channel_atten.

Values:

ADC_ATTEN_DB_0 = 0
No input attenuation, ADC can measure up to approx. 800 mV.

ADC_ATTEN_DB_2_5 = 1
The input voltage of ADC will be attenuated extending the range of measurement by about 2.5 dB (1.33 x)

ADC_ATTEN_DB_6 = 2
The input voltage of ADC will be attenuated extending the range of measurement by about 6 dB (2 x)

ADC_ATTEN_DB_11 = 3
The input voltage of ADC will be attenuated extending the range of measurement by about 11 dB (3.55 x)

ADC_ATTEN_MAX

enum adc_bits_width_t
ADC resolution setting option.

Note Only used in single read mode

Values:

ADC_WIDTH_BIT_12 = 3
ADC capture width is 12Bit.

ADC_WIDTH_MAX

enum adc_digi_convert_mode_t
ADC digital controller (DMA mode) work mode.

Values:

ADC_CONV_SINGLE_UNIT_1 = 1
Only use ADC1 for conversion.

ADC_CONV_SINGLE_UNIT_2 = 2
Only use ADC2 for conversion.

ADC_CONV_BOTH_UNIT = 3
Use Both ADC1 and ADC2 for conversion simultaneously.

ADC_CONV_ALTER_UNIT = 7
Use both ADC1 and ADC2 for conversion by turn. e.g. ADC1 -> ADC2 -> ADC1 -> ADC2 ...

ADC_CONV_UNIT_MAX

enum adc_digi_output_format_t
ADC digital controller (DMA mode) output data format option.

Values:

ADC_DIGI_FORMAT_12BIT
ADC to DMA data format, [15:12]-channel, [11: 0]-12 bits ADC data (adc_digi_output_data_t). Note: For single convert mode.

ADC_DIGI_FORMAT_11BIT
ADC to DMA data format, [15]-adc unit, [14:11]-channel, [10: 0]-11 bits ADC data (adc_digi_output_data_t). Note: For multi or alter convert mode.

ADC_DIGI_FORMAT_MAX

ADC_DIGI_OUTPUT_FORMAT_TYPE1
See adc_digi_output_data_t.type1
ADC_DIGI_OUTPUT_FORMAT_TYPE2
See \texttt{adc_digi_output_data_t.type2}

\begin{verbatim}
enum adc_arbiter_mode_t
ADC arbiter work mode option.
\textbf{Note} ESP32-S2: Only ADC2 support arbiter.
\end{verbatim}
\textbf{Values}:

\texttt{ADC_ARB_MODE_SHIELD}
Forceshieldarbiter,Selectthehighestprioritycontrollertowork.

\texttt{ADC_ARB_MODE_FIX}
Fixedpriorityswitchcontrollermode.

\texttt{ADC_ARB_MODE_LOOP}
Loop priority switch controller mode. Each controller has the same priority, and the arbiter will switch
to the next controller after the measurement is completed.

\begin{verbatim}
enum adc_digi_filter_idx_t
ADC digital controller (DMA mode) filter index options.
\textbf{Note} For ESP32-S2, The filter object of the ADC is fixed.
\end{verbatim}
\textbf{Values}:

\texttt{ADC_DIGI_FILTER_IDX0} = 0
The filter index 0. For ESP32-S2, It can only be used to filter all enabled channels of ADC1 unit at the same time.

\texttt{ADC_DIGI_FILTER_IDX1}
The filter index 1. For ESP32-S2, It can only be used to filter all enabled channels of ADC2 unit at the same time.

\texttt{ADC_DIGI_FILTER_IDX_MAX}

\begin{verbatim}
enum adc_digi_filter_mode_t
ADC digital controller (DMA mode) filter type options. Expression: filter_data = (k-1)/k * last_data +
new_data / k.
\end{verbatim}
\textbf{Values}:

\texttt{ADC_DIGI_FILTER_IIR_2} = 0
The filter mode is first-order IIR filter. The coefficient is 2.

\texttt{ADC_DIGI_FILTER_IIR_4}
The filter mode is first-order IIR filter. The coefficient is 4.

\texttt{ADC_DIGI_FILTER_IIR_8}
The filter mode is first-order IIR filter. The coefficient is 8.

\texttt{ADC_DIGI_FILTER_IIR_16}
The filter mode is first-order IIR filter. The coefficient is 16.

\texttt{ADC_DIGI_FILTER_IIR_64}
The filter mode is first-order IIR filter. The coefficient is 64.

\texttt{ADC_DIGI_FILTER_IIR_MAX}

\begin{verbatim}
enum adc_digi_monitor_idx_t
ADC digital controller (DMA mode) monitor index options.
\textbf{Note} For ESP32-S2, The monitor object of the ADC is fixed.
\end{verbatim}
\textbf{Values}:

\texttt{ADC_DIGI_MONITOR_IDX0} = 0
The monitor index 0. For ESP32-S2, It can only be used to monitor all enabled channels of ADC1 unit at the same time.
ADC_DIGI_MONITOR_IDX1
The monitor index 1. For ESP32-S2, it can only be used to monitor all enabled channels of ADC2 unit at the same time.

ADC_DIGI_MONITOR_IDX_MAX

enum adc_digi_monitor_mode_t
Set monitor mode of adc digital controller. MONITOR_HIGH: If ADC_OUT > threshold, Generates monitor interrupt. MONITOR_LOW: If ADC_OUT < threshold, Generates monitor interrupt.

Values:
ADC_DIGI_MONITOR_HIGH = 0
If ADC_OUT > threshold, Generates monitor interrupt.

ADC_DIGI_MONITOR_LOW
If ADC_OUT < threshold, Generates monitor interrupt.

ADC_DIGI_MONITOR_MAX

enum adc_i2s_source_t
ESP32 ADC DMA source selection.

Values:
ADC_I2S_DATA_SRC_IO_SIG = 0
I2S data from GPIO matrix signal

ADC_I2S_DATA_SRC_ADC = 1
I2S data from ADC

ADC_I2S_DATA_SRC_MAX

ADC Calibration

Header File
- components/esp_adc_cal/include/esp_adc_cal.h

Functions

esp_err_t esp_adc_cal_check_efuse(esp_adc_cal_value_t value_type)
Checks if ADC calibration values are burned into eFuse.

This function checks if ADC reference voltage or Two Point values have been burned to the eFuse of the current ESP32

Note in ESP32S2, only ESP_ADC_CAL_VAL_EFUSE_TP is supported. Some old ESP32S2s do not support this, either. In which case you have to calibrate it manually, possibly by performing your own two-point calibration on the chip.

Return
- ESP_OK: The calibration mode is supported in eFuse
- ESP_ERR_NOT_SUPPORTED: Error, eFuse values are not burned
- ESP_ERR_INVALID_ARG: Error, invalid argument (ESP_ADC_CAL_VAL_DEFAULT_VREF)

Parameters
- value_type: Type of calibration value (ESP_ADC_CAL_VAL_EFUSE_VREF or ESP_ADC_CAL_VAL_EFUSE_TP)

esp_adc_cal_value_t esp_adc_cal_characterize(adc_unit_t adc_num, adc_atten_t atten, adc_bits_width_t bit_width, uint32_t default_vref, esp_adc_cal_characteristics_t *chars)

Characterize an ADC at a particular attenuation.

This function will characterize the ADC at a particular attenuation and generate the ADC-Voltage curve in the form of \[ y = \text{coeff}_a \cdot x + \text{coeff}_b \]. Characterization can be based on Two Point values, eFuse Vref, or default Vref and the calibration values will be prioritized in that order.
Note  For ESP32, Two Point values and eFuse Vref calibration can be enabled/disabled using menuconfig. For ESP32s2, only Two Point values calibration and only ADC_WIDTH_BIT_13 is supported. The parameter default_vref is unused.

Return  
- ESP_ADC_CAL_VAL_EFUSE_VREF: eFuse Vref used for characterization
- ESP_ADC_CAL_VAL_EFUSE_TP: Two Point value used for characterization (only in Linear Mode)
- ESP_ADC_CAL_VAL_DEFAULT_VREF: Default Vref used for characterization

Parameters  
- [in] adc_num: ADC to characterize (ADC_UNIT_1 or ADC_UNIT_2)
- [in] atten: Attenuation to characterize
- [in] bit_width: Bit width configuration of ADC
- [in] default_vref: Default ADC reference voltage in mV (Only in ESP32, used if eFuse values is not available)
- [out] chars: Pointer to empty structure used to store ADC characteristics

uint32_t esp_adc_cal_raw_to_voltage(uint32_t adc_reading, const esp_adc_cal_characteristics_t *chars)

Convert an ADC reading to voltage in mV.

This function converts an ADC reading to a voltage in mV based on the ADC’s characteristics.

Note  Characteristics structure must be initialized before this function is called (call esp_adc_cal_characterize())

Return  Voltage in mV

Parameters  
- [in] adc_reading: ADC reading
- [in] chars: Pointer to initialized structure containing ADC characteristics

esp_err_t esp_adc_cal_get_voltage(adc_channel_t channel, const esp_adc_cal_characteristics_t *chars, uint32_t *voltage)

Reads an ADC and converts the reading to a voltage in mV.

This function reads an ADC then converts the raw reading to a voltage in mV based on the characteristics provided. The ADC that is read is also determined by the characteristics.

Note  The Characteristics structure must be initialized before this function is called (call esp_adc_cal_characterize())

Return  
- ESP_OK: ADC read and converted to mV
- ESP_ERR_INVALID_ARG: Error due to invalid arguments
- ESP_ERR_INVALID_STATE: Reading result is invalid. Try to read again.

Parameters  
- [in] channel: ADC Channel to read
- [in] chars: Pointer to initialized ADC characteristics structure
- [out] voltage: Pointer to store converted voltage

Structures  
struct esp_adc_cal_characteristics_t
Structure storing characteristics of an ADC.

Note  Call esp_adc_cal_characterize() to initialize the structure

Public Members  

adc_unit_t adc_num  
ADC number

adc_atten_t atten  
ADC attenuation
**adc_bits_width_t**
ADC bit width

```c
uint32_t coeff_a
```
Gradient of ADC-Voltage curve

```c
uint32_t coeff_b
```
Offset of ADC-Voltage curve

```c
uint32_t vref
```
Vref used by lookup table

```c
const uint32_t* low_curve
```
Pointer to low Vref curve of lookup table (NULL if unused)

```c
const uint32_t* high_curve
```
Pointer to high Vref curve of lookup table (NULL if unused)

```c
uint8_t version
```
ADC Calibration

---

**Enumerations**

```c
def esp_adc_cal_value_t
```
Type of calibration value used in characterization.

**Values:**

- `ESP_ADC_CAL_VAL_EFUSE_VREF = 0`
Characterization based on reference voltage stored in eFuse

- `ESP_ADC_CAL_VAL_EFUSE_TP = 1`
Characterization based on Two Point values stored in eFuse

- `ESP_ADC_CAL_VAL_DEFAULT_VREF = 2`
Characterization based on default reference voltage

- `ESP_ADC_CAL_VAL_EFUSE_TP_FIT = 3`
Characterization based on Two Point values and fitting curve coefficients stored in eFuse

- `ESP_ADC_CAL_VAL_MAX`

- `ESP_ADC_CAL_VAL_NOT_SUPPORTED = ESP_ADC_CAL_VAL_MAX`

---

### 2.3.2 GPIO & RTC GPIO

**Overview**

The ESP32-S3 chip features 45 physical GPIO pads. Some GPIO pads cannot be used or do not have the corresponding pin on the chip package. For more details, see *ESP32-S3 Technical Reference Manual > IO MUX and GPIO Matrix (GPIO, IO_MUX) [PDF]*. Each pad can be used as a general purpose I/O or can be connected to an internal peripheral signal.

The table below provides more information on pin usage, and please note the comments in the table for GPIOs with restrictions.

</tbody>
</table>

**Note:**

- Strapping pin: GPIO0, GPIO3, GPIO45 and GPIO46 are strapping pins.
- SPI0/1: GPIO26-32 are usually used for SPI flash and PSRAM and not recommended for other uses. When using Octal Flash or Octal PSRAM or both, GPIO33−37 are connected to SPII04～SPII07 and SPIDQS. Therefore on ESP32-S3R8 / ESP32-S3R8V board GPIO33−37 are also not recommended for other uses.
- USB-JTAG: GPIO 19 and 20 are used by USB-JTAG by default. In order to use them as GPIOs, USB-JTAG will be disabled by the drivers.
There is also separate “RTC GPIO” support, which functions when GPIOs are routed to the “RTC” low-power and analog subsystem. These pin functions can be used when:

- In deep sleep
- The Ultra Low Power co-processor is running
- Analog functions such as ADC/DAC/etc are in use.

**Application Example**

GPIO output and input interrupt example: peripherals/gpio/generic_gpio.

**API Reference - Normal GPIO**

**Header File**

- components/driver/include/driver/gpio.h

**Functions**

```c
esp_err_t gpio_config(const gpio_config_t *pGPIOConfig)

Configure GPIO's Mode, pull-up, PullDown, IntrType
```

**Return**

- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**

- pGPIOConfig: Pointer to GPIO configure struct

```c
esp_err_t gpio_reset_pin (gpio_num_t gpio_num)

Reset an gpio to default state (select gpio function, enable pullup and disable input and output).
```

**Note** This function also configures the IOMUX for this pin to the GPIO function, and disconnects any other peripheral output configured via GPIO Matrix.

**Return** Always return ESP_OK.

**Parameters**

- gpio_num: GPIO number.

```c
esp_err_t gpio_set_intr_type (gpio_num_t gpio_num, gpio_int_type_t intr_type)

GPIO set interrupt trigger type.
```

**Return**

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**

- gpio_num: GPIO number. If you want to set the trigger type of e.g. of GPIO16, gpio_num should be GPIO_NUM_16 (16);
- intr_type: Interrupt type, select from gpio_int_type_t

```c
esp_err_t gpio_intr_enable (gpio_num_t gpio_num)

Enable GPIO module interrupt signal.
```

**Note** Please do not use the interrupt of GPIO36 and GPIO39 when using ADC or Wi-Fi with sleep mode enabled. Please refer to the comments of adc1_get_raw. Please refer to section 3.11 of ‘ECO_and_ Workarounds_for_Bugs_in_ESP32’ for the description of this issue. As a workaround, call adc_power_acquire() in the app. This will result in higher power consumption (by ~1mA), but will remove the glitches on GPIO36 and GPIO39.

**Return**

- ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- gpio_num: GPIO number. If you want to enable an interrupt on e.g. GPIO16, gpio_num should be GPIO_NUM_16 (16);

```c
esp_err_t gpio_intr_disable(gpio_num_t gpio_num)
```
Disable GPIO module interrupt signal.

**Return**
- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- gpio_num: GPIO number. If you want to disable the interrupt of e.g. GPIO16, gpio_num should be GPIO_NUM_16 (16);

```c
esp_err_t gpio_set_level(gpio_num_t gpio_num, uint32_t level)
```
GPIO set output level.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG GPIO number error

**Parameters**
- gpio_num: GPIO number. If you want to set the output level of e.g. GPIO16, gpio_num should be GPIO_NUM_16 (16);
- level: Output level. 0: low; 1: high

```c
int gpio_get_level(gpio_num_t gpio_num)
```
GPIO get input level.

**Warning** If the pad is not configured for input (or input and output) the returned value is always 0.

**Return**
- 0 the GPIO input level is 0
- 1 the GPIO input level is 1

**Parameters**
- gpio_num: GPIO number. If you want to get the logic level of e.g. pin GPIO16, gpio_num should be GPIO_NUM_16 (16);

```c
esp_err_t gpio_set_direction(gpio_num_t gpio_num, gpio_mode_t mode)
```
GPIO set direction.

Configure GPIO direction, such as output_only, input_only, output_and_input

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG GPIO error

**Parameters**
- gpio_num: Configure GPIO pins number, it should be GPIO number. If you want to set direction of e.g. GPIO16, gpio_num should be GPIO_NUM_16 (16);
- mode: GPIO direction

```c
esp_err_t gpio_set_pull_mode(gpio_num_t gpio_num, gpio_pull_mode_t pull)
```
Configure GPIO pull-up/pull-down resistors.

Only pins that support both input & output have integrated pull-up and pull-down resistors. Input-only GPIOs 34-39 do not.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG : Parameter error

**Parameters**
- gpio_num: GPIO number. If you want to set pull up or down mode for e.g. GPIO16, gpio_num should be GPIO_NUM_16 (16);
- pull: GPIO pull up/down mode.
**esp_err_t gpio_wakeup_enable (gpio_num_t gpio_num, gpio_int_type_t intr_type)**

Enable GPIO wake-up function.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- gpio_num: GPIO number.
- intr_type: GPIO wake-up type. Only GPIO_INTR_LOW_LEVEL or GPIO_INTR_HIGH_LEVEL can be used.

**esp_err_t gpio_wakeup_disable (gpio_num_t gpio_num)**

Disable GPIO wake-up function.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- gpio_num: GPIO number

**esp_err_t gpio_isr_register (void (*fn) (void *)) void *, void *arg, int intr_alloc_flags, gpio_isr_handle_t *handle**

Register GPIO interrupt handler, the handler is an ISR. The handler will be attached to the same CPU core that this function is running on. This ISR function is called whenever any GPIO interrupt occurs. See the alternative gpio_install_isr_service() and gpio_isr_handler_add() API in order to have the driver support per-GPIO ISRs.

To disable or remove the ISR, pass the returned handle to the interrupt allocation functions.

**Parameters**
- fn: Interrupt handler function.
- arg: Parameter for handler function
- intr_alloc_flags: Flags used to allocate the interrupt. One or multiple (ORred) ESP_INTR_FLAG_* values. See esp_intr_alloc.h for more info.
- handle: Pointer to return handle. If non-NULL, a handle for the interrupt will be returned here.

**Return**
- ESP_OK Success;
- ESP_ERR_INVALID_ARG GPIO error
- ESP_ERR_NOT_FOUND No free interrupt found with the specified flags

**esp_err_t gpio_pullup_en (gpio_num_t gpio_num)**

Enable pull-up on GPIO.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- gpio_num: GPIO number

**esp_err_t gpio_pullup_dis (gpio_num_t gpio_num)**

Disable pull-up on GPIO.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- gpio_num: GPIO number

**esp_err_t gpio_pulldown_en (gpio_num_t gpio_num)**

Enable pull-down on GPIO.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- gpio_num: GPIO number
Parameters
- gpio_num: GPIO number

`esp_err_t gpio_pulldown_dis (gpio_num_t gpio_num)`

Disable pull-down on GPIO.

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters
- gpio_num: GPIO number

`esp_err_t gpio_install_isr_service (int intr_alloc_flags)`

Install the driver’s GPIO ISR handler service, which allows per-pin GPIO interrupt handlers.

This function is incompatible with gpio_isr_register() - if that function is used, a single global ISR is registered for all GPIO interrupts. If this function is used, the ISR service provides a global GPIO ISR and individual pin handlers are registered via the gpio_isr_handler_add() function.

Return
- ESP_OK Success
- ESP_ERR_NO_MEM No memory to install this service
- ESP_ERR_INVALID_STATE ISR service already installed.
- ESP_ERR_NOT_FOUND No free interrupt found with the specified flags
- ESP_ERR_INVALID_ARG GPIO error

Parameters
- intr_alloc_flags: Flags used to allocate the interrupt. One or multiple (ORred) ESP_INTR_FLAG_* values. See esp_intr_alloc.h for more info.

`void gpio_uninstall_isr_service (void)`

Uninstall the driver’s GPIO ISR service, freeing related resources.

`esp_err_t gpio_isr_handler_add (gpio_num_t gpio_num, gpio_isr_t isr_handler, void* args)`

Add ISR handler for the corresponding GPIO pin.

Call this function after using gpio_install_isr_service() to install the driver’s GPIO ISR handler service.

The pin ISR handlers no longer need to be declared with IRAM_ATTR, unless you pass the ESP_INTR_FLAG_IRAM flag when allocating the ISR in gpio_install_isr_service().

This ISR handler will be called from an ISR. So there is a stack size limit (configurable as “ISR stack size” in menuconfig). This limit is smaller compared to a global GPIO interrupt handler due to the additional level of indirection.

Return
- ESP_OK Success
- ESP_ERR_INVALID_STATE Wrong state, the ISR service has not been initialized.
- ESP_ERR_INVALID_ARG Parameter error

Parameters
- gpio_num: GPIO number
- isr_handler: ISR handler function for the corresponding GPIO number.
- args: parameter for ISR handler.

`esp_err_t gpio_isr_handler_remove (gpio_num_t gpio_num)`

Remove ISR handler for the corresponding GPIO pin.

Return
- ESP_OK Success
- ESP_ERR_INVALID_STATE Wrong state, the ISR service has not been initialized.
- ESP_ERR_INVALID_ARG Parameter error

Parameters
- gpio_num: GPIO number

`esp_err_t gpio_set_drive_capability (gpio_num_t gpio_num, gpio_drive_cap_t strength)`

Set GPIO pad drive capability.
Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- **gpio_num**: GPIO number, only support output GPIOs
- **strength**: Drive capability of the pad

```c
esp_err_t gpio_get_drive_capability (gpio_num_t gpio_num, gpio_drive_cap_t *strength)
```

Get GPIO pad drive capability.

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- **gpio_num**: GPIO number, only support output GPIOs
- **strength**: Pointer to accept drive capability of the pad

```c
esp_err_t gpio_hold_en (gpio_num_t gpio_num)
```

Enable gpio pad hold function.

The gpio pad hold function works in both input and output modes, but must be output-capable gpios. If pad hold enabled: in output mode: the output level of the pad will be force locked and can not be changed. in input mode: the input value read will not change, regardless the changes of input signal.

The state of digital gpio cannot be held during Deep-sleep, and it will resume the hold function when the chip wakes up from Deep-sleep. If the digital gpio also needs to be held during Deep-sleep, `gpio_deep_sleep_hold_en` should also be called.

Power down or call `gpio_hold_dis` will disable this function.

Return

- ESP_OK Success
- ESP_ERR_NOT_SUPPORTED Not support pad hold function

Parameters

- **gpio_num**: GPIO number, only support output-capable GPIOs

```c
esp_err_t gpio_hold_dis (gpio_num_t gpio_num)
```

Disable gpio pad hold function.

When the chip is woken up from Deep-sleep, the gpio will be set to the default mode, so, the gpio will output the default level if this function is called. If you don’t want the level changes, the gpio should be configured to a known state before this function is called. e.g. If you hold gpio18 high during Deep-sleep, after the chip is woken up and `gpio_hold_dis` is called, gpio18 will output low level (because gpio18 is input mode by default). If you don’t want this behavior, you should configure gpio18 as output mode and set it to hight level before calling `gpio_hold_dis`.

Return

- ESP_OK Success
- ESP_ERR_NOT_SUPPORTED Not support pad hold function

Parameters

- **gpio_num**: GPIO number, only support output-capable GPIOs

```c
void gpio_deep_sleep_hold_en (void)
```

Enable all digital gpio pad hold function during Deep-sleep.

When the chip is in Deep-sleep mode, all digital gpio will hold the state before sleep, and when the chip is woken up, the status of digital gpio will not be held. Note that the pad hold feature only works when the chip is in Deep-sleep mode, when not in sleep mode, the digital gpio state can be changed even you have called this function.

Power down or call `gpio_hold_dis` will disable this function, otherwise, the digital gpio hold feature works as long as the chip enter Deep-sleep.

```c
void gpio_deep_sleep_hold_dis (void)
```

Disable all digital gpio pad hold function during Deep-sleep.
**Chapter 2. API Reference**

void **gpio_iomux_in**(uint32_t gpio_num, uint32_t signal_idx)

Set pad input to a peripheral signal through the IOMUX.

**Parameters**

- **gpio_num**: GPIO number of the pad.
- **signal_idx**: Peripheral signal id to input. One of the *_IN_IDX signals in soc/gpio_sig_map.h.

void **gpio_iomux_out**(uint8_t gpio_num, int func, bool oen_inv)

Set peripheral output to an GPIO pad through the IOMUX.

**Parameters**

- **gpio_num**: gpio_num GPIO number of the pad.
- **func**: The function number of the peripheral pinto output pin. One of the FUNC_X_* of specified pin (X) in soc/io_mux_reg.h.
- **oen_inv**: True if the output enable needs to be inverted, otherwise False.

**esp_err_t** gpio_force_hold_all(void)

Force hold digital and rtc gpio pad.

**Note** GPIO force hold, whether the chip in sleep mode or wakeup mode.

**esp_err_t** gpio_force_unhold_all(void)

Force unhold digital and rtc gpio pad.

**Note** GPIO force unhold, whether the chip in sleep mode or wakeup mode.

**esp_err_t** gpio_sleep_sel_en(gpio_num_t gpio_num)

Enable SLP_SEL to change GPIO status automatically in lightsleep.

**Return**

- ESP_OK Success

**Parameters**

- **gpio_num**: GPIO number of the pad.

**esp_err_t** gpio_sleep_sel_dis(gpio_num_t gpio_num)

Disable SLP_SEL to change GPIO status automatically in lightsleep.

**Return**

- ESP_OK Success

**Parameters**

- **gpio_num**: GPIO number of the pad.

**esp_err_t** gpio_sleep_set_direction(gpio_num_t gpio_num, gpio_mode_t mode)

GPIO set direction at sleep.

Configure GPIO direction, such as output only, input only, output and input

**Return**

- ESP_OK Success
- ESP_ERR_INVALID_ARG GPIO error

**Parameters**

- **gpio_num**: Configure GPIO pins number, it should be GPIO number. If you want to set direction of e.g. GPIO16, gpio_num should be GPIO_NUM_16 (16);
- **mode**: GPIO direction

**esp_err_t** gpio_sleep_set_pull_mode(gpio_num_t gpio_num, gpio_pull_mode_t pull)

Configure GPIO pull-up/pull-down resistors at sleep.

Only pins that support both input & output have integrated pull-up and pull-down resistors. Input-only GPIOs 34-39 do not.

**Return**

- ESP_OK Success
- ESP_ERR_INVALID_ARG : Parameter error

**Parameters**
• **gpio_num** : GPIO number. If you want to set pull up or down mode for e.g. GPIO16, gpio_num should be GPIO_NUM_16(16);
• **pull** : GPIO pull up/down mode.

**Macros**

`GPIO_PIN_COUNT`  
`GPIO_IS_VALID_GPIO(gpio_num)`  
Check whether it is a valid GPIO number.

`GPIO_IS_VALID_OUTPUT_GPIO(gpio_num)`  
Check whether it can be a valid GPIO number of output mode.

**Type Definitions**

```c
typedef intr_handle_t gpio_isr_handle_t
```

**Header File**

• `components/hal/include/hal/gpio_types.h`

**Structures**

```c
struct gpio_config_t  
```
Configuration parameters of GPIO pad for gpio_config function.

**Public Members**

```c
uint64_t pin_bit_mask  
```
GPIO pin: set with bit mask, each bit maps to a GPIO

```c
gpio_mode_t mode  
```
GPIO mode: set input/output mode

```c
gpio_pullup_t pull_up_en  
```
GPIO pull-up

```c
gpio_pulldown_t pull_down_en  
```
GPIO pull-down

API Reference - RTC GPIO

Header File
   • components/driver/include/driver/rtc_io.h

Functions
bool rtc_gpio_is_valid_gpio (gpio_num_t gpio_num)
   Determine if the specified GPIO is a valid RTC GPIO.
   Return true if GPIO is valid for RTC GPIO use. false otherwise.
   Parameters
      • gpio_num: GPIO number

int rtc_io_number_get (gpio_num_t gpio_num)
   Get RTC IO index number by gpio number.
   Return >=0: Index of rtcio. -1 : The gpio is not rtcio.
   Parameters
      • gpio_num: GPIO number
Chapter 2. API Reference

```c
esp_err_t rtc_gpio_init (gpio_num_t gpio_num)
Init a GPIO as RTC GPIO.

This function must be called when initializing a pad for an analog function.

Return
• ESP_OK success
• ESP_ERR_INVALID_ARG GPIO is not an RTC IO

Parameters
• gpio_num: GPIO number (e.g. GPIO_NUM_12)
```

```c
esp_err_t rtc_gpio_deinit (gpio_num_t gpio_num)
Init a GPIO as digital GPIO.

Return
• ESP_OK success
• ESP_ERR_INVALID_ARG GPIO is not an RTC IO

Parameters
• gpio_num: GPIO number (e.g. GPIO_NUM_12)
```

```c
uint32_t rtc_gpio_get_level (gpio_num_t gpio_num)
Get the RTC IO input level.

Return
• 1 High level
• 0 Low level
• ESP_ERR_INVALID_ARG GPIO is not an RTC IO

Parameters
• gpio_num: GPIO number (e.g. GPIO_NUM_12)
```

```c
esp_err_t rtc_gpio_set_level (gpio_num_t gpio_num, uint32_t level)
Set the RTC IO output level.

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG GPIO is not an RTC IO

Parameters
• gpio_num: GPIO number (e.g. GPIO_NUM_12)
• level: output level
```

```c
esp_err_t rtc_gpio_set_direction (gpio_num_t gpio_num, rtc_gpio_mode_t mode)
RT CGPIO set direction.

Configure RTC GPIO direction, such as output only, input only, output and input.

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG GPIO is not an RTC IO

Parameters
• gpio_num: GPIO number (e.g. GPIO_NUM_12)
• mode: GPIO direction
```

```c
esp_err_t rtc_gpio_set_direction_in_sleep (gpio_num_t gpio_num, rtc_gpio_mode_t mode)
RT CGPIO set direction in deep sleep mode or disable sleep status (default). In some application scenarios, IO needs to have another states during deep sleep.

NOTE: ESP32 support INPUT_ONLY mode. ESP32S2 support INPUT_ONLY, OUTPUT_ONLY, INPUT_OUTPUT mode.

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG GPIO is not an RTC IO

Parameters
• gpio_num: GPIO number (e.g. GPIO_NUM_12)
• mode: GPIO direction
```
```c
esp_err_t rtc_gpio_pullup_en(gpio_num_t gpio_num)
RTC GPIO pullup enable.

This function only works for RTC IOs. In general, call gpio_pullup_en, which will work both for normal
GPIOs and RTC IOs.

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG GPIO is not an RTC IO

Parameters
• gpio_num: GPIO number (e.g. GPIO_NUM_12)

esp_err_t rtc_gpio_pulldown_en(gpio_num_t gpio_num)
RTC GPIO pulldown enable.

This function only works for RTC IOs. In general, call gpio_pulldown_en, which will work both for normal
GPIOs and RTC IOs.

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG GPIO is not an RTC IO

Parameters
• gpio_num: GPIO number (e.g. GPIO_NUM_12)

esp_err_t rtc_gpio_pullup_dis(gpio_num_t gpio_num)
RTC GPIO pullup disable.

This function only works for RTC IOs. In general, call gpio_pullup_dis, which will work both for normal
GPIOs and RTC IOs.

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG GPIO is not an RTC IO

Parameters
• gpio_num: GPIO number (e.g. GPIO_NUM_12)

esp_err_t rtc_gpio_pulldown_dis(gpio_num_t gpio_num)
RTC GPIO pulldown disable.

This function only works for RTC IOs. In general, call gpio_pulldown_dis, which will work both for normal
GPIOs and RTC IOs.

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG GPIO is not an RTC IO

Parameters
• gpio_num: GPIO number (e.g. GPIO_NUM_12)

esp_err_t rtc_gpio_set_drive_capability(gpio_num_t gpio_num, gpio_drive_cap_t strength)
Set RTC GPIO pad drive capability.

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

Parameters
• gpio_num: GPIO number, only support output GPIOs
• strength: Drive capability of the pad

esp_err_t rtc_gpio_get_drive_capability(gpio_num_t gpio_num, gpio_drive_cap_t *strength)
Get RTC GPIO pad drive capability.

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

Parameters
• gpio_num: GPIO number, only support output GPIOs
```
Chapter 2. API Reference

• strength: Pointer to accept drive capability of the pad

**esp_err_t rtc_gpio_hold_en(gpio_num_t gpio_num)**

Enable hold function on an RTC IO pad.

Enabling HOLD function will cause the pad to latch current values of input enable, output enable, output value, function, drive strength values. This function is useful when going into light or deep sleep mode to prevent the pin configuration from changing.

**Return**

• ESP_OK Success
• ESP_ERR_INVALID_ARG GPIO is not an RTC IO

**Parameters**

• gpio_num: GPIO number (e.g. GPIO_NUM_12)

**esp_err_t rtc_gpio_hold_dis(gpio_num_t gpio_num)**

Disable hold function on an RTC IO pad.

Disabling hold function will allow the pad receive the values of input enable, output enable, output value, function, drive strength from RTC_IO peripheral.

**Return**

• ESP_OK Success
• ESP_ERR_INVALID_ARG GPIO is not an RTC IO

**Parameters**

• gpio_num: GPIO number (e.g. GPIO_NUM_12)

**esp_err_t rtc_gpio_isolate(gpio_num_t gpio_num)**

Helper function to disconnect internal circuits from an RTC IO. This function disables input, output, pullup, pulldown, and enables hold feature for an RTC IO. Use this function if an RTC IO needs to be disconnected from internal circuits in deep sleep, to minimize leakage current.

In particular, for ESP32-WROVER module, call rtc_gpio_isolate(GPIO_NUM_12) before entering deep sleep, to reduce deep sleep current.

**Return**

• ESP_OK on success
• ESP_ERR_INVALID_ARG if GPIO is not an RTC IO

**Parameters**

• gpio_num: GPIO number (e.g. GPIO_NUM_12).

**esp_err_t rtc_gpio_force_hold_all(void)**

Enable force hold signal for all RTC IOs.

Each RTC pad has a “force hold” input signal from the RTC controller. If this signal is set, pad latches current values of input enable, function, output enable, and other signals which come from the RTC mux. Force hold signal is enabled before going into deep sleep for pins which are used for EXf1 wakeup.

**esp_err_t rtc_gpio_force_hold_dis_all(void)**

Disable force hold signal for all RTC IOs.

**esp_err_t rtc_gpio_wakeup_enable(gpio_num_t gpio_num, gpio_int_type_t intr_type)**

Enable wakeup from sleep mode using specific GPIO.

**Return**

• ESP_OK on success
• ESP_ERR_INVALID_ARG if gpio_num is not an RTC IO, or intr_type is not one of GPIO_INTR_HIGH_LEVEL, GPIO_INTR_LOW_LEVEL.

**Parameters**

• gpio_num: GPIO number
• intr_type: Wakeup on high level (GPIO_INTR_HIGH_LEVEL) or low level (GPIO_INTR_LOW_LEVEL)

**esp_err_t rtc_gpio_wakeup_disable(gpio_num_t gpio_num)**

Disable wakeup from sleep mode using specific GPIO.
## 2.3.3 General Purpose Timer (GPTimer)

### Introduction

A general purpose timer is a hardware timer with high resolution and flexible alarm action. The behavior when the internal counter of a timer reaches a specific target value is called timer alarm. When a timer alarms, a user registered per-timer callback would be called.

Typically, a general purpose timer can be used in scenarios like:

- Free running as a wall clock, fetching a high-resolution time stamp at any time and any places
- Generate period alarms, trigger events periodically
- Generate one-shot alarm, respond in target time

### Functional Overview

The following sections of this document cover the typical steps to install and operate a timer:

- **Resource Allocation** - covers which parameters should be set up to get a timer handle and how to recycle the resources when GPTimer finishes working.
- **Set and Get count value** - covers how to force the timer counting from a start point and how to get the count value at anytime.
- **Set Up Alarm Action** - covers the parameters that should be set up to enable the alarm event.
Register Event Callbacks - covers how to hook user specific code to the alarm event callback function.
Start and Stop timer - shows some typical use cases that start the timer with different alarm behavior.
Power Management - describes how different source clock selections can affect power consumption.
IRAM Safe - describes tips on how to make the timer interrupt and IO control functions work better along with a disabled cache.
Thread Safety - lists which APIs are guaranteed to be thread safe by the driver.

Resource Allocation  Different ESP chip might have different number of independent timer groups, and within each group, there could also be several independent timers. Refer to the datasheet to find out how many hardware timers exist (usually described in the “General Purpose Timer” chapter).

From driver’s point of view, a GPTimer instance is represented by gptimer_handle_t. The driver behind will manage all available hardware resources in a pool, so that users don’t need to care about which timer and which group it belongs to.

To install a timer instance, there’s a configuration structure that needs to be given in advance: gptimer_config_t:

- clk_src selects the source clock for the timer. The available clocks are listed in gptimer_clock_source_t, you can only pick one of them. For the effect on power consumption of different clock source, please refer to Power management section.
- direction sets the counting direction of the timer, supported directions are listed in gptimer_count_direction_t, you can only pick one of them.
- resolution_hz sets the resolution of the internal counter. Each count step is equivalent to 1 / resolution_hz seconds.
- Optional intr_shared sets whether or not mark the timer interrupt source as a shared one. For the pros/cons of a shared interrupt, you can refer to Interrupt Handling.

With all the above configurations set in the structure, the structure can be passed to gptimer_new_timer() which will instantiate the timer instance and return a handle of the timer.

The function can fail due to various errors such as insufficient memory, invalid arguments, etc. Specifically, when there are no more free timers (i.e. all hardware resources have been used up), then ESP_ERR_NOT_FOUND will be returned. The total number of available timers is represented by the SOC_TIMER_GROUP_TOTAL_TIMERS and its value will depend on the ESP chip.

If a previously created GPTimer instance is no longer required, you should recycle the timer by calling gptimer_del_timer(). This will allow the underlying HW timer to be used for other purposes. Before deleting a GPTimer handle, you should stop it by gptimer_stop() in advance or make sure it has not started yet by gptimer_start().

Creating a GPTimer Handle with Resolution of 1MHz

```c
#include <gptimer.h>

const gptimer_config_t timer_config = {
    .clk_src = GPTIMER_CLK_SRC_APB,
    .direction = GPTIMER_COUNT_UP,
    .resolution_hz = 1 * 1000 * 1000, // 1MHz, 1 tick = 1us
};

ESP_ERROR_CHECK(gptimer_new_timer(&timer_config, &gptimer));
```

Set and Get Count Value  When the GPTimer is created, the internal counter will be reset to zero by default. The counter value can be updated asynchronously by gptimer_set_raw_count(). The maximum count value is dependent on the hardware timer’s bit-width, which is also reflected by the SOC macro SOC_TIMER_GROUP_COUNTER_BIT_WIDTH. When updating the raw count of an active timer, the timer will immediately start counting from the new value.

Count value can be retrieved by gptimer_get_raw_count(), at anytime.

Some ESP chip might only support a sub-set of the clocks, if an unsupported clock source is specified, you will get a runtime error during timer installation.
**Set Up Alarm Action**  
Most of the use cases of GPTimer should set up the alarm action before starting the timer, except for the simple wall-clock scenario, where a free running timer is enough. To set up the alarm action, one should configure several members of `gptimer_alarm_config_t` based on how he takes use of the alarm event:

- **alarm_count** sets the target count value that will trigger the alarm event. You should also take the counting direction into consideration when setting the alarm value. Specially, `alarm_count` and `reload_count` can’t be set to the same value when `auto_reload_on_alarm` is true, as keeping reload with a target alarm count is meaningless.
- **reload_count** sets the count value to be reloaded when the alarm event happens. This configuration only takes effect when `auto_reload_on_alarm` is set to true.
- **auto_reload_on_alarm** flag sets whether to enable the auto-reload feature. If enabled, the hardware timer will reload the value of `reload_count` into counter immediately when alarm event happens.

To make the alarm configurations take effect, one should call `gptimer_set_alarm_action()`. Especially, if `gptimer_alarm_config_t` is set to NULL, the alarm function will be disabled.

**Note:**
- If an alarm value is set and the timer has already crossed this value, the alarm will be triggered immediately.

**Register Event Callbacks**  
After the timer starts up, it can generate specific event (e.g. the “Alarm Event”) dynamically. If you have some function that should be called when event happens, you should hook your function to the interrupt service routine by calling `gptimer_register_event_callbacks()`. All supported event callbacks are listed in the `gptimer_event_callbacks_t`:

- **on_alarm** sets callback function for alarm event. As this function is called within the ISR context, user must ensure that the function doesn’t attempt to block (e.g., by making sure that only FreeRTOS APIs with ISR suffix are called from within the function). The function prototype is declared in `gptimer_alarm_cb_t`. One can save his own context to `gptimer_register_event_callbacks()` as well, via the parameter `user_data`. The user data will be directly passed to the callback functions.

**Start and Stop Timer**  
To start a timer means to enable its internal counter, it can only be achieved by calling `gptimer_start()`. The timer can be stopped at any time (even in the interrupt context) by `gptimer_stop()`. One thing should be kept in mind, calling of `gptimer_start()` should have the same times of calling `gptimer_stop()` before you delete the timer, otherwise the driver might be put in an undetermined state. For example, the timer might keep a Power Management lock, which in return increase the power consumption. Also see Power management section.

**Start Timer As a Wall Clock**

```c
ESP_ERROR_CHECK(gptimer_start(gptimer));
// Retrieve timestamp at anytime
uint64_t count;
ESP_ERROR_CHECK(gptimer_get_raw_count(gptimer, &count));
```

**Trigger Period Events**

```c
typedef struct {
  uint64_t event_count;
} example_queue_element_t;

static bool example_timer_on_alarm_cb(gptimer_handle_t timer, const gptimer_alarm_event_data_t *edata, void *user_ctx)
{
  BaseType_t high_task_awoken = pdFALSE;
  QueueHandle_t queue = (QueueHandle_t)user_ctx;

  // Continue with your code.
}
```

(continues on next page)
// Retrieve count value from event data
example_queue_element_t ele = {
    .event_count = edata->count_value
};
// Optional: send the event data to other task by OS queue
// Don't introduce complex logics in callbacks.
// Suggest dealing with event data in the main loop, instead of in this_
   callback
xQueueSendFromISR(queue, &ele, &high_task_awoken);
// return whether we need to yield at the end of ISR
return high_task_awoken == pdTRUE;
}
gptimer_alarm_config_t alarm_config = {
    .reload_count = 0, // counter will reload with 0 on alarm event
    .alarm_count = 1000000, // period = 1s @resolution 1MHz
    .flags.auto_reload_on_alarm = true, // enable auto-reload
};
ESP_ERROR_CHECK(gptimer_set_alarm_action(gptimer, &alarm_config));
gptimer_event_callbacks_t cbs = {
    .on_alarm = example_timer_on_alarm_cb, // register user callback
};
ESP_ERROR_CHECK(gptimer_register_event_callbacks(gptimer, &cbs, queue));
ESP_ERROR_CHECK(gptimer_start(gptimer));

Trigger One-Shot Event
typedef struct {
    uint64_t event_count;
} example_queue_element_t;

static bool example_timer_on_alarm_cb(gptimer_handle_t timer, const gptimer_alarm_
   event_data_t *edata, void *user_ctx)
{
    BaseType_t high_task_awoken = pdFALSE;
    QueueHandle_t queue = (QueueHandle_t)user_ctx;
    // Stop timer the sooner the better
    gptimer_stop(timer);
    // Retrieve count value from event data
    example_queue_element_t ele = {
        .event_count = edata->count_value
    };
    // Optional: send the event data to other task by OS queue
    xQueueSendFromISR(queue, &ele, &high_task_awoken);
    // return whether we need to yield at the end of ISR
    return high_task_awoken == pdTRUE;
}
gptimer_alarm_config_t alarm_config = {
    .alarm_count = 1 * 1000 * 1000, // alarm target = 1s @resolution 1MHz
};
ESP_ERROR_CHECK(gptimer_set_alarm_action(gptimer, &alarm_config));
gptimer_event_callbacks_t cbs = {
    .on_alarm = example_timer_on_alarm_cb, // register user callback
};
ESP_ERROR_CHECK(gptimer_register_event_callbacks(gptimer, &cbs, queue));
ESP_ERROR_CHECK(gptimer_start(gptimer));
**Dynamic Alarm Update**  
Alarm value can be updated dynamically inside the ISR handler callback, by changing the `alarm_value` of `gptimer_alarm_event_data_t`. Then the alarm value will be updated after the callback function returns.

```c
typedef struct {
  uint64_t event_count;
} example_queue_element_t;

static bool example_timer_on_alarm_cb(gptimer_handle_t timer, const gptimer_alarm_event_data_t *edata, void *user_ctx) {
  BaseType_t high_task_awoken = pdFALSE;
  QueueHandle_t queue = (QueueHandle_t)user_data;
  // Retrieve count value from event data
  example_queue_element_t ele = {
    .event_count = edata->count_value
  };
  // Optional: send the event data to other task by OS queue
  xQueueSendFromISR(queue, &ele, &high_task_awoken);
  // reconfigure alarm value
  gptimer_alarm_config_t alarm_config = {
    .alarm_count = edata->alarm_value + 1000000, // alarm in next 1s
  };
  gptimer_set_alarm_action(timer, &alarm_config);
  // return whether we need to yield at the end of ISR
  return high_task_awoken == pdTRUE;
}
```

**Power Management**  
When power management is enabled (i.e. `CONFIG_PM_ENABLE` is on), the system will adjust the APB frequency before going into light sleep, thus potentially changing the period of a GPTimer’s counting step and leading to inaccurate time keeping.

However, the driver can prevent the system from changing APB frequency by acquiring a power management lock of type `ESP_PM_APB_FREQ_MAX`. Whenever the driver creates a GPTimer instance that has selected `GPTIMER_CLK_SRC_APB` as its clock source, the driver will guarantee that the power management lock is acquired when the timer is started by `gptimer_start()`. Likewise, the driver releases the lock when `gptimer_stop()` is called for that timer. This requires that the `gptimer_start()` and `gptimer_stop()` should appear in pairs.

**IRAM Safe**  
By default, the GPTimer interrupt will be deferred when the Cache is disabled for reasons like writing/erasing Flash. Thus the alarm interrupt will not get executed in time, which is not expected in a real-time application.

There’s a Kconfig option `CONFIG_GPTIMER_ISR_IRAM_SAFE` that will:

1. Enable the interrupt being serviced even when cache is disabled
2. Place all functions that used by the ISR into IRAM
3. Place driver object into DRAM (in case it’s linked to PSRAM by accident)

`on_alarm` callback and the functions invoked by itself should also be placed in IRAM, users need to take care of them by themselves.
This will allow the interrupt to run while the cache is disabled but will come at the cost of increased IRAM consumption.

There’s another Kconfig option `CONFIG_GPTIMER_CTRL_FUNC_IN_IRAM` that can put commonly used IO control functions into IRAM as well. So that these functions can also be executable when the cache is disabled. These IO control functions are as follows:

- `gptimer_start()`
- `gptimer_stop()`
- `gptimer_get_raw_count()`
- `gptimer_set_raw_count()`
- `gptimer_set_alarm_action()`

**Thread Safety** The factory function `gptimer_new_timer()` is guaranteed to be thread safe by the driver, which means, user can call it from different RTOS tasks without protection by extra locks. Other functions that take the `gptimer_handle_t` as the first positional parameter, are not thread safe. The lifecycle of the gptimer handle is maintained by the user. So user should avoid calling them concurrently. If it has to, then one should introduce another mutex to prevent the gptimer handle being accessed concurrently.

### Application Examples

Typical use cases of GPTimer are listed in the example: `peripherals/timer_group/gptimer`.

### API Reference

#### Header File

- `components/driver/include/driver/gptimer.h`

#### Functions

**esp_err_t gptimer_new_timer(const gptimer_config_t *config, gptimer_handle_t *ret_timer)**

Create a new General Purpose Timer, and return the handle.

**Note** Once a timer is created, it is placed in the stopped state and will not start until `gptimer_start()` is called.

**Return**

- ESP_OK: Create GPTimer successfully
- ESP_ERR_INVALID_ARG: Create GPTimer failed because of invalid argument
- ESP_ERR_NO_MEM: Create GPTimer failed because out of memory
- ESP_ERR_NOT_FOUND: Create GPTimer failed because all hardware timers are used up and no more free one
- ESP_FAIL: Create GPTimer failed because of other error

**Parameters**

- [in] config: GPTimer configuration
- [out] ret_timer: Returned timer handle

**esp_err_t gptimer_del_timer(gptimer_handle_t timer)**

Delete the GPTimer handle.

**Note** A timer must be in a stop state before it can be deleted.

**Return**

- ESP_OK: Delete GPTimer successfully
- ESP_ERR_INVALID_ARG: Delete GPTimer failed because of invalid argument
- ESP_ERR_INVAL_STATE: Delete GPTimer failed because the timer has not stopped
- ESP_FAIL: Delete GPTimer failed because of other error

**Parameters**

- [in] timer: Timer handle created by `gptimer_new_timer()`
**esp_err_t gptimer_set_raw_count (gptimer_handle_t timer, uint64_t value)**

Set GPTimer raw count value.

**Note** When updating the raw count of an active timer, the timer will immediately start counting from the new value.

**Note** This function is allowed to run within ISR context

**Note** This function is allowed to be executed when Cache is disabled, by enabling CONFIG_GPTIMER_CTRL_FUNC_IN_IRAM

**Return**
- ESP_OK: Set GPTimer raw count value successfully
- ESP_ERR_INVALID_ARG: Set GPTimer raw count value failed because of invalid argument
- ESP_FAIL: Set GPTimer raw count value failed because of other error

**Parameters**
- [in] timer: Timer handle created by gptimer_new_timer()
- [in] value: Count value to be set

**esp_err_t gptimer_get_raw_count (gptimer_handle_t timer, uint64_t* value)**

Get GPTimer raw count value.

**Note** With the raw count value and the resolution set in the gptimer_config_t, you can convert the count value into seconds.

**Note** This function is allowed to run within ISR context

**Note** This function is allowed to be executed when Cache is disabled, by enabling CONFIG_GPTIMER_CTRL_FUNC_IN_IRAM

**Return**
- ESP_OK: Get GPTimer raw count value successfully
- ESP_ERR_INVALID_ARG: Get GPTimer raw count value failed because of invalid argument
- ESP_FAIL: Get GPTimer raw count value failed because of other error

**Parameters**
- [in] timer: Timer handle created by gptimer_new_timer()
- [out] value: Returned GPTimer count value

**esp_err_t gptimer_register_event_callbacks (gptimer_handle_t timer, const gptimer_event_callbacks_t *cbs, void *user_data)**

Set callbacks for GPTimer.

**Note** The user registered callbacks are expected to be runnable within ISR context

**Return**
- ESP_OK: Set event callbacks successfully
- ESP_ERR_INVALID_ARG: Set event callbacks failed because of invalid argument
- ESP_FAIL: Set event callbacks failed because of other error

**Parameters**
- [in] timer: Timer handle created by gptimer_new_timer()
- [in] cbs: Group of callback functions
- [in] user_data: User data, which will be passed to callback functions directly

**esp_err_t gptimer_set_alarm_action (gptimer_handle_t timer, const gptimer_alarm_config_t *config)**

Set alarm event actions for GPTimer.

**Note** This function is allowed to run within ISR context

**Note** This function is allowed to be executed when Cache is disabled, by enabling CONFIG_GPTIMER_CTRL_FUNC_IN_IRAM

**Return**
- ESP_OK: Set alarm action for GPTimer successfully
- ESP_ERR_INVALID_ARG: Set alarm action for GPTimer failed because of invalid argument
- ESP_FAIL: Set alarm action for GPTimer failed because of other error

**Parameters**
- [in] timer: Timer handle created by gptimer_new_timer()
- [in] config: Alarm configuration, especially, set config to NULL means disabling the alarm function
**Chapter 2. API Reference**

### esp_err_t gptimer_start(gptimer_handle_t timer)

Start GPTimer.

**Note** This function is allowed to run within ISR context

**Note** This function is allowed to be executed when Cache is disabled, by enabling CONFIG_GPTIMER_CTRL_FUNC_IN_IRAM

**Return**
- ESP_OK: Start GPTimer successfully
- ESP_ERR_INVALID_ARG: Start GPTimer failed because of invalid argument
- ESP_ERR_INVALID_STATE: Start GPTimer failed because the timer is not in stop state
- ESP_FAIL: Start GPTimer failed because of other error

**Parameters**
- `[in]` timer: Timer handle created by gptimer_new_timer()

### esp_err_t gptimer_stop(gptimer_handle_t timer)

Stop GPTimer.

**Note** This function is allowed to run within ISR context

**Note** This function is allowed to be executed when Cache is disabled, by enabling CONFIG_GPTIMER_CTRL_FUNC_IN_IRAM

**Return**
- ESP_OK: Stop GPTimer successfully
- ESP_ERR_INVALID_ARG: Stop GPTimer failed because of invalid argument
- ESP_ERR_INVALID_STATE: Stop GPTimer failed because the timer is not in start state
- ESP_FAIL: Stop GPTimer failed because of other error

**Parameters**
- `[in]` timer: Timer handle created by gptimer_new_timer()

### Structures

**struct gptimer_alarm_event_data_t**

GPTimer alarm event data.

**Public Members**

- `uint64_t count_value`
  - Current count value
- `uint64_t alarm_value`
  - Current alarm value

**struct gptimer_event_callbacks_t**

Group of supported GPTimer callbacks.

**Note** The callbacks are all running under ISR environment

**Public Members**

- `gptimer_alarm_cb_t on_alarm`
  - Timer alarm callback

**struct gptimer_config_t**

General Purpose Timer configuration.

**Public Members**

- `gptimer_clock_source_t clk_src`
  - GPTimer clock source
- `gptimer_count_direction_t direction`
  - Count direction
uint32_t resolution_hz
    Counter resolution (working frequency) in Hz, hence, the step size of each count tick equals to \((1 / \text{resolution}_hz)\) seconds

uint32_t intr_shared : 1
    Set true, the timer interrupt number can be shared with other peripherals

\textbf{struct gptimer_alarm_config_t}
    General Purpose Timer alarm configuration.

\textbf{Public Members}

uint64_t alarm_count
    Alarm target count value

uint64_t reload_count
    Alarm reload count value, effect only when \text{auto\_reload\_on\_alarm} is set to true

uint32_t auto_reload_on_alarm : 1
    Reload the count value by hardware, immediately at the alarm event

\textbf{Type Definitions}

typedef struct gptimer_t *gptimer_handle_t
    Type of General Purpose Timer handle.

typedef bool (*gptimer_alarm_cb_t)(gptimer_handle_t timer, const gptimer_alarm_event_data_t *edata, void *user_ctx)
    Timer alarm callback prototype.

\textbf{Return}
    Whether a high priority task has been waken up by this function

\textbf{Parameters}

- [in] timer: Timer handle created by \text{gptimer\_new\_timer}()
- [in] edata: Alarm event data, fed by driver
- [in] user_ctx: User data, passed from \text{gptimer\_register\_event\_callbacks}()

\textbf{Header File}

- components/hal/include/hal/timer_types.h

\textbf{Enumerations}

\textbf{enum gptimer_clock_source_t}
    GPTimer clock source.

\textbf{Note}
    The clock source listed here is not supported on all targets

\textbf{Note}
    User should select the clock source based on real requirements:

<table>
<thead>
<tr>
<th>GPTimer clock source</th>
<th>Features</th>
<th>Power Management</th>
</tr>
</thead>
<tbody>
<tr>
<td>GPTIMER_CLK_SRC_APB</td>
<td>High resolution</td>
<td>ESP_PM_APB_FREQ_MAX lock</td>
</tr>
<tr>
<td>GPTIMER_CLK_SRC_XTAL</td>
<td>Medium resolution, high accuracy</td>
<td>No PM lock</td>
</tr>
</tbody>
</table>

\textbf{Values:}

- GPTIMER_CLK_SRC_APB
    Select APB as the source clock

- GPTIMER_CLK_SRC_XTAL
    Select XTAL as the source clock
Chapter 2. API Reference

2.3.4 Dedicated GPIO

Overview

The dedicated GPIO is designed for CPU interaction with GPIO matrix and IO MUX. Any GPIO that is configured as “dedicated” can be accessed by CPU instructions directly, which makes it easy to achieve a high GPIO flip speed, and simulate serial/parallel interface in a bit-banging way. As toggling a GPIO in this “CPU Dedicated” way costs few overhead, it would be great for cases like performance measurement using an oscilloscope.

Create/Destroy GPIO Bundle

A GPIO bundle is a group of GPIOs, which can be manipulated at the same time in one CPU cycle. The maximal number of GPIOs that a bundle can contain is limited by each CPU. What’s more, the GPIO bundle has a strong relevance to the CPU which it derives from. Any operations on the GPIO bundle should be put inside a task which is running on the same CPU core to the GPIO bundle belongs to. Likewise, only those ISRs who are installed on the same CPU core are allowed to do operations on that GPIO bundle.

Note: Dedicated GPIO is more of a CPU peripheral, so it has a strong relationship with CPU core. It’s highly recommended to install and operate GPIO bundle in a pin-to-core task. For example, if GPIOA is connected to CPU0, and the dedicated GPIO instruction is issued from CPU1, then it’s impossible to control GPIOA.

To install a GPIO bundle, one needs to call dedic_gpio_new_bundle() to allocate the software resources and connect the dedicated channels to user selected GPIOs. Configurations for a GPIO bundle are covered in dedic_gpio_bundle_config_t structure:

- gpio_array: An array that contains GPIO number.
- array_size: Element number of gpio_array.
- flags: Extra flags to control the behavior of GPIO Bundle.
  - in_en and out_en are used to select whether to enable the input and output function (note, they can be enabled together).
  - in_invert and out_invert are used to select whether to invert the GPIO signal.

The following code shows how to install a output only GPIO bundle:

```c
// configure GPIO
const int bundleA_gpios[] = {0, 1};
gpio_config_t io_conf = {
  .mode = GPIO_MODE_OUTPUT,
};
for (int i = 0; i < sizeof(bundleA_gpios) / sizeof(bundleA_gpios[0]); i++) {
  io_conf.pin_bit_mask = 1ULL << bundleA_gpios[i];
  gpio_config(&io_conf);
}
// Create bundleA, output only
dedic_gpio_bundle_handle_t bundleA = NULL;
dedic_gpio_bundle_config_t bundleA_config = {
  .gpio_array = bundleA_gpios,
}
```

(continues on next page)
array_size = sizeof(bundleA_gpios) / sizeof(bundleA_gpios[0]),
.flags = {
    .out_en = 1,
},
};
ESP_ERROR_CHECK(dedic_gpio_new_bundle(&bundleA_config, &bundleA));

To uninstall the GPIO bundle, one needs to call `dedic_gpio_del_bundle()`.

**Note:** `dedic_gpio_new_bundle()` doesn’t cover any GPIO pad configuration (e.g. pull up/down, drive ability, output/input enable), so before installing a dedicated GPIO bundle, you have to configure the GPIO separately using GPIO driver API (e.g. `gpio_config()`). For more information about GPIO driver, please refer to [GPIO API Reference](#).

### GPIO Bundle Operations

<table>
<thead>
<tr>
<th>Operations</th>
<th>Functions</th>
</tr>
</thead>
<tbody>
<tr>
<td>Write to GPIOs in the bundle by mask</td>
<td><code>dedic_gpio_bundle_write()</code></td>
</tr>
<tr>
<td>Read the value that input to bundle</td>
<td><code>dedic_gpio_bundle_read_out()</code></td>
</tr>
<tr>
<td>Read the value that output from bundle</td>
<td><code>dedic_gpio_bundle_read_in()</code></td>
</tr>
</tbody>
</table>

**Note:** The functions above just wrap the customized instructions defined for ESP32-S3, for the details of those instructions, please refer to [ESP32-S3 Technical Reference Manual > IO MUX and GPIO Matrix (GPIO, IO_MUX)](PDF).

### Manipulate GPIOs by Writing Assembly Code

For advanced users, they can always manipulate the GPIOs by writing assembly code or invoking CPU Low Level APIs. The usual procedure could be:

1. Allocate a GPIO bundle: `dedic_gpio_new_bundle()`
2. Query the mask occupied by that bundle: `dedic_gpio_get_out_mask()` or/and `dedic_gpio_get_in_mask()`
3. Call CPU LL apis (e.g. `cpu_ll_write_dedic_gpio_mask`) or write assembly code with that mask
4. The fastest way of toggling IO is to use the dedicated “set/clear” instructions:

<table>
<thead>
<tr>
<th>CPU Arch</th>
<th>Set bits of GPIO</th>
<th>Clear bits of GPIO</th>
<th>Remarks</th>
<th>Remarks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Xtensa</td>
<td>set_bit_gpio_out imm[7:0]</td>
<td>clr_bit_gpio_out imm[7:0]</td>
<td>immediate value width depends on the number of dedicated GPIO channels</td>
<td></td>
</tr>
<tr>
<td>RISC-V</td>
<td>csrsei rd, csr, imm[4:0]</td>
<td>csrsei rd, csr, imm[4:0]</td>
<td>can only control the lowest 4 GPIO channels</td>
<td></td>
</tr>
</tbody>
</table>

For details of supported dedicated GPIO instructions, please refer to [ESP32-S3 Technical Reference Manual > IO MUX and GPIO Matrix (GPIO, IO_MUX)](PDF). The supported dedicated CPU instructions are also wrapped inside `soc/cpu_ll.h` as helper inline functions.

**Note:** Writing assembly code in application could make your code hard to port between targets, because those customized instructions are not guaranteed to remain the same format on different targets.
Application Example

Matrix keyboard example based on dedicated GPIO: peripherals/gpio/matrix_keyboard.

API Reference

Header File

- components/driver/include/driver/dedic_gpio.h

Functions

dedicated_gpio_get_out_mask

```c
esp_err_t dedicated_gpio_get_out_mask(dedic_gpio_bundle_handle_t bundle, uint32_t* mask)
```

Get allocated channel mask.

**Return**

- ESP_OK: Get channel mask successfully
- ESP_ERR_INVALID_ARG: Get channel mask failed because of invalid argument
- ESP_FAIL: Get channel mask failed because of other error

**Note** Each bundle should have at least one mask (in or/and out), based on bundle configuration.

**Note** With the returned mask, user can directly invoke LL function like “cpu_pll_write_dedic_gpio_mask” or write assembly code with dedicated GPIO instructions, to get better performance on GPIO manipulation.

**Parameters**

- \[\text{in}\] bundle: Handle of GPIO bundle that returned from “dedic_gpio_new_bundle”
- \[\text{out}\] mask: Returned mask value for on specific direction (in or out)

dedicated_gpio_get_in_mask

```c
esp_err_t dedicated_gpio_get_in_mask(dedic_gpio_bundle_handle_t bundle, uint32_t* mask)
```

**Parameters**

- \[\text{in}\] bundle: Handle of GPIO bundle that returned from “dedic_gpio_new_bundle”
- \[\text{out}\] mask: Returned mask value for on specific direction (in or out)

dedicated_gpio_new_bundle

```c
esp_err_t dedicated_gpio_new_bundle(const dedic_gpio_bundle_config_t* config, dedic_gpio_bundle_handle_t* ret_bundle)
```

Create GPIO bundle and return the handle.

**Return**

- ESP_OK: Create GPIO bundle successfully
- ESP_ERR_INVALID_ARG: Create GPIO bundle failed because of invalid argument
- ESP_ERR_NO_MEM: Create GPIO bundle failed because of no capable memory
- ESP_ERR_NOT_FOUND: Create GPIO bundle failed because of no enough continuous dedicated channels
- ESP_FAIL: Create GPIO bundle failed because of other error

**Note** One has to enable at least input or output mode in “config” parameter.

**Parameters**

- \[\text{in}\] config: Configuration of GPIO bundle
- \[\text{out}\] ret_bundle: Returned handle of the new created GPIO bundle

dedicated_gpio_del_bundle

```c
esp_err_t dedicated_gpio_del_bundle(dedic_gpio_bundle_handle_t bundle)
```

Destory GPIO bundle.

**Return**

- ESP_OK: Destory GPIO bundle successfully
- ESP_ERR_INVALID_ARG: Destory GPIO bundle failed because of invalid argument
- ESP_FAIL: Destory GPIO bundle failed because of other error

**Parameters**

- \[\text{in}\] bundle: Handle of GPIO bundle that returned from “dedic_gpio_new_bundle”

dedicated_gpio_bundle_write

```c
void dedicated_gpio_bundle_write(dedic_gpio_bundle_handle_t bundle, uint32_t mask, uint32_t value)
```

Write value to GPIO bundle.

**Note** The mask is seen from the view of GPIO bundle. For example, bundleA contains [GPIO10, GPIO12, GPIO17], to set GPIO17 individually, the mask should be 0x04.

**Note** For performance reasons, this function doesn’t check the validity of any parameters, and is placed in IRAM.

**Parameters**

- \[\text{in}\] bundle: Handle of GPIO bundle that returned from “dedic_gpio_new_bundle”
- \[\text{out}\] mask: Mask used to write value
- \[\text{out}\] value: Value to write to GPIO bundle
Chapter 2. API Reference

- [in] bundle: Handle of GPIO bundle that returned from “dedic_gpio_new_bundle”
- [in] mask: Mask of the GPIOs to be written in the given bundle
- [in] value: Value to write to given GPIO bundle, low bit represents low member in the bundle

```c
uint32_t dedic_gpio_bundle_read_out (dedic_gpio_bundle_handle_t bundle)
```
Read the value that output from the given GPIO bundle.

**Return** Value that output from the GPIO bundle, low bit represents low member in the bundle

**Note** For performance reasons, this function doesn’t check the validity of any parameters, and is placed in IRAM.

**Parameters**
- [in] bundle: Handle of GPIO bundle that returned from “dedic_gpio_new_bundle”

```c
uint32_t dedic_gpio_bundle_read_in (dedic_gpio_bundle_handle_t bundle)
```
Read the value that input to the given GPIO bundle.

**Return** Value that input to the GPIO bundle, low bit represents low member in the bundle

**Note** For performance reasons, this function doesn’t check the validity of any parameters, and is placed in IRAM.

**Parameters**
- [in] bundle: Handle of GPIO bundle that returned from “dedic_gpio_new_bundle”

---

**Structures**

```c
struct dedic_gpio_bundle_config_t
```
Type of Dedicated GPIO bundle configuration.

**Public Members**

```c
const int *gpio_array
```
Array of GPIO numbers, gpio_array[0] ~ gpio_array[size-1] <=> low_dedic_channel_num ~ high_dedic_channel_num

```c
size_t array_size
```
Number of GPIOs in gpio_array

```c
unsigned int in_en : 1
```
Enable input

```c
unsigned int in_invert : 1
```
Invert input signal

```c
unsigned int out_en : 1
```
Enable output

```c
unsigned int out_invert : 1
```
Invert output signal

```c
struct dedic_gpio_bundle_config_t::[anonymous] flags
```
Flags to control specific behaviour of GPIO bundle

---

**Type Definitions**

```c
typedef struct dedic_gpio_bundle_t *dedic_gpio_bundle_handle_t
```
Type of Dedicated GPIO bundle.

---

### 2.3.5 Hash-based Message Authentication Code (HMAC)

The HMAC (Hash-based Message Authentication Code) module provides hardware acceleration for SHA256-HMAC generation using a key burned into an eFuse block. HMACs work with pre-shared secret keys and provide authenticity and integrity to a message.
Chapter 2. API Reference

For more detailed information on the application workflow and the HMAC calculation process, see ESP32-S3 Technical Reference Manual > HMAC Accelerator (HMAC) [PDF].

**Generalized Application Scheme**

Let there be two parties, A and B. They want to verify the authenticity and integrity of messages sent between each other. Before they can start sending messages, they need to exchange the secret key via a secure channel. To verify A’s messages, B can do the following:

- A calculates the HMAC of the message it wants to send.
- A sends the message and the HMAC to B.
- B calculates HMAC of the received message itself.
- B checks whether the received and calculated HMACs match. If they do match, the message is authentic.

However, the HMAC itself isn’t bound to this use case. It can also be used for challenge-response protocols supporting HMAC or as a key input for further security modules (see below), etc.

**HMAC on the ESP32-S3**

On the ESP32-S3, the HMAC module works with a secret key burnt into the eFuses. This eFuse key can be made completely inaccessible for any resources outside the cryptographic modules, thus avoiding key leakage.

Furthermore, the ESP32-S3 has three different application scenarios for its HMAC module:

1. HMAC is generated for software use
2. HMAC is used as a key for the Digital Signature (DS) module
3. HMAC is used for enabling the soft-disabled JTAG interface

The first mode is also called *Upstream* mode, while the last two modes are also called *Downstream* modes.

**eFuse Keys for HMAC**  Six physical eFuse blocks can be used as keys for the HMAC module: block 4 up to block 9. The enum `hmac_key_id_t` in the API maps them to `HMAC_KEY0 ... HMAC_KEY5`. Each key has a corresponding eFuse parameter `key purpose` determining for which of the three HMAC application scenarios (see below) the key may be used:

<table>
<thead>
<tr>
<th>Key Purpose</th>
<th>Application Scenario</th>
</tr>
</thead>
<tbody>
<tr>
<td>8</td>
<td>HMAC generated for software use</td>
</tr>
<tr>
<td>7</td>
<td>HMAC used as a key for the Digital Signature (DS) module</td>
</tr>
<tr>
<td>6</td>
<td>HMAC used for enabling the soft-disabled JTAG interface</td>
</tr>
<tr>
<td>5</td>
<td>HMAC both as a key for the DS module and for enabling JTAG</td>
</tr>
</tbody>
</table>

This is to prevent the usage of a key for a different function than originally intended.

To calculate an HMAC, the software has to provide the ID of the key block containing the secret key as well as the `key purpose` (see ESP32-S3 Technical Reference Manual > eFuse Controller (eFuse) [PDF]). Before the HMAC key calculation, the HMAC module looks up the purpose of the provided key block. The calculation only proceeds if the provided key purpose matches the purpose stored in the eFuses of the key block provided by the ID.

**HMAC Generation for Software**  Key Purpose value: 8

In this case, the HMAC is given out to the software (e.g. to authenticate a message).

The API to calculate the HMAC is `esp_hmac_calculate()`. Only the message, message length and the eFuse key block ID have to be provided to that function. The rest, like setting the key purpose, is done automatically.
**HMAC for Digital Signature**  Key Purpose values: 7, 5

The HMAC can be used as a key derivation function to decrypt private key parameters which are used by the Digital Signature module. A standard message is used by the hardware in that case. The user only needs to provide the eFuse key block and purpose on the HMAC side (additional parameters are required for the Digital Signature component in that case). Neither the key nor the actual HMAC are ever exposed to outside the HMAC module and DS component. The calculation of the HMAC and its hand-over to the DS component happen internally.

For more details, see *ESP32-S3 Technical Reference Manual > Digital Signature (DS)* [PDF].

**HMAC for Enabling JTAG**  Key Purpose values: 6, 5

The third application is using the HMAC as a key to enable JTAG if it was soft-disabled before. Following is the procedure to re-enable the JTAG

**Setup**

1. Generate a 256-bit HMAC secret key to use for JTAG re-enable.
2. Write the key to an eFuse block with key purpose HMAC_DOWN_ALL (5) or HMAC_DOWN_JTAG (6).
   This can be done using the ets_efuse_write_key() function in the firmware or using esfuse.py from the host.
3. Configure the eFuse key block to be read protected using the esp_efuse_set_read_protect(), so that software cannot read back the value.
4. Burn the “soft JTAG disable” bit by esp_efuse_write_field_bit(ESP_EFUSE_SOFT_DIS_JTAG). This will permanently disable JTAG unless the correct key value is provided by software.

**JTAG enable**

1. The key to re-enable JTAG is the output of the HMAC-SHA256 function using the secret key in eFuse and 32 0x00 bytes as the message.
2. Pass this key value when calling the esp_hmac_jtag_enable() function from the firmware.
3. To re-disable JTAG in the firmware, reset the system or call esp_hmac_jtag_disable().

For more details, see *ESP32-S3 Technical Reference Manual > HMAC Accelerator (HMAC)* [PDF].

**Application Outline**

Following code is an outline of how to set an eFuse key and then use it to calculate an HMAC for software usage. We use ets_efuse_write_key to set physical key block 4 in the eFuse for the HMAC module together with its purpose. ETS_EFUSE_KEY_PURPOSE_HMAC_UP (8) means that this key can only be used for HMAC generation for software usage:

```c
#include "esp32s3/rom/efuse.h"

const uint8_t key_data[32] = { ... };

int ets_status = ets_efuse_write_key(ETS_EFUSE_BLOCK_KEY4, ETS_EFUSE_KEY_PURPOSE_HMAC_UP, key_data, sizeof(key_data));

if (ets_status == ESP_OK) {
    // written key
} else {
    // writing key failed, maybe written already
}
```

Now we can use the saved key to calculate an HMAC for software usage.

```c
#include "esp_hmac.h"

uint8_t hmac[32];

const char *message = "Hello, HMAC!";
```

(continues on next page)
const size_t msg_len = 12;

esp_err_t result = esp_hmac_calculate(HMAC_KEY4, message, msg_len, hmac);

if (result == ESP_OK) {
  // HMAC written to hmac now
} else {
  // failure calculating HMAC
}

API Reference

Header File

- components/esp_hw_support/include/soc/esp32s3/esp_hmac.h

Functions

**esp_err_t esp_hmac_calculate(hmac_key_id_t key_id, const void *message, size_t message_len, uint8_t *hmac)**

Calculate the HMAC of a given message.

Calculate the HMAC hmac of a given message message with length message_len. SHA256 is used for the calculation (fixed on ESP32S3).

**Note** Uses the HMAC peripheral in “upstream” mode.

**Return**
- ESP_OK, if the calculation was successful,
- ESP_ERR_INVALID_ARG if message or hmac is a nullptr or if key_id out of range
- ESP_FAIL, if the hmac calculation failed

**Parameters**
- key_id: Determines which of the 6 key blocks in the efuses should be used for the HMAC calculation. The corresponding purpose field of the key block in the efuse must be set to the HMAC upstream purpose value.
- message: the message for which to calculate the HMAC
- message_len: message length
- [out] hmac: the hmac result; the buffer behind the provided pointer must be 32 bytes long

**esp_err_t esp_hmac_jtag_enable(hmac_key_id_t key_id, const uint8_t *token)**

Use HMAC peripheral in Downstream mode to re-enable the JTAG, if it is not permanently disabled by HW. In downstream mode, HMAC calculations performed by peripheral are used internally and not provided back to user.

**Return**
- ESP_OK, if the calculation was successful, if the calculated HMAC value matches with provided token, JTAG will be re-enable otherwise JTAG will remain disabled. Return value does not indicate the JTAG status.
- ESP_FAIL, if the hmac calculation failed or JTAG is permanently disabled by EFUSE_HARD_DIS_JTAG eFuse parameter.
- ESP_ERR_INVALID_ARG, invalid input arguments

**Parameters**
- key_id: Determines which of the 6 key blocks in the efuses should be used for the HMAC calculation. The corresponding purpose field of the key block in the efuse must be set to HMAC downstream purpose.
- token: Pre calculated HMAC value of the 32-byte 0x00 using SHA-256 and the known private HMAC key. The key is already programmed to a eFuse key block. The key block number is provided as the first parameter to this function.

**esp_err_t esp_hmac_jtag_disable(void)**

Disable the JTAG which might be enabled using the HMAC downstream mode. This function just clears the
result generated by calling esp_hmac_jtag_enable() API.

**Return**

- ESP_OK return ESP_OK after writing the HMAC_SET_INVALIDATE_JTAG_REG with value 1.

**Enumerations**

```c
enum hmac_key_id_t
{
    HMAC_KEY0 = 0,
    HMAC_KEY1,
    HMAC_KEY2,
    HMAC_KEY3,
    HMAC_KEY4,
    HMAC_KEY5,
    HMAC_KEY_MAX
};
```

**2.3.6 Digital Signature (DS)**

The Digital Signature (DS) module provides hardware acceleration of signing messages based on RSA. It uses pre-encrypted parameters to calculate a signature. The parameters are encrypted using HMAC as a key-derivation function. In turn, the HMAC uses eFuses as input key. The whole process happens in hardware so that neither the decryption key for the RSA parameters nor the input key for the HMAC key derivation function can be seen by the software while calculating the signature.

For more detailed information on the hardware involved in signature calculation and the registers used, see *ESP32-S3 Technical Reference Manual > Digital Signature (DS)* [PDF].

**Private Key Parameters**

The private key parameters for the RSA signature are stored in flash. To prevent unauthorized access, they are AES-encrypted. The HMAC module is used as a key-derivation function to calculate the AES encryption key for the private key parameters. In turn, the HMAC module uses a key from the eFuses key block which can be read-protected to prevent unauthorized access as well.

Upon signature calculation invocation, the software only specifies which eFuse key to use, the corresponding eFuse key purpose, the location of the encrypted RSA parameters and the message.

**Key Generation**

Both the HMAC key and the RSA private key have to be created and stored before the DS peripheral can be used. This needs to be done in software on the ESP32-S3 or alternatively on a host. For this context, the IDF provides esp_efuse_write_block() to set the HMAC key and esp_hmac_calculate() to encrypt the private RSA key parameters.

You can find instructions on how to calculate and assemble the private key parameters in *ESP32-S3 Technical Reference Manual > Digital Signature (DS)* [PDF].
Signature Calculation with IDF

For more detailed information on the workflow and the registers used, see ESP32-S3 Technical Reference Manual > Digital Signature (DS) [PDF].

Three parameters need to be prepared to calculate the digital signature:

1. the eFuse key block ID which is used as key for the HMAC,
2. the location of the encrypted private key parameters,
3. and the message to be signed.

Since the signature calculation takes some time, there are two possible API versions to use in IDF. The first one is esp_ds_sign() and simply blocks until the calculation is finished. If software needs to do something else during the calculation, esp_ds_start_sign() can be called, followed by periodic calls to esp_ds_is_busy() to check when the calculation has finished. Once the calculation has finished, esp_ds_finish_sign() can be called to get the resulting signature.

The APIs esp_ds_sign() and esp_ds_start_sign() calculate a plain RSA signature with help of the DS peripheral. This signature needs to be converted to appropriate format for further use. For example, MbedTLS SSL stack supports PKCS#1 format. The API esp_ds_rsa_sign() can be used to obtain the signature directly in the PKCS#1 v1.5 format. It internally uses esp_ds_start_sign() and converts the signature into PKCS#1 v1.5 format.

Note: Note that this is only the basic DS building block, the message length is fixed. To create signatures of arbitrary messages, the input is normally a hash of the actual message, padded up to the required length. An API to do this is planned in the future.

Configure the DS peripheral for a TLS connection

The DS peripheral on ESP32-S3 chip must be configured before it can be used for a TLS connection. The configuration involves the following steps -

1. Randomly generate a 256 bit value called the Initialization Vector (IV).
2. Randomly generate a 256 bit value called the HMAC_KEY.
3. Calculate the encrypted private key parameters from the client private key (RSA) and the parameters generated in the above steps.
4. Then burn the 256 bit HMAC_KEY on the efuse, which can only be read by the DS peripheral.

For more details, see ESP32-S3 Technical Reference Manual > Digital Signature (DS) [PDF].

To configure the DS peripheral for development purposes, you can use the python script configure_ds.py. More details about the configure_ds.py script can be found at mqtt example README.

The encrypted private key parameters obtained after the DS peripheral configuration are then to be kept in flash. Furthermore, they are to be passed to the DS peripheral which makes use of those parameters for the Digital Signature operation. Non Volatile Storage can be used to store the encrypted private key parameters in flash. The script configure_ds.py creates an NVS partition for the encrypted private key parameters. Then the script flashes this partition onto the ESP32-S3. The application then needs to read the DS data from NVS, which can be done with the function esp_read_ds_data_from_nvs() in file ssl_ds/main/app_main.c

The process of initializing the DS peripheral and then performing the Digital Signature operation is done internally with help of ESP-TLS. Please refer to Digital Signature with ESP-TLS in ESP-TLS for more details. As mentioned in the ESP-TLS documentation, the application only needs to provide the encrypted private key parameters to the esp_tls context (as ds_data), which internally performs all necessary operations for initializing the DS peripheral and then performing the DS operation.

Example for SSL Mutual Authentication using DS

The example ssl_ds shows how to use the DS peripheral for mutual authentication. The example uses mqtt_client (Implemented through ESP-MQTT) to connect to broker test.mosquitto.org using ssl transport with mutual authenti-
API Reference

Header File

- components/esp_hw_support/include/soc/esp32s3/esp_ds.h

Functions

**esp_err_t esp_ds_sign**(const void *message, const esp_ds_data_t *data, hmac_key_id_t key_id, void **signature)

Sign the message.

This function is a wrapper around esp_ds_finish_sign() and esp_ds_start_sign(), so do not use them in parallel. It blocks until the signing is finished and then returns the signature.

The function calculates a plain RSA signature with help of the DS peripheral. The RSA encryption operation is as follows: \( Z = XY \mod M \) where, \( Z \) is the signature, \( X \) is the input message, \( Y \) and \( M \) are the RSA private key parameters.

**Note** This function locks the HMAC, SHA, AES and RSA components during its entire execution time.

**Return**

- ESP_OK if successful, the signature was written to the parameter signature.
- ESP_ERR_INVALID_ARG if one of the parameters is NULL or data->rsa_length is too long or 0
- ESP_ERR_HW_CRYPTO_DS_HMAC_FAIL if there was an HMAC failure during retrieval of the decryption key
- ESP_ERR_NO_MEM if there hasn’t been enough memory to allocate the context object
- ESP_ERR_HW_CRYPTO_DS_INVALID_KEY if there’s a problem with passing the HMAC key to the DS component
- ESP_ERR_HW_CRYPTO_DS_INVALID_DIGEST if the message digest didn’t match; the signature is invalid.
- ESP_ERR_HW_CRYPTO_DS_INVALID_PADDING if the message padding is incorrect, the signature can be read though since the message digest matches.

**Parameters**

- message: the message to be signed; its length should be (data->rsa_length + 1)*4 bytes
- data: the encrypted signing key data (AES encrypted RSA key + IV)
- key_id: the HMAC key ID determining the HMAC key of the HMAC which will be used to decrypt the signing key data
- signature: the destination of the signature, should be (data->rsa_length + 1)*4 bytes long

**esp_err_t esp_ds_start_sign**(const void *message, const esp_ds_data_t *data, hmac_key_id_t key_id, esp_ds_context_t **esp_ds_ctx)

Start the signing process.

This function yields a context object which needs to be passed to esp_ds_finish_sign() to finish the signing process.

The function calculates a plain RSA signature with help of the DS peripheral. The RSA encryption operation is as follows: \( Z = XY \mod M \) where, \( Z \) is the signature, \( X \) is the input message, \( Y \) and \( M \) are the RSA private key parameters.

**Note** This function locks the HMAC, SHA, AES and RSA components, so the user has to ensure to call esp_ds_finish_sign() in a timely manner.

**Return**

- ESP_OK if successful, the ds operation was started now and has to be finished with esp_ds_finish_sign()
- ESP_ERR_INVALID_ARG if one of the parameters is NULL or data->rsa_length is too long or 0
- ESP_ERR_HW_CRYPTO_DS_HMAC_FAIL if there was an HMAC failure during retrieval of the decryption key
- ESP_ERR_NO_MEM if there hasn’t been enough memory to allocate the context object
- ESP_ERR_HW_CRYPTO_DS_INVALID_KEY if there’s a problem with passing the HMAC key to the DS component
Parameters

- **message**: the message to be signed; its length should be `(data->rsa_length + 1)*4` bytes
- **data**: the encrypted signing key data (AES encrypted RSA key + IV)
- **key_id**: the HMAC key ID determining the HMAC key of the HMAC which will be used to decrypt the signing key data
- **esp_ds_ctx**: the context object which is needed for finishing the signing process later

bool esp_ds_is_busy (void)

Return true if the DS peripheral is busy, otherwise false.

**Note** Only valid if `esp_ds_start_sign()` was called before.

`esp_err_t esp_ds_finish_sign (void *signature, esp_ds_context_t *esp_ds_ctx)`

Finish the signing process.

**Return**

- ESP_OK if successful, the ds operation has been finished and the result is written to `signature`.
- ESP_ERR_INVALID_ARG if one of the parameters is NULL
- ESP_ERR_HW_CRYPTO_DS_INVALID_DIGEST if the message digest didn’t match; the signature is invalid.
- ESP_ERR_HW_CRYPTO_DS_INVALID_PADDING if the message padding is incorrect, the signature can be read though since the message digest matches.

Parameters

- **signature**: the destination of the signature, should be `(data->rsa_length + 1)*4` bytes long
- **esp_ds_ctx**: the context object retrieved by `esp_ds_start_sign()`

`esp_err_t esp_ds_encrypt_params (esp_ds_data_t *data, const void *iv, const esp_ds_p_data_t *p_data, const void *key)`

Encrypt the private key parameters.

**Return**

- ESP_OK if successful, the ds operation has been finished and the result is written to `signature`.
- ESP_ERR_INVALID_ARG if one of the parameters is NULL or `p_data->rsa_length` is too long

Parameters

- **data**: Output buffer to store encrypted data, suitable for later use generating signatures. The allocated memory must be in internal memory and word aligned since it’s filled by DMA. Both is asserted at run time.
- **iv**: Pointer to 16 byte IV buffer, will be copied into ‘data’. Should be randomly generated bytes each time.
- **p_data**: Pointer to input plain text key data. The expectation is this data will be deleted after this process is done and ‘data’ is stored.
- **key**: Pointer to 32 bytes of key data. Type determined by `key_type` parameter. The expectation is the corresponding HMAC key will be stored to efuse and then permanently erased.

Structures

**struct esp_digital_signature_data**

Encrypted private key data. Recommended to store in flash in this format.

**Note** This struct has to match to one from the ROM code! This documentation is mostly taken from there.

Public Members

derived from

**esp_digital_signature_length_t rsa_length**

RSA LENGTH register parameters (number of words in RSA key & operands, minus one).

Max value 127 (for RSA 4096).

This value must match the length field encrypted and stored in ‘c’, or invalid results will be returned. (The DS peripheral will always use the value in ‘c’, not this value, so an attacker can’t alter the DS peripheral results this way, it will just truncate or extend the message and the resulting signature in software.)
Note In IDF, the enum type length is the same as of type unsigned, so they can be used interchangably. See the ROM code for the original declaration of struct ets_ds_data_t.

```c
uint8_t iv[ESP_DS_IV_LEN]
IV value used to encrypt ‘c’

uint8_t[c][ESP_DS_C_LEN]
Encrypted Digital Signature parameters. Result of AES-CBC encryption of plaintext values. Includes an encrypted message digest.
```

```c
struct esp_ds_p_data_t
Plaintext parameters used by Digital Signature.
Not used for signing with DS peripheral, but can be encrypted in-device by calling esp_ds_encrypt_params()

Note This documentation is mostly taken from the ROM code.
```

Public Members

```c
uint32_t Y[(4096)/32]
RSA exponent.

uint32_t M[(4096)/32]
RSA modulus.

uint32_t Rb[(4096)/32]
RSA r inverse operand.

uint32_t M_prime
RSA M prime operand.

```

```c
dsp_digital_signature_length_t length
RSA length.
```

Macros

```c
ESP32S3_ERR_HW_CRYPTO_DS_HMAC_FAIL
HMAC peripheral problem

ESP32S3_ERR_HW_CRYPTO_DS_INVALID_KEY
given HMAC key isn’t correct, HMAC peripheral problem

ESP32S3_ERR_HW_CRYPTO_DS_INVALID_DIGEST
message digest check failed, result is invalid

ESP32S3_ERR_HW_CRYPTO_DS_INVALID_PADDING
padding check failed, but result is produced anyway and can be read

ESP_DS_IV_LEN

ESP_DS_C_LEN
```

Type Definitions

```c
typedef struct esp_ds_context esp_ds_context_t
Encrypted private key data. Recommended to store in flash in this format.

Note This struct has to match to one from the ROM code! This documentation is mostly taken from there.
```

Enumerations

```c
enum esp_digital_signature_length_t
Values:

ESP_DS_RSA_1024 = (1024 / 32) - 1
ESP_DS_RSA_2048 = (2048 / 32) - 1
```

Submit Document Feedback
2.3.7 Inter-Integrated Circuit (I2C)

Overview

I2C is a serial, synchronous, half-duplex communication protocol that allows co-existence of multiple masters and slaves on the same bus. The I2C bus consists of two lines: serial data line (SDA) and serial clock (SCL). Both lines require pull-up resistors.

With such advantages as simplicity and low manufacturing cost, I2C is mostly used for communication of low-speed peripheral devices over short distances (within one foot).

ESP32-S3 has 2 I2C controller (also referred to as port), responsible for handling communications on the I2C bus. A single I2C controller can operate as master or slave.

Driver Features

I2C driver governs communications of devices over the I2C bus. The driver supports the following features:

• Reading and writing bytes in Master mode
• Slave mode
• Reading and writing to registers which are in turn read/written by the master

Driver Usage

The following sections describe typical steps of configuring and operating the I2C driver:

1. **Configuration** - set the initialization parameters (master or slave mode, GPIO pins for SDA and SCL, clock speed, etc.)
2. **Install Driver** - activate the driver on one of the two I2C controllers as a master or slave
3. Depending on whether you configure the driver for a master or slave, choose the appropriate item
   a) **Communication as Master** - handle communications (master)
   b) **Communication as Slave** - respond to messages from the master (slave)
4. **Interrupt Handling** - configure and service I2C interrupts
5. **Customized Configuration** - adjust default I2C communication parameters (timings, bit order, etc.)
6. **Error Handling** - how to recognize and handle driver configuration and communication errors
7. **Delete Driver** - release resources used by the I2C driver when communication ends

**Configuration** To establish I2C communication, start by configuring the driver. This is done by setting the parameters of the structure `i2c_config_t`:

• Set I2C mode of operation - slave or master from `i2c_mode_t`
• Configure communication pins
  – Assign GPIO pins for SDA and SCL signals
  – Set whether to enable ESP32-S3’s internal pull-ups
• (Master only) Set I2C clock speed
• (Slave only) Configure the following
  – Whether to enable 10 bit address mode
  – Define slave address

After that, initialize the configuration for a given I2C port. For this, call the function `i2c_param_config()` and pass to it the port number and the structure `i2c_config_t`.

Configuration example (master):

```c
i2c_config_t config;
config.i2c_mode = I2C_MASTER;
config.sda_pin = GPIO_PIN(32);
config.scl_pin = GPIO_PIN(33);
config.sda_pullup = true;
config.scl_pullup = true;
config.clock_speed = 100000;
config.address_mode = I2C_ADDRESS_7BIT;
config.address = 0b1000000;
config.is_master = true;

i2c_param_config(1, &config);
```
```c
int i2c_master_port = 0;
i2c_config_t conf = {
    .mode = I2C_MODE_MASTER,
    .sda_io_num = I2C_MASTER_SDA_IO,       // select GPIO specific to your
    .sda_pullup_en = GPIO_PULLUP_ENABLE,   // select GPIO specific to your
    .scl_io_num = I2C_MASTER_SCL_IO,       // select GPIO specific to your
    .scl_pullup_en = GPIO_PULLUP_ENABLE,   // select GPIO specific to your
    .master.clk_speed = I2C_MASTER_FREQ_HZ, // select frequency specific to your
    // .clk_flags = 0, /*!< Optional, you can use I2C_SCLK_SRC_FLAG_*/
    // flags to choose i2c source clock here. */
};
```

Configuration example (slave):

```c
int i2c_slave_port = I2C_SLAVE_NUM;
i2c_config_t conf_slave = {
    .sda_io_num = I2C_SLAVE_SDA_IO,       // select GPIO specific to your
    .sda_pullup_en = GPIO_PULLUP_ENABLE,   // select GPIO specific to your
    .scl_io_num = I2C_SLAVE_SCL_IO,       // select GPIO specific to your
    .scl_pullup_en = GPIO_PULLUP_ENABLE,   // select GPIO specific to your
    .mode = I2C_MODE_SLAVE,
    .slave.addr_10bit_en = 0,
    .slave.addr = ESP_SLAVE_ADDR,        // address of your project
};
```

At this stage, `i2c_param_config()` also sets a few other I2C configuration parameters to default values that are defined by the I2C specification. For more details on the values and how to modify them, see Customized Configuration.

Source Clock Configuration  Clock sources allocator is added for supporting different clock sources. The clock allocator will choose one clock source that meets all the requirements of frequency and capability (as requested in `i2c_config_t::clk_flags`).

When `i2c_config_t::clk_flags` is 0, the clock allocator will select only according to the desired frequency. If no special capabilities are needed, such as APB, you can configure the clock allocator to select the source clock only according to the desired frequency. For this, set `i2c_config_t::clk_flags` to 0. For clock characteristics, see the table below.

**Note:** A clock is not a valid option, if it doesn’t meet the requested capabilities, i.e. any bit of requested capabilities (clk_flags) is 0 in the clock’s capabilities.

<table>
<thead>
<tr>
<th>Clock name</th>
<th>Clock frequency</th>
<th>MAX freq for SCL</th>
<th>Clock capabilities</th>
</tr>
</thead>
<tbody>
<tr>
<td>XTAL clock</td>
<td>40 MHz</td>
<td>2 MHz</td>
<td>/</td>
</tr>
<tr>
<td>RTC clock</td>
<td>20 MHz</td>
<td>1 MHz</td>
<td>I2C_SCLK_SRC_FLAG_AWARE_DFS, I2C_SCLK_SRC_FLAG_LIGHT_SLEEP</td>
</tr>
</tbody>
</table>

Explanations for `i2c_config_t::clk_flags` are as follows:

1. **I2C_SCLK_SRC_FLAG_AWARE_DFS**: Clock’s baud rate will not change while APB clock is changing.
2. **I2C_SCLK_SRC_FLAG_LIGHT_SLEEP**: It supports Light-sleep mode, which APB clock cannot do.
3. Some flags may not be supported on ESP32-S3, reading technical reference manual before using it.

**Note**: The clock frequency of SCL in master mode should not be larger than max frequency for SCL mentioned in the table above.

### Install Driver

After the I2C driver is configured, install it by calling the function `i2c_driver_install()` with the following parameters:

- Port number, one of the two port numbers from `i2c_port_t`
- Master or slave, selected from `i2c_mode_t`
- (Slave only) Size of buffers to allocate for sending and receiving data. As I2C is a master-centric bus, data can only go from the slave to the master at the master’s request. Therefore, the slave will usually have a send buffer where the slave application writes data. The data remains in the send buffer to be read by the master at the master’s own discretion.
- Flags for allocating the interrupt (see ESP_INTR_FLAG_* values in `esp_hw_support/include/esp_intr_alloc.h`)

### Communication as Master

After installing the I2C driver, ESP32-S3 is ready to communicate with other I2C devices.

ESP32-S3’s I2C controller operating as master is responsible for establishing communication with I2C slave devices and sending commands to trigger a slave to action, for example, to take a measurement and send the readings back to the master.

For better process organization, the driver provides a container, called a “command link”, that should be populated with a sequence of commands and then passed to the I2C controller for execution.

### Master Write

The example below shows how to build a command link for an I2C master to send n bytes to a slave.

![Fig. 5: I2C command link - master write example](image)

The following describes how a command link for a “master write” is set up and what comes inside:

1. Create a command link with `i2c_cmd_link_create()`.
   Then, populate it with the series of data to be sent to the slave:
   a) **Start bit**: `i2c_master_start()`
b) **Slave address** - `i2c_master_write_byte()`. The single byte address is provided as an argument of this function call.

c) **Data** - One or more bytes as an argument of `i2c_master_write()`

d) **Stop bit** - `i2c_master_stop()`

Both functions `i2c_master_write_byte()` and `i2c_master_write()` have an additional argument specifying whether the master should ensure that it has received the ACK bit.

2. Trigger the execution of the command link by I2C controller by calling `i2c_master_cmd_begin()`. Once the execution is triggered, the command link cannot be modified.

3. After the commands are transmitted, release the resources used by the command link by calling `i2c_cmd_link_delete()`.

**Master Read** The example below shows how to build a command link for an I2C master to read \( n \) bytes from a slave.

Compared to writing data, the command link is populated in Step 4 not with `i2c_master_write(...)` functions but with `i2c_master_read_byte()` and/or `i2c_master_read()`. Also, the last read in Step 5 is configured so that the master does not provide the ACK bit.

**Indicating Write or Read** After sending a slave address (see Step 3 on both diagrams above), the master either writes or reads from the slave.

The information on what the master will actually do is hidden in the least significant bit of the slave’s address.

For this reason, the command link sent by the master to write data to the slave contains the address `(ESP_SLAVE_ADDR << 1) | I2C_MASTER_WRITE` and looks as follows:

```
i2c_master_write_byte(cmd, (ESP_SLAVE_ADDR << 1) | I2C_MASTER_WRITE, ACK_EN);
```

Likewise, the command link to read from the slave looks as follows:

```
i2c_master_write_byte(cmd, (ESP_SLAVE_ADDR << 1) | I2C_MASTER_READ, ACK_EN);
```

**Communication as Slave** After installing the I2C driver, ESP32-S3 is ready to communicate with other I2C devices.

The API provides the following functions for slaves

- `i2c_slave_read_buffer()`
Whenever the master writes data to the slave, the slave will automatically store it in the receive buffer. This allows the slave application to call the function `i2c_slave_read_buffer()` at its own discretion. This function also has a parameter to specify block time if no data is in the receive buffer. This will allow the slave application to wait with a specified timeout for data to arrive to the buffer.

- **i2c_slave_write_buffer()**
  The send buffer is used to store all the data that the slave wants to send to the master in FIFO order. The data stays there until the master requests for it. The function `i2c_slave_write_buffer()` has a parameter to specify block time if the send buffer is full. This will allow the slave application to wait with a specified timeout for the adequate amount of space to become available in the send buffer.

A code example showing how to use these functions can be found in `peripherals/i2c`.

**Interrupt Handling**  
During driver installation, an interrupt handler is installed by default.

**Customized Configuration**  
As mentioned at the end of Section *Configuration*, when the function `i2c_param_config()` initializes the driver configuration for an I2C port, it also sets several I2C communication parameters to default values defined in the *I2C specification*. Some other related parameters are pre-configured in registers of the I2C controller.

All these parameters can be changed to user-defined values by calling dedicated functions given in the table below. Please note that the timing values are defined in APB clock cycles. The frequency of APB is specified in `I2C_APB_CLK_FREQ`.

<table>
<thead>
<tr>
<th>Parameters to Change</th>
<th>Function</th>
</tr>
</thead>
<tbody>
<tr>
<td>High time and low time for SCL pulses</td>
<td><code>i2c_set_period()</code></td>
</tr>
<tr>
<td>SCL and SDA signal timing used during generation of <strong>start</strong> signals</td>
<td><code>i2c_set_start_timing()</code></td>
</tr>
<tr>
<td>SCL and SDA signal timing used during generation of <strong>stop</strong> signals</td>
<td><code>i2c_set_stop_timing()</code></td>
</tr>
<tr>
<td>Timing relationship between SCL and SDA signals when slave samples, as well as when master toggles</td>
<td><code>i2c_set_data_timing()</code></td>
</tr>
<tr>
<td>I2C timeout</td>
<td><code>i2c_set_timeout()</code></td>
</tr>
<tr>
<td>Choice between transmitting / receiving the LSB or MSB first, choose one of the modes defined in <code>i2c_trans_mode_t</code></td>
<td><code>i2c_set_data_mode()</code></td>
</tr>
</tbody>
</table>

Each of the above functions has a _get_ counterpart to check the currently set value. For example, to check the I2C timeout value, call `i2c_get_timeout()`.

To check the default parameter values which are set during the driver configuration process, please refer to the file `driver/i2c.c` and look for defines with the suffix `_DEFAULT`.

You can also select different pins for SDA and SCL signals and alter the configuration of pull-ups with the function `i2c_set_pin()`. If you want to modify already entered values, use the function `i2c_param_config()`.

**Note:** ESP32-S3’s internal pull-ups are in the range of tens of kOhm, which is, in most cases, insufficient for use as I2C pull-ups. Users are advised to use external pull-ups with values described in the *I2C specification*.

**Error Handling**  
The majority of I2C driver functions either return `ESP_OK` on successful completion or a specific error code on failure. It is a good practice to always check the returned values and implement error handling. The driver also prints out log messages that contain error details, e.g., when checking the validity of entered configuration. For details please refer to the file `driver/i2c.c` and look for defines with the suffix `_ERR_STR`.

Use dedicated interrupts to capture communication failures. For instance, if a slave stretches the clock for too long while preparing the data to send back to master, the interrupt `I2C_TIME_OUT_INT` will be triggered. For detailed information, see *Interrupt Handling*.
In case of a communication failure, you can reset the internal hardware buffers by calling the functions `i2c_reset_tx_fifo()` and `i2c_reset_rx_fifo()` for the send and receive buffers respectively.

**Delete Driver**  When the I2C communication is established with the function `i2c_driver_install()` and is not required for some substantial amount of time, the driver may be deinitialized to release allocated resources by calling `i2c_driver_delete()`.

Before calling `i2c_driver_delete()` to remove i2c driver, please make sure that all threads have stopped using the driver in any way, because this function does not guarantee thread safety.

**Application Example**

I2C master and slave example: `peripherals/i2c`.

**API Reference**

**Header File**

- `components/driver/include/driver/i2c.h`

**Functions**

- `esp_err_t i2c_driver_install(i2c_port_t i2c_num, i2c_mode_t mode, size_t slv_rx_buf_len, size_t slv_tx_buf_len, int intr_alloc_flags)`

  Install an I2C driver.

  **Note** In master mode, if the cache is likely to be disabled (such as write flash) and the slave is time-sensitive, ESP_INTR_FLAG_IRAM is suggested to be used. In this case, please use the memory allocated from internal RAM in i2c read and write function, because we cannot access the psmem (if psmem is enabled) in interrupt handle function when cache is disabled.

  **Return**

  - ESP_OK Success
  - ESP_ERR_INVALID_ARG Parameter error
  - ESP_FAIL Driver installation error

  **Parameters**

  - `i2c_num`: I2C port number
  - `mode`: I2C mode (either master or slave)
  - `slv_rx_buf_len`: Receiving buffer size. Only slave mode will use this value, it is ignored in master mode.
  - `slv_tx_buf_len`: Sending buffer size. Only slave mode will use this value, it is ignored in master mode.
  - `intr_alloc_flags`: Flags used to allocate the interrupt. One or multiple (ORred) ESP_INTR_FLAG_* values. See esp_intr_alloc.h for more info.

- `esp_err_t i2c_driver_delete(i2c_port_t i2c_num)`

  Delete I2C driver.

  **Note** This function does not guarantee thread safety. Please make sure that no thread will continuously hold semaphores before calling the delete function.

  **Return**

  - ESP_OK Success
  - ESP_ERR_INVALID_ARG Parameter error

  **Parameters**

  - `i2c_num`: I2C port to delete

- `esp_err_t i2c_param_config(i2c_port_t i2c_num, const i2c_config_t *i2c_conf)`

  Configure an I2C bus with the given configuration.

  **Return**

  - ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- i2c_num: I2C port to configure
- i2c_conf: Pointer to the I2C configuration

```c
esp_err_t i2c_reset_tx_fifo(i2c_port_t i2c_num)
```
reset I2C tx hardware fifo

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- i2c_num: I2C port number

```c
esp_err_t i2c_reset_rx_fifo(i2c_port_t i2c_num)
```
reset I2C rx fifo

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- i2c_num: I2C port number

```c
esp_err_t i2c_set_pin(i2c_port_t i2c_num, int sda_io_num, int scl_io_num, bool sda_pullup_en, bool scl_pullup_en, i2c_mode_t mode)
```
Configure GPIO pins for I2C SCK and SDA signals.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- i2c_num: I2C port number
- sda_io_num: GPIO number for I2C SDA signal
- scl_io_num: GPIO number for I2C SCL signal
- sda_pullup_en: Enable the internal pullup for SDA pin
- scl_pullup_en: Enable the internal pullup for SCL pin
- mode: I2C mode

```c
esp_err_t i2c_master_write_to_device(i2c_port_t i2c_num, uint8_t device_address, const uint8_t *write_buffer, size_t write_size, TickType_t ticks_to_wait)
```
Perform a write to a device connected to a particular I2C port. This function is a wrapper to i2c_master_start(), i2c_master_write(), i2c_master_read(), etc... It shall only be called in I2C master mode.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_FAIL Sending command error, slave hasn’t ACK the transfer.
- ESP_ERR_INVALID_STATE I2C driver not installed or not in master mode.
- ESP_ERR_TIMEOUT Operation timeout because the bus is busy.

**Parameters**
- i2c_num: I2C port number to perform the transfer on
- device_address: I2C device’s 7-bit address
- write_buffer: Bytes to send on the bus
- write_size: Size, in bytes, of the write buffer
- ticks_to_wait: Maximum ticks to wait before issuing a timeout.

```c
esp_err_t i2c_master_read_from_device(i2c_port_t i2c_num, uint8_t device_address, uint8_t *read_buffer, size_t read_size, TickType_t ticks_to_wait)
```
Perform a read to a device connected to a particular I2C port. This function is a wrapper to
i2c_master_start(), i2c_master_write(), i2c_master_read(), etc... It shall only be called in I2C master mode.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_FAIL Sending command error, slave hasn’t ACK the transfer.
- ESP_ERR_INVALID_STATE I2C driver not installed or not in master mode.
- ESP_ERR_TIMEOUT Operation timeout because the bus is busy.

**Parameters**
- i2c_num: I2C port number to perform the transfer on
- device_address: I2C device’s 7-bit address
- read_buffer: Buffer to store the bytes received on the bus
- read_size: Size, in bytes, of the read buffer
- ticks_to_wait: Maximum ticks to wait before issuing a timeout.

```c
esp_err_t i2c_master_write_read_device(i2c_port_t i2c_num, uint8_t device_address, const uint8_t *write_buffer, size_t write_size, uint8_t *read_buffer, size_t read_size, TickType_t ticks_to_wait)
```

Perform a write followed by a read to a device on the I2C bus. A repeated start signal is used between the write and read, thus, the bus is not released until the two transactions are finished. This function is a wrapper to i2c_master_start(), i2c_master_write(), i2c_master_read(), etc... It shall only be called in I2C master mode.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_FAIL Sending command error, slave hasn’t ACK the transfer.
- ESP_ERR_INVALID_STATE I2C driver not installed or not in master mode.
- ESP_ERR_TIMEOUT Operation timeout because the bus is busy.

**Parameters**
- i2c_num: I2C port number to perform the transfer on
- device_address: I2C device’s 7-bit address
- write_buffer: Bytes to send on the bus
- write_size: Size, in bytes, of the write buffer
- read_buffer: Buffer to store the bytes received on the bus
- read_size: Size, in bytes, of the read buffer
- ticks_to_wait: Maximum ticks to wait before issuing a timeout.

```c
i2c_cmd_handle_t i2c_cmd_link_create_static(uint8_t *buffer, uint32_t size)
```

Create and initialize an I2C commands list with a given buffer. All the allocations for data or signals (START, STOP, ACK, ...) will be performed within this buffer. This buffer must be valid during the whole transaction. After finishing the I2C transactions, it is required to call i2c_cmd_link_delete_static().

**Note** It is highly advised to not allocate this buffer on the stack. The size of the data used underneath may increase in the future, resulting in a possible stack overflow as the macro I2C_LINK_RECOMMENDED_SIZE would also return a bigger value. A better option is to use a buffer allocated statically or dynamically (with malloc).

**Return** Handle to the I2C command link or NULL if the buffer provided is too small, please use I2C_LINK_RECOMMENDED_SIZE macro to get the recommended size for the buffer.

**Parameters**
- buffer: Buffer to use for commands allocations
- size: Size in bytes of the buffer

```c
i2c_cmd_handle_t i2c_cmd_link_create(void)
```

Create and initialize an I2C commands list with a given buffer. After finishing the I2C transactions, it is required to call i2c_cmd_link_delete() to release and return the resources. The required bytes will be dynamically allocated.

**Return** Handle to the I2C command link or NULL in case of insufficient dynamic memory.
void i2c_cmd_link_delete_static(i2c_cmd_handle_t cmd_handle)
Free the I2C commands list allocated statically with i2c_cmd_link_create_static.

Parameters
- cmd_handle: I2C commands list allocated statically. This handle should be created thanks to
  i2c_cmd_link_create_static() function

void i2c_cmd_link_delete(i2c_cmd_handle_t cmd_handle)
Free the I2C commands list.

Parameters
- cmd_handle: I2C commands list. This handle should be created thanks to
  i2c_cmd_link_create() function

esp_err_t i2c_master_start(i2c_cmd_handle_t cmd_handle)
Queue a “START signal” to the given commands list. This function shall only be called in I2C master mode.
Call i2c_master_cmd_begin() to send all the queued commands.

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NO_MEM The static buffer used to create cmd_handler is too small
- ESP_FAIL No more memory left on the heap

Parameters
- cmd_handle: I2C commands list

esp_err_t i2c_master_write_byte(i2c_cmd_handle_t cmd_handle, uint8_t data, bool ack_en)
Queue a “write byte” command to the commands list. A single byte will be sent on the I2C port. This function shall only be called in I2C master mode. Call i2c_master_cmd_begin() to send all queued commands.

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NO_MEM The static buffer used to create cmd_handler is too small
- ESP_FAIL No more memory left on the heap

Parameters
- cmd_handle: I2C commands list
- data: Byte to send on the port
- ack_en: Enable ACK signal

esp_err_t i2c_master_write(i2c_cmd_handle_t cmd_handle, const uint8_t *data, size_t data_len, bool ack_en)
Queue a “write (multiple) bytes” command to the commands list. This function shall only be called in I2C master mode. Call i2c_master_cmd_begin() to send all queued commands.

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NO_MEM The static buffer used to create cmd_handler is too small
- ESP_FAIL No more memory left on the heap

Parameters
- cmd_handle: I2C commands list
- data: Bytes to send. This buffer shall remain valid until the transaction is finished. If the PSRAM is enabled and intr_flag is set to ESP_INTR_FLAG_IRAM, data should be allocated from internal RAM.
- data_len: Length, in bytes, of the data buffer
- ack_en: Enable ACK signal

esp_err_t i2c_master_read_byte(i2c_cmd_handle_t cmd_handle, uint8_t *data, i2c_ack_type_t ack)
Queue a “read byte” command to the commands list. A single byte will be read on the I2C bus. This function shall only be called in I2C master mode. Call i2c_master_cmd_begin() to send all queued commands.

Return
- ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error
• ESP_ERR_NO_MEM The static buffer used to create cmd_handler is too small
• ESP_FAIL No more memory left on the heap

Parameters
• cmd_handle: I2C commands list
• data: Pointer where the received byte will be stored. This buffer shall remain valid until the transaction is finished.
• ack: ACK signal

`esp_err_t i2c_master_read(i2c_cmd_handle_t cmd_handle, uint8_t *data, size_t data_len, i2c_ack_type_t ack)`

Queue a “read (multiple) bytes” command to the commands list. Multiple bytes will be read on the I2C bus. This function shall only be called in I2C master mode. Call `i2c_master_cmd_begin()` to send all queued commands.

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error
• ESP_ERR_NO_MEM The static buffer used to create cmd_handler is too small
• ESP_FAIL No more memory left on the heap

Parameters
• cmd_handle: I2C commands list
• data: Pointer where the received bytes will be stored. This buffer shall remain valid until the transaction is finished.
• data_len: Size, in bytes, of the data buffer
• ack: ACK signal

`esp_err_t i2c_master_stop(i2c_cmd_handle_t cmd_handle)`

Queue a “STOP signal” to the given commands list. This function shall only be called in I2C master mode. Call `i2c_master_cmd_begin()` to send all the queued commands.

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error
• ESP_ERR_NO_MEM The static buffer used to create cmd_handler is too small
• ESP_FAIL No more memory left on the heap

Parameters
• cmd_handle: I2C commands list

`esp_err_t i2c_master_cmd_begin(i2c_port_t i2c_num, i2c_cmd_handle_t cmd_handle, TickType_t ticks_to_wait)`

Send all the queued commands on the I2C bus, in master mode. The task will be blocked until all the commands have been sent out. The I2C APIs are not thread-safe, if you want to use one I2C port in different tasks, you need to take care of the multi-thread issue. This function shall only be called in I2C master mode.

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error
• ESP_FAIL Sending command error, slave hasn’t ACK the transfer.
• ESP_ERR_INVALID_STATE I2C driver not installed or not in master mode.
• ESP_ERR_TIMEOUT Operation timeout because the bus is busy.

Parameters
• i2c_num: I2C port number
• cmd_handle: I2C commands list
• ticks_to_wait: Maximum ticks to wait before issuing a timeout.

`int i2c_slave_write_buffer(i2c_port_t i2c_num, const uint8_t *data, int size, TickType_t ticks_to_wait)`

Write bytes to internal ringbuffer of the I2C slave data. When the TX fifo empty, the ISR will fill the hardware FIFO with the internal ringbuffer’s data.

Note This function shall only be called in I2C slave mode.

Return
• ESP_FAIL (-1) Parameter error
• Other (>=0) The number of data bytes pushed to the I2C slave buffer.

Parameters
• i2c_num: I2C port number
• data: Bytes to write into internal buffer
• size: Size, in bytes, of data buffer
• ticks_to_wait: Maximum ticks to wait.

int i2c_slave_read_buffer (i2c_port_t i2c_num, uint8_t *data, size_t max_size, TickType_t ticks_to_wait)

Read bytes from I2C internal buffer. When the I2C bus receives data, the ISR will copy them from the hardware RX FIFO to the internal ringbuffer. Calling this function will then copy bytes from the internal ringbuffer to the data user buffer.

Note This function shall only be called in I2C slave mode.

Return
• ESP_FAIL (-1) Parameter error
• Others (>=0) The number of data bytes read from I2C slave buffer.

Parameters
• i2c_num: I2C port number
• data: Buffer to fill with ringbuffer’s bytes
• max_size: Maximum bytes to read
• ticks_to_wait: Maximum waiting ticks

esp_err_t i2c_set_period (i2c_port_t i2c_num, int high_period, int low_period)
Set I2C master clock period.

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

Parameters
• i2c_num: I2C port number
• high_period: Clock cycle number during SCL is high level, high_period is a 14 bit value
• low_period: Clock cycle number during SCL is low level, low_period is a 14 bit value

esp_err_t i2c_get_period (i2c_port_t i2c_num, int *high_period, int *low_period)
Get I2C master clock period.

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

Parameters
• i2c_num: I2C port number
• high_period: pointer to get clock cycle number during SCL is high level, will get a 14 bit value
• low_period: pointer to get clock cycle number during SCL is low level, will get a 14 bit value

esp_err_t i2c_filter_enable (i2c_port_t i2c_num, uint8_t cyc_num)
Enable hardware filter on I2C bus Sometimes the I2C bus is disturbed by high frequency noise (about 20ns), or the rising edge of the SCL clock is very slow, these may cause the master state machine to break. Enable hardware filter can filter out high frequency interference and make the master more stable.

Note Enable filter will slow down the SCL clock.

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

Parameters
• i2c_num: I2C port number to filter
• cyc_num: the APB cycles need to be filtered (0<= cyc_num <=7). When the period of a pulse is less than cyc_num * APB_cycle, the I2C controller will ignore this pulse.

esp_err_t i2c_filter_disable (i2c_port_t i2c_num)
Disable filter on I2C bus.
Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

Parameters
• i2c_num: I2C port number

`esp_err_t i2c_set_start_timing(i2c_port_t i2c_num, int setup_time, int hold_time)`
set I2C master start signal timing

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

Parameters
• i2c_num: I2C port number
• setup_time: clock number between the falling-edge of SDA and rising-edge of SCL for start mark, it’s a 10-bit value.
• hold_time: clock number between the falling-edge of SDA and falling-edge of SCL for start mark, it’s a 10-bit value.

`esp_err_t i2c_get_start_timing(i2c_port_t i2c_num, int *setup_time, int *hold_time)`
get I2C master start signal timing

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

Parameters
• i2c_num: I2C port number
• setup_time: pointer to get setup time
• hold_time: pointer to get hold time

`esp_err_t i2c_set_stop_timing(i2c_port_t i2c_num, int setup_time, int hold_time)`
set I2C master stop signal timing

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

Parameters
• i2c_num: I2C port number
• setup_time: clock number between the rising-edge of SCL and the rising-edge of SDA, it’s a 10-bit value.
• hold_time: clock number after the STOP bit’s rising-edge, it’s a 14-bit value.

`esp_err_t i2c_get_stop_timing(i2c_port_t i2c_num, int *setup_time, int *hold_time)`
get I2C master stop signal timing

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

Parameters
• i2c_num: I2C port number
• setup_time: pointer to get setup time.
• hold_time: pointer to get hold time.

`esp_err_t i2c_set_data_timing(i2c_port_t i2c_num, int sample_time, int hold_time)`
set I2C data signal timing

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

Parameters
• i2c_num: I2C port number
• sample_time: clock number I2C used to sample data on SDA after the rising-edge of SCL, it’s a 10-bit value.
• hold_time: clock number I2C used to hold the data after the falling-edge of SCL, it’s a 10-bit value

```c
esp_err_t i2c_get_data_timing(i2c_port_t i2c_num, int *sample_time, int *hold_time)
```

get I2C data signal timing

Return

• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

Parameters

• i2c_num: I2C port number
• sample_time: pointer to get sample time
• hold_time: pointer to get hold time

```c
esp_err_t i2c_set_timeout(i2c_port_t i2c_num, int timeout)
```

set I2C timeout value

Return

• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

Parameters

• i2c_num: I2C port number
• timeout: timeout value for I2C bus (unit: APB 80Mhz clock cycle)

```c
esp_err_t i2c_get_timeout(i2c_port_t i2c_num, int *timeout)
```

get I2C timeout value

Return

• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

Parameters

• i2c_num: I2C port number
• timeout: pointer to get timeout value

```c
esp_err_t i2c_set_data_mode(i2c_port_t i2c_num, i2c_trans_mode_t tx_trans_mode, i2c_trans_mode_t rx_trans_mode)
```

set I2C data transfer mode

Return

• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

Parameters

• i2c_num: I2C port number
• tx_trans_mode: I2C sending data mode
• rx_trans_mode: I2C receiving data mode

```c
esp_err_t i2c_get_data_mode(i2c_port_t i2c_num, i2c_trans_mode_t *tx_trans_mode, i2c_trans_mode_t *rx_trans_mode)
```

get I2C data transfer mode

Return

• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

Parameters

• i2c_num: I2C port number
• tx_trans_mode: pointer to get I2C sending data mode
• rx_trans_mode: pointer to get I2C receiving data mode

Structures

```c
struct i2c_config_t
```

I2C initialization parameters.

### i2c_mode_t mode
I2C mode

### int sda_io_num
GPIO number for I2C sda signal

### int scl_io_num
GPIO number for I2C scl signal

### bool sda_pullup_en
Internal GPIO pull mode for I2C sda signal

### bool scl_pullup_en
Internal GPIO pull mode for I2C scl signal

### uint32_t clk_speed
I2C clock frequency for master mode, (no higher than 1MHz for now)

### struct i2c_config_t :: [anonymous] :: [anonymous] master
I2C master config

### uint8_t addr_10bit_en
I2C 10bit address mode enable for slave mode

### uint16_t slave_addr
I2C address for slave mode

### uint32_t maximum_speed
I2C expected clock speed from SCL.

### struct i2c_config_t :: [anonymous] :: [anonymous] slave
I2C slave config

### uint32_t clk_flags
Bitwise of **I2C_SCLK_SRC_FLAG_**FOR_DFS** for clk source choice

## Macros

### I2C_APB_CLK_FREQ
I2C source clock is APB clock, 80MHz

### I2C_NUM_MAX
I2C port max

### I2C_NUM_0
I2C port 0

### I2C_NUM_1
I2C port 1

### I2C_SCLK_SRC_FLAG_FOR_NOMAL
Any one clock source that is available for the specified frequency may be choosen

### I2C_SCLK_SRC_FLAG_AWARE_DFS
For REF tick clock, it won’t change with APB.

### I2C_SCLK_SRC_FLAG_LIGHT_SLEEP
For light sleep mode.

### I2C_INTERNAL_STRUCT_SIZE
Minimum size, in bytes, of the internal private structure used to describe I2C commands link.

### I2C_LINK_RECOMMENDED_SIZE (TRANSACTIONS)
The following macro is used to determine the recommended size of the buffer to pass to i2c_cmd_link_create_static() function. It requires one parameter, TRANSACTIONS, describing the number of transactions intended to be performed on the I2C port. For example, if one wants
to perform a read on an I2C device register, **TRANSACTIONS** must be at least 2, because the commands required are the following:

- write device register
- read register content

Signals such as "(repeated) start", "stop", "nack", "ack" shall not be counted.

**Type Definitions**

```c
typedef void *i2c_cmd_handle_t
I2C command handle
```

**Header File**

- components/hal/include/hal/i2c_types.h

**Macros**

`I2C_CLK_FREQ_MAX`
Use the highest speed that is available for the clock source picked by clk_flags.

**Type Definitions**

```c
typedef int i2c_port_t
I2C port number, can be I2C_NUM_0 ~ (I2C_NUM_MAX-1).
```

**Enumerations**

```c
def type i2c_mode_t
Values:

I2C_MODE_SLAVE = 0
I2C slave mode

I2C_MODE_MASTER
I2C master mode

I2C_MODE_MAX
```

```c
def type i2c_rw_t
Values:

I2C_MASTER_WRITE = 0
I2C write data

I2C_MASTER_READ
I2C read data
```

```c
def type i2c_trans_mode_t
Values:

I2C_DATA_MODE_MSB_FIRST = 0
I2C data msb first

I2C_DATA_MODE_LSB_FIRST = 1
I2C data lsb first

I2C_DATA_MODE_MAX
```

```c
def type i2c_addr_mode_t
Values:

I2C_ADDR_BIT_7 = 0
I2C 7bit address for slave mode
```
Chapter 2. API Reference

`I2C_ADDR_BIT_10`
I2C 10bit address for slave mode

`I2C_ADDR_BIT_MAX`

`enum i2c_ack_type_t`
Values:
- `I2C_MASTER_ACK = 0x0`
  I2C ack for each byte read
- `I2C_MASTER_NACK = 0x1`
  I2C nack for each byte read
- `I2C_MASTER_LAST_NACK = 0x2`
  I2C nack for the last byte

`I2C_MASTER_ACK_MAX`

`enum i2c_sclk_t`
I2C clock source, sorting from smallest to largest, place them in order. This can be expanded in the future use.
Values:
- `I2C_SCLK_DEFAULT = 0`
  I2C source clock not selected
- `I2C_SCLK_XTAL`
  I2C source clock from XTAL, 40M
- `I2C_SCLK_RTC`
  I2C source clock from 8M RTC, 8M
- `I2C_SCLK_MAX`

2.3.8 Inter-IC Sound (I2S)

**Overview**

I2S (Inter-IC Sound) is a serial, synchronous communication protocol that is usually used for transmitting audio data between two digital audio devices.

ESP32-S3 contains two I2S peripheral(s). These peripherals can be configured to input and output sample data via the I2S driver.

An I2S bus consists of the following lines:
- Master clock line (operational)
- Bit clock line
- Channel select line
- Serial data line

Each I2S controller has the following features that can be configured using the I2S driver:
- Operation as system master or slave
- Capable of acting as transmitter or receiver
- DMA controller that allows for streaming sample data without requiring the CPU to copy each data sample

Each controller can operate in half-duplex communication mode. Thus, the two controllers can be combined to establish full-duplex communication.

**Functional Overview**

**Installing the Driver** Install the I2S driver by calling the function `i2s_driver_install` and passing the following arguments:
Chapter 2. API Reference

- Port number
- The structure `i2s_config_t` with defined communication parameters
- Event queue size and handle

Once `cpp:func`i2s_driver_install` returns `ESP_OK`, it means I2S has started.

Configuration example:

```c
static const int i2s_num = 0; // i2s port number

i2s_config_t i2s_config = {
    .mode = I2S_MODE_MASTER | I2S_MODE_TX,
    .sample_rate = 44100,
    .bits_per_sample = I2S_BITS_PER_SAMPLE_16BIT,
    .channel_format = I2S_CHANNEL_FMT_RIGHT_LEFT,
    .communication_format = I2S_COMM_FORMAT_STAND_I2S,
    .tx_desc_auto_clear = false,
    .dma_desc_num = 8,
    .dma_frame_num = 64,
    .bits_per_chan = I2S_BITS_PER_SAMPLE_16BIT
};

i2s_driver_install(I2S_NUM, &i2s_config, 0, NULL);
```

**Setting Communication Pins** Once the driver is installed, configure physical GPIO pins to which signals will be routed. For this, call the function `cpp:func`i2s_set_pin` and pass the following arguments to it:

- Port number
- The structure `i2s_pin_config_t` defining the GPIO pin numbers to which the driver should route the MCK, BCK, WS, DATA out, and DATA in signals. If you want to keep a currently allocated pin number for a specific signal, or if this signal is unused, then pass the macro `I2S_PIN_NO_CHANGE`. See the example below.

**Note:** MCK only takes effect in `I2S_MODE_MASTER` mode.

```c
static const i2s_pin_config_t pin_config = {
    .mck_io_num = 0,
    .bck_io_num = 4,
    .ws_io_num = 5,
    .data_out_num = 18,
    .data_in_num = I2S_PIN_NO_CHANGE
};

i2s_set_pin(i2s_num, &pin_config);
```

**Running I2S Communication** To perform a transmission:

- Prepare the data for sending
- Call the function `i2s_write()` and pass the data buffer address and data length to it

The function will write the data to the DMA Tx buffer, and then the data will be transmitted automatically.

```c
i2s_write(I2S_NUM, samples_data, ((bits+8)/16)*SAMPLE_PER_CYCLE*4, &i2s_bytes_write, 100);
```

To retrieve received data, use the function `i2s_read()`. It will retrieve the data from the DMA Rx buffer, once the data is received by the I2S controller.

```c
i2s_read(I2S_NUM, data_recv, ((bits+8)/16)*SAMPLE_PER_CYCLE*4, &i2s_bytes_read, 100);
```
You can temporarily stop the I2S driver by calling the function `i2s_stop()`, which will disable the I2S Tx/Rx units until the function `i2s_start()` is called. If the function `cpp:func`i2s_driver_install` is used, the driver will start up automatically eliminating the need to call `i2s_start()`.

**Deleting the Driver** If the established communication is no longer required, the driver can be removed to free allocated resources by calling `i2s_driver_uninstall()`.

**Application Example**

A code example for the I2S driver can be found in the directory `peripherals/i2s`.

In addition, there is a short configuration examples for the I2S driver.

**I2S configuration** Example for general usage.

```c
#include "driver/i2s.h"

static const int i2s_num = 0; // I2S port number
static const i2s_config_t i2s_config = {
    .mode = I2S_MODE_MASTER | I2S_MODE_TX,
    .sample_rate = 44100,
    .bits_per_sample = I2S_BITS_PER_SAMPLE_16BIT,
    .channel_format = I2S_CHANNEL_FMT_RIGHT_LEFT,
    .communication_format = I2S_COMM_FORMAT_STAND_I2S
    .tx_desc_auto_clear = false,
    .dma_desc_num = 8,
    .dma_frame_num = 64
};

static const i2s_pin_config_t pin_config = {
    .bck_io_num = 4,
    .ws_io_num = 5,
    .data_out_num = 18,
    .data_in_num = I2S_PIN_NO_CHANGE
};
i2s_driver_install(i2s_num, &i2s_config, 0, NULL); // install and start i2s driver
i2s_set_pin(i2s_num, &pin_config);
...
// You can reset parameters by calling 'i2s_set_clk'
/*
 * The low 16 bits are the valid data bits in one chan and the high 16 bits are
 * the total bits in one chan. If high 16 bits is smaller than low 16 bits, it will
 * be set to a same value as low 16 bits.
 */
static const uint32_t bits_cfg = (I2S_BITS_PER_CHAN_32BIT << 16) | I2S_BITS_PER_SAMPLE_16BIT;
i2s_set_clk(i2s_num, 22050, bits_cfg, I2S_CHANNEL_STEREO);
...
i2s_driver_uninstall(i2s_num); // stop & destroy i2s driver
```

I2S on ESP32-S3 support TDM mode, up to 16 channels are available in TDM mode. If you want to use TDM mode, set field `channel_format` of `i2s_config_t` to `I2S_CHANNEL_FMT_MULTIPLE`. Then enable the channels by setting `chan_mask` using masks in `i2s_channel_t`, the number of active channels and total channels will be calculate automatically. Also you can set a particular total channel number for it, but it shouldn’t be smaller than the largest channel you use.
If active channels are discrete, the inactive channels within total channels will be filled by a constant automatically. But if `skip_msk` is enabled, these inactive channels will be skiped.

```c
#include "driver/i2s.h"

static const int i2s_num = 0; // i2s port number

i2s_config_t i2s_config = {
    .mode = I2S_MODE_MASTER | I2S_MODE_TX,
    .sample_rate = 44100,
    .bits_per_sample = I2S_BITS_PER_SAMPLE_16BIT,
    .channel_format = I2S_CHANNEL_FMT_RIGHT_LEFT,
    .communication_format = I2S_COMM_FORMAT_STAND_I2S
    .tx_desc_auto_clear = false,
    .dma_desc_num = 8,
    .dma_frame_num = 64,
    .chan_mask = I2S_TDM_ACTIVE_CH0 | I2S_TDM_ACTIVE_CH2
};

static const i2s_pin_config_t pin_config = {
    .bck_io_num = 4,
    .ws_io_num = 5,
    .data_out_num = 18,
    .data_in_num = I2S_PIN_NO_CHANGE
};

i2s_driver_install(i2s_num, &i2s_config, 0, NULL); //install and start i2s driver
i2s_set_pin(i2s_num, &pin_config);

... /* You can reset parameters by calling 'i2s_set_clk' */
  /* The low 16 bits are the valid data bits in one chan and the high 16 bits are
  * the total bits in one chan. If high 16 bits is smaller than low 16 bits, it will
  * be set to a same value as low 16 bits.
  */

uint32_t bits_cfg = (I2S_BITS_PER_CHAN_32BIT << 16) | I2S_BITS_PER_SAMPLE_16BIT;
i2s_set_clk(i2s_port_t i2s_num, 22050, bits_cfg, I2S_TDM_ACTIVE_CH0 | I2S_TDM_ACTIVE_CH1); // set clock
...

i2s_driver_uninstall(i2s_num); //stop & destroy i2s driver
```

**Application Notes** If you are using a high sample rate like more than 48 kHz or see the data being lost, the following information might help.

Considering different applications have different requirements, `dma_desc_num` and `dma_frame_num` are made public. Here is the detailed explanation to these two fields:

- **`dma_desc_num`**: The total number of descriptors used by I2S DMA to receive/transmit data. A descriptor includes some information such as buffer address, the address of the next descriptor, and the buffer length. Since one descriptor points to one buffer, therefore, `dma_desc_num` can be interpreted as the total number of DMA buffers used to store data from DMA interrupt. Notice that these buffers are internal to `i2s_read()` and descriptors are created automatically inside of the I2S driver. Users only need to set the buffer number while the length is derived from the parameter described below.

- **`dma_frame_num`**: The number of frames for one-time sampling. The frame here means the total data from all the channels in one WS cycle. For example, if two channels in stereo mode (i.e., `channel_format` is set to `I2S_CHANNEL_FMT_RIGHT_LEFT`) are active, and each channel transfers 32 bits (i.e., `bits_per_sample` is set to `I2S_BITS_PER_CHAN_32BIT`), then the total number of bytes of a frame is `channel_format * bits_per_sample = 2 * 32 / 8 = 8` bytes. For example, we assume that the current `dma_frame_num` is 100, then the length of the DMA buffer is `8 * 100 = 800` bytes. Note
that the length of an internal DMA buffer shouldn’t be greater than 4092.

When the data received by DMA reach the size of internal DMA buffer, a receive interrupt is triggered, and an internal message queue will transport this buffer to `i2s_read()`. The main task of `i2s_read()` is to copy the data in the internal DMA buffer into the user given buffer. Since the internal DMA buffer is usually not equal to the user given buffer size, there are two cases:

- If the size of internal DMA buffers is smaller than the user given buffer size, `i2s_read()` will consume several internal DMA buffers to fill up the user given buffer. If the message queue of DMA buffer is not long enough, `i2s_read()` will be blocked on receive message queue until getting enough data. You can estimate the time `i2s_read()` function is blocked by the formula block_time (sec) = (given_buffer_size) / (sample_rate * channel_num * channel_bytes). If we place `i2s_read()` in a while together with other functions we should also consider the time the loop execution is blocked by the other functions before `i2s_read()` is executed again. It is not allowed to exceed the max_wait_time (sec) = ((dma_desc_num - 1) * dma_buffer_size) / (sample_rate), otherwise the internal message queue will overflow and in consequence some data will be lost.

- If the DMA buffer size is greater than the user given buffer size, it means `i2s_read()` would need to be called in a loop several times to take all the data, the max_wait_time may be exceeded, and the message queue overflow is likely to happen. Therefore it is quite risky to use a small user buffer for data receiving.

Here are a couple of tips when the sample rate is high:

1. Increasing `dma_frame_num` can help to reduce the I2S DMA interrupt frequency;
2. Increasing `dma_desc_num` can help to allow a longer max_wait_time to be spent by the other functions in the loop containing `i2s_read();`

   ```c
   while (1) {
      ... // Other operations (e.g. Waiting on a semaphore)
      i2s_read(I2S_NUM, user_given_buffer, user_given_buffer_size, &i2s_bytes_read, 100);
      ... // Other operations (e.g. Sending the data to another thread...
      // Avoid any data processing here.)
   }
   ```

3. Increasing the size of the buffer internal to `i2s_read()` can help to increase the max_wait_time. When you process I2S data (like storing the data to an SD card) in another thread, the time spent in processing thread for one loop should not exceed the max_wait_time otherwise some data will be lost. So if the processing of the received data received is rather slow, please allow `i2s_read()` a big internal buffer for storing the read data;
4. Allocating at least two user given buffers can improve the data receipt efficiency. One buffer can continue to receive data while the other one is under processing. But we have to guarantee the buffer that is going to read data is not under processing in the other thread. We can use a semaphore or another lock to avoid overwriting the data in the buffer while it is still under processing:

   ```c
   uint8_t **user_given_buffers = (uint8_t **)calloc(buffer_num, sizeof(uint8_t *));
   // Don’t forget to check if user_given_buffers is NULL here
   for (int i = 0; i < buffer_num; i++) {
      user_given_buffers[i] = (uint8_t *)calloc(user_given_buffer_size, sizeof(uint8_t *));
      // Don’t forget to check if user_given_buffers[i] is NULL here
   }
   int cnt = 0;
   while (1) {
      ... // Other operations (e.g. Waiting on a semaphore)
      i2s_read(I2S_NUM, user_given_buffer[cnt], user_given_buffer_size, &i2s_bytes_read, 100);
      ... // Other operations (e.g. Sending the data to another thread...
      // Avoid any data processing here.)
      cnt++;
      cnt %= buffer_num;
   }
   ```
5. Increasing the priority of the thread that contains `i2s_read()` can help the data in the message queue to be taken more timely.

To check whether there are data lost, you can offer an event queue handler to the driver during installation:

```c
QueueHandle_t evt_que;
i2s_driver_install(i2s_num, &i2s_config, 10, &evt_que);
```

You will receive `I2S_EVENT_RX_Q_OVF` event when there are data lost.

### API Reference

#### Header File

- components/driver/include/driver/i2s.h

#### Functions

**esp_err_t i2s_set_pin(i2s_port_t i2s_num, const i2s_pin_config_t *pin)**

Set I2S pin number.

Inside the pin configuration structure, set I2S_PIN_NO_CHANGE for any pin where the current configuration should not be changed.

**Note** The I2S peripheral output signals can be connected to multiple GPIO pads. However, the I2S peripheral input signal can only be connected to one GPIO pad.

**Parameters**

- `i2s_num`: I2S port number
- `pin`: I2S Pin structure, or NULL to set 2-channel 8-bit internal DAC pin configuration (GPIO25 & GPIO26)

**Note** if `*pin` is set as NULL, this function will initialize both of the built-in DAC channels by default. if you don’t want this to happen and you want to initialize only one of the DAC channels, you can call `i2s_set_dac_mode` instead.

**Return**

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_FAIL IO error

**esp_err_t i2s_set_pdm_rx_down_sample(i2s_port_t i2s_num, i2s_pdm_dsr_t downsampling)**

Set PDM mode down-sample rate In PDM RX mode, there would be 2 rounds of downsampling process in hardware. In the first downsampling process, the sampling number can be 16 or 8. In the second downsampling process, the sampling number is fixed as 8. So the clock frequency in PDM RX mode would be `(fpcm * 64)` or `(fpcm * 128)` accordingly.

**Note** After calling this function, it would call `i2s_set_clk` inside to update the clock frequency. Please call this function after I2S driver has been initialized.

**Return**

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NO_MEM Out of memory

**Parameters**

- `i2s_num`: I2S port number
- `downsampling`: I2S RX down sample rate for PDM mode.

**esp_err_t i2s_set_pdm_tx_up_sample(i2s_port_t i2s_num, const i2s_pdm_tx_upsample_cfg_t *upsample_cfg)**

Set TX PDM mode up-sample rate.

**Note** If you have set PDM mode while calling ‘`i2s_driver_install`’, default PDM TX upsample parameters have already been set, no need to call this function again if you don’t have to change the default configuration.

**Return**
Chapter 2. API Reference

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NO_MEM Out of memory

Parameters
- i2s_num: I2S port number
- upsample_cfg: Set I2S PDM upsample rate configuration

```c
esp_err_t i2s_driver_install(i2s_port_t i2s_num, const i2s_config_t *i2s_config, int queue_size, void *i2s_queue)
```

Install and start I2S driver.

This function must be called before any I2S driver read/write operations.

Parameters
- i2s_num: I2S port number
- i2s_config: I2S configurations - see i2s_config_t struct
- queue_size: I2S event queue size/depth.
- i2s_queue: I2S event queue handle, if set NULL, driver will not use an event queue.

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NO_MEM Out of memory
- ESP_ERR_INVALID_STATE Current I2S port is in use

```c
esp_err_t i2s_driver_uninstall(i2s_port_t i2s_num)
```

Uninstall I2S driver.

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_INVALID_STATE I2S port has been uninstalled by others (e.g. LCD i80)

Parameters
- i2s_num: I2S port number

```c
esp_err_t i2s_write(i2s_port_t i2s_num, const void *src, size_t size, size_t *bytes_written, TickType_t ticks_to_wait)
```

Write data to I2S DMA transmit buffer.

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters
- i2s_num: I2S port number
- src: Source address to write from
- size: Size of data in bytes
- [out] bytes_written: Number of bytes written, if timeout, the result will be less than the size passed in.
- ticks_to_wait: TX buffer wait timeout in RTOS ticks. If this many ticks pass without space becoming available in the DMA transmit buffer, then the function will return (note that if the data is written to the DMA buffer in pieces, the overall operation may still take longer than this timeout.) Pass portMAX_DELAY for no timeout.

```c
esp_err_t i2s_write_expanded(i2s_port_t i2s_num, const void *src, size_t size_t src_bits, size_t aim_bits, size_t *bytes_written, TickType_t ticks_to_wait)
```

Write data to I2S DMA transmit buffer while expanding the number of bits per sample. For example, expanding 16-bit PCM to 32-bit PCM.

Format of the data in source buffer is determined by the I2S configuration (see i2s_config_t).

Parameters
- i2s_num: I2S port number
- src: Source address to write from
- size: Size of data in bytes
Chapter 2. API Reference

- **src_bits**: Source audio bit
- **aim_bits**: Bit wanted, no more than 32, and must be greater than src_bits
- **[out] bytes_written**: Number of bytes written, if timeout, the result will be less than the size passed in.
- **ticks_to_wait**: TX buffer wait timeout in RTOS ticks. If this many ticks pass without space becoming available in the DMA transmit buffer, then the function will return (note that if the data is written to the DMA buffer in pieces, the overall operation may still take longer than this timeout.) Pass portMAX_DELAY for no timeout.

**Return**

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

```c
esp_err_t i2s_read(i2s_port_t i2s_num, void *dest, size_t size, size_t *bytes_read, TickType_t ticks_to_wait)
```

Read data from I2S DMA receive buffer.

**Note** If the built-in ADC mode is enabled, we should call i2s_adc_enable and i2s_adc_disable around the whole reading process, to prevent the data getting corrupted.

**Return**

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**

- i2s_num: I2S port number
- dest: Destination address to read into
- size: Size of data in bytes
- [out] bytes_read: Number of bytes read, if timeout, bytes read will be less than the size passed in.
- ticks_to_wait: RX buffer wait timeout in RTOS ticks. If this many ticks pass without bytes becoming available in the DMA receive buffer, then the function will return (note that if data is read from the DMA buffer in pieces, the overall operation may still take longer than this timeout.) Pass portMAX_DELAY for no timeout.

```c
esp_err_t i2s_set_sample_rates(i2s_port_t i2s_num, uint32_t rate)
```

Set sample rate used for I2S RX and TX.

The bit clock rate is determined by the sample rate and i2s_config_t configuration parameters (number of channels, bits_per_sample).

\[
\text{bit\_clock} = \text{rate} \times (\text{number of channels}) \times \text{bits\_per\_sample}
\]

**Return**

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NO_MEM Out of memory

**Parameters**

- i2s_num: I2S port number
- rate: I2S sample rate (ex: 8000, 44100…)

```c
esp_err_t i2s_stop(i2s_port_t i2s_num)
```

Stop I2S driver.

There is no need to call i2s_stop() before calling i2s_driver_uninstall().

Disables I2S TX/RX, until i2s_start() is called.

**Return**

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**

- i2s_num: I2S port number

```c
esp_err_t i2s_start(i2s_port_t i2s_num)
```

Start I2S driver.
It is not necessary to call this function after `i2s_driver_install()` (it is started automatically), however it is necessary to call it after `i2s_stop()`.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- `i2s_num`: I2S port number

```c
esp_err_t i2s_zero_dma_buffer (i2s_port_t i2s_num)
```
Zero the contents of the TX DMA buffer.

Pushes zero-byte samples into the TX DMA buffer, until it is full.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- `i2s_num`: I2S port number

```c
esp_err_t i2s_pcm_config (i2s_port_t i2s_num, const i2s_pcm_cfg_t *pcm_cfg)
```
Configure I2S a/u-law decompressor or compressor.

**Note**
This function should be called after i2s driver installed. Only take effective when the i2s ‘communication_format’ is set to ‘I2S_COMM_FORMAT_STAND_PCM_SHORT’ or ‘I2S_COMM_FORMAT_STAND_PCM_LONG’.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- `i2s_num`: I2S port number
- `pcm_cfg`: including mode selection and a/u-law decompress or compress configuration parameter

```c
esp_err_t i2s_set_clk (i2s_port_t i2s_num, uint32_t rate, uint32_t bits_cfg, i2s_channel_t ch)
```
Set clock & bit width used for I2S RX and TX.

Similar to `i2s_set_sample_rates()`, but also sets bit width.

1. stop i2s;
2. calculate mclk, bck, bck_factor
3. malloc dma buffer;
4. start i2s

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NO_MEM Out of memory

**Parameters**
- `i2s_num`: I2S port number
- `rate`: I2S sample rate (ex: 8000, 44100…)
- `bits_cfg`: I2S bits configuration the low 16 bits is for data bits per sample in one channel (see ‘i2s_bits_per_sample_t’) the high 16 bits is for total bits in one channel (see ‘i2s_bits_per_chan_t’) high 16bits =0 means same as the bits per sample.
- `ch`: I2S channel, (I2S_CHANNEL_MONO, I2S_CHANNEL_STEREO or specific channel in TDM mode)

```c
float i2s_get_clk (i2s_port_t i2s_num)
```
get clock set on particular port number.

**Return**
- actual clock set by i2s driver

**Parameters**
- `i2s_num`: I2S port number
Structures

struct i2s_pcm_cfg_t
I2S PCM configuration.

Public Members

i2s_pcm_compress_t pcm_type
I2SPCM a/u-law decompress or compress type

struct i2s_pdm_tx_upsample_cfg_t
I2S PDM up-sample rate configuration.

Note TX PDM can only be set to the following two upsampling rate configurations:
1: fp = 960, fs = sample_rate / 100, in this case, Fpdm = 128*48000
2: fp = 960, fs = 480, in this case, Fpdm = 128*Fpcm
= 128*sample_rate If the pdm receiver do not care the pdm serial clock, it’s recommended set Fpdm
= 128*48000. Otherwise, the second configuration should be applied.

Public Members

int sample_rate
I2SPDM sample rate

int fp
I2SPDM TX upsampling paramater. Normally it should be set to 960

int fs
I2SPDM TX upsampling paramater. When it is set to 480, the pdm clock frequency Fpdm = 128 *
sample_rate, when it is set to sample_rate / 100. Fpdm will be fixed to 128*48000

struct i2s_pin_config_t
I2S pin number for i2s_set_pin.

Public Members

int mck_io_num
MCK in out pin. Note that ESP32 supports setting MCK on GPIO0/GPIO1/GPIO3 only

int bck_io_num
BCK in out pin

int ws_io_num
WS in out pin

int data_out_num
DATA out pin

int data_in_num
DATA in pin

struct i2s_driver_config_t
I2S driver configuration parameters.

Public Members

i2s_mode_t mode
I2S work mode

uint32_t sample_rate
I2S sample rate

i2s_bits_per_sample_t bits_per_sample
I2S sample bits in one channel
**i2s_channel_fmt_t**

I2S channel format.

**i2s_comm_format_t**

I2S communication format

**int intr_alloc_flags**

Flags used to allocate the interrupt. One or multiple (ORred) ESP_INTR_FLAG_* values. See esp_intr_alloc.h for more info

**int dma_desc_num**

The total number of descriptors used by I2S DMA to receive/transmit data

**int dma_buf_count**

This is an alias to ‘dma_desc_num’ for backward compatibility

**int dma_frame_num**

Number of frames for one-time sampling. The frame here means the total data from all the channels in a WS cycle

**int dma_buf_len**

This is an alias to ‘dma_frame_num’ for backward compatibility

**bool use_apll**

I2S using APPLL as main I2S clock, enable it to get accurate clock

**bool tx_desc_auto_clear**

I2S auto clear tx descriptor if there is underflow condition (helps in avoiding noise in case of data unavailability)

**int fixed_mclk**

I2S using fixed MCLK output. If use_apll = true and fixed_mclk > 0, then the clock output for i2s is fixed and equal to the fixed_mclk value. If fixed_mclk set, mclk_multiple won’t take effect

**i2s_mclk_multiple_t/mclk_multiple**

The multiple of I2S master clock(MCLK) to sample rate

**i2s_bits_per_chan_t/bits_per_chan**

I2S total bits in one channel, only take effect when larger than ‘bits_per_sample’, default ‘0’ means equal to ‘bits_per_sample’

**i2s_channel_t/chan_mask**

I2S active channel bit mask. set value in i2s_channel_t to enable specific channel, the bit map of active channel can not exceed (0x1<<total_chan).

**uint32_t/total_chan**

I2S Total number of channels. If it is smaller than the biggest active channel number, it will be set to this number automatically.

**bool left_align**

Set to enable left alignment

**bool big_edin**

Set to enable big edin

**bool bit_order_msb**

Set to enable msb order

**bool skip_msk**

Set to enable skip mask. If it is enabled, only the data of the enabled channels will be sent, otherwise all data stored in DMA TX buffer will be sent

**struct i2s_event_t**

Event structure used in I2S event queue.
Public Members

i2s_event_type_t type
I2S event type

size_t size
I2S data size for I2S_DATA event

Macros

I2S_PIN_NO_CHANGE
Use in i2s_pin_config_t for pins which should not be changed

I2S_PDM_DEFAULT_UPSAMPLE_CONFIG(rate)
Default I2S PDM Up-Sampling Rate configuration.

Type Definitions

typedef i2s_driver_config_t i2s_config_t
typedef intr_handle_t i2s_isr_handle_t

Enumerations

enum i2s_port_t
I2S port number, the max port number is (I2S_NUM_MAX -1).

Values:

I2S_NUM_0 = 0
I2S port 0

I2S_NUM_1 = 1
I2S port 1

I2S_NUM_MAX
I2S port max

enum i2s_event_type_t
I2S event queue types.

Values:

I2S_EVENT_DMA_ERROR

I2S_EVENT_TX_DONE
I2S DMA finish sent 1 buffer

I2S_EVENT_RX_DONE
I2S DMA finish received 1 buffer

I2S_EVENT_TX_Q_OVF
I2S DMA sent queue overflow

I2S_EVENT_RX_Q_OVF
I2S DMA receive queue overflow

I2S_EVENT_MAX
I2S event max index

Header File

- components/hal/include/hal/i2s_types.h
Enumerations

**enum i2s_bits_per_sample_t**

I2S bit width per sample.

Values:

- **I2S_BITS_PER_SAMPLE_8BIT** = 8
  - data bit-width: 8
- **I2S_BITS_PER_SAMPLE_16BIT** = 16
  - data bit-width: 16
- **I2S_BITS_PER_SAMPLE_24BIT** = 24
  - data bit-width: 24
- **I2S_BITS_PER_SAMPLE_32BIT** = 32
  - data bit-width: 32

**enum i2s_bits_per_chan_t**

I2S bit width per chan.

Values:

- **I2S_BITS_PER_CHAN_DEFAULT** = 0
  - channel bit-width equals to data bit-width
- **I2S_BITS_PER_CHAN_8BIT** = (8)
  - channel bit-width: 8
- **I2S_BITS_PER_CHAN_16BIT** = (16)
  - channel bit-width: 16
- **I2S_BITS_PER_CHAN_24BIT** = (24)
  - channel bit-width: 24
- **I2S_BITS_PER_CHAN_32BIT** = (32)
  - channel bit-width: 32

**enum i2s_channel_t**

I2S channel.

Values:

- **I2S_CHANNEL_MONO** = (0x01 << 31) | 0x03
  - I2S channel (mono), two channel enabled. In this mode, you only need to send one channel data but the fifo will copy same data for another channel automatically, then both channels will transmit same data. The highest bit is for differentiating I2S_CHANNEL_STEREO since they both use two channels
- **I2S_CHANNEL_STEREO** = 0x03
  - I2S channel (stereo), two channel enabled. In this mode, two channels will transmit different data.
- **I2S_TDM_ACTIVE_CH0** = (0x1 << 0)
  - I2S channel 0 enabled
- **I2S_TDM_ACTIVE_CH1** = (0x1 << 1)
  - I2S channel 1 enabled
- **I2S_TDM_ACTIVE_CH2** = (0x1 << 2)
  - I2S channel 2 enabled
- **I2S_TDM_ACTIVE_CH3** = (0x1 << 3)
  - I2S channel 3 enabled
- **I2S_TDM_ACTIVE_CH4** = (0x1 << 4)
  - I2S channel 4 enabled
- **I2S_TDM_ACTIVE_CH5** = (0x1 << 5)
  - I2S channel 5 enabled
I2S_TDM_ACTIVE_CH6 = (0x1 << 6)
I2S channel 6 enabled

I2S_TDM_ACTIVE_CH7 = (0x1 << 7)
I2S channel 7 enabled

I2S_TDM_ACTIVE_CH8 = (0x1 << 8)
I2S channel 8 enabled

I2S_TDM_ACTIVE_CH9 = (0x1 << 9)
I2S channel 9 enabled

I2S_TDM_ACTIVE_CH10 = (0x1 << 10)
I2S channel 10 enabled

I2S_TDM_ACTIVE_CH11 = (0x1 << 11)
I2S channel 11 enabled

I2S_TDM_ACTIVE_CH12 = (0x1 << 12)
I2S channel 12 enabled

I2S_TDM_ACTIVE_CH13 = (0x1 << 13)
I2S channel 13 enabled

I2S_TDM_ACTIVE_CH14 = (0x1 << 14)
I2S channel 14 enabled

I2S_TDM_ACTIVE_CH15 = (0x1 << 15)
I2S channel 15 enabled

enum i2s_comm_format_t
I2S communication standard format.

Values:

I2S_COMM_FORMAT_STAND_I2S = 0x01
I2S communication I2S Philips standard, data launch at second BCK

I2S_COMM_FORMAT_STAND_MSB = 0x02
I2S communication MSB alignment standard, data launch at first BCK

I2S_COMM_FORMAT_STAND_PCM_SHORT = 0x04
PCM Short standard, also known as DSP mode. The period of synchronization signal (WS) is 1 bck cycle.

I2S_COMM_FORMAT_STAND_PCM_LONG = 0x0C
PCM Long standard. The period of synchronization signal (WS) is channel_bit*bck cycles.

I2S_COMM_FORMAT_STAND_MAX
standard max

I2S_COMM_FORMAT_I2S = 0x01
I2S communication format I2S, correspond to I2S_COMM_FORMAT_STAND_I2S

I2S_COMM_FORMAT_I2S_MSB = 0x01
I2S format MSB, (I2S_COMM_FORMAT_I2S \| I2S_COMM_FORMAT_I2S_MSB) correspond to I2S_COMM_FORMAT_STAND_I2S

I2S_COMM_FORMAT_I2S_LSB = 0x02
I2S format LSB, (I2S_COMM_FORMAT_I2S \| I2S_COMM_FORMAT_I2S_LSB) correspond to I2S_COMM_FORMAT_STAND_MSB

I2S_COMM_FORMAT_PCM = 0x04
I2S communication format PCM, correspond to I2S_COMM_FORMAT_STAND_PCM_SHORT

I2S_COMM_FORMAT_PCM_SHORT = 0x04
PCM Short, (I2S_COMM_FORMAT_PCM \| I2S_COMM_FORMAT_PCM_SHORT) correspond to I2S_COMM_FORMAT_STAND_PCM_SHORT
I2S_COMM_FORMAT_PCM_LONG = 0x08

PCM Long, (I2S_COMM_FORMAT_PCM | I2S_COMM_FORMAT_PCM_LONG) correspond to
I2S_COMM_FORMAT_STAND_PCM_LONG

enum i2s_channel_fmt_t
I2S channel format type.

Values:

I2S_CHANNEL_FMT_RIGHT_LEFT
Separated left and right channel

I2S_CHANNEL_FMT_ALL_RIGHT
Load right channel data in both two channels

I2S_CHANNEL_FMT_ALL_LEFT
Load left channel data in both two channels

I2S_CHANNEL_FMT_ONLY_RIGHT
Only load data in right channel (mono mode)

I2S_CHANNEL_FMT_ONLY_LEFT
Only load data in left channel (mono mode)

I2S_CHANNEL_FMT_MULTIPLE
More than two channels are used

enum i2s_mode_t
I2S Mode.

Values:

I2S_MODE_MASTER = (0x1 << 0)
Master mode

I2S_MODE_SLAVE = (0x1 << 1)
Slave mode

I2S_MODE_TX = (0x1 << 2)
TX mode

I2S_MODE_RX = (0x1 << 3)
RX mode

I2S_MODE_PDM = (0x1 << 6)
I2S PDM mode

enum i2s_clock_src_t
I2S source clock.

Values:

I2S_CLK_D2CLK = 0
Clock from PLL_D2_CLK(160M)

enum i2s_mclk_multiple_t
The multiple of mclk to sample rate.

Values:

I2S_MCLK_MULTIPLE_DEFAULT = 0
Default value, mclk = sample_rate * 256

I2S_MCLK_MULTIPLE_128 = 128
mclk = sample_rate * 128

I2S_MCLK_MULTIPLE_256 = 256
mclk = sample_rate * 256
\[ I2S_{\text{MCLK\_MULTIPLE\_384}} = 384 \]
\[ \text{mclk} = \text{sample\_rate} \times 384 \]

**enum i2s_pcm_compress_t**  
A/U-law decompress or compress configuration.

*Values:*

- **I2S_PCM_DISABLE = 0**  
  Disable A/U law decompress or compress
- **I2S_PCM_A_DECOMPRESS**  
  A-law decompress
- **I2S_PCM_A_COMPRESS**  
  A-law compress
- **I2S_PCM_U_DECOMPRESS**  
  U-law decompress
- **I2S_PCM_U_COMPRESS**  
  U-law compress

**enum i2s_pdm_dsr_t**  
I2S PDM RX downsample mode.

*Values:*

- **I2S_PDM_DSR_8S = 0**  
  Downsampling number is 8 for PDM RX mode
- **I2S_PDM_DSR_16S**  
  Downsampling number is 16 for PDM RX mode
- **I2S_PDM_DSR_MAX**

**enum i2s_pdm_sig_scale_t**

*Values:*

- **I2S_PDM_SIG_SCALING_DIV_2 = 0**  
  I2S TX PDM sigmadelta signal scaling: /2
- **I2S_PDM_SIG_SCALING_MUL_1**  
  I2S TX PDM sigmadelta signal scaling: x1
- **I2S_PDM_SIG_SCALING_MUL_2 = 2**  
  I2S TX PDM sigmadelta signal scaling: x2
- **I2S_PDM_SIG_SCALING_MUL_4 = 3**  
  I2S TX PDM sigmadelta signal scaling: x4

## 2.3.9 LCD

**Introduction**

ESP chips can generate various kinds of timings that needed by common LCDs on the market, like SPI LCD, I80 LCD (a.k.a Intel 8080 parallel LCD), RGB LCD, I2C LCD, etc. The `esp_lcd` component is officially to support those LCDs with a group of universal APIs across chips.

**Functional Overview**

In `esp_lcd`, an LCD panel is represented by `esp_lcd_panel_handle_t`, which plays the role of an **abstract frame buffer**, regardless of the frame memory is allocated inside ESP chip or in external LCD controller. Based on the location of the frame buffer, the LCD panel allocation functions are mainly grouped into the following categories:
Chapter 2. API Reference

- **RGB LCD panel** - is simply based on a group of specific synchronous signals indicating where to start and stop a frame.
- **Controller based LCD panel** involves multiple steps to get a panel handle, like bus allocation, IO device registration and controller driver install.

After we get the LCD handle, the remaining LCD operations are the same for different LCD interfaces and vendors.

### Application Example

LCD examples are located under: `peripherals/lcd`:

- Jpeg decoding and LCD display - `peripherals/lcd/tjpgd`
- i80 controller based LCD and LVGL animation UI - `peripherals/lcd/i80_controller`
- GC9A01 user customized driver and dash board UI - `peripherals/lcd/gc9a01`
- RGB panel example with scatter chart UI - `peripherals/lcd/rgb_panel`
- I2C interfaced OLED display scrolling text - `peripherals/lcd/i2c_oled`

### API Reference

#### Header File

- `components/hal/include/hal/lcd_types.h`

#### Enumerations

**enum lcd_clock_source_t**

LCD clock source.

<table>
<thead>
<tr>
<th>LCD clock source</th>
<th>Features</th>
<th>Power Management</th>
</tr>
</thead>
<tbody>
<tr>
<td>LCD_CLK_SRC_PLL160M</td>
<td>High resolution</td>
<td>ESP_PM_APB_FREQ_MAX lock</td>
</tr>
<tr>
<td>LCD_CLK_SRC_PLL240M</td>
<td>High resolution</td>
<td>ESP_PM_APB_FREQ_MAX lock</td>
</tr>
<tr>
<td>LCD_CLK_SRC_APLL</td>
<td>Configurable resolution</td>
<td>ESP_PM_NO_LIGHT_SLEEP lock</td>
</tr>
<tr>
<td>LCD_CLK_SRC_XTAL</td>
<td>Medium resolution</td>
<td>No PM lock</td>
</tr>
</tbody>
</table>

**Values**:

- **LCD_CLK_SRC_PLL160M**
  Select PLL160M as the source clock
- **LCD_CLK_SRC_PLL240M**
  Select PLL240M as the source clock
- **LCD_CLK_SRC_APLL**
  Select APLL as the source clock
- **LCD_CLK_SRC_XTAL**
  Select XTAL as the source clock

#### Header File

- `components/esp_lcd/include/esp_lcd_types.h`

#### Type Definitions

```c
typedef struct esp_lcd_panel_io_t *esp_lcd_panel_io_handle_t
Type of LCD panel IO handle
```

```c
typedef struct esp_lcd_panel_t *esp_lcd_panel_handle_t
Type of LCD panel handle
```
Chapter 2. API Reference

Enumerations

```c
enum esp_lcd_color_space_t

   {ESP_LCD_COLOR_SPACE_RGB,  // Color space: RGB
    ESP_LCD_COLOR_SPACE_BGR,  // Color space: BGR
    ESP_LCD_COLOR_SPACE_MONOCHROME // Color space: monochrome
   };
```

Header File

- `components/esp_lcd/include/esp_lcd_panel_io.h`

Functions

```c
esp_err_t esp_lcd_panel_io_tx_param(esp_lcd_panel_io_handle_t io, int lcd_cmd, const void *param, size_t param_size)
```

Transmit LCD command and corresponding parameters.

**Note** Commands sent by this function are short, so they are sent using polling transactions. The function does not return before the command transfer is completed. If any queued transactions sent by `esp_lcd_panel_io_tx_color()` are still pending when this function is called, this function will wait until they are finished and the queue is empty before sending the command(s).

**Return**

- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_OK on success

**Parameters**

- [in] `io`: LCD panel IO handle, which is created by other factory API like `esp_lcd_new_panel_io_spi()`
- [in] `lcd_cmd`: The specific LCD command
- [in] `param`: Buffer that holds the command specific parameters, set to NULL if no parameter is needed for the command
- [in] `param_size`: Size of `param` in memory, in bytes, set to zero if no parameter is needed for the command

```c
esp_err_t esp_lcd_panel_io_tx_color(esp_lcd_panel_io_handle_t io, int lcd_cmd, const void *color, size_t color_size)
```

Transmit LCD RGB data.

**Note** This function will package the command and RGB data into a transaction, and push into a queue. The real transmission is performed in the background (DMA+interrupt). The caller should take care of the lifecycle of the `color` buffer. Recycling of color buffer should be done in the callback `on_color_trans_done()`.

**Return**

- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_OK on success

**Parameters**

- [in] `io`: LCD panel IO handle, which is created by factory API like `esp_lcd_new_panel_io_spi()`
- [in] `lcd_cmd`: The specific LCD command
- [in] `color`: Buffer that holds the RGB color data
- [in] `color_size`: Size of `color` in memory, in bytes

```c
esp_err_t esp_lcd_panel_io_del(esp_lcd_panel_io_handle_t io)
```

Destroy LCD panel IO handle (deinitialize panel and free all corresponding resource)

**Return**

- ESP_ERR_INVALID_ARG if parameter is invalid
• ESP_OK on success

Parameters
• [in] io: LCD panel IO handle, which is created by factory API like esp_lcd_new_panel_io_spi()

\[
\text{esp_err_t esp_lcd_new_panel_io_spi}(\text{esp_lcd_spi_bus_handle_t \ bus, const esp_lcd_panel_io_spi_config_t \ *io_config, esp_lcd_panel_io_handle_t \ *ret_io})
\]

Create LCD panel IO handle, for SPI interface.

Return
• ESP_ERR_INVALID_ARG if parameter is invalid
• ESP_ERR_NO_MEM if out of memory
• ESP_OK on success

Parameters
• [in] bus: SPI bus handle
• [in] io_config: IO configuration, for SPI interface
• [out] ret_io: Returned IO handle

\[
\text{esp_err_t esp_lcd_new_panel_io_i2c}(\text{esp_lcd_i2c_bus_handle_t \ bus, const esp_lcd_panel_io_i2c_config_t \ *io_config, esp_lcd_panel_io_handle_t \ *ret_io})
\]

Create LCD panel IO handle, for I2C interface.

Return
• ESP_ERR_INVALID_ARG if parameter is invalid
• ESP_ERR_NO_MEM if out of memory
• ESP_OK on success

Parameters
• [in] bus: I2C bus handle
• [in] io_config: IO configuration, for I2C interface
• [out] ret_io: Returned IO handle

\[
\text{esp_err_t esp_lcd_new_i80_bus}(\text{const esp_lcd_i80_bus_config_t \ *bus_config, esp_lcd_i80_bus_handle_t \ *ret_bus})
\]

Create Intel 8080 bus handle.

Return
• ESP_ERR_INVALID_ARG if parameter is invalid
• ESP_ERR_NO_MEM if out of memory
• ESP_ERR_NOT_FOUND if no free bus is available
• ESP_OK on success

Parameters
• [in] bus_config: Bus configuration
• [out] ret_bus: Returned bus handle

\[
\text{esp_err_t esp_lcd_del_i80_bus}(\text{esp_lcd_i80_bus_handle_t \ bus})
\]

Destory Intel 8080 bus handle.

Return
• ESP_ERR_INVALID_ARG if parameter is invalid
• ESP_ERR_INVALID_STATE if there still be some device attached to the bus
• ESP_OK on success

Parameters
• [in] bus: Intel 8080 bus handle, created by esp_lcd_new_i80_bus()

\[
\text{esp_err_t esp_lcd_new_panel_io_i80}(\text{esp_lcd_i80_bus_handle_t \ bus, const esp_lcd_panel_io_i80_config_t \ *io_config, esp_lcd_panel_io_handle_t \ *ret_io})
\]

Create LCD panel IO, for Intel 8080 interface.

Return
• ESP_ERR_INVALID_ARG if parameter is invalid
• ESP_ERR_NOT_SUPPORTED if some configuration can’t be satisfied, e.g. pixel clock out of the range
• ESP_ERR_NO_MEM if out of memory
• ESP_OK on success

Parameters
• [in] bus: Intel 8080 bus handle, created by esp_lcd_new_i80_bus()
• [in] io_config: IO configuration, for i80 interface
• [out] ret_io: Returned panel IO handle

Structures
struct esp_lcd_panel_io_event_data_t
Type of LCD panel IO event data.
struct esp_lcd_panel_io_spi_config_t
Panel IO configuration structure, for SPI interface.

Public Members
int cs_gpio_num
  GPIO used for CS line
int dc_gpio_num
  GPIO used to select the D/C line, set this to -1 if the D/C line not controlled by manually pulling high/low GPIO
int spi_mode
  Traditional SPI mode (0~3)
unsigned int pclk_hz
  Frequency of pixel clock
size_t trans_queue_depth
  Size of internal transaction queue

esp_lcd_panel_io_color_trans_done_cb_t on_color_trans_done
  Callback invoked when color data transfer has finished
void *user_ctx
  User private data, passed directly to on_color_trans_done’s user_ctx

int lcd_cmd_bits
  Bit-width of LCD command
int lcd_param_bits
  Bit-width of LCD parameter
unsigned int dc_as_cmd_phase : 1
  D/C line value is encoded into SPI transaction command phase
unsigned int dc_low_on_data : 1
  If this flag is enabled, DC line = 0 means transfer data, DC line = 1 means transfer command; vice versa
unsigned int octal_mode : 1
  Transmit with octal mode (8 data lines), this mode is used to simulate Intel 8080 timing

Public Members
uint32_t dev_addr
  I2C device address
esp_lcd_panel_io_color_trans_done_cb_t on_color_trans_done
Callback invoked when color data transfer has finished

void *user_ctx
User private data, passed directly to on_color_trans_done’s user_ctx

size_t control_phase_bytes
I2C LCD panel will encode control information (e.g. D/C selection) into control phase, in several bytes

unsigned int dc_bit_offset
Offset of the D/C selection bit in control phase

int lcd_cmd_bits
Bit-width of LCD command

int lcd_param_bits
Bit-width of LCD parameter

unsigned int dc_low_on_data : 1
If this flag is enabled, DC line = 0 means transfer data, DC line = 1 means transfer command; vice versa

struct esp_lcd_panel_io_color_trans_done_cb_t
Callback invoked when color data was transferred done

Public Members

int dc_gpio_num
GPIO used for D/C line

int wr_gpio_num
GPIO used for WR line

lcd_clock_source_t clk_src
Clock source for the I80 LCD peripheral

int data_gpio_nums[(16)]
GPIOs used for data lines

size_t bus_width
Number of data lines, 8 or 16

size_t max_transfer_bytes
Maximum transfer size, this determines the length of internal DMA link

size_t psram_trans_align
DMA transfer alignment for data allocated from PSRAM

size_t sram_trans_align
DMA transfer alignment for data allocated from SRAM

struct esp_lcd_i80_bus_config_t
LCD Intel 8080 bus configuration structure.

Public Members

int cs_gpio_num
GPIO used for CS line, set to -1 will declaim exclusively use of I80 bus

unsigned int pclk_hz
Frequency of pixel clock

size_t trans_queue_depth
Transaction queue size, larger queue, higher throughput

esp_lcd_panel_io_color_trans_done_cb_t on_color_trans_done
Callback invoked when color data was transferred done
void *user_ctx
    User private data, passed directly to on_color_trans_done’s user_ctx

int lcd_cmd_bits
    Bit-width of LCD command

int lcd_param_bits
    Bit-width of LCD parameter

unsigned int dc_idle_level : 1
    Level of DC line in IDLE phase

unsigned int dc_cmd_level : 1
    Level of DC line in CMD phase

unsigned int dc_dummy_level : 1
    Level of DC line in DUMMY phase

unsigned int dc_data_level : 1
    Level of DC line in DATA phase

struct esp_lcd_panel_io_i80_config_t::[anonymous] dc_levels
    Each i80 device might have its own D/C control logic

unsigned int cs_active_high : 1
    If set, a high level of CS line will select the device, otherwise, CS line is low level active

unsigned int reverse_color_bits : 1
    Reverse the data bits, D[N:0] -> D[0:N]

unsigned int swap_color_bytes : 1
    Swap adjacent two color bytes

unsigned int pclk_active_neg : 1
    The display will write data lines when there’s a falling edge on WR signal (a.k.a the PCLK)

unsigned int pclk_idle_low : 1
    The WR signal (a.k.a the PCLK) stays at low level in IDLE phase

Type Definitions
typedef void *esp_lcd_spi_bus_handle_t
    Type of LCD SPI bus handle
typedef void *esp_lcd_i2c_bus_handle_t
    Type of LCD I2C bus handle
typedef struct esp_lcd_i80_bus_t *esp_lcd_i80_bus_handle_t
    Type of LCD intel 8080 bus handle

typedef bool (*esp_lcd_panel_io_color_trans_done_cb_t)(esp_lcd_panel_io_handle_t panel_io,
    esp_lcd_panel_io_event_data_t *edata, void *user_ctx)

Declare the prototype of the function that will be invoked when panel IO finishes transferring color data.

Return Whether a high priority task has been waken up by this function

Parameters

• [in] panel_io: LCD panel IO handle, which is created by factory API like esp_lcd_new_panel_io_spi()
• [in] edata: Panel IO event data, fed by driver
• [in] user_ctx: User data, passed from esp_lcd_panel_io_xxx_config_t

Header File

• components/esp_lcd/include/esp_lcd_panel_ops.h
## Functions

**esp_err_t esp_lcd_panel_reset (esp_lcd_panel_handle_t panel)**
Reset LCD panel.

Note: Panel reset must be called before attempting to initialize the panel using `esp_lcd_panel_init()`.

Return
- **ESP_OK** on success

Parameters
- **[in]** `panel`: LCD panel handle, which is created by other factory API like `esp_lcd_new_panel_st7789()`.

**esp_err_t esp_lcd_panel_init (esp_lcd_panel_handle_t panel)**
Initialize LCD panel.

Note: Before calling this function, make sure the LCD panel has finished the reset stage by `esp_lcd_panel_reset()`.

Return
- **ESP_OK** on success

Parameters
- **[in]** `panel`: LCD panel handle, which is created by other factory API like `esp_lcd_new_panel_st7789()`.

**esp_err_t esp_lcd_panel_del (esp_lcd_panel_handle_t panel)**
Deinitialize the LCD panel.

Return
- **ESP_OK** on success

Parameters
- **[in]** `panel`: LCD panel handle, which is created by other factory API like `esp_lcd_new_panel_st7789()`.

**esp_err_t esp_lcd_panel_draw_bitmap (esp_lcd_panel_handle_t panel, int x_start, int y_start, int x_end, int y_end, const void* color_data)**
Draw bitmap on LCD panel.

Return
- **ESP_OK** on success

Parameters
- **[in]** `panel`: LCD panel handle, which is created by other factory API like `esp_lcd_new_panel_st7789()`.
- **[in]** `x_start`: Start index on x-axis (x_start included)
- **[in]** `y_start`: Start index on y-axis (y_start included)
- **[in]** `x_end`: End index on x-axis (x_end not included)
- **[in]** `y_end`: End index on y-axis (y_end not included)
- **[in]** `color_data`: RGB color data that will be dumped to the specific window range.

**esp_err_t esp_lcd_panel_mirror (esp_lcd_panel_handle_t panel, bool mirror_x, bool mirror_y)**
Mirror the LCD panel on specific axis.

Note: Combined with `esp_lcd_panel_swap_xy()`, one can realize screen rotation.

Return
- **ESP_OK** on success
- **ESP_ERR_NOT_SUPPORTED** if this function is not supported by the panel

Parameters
- **[in]** `panel`: LCD panel handle, which is created by other factory API like `esp_lcd_new_panel_st7789()`.
- **[in]** `mirror_x`: Whether the panel will be mirrored about the x axis
- **[in]** `mirror_y`: Whether the panel will be mirrored about the y axis

**esp_err_t esp_lcd_panel_swap_xy (esp_lcd_panel_handle_t panel, bool swap_axes)**
Swap/Exchange x and y axis.

Note: Combined with `esp_lcd_panel_mirror()`, one can realize screen rotation.

Return
- **ESP_OK** on success
- **ESP_ERR_NOT_SUPPORTED** if this function is not supported by the panel

Parameters
- **[in]** `panel`: LCD panel handle, which is created by other factory API like `esp_lcd_new_panel_st7789()`.
- **[in]** `swap_axes`: Whether the panel will be swapped x and y axis.
• ESP_OK on success
• ESP_ERR_NOT_SUPPORTED if this function is not supported by the panel

**Parameters**
- [in] panel: LCD panel handle, which is created by other factory API like esp_lcd_new_panel_st7789()
- [in] swap_axes: Whether to swap the x and y axis

```
esp_err_t esp_lcd_panel_set_gap(esp_lcd_panel_handle_t panel, int x_gap, int y_gap)
```

Set extra gap in x and y axis.

The gap is the space (in pixels) between the left/top sides of the LCD panel and the first row/column respectively of the actual contents displayed.

**Note** Setting a gap is useful when positioning or centering a frame that is smaller than the LCD.

**Return**
- ESP_OK on success

**Parameters**
- [in] panel: LCD panel handle, which is created by other factory API like esp_lcd_new_panel_st7789()
- [in] x_gap: Extra gap on x axis, in pixels
- [in] y_gap: Extra gap on y axis, in pixels

```
esp_err_t esp_lcd_panel_invert_color(esp_lcd_panel_handle_t panel, bool invert_color_data)
```

Invert the color (bit-wise invert the color data line)

**Return**
- ESP_OK on success

**Parameters**
- [in] panel: LCD panel handle, which is created by other factory API like esp_lcd_new_panel_st7789()
- [in] invert_color_data: Whether to invert the color data

```
esp_err_t esp_lcd_panel_disp_off(esp_lcd_panel_handle_t panel, bool off)
```

Turn off the display.

**Return**
- ESP_OK on success
- ESP_ERR_NOT_SUPPORTED if this function is not supported by the panel

**Parameters**
- [in] panel: LCD panel handle, which is created by other factory API like esp_lcd_new_panel_st7789()
- [in] off: Whether to turn off the screen

**Header File**
- components/esp_lcd/include/esp_lcd_panel_rgb.h

**Functions**

```
esp_err_t esp_lcd_new_rgb_panel(const esp_lcd_rgb_panel_config_t *rgb_panel_config, esp_lcd_panel_handle_t *ret_panel)
```

Create RGB LCD panel.

**Return**
- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_NO_MEM if out of memory
- ESP_ERR_NOT_FOUND if no free RGB panel is available
- ESP_OK on success

**Parameters**
- rgb_panel_config: RGB panel configuration
- ret_panel: Returned LCD panel handle
Structures

```c
struct esp_lcd_rgb_timing_t
```

LCD RGB timing structure.

Diagram of the timing structure.
Public Members

unsigned int \texttt{pclk\_hz}
Frequency of pixel clock

unsigned int \texttt{h\_res}
Horizontal resolution, i.e. the number of pixels in a line

unsigned int \texttt{v\_res}
Vertical resolution, i.e. the number of lines in the frame

unsigned int \texttt{hsync\_pulse\_width}
Horizontal sync width, unit: PCLK period

unsigned int \texttt{hsync\_back\_porch}
Horizontal back porch, number of PCLK between hsync and start of line active data

unsigned int \texttt{hsync\_front\_porch}
Horizontal front porch, number of PCLK between the end of active data and the next hsync

unsigned int \texttt{vsync\_pulse\_width}
Vertical sync width, unit: number of lines

unsigned int \texttt{vsync\_back\_porch}
Vertical back porch, number of invalid lines between vsync and start of frame

unsigned int \texttt{vsync\_front\_porch}
Vertical front porch, number of invalid lines between then end of frame and the next vsync

unsigned int \texttt{hsync\_idle\_low} : 1
The hsync signal is low in IDLE state

unsigned int \texttt{vsync\_idle\_low} : 1
The vsync signal is low in IDLE state

unsigned int \texttt{de\_idle\_high} : 1
The de signal is high in IDLE state

unsigned int \texttt{pclk\_active\_neg} : 1
Whether the display data is clocked out at the falling edge of PCLK

unsigned int \texttt{pclk\_idle\_high} : 1
The PCLK stays at high level in IDLE phase

\textbf{struct esp\_lcd\_rgb\_panel\_event\_data\_t}
Type of RGB LCD panel event data.

\textbf{struct esp\_lcd\_rgb\_panel\_config\_t}
LCD RGB panel configuration structure.

Public Members

\texttt{lcd\_clock\_source\_t clk\_src}
Clock source for the RGB LCD peripheral

\texttt{esp\_lcd\_rgb\_timing\_t timings}
RGB timing parameters

\texttt{size\_t data\_width}
Number of data lines

\texttt{size\_t sram\_trans\_align}
Alignment for framebuffer that allocated in SRAM

Alignment for framebuffer that allocated in PSRAM
int hsync_gpio_num
   GPIO used for HSYNC signal

int vsync_gpio_num
   GPIO used for VSYNC signal

int de_gpio_num
   GPIO used for DE signal, set to -1 if it’s not used

int pclk_gpio_num
   GPIO used for PCLK signal

int data_gpio_nums[(16)]
   GPIOs used for data lines

int disp_gpio_num
   GPIO used for display control signal, set to -1 if it’s not used

esp_lcd_rgb_panel_frame_trans_done_cb_t on_frame_trans_done
   Callback invoked when one frame buffer has transferred done

void *user_ctx
   User data which would be passed to on_frame_trans_done’s user_ctx

unsigned int disp_active_low : 1
   If this flag is enabled, a low level of display control signal can turn the screen on; vice versa

unsigned int relax_on_idle : 1
   If this flag is enabled, the host won’t refresh the LCD if nothing changed in host’s frame buffer (this is useful for LCD with built-in GRAM)

unsigned int fb_in_psram : 1
   If this flag is enabled, the frame buffer will be allocated from PSRAM preferentially

Type Definitions

typedef bool (*esp_lcd_rgb_panel_frame_trans_done_cb_t)(esp_lcd_panel_handle_t panel, esp_lcd_rgb_panel_event_data_t *edata, void *user_ctx)

Declare the prototype of the function that will be invoked when panel IO finishes transferring color data.

Return
   Whether a high priority task has been waken up by this function

Parameters
   • [in] panel: LCD panel handle, returned from esp_lcd_new_rgb_panel
   • [in] edata: Panel event data, fed by driver
   • [in] user_ctx: User data, passed from esp_lcd_rgb_panel_config_t

Header File

   • components/esp_lcd/include/esp_lcd_panel_vendor.h

Functions

esp_err_t esp_lcd_new_panel_st7789(const esp_lcd_io_handle_t io, const esp_lcd_panel_dev_config_t *panel_dev_config, esp_lcd_panel_handle_t *ret_panel)

Create LCD panel for model ST7789.

Return
   • ESP_ERR_INVALID_ARG if parameter is invalid
   • ESP_ERR_NO_MEM if out of memory
   • ESP_OK on success

Parameters
   • [in] io: LCD panel IO handle
Chapter 2. API Reference

- [in] panel_dev_config: general panel device configuration
- [out] ret_panel: Returned LCD panel handle

```c
esp_err_t esp_lcd_new_panel_nt35510(const esp_lcd_panel_io_handle_t io, const esp_lcd_panel_dev_config_t *panel_dev_config, esp_lcd_panel_handle_t *ret_panel)
```

Create LCD panel for model NT35510.

**Return**
- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_NO_MEM if out of memory
- ESP_OK on success

**Parameters**
- [in] io: LCD panel IO handle
- [in] panel_dev_config: general panel device configuration
- [out] ret_panel: Returned LCD panel handle

```c
esp_err_t esp_lcd_new_panel_ssd1306(const esp_lcd_panel_io_handle_t io, const esp_lcd_panel_dev_config_t *panel_dev_config, esp_lcd_panel_handle_t *ret_panel)
```

Create LCD panel for model SSD1306.

**Return**
- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_NO_MEM if out of memory
- ESP_OK on success

**Parameters**
- [in] io: LCD panel IO handle
- [in] panel_dev_config: general panel device configuration
- [out] ret_panel: Returned LCD panel handle

**Structures**

```c
struct esp_lcd_panel_dev_config_t
```

Configuration structure for panel device.

**Public Members**

- int reset_gpio_num
  - GPIO used to reset the LCD panel, set to -1 if it’s not used

```c
esp_lcd_color_space_t color_space
```

Set the color space used by the LCD panel

- unsigned int bits_per_pixel
  - Color depth, in bpp

- unsigned int reset_active_high : 1
  - Setting this if the panel reset is high level active

2.3.10 LED Control (LEDC)

**Introduction**

The LED control (LEDC) peripheral is primarily designed to control the intensity of LEDs, although it can also be used to generate PWM signals for other purposes. It has 8 channels which can generate independent waveforms that can be used, for example, to drive RGB LED devices.

The PWM controller can automatically increase or decrease the duty cycle gradually, allowing for fades without any processor interference.
Functionality Overview

Setting up a channel of the LEDC is done in three steps. Note that unlike ESP32, ESP32-S3 only supports configuring channels in “low speed” mode.

1. **Timer Configuration** by specifying the PWM signal’s frequency and duty cycle resolution.
2. **Channel Configuration** by associating it with the timer and GPIO to output the PWM signal.
3. **Change PWM Signal** that drives the output in order to change LED’s intensity. This can be done under the full control of software or with hardware fading functions.

As an optional step, it is also possible to set up an interrupt on fade end.

![Fig. 7: Key Settings of LED PWM Controller’s API](image)

**Timer Configuration** Setting the timer is done by calling the function `ledc_timer_config()` and passing the data structure `ledc_timer_config_t` that contains the following configuration settings:

- Speed mode (value must be `LEDC_LOW_SPEED_MODE`)
- Timer number `ledc_timer_t`
- PWM signal frequency
- Resolution of PWM duty
- Source clock `ledc_clk_config_t`

The frequency and the duty resolution are interdependent. The higher the PWM frequency, the lower the duty resolution which is available, and vice versa. This relationship might be important if you are planning to use this API for purposes other than changing the intensity of LEDs. For more details, see Section *Supported Range of Frequency and Duty Resolutions*.

The source clock can also limit the PWM frequency. The higher the source clock frequency, the higher the maximum PWM frequency can be configured.

Chapter 2. API Reference

**Note:** For ESP32-S3, all timers share one clock source. In other words, it is impossible to use different clock sources for different timers.

**Channel Configuration**  When the timer is set up, configure the desired channel (one out of `ledc_channel_t`). This is done by calling the function `ledc_channel_config()`. Similar to the timer configuration, the channel setup function should be passed a structure `ledc_channel_config_t` that contains the channel’s configuration parameters.

At this point, the channel should start operating and generating the PWM signal on the selected GPIO, as configured in `ledc_channel_config_t`, with the frequency specified in the timer settings and the given duty cycle. The channel operation (signal generation) can be suspended at any time by calling the function `ledc_stop()`.

**Change PWM Signal**  Once the channel starts operating and generating the PWM signal with the constant duty cycle and frequency, there are a couple of ways to change this signal. When driving LEDs, primarily the duty cycle is changed to vary the light intensity.

The following two sections describe how to change the duty cycle using software and hardware fading. If required, the signal’s frequency can also be changed; it is covered in Section Change PWM Frequency.

**Note:** All the timers and channels in the ESP32-S3’s LED PWM Controller only support low speed mode. Any change of PWM settings must be explicitly triggered by software (see below).

**Change PWM Duty Cycle Using Software**  To set the duty cycle, use the dedicated function `ledc_set_duty()`. After that, call `ledc_update_duty()` to activate the changes. To check the currently set value, use the corresponding `_get_` function `ledc_get_duty()`.

Another way to set the duty cycle, as well as some other channel parameters, is by calling `ledc_channel_config()` covered in Section Channel Configuration.

The range of the duty cycle values passed to functions depends on selected `duty_resolution` and should be from $0$ to $(2^{*duty\_resolution}) - 1$. For example, if the selected duty resolution is 10, then the duty cycle values can range from 0 to 1023. This provides the resolution of ~0.1%.

**Change PWM Duty Cycle using Hardware**  The LEDC hardware provides the means to gradually transition from one duty cycle value to another. To use this functionality, enable fading with `ledc_fade_func_install()` and then configure it by calling one of the available fading functions:

- `ledc_set_fade_with_time()`
- `ledc_set_fade_with_step()`
- `ledc_set_fade()`

Start fading with `ledc_fade_start()`. A fade can be operated in blocking or non-blocking mode, please check `ledc_fade_mode_t` for the difference between the two available fade modes. Note that with either fade mode, the next fade or fixed-duty update will not take effect until the last fade finishes or is stopped. `ledc_fade_stop()` has to be called to stop a fade that is in progress.

To get a notification about the completion of a fade operation, a fade end callback function can be registered for each channel by calling `ledc_cb_register()` after the fade service being installed.

If not required anymore, fading and an associated interrupt can be disabled with `ledc_fade_func_uninstall()`.
**Change PWM Frequency**  The LEDC API provides several ways to change the PWM frequency “on the fly”:

- Set the frequency by calling `ledc_set_freq()`. There is a corresponding function `ledc_get_freq()` to check the current frequency.
- Change the frequency and the duty resolution by calling `ledc_bind_channel_timer()` to bind some other timer to the channel.
- Change the channel’s timer by calling `ledc_channel_config()`.

**More Control Over PWM**  There are several lower level timer-specific functions that can be used to change PWM settings:

- `ledc_timer_set()`
- `ledc_timer_rst()`
- `ledc_timer_pause()`
- `ledc_timer_resume()`

The first two functions are called “behind the scenes” by `ledc_channel_config()` to provide a startup of a timer after it is configured.

**Use Interrupts**  When configuring an LEDC channel, one of the parameters selected within `ledc_channel_config_t` is `ledc_intr_type_t` which triggers an interrupt on fade completion.

For registration of a handler to address this interrupt, call `ledc_isr_register()`.

**Supported Range of Frequency and Duty Resolutions**

The LED PWM Controller is designed primarily to drive LEDs. It provides a large flexibility of PWM duty cycle settings. For instance, the PWM frequency of 5 kHz can have the maximum duty resolution of 13 bits. This means that the duty can be set anywhere from 0 to 100% with a resolution of -0.012% (2 ** 13 = 8192 discrete levels of the LED intensity). Note, however, that these parameters depend on the clock signal clocking the LED PWM Controller timer which in turn clocks the channel (see timer configuration and the ESP32-S3 Technical Reference Manual > LED PWM Controller (LEDC) [PDF]).

The LEDC can be used for generating signals at much higher frequencies that are sufficient enough to clock other devices, e.g., a digital camera module. In this case, the maximum available frequency is 40 MHz with duty resolution of 1 bit. This means that the duty cycle is fixed at 50% and cannot be adjusted.

The LEDC API is designed to report an error when trying to set a frequency and a duty resolution that exceed the range of LEDC’s hardware. For example, an attempt to set the frequency to 20 MHz and the duty resolution to 3 bits will result in the following error reported on a serial monitor:

```
E (196) ledc: requested frequency and duty resolution cannot be achieved, try--
    reducing freq_hz or duty_resolution. div_param=128
```

In such a situation, either the duty resolution or the frequency must be reduced. For example, setting the duty resolution to 2 will resolve this issue and will make it possible to set the duty cycle at 25% steps, i.e., at 25%, 50% or 75%.

The LEDC driver will also capture and report attempts to configure frequency / duty resolution combinations that are below the supported minimum, e.g.:

```
E (196) ledc: requested frequency and duty resolution cannot be achieved, try--
    increasing freq_hz or duty_resolution. div_param=128000000
```

The duty resolution is normally set using `ledc_timer_bit_t`. This enumeration covers the range from 10 to 15 bits. If a smaller duty resolution is required (from 10 down to 1), enter the equivalent numeric values directly.
Chapter 2. API Reference

Application Example

The LEDC change duty cycle and fading control example: peripherals/ledc/ledc_fade.
The LEDC basic example: peripherals/ledc/ledc_basic.

API Reference

Header File

- components/driver/include/driver/ledc.h

Functions

`esp_err_t ledc_channel_config(const ledc_channel_config_t *ledc_conf)`

LEDC channel configuration Configure LEDC channel with the given channel/output gpio_num/interrupt/source timer/frequency(Hz)/LEDC duty resolution.

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- `ledc_conf`: Pointer of LEDC channel configure struct

`esp_err_t ledc_timer_config(const ledc_timer_config_t *timer_conf)`

LEDC timer configuration Configure LEDC timer with the given source timer/frequency(Hz)/duty_resolution.

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_FAIL Can not find a proper pre-divider number base on the given frequency and the current duty_resolution.

Parameters

- `timer_conf`: Pointer of LEDC timer configure struct

`esp_err_t ledc_update_duty(ledc_mode_t speed_mode, ledc_channel_t channel)`

LEDC update channel parameters.

Note Call this function to activate the LEDC updated parameters. After ledc_set_duty, we need to call this function to update the settings. And the new LEDC parameters don’t take effect until the next PWM cycle.

Note ledc_set_duty, ledc_set_duty_with_hpoint and ledc_update_duty are not thread-safe, do not call these functions to control one LEDC channel in different tasks at the same time. A thread-safe version of API is ledc_set_duty_and_update

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- `speed_mode`: Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- `channel`: LEDC channel (0 - LEDC_CHANNEL_MAX-1), select from ledc_channel_t

`esp_err_t ledc_set_pin(int gpio_num, ledc_mode_t speed_mode, ledc_channel_t ledc_channel)`

Set LEDC output gpio.

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- `gpio_num`: The LEDC output gpio
- `speed_mode`: Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- `ledc_channel`: LEDC channel (0 - LEDC_CHANNEL_MAX-1), select from ledc_channel_t
**esp_err_t ledc_stop (ledc_mode_t speed_mode, ledc_channel_t channel, uint32_t idle_level)**

LEDC stop. Disable LEDC output, and set idle level.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- speed_mode: Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- channel: LEDC channel (0 - LEDC_CHANNEL_MAX-1), select from ledc_channel_t
- idle_level: Set output idle level after LEDC stops.

**esp_err_t ledc_set_freq (ledc_mode_t speed_mode, ledc_timer_t timer_num, uint32_t freq_hz)**

LEDC set channel frequency (Hz)

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_FAIL Can not find a proper pre-divider number base on the given frequency and the current duty_resolution.

**Parameters**
- speed_mode: Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- timer_num: LEDC timer index (0-3), select from ledc_timer_t
- freq_hz: Set the LEDC frequency

**uint32_t ledc_get_freq (ledc_mode_t speed_mode, ledc_timer_t timer_num)**

LEDC get channel frequency (Hz)

**Return**
- 0 error
- Others Current LEDC frequency

**Parameters**
- speed_mode: Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- timer_num: LEDC timer index (0-3), select from ledc_timer_t

**esp_err_t ledc_set_duty_with_hpoint (ledc_mode_t speed_mode, ledc_channel_t channel, uint32_t duty, uint32_t hpoint)**

LEDC set duty and hpoint value. Only after calling ledc_update_duty will the duty update.

**Note**
ledc_set_duty, ledc_set_duty_with_hpoint and ledc_update_duty are not thread-safe, do not call these functions to control one LEDC channel in different tasks at the same time. A thread-safe version of API is ledc_set_duty_and_update.

**Note**
For ESP32, hardware does not support any duty change while a fade operation is running in progress on that channel. Other duty operations will have to wait until the fade operation has finished.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- speed_mode: Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- channel: LEDC channel (0 - LEDC_CHANNEL_MAX-1), select from ledc_channel_t
- duty: Set the LEDC duty, the range of duty setting is \[0, (2**duty_resolution) - 1\]
- hpoint: Set the LEDC hpoint value(max: 0xfffff)

**int ledc_get_hpoint (ledc_mode_t speed_mode, ledc_channel_t channel)**

LEDC get hpoint value, the counter value when the output is set high level.

**Return**
- LEDC_ERR_VAL if parameter error
- Others Current hpoint value of LEDC channel

**Parameters**
• speed_mode: Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
• channel: LEDC channel (0 - LEDC_CHANNEL_MAX-1), select from ledc_channel_t

```c
esp_err_t ledc_set_duty (ledc_mode_t speed_mode, ledc_channel_t channel, uint32_t duty)
```
LEDC set duty This function do not change the hpoint value of this channel. if needed, please call ledc_set_duty_with_hpoint. only after calling ledc_update_duty will the duty update.

**Note** ledc_set_duty, ledc_set_duty_with_hpoint and ledc_update_duty are not thread-safe, do not call these functions to control one LEDC channel in different tasks at the same time. A thread-safe version of API is ledc_set_duty_and_update.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- speed_mode: Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- channel: LEDC channel (0 - LEDC_CHANNEL_MAX-1), select from ledc_channel_t
- duty: Set the LEDC duty, the range of duty setting is \([0, (2^{**duty_resolution}) - 1]\)

```c
uint32_t ledc_get_duty (ledc_mode_t speed_mode, ledc_channel_t channel)
```
LEDC get duty This function returns the duty at the present PWM cycle. You shouldn’t expect the function to return the new duty in the same cycle of calling ledc_update_duty, because duty update doesn’t take effect until the next cycle.

**Return**
- LEDC_ERR_DUTY if parameter error
- Others Current LEDC duty

**Parameters**
- speed_mode: Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- channel: LEDC channel (0 - LEDC_CHANNEL_MAX-1), select from ledc_channel_t
- duty: Set the LEDC duty, the range of duty setting is \([0, (2^{**duty_resolution}) - 1]\)

```c
esp_err_t ledc_set_fade (ledc_mode_t speed_mode, ledc_channel_t channel, uint32_t duty,
ledc_duty_direction_t fade_direction, uint32_t step_num, uint32_t duty_cycle_num,
uint32_t duty_scale)
```
LEDC set gradient Set LEDC gradient, After the function calls the ledc_update_duty function, the function can take effect.

**Note** For ESP32, hardware does not support any duty change while a fade operation is running on that channel. Other duty operations will have to wait until the fade operation has finished.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- speed_mode: Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- channel: LEDC channel (0 - LEDC_CHANNEL_MAX-1), select from ledc_channel_t
- duty: Set the start of the gradient duty, the range of duty setting is \([0, (2^{**duty_resolution}) - 1]\)
- fade_direction: Set the direction of the gradient
- step_num: Set the number of the gradient
- duty_cycle_num: Set how many LEDC tick each time the gradient lasts
- duty_scale: Set gradient change amplitude

```c
esp_err_t ledc_isr_register (void (*fn) void * arg, int intr_alloc_flags, ledc_isr_handle_t *handle)
```
Register LEDC interrupt handler, the handler is an ISR. The handler will be attached to the same CPU core that this function is running on.

**Return**
- ESP_OK Success
• ESP_ERR_INVALID_ARG Function pointer error.

**Parameters**
- fn: Interrupt handler function.
- arg: User-supplied argument passed to the handler function.
- intr_alloc_flags: Flags used to allocate the interrupt. One or multiple (ORed) ESP_INTR_FLAG_* values. See esp_intr_alloc.h for more info.
- handle: Pointer to return handle. If non-NULL, a handle for the interrupt will be returned here.

```c
esp_err_t ledc_timer_set (ledc_mode_t speed_mode, ledc_timer_t timer_sel, uint32_t clock_divider, uint32_t duty_resolution, ledc_clk_src_t clk_src)
```

Configure LEDC settings.

**Return**
- (-1) Parameter error
- Other Current LEDC duty

**Parameters**
- speed_mode: Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- timer_sel: Timer index (0-3), there are 4 timers in LEDC module
- clock_divider: Timer clock divide value, the timer clock is divided from the selected clock source
- duty_resolution: Resolution of duty setting in number of bits. The range of duty values is [0, (2**duty_resolution)]
- clk_src: Select LEDC source clock.

```c
esp_err_t ledc_timer_rst (ledc_mode_t speed_mode, ledc_timer_t timer_sel)
```

Reset LEDC timer.

**Return**
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

**Parameters**
- speed_mode: Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- timer_sel: LEDC timer index (0-3), select from ledc_timer_t

```c
esp_err_t ledc_timer_pause (ledc_mode_t speed_mode, ledc_timer_t timer_sel)
```

Pause LEDC timer counter.

**Return**
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

**Parameters**
- speed_mode: Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- timer_sel: LEDC timer index (0-3), select from ledc_timer_t

```c
esp_err_t ledc_timer_resume (ledc_mode_t speed_mode, ledc_timer_t timer_sel)
```

Resume LEDC timer.

**Return**
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

**Parameters**
- speed_mode: Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- timer_sel: LEDC timer index (0-3), select from ledc_timer_t

```c
esp_err_t ledc_bind_channel_timer (ledc_mode_t speed_mode, ledc_channel_t channel, ledc_timer_t timer_sel)
```

Bind LEDC channel with the selected timer.

**Return**
Chapter 2. API Reference

- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

**Parameters**
- **speed_mode**: Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel**: LEDC channel index (0 - LEDC_CHANNEL_MAX-1), select from ledc_channel_t
- **timer_sel**: LEDC timer index (0-3), select from ledc_timer_t

```c
esp_err_t ledc_set_fade_with_step(ledc_mode_t speed_mode, ledc_channel_t channel, uint32_t target_duty, uint32_t scale, uint32_t cycle_num)
```

Set LEDC fade function.

**Note**
Call ledc_fade_func_install() once before calling this function. Call ledc_fade_start() after this to start fading.

**Note**
ledc_set_fade_with_step, ledc_set_fade_with_time and ledc_fade_start are not thread-safe, do not call these functions to control one LEDC channel in different tasks at the same time. A thread-safe version of API is ledc_set_fade_step_and_start

**Note**
For ESP32, hardware does not support any duty change while a fade operation is running in progress on that channel. Other duty operations will have to wait until the fade operation has finished.

**Return**
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success
- ESP_ERR_INVALID_STATE Fade function not installed.
- ESP_FAIL Fade function init error

**Parameters**
- **speed_mode**: Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel**: LEDC channel index (0 - LEDC_CHANNEL_MAX-1), select from ledc_channel_t
- **target_duty**: Target duty of fading [0, (2**duty_resolution) - 1]
- **scale**: Controls the increase or decrease step scale.
- **cycle_num**: increase or decrease the duty every cycle_num cycles

```c
esp_err_t ledc_set_fade_with_time(ledc_mode_t speed_mode, ledc_channel_t channel, uint32_t target_duty, int max_fade_time_ms)
```

Set LEDC fade function, with a limited time.

**Note**
Call ledc_fade_func_install() once before calling this function. Call ledc_fade_start() after this to start fading.

**Note**
ledc_set_fade_with_step, ledc_set_fade_with_time and ledc_fade_start are not thread-safe, do not call these functions to control one LEDC channel in different tasks at the same time. A thread-safe version of API is ledc_set_fade_step_and_start

**Note**
For ESP32, hardware does not support any duty change while a fade operation is running in progress on that channel. Other duty operations will have to wait until the fade operation has finished.

**Return**
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success
- ESP_ERR_INVALID_STATE Fade function not installed.
- ESP_FAIL Fade function init error

**Parameters**
- **speed_mode**: Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel**: LEDC channel index (0 - LEDC_CHANNEL_MAX-1), select from ledc_channel_t
- **target_duty**: Target duty of fading [0, (2**duty_resolution) - 1]
- **max_fade_time_ms**: The maximum time of the fading (ms).

```c
esp_err_t ledc_fade_func_install(int intr_alloc_flags)
```

Install LEDC fade function. This function will occupy interrupt of LEDC module.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_STATE Fade function already installed.
Chapter 2. API Reference

Parameters

• **intr_alloc_flags**: Flags used to allocate the interrupt. One or multiple (ORred) ESP_INTR_FLAG_* values. See esp_intr_alloc.h for more info.

```c
void ledc_fade_func_uninstall (void)
```

Uninstall LEDC fade function.

```c
esp_err_t ledc_fade_start (ledc_mode_t speed_mode, ledc_channel_t channel, ledc_fade_mode_t fade_mode)
```

Start LEDC fading.

**Note**  
Call `ledc_fade_func_install()` once before calling this function. Call this API right after `ledc_set_fade_with_time` or `ledc_set_fade_with_step` before to start fading.

**Note**  
Starting fade operation with this API is not thread-safe, use with care.

**Note**  
For ESP32, hardware does not support any duty change while a fade operation is running in progress on that channel. Other duty operations will have to wait until the fade operation has finished.

**Return**

• ESP_OK Success
• ESP_ERR_INVALID_STATE Fade function not installed.
• ESP_ERR_INVALID_ARG Parameter error.

Parameters

• **speed_mode**: Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
• **channel**: LEDC channel number
• **fade_mode**: Whether to block until fading done. See ledc_types.h `ledc_fade_mode_t` for more info. Note that this function will not return until fading to the target duty if `LEDC_FADE_WAIT_DONE` mode is selected.

```c
esp_err_t ledc_fade_stop (ledc_mode_t speed_mode, ledc_channel_t channel)
```

Stop LEDC fading. Duty of the channel will stay at its present value.

**Note**  
This API can be called if a new fixed duty or a new fade want to be set while the last fade operation is still running in progress.

**Note**  
Call this API will abort the fading operation only if it was started by calling `ledc_fade_start` with `LEDC_FADE_NO_WAIT` mode.

**Note**  
If a fade was started with `LEDC_FADE_WAIT_DONE` mode, calling this API afterwards is no use in stopping the fade. Fade will continue until it reaches the target duty.

**Return**

• ESP_OK Success
• ESP_ERR_INVALID_STATE Fade function not installed.
• ESP_ERR_INVALID_ARG Parameter error.

Parameters

• **speed_mode**: Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
• **channel**: LEDC channel number

```c
esp_err_t ledc_set_duty_and_update (ledc_mode_t speed_mode, ledc_channel_t channel, uint32_t duty, uint32_t hpoint)
```

A thread-safe API to set duty for LEDC channel and return when duty updated.

**Note**  
For ESP32, hardware does not support any duty change while a fade operation is running in progress on that channel. Other duty operations will have to wait until the fade operation has finished.

**Parameters**

• **speed_mode**: Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
• **channel**: LEDC channel (0 - LEDC_CHANNEL_MAX-1), select from `ledc_channel_t`
• **duty**: Set the LEDC duty, the range of duty setting is [0, (2**duty_resolution) - 1]
• **hpoint**: Set the LEDC hpoint value(max: 0xfffff)

```c
esp_err_t ledc_set_fade_time_and_start (ledc_mode_t speed_mode, ledc_channel_t channel, uint32_t target_duty, uint32_t max_fade_time_ms, ledc_fade_mode_t fade_mode)
```

A thread-safe API to set and start LEDC fade function, with a limited time.
Note Call ledc_fade_func_install() once, before calling this function.

Note For ESP32, hardware does not support any duty change while a fade operation is running in progress on that channel. Other duty operations will have to wait until the fade operation has finished.

Return
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success
- ESP_ERR_INVALID_STATE Fade function not installed.
- ESP_FAIL Fade function init error

Parameters
- speed_mode: Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- channel: LEDC channel index (0 - LEDC_CHANNEL_MAX-1), select from ledc_channel_t
- target_duty: Target duty of fading [0, (2**duty_resolution) - 1]
- fade_mode: choose blocking or non-blocking mode

```c
esp_err_t ledc_set_fade_step_and_start(ledc_mode_t speed_mode, ledc_channel_t channel, uint32_t target_duty, uint32_t scale, uint32_t cycle_num, ledc_fade_mode_t fade_mode)
```

A thread-safe API to set and start LEDC fade function.

Note Call ledc_fade_func_install() once before calling this function.

Note For ESP32, hardware does not support any duty change while a fade operation is running in progress on that channel. Other duty operations will have to wait until the fade operation has finished.

Return
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success
- ESP_ERR_INVALID_STATE Fade function not installed.
- ESP_FAIL Fade function init error

Parameters
- speed_mode: Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- channel: LEDC channel index (0 - LEDC_CHANNEL_MAX-1), select from ledc_channel_t
- target_duty: Target duty of fading [0, (2**duty_resolution) - 1]
- scale: Controls the increase or decrease step scale.
- cycle_num: increase or decrease the duty every cycle_num cycles
- fade_mode: choose blocking or non-blocking mode

```c
esp_err_t ledc_cb_register(ledc_mode_t speed_mode, ledc_channel_t channel, ledc_cbs_t *cbs, void *user_arg)
```

LEDC callback registration function.

Note The callback is called from an ISR, it must never attempt to block, and any FreeRTOS API called must be ISR capable.

Return
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success
- ESP_ERR_INVALID_STATE Fade function not installed.
- ESP_FAIL Fade function init error

Parameters
- speed_mode: Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- channel: LEDC channel index (0 - LEDC_CHANNEL_MAX-1), select from ledc_channel_t
- cbs: Group of LEDC callback functions
- user_arg: user registered data for the callback function

Structures

```c
struct ledc_channel_config_t
```

Configuration parameters of LEDC channel for ledc_channel_config function.
Public Members

```c
int gpio_num
    the LEDC output gpio_num, if you want to use gpio16, gpio_num = 16

ledc_mode_t speed_mode
    LEDC speed speed_mode, high-speed mode or low-speed mode

ledc_channel_t channel
    LEDC channel (0 - 7)

ledc_intr_type_t intr_type
    configure interrupt, Fade interrupt enable or Fade interrupt disable

ledc_timer_t timer_sel
    Select the timer source of channel (0 - 3)

uint32_t duty
    LEDC channel duty, the range of duty setting is [0, (2**duty_resolution)]

int hpoint
    LEDC channel hpoint value, the max value is 0xfffff

unsigned int output_invert : 1
    Enable (1) or disable (0) gpio output invert

struct ledc_channel_config_t::[anonymous] flags
    LEDC flags

struct ledc_timer_config_t
    Configuration parameters of LEDC Timer timer for ledc_timer_config function.
```

Public Members

```c
ledc_mode_t speed_mode
    LEDC speed speed_mode, high-speed mode or low-speed mode

ledc_timer_bit_t duty_resolution
    LEDC channel duty resolution

ledc_timer_bit_t bit_num
    Deprecated in ESP-IDF 3.0. This is an alias to ‘duty_resolution’ for backward compatibility with ESP-IDF 2.1

ledc_timer_t timer_num
    The timer source of channel (0 - 3)

uint32_t freq_hz
    LEDC timer frequency (Hz)

ledc_clkCfg_t clk_cfg
    Configure LEDC source clock. For low speed channels and high speed channels, you can specify the source clock using LEDC_USE_REF_TICK, LEDC_USE_APB_CLK or LEDC_AUTO_CLK. For low speed channels, you can also specify the source clock using LEDC_USE_RTC8M_CLK, in this case, all low speed channel’s source clock must be RTC8M_CLK

struct ledc_cb_param_t
    LEDC callback parameter.
```

Public Members

```c
ledc_cb_event_t event
    Event name
```
Chapter 2. API Reference

```c
uint32_t speed_mode
        Speed mode of the LEDC channel group

uint32_t channel
        LEDC channel (0 - LEDC_CHANNEL_MAX-1)

uint32_t duty
        LEDC current duty of the channel, the range of duty is [0, (2^duty_resolution) - 1]

struct ledc_cbs_t
        Group of supported LEDC callbacks.

Note: The callbacks are all running under ISR environment

Public Members

lede_cb_t fade_cb
        LEDC fade_end callback function

Macros

LEDC_APB_CLK_HZ
LEDC_REF_CLK_HZ
LEDC_ERR_DUTY
LEDC_ERR_VAL

Type Definitions

typedef intr_handle_t ledc_isr_handle_t

typedef bool (*lede_cb_t)(const ledc_cb_param_t *param, void *user_arg)
        Type of LEDC event callback.

Parameters

        • param: LEDC callback parameter
        • user_arg: User registered data

Enumerations

enum ledc_cb_event_t
        LEDC callback event type.

Values:

        LEDC_FADE_END_EVT
        LEDC fade end event

Header File

• components/hal/include/hal/ledc_types.h

Enumerations

enum ledc_mode_t
        Values:

        LEDC_LOW_SPEED_MODE
        LEDC low speed speed_mode

        LEDC_SPEED_MODE_MAX
        LEDC speed limit

enum ledc_intr_type_t
        Values:
```
Chapter 2. API Reference

```c
LED_INTR_DISABLE = 0
    Disable LEDC interrupt
LED_INTR_FADE_END
    Enable LEDC interrupt
LED_INTR_MAX
```

`enum ledc_duty_direction_t`

*Values:*

- **LEDC_DUTY_DIR_DECREASE = 0**
  LEDC duty decrease direction
- **LEDC_DUTY_DIR_INCREASE = 1**
  LEDC duty increase direction
- **LEDC_DUTY_DIR_MAX**

`enum ledc_slow_clk_sel_t`

*Values:*

- **LEDC_SLOW_CLK_RTC8M = 0**
  LEDC low speed timer clock source is 8MHz RTC clock
- **LEDC_SLOW_CLK_APB**
  LEDC low speed timer clock source is 80MHz APB clock
- **LEDC_SLOW_CLK_XTAL**
  LEDC low speed timer clock source XTAL clock

`enum ledc_clk_cfg_t`

In theory, the following enumeration shall be placed in LEDC driver’s header. However, as the next enumeration, `ledc_clk_src_t`, makes the use of some of these values and to avoid mutual inclusion of the headers, we must define it here.

*Values:*

- **LEDC_AUTO_CLK = 0**
  The driver will automatically select the source clock (REF_TICK or APB) based on the giving resolution and duty parameter when init the timer
- **LEDC_USE_APB_CLK**
  LEDC timer select APB clock as source clock
- **LEDC_USE_RTC8M_CLK**
  LEDC timer select RTC8M_CLK as source clock. Only for low speed channels and this parameter must be the same for all low speed channels
- **LEDC_USE_XTAL_CLK**
  LEDC timer select XTAL clock as source clock

`enum ledc_clk_src_t`

*Values:*

- **LEDC_APB_CLK = LEDC_USE_APB_CLK**
  LEDC timer clock divided from APB clock (80Mhz)
- **LEDC_SCLK = LEDC_USE_APB_CLK**
  Selecting this value for LEDC_TICK_SEL_TIMER let the hardware take its source clock from LEDC_APB_CLK_SEL

`enum ledc_timer_t`

*Values:*

- **LEDC_TIMER_0 = 0**
  LEDC timer 0
```
Chapter 2. API Reference

```c
enum ledc_channel_t
Values:
LEDC_CHANNEL_0 = 0
LEDC_CHANNEL_1
LEDC_CHANNEL_2
LEDC_CHANNEL_3
LEDC_CHANNEL_4
LEDC_CHANNEL_5
LEDC_CHANNEL_6
LEDC_CHANNEL_7
LEDC_CHANNEL_MAX
```

```c
enum ledc_timer_bit_t
Values:
LEDC_TIMER_1_BIT = 1
LEDC_TIMER_2_BIT
LEDC_TIMER_3_BIT
LEDC_TIMER_4_BIT
LEDC_TIMER_5_BIT
LEDC_TIMER_6_BIT
LEDC_TIMER_7_BIT
LEDC_TIMER_8_BIT
LEDC_TIMER_9_BIT
```

LED_C.Timer 1
LED_C.timer 2
LED_C.timer 3
LED_C_TIMER_MAX
Chapter 2. API Reference

LEDC_TIMER_10_BIT
LEDC PWM duty resolution of 10 bits

LEDC_TIMER_11_BIT
LEDC PWM duty resolution of 11 bits

LEDC_TIMER_12_BIT
LEDC PWM duty resolution of 12 bits

LEDC_TIMER_13_BIT
LEDC PWM duty resolution of 13 bits

LEDC_TIMER_14_BIT
LEDC PWM duty resolution of 14 bits

LEDC_TIMER_BIT_MAX

enum ledc_fade_mode_t
Values:

LEDC_FADE_NO_WAIT = 0
LEDC fade function will return immediately

LEDC_FADE_WAIT_DONE
LEDC fade function will block until fading to the target duty

LEDC_FADE_MAX

2.3.11 Motor Control Pulse Width Modulator (MCPWM)

ESP32-S3 has two MCPWM units which can be used to control different types of motors. Each unit has three pairs of PWM outputs.

More detailed block diagram of the MCPWM unit is shown below. Each A/B pair may be clocked by any one of the three timers Timer 0, 1 and 2. The same timer may be used to clock more than one pair of PWM outputs. Each unit is also able to collect inputs such as SYNC SIGNALS, detect FAULT SIGNALS like motor overcurrent or overvoltage, as well as obtain feedback with CAPTURE SIGNALS on e.g. a rotor position.

Description of this API starts with configuration of MCPWM’s Timer and Generator submodules to provide the basic motor control functionality. Then it discusses more advanced submodules and functionalities of a Fault Handler, signal Capture and Carrier.
Chapter 2. API Reference

Fig. 9: MCPWM Block Diagram

Contents

- **Configure** a basic functionality of the outputs
- **Operate** the outputs to drive a motor
- **Adjust** how the motor is driven
- **Synchronize** sync timers to work together
- **Capture** external signals to provide additional control over the outputs
- Use **Fault Handler** to detect and manage faults
- Add a higher frequency **Carrier**, if output signals are passed through an isolation transformer
- Extra configuration of **Resolution**.

Configure

The scope of configuration depends on the motor type, in particular how many outputs and inputs are required, and what will be the sequence of signals to drive the motor.

In this case we will describe a simple configuration to control a brushed DC motor that is using only some of the available MCPWM’s resources. An example circuit is shown below. It includes a **H-Bridge** to switch polarization of a voltage applied to the motor (M) and to provide sufficient current to drive it.

Configuration covers the following steps:

1. Selection of a MCPWM unit that will be used to drive the motor. There are two units available on-board of ESP32-S3 and enumerated in `mcpwm_unit_t`.
2. Initialization of two GPIOs as output signals within selected unit by calling `mcpwm_gpio_init()`. The two output signals are typically used to command the motor to rotate right or left. All available signal options are listed in `mcpwm_io_signals_t`. To set more than a single pin at a time, use function `mcpwm_set_pin()` together with `mcpwm_pin_config_t`.
3. Selection of a timer. There are three timers available within the unit. The timers are listed in `mcpwm_timer_t`. 
4. Setting of the timer frequency and initial duty within `mcpwm_config_t` structure.
5. Setting timer resolution if necessary, by calling `mcpwm_group_set_resolution()` and `mcpwm_timer_set_resolution()`.
6. Calling of `mcpwm_init()` with the above parameters to make the configuration effective.

**Operate**

To operate a motor connected to the MCPWM unit, e.g. turn it left or right, or vary the speed, we should apply some control signals to the unit’s outputs. The outputs are organized into three pairs. Within a pair they are labeled “A” and “B” and each driven by a submodule called an “Generator”. To provide a PWM signal, the Operator itself, which contains two Generators, should be clocked by one of three available Timers. To make the API simpler, each Timer is automatically associated by the API to drive an Operator of the same index, e.g. Timer 0 is associated with Operator 0.

There are the following basic ways to control the outputs:

- We can drive particular signal steady high or steady low with function `mcpwm_set_signal_high()` or `mcpwm_set_signal_low()`. This will make the motor to turn with a maximum speed or stop. Depending on selected output A or B the motor will rotate either right or left.
- Another option is to drive the outputs with the PWM signal by calling `mcpwm_start()` or `mcpwm_stop()`. The motor speed will be proportional to the PWM duty.
- To vary PWM’s duty call `mcpwm_set_duty()` and provide the duty value in %. Optionally, you may call `mcpwm_set_duty_in_us()`, if you prefer to set the duty in microseconds. Checking of currently set value is possible by calling `mcpwm_get_duty()`. Phase of the PWM signal may be altered by calling `mcpwm_set_duty_type()`. The duty is set individually for each A and B output using `mcpwm_generator_t` in specific function calls. The duty value refers either to high or low output signal duration. This is configured when calling `mcpwm_init()`, as discussed in section **Configure**, and selecting one of options from `mcpwm_duty_type_t`.

**Note:** Call function `mcpwm_set_duty_type()` every time after `mcpwm_set_signal_high()` or `mcpwm_set_signal_low()` to resume with previously set duty cycle.
Adjust

There are couple of ways to adjust a signal on the outputs and changing how the motor operates.

- Set specific PWM frequency by calling `mcpwm_set_frequency()`. This may be required to adjust to electrical or mechanical characteristics of particular motor and driver. To check what frequency is set, use function `mcpwm_get_frequency()`.
- Introduce a dead time between outputs A and B when they are changing the state to reverse direction of the motor rotation. This is to make up for on/off switching delay of the motor driver FETs. The dead time options are defined in `mcpwm_deadtime_type_t` and enabled by calling `mcpwm_deadtime_enable()`. To disable this functionality call `mcpwm_deadtime_disable()`.
- Synchronize outputs of operator submodules, e.g. to get raising edge of PWM0A/B and PWM1A/B to start exactly at the same time, or shift them between each other by a given phase. Synchronization is triggered by SYNC SIGNALS shown on the block diagram of the MCPWM above, and defined in `mcpwm_sync_signal_t`. To attach the signal to a GPIO call `mcpwm_gpio_init()`. You can then enable synchronization with function `mcpwm_sync_configure()`. As input parameters provide MCPWM unit, timer to synchronize, the synchronization signal and a phase to delay the timer.

**Note:** Synchronization signals are referred to using two different enumerations. First one `mcpwm_io_signals_t` is used together with function `mcpwm_gpio_init()` when selecting a GPIO as the signal input source. The second one `mcpwm_sync_signal_t` is used when enabling or disabling synchronization with `mcpwm_sync_configure()` or `mcpwm_sync_disable()`.

- Vary the pattern of the A/B output signals by getting MCPWM counters to count up, down and up/down (automatically changing the count direction). Respective configuration is done when calling `mcpwm_init()`, as discussed in section Configure, and selecting one of counter types from `mcpwm_counter_type_t`. For explanation of how A/B PWM output signals are generated, see ESP32-S3 Technical Reference Manual > Motor Control PWM (MCPWM) [PDF].

Synchronize

Each PWM timer has a synchronization input and a synchronization output. The synchronization input can be selected from other timers’ synchronization outputs or GPIO signals via the GPIO matrix. Timer’s synchronization signal can be generated from either the input sync signal or when the count value reaches peak/zero. Thus, the PWM timers can be chained together with their phase-locked. During synchronization, the PWM timer clock prescaler will reset its counter in order to synchronize the PWM timer clock.

The functionality is enabled in following steps:

1. Make sure the PWM timer and operator are already configured so that sync will inherit its config (count mode, freq and duty).
2. Enabling sync input of the timer by invoking `mcpwm_sync_configure()`, selecting desired signal input from `mcpwm_sync_signal_t`, and setting the desired phase range from 0 to 999 which is mapped to 0%~99.9%. 0 means zero phase is applied and output is fired at the same time. And selecting desired counting direction.
3. Enabling one of sync event source from another timer or from external GPIO input.

To sync with another timer:

Enabling sync output of another timer by invoking `mcpwm_set_timer_sync_output()` and selecting desired event to generate sync output from `mcpwm_timer_sync_trigger_t`.

To sync with GPIO positive edge input (negative edge requires `mcpwm_sync_invert_gpio_synchro()`):

Configuring GPIOs to act as the sync signal inputs by calling functions `mcpwm_gpio_init()` or `mcpwm_set_pin()`, which were described in section Configure.

It’s normal condition that chained sync signal may have tens or even hundreds of nanoseconds of delay between each timer output due to hardware limitation. To sync two timers accurately it is required to have the third timer occupied to produce sync event that can be consumed parallel by other two timer, so that those two timer will have
no delay between each other but have the same delay between the timer which provides events. Another solution is introducing an external GPIO event source so that all three timers can be synced together with no delay.

Software sync event which triggered on one timer can be propagated to other timers on ESP32-S3, which can be used as a tricky way to get all three timers synced without any extra requirement.

```c
// configure timer0 as trigger source
mcpwm_set_timer_sync_output(MCPWM_UNIT_0, MCPWM_TIMER_0, MCPWM_SWSYNC_SOURCE_,
  &SYNCIN);
mcpwm_sync_config_t sync_conf = {
  .sync_sig = MCPWM_SELECT_TIMER0_SYNC,
  .timer_val = 0,
  .count_direction = MCPWM_TIMER_DIRECTION_UP,
};
mcpwm_sync_configure(TARGET_MCPWM_UNIT, MCPWM_TIMER_0, &sync_conf);
mcpwm_sync_configure(TARGET_MCPWM_UNIT, MCPWM_TIMER_1, &sync_conf);
mcpwm_sync_configure(TARGET_MCPWM_UNIT, MCPWM_TIMER_2, &sync_conf);
// then send soft sync event to timer0
mcpwm_timer_trigger_soft_sync(MCPWM_UNIT_0, MCPWM_TIMER_0);
```

If not required anymore, the capture functionality may be disabled with `mcpwm_sync_disable()`.

**Capture**

One of requirements of BLDC (Brushless DC, see figure below) motor control is sensing of the rotor position. To facilitate this task each MCPWM unit provides three sensing inputs together with dedicated hardware. The hardware is able to detect the input signal’s edge and measure time between signals. As result the control software is simpler and the CPU power may be used for other tasks.

![Fig. 11: Example of Brushless DC Motor Control with MCPWM](image)

The capture functionality may be used for other types of motors or tasks. The functionality is enabled in two steps:

1. Configuration of GPIOs to act as the capture signal inputs by calling functions `mcpwm_gpio_init()` or `mcpwm_set_pin()`, that were described in section Configure.
2. Enabling of the functionality itself by invoking `mcpwm_capture_enable_channel()`, selecting desired signal input from `mcpwm_capture_channel_id_t`, setting the signal edge, signal count prescaler and user callback within `mcpwm_capture_config_t`.

Within the second step above a 32-bit capture timer is enabled. The timer runs continuously driven by the APB clock. The clock frequency is typically 80 MHz. On each capture event the capture timer’s value is stored in timestamp register that may be then checked by calling `mcpwm_capture_signal_get_value()`. The edge of the last signal may be checked with `mcpwm_capture_signal_get_edge()`. Those data are also provided inside callback function as event data `cap_event_data_t`.

If not required anymore, the capture functionality may be disabled with `mcpwm_capture_disable_channel()`.

Capture prescale is different from other modules as it is applied to the input signal, not the timer source. Prescaler has maintained its own level state with the initial value set to low and is detecting the positive edge of the input signal to change its internal state. That means if two pairs of positive and negative edges are passed to input, the prescaler’s internal state will change twice. ISR will report on this internal state change, not the input signal. For example, setting prescale to 2 will generate ISR callback on each positive edge of input if both edge is selected via `mcpwm_capture_config_t`. Or each 2 positive edges of input if only one edge is selected though `mcpwm_capture_config_t`.

**Fault Handler**

Each unit of the MCPWM is able to sense external signals with information about failure of the motor, the motor driver or any other device connected to the MCPWM. There are three fault inputs per unit that may be routed to user selectable GPIOs. The MCPWM may be configured to perform one of four predefined actions on A/B outputs when a fault signal is received:

- lock current state of the output
- set the output low
- set the output high
- toggle the output

The user should determine possible failure modes of the motor and what action should be performed on detection of particular fault, e.g. drive all outputs low for a brushed motor, or lock current state for a stepper motor, etc. As result of this action the motor should be put into a safe state to reduce likelihood of a damage caused by the fault.

The fault handler functionality is enabled in two steps:

1. Configuration of GPIOs to act as fault signal inputs. This is done in analogous way as described for capture signals in section above. It includes setting the signal level to trigger the fault as defined in `mcpwm_fault_input_level_t`.
2. Initialization of the fault handler by calling either `mcpwm_fault_set_oneshot_mode()` or `mcpwm_fault_set_cyc_mode()`. These functions set the mode that MCPWM should operate once fault signal becomes inactive. There are two modes possible:

- State of MCPWM unit will be locked until reset - `mcpwm_fault_set_oneshot_mode()`.
- The MCPWM will resume operation once fault signal becoming inactive - `mcpwm_fault_set_cyc_mode()`.

The function call parameters include selection of one of three fault inputs defined in `mcpwm_fault_signal_t` and specific action on outputs A and B defined in `mcpwm_action_on_pwmxa_t` and `mcpwm_action_on_pwmxb_t`.

Particular fault signal may be disabled at the runtime by calling `mcpwm_fault_deinit()`.

**Carrier**

The MCPWM has a carrier submodule used if galvanic isolation from the motor driver is required by passing the A/B output signals through transformers. Any of A and B output signals may be at 100% duty and not changing whenever motor is required to run steady at the full load. Coupling of non alternating signals with a transformer is problematic, so the signals are modulated by the carrier submodule to create an AC waveform, to make the coupling possible.
To use the carrier submodule, it should be first initialized by calling `mcpwm_carrier_init()`. The carrier parameters are defined in `mcpwm_carrier_config_t` structure invoked within the function call. Then the carrier functionality may be enabled by calling `mcpwm_carrier_enable()`.

The carrier parameters may be then altered at a runtime by calling dedicated functions to change individual fields of the `mcpwm_carrier_config_t` structure, like `mcpwm_carrier_set_period()`, `mcpwm_carrier_set_duty_cycle()`, `mcpwm_carrier_output_invert()`, etc.

This includes enabling and setting duration of the first pulse of the carrier with `mcpwm_carrier_oneshot_mode_enable()`. For more details, see ESP32-S3 Technical Reference Manual > Motor Control PWM (MCPWM) > PWM Carrier Submodule [PDF].

To disable carrier functionality call `mcpwm_carrier_disable()`.

**Interrupts**

Registering of the MCPWM interrupt handler is possible by calling `mcpwm_isr_register()`. Note if `mcpwm_capture_enable_channel()` is used then a default ISR routine will be installed hence please do not call this function to register any more.

**Resolution**

The default resolution for MCPWM group and MCPWM timer are configured to 10MHz and 1MHz in `mcpwm_init()`, which might be not enough for some applications. The driver also provides two APIs that can be used to override the default resolution: `mcpwm_group_set_resolution()` and `mcpwm_timer_set_resolution()`.

Note that, these two APIs won’t update the frequency and duty automatically, to achieve that, one has to call `mcpwm_set_frequency()` and `mcpwm_set_duty()` accordingly.

To get PWM pulse that is below 15Hz, please set the resolution to a lower value. For high frequency PWM with limited step range, please set them with higher value.

**Application Example**

MCPWM example are located under: `peripherals/mcpwm`:

- Control of BLDC (brushless DC) motor with hall sensor feedback - `peripherals/mcpwm/mcpwm_bldc_hall_control`
- Brushed DC motor control - `peripherals/mcpwm/mcpwm_bdc_speed_control`
- Servo motor control - `peripherals/mcpwm/mcpwm_servo_control`
- HC-SR04 sensor with capture - `peripherals/mcpwm/mcpwm_capture_hc_sr04`

**Enumerations**

```c
enum mcpwm_timer_direction_t
{
    MCPWM_TIMER_DIRECTION_UP = 0,
    MCPWM_TIMER_DIRECTION_DOWN = 1,
};
```

Values:

- `MCPWM_TIMER_DIRECTION_UP`: Counting direction: Increase
- `MCPWM_TIMER_DIRECTION_DOWN`: Counting direction: Decrease
enum mcpwm_timer_event_t
Values:

MCPWM TIMER EVENT ZERO
MCPWM timer counts to zero

MCPWM TIMER EVENT PEAK
MCPWM timer counts to peak

def mcpwm_timer_event_t

enum mcpwm_timer_count_mode_t
Values:

MCPWM TIMER COUNT MODE PAUSE
MCPWM timer paused

MCPWM TIMER COUNT MODE UP
MCPWM timer counting up

MCPWM TIMER COUNT MODE DOWN
MCPWM timer counting down

MCPWM TIMER COUNT MODE UP DOWN
MCPWM timer counting up and down

def mcpwm_timer_count_mode_t

def mcpwm_timer_execute_cmd_t

enum mcpwm_timer_execute_cmd_t
Values:

MCPWM TIMER STOP AT ZERO
MCPWM timer stops when counting to zero

MCPWM TIMER STOP AT PEAK
MCPWM timer stops when counting to peak

MCPWM TIMER START NO STOP
MCPWM timer starts counting

MCPWM TIMER START STOP AT ZERO
MCPWM timer starts counting and stops when counting to zero

MCPWM TIMER START STOP AT PEAK
MCPWM timer starts counting and stops when counting to peak

def mcpwm_timer_execute_cmd_t

def mcpwm_generator_action_t

enum mcpwm_generator_action_t
Values:

MCPWM GEN ACTION KEEP
Generator action: Keep the same level

MCPWM GEN ACTION LOW
Generator action: Force to low level

MCPWM GEN ACTION HIGH
Generator action: Force to high level

MCPWM GEN ACTION_TOGGLE
Generator action: Toggle level

def mcpwm_generator_action_t

def mcpwm_trip_type_t

enum mcpwm_trip_type_t
Values:

MCPWM TRIP TYPE CBC
CBC trip type, shut down the operator cycle by cycle

MCPWM TRIP TYPE OST
OST trip type, shut down the operator in one shot

def mcpwm_trip_type_t

Functions

```c
esp_err_t mcpwm_gpio_init(mcpwm_unit_t mcpwm_num, mcpwm_io_signals_t io_signal, int gpio_num)
```

This function initializes each gpio signal for MCPWM.

**Note** This function initializes one gpio at a time.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- mcpwm_num: set MCPWM unit(0-1)
- io_signal: set MCPWM signals, each MCPWM unit has 6 output(MCPWMXA, MCPWMXB) and 9 input(SYNC_X, FAULT_X, CAP_X) ‘X’ is timer_num(0-2)
- gpio_num: set this to configure gpio for MCPWM, if you want to use gpio16, gpio_num = 16

```c
esp_err_t mcpwm_set_pin(mcpwm_unit_t mcpwm_num, const mcpwm_pin_config_t *mcpwm_pin)
```

Initialize MCPWM gpio structure.

**Note** This function initialize a group of MCPWM GPIOs at a time.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- mcpwm_num: set MCPWM unit(0-1)
- mcpwm_pin: MCPWM pin structure

```c
esp_err_t mcpwm_init(mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num, const mcpwm_config_t *mcpwm_conf)
```

Initialize MCPWM parameters.

**Note** The default resolution configured for MCPWM group and timer are 160M / 16 = 10M and 10M / 10 = 1M The default resolution can be changed by calling mcpwm_group_set_resolution() and mcpwm_timer_set_resolution(), before calling this function.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- mcpwm_num: set MCPWM unit(0-1)
- timer_num: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers.
- mcpwm_conf: configure structure mcpwm_config_t

```c
esp_err_t mcpwm_group_set_resolution(mcpwm_unit_t mcpwm_num, unsigned long int resolution)
```

Set resolution of the MCPWM group.

**Note** This will override default resolution of group(=10,000,000). This WILL NOT automatically update frequency and duty. Call mcpwm_set_frequency() and mcpwm_set_duty() manually to set them back.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- mcpwm_num: set MCPWM unit(0-1)
- resolution: set expected frequency resolution

```c
esp_err_t mcpwm_timer_set_resolution(mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num, unsigned long int resolution)
```

Set resolution of each timer.

**Note** This WILL override default resolution of timer(=1,000,000). This WILL NOT automatically update frequency and duty. Call mcpwm_set_frequency() and mcpwm_set_duty() manually to set them back.
Chapter 2. API Reference

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters
- mcpwm_num: set MCPWM unit(0-1)
- timer_num: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
- resolution: set expected frequency resolution

```c
esp_err_t mcpwm_set_frequency(mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num, uint32_t frequency)
```
Set frequency(in Hz) of MCPWM timer.

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters
- mcpwm_num: set MCPWM unit(0-1)
- timer_num: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
- frequency: set the frequency in Hz of each timer

```c
esp_err_t mcpwm_set_duty(mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num, mcpwm_generator_t gen, float duty)
```
Set duty cycle of each operator(MCPWMXA/MCPWMXB)

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters
- mcpwm_num: set MCPWM unit(0-1)
- timer_num: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
- gen: set the generator(MCPWMXA/MCPWMXB), ‘X’ is operator number selected
- duty: set duty cycle in % (i.e for 62.3% duty cycle, duty = 62.3) of each operator

```c
esp_err_t mcpwm_set_duty_in_us(mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num, mcpwm_generator_t gen, uint32_t duty_in_us)
```
Set duty cycle of each operator(MCPWMXA/MCPWMXB) in us.

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters
- mcpwm_num: set MCPWM unit(0-1)
- timer_num: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
- gen: set the generator(MCPWMXA/MCPWMXB), ‘X’ is operator number selected
- duty_in_us: set duty value in microseconds of each operator

```c
esp_err_t mcpwm_set_duty_type(mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num, mcpwm_generator_t gen, mcpwm_duty_type_t duty_type)
```
Set duty either active high or active low(out of phase/inverted)

Note: Call this function every time after mcpwm_set_signal_high or mcpwm_set_signal_low to resume with previously set duty cycle

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters
- mcpwm_num: set MCPWM unit(0-1)
- timer_num: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
- gen: set the generator(MCPWMXA/MCPWMXB), ‘X’ is operator number selected
- duty_type: set active low or active high duty type

```c
uint32_t mcpwm_get_frequency(mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num)
```
Get frequency of timer.
Chapter 2. API Reference

Return
• frequency of timer

Parameters
• mcpwm_num: set MCPWM unit(0-1)
• timer_num: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers

float mcpwm_get_duty(const mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num, mcpwm_operator_t gen)
Get duty cycle of each operator.

Return
• duty cycle in % of each operator(56.7 means duty is 56.7%)

Parameters
• mcpwm_num: set MCPWM unit(0-1)
• timer_num: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
• gen: set the generator(MCPWMXA/MCPWMXB), ‘x’ is operator number selected

uint32_t mcpwm_get_duty_in_us(const mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num, mcpwm_operator_t gen)
Get duty cycle of each operator in us.

Return
• duty cycle in us of each operator

Parameters
• mcpwm_num: set MCPWM unit(0-1)
• timer_num: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
• gen: set the generator(MCPWMXA/MCPWMXB), ‘x’ is operator number selected

esp_err_t mcpwm_set_signal_high(const mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num, mcpwm_generator_t gen)
Use this function to set MCPWM signal high.

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

Parameters
• mcpwm_num: set MCPWM unit(0-1)
• timer_num: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
• gen: set the generator(MCPWMXA/MCPWMXB), ‘x’ is timer number selected

esp_err_t mcpwm_set_signal_low(const mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num, mcpwm_generator_t gen)
Use this function to set MCPWM signal low.

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

Parameters
• mcpwm_num: set MCPWM unit(0-1)
• timer_num: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
• gen: set the generator(MCPWMXA/MCPWMXB), ‘x’ is timer number selected

esp_err_t mcpwm_start(const mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num)
Start MCPWM signal on timer ‘x’.

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

Parameters
• mcpwm_num: set MCPWM unit(0-1)
• timer_num: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers

esp_err_t mcpwm_stop(const mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num)
Start MCPWM signal on timer ‘x’.
Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- `mcpwm_num`: set MCPWM unit(0-1)
- `timer_num`: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers

```c
esp_err_t mcpwm_carrier_init(mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num, const mcpwm_carrier_config_t *carrier_conf)
```

Initialize carrier configuration.

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- `mcpwm_num`: set MCPWM unit(0-1)
- `timer_num`: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
- `carrier_conf`: configure structure `mcpwm_carrier_config_t`

```c
esp_err_t mcpwm_carrier_enable(mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num)
```

Enable MCPWM carrier submodule, for respective timer.

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- `mcpwm_num`: set MCPWM unit(0-1)
- `timer_num`: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers

```c
esp_err_t mcpwm_carrier_disable(mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num)
```

Disable MCPWM carrier submodule, for respective timer.

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- `mcpwm_num`: set MCPWM unit(0-1)
- `timer_num`: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers

```c
esp_err_t mcpwm_carrier_set_period(mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num, uint8_t carrier_period)
```

Set period of carrier.

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- `mcpwm_num`: set MCPWM unit(0-1)
- `timer_num`: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
- `carrier_period`: set the carrier period of each timer, carrier period = (carrier_period + 1)*800ns (carrier_period <= 15)

```c
esp_err_t mcpwm_carrier_set_duty_cycle(mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num, uint8_t carrier_duty)
```

Set duty_cycle of carrier.

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- `mcpwm_num`: set MCPWM unit(0-1)
- `timer_num`: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
- `carrier_duty`: set duty_cycle of carrier , carrier duty cycle = carrier_duty*12.5% (chop_duty <= 7)
Chapter 2. API Reference

```
esp_err_t mcpwm_carrier_oneshot_mode_enable(mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num, uint8_t pulse_width)

Enable and set width of first pulse in carrier oneshot mode.

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

Parameters
• mcpwm_num: set MCPWM unit(0-1)
• timer_num: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
• pulse_width: set pulse width of first pulse in oneshot mode, width = (carrier period)*(pulse_width + 1) (pulse_width <= 15)

esp_err_t mcpwm_carrier_oneshot_mode_disable(mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num)

Disable oneshot mode, width of first pulse = carrier period.

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

Parameters
• mcpwm_num: set MCPWM unit(0-1)
• timer_num: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers

esp_err_t mcpwm_carrier_output_invert(mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num, mcpwm_carrier_out_ivt_t carrier_ivt_mode)

Enable or disable carrier output inversion.

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

Parameters
• mcpwm_num: set MCPWM unit(0-1)
• timer_num: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
• carrier_ivt_mode: enable or disable carrier output inversion

esp_err_t mcpwm_deadtime_enable(mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num, mcpwm_deadtime_type_t dt_mode, uint32_t red, uint32_t fed)

Enable and initialize deadtime for each MCPWM timer.

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

Parameters
• mcpwm_num: set MCPWM unit(0-1)
• timer_num: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
• dt_mode: set deadtime mode
• red: set rising edge delay = red*100ns
• fed: set rising edge delay = fed*100ns

esp_err_t mcpwm_deadtime_disable(mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num)

Disable deadtime on MCPWM timer.

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

Parameters
• mcpwm_num: set MCPWM unit(0-1)
• timer_num: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers

esp_err_t mcpwm_fault_init(mcpwm_unit_t mcpwm_num, mcpwm_fault_input_level_t input_level, mcpwm_fault_signal_t fault_sig)

Initialize fault submodule, currently low level triggering is not supported.
```
Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- mcpwm_num: set MCPWM unit(0-1)
- timer_num: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
- fault_sig: set the fault pin, which needs to be enabled
- input_level: set fault signal level, which will cause fault to occur

```c
esp_err_t mcpwm_fault_set_oneshot_mode(mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num, mcpwm_fault_signal_t fault_sig, mcpwm_output_action_t action_on_pwmxa, mcpwm_output_action_t action_on_pwmxb)
```

Set oneshot mode on fault detection, once fault occur in oneshot mode reset is required to resume MCPWM signals.

Note currently low level triggering is not supported

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- mcpwm_num: set MCPWM unit(0-1)
- timer_num: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
- fault_sig: set the fault pin, which needs to be enabled for oneshot mode
- action_on_pwmxa: action to be taken on MCPWMXA when fault occurs, either no change or high or low or toggle
- action_on_pwmxb: action to be taken on MCPWMXB when fault occurs, either no change or high or low or toggle

```c
esp_err_t mcpwm_fault_set_cyc_mode(mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num, mcpwm_fault_signal_t fault_sig, mcpwm_output_action_t action_on_pwmxa, mcpwm_output_action_t action_on_pwmxb)
```

Set cycle-by-cycle mode on fault detection, once fault occur in cyc mode MCPWM signal resumes as soon as fault signal becomes inactive.

Note currently low level triggering is not supported

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- mcpwm_num: set MCPWM unit(0-1)
- timer_num: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
- fault_sig: set the fault pin, which needs to be enabled for cyc mode
- action_on_pwmxa: action to be taken on MCPWMXA when fault occurs, either no change or high or low or toggle
- action_on_pwmxb: action to be taken on MCPWMXB when fault occurs, either no change or high or low or toggle

```c
esp_err_t mcpwm_fault_deinit(mcpwm_unit_t mcpwm_num, mcpwm_fault_signal_t fault_sig)
```

Disable fault signal.

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- mcpwm_num: set MCPWM unit(0-1)
- fault_sig: fault pin, which needs to be disabled

```c
esp_err_t mcpwm_capture_enable(mcpwm_unit_t mcpwm_num, mcpwm_capture_signal_t cap_sig, mcpwm_capture_on_edge_t cap_edge, uint32_t num_of_pulse)
```

Initialize capture submodule.
Note: Enabling capture feature would also enable the capture interrupt event, users have to register an interrupt handler by `mcpwm_isr_register`, and in there, query the capture data.

Note: The capture timer uses APB_CLK (typically 80MHz) as the count source.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- `mcpwm_num`: set MCPWM unit(0-1)
- `cap_edge`: set capture edge, BIT(0) - negative edge, BIT(1) - positive edge
- `cap_sig`: capture pin, which needs to be enabled
- `num_of_pulse`: Input capture signal prescaling, ranges from 0 to 255, representing prescaling from 1 to 256.

```c
esp_err_t mcpwm_capture_disable(mcpwm_unit_t mcpwm_num, mcpwm_capture_signal_t cap_sig)
```
Disable capture signal.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- `mcpwm_num`: set MCPWM unit(0-1)
- `cap_sig`: capture pin, which needs to be disabled

```c
esp_err_t mcpwm_capture_enable_channel(mcpwm_unit_t mcpwm_num, mcpwm_capture_channel_id_t cap_channel, const mcpwm_capture_config_t *cap_conf)
```
Enable capture channel.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- `mcpwm_num`: set MCPWM unit(0-1)
- `cap_channel`: capture channel, which needs to be enabled
- `cap_conf`: capture channel configuration

```c
esp_err_t mcpwm_capture_disable_channel(mcpwm_unit_t mcpwm_num, mcpwm_capture_channel_id_t cap_channel)
```
Disable capture channel.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- `mcpwm_num`: set MCPWM unit(0-1)
- `cap_channel`: capture channel, which needs to be disabled

```c
uint32_t mcpwm_capture_signal_get_value(mcpwm_unit_t mcpwm_num, mcpwm_capture_signal_t cap_sig)
```
Get capture value.

**Return** Captured value

**Parameters**
- `mcpwm_num`: set MCPWM unit(0-1)
- `cap_sig`: capture channel on which value is to be measured

```c
uint32_t mcpwm_capture_signal_get_edge(mcpwm_unit_t mcpwm_num, mcpwm_capture_signal_t cap_sig)
```
Get edge of capture signal.

**Return** Capture signal edge: 1 - positive edge, 2 - negative edge

**Parameters**
- `mcpwm_num`: set MCPWM unit(0-1)
- `cap_sig`: capture channel of whose edge is to be determined
**esp_err_t mcpwm_sync_enable** (mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num, mcpwm_sync_signal_t sync_sig, uint32_t phase_val)

Initializes sync submodule and sets the signal that will cause the timer be loaded with pre-defined value.

**Note** Count direction is undefined within this API

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- mcpwm_num: set MCPWM unit(0-1)
- timer_num: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
- sync_sig: set the synchronization input signal
- phase_val: phase value in 1/1000 (for 86.7%, phase_val = 867) which timer moves to on sync signal

**esp_err_t mcpwm_sync_configure** (mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num, const mcpwm_sync_config_t *sync_conf)

Initialize sync submodule and sets the signal that will cause the timer be loaded with pre-defined value.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- mcpwm_num: set MCPWM unit(0-1)
- timer_num: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
- sync_conf: sync configuration on this timer

**esp_err_t mcpwm_sync_disable** (mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num)

Disable sync submodule on given timer.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- mcpwm_num: set MCPWM unit(0-1)
- timer_num: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers

**esp_err_t mcpwm_set_timer_sync_output** (mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num, mcpwm_timer_sync_trigger_t trigger)

Set sync output on given timer Configures what event triggers MCPWM timer to output a sync signal.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- mcpwm_num: set MCPWM unit(0-1)
- timer_num: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
- trigger: set the trigger that will cause the timer to generate a software sync signal. Specifically, MCPWM_SWSYNC_SOURCE_DISABLED will disable the timer from generating sync signal.

**esp_err_t mcpwm_timer_trigger_soft_sync** (mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num)

Trigger a software sync event and sends it to a specific timer.

**Note** This software sync event will have the same effect as hw one, except that:
- On esp32s3 the soft sync event can be routed to its output if MCPWM_SWSYNC.getSource.SYNCCIN is selected via mcpwm_set_timer_sync_output()
- On esp32 there is no such behavior and soft sync event will only take effect on this timer and can not be propagated to others.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Function pointer error.

**Parameters**
Chapter 2. API Reference

- `mcpwm_num`: set MCPWM unit (0-1)
- `timer_num`: set timer number (0-2) of MCPWM, each MCPWM unit has 3 timers

```c
esp_err_t mcpwm_sync_invert_gpio_synchro(mcpwm_unit_t mcpwm_num, mcpwm_sync_signal_t sync_sig, bool invert)
```

Set external GPIO sync input inverter.

**Return**
- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Function pointer error.

**Parameters**
- `mcpwm_num`: set MCPWM unit (0-1)
- `sync_sig`: set sync signal of MCPWM, only supports GPIO sync signal
- `invert`: whether GPIO sync source input is inverted (to get negative edge trigger)

```c
esp_err_t mcpwm_isr_register(mcpwm_unit_t mcpwm_num, void(*fn)(void*), void *arg, int intr_alloc_flags, intr_handle_t *handle)
```

Register MCPWM interrupt handler, the handler is an ISR. The handler will be attached to the same CPU core that this function is running on.

**Return**
- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Function pointer error.

**Parameters**
- `mcpwm_num`: set MCPWM unit (0-1)
- `fn`: interrupt handler function.
- `arg`: user-supplied argument passed to the handler function.
- `intr_alloc_flags`: flags used to allocate the interrupt. One or multiple (ORred) `ESP_INTR_FLAG_*` values. See esp_intr_alloc.h for more info.
- `handle`: pointer to return handle. If non-NULL, a handle for the interrupt will be returned here.

**Structures**

```c
struct mcpwm_pin_config_t
```

pin number for MCPWM

**Public Members**

- `int mcpwm0a_out_num` MCPWM0A out pin
- `int mcpwm0b_out_num` MCPWM0A out pin
- `int mcpwm1a_out_num` MCPWM0A out pin
- `int mcpwm1b_out_num` MCPWM0A out pin

- `int mcpwm2b_out_num` MCPWM0A out pin
- `int mcpwm_sync0_in_num` SYNC0 in pin
- `int mcpwm_sync1_in_num` SYNC1 in pin
- `int mcpwm_sync2_in_num` SYNC2 in pin
Chapter 2. API Reference

```c
int mcpwm_fault0_in_num
FAULT0 in pin
int mcpwm_fault1_in_num
FAULT1 in pin
int mcpwm_fault2_in_num
FAULT2 in pin
int mcpwm_cap0_in_num
CAP0 in pin
int mcpwm_cap1_in_num
CAP1 in pin
int mcpwm_cap2_in_num
CAP2 in pin

struct cap_event_data_t
event data that will be passed into ISR callback
```

Public Members

```c
mcpwm_capture_on_edge_t cap_edge
Which signal edge is detected

uint32_t cap_value
Corresponding timestamp when event occurs. Clock rate = APB(usually 80M)
```

```c
struct mcpwm_config_t
MCPWM config structure.
```

Public Members

```c
uint32_t frequency
Set frequency of MCPWM in Hz
float cmpr_a
Set % duty cycle for operator a(MCPWMXA), i.e for 62.3% duty cycle, duty_a = 62.3
float cmpr_b
Set % duty cycle for operator b(MCPWMXB), i.e for 48% duty cycle, duty_b = 48.0
mcpwm_duty_type_t duty_mode
Set type of duty cycle
mcpwm_counter_type_t counter_mode
Set type of MCPWM counter
```

```c
struct mcpwm_carrier_config_t
MCPWM carrier configuration structure.
```

Public Members

```c
uint8_t carrier_period
Set carrier period = (carrier_period + 1)*800ns, carrier_period should be < 16
uint8_t carrier_duty
Set carrier duty cycle, carrier_duty should be less than 8 (increment every 12.5%)
uint8_t pulse_width_in_os
Set pulse width of first pulse in one shot mode = (carrier period)*(pulse_width_in_os + 1), should be less then 16
```
Chapter 2. API Reference

```c
mcpwm_carrier_os_t carrier_os_mode
   Enable or disable carrier oneshot mode

mcpwm_carrier_out_ivt_t carrier_ivt_mode
   Invert output of carrier
```

```c
def struct mcpwm_capture_config_t
   MCPWM config capture structure.

Public Members

mcpwm_capture_on_edge_t cap_edge
   Set capture edge

uint32_t cap_prescale
   Prescale of capture signal, ranging from 1 to 256

cap_isr_cb_t capture_cb
   User defined capture event callback, running under interrupt context

void *user_data
   User defined ISR callback function args
```

```c
def struct mcpwm_sync_config_t
   MCPWM config sync structure.

Public Members

mcpwm_sync_signal_t sync_sig
   Set sync input signal that will cause timer to sync

uint32_t timer_val
   Counter value to be set after sync, in 0 ~ 999, unit: 1 / 1000 * peak
```

```c
mcpwm_timer_direction_t count_direction
   Counting direction to be set after sync
```

Type Definitions

typedef mcpwm_generator_t mcpwm_operator_t

typedef mcpwm_output_action_t mcpwm_action_on_pwmxa_t

typedef mcpwm_output_action_t mcpwm_action_on_pwmxb_t

typedef mcpwm_capture_signal_t mcpwm_capture_channel_id_t

MCPWM capture channel ID alias.

typedef bool (*cap_isr_cb_t)(mcpwm_unit_t mcpwm, mcpwm_capture_channel_id_t cap_channel,
                          const cap_event_data_t *edata, void *user_data)

Type of capture event callback.

Note Since this an ISR callback so do not do anything that may block and call APIs that is designed to be used within ISR (usually has ‘_ISR’ postfix)

Return Whether a task switch is needed after the callback function returns, this is usually due to the callback wakes up some high priority task.

Parameters

• mcpwm: MCPWM unit (0-1)
• cap_channel: capture channel ID
• edata: Capture event data, contains capture edge and capture value, fed by the driver
• user_data: User registered data, passed from mcpwm_capture_config_t

Enumerations

enum mcpwm_io_signals_t

IO signals for the MCPWM.

- 6 MCPWM output pins that generate PWM signals
- 3 MCPWM fault input pins to detect faults like overcurrent, overvoltage, etc.
- 3 MCPWM sync input pins to synchronize MCPWM outputs signals
- 3 MCPWM capture input pins to gather feedback from controlled motors, using e.g. hall sensors

Values:

MCPWM0A = 0
PWM0A output pin

MCPWM0B
PWM0B output pin

MCPWM1A
PWM1A output pin

MCPWM1B
PWM1B output pin

MCPWM2A
PWM2A output pin

MCPWM2B
PWM2B output pin

MCPWM_SYNC_0
SYNC0 input pin

MCPWM_SYNC_1
SYNC1 input pin

MCPWM_SYNC_2
SYNC2 input pin

MCPWM_FAULT_0
FAULT0 input pin
MCPWM_FAULT_1
FAULT1 input pin

MCPWM_FAULT_2
FAULT2 input pin

MCPWM_CAP_0 = 84
CAP0 input pin

MCPWM_CAP_1
CAP1 input pin

MCPWM_CAP_2
CAP2 input pin

def mcpwm_unit_t
Select MCPWM unit.
Values:

MCPWM_UNIT_0
MCPWM unit0 selected

MCPWM_UNIT_1
MCPWM unit1 selected

MCPWM_UNIT_MAX
Max number of MCPWM units

def mcpwm_timer_t
Select MCPWM timer.
Values:

MCPWM_TIMER_0
Select MCPWM timer0

MCPWM_TIMER_1
Select MCPWM timer1

MCPWM_TIMER_2
Select MCPWM timer2

MCPWM_TIMER_MAX
Max number of timers in a unit

def mcpwm_generator_t
Select MCPWM operator.
Values:

MCPWM_GEN_A
Select MCPWMXA, where ‘X’ is operator number

MCPWM_GEN_B
Select MCPWMXB, where ‘X’ is operator number

MCPWM_GEN_MAX
Num of generators to each operator of MCPWM

def mcpwm_carrier_os_t
MCPWM carrier oneshot mode, in this mode the width of the first pulse of carrier can be programmed.
Values:

MCPWM_ONESHOT_MODE_DIS
Enable oneshot mode

MCPWM_ONESHOT_MODE_EN
Disable oneshot mode
enum mcpwm_carrier_out_ivt_t
MCPWM carrier output inversion, high frequency carrier signal active with MCPWM signal is high.

Values:
MCPWM_CARRIER_OUT_IVT_DIS
Enable carrier output inversion
MCPWM_CARRIER_OUT_IVT_EN
Disable carrier output inversion

denum mcpwm_fault_signal_t
MCPWM select fault signal input.

Values:
MCPWM_SELECT_F0
Select F0 as input
MCPWM_SELECT_F1
Select F1 as input
MCPWM_SELECT_F2
Select F2 as input

denum mcpwm_sync_signal_t
MCPWM select sync signal input.

Values:
MCPWM_SELECT_NO_INPUT
No sync input selected
MCPWM_SELECT_TIMER0_SYNC
Select software sync signal from timer0 as input
MCPWM_SELECT_TIMER1_SYNC
Select software sync signal from timer1 as input
MCPWM_SELECT_TIMER2_SYNC
Select software sync signal from timer2 as input
MCPWM_SELECT_GPIO_SYNC0
Select GPIO SYNC0 as input
MCPWM_SELECT_GPIO_SYNC1
Select GPIO SYNC1 as input
MCPWM_SELECT_GPIO_SYNC2
Select GPIO SYNC2 as input

denum mcpwm_timer_sync_trigger_t
MCPWM timer sync event trigger.

Values:
MCPWM_SWSYNC_SOURCE_SYNCIN
the input sync signal will be routed to its sync output path
MCPWM_SWSYNC_SOURCE_TZ
sync signal generated when timer counts to zero
MCPWM_SWSYNC_SOURCE_TEP
sync signal generated when timer counts to peak
MCPWM_SWSYNC_SOURCE_DISABLED
timer does not generate sync signals
### enum mcpwm_fault_input_level_t
MCPWM select triggering level of fault signal.

**Values:**
- **MCPWM_LOW_LEVEL_TGR**
  Fault condition occurs when fault input signal goes from high to low
- **MCPWM_HIGH_LEVEL_TGR**
  Fault condition occurs when fault input signal goes low to high

### enum mcpwm_capture_on_edge_t
MCPWM select capture starts from which edge.

**Values:**
- **MCPWM_NEG_EDGE** = BIT(0)
  Capture the negative edge
- **MCPWM_POS_EDGE** = BIT(1)
  Capture the positive edge
- **MCPWM_BOTH_EDGE** = BIT(1) | BIT(0)
  Capture both edges

### enum mcpwm_intr_t
Interrupt masks for MCPWM capture.

**Values:**
- **MCPWM_LL_INTR_CAP0** = BIT(27)
  Capture 0 happened.
- **MCPWM_LL_INTR_CAP1** = BIT(28)
  Capture 1 happened.
- **MCPWM_LL_INTR_CAP2** = BIT(29)
  Capture 2 happened.

### enum mcpwm_counter_type_t
Select type of MCPWM counter.

**Values:**
- **MCPWM_FREEZE_COUNTER**
  Counter freeze
- **MCPWM_UP_COUNTER**
  For asymmetric MCPWM
- **MCPWM_DOWN_COUNTER**
  For asymmetric MCPWM
- **MCPWM_UP_DOWN_COUNTER**
  For symmetric MCPWM, frequency is half of MCPWM frequency set
- **MCPWM_COUNTER_MAX**
  Maximum counter mode

### enum mcpwm_duty_type_t
Select type of MCPWM duty cycle mode.

**Values:**
- **MCPWM_DUTY_MODE_0** = 0
  Active high duty, i.e. duty cycle proportional to high time for asymmetric MCPWM
- **MCPWM_DUTY_MODE_1**
  Active low duty, i.e. duty cycle proportional to low time for asymmetric MCPWM, out of phase(inverted) MCPWM
Chapter 2. API Reference

MCPWM_HAL_GENERATOR_MODE_FORCE_LOW
MCPWM_HAL_GENERATOR_MODE_FORCE_HIGH
MCPWM_DUTY_MODE_MAX

Num of duty cycle modes

def mcpwm_deadtime_type_t
MCPWM deadtime types, used to generate deadtime, RED refers to rising edge delay and FED refers to falling edge delay.
Values:

MCPWM_DEADTIME_BYPASS = 0
Bypass the deadtime

MCPWM_BYPASS_RED
MCPWMXA Out = MCPWMXA In with no delay, MCPWMXB Out = MCPWMXA In with falling edge delay

MCPWM_BYPASS_FED
MCPWMXA Out = MCPWMXA In with rising edge delay, MCPWMXB Out = MCPWMXB In with no delay

MCPWM_ACTIVE_HIGH_MODE
MCPWMXA Out = MCPWMXA In with rising edge delay, MCPWMXB Out = MCPWMXA In with falling edge delay

MCPWM_ACTIVE_LOW_MODE
MCPWMXA Out = MCPWMXA In with compliment of rising edge delay, MCPWMXB Out = MCPWMXA In with compliment of falling edge delay

MCPWM_ACTIVE_HIGH_COMPLIMENT_MODE
MCPWMXA Out = MCPWMXA In with rising edge delay, MCPWMXB = MCPWMXA In with compliment of falling edge delay

MCPWM_ACTIVE_LOW_COMPLIMENT_MODE
MCPWMXA Out = MCPWMXA In with compliment of rising edge delay, MCPWMXB Out = MCPWMXA In with falling edge delay

MCPWM_ACTIVE_RED_FED_FROM_PWMXA
MCPWMXA Out = MCPWMXB Out = MCPWMXA In with rising edge delay as well as falling edge delay

MCPWM_ACTIVE_RED_FED_FROM_PWMXB
MCPWMXA Out = MCPWMXB Out = MCPWMXB In with rising edge delay as well as falling edge delay

MCPWM_DEADTIME_TYPE_MAX
Maximum number of supported dead time modes

def mcpwm_output_action_t
MCPWM select action to be taken on the output when event happens.
Values:

MCPWM_ACTION_NO_CHANGE = 0
No change in the output

MCPWM_ACTION_FORCE_LOW
Make output low

MCPWM_ACTION_FORCE_HIGH
Make output high

MCPWM_ACTION_TOGGLE
Make output toggle
```c
enum mcpwm_capture_signal_t

MCPWM_SELECT_CAP0
    Select CAP0 as input

MCPWM_SELECT_CAP1
    Select CAP1 as input

MCPWM_SELECT_CAP2
    Select CAP2 as input
```

2.3.12 Pulse Counter (PCNT)

Introduction

The PCNT (Pulse Counter) module is designed to count the number of rising and/or falling edges of an input signal. Each pulse counter unit has a 16-bit signed counter register and two channels that can be configured to either increment or decrement the counter. Each channel has a signal input that accepts signal edges to be detected, as well as a control input that can be used to enable or disable the signal input. The inputs have optional filters that can be used to discard unwanted glitches in the signal.

Functionality Overview

Description of functionality of this API has been broken down into four sections:

- **Configuration** - describes counter’s configuration parameters and how to setup the counter.
- **Operating the Counter** - provides information on control functions to pause, measure and clear the counter.
- **Filtering Pulses** - describes options to filtering pulses and the counter control signals.
- **Using Interrupts** - presents how to trigger interrupts on specific states of the counter.

Configuration

The PCNT module has 8 independent counting “units” numbered from 0 to 7. In the API they are referred to using `pcnt_unit_t`. Each unit has two independent channels numbered as 0 and 1 and specified with `pcnt_channel_t`.

The configuration is provided separately per unit’s channel using `pcnt_config_t` and covers:

- The unit and the channel number this configuration refers to.
- GPIO numbers of the pulse input and the pulse gate input.
- Two pairs of parameters: `pcnt_ctrl_mode_t` and `pcnt_count_mode_t` to define how the counter reacts depending on the status of control signal and how counting is done positive / negative edge of the pulses.
- Two limit values (minimum / maximum) that are used to establish watchpoints and trigger interrupts when the pulse count is meeting particular limit.

Setting up of particular channel is then done by calling a function `pcnt_unit_config()` with above `pcnt_config_t` as the input parameter.

To disable the pulse or the control input pin in configuration, provide `PCNT_PIN_NOT_USED` instead of the GPIO number.

Operating the Counter

After doing setup with `pcnt_unit_config()`, the counter immediately starts to operate. The accumulated pulse count can be checked by calling `pcnt_get_counter_value()`.
There are couple of functions that allow to control the counter’s operation: `pcnt_counter_pause()`, `pcnt_counter_resume()` and `pcnt_counter_clear()`.

It is also possible to dynamically change the previously set up counter modes with `pcnt_unit_config()` by calling `pcnt_set_mode()`.

If desired, the pulse input pin and the control input pin may be changed “on the fly” using `pcnt_set_pin()`.

To disable particular input provide as a function parameter `PCNT_PIN_NOT_USED` instead of the GPIO number.

**Note:** For the counter not to miss any pulses, the pulse duration should be longer than one APB_CLK cycle (12.5 ns). The pulses are sampled on the edges of the APB_CLK clock and may be missed, if fall between the edges. This applies to counter operation with or without a filter.

### Filtering Pulses

The PCNT unit features filters on each of the pulse and control inputs, adding the option to ignore short glitches in the signals.

The length of ignored pulses is provided in APB_CLK clock cycles by calling `pcnt_set_filter_value()`. The current filter setting may be checked with `pcnt_get_filter_value()`. The APB_CLK clock is running at 80 MHz.

The filter is put into operation / suspended by calling `pcnt_filter_enable()` / `pcnt_filter_disable()`.

### Using Interrupts

There are five counter state watch events, defined in `pcnt_evt_type_t`, that are able to trigger an interrupt. The event happens on the pulse counter reaching specific values:

- Minimum or maximum count values: `counter_l_lim` or `counter_h_lim` provided in `pcnt_config_t` as discussed in Configuration
- Threshold 0 or Threshold 1 values set using function `pcnt_set_event_value()`.
- Pulse count = 0

To register, enable or disable an interrupt to service the above events, call `pcnt_isr_register()`, `pcnt_intr_enable()`, and `pcnt_intr_disable()`. To enable or disable events on reaching threshold values, you will also need to call functions `pcnt_event_enable()` and `pcnt_event_disable()`.

In order to check what are the threshold values currently set, use function `pcnt_get_event_value()`.

### Application Example

- Pulse counter with control signal and event interrupt example: `peripherals/pcnt/pulse_count_event`.
- Parse the signal generated from rotary encoder: `peripherals/pcnt/rotary_encoder`.

### API Reference

#### Header File

- `components/driver/include/driver/pcnt.h`

#### Functions

```c
esp_err_t pcnt_unit_config(const pcnt_config_t *pcnt_config)
```

Configure Pulse Counter unit.
This function will disable three events: PCNT_EVT_L_LIM, PCNT_EVT_H_LIM, PCNT_EVT_ZERO.

Return
- ESP_OK Success
- ESP_ERR_INVALID_STATE_pct_count_driver_already_initialized
- ESP_ERR_INVALID_ARG Parameter error

Parameters
- pcnt_config: Pointer of Pulse Counter unit configure parameter

\textit{esp_err_t} \textbf{pcnt_get_counter_value} (\textit{pcnt_unit_t} \textit{pcnt_unit}, int16_t \*\textit{count})
Get pulse counter value.

Return
- ESP_OK Success
- ESP_ERR_INVALID_STATE_pct_count_driver_has_not_been_initialized
- ESP_ERR_INVALID_ARG Parameter error

Parameters
- \textit{pcnt_unit}: Pulse Counter unit number
- \textit{count}: Pointer to accept counter value

\textit{esp_err_t} \textbf{pcnt_counter_pause} (\textit{pcnt_unit_t} \textit{pcnt_unit})
Pause PCNT counter of PCNT unit.

Return
- ESP_OK Success
- ESP_ERR_INVALID_STATE_pct_count_driver_has_not_been_initialized
- ESP_ERR_INVALID_ARG Parameter error

Parameters
- \textit{pcnt_unit}: PCNT unit number

\textit{esp_err_t} \textbf{pcnt_counter_resume} (\textit{pcnt_unit_t} \textit{pcnt_unit})
Resume counting for PCNT counter.

Return
- ESP_OK Success
- ESP_ERR_INVALID_STATE_pct_count_driver_has_not_been_initialized
- ESP_ERR_INVALID_ARG Parameter error

Parameters
- \textit{pcnt_unit}: PCNT unit number, select from \textit{pcnt_unit_t}

\textit{esp_err_t} \textbf{pcnt_counter_clear} (\textit{pcnt_unit_t} \textit{pcnt_unit})
Clear and reset PCNT counter value to zero.

Return
- ESP_OK Success
- ESP_ERR_INVALID_STATE_pct_count_driver_has_not_been_initialized
- ESP_ERR_INVALID_ARG Parameter error

Parameters
- \textit{pcnt_unit}: PCNT unit number, select from \textit{pcnt_unit_t}

\textit{esp_err_t} \textbf{pcnt_intr_enable} (\textit{pcnt_unit_t} \textit{pcnt_unit})
Enable PCNT interrupt for PCNT unit.

Note Each Pulse counter unit has five watch point events that share the same interrupt. Configure events with\textit{pcnt_event_enable()} and \textit{pcnt_event_disable()}.

Return
- ESP_OK Success
- ESP_ERR_INVALID_STATE_pct_count_driver_has_not_been_initialized
- ESP_ERR_INVALID_ARG Parameter error

Parameters
- \textit{pcnt_unit}: PCNT unit number

\textit{esp_err_t} \textbf{pcnt_intr_disable} (\textit{pcnt_unit_t} \textit{pcnt_unit})
Disable PCNT interrupt for PCNT unit.
Return

• ESP_OK Success
• ESP_ERR_INVALID_STATE pcnt driver has not been initialized
• ESP_ERR_INVALID_ARG Parameter error

Parameters

• pcnt_unit: PCNT unit number

`esp_err_t pcnt_event_enable(pcnt_unit_t unit, pcnt_evt_type_t evt_type)`

Enable PCNT event of PCNT unit.

Return

• ESP_OK Success
• ESP_ERR_INVALID_STATE pcnt driver has not been initialized
• ESP_ERR_INVALID_ARG Parameter error

Parameters

• unit: PCNT unit number
• evt_type: Watch point event type. All enabled events share the same interrupt (one interrupt per pulse counter unit).

`esp_err_t pcnt_event_disable(pcnt_unit_t unit, pcnt_evt_type_t evt_type)`

Disable PCNT event of PCNT unit.

Return

• ESP_OK Success
• ESP_ERR_INVALID_STATE pcnt driver has not been initialized
• ESP_ERR_INVALID_ARG Parameter error

Parameters

• unit: PCNT unit number
• evt_type: Watch point event type. All enabled events share the same interrupt (one interrupt per pulse counter unit).

`esp_err_t pcnt_set_event_value(pcnt_unit_t unit, pcnt_evt_type_t evt_type, int16_t value)`

Set PCNT event value of PCNT unit.

Return

• ESP_OK Success
• ESP_ERR_INVALID_STATE pcnt driver has not been initialized
• ESP_ERR_INVALID_ARG Parameter error

Parameters

• unit: PCNT unit number
• evt_type: Watch point event type. All enabled events share the same interrupt (one interrupt per pulse counter unit).
• value: Counter value for PCNT event

`esp_err_t pcnt_get_event_value(pcnt_unit_t unit, pcnt_evt_type_t evt_type, int16_t* value)`

Get PCNT event value of PCNT unit.

Return

• ESP_OK Success
• ESP_ERR_INVALID_STATE pcnt driver has not been initialized
• ESP_ERR_INVALID_ARG Parameter error

Parameters

• unit: PCNT unit number
• evt_type: Watch point event type. All enabled events share the same interrupt (one interrupt per pulse counter unit).
• value: Pointer to accept counter value for PCNT event

`esp_err_t pcnt_get_event_status(pcnt_unit_t unit, uint32_t* status)`

Get PCNT event status of PCNT unit.

Return

• ESP_OK Success
• ESP_ERR_INVALID_STATE pcnt driver has not been initialized
Chapter 2. API Reference

- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- unit: PCNT unit number
- status: Pointer to accept event status word

`esp_err_t pcnt_isr_unregister (pcnt_isr_handle_t handle)`
Unregister PCNT interrupt handler (registered by `pcnt_isr_register`), the handler is an ISR. The handler will be attached to the same CPU core that this function is running on. If the interrupt service is registered by `pcnt_isr_service_install`, please call `pcnt_isr_service_uninstall` instead.

**Return**
- ESP_OK Success
- ESP_ERR_NOT_FOUND Can not find the interrupt that matches the flags.
- ESP_ERR_INVALID_ARG Function pointer error

**Parameters**
- handle: handle to unregister the ISR service.

`esp_err_t pcnt_isr_register (void (*fn) void*)`,
void *arg, int intr_alloc_flags, pcnt_isr_handle_t *handle
Register PCNT interrupt handler, the handler is an ISR. The handler will be attached to the same CPU core that this function is running on. Please do not use `pcnt_isr_service_install` if this function was called.

**Return**
- ESP_OK Success
- ESP_ERR_NOT_FOUND Can not find the interrupt that matches the flags.
- ESP_ERR_INVALID_ARG Function pointer error

**Parameters**
- fn: Interrupt handler function.
- arg: Parameter for handler function
- intr_alloc_flags: Flags used to allocate the interrupt. One or multiple (ORred) ESP_INTR_FLAG_* values. See esp_intr_alloc.h for more info.
- handle: Pointer to return handle. If non-NULL, a handle for the interrupt will be returned here. Calling `pcnt_isr_unregister` to unregister this ISR service if needed, but only if the handle is not NULL.

`esp_err_t pcnt_set_pin (pcnt_unit_t unit, pcnt_channel_t channel, int pulse_io, int ctrl_io)`
Configure PCNT pulse signal input pin and control input pin.

**Note** Set the signal input to PCNT_PIN_NOT_USED if unused.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_STATE pcnt driver has not been initialized
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- unit: PCNT unit number
- channel: PCNT channel number
- pulse_io: Pulse signal input GPIO
- ctrl_io: Control signal input GPIO

`esp_err_t pcnt_filter_enable (pcnt_unit_t unit)`
Enable PCNT input filter.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_STATE pcnt driver has not been initialized
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- unit: PCNT unit number

`esp_err_t pcnt_filter_disable (pcnt_unit_t unit)`
Disable PCNT input filter.

**Return**
• ESP_OK Success
• ESP_ERR_INVALID_STATE pcnt driver has not been initialized
• ESP_ERR_INVALID_ARG Parameter error

**Parameters**

- *unit*: PCNT unit number

```c
esp_err_t pcnt_set_filter_value(pcnt_unit_t unit, uint16_t filter_val)
```

Set PCNT filter value.

**Note** filter_val is a 10-bit value, so the maximum filter_val should be limited to 1023.

**Return**

- ESP_OK Success
- ESP_ERR_INVALID_STATE pcnt driver has not been initialized
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**

- *unit*: PCNT unit number
- *filter_val*: PCNT signal filter value, counter in APB_CLK cycles. Any pulses lasting shorter than this will be ignored when the filter is enabled.

```c
esp_err_t pcnt_get_filter_value(pcnt_unit_t unit, uint16_t* filter_val)
```

Get PCNT filter value.

**Return**

- ESP_OK Success
- ESP_ERR_INVALID_STATE pcnt driver has not been initialized
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**

- *unit*: PCNT unit number
- *filter_val*: Pointer to accept PCNT filter value.

```c
esp_err_t pcnt_set_mode(pcnt_unit_t unit, pcnt_channel_t channel, pcnt_count_mode_t pos_mode, pcnt_count_mode_t neg_mode, pcnt_ctrl_mode_t hctrl_mode, pcnt_ctrl_mode_t lctrl_mode)
```

Set PCNT counter mode.

**Return**

- ESP_OK Success
- ESP_ERR_INVALID_STATE pcnt driver has not been initialized
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**

- *unit*: PCNT unit number
- *channel*: PCNT channel number
- *pos_mode*: Counter mode when detecting positive edge
- *neg_mode*: Counter mode when detecting negative edge
- *hctrl_mode*: Counter mode when control signal is high level
- *lctrl_mode*: Counter mode when control signal is low level

```c
esp_err_t pcnt_isr_handler_add(pcnt_unit_t unit, void (*isr_handler)(void *, void *), void *args)
```

Add ISR handler for specified unit.

Call this function after using pcnt_isr_service_install() to install the PCNT driver’s ISR handler service.

The ISR handlers do not need to be declared with IRAM_ATTR, unless you pass the ESP_INTR_FLAG_IRAM flag when allocating the ISR in pcnt_isr_service_install().

This ISR handler will be called from an ISR. So there is a stack size limit (configurable as “ISR stack size” in menuconfig). This limit is smaller compared to a global PCNT interrupt handler due to the additional level of indirection.

**Return**

- ESP_OK Success
- ESP_ERR_INVALID_STATE pcnt driver has not been initialized
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**

- *unit*: PCNT unit number
- *isr_handler*: ISR handler function
- *args*: User-defined data passed to the ISR.
Chapter 2. API Reference

- `unit`: PCNT unit number
- `isr_handler`: Interrupt handler function.
- `args`: Parameter for handler function

**esp_err_t pcnt_isr_service_install** (**int intr_alloc_flags**) 
Install PCNT ISR service.

**Note** We can manage different interrupt service for each unit. This function will use the default ISR handle service. Calling `pcnt_isr_service_uninstall` to uninstall the default service if needed. Please do not use `pcnt_isr_register` if this function was called.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_STATE pcnt driver has not been initialized
- ESP_ERR_NO_MEM No memory to install this service
- ESP_ERR_INVALID_STATE ISR service already installed

**Parameters**
- `intr_alloc_flags`: Flags used to allocate the interrupt. One or multiple (ORed) `ESP_INTR_FLAG_*` values. See `esp_intr_alloc.h` for more info.

**void pcnt_isr_service_uninstall** (**void**) 
Uninstall PCNT ISR service, freeing related resources.

**esp_err_t pcnt_isr_handler_remove** (**pcnt_unit_t unit**) 
Delete ISR handler for specified unit.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_STATE pcnt driver has not been initialized
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- `unit`: PCNT unit number

**Structures**

**struct pcnt_config_t**
Pulse Counter configuration for a single channel.

**Public Members**

- `int pulse_gpio_num` 
Pulse input GPIO number, if you want to use GPIO16, enter `pulse_gpio_num = 16`, a negative value will be ignored
- `int ctrl_gpio_num` 
Control signal input GPIO number, a negative value will be ignored
- `pcnt_ctrl_mode_t lctrl_mode` 
PCNT low control mode
- `pcnt_ctrl_mode_t hctrl_mode` 
PCNT high control mode
- `pcnt_count_mode_t pos_mode` 
PCNT positive edge count mode
- `pcnt_count_mode_t neg_mode` 
PCNT negative edge count mode
- `int16_t counter_h_lim` 
Maximum counter value
- `int16_t counter_l_lim` 
Minimum counter value
Chapter 2. API Reference

```c
pcnt_unit_t unit
    PCNT unit number
pcnt_channel_t channel
    the PCNT channel
```

### Macros

**PCNT_PIN_NOT_USED**
When selected for a pin, this pin will not be used.

**PCNT_MODE_KEEP**
Control mode: won’t change counter mode.

**PCNT_MODE_REVERSE**
Control mode: invert counter mode (increase -> decrease, decrease -> increase).

**PCNT_MODE_DISABLE**
Control mode: Inhibit counter (counter value will not change in this condition).

**PCNT_MODE_MAX**

**PCNT_COUNT_DIS**
Counter mode: Inhibit counter (counter value will not change in this condition).

**PCNT_COUNT_INC**
Counter mode: Increase counter value.

**PCNT_COUNT_DEC**
Counter mode: Decrease counter value.

**PCNT_COUNT_MAX**

### Type Definitions

```c
typedef intr_handle_t pcnt_isr_handle_t
typedef pcnt_channel_level_action_t pcnt_ctrl_mode_t
```

Selection of available modes that determine the counter’s action depending on the state of the control signal’s input GPIO.

**Note** Configuration covers two actions, one for high, and one for low level on the control input.

```c
typedef pcnt_channel_edge_action_t pcnt_count_mode_t
```

Selection of available modes that determine the counter’s action on the edge of the pulse signal’s input GPIO.

**Note** Configuration covers two actions, one for positive, and one for negative edge on the pulse input.

### Enumerations

```c
enum pcnt_port_t
    PCNT port number, the max port number is (PCNT_PORT_MAX - 1).

Values:

**PCNT_PORT_0**
    PCNT port 0

**PCNT_PORT_MAX**
    PCNT port max

enum pcnt_unit_t
    Selection of all available PCNT units.

Values:

**PCNT_UNIT_0**
    PCNT unit 0

**PCNT_UNIT_1**
    PCNT unit 1
```
Chapter 2. API Reference

PCNT_UNIT_2
PCNT unit 2

PCNT_UNIT_3
PCNT unit 3

PCNT_UNIT_MAX

enum pcnt_channel_t
Selection of channels available for a single PCNT unit.

Values:

PCNT_CHANNEL_0
PCNT channel 0

PCNT_CHANNEL_1
PCNT channel 1

PCNT_CHANNEL_MAX

enum pcnt_evt_type_t
Selection of counter’s events the may trigger an interrupt.

Values:

PCNT_EVT_THRES_1 = 1 << 2
PCNT watch point event: threshold1 value event

PCNT_EVT_THRES_0 = 1 << 3
PCNT watch point event: threshold0 value event

PCNT_EVT_L_LIM = 1 << 4
PCNT watch point event: Minimum counter value

PCNT_EVT_H_LIM = 1 << 5
PCNT watch point event: Maximum counter value

PCNT_EVT_ZERO = 1 << 6
PCNT watch point event: counter value zero event

PCNT_EVT_MAX

Header File

• components/hal/include/hal/pcnt_types.h

Enumerations

enum pcnt_channel_level_action_t
PCNT channel action on control level.

Values:

PCNT_CHANNEL_LEVEL_ACTION_KEEP
Keep current count mode

PCNT_CHANNEL_LEVEL_ACTION_INVERSE
Invert current count mode (increase -> decrease, decrease -> increase)

PCNT_CHANNEL_LEVEL_ACTION_HOLD
Hold current count value

enum pcnt_channel_edge_action_t
PCNT channel action on signal edge.

Values:

PCNT_CHANNEL_EDGE_ACTION_HOLD
Hold current count value
Chapter 2. API Reference

**PCNT_CHANNEL_EDGE_ACTION_INCREASE**
Increase count value

**PCNT_CHANNEL_EDGE_ACTION_DECREASE**
Decrease count value

defined as:

```c
enum pcnt_unit_count_sign_t
{
  PCNT_UNIT_COUNT_SIGN_ZERO_POS,  // positive value to zero
  PCNT_UNIT_COUNT_SIGN_ZERO_NEG,  // negative value to zero
  PCNT_UNIT_COUNT_SIGN_NEG,       // counter value negative
  PCNT_UNIT_COUNT_SIGN_POS        // counter value positive
};
```

## 2.3.13 Remote Control (RMT)

The RMT (Remote Control) module driver can be used to send and receive infrared remote control signals. Due to the flexibility of the RMT module, the driver can also be used to generate or receive many other types of signals.

The signal, which consists of a series of pulses, is generated by RMT’s transmitter based on a list of values. The values define the pulse duration and a binary level, see below. The transmitter can also provide a carrier and modulate it with provided pulses.

The reverse operation is performed by the receiver, where a series of pulses is decoded into a list of values containing the pulse duration and binary level. A filter may be applied to remove high frequency noise from the input signal.

There are a couple of typical steps to setup and operate the RMT and they are discussed in the following sections:

1. **Configure Driver**
2. **Transmit Data or Receive Data**
3. **Change Operation Parameters**
4. **Use Interrupts**

The RMT has eight channels numbered from zero to seven. The first half (i.e. Channel 0 ~ 3) channels can only be configured for transmitting, and the other half (i.e. Channel 4 ~ 7) channels can only be configured for receiving. They are referred to using indexes defined in structure `rmt_channel_t`.

![RMT Transmitter Overview](image-url)
Configure Driver

There are several parameters that define how particular channel operates. Most of these parameters are configured by setting specific members of `rmt_config_t` structure. Some of the parameters are common to both transmit or receive mode, and some are mode specific. They are all discussed below.

Common Parameters

- The channel to be configured, select one from the `rmt_channel_t` enumerator.
- The RMT operation mode - whether this channel is used to transmit or receive data, selected by setting a `rmt_mode` member to one of the values from `rmt_mode_t`.
- What is the pin number to transmit or receive RMT signals, selected by setting `gpio_num`.
- How many memory blocks will be used by the channel, set with `mem_block_num`.
- Extra miscellaneous parameters for the channel can be set in the `flags`.
  - When `RMT_CHANNEL_FLAGS_AWARE_DFS` is set, RMT channel will take REF_TICK or XTAL as source clock. The benefit is, RMT channel can continue work even when APB clock is changing. See `power_management` for more information.
  - When `RMT_CHANNEL_FLAGS_INVERT_SIG` is set, the driver will invert the RMT signals sending to or receiving from the channel. It just works like an external inverter connected to the GPIO of certain RMT channel.
- A clock divider, that will determine the range of pulse length generated by the RMT transmitter or discriminated by the receiver. Selected by setting `clk_div` to a value within [1..255] range. The RMT source clock is typically APB CLK, 80Mhz by default. But when `RMT_CHANNEL_FLAGS_AWARE_DFS` is set in `flags`, RMT source clock is changed to REF_TICK or XTAL.

Note: The period of a square wave after the clock divider is called a ‘tick’. The length of the pulses generated by the RMT transmitter or discriminated by the receiver is configured in number of ‘ticks’.

There are also couple of specific parameters that should be set up depending if selected channel is configured in Transmit Mode or Receive Mode:

Transmit Mode  When configuring channel in transmit mode, set `tx_config` and the following members of `rmt_tx_config_t`:

- Transmit the currently configured data items in a loop - `loop_en`
- Enable the RMT carrier signal - `carrier_en`
- Frequency of the carrier in Hz - `carrier_freq_hz`
- Duty cycle of the carrier signal in percent (%) - `carrier_duty_percent`
- Level of the RMT output, when the carrier is applied - `carrier_level`
• Enable the RMT output if idle - `idle_output_en`
• Set the signal level on the RMT output if idle - `idle_level`
• Specify maximum number of transmissions in a loop - `loop_count`

**Receive Mode**  In receive mode, set `rx_config` and the following members of `rmt_rx_config_t`:

• Enable a filter on the input of the RMT receiver - `filter_en`
• A threshold of the filter, set in the number of ticks - `filter_ticks_thresh`. Pulses shorter than this setting will be filtered out. Note, that the range of entered tick values is [0..255].
• A pulse length threshold that will turn the RMT receiver idle, set in number of ticks - `idle_threshold`. The receiver will ignore pulses longer than this setting.
• Enable the RMT carrier demodulation - `carrier_rm`
• Frequency of the carrier in Hz - `carrier_freq_hz`
• Duty cycle of the carrier signal in percent (%) - `carrier_duty_percent`
• Level of the RMT input, where the carrier is modulated to - `carrier_level`

**Finalize Configuration**  Once the `rmt_config_t` structure is populated with parameters, it should be then invoked with `rmt_config()` to make the configuration effective.

The last configuration step is installation of the driver in memory by calling `rmt_driver_install()`. If `rx_buf_size` parameter of this function is > 0, then a ring buffer for incoming data will be allocated. A default ISR handler will be installed, see a note in Use Interrupts.

Now, depending on how the channel is configured, we are ready to either Transmit Data or Receive Data. This is described in next two sections.

**Transmit Data**

Before being able to transmit some RMT pulses, we need to define the pulse pattern. The minimum pattern recognized by the RMT controller, later called an ‘item’, is provided in a structure `rmt_item32_t`. Each item consists of two pairs of two values. The first value in a pair describes the signal duration in ticks and is 15 bits long, the second provides the signal level (high or low) and is contained in a single bit. A block of couple of items and the structure of an item is presented below.

![Structure of RMT items](image)

For a simple example how to define a block of items see `peripherals/rmt/morse_code`. 
The items are provided to the RMT controller by calling function `rmt_write_items()`. This function also automatically triggers start of transmission. It may be called to wait for transmission completion or exit just after transmission start. In such case you can wait for the transmission end by calling `rmt_wait_tx_done()`. This function does not limit the number of data items to transmit. It is using an interrupt to successively copy the new data chunks to RMT’s internal memory as previously provided data are sent out.

Another way to provide data for transmission is by calling `rmt_fill_tx_items()`. In this case transmission is not started automatically. To control the transmission process use `rmt_tx_start()` and `rmt_tx_stop()`. The number of items to sent is restricted by the size of memory blocks allocated in the RMT controller’s internal memory, see `rmt_set_mem_block_num()`.

**Receive Data**

Before starting the receiver we need some storage for incoming items. The RMT controller has 384 x 32-bits of internal RAM shared between all eight channels.

In typical scenarios it is not enough as an ultimate storage for all incoming (and outgoing) items. Therefore this API supports retrieval of incoming items on the fly to save them in a ring buffer of a size defined by the user. The size is provided when calling `rmt_driver_install()` discussed above. To get a handle to this buffer call `rmt_get_ringbuf_handle()`.

With the above steps complete we can start the receiver by calling `rmt_rx_start()` and then move to checking what’s inside the buffer. To do so, you can use common FreeRTOS functions that interact with the ring buffer. Please see an example how to do it in `peripherals/rmt/ir_protocols`.

To stop the receiver, call `rmt_rx_stop()`.

**Change Operation Parameters**

Previously described function `rmt_config()` provides a convenient way to set several configuration parameters in one shot. This is usually done on application start. Then, when the application is running, the API provides an alternate way to update individual parameters by calling dedicated functions. Each function refers to the specific RMT channel provided as the first input parameter. Most of the functions have `_get_` counterpart to read back the currently configured value.

**Parameters Common to Transmit and Receive Mode**

- Selection of a GPIO pin number on the input or output of the RMT - `rmt_set_gpio()`
- Number of memory blocks allocated for the incoming or outgoing data - `rmt_set_mem_pd()`
- Setting of the clock divider - `rmt_set_clk_div()`
- Selection of the clock source, note that currently one clock source is supported, the APB clock which is 80Mhz - `rmt_set_source_clk()`

**Transmit Mode Parameters**

- Enable or disable the loop back mode for the transmitter - `rmt_set_tx_loop_mode()`
- Binary level on the output to apply the carrier - `rmt_set_tx_carrier()`, selected from `rmt_carrier_level_t`
- Determines the binary level on the output when transmitter is idle - `rmt_set_idle_level()`, selected from `rmt_idle_level_t`
- Enable or disable loop count feature to automatically transmit items for N iterations, then trigger an ISR callback - `rmt_set_tx_loop_count()`
- Enable automatically stopping when the number of iterations matches the set loop count. Note this is not reliable for target that doesn’t support `SOC_RMT_SUPPORT_TX_LOOP_AUTOSTOP` - `rmt_enable_tx_loop_autostop()`
Receive Mode Parameters

- The filter setting - `rmt_set_rx_filter()`
- The receiver threshold setting - `rmt_set_rx_idle_thresh()`
- Whether the transmitter or receiver is entitled to access RMT’s memory - `rmt_set_memory_owner()`, selection is from `rmt_mem_owner_t`.

Use Interrupts

Registering of an interrupt handler for the RMT controller is done by calling `rmt_isr_register()`.

**Note:** When calling `rmt_driver_install()` to use the system RMT driver, a default ISR is being installed. In such a case you cannot register a generic ISR handler with `rmt_isr_register()`.

The RMT controller triggers interrupts on four specific events described below. To enable interrupts on these events, the following functions are provided:

- The RMT receiver has finished receiving a signal - `rmt_set_rx_intr_en()`
- The RMT transmitter has finished transmitting the signal - `rmt_set_tx_intr_en()`
- The number of events the transmitter has sent matches a threshold value - `rmt_set_tx_thr_intr_en()`
- Ownership to the RMT memory block has been violated - `rmt_set_err_intr_en()`

Setting or clearing an interrupt enable mask for specific channels and events may be also done by calling `rmt_set_intr_enable_mask()` or `rmt_clr_intr_enable_mask()`.

When servicing an interrupt within an ISR, the interrupt need to explicitly cleared. To do so, set specific bits described as `RMT.int.clr.val.chN_event_name` and defined as a volatile struct in `soc/esp32s3/include/soc/rmt_struct.h`, where N is the RMT channel number [0, n] and the `event_name` is one of four events described above.

If you do not need an ISR anymore, you can deregister it by calling a function `rmt_isr_deregister()`.

**Warning:** It’s not recommended for users to register an interrupt handler in their applications. RMT driver is highly dependent on interrupt, especially when doing transaction in a ping-pong way, so the driver itself has registered a default handler called `rmt_driver_isr_default`. Instead, if what you want is to get a notification when transaction is done, go ahead with `rmt_register_tx_end_callback()`.

Uninstall Driver

If the RMT driver has been installed with `rmt_driver_install()` for some specific period of time and then not required, the driver may be removed to free allocated resources by calling `rmt_driver_uninstall()`.

Application Examples

- Using RMT to send morse code: `peripherals/rmt/morse_code`
- Using RMT to drive RGB LED strip: `peripherals/rmt/led_strip`
- NEC remote control TX and RX example: `peripherals/rmt/ir_protocols`
- Musical buzzer example: `peripherals/rmt/musical_buzzer`

API Reference

Header File

Chapter 2. API Reference

**Functions**

```c
esp_err_t rmt_set_clk_div (rmt_channel_t channel, uint8_t div_cnt)
```
Set RMT clock divider, channel clock is divided from source clock.

**Return**
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

**Parameters**
- channel: RMT channel
- div_cnt: RMT counter clock divider

```c
esp_err_t rmt_get_clk_div (rmt_channel_t channel, uint8_t* div_cnt)
```
Get RMT clock divider, channel clock is divided from source clock.

**Return**
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

**Parameters**
- channel: RMT channel
- div_cnt: pointer to accept RMT counter divider

```c
esp_err_t rmt_set_rx_idle_thresh (rmt_channel_t channel, uint16_t thresh)
```
Set RMT RX idle threshold value.

In receive mode, when no edge is detected on the input signal for longer than idle_thres channel clock cycles, the receive process is finished.

**Return**
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

**Parameters**
- channel: RMT channel
- thresh: RMT RX idle threshold

```c
esp_err_t rmt_get_rx_idle_thresh (rmt_channel_t channel, uint16_t* thresh)
```
Get RMT idle threshold value.

In receive mode, when no edge is detected on the input signal for longer than idle_thres channel clock cycles, the receive process is finished.

**Return**
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

**Parameters**
- channel: RMT channel
- thresh: pointer to accept RMT RX idle threshold value

```c
esp_err_t rmt_set_mem_block_num (rmt_channel_t channel, uint8_t rmt_mem_num)
```
Set RMT memory block number for RMT channel.

This function is used to configure the amount of memory blocks allocated to channel n. The 8 channels share a 512x32-bit RAM block which can be read and written by the processor cores over the APB bus, as well as read by the transmitters and written by the receivers.

The RAM address range for channel n is start_addr_CHn to end_addr_CHn, which are defined by:

```
Memory block start address is RMT_CHANNEL_MEM(n) (in soc/rmt_reg.h), that is, start_addr_CHn = RMT base address + 0x800 + 64 * 4 * n, and end_addr_CHn = RMT base address + 0x800 + 64 * 4 * n + 64 * 4 * RMT_MEM_SIZE_CHn mod 512 + 4
```

(continues on next page)
If memory block number of one channel is set to a value greater than 1, this channel will occupy the memory block of the next channel. Channel 0 can use at most 8 blocks of memory, accordingly channel 7 can only use one memory block.

Return
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

Parameters
- `channel`: RMT channel
- `rmt_mem_num`: RMT RX memory block number, one block has 64 * 32 bits.

```c
esp_err_t rmt_get_mem_block_num(rmt_channel_t channel, uint8_t* rmt_mem_num)
```

Get RMT memory block number.

Return
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

Parameters
- `channel`: RMT channel
- `rmt_mem_num`: Pointer to accept RMT RX memory block number

```c
esp_err_t rmt_set_tx_carrier(rmt_channel_t channel, bool carrier_en, uint16_t high_level, uint16_t low_level, rmt_carrier_level_t carrier_level)
```

Configure RMT carrier for TX signal.

Set different values for `carrier_high` and `carrier_low` to set different frequency of carrier. The unit of `carrier_high`/`low` is the source clock tick, not the divided channel counter clock.

Return
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

Parameters
- `channel`: RMT channel
- `carrier_en`: Whether to enable output carrier.
- `high_level`: High level duration of carrier
- `low_level`: Low level duration of carrier.
- `carrier_level`: Configure the way carrier wave is modulated for channel.
  - 1'b1: transmit on low output level
  - 1'b0: transmit on high output level

```c
esp_err_t rmt_set_mem_pd(rmt_channel_t channel, bool pd_en)
```

Set RMT memory in low power mode.

Reduce power consumed by memory. memory is in low power state.

Return
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

Parameters
- `channel`: RMT channel
- `pd_en`: RMT memory low power enable.

```c
esp_err_t rmt_get_mem_pd(rmt_channel_t channel, bool *pd_en)
```

Get RMT memory low power mode.

Return
• ESP_ERR_INVALID_ARG Parameter error
• ESP_OK Success

Parameters
• channel: RMT channel
• pd_en: Pointer to accept RMT memory low power mode.

\texttt{esp_err_t rmt\_tx\_start(rmt\_channel\_t channel, bool tx\_idx\_rst)}

Set RMT start sending data from memory.

Return
• ESP_ERR_INVALID_ARG Parameter error
• ESP_OK Success

Parameters
• channel: RMT channel

\texttt{esp_err_t rmt\_tx\_stop(rmt\_channel\_t channel)}

Set RMT stop sending.

Return
• ESP_ERR_INVALID_ARG Parameter error
• ESP_OK Success

Parameters
• channel: RMT channel

\texttt{esp_err_t rmt\_rx\_start(rmt\_channel\_t channel, bool rx\_idx\_rst)}

Set RMT start receiving data.

Return
• ESP_ERR_INVALID_ARG Parameter error
• ESP_OK Success

Parameters
• channel: RMT channel

\texttt{esp_err_t rmt\_rx\_stop(rmt\_channel\_t channel)}

Set RMT stop receiving data.

Return
• ESP_ERR_INVALID_ARG Parameter error
• ESP_OK Success

Parameters
• channel: RMT channel

\texttt{esp_err_t rmt\_tx\_memory\_reset(rmt\_channel\_t channel)}

Reset RMT TX memory.

Return
• ESP_ERR_INVALID_ARG Parameter error
• ESP_OK Success

Parameters
• channel: RMT channel

\texttt{esp_err_t rmt\_rx\_memory\_reset(rmt\_channel\_t channel)}

Reset RMT RX memory.

Return
• ESP_ERR_INVALID_ARG Parameter error
• ESP_OK Success

Parameters
• channel: RMT channel
**esp_err_t rmt_set_memory_owner (rmt_channel_t channel, rmt_mem_owner_t owner)**

Set RMT memory owner.

**Note** Setting memory is only valid for RX channel.

**Return**
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

**Parameters**
- channel: RMT channel
- owner: To set when the transmitter or receiver can process the memory of channel.

**esp_err_t rmt_get_memory_owner (rmt_channel_t channel, rmt_mem_owner_t *owner)**

Get RMT memory owner.

**Return**
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

**Parameters**
- channel: RMT channel
- owner: Pointer to get memory owner.

**esp_err_t rmt_set_tx_loop_mode (rmt_channel_t channel, bool loop_en)**

Set RMT tx loop mode.

**Return**
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

**Parameters**
- channel: RMT channel
- loop_en: Enable RMT transmitter loop sending mode. If set true, transmitter will continue sending from the first data to the last data in channel over and over again in a loop.

**esp_err_t rmt_get_tx_loop_mode (rmt_channel_t channel, bool *loop_en)**

Get RMT tx loop mode.

**Return**
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

**Parameters**
- channel: RMT channel
- loop_en: Pointer to accept RMT transmitter loop sending mode.

**esp_err_t rmt_set_rx_filter (rmt_channel_t channel, bool rx_filter_en, uint8_t thresh)**

Set RMT RX filter.

In receive mode, channel will ignore input pulse when the pulse width is smaller than threshold.

Counted in source clock, not divided counter clock.

**Return**
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

**Parameters**
- channel: RMT channel
- rx_filter_en: To enable RMT receiver filter.
- thresh: Threshold of pulse width for receiver.

**esp_err_t rmt_set_source_clk (rmt_channel_t channel, rmt_source_clk_t base_clk)**

Set RMT source clock.

RMT module has two clock sources:
1. APB clock which is 80Mhz
2. REF tick clock, which would be 1Mhz (not supported in this version).
Return

- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

Parameters

- channel: RMT channel
- base_clk: To choose source clock for RMT module.

**esp_err_t rmt_get_source_clk (rmt_channel_t channel, rmt_source_clk_t *src_clk)**

Get RMT source clock.

---

RMT module has two clock sources:
1. APB clock which is 80Mhz
2. REF tick clock, which would be 1Mhz (not supported in this version).

Return

- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

Parameters

- channel: RMT channel
- src_clk: Pointer to accept source clock for RMT module.

**esp_err_t rmt_set_idle_level (rmt_channel_t channel, bool idle_out_en, rmt_idle_level_t level)**

Set RMT idle output level for transmitter.

Return

- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

Parameters

- channel: RMT channel
- idle_out_en: To enable idle level output.
- level: To set the output signal’s level for channel in idle state.

**esp_err_t rmt_get_idle_level (rmt_channel_t channel, bool *idle_out_en, rmt_idle_level_t *level)**

Get RMT idle output level for transmitter.

Return

- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

Parameters

- channel: RMT channel
- idle_out_en: Pointer to accept value of enable idle.
- level: Pointer to accept value of output signal’s level in idle state for specified channel.

**esp_err_t rmt_get_status (rmt_channel_t channel, uint32_t *status)**

Get RMT status.

Return

- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

Parameters

- channel: RMT channel
- status: Pointer to accept channel status. Please refer to RMT_CHnSTATUS_REG(n=0-7) in rmt_reg.h for more details of each field.

**esp_err_t rmt_set_rx_intr_en (rmt_channel_t channel, bool en)**

Set RMT RX interrupt enable.

Return

- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

Parameters

- channel: RMT channel
- en: enable or disable RX interrupt.
**esp_err_t rmt_set_err_intr_en(rmt_channel_t channel, bool en)**

Set RMT RX error interrupt enable.

**Return**
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

**Parameters**
- channel: RMT channel
- en: enable or disable RX err interrupt.

**esp_err_t rmt_set_tx_intr_en(rmt_channel_t channel, bool en)**

Set RMT TX interrupt enable.

**Return**
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

**Parameters**
- channel: RMT channel
- en: enable or disable TX interrupt.

**esp_err_t rmt_set_tx_thr_intr_en(rmt_channel_t channel, bool en, uint16_t evt_thresh)**

Set RMT TX threshold event interrupt enable.

An interrupt will be triggered when the number of transmitted items reaches the threshold value.

**Return**
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

**Parameters**
- channel: RMT channel
- en: enable or disable TX event interrupt.
- evt_thresh: RMT event interrupt threshold value

**esp_err_t rmt_set_gpio(rmt_channel_t channel, rmt_mode_t mode, gpio_num_t gpio_num, bool invert_signal)**

Configure the GPIO used by RMT channel.

**Return**
- ESP_ERR_INVALID_ARG Configure RMT GPIO failed because of wrong parameter
- ESP_OK Configure RMT GPIO successfully

**Parameters**
- channel: RMT channel
- mode: RMT mode, either RMT_MODE_TX or RMT_MODE_RX
- gpio_num: GPIO number, which is connected with certain RMT signal
- invert_signal: Invert RMT signal physically by GPIO matrix

**esp_err_t rmt_config(const rmt_config_t *rmt_param)**

Configure RMT parameters.

**Return**
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

**Parameters**
- rmt_param: RMT parameter struct

**esp_err_t rmt_isr_register(void (*fn) void * arg, int intr_alloc_flags, rmt_isr_handle_t *handle)**

Register RMT interrupt handler, the handler is an ISR.

The handler will be attached to the same CPU core that this function is running on.

**Note** If you already called rmt_driver_install to use system RMT driver, please do not register ISR handler again.
Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG Function pointer error.
• ESP_FAIL System driver installed, can not register ISR handler for RMT

Parameters
• fn: Interrupt handler function.
• arg: Parameter for the handler function
• intr_alloc_flags: Flags used to allocate the interrupt. One or multiple (ORred) ESP_INTR_FLAG_* values. See esp_intr_alloc.h for more info.
• handle: If non-zero, a handle to later clean up the ISR gets stored here.

`esp_err_t rmt_isr_deregister(rmt_isr_handle_t handle)`
Deregister previously registered RMT interrupt handler.

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG Handle invalid

Parameters
• handle: Handle obtained from rmt_isr_register

`esp_err_t rmt_fill_tx_items(rmt_channel_t channel, const rmt_item32_t *item, uint16_t item_num, uint16_t mem_offset)`
Fill memory data of channel with given RMT items.

Return
• ESP_ERR_INVALID_ARG Parameter error
• ESP_OK Success

Parameters
• channel: RMT channel
• item: Pointer of items.
• item_num: RMT sending items number.
• mem_offset: Index offset of memory.

`esp_err_t rmt_driver_install(rmt_channel_t channel, size_t rx_buf_size, int intr_alloc_flags)`
Initialize RMT driver.

Return
• ESP_ERR_INVALID_STATE Driver is already installed, call rmt_driver_uninstall first.
• ESP_ERR_NO_MEM Memory allocation failure
• ESP_ERR_INVALID_ARG Parameter error
• ESP_OK Success

Parameters
• channel: RMT channel
• rx_buf_size: Size of RMT RX ringbuffer. Can be 0 if the RX ringbuffer is not used.
• intr_alloc_flags: Flags for the RMT driver interrupt handler. Pass 0 for default flags. See esp_intr_alloc.h for details. If ESP_INTR_FLAG_IRAM is used, please do not use the memory allocated from psram when calling rmt_write_items.

`esp_err_t rmt_driver_uninstall(rmt_channel_t channel)`
Uninstall RMT driver.

Return
• ESP_ERR_INVALID_ARG Parameter error
• ESP_OK Success

Parameters
• channel: RMT channel

`esp_err_t rmt_get_channel_status(rmt_channel_status_result_t *channel_status)`
Get the current status of eight channels.

Note Do not call this function if it is possible that rmt_driver_uninstall will be called at the same time.

Return
**Chapter 2. API Reference**

- **ESP_ERR_INVALID_ARG** Parameter is NULL
- **ESP_OK** Success

### Parameters
- **channel_status**: store the current status of each channel

```c
esp_err_t rmt_get_counter_clock(rmt_channel_t channel, uint32_t* clock_hz)
```

Get speed of channel’s internal counter clock.

**Return**
- **ESP_ERR_INVALID_ARG** Parameter is NULL
- **ESP_OK** Success

### Parameters
- **channel**: RMT channel
- **clock_hz**: counter clock speed, in hz

```c
esp_err_t rmt_write_items(rmt_channel_t channel, const rmt_item32_t* rmt_item, int item_num, bool wait_tx_done)
```

RMT send waveform from rmt_item array.

**Note**
This function will not copy data, instead, it will point to the original items, and send the waveform items.

If `wait_tx_done` is set to true, this function will block and will not return until all items have been sent out. If `wait_tx_done` is set to false, this function will return immediately, and the driver interrupt will continue sending the items. We must make sure the item data will not be damaged when the driver is still sending items in driver interrupt.

**Return**
- **ESP_ERR_INVALID_ARG** Parameter error
- **ESP_OK** Success

### Parameters
- **channel**: RMT channel
- **rmt_item**: head point of RMT items array. If ESP_INTR_FLAG_IRAM is used, please do not use the memory allocated from psram when calling rmt_write_items.
- **item_num**: RMT data item number.
- **wait_tx_done**:
  - If set 1, it will block the task and wait for sending done.
  - If set 0, it will not wait and return immediately.

```c
esp_err_t rmt_wait_tx_done(rmt_channel_t channel, TickType_t wait_time)
```

Wait RMT TX finished.

**Return**
- **ESP_OK** RMT Tx done successfully
- **ESP_ERR_TIMEOUT** Exceeded the ‘wait_time’ given
- **ESP_ERR_INVALID_ARG** Parameter error
- **ESP_FAIL** Driver not installed

### Parameters
- **channel**: RMT channel
- **wait_time**: Maximum time in ticks to wait for transmission to be complete. If set 0, return immediately with ESP_ERR_TIMEOUT if TX is busy (polling).

```c
esp_err_t rmt_get_ringbuf_handle(rmt_channel_t channel, RingbufHandle_t* buf_handle)
```

Get ringbuffer from RMT.

**Return**
- **ESP_ERR_INVALID_ARG** Parameter error
- **ESP_OK** Success

### Parameters
- **channel**: RMT channel
- **buf_handle**: Pointer to buffer handle to accept RX ringbuffer handle.

Users can get the RMT RX ringbuffer handle, and process the RX data.
**Chapter 2. API Reference**

**esp_err_t rmt_translator_init (rmt_channel_t channel, sample_to_rmt_t fn)**

Init rmt translator and register user callback. The callback will convert the raw data that needs to be sent to rmt format. If a channel is initialized more than once, the user callback will be replaced by the later.

**Return**
- ESP_FAIL Init fail.
- ESP_OK Init success.

**Parameters**
- channel: RMT channel.
- fn: Point to the data conversion function.

**esp_err_t rmt_translator_set_context (rmt_channel_t channel, void *context)**

Set user context for the translator of specific channel.

**Return**
- ESP_FAIL Set context fail
- ESP_OK Set context success

**Parameters**
- channel: RMT channel number
- context: User context

**esp_err_t rmt_translator_get_context (const size_t *item_num, void **context)**

Get the user context set by ‘rmt_translator_set_context’.

**Note** This API must be invoked in the RMT translator callback function, and the first argument must be the actual parameter ‘item_num’ you got in that callback function.

**Return**
- ESP_FAIL Get context fail
- ESP_OK Get context success

**Parameters**
- item_num: Address of the memory which contains the number of translated items (It’s from driver’s internal memory)
- context: Returned User context

**esp_err_t rmt_write_sample (rmt_channel_t channel, const uint8_t *src, size_t src_size, bool wait_tx_done)**

Translate uint8_t type of data into rmt format and send it out. Requires rmt_translator_init to init the translator first.

**Return**
- ESP_FAIL Send fail
- ESP_OK Send success

**Parameters**
- channel: RMT channel.
- src: Pointer to the raw data.
- src_size: The size of the raw data.
- wait_tx_done: Set true to wait all data sent done.

**rmt_tx_end_callback_t rmt_register_tx_end_callback (rmt_tx_end_fn_t function, void *arg)**

Registers a callback that will be called when transmission ends.

Called by rmt_driver_isr_default in interrupt context.

**Note** Requires rmt_driver_install to install the default ISR handler.

**Return** the previous callback settings (members will be set to NULL if there was none)

**Parameters**
- function: Function to be called from the default interrupt handler or NULL.
- arg: Argument which will be provided to the callback when it is called.

**esp_err_t rmt_set_rx_thr_intr_en (rmt_channel_t channel, bool en, uint16_t evt_thresh)**

Set RMT RX threshold event interrupt enable.

An interrupt will be triggered when the number of received items reaches the threshold value.
### ESP_ERR_INVALID_ARG Parameter error
- Parameter error

### ESP_OK Success
- Success

### Parameters
- channel: RMT channel
- en: enable or disable RX event interrupt.
- evt_thresh: RMT event interrupt threshold value

### `esp_err_t rmt_add_channel_to_group (rmt_channel_t channel)`
Add channel into a synchronous group (channels in the same group can start transaction simultaneously)

#### Return
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

#### Parameters
- channel: RMT channel

### `esp_err_t rmt_remove_channel_from_group (rmt_channel_t channel)`
Remove channel out of a group.

#### Return
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

#### Parameters
- channel: RMT channel

### `esp_err_t rmt_set_tx_loop_count (rmt_channel_t channel, uint32_t count)`
Set loop count threshold value for RMT TX channel.

When tx loop count reaches this value, an ISR callback will notify user

#### Return
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

#### Parameters
- channel: RMT channel
- count: loop count, 1 ~ 1023

### `esp_err_t rmt_enable_tx_loop_autostop (rmt_channel_t channel, bool en)`
Enable or disable the feature that when loop count reaches the threshold, RMT will stop transmitting.

- When the loop auto-stop feature is enabled will halt RMT transmission after the loop count reaches a certain threshold
- When disabled, the RMT transmission continue indefinitely until halted by the users

#### Note
- The auto-stop feature is implemented in hardware on particular targets (i.e. those with SOC_RMT_SUPPORT_TX_LOOP_AUTOSTOP defined). Otherwise, the auto-stop feature is implemented in software via the interrupt.

#### Return
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

#### Parameters
- channel: RMT channel
- en: enable bit

### `esp_err_t rmt_memory_rw_rst (rmt_channel_t channel)`
Reset RMT TX/RX memory index.

#### Return
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

#### Parameters
- channel: RMT channel
void \texttt{rmt\_set\_intr\_enable\_mask} (uint32\_t \texttt{mask})
Set mask value to RMT interrupt enable register.

\textbf{Parameters}
- \texttt{mask}: Bit mask to set to the register

void \texttt{rmt\_clr\_intr\_enable\_mask} (uint32\_t \texttt{mask})
Clear mask value to RMT interrupt enable register.

\textbf{Parameters}
- \texttt{mask}: Bit mask to clear the register

\texttt{esp\_err\_t rmt\_set\_pin} (rmt\_channel\_t \texttt{channel}, rmt\_mode\_t \texttt{mode}, gpio\_num\_t \texttt{gpio\_num})
Set RMT pin.

\textbf{Return}
- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_OK Success

\textbf{Parameters}
- \texttt{channel}: RMT channel
- \texttt{mode}: TX or RX mode for RMT
- \texttt{gpio\_num}: GPIO number to transmit or receive the signal.

\textbf{Structures}
\texttt{struct rmt\_item32\_t}
Definition of RMT item.

\textbf{Public Members}
- \texttt{uint32\_t duration0}: 15
  Duration of level0
- \texttt{uint32\_t level0}: 1
  Level of the first part
- \texttt{uint32\_t duration1}: 15
  Duration of level1
- \texttt{uint32\_t level1}: 1
  Level of the second part
- \texttt{uint32\_t val}
  Equivalent unsigned value for the RMT item

\texttt{struct rmt\_tx\_config\_t}
Data struct of RMT TX configure parameters.

\textbf{Public Members}
- \texttt{uint32\_t carrier\_freq\_hz}
  RMT carrier frequency

\texttt{rmt\_carrier\_level\_t carrier\_level}
Level of the RMT output, when the carrier is applied

\texttt{rmt\_idle\_level\_t idle\_level}
RMT idle level

\texttt{uint8\_t carrier\_duty\_percent}
RMT carrier duty (%)

\texttt{uint32\_t loop\_count}
Maximum loop count
bool carrier_en
   RMT carrier enable

bool loop_en
   Enable sending RMT items in a loop

bool idle_output_en
   RMT idle level output enable

struct rmt_rx_config_t
   Data struct of RMT RX configure parameters.

Public Members

    uint16_t idle_threshold
       RMT RX idle threshold

    uint8_t filter_ticks_thresh
       RMT filter tick number

    bool filter_en
       RMT receiver filter enable

    bool rm_carrier
       RMT receiver remove carrier enable

    uint32_t carrier_freq_hz
       RMT carrier frequency

    uint8_t carrier_duty_percent
       RMT carrier duty (%)

    rmt_carrier_level_t carrier_level
       The level to remove the carrier

struct rmt_config_t
   Data struct of RMT configure parameters.

Public Members

    rmt_mode_t rmt_mode
       RMT mode: transmitter or receiver

    rmt_channel_t channel
       RMT channel

    gpio_num_t gpio_num
       RMT GPIO number

    uint8_t clk_div
       RMT channel counter divider

    uint8_t mem_block_num
       RMT memory block number

    uint32_t flags
       RMT channel extra configurations, OR’d with RMT_CHANNEL_FLAGS[*]

    rmt_tx_config_t tx_config
       RMT TX parameter

    rmt_rx_config_t rx_config
       RMT RX parameter

struct rmt_tx_end_callback_t
   Structure encapsulating a RMT TX end callback.
Public Members

```c
rmt_tx_end_fn_t function
    Function which is called on RMT TX end

void *arg
    Optional argument passed to function
```

Macros

```c
RMT_CHANNEL_FLAGS_AWARE_DFS
    Channel can work during APB clock scaling

RMT_CHANNEL_FLAGS_INVERT_SIG
    Invert RMT signal

RMT_MEM_ITEM_NUM
    Define memory space of each RMT channel (in words = 4 bytes)

RMT_DEFAULT_CONFIG_TX (gpio, channel_id)
    Default configuration for Tx channel.

RMT_DEFAULT_CONFIG_RX (gpio, channel_id)
    Default configuration for RX channel.
```

Type Definitions

```c
typedef intr_handle_t rmt_isr_handle_t
    RMT interrupt handle.

typedef void (*rmt_tx_end_fn_t)(rmt_channel_t channel, void *arg)
    Type of RMT Tx End callback function.

typedef void (*sample_to_rmt_t)(const void *src, rmt_item32_t *dest, size_t src_size, size_t wanted_num, size_t *translated_size, size_t *item_num)
    User callback function to convert uint8_t type data to rmt format(rmt_item32_t).
```

Note
In fact, item_num should be a multiple of translated_size, e.g.: When we convert each byte of uint8_t type data to rmt format data, the relation between item_num and translated_size should be item_num = translated_size*8.

Parameters

- `src`: Pointer to the buffer storing the raw data that needs to be converted to rmt format.
- `[out] dest`: Pointer to the buffer storing the rmt format data.
- `src_size`: The raw data size.
- `wanted_num`: The number of rmt format data that wanted to get.
- `[out] translated_size`: The size of the raw data that has been converted to rmt format, it should return 0 if no data is converted in user callback.
- `[out] item_num`: The number of the rmt format data that actually converted to, it can be less than wanted_num if there is not enough raw data, but cannot exceed wanted_num. it should return 0 if no data was converted.

Header File

- `components/hal/include/hal/rmt_types.h`

Structures

```c
struct rmt_channel_status_result_t
    Data struct of RMT channel status.
```
Chapter 2. API Reference

Public Members

```c
rmt_channel_status_t status[RMT_CHANNEL_MAX]
```

Store the current status of each channel

Enumerations

```c
class rmt_channel_t
RMT channel ID.

Values:
- RMT_CHANNEL_0: RMT channel number 0
- RMT_CHANNEL_1: RMT channel number 1
- RMT_CHANNEL_2: RMT channel number 2
- RMT_CHANNEL_3: RMT channel number 3
- RMT_CHANNEL_4: RMT channel number 4
- RMT_CHANNEL_5: RMT channel number 5
- RMT_CHANNEL_6: RMT channel number 6
- RMT_CHANNEL_7: RMT channel number 7
- RMT_CHANNEL_MAX: Number of RMT channels
```

```c
class rmt_mem_owner_t
RMT Internal Memory Owner.

Values:
- RMT_MEM_OWNER_TX: RMT RX mode, RMT transmitter owns the memory block
- RMT_MEM_OWNER_RX: RMT RX mode, RMT receiver owns the memory block
- RMT_MEM_OWNER_MAX
```

```c
class rmt_source_clk_t
Clock Source of RMT Channel.

Values:
- RMT_BASECLK_APB = 1: RMT source clock is APB CLK, 80Mhz by default
- RMT_BASECLK_XTAL = 3: RMT source clock is XTAL clock, 40Mhz by default
- RMT_BASECLK_MAX
```

```c
class rmt_data_mode_t
RMT Data Mode.

Note: We highly recommended to use MEM mode not FIFO mode since there will be some gotcha in FIFO mode.
```

```c
enum rmt_mem_owner_t
RMT Internal Memory Owner.

Values:
- RMT_MEM_OWNER_TX: RMT RX mode, RMT transmitter owns the memory block
- RMT_MEM_OWNER_RX: RMT RX mode, RMT receiver owns the memory block
- RMT_MEM_OWNER_MAX
```

```c
class rmt_source_clk_t
Clock Source of RMT Channel.

Values:
- RMT_BASECLK_APB = 1: RMT source clock is APB CLK, 80Mhz by default
- RMT_BASECLK_XTAL = 3: RMT source clock is XTAL clock, 40Mhz by default
- RMT_BASECLK_MAX
```

```c
class rmt_data_mode_t
RMT Data Mode.

Note: We highly recommended to use MEM mode not FIFO mode since there will be some gotcha in FIFO mode.
```
Chapter 2. API Reference

Values:

RMT_DATA_MODE_FIFO
RMT_DATA_MODE_MEM
RMT_DATA_MODE_MAX

enum rmt_mode_t
RMT Channel Working Mode (TX or RX)

Values:

RMT_MODE_TX
RMT_TX mode
RMT_MODE_RX
RMT RX mode
RMT_MODE_MAX

enum rmt_idle_level_t
RMT Idle Level.

Values:

RMT_IDLE_LEVEL_LOW
RMT TX idle level: low Level
RMT_IDLE_LEVEL_HIGH
RMT TX idle level: high Level
RMT_IDLE_LEVEL_MAX

enum rmt_carrier_level_t
RMT Carrier Level.

Values:

RMT_CARRIER_LEVEL_LOW
RMT carrier wave is modulated for low Level output
RMT_CARRIER_LEVEL_HIGH
RMT carrier wave is modulated for high Level output
RMT_CARRIER_LEVEL_MAX

enum rmt_channel_status_t
RMT Channel Status.

Values:

RMT_CHANNEL_UNINIT
RMT channel uninitialized
RMT_CHANNEL_IDLE
RMT channel status idle
RMT_CHANNEL_BUSY
RMT channel status busy

2.3.14 SD Pull-up Requirements

Espressif hardware products are designed for multiple use cases which may require different pull states on pins. For this reason, the pull state of particular pins on certain products will need to be adjusted to provide the pull-ups required in the SD bus.

SD pull-up requirements apply to cases where ESP32-S3 uses the SPI or SDMMC controller to communicate with SD cards. When an SD card is operating in SPI mode or 1-bit SD mode, the CMD and DATA (DAT0 - DAT3) lines
of the SD bus must be pulled up by 10 kOhm resistors. SD cards and SDIO devices should also have pull-ups on all above-mentioned lines (regardless of whether these lines are connected to the host) in order to prevent them from entering a wrong state.

This document has the following structure:

- **Overview of compatibility** between the default pull states on pins of Espressif’s products and the states required by the SD bus
- **Solutions** - ideas on how to resolve compatibility issues
- **Related information** - other relevant information

### Overview of Compatibility

This section provides an overview of compatibility issues that might occur when using SDIO (secure digital input output). Since the SD bus needs to be connected to pull-ups, these issues should be resolved regardless of whether they are related to master (host) or slave (device). Each issue has links to its respective solution. A solution for a host and device may differ.

#### Systems on a Chip (SoCs)

ESP32-S3 SDMMC host controller allows using any of GPIOs for any of SD interface signals. However, it is recommended to avoid using strapping GPIOs, GPIOs with internal weak pull-downs and GPIOs commonly used for other purposes to prevent conflicts:

- GPIO0 (strapping pin)
- GPIO45, GPIO46 (strapping pins, internal weak pulldown)
- GPIO26 - GPIO32 (commonly used for SPI Flash and PSRAM)
- GPIO33 - GPIO37 (when using chips and modules with Octal SPI Flash or Octal PSRAM)
- GPIO43, GPIO44 (GPIOs used for UART0 by default)
- GPIO19, GPIO20 (GPIOs used for USB by default)

#### Systems in Packages (SIP)

#### Modules

#### Development Boards

- ESP32-S3-DevKitC-1
  - No Pull-ups
- ESP32-S3-USB-OTG
  - The board may be used in 1-line and 4-line SD mode or SPI mode.
  - Required pull-ups are provided on GPIOs 33-38.
- ESP32-S3-EYE
  - The board is limited to 1-line SD mode.
  - Required pull-ups are provided on GPIOs 38-40.

#### Solutions

**No Pull-ups** If you use a development board without pull-ups, you can do the following:

- If your host and slave device are on separate boards, replace one of them with a board that has pull-ups. For the list of Espressif’s development boards with pull-ups, go to **Development Boards**.
- Attach external pull-ups by connecting each pin which requires a pull-up to VDD via a 10 kOhm resistor.
Related Information

2.3.15 SDMMC Host Driver

Overview

ESP32-S3’s SDMMC host peripheral has two slots. Each slot can be used independently to connect to an SD card, SDIO device or eMMC chip.

Both slots (SDMMC_HOST_SLOT_0, SDMMC_HOST_SLOT_1) support 1-, 4- and 8-line SD interface. The slots are connected to ESP32-S3 GPIOs using GPIO matrix. This means that any GPIO may be used for each of the SD card signals.

Supported Speed Modes

SDMMC Host driver supports the following speed modes:

- Default Speed (20 MHz), 1/4-line (with SD cards), and 1/4/8-line (with 3.3 V eMMC)
- High Speed (40 MHz), 1/4-line (with SD cards), and 1/4/8-line (with 3.3 V eMMC)
- High Speed DDR (40 MHz), 4-line (with 3.3 V eMMC)

Speed modes not supported at present:

- High Speed DDR mode, 8-line eMMC
- UHS-I 1.8 V modes, 4-line SD cards

Using the SDMMC Host Driver

Of all the functions listed below, only the following ones will be used directly by most applications:

- sdmmc_host_init()
- sdmmc_host_init_slot()
- sdmmc_host_deinit()

Other functions, such as the ones given below, will be called by the SD/MMC protocol layer via function pointers in the sdmmc_host_t structure:

- sdmmc_host_set_bus_width()
- sdmmc_host_set_card_clk()
- sdmmc_host_do_transaction()

Configuring Bus Width and Frequency

With the default initializers for sdmmc_host_t and sdmmc_slot_config_t (SDMMC_HOST_DEFAULT and SDMMC_SLOT_CONFIG_DEFAULT), SDMMC Host driver will attempt to use the widest bus supported by the card (4 lines for SD, 8 lines for eMMC) and the frequency of 20 MHz.

In the designs where communication at 40 MHz frequency can be achieved, it is possible to increase the bus frequency by changing the max_freq_khz field of sdmmc_host_t:

```
sdmmc_host_t host = SDMMC_HOST_DEFAULT();
host.max_freq_khz = SDMMC_FREQ_HIGHSPEED;
```

To configure the bus width, set the width field of sdmmc_slot_config_t. For example, to set 1-line mode:

```
sdmmc_slot_config_t slot = SDMMC_SLOT_CONFIG_DEFAULT();
slot.width = 1;
```
Configuring GPIOs

ESP32-S3 SDMMC Host can be configured to use arbitrary GPIOs for each of the signals. Configuration is performed by setting members of `sdmmc_slot_config_t` structure. For example, to use GPIOs 1-6 for CLK, CMD, D0 - D3 signals, respectively:

```c
sdmmc_slot_config_t slot = SDMMC_SLOT_CONFIG_DEFAULT();
slot.clk = GPIO_NUM_1;
slot.cmd = GPIO_NUM_2;
slot.d0 = GPIO_NUM_3;
slot.d1 = GPIO_NUM_4;
slot.d2 = GPIO_NUM_5;
slot.d3 = GPIO_NUM_6;
```

It is also possible to configure Card Detect and Write Protect pins. Similar to other signals, set `cd` and `wp` members of the same structure:

```c
slot.cd = GPIO_NUM_7;
slot.wp = GPIO_NUM_8;
```

`SDMMC_SLOT_CONFIG_DEFAULT` sets both to `GPIO_NUM_NC`, meaning that by default the signals are not used.

Once `sdmmc_slot_config_t` structure is initialized this way, you can use it when calling `sdmmc_host_init_slot()` or one of the higher level functions, such as `esp_vfs_fat_sdmmc_mount()`.

**DDR Mode for eMMC chips**

By default, DDR mode will be used if:

- SDMMC host frequency is set to `SDMMC_FREQ_HIGHSPEED` in `sdmmc_host_t` structure, and
- eMMC chip reports DDR mode support in its CSD register

DDR mode places higher requirements for signal integrity. To disable DDR mode while keeping `SDMMC_FREQ_HIGHSPEED` frequency, clear `SDMMC_HOST_FLAG_DDR` bit in `flags` field of `sdmmc_host_t`:

```c
sdmmc_host_t host = SDMMC_HOST_DEFAULT();
host.max_freq_khz = SDMMC_FREQ_HIGHSPEED;
host.flags &= ~SDMMC_HOST_FLAG_DDR;
```

See *SD/SDIO/MMC Driver* for the higher level driver which implements the protocol layer.

See *SD SPI Host Driver* for a similar driver which uses the SPI controller and is limited to SD protocol’s SPI mode.

See *SD Pull-up Requirements* for pullup support and compatibilities of modules and development kits.

**API Reference**

**Header File**

- components/driver/include/driver/sdmmc_host.h

**Functions**

- `esp_err_t sdmmc_host_init(void)`
  
  Initialize SDMMC host peripheral.

  **Note** This function is not thread safe

  **Return**

  - ESP_OK on success
Chapter 2. API Reference

- ESP_ERR_INVALID_STATE if sdmmc_host_init was already called
- ESP_ERR_NO_MEM if memory can not be allocated

\texttt{esp_err_t sdmmc_host_init_slot (int slot, const sdmmc_slot_config_t *slot_config)}

Initialize given slot of SDMMC peripheral.

On the ESP32, SDMMC peripheral has two slots:

- Slot 0: 8-bit wide, maps to HS1_* signals in PIN_MUX
- Slot 1: 4-bit wide, maps to HS2_* signals in PIN_MUX

Card detect and write protect signals can be routed to arbitrary GPIOs using GPIO matrix.

\textbf{Note} This function is not thread safe

\textbf{Return}

- ESP_OK on success
- ESP_ERR_INVALID_STATE if host has not been initialized using sdmmc_host_init

\textbf{Parameters}

- \texttt{slot}: slot number (SDMMC_HOST_SLOT_0 or SDMMC_HOST_SLOT_1)
- \texttt{slot_config}: additional configuration for the slot

\texttt{esp_err_t sdmmc_host_set_bus_width (int slot, size_t width)}

Select bus width to be used for data transfer.

SD/MMC card must be initialized prior to this command, and a command to set bus width has to be sent to the card (e.g. SD_APP_SET_BUS_WIDTH)

\textbf{Note} This function is not thread safe

\textbf{Return}

- ESP_OK on success
- ESP_ERR_INVALID_ARG if slot number or width is not valid

\textbf{Parameters}

- \texttt{slot}: slot number (SDMMC_HOST_SLOT_0 or SDMMC_HOST_SLOT_1)
- \texttt{width}: bus width (1, 4, or 8 for slot 0; 1 or 4 for slot 1)

\texttt{size_t sdmmc_host_get_slot_width (int slot)}

Get bus width configured in sdmmc_host_init_slot to be used for data transfer.

\textbf{Return} configured bus width of the specified slot.

\textbf{Parameters}

- \texttt{slot}: slot number (SDMMC_HOST_SLOT_0 or SDMMC_HOST_SLOT_1)

\texttt{esp_err_t sdmmc_host_set_card_clk (int slot, uint32_t freq_khz)}

Set card clock frequency.

Currently only integer fractions of 40MHz clock can be used. For High Speed cards, 40MHz can be used. For Default Speed cards, 20MHz can be used.

\textbf{Note} This function is not thread safe

\textbf{Return}

- ESP_OK on success
- other error codes may be returned in the future

\textbf{Parameters}

- \texttt{slot}: slot number (SDMMC_HOST_SLOT_0 or SDMMC_HOST_SLOT_1)
- \texttt{freq_khz}: card clock frequency, in kHz

\texttt{esp_err_t sdmmc_host_set_bus_ddr_mode (int slot, bool ddr_enabled)}

Enable or disable DDR mode of SD interface.

\textbf{Return}

- ESP_OK on success
- ESP_ERR_NOT_SUPPORTED if DDR mode is not supported on this slot

\textbf{Parameters}

- \texttt{slot}: slot number (SDMMC_HOST_SLOT_0 or SDMMC_HOST_SLOT_1)
- \texttt{ddr_enabled}: enable or disable DDR mode
esp_err_t sdmmc_host_do_transaction (int slot, sdmmc_command_t *cmdinfo)

Send command to the card and get response.

This function returns when command is sent and response is received, or data is transferred, or timeout occurs.

**Note** This function is not thread safe w.r.t. init/deinit functions, and bus width/clock speed configuration functions. Multiple tasks can call sdmmc_host_do_transaction as long as other sdmmc_host_* functions are not called.

**Attention** Data buffer passed in cmdinfo->data must be in DMA capable memory

**Return**
- ESP_OK on success
- ESP_ERR_TIMEOUT if response or data transfer has timed out
- ESP_ERR_INVALID_CRC if response or data transfer CRC check has failed
- ESP_ERR_INVALID_RESPONSE if the card has sent an invalid response
- ESP_ERR_INVALID_SIZE if the size of data transfer is not valid in SD protocol
- ESP_ERR_INVALID_ARG if the data buffer is not in DMA capable memory

**Parameters**
- slot: slot number (SDMMC_HOST_SLOT_0 or SDMMC_HOST_SLOT_1)
- cmdinfo: pointer to structure describing command and data to transfer

esp_err_t sdmmc_host_io_int_enable (int slot)

Enable IO interrupts.

This function configures the host to accept SDIO interrupts.

**Return** returns ESP_OK, other errors possible in the future

**Parameters**
- slot: slot number (SDMMC_HOST_SLOT_0 or SDMMC_HOST_SLOT_1)

esp_err_t sdmmc_host_io_int_wait (int slot, TickType_t timeout_ticks)

Block until an SDIO interrupt is received, or timeout occurs.

**Return**
- ESP_OK on success (interrupt received)
- ESP_ERR_TIMEOUT if the interrupt did not occur within timeout_ticks

**Parameters**
- slot: slot number (SDMMC_HOST_SLOT_0 or SDMMC_HOST_SLOT_1)
- timeout_ticks: number of RTOS ticks to wait for the interrupt

esp_err_t sdmmc_host_deinit (void)

Disable SDMMC host and release allocated resources.

**Note** This function is not thread safe

**Return**
- ESP_OK on success
- ESP_ERR_INVALID_STATE if sdmmc_host_init function has not been called

esp_err_t sdmmc_host_pullup_en (int slot, int width)

Enable the pull-ups of sd pins.

This function is deprecated. Please set SDMMC_SLOT_FLAG_INTERNAL_PULLUP flag in sdmmc_slot_config_t::flags instead.

**Note** You should always place actual pullups on the lines instead of using this function. Internal pullup resistance are high and not sufficient, may cause instability in products. This is for debug or examples only.

**Return**
- ESP_OK: if success
- ESP_ERR_INVALID_ARG: if configured width larger than maximum the slot can support

**Parameters**
- slot: Slot to use, normally set it to 1.
- width: Bit width of your configuration, 1 or 4.
Structures

```c
struct sdmmc_slot_config_t
    Extra configuration for SDMMC peripheral slot
```

Public Members

```c
gpio_num_t clk
    GPIO number of CLK signal.

gpio_num_t cmd
    GPIO number of CMD signal.

gpio_num_t d0
    GPIO number of D0 signal.

gpio_num_t d1
    GPIO number of D1 signal.

gpio_num_t d2
    GPIO number of D2 signal.

gpio_num_t d3
    GPIO number of D3 signal.

gpio_num_t d4
    GPIO number of D4 signal. Ignored in 1- or 4-line mode.

gpio_num_t d5
    GPIO number of D5 signal. Ignored in 1- or 4-line mode.

gpio_num_t d6
    GPIO number of D6 signal. Ignored in 1- or 4-line mode.

gpio_num_t d7
    GPIO number of D7 signal. Ignored in 1- or 4-line mode.

gpio_num_t gpio_cd
    GPIO number of card detect signal.

gpio_num_t cd
    GPIO number of card detect signal; shorter name.

gpio_num_t gpio_wp
    GPIO number of write protect signal.

gpio_num_t wp
    GPIO number of write protect signal; shorter name.

uint8_t width
    Bus width used by the slot (might be less than the max width supported)

uint32_t flags
    Features used by this slot.
```

Macros

```c
SDMMC_HOST_SLOT_0
    SDMMC slot 0.

SDMMC_HOST_SLOT_1
    SDMMC slot 1.

SDMMC_HOST_DEFAULT()
    Default sdmmc_host_t structure initializer for SDMMC peripheral.

    Uses SDMMC peripheral, with 4-bit mode enabled, and max frequency set to 20MHz
```
### Chapter 2. API Reference

#### SDMMC_SLOT_FLAG_INTERNAL_PULLUP
Enable internal pullups on enabled pins. The internal pullups are insufficient however, please make sure external pullups are connected on the bus. This is for debug / example purpose only.

#### SDMMC_SLOT_NO_CD
indicates that card detect line is not used

#### SDMMC_SLOT_NO_WP
indicates that write protect line is not used

#### SDMMC_SLOT_WIDTH_DEFAULT
use the maximum possible width for the slot

#### SDMMC_SLOT_CONFIG_DEFAULT
Macro defining default configuration of SDMMC host slot

### 2.3.16 SD SPI Host Driver

#### Overview
The SD SPI host driver allows communicating with one or more SD cards by the SPI Master driver which makes use of the SPI host. Each card is accessed through an SD SPI device represented by an `sdspi_dev_handle_t` `spi_handler` returned when attaching the device to an SPI bus by calling `sdspi_host_init_device`. The bus should be already initialized before (by `spi_bus_initialize`).

With the help of the SPI Master driver based on, the SPI bus can be shared among SD cards and other SPI devices. The SPI Master driver will handle exclusive access from different tasks.

The SD SPI driver uses software-controlled CS signal.

#### How to Use
Firstly, use the macro `SDSPI_DEVICE_CONFIG_DEFAULT` to initialize a structure `sdmmc_slot_config_t`, which is used to initialize an SD SPI device. This macro will also fill in the default pin mappings, which is same as the pin mappings of SDMMC host driver. Modify the host and pins of the structure to desired value. Then call `sdspi_host_init_device` to initialize the SD SPI device and attach to its bus.

Then use `SDSPI_HOST_DEFAULT` macro to initialize a `sdmmc_host_t` structure, which is used to store the state and configurations of upper layer (SD/SDIO/MMC driver). Modify the `slot` parameter of the structure to the SD SPI device `spi_handler` just returned from `sdspi_host_init_device`. Call `sdmmc_card_init` with the `sdmmc_host_t` to probe and initialize the SD card.

Now you can use SD/SDIO/MMC driver functions to access your card!

#### Other Details
Only the following driver’s API functions are normally used by most applications:

- `sdspi_host_init()`
- `sdspi_host_init_device()`
- `sdspi_host_remove_device()`
- `sdspi_host_deinit()`

Other functions are mostly used by the protocol level SD/SDIO/MMC driver via function pointers in the `sdmmc_host_t` structure. For more details, see the SD/SDIO/MMC Driver.

**Note:** SD over SPI does not support speeds above `SDMMC_FREQ_DEFAULT` due to the limitations of the SPI driver.
Warning: If you want to share the SPI bus among SD card and other SPI devices, there are some restrictions, see *Sharing the SPI bus among SD card and other SPI devices*.

Related Docs

**Sharing the SPI bus among SD card and other SPI devices** The SD card has a SPI mode, which allows it to be communicated to as a SPI device. But there are some restrictions that we need to pay attention to.

**Pin loading of other devices** When adding more devices onto the same bus, the overall pin loading increases. The loading consists of AC loading (pin capacitor) and DC loading (pull-ups).

**AC loading** SD cards, which are designed for high-speed communications, have small pin capacitors (AC loading) to work until 50MHz. However, the other attached devices will increase the pin’s AC loading.

Heavy AC loading of a pin may prevent the pin from being toggled quickly. By using an oscilloscope, you will see the edges of the pin become smoother and not ideal any more (the gradient of the edge is smaller). The setup timing requirements of an SD card may be violated when the card is connected to such bus. Even worse, the clock from the host may not be recognized by the SD card and other SPI devices on the same bus.

This issue may be more obvious if other attached devices are not designed to work at the same frequency as the SD card, because they may have larger pin capacitors.

To see if your pin AC loading is too heavy, you can try the following tests:

(Terminology: **launch edge**: at which clock edge the data start to toggle; **latch edge**: at which clock edge the data is supposed to be sampled by the receiver, for SD card, it’s the rising edge.)

1. Use an oscilloscope to see the clock and compare the data line to the clock. - If you see the clock is not fast enough (for example, the rising/falling edge is longer than 1/4 of the clock cycle), it means the clock is skewed too much. - If you see the data line unstable before the latch edge of the clock, it means the load of the data line is too large.
   You may also observed the corresponding phenomenon (data delayed largely from launching edge of clock) with logic analyzers. But it’s not as obvious as with an oscilloscope.
2. Try to use slower clock frequency.
   If the lower frequency can work while the higher frequency can’t, it’s an indication of the AC loading on the pins is too large.

If the AC loading of the pins is too large, you can either use other faster devices (with lower pin load) or slow down the clock speed.

**DC loading** The pull-ups required by SD cards are usually around 10kOhm to 50kOhm, which may be too strong for some other SPI devices.

Check the specification of your device about its DC output current, it should be larger than 700uA, otherwise the device output may not be read correctly.

**Initialization sequence**

**Note:** If you see any problem in the following steps, please make sure the timing is correct first. You can try to slow down the clock speed (**SDMMC_FREQ_PROBING = 400 KHz for SD card**) to avoid the influence of pin AC loading (see above section).

When using a SD card with other SPI devices on the same SPI bus, due to the restrictions of the SD card startup flow, the following initialization sequence should be followed: (See also **storage/sd_card**)

1. Initialize the SPI bus properly by **spi_bus_initialize**.
2. Tie the CS lines of all other devices than the SD card to high. This is to avoid conflicts to the SD card in the following step. You can do this by either:
   1. Attach devices to the SPI bus by calling `spi_bus_add_device`. This function will initialize the GPIO that is used as CS to the idle level: high.
   2. Initialize GPIO on the CS pin that needs to be tied up before actually adding a new device.
   3. Rely on the internal/external pull-up (not recommended) to pull-up all the CS pins when the GPIOs of ESP are not initialized yet. You need to check carefully the pull-up is strong enough and there are no other pull-downs that will influence the pull-up (For example, internal pull-down should be enabled).
3. Mount the card to the filesystem by calling `esp_vfs_fat_sdspi_mount`. This step will put the SD card into the SPI mode, which SHOULD be done before all other SPI communications on the same bus. Otherwise the card will stay in the SD mode, in which mode it may randomly respond to any SPI communications on the bus, even when its CS line is not addressed. If you want to test this behavior, please also note that, once the card is put into SPI mode, it will not return to SD mode before next power cycle, i.e. powered down and powered up again.
4. Now you can talk to other SPI devices freely!

**API Reference**

**Header File**

- components/driver/include/driver/sdspi_host.h

**Functions**

`esp_err_t sdspi_host_init (void)`
Initialize SD SPI driver.

*Note* This function is not thread safe

*Return*  
- ESP_OK on success  
- other error codes may be returned in future versions

`esp_err_t sdspi_host_init_device (const sdspi_device_config_t *dev_config, sdspi_dev_handle_t *out_handle)`  
Attach and initialize an SD SPI device on the specific SPI bus.

*Note* This function is not thread safe  
*Note* Initialize the SPI bus by `spi_bus_initialize()` before calling this function.  
*Note* The SDIO over sdspi needs an extra interrupt line. Call `gpio_install_isr_service()` before this function.

*Return*  
- ESP_OK on success  
- ESP_ERR_INVALID_ARG if sdspi_host_init_device has invalid arguments  
- ESP_ERR_NO_MEM if memory can not be allocated  
- other errors from the underlying spi_master and gpio drivers

*Parameters*  
- `dev_config`: pointer to device configuration structure  
- `out_handle`: Output of the handle to the sdspi device.

`esp_err_t sdspi_host_remove_device (sdspi_dev_handle_t handle)`  
Remove an SD SPI device.

*Return* Always ESP_OK

*Parameters*  
- `handle`: Handle of the SD SPI device

`esp_err_t sdspi_host_do_transaction (sdspi_dev_handle_t handle, sdmmc_command_t *cmdinfo)`  
Send command to the card and get response.

This function returns when command is sent and response is received, or data is transferred, or timeout occurs.
Note This function is not thread safe w.r.t. init/deinit functions, and bus width/clock speed configuration functions. Multiple tasks can call sdspi_host_do_transaction as long as other sdspi_host_* functions are not called.

Return
- ESP_OK on success
- ESP_ERR_TIMEOUT if response or data transfer has timed out
- ESP_ERR_INVALID_CRC if response or data transfer CRC check has failed
- ESP_ERR_INVALID_RESPONSE if the card has sent an invalid response

Parameters
- handle: Handle of the sdspi device
- cmdinfo: pointer to structure describing command and data to transfer

```c
esp_err_t sdspi_host_set_card_clk(sdspi_dev_handle_t host, uint32_t freq_khz)
```
Set card clock frequency.

Currently only integer fractions of 40MHz clock can be used. For High Speed cards, 40MHz can be used. For Default Speed cards, 20MHz can be used.

Note This function is not thread safe

Return
- ESP_OK on success
- other error codes may be returned in the future

Parameters
- host: Handle of the sdspi device
- freq_khz: card clock frequency, in kHz

```c
esp_err_t sdspi_host_deinit(void)
```
Release resources allocated using sdspi_host_init.

Note This function is not thread safe

Return
- ESP_OK on success
- ESP_ERR_INVALID_STATE if sdspi_host_init function has not been called

```c
esp_err_t sdspi_host_io_int_enable(sdspi_dev_handle_t handle)
```
Enable SDIO interrupt.

Return
- ESP_OK on success

Parameters
- handle: Handle of the sdspi device

```c
esp_err_t sdspi_host_io_int_wait(sdspi_dev_handle_t handle, TickType_t timeout_ticks)
```
Wait for SDIO interrupt until timeout.

Return
- ESP_OK on success

Parameters
- handle: Handle of the sdspi device
- timeout_ticks: Ticks to wait before timeout.

```c
esp_err_t sdspi_host_init_slot(int slot, const sdspi_slot_config_t *slot_config)
```
Initialize SD SPI driver for the specific SPI controller.

Note This function is not thread safe

Note The SDIO over.sdspi needs an extra interrupt line. Call gpio_install_isr_service() before this function.

Parameters
- slot: SPI controller to use (SPI2_HOST or SPI3_HOST)
- slot_config: pointer to slot configuration structure

Return
- ESP_OK on success
- ESP_ERR_INVALID_ARG if sdspi_init_slot has invalid arguments
Chapter 2. API Reference

- ESP_ERR_NO_MEM if memory cannot be allocated
- other errors from the underlying spi_master and gpio drivers

**Structures**

```c
struct sdspi_device_config_t
    Extra configuration for SD SPI device.
```

**Public Members**

```c
spi_host_device_t host_id
    SPI host to use, SPIx_HOST (see spi_types.h).

gpio_num_t gpio_cs
    GPIO number of CS signal.

gpio_num_t gpio_cd
    GPIO number of card detect signal.

gpio_num_t gpio_wp
    GPIO number of write protect signal.

gpio_num_t gpio_int
    GPIO number of interrupt line (input) for SDIO card.
```

```c
struct sdspi_slot_config_t
    Extra configuration for SPI host.
```

**Public Members**

```c
gpio_num_t gpio_cs
    GPIO number of CS signal.

gpio_num_t gpio_cd
    GPIO number of card detect signal.

gpio_num_t gpio_wp
    GPIO number of write protect signal.

gpio_num_t gpio_int
    GPIO number of interrupt line (input) for SDIO card.

gpio_num_t gpio_miso
    GPIO number of MISO signal.

gpio_num_t gpio_mosi
    GPIO number of MOSI signal.

gpio_num_t gpio_sck
    GPIO number of SCK signal.

int dma_channel
    DMA channel to be used by SPI driver (1 or 2).
```

**Macros**

```c
SDSPI_DEFAULT_HOST
SDSPI_HOST_DEFAULT()
```

Default `sdmmc_host_t` structure initializer for SD over SPI driver.

- Uses SPI mode and max frequency set to 20MHz
- ‘slot’ should be set to an sdspi device initialized by `sdspi_host_init_device()`.
SDSPI_SLOT_NO_CD
indicates that card detect line is not used

SDSPI_SLOT_NO_WP
indicates that write protect line is not used

SDSPI_SLOT_NO_INT
indicates that interrupt line is not used

SDSPI_DEVICE_CONFIG_DEFAULT()
Macro defining default configuration of SD SPI device.

SDSPI_SLOT_CONFIG_DEFAULT()
Macro defining default configuration of SPI host

**Type Definitions**

```c
typedef int sdspi_dev_handle_t
Handle representing an SD SPI device.
```

### 2.3.17 Sigma-delta Modulation

**Introduction**

ESP32-S3 has a second-order sigma-delta modulation module. This driver configures the channels of the sigma-delta module.

**Functionality Overview**

There are 8 independent sigma-delta modulation channels identified with `sigmadelta_channel_t`. Each channel is capable to output the binary, hardware generated signal with the sigma-delta modulation.

Selected channel should be set up by providing configuration parameters in `sigmadelta_config_t` and then applying this configuration with `sigmadelta_config()`.

Another option is to call individual functions, that will configure all required parameters one by one:

- **Prescaler** of the sigma-delta generator - `sigmadelta_set_prescale()`
- **Duty** of the output signal - `sigmadelta_set_duty()`
- **GPIO pin** to output modulated signal - `sigmadelta_set_pin()`

The range of the ‘duty’ input parameter of `sigmadelta_set_duty()` is from -128 to 127 (eight bit signed integer). If zero value is set, then the output signal’s duty will be about 50%, see description of `sigmadelta_set_duty()`.

**Convert to analog signal (Optional)**

Typically, if the sigma-delta signal is connected to an LED, you don’t have to add any filter between them (because our eyes are a low pass filter naturally). However, if you want to check the real voltage or watch the analog waveform, you need to design an analog low pass filter. Also, it is recommended to use an active filter instead of a passive filter to gain better isolation and not lose too much voltage.

For example, you can take the following Sallen-Key topology Low Pass Filter as a reference.

**Application Example**

Sigma-delta Modulation example: `peripherals/sigmadelta`. 
Fig. 15: Sallen-Key Low Pass Filter

API Reference

Header File

- components/driver/include/driver/sigmadelta.h

Functions

`esp_err_t sigmadelta_config(const sigmadelta_config_t *config)`
Configure Sigma-delta channel.

Return

- ESP_OK Success
- ESP_ERR_INVALID_STATE sigmadeltadriver already initialized
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- `config`: Pointer of Sigma-delta channel configuration struct

This function is used to set Sigma-delta channel duty, if you add a capacitor between the output pin and ground, the average output voltage will be Vdc = VDDIO / 256 * duty + VDDIO/2, where VDDIO is the power supply voltage.

`esp_err_t sigmadelta_set_duty(sigmadelta_channel_t channel, int8_t duty)`
Set Sigma-delta channel duty.

Return

- ESP_OK Success
- ESP_ERR_INVALID_STATE sigmadeltadriver has not been initialized
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- `channel`: Sigma-delta channel number
- `duty`: Sigma-delta duty of one channel, the value ranges from -128 to 127, recommended range is -90 ~ 90. The waveform is more like a random one in this range.
**esp_err_t sigmadelta_set_prescale** (sigmadelta_channel_t channel, uint8_t prescale)

Set Sigma-delta channel’s clock pre-scale value. The source clock is APP_CLK, 80MHz. The clock frequency of the sigma-delta channel is APP_CLK / pre_scale.

**Return**

- ESP_OK Success
- ESP_ERR_INVALID_STATE sigmadeltadriver has not been initialized
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**

- `channel`: Sigma-delta channel number
- `prescale`: The divider of source clock, ranges from 0 to 255

**esp_err_t sigmadelta_set_pin** (sigmadelta_channel_t channel, gpio_num_t gpio_num)

Set Sigma-delta signal output pin.

**Return**

- ESP_OK Success
- ESP_ERR_INVALID_STATE sigmadeltadriver has not been initialized
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**

- `channel`: Sigma-delta channel number
- `gpio_num`: GPIO number of output pin

**Structures**

**struct sigmadelta_config_t**

Sigma-delta configure struct.

**Public Members**

**sigmadelta_channel_t channel**

Sigma-delta channel number

**int8_t sigmadelta_duty**

Sigma-delta duty, duty ranges from -128 to 127.

**uint8_t sigmadelta_prescale**

Sigma-delta prescale, prescale ranges from 0 to 255.

**uint8_t sigmadelta_gpio**

Sigma-delta output io number, refer to gpio.h for more details.

**Header File**

- components/hal/include/hal/sigmadelta_types.h

**Enumerations**

**enum sigmadelta_port_t**

SIGMADELTA port number, the max port number is (SIGMADELTA_NUM_MAX -1).

**Values:**

- **SIGMADELTA_PORT_0** SIGMADELTA port 0
- **SIGMADELTA_PORT_MAX** SIGMADELTA port max

**enum sigmadelta_channel_t**

Sigma-delta channel list.

**Values:**
2.3.18 SPI Master Driver

SPI Master driver is a program that controls ESP32-S3’s SPI peripherals while they function as masters.

Overview of ESP32-S3’s SPI peripherals

ESP32-S3 integrates 4 SPI peripherals.

- SPI0 and SPI1 are used internally to access the ESP32-S3’s attached flash memory. Both controllers share the same SPI bus signals, and there is an arbiter to determine which can access the bus. Currently, SPI Master driver does not support SPI1 bus.

- SPI2 and SPI3 are general purpose SPI controllers. They are open to users. SPI2 and SPI3 have independent signal buses with the same respective names. SPI2 has 6 CS lines. SPI3 has 3 CS lines. Each CS line can be used to drive one SPI slave.

Terminology

The terms used in relation to the SPI master driver are given in the table below.
<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Host</strong></td>
<td>The SPI controller peripheral inside ESP32-S3 that initiates SPI transmissions over the bus, and acts as an SPI Master.</td>
</tr>
<tr>
<td><strong>Device</strong></td>
<td>SPI slave device. An SPI bus may be connected to one or more Devices. Each Device shares the MOSI, MISO and SCLK signals but is only active on the bus when the Host asserts the Device’s individual CS line.</td>
</tr>
<tr>
<td><strong>Bus</strong></td>
<td>A signal bus, common to all Devices connected to one Host. In general, a bus includes the following lines: MOSI, MISO, SCLK, one or more CS lines, and, optionally, QUADWP and QUADHD. So Devices are connected to the same lines, with the exception that each Device has its own CS line. Several Devices can also share one CS line if connected in the daisy-chain manner.</td>
</tr>
<tr>
<td><strong>MOSI</strong></td>
<td>Master Out, Slave In, a.k.a. D. Data transmission from a Host to Device. Also data0 signal in Octal/OPI mode.</td>
</tr>
<tr>
<td><strong>MISO</strong></td>
<td>Master In, Slave Out, a.k.a. Q. Data transmission from a Device to Host. Also data1 signal in Octal/OPI mode.</td>
</tr>
<tr>
<td><strong>SCLK</strong></td>
<td>Serial Clock. Oscillating signal generated by a Host that keeps the transmission of data bits in sync.</td>
</tr>
<tr>
<td><strong>CS</strong></td>
<td>Chip Select. Allows a Host to select individual Device(s) connected to the bus in order to send or receive data.</td>
</tr>
<tr>
<td><strong>QUADWP</strong></td>
<td>Protect signal. Used for 4-bit (qio/qout) transactions. Also for data2 signal in Octal/OPI mode.</td>
</tr>
<tr>
<td><strong>QUADHD</strong></td>
<td>Signal. Used for 4-bit (qio/qout) transactions. Also for data3 signal in Octal/OPI mode.</td>
</tr>
<tr>
<td><strong>DATA4</strong></td>
<td>Data4 signal in Octal/OPI mode.</td>
</tr>
<tr>
<td><strong>DATA5</strong></td>
<td>Data5 signal in Octal/OPI mode.</td>
</tr>
<tr>
<td><strong>DATA6</strong></td>
<td>Data6 signal in Octal/OPI mode.</td>
</tr>
<tr>
<td><strong>DATA7</strong></td>
<td>Data7 signal in Octal/OPI mode.</td>
</tr>
<tr>
<td><strong>Assert</strong></td>
<td>The action of activating a line.</td>
</tr>
<tr>
<td><strong>De-assert</strong></td>
<td>The action of returning the line back to inactive (back to idle) status.</td>
</tr>
<tr>
<td><strong>Transaction</strong></td>
<td>One instance of a Host asserting a CS line, transferring data to and from a Device, and de-asserting the CS line. Transactions are atomic, which means they can never be interrupted by another transaction.</td>
</tr>
<tr>
<td><strong>Launch edge</strong></td>
<td>Edge of the clock at which the source register launches the signal onto the line.</td>
</tr>
<tr>
<td><strong>Latch edge</strong></td>
<td>Edge of the clock at which the destination register latches in the signal.</td>
</tr>
</tbody>
</table>

**Driver Features**

The SPI master driver governs communications of Hosts with Devices. The driver supports the following features:

- Multi-threaded environments
- Transparent handling of DMA transfers while reading and writing data
- Automatic time-division multiplexing of data coming from different Devices on the same signal bus, see SPI Bus Lock.

**Warning:** The SPI master driver has the concept of multiple Devices connected to a single bus (sharing a single ESP32-S3 SPI peripheral). As long as each Device is accessed by only one task, the driver is thread safe. However, if multiple tasks try to access the same SPI Device, the driver is not thread-safe. In this case, it is recommended to either:

- Refactor your application so that each SPI peripheral is only accessed by a single task at a time.
- Add a mutex lock around the shared Device using xSemaphoreCreateMutex.

**SPI Features**
SPI Master

SPI Bus Lock  To realize the multiplexing of different devices from different drivers (SPI Master, SPI Flash, etc.), an SPI bus lock is applied on each SPI bus. Drivers can attach their devices onto the bus with the arbitration of the lock.

Each bus lock are initialized with a BG (background) service registered, all devices request to do transactions on the bus should wait until the BG to be successfully disabled.

- For SPI1 bus, the BG is the cache, the bus lock will help to disable the cache before device operations starts, and enable it again after device releasing the lock. No devices on SPI1 is allowed using ISR (it’s meaningless for the task to yield to other tasks when the cache is disabled).
- For other buses, the driver may register its ISR as the BG. The bus lock will block a device task when it requests for exclusive use of the bus, try to disable the ISR, and unblock the device task allowed to exclusively use the bus when the ISR is successfully disabled. When the task releases the lock, the lock will also try to resume the ISR if there are pending transactions to be done in the ISR.

SPI Transactions

An SPI bus transaction consists of five phases which can be found in the table below. Any of these phases can be skipped.

<table>
<thead>
<tr>
<th>Phase</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command</td>
<td>In this phase, a command (0-16 bit) is written to the bus by the Host.</td>
</tr>
<tr>
<td>Address</td>
<td>In this phase, an address (0-32 bit) is transmitted over the bus by the Host.</td>
</tr>
<tr>
<td>Write</td>
<td>Host sends data to a Device. This data follows the optional command and address phases and is indistinguishable from them at the electrical level.</td>
</tr>
<tr>
<td>Dummy</td>
<td>This phase is configurable and is used to meet the timing requirements.</td>
</tr>
<tr>
<td>Read</td>
<td>Device sends data to its Host.</td>
</tr>
</tbody>
</table>

The attributes of a transaction are determined by the bus configuration structure `spi_bus_config_t`, device configuration structure `spi_device_interface_config_t`, and transaction configuration structure `spi_transaction_t`.

An SPI Host can send full-duplex transactions, during which the read and write phases occur simultaneously. The total transaction length is determined by the sum of the following members:

- `spi_device_interface_config_t::command_bits`
- `spi_device_interface_config_t::address_bits`
- `spi_transaction_t::length`

While the member `spi_transaction_t::rxlength` only determines the length of data received into the buffer.

In half-duplex transactions, the read and write phases are not simultaneous (one direction at a time). The lengths of the write and read phases are determined by `length` and `rxlength` members of the struct `spi_transaction_t` respectively.

The command and address phases are optional, as not every SPI device requires a command and/or address. This is reflected in the Device’s configuration: if `command_bits` and/or `address_bits` are set to zero, no command or address phase will occur.

The read and write phases can also be optional, as not every transaction requires both writing and reading data. If `rx_buffer` is NULL and `SPI_TRANS_USE_RXDATA` is not set, the read phase is skipped. If `tx_buffer` is NULL and `SPI_TRANS_USE_TXDATA` is not set, the write phase is skipped.

The driver supports two types of transactions: the interrupt transactions and polling transactions. The programmer can choose to use a different transaction type per Device. If your Device requires both transaction types, see Notes on Sending Mixed Transactions to the Same Device.
**Interrupt Transactions**  Interrupt transactions will block the transaction routine until the transaction completes, thus allowing the CPU to run other tasks.

An application task can queue multiple transactions, and the driver will automatically handle them one-by-one in the interrupt service routine (ISR). It allows the task to switch to other procedures until all the transactions complete.

**Polling Transactions**  Polling transactions do not use interrupts. The routine keeps polling the SPI Host’s status bit until the transaction is finished.

All the tasks that use interrupt transactions can be blocked by the queue. At this point, they will need to wait for the ISR to run twice before the transaction is finished. Polling transactions save time otherwise spent on queue handling and context switching, which results in smaller transaction duration. The disadvantage is that the CPU is busy while these transactions are in progress.

The `spi_device_polling_end()` routine needs an overhead of at least 1 us to unblock other tasks when the transaction is finished. It is strongly recommended to wrap a series of polling transactions using the functions `spi_device_acquire_bus()` and `spi_device_release_bus()` to avoid the overhead. For more information, see *Bus Acquiring*.

**Transaction Line Mode**  Supported line modes for ESP32-S3 are listed as follows, to make use of these modes, set the member flags in the struct `spi_transaction_t` as shown in the Transaction Flag column. If you want to check if corresponding IO pins are set or not, set the member flags in the `spi_bus_config_t` as shown in the Bus IO setting Flag column.

<table>
<thead>
<tr>

</tr>
</tbody>
</table>

**Command and Address Phases**  During the command and address phases, the members `cmd` and `addr` in the struct `spi_transaction_t` are sent to the bus, nothing is read at this time. The default lengths of the command and address phases are set in `spi_device_interface_config_t` by calling `spi_bus_add_device()`. If the flags SPI_TRANS_VARIABLE_CMD and SPI_TRANS_VARIABLE_ADDR in the member `spi_transaction_t::flags` are not set, the driver automatically sets the length of these phases to default values during Device initialization.

If the lengths of the command and address phases need to be variable, declare the struct `spi_transaction_ext_t`, set the flags SPI_TRANS_VARIABLE_CMD and/or
Chapter 2. API Reference

SPI_TRANS_VARIABLE_ADDR in the member spi_transaction_ext_t::base and configure the rest of base as usual. Then the length of each phase will be equal to command_bits and address_bits set in the struct spi_transaction_ext_t.

If the command and address phase need to be as the same number of lines as data phase, you need to set SPI_TRANS_MULTILINE_CMD and/or SPI_TRANS_MULTILINE_ADDR to the flags member in the struct spi_transaction_t. Also see Transaction Line Mode.

**Write and Read Phases**  Normally, the data that needs to be transferred to or from a Device will be read from or written to a chunk of memory indicated by the members rx_buffer and tx_buffer of the structure spi_transaction_t. If DMA is enabled for transfers, the buffers are required to be:

1. Allocated in DMA–capable internal memory. If *external PSRAM is enabled*, this means using pvPortMallocCaps(size, MALLOC_CAP_DMA).
2. 32-bit aligned (starting from a 32-bit boundary and having a length of multiples of 4 bytes).

If these requirements are not satisfied, the transaction efficiency will be affected due to the allocation and copying of temporary buffers.

If using more than one data lines to transmit, please set SPI_DEVICE_HALFDUPLEX flag for the member flags in the struct spi_device_interface_config_t. And the member flags in the struct spi_transaction_t should be set as described in Transaction Line Mode.

**Note:** Half-duplex transactions with both read and write phases are not supported. Please use full duplex mode.

**Bus Acquiring**  Sometimes you might want to send SPI transactions exclusively and continuously so that it takes as little time as possible. For this, you can use bus acquiring, which helps to suspend transactions (both polling or interrupt) to other devices until the bus is released. To acquire and release a bus, use the functions spi_device_acquire_bus() and spi_device_release_bus().

**Driver Usage**

- Initialize an SPI bus by calling the function spi_bus_initialize(). Make sure to set the correct I/O pins in the struct spi_bus_config_t. Set the signals that are not needed to -1.
- Register a Device connected to the bus with the driver by calling the function spi_bus_add_device(). Make sure to configure any timing requirements the device might need with the parameter dev_config. You should now have obtained the Device’s handle which will be used when sending a transaction to it.
- To interact with the Device, fill one or more spi_transaction_t structs with any transaction parameters required. Then send the structs either using a polling transaction or an interrupt transaction:
  - **Interrupt** Either queue all transactions by calling the function spi_device_queue_trans() and, at a later time, query the result using the function spi_device_get_trans_result(), or handle all requests synchronously by feeding them into spi_device_transmit().
  - **Polling** Call the function spi_device_polling_transmit() to send polling transactions. Alternatively, if you want to insert something in between, send the transactions by using spi_device_polling_start() and spi_device_polling_end().
- (Optional) To perform back-to-back transactions with a Device, call the function spi_device_acquire_bus() before sending transactions and spi_device_release_bus() after the transactions have been sent.
- (Optional) To unload the driver for a certain Device, call spi_bus_remove_device() with the Device handle as an argument.
- (Optional) To remove the driver for a bus, make sure no more drivers are attached and call spi_bus_free().

The example code for the SPI master driver can be found in the peripherals/spi_master directory of ESP-IDF examples.
Transactions with Data Not Exceeding 32 Bits  When the transaction data size is equal to or less than 32 bits, it will be sub-optimal to allocate a buffer for the data. The data can be directly stored in the transaction struct instead. For transmitted data, it can be achieved by using the tx_data member and setting the SPI_TRANS_USE_TXDATA flag on the transmission. For received data, use rx_data and set SPI_TRANS_USE_RXDATA. In both cases, do not touch the tx_buffer or rx_buffer members, because they use the same memory locations as tx_data and rx_data.

Transactions with Integers Other Than uint8_t  An SPI Host reads and writes data into memory byte by byte. By default, data is sent with the most significant bit (MSB) first, as LSB first used in rare cases. If a value less than 8 bits needs to be sent, the bits should be written into memory in the MSB first manner.

For example, if 0b00010 needs to be sent, it should be written into a uint8_t variable, and the length for reading should be set to 5 bits. The Device will still receive 8 bits with 3 additional “random” bits, so the reading must be performed correctly.

On top of that, ESP32-S3 is a little-endian chip, which means that the least significant byte of uint16_t and uint32_t variables is stored at the smallest address. Hence, if uint16_t is stored in memory, bits [7:0] are sent first, followed by bits [15:8].

For cases when the data to be transmitted has the size differing from uint8_t arrays, the following macros can be used to transform data to the format that can be sent by the SPI driver directly:

- SPI_SWAP_DATA_TX for data to be transmitted
- SPI_SWAP_DATA_RX for data received

Notes on Sending Mixed Transactions to the Same Device  To reduce coding complexity, send only one type of transactions (interrupt or polling) to one Device. However, you still can send both interrupt and polling transactions alternately. The notes below explain how to do this.

The polling transactions should be initiated only after all the polling and interrupt transactions are finished.

Since an unfinished polling transaction blocks other transactions, please do not forget to call the function spi_device_polling_end() after spi_device_polling_start() to allow other transactions or to allow other Devices to use the bus. Remember that if there is no need to switch to other tasks during your polling transaction, you can initiate a transaction with spi_device_polling_transmit() so that it will be ended automatically.

In-flight polling transactions are disturbed by the ISR operation to accommodate interrupt transactions. Always make sure that all the interrupt transactions sent to the ISR are finished before you call spi_device_polling_start(). To do that, you can keep calling spi_device_get_trans_result() until all the transactions are returned.

To have better control of the calling sequence of functions, send mixed transactions to the same Device only within a single task.

Transfer Speed Considerations

There are three factors limiting the transfer speed:

- Transaction interval
- SPI clock frequency
- Cache miss of SPI functions, including callbacks

The main parameter that determines the transfer speed for large transactions is clock frequency. For multiple small transactions, the transfer speed is mostly determined by the length of transaction intervals.

Transaction Duration  Transaction duration includes setting up SPI peripheral registers, copying data to FIFOs or setting up DMA links, and the time for SPI transaction.

Interrupt transactions allow appending extra overhead to accommodate the cost of FreeRTOS queues and the time needed for switching between tasks and the ISR.
For **interrupt transactions**, the CPU can switch to other tasks when a transaction is in progress. This saves the CPU time but increases the transaction duration. See **Interrupt Transactions**. For **polling transactions**, it does not block the task but allows to do polling when the transaction is in progress. For more information, see **Polling Transactions**.

If DMA is enabled, setting up the linked list requires about 2 µs per transaction. When a master is transferring data, it automatically reads the data from the linked list. If DMA is not enabled, the CPU has to write and read each byte from the FIFO by itself. Usually, this is faster than 2 µs, but the transaction length is limited to 64 bytes for both write and read.

Typical transaction duration for one byte of data are given below.

- Interrupt Transaction via DMA: 26 µs.
- Interrupt Transaction via CPU: 24 µs.
- Polling Transaction via DMA: 11 µs.
- Polling Transaction via CPU: 9 µs.

**SPI Clock Frequency**   Transferring each byte takes eight times the clock period $8/f_{spi}$.

**Cache Miss**   The default config puts only the ISR into the IRAM. Other SPI related functions, including the driver itself and the callback, might suffer from cache misses and will need to wait until the code is read from flash. Select `CONFIG_SPI_MASTER_IN_IRAM` to put the whole SPI driver into IRAM and put the entire callback(s) and its callee functions into IRAM to prevent cache misses.

For an interrupt transaction, the overall cost is $20+8n/f_{spi}[MHz][\mu s]$ for n bytes transferred in one transaction. Hence, the transferring speed is: $n/(20+8n/f_{spi})$. An example of transferring speed at 8 MHz clock speed is given in the following table.

<table>
<thead>
<tr>
<th>Frequency (MHz)</th>
<th>Transaction Interval (µs)</th>
<th>Transaction Length (bytes)</th>
<th>Total Time (µs)</th>
<th>Total Speed (KBps)</th>
</tr>
</thead>
<tbody>
<tr>
<td>8</td>
<td>25</td>
<td>1</td>
<td>26</td>
<td>38.5</td>
</tr>
<tr>
<td>8</td>
<td>25</td>
<td>8</td>
<td>33</td>
<td>242.4</td>
</tr>
<tr>
<td>8</td>
<td>25</td>
<td>16</td>
<td>41</td>
<td>490.2</td>
</tr>
<tr>
<td>8</td>
<td>25</td>
<td>64</td>
<td>89</td>
<td>719.1</td>
</tr>
<tr>
<td>8</td>
<td>25</td>
<td>128</td>
<td>153</td>
<td>836.6</td>
</tr>
</tbody>
</table>

When a transaction length is short, the cost of transaction interval is high. If possible, try to squash several short transactions into one transaction to achieve a higher transfer speed.

Please note that the ISR is disabled during flash operation by default. To keep sending transactions during flash operations, enable `CONFIG_SPI_MASTER_ISR_IN_IRAM` and set `ESP_INTR_FLAG_IRAM` in the member `spi_bus_config_t::intr_flags`. In this case, all the transactions queued before starting flash operations will be handled by the ISR in parallel. Also note that the callback of each Device and their callee functions should be in IRAM, or your callback will crash due to cache miss. For more details, see **IRAM-Safe Interrupt Handlers**.

**Application Example**

The code example for using the SPI master half duplex mode to read/write a AT93C46D EEPROM (8-bit mode) can be found in the `peripherals/spi_master/hd_eeprom` directory of ESP-IDF examples.

**API Reference - SPI Common**

**Header File**

- components/hal/include/hal/spi_types.h
Structures

struct spi_line_mode_t
Line mode of SPI transaction phases: CMD, ADDR, DOUT/DIN.

Public Members

uint8_t cmd_lines
The line width of command phase, e.g. 2-line-cmd-phase.

uint8_t addr_lines
The line width of address phase, e.g. 1-line-addr-phase.

uint8_t data_lines
The line width of data phase, e.g. 4-line-data-phase.

Enumerations

enum spi_host_device_t
Enum with the three SPI peripherals that are software-accessible in it.

Values:

SPI1_HOST = 0
SPI1.

SPI2_HOST = 1
SPI2.

SPI3_HOST = 2
SPI3.

SPI_HOST_MAX
invalid host value

enum spi_clock_source_t

Values:

SPI_CLK_APB
Select APB as the source clock.

SPI_CLK_XTAL
Select XTAL as the source clock.

enum spi_event_t

SPI Events.

Values:

SPI_EV_BUF_TX = BIT(0)
The buffer has sent data to master.

SPI_EV_BUF_RX = BIT(1)
The buffer has received data from master.

SPI_EV_SEND_DMA_READY = BIT(2)
Slave has loaded its TX data buffer to the hardware (DMA).

SPI_EV_SEND = BIT(3)
Master has received certain number of the data, the number is determined by Master.

SPI_EV_RECV_DMA_READY = BIT(4)
Slave has loaded its RX data buffer to the hardware (DMA).

SPI_EV_RECV = BIT(5)
Slave has received certain number of data from master, the number is determined by Master.

SPI_EV_CMD9 = BIT(6)
Received CMD9 from master.
Chapter 2. API Reference

SPI_EV_CMDA = BIT(7)
Received CMDA from master.

SPI_EV_TRANS = BIT(8)
A transaction has done.

Header File
• components/driver/include/driver/spi_common.h

Functions

esp_err_t spi_bus_initialize(spi_host_device_t host_id, const spi_bus_config_t *bus_config, spi_dma_chan_t dma_chan)
Initialize a SPI bus.

Warning SPI0/1 is not supported
Warning If a DMA channel is selected, any transmit and receive buffer used should be allocated in DMA-capable memory.
Warning The ISR of SPI is always executed on the core which calls this function. Never starve the ISR on this core or the SPI transactions will not be handled.

Return
• ESP_ERR_INVALID_ARG if configuration is invalid
• ESP_ERR_INVALID_STATE if host already is in use
• ESP_ERR_NOT_FOUND if there is no available DMA channel
• ESP_ERR_NO_MEM if out of memory
• ESP_OK on success

Parameters
• host_id: SPI peripheral that controls this bus
• bus_config: Pointer to a spi_bus_config_t struct specifying how the host should be initialized
• dma_chan: Selecting a DMA channel for an SPI bus allows transactions on the bus with size only limited by the amount of internal memory.
  – Selecting SPI_DMA_DISABLED limits the size of transactions.
  – Set to SPI_DMA_DISABLED if only the SPI flash uses this bus.
  – Set to SPI_DMA_CH_AUTO to let the driver to allocate the DMA channel.

esp_err_t spi_bus_free(spi_host_device_t host_id)
Free a SPI bus.

Warning In order for this to succeed, all devices have to be removed first.

Return
• ESP_ERR_INVALID_ARG if parameter is invalid
• ESP_ERR_INVALID_STATE if not all devices on the bus are freed
• ESP_OK on success

Parameters
• host_id: SPI peripheral to free

Structures

struct spi_bus_config_t
This is a configuration structure for a SPI bus.

You can use this structure to specify the GPIO pins of the bus. Normally, the driver will use the GPIO matrix to route the signals. An exception is made when all signals either can be routed through the IO_MUX or are -1. In that case, the IO_MUX is used, allowing for >40MHz speeds.

Note Be advised that the slave driver does not use the quadwp/quadhd lines and fields in spi_bus_config_t refering to these lines will be ignored and can thus safely be left uninitialized.
Public Members

int mosi_io_num
   GPIO pin for Master Out Slave In (=spi_d) signal, or -1 if not used.

int data0_io_num
   GPIO pin for spi data0 signal in quad/octal mode, or -1 if not used.

int miso_io_num
   GPIO pin for Master In Slave Out (=spi_q) signal, or -1 if not used.

int data1_io_num
   GPIO pin for spi data1 signal in quad/octal mode, or -1 if not used.

int sclk_io_num
   GPIO pin for SPI Clock signal, or -1 if not used.

int quadwp_io_num
   GPIO pin for WP (Write Protect) signal, or -1 if not used.

int data2_io_num
   GPIO pin for spi data2 signal in quad/octal mode, or -1 if not used.

int quadhd_io_num
   GPIO pin for HD (Hold) signal, or -1 if not used.

int data3_io_num
   GPIO pin for spi data3 signal in quad/octal mode, or -1 if not used.

int data4_io_num
   GPIO pin for spi data4 signal in octal mode, or -1 if not used.

int data5_io_num
   GPIO pin for spi data5 signal in octal mode, or -1 if not used.

int data6_io_num
   GPIO pin for spi data6 signal in octal mode, or -1 if not used.

int data7_io_num
   GPIO pin for spi data7 signal in octal mode, or -1 if not used.

int max_transfer_sz
   Maximum transfer size, in bytes. Defaults to 4092 if 0 when DMA enabled, or to 
   SOC_SPI_MAXIMUM_BUFFER_SIZE if DMA is disabled.

uint32_t flags
   Abilities of bus to be checked by the driver. Or-ed value of 
   SPICOMMON_BUSFLAG_* flags.

int intr_flags
   Interrupt flag for the bus to set the priority, and IRAM attribute, see esp_intr_alloc.h. Note that 
   the EDGE, INTRDISABLED attribute are ignored by the driver. Note that if ESP_INTR_FLAG_IRAM 
   is set, ALL the callbacks of the driver, and their callee functions, should be put in the IRAM.

Macros

SPI_MAX_DMA_LEN
SPI_SWAP_DATA_TX (DATA, LEN)
   Transform unsigned integer of length <= 32 bits to the format which can be sent by the SPI driver directly.

E.g. to send 9 bits of data, you can:

```
uint16_t data = SPI_SWAP_DATA_TX(0x145, 9);
```

Then points tx_buffer to &data.

Parameters

   • DATA: Data to be sent, can be uint8_t, uint16_t or uint32_t.
• LEN: Length of data to be sent, since the SPI peripheral sends from the MSB, this helps to shift the data to the MSB.

**SPI_SWAP_DATA_RX** (DATA, LEN)
Transform received data of length <= 32 bits to the format of an unsigned integer.

E.g. to transform the data of 15 bits placed in a 4-byte array to integer:

```c
uint16_t data = SPI_SWAP_DATA_RX(*(uint32_t*)t->rx_data, 15);
```

**Parameters**
- **DATA**: Data to be rearranged, can be uint8_t, uint16_t or uint32_t.
- **LEN**: Length of data received, since the SPI peripheral writes from the MSB, this helps to shift the data to the LSB.

**SPICOMMON_BUSFLAG_SLAVE**
Initialize I/O in slave mode.

**SPICOMMON_BUSFLAG_MASTER**
Initialize I/O in master mode.

**SPICOMMON_BUSFLAG_IOMUX_PINS**
Check using iomux pins. Or indicates the pins are configured through the IO mux rather than GPIO matrix.

**SPICOMMON_BUSFLAG_GPIO_PINS**
Force the signals to be routed through GPIO matrix. Or indicates the pins are routed through the GPIO matrix.

**SPICOMMON_BUSFLAG_SCLCK**
Check existing of SCLK pin. Or indicates CLK line initialized.

**SPICOMMON_BUSFLAG_MISO**
Check existing of MISO pin. Or indicates MISO line initialized.

**SPICOMMON_BUSFLAG_MOSI**
Check existing of MOSI pin. Or indicates MOSI line initialized.

**SPICOMMON_BUSFLAG_DUAL**
Check MOSI and MISO pins can output. Or indicates bus able to work under DIO mode.

**SPICOMMON_BUSFLAG_WPHD**
Check existing of WP and HD pins. Or indicates WP & HD pins initialized.

**SPICOMMON_BUSFLAG_QUAD**
Check existing of MOSI/MISO/WP/HD pins as output. Or indicates bus able to work under QIO mode.

**SPICOMMON_BUSFLAG_I04_I07**
Check existing of I04-I07 pins. Or indicates IO4~IO7 pins initialized.

**SPICOMMON_BUSFLAG_OCTAL**
Check existing of MOSI/MISO/WP/HD/SPI04/SPI05/SPI06/SPI07 pins as output. Or indicates bus able to work under octal mode.

**SPICOMMON_BUSFLAG_NATIVE_PINS**

**Type Definitions**
```c
typedef spi_common_dma_t spi_dma_chan_t
```

**Enumerations**
```c
enum spi_common_dma_t
    SPI_DMA_DISABLED = 0
    Do not enable DMA for SPI.
```
SPI_DMA_CH_AUTO = 3
Enable DMA, channel is automatically selected by driver.

API Reference - SPI Master

Header File
- components/driver/include/driver/spi_master.h

Functions

```c
esp_err_t spi_bus_add_device(spi_host_device_t host_id, const spi_device_interface_config_t *dev_config, spi_device_handle_t *handle)
```

Allocate a device on a SPI bus.

This initializes the internal structures for a device, plus allocates a CS pin on the indicated SPI master peripheral and routes it to the indicated GPIO. All SPI master devices have three CS pins and can thus control up to three devices.

**Note** While in general, speeds up to 80MHz on the dedicated SPI pins and 40MHz on GPIO-matrix-routed pins are supported, full-duplex transfers routed over the GPIO matrix only support speeds up to 26MHz.

**Return**
- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_NOT_FOUND if host doesn’t have any free CS slots
- ESP_ERR_NO_MEM if out of memory
- ESP_OK on success

**Parameters**
- host_id: SPI peripheral to allocate device on
- dev_config: SPI interface protocol config for the device
- handle: Pointer to variable to hold the device handle

```c
esp_err_t spi_bus_remove_device(spi_device_handle_t handle)
```

Remove a device from the SPI bus.

**Return**
- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_INVALID_STATE if device already is freed
- ESP_OK on success

**Parameters**
- handle: Device handle to free

```c
esp_err_t spi_device_queue_trans(spi_device_handle_t handle, spi_transaction_t *trans_desc, TickType_t ticks_to_wait)
```

Queue a SPI transaction for interrupt transaction execution. Get the result by `spi_device_get_trans_result`.

**Note** Normally a device cannot start (queue) polling and interrupt transactions simultaneously.

**Return**
- ESP_ERR_INVALID_ARG if parameter is invalid. This can happen if `SPI_TRANS_CS_KEEP_ACTIVE` flag is specified while the bus was not acquired (`spi_device_acquire_bus()` should be called first)
- ESP_ERR_TIMEOUT if there was no room in the queue before `ticks_to_wait` expired
- ESP_ERR_NO_MEM if allocating DMA-capable temporary buffer failed
- ESP_ERR_INVALID_STATE if previous transactions are not finished
- ESP_OK on success

**Parameters**
- handle: Device handle obtained using `spi_host_add_dev`
- trans_desc: Description of transaction to execute
- ticks_to_wait: Ticks to wait until there’s room in the queue; use `portMAX_DELAY` to never time out.
**esp_err_t** spi_device_get_trans_result(spi_device_handle_t handle, spi_transaction_t **trans_desc, TickType_t ticks_to_wait)

Get the result of a SPI transaction queued earlier by `spi_device_queue_trans`.

This routine will wait until a transaction to the given device successfully completed. It will then return the description of the completed transaction so software can inspect the result and e.g. free the memory or re-use the buffers.

**Return**
- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_TIMEOUT if there was no completed transaction before `ticks_to_wait` expired
- ESP_OK on success

**Parameters**
- `handle`: Device handle obtained using `spi_host_add_dev`
- `trans_desc`: Pointer to variable able to contain a pointer to the description of the transaction that is executed. The descriptor should not be modified until the descriptor is returned by `spi_device_get_trans_result`.
- `ticks_to_wait`: Ticks to wait until there’s a returned item; use `portMAX_DELAY` to never timeout.

**esp_err_t** spi_device_transmit(spi_device_handle_t handle, spi_transaction_t *trans_desc)

Send a SPI transaction, wait for it to complete, and return the result.

This function is the equivalent of calling `spi_device_queue_trans()` followed by `spi_device_get_trans_result()`. Do not use this when there is still a transaction separately queued (started) from `spi_device_queue_trans()` or polling_start/transmit that has’t been finalized.

**Note** This function is not thread safe when multiple tasks access the same SPI device. Normally a device cannot start (queue) polling and interrupt transactions simultaneously.

**Return**
- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_OK on success

**Parameters**
- `handle`: Device handle obtained using `spi_host_add_dev`
- `trans_desc`: Description of transaction to execute

**esp_err_t** spi_device_polling_start(spi_device_handle_t handle, spi_transaction_t *trans_desc, TickType_t ticks_to_wait)

Immediately start a polling transaction.

**Note** Normally a device cannot start (queue) polling and interrupt transactions simultaneously. Moreover, a device cannot start a new polling transaction if another polling transaction is not finished.

**Return**
- ESP_ERR_INVALID_ARG if parameter is invalid. This can happen if SPI_TRANS_CS_KEEP_ACTIVE flag is specified while the bus was not acquired (`spi_device_acquire_bus()` should be called first)
- ESP_ERR_TIMEOUT if the device cannot get control of the bus before `ticks_to_wait` expired
- ESP_ERR_NO_MEM if allocating DMA-capable temporary buffer failed
- ESP_ERR_INVALID_STATE if previous transactions are not finished
- ESP_OK on success

**Parameters**
- `handle`: Device handle obtained using `spi_host_add_dev`
- `trans_desc`: Description of transaction to execute
- `ticks_to_wait`: Ticks to wait until there’s room in the queue; currently only `portMAX_DELAY` is supported.

**esp_err_t** spi_device_polling_end(spi_device_handle_t handle, TickType_t ticks_to_wait)

Poll until the polling transaction ends.

This routine will not return until the transaction to the given device has successfully completed. The task is not blocked, but actively busy-spins for the transaction to be completed.

**Return**
Chapter 2. API Reference

- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_TIMEOUT if the transaction cannot finish before ticks_to_wait expired
- ESP_OK on success

Parameters
- handle: Device handle obtained using spi_host_add_dev
- ticks_to_wait: Ticks to wait until there’s a returned item; use portMAX_DELAY to never time out.

```c
esp_err_t spi_device_polling_transmit(spi_device_handle_t handle, spi_transaction_t *trans_desc)
```
Send a polling transaction, wait for it to complete, and return the result.

This function is the equivalent of calling spi_device_polling_start() followed by spi_device_polling_end(). Do not use this when there is still a transaction that hasn’t been finalized.

Note This function is not thread safe when multiple tasks access the same SPI device. Normally a device cannot start (queue) polling and interrupt transactions simultaneously.

Return
- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_OK on success

Parameters
- handle: Device handle obtained using spi_host_add_dev
- trans_desc: Description of transaction to execute

```c
esp_err_t spi_device_acquire_bus(spi_device_handle_t device, TickType_t wait)
```
Occupy the SPI bus for a device to do continuous transactions.

Transactions to all other devices will be put off until spi_device_release_bus is called.

Note The function will wait until all the existing transactions have been sent.

Return
- ESP_ERR_INVALID_ARG: wait is not set to portMAX_DELAY.
- ESP_OK: Success.

Parameters
- device: The device to occupy the bus.
- wait: Time to wait before the the bus is occupied by the device. Currently MUST set to portMAX_DELAY.

```c
void spi_device_release_bus(spi_device_handle_t dev)
```
Release the SPI bus occupied by the device. All other devices can start sending transactions.

Parameters
- dev: The device to release the bus.

```c
int spi_cal_clock(int fapb, int hz, int duty_cycle, uint32_t *reg_o)
```
Calculate the working frequency that is most close to desired frequency, and also the register value.

Parameters
- fapb: The frequency of apb clock, should be APB_CLK_FREQ.
- hz: Desired working frequency
- duty_cycle: Duty cycle of the spi clock
- reg_o: Output of value to be set in clock register, or NULL if not needed.

Return Actual working frequency that most fit.

```c
int spi_get_actual_clock(int fapb, int hz, int duty_cycle)
```
Calculate the working frequency that is most close to desired frequency.

Return Actual working frequency that most fit.

Parameters
- fapb: The frequency of apb clock, should be APB_CLK_FREQ.
- hz: Desired working frequency
- duty_cycle: Duty cycle of the spi clock
void spi_get_timing(bool gpio_is_used, int input_delay_ns, int eff_clk, int *dummy_o, int *cycles_remain_o)

Calculate the timing settings of specified frequency and settings.

**Note** If **dummy_o** is not zero, it means dummy bits should be applied in half duplex mode, and full duplex mode may not work.

**Parameters**
- `gpio_is_used`: True if using GPIO matrix, or False if iomux pins are used.
- `input_delay_ns`: Input delay from SCLK launch edge to MISO data valid.
- `eff_clk`: Effective clock frequency (in Hz) from spi_cal_clock.
- `dummy_o`: Address of dummy bits used output. Set to NULL if not needed.
- `cycles_remain_o`: Address of cycles remaining (after dummy bits are used) output.
  - `-1` If too many cycles remaining, suggest to compensate half a clock.
  - `0` If no remaining cycles or dummy bits are not used.
  - positive value: cycles suggest to compensate.

int spi_get_freq_limit(bool gpio_is_used, int input_delay_ns)

Get the frequency limit of current configurations. SPI master working at this limit is OK, while above the limit, full duplex mode and DMA will not work, and dummy bits will be applied in the half duplex mode.

**Return** Frequency limit of current configurations.

**Parameters**
- `gpio_is_used`: True if using GPIO matrix, or False if native pins are used.
- `input_delay_ns`: Input delay from SCLK launch edge to MISO data valid.

**Structures**

```c
struct spi_device_interface_config_t
```

This is a configuration for a SPI slave device that is connected to one of the SPI buses.

**Public Members**

```c
uint8_t command_bits
```

Default amount of bits in command phase (0-16), used when SPI_TRANS_VARIABLE_CMD is not used, otherwise ignored.

```c
uint8_t address_bits
```

Default amount of bits in address phase (0-64), used when SPI_TRANS_VARIABLE_ADDR is not used, otherwise ignored.

```c
uint8_t dummy_bits
```

Amount of dummy bits to insert between address and data phase.

```c
uint8_t mode
```

SPI mode, representing a pair of (CPOL, CPHA) configuration:

- `0`: (0,0)
- `1`: (0,1)
- `2`: (1,0)
- `3`: (1,1)

```c
uint16_t duty_cycle_pos
```

Duty cycle of positive clock, in 1/256th increments (128 = 50%/50% duty). Setting this to 0 (=not setting it) is equivalent to setting this to 128.

```c
uint16_t cs_ena_pretrans
```

Amount of SPI bit-cycles the cs should be activated before the transmission (0-16). This only works on half-duplex transactions.

```c
uint8_t cs_ena_posttrans
```

Amount of SPI bit-cycles the cs should stay active after the transmission (0-16)
Chapter 2. API Reference

int clock_speed_hz
   Clock speed, divisors of 80MHz, in Hz. See SPI_MASTER_FREQ_*.

int input_delay_ns
   Maximum data valid time of slave. The time required between SCLK and MISO valid, including the
   possible clock delay from slave to master. The driver uses this value to give an extra delay before the
   MISO is ready on the line. Leave at 0 unless you know you need a delay. For better timing performance
   at high frequency (over 8MHz), it’s suggest to have the right value.

int spics_io_num
   CS GPIO pin for this device, or -1 if not used.

uint32_t flags
   Bitwise OR of SPI_DEVICE_* flags.

int queue_size
   Transaction queue size. This sets how many transactions can be ‘in the air’ (queued using
   spi_device_queue_trans but not yet finished using spi_device_get_trans_result) at the same time.

transaction_cb_t pre_cb
   Callback to be called before a transmission is started.
   This callback is called within interrupt context should be in IRAM for best performance, see “Transferring Speed” section in the SPI Master documentation for full details. If not, the callback may crash
during flash operation when the driver is initialized with ESP_INTR_FLAG_IRAM.

transaction_cb_t post_cb
   Callback to be called after a transmission has completed.
   This callback is called within interrupt context should be in IRAM for best performance, see “Transferring Speed” section in the SPI Master documentation for full details. If not, the callback may crash
during flash operation when the driver is initialized with ESP_INTR_FLAG_IRAM.

struct spi_transaction_t
   This structure describes one SPI transaction. The descriptor should not be modified until the transaction finishes.

Public Members

uint32_t flags
   Bitwise OR of SPI_TRANS_* flags.

uint16_t cmd
   Command data, of which the length is set in the command_bits of spi_device_interface_config_t.
   NOTE: this field, used to be “command” in ESP-IDF 2.1 and before, is re-written to be used in
   a new way in ESP-IDF 3.0.
   Example: write 0x0123 and command_bits=12 to send command 0x12, 0x3_ (in previous version, you
   may have to write 0x3_12).

uint64_t addr
   Address data, of which the length is set in the address_bits of spi_device_interface_config_t.
   NOTE: this field, used to be “address” in ESP-IDF 2.1 and before, is re-written to be used in
   a new way in ESP-IDF3.0.
   Example: write 0x123400 and address_bits=24 to send address of 0x12, 0x34, 0x00 (in previous version,
   you may have to write 0x12340000).

size_t length
   Total data length, in bits.

size_t rxlength
   Total data length received, should be not greater than length in full-duplex mode (0 defaults this to the
   value of length).
void *user
User-defined variable. Can be used to store eg transaction ID.

const void *tx_buffer
Pointer to transmit buffer, or NULL for no MOSI phase.

uint8_t tx_data[4]
If SPI_TRANS_USE_TXDATA is set, data set here is sent directly from this variable.

void *rx_buffer
Pointer to receive buffer, or NULL for no MISO phase. Written by 4 bytes-unit if DMA is used.

uint8_t rx_data[4]
If SPI_TRANS_USE_RXDATA is set, data is received directly to this variable.

struct spi_transaction_ext_t
This struct is for SPI transactions which may change their address and command length. Please do set the flags in base to SPI_TRANS_VARIABLE_CMD_ADR to use the bit length here.

Public Members

struct spi_transaction_t base
Transaction data, so that pointer to spi_transaction_t can be converted into spi_transaction_ext_t.

uint8_t command_bits
The command length in this transaction, in bits.

uint8_t address_bits
The address length in this transaction, in bits.

uint8_t dummy_bits
The dummy length in this transaction, in bits.

Macros

SPI_MASTER_FREQ_8M
SPI master clock is divided by 80MHz apb clock. Below defines are example frequencies, and are accurate. Be free to specify a random frequency, it will be rounded to closest frequency (to macros below if above 8MHz).

8MHz

SPI_MASTER_FREQ_9M
8.89MHz

SPI_MASTER_FREQ_10M
10MHz

SPI_MASTER_FREQ_11M
11.43MHz

SPI_MASTER_FREQ_13M
13.33MHz

SPI_MASTER_FREQ_16M
16MHz

SPI_MASTER_FREQ_20M
20MHz

SPI_MASTER_FREQ_26M
26.67MHz

SPI_MASTER_FREQ_40M
40MHz

SPI_MASTER_FREQ_80M
80MHz
**SPI_DEVICE_TXBIT_LSBFIRST**
Transmit command/address/data LSB first instead of the default MSB first.

**SPI_DEVICE_RXBIT_LSBFIRST**
Receive data LSB first instead of the default MSB first.

**SPI_DEVICE_BIT_LSBFIRST**
Transmit and receive LSB first.

**SPI_DEVICE_3WIRE**
Use MOSI (=spid) for both sending and receiving data.

**SPI_DEVICE_POSITIVE_CS**
Make CS positive during a transaction instead of negative.

**SPI_DEVICE_HALFDUPLEX**
Transmit data before receiving it, instead of simultaneously.

**SPI_DEVICE_CLK_AS_CS**
Output clock on CS line if CS is active.

**SPI_DEVICE_NO_DUMMY**
There are timing issue when reading at high frequency (the frequency is related to whether iomux pins are used, valid time after slave sees the clock).

- In half-duplex mode, the driver automatically inserts dummy bits before reading phase to fix the timing issue. Set this flag to disable this feature.
- In full-duplex mode, however, the hardware cannot use dummy bits, so there is no way to prevent data being read from getting corrupted. Set this flag to confirm that you’re going to work with output only, or read without dummy bits at your own risk.

**SPI_DEVICE_DDRCLK**

**SPI_TRANS_MODE_DIO**
Transmit/receive data in 2-bit mode.

**SPI_TRANS_MODE_QIO**
Transmit/receive data in 4-bit mode.

**SPI_TRANS_USE_RXDATA**
Receive into rx_data member of *spi_transaction_t* instead into memory at rx_buffer.

**SPI_TRANS_USE_TXDATA**
Transmit tx_data member of *spi_transaction_t* instead of data at tx_buffer. Do not set tx_buffer when using this.

**SPI_TRANS_MODE_DIOQIO_ADDR**
Also transmit address in mode selected by SPI_MODE_DIO/SPI_MODE_QIO.

**SPI_TRANS_VARIABLE_CMD**
Use the command_bits in *spi_transaction_ext_t* rather than default value in *spi_device_interface_config_t*.

**SPI_TRANS_VARIABLE_ADDR**
Use the address_bits in *spi_transaction_ext_t* rather than default value in *spi_device_interface_config_t*.

**SPI_TRANS_VARIABLE_DUMMY**
Use the dummy_bits in *spi_transaction_ext_t* rather than default value in *spi_device_interface_config_t*.

**SPI_TRANS_CS_KEEP_ACTIVE**
Keep CS active after data transfer.

**SPI_TRANS_MULTILINE_CMD**
The data lines used at command phase is the same as data phase (otherwise, only one data line is used at command phase)
SPI_TRANS_MODE_OCT
Transmit/receive data in 8-bit mode.

SPI_TRANS_MULTILINE_ADDR
The data lines used at address phase is the same as data phase (otherwise, only one data line is used at address phase)

Type Definitions

typedef struct spi_transaction_t spi_transaction_t

typedef void (*transaction_cb_t)(spi_transaction_t *trans)

typedef struct spi_device_t *spi_device_handle_t
Handle for a device on a SPI bus.

2.3.19 SPI Slave Driver

SPI Slave driver is a program that controls ESP32-S3’s SPI peripherals while they function as slaves.

Overview of ESP32-S3’s SPI peripherals

ESP32-S3 integrates two general purpose SPI controllers which can be used as slave nodes driven by an off-chip SPI master

SPI2 and SPI3 have independent signal buses with the same respective names.

Terminology

The terms used in relation to the SPI slave driver are given in the table below.
<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Host</strong></td>
<td>The SPI controller peripheral external to ESP32-S3 that initiates SPI transmissions over the bus, and acts as an SPI Master.</td>
</tr>
<tr>
<td><strong>Device</strong></td>
<td>SPI slave device (general purpose SPI controller). Each Device shares the MOSI, MISO and SCLK signals but is only active on the bus when the Host asserts the Device’s individual CS line.</td>
</tr>
<tr>
<td><strong>Bus</strong></td>
<td>A signal bus, common to all Devices connected to one Host. In general, a bus includes the following lines: MISO, MOSI, SCLK, one or more CS lines, and, optionally, QUADWP and QUADHD. So Devices are connected to the same lines, with the exception that each Device has its own CS line. Several Devices can also share one CS line if connected in the daisy-chain manner.</td>
</tr>
<tr>
<td><strong>MISO</strong></td>
<td>Master In, Slave Out, a.k.a. Q. Data transmission from a Device to Host.</td>
</tr>
<tr>
<td><strong>MOSI</strong></td>
<td>Master Out, Slave in, a.k.a. D. Data transmission from a Host to Device.</td>
</tr>
<tr>
<td><strong>SCLK</strong></td>
<td>Serial Clock. Oscillating signal generated by a Host that keeps the transmission of data bits in sync.</td>
</tr>
<tr>
<td><strong>CS</strong></td>
<td>Chip Select. Allows a Host to select individual Device(s) connected to the bus in order to send or receive data.</td>

<td>Edge of the clock at which the destination register latches in the signal.</td>
</tr>
</tbody>
</table>

**Driver Features**

The SPI slave driver allows using the SPI peripherals as full-duplex Devices. The driver can send/receive transactions up to 64 bytes in length, or utilize DMA to send/receive longer transactions. However, there are some known issues related to DMA.

**SPI Transactions**

A full-duplex SPI transaction begins when the Host asserts the CS line and starts sending out clock pulses on the SCLK line. Every clock pulse, a data bit is shifted from the Host to the Device on the MOSI line and back on the MISO line at the same time. At the end of the transaction, the Host de-asserts the CS line.
The attributes of a transaction are determined by the configuration structure for an SPI host acting as a slave device `spi_slave_interface_config_t`, and transaction configuration structure `spi_slave_transaction_t`.

As not every transaction requires both writing and reading data, you have a choice to configure the `spi_transaction_t` structure for TX only, RX only, or TX and RX transactions. If `spi_slave_transaction_t::rx_buffer` is set to NULL, the read phase will be skipped. If `spi_slave_transaction_t::tx_buffer` is set to NULL, the write phase will be skipped.

**Note:** A Host should not start a transaction before its Device is ready for receiving data. It is recommended to use another GPIO pin for a handshake signal to sync the Devices. For more details, see *Transaction Interval*.

**Driver Usage**

- Initialize an SPI peripheral as a Device by calling the function `spi_slave_initialize`. Make sure to set the correct I/O pins in the `bus_config` struct. Set the unused signals to `-1`.
- Before initiating transactions, fill one or more `spi_slave_transaction_t` structs with the transaction parameters required. Either queue all transactions by calling the function `spi_slave_queue_trans()` and, at a later time, query the result by using the function `spi_slave_get_trans_result()`, or handle all requests individually by feeding them into `spi_slave_transmit()`. The latter two functions will be blocked until the Host has initiated and finished a transaction, causing the queued data to be sent and received.
- (Optional) To unload the SPI slave driver, call `spi_slave_free()`.

**Transaction Data and Master/Slave Length Mismatches**

Normally, the data that needs to be transferred to or from a Device is read or written to a chunk of memory indicated by the `rx_buffer` and `tx_buffer` members of the `spi_transaction_t` structure. The SPI driver can be configured to use DMA for transfers, in which case these buffers must be allocated in DMA-capable memory using `pvPortMallocCaps(size, MALLOC_CAP_DMA)`.

The amount of data that the driver can read or write to the buffers is limited by the member `spi_transaction_t::length`. However, this member does not define the actual length of an SPI transaction. A transaction's length is determined by a Host which drives the clock and CS lines. The actual length of the transmission can be read only after a transaction is finished from the member `spi_slave_transaction_t::trans_len`.

If the length of the transmission is greater than the buffer length, only the initial number of bits specified in the `length` member will be sent and received. In this case, `trans_len` is set to `length` instead of the actual transaction length. To meet the actual transaction length requirements, set `length` to a value greater than the maximum `trans_len` expected. If the transmission length is shorter than the buffer length, only the data equal to the length of the buffer will be transmitted.

**Speed and Timing Considerations**

**Transaction Interval** The ESP32-S3 SPI slave peripherals are designed as general purpose Devices controlled by a CPU. As opposed to dedicated slaves, CPU-based SPI Devices have a limited number of pre-defined registers. All transactions must be handled by the CPU, which means that the transfers and responses are not real-time, and there might be noticeable latency.

As a solution, a Device’s response rate can be doubled by using the functions `spi_slave_queue_trans()` and then `spi_slave_get_trans_result()` instead of using `spi_slave_transmit()`.

You can also configure a GPIO pin through which the Device will signal to the Host when it is ready for a new transaction. A code example of this can be found in `peripherals/spi_slave`.

---

Submit Document Feedback
SCLK Frequency Requirements  The SPI slaves are designed to operate at up to 60 MHz. The data cannot be recognized or received correctly if the clock is too fast or does not have a 50% duty cycle.

Restrictions and Known Issues

1. If DMA is enabled, the rx buffer should be word-aligned (starting from a 32-bit boundary and having a length of multiples of 4 bytes). Otherwise, DMA may write incorrectly or not in a boundary aligned manner. The driver reports an error if this condition is not satisfied.
   Also, a Host should write lengths that are multiples of 4 bytes. The data with inappropriate lengths will be discarded.

Application Example

The code example for Device/Host communication can be found in the peripherals/spi_slave directory of ESP-IDF examples.

Header File

- components/driver/include/driver/spi_slave.h

Functions

*esp_err_t* spi_slave_initialize*(spi_host_device_t* host, const spi_bus_config_t* bus_config, const spi_slave_interface_config_t* slave_config, spi_dma_chan_t dma_chan)*

Initialize a SPI bus as a slave interface.

**Warning** SPI0/1 is not supported

**Warning** If a DMA channel is selected, any transmit and receive buffer used should be allocated in DMA-capable memory.

**Warning** The ISR of SPI is always executed on the core which calls this function. Never starve the ISR on this core or the SPI transactions will not be handled.

**Return**

- ESP_ERR_INVALID_ARG if configuration is invalid
- ESP_ERR_INVALID_STATE if host already in use
- ESP_ERR_NOT_FOUND if there is no available DMA channel
- ESP_ERR_NO_MEM if out of memory
- ESP_OK on success

**Parameters**

- host: SPI peripheral to use as a SPI slave interface
- bus_config: Pointer to a *spi_bus_config_t* struct specifying how the host should be initialized
- slave_config: Pointer to a *spi_slave_interface_config_t* struct specifying the details for the slave interface
- dma_chan: - Selecting a DMA channel for an SPI bus allows transactions on the bus with size only limited by the amount of internal memory.
  - Selecting SPI_DMA_DISABLED limits the size of transactions.
  - Set to SPI_DMA_DISABLED if only the SPI flash uses this bus.
  - Set to SPI_DMA_CHANNEL to let the driver to allocate the DMA channel.

*esp_err_t* spi_slave_free*(spi_host_device_t* host)*

Free a SPI bus claimed as a SPI slave interface.

**Return**

- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_INVALID_STATE if not all devices on the bus are freed
- ESP_OK on success

**Parameters**
• **host**: SPI peripheral to free

```c
esp_err_t spi_slave_queue_trans(spi_host_device_t host, const spi_slave_transaction_t trans_desc, TickType_t ticks_to_wait)
```

Queue a SPI transaction for execution.

Queues a SPI transaction to be executed by this slave device. (The transaction queue size was specified when the slave device was initialised via `spi_slave_initialize`.) This function may block if the queue is full (depending on the `ticks_to_wait` parameter). No SPI operation is directly initiated by this function, the next queued transaction will happen when the master initiates a SPI transaction by pulling down CS and sending out clock signals.

This function hands over ownership of the buffers in `trans_desc` to the SPI slave driver; the application is not to access this memory until `spi_slave_queue_trans` is called to hand ownership back to the application.

**Return**

- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_OK on success

**Parameters**

- **host**: SPI peripheral that is acting as a slave
- **trans_desc**: Description of transaction to execute. Not const because we may want to write status back into the transaction description.
- **ticks_to_wait**: Ticks to wait until there’s room in the queue; use portMAX_DELAY to never time out.

```c
esp_err_t spi_slave_get_trans_result(spi_host_device_t host, spi_slave_transaction_t *trans_desc, TickType_t ticks_to_wait)
```

Get the result of a SPI transaction queued earlier.

This routine will wait until a transaction to the given device (queued earlier with `spi_slave_queue_trans`) has successfully completed. It will then return the description of the completed transaction so software can inspect the result and e.g. free the memory or re-use the buffers.

It is mandatory to eventually use this function for any transaction queued by `spi_slave_queue_trans`.

**Return**

- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_OK on success

**Parameters**

- **host**: SPI peripheral to that is acting as a slave
- **[out] trans_desc**: Pointer to variable able to contain a pointer to the description of the transaction that is executed
- **ticks_to_wait**: Ticks to wait until there’s a returned item; use portMAX_DELAY to never time out.

```c
esp_err_t spi_slave_transmit(spi_host_device_t host, spi_slave_transaction_t *trans_desc, TickType_t ticks_to_wait)
```

Do a SPI transaction.

Essentially does the same as `spi_slave_queue_trans` followed by `spi_slave_get_trans_result`. Do not use this when there is still a transaction queued that hasn’t been finalized using `spi_slave_get_trans_result`.

**Return**

- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_OK on success

**Parameters**

- **host**: SPI peripheral to that is acting as a slave
- **trans_desc**: Pointer to variable able to contain a pointer to the description of the transaction that is executed. Not const because we may want to write status back into the transaction description.
- **ticks_to_wait**: Ticks to wait until there’s a returned item; use portMAX_DELAY to never time out.

**Structures**
**struct spi_slave_interface_config_t**

This is a configuration for a SPI host acting as a slave device.

**Public Members**

```c
int spics_io_num
    CS GPIO pin for this device.
```

```c
uint32_t flags
    Bitwise OR of SPI_SLAVE_* flags.
```

```c
int queue_size
    Transaction queue size. This sets how many transactions can be ‘in the air’ (queued using spi_slave_queue_trans but not yet finished using spi_slave_get_trans_result) at the same time.
```

```c
uint8_t mode
    SPI mode, representing a pair of (CPOL, CPHA) configuration:
    • 0: (0, 0)
    • 1: (0, 1)
    • 2: (1, 0)
    • 3: (1, 1)
```

**slave_transaction_cb / post_setup_cb**

Callback called after the SPI registers are loaded with new data.

This callback is called within interrupt context should be in IRAM for best performance, see “Transferring Speed” section in the SPI Master documentation for full details. If not, the callback may crash during flash operation when the driver is initialized with ESP_INTR_FLAG_IRAM.

**slave_transaction_cb / post_trans_cb**

Callback called after a transaction is done.

This callback is called within interrupt context should be in IRAM for best performance, see “Transferring Speed” section in the SPI Master documentation for full details. If not, the callback may crash during flash operation when the driver is initialized with ESP_INTR_FLAG_IRAM.

**struct spi_slave_transaction_t**

This structure describes one SPI transaction

**Public Members**

```c
size_t length
    Total data length, in bits.
```

```c
size_t trans_len
    Transaction data length, in bits.
```

```c
const void *tx_buffer
    Pointer to transmit buffer, or NULL for no MOSI phase.
```

```c
void *rx_buffer
    Pointer to receive buffer, or NULL for no MISO phase. When the DMA is enabled, must start at WORD boundary (rx_buffer%4==0), and has length of a multiple of 4 bytes.
```

```c
void *user
    User-defined variable. Can be used to store eg transaction ID.
```

**Macros**

`SPI_SLAVE_TXBIT_LSBFIRST`

Transmit command/address/data LSB first instead of the default MSB first.

`SPI_SLAVE_RXBIT_LSBFIRST`

Receive data LSB first instead of the default MSB first.
SPI_SLAVE_BIT_LSBFIRST
Transmit and receive LSB first.

Type Definitions
typedef struct spi_slave_transaction_t spi_slave_transaction_t
typedef void (*slave_transaction_cb_t)(spi_slave_transaction_t *trans)

2.3.20 Touch Sensor

Introduction

A touch sensor system is built on a substrate which carries electrodes and relevant connections under a protective flat surface. When a user touches the surface, the capacitance variation is used to evaluate if the touch was valid.

Touch sensor on ESP32-S3 can support up to 14 capacitive touch pads / GPIOs.

The sensing pads can be arranged in different combinations (e.g., matrix, slider), so that a larger area or more points can be detected. The touch pad sensing process is under the control of a hardware-implemented finite-state machine (FSM) which is initiated by software or a dedicated hardware timer.

For design, operation, and control registers of a touch sensor, see ESP32-S3 Technical Reference Manual > On-Chip Sensors and Analog Signal Processing [PDF].

In-depth design details of touch sensors and firmware development guidelines for ESP32-S3 are available in Touch Sensor Application Note.

Functionality Overview

Description of API is broken down into groups of functions to provide a quick overview of the following features:

• Initialization of touch pad driver
• Configuration of touch pad GPIO pins
• Taking measurements
• Adjusting parameters of measurements
• Filtering measurements
• Touch detection methods
• Setting up interrupts to report touch detection
• Waking up from Sleep mode on interrupt

For detailed description of a particular function, please go to Section API Reference. Practical implementation of this API is covered in Section Application Examples.

Initialization Before using a touch pad, you need to initialize the touch pad driver by calling the function touch_pad_init(). This function sets several ..._DEFAULT driver parameters listed in API Reference under Macros. It also removes the information about which pads have been touched before, if any, and disables interrupts.

If the driver is not required anymore, deinitialize it by calling touch_pad_deinit().

Configuration Enabling the touch sensor functionality for a particular GPIO is done with touch_pad_config().

Use the function touch_pad_set_fsm_mode() to select if touch pad measurement (operated by FSM) should be started automatically by a hardware timer, or by software. If software mode is selected, use touch_pad_sw_start() to start the FSM.
Touch State Measurements  The following function come in handy to read raw measurements from the sensor:

- `touch_pad_read_raw_data()`

It can also be used, for example, to evaluate a particular touch pad design by checking the range of sensor readings when a pad is touched or released. This information can be then used to establish a touch threshold.

For the demonstration of how to read the touch pad data, check the application example `peripherals/touch_sensor/touch_sensor_v2/touch_pad_read`.

Optimization of Measurements  A touch sensor has several configurable parameters to match the characteristics of a particular touch pad design. For instance, to sense smaller capacity changes, it is possible to narrow down the reference voltage range within which the touch pads are charged / discharged. The high and low reference voltages are set using the function `touch_pad_set_voltage()`.

Besides the ability to discern smaller capacity changes, a positive side effect is reduction of power consumption for low power applications. A likely negative effect is an increase in measurement noise. If the dynamic range of obtained readings is still satisfactory, then further reduction of power consumption might be done by reducing the measurement time with `touch_pad_set_meas_time()`.

The following list summarizes available measurement parameters and corresponding ‘set’ functions:

- Touch pad charge / discharge parameters:
  - voltage range: `touch_pad_set_voltage()`
  - speed (slope): `touch_pad_set_cnt_mode()`
- Measurement time: `touch_pad_set_meas_time()`

Relationship between the voltage range (high / low reference voltages), speed (slope), and measurement time is shown in the figure below.

![Fig. 16: Touch pad - relationship between measurement parameters](image)

The last chart Output represents the touch sensor reading, i.e., the count of pulses collected within the measurement time.

All functions are provided in pairs to set a specific parameter and to get the current parameter’s value, e.g., `touch_pad_set_voltage()` and `touch_pad_get_voltage()`.

Filtering of Measurements  If measurements are noisy, you can filter them with provided API functions. The ESP32-S3’s touch functionality provide two sets of APIs for doing this.
There is an internal touch channel that is not connected to any external GPIO. The measurements from this denoise pad can be used to filters out interference introduced on all channels, such as noise introduced by the power supply and external EMI. The denoise parameters are set with the function `touch_pad_denoise_set_config()` and started by with `touch_pad_denoise_enable()`.

There is also a configurable hardware implemented IIR-filter (infinite impulse response). This IIR-filter is configured with the function `touch_pad_filter_set_config()` and enabled by calling `touch_pad_filter_enable()`.

**Touch Detection**  Touch detection is implemented in ESP32’s hardware based on the user-configured threshold and raw measurements executed by FSM. Use the functions `touch_pad_get_status()` to check which pads have been touched and `touch_pad_clear_status()` to clear the touch status information.

Hardware touch detection can also be wired to interrupts. This is described in the next section.

If measurements are noisy and capacity changes are small, hardware touch detection might be unreliable. To resolve this issue, instead of using hardware detection / provided interrupts, implement measurement filtering and perform touch detection in your own application. For sample implementation of both methods of touch detection, see `peripherals/touch_sensor/touch_sensor_v2/touch_pad_interrupt`.

**Touch Triggered Interrupts**  Before enabling an interrupt on a touch detection, you should establish a touch detection threshold. Use the functions described in Touch State Measurements to read and display sensor measurements when a pad is touched and released. Apply a filter if measurements are noisy and relative capacity changes are small. Depending on your application and environment conditions, test the influence of temperature and power supply voltage changes on measured values.

Once a detection threshold is established, it can be set during initialization with `touch_pad_config()` or at the runtime with `touch_pad_set_thresh()`.

Finally, configure and manage interrupt calls using the following functions:

- `touch_pad_isr_register()` / `touch_pad_isr_deregister()`
- `touch_pad_intr_enable()` / `touch_pad_intr_disable()`

When interrupts are operational, you can obtain the information from which particular pad an interrupt came by invoking `touch_pad_get_status()` and clear the pad status with `touch_pad_clear_status()`.

**Application Examples**

- Touch sensor read example: `peripherals/touch_sensor/touch_sensor_v2/touch_pad_read`.
- Touch sensor interrupt example: `peripherals/touch_sensor/touch_sensor_v2/touch_pad_interrupt`.

**API Reference**

**Header File**

- `components/driver/esp32s3/include/driver/touch_sensor.h`

**Functions**

- `esp_err_t touch_pad_fsm_start (void)`
  - Set touch sensor FSM start.
  - **Note** Start FSM after the touch sensor FSM mode is set.
  - **Note** Call this function will reset benchmark of all touch channels.
  - **Return**
    - ESP_OK on success

- `esp_err_t touch_pad_fsm_stop (void)`
  - Stop touch sensor FSM.
Return

- ESP_OK on success

```
esp_err_t touch_pad_sw_start (void)
```

Trigger a touch sensor measurement, only support in SW mode of FSM.

Return

- ESP_OK on success

```
esp_err_t touch_pad_set_meas_time (uint16_t sleep_cycle, uint16_t meas_times)
```

Set touch sensor times of charge and discharge and sleep time. Excessive total time will slow down the touch response. Too small measurement time will not be sampled enough, resulting in inaccurate measurements.

Note The greater the duty cycle of the measurement time, the more system power is consumed.

Return

- ESP_OK on success

Parameters

- sleep_cycle: The touch sensor will sleep after each measurement. sleep_cycle decide the interval between each measurement. t_sleep = sleep_cycle / (RTC_SLOW_CLK frequency). The approximate frequency value of RTC_SLOW_CLK can be obtained using rtc_clk_slow_freq_get_hz function.
- meas_times: The times of charge and discharge in each measure process of touch channels. The timer frequency is 8Mhz. Range: 0 ~ 0xffff. Recommended typical value: Modify this value to make the measurement time around 1ms.

```
esp_err_t touch_pad_get_meas_time (uint16_t *sleep_cycle, uint16_t *meas_times)
```

Get touch sensor times of charge and discharge and sleep time.

Return

- ESP_OK on success

Parameters

- sleep_cycle: Pointer to accept sleep cycle number
- meas_times: Pointer to accept measurement times count.

```
esp_err_t touch_pad_set_idle_channel_connect (touch_pad_conn_type_t type)
```

Set connection type of touch channel in idle status. When a channel is in measurement mode, other initialized channels are in idle mode. The touch channel is generally adjacent to the trace, so the connection state of the idle channel affects the stability and sensitivity of the test channel. The CONN_HIGHZ(high resistance) setting increases the sensitivity of touch channels. The CONN_GND(grounding) setting increases the stability of touch channels.

Return

- ESP_OK on success

Parameters

- type: Select idle channel connect to high resistance state or ground.

```
esp_err_t touch_pad_get_idle_channel_connect (touch_pad_conn_type_t *type)
```

Set connection type of touch channel in idle status. When a channel is in measurement mode, other initialized channels are in idle mode. The touch channel is generally adjacent to the trace, so the connection state of the idle channel affects the stability and sensitivity of the test channel. The CONN_HIGHZ(high resistance) setting increases the sensitivity of touch channels. The CONN_GND(grounding) setting increases the stability of touch channels.

Return

- ESP_OK on success

Parameters

- type: Pointer to connection type.

```
esp_err_t touch_pad_set_thresh (touch_pad_t touch_num, uint32_t threshold)
```

Set the trigger threshold of touch sensor. The threshold determines the sensitivity of the touch sensor. The threshold is the original value of the trigger state minus the benchmark value.

Note If set "TOUCH_PAD_THRESHOLD_MAX", the touch is never be triggered.

Return

- ESP_OK on success
• ESP_OK on success

Parameters
• touch_num: touch pad index
• threshold: threshold of touch sensor. Should be less than the max change value of touch.

```c
esp_err_t touch_pad_get_thresh(touch_pad_t touch_num, uint32_t* threshold)
```
Get touch sensor trigger threshold.

Return
• ESP_OK on success
• ESP_ERR_INVALID_ARG if argument is wrong

Parameters
• touch_num: touch pad index
• threshold: pointer to accept threshold

```c
esp_err_t touch_pad_set_channel_mask(uint16_t enable_mask)
```
Register touch channel into touch sensor scan group. The working mode of the touch sensor is cyclically scanned. This function will set the scan bits according to the given bitmask.

Note
If set this mask, the FSM timer should be stop firstly.
Note
The touch sensor that in scan map, should be deinit GPIO function firstly by `touch_pad_io_init`.

Return
• ESP_OK on success

Parameters
• enable_mask: bitmask of touch sensor scan group. e.g. TOUCH_PAD_NUM14 -> BIT(14)

```c
esp_err_t touch_pad_get_channel_mask(uint16_t* enable_mask)
```
Get the touch sensor scan group bit mask.

Return
• ESP_OK on success

Parameters
• enable_mask: Pointer to bitmask of touch sensor scan group. e.g. TOUCH_PAD_NUM14 -> BIT(14)

```c
esp_err_t touch_pad_clear_channel_mask(uint16_t enable_mask)
```
Clear touch channel from touch sensor scan group. The working mode of the touch sensor is cyclically scanned. This function will clear the scan bits according to the given bitmask.

Note
If clear all mask, the FSM timer should be stop firstly.

Return
• ESP_OK on success

Parameters
• enable_mask: bitmask of touch sensor scan group. e.g. TOUCH_PAD_NUM14 -> BIT(14)

```c
esp_err_t touch_pad_config(touch_pad_t touch_num)
```
Configure parameter for each touch channel.

Note
Touch num 0 is denoise channel, please use `touch_pad_denoise_enable` to set denoise function

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG if argument wrong
• ESP_FAIL if touch pad not initialized

Parameters
• touch_num: touch pad index

```c
esp_err_t touch_pad_reset(void)
```
Reset the FSM of touch module.

Note
Call this function after `touch_pad_fsm_stop`.

Return
• ESP_OK Success

```c
touch_pad_t touch_pad_get_current_meas_channel(void)
```
Get the current measure channel.
Note Should be called when touch sensor measurement is in cyclic scan mode.

Return
- touch channel number

uint32_t touch_pad_read_intr_status_mask (void)
Get the touch sensor interrupt status mask.

Return
- touch interrupt bit

esp_err_t touch_pad_intr_enable (touch_pad_intr_mask_t int_mask)
Enable touch sensor interrupt by bitmask.

Note This API can be called in ISR handler.

Return
- ESP_OK on success

Parameters
- int_mask: Pad mask to enable interrupts

esp_err_t touch_pad_intr_disable (touch_pad_intr_mask_t int_mask)
Disable touch sensor interrupt by bitmask.

Note This API can be called in ISR handler.

Return
- ESP_OK on success

Parameters
- int_mask: Pad mask to disable interrupts

esp_err_t touch_pad_intr_clear (touch_pad_intr_mask_t int_mask)
Clear touch sensor interrupt by bitmask.

Return
- ESP_OK on success

Parameters
- int_mask: Pad mask to clear interrupts

esp_err_t touch_pad_isr_register (intr_handler_t fn, void *arg, touch_pad_intr_mask_t intr_mask)
Register touch-pad ISR. The handler will be attached to the same CPU core that this function is running on.

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG Arguments error
- ESP_ERR_NO_MEM No memory

Parameters
- fn: Pointer to ISR handler
- arg: Parameter for ISR
- intr_mask: Enable touch sensor interrupt handler by bitmask.

esp_err_t touch_pad_timeout_set (bool enable, uint32_t threshold)
Enable/disable the timeout check and set timeout threshold for all touch sensor channels measurements. If enable: When the touch reading of a touch channel exceeds the measurement threshold, a timeout interrupt will be generated. If disable: the FSM does not check if the channel under measurement times out.

Note The threshold compared with touch readings.

Note In order to avoid abnormal short circuit of some touch channels. This function should be turned on. Ensure the normal operation of other touch channels.

Return
- ESP_OK Success

Parameters
- enable: true(default): Enable the timeout check; false: Disable the timeout check.
- threshold: For all channels, the maximum value that will not be exceeded during normal operation.

esp_err_t touch_pad_timeout_resume (void)
Call this interface after timeout to make the touch channel resume normal work. Point on the next channel to
measure. If this API is not called, the touch FSM will stop the measurement after timeout interrupt.

**Note** Call this API after finishes the exception handling by user.

**Return**
- ESP_OK Success

```c
esp_err_t touch_pad_read_raw_data(touch_pad_t touch_num, uint32_t *raw_data)
```
get raw data of touch sensor.

**Note** After the initialization is complete, the “raw_data” is max value. You need to wait for a measurement cycle before you can read the correct touch value.

**Return**
- ESP_OK Success
- ESP_FAIL Touch channel 0 haven’t this parameter.

**Parameters**
- touch_num: touch pad index
- raw_data: pointer to accept touch sensor value

```c
esp_err_t touch_pad_read_benchmark(touch_pad_t touch_num, uint32_t *benchmark)
```
get benchmark of touch sensor.

**Note** After initialization, the benchmark value is the maximum during the first measurement period.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Touch channel 0 haven’t this parameter.

**Parameters**
- touch_num: touch pad index
- benchmark: pointer to accept touch sensor benchmark value

```c
esp_err_t touch_pad_filter_read_smooth(touch_pad_t touch_num, uint32_t *smooth)
```
Get smoothed data that obtained by filtering the raw data.

**Parameters**
- touch_num: touch pad index
- smooth: pointer to smoothed data

```c
esp_err_t touch_pad_reset_benchmark(touch_pad_t touch_num)
```
Force reset benchmark to raw data of touch sensor.

**Return**
- ESP_OK Success

**Parameters**
- touch_num: touch pad index
  - TOUCH_PAD_MAX Reset baseline of all channels

```c
esp_err_t touch_pad_filter_set_config(const touch_filter_config_t *filter_info)
```
set parameter of touch sensor filter and detection algorithm. For more details on the detection algorithm, please refer to the application documentation.

**Return**
- ESP_OK Success

**Parameters**
- filter_info: select filter type and threshold of detection algorithm

```c
esp_err_t touch_pad_filter_get_config(touch_filter_config_t *filter_info)
```
get parameter of touch sensor filter and detection algorithm. For more details on the detection algorithm, please refer to the application documentation.

**Return**
- ESP_OK Success

**Parameters**
- filter_info: select filter type and threshold of detection algorithm

```c
esp_err_t touch_pad_filter_enable(void)
```
enable touch sensor filter for detection algorithm. For more details on the detection algorithm, please refer to
the application documentation.

Return
• ESP_OK Success

Esp_err_t touch_pad_filter_disable (void)
disable touch sensor filter for detection algorithm. For more details on the detection algorithm, please refer to
the application documentation.

Return
• ESP_OK Success

Esp_err_t touch_pad_denoise_set_config (const touch_pad_denoise_t *denoise)
set parameter of denoise pad (TOUCH_PAD_NUM0). T0 is an internal channel that does not have a corre-
spending external GPIO. T0 will work simultaneously with the measured channel Tn. Finally, the actual
measured value of Tn is the value after subtracting lower bits of T0. The noise reduction function filters out
interference introduced simultaneously on all channels, such as noise introduced by power supplies and external
EMI.

Return
• ESP_OK Success

Parameters
• denoise: parameter of denoise

Esp_err_t touch_pad_denoise_get_config (touch_pad_denoise_t *denoise)
get parameter of denoise pad (TOUCH_PAD_NUM0).

Return
• ESP_OK Success

Parameters
• denoise: Pointer to parameter of denoise

Esp_err_t touch_pad_denoise_enable (void)
enable denoise function. T0 is an internal channel that does not have a corresponding external GPIO. T0 will
work simultaneously with the measured channel Tn. Finally, the actual measured value of Tn is the value after
subtracting lower bits of T0. The noise reduction function filters out interference introduced simultaneously
on all channels, such as noise introduced by power supplies and external EMI.

Return
• ESP_OK Success

Esp_err_t touch_pad_denoise_disable (void)
disable denoise function.

Return
• ESP_OK Success

Esp_err_t touch_pad_denoise_read_data (uint32_t *data)
Get denoise measure value (TOUCH_PAD_NUM0).

Return
• ESP_OK Success

Parameters
• data: Pointer to receive denoise value

Esp_err_t touch_pad_waterproof_set_config (const touch_pad_waterproof_t *waterproof)
set parameter of waterproof function.

The waterproof function includes a shielded channel (TOUCH_PAD_NUM14) and a
→guard channel. Guard pad is used to detect the large area of water covering the touch...
→panel. Shield pad is used to shield the influence of water droplets covering the...
→touch panel. It is generally designed as a grid and is placed around the touch buttons.
Return
• ESP_OK Success

Parameters
• waterproof: parameter of waterproof

\texttt{esp_err_t touch_pad_waterproof_get_config(touch_pad_waterproof_t \*waterproof)}
get parameter of waterproof function.

Return
• ESP_OK Success

Parameters
• waterproof: parameter of waterproof

\texttt{esp_err_t touch_pad_waterproof_enable (void)}
Enable parameter of waterproof function. Should be called after function touch_pad_waterproof_set_config.

Return
• ESP_OK Success

\texttt{esp_err_t touch_pad_waterproof_disable (void)}
Disable parameter of waterproof function.

Return
• ESP_OK Success

\texttt{esp_err_t touch_pad_proximity_enable (touch_pad_t touch_num, bool enabled)}
Enable/disable proximity function of touch channels. The proximity sensor measurement is the accumulation of touch channel measurements.

Note Supports up to three touch channels configured as proximity sensors.

Return
• ESP_OK: Configured correctly.
• ESP_ERR_INVALID_ARG: Touch channel number error.
• ESP_ERR_NOT_SUPPORTED: Don’t support configured.

Parameters
• touch_num: touch pad index
• enabled: true: enable the proximity function; false: disable the proximity function

\texttt{esp_err_t touch_pad_proximity_set_count (touch_pad_t touch_num, uint32_t count)}
Set measure count of proximity channel. The proximity sensor measurement is the accumulation of touch channel measurements.

Note All proximity channels use the same \texttt{count} value. So please pass the parameter \texttt{TOUCH_PAD_MAX}.

Return
• ESP_OK: Configured correctly.
• ESP_ERR_INVALID_ARG: Touch channel number error.

Parameters
• touch_num: Touch pad index. In this version, pass the parameter \texttt{TOUCH_PAD_MAX}.
• count: The cumulative times of measurements for proximity pad. Range: 0 ~ 255.

\texttt{esp_err_t touch_pad_proximity_get_count (touch_pad_t touch_num, uint32_t \*count)}
Get measure count of proximity channel. The proximity sensor measurement is the accumulation of touch channel measurements.

Note All proximity channels use the same \texttt{count} value. So please pass the parameter \texttt{TOUCH_PAD_MAX}.

Return
• ESP_OK: Configured correctly.
• ESP_ERR_INVALID_ARG: Touch channel number error.

Parameters
• touch_num: Touch pad index. In this version, pass the parameter \texttt{TOUCH_PAD_MAX}.
• count: The cumulative times of measurements for proximity pad. Range: 0 ~ 255.
esp_err_t touch_pad_proximity_get_data (touch_pad_t touch_num, uint32_t *measure_out)

Get the accumulated measurement of the proximity sensor. The proximity sensor measurement is the accumulation of touch channel measurements.

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG Touch num is not proximity

Parameters
- touch_num: touch pad index
- measure_out: If the accumulation process does not end, the measure_out is the process value.

esp_err_t touch_pad_sleep_channel_get_info (touch_pad_sleep_channel_t *slp_config)

Get parameter of touch sensor sleep channel. The touch sensor can works in sleep mode to wake up sleep.

Note After the sleep channel is configured, Please use special functions for sleep channel. e.g. The user should use touch_pad_sleep_channel_read_data instead of touch_pad_read_raw_data to obtain the sleep channel reading.

Return
- ESP_OK Success

Parameters
- slp_config: touch sleep pad config.

esp_err_t touch_pad_sleep_channel_enable (touch_pad_t pad_num, bool enable)

Enable/Disable sleep channel function for touch sensor. The touch sensor can works in sleep mode to wake up sleep.

Note ESP32S2 only support one sleep channel.

Note After the sleep channel is configured, Please use special functions for sleep channel. e.g. The user should use touch_pad_sleep_channel_read_data instead of touch_pad_read_raw_data to obtain the sleep channel reading.

Return
- ESP_OK Success

Parameters
- pad_num: Set touch channel number for sleep pad. Only one touch sensor channel is supported in deep sleep mode.
- enable: true: enable sleep pad for touch sensor; false: disable sleep pad for touch sensor;

esp_err_t touch_pad_sleep_channel_enable_proximity (touch_pad_t pad_num, bool enable)

Enable/Disable proximity function for sleep channel. The touch sensor can works in sleep mode to wake up sleep.

Note ESP32S2 only support one sleep channel.

Return
- ESP_OK Success

Parameters
- pad_num: Set touch channel number for sleep pad. Only one touch sensor channel is supported in deep sleep mode.
- enable: true: enable proximity for sleep channel; false: disable proximity for sleep channel;

esp_err_t touch_pad_sleep_set_threshold (touch_pad_t pad_num, uint32_t touch_thres)

Set the trigger threshold of touch sensor in deep sleep. The threshold determines the sensitivity of the touch sensor.

Note In general, the touch threshold during sleep can use the threshold parameter parameters before sleep.

Return
- ESP_OK Success

Parameters
- pad_num: Set touch channel number for sleep pad. Only one touch sensor channel is supported in deep sleep mode.
- touch_thres: touch sleep pad threshold
**esp_err_t touch_pad_sleep_get_threshold (touch_pad_t pad_num, uint32_t *touch_thres)**

Get the trigger threshold of touch sensor in deep sleep. The threshold determines the sensitivity of the touch sensor.

**Note** In general, the touch threshold during sleep can use the threshold parameter parameters before sleep.

**Return**
- ESP_OK Success

**Parameters**
- **pad_num**: Set touch channel number for sleep pad. Only one touch sensor channel is supported in deep sleep mode.
- **touch_thres**: touch sleep pad threshold

**esp_err_t touch_pad_sleep_channel_read_benchmark (touch_pad_t pad_num, uint32_t *benchmark)**

Read benchmark of touch sensor sleep channel.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG parameter is NULL

**Parameters**
- **pad_num**: Set touch channel number for sleep pad. Only one touch sensor channel is supported in deep sleep mode.
- **benchmark**: pointer to accept touch sensor benchmark value

**esp_err_t touch_pad_sleep_channel_read_smooth (touch_pad_t pad_num, uint32_t *smooth_data)**

Read smoothed data of touch sensor sleep channel. Smoothed data is filtered from the raw data.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG parameter is NULL

**Parameters**
- **pad_num**: Set touch channel number for sleep pad. Only one touch sensor channel is supported in deep sleep mode.
- **smooth_data**: pointer to accept touch sensor smoothed data

**esp_err_t touch_pad_sleep_channel_read_data (touch_pad_t pad_num, uint32_t *raw_data)**

Read raw data of touch sensor sleep channel.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG parameter is NULL

**Parameters**
- **pad_num**: Set touch channel number for sleep pad. Only one touch sensor channel is supported in deep sleep mode.
- **raw_data**: pointer to accept touch sensor raw data

**esp_err_t touch_pad_sleep_channel_reset_benchmark (void)**

Reset benchmark of touch sensor sleep channel.

**Return**
- ESP_OK Success

**esp_err_t touch_pad_sleep_channel_read_proximity_cnt (touch_pad_t pad_num, uint32_t *proximity_cnt)**

Read proximity count of touch sensor sleep channel.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG parameter is NULL

**Parameters**
- **pad_num**: Set touch channel number for sleep pad. Only one touch sensor channel is supported in deep sleep mode.
- **proximity_cnt**: pointer to accept touch sensor proximity count value
Change the operating frequency of touch pad in deep sleep state. Reducing the operating frequency can effectively reduce power consumption. If this function is not called, the working frequency of touch in the deep sleep state is the same as that in the wake-up state.

Return
• ESP_OK Success

Parameters
• sleep_cycle: The touch sensor will sleep after each measurement. sleep_cycle decide the interval between each measurement. \( t_{\text{sleep}} = \frac{\text{sleep_cycle}}{(\text{RTC}_\text{SLOW}_\text{CLK} \text{ frequency})} \). The approximate frequency value of RTC\_SLOW\_CLK can be obtained using \text{rtc\_clk\_slow\_freq\_get\_hz} function.
• meas_times: The times of charge and discharge in each measure process of touch channels. The timer frequency is 8Mhz. Range: 0 ~ 0xffff. Recommended typical value: Modify this value to make the measurement time around 1ms.

Header File
• components/driver/include/driver/touch_sensor_common.h

Functions

\text{esp\_err\_t touch\_pad\_init} (void)
Initialize touch module.

Note If default parameter don’t match the usage scenario, it can be changed after this function.

Return
• ESP_OK Success
• ESP_ERR_NO_MEM Touch pad init error
• ESP_ERR_NOT_SUPPORTED Touch pad is providing current to external XTAL

\text{esp\_err\_t touch\_pad\_deinit} (void)
Un-install touch pad driver.

Note After this function is called, other touch functions are prohibited from being called.

Return
• ESP_OK Success
• ESP_FAIL Touch pad driver not initialized

\text{esp\_err\_t touch\_pad\_io\_init} (\text{touch\_pad\_t touch\_num})
Initialize touch pad GPIO.

Return
• ESP_OK on success
• ESP_ERR_INVALID_ARG if argument is wrong

Parameters
• touch_num: touch pad index

\text{esp\_err\_t touch\_pad\_set\_voltage} (\text{touch\_high\_volt\_t refh, touch\_low\_volt\_t refl, touch\_volt\_atten\_t atten})
Set touch sensor high voltage threshold of chanrge. The touch sensor measures the channel capacitance value by charging and discharging the channel. So the high threshold should be less than the supply voltage.

Return
• ESP_OK on success
• ESP_ERR_INVALID_ARG if argument is wrong

Parameters
• refh: the value of DREFH
• refl: the value of DREFL
• atten: the attenuation on DREFH
```
esp_err_t touch_pad_get_voltage(touch_high_volt_t *refh,
                              touch_low_volt_t *refl,
                              touch_volt_atten_t *atten)

Get touch sensor reference voltage.

Return
• ESP_OK on success

Parameters
• refh: pointer to accept DREFH value
• refl: pointer to accept DREFL value
• atten: pointer to accept the attenuation on DREFH
```

```
esp_err_t touch_pad_set_cnt_mode(touch_pad_t touch_num,
                                 touch_cnt_slope_t slope,
                                 touch_tie_opt_t opt)

Set touch sensor charge/discharge speed for each pad. If the slope is 0, the counter would always be zero. If the slope is 1, the charging and discharging would be slow, accordingly. If the slope is set 7, which is the maximum value, the charging and discharging would be fast.

Note The higher the charge and discharge current, the greater the immunity of the touch channel, but it will increase the system power consumption.

Return
• ESP_OK on success
• ESP_ERR_INVALID_ARG if argument is wrong

Parameters
• touch_num: touch pad index
• slope: touch pad charge/discharge speed
• opt: the initial voltage
```

```
esp_err_t touch_pad_get_cnt_mode(touch_pad_t touch_num,
                                 touch_cnt_slope_t *slope,
                                 touch_tie_opt_t *opt)

Get touch sensor charge/discharge speed for each pad.

Return
• ESP_OK on success
• ESP_ERR_INVALID_ARG if argument is wrong

Parameters
• touch_num: touch pad index
• slope: pointer to accept touch pad charge/discharge slope
• opt: pointer to accept the initial voltage
```

```
esp_err_t touch_pad_isr_deregister(void (*fn)) void *
                                  , void *arg

Deregister the handler previously registered using touch_pad_isr_handler_register.

Return
• ESP_OK on success
• ESP_ERR_INVALID_STATE if a handler matching both fn and arg isn’t registered

Parameters
• fn: handler function to call (as passed to touch_pad_isr_handler_register)
• arg: argument of the handler (as passed to touch_pad_isr_handler_register)
```

```
esp_err_t touch_pad_get_wakeup_status(touch_pad_t *pad_num)

Get the touch pad which caused wakeup from deep sleep.

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG parameter is NULL

Parameters
• pad_num: pointer to touch pad which caused wakeup
```

```
esp_err_t touch_pad_set_fsm_mode(touch_fsm_mode_t mode)

Set touch sensor FSM mode, the test action can be triggered by the timer, as well as by the software.

Return
• ESP_OK on success
• ESP_ERR_INVALID_ARG if argument is wrong
```
Parameters
• mode: FSM mode

`esp_err_t touch_pad_get_fsm_mode (touch_fsm_mode_t *mode)`
Get touch sensor FSM mode.

Return
• ESP_OK on success

Parameters
• mode: pointer to accept FSM mode

`esp_err_t touch_pad_clear_status (void)`
To clear the touch sensor channel active status.

Note The FSM automatically updates the touch sensor status. It is generally not necessary to call this API to clear the status.

Return
• ESP_OK on success

`uint32_t touch_pad_get_status (void)`
Get the touch sensor channel active status mask. The bit position represents the channel number. The 0/1 status of the bit represents the trigger status.

Return
• The touch sensor status. e.g. Touch1 trigger status is `status_mask & BIT1`.

`bool touch_pad_meas_is_done (void)`
Check touch sensor measurement status.

Return
• True measurement is under way
• False measurement done

GPIO Lookup Macros Some useful macros can be used to specified the GPIO number of a touch pad channel, or vice versa. e.g.

1. `TOUCH_PAD_NUM5_GPIO_NUM` is the GPIO number of channel 5 (12);  
2. `TOUCH_PAD_GPIO4_CHANNEL` is the channel number of GPIO 4 (channel 0).

Structures
struct touch_pad_denoise
  Touch sensor denoise configuration

  Public Members

  touch_pad_denoise_grade_t grade
  Select denoise range of denoise channel. Determined by measuring the noise amplitude of the denoise channel.

  touch_pad_denoise_cap_t cap_level
  Select internal reference capacitance of denoise channel. Ensure that the denoise readings are closest to the readings of the channel being measured. Use touch_pad_denoise_read_data to get the reading of denoise channel. The equivalent capacitance of the shielded channel can be calculated from the reading of denoise channel.

struct touch_pad_waterproof
  Touch sensor waterproof configuration

  Public Members

  touch_pad_t guard_ring_pad
  Waterproof. Select touch channel use for guard pad. Guard pad is used to detect the large area of water covering the touch panel.

  touch_pad_shield_driver_t shield_driver
  Waterproof. Shield channel drive capability configuration. Shield pad is used to shield the influence of water droplets covering the touch panel. When the waterproof function is enabled, Touch14 is set as shield channel by default. The larger the parasitic capacitance on the shielding channel, the higher
the drive capability needs to be set. The equivalent capacitance of the shield channel can be estimated through the reading value of the denoise channel (Touch0).

```c
struct touch_filter_config
    Touch sensor filter configuration

Public Members

touch_filter_mode_t mode
    Set filter mode. The input of the filter is the raw value of touch reading, and the output of the filter is involved in the judgment of the touch state.

uint32_t debounce_cnt
    Set debounce count, such as \( n \). If the measured values continue to exceed the threshold for \( n+1 \) times, the touch sensor state changes. Range: 0 ~ 7

uint32_t noise_thr
    Noise threshold coefficient. Higher = More noise resistance. The actual noise should be less than (noise coefficient * touch threshold). Range: 0 ~ 3. The coefficient is 0: 4/8; 1: 3/8; 2: 2/8; 3: 1;

uint32_t jitter_step
    Set jitter filter step size. Range: 0 ~ 15

touch_smooth_mode_t smh_lvl
    Level of filter applied on the original data against large noise interference.
```

```c
struct touch_pad_sleep_channel_t
    Touch sensor channel sleep configuration

Public Members

touch_pad_t touch_num
    Set touch channel number for sleep pad. Only one touch sensor channel is supported in deep sleep mode. If clear the sleep channel, point this pad to TOUCH_PAD_NUM0

bool en_proximity
    enable proximity function for sleep pad
```

**Macros**

- `TOUCH_PAD_BIT_MASK_ALL`
- `TOUCH_PAD_SLOPE_DEFAULT`
- `TOUCH_PAD_TIE_OPT_DEFAULT`
- `TOUCH_PAD_BIT_MASK_MAX`
- `TOUCH_PAD_HIGH_VOLTAGE_THRESHOLD`
- `TOUCH_PAD_LOW_VOLTAGE_THRESHOLD`
- `TOUCH_PAD_ATTEN_VOLTAGE_THRESHOLD`
- `TOUCH_PAD_IDLE_CH.CONNECT_DEFAULT`
- `TOUCH_PAD_THRESHOLD_MAX`

If set touch threshold max value, the touch sensor can’t be in touched status.

**TOUCH_PAD_SLEEP_CYCLE_DEFAULT**

Excessive total time will slow down the touch response. Too small measurement time will not be sampled enough, resulting in inaccurate measurements.

**Note** The greater the duty cycle of the measurement time, the more system power is consumed. The number of sleep cycle in each measure process of touch channels. The timer frequency is RTC_SLOW_CLK (can be 150k or 32k depending on the options). Range: 0 ~ 0xffff
Chapter 2. API Reference

**TOUCH_PAD_MEASURE_CYCLE_DEFAULT**

The times of charge and discharge in each measure process of touch channels. The timer frequency is 8Mhz. Recommended typical value: Modify this value to make the measurement time around 1ms. Range: 0 ~ 0xffff

**TOUCH_PAD_INTR_MASK_ALL**

All touch interrupt type enable.

**TOUCH_PROXIMITY_MEAS_NUM_MAX**

Touch sensor proximity detection configuration

**TOUCH_DEBOUNCE_CNT_MAX**

**TOUCH_NOISE_THR_MAX**

**TOUCH_JITTER_STEP_MAX**

**Type Definitions**

```c
typedef struct touch_pad_denoise touch_pad_denoise_t

typedef struct touch_pad_waterproof touch_pad_waterproof_t

typedef struct touch_filter_config touch_filter_config_t
```

**Enumerations**

```c
enum touch_pad_t

 Values:

 TOUCH_PAD_NUM0 = 0
 Touch pad channel 0 is GPIO4(ESP32)

 TOUCH_PAD_NUM1
 Touch pad channel 1 is GPIO0(ESP32) / GPIO1(ESP32-S2)

 TOUCH_PAD_NUM2
 Touch pad channel 2 is GPIO2(ESP32) / GPIO2(ESP32-S2)

 TOUCH_PAD_NUM3
 Touch pad channel 3 is GPIO15(ESP32) / GPIO3(ESP32-S2)

 TOUCH_PAD_NUM4
 Touch pad channel 4 is GPIO13(ESP32) / GPIO4(ESP32-S2)

 TOUCH_PAD_NUM5
 Touch pad channel 5 is GPIO12(ESP32) / GPIO5(ESP32-S2)

 TOUCH_PAD_NUM6
 Touch pad channel 6 is GPIO14(ESP32) / GPIO6(ESP32-S2)

 TOUCH_PAD_NUM7
 Touch pad channel 7 is GPIO27(ESP32) / GPIO7(ESP32-S2)

 TOUCH_PAD_NUM8
 Touch pad channel 8 is GPIO33(ESP32) / GPIO8(ESP32-S2)

 TOUCH_PAD_NUM9
 Touch pad channel 9 is GPIO32(ESP32) / GPIO9(ESP32-S2)

 TOUCH_PAD_NUM10
 Touch channel 10 is GPIO10(ESP32-S2)

 TOUCH_PAD_NUM11
 Touch channel 11 is GPIO11(ESP32-S2)
```
**Chapter 2. API Reference**

`TOUCH_PAD_NUM12`
- Touch channel 12 is GPIO12(ESP32-S2)

`TOUCH_PAD_NUM13`
- Touch channel 13 is GPIO13(ESP32-S2)

`TOUCH_PAD_NUM14`
- Touch channel 14 is GPIO14(ESP32-S2)

**`TOUCH_PAD_MAX`**

**`enum touch_high_volt_t`**
- Touch sensor high reference voltage

*Values:*

- `TOUCH_HVOLT_KEEP = -1`  
  Touch sensor high reference voltage, no change

- `TOUCH_HVOLT_2V4 = 0`  
  Touch sensor high reference voltage, 2.4V

- `TOUCH_HVOLT_2V5`  
  Touch sensor high reference voltage, 2.5V

- `TOUCH_HVOLT_2V6`  
  Touch sensor high reference voltage, 2.6V

- `TOUCH_HVOLT_2V7`  
  Touch sensor high reference voltage, 2.7V

**`TOUCH_HVOLT_MAX`**

**`enum touch_low_volt_t`**
- Touch sensor low reference voltage

*Values:*

- `TOUCH_LVOLT_KEEP = -1`  
  Touch sensor low reference voltage, no change

- `TOUCH_LVOLT_0V5`  
  Touch sensor low reference voltage, 0.5V

- `TOUCH_LVOLT_0V6`  
  Touch sensor low reference voltage, 0.6V

- `TOUCH_LVOLT_0V7`  
  Touch sensor low reference voltage, 0.7V

- `TOUCH_LVOLT_0V8`  
  Touch sensor low reference voltage, 0.8V

**`TOUCH_LVOLT_MAX`**

**`enum touch_volt_atten_t`**
- Touch sensor high reference voltage attenuation

*Values:*

- `TOUCH_HVOLT_ATTEN_KEEP = -1`  
  Touch sensor high reference voltage attenuation, no change

- `TOUCH_HVOLT_ATTEN_1V5 = 0`  
  Touch sensor high reference voltage attenuation, 1.5V attenuation

- `TOUCH_HVOLT_ATTEN_1V`  
  Touch sensor high reference voltage attenuation, 1.0V attenuation

- `TOUCH_HVOLT_ATTEN_0V5`  
  Touch sensor high reference voltage attenuation, 0.5V attenuation
**TOUCH_HVOLT_ATTEN_0V**
Touch sensor high reference voltage attenuation, 0V attenuation

**TOUCH_HVOLT_ATTEN_MAX**

enum touch_cnt_slope_t
Touch sensor charge/discharge speed

Values:

- **TOUCH_PAD_SLOPE_0** = 0
  Touch sensor charge / discharge speed, always zero
- **TOUCH_PAD_SLOPE_1** = 1
  Touch sensor charge / discharge speed, slowest
- **TOUCH_PAD_SLOPE_2** = 2
  Touch sensor charge / discharge speed
- **TOUCH_PAD_SLOPE_3** = 3
  Touch sensor charge / discharge speed
- **TOUCH_PAD_SLOPE_4** = 4
  Touch sensor charge / discharge speed
- **TOUCH_PAD_SLOPE_5** = 5
  Touch sensor charge / discharge speed
- **TOUCH_PAD_SLOPE_6** = 6
  Touch sensor charge / discharge speed
- **TOUCH_PAD_SLOPE_7** = 7
  Touch sensor charge / discharge speed, fast

**TOUCH_PAD_SLOPE_MAX**

enum touch_tie_opt_t
Touch sensor initial charge level

Values:

- **TOUCH_PAD_TIE_OPT_LOW** = 0
  Initial level of charging voltage, low level
- **TOUCH_PAD_TIE_OPT_HIGH** = 1
  Initial level of charging voltage, high level

**TOUCH_PAD_TIE_OPT_MAX**

enum touch_fsm_mode_t
Touch sensor FSM mode

Values:

- **TOUCH_FSM_MODE_TIMER** = 0
  To start touch FSM by timer
- **TOUCH_FSM_MODE_SW**
  To start touch FSM by software trigger

**TOUCH_FSM_MODE_MAX**

enum touch_trigger_mode_t

Values:

- **TOUCH_TRIGGER_BELOW** = 0
  Touch interrupt will happen if counter value is less than threshold.
- **TOUCH_TRIGGER_ABOVE** = 1
  Touch interrupt will happen if counter value is larger than threshold.
Chapter 2. API Reference

TOUCH_TRIGGER_MAX

enum touch_trigger_src_t
Values:

TOUCH_TRIGGER_SOURCE_BOTH = 0
wakeup interrupt is generated if both SET1 and SET2 are “touched”

TOUCH_TRIGGER_SOURCE_SET1 = 1
wakeup interrupt is generated if SET1 is “touched”

TOUCH_TRIGGER_SOURCE_MAX

enum touch_pad_intr_mask_t
Values:

TOUCH_PAD_INTR_MASK_DONE = BIT(0)
  Measurement done for one of the enabled channels.

TOUCH_PAD_INTR_MASK_ACTIVE = BIT(1)
  Active for one of the enabled channels.

TOUCH_PAD_INTR_MASK_INACTIVE = BIT(2)
  Inactive for one of the enabled channels.

TOUCH_PAD_INTR_MASK_SCAN_DONE = BIT(3)
  Measurement done for all the enabled channels.

TOUCH_PAD_INTR_MASK_TIMEOUT = BIT(4)
  Timeout for one of the enabled channels.

TOUCH_PAD_INTR_MASK_PROXI_MEAS_DONE = BIT(5)
  For proximity sensor, when the number of measurements reaches the set count of measurements, an interrupt will be generated.

enum touch_pad_denoise_grade_t
Values:

TOUCH_PAD_DENOISE_BIT12 = 0
  Denoise range is 12bit

TOUCH_PAD_DENOISE_BIT10 = 1
  Denoise range is 10bit

TOUCH_PAD_DENOISE_BIT8 = 2
  Denoise range is 8bit

TOUCH_PAD_DENOISE_BIT4 = 3
  Denoise range is 4bit

TOUCH_PAD_DENOISE_MAX

enum touch_pad_denoise_cap_t
Values:

TOUCH_PAD_DENOISE_CAP_L0 = 0
  Denoise channel internal reference capacitance is 5pf

TOUCH_PAD_DENOISE_CAP_L1 = 1
  Denoise channel internal reference capacitance is 6.4pf

TOUCH_PAD_DENOISE_CAP_L2 = 2
  Denoise channel internal reference capacitance is 7.8pf

TOUCH_PAD_DENOISE_CAP_L3 = 3
  Denoise channel internal reference capacitance is 9.2pf

TOUCH_PAD_DENOISE_CAP_L4 = 4
  Denoise channel internal reference capacitance is 10.6pf
Chapter 2. API Reference

 TOUCH_PAD_DENOISE_CAP_L5 = 5
    Denoise channel internal reference capacitance is 12.0pf

 TOUCH_PAD_DENOISE_CAP_L6 = 6
    Denoise channel internal reference capacitance is 13.4pf

 TOUCH_PAD_DENOISE_CAP_L7 = 7
    Denoise channel internal reference capacitance is 14.8pf

 TOUCH_PAD_DENOISE_CAP_MAX = 8

 enum touch_pad_shield_driver_t
    Touch sensor shield channel drive capability level

 Values:

 TOUCH_PAD_SHIELD_DRV_L0 = 0
    The max equivalent capacitance in shield channel is 40pf

 TOUCH_PAD_SHIELD_DRV_L1
    The max equivalent capacitance in shield channel is 80pf

 TOUCH_PAD_SHIELD_DRV_L2
    The max equivalent capacitance in shield channel is 120pf

 TOUCH_PAD_SHIELD_DRV_L3
    The max equivalent capacitance in shield channel is 160pf

 TOUCH_PAD_SHIELD_DRV_L4
    The max equivalent capacitance in shield channel is 200pf

 TOUCH_PAD_SHIELD_DRV_L5
    The max equivalent capacitance in shield channel is 240pf

 TOUCH_PAD_SHIELD_DRV_L6
    The max equivalent capacitance in shield channel is 280pf

 TOUCH_PAD_SHIELD_DRV_L7
    The max equivalent capacitance in shield channel is 320pf

 TOUCH_PAD_SHIELD_DRV_MAX

 enum touch_pad_conn_type_t
    Touch channel idle state configuration

 Values:

 TOUCH_PAD_CONN_HIGHZ = 0
    Idle status of touch channel is high resistance state

 TOUCH_PAD_CONN_GND = 1
    Idle status of touch channel is ground connection

 TOUCH_PAD_CONN_MAX

 enum touch_filter_mode_t
    Touch channel IIR filter coefficient configuration.

 Note On ESP32S2. There is an error in the IIR calculation. The magnitude of the error is twice the filter coefficient. So please select a smaller filter coefficient on the basis of meeting the filtering requirements. Recommended filter coefficient selection IIR_16.

 Values:

 TOUCH_PAD_FILTER_IIR_4 = 0
    The filter mode is first-order IIR filter. The coefficient is 4.

 TOUCH_PAD_FILTER_IIR_8
    The filter mode is first-order IIR filter. The coefficient is 8.
The filter mode is first-order IIR filter. The coefficient is 16 (Typical value).

The filter mode is first-order IIR filter. The coefficient is 32.

The filter mode is first-order IIR filter. The coefficient is 64.

The filter mode is first-order IIR filter. The coefficient is 128.

The filter mode is first-order IIR filter. The coefficient is 256.

The filter mode is jitter filter

**enum touch_smooth_mode_t**

Level of filter applied on the original data against large noise interference.

**Note** On ESP32S2, there is an error in the IIR calculation. The magnitude of the error is twice the filter coefficient. So please select a smaller filter coefficient on the basis of meeting the filtering requirements.

Recommended filter coefficient selection **IIR_2**.

**Values:**

**TOUCH_PAD_SMOOTH_OFF** = 0

No filtering of raw data.

**TOUCH_PAD_SMOOTH_IIR_2** = 1

Filter the raw data. The coefficient is 2 (Typical value).

**TOUCH_PAD_SMOOTH_IIR_4** = 2

Filter the raw data. The coefficient is 4.

**TOUCH_PAD_SMOOTH_IIR_8** = 3

Filter the raw data. The coefficient is 8.

**TOUCH_PAD_SMOOTH_MAX**

### 2.3.21 Two-Wire Automotive Interface (TWAI)

**Overview**

The Two-Wire Automotive Interface (TWAI) is a real-time serial communication protocol suited for automotive and industrial applications. It is compatible with ISO11898-1 Classical frames, thus can support Standard Frame Format (11-bit ID) and Extended Frame Format (29-bit ID). The ESP32-S3’s peripherals contains a TWAI controller that can be configured to communicate on a TWAI bus via an external transceiver.

**Warning:** The TWAI controller is not compatible with ISO11898-1 FD Format frames, and will interpret such frames as errors.

This programming guide is split into the following sections:

1. **TWAI Protocol Summary**
2. **Signals Lines and Transceiver**
3. **Driver Configuration**
4. **Driver Operation**
5. **Examples**
TWAI Protocol Summary

The TWAI is a multi-master, multi-cast, asynchronous, serial communication protocol. TWAI also supports error detection and signalling, and inbuilt message prioritization.

Multi-master: Any node on the bus can initiate the transfer of a message.

Multi-cast: When a node transmits a message, all nodes on the bus will receive the message (i.e., broadcast) thus ensuring data consistency across all nodes. However, some nodes can selectively choose which messages to accept via the use of acceptance filtering (multi-cast).

Asynchronous: The bus does not contain a clock signal. All nodes on the bus operate at the same bit rate and synchronize using the edges of the bits transmitted on the bus.

Error Detection and Signalling: Every node will constantly monitor the bus. When any node detects an error, it will signal the detection by transmitting an error frame. Other nodes will receive the error frame and transmit their own error frames in response. This will result in an error detection being propagated to all nodes on the bus.

Message Priorities: Messages contain an ID field. If two or more nodes attempt to transmit simultaneously, the node transmitting the message with the lower ID value will win arbitration of the bus. All other nodes will become receivers ensuring that there is at most one transmitter at any time.

TWAI Messages

TWAI Messages are split into Data Frames and Remote Frames. Data Frames are used to deliver a data payload to other nodes, whereas a Remote Frame is used to request a Data Frame from other nodes (other nodes can optionally respond with a Data Frame). Data and Remote Frames have two frame formats known as Extended Frame and Standard Frame which contain a 29-bit ID and an 11-bit ID respectively. A TWAI message consists of the following fields:

- 29-bit or 11-bit ID: Determines the priority of the message (lower value has higher priority).
- Data Length Code (DLC) between 0 to 8: Indicates the size (in bytes) of the data payload for a Data Frame, or the amount of data to request for a Remote Frame.
- Up to 8 bytes of data for a Data Frame (should match DLC).

Error States and Counters

The TWAI protocol implements a feature known as “fault confinement” where a persistently erroneous node will eventually eliminate itself from the bus. This is implemented by requiring every node to maintain two internal error counters known as the Transmit Error Counter (TEC) and the Receive Error Counter (REC). The two error counters are incremented and decremented according to a set of rules (where the counters increase on an error, and decrease on a successful message transmission/reception). The values of the counters are used to determine a node’s error state, namely Error Active, Error Passive, and Bus-Off.

Error Active: A node is Error Active when both TEC and REC are less than 128 and indicates that the node is operating normally. Error Active nodes are allowed to participate in bus communications, and will actively signal the detection of any errors by automatically transmitting an Active Error Flag over the bus.

Error Passive: A node is Error Passive when either the TEC or REC becomes greater than or equal to 128. Error Passive nodes are still able to take part in bus communications, but will instead transmit a Passive Error Flag upon detection of an error.

Bus-Off: A node becomes Bus-Off when the TEC becomes greater than or equal to 256. A Bus-Off node is unable influence the bus in any manner (essentially disconnected from the bus) thus eliminating itself from the bus. A node will remain in the Bus-Off state until it undergoes bus-off recovery.

Signals Lines and Transceiver

The TWAI controller does not contain an integrated transceiver. Therefore, to connect the TWAI controller to a TWAI bus, an external transceiver is required. The type of external transceiver used should depend on the application’s physical layer specification (e.g. using SN65HVD23x transceivers for ISO 11898-2 compatibility).

The TWAI controller’s interface consists of 4 signal lines known as TX, RX, BUS-OFF, and CLKOUT. These four signal lines can be routed through the GPIO Matrix to the ESP32-S3’s GPIO pads.
**TX and RX:** The TX and RX signal lines are required to interface with an external transceiver. Both signal lines represent/interpret a dominant bit as a low logic level (0V), and a recessive bit as a high logic level (3.3V).

**BUS-OFF:** The BUS-OFF signal line is optional and is set to a low logic level (0V) whenever the TWAI controller reaches a bus-off state. The BUS-OFF signal line is set to a high logic level (3.3V) otherwise.

**CLKOUT:** The CLKOUT signal line is optional and outputs a prescaled version of the controller’s source clock (APB Clock).

**Note:** An external transceiver must internally loopback the TX to RX such that a change in logic level to the TX signal line can be observed on the RX line. Failing to do so will cause the TWAI controller to interpret differences in logic levels between the two signal lines as a loss in arbitration or a bit error.

**Driver Configuration**

This section covers how to configure the TWAI driver.

**Operating Modes** The TWAI driver supports the following modes of operations:

**Normal Mode:** The normal operating mode allows the TWAI controller to take part in bus activities such as transmitting and receiving messages/error frames.Acknowledgement from another node is required when transmitting a message.

**No Ack Mode:** The No Acknowledgement mode is similar to normal mode, however acknowledgements are not required for a message transmission to be considered successful. This mode is useful when self testing the TWAI controller (loopback of transmissions).

**Listen Only Mode:** This mode will prevent the TWAI controller from influencing the bus. Therefore, transmission of messages/acknowledgement/error frames will be disabled. However the TWAI controller will still be able to receive messages but will not acknowledge the message. This mode is suited for bus monitor applications.

**Alerts** The TWAI driver contains an alert feature that is used to notify the application layer of certain TWAI controller or TWAI bus events. Alerts are selectively enabled when the TWAI driver is installed, but can be reconfigured.
Chapter 2. API Reference

during runtime by calling `twai_reconfigure_alerts()`. The application can then wait for any enabled alerts to occur by calling `twai_read_alerts()`. The TWAI driver supports the following alerts:

<table>
<thead>
<tr>
<th>Alert Flag</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TWAI_ALERT_TX_IDLE</td>
<td>No more messages queued for transmission</td>
</tr>
<tr>
<td>TWAI_ALERT_TX_SUCCESS</td>
<td>The previous transmission was successful</td>
</tr>
<tr>
<td>TWAI_ALERT_RX_DATA</td>
<td>A frame has been received and added to the RX queue</td>
</tr>
<tr>
<td>TWAI_ALERT_BELOW_ERR_WARN</td>
<td>Both error counters have dropped below error warning limit</td>
</tr>
<tr>
<td>TWAI_ALERT_ERR_ACTIVE</td>
<td>TWAI controller has become error active</td>
</tr>
<tr>
<td>TWAI_ALERT_RECOVERY_IN_PROGRESS</td>
<td>TWAI controller is undergoing bus recovery</td>
</tr>
<tr>
<td>TWAI_ALERT_BUS_RECOVERED</td>
<td>TWAI controller has successfully completed bus recovery</td>
</tr>
<tr>
<td>TWAI_ALERT_ARB_LOST</td>
<td>The previous transmission lost arbitration</td>
</tr>
<tr>
<td>TWAI_ALERT_ABove_ERR_WARN</td>
<td>One of the error counters have exceeded the error warning limit</td>
</tr>
<tr>
<td>TWAI_ALERT_BUS_ERROR</td>
<td>A (Bit, Stuff, CRC, Form, ACK) error has occurred on the bus</td>
</tr>
<tr>
<td>TWAI_ALERT_RX_FAILED</td>
<td>The previous transmission has failed</td>
</tr>
<tr>
<td>TWAI_ALERT_RX_QUEUE_FULL</td>
<td>The RX queue is full causing a received frame to be lost</td>
</tr>
<tr>
<td>TWAI_ALERT_ERR_PASS</td>
<td>TWAI controller has become error passive</td>
</tr>
<tr>
<td>TWAI_ALERT_BUS_OFF</td>
<td>Bus-off condition occurred. TWAI controller can no longer influence bus</td>
</tr>
</tbody>
</table>

**Note:** The TWAI controller’s error warning limit is used to preemptively warn the application of bus errors before the error passive state is reached. By default, the TWAI driver sets the error warning limit to 96. The TWAI_ALERT_ABove_ERR_WARN is raised when the TEC or REC becomes larger then or equal to the error warning limit. The TWAI_ALERT_BELOW_ERR_WARN is raised when both TEC and REC return back to values below 96.

**Note:** When enabling alerts, the TWAI_ALERT_AND_LOG flag can be used to cause the TWAI driver to log any raised alerts to UART. However, alert logging is disabled and TWAI_ALERT_AND_LOG if the CONFIG_TWAI_ISR_IN_IRAM option is enabled (see Placing ISR into IRAM).

**Note:** The TWAI_ALERT_ALL and TWAI_ALERT_NONE macros can also be used to enable/disable all alerts during configuration/reconfiguration.

**Bit Timing**  The operating bit rate of the TWAI driver is configured using the `twai_timing_config_t` structure. The period of each bit is made up of multiple time quanta, and the period of a time quantum is determined by a prescaled version of the TWAI controller’s source clock. A single bit contains the following segments in the following order:

1. The **Synchronization Segment** consists of a single time quantum  
2. **Timing Segment 1** consists of 1 to 16 time quanta before sample point  
3. **Timing Segment 2** consists of 1 to 8 time quanta after sample point

The Baudrate Prescaler is used to determine the period of each time quantum by dividing the TWAI controller’s source clock (80 MHz APB clock). On the ESP32-S3, the brp can be any even number from 2 to 128.

The sample point of a bit is located on the intersection of Timing Segment 1 and 2. Enabling **Triple Sampling** will cause 3 time quanta to be sampled per bit instead of 1 (extra samples are located at the tail end of Timing Segment 1).

The Synchronization Jump Width is used to determine the maximum number of time quanta a single bit time can be lengthened/shortened for synchronization purposes. sjw can range from 1 to 4.
Note: Multiple combinations of \( brp, tseg_1, tseg_2 \), and \( sjw \) can achieve the same bit rate. Users should tune these values to the physical characteristics of their bus by taking into account factors such as propagation delay, node information processing time, and phase errors.

Bit timing **macro initializers** are also available for commonly used bit rates. The following macro initializers are provided by the TWAI driver.

- \texttt{TWAI\_TIMING\_CONFIG\_1MBITS()}
- \texttt{TWAI\_TIMING\_CONFIG\_800KBITS()}
- \texttt{TWAI\_TIMING\_CONFIG\_500KBITS()}
- \texttt{TWAI\_TIMING\_CONFIG\_250KBITS()}
- \texttt{TWAI\_TIMING\_CONFIG\_125KBITS()}
- \texttt{TWAI\_TIMING\_CONFIG\_100KBITS()}
- \texttt{TWAI\_TIMING\_CONFIG\_50KBITS()}
- \texttt{TWAI\_TIMING\_CONFIG\_25KBITS()}
- \texttt{TWAI\_TIMING\_CONFIG\_20KBITS()}
- \texttt{TWAI\_TIMING\_CONFIG\_16KBITS()}
- \texttt{TWAI\_TIMING\_CONFIG\_12\_5KBITS()}
- \texttt{TWAI\_TIMING\_CONFIG\_10KBITS()}
- \texttt{TWAI\_TIMING\_CONFIG\_5KBITS()}
- \texttt{TWAI\_TIMING\_CONFIG\_1KBITS()}

**Acceptance Filter** The TWAI controller contains a hardware acceptance filter which can be used to filter messages of a particular ID. A node that filters out a message **will not receive the message, but will still acknowledge it**. Acceptance filters can make a node more efficient by filtering out messages sent over the bus that are irrelevant to the node. The acceptance filter is configured using two 32-bit values within \texttt{twai\_filter\_config\_t} known as the acceptance code and the acceptance mask.

The **acceptance code** specifies the bit sequence which a message’s ID, RTR, and data bytes must match in order for the message to be received by the TWAI controller. The **acceptance mask** is a bit sequence specifying which bits of the acceptance code can be ignored. This allows for messages of different IDs to be accepted by a single acceptance code.

The acceptance filter can be used under **Single or Dual Filter Mode**. Single Filter Mode will use the acceptance code and mask to define a single filter. This allows for the first two data bytes of a standard frame to be filtered, or the entirety of an extended frame’s 29-bit ID. The following diagram illustrates how the 32-bit acceptance code and mask will be interpreted under Single Filter Mode (Note: The yellow and blue fields represent standard and extended frame formats respectively).

![Fig. 19: Bit layout of single filter mode (Right side MSBit)](image-url)
**Dual Filter Mode** will use the acceptance code and mask to define two separate filters allowing for increased flexibility of ID’s to accept, but does not allow for all 29-bits of an extended ID to be filtered. The following diagram illustrates how the 32-bit acceptance code and mask will be interpreted under Dual Filter Mode (Note: The yellow and blue fields represent standard and extended frame formats respectively).

Fig. 20: Bit layout of dual filter mode (Right side MSBit)

**Disabling TX Queue**  The TX queue can be disabled during configuration by setting the `tx_queue_len` member of `twai_general_config_t` to 0. This will allow applications that do not require message transmission to save a small amount of memory when using the TWAI driver.

**Placing ISR into IRAM**  The TWAI driver’s ISR (Interrupt Service Routine) can be placed into IRAM so that the ISR can still run whilst the cache is disabled. Placing the ISR into IRAM may be necessary to maintain the TWAI driver’s functionality during lengthy cache disabling operations (such as SPI Flash writes, OTA updates etc). Whilst the cache is disabled, the ISR will continue to:

- Read received messages from the RX buffer and place them into the driver’s RX queue.
- Load messages pending transmission from the driver’s TX queue and write them into the TX buffer.

To place the TWAI driver’s ISR, users must do the following:

- Enable the `CONFIG_TWAI_ISR_IN_IRAM` option using `idf.py menuconfig`.
- When calling `twai_driver_install()`, the `intr_flags` member of `twai_general_config_t` should set the `ESP_INTR_FLAG_IRAM` set.

**Note:** When the `CONFIG_TWAI_ISR_IN_IRAM` option is enabled, the TWAI driver will no longer log any alerts (i.e., the `TWAI_ALERT_AND_LOG` flag will not have any effect).

**Driver Operation**

The TWAI driver is designed with distinct states and strict rules regarding the functions or conditions that trigger a state transition. The following diagram illustrates the various states and their transitions.

Fig. 21: State transition diagram of the TWAI driver (see table below)
<table>
<thead>
<tr>
<th>Label</th>
<th>Transition</th>
<th>Action/Condition</th>
</tr>
</thead>
<tbody>
<tr>
<td>A</td>
<td>Uninstalled -&gt; Stopped</td>
<td>twai_driver_install()</td>
</tr>
<tr>
<td>B</td>
<td>Stopped -&gt; Uninstalled</td>
<td>twai_driver_uninstall()</td>
</tr>
<tr>
<td>C</td>
<td>Stopped -&gt; Running</td>
<td>twai_start()</td>
</tr>
<tr>
<td>D</td>
<td>Running -&gt; Stopped</td>
<td>twai_stop()</td>
</tr>
<tr>

</tr>
<tr>
<td>H</td>
<td>Recovering -&gt; Stopped</td>
<td>128 occurrences of 11 consecutive recessive bits.</td>
</tr>
</tbody>
</table>

**Driver States**

**Uninstalled:** In the uninstalled state, no memory is allocated for the driver and the TWAI controller is powered OFF.

**Stopped:** In this state, the TWAI controller is powered ON and the TWAI driver has been installed. However the TWAI controller will be unable to take part in any bus activities such as transmitting, receiving, or acknowledging messages.

**Running:** In the running state, the TWAI controller is able to take part in bus activities. Therefore messages can be transmitted/received/acknowledged. Furthermore the TWAI controller will be able to transmit error frames upon detection of errors on the bus.

**Bus-Off:** The bus-off state is automatically entered when the TWAI controller’s Transmit Error Counter becomes greater than or equal to 256. The bus-off state indicates the occurrence of severe errors on the bus or in the TWAI controller. Whilst in the bus-off state, the TWAI controller will be unable to take part in any bus activities. To exit the bus-off state, the TWAI controller must undergo the bus recovery process.

**Recovering:** The recovering state is entered when the TWAI controller undergoes bus recovery. The TWAI controller/TWAI driver will remain in the recovering state until the 128 occurrences of 11 consecutive recessive bits is observed on the bus.

**Message Fields and Flags**

The TWAI driver distinguishes different types of messages by using the various bit field members of the `twai_message_t` structure. These bit field members determine whether a message is in standard or extended format, a remote frame, and the type of transmission to use when transmitting such a message.

These bit field members can also be toggled using the the flags member of `twai_message_t` and the following message flags:

<table>
<thead>
<tr>
<th>Message Flag</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TWAI_MSG_FLAG_EXTD</td>
<td>Message is in Extended Frame Format (29bit ID)</td>
</tr>
<tr>
<td>TWAI_MSG_FLAG_RTR</td>
<td>Message is a Remote Frame (Remote Transmission Request)</td>
</tr>
<tr>
<td>TWAI_MSG_FLAG_SS</td>
<td>Transmit message using Single Shot Transmission (Message will not be retransmitted upon error or loss of arbitration). Unused for received message.</td>
</tr>
<tr>
<td>TWAI_MSG_FLAG_SELF</td>
<td>Transmit message using Self Reception Request (Transmitted message will also be received by the same node). Unused for received message.</td>
</tr>
<tr>
<td>TWAI_MSG_FLAG_DLC_NON_COMP</td>
<td>Message’s Data length code is larger than 8. This will break compliance with TWAI</td>
</tr>
<tr>
<td>TWAI_MSG_FLAG_NONE</td>
<td>Clears all bit fields. Equivalent to a Standard Frame Format (11bit ID) Data Frame.</td>
</tr>
</tbody>
</table>

**Examples**

**Configuration & Installation**

The following code snippet demonstrates how to configure, install, and start the TWAI driver via the use of the various configuration structures, macro initializers, the `twai_driver_install()` function, and the `twai_start()` function.
Chapter 2. API Reference

```c
#include "driver/gpio.h"
#include "driver/twai.h"

void app_main()
{
    //Initialize configuration structures using macro initializers
    twai_general_config_t g_config = TWAI_GENERAL_CONFIG_DEFAULT(GPIO_NUM_21, GPIO_NUM_22, TWAI_MODE_NORMAL);
    twai_timing_config_t t_config = TWAI_TIMING_CONFIG_500KBITS();
    twai_filter_config_t f_config = TWAI_FILTER_CONFIG_ACCEPT_ALL();

    //Install TWAI driver
    if (twai_driver_install(&g_config, &t_config, &f_config) == ESP_OK) {
        printf("Driver installed\n");
    } else {
        printf("Failed to install driver\n");
        return;
    }

    //Start TWAI driver
    if (twai_start() == ESP_OK) {
        printf("Driver started\n");
    } else {
        printf("Failed to start driver\n");
        return;
    }
    ...
}
```

The usage of macro initializers is not mandatory and each of the configuration structures can be manually.

**Message Transmission** The following code snippet demonstrates how to transmit a message via the usage of the `twai_message_t` type and `twai_transmit()` function.

```c
#include "driver/twai.h"
...

//Configure message to transmit
twai_message_t message;
message.identifier = 0xAAAA;
message.extd = 1;
message.data_length_code = 4;
for (int i = 0; i < 4; i++) {
    message.data[i] = 0;
}

//Queue message for transmission
if (twai_transmit(&message, pdMS_TO_TICKS(1000)) == ESP_OK) {
    printf("Message queued for transmission\n");
} else {
    printf("Failed to queue message for transmission\n");
}
```

**Message Reception** The following code snippet demonstrates how to receive a message via the usage of the `twai_message_t` type and `twai_receive()` function.
// Wait for message to be received
twai_message_t message;
if (twai_receive(&message, pdMS_TO_TICKS(10000)) == ESP_OK) {
    printf("Message received\n");
} else {
    printf("Failed to receive message\n");
    return;
}

// Process received message
if (message.extd) {
    printf("Message is in Extended Format\n");
} else {
    printf("Message is in Standard Format\n");
}
printf("ID is %d\n", message.identifier);
if (!(message.rtr)) {
    for (int i = 0; i < message.data_length_code; i++) {
        printf("Data byte %d = %d\n", i, message.data[i]);
    }
}

Reconfiguring and Reading Alerts The following code snippet demonstrates how to reconfigure and read TWAI driver alerts via the use of the twai_reconfigure_alerts() and twai_read_alerts() functions.

#include "driver/twai.h"
...
// Reconfigure alerts to detect Error Passive and Bus-Off error states
uint32_t alerts_to_enable = TWAI_ALERT_ERR_PASS | TWAI_ALERT_BUS_OFF;
if (twai_reconfigure_alerts(alerts_to_enable, NULL) == ESP_OK) {
    printf("Alerts reconfigured\n");
} else {
    printf("Failed to reconfigure alerts\n");
}

// Block indefinitely until an alert occurs
uint32_t alerts_triggered;
twai_read_alerts(&alerts_triggered, portMAX_DELAY);

Stop and Uninstall The following code demonstrates how to stop and uninstall the TWAI driver via the use of the twai_stop() and twai_driver_uninstall() functions.

#include "driver/twai.h"
...
// Stop the TWAI driver
if (twai_stop() == ESP_OK) {
    printf("Driver stopped\n");
} else {
    printf("Failed to stop driver\n");
    return;
}
// Uninstall the TWAI driver
if (twai_driver_uninstall() == ESP_OK) {
  printf("Driver uninstalled\n");
} else {
  printf("Failed to uninstall driver\n");
  return;
}

**Multiple ID Filter Configuration** The acceptance mask in `twai_filter_config_t` can be configured such that two or more IDs will be accepted for a single filter. For a particular filter to accept multiple IDs, the conflicting bit positions amongst the IDs must be set in the acceptance mask. The acceptance code can be set to any one of the IDs.

The following example shows how the calculate the acceptance mask given multiple IDs:

<table>
<thead>
<tr>
<th>ID1</th>
<th>11'b101 1010 0000</th>
</tr>
</thead>
<tbody>
<tr>
<td>ID2</td>
<td>11'b101 1010 0001</td>
</tr>
<tr>
<td>ID3</td>
<td>11'b101 1010 0100</td>
</tr>
<tr>
<td>ID4</td>
<td>11'b101 1010 1000</td>
</tr>
</tbody>
</table>

// Acceptance Mask
MASK = 11'b000 0000 1101

**Application Examples**

**Network Example:** The TWAINetwork example demonstrates communication between two ESP32-S3s using the TWAI driver API. One TWAI node acts as a network master that initiates and ceases the transfer of a data from another node acting as a network slave. The example can be found via `peripherals/twai/twai_network`.

**Alert and Recovery Example:** This example demonstrates how to use the TWAI driver’s alert and bus-off recovery API. The example purposely introduces errors on the bus to put the TWAI controller into the Bus-Off state. An alert is used to detect the Bus-Off state and trigger the bus recovery process. The example can be found via `peripherals/twai/twai_alert_and_recovery`.

**Self Test Example:** This example uses the No Acknowledge Mode and Self Reception Request to cause the TWAI controller to send and simultaneously receive a series of messages. This example can be used to verify if the connections between the TWAI controller and the external transceiver are working correctly. The example can be found via `peripherals/twai/twai_self_test`.

- components/hal/include/hal/twai_types.h

**Structures**

`struct twai_message_t`

Structure to store a TWAI message.

**Note** The flags member is deprecated

**Public Members**

- `uint32_t extd : 1`
  - Extended Frame Format (29bit ID)
- `uint32_t rtr : 1`
  - Message is a Remote Frame
uint32_t ss  
Transmit as a Single Shot Transmission. Unused for received.

uint32_t self  
Transmit as a Self Reception Request. Unused for received.

uint32_t dlc_non_comp  
Message’s Data length code is larger than 8. This will break compliance with ISO 11898-1

uint32_t reserved  
Reserved bits

uint32_t flags  
Deprecated: Alternate way to set bits using message flags

uint32_t identifier  
11 or 29 bit identifier

uint8_t data_length_code  
Data length code

uint8_t data[TWAI_FRAME_MAX_DLC]  
Data bytes (not relevant in RTR frame)

struct twai_timing_config_t  
Structure for bit timing configuration of the TWAI driver.

Note  Macro initializers are available for this structure

Public Members

uint32_t brp  
Baudrate prescaler (i.e., APB clock divider). Any even number from 2 to 128 for ESP32, 2 to 32768 for ESP32S2. For ESP32 Rev 2 or later, multiples of 4 from 132 to 256 are also supported

uint8_t tseg_1  
Timing segment 1 (Number of time quanta, between 1 to 16)

uint8_t tseg_2  
Timing segment 2 (Number of time quanta, 1 to 8)

uint8_t sjw  
Synchronization Jump Width (Max time quanta jump for synchronize from 1 to 4)

bool triple_sampling  
Enables triple sampling when the TWAI controller samples a bit

struct twai_filter_config_t  
Structure for acceptance filter configuration of the TWAI driver (see documentation)

Note  Macro initializers are available for this structure

Public Members

uint32_t acceptance_code  
32-bit acceptance code

uint32_t acceptance_mask  
32-bit acceptance mask

bool single_filter  
Use Single Filter Mode (see documentation)
Chapter 2. API Reference

Macros

**TWAI_EXTD_ID_MASK**
TWAI Constants.
Bit mask for 29 bit Extended Frame Format ID

**TWAI_STD_ID_MASK**
Bit mask for 11 bit Standard Frame Format ID

**TWAI_FRAME_MAX_DLC**
Max data bytes allowed in TWAI

**TWAI_FRAME_EXTD_ID_LEN_BYTES**
EFF ID requires 4 bytes (29bit)

**TWAI_FRAME_STD_ID_LEN_BYTES**
SFF ID requires 2 bytes (11bit)

**TWAI_ERR_PASS_THRESH**
Error counter threshold for error passive

Enumerations

enum twai_mode_t
TWAI Controller operating modes.
Values:

**TWAI_MODE_NORMAL**
Normal operating mode where TWAI controller can send/receive/acknowledge messages

**TWAI_MODE_NO_ACK**
Transmission does not require acknowledgment. Use this mode for self testing

**TWAI_MODE_LISTEN_ONLY**
The TWAI controller will not influence the bus (No transmissions or acknowledgments) but can receive messages

Header File

- components/driver/include/driver/twai.h

Functions

esp_err_t twai_driver_install(const twai_general_config_t *g_config, const twai_timing_config_t *t_config, const twai_filter_config_t *f_config)
Install TWAI driver.
This function installs the TWAI driver using three configuration structures. The required memory is allocated and the TWAI driver is placed in the stopped state after running this function.

Note Macro initializers are available for the configuration structures (see documentation)

Note To reinstall the TWAI driver, call twai_driver_uninstall() first

Return

- ESP_OK: Successfully installed TWAI driver
- ESP_ERR_INVALID_ARG: Arguments are invalid
- ESP_ERR_NO_MEM: Insufficient memory
- ESP_ERR_INVALID_STATE: Driver is already installed

Parameters

- [in] g_config: General configuration structure
- [in] t_config: Timing configuration structure
- [in] f_config: Filter configuration structure
esp_err_t twai_driver_uninstall (void)

Uninstall the TWAI driver.

This function uninstalls the TWAI driver, freeing the memory utilized by the driver. This function can only be called when the driver is in the stopped state or the bus-off state.

**Warning** The application must ensure that no tasks are blocked on TX/RX queues or alerts when this function is called.

**Return**
- ESP_OK: Successfully uninstalled TWAI driver
- ESP_ERR_INVALID_STATE: Driver is not in stopped/bus-off state, or is not installed

esp_err_t twai_start (void)

Start the TWAI driver.

This function starts the TWAI driver, putting the TWAI driver into the running state. This allows the TWAI driver to participate in TWAI bus activities such as transmitting/receiving messages. The TX and RX queue are reset in this function, clearing any messages that are unread or pending transmission. This function can only be called when the TWAI driver is in the stopped state.

**Return**
- ESP_OK: TWAI driver is now running
- ESP_ERR_INVALID_STATE: Driver is not in stopped state, or is not installed

esp_err_t twai_stop (void)

Stop the TWAI driver.

This function stops the TWAI driver, preventing any further message from being transmitted or received until twai_start() is called. Any messages in the TX queue are cleared. Any messages in the RX queue should be read by the application after this function is called. This function can only be called when the TWAI driver is in the running state.

**Warning** A message currently being transmitted/received on the TWAI bus will be ceased immediately. This may lead to other TWAI nodes interpreting the unfinished message as an error.

**Return**
- ESP_OK: TWAI driver is now Stopped
- ESP_ERR_INVALID_STATE: Driver is not in running state, or is not installed

esp_err_t twai_transmit (const twai_message_t *message, TickType_t ticks_to_wait)

Transmit a TWAI message.

This function queues a TWAI message for transmission. Transmission will start immediately if no other messages are queued for transmission. If the TX queue is full, this function will block until more space becomes available or until it times out. If the TX queue is disabled (TX queue length = 0 in configuration), this function will return immediately if another message is undergoing transmission. This function can only be called when the TWAI driver is in the running state and cannot be called under Listen Only Mode.

**Note** This function does not guarantee that the transmission is successful. The TX_SUCCESS/ TX_FAILED alert can be enabled to alert the application upon the success/failure of a transmission.

**Note** The TX_IDLE alert can be used to alert the application when no other messages are awaiting transmission.

**Return**
- ESP_OK: Transmission successfully queued/initiated
- ESP_ERR_INVALID_ARG: Arguments are invalid
- ESP_ERR_TIMEOUT: Timed out waiting for space on TX queue
- ESP_FAIL: TX queue is disabled and another message is currently transmitting
- ESP_ERR_INVALID_STATE: TWAI driver is not in running state, or is not installed
- ESP_ERR_NOT_SUPPORTED: Listen Only Mode does not support transmissions

**Parameters**
- [in] message: Message to transmit
- [in] ticks_to_wait: Number of FreeRTOS ticks to block on the TX queue

esp_err_t twai_receive (twai_message_t *message, TickType_t ticks_to_wait)

Receive a TWAI message.
This function receives a message from the RX queue. The flags field of the message structure will indicate the type of message received. This function will block if there are no messages in the RX queue.

**Warning** The flags field of the received message should be checked to determine if the received message contains any data bytes.

**Return**
- ESP_OK: Message successfully received from RX queue
- ESP_ERR_TIMEOUT: Timed out waiting for message
- ESP_ERR_INVALID_ARG: Arguments are invalid
- ESP_ERR_INVALID_STATE: TWAI driver is not installed

**Parameters**
- `[out] message`: Received message
- `[in] ticks_to_wait`: Number of FreeRTOS ticks to block on RX queue

```c
esp_err_t twai_read_alerts (uint32_t *alerts, TickType_t ticks_to_wait)```

Read TWAI driver alerts.

This function will read the alerts raised by the TWAI driver. If no alert has been issued when this function is called, this function will block until an alert occurs or until it timeouts.

**Note** Multiple alerts can be raised simultaneously. The application should check for all alerts that have been enabled.

**Return**
- ESP_OK: Alerts read
- ESP_ERR_TIMEOUT: Timed out waiting for alerts
- ESP_ERR_INVALID_ARG: Arguments are invalid
- ESP_ERR_INVALID_STATE: TWAI driver is not installed

**Parameters**
- `[out] alerts`: Bit field of raised alerts (see documentation for alert flags)
- `[in] ticks_to_wait`: Number of FreeRTOS ticks to block for alert

```c
esp_err_t twai_reconfigure_alerts (uint32_t alerts_enabled, uint32_t *current_alerts)```

Reconfigure which alerts are enabled.

This function reconfigures which alerts are enabled. If there are alerts which have not been read whilst reconfiguring, this function can read those alerts.

**Return**
- ESP_OK: Alerts reconfigured
- ESP_ERR_INVALID_STATE: TWAI driver is not installed

**Parameters**
- `[in] alerts_enabled`: Bit field of alerts to enable (see documentation for alert flags)
- `[out] current_alerts`: Bit field of currently raised alerts. Set to NULL if unused

```c
esp_err_t twai_initiate_recovery (void)```

Start the bus recovery process.

This function initiates the bus recovery process when the TWAI driver is in the bus-off state. Once initiated, the TWAI driver will enter the recovering state and wait for 128 occurrences of the bus-free signal on the TWAI bus before returning to the stopped state. This function will reset the TX queue, clearing any messages pending transmission.

**Note** The BUS_RECOVERED alert can be enabled to alert the application when the bus recovery process completes.

**Return**
- ESP_OK: Bus recovery started
- ESP_ERR_INVALID_STATE: TWAI driver is not in the bus-off state, or is not installed

```c
esp_err_t twai_get_status_info (twai_status_info_t *status_info)```

Get current status information of the TWAI driver.

**Return**
- ESP_OK: Status information retrieved
- ESP_ERR_INVALID_ARG: Arguments are invalid
- ESP_ERR_INVALID_STATE: TWAI driver is not installed

**Parameters**
- `[out] status_info`: Status information

```c
esp_err_t twai_clear_transmit_queue (void)
```

Clear the transmit queue.

This function will clear the transmit queue of all messages.

**Note** The transmit queue is automatically cleared when twai_stop() or twai_initiate_recovery() is called.

**Return**
- ESP_OK: Transmit queue cleared
- ESP_ERR_INVALID_STATE: TWAI driver is not installed or TX queue is disabled

```c
esp_err_t twai_clear_receive_queue (void)
```

Clear the receive queue.

This function will clear the receive queue of all messages.

**Note** The receive queue is automatically cleared when twai_start() is called.

**Return**
- ESP_OK: Transmit queue cleared
- ESP_ERR_INVALID_STATE: TWAI driver is not installed

**Structures**

```c
struct twai_general_config_t
```

Structure for general configuration of the TWAI driver.

**Note** Macro initializers are available for this structure

**Public Members**

```c
twai_mode_t mode
```

Mode of TWAI controller

```c
gpio_num_t tx_io
```

Transmit GPIO number

```c
gpio_num_t rx_io
```

Receive GPIO number

```c
gpio_num_t clkout_io
```

CLKOUT GPIO number (optional, set to -1 if unused)

```c
gpio_num_t bus_off_io
```

Bus off indicator GPIO number (optional, set to -1 if unused)

```c
uint32_t tx_queue_len
```

Number of messages TX queue can hold (set to 0 to disable TX Queue)

```c
uint32_t rx_queue_len
```

Number of messages RX queue can hold

```c
uint32_t alerts_enabled
```

Bit field of alerts to enable (see documentation)

```c
uint32_t clkout_divider
```

CLKOUT divider. Can be 1 or any even number from 2 to 14 (optional, set to 0 if unused)

```c
int intr_flags
```

Interrupt flags to set the priority of the driver’s ISR. Note that to use the ESP_INTR_FLAG_IRAM, the CONFIG_TWAI_ISR_IN_IRAM option should be enabled first.

```c
struct twai_status_info_t
```

Structure to store status information of TWAI driver.
Public Members

\begin{verbatim}
\textbf{twai_state_t} \textbf{state}
Current state of TWAI controller (Stopped/Running/Bus-Off/Recovery)

\textbf{uint32_t} \textbf{msgs_to_tx}
Number of messages queued for transmission or awaiting transmission completion

\textbf{uint32_t} \textbf{msgs_to_rx}
Number of messages in RX queue waiting to be read

\textbf{uint32_t} \textbf{tx_error_counter}
Current value of Transmit Error Counter

\textbf{uint32_t} \textbf{rx_error_counter}
Current value of Receive Error Counter

\textbf{uint32_t} \textbf{tx_failed_count}
Number of messages that failed transmissions

\textbf{uint32_t} \textbf{rx_missed_count}
Number of messages that were lost due to a full RX queue (or errata workaround if enabled)

\textbf{uint32_t} \textbf{rx_overrun_count}
Number of messages that were lost due to a RX FIFO overrun

\textbf{uint32_t} \textbf{arb_lost_count}
Number of instances arbitration was lost

\textbf{uint32_t} \textbf{bus_error_count}
Number of instances a bus error has occurred
\end{verbatim}

\textbf{TWAI_IO_UNUSED}
Marks GPIO as unused in TWAI configuration
\end{verbatim}

Enumerations

\begin{verbatim}
\textbf{enum twai_state_t}
TWAI driver states.

Values:

\textbf{TWAI_STATE_STOPPED}
Stopped state. The TWAI controller will not participate in any TWAI bus activities

\textbf{TWAI_STATE_RUNNING}
Running state. The TWAI controller can transmit and receive messages

\textbf{TWAI_STATE_BUS_OFF}
Bus-off state. The TWAI controller cannot participate in bus activities until it has recovered

\textbf{TWAI_STATE_RECOVERING}
Recovering state. The TWAI controller is undergoing bus recovery
\end{verbatim}

2.3.22 Universal Asynchronous Receiver/Transmitter (UART)

Overview

A Universal Asynchronous Receiver/Transmitter (UART) is a hardware feature that handles communication (i.e., timing requirements and data framing) using widely-adopted asynchronous serial communication interfaces, such as RS232, RS422, RS485. A UART provides a widely adopted and cheap method to realize full-duplex or half-duplex data exchange among different devices.
The ESP32-S3 chip has three UART controllers (UART0, UART1, and UART2), each featuring an identical set of registers to simplify programming and for more flexibility.

Each UART controller is independently configurable with parameters such as baud rate, data bit length, bit ordering, number of stop bits, parity bit etc. All the controllers are compatible with UART-enabled devices from various manufacturers and can also support Infrared Data Association protocols (IrDA).

**Functional Overview**

The following overview describes how to establish communication between an ESP32-S3 and other UART devices using the functions and data types of the UART driver. The overview reflects a typical programming workflow and is broken down into the sections provided below:

1. **Setting Communication Parameters** - Setting baud rate, data bits, stop bits, etc.
2. **Setting Communication Pins** - Assigning pins for connection to a device.
3. **Driver Installation** - Allocating ESP32-S3’s resources for the UART driver.
4. **Running UART Communication** - Sending / receiving data
5. **Using Interrupts** - Triggering interrupts on specific communication events
6. **Deleting a Driver** - Freeing allocated resources if a UART communication is no longer required

Steps 1 to 3 comprise the configuration stage. Step 4 is where the UART starts operating. Steps 5 and 6 are optional.

The UART driver’s functions identify each of the UART controllers using `uart_port_t`. This identification is needed for all the following function calls.

**Setting Communication Parameters**  UART communication parameters can be configured all in a single step or individually in multiple steps.

**Single Step**  Call the function `uart_param_config()` and pass to it a `uart_config_t` structure. The `uart_config_t` structure should contain all the required parameters. See the example below.

```c
const uart_port_t uart_num = UART_NUM_2;
uart_config_t uart_config = {
    .baud_rate = 115200,
    .data_bits = UART_DATA_8_BITS,
    .parity = UART_PARITY_DISABLE,
    .stop_bits = UART_STOP_BITS_1,
    .flow_ctrl = UART_HW_FLOWCTRL_CTS_RTS,
    .rx_flow_ctrl_thresh = 122,
};
// Configure UART parameters
ESP_ERROR_CHECK(uart_param_config(uart_num, &uart_config));
```

For more information on how to configure the hardware flow control options, please refer to peripherals/uart/uart_echo.

**Multiple Steps**  Configure specific parameters individually by calling a dedicated function from the table given below. These functions are also useful if re-configuring a single parameter.

**Table 6: Functions for Configuring specific parameters individually**

<table>
<thead>
<tr>
<th>Parameter to Configure</th>
<th>Function</th>
</tr>
</thead>
<tbody>
<tr>
<td>Baud rate</td>
<td><code>uart_set_baudrate()</code></td>
</tr>
<tr>
<td>Number of transmitted bits</td>
<td><code>uart_set_word_length()</code> selected out of <code>uart_word_length_t</code></td>
</tr>
<tr>
<td>Parity control</td>
<td><code>uart_set_parity()</code> selected out of <code>uart_parity_t</code></td>
</tr>
<tr>
<td>Number of stop bits</td>
<td><code>uart_set_stop_bits()</code> selected out of <code>uart_stop_bits_t</code></td>
</tr>
<tr>
<td>Hardware flow control mode</td>
<td><code>uart_set_hw_flow_ctrl()</code> selected out of <code>uart_hw_flowcontrol_t</code></td>
</tr>
<tr>
<td>Communication mode</td>
<td><code>uart_set_mode()</code> selected out of <code>uart_mode_t</code></td>
</tr>
</tbody>
</table>
Each of the above functions has a \_get\_ counterpart to check the currently set value. For example, to check the current baud rate value, call \texttt{uart\_get\_baudrate()}.

**Setting Communication Pins**  After setting communication parameters, configure the physical GPIO pins to which the other UART device will be connected. For this, call the function \texttt{uart\_set\_pin()} and specify the GPIO pin numbers to which the driver should route the Tx, Rx, RTS, and CTS signals. If you want to keep a currently allocated pin number for a specific signal, pass the macro \texttt{UART\_PIN\_NO\_CHANGE}.

The same macro should be specified for pins that will not be used.

```c
// Set UART pins(TX: IO4, RX: IO5, RTS: IO18, CTS: IO19)
ESP_ERROR_CHECK(uart_set_pin(UART_NUM_2, 4, 5, 18, 19));
```

**Driver Installation**  Once the communication pins are set, install the driver by calling \texttt{uart\_driver\_install()} and specify the following parameters:

- Size of Tx ring buffer
- Size of Rx ring buffer
- Event queue handle and size
- Flags to allocate an interrupt

The function will allocate the required internal resources for the UART driver.

```c
// Setup UART buffered IO with event queue
const int uart_buffer_size = (1024 * 2);
QueueHandle_t uart_queue;
// Install UART driver using an event queue here
ESP_ERROR_CHECK(uart_driver_install(UART_NUM_2, uart_buffer_size, 
                                    uart_buffer_size, 10, &uart_queue, 0));
```

Once this step is complete, you can connect the external UART device and check the communication.

**Running UART Communication**  Serial communication is controlled by each UART controller’s finite state machine (FSM).

The process of sending data involves the following steps:

1. Write data into Tx FIFO buffer
2. FSM serializes the data
3. FSM sends the data out

The process of receiving data is similar, but the steps are reversed:

1. FSM processes an incoming serial stream and parallelizes it
2. FSM writes the data into Rx FIFO buffer
3. Read the data from Rx FIFO buffer

Therefore, an application will be limited to writing and reading data from a respective buffer using \texttt{uart\_write\_bytes()} and \texttt{uart\_read\_bytes()} respectively, and the FSM will do the rest.

**Transmitting**  After preparing the data for transmission, call the function \texttt{uart\_write\_bytes()} and pass the data buffer’s address and data length to it. The function will copy the data to the Tx ring buffer (either immediately or after enough space is available), and then exit. When there is free space in the Tx FIFO buffer, an interrupt service routine (ISR) moves the data from the Tx ring buffer to the Tx FIFO buffer in the background. The code below demonstrates the use of this function.

```c
// Write data to UART.
char* test_str = "This is a test string.\n";
uart_write_bytes(uart_num, (const char*)test_str, strlen(test_str));
```
The function `uart_write_bytes_with_break()` is similar to `uart_write_bytes()` but adds a serial break signal at the end of the transmission. A ‘serial break signal’ means holding the Tx line low for a period longer than one data frame.

```c
// Write data to UART, end with a break signal.
uart_write_bytes_with_break(uart_num, "test break\n", strlen("test break\n"), 100);
```

Another function for writing data to the Tx FIFO buffer is `uart_tx_chars()`. Unlike `uart_write_bytes()`, this function will not block until space is available. Instead, it will write all data which can immediately fit into the hardware Tx FIFO, and then return the number of bytes that were written.

There is a ‘companion’ function `uart_wait_tx_done()` that monitors the status of the Tx FIFO buffer and returns once it is empty.

```c
// Wait for packet to be sent
const uart_port_t uart_num = UART_NUM_2;
ESP_ERROR_CHECK(uart_wait_tx_done(uart_num, 100)); // wait timeout is 100 RTOS_ticks (TickType_t)
```

**Receiving**  Once the data is received by the UART and saved in the Rx FIFO buffer, it needs to be retrieved using the function `uart_read_bytes()`. Before reading data, you can check the number of bytes available in the Rx FIFO buffer by calling `uart_get_buffered_data_len()`. An example of using these functions is given below.

```c
// Read data from UART.
const uart_port_t uart_num = UART_NUM_2;
uint8_t data[128];
int length = 0;
ESP_ERROR_CHECK(uart_get_buffered_data_len(uart_num, (size_t *)&length));
length = uart_read_bytes(uart_num, data, length, 100);
```

If the data in the Rx FIFO buffer is no longer needed, you can clear the buffer by calling `uart_flush()`.

**Software Flow Control**  If the hardware flow control is disabled, you can manually set the RTS and DTR signal levels by using the functions `uart_set_rts()` and `uart_set_dtr()` respectively.

**Communication Mode Selection**  The UART controller supports a number of communication modes. A mode can be selected using the function `uart_set_mode()`. Once a specific mode is selected, the UART driver will handle the behavior of a connected UART device accordingly. As an example, it can control the RS485 driver chip using the RTS line to allow half-duplex RS485 communication.

```c
// Setup UART in rs485 half duplex mode
ESP_ERROR_CHECK(uart_set_mode(uart_num, UART_MODE_RS485_HALF_DUPLEX));
```

**Using Interrupts**  There are many interrupts that can be generated following specific UART states or detected errors. The full list of available interrupts is provided in [ESP32-S3 Technical Reference Manual > UART Controller (UART) > UART Interrupts and UHCI Interrupts](#). You can enable or disable specific interrupts by calling `uart_enable_intr_mask()` or `uart_disable_intr_mask()` respectively. The mask of all interrupts is available as `UART_INTR_MASK`.

The `uart_driver_install()` function installs the driver’s internal interrupt handler to manage the Tx and Rx ring buffers and provides high-level API functions like events (see below).

The API provides a convenient way to handle specific interrupts discussed in this document by wrapping them into dedicated functions:

- **Event detection**: There are several events defined in `uart_event_type_t` that may be reported to a user application using the FreeRTOS queue functionality. You can enable this functionality when calling
uart_driver_install() described in Driver Installation. An example of using Event detection can be found in peripherals/uart/uart_events.

- **FIFO space threshold or transmission timeout reached**: The Tx and Rx FIFO buffers can trigger an interrupt when they are filled with a specific number of characters, or on a timeout of sending or receiving data. To use these interrupts, do the following:
  - Configure respective threshold values of the buffer length and timeout by entering them in the structure uart_intr_config_t and calling uart_intr_config()
  - Enable the interrupts using the functions uart_enable_tx_intr() and uart_enable_rx_intr()
  - Disable these interrupts using the corresponding functions uart_disable_tx_intr() or uart_disable_rx_intr()

- **Pattern detection**: An interrupt triggered on detecting a ‘pattern’ of the same character being received/sent repeatedly for a number of times. This functionality is demonstrated in the example peripherals/uart/uart_events.
  - It can be used, e.g., to detect a command string followed by a specific number of identical characters (the ‘pattern’) added at the end of the command string. The following functions are available:
    - Configure and enable this interrupt using uart_enable_pattern_det_intr()
    - Disable the interrupt using uart_disable_pattern_det_intr()

**Macros** The API also defines several macros. For example, UART_FIFO_LEN defines the length of hardware FIFO buffers; UART_BITRATE_MAX gives the maximum baud rate supported by the UART controllers, etc.

**Deleting a Driver** If the communication established with uart_driver_install() is no longer required, the driver can be removed to free allocated resources by calling uart_driver_delete()

**Overview of RS485 specific communication options**

Note: The following section will use [UART_REGISTER_NAME].[UART_FIELD_BIT] to refer to UART register fields/bits. For more information on a specific option bit, see ESP32-S3 Technical Reference Manual > UART Controller (UART) > Register Summary [PDF]. Use the register name to navigate to the register description and then find the field/bit.

- UART_RS485_CONF_REG.UART_RS485_EN: setting this bit enables RS485 communication mode support.
- UART_RS485_CONF_REG.UART_RS485TX_RX_EN: if this bit is set, the transmitter’s output signal loops back to the receiver’s input signal.
- UART_RS485_CONF_REG.UART_RS485RXBY_TX_EN: if this bit is set, the transmitter will still be sending data if the receiver is busy (removes collisions automatically by hardware).

The ESP32-S3’s RS485 UART hardware can detect signal collisions during transmission of a datagram and generate the interrupt UART_RS485_CLASH_INT if this interrupt is enabled. The term collision means that a transmitted datagram is not equal to the one received on the other end. Data collisions are usually associated with the presence of other active devices on the bus or might occur due to bus errors.

The collision detection feature allows handling collisions when their interrupts are activated and triggered. The interrupts UART_RS485_FRM_ERR_INT and UART_RS485_PARITY_ERR_INT can be used with the collision detection feature to control frame errors and parity bit errors accordingly in RS485 mode. This functionality is supported in the UART driver and can be used by selecting the UART_MODE_RS485_APP_CTRL mode (see the function uart_set_mode()).

The collision detection feature can work with circuit A and circuit C (see Section Interface Connection Options). In the case of using circuit A or B, the RTS pin connected to the DE pin of the bus driver should be controlled by the user application. Use the function uart_get_collision_flag() to check if the collision detection flag has been raised.

The ESP32-S3 UART controllers themselves do not support half-duplex communication as they cannot provide automatic control of the RTS pin connected to the ~RE/DE input of RS485 bus driver. However, half-duplex com-
munication can be achieved via software control of the RTS pin by the UART driver. This can be enabled by selecting the `UART_MODE_RS485_HALF_DUPLEX` mode when calling `uart_set_mode()`.

Once the host starts writing data to the Tx FIFO buffer, the UART driver automatically asserts the RTS pin (logic 1); once the last bit of the data has been transmitted, the driver de-asserts the RTS pin (logic 0). To use this mode, the software would have to disable the hardware flow control function. This mode works with all the used circuits shown below.

**Interface Connection Options**  This section provides example schematics to demonstrate the basic aspects of ESP32-S3’s RS485 interface connection.

**Note:**
- The schematics below do not necessarily contain all required elements.
- The analog devices ADM483 & ADM2483 are examples of common RS485 transceivers and can be replaced with other similar transceivers.

**Circuit A: Collision Detection Circuit**

ESP       | RTS ------->| DE |
|              | A|----------<> A |
|              | /RE |
| +-----| /RE |
| +--------x--------+
| |
| GND     GND
```

This circuit is preferable because it allows for collision detection and is quite simple at the same time. The receiver in the line driver is constantly enabled, which allows the UART to monitor the RS485 bus. Echo suppression is performed by the UART peripheral when the bit `UART_RS485_CONF_REG.UART_RS485TX_RX_EN` is enabled.

**Circuit B: Manual Switching Transmitter/Receiver Without Collision Detection**

```
VCC ---------------+     
|                  |
|                  |
+--------x--------+
RXD <--------| R |
|            | B|----------<> B |
TXD ------->| D | ADM483 |
|            | RS485 bus side |
ESP       | RTS ------->| DE |
|              | A|----------<> A |
|              | /RE |
| +-----| /RE |
| +--------x--------+
| |
| GND
```

This circuit does not allow for collision detection. It suppresses the null bytes that the hardware receives when the bit `UART_RS485_CONF_REG.UART_RS485TX_RX_EN` is set. The bit `UART_RS485_CONF_REG.UART_RS485RXBY_TX_EN` is not applicable in this case.

**Circuit C: Auto Switching Transmitter/Receiver**
This galvanically isolated circuit does not require RTS pin control by a software application or driver because it controls the transceiver direction automatically. However, it requires suppressing null bytes during transmission by setting UART_RS485_CONF_REG.UART_RS485RXBY_TX_EN to 1 and UART_RS485_CONF_REG.UART_RS485TX_RX_EN to 0. This setup can work in any RS485 UART mode or even in UART_MODE_UART.

Application Examples

The table below describes the code examples available in the directory peripherals/uart/.

<table>
<thead>
<tr>
<th>Code Example</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>peripherals/uart/uart_echo</td>
<td>Configuring UART settings, installing the UART driver, and reading/writing over the UART1 interface.</td>

API Reference

Header File

- components/driver/include/driver/uart.h

Functions

```c
esp_err_t uart_driver_install(uart_port_t uart_num, int rx_buffer_size, int tx_buffer_size, int queue_size, QueueHandle_t *uart_queue, int intr_alloc_flags)
```

Install UART driver and set the UART to the default configuration.

UART ISR handler will be attached to the same CPU core that this function is running on.
Note Rx_buffer_size should be greater than UART_FIFO_LEN. Tx_buffer_size should be either zero or greater than UART_FIFO_LEN.

Return
- ESP_OK Success
- ESP_FAIL Parameter error

Parameters
- uart_num: UART port number, the max port number is (UART_NUM_MAX -1).
- rx_buffer_size: UART RX ring buffer size.
- tx_buffer_size: UART TX ring buffer size. If set to zero, driver will not use TX buffer. TX function will block task until all data have been sent out.
- queue_size: UART event queue size/depth.
- uart_queue: UART event queue handle (out param). On success, a new queue handle is written here to provide access to UART events. If set to NULL, driver will not use an event queue.
- intr_alloc_flags: Flags used to allocate the interrupt. One or multiple (ORed) ESP_INTR_FLAG_* values. See esp_intr_alloc.h for more info. Do not set ESP_INTR_FLAG_IRAM here (the driver’s ISR handler is not located in IRAM)

esp_err_t uart_driver_delete(uart_port_t uart_num)
Uninstall UART driver.

Return
- ESP_OK Success
- ESP_FAIL Parameter error

Parameters
- uart_num: UART port number, the max port number is (UART_NUM_MAX -1).

bool uart_is_driver_installed(uart_port_t uart_num)
Checks whether the driver is installed or not.

Return
- true driver is installed
- false driver is not installed

Parameters
- uart_num: UART port number, the max port number is (UART_NUM_MAX -1).

esp_err_t uart_set_word_length(uart_port_t uart_num, uart_word_length_t data_bit)
Set UART data bits.

Return
- ESP_OK Success
- ESP_FAIL Parameter error

Parameters
- uart_num: UART port number, the max port number is (UART_NUM_MAX -1).
- data_bit: UART data bits

esp_err_t uart_get_word_length(uart_port_t uart_num, uart_word_length_t *data_bit)
Get the UART data bit configuration.

Return
- ESP_FAIL Parameter error
- ESP_OK Success, result will be put in (*data_bit)

Parameters
- uart_num: UART port number, the max port number is (UART_NUM_MAX -1).
- data_bit: Pointer to accept value of UART data bits.

esp_err_t uart_set_stop_bits(uart_port_t uart_num, uart_stop_bits_t stop_bits)
Set UART stop bits.

Return
- ESP_OK Success
- ESP_FAIL Fail

Parameters
- uart_num: UART port number, the max port number is (UART_NUM_MAX -1).
- stop_bits: UART stop bits
esp_err_t uart_get_stop_bits(uart_port_t uart_num, uart_stop_bits_t *stop_bits)
Get the UART stop bit configuration.

Return
• ESP_FAIL Parameter error
• ESP_OK Success, result will be put in (*stop_bits)

Parameters
• uart_num: UART port number, the max port number is (UART_NUM_MAX -1).
• stop_bits: Pointer to accept value of UART stop bits.

esp_err_t uart_set_parity(uart_port_t uart_num, uart_parity_t parity_mode)
Set UART parity mode.

Return
• ESP_FAIL Parameter error
• ESP_OK Success

Parameters
• uart_num: UART port number, the max port number is (UART_NUM_MAX -1).
• parity_mode: the enum of uart parity configuration

esp_err_t uart_get_parity(uart_port_t uart_num, uart_parity_t *parity_mode)
Get the UART parity mode configuration.

Return
• ESP_FAIL Parameter error
• ESP_OK Success, result will be put in (*parity_mode)

Parameters
• uart_num: UART port number, the max port number is (UART_NUM_MAX -1).
• parity_mode: Pointer to accept value of UART parity mode.

esp_err_t uart_set_baudrate(uart_port_t uart_num, uint32_t baudrate)
Set UART baud rate.

Return
• ESP_FAIL Parameter error
• ESP_OK Success

Parameters
• uart_num: UART port number, the max port number is (UART_NUM_MAX -1).
• baudrate: UART baud rate.

esp_err_t uart_get_baudrate(uart_port_t uart_num, uint32_t *baudrate)
Get the UART baud rate configuration.

Return
• ESP_FAIL Parameter error
• ESP_OK Success, result will be put in (*baudrate)

Parameters
• uart_num: UART port number, the max port number is (UART_NUM_MAX -1).
• baudrate: Pointer to accept value of UART baud rate

esp_err_t uart_set_line_inverse(uart_port_t uart_num, uint32_t inverse_mask)
Set UART line inverse mode.

Return
• ESP_OK Success
• ESP_FAIL Parameter error

Parameters
• uart_num: UART port number, the max port number is (UART_NUM_MAX -1).
• inverse_mask: Choose the wires that need to be inverted. Using the ORred mask of

uart_signal_inv_t

esp_err_t uart_set_hw_flow_ctrl(uart_port_t uart_num, uart_hw_flowcontrol_t flow_ctrl, uint8_t rx_thresh)
Set hardware flow control.
Return
• ESP_OK Success
• ESP_FAIL Parameter error

Parameters
• uart_num: UART port number, the max port number is (UART_NUM_MAX -1).
• flow_ctrl: Hardware flow control mode
• rx_thresh: Threshold of Hardware RX flow control (0 ~ UART_FIFO_LEN). Only when UART_HW_FLOWCTRL_RTS is set, will the rx_thresh value be set.

`esp_err_t uart_set_sw_flow_ctrl(uart_port_t uart_num, bool enable, uint8_t rx_thresh_xon, uint8_t rx_thresh_xoff)`
Set software flow control.

Return
• ESP_OK Success
• ESP_FAIL Parameter error

Parameters
• uart_num: UART_NUM_0, UART_NUM_1 or UART_NUM_2
• enable: switch on or off
• rx_thresh_xon: low water mark
• rx_thresh_xoff: high water mark

`esp_err_t uart_get_hw_flow_ctrl(uart_port_t uart_num, uart_hw_flowcontrol_t *flow_ctrl)`
Get the UART hardware flow control configuration.

Return
• ESP_FAIL Parameter error
• ESP_OK Success, result will be put in (*flow_ctrl)

Parameters
• uart_num: UART port number, the max port number is (UART_NUM_MAX -1).
• flow_ctrl: Option for different flow control mode.

`esp_err_t uart_clear_intr_status(uart_port_t uart_num, uint32_t clr_mask)`
Clear UART interrupt status.

Return
• ESP_OK Success
• ESP_FAIL Parameter error

Parameters
• uart_num: UART port number, the max port number is (UART_NUM_MAX -1).
• clr_mask: Bit mask of the interrupt status to be cleared.

`esp_err_t uart_enable_intr_mask(uart_port_t uart_num, uint32_t enable_mask)`
Set UART interrupt enable.

Return
• ESP_OK Success
• ESP_FAIL Parameter error

Parameters
• uart_num: UART port number, the max port number is (UART_NUM_MAX -1).
• enable_mask: Bit mask of the enable bits.

`esp_err_t uart_disable_intr_mask(uart_port_t uart_num, uint32_t disable_mask)`
Clear UART interrupt enable bits.

Return
• ESP_OK Success
• ESP_FAIL Parameter error

Parameters
• uart_num: UART port number, the max port number is (UART_NUM_MAX -1).
• disable_mask: Bit mask of the disable bits.

`esp_err_t uart_enable_rx_intr(uart_port_t uart_num)`
Enable UART RX interrupt (RX_FULL & RX_TIMEOUT INTERRUPT)
Return
- ESP_OK Success
- ESP_FAIL Parameter error

Parameters
- uart_num: UART port number, the max port number is (UART_NUM_MAX -1).

```c
esp_err_t uart_disable_rx_intr(uart_port_t uart_num)
```

Disable UART RX interrupt (RX_FULL & RX_TIMEOUT INTERRUPT)

Return
- ESP_OK Success
- ESP_FAIL Parameter error

Parameters
- uart_num: UART port number, the max port number is (UART_NUM_MAX -1).

```c
esp_err_t uart_disable_tx_intr(uart_port_t uart_num)
```

Disable UART TX interrupt (TX_FULL & TX_TIMEOUT INTERRUPT)

Return
- ESP_OK Success
- ESP_FAIL Parameter error

Parameters
- uart_num: UART port number

```c
esp_err_t uart_enable_tx_intr(uart_port_t uart_num, int enable, int thresh)
```

Enable UART TX interrupt (TX_FULL & TX_TIMEOUT INTERRUPT)

Return
- ESP_OK Success
- ESP_FAIL Parameter error

Parameters
- uart_num: UART port number, the max port number is (UART_NUM_MAX -1).
- enable: 1: enable; 0: disable
- thresh: Threshold of TX interrupt, 0 ~ UART_FIFO_LEN

```c
esp_err_t uart_set_pin(uart_port_t uart_num, int tx_io_num, int rx_io_num, int rts_io_num, int cts_io_num)
```

Assign signals of a UART peripheral to GPIO pins.

Note If the GPIO number configured for a UART signal matches one of the IOMUX signals for that GPIO, the signal will be connected directly via the IOMUX. Otherwise the GPIO and signal will be connected via the GPIO Matrix. For example, if on an ESP32 the call `uart_set_pin(0, 1, 3, -1, -1)` is performed, as GPIO1 is UART0’s default TX pin and GPIO3 is UART0’s default RX pin, both will be connected to respectively U0TXD and U0RXD through the IOMUX, totally bypassing the GPIO matrix. The check is performed on a per-pin basis. Thus, it is possible to have RX pin binded to a GPIO through the GPIO matrix, whereas TX is binded to its GPIO through the IOMUX.

Note Internal signal can be output to multiple GPIO pads. Only one GPIO pad can connect with input signal.

Return
- ESP_OK Success
- ESP_FAIL Parameter error

Parameters
- uart_num: UART port number, the max port number is (UART_NUM_MAX -1).
- tx_io_num: UART TX pin GPIO number.
- rx_io_num: UART RX pin GPIO number.
- rts_io_num: UART RTS pin GPIO number.
- cts_io_num: UART CTS pin GPIO number.

```c
esp_err_t uart_set_rts(uart_port_t uart_num, int level)
```

Manually set the UART RTS pin level.

Note UART must be configured with hardware flow control disabled.

Return
- ESP_OK Success
• ESP_FAIL Parameter error

Parameters
• uart_num: UART port number, the max port number is (UART_NUM_MAX -1).
• level: 1: RTS output low (active); 0: RTS output high (block)

`esp_err_t uart_set_dtr(uart_port_t uart_num, int level)`
Manually set the UART DTR pin level.

Return
• ESP_OK Success
• ESP_FAIL Parameter error

Parameters
• uart_num: UART port number, the max port number is (UART_NUM_MAX -1).
• level: 1: DTR output low; 0: DTR output high

`esp_err_t uart_set_tx_idle_num(uart_port_t uart_num, uint16_t idle_num)`
Set UART idle interval after tx FIFO is empty.

Return
• ESP_OK Success
• ESP_FAIL Parameter error

Parameters
• uart_num: UART port number, the max port number is (UART_NUM_MAX -1).
• idle_num: idle interval after tx FIFO is empty(unit: the time it takes to send one bit under current baudrate)

`esp_err_t uart_param_config(uart_port_t uart_num, const uart_config_t *uart_config)`
Set UART configuration parameters.

Return
• ESP_OK Success
• ESP_FAIL Parameter error

Parameters
• uart_num: UART port number, the max port number is (UART_NUM_MAX -1).
• uart_config: UART parameter settings

`esp_err_t uart_intr_config(uart_port_t uart_num, const uart_intr_config_t *intr_conf)`
Configure UART interrupts.

Return
• ESP_OK Success
• ESP_FAIL Parameter error

Parameters
• uart_num: UART port number, the max port number is (UART_NUM_MAX -1).
• intr_conf: UART interrupt settings

`esp_err_t uart_wait_tx_done(uart_port_t uart_num, TickType_t ticks_to_wait)`
Wait until UART TX FIFO is empty.

Return
• ESP_OK Success
• ESP_FAIL Parameter error
• ESP_ERR_TIMEOUT Timeout

Parameters
• uart_num: UART port number, the max port number is (UART_NUM_MAX -1).
• ticks_to_wait: Timeout, count in RTOS ticks

`int uart_tx_chars(uart_port_t uart_num, const char *buffer, uint32_t len)`
Send data to the UART port from a given buffer and length.

This function will not wait for enough space in TX FIFO. It will just fill the available TX FIFO and return when the FIFO is full.

Note This function should only be used when UART TX buffer is not enabled.

Return
Chapter 2. API Reference

- (-1) Parameter error
- OTHERS (>=0) The number of bytes pushed to the TX FIFO

**Parameters**
- uart_num: UART port number, the max port number is (UART_NUM_MAX -1).
- buffer: data buffer address
- len: data length to send

```c
int uart_write_bytes (uart_port_t uart_num, const void *src, size_t size)
```

Send data to the UART port from a given buffer and length.

If the UART driver’s parameter ‘tx_buffer_size’ is set to zero: This function will not return until all the data have been sent out, or at least pushed into TX FIFO.

Otherwise, if the ‘tx_buffer_size’ > 0, this function will return after copying all the data to tx ring buffer, UART ISR will then move data from the ring buffer to TX FIFO gradually.

**Return**
- (-1) Parameter error
- OTHERS (>=0) The number of bytes pushed to the TX FIFO

**Parameters**
- uart_num: UART port number, the max port number is (UART_NUM_MAX -1).
- src: data buffer address
- size: data length to send

```c
int uart_write_bytes_with_break (uart_port_t uart_num, const void *src, size_t size, int brk_len)
```

Send data to the UART port from a given buffer and length.

If the UART driver’s parameter ‘tx_buffer_size’ is set to zero: This function will not return until all the data and the break signal have been sent out. After all data is sent out, send a break signal.

Otherwise, if the ‘tx_buffer_size’ > 0, this function will return after copying all the data to tx ring buffer, UART ISR will then move data from the ring buffer to TX FIFO gradually. After all data sent out, send a break signal.

**Return**
- (-1) Parameter error
- OTHERS (>=0) The number of bytes pushed to the TX FIFO

**Parameters**
- uart_num: UART port number, the max port number is (UART_NUM_MAX -1).
- buf: pointer to the buffer.
- length: data length
- ticks_to_wait: sTimeout, count in RTOS ticks

```c
esp_err_t uart_flush (uart_port_t uart_num)
```

Alias of uart_flush_input. UART ring buffer flush. This will discard all data in the UART RX buffer.

**Note** Instead of waiting the data sent out, this function will clear UART rx buffer. In order to send all the data in tx FIFO, we can use uart_wait_tx_done function.

**Return**
- ESP_OK Success
- ESP_FAIL Parameter error
### Parameters
- uart_num: UART port number, the max port number is (UART_NUM_MAX - 1).

#### `esp_err_t uart_flush_input (uart_port_t uart_num)`
Clear input buffer, discard all the data is in the ring-buffer.

**Note** In order to send all the data in tx FIFO, we can use uart_wait_tx_done function.

**Return**
- ESP_OK Success
- ESP_FAIL Parameter error

#### `esp_err_t uart_get_buffered_data_len (uart_port_t uart_num, size_t *size)`
UART get RX ring buffer cached data length.

**Return**
- ESP_OK Success
- ESP_FAIL Parameter error

#### `esp_err_t uart_disable_pattern_det_intr (uart_port_t uart_num)`
UART disable pattern detect function. Designed for applications like `AT commands`. When the hardware detects a series of one same character, the interrupt will be triggered.

**Return**
- ESP_OK Success
- ESP_FAIL Parameter error

#### `esp_err_t uart_enable_pattern_det_baud_intr (uart_port_t uart_num, char pattern_chr, uint8_t chr_num, int chr_tout, int post_idle, int pre_idle)`
UART enable pattern detect function. Designed for applications like `AT commands`. When the hardware detect a series of one same character, the interrupt will be triggered.

**Return**
- ESP_OK Success
- ESP_FAIL Parameter error

#### `int uart_pattern_pop_pos (uart_port_t uart_num)`
Return the nearest detected pattern position in buffer. The positions of the detected pattern are saved in a queue, this function will dequeue the first pattern position and move the pointer to next pattern position.

The following APIs will modify the pattern position info: uart_flush_input, uart_read_bytes, uart_driver_delete, uart_pop_pattern_pos It is the application’s responsibility to ensure atomic access to the pattern queue and the rx data buffer when using pattern detect feature.
Note If the RX buffer is full and flow control is not enabled, the detected pattern may not be found in the rx buffer due to overflow.

Return
• (-1) No pattern found for current index or parameter error
• others the pattern position in rx buffer.

Parameters
• uart_num: UART port number, the max port number is (UART_NUM_MAX -1).

int uart_pattern_get_pos (uart_port_t uart_num)
Return the nearest detected pattern position in buffer. The positions of the detected pattern are saved in a queue, This function do nothing to the queue.

The following APIs will modify the pattern position info: uart_flush_input, uart_read_bytes, uart_driver_delete, uart_pop_pattern_pos It is the application’s responsibility to ensure atomic access to the pattern queue and the rx data buffer when using pattern detect feature.

Note If the RX buffer is full and flow control is not enabled, the detected pattern may not be found in the rx buffer due to overflow.

Return
• (-1) No pattern found for current index or parameter error
• others the pattern position in rx buffer.

Parameters
• uart_num: UART port number, the max port number is (UART_NUM_MAX -1).

esp_err_t uart_pattern_queue_reset (uart_port_t uart_num, int queue_length)
Allocate a new memory with the given length to save record the detected pattern position in rx buffer.

Return
• ESP_ERR_NO_MEM No enough memory
• ESP_ERR_INVALID_STATE Driver not installed
• ESP_FAIL Parameter error
• ESP_OK Success

Parameters
• uart_num: UART port number, the max port number is (UART_NUM_MAX -1).
• queue_length: Max queue length for the detected pattern. If the queue length is not large enough, some pattern positions might be lost. Set this value to the maximum number of patterns that could be saved in data buffer at the same time.

esp_err_t uart_set_mode (uart_port_t uart_num, uart_mode_t mode)
UART set communication mode.

Note This function must be executed after uart_driver_install(), when the driver object is initialized.

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

Parameters
• uart_num: Uart number to configure, the max port number is (UART_NUM_MAX -1).
• mode: UART UART mode to set

esp_err_t uart_set_rx_full_threshold (uart_port_t uart_num, int threshold)
Set uart threshold value for RX fifo full.

Note If application is using higher baudrate and it is observed that bytes in hardware RX fifo are overwritten then this threshold can be reduced.

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error
• ESP_ERR_INVALID_STATE Driver is not installed

Parameters
• uart_num: UART_NUM_0, UART_NUM_1 or UART_NUM_2
• threshold: Threshold value above which RX fifo full interrupt is generated
**esp_err_t uart_set_tx_empty_threshold** *(uart_port_t uart_num, int threshold)*

Set uart threshold values for TX fifo empty.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_INVALID_STATE Driver is not installed

**Parameters**
- **uart_num**: UART_NUM_0, UART_NUM_1 or UART_NUM_2
- **threshold**: Threshold value below which TX fifo empty interrupt is generated

**esp_err_t uart_set_rx_timeout** *(uart_port_t uart_num, const uint8_t tout_thresh)*

UART set threshold timeout for TOUT feature.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_INVALID_STATE Driver is not installed

**Parameters**
- **uart_num**: Uart number to configure, the max port number is (UART_NUM_MAX -1).
- **tout_thresh**: This parameter defines timeout threshold in uart symbol periods. The maximum value of threshold is 126. tout_thresh = 1, defines TOUT interrupt timeout equal to transmission time of one symbol (~11 bit) on current baudrate. If the time is expired the UART_RXFIFO_TOUT_INT interrupt is triggered. If tout_thresh == 0, the TOUT feature is disabled.

**esp_err_t uart_get_collision_flag** *(uart_port_t uart_num, bool *collision_flag)*

Returns collision detection flag for RS485 mode Function returns the collision detection flag into variable pointed by collision_flag. *collision_flag = true, if collision detected else it is equal to false. This function should be executed when actual transmission is completed (after uart_write_bytes()).

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- **uart_num**: Uart number to configure the max port number is (UART_NUM_MAX -1).
- **collision_flag**: Pointer to variable of type bool to return collision flag.

**esp_err_t uart_set_wakeup_threshold** *(uart_port_t uart_num, int wakeup_threshold)*

Set the number of RX pin signal edges for light sleep wakeup.

UART can be used to wake up the system from light sleep. This feature works by counting the number of positive edges on RX pin and comparing the count to the threshold. When the count exceeds the threshold, system is woken up from light sleep. This function allows setting the threshold value.

Stop bit and parity bits (if enabled) also contribute to the number of edges. For example, letter ‘a’ with ASCII code 97 is encoded as 0100001101 on the wire (with 8n1 configuration), start and stop bits included. This sequence has 3 positive edges (transitions from 0 to 1). Therefore, to wake up the system when ‘a’ is sent, set wakeup_threshold=3.

The character that triggers wakeup is not received by UART (i.e. it can not be obtained from UART FIFO). Depending on the baud rate, a few characters after that will also not be received. Note that when the chip enters and exits light sleep mode, APB frequency will be changing. To make sure that UART has correct baud rate all the time, select REF_TICK as UART clock source, by setting use_ref_tick field in uart_config_t to true.

**Note** in ESP32, the wakeup signal can only be input via IO_MUX (i.e. GPIO3 should be configured as function_1 to wake up UART0, GPIO9 should be configured as function_5 to wake up UART1), UART2 does not support light sleep wakeup feature.

**Return**
- ESP_OK on success
- ESP_ERR_INVALID_ARG if uart_num is incorrect or wakeup_threshold is outside of [3, 0x3ff] range.

**Parameters**
- **uart_num**: UART number, the max port number is (UART_NUM_MAX -1).
• wakeuup_threshold: number of RX edges for light sleep wakeup, value is 3 .. 0x3ff.

\[\text{esp_err_t uart_get_wakeup_threshold (uart_port_t uart_num, int *out_wakeup_threshold)}\]

Get the number of RX pin signal edges for light sleep wakeup.

See description of uart_set_wakeup_threshold for the explanation of UART wakeup feature.

**Return**
- ESP_OK on success
- ESP_ERR_INVALID_ARG if out_wakeup_threshold is NULL

**Parameters**
- \(\text{uart_num}\): UART number, the max port number is (UART_NUM_MAX -1).
- \(\text{[out] out_wakeup_threshold}\): output, set to the current value of wakeuup threshold for the given UART.

\[\text{esp_err_t uart_wait_tx_idle_polling (uart_port_t uart_num)}\]

Wait until UART tx memory empty and the last char send ok (polling mode).

**Return**
- ESP_OK on success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_FAIL Driver not installed

**Parameters**
- \(\text{uart_num}\): UART number

\[\text{esp_err_t uart_set_loop_back (uart_port_t uart_num, bool loop_back_en)}\]

Configure TX signal loop back to RX module, just for the test usage.

**Return**
- ESP_OK on success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_FAIL Driver not installed

**Parameters**
- \(\text{uart_num}\): UART number
- \(\text{loop_back_en}\): Set true to enable the loop back function, else set it false.

\[\text{void uart_set_always_rx_timeout (uart_port_t uart_num, bool always_rx_timeout_en)}\]

Configure behavior of UART RX timeout interrupt.

When always_RX_timeout is true, timeout interrupt is triggered even if FIFO is full. This function can cause extra timeout interrupts triggered only to send the timeout event. Call this function only if you want to ensure timeout interrupt will always happen after a byte stream.

**Parameters**
- \(\text{uart_num}\): UART number
- \(\text{always_rx_timeout_en}\): Set to false enable the default behavior of timeout interrupt, set it to true to always trigger timeout interrupt.

**Structures**

\textbf{struct uart_intr_config_t}

UART interrupt configuration parameters for uart_intr_config function.

**Public Members**

\textbf{uint32_t intr_enable_mask}

UART interrupt enable mask, choose from UART_XXXX_INT_ENA_M under UART_INT_ENA_REG(i), connect with bit-or operator

\textbf{uint8_t rx_timeout_thresh}

UART timeout interrupt threshold (unit: time of sending one byte)
uint8_t txfifo_empty_intr_thresh
  UART TX empty interrupt threshold.

uint8_t rxfifo_full_thresh
  UART RX full interrupt threshold.

struct uart_event_t
  Event structure used in UART event queue.

Public Members

  uart_event_type_t type
    UART event type

  size_t size
    UART data size for UART_DATA event

  bool timeout_flag
    UART data read timeout flag for UART_DATA event (no new data received during configured RX TOUT) If the event is caused by FIFO-full interrupt, then there will be no event with the timeout flag before the next byte coming.

Macros

UART_NUM_0
  UART port 0

UART_NUM_1
  UART port 1

UART_NUM_2
  UART port 2

UART_NUM_MAX
  UART port max

UART_PIN_NO_CHANGE

UART_FIFO_LEN
  Length of the UART HW FIFO.

UART_BITRATE_MAX
  Maximum configurable bitrate.

Type Definitions

typedef intr_handle_t uart_isr_handle_t

Enumerations

enum uart_event_type_t
  UART event types used in the ring buffer.

  Values:

  UART_DATA
    UART data event

  UART_BREAK
    UART break event

  UART_BUFFER_FULL
    UART RX buffer full event

  UART_FIFO_OVF
    UART FIFO overflow event
Chapter 2. API Reference

UART_FRAME_ERR
UART RX frame error event

UART_PARITY_ERR
UART RX parity event

UART_DATA_BREAK
UART TX data and break event

UART_PATTERN_DET
UART pattern detected

UART_WAKEUP
UART wakeup event

UART_EVENT_MAX
UART event max index

Header File
- components/hal/include/hal/uart_types.h

Structures

struct uart_at_cmd_t
UART AT cmd char configuration parameters Note that this function may different on different chip. Please refer to the TRM at configuration.

Public Members

uint8_t cmd_char
UART AT cmd char

uint8_t char_num
AT cmd char repeat number

uint32_t gap_tout
gap time(in baud-rate) between AT cmd char

uint32_t pre_idle
the idle time(in baud-rate) between the non AT char and first AT char

uint32_t post_idle
the idle time(in baud-rate) between the last AT char and the none AT char

struct uart_sw_flowctrl_t
UART software flow control configuration parameters.

Public Members

uint8_t xon_char
Xon flow control char

uint8_t xoff_char
Xoff flow control char

uint8_t xon_thrd
If the software flow control is enabled and the data amount in rxfifo is less than xon_thrd, an xon_char will be sent

uint8_t xoff_thrd
If the software flow control is enabled and the data amount in rxfifo is more than xoff_thrd, an xoff_char will be sent
struct uart_config_t
UART configuration parameters for uart_param_config function.

Public Members

int baud_rate
UART baud rate

uart_word_length_t data_bits
UART byte size

uart_parity_t parity
UART parity mode

uart_stop_bits_t stop_bits
UART stop bits

uart_hw_flowcontrol_t flow_ctrl
UART HW flow control mode (cts/rts)

uint8_t rx_flow_ctl_thresh
UART HW RTS threshold

uart_sclk_t source_clk
UART source clock selection

bool use_ref_tick
Deprecated method to select ref tick clock source, set source_clk field instead

Type Definitions
typedef int uart_port_t
UART port number, can be UART_NUM_0 - (UART_NUM_MAX -1).

Enumerations
enum uart_mode_t
UART mode selection.
Values:

UART_MODE_UART = 0x00
mode: regular UART mode

UART_MODE_RS485_HALF_DUPLEX = 0x01
mode: half duplex RS485 UART mode control by RTS pin

UART_MODE_IRDA = 0x02
mode: IRDA UART mode

UART_MODE_RS485_COLLISION_DETECT = 0x03
mode: RS485 collision detection UART mode (used for test purposes)

UART_MODE_RS485_APP_CTRL = 0x04
mode: application control RS485 UART mode (used for test purposes)

enum uart_word_length_t
UART word length constants.
Values:

UART_DATA_5_BITS = 0x0
word length: 5bits

UART_DATA_6_BITS = 0x1
word length: 6bits
UART_DATA_7_BITS = 0x2
    word length: 7bits
UART_DATA_8_BITS = 0x3
    word length: 8bits
UART_DATA_BITS_MAX = 0x4

enum uart_stop_bits_t
    UART stop bits number.
    Values:
    UART_STOP_BITS_1 = 0x1
        stop bit: 1bit
    UART_STOP_BITS_1_5 = 0x2
        stop bit: 1.5bits
    UART_STOP_BITS_2 = 0x3
        stop bit: 2bits
    UART_STOP_BITS_MAX = 0x4

enum uart_parity_t
    UART parity constants.
    Values:
    UART_PARITY_DISABLE = 0x0
        Disable UART parity
    UART_PARITY_EVEN = 0x2
        Enable UART even parity
    UART_PARITY_ODD = 0x3
        Enable UART odd parity

enum uart_hw_flowcontrol_t
    UART hardware flow control modes.
    Values:
    UART_HW_FLOWCTRL_DISABLE = 0x0
        disable hardware flow control
    UART_HW_FLOWCTRL_RTS = 0x1
        enable RX hardware flow control (rts)
    UART_HW_FLOWCTRL_CTS = 0x2
        enable TX hardware flow control (cts)
    UART_HW_FLOWCTRL_CTS_RTS = 0x3
        enable hardware flow control
    UART_HW_FLOWCTRL_MAX = 0x4

enum uart_signal_inv_t
    UART signal bit map.
    Values:
    UART_SIGNAL_INV_DISABLE = 0
        Disable UART signal inverse
    UART_SIGNAL_IRDA_TX_INV = (0x1 << 0)
        inverse the UART irda_tx signal
    UART_SIGNAL_IRDA_RX_INV = (0x1 << 1)
        inverse the UART irda_rx signal
UART_SIGNAL_RXD_INV = (0x1 << 2)  
inverse the UART rxdsignal
UART_SIGNAL_CTS_INV = (0x1 << 3)  
inverse the UART cts signal
UART_SIGNAL_DSR_INV = (0x1 << 4)  
inverse the UART dsr signal
UART_SIGNAL_TXD_INV = (0x1 << 5)  
inverse the UART txd signal
UART_SIGNAL_RTS_INV = (0x1 << 6)  
inverse the UART rts signal
UART_SIGNAL_DTR_INV = (0x1 << 7)  
inverse the UART dtr signal

enum uart_sclk_t
UART source clock.

Values:

UART_SCLK_APB = 0x0  
UART source clock from APB
UART_SCLK_RTC = 0x1  
UART source clock from RTC
UART_SCLK_XTAL = 0x2  
UART source clock from XTAL

GPIO Lookup Macros  The UART peripherals have dedicated IO_MUX pins to which they are connected directly. However, signals can also be routed to other pins using the less direct GPIO matrix. To use direct routes, you need to know which pin is a dedicated IO_MUX pin for a UART channel. GPIO Lookup Macros simplify the process of finding and assigning IO_MUX pins. You choose a macro based on either the IO_MUX pin number, or a required UART channel name, and the macro will return the matching counterpart for you. See some examples below.

Note: These macros are useful if you need very high UART baud rates (over 40 MHz), which means you will have to use IO_MUX pins only. In other cases, these macros can be ignored, and you can use the GPIO Matrix as it allows you to configure any GPIO pin for any UART function.

1. UART_NUM_2_TXD_DIRECT_GPIO_NUM returns the IO_MUX pin number of UART channel 2 TXD pin (pin 17)
2. UART_GPIO19_DIRECT_CHANNEL returns the UART number of GPIO 19 when connected to the UART peripheral via IO_MUX (this is UART_NUM_0)
3. UART_CTS_GPIO19_DIRECT_CHANNEL returns the UART number of GPIO 19 when used as the UART CTS pin via IO_MUX (this is UART_NUM_0). Similar to the above macro but specifies the pin function which is also part of the IO_MUX assignment.

Header File

- components/soc/esp32s3/include/soc/uart_channel.h

Macros

UART_GPIO1_DIRECT_CHANNEL
UART_NUM_0_TXD_DIRECT_GPIO_NUM
UART_GPIO3_DIRECT_CHANNEL
UART_NUM_0_RXD_DIRECT_GPIO_NUM
2.3.23 USB Device Driver

Overview

The driver allows users to use ESP32-S3 chips to develop USB devices on top the TinyUSB stack. TinyUSB is integrating with ESP-IDF to provide USB features of the framework. Using this driver the chip works as a composite device supporting to represent several USB devices simultaneously. Currently, only the communications device class (CDC) type of the device with the ACM (Abstract Control Model) subclass is supported.
Chapter 2. API Reference

Features

- Configuration of device and string USB descriptors
- USB Serial Device (CDC-ACM)
- Input and output through USB Serial Device

Hardware USB Connection

- Any board with the ESP32-S3 chip with USB connectors or with exposed USB’s D+ and D- (DATA+/DATA-) pins.

If the board has no USB connector but has the pins, connect pins directly to the host (e.g. with do-it-yourself cable from any USB connection cable).

On ESP32-S3, connect GPIO 20 and 19 to D+/D- respectively:

Driver Structure

As the basis is used the TinyUSB stack.

On top of it the driver implements:

- Customization of USB descriptors
- Serial device support
- Redirecting of standard streams through the Serial device
- Encapsulated driver’s task servicing the TinyUSB

Configuration

Via Menuconfig options you can specify:

- Several of descriptor’s parameters (see: Descriptors Configuration below)
- USB Serial low-level Configuration
- The verbosity of the TinyUSB’s log
- Disable the TinyUSB main task (for the custom implementation)

Descriptors Configuration

The driver’s descriptors are provided by the tinyusb_config_t structure’s descriptor and string_descriptor members. Therefore, users should initialize tinyusb_config_t to their desired descriptor before calling tinyusb_driver_install() to install driver.
However, the driver also provides a default descriptor. The driver can be installed with the default descriptor by setting the `descriptor` and `string_descriptor` members of `tinyusb_config_t` to `NULL` before calling `tinyusb_driver_install()`. The driver’s default descriptor is specified using Menuconfig, where the following fields should be configured:

- PID
- VID
- bcdDevice
- Manufacturer
- Product name
- Name of CDC device if it is On
- Serial number

If you want to use own descriptors with extended modification, you can define them during the driver installation process.

**Install Driver**

To initialize the driver, users should call `tinyusb_driver_install()`. The driver’s configuration is specified in a `tinyusb_config_t` structure that is passed as an argument to `tinyusb_driver_install()`.

Note that the `tinyusb_config_t` structure can be zero initialized (e.g. `tinyusb_config_t tusb_cfg = { 0 }`) or partially (as shown below). For any member that is initialized to `0` or `NULL`, the driver will use its default configuration values for that member (see example below)

```c
tinyusb_config_t partial_init = {
    .descriptor = NULL, //Uses default descriptor specified in Menuconfig
    .string_descriptor = NULL, //Uses default string specified in Menuconfig
    .external_phy = false,
}
```

**USB Serial Device (CDC-ACM)**

If the CDC option is enabled in Menuconfig, the USB Serial Device could be initialized with `tusb_cdc_acm_init()` according to the settings from `tinyusb_config_cdcacm_t` (see example below).

```c
tinyusb_config_cdcacm_t amc_cfg = {
    .usb_dev = TINYUSB_USBDEV_0,
    .cdc_port = TINYUSB_CDC_ACM_0,
    .rx_unread_buf_sz = 64,
    .callback_rx = NULL,
    .callback_rx_wanted_char = NULL,
    .callback_line_state_changed = NULL,
    .callback_line_coding_changed = NULL
};
tusb_cdc_acm_init(&amc_cfg);
```

To specify callbacks you can either set the pointer to your `tusb_cdcacm_callback_t` function in the configuration structure or call `tinyusb_cdcacm_register_callback()` after initialization.

**USB Serial Console**  The driver allows to redirect all standard application strings (stdin/out/err) to the USB Serial Device and return them to UART using `esp_tusb_init_console()/esp_tusb_deinit_console()` functions.

**Application Examples**

The table below describes the code examples available in the directory `peripherals/usb/`.

**API Reference**

**Header File**

- `components/tinyusb/additions/include/tinyusb.h`

**Functions**

```c
esp_err_t tinyusb_driver_install(const tinyusb_config_t *config)
```

This is an all-in-one helper function, including:

1. USB device driver initialization
2. Descriptors preparation
3. TinyUSB stack initialization
4. Creates and start a task to handle usb events

**Note** Don’t change Custom descriptor, but if it has to be done, Suggest to define as follows in order to match the Interface Association Descriptor (IAD): bDeviceClass = TUSB_CLASS_MISC, bDeviceSubClass = MISC_SUBCLASS_COMMON,

**Parameters**

- `config`: tinyusb stack specific configuration

**Return Value**

- `ESP_ERR_INVALID_ARG`: Install driver and tinyusb stack failed because of invalid argument
- `ESP_FAIL`: Install driver and tinyusb stack failed because of internal error
- `ESP_OK`: Install driver and tinyusb stack successfully

**Structures**

```c
struct tinyusb_config_t
```

Configuration structure of the tinyUSB core.

**Public Members**

- `tusb_desc_device_t *descriptor`
  Pointer to a device descriptor
- `const char **string_descriptor`
  Pointer to an array of string descriptors
- `bool external_phy`
  Should USB use an external PHY

**Header File**

- `components/tinyusb/additions/include/tinyusb_types.h`

**Macros**

- `USB_ESPRESSIF_VID`
- `USB_STRING_DESCRIPTOR_ARRAY_SIZE`
### Enumerations

**enum tinyusb_usbdev_t**

Values:

- **TINYUSB_USBDEV_0**

### Header File

- components/tinyusb/additions/include/tusb_cdc_acm.h

### Functions

**esp_err_t tusb_cdc_acm_init(const tinyusb_config_cdcacm_t *cfg)**

Initialize CDC ACM. Initialization will be finished with the `tud_cdc_line_state_cb` callback.

- **Return esp_err_t**
- **Parameters**
  - `cfg`: init configuration structure

**esp_err_t tusb_cdcacm_register_callback(tinyusb_cdcacm_itf_t itf, cdcacm_event_type_t event_type, tusb_cdcacm_callback_t callback)**

Register a callback invoking on CDC event. If the callback had been already registered, it will be overwritten.

- **Return esp_err_t**: ESP_OK or ESP_ERR_INVALID_ARG
- **Parameters**
  - `itf`: number of a CDC object
  - `event_type`: type of registered event for a callback
  - `callback`: callback function

**esp_err_t tusb_cdcacm_unregister_callback(tinyusb_cdcacm_itf_t itf, cdcacm_event_type_t event_type)**

Unregister a callback invoking on CDC event.

- **Return esp_err_t**: ESP_OK or ESP_ERR_INVALID_ARG
- **Parameters**
  - `itf`: number of a CDC object
  - `event_type`: type of registered event for a callback

**size_t tinyusb_cdcacm_write_queue_char(tinyusb_cdcacm_itf_t itf, char ch)**

Sent one character to a write buffer.

- **Return size_t**: amount of queued bytes
- **Parameters**
  - `itf`: number of a CDC object
  - `ch`: character to send

**size_t tinyusb_cdcacm_write_queue(tinyusb_cdcacm_itf_t itf, const uint8_t *in_buf, size_t in_size)**

Write data to write buffer from a byte array.

- **Return size_t**: amount of queued bytes
- **Parameters**
  - `itf`: number of a CDC object
  - `in_buf`: a source array
  - `in_size`: size to write from arr_src

**esp_err_t tusb_cdcacm_write_flush(tinyusb_cdcacm_itf_t itf, uint32_t timeout_ticks)**

Send all data from a write buffer. Use `tinyusb_cdcacm_write_queue` to add data to the buffer.

---

WARNING! TinyUSB can block output Endpoint for several RX callbacks, after...

---

...will do additional flush
after the each trasfer. That can leads to the situation when you requested...

---

...a flush, but it will fail until
out of the next callbacks ends.

SO USING OF THE FLUSH WITH TIMEOUTS IN CALLBACKS IS NOT RECOMENDED - YOU...

---

...CAN GET A LOCK FOR THE TIMEOUT
Return esp_err_t - ESP_OK if (timeout_ticks > 0) and and flush was successful, ESP_ERR_TIMEOUT if timeout occurred3 or flush was successful with (timeout_ticks == 0) ESP_FAIL if flush was unsuccessful

Parameters

• if: - number of a CDC object
• timeout_ticks: - waiting until flush will be considered as failed

`esp_err_t tinyusb_cdcacm_read(tinyusb_cdcacm_itf_t itf, uint8_t *out_buf, size_t out_buf_sz, size_t *rx_data_size)`

Read a content to the array, and defines it’s size to the sz_store.

Return esp_err_t ESP_OK, ESP_FAIL or ESP_ERR_INVALID_STATE

Parameters

• if: - number of a CDC object
• out_buf: - to this array will be stored the object from a CDC buffer
• out_buf_sz: - size of buffer for results
• rx_data_size: - to this address will be stored the object’s size

`bool tusb_cdc_acm_initialized(tinyusb_cdcacm_itf_t if)`

Check if the ACM initialized.

Return true or false

Parameters

• if: - number of a CDC object

Structures

`struct cdcacm_event_rx_wanted_char_data_t`

Data provided to the input of the callback_rx_wanted_char callback.

Public Members

char wanted_char

Wanted character

`struct cdcacm_event_line_state_changed_data_t`

Data provided to the input of the callback_line_state_changed callback.

Public Members

bool dtr

Data Terminal Ready (DTR) line state

bool rts

Request To Send (RTS) line state

`struct cdcacm_event_line_coding_changed_data_t`

Data provided to the input of the line_coding_changed callback.

Public Members

const cdc_line_coding_t *p_line_coding

New line coding value

`struct cdcacm_event_t`

Describes an event passing to the input of a callbacks.
Public Members

cdcacm_event_type_t type
    Event type

cdcacm_event_rx_wanted_char_data_t rx_wanted_char_data
    Data input of the callback_rx_wanted_char callback

cdcacm_event_line_state_changed_data_t line_state_changed_data
    Data input of the callback_line_state_changed callback

cdcacm_event_line_coding_changed_data_t line_coding_changed_data
    Data input of the line_coding_changed callback

struct tinyusb_config_cdcacm_t
    Configuration structure for CDC-ACM.

Public Members

tinyusb_usbdev_t usb_dev
    Usb device to set up

tinyusb_cdcacm_if_t cdc_port
    CDC port

size_t rx_unread_buf_sz
    Amount of data that can be passed to the AMC at once

tusb_cdcacm_callback_t callback_rx
    Pointer to the function with the tusb_cdcacm_callback_t type that will be handled as a callback

tusb_cdcacm_callback_t callback_rx_wanted_char
    Pointer to the function with the tusb_cdcacm_callback_t type that will be handled as a callback

tusb_cdcacm_callback_t callback_line_state_changed
    Pointer to the function with the tusb_cdcacm_callback_t type that will be handled as a callback

tusb_cdcacm_callback_t callback_line_coding_changed
    Pointer to the function with the tusb_cdcacm_callback_t type that will be handled as a callback

Type Definitions
typedef void (*tusb_cdcacm_callback_t)(int ift, cdcacm_event_t *event)
    CDC-ACM callback type.

Enumerations
enum tinyusb_cdcacm_if_t
    CDC ports available to setup.

Values:
    TINYUSB_CDC_ACM_0 = 0x0
    TINYUSB_CDC_ACM_1
    TINYUSB_CDC_ACM_MAX

enum cdcacm_event_type_t
    Types of CDC ACM events.

Values:
    CDC_EVENT_RX
    CDC_EVENT_RX_WANTED_CHAR
    CDC_EVENT_LINE_STATE_CHANGED
Chapter 2. API Reference

**CDC_EVENT_LINE_CODING_CHANGED**

**Header File**
- components/tinyusb/additions/include/tusb_console.h

**Functions**

- **esp_err_t esp_tusb_init_console** (int cdc_intf)
  Redirect output to the USB serial.
  
  **Return** esp_err_t - ESP_OK, ESP_FAIL or an error code
  **Parameters**
  - cdc_intf: - interface number of TinyUSB’s CDC

- **esp_err_t esp_tusb_deinit_console** (int cdc_intf)
  Switch log to the default output.
  
  **Return** esp_err_t
  **Parameters**
  - cdc_intf: - interface number of TinyUSB’s CDC

**Header File**
- components/tinyusb/additions/include/tusb_tasks.h

**Functions**

- **esp_err_t tusb_run_task** (void)
  This helper function creates and starts a task which wraps `tud_task()`.
  The wrapper function basically wraps `tud_task` and some log. Default parameters: stack size and priority as configured, argument = NULL, not pinned to any core. If you have more requirements for this task, you can create your own task which calls `tud_task` as the last step.
  
  **Return Value**
  - ESP_OK: run TinyUSB main task successfully
  - ESP_FAIL: run TinyUSB main task failed of internal error
  - ESP_ERR_INVALID_STATE: TinyUSB main task has been created before

- **esp_err_t tusb_stop_task** (void)
  This helper function stops and destroys the task created by `tusb_run_task()`
  
  **Return Value**
  - ESP_OK: stop and desroy TinyUSB main task successfully
  - ESP_ERR_INVALID_STATE: TinyUSB main task hasn’t been created yet

**Header File**
- components/tinyusb/additions/include/vfs_tinyusb.h

**Functions**

- **esp_err_t esp_vfs_tusb_cdc_register** (int cdc_intf, char const *path)
  Register TinyUSB CDC at VFS with path.
  
  **Return** esp_err_t ESP_OK or ESP_FAIL
  **Parameters**
  - cdc_intf: - interface number of TinyUSB’s CDC
  - path: - path where the CDC will be registered, `/dev/tusb_cdc` will be used if left NULL.

- **esp_err_t esp_vfs_tusb_cdc_unregister** (char const *path)
  Unregister TinyUSB CDC from VFS.
  
  **Return** esp_err_t ESP_OK or ESP_FAIL
Chapter 2. API Reference

Parameters
- **path**: path where the CDC will be unregistered if NULL will be used /dev/tusb_cdc

2.3.24 USB Host

**Warning**: The USB Host Library API is a beta version thus is subject to change.

The document provides information regarding the USB Host Library. This document is split into the following sections:

<table>
<thead>
<tr>
<th>Sections</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>USB Host</strong></td>
</tr>
<tr>
<td>- Overview</td>
</tr>
<tr>
<td>- Architecture</td>
</tr>
<tr>
<td>- Usage</td>
</tr>
<tr>
<td>- Examples</td>
</tr>
<tr>
<td>- API Reference</td>
</tr>
</tbody>
</table>

**Overview**

The USB Host Library (hereinafter referred to as the Host Library) is the lowest public facing API layer of the ESP-IDF USB Host Stack. In most cases, applications that require USB Host functionality will not need to interface with the Host Library directly. Instead, most applications will use the API provided by a host class driver that is implemented on top of the Host Library.

However, users may want to use the Host Library directly for some of (but not limited to) the following reasons:

- The user needs to implement a custom host class driver such as a vendor specific class driver
- The user has a requirement for a lower level of abstraction due to resource/latency requirements

**Features & Limitations**

The Host Library has the following features:

- Supports Full Speed (FS) and Low Speed (LS) Devices
- Supports all four transfer types (Control, Bulk, Interrupt, and Isochronous)
- Allows multiple class drivers to run simultaneously (i.e., multiple clients of the Host Library)
- A single device can be used by multiple clients simultaneously (e.g., composite devices)
- The Host Library itself (and the underlying Host Stack) does not internally instantiate any OS tasks. The number of tasks are entirely controlled by how the Host Library interface is used. However, a general rule of thumb regarding the number of tasks is *(the number of host class drivers running + 1)*.

Currently, the Host Library (and the underlying Host Stack) has the following limitations:

- Only supports a single device, but the Host Library’s API is designed for multiple device support.
- Only supports Asynchronous transfers
- Transfer timeouts are not supported yet

**Architecture**

The diagram above shows the key entities that are involved when implementing USB Host functionality. These entities are:

- The **Host Library**
- **Clients** of the Host Library
- **Devices**
The Host Library is the lowest public facing layer of the USB Host Stack. Any other IDF component (such as a class driver or a user component) that needs to communicate with a connected USB device can only do so using the Host Library API either directly or indirectly.

The Host Library’s API is split into two sub-sets, namely the **Library API** and **Client API**.

- The Client API handles the communication between a client of the Host Library and one or more USB devices. The Client API should only be called by registered clients of the Host Library.
- The Library API handles all of the Host Library processing that is not specific to a single client (e.g., device enumeration). Usually, the library API is called by a Host Library Daemon Task.

**Clients** A client of the Host Library is a software component (such as a host class driver or user component) that uses the Host Library to communicate with a USB device. Generally each client has a one-to-one relation with a task, meaning that for a particular client, all of its Client API calls should be done from the context of the same task.

By organizing the software components that use the Host Library’s into clients, the Host Library can delegate the handling of all client events (i.e., the events specific to that client) to the client’s task. In other words, each client task is responsible for all the required processing and event handling associated with the USB communication that the client initiates.

**Daemon Task** Although the Host Library delegates the handling of client events to the clients themselves, there are still Library events (i.e., events that are not specific to a client) that need to be handled. Library event handling can include things such as:

- Handling USB device connection, enumeration, and disconnection
- Rerouting control transfers to/from clients
- Forwarding events to clients

Therefore, in addition to the client tasks, the Host Library also requires a task (usually the Host Library Daemon Task) to handle all of the library events.
Devices  The Host Library hides the details of device handling (such as connection, memory allocation, and enumeration) from the clients. The clients are provided only with a list of already connected and enumerated devices to choose from. During enumeration, each device is configured to use configuration 1.

It is possible for a two or more clients to simultaneously communicate with the same device as long as they are not communicating to the same interface. However, multiple clients can simultaneously communicate with the same device’s default endpoint (EP0), which will result in their control transfers being serialized.

For a client to communicate with a device, the client must:

1. Open the device using the device’s address. This lets the Host Library know that the client is using that device.
2. Claim the interface(s) that will be used for communication. This prevents other clients from claiming the same interface(s).
3. Send transfers to the endpoints in the claimed interface. The client’s task is responsible for handling its own processing and events.

Usage

The Host Library (and the underlying Host Stack) will not create any tasks. All tasks (i.e., the client tasks and the Daemon Task) will need to be created by the class drivers or the user. Instead, the Host Library provides two event handler functions that will handle all of the required Host Library processing, thus these functions should be called repeatedly from the client tasks and the Daemon Task. Therefore, the implementation of client tasks and the Daemon Task will be the largely centered around the invocation of these event handler functions.

Host Library & Daemon Task

Basic Usage  The Host Library API provides `usb_host_lib_handle_events()` to handle library events. This function should be called repeatedly, typically from the daemon task. Some notable features regarding `usb_host_lib_handle_events()` are:

- The function can block until a library event needs handling
- Event flags are returned on each invocation. These event flags are useful for knowing when the Host Library can be uninstalled.

A bare-bones Daemon Task would resemble something like the following code snippet:

```c
#include "usb/usb_host.h"

void daemon_task(void *arg)
{
    ...  
    bool exit = false;
    while (!exit) {
        uint32_t event_flags;
        usb_host_lib_handle_events(portMAX_DELAY, &event_flags);
        if (event_flags & USB_HOST_LIB_EVENT_FLAGS_NO_CLIENTS) {
            ...  
        }
        if (event_flags & USB_HOST_LIB_EVENT_FLAGS_ALL_FREE) {
            ...  
        }
        ...  
    }
    ...  
}
```

Note:  See the peripherals/usb/host/usb_host_lib example for a full implementation of the Daemon Task
The graph above illustrates the typical lifecycle of the Host Library with multiple clients and devices. Specifically, the example involves:

- two registered clients (Client 1 and Client 2)
- two connected devices (Device 1 and Device 2), where Client 1 communicates with Device 1 and Client 2 communicates with Device 2.

With reference the graph above, the typical lifecycle involves the following key stages.

1. **The Host Library is installed by calling `usb_host_install()`**.
   - Installation must be done before any other Host Library API is called.
   - Where `usb_host_install()` is called (e.g., from the Daemon Task or another task) will depend on the synchronization logic between the Daemon Task, client tasks, and the rest of the system.

2. **Once the Host Library is installed, the clients can be registered by calling `usb_host_client_register()`**.
   - This is typically called from the client task (where the client task waits for a signal from the Daemon Task).
   - This can be called elsewhere if necessary as long it is called after `usb_host_install()`.

3. **Device 1 connects and is then enumerated**.
   - Each registered client (in this case Client 1 and Client 2) are notified of the new device by way of the `USB_HOST_CLIENT_EVENT_NEW_DEV` event.
   - Client 1 opens Device 1 and begins communication with it.

4. **Similarly Device 2 connects and is enumerated**.
   - Client 1 and 2 are notified of a new device (via a `USB_HOST_CLIENT_EVENT_NEW_DEV` event).
   - Client 2 opens Device 2 and begins communication with it.

5. **Device 1 suddenly disconnects**.
   - Client 1 is notified by way of `USB_HOST_CLIENT_EVENT_DEV_GONE` and begins its cleanup.
   - Client 2 is not notified as it has not opened Device 1.

6. **Client 1 completes its clean up and deregisters by calling `usb_host_client_deregister()`**.
   - This is typically called from the client task before the task exits.
   - This can be called elsewhere if necessary as long as Client 1 has already completed its clean up.

7. **Client 2 completes its communication with Device 2. Client 2 then closes Device 2 and deregisters itself**.
   - The Daemon Task is notified of the deregistration of all clients by way the `USB_HOST_LIB_EVENT_FLAGS_NO_CLIENTS` event flag as Client 2 is the last client to deregister.
   - Device 2 is still allocated (i.e., not freed) as it is still connected albeit not currently opened by any client.

8. **The Daemon Task decides to cleanup as there are no more clients**.
   - The Daemon Task must free Device 2 first by calling `usb_host_device_free_all()`.
   - If `usb_host_device_free_all()` was able to free all devices, the function will return `ESP_OK` indicating that all devices have been freed.
• If `usb_host_device_free_all()` was unable to free all devices (e.g., because the device is still opened by a client), the function will return `ESP_ERR_NOT_FINISHED`.
• The Daemon Task must wait for `usb_host_lib_handle_events()` to return the `USB_HOST_LIB_EVENT_FLAGS_ALL_FREE` event flag in order to know when all devices have been freed.

9. Once the Daemon Task has verified that all clients have deregistered and all devices have been freed, it can now uninstall the Host Library by calling `usb_host_uninstall()`.

Clients & Class Driver

**Basic Usage** The Host Library API provides `usb_host_client_handle_events()` to handle a particular client’s events. This function should be called repeatedly, typically from the client’s task. Some notable features regarding `usb_host_client_handle_events()` are:

- The function can block until a client event needs handling
- The function’s primary purpose is to call the various event handling callbacks when a client event occurs.

The following callbacks are called from within `usb_host_client_handle_events()` thus allowing the client task to be notified of events.

- The client event callback of type `usb_host_client_event_cb_t` which delivers client event messages to the client. Client event messages indicate events such as the addition or removal of a device.
- The USB transfer completion callback of type `usb_transfer_cb_t` which indicates that a particular USB transfer previously submitted by the client has completed.

**Note:** Given that the callbacks are called from within `usb_host_client_handle_events()`, users should avoid blocking from within the callbacks as this will result in `usb_host_client_handle_events()` being blocked as well, thus preventing other pending client events from being handled.

The following code snippet demonstrates a bare-bones host class driver and its client task. The code snippet contains:

- A simple client task function `client_task` that calls `usb_host_client_handle_events()` in a loop.
- Implementations of a client event callback and transfer completion callbacks.
- Implementation of a simple state machine for the class driver. The class driver simply opens a device, sends an OUT transfer to EP1, then closes the device.

```c
#include <string.h>
#include "usb/usb_host.h"

#define CLASS_DRIVER_ACTION_OPEN_DEV 0x01
#define CLASS_DRIVER_ACTION_TRANSFER 0x02
#define CLASS_DRIVER_ACTION_CLOSE_DEV 0x03

struct class_driver_control {
    uint32_t actions;
    uint8_t dev_addr;
    usb_host_client_handle_t client_hdl;
    usb_device_handle_t dev_hdl;
};

static void client_event_cb(const usb_host_client_event_msg_t *event_msg, void *arg) {
    struct class_driver_control *class_driver_obj = (struct class_driver_control *)arg;
    switch (event_msg->event) {
```
case USB_HOST_CLIENT_EVENT_NEW_DEV:
    class_driver_obj->actions |= CLASS_DRIVER_ACTION_OPEN_DEV;
    class_driver_obj->dev_addr = event_msg->new_dev.address; // Store the address of the new device
    break;

case USB_HOST_CLIENT_EVENT_DEV_GONE:
    class_driver_obj->actions |= CLASS_DRIVER_ACTION_CLOSE_DEV;
    break;

default:
    break;
}

static void transfer_cb(usb_transfer_t *transfer)
{
    // This is function is called from within usb_host_client_handle_events(). Don't block and try to keep it short
    struct class_driver_control *class_driver_obj = (struct class_driver_control_ * transfer->context;
    printf("Transfer status %d, actual number of bytes transferred %d\n", transfer->status, transfer->actual_num_bytes);
    class_driver_obj->actions |= CLASS_DRIVER_ACTION_CLOSE_DEV;
}

void client_task(void *arg)
{
    ... // Wait until Host Library is installed
    // Initialize class driver objects
    struct class_driver_control class_driver_obj = {0};
    // Register the client
    usb_host_client_config_t client_config = {
        .is_synchronous = false,
        .max_num_event_msg = 5,
        .async = {
            .client_event_callback = client_event_cb,
            .callback_arg = &class_driver_obj,
        },
    };
    usb_host_client_register(&client_config, &class_driver_obj.client_hdl);
    // Allocate a USB transfer
    usb_transfer_t *transfer;
    usb_host_transfer_alloc(1024, 0, &transfer);

    // Event handling loop
    bool exit = false;
    while (!exit) {
        // Call the client event handler function
        usb_host_client_handle_events(class_driver_obj.client_hdl, portMAX_DELAY);
        // Execute pending class driver actions
        if (class_driver_obj.actions & CLASS_DRIVER_ACTION_OPEN_DEV) {
            // Open the device and claim interface 1
            usb_host_device_open(class_driver_obj.client_hdl, class_driver_obj.dev_addr, &class_driver_obj.dev_hdl);
            usb_host_interface_claim(class_driver_obj.client_hdl, class_driver_obj.dev_hdl, 1, 0);
        }
        if (class_driver_obj.actions & CLASS_DRIVER_ACTION_TRANSFER) {
            // Send an OUT transfer to EP1
            memset(transfer->data_buffer, 0xAA, 1024);
            transfer->num_bytes = 1024;
            transfer->device_handle = class_driver_obj.dev_hdl;
        }
    }
}
transfer->bEndpointAddress = 0x01;
transfer->callback = transfer_cb;
transfer->context = (void *)&class_driver_obj;
usb_host_transfer_submit(transfer);
}
if (class_driver_obj.actions & CLASS_DRIVER_ACTION_CLOSE_DEV) {
    //Release the interface and close the device
    usb_host_interface_release(class_driver_obj.client_hdl, class_driver_obj.dev_hdl);
    usb_host_device_close(class_driver_obj.client_hdl, class_driver_obj.dev_hdl);
    exit = true;
}
... //Handle any other actions required by the class driver

//Cleanup class driver
usb_host_transfer_free(transfer);
usb_host_client_deregister(class_driver_obj.client_hdl);
... //Delete the task and any other signal Daemon Task if required

Note: An actual host class driver will likely supported many more features, thus will have a much more complex state machine. A host class driver will likely also need to:

- Be able to open multiple devices
- Parse an opened device’s descriptors to identify if the device is of the target class
- Communicate with multiple endpoints of an interface in a particular order
- Claim multiple interfaces of a device
- Handle various errors

Lifecycle The typical life cycle of a client task and class driver will go through the following stages:

1. Wait for some signal regarding the Host Library being installed.
2. Register the client via `usb_host_client_register()` and allocate any other class driver resources (e.g., allocating transfers using `usb_host_transfer_alloc()`).
3. For each new device that the class driver needs to communicate with:
   a. Check if the device is already connected via `usb_host_device_addr_list_fill()`.
   b. If the device is not already connected, wait for a USB_HOST_CLIENT_EVENT_NEW_DEV event from the client event callback.
   c. Open the device via `usb_host_device_open()`.
   d. Parse the device and configuration descriptors via `usb_host_get_device_descriptor()` and `usb_host_get_active_config_descriptor()` respectively.
   e. Claim the necessary interfaces of the device via `usb_host_interface_claim()`.
4. Submit transfers to the device via `usb_host_transfer_submit()` or `usb_host_transfer_submit_control()`.
5. Once an opened device is no longer needed by the class driver, or has disconnected (as indicated by a USB_HOST_CLIENT_EVENT_DEV_GONE event):
   a. Stop any previously submitted transfers to the device’s endpoints by calling `usb_host_endpoint_halt()` and `usb_host_endpoint_flush()` on those endpoints.
   b. Release all previously claimed interfaces via `usb_host_interface_release()`.
   c. Close the device via `usb_host_device_close()`.
6. Deregister the client via `usb_host_client_deregister()` and free any other class driver resources.
7. Delete the client task. Signal the Daemon Task if necessary.
Chapter 2. API Reference

Examples

Host Library Examples  The peripherals/usb/host/usb_host_lib demonstrates basic usage of the USB Host Library’s API to implement a pseudo class driver.

Class Driver Examples  The USB Host Stack provides a number of examples that implement host class drivers using the Host Library’s API.

CDC-ACM

• A host class driver for the Communication Device Class (Abstract Control Model) is currently implemented as an example component (found via peripherals/usb/host/cdc/common/cdc_acm_host).
• The peripherals/usb/host/cdc/cdc_acm_host example uses the CDC-ACM host driver component to communicate with CDC-ACM devices
• The peripherals/usb/host/cdc/cdc_acm_bg96 example uses the CDC-ACM host driver component to communicate with non-compliant CDC-ACM devices (i.e., vendor-specific classes that support a subset of CDC-ACM features) such as the Quectel BG96 modem.

MSC

• A host class driver for the Mass Storage Class (Bulk-Only Transport) is currently implemented as an example found via peripherals/usb/host/msc.

API Reference

The API of the USB Host Library is separated into the following header files. However, it is sufficient for applications to only #include "usb/usb_host.h" and all of USB Host Library headers will also be included.

• usb/include/usb/usb_host.h contains the functions and types of the USB Host Library
• usb/include/usb/usb_helpers.h contains various helper functions that are related to the USB protocol such as descriptor parsing.
• usb/include/usb/usb_types_stack.h contains types that are are used across multiple layers of the USB Host stack.
• usb/include/usb/usb_types_ch9.h contains types and macros related to Chapter 9 of the USB2.0 specification (i.e., descriptors and standard requests).

Header File

• components/usb/include/usb/usb_host.h

Functions

esp_err_t usb_host_install (const usb_host_config_t *config)
Install the USB Host Library.
• This function should only once to install the USB Host Library
• This function should be called before any other USB Host Library functions are called

Note  If skip_phy_setup is set in the install configuration, the user is responsible for ensuring that the underlying Host Controller is enabled and the USB PHY (internal or external) is already setup before this function is called.

Return  esp_err_t

Parameters
• [in] config: USB Host Library configuration

esp_err_t usb_host_uninstall (void)
Uninstall the USB Host Library.
• This function should be called to uninstall the USB Host Library, thereby freeing its resources
Chapter 2. API Reference

- All clients must have been deregistered before calling this function
- All devices must have been freed by calling usb_host_device_free_all() and receiving the USB_HOST_LIB_EVENT_FLAGS_ALL_FREE event flag

**Note** If skip_phy_setup was set when the Host Library was installed, the user is responsible for disabling the underlying Host Controller and USB PHY (internal or external).

**Return** esp_err_t

```c
esp_err_t usb_host_lib_handle_events (TickType_t timeout_ticks, uint32_t *event_flags_ret)
```

Handle USB Host Library events.

- This function handles all of the USB Host Library’s processing and should be called repeatedly in a loop
- Check event_flags_ret to see if an flags are set indicating particular USB Host Library events
- This function should never be called by multiple threads simultaneously

**Note** This function can block

**Return** esp_err_t

**Parameters**

- [in] timeout_ticks: Timeout in ticks to wait for an event to occur
- [out] event_flags_ret: Event flags that indicate what USB Host Library event occurred.

```c
esp_err_t usb_host_lib_unblock (void)
```

Unblock the USB Host Library handler.

- This function simply unblocks the USB Host Library event handling function (usb_host_lib_handle_events())

**Return** esp_err_t

```c
esp_err_t usb_host_lib_info (usb_host_lib_info_t *info_ret)
```

Get current information about the USB Host Library.

**Return** esp_err_t

**Parameters**

- [out] info_ret: USB Host Library Information

```c
esp_err_t usb_host_client_register (const usb_host_client_config_t *client_config,
                                 usb_host_client_handle_t *client_hdl_ret)
```

Register a client of the USB Host Library.

- This function registers a client of the USB Host Library
- Once a client is registered, its processing function usb_host_client_handle_events() should be called repeatedly

**Return** esp_err_t

**Parameters**

- [in] client_config: Client configuration
- [out] client_hdl_ret: Client handle

```c
esp_err_t usb_host_client_deregister (usb_host_client_handle_t client_hdl)
```

Deregister a USB Host Library client.

- This function deregisters a client of the USB Host Library
- The client must have closed all previously opened devices before attempting to deregister

**Return** esp_err_t

**Parameters**

- [in] client_hdl: Client handle

```c
esp_err_t usb_host_client_handle_events (usb_host_client_handle_t client_hdl, TickType_t timeout_ticks)
```

USB Host Library client processing function.

- This function handles all of a client’s processing and should be called repeatedly in a loop
- For a particular client, this function should never be called by multiple threads simultaneously

**Note** This function can block

**Return** esp_err_t
Chapter 2. API Reference

Parameters
  • [in] client_hdl: Client handle
  • [in] timeout_ticks: Timeout in ticks to wait for an event to occur

\texttt{esp_err_t usb_host_client_unblock(usb_host_client_handle_t client_hdl)}

Unblock a client.

  • This function simply unblocks a client if it is blocked on the usb_host_client_handle_events() function.
  • This function is useful when need to unblock a client in order to deregister it.

Return esp_err_t

Parameters
  • [in] client_hdl: Client handle

\texttt{esp_err_t usb_host_device_open(usb_host_client_handle_t client_hdl, uint8_t dev_addr, usb_device_handle_t *dev_hdl_ret)}

Open a device.

  • This function allows a client to open a device
  • A client must open a device first before attempting to use it (e.g., sending transfers, device requests etc.)

Return esp_err_t

Parameters
  • [in] client_hdl: Client handle
  • [in] dev_addr: Device’s address
  • [out] dev_hdl_ret: Device’s handle

\texttt{esp_err_t usb_host_device_close(usb_host_client_handle_t client_hdl, usb_device_handle_t dev_hdl)}

Close a device.

  • This function allows a client to close a device
  • A client must close a device after it has finished using the device (claimed interfaces must also be released)
  • A client must close all devices it has opened before deregistering

Note This function can block

Return esp_err_t

Parameters
  • [in] client_hdl: Client handle
  • [in] dev_hdl: Device handle

\texttt{esp_err_t usb_host_device_free_all(void)}

Indicate that all devices can be freed when possible.

  • This function marks all devices as waiting to be freed
  • If a device is not opened by any clients, it will be freed immediately
  • If a device is opened by at least one client, the device will be free when the last client closes that device.
  • Wait for the USB_HOST_LIB_EVENT_FLAGS_ALL_FREE flag to be set by usb_host_lib_handle_events() in order to know when all devices have been freed
  • This function is useful when cleaning up devices before uninstalling the USB Host Library

Return
  • ESP_ERR_NOT_FINISHED: There are one or more devices that still need to be freed. Wait for USB_HOST_LIB_EVENT_FLAGS_ALL_FREE event
  • ESP_OK: All devices already freed (i.e., there were no devices)
  • Other: Error

\texttt{esp_err_t usb_host_device_addr_list_fill(int list_len, uint8_t *dev_addr_list, int *num_dev_ret)}

Fill a list of device address.

  • This function fills an empty list with the address of connected devices
  • The Device addresses can then used in usb_host_device_open()
  • If there are more devices than the list_len, this function will only fill up to list_len number of devices

Return esp_err_t
Parameters
• [in] list_len: Length of the empty list
• [inout] dev_addr_list: Empty list to be filled
• [out] num_dev_ret: Number of devices

esp_err_t usb_host_device_info(usb_device_handle_t dev_hdl, usb_device_info_t *dev_info)
Get device’s information.
• This function gets some basic information of a device
• The device must be opened first before attempting to get its information

Note
This function can block
Return esp_err_t
Parameters
• [in] dev_hdl: Device handle
• [out] dev_info: Device information

Note
This function can block
Parameters
• [in] dev_hdl: Device handle
• [out] device_desc: Device descriptor

esp_err_t usb_host_get_active_config_descriptor(usb_device_handle_t dev_hdl, const usb_config_desc_t **config_desc)
Get device’s active configuration descriptor.
• A client must call usb_host_device_open() first
• No control transfer is sent. The device’s active configuration descriptor is cached on enumeration
• This function simple returns a pointer to the cached descriptor

Note
No control transfer is sent. A device’s active configuration descriptor is cached on enumeration
Return esp_err_t
Parameters
• [in] dev_hdl: Device handle
• [out] config_desc: Configuration descriptor

sp_err_t usb_host_interface_claim(usb_host_client_handle_t client_hdl, usb_device_handle_t dev_hdl, uint8_t bInterfaceNumber, uint8_t bAlternateSetting)
Function for a client to claim a device’s interface.
• A client must claim a device’s interface before attempting to communicate with any of its endpoints
• Once an interface is claimed by a client, it cannot be claimed by any other client.

Note
This function can block
Return esp_err_t
Parameters
• [in] client_hdl: Client handle
• [in] dev_hdl: Device handle
• [in] bInterfaceNumber: Interface number
• [in] bAlternateSetting: Interface alternate setting number

esp_err_t usb_host_interface_release(usb_host_client_handle_t client_hdl, usb_device_handle_t dev_hdl, uint8_t bInterfaceNumber)
Function for a client to release a previously claimed interface.
A client should release a device’s interface after it no longer needs to communicate with the interface.
A client must release all of its interfaces of a device it has claimed before being able to close the device.

**Note** This function can block

**Return** `esp_err_t`

**Parameters**
- `[in] client_hdl`: Client handle
- `[in] dev_hdl`: Device handle
- `[in] bInterfaceNumber`: Interface number

```c
esp_err_t usb_host_endpoint_halt(usb_device_handle_t dev_hdl, uint8_t bEndpointAddress)
```

Halt a particular endpoint.

- The device must have been opened by a client
- The endpoint must be part of an interface claimed by a client
- Once halted, the endpoint must be cleared using `usb_host_endpoint_clear()` before it can communicate again

**Note** This function can block

**Return** `esp_err_t`

**Parameters**
- `dev_hdl`: Device handle
- `bEndpointAddress`: Endpoint address

```c
esp_err_t usb_host_endpoint_flush(usb_device_handle_t dev_hdl, uint8_t bEndpointAddress)
```

Flush a particular endpoint.

- The device must have been opened by a client
- The endpoint must be part of an interface claimed by a client
- The endpoint must have been halted (either through a transfer error, or `usb_host_endpoint_halt()`)
- Flushing an endpoint will cause any queued up transfers to be canceled

**Note** This function can block

**Return** `esp_err_t`

**Parameters**
- `dev_hdl`: Device handle
- `bEndpointAddress`: Endpoint address

```c
esp_err_t usb_host_endpoint_clear(usb_device_handle_t dev_hdl, uint8_t bEndpointAddress)
```

Clear a halt on a particular endpoint.

- The device must have been opened by a client
- The endpoint must be part of an interface claimed by a client
- The endpoint must have been halted (either through a transfer error, or `usb_host_endpoint_halt()`)
- If the endpoint has any queued up transfers, clearing a halt will resume their execution

**Note** This function can block

**Return** `esp_err_t`

**Parameters**
- `dev_hdl`: Device handle
- `bEndpointAddress`: Endpoint address

```c
esp_err_t usb_host_transfer_alloc(size_t data_buffer_size, int num_isoc_packets, usb_transfer_t **transfer)
```

Allocate a transfer object.

- This function allocates a transfer object
- Each transfer object has a fixed sized buffer specified on allocation
- A transfer object can be re-used indefinitely
- A transfer can be submitted using `usb_host_transfer_submit()` or `usb_host_transfer_submit_control()`

**Return** `esp_err_t`

**Parameters**
- `[in] data_buffer_size`: Size of the transfer’s data buffer
Chapter 2. API Reference

- [in] num_isoc_packets: Number of isochronous packets in transfer (set to 0 for non-isochronous transfers)
- [out] transfer: Transfer object

```c
esp_err_t usb_host_transfer_free(usb_transfer_t *transfer)
```
Free a transfer object.

- Free a transfer object previously allocated using usb_host_transfer_alloc()
- The transfer must not be in-flight when attempting to free it
- If a NULL pointer is passed, this function will simply return ESP_OK

Return: esp_err_t
Parameters
- [in] transfer: Transfer object

```c
esp_err_t usb_host_transfer_submit(usb_transfer_t *transfer)
```
Submit a non-control transfer.

- Submit a transfer to a particular endpoint. The device and endpoint number is specified inside the transfer
- The transfer must be properly initialized before submitting
- On completion, the transfer’s callback will be called from the client’s usb_host_client_handle_events() function.

Return: esp_err_t
Parameters
- [in] transfer: Initialized transfer object

```c
esp_err_t usb_host_transfer_submit_control(usb_host_client_handle_t client_hdl, ush_transfer_t *transfer)
```
Submit a control transfer.

- Submit a control transfer to a particular device. The client must have opened the device first
- The transfer must be properly initialized before submitting. The first 8 bytes of the transfer’s data buffer should contain the control transfer setup packet
- On completion, the transfer’s callback will be called from the client’s usb_host_client_handle_events() function.

Return: esp_err_t
Parameters
- [in] client_hdl: Client handle
- [in] transfer: Initialized transfer object

Structures
```c
struct usb_host_client_event_msg_t
```
Client event message.

Client event messages are sent to each client of the USB Host Library in order to notify them of various USB Host Library events such as:

- Addition of new devices
- Removal of existing devices

Note: The event message structure has a union with members corresponding to each particular event. Based on the event type, only the relevant member field should be accessed.

Public Members
```c
usb_host_client_event_t event
```
Type of event

```c
uint8_t address
```
New device’s address
**usb_device_handle_t** `dev_hdl`

The handle of the device that was gone

**struct usb_host_lib_info_t**

Current information about the USB Host Library obtained via `usb_host_lib_info()`

**Public Members**

- `int num_devices`
  Current number of connected (and enumerated) devices
- `int num_clients`
  Current number of registered clients

**struct usb_host_config_t**

USB Host Library configuration.

Configuration structure of the USB Host Library. Provided in the `usb_host_install()` function

**Public Members**

- `bool skip_phy_setup`
  If set, the USB Host Library will not configure the USB PHY thus allowing the user to manually configure the USB PHY before calling `usb_host_install()`. Users should set this if they want to use an external USB PHY. Otherwise, the USB Host Library will automatically configure the internal USB PHY
- `int intr_flags`
  Interrupt flags for the underlying ISR used by the USB Host stack

**struct usb_host_client_config_t**

USB Host Library Client configuration.

Configuration structure for a USB Host Library client. Provided in `usb_host_client_register()`

**Public Members**

- `bool is_synchronous`
  Whether the client is asynchronous or synchronous or not. Set to false for now.
- `int max_num_event_msg`
  Maximum number of event messages that can be stored (e.g., 3)
- `usb_host_client_event_cb_t client_event_callback`
  Client’s event callback function
- `void *callback_arg`
  Event callback function argument

**Macros**

- `USB_HOST_LIB_EVENT_FLAGS_NO_CLIENTS`
  All clients have been deregistered from the USB Host Library
- `USB_HOST_LIB_EVENT_FLAGS_ALL_FREE`
  The USB Host Library has freed all devices

**Type Definitions**

- `typedef struct usb_host_client_handle_s *usb_host_client_handle_t`
  Handle to a USB Host Library asynchronous client.
  An asynchronous client can be registered using `usb_host_client_register()`

  **Note** Asynchronous API
typedef void (*usb_host_client_event_cb_t)(const usb_host_client_event_msg_t *event_msg, void *arg)

Client event callback.
• Each client of the USB Host Library must register an event callback to receive event messages from the USB Host Library.
• The client event callback is run from the context of the clients usb_host_client_handle_events() function

Enumerations
enum usb_host_client_event_t
The type event in a client event message.
Values:
USB_HOST_CLIENT_EVENT_NEW_DEV
A new device has been enumerated and added to the USB Host Library
USB_HOST_CLIENT_EVENT_DEV_GONE
A device opened by the client is now gone

Header File
• components/usb/include/usb/usb_helpers.h

Functions
const usb_standard_desc_t *usb_parse_next_descriptor(const usb_standard_desc_t *cur_desc, uint16_t wTotalLength, int *offset)
Get the next descriptor.
Given a particular descriptor within a full configuration descriptor, get the next descriptor within the configuration descriptor. This is a convenience function that can be used to walk each individual descriptor within a full configuration descriptor.

Return usb_standard_desc_t* Next descriptor, NULL if end of configuration descriptor reached

Parameters
• [in] cur_desc: Current descriptor
• [in] wTotalLength: Total length of the configuration descriptor
• [inout] offset: Byte offset relative to the start of the configuration descriptor. On input, it is the offset of the current descriptor. On output, it is the offset of the returned descriptor.

const usb_standard_desc_t *usb_parse_next_descriptor_of_type(const usb_standard_desc_t *cur_desc, uint16_t wTotalLength, uint8_t bDescriptorType, int *offset)
Get the next descriptor of a particular type.
Given a particular descriptor within a full configuration descriptor, get the next descriptor of a particular type (i.e., using the bDescriptorType value) within the configuration descriptor.

Return usb_standard_desc_t* Next descriptor, NULL if end descriptor is not found or configuration descriptor reached

Parameters
• [in] cur_desc: Current descriptor
• [in] wTotalLength: Total length of the configuration descriptor
• [in] bDescriptorType: Type of the next descriptor to get
• [inout] offset: Byte offset relative to the start of the configuration descriptor. On input, it is the offset of the current descriptor. On output, it is the offset of the returned descriptor.
### Chapter 2. API Reference

```c
int usb_parse_interface_number_of_alternate(const usb_config_desc_t *config_desc, uint8_t bInterfaceNumber)
```

Get the number of alternate settings for a bInterfaceNumber.

Given a particular configuration descriptor, for a particular bInterfaceNumber, get the number of alternate settings available for that interface (i.e., the max possible value of bAlternateSetting for that bInterfaceNumber).

**Return** int The number of alternate settings that the interface has, -1 if bInterfaceNumber not found

**Parameters**
- [in] config_desc: Pointer to the start of a full configuration descriptor
- [in] bInterfaceNumber: Interface number

```c
const usb_intf_desc_t *usb_parse_interface_descriptor(const usb_config_desc_t *config_desc, uint8_t bInterfaceNumber, uint8_t bAlternateSetting, int *offset)
```

Get a particular interface descriptor (using bInterfaceNumber and bAlternateSetting)

Given a full configuration descriptor, get a particular interface descriptor.

**Note** To get the number of alternate settings for a particular bInterfaceNumber, call `usb_parse_interface_number_of_alternate()`

**Return** const usb_intf_desc_t* Pointer to interface descriptor, NULL if not found.

**Parameters**
- [in] config_desc: Pointer to the start of a full configuration descriptor
- [in] bInterfaceNumber: Interface number
- [in] bAlternateSetting: Alternate setting number
- [out] offset: Byte offset of the interface descriptor relative to the start of the configuration descriptor. Can be NULL.

```c
const usb_ep_desc_t *usb_parse_endpoint_descriptor_by_index(const usb_intf_desc_t *intf_desc, int index, uint16_t wTotalLength, int *offset)
```

Get an endpoint descriptor within an interface descriptor.

Given an interface descriptor, get the Nth endpoint descriptor of the interface. The number of endpoints in an interface is indicated by the bNumEndpoints field of the interface descriptor.

**Note** If bNumEndpoints is 0, it means the interface uses the default endpoint only

**Return** const usb_ep_desc_t* Pointer to endpoint descriptor, NULL if not found.

**Parameters**
- [in] intf_desc: Pointer to the start of an interface descriptor
- [in] index: Endpoint index
- [in] wTotalLength: Total length of the containing configuration descriptor
- [inout] offset: Byte offset relative to the start of the configuration descriptor. On input, it is the offset of the interface descriptor. On output, it is the offset of the endpoint descriptor.

```c
const usb_ep_desc_t *usb_parse_endpoint_descriptor_by_address(const usb_config_desc_t *config_desc, uint8_t bInterfaceNumber, uint8_t bAlternateSetting, uint8_t bEndpointAddress, int *offset)
```

Get an endpoint descriptor based on an endpoint’s address.

Given a configuration descriptor, get an endpoint descriptor based on it’s bEndpointAddress, bAlternateSetting, and bInterfaceNumber.

**Return** const usb_ep_desc_t* Pointer to endpoint descriptor, NULL if not found.

**Parameters**
- [in] config_desc: Pointer to the start of a full configuration descriptor
• [in] bInterfaceNumber: Interface number
• [in] bAlternateSetting: Alternate setting number
• [in] bEndpointAddress: Endpoint address
• [out] offset: Byte offset of the endpoint descriptor relative to the start of the configuration descriptor. Can be NULL.

```c
void usb_print_device_descriptor(const usb_device_desc_t *devc_desc)
```

Print device descriptor.

**Parameters**
- devc_desc: Device descriptor

```c
void usb_print_config_descriptor(const usb_config_desc_t *cfg_desc,
                               print_class_descriptor_cb class_specific_cb)
```

Print configuration descriptor.

- This function prints the full contents of a configuration descriptor (including interface and endpoint descriptors)
- When a non-standard descriptor is encountered, this function will call the class_specific_cb if it is provided

**Parameters**
- cfg_desc: Configuration descriptor
- class_specific_cb: Class specific descriptor callback. Can be NULL

```c
void usb_print_string_descriptor(const usb_str_desc_t *str_desc)
```

Print a string descriptor.

- This function will only print ASCII characters of the UTF-16 encoded string

**Parameters**
- str_desc: String descriptor

```c
static int usb_round_up_to_mps(int num_bytes, int mps)
```

Round up to an integer multiple of endpoint’s MPS.

- This is a convenience function to round up a size/length to an endpoint’s MPS (Maximum packet size). This is useful when calculating transfer or buffer lengths of IN endpoints.
  - If MPS <= 0, this function will return 0
  - If num_bytes <= 0, this function will return 0

**Return**
- int Round up integer multiple of MPS

**Parameters**
- [in] num_bytes: Number of bytes
- [in] mps: MPS

**Type Definitions**

```c
typedef void (*print_class_descriptor_cb)(const usb_standard_desc_t *)
```

Print class specific descriptor callback.

- Optional callback to be provided to `usb_print_config_descriptor()` function. The callback is called when a non-standard descriptor is encountered. The callback should decode the descriptor as print it.

**Header File**

- components/usb/include/usb/usb_types_stack.h

**Structures**

```c
struct usb_device_info_t
```

Basic information of an enumerated device.
Public Members

```c
usb_speed_t speed
    Device’s speed
```

```c
uint8_t dev_addr
    Device’s address
```

```c
uint8_t bMaxPacketSize0
    The maximum packet size of the device’s default endpoint
```

```c
uint8_t bConfigurationValue
    Device’s current configuration number
```

```c
const usb_str_desc_t *str_desc_manufacturer
    Pointer to Manufacturer string descriptor (can be NULL)
```

```c
const usb_str_desc_t *str_desc_product
    Pointer to Product string descriptor (can be NULL)
```

```c
const usb_str_desc_t *str_desc_serial_num
    Pointer to Serial Number string descriptor (can be NULL)
```

```c
struct usb_isoc_packet_desc_t
    Isochronous packet descriptor.
```

If the number of bytes in an Isochronous transfer is larger than the MPS of the endpoint, the transfer is split into multiple packets transmitted at the endpoint’s specified interval. An array of Isochronous packet descriptors describes how an Isochronous transfer should be split into multiple packets.

Public Members

```c
int num_bytes
    Number of bytes to transmit/receive in the packet. IN packets should be integer multiple of MPS
```

```c
int actual_num_bytes
    Actual number of bytes transmitted/received in the packet
```

```c
usb_transfer_status_t status
    Status of the packet
```

```c
struct usb_transfer_s
```

Public Members

```c
uint8_t *const data_buffer
    Pointer to data buffer
```

```c
const size_t data_buffer_size
    Size of the data buffer in bytes
```

```c
int num_bytes
    Number of bytes to transfer. Control transfers should include the size of the setup packet. Isochronous transfer should be the total transfer size of all packets. For non-control IN transfers, num_bytes should be an integer multiple of MPS.
```

```c
int actual_num_bytes
    Actual number of bytes transferred
```

```c
uint32_t flags
    Transfer flags
```

```c
usb_device_handle_t device_handle
    Device handle
```
Chapter 2. API Reference

```c
uint8_t bEndpointAddress
    Endpoint Address

usb_transfer_status_t status
    Status of the transfer

uint32_t timeout_ms
    Timeout (in milliseconds) of the packet (currently not supported yet)

usb_transfer_cb_t callback
    Transfer callback

void *context
    Context variable for transfer to associate transfer with something

const int num_isoc_packets
    Only relevant to Isochronous. Number of service periods (i.e., intervals) to transfer data buffer over.

usb_isoc_packet_desc_t isoc_packet_desc[]
    Descriptors for each Isochronous packet
```

### Macros

**USB_TRANSFER_FLAG_ZERO_PACK**

Terminate Bulk/Interrupt OUT transfer with a zero length packet.

OUT transfers normally terminate when the Host has transferred the exact amount of data it needs to the device. However, for bulk and interrupt OUT transfers, if the transfer size just happened to be a multiple of MPS, it will be impossible to know the boundary between two consecutive transfers to the same endpoint.

Therefore, this flag will cause the transfer to automatically add a zero length packet (ZLP) at the end of the transfer if the following conditions are met:

- The target endpoint is a Bulk/Interrupt OUT endpoint (Host to device)
- The transfer’s length (i.e., transfer.num_bytes) is a multiple of the endpoint’s MPS

Otherwise, this flag has no effect.

Users should check whether their target device’s class requires a ZLP, as not all Bulk/Interrupt OUT endpoints require them. For example:

- For MSC Bulk Only Transport class, the Host MUST NEVER send a ZLP. Bulk transfer boundaries are determined by the CBW and CSW instead
- For CDC Ethernet, the Host MUST ALWAYS send a ZLP if a segment (i.e., a transfer) is a multiple of MPS (See 3.3.1 Segment Delineation)

**Note** See USB2.0 specification 5.7.3 and 5.8.3 for more details

**Note** IN transfers normally terminate when the Host as receive the exact amount of data it needs (must be multiple of MPS) or the endpoint sends a short packet to the Host (For bulk OUT only). Indicates that a bulk OUT transfers should always terminate with a short packet, even if it means adding an extra zero length packet

### Type Definitions

```c
typedef struct usb_device_handle_s *usb_device_handle_t
    Handle of a USB Device connected to a USB Host.

typedef struct usb_transfer_s usb_transfer_t
    USB transfer structure.
```

This structure is used to represent a transfer from a software client to an endpoint over the USB bus. Some of the fields are made const on purpose as they are fixed on allocation. Users should call the appropriate USB Host Library function to allocate a USB transfer structure instead of allocating this structure themselves.

The transfer type is inferred from the endpoint this transfer is sent to. Depending on the transfer type, users should note the following:
• Bulk: This structure represents a single bulk transfer. If the number of bytes exceeds the endpoint’s MPS, the transfer will be split into multiple MPS sized packets followed by a short packet.
• Control: This structure represents a single control transfer. This first 8 bytes of the data_buffer must be filled with the setup packet (see `usb_setup_packet_t`). The num_bytes field should be the total size of the transfer (i.e., size of setup packet + wLength).
• Interrupt: Represents an interrupt transfer. If num_bytes exceeds the MPS of the endpoint, the transfer will be split into multiple packets, and each packet is transferred at the endpoint’s specified interval.

Note For Bulk/Control/Interrupt IN transfers, the num_bytes must be a integer multiple of the endpoint’s MPS

Note This structure should be allocated via `usb_host_transfer_alloc()`
Note Once the transfer has been submitted, users should not modify the structure until the transfer has completed

typedef void (*usb_transfer_cb_t)(usb_transfer_t *transfer)
USB transfer completion callback.

Enumerations
enum usb_speed_t
USB Standard Speeds.

Values:

USB_SPEED_LOW = 0
USB Low Speed (1.5 Mbit/s)

USB_SPEED_FULL
USB Full Speed (12 Mbit/s)

enum usb_transfer_type_t
The type of USB transfer.

Note The enum values need to match the bmAttributes field of an EP descriptor

Values:

USB_TRANSFER_TYPE_CTRL = 0
USB_TRANSFER_TYPE_ISOCHRONOUS

USB_TRANSFER_TYPE_BULK
USB_TRANSFER_TYPE_INTR

enum usb_transfer_status_t
The status of a particular transfer.

Values:

USB_TRANSFER_STATUS_COMPLETED
The transfer was successful (but may be short)

USB_TRANSFER_STATUS_ERROR
The transfer failed because due to excessive errors (e.g. no response or CRC error)

USB_TRANSFER_STATUS_TIMED_OUT
The transfer failed due to a time out

USB_TRANSFER_STATUS_CANCELED
The transfer was canceled
USB_TRANSFER_STATUSSTALL
The transfer was stalled

USB_TRANSFER_STATUS_OVERFLOW
The transfer as more data was sent than was requested

USB_TRANSFER_STATUS_SKIPPED
ISOC packets only. The packet was skipped due to system latency or bus overload

USB_TRANSFER_STATUS_NO_DEVICE
The transfer failed because the target device is gone

Header File

- components/usb/include/usb/usb_types_ch9.h

Unions

union usb_setup_packet_t
#include <usb_types_ch9.h> Structure representing a USB control transfer setup packet.

See Table 9-2 of USB2.0 specification for more details

Public Members

uint8_t bmRequestType
Characteristics of request

uint8_t bRequest
Specific request

uint16_t wValue
Word-sized field that varies according to request

uint16_t wIndex
Word-sized field that varies according to request; typically used to pass an index or offset

uint16_t wLength
Number of bytes to transfer if there is a data stage

struct usb_setup_packet_t::[anonymous] [anonymous]
uint8_t val[USB_SETUP_PACKET_SIZE]

union usb_standard_desc_t
#include <usb_types_ch9.h> USB standard descriptor.

All USB standard descriptors start with these two bytes. Use this type when traversing over configuration descriptors

Public Members

uint8_t bLength
Size of the descriptor in bytes

uint8_t bDescriptorType
Descriptor Type

struct usb_standard_desc_t::[anonymous] USB_DESC_ATTR
uint8_t val[USB_STANDARD_DESC_SIZE]

union usb_device_desc_t
#include <usb_types_ch9.h> Structure representing a USB device descriptor.

See Table 9-8 of USB2.0 specification for more details
Public Members

uint8_t \texttt{bLength}  
Size of the descriptor in bytes

uint8_t \texttt{bDescriptorType}  
DEVICE Descriptor Type

uint16_t \texttt{bcdUSB}  
USB Specification Release Number in Binary-Coded Decimal (i.e., 2.10 is 210H)

uint8_t \texttt{bDeviceClass}  
Class code (assigned by the USB-IF)

uint8_t \texttt{bDeviceSubClass}  
Subclass code (assigned by the USB-IF)

uint8_t \texttt{bDeviceProtocol}  
Protocol code (assigned by the USB-IF)

uint8_t \texttt{bMaxPacketSize0}  
Maximum packet size for endpoint zero (only 8, 16, 32, or 64 are valid)

uint16_t \texttt{idVendor}  
Vendor ID (assigned by the USB-IF)

uint16_t \texttt{idProduct}  
Product ID (assigned by the manufacturer)

uint16_t \texttt{bcdDevice}  
Device release number in binary-coded decimal

uint8_t \texttt{iManufacturer}  
Index of string descriptor describing manufacturer

uint8_t \texttt{iProduct}  
Index of string descriptor describing product

uint8_t \texttt{iSerialNumber}  
Index of string descriptor describing the device’s serial number

uint8_t \texttt{bNumConfigurations}  
Number of possible configurations

\begin{verbatim}
struct usb_device_desc_t::[anonymous] USB_DESC_ATTR

uint8_t val[USB_DEVICE_DESC_SIZE]
\end{verbatim}

union usb_config_desc_t

#include <usb_types_ch9.h> Structure representing a short USB configuration descriptor.

See Table 9-10 of USB2.0 specification for more details

Note The full USB configuration includes all the interface and endpoint descriptors of that configuration.

Public Members

uint8_t \texttt{bLength}  
Size of the descriptor in bytes

uint8_t \texttt{bDescriptorType}  
CONFIGURATION Descriptor Type

uint16_t \texttt{wTotalLength}  
Total length of data returned for this configuration

uint8_t \texttt{bNumInterfaces}  
Number of interfaces supported by this configuration
Chapter 2. API Reference

uint8_t bConfigurationValue
    Value to use as an argument to the SetConfiguration() request to select this configuration

uint8_t iConfiguration
    Index of string descriptor describing this configuration

uint8_t bmAttributes
    Configuration characteristics

uint8_t bMaxPower
    Maximum power consumption of the USB device from the bus in this specific configuration when the
device is fully operational.

struct usb_config_desc_t::[anonymous] USB_DESC_ATTR
    uint8_t val[USB_CONFIG_DESC_SIZE]

union usb_iad_desc_t
    #include <usb_types_ch9.h> Structure representing a USB interface association descriptor.

Public Members

uint8_t bLength
    Size of the descriptor in bytes

uint8_t bDescriptorType
    INTERFACE ASSOCIATION Descriptor Type

uint8_t bFirstInterface
    Interface number of the first interface that is associated with this function

uint8_t bInterfaceCount
    Number of contiguous interfaces that are associated with this function

uint8_t bFunctionClass
    Class code (assigned by USB-IF)

uint8_t bFunctionSubClass
    Subclass code (assigned by USB-IF)

uint8_t bFunctionProtocol
    Protocol code (assigned by USB-IF)

uint8_t iFunction
    Index of string descriptor describing this function

struct usb_iad_desc_t::[anonymous] USB_DESC_ATTR
    uint8_t val[USB_IAD_DESC_SIZE]

union usb_intf_desc_t
    #include <usb_types_ch9.h> Structure representing a USB interface descriptor.

See Table 9-12 of USB2.0 specification for more details

Public Members

uint8_t bLength
    Size of the descriptor in bytes

uint8_t bDescriptorType
    INTERFACE Descriptor Type

uint8_t bInterfaceNumber
    Number of this interface.
uint8_t bAlternateSetting
   Value used to select this alternate setting for the interface identified in the prior field

uint8_t bNumEndpoints
   Number of endpoints used by this interface (excluding endpoint zero).

uint8_t bInterfaceClass
   Class code (assigned by the USB-IF)

uint8_t bInterfaceSubClass
   Subclass code (assigned by the USB-IF)

uint8_t bInterfaceProtocol
   Protocol code (assigned by the USB)

uint8_t iInterface
   Index of string descriptor describing this interface

struct usb_intf_desc_t::[anonymous] USB_DESC_ATTR

union usb_ep_desc_t
   #include <usb_types_ch9.h> Structure representing a USB endpoint descriptor.
   See Table 9-13 of USB2.0 specification for more details

Public Members

uint8_t bLength
   Size of the descriptor in bytes

uint8_t bDescriptorType
   ENDPOINT Descriptor Type

uint8_t bEndpointAddress
   The address of the endpoint on the USB device described by this descriptor

uint8_t bmAttributes
   This field describes the endpoint’s attributes when it is configured using the bConfigurationValue.

uint16_t wMaxPacketSize
   Maximum packet size this endpoint is capable of sending or receiving when this configuration is selected.

uint8_t bInterval
   Interval for polling Isochronous and Interrupt endpoints. Expressed in frames or microframes depending on the device operating speed (1 ms for Low-Speed and Full-Speed or 125 us for USB High-Speed and above).

struct usb_ep_desc_t::[anonymous] USB_DESC_ATTR

union usb_str_desc_t
   #include <usb_types_ch9.h> Structure representing a USB string descriptor.

Public Members

uint8_t bLength
   Size of the descriptor in bytes

uint8_t bDescriptorType
   STRING Descriptor Type

uint16_t wData[]
   UTF-16LE encoded

```c
struct usb_desc_t::[anonymous] USB_DESC_ATTR
uint8_t val[USB_STR_DESC_SIZE]
```

**Macros**

USB_W_VALUE_DT_ENDPOINT
USB_W_VALUE_DT_DEVICE_QUALIFIER
USB_W_VALUE_DT_OTHER_SPEED_CONFIG
USB_W_VALUE_DT_INTERFACE_POWER
USB_SETUP_PACKET_INIT_SET_ADDR (setup_pkt_ptr, addr)
  Initializer for a SET_ADDRESS request.
   Sets the address of a connected device
USB_SETUP_PACKET_INIT_GET_DEVICE_DESC (setup_pkt_ptr)
  Initializer for a request to get a device’s device descriptor.
USB_SETUP_PACKET_INIT_GET_CONFIG (setup_pkt_ptr)
  Initializer for a request to get a device’s current configuration number.
USB_SETUP_PACKET_INIT_GET_CONFIG_DESC (setup_pkt_ptr, desc_index, desc_len)
   Initializer for a request to get one of the device’s current configuration descriptor.
   • desc_index indicates the configuration’s index number
   • Number of bytes of the configuration descriptor to get
USB_SETUP_PACKET_INIT_SET_CONFIG (setup_pkt_ptr, config_num)
   Initializer for a request to set a device’s current configuration number.
USB_SETUP_PACKET_INIT_SET_INTERFACE (setup_pkt_ptr, intf_num, alt_setting_num)
   Initializer for a request to set an interface’s alternate setting.
USB_SETUP_PACKET_INIT_GET_STR_DESC (setup_pkt_ptr, string_index, lang_id, desc_len)
   Initializer for a request to get a string descriptor.
USB_STANDARD_DESC_SIZE
   Size of dummy USB standard descriptor.
USB_DEVICE_DESC_SIZE
  Size of a USB device descriptor in bytes.

USB_CLASS_PER_INTERFACE
  Possible base class values of the bDeviceClass field of a USB device descriptor.

USB_CLASS_VENDOR_SPEC
USB_SUBCLASS_VENDOR_SPEC
  Vendor specific subclass code.

USB_CONFIG_DESC_SIZE
  Size of a short USB configuration descriptor in bytes.

  Note  The size of a full USB configuration includes all the interface and endpoint descriptors of that configuration.

USB_BM_ATTRIBUTES_ONE
  Bit masks belonging to the bmAttributes field of a configuration descriptor.

USB_BM_ATTRIBUTES_SELFPOWER
USB_BM_ATTRIBUTES_WAKEUP
USB_BM_ATTRIBUTES_BATTERY

USB_IAD_DESC_SIZE
  Size of a USB interface association descriptor in bytes.

USB_INTF_DESC_SIZE
  Size of a USB interface descriptor in bytes.

USB_EP_DESC_SIZE
  Size of a USB endpoint descriptor in bytes.
USB_B_ENDPOINT_ADDRESS_EP_NUM_MASK
Bit masks belonging to the bEndpointAddress field of an endpoint descriptor.

USB_B_ENDPOINT_ADDRESS_EP_DIR_MASK

USB_BM_ATTRIBUTES_XFERTYPE_MASK
Bit masks belonging to the bmAttributes field of an endpoint descriptor.

USB_BM_ATTRIBUTES_XFER_CONTROL
USB_BM_ATTRIBUTES_XFER_ISOC
USB_BM_ATTRIBUTES_XFER_BULK
USB_BM_ATTRIBUTES_XFER_INT
USB_B_M_ATTRIBUTES_SYNCTYPE_MASK
USB_BM_ATTRIBUTES_SYNC_NONE
USB_BM_ATTRIBUTES_SYNC_ASYNC
USB_BM_ATTRIBUTES_SYNC_ADAPTIVE
USB_BM_ATTRIBUTES_SYNC_SYNC
USB_BM_ATTRIBUTES_USAGETYPE_MASK
USB_BM_ATTRIBUTES_USAGE_DATA
USB_BM_ATTRIBUTES_USAGE_FEEDBACK
USB_BM_ATTRIBUTES_USAGE_IMPLICIT_FB

USB_EP_DESC_GET_XFERTYPE (desc_ptr)
Macro helper to get information about an endpoint from its descriptor.

USB_EP_DESC_GET_EP_NUM (desc_ptr)
USB_EP_DESC_GET_EP_DIR (desc_ptr)
USB_EP_DESC_GET_MPS (desc_ptr)

USB_STR_DESC_SIZE
Size of a short USB string descriptor in bytes.

Enumerations

enum usb_device_state_t
USB2.0 device states.

See Table 9-1 of USB2.0 specification for more details

Note The USB_DEVICE_STATE_NOT_ATTACHED is not part of the USB2.0 specification, but is a catch
all state for devices that need to be cleaned up after a sudden disconnection or port error.

Values:

USB_DEVICE_STATE_NOT_ATTACHED
The device was previously configured or suspended, but is no longer attached (either suddenly discon-
nected or a port error)

USB_DEVICE_STATE_ATTACHED
Device is attached to the USB, but is not powered.

USB_DEVICE_STATEPOWERED
Device is attached to the USB and powered, but has not been reset.

USB_DEVICE_STATE_DEFAULT
Device is attached to the USB and powered and has been reset, but has not been assigned a unique address.
Device responds at the default address.
**USB_DEVICE_STATE_ADDRESS**
Device is attached to the USB, powered, has been reset, and a unique device address has been assigned. Device is not configured.

**USB_DEVICE_STATE_CONFIGURED**
Device is attached to the USB, powered, has been reset, has a unique address, is configured, and is not suspended. The host may now use the function provided by the device.

**USBDEVICE_STATE_SUSPENDED**
Device is, at minimum, attached to the USB and is powered and has not seen bus activity for 3 ms. It may also have a unique address and be configured for use. However, because the device is suspended, the host may not use the device’s function.

Code examples for this API section are provided in the peripherals directory of ESP-IDF examples.

### 2.4 Application Protocols

#### 2.4.1 ASIO port

**Overview**
Asio is a cross-platform C++ library, see https://think-async.com. It provides a consistent asynchronous model using a modern C++ approach.

**ASIO documentation** Please refer to the original asio documentation at https://think-async.com/Asio/Documentation. Asio also comes with a number of examples which could be found under Documentation/Examples on that web site.

**Supported features** ESP platform port currently supports only network asynchronous socket operations; does not support serial port. SSL/TLS support is disabled by default and could be enabled in component configuration menu by choosing TLS library from
- mbedTLS with OpenSSL translation layer (default option)
- wolfSSL

SSL support is very basic at this stage and it does include following features:
- Verification callbacks
- DH property files
- Certificates/private keys file APIs

Internal asio settings for ESP include
- EXCEPTIONS are enabled in ASIO if enabled in menuconfig
- TYPEID is enabled in ASIO if enabled in menuconfig

**Application Example**

ESP examples are based on standard asio protocols/asio:

- protocols/asio/udp_echo_server
- protocols/asio/tcp_echo_server
- protocols/asio/asio_chat
- protocols/asio/ssl_client_server

Please refer to the specific example README.md for details.

2.4.2 ESP-MQTT

Overview

ESP-MQTT is an implementation of MQTT protocol client (MQTT is a lightweight publish/subscribe messaging protocol).

Features

- Supports MQTT over TCP, SSL with mbedtls, MQTT over Websocket, MQTT over Websocket Secure.
- Easy to setup with URI
- Multiple instances (Multiple clients in one application)
- Support subscribing, publishing, authentication, last will messages, keep alive pings and all 3 QoS levels (it should be a fully functional client).

Application Example

- protocols/mqtt/tcp: MQTT over tcp, default port 1883
- protocols/mqtt/ssl: MQTT over tcp, default port 8883
- protocols/mqtt/ssl_psk: MQTT over tcp using pre-shared keys for authentication, default port 8883
- protocols/mqtt/ws: MQTT over Websocket, default port 80
- protocols/mqtt/wss: MQTT over Websocket Secure, default port 443

Configuration

URI

- Currently support mqtt, mqtts, ws, wss schemes
- MQTT over TCP samples:
  - mqtt://mqtt.eclipseprojects.io: MQTT over TCP, default port 1883:
  - mqtt://mqtt.eclipseprojects.io:1884 MQTT over TCP, port 1884:
  - mqtt://username:password@mqtt.eclipseprojects.io:1884 MQTT over TCP, port 1884, with username and password
- MQTT over SSL samples:
  - mqtts://mqtt.eclipseprojects.io: MQTT over SSL, port 8883
  - mqtts://mqtt.eclipseprojects.io:8884: MQTT over SSL, port 8884
- MQTT over Websocket samples:
  - ws://mqtt.eclipseprojects.io:80/mqtt
- MQTT over Websocket Secure samples:
  - wss://mqtt.eclipseprojects.io:443/mqtt
- Minimal configurations:

```c
const esp_mqtt_client_config_t mqtt_cfg = {
  .uri = "mqtt://mqtt.eclipseprojects.io",
  // .user_context = (void *)your_context
};
esp_mqtt_client_handle_t client = esp_mqtt_client_init(&mqtt_cfg);
esp_mqtt_client_register_event(client, ESP_EVENT_ANY_ID, mqtt_event_handler,
    &client);
esp_mqtt_client_start(client);
```

- Note: By default mqtt client uses event loop library to post related mqtt events (connected, subscribed, published, etc.)
SSL

- Get certificate from server, example: `mqtt.eclipseprojects.io openssl s_client -showcerts -connect mqtt.eclipseprojects.io:8883 </dev/null 2>/dev/null x509 -outform PEM >mqtt_eclipse_org.pem`
- Check the sample application: `examples/mqtt_ssl`
- Configuration:

```c
const esp_mqtt_client_config_t mqtt_cfg = {
    .uri = "mqtts://mqtt.eclipseprojects.io:8883",
    .event_handle = mqtt_event_handler,
    .cert_pem = (const char *)mqtt_eclipse_org_pem_start,
};
```

If the certificate is not null-terminated then `cert_len` should also be set. Other SSL related configuration parameters are:

- `use_global_ca_store`: use the global certificate store to verify server certificate, see esp-tls.h for more information
- `client_cert_pem`: pointer to certificate data in PEM or DER format for SSL mutual authentication, default is NULL, not required if mutual authentication is not needed.
- `client_cert_len`: length of the buffer pointed to by `client_cert_pem`. May be 0 for null-terminated pem.
- `client_key_pem`: pointer to private key data in PEM or DER format for SSL mutual authentication, default is NULL, not required if mutual authentication is not needed.
- `client_key_len`: length of the buffer pointed to by `client_key_pem`. May be 0 for null-terminated pem.
- `psk_hint_key`: pointer to PSK struct defined in esp_tls.h to enable PSK authentication (as alternative to certificate verification). If not NULL and server/client certificates are NULL, PSK is enabled
- `alpn_protos`: NULL-terminated list of protocols to be used for ALPN.

**Last Will and Testament**  MQTT allows for a last will and testament (LWT) message to notify other clients when a client ungracefully disconnects. This is configured by the following fields in the `esp_mqtt_client_config_t` struct.

- `lwt_topic`: pointer to the LWT message topic
- `lwt_msg`: pointer to the LWT message
- `lwt_msg_len`: length of the LWT message, required if `lwt_msg` is not null-terminated
- `lwt_qos`: quality of service for the LWT message
- `lwt_retain`: specifies the retain flag of the LWT message

**Other Configuration Parameters**

- `disable_clean_session`: determines the clean session flag for the connect message, defaults to a clean session
- `keepalive`: determines how many seconds the client will wait for a ping response before disconnecting, default is 120 seconds.
- `disable_auto_reconnect`: enable to stop the client from reconnecting to server after errors or disconnects
- `user_context`: custom context that will be passed to the event handler
- `task_prio`: MQTT task priority, defaults to 5
- `task_stack`: MQTT task stack size, defaults to 6144 bytes, setting this will override setting from menu-config
- `buffer_size`: size of MQTT send/receive buffer, default is 1024 bytes
- `username`: pointer to the username used for connecting to the broker
- `password`: pointer to the password used for connecting to the broker
- `client_id`: pointer to the client id, defaults to ESP32_%CHIPID% where %CHIPID% are the last 3 bytes of MAC address in hex format
- `host`: MQTT broker domain (ipv4 as string), setting the uri will override this
- `port`: MQTT broker port, specifying the port in the uri will override this
- `transport`: sets the transport protocol, setting the uri will override this
API Reference

Chapter 2. API Reference

- refresh_connection_after_ms: refresh connection after this value (in milliseconds)
- event_handle: handle for MQTT events as a callback in legacy mode
- event_loop_handle: handle for MQTT event loop library

For more options on esp_mqtt_client_config_t, please refer to API reference below

**Change settings in Project Configuration Menu**  The settings for MQTT can be found using idf.py menu-config, under Component config -> ESP-MQTT Configuration

The following settings are available:

- `CONFIG_MQTT_PROTOCOL_311`: Enables 3.1.1 version of MQTT protocol
- `CONFIG_MQTT_TRANSPORT_SSL, CONFIG_MQTT_TRANSPORT_WEBSOCKET`: Enables specific MQTT transport layer, such as SSL, WEBSOCKET, WEBSOCKET_SECURE
- `CONFIG_MQTT_CUSTOM_OUTBOX`: Disables default implementation of mqtt_outbox, so a specific implementation can be supplied

**Events**

The following events may be posted by the MQTT client:

- `MQTT_EVENT_BEFORE_CONNECT`: The client is initialized and about to start connecting to the broker.
- `MQTT_EVENT_CONNECTED`: The client has successfully established a connection to the broker. The client is now ready to send and receive data.
- `MQTT_EVENT_DISCONNECTED`: The client has aborted the connection due to being unable to read or write data, e.g. because the server is unavailable.
- `MQTT_EVENT_SUBSCRIBED`: The broker has acknowledged the client’s subscribe request. The event data will contain the message ID of the subscribe message.
- `MQTT_EVENT_UNSUBSCRIBED`: The broker has acknowledged the client’s unsubscribe request. The event data will contain the message ID of the unsubscribe message.
- `MQTT_EVENT_PUBLISHED`: The broker has acknowledged the client’s publish message. This will only be posted for Quality of Service level 1 and 2, as level 0 does not use acknowledgements. The event data will contain the message ID of the publish message.
- `MQTT_EVENT_DATA`: The client has received a publish message. The event data contains: message ID, name of the topic it was published to, received data and its length. For data that exceeds the internal buffer multiple `MQTT_EVENT_DATA` will be posted and `current_data_offset` and `total_data_len` from event data updated to keep track of the fragmented message.
- `MQTT_EVENT_ERROR`: The client has encountered an error. `esp_mqtt_error_type_t` from `error_handle` in the event data can be used to further determine the type of the error. The type of error will determine which parts of the `error_handle` struct is filled.

**API Reference**

**Header File**

- `components/mqtt/esp-mqtt/include/mqtt_client.h`

**Functions**

```c
esp_mqtt_client_handle_t esp_mqtt_client_init(const esp_mqtt_client_config_t *config)
```

Creates mqtt client handle based on the configuration.

- `Return` mqtt_client_handle if successfully created, NULL on error
- `Parameters`
  - `config`: mqtt configuration structure

```c
esp_err_t esp_mqtt_client_set_uri(esp_mqtt_client_handle_t client, const char *uri)
```

Sets mqtt connection URI. This API is usually used to overrides the URI configured in `esp_mqtt_client_init`.

- `Return` ESP_FAIL if URI parse error, ESP_OK on success
- `Parameters`

---

Submit Document Feedback
Chapter 2. API Reference

- client: mqtt client handle
- uri:

```c
esp_err_t esp_mqtt_client_start(esp_mqtt_client_handle_t client)
```
Starts mqtt client with already created client handle.

**Return** ESP_OK on success ESP_ERR_INVALID_ARG on wrong initialization ESP_FAIL on other error

**Parameters**
- client: mqtt client handle

```c
esp_err_t esp_mqtt_client_reconnect(esp_mqtt_client_handle_t client)
```
This api is typically used to force reconnection upon a specific event.

**Return** ESP_OK on success ESP_ERR_INVALID_ARG on wrong initialization ESP_FAIL if client is in invalid state

**Parameters**
- client: mqtt client handle

```c
esp_err_t esp_mqtt_client_disconnect(esp_mqtt_client_handle_t client)
```
This api is typically used to force disconnection from the broker.

**Return** ESP_OK on success ESP_ERR_INVALID_ARG on wrong initialization

**Parameters**
- client: mqtt client handle

```c
esp_err_t esp_mqtt_client_stop(esp_mqtt_client_handle_t client)
```
Stops mqtt client tasks.

- Notes:
  - Cannot be called from themqtt event handler

**Return** ESP_OK on success ESP_ERR_INVALID_ARG on wrong initialization ESP_FAIL if client is in invalid state

**Parameters**
- client: mqtt client handle

```c
int esp_mqtt_client_subscribe(esp_mqtt_client_handle_t client, const char *topic, int qos)
```
Subscribe the client to defined topic with defined qos.

**Notes:**
- Client must be connected to send subscribe message
- This API is could be executed from a user task or from a mqtt event callback i.e. internal mqtt task (API is protected by internal mutex, so it might block if a longer data receive operation is in progress.

**Return** message_id of the subscribe message on success -1 on failure

**Parameters**
- client: mqtt client handle
- topic:
- qos:

```c
int esp_mqtt_client_unsubscribe(esp_mqtt_client_handle_t client, const char *topic)
```
Unsubscribe the client from defined topic.

**Notes:**
- Client must be connected to send unsubscribe message
- It is thread safe, please refer to esp_mqtt_client_subscribe for details

**Return** message_id of the subscribe message on success -1 on failure

**Parameters**
- client: mqtt client handle
- topic:

```c
int esp_mqtt_client_publish(esp_mqtt_client_handle_t client, const char *topic, const char *data, int len, int qos, int retain)
```
Client to send a publish message to the broker.
Notes:

- This API might block for several seconds, either due to network timeout (10s) or if publishing payloads longer than internal buffer (due to message fragmentation)
- Client doesn’t have to be connected for this API to work, enqueuing the messages with qos > 1 (returning -1 for all the qos=0 messages if disconnected). If MQTT_SKIP_PUBLISH_IF_DISCONNECTED is enabled, this API will not attempt to publish when the client is not connected and will always return -1.
- It is thread safe, please refer to esp_mqtt_client_subscribe for details

Return message_id of the publish message (for QoS 0 message_id will always be zero) on success. -1 on failure.

Parameters
- client: mqtt client handle
- topic: topic string
- data: payload string (set to NULL, sending empty payload message)
- len: data length, if set to 0, length is calculated from payload string
- qos: qos of publish message
- retain: retain flag

int esp_mqtt_client_enqueue (esp_mqtt_client_handle_t client, const char *topic, const char *data, int len, int qos, int retain, bool store)

Enqueue a message to the outbox, to be sent later. Typically used for messages with qos > 0, but could be also used for qos=0 messages if store=true.

This API generates and stores the publish message into the internal outbox and the actual sending to the network is performed in the mqtt-task context (in contrast to the esp_mqtt_client_publish() which sends the publish message immediately in the user task’s context). Thus, it could be used as a non blocking version of esp_mqtt_client_publish().

Return message_id if queued successfully, -1 otherwise

Parameters
- client: mqtt client handle
- topic: topic string
- data: payload string (set to NULL, sending empty payload message)
- len: data length, if set to 0, length is calculated from payload string
- qos: qos of publish message
- retain: retain flag
- store: if true, all messages are enqueued; otherwise only qos1 and qos 2 are enqueued

esp_err_t esp_mqtt_client_destroy (esp_mqtt_client_handle_t client)

Destroys the client handle.

Notes:
- Cannot be called from the mqtt event handler

Return ESP_OK ESP_ERR_INVALID_ARG on wrong initialization

Parameters
- client: mqtt client handle

esp_err_t esp_mqtt_set_config (esp_mqtt_client_handle_t client, const esp_mqtt_client_config_t *config)

Set configuration structure, typically used when updating the config (i.e. on “before_connect” event.

Return ESP_ERR_NO_MEM if failed to allocate ESP_ERR_INVALID_ARG if conflicts on transport configuration. ESP_OK on success

Parameters
- client: mqtt client handle
- config: mqtt configuration structure

esp_err_t esp_mqtt_client_register_event (esp_mqtt_client_handle_t client, esp_mqtt_event_id_t event, esp_event_handler_t event_handler, void *event_handler_arg)

Registers mqtt event.
Chapter 2. API Reference

**Return** ESP_ERR_NO_MEM if failed to allocate ESP_ERR_INVALID_ARG on wrong initialization
ESP_OK on success

**Parameters**
- `client`: mqtt client handle
- `event`: event type
- `event_handler`: handler callback
- `event_handler_arg`: handlers context

int `esp_mqtt_client_get_outbox_size` (esp_mqtt_client_handle_t client)

Get outbox size.

**Return** outbox size 0 on wrong initialization

**Parameters**
- `client`: mqtt client handle

**Structures**

**struct esp_mqtt_error_codes**
MQTT error code structure to be passed as a contextual information into ERROR event.

Important: This structure extends `esp_tls_last_error` error structure and is backward compatible with it (so might be down-casted and treated as `esp_tls_last_error` error, but recommended to update applications if used this way previously)

Use this structure directly checking error_type first and then appropriate error code depending on the source of the error:

<table>
<thead>
<tr>
<th>error_type</th>
<th>related member variables</th>
<th>note</th>
<th>related to source of error</th>
</tr>
</thead>
<tbody>
<tr>
<td>MQTT_ERROR_TYPE_TCP_TRANSPORT</td>
<td>esp_tls_last_esp_err, esp_tls_stack_err, esp_tls_cert_verify_flags, sock_errno</td>
<td>Error reported from tcp_transport/esp-tls</td>
<td></td>
</tr>
<tr>
<td>MQTT_ERROR_TYPE_CONNECTION_REFUSED</td>
<td>connect_return_code</td>
<td>Internal error reported from MQTT broker on connection</td>
<td></td>
</tr>
</tbody>
</table>

**Public Members**

`esp_err_t` `esp_tls_last_esp_err`
last esp_err code reported from esp-tls component

int `esp_tls_stack_err`
tls specific error code reported from underlying tls stack

int `esp_tls_cert_verify_flags`
tls flags reported from underlying tls stack during certificate verification

`esp_mqtt_error_type_t` `error_type`
error type referring to the source of the error

`esp_mqtt_connect_return_code_t` `connect_return_code`
connection refused error code reported from MQTT broker on connection

int `esp_transport_sock_errno`
erno from the underlying socket

**struct esp_mqtt_event_t**
MQTT event configuration structure

**Public Members**

`esp_mqtt_event_id_t` `event_id`
MQTT event type

`esp_mqtt_client_handle_t` `client`
MQTT client handle for this event
void *user_context
    User context passed from MQTT client config

char *data
    Data associated with this event

int data_len
    Length of the data for this event

int total_data_len
    Total length of the data (longer data are supplied with multiple events)

int current_data_offset
    Actual offset for the data associated with this event

char *topic
    Topic associated with this event

int topic_len
    Length of the topic for this event associated with this event

int msg_id
    MQTT message id of message

int session_present
    MQTT session_present flag for connection event

.esp_mqtt_error_codes_t *error_handle
    esp-mqtt error handle including esp-tls errors as well as internal mqtt errors

bool retain
    Retained flag of the message associated with this event

int qos
    qos of the messages associated with this event

bool dup
    dup flag of the message associated with this event

struct esp_mqtt_client_config_t
    MQTT client configuration structure

Public Members

mqtt_event_callback_t event_handle
    handle for MQTT events as a callback in legacy mode

.exp_event_loop_handle_t event_loop_handle
    handle for MQTT event loop library

const char *host
    MQTT server domain (ipv4 as string)

const char *uri
    Complete MQTT broker URI

uint32_t port
    MQTT server port

bool set_null_client_id
    Selects a NULL client id

const char *client_id
    Set client id. Ignored if set_null_client_id == true If NULL set the default client id. Default client id is
    ESP32_CHIPID% where CHIPID% are last 3 bytes of MAC address in hex format
**const** char *username
MQTT username

**const** char *password
MQTT password

**const** char *lwt_topic
LWT (Last Will and Testament) message topic (NULL by default)

**const** char *lwt_msg
LWT message (NULL by default)

int lwt_qos
LWT message qos

int lwt_retain
LWT retained message flag

int lwt_msg_len
LWT message length

**int** disable_clean_session
mqqt clean session, default clean_session is true

**int** keepalive
mqqt keepalive, default is 120 seconds

**bool** disable_auto_reconnect
this mqtt client will reconnect to server (when errors/disconnect). Set disable_auto_reconnect=true to disable

void *user_context
pass user context to this option, then can receive that context in event->user_context

**int** task_prio
MQTT task priority, default is 5, can be changed in make menuconfig

**int** task_stack
MQTT task stack size, default is 6144 bytes, can be changed in make menuconfig

**int** buffer_size
size of MQTT send/receive buffer, default is 1024 (only receive buffer size if out_buffer_size defined)

**const** char *cert_pem
Pointer to certificate data in PEM or DER format for server verify (with SSL), default is NULL, not required to verify the server. PEM-format must have a terminating NULL-character. DER-format requires the length to be passed in cert_len.

**size_t** cert_len
Length of the buffer pointed to by cert_pem. May be 0 for null-terminated pem

**const** char *client_cert_pem
Pointer to certificate data in PEM or DER format for SSL mutual authentication, default is NULL, not required if mutual authentication is not needed. If it is not NULL, also client_key_pem has to be provided. PEM-format must have a terminating NULL-character. DER-format requires the length to be passed in client_cert_len.

**size_t** client_cert_len
Length of the buffer pointed to by client_cert_pem. May be 0 for null-terminated pem

**const** char *client_key_pem
Pointer to private key data in PEM or DER format for SSL mutual authentication, default is NULL, not required if mutual authentication is not needed. If it is not NULL, also client_cert_pem has to be provided. PEM-format must have a terminating NULL-character. DER-format requires the length to be passed in client_key_len
size_t client_key_len
  Length of the buffer pointed to by client_key_pem. May be 0 for null-terminated pem

esp_mqtt_transport_t transport
  overrides URI transport

int refresh_connection_after_ms
  Refresh connection after this value (in milliseconds)

const struct psk_key_hint *psk_hint_key
  Pointer to PSK struct defined in esp_tls.h to enable PSK authentication (as alternative to certificate verification). If not NULL and server/client certificates are NULL, PSK is enabled

bool use_global_ca_store
  Use a global ca_store for all the connections in which this bool is set.

esp_err_t (*crt_bundle_attach)(void *conf)
  Pointer to ESP x509 Certificate Bundle attach function for the usage of certification bundles in mqtt

int reconnect_timeout_ms
  Reconnect to the broker after this value in miliseconds if auto reconnect is not disabled (defaults to 10s)

const char **alpn_protos
  NULL-terminated list of supported application protocols to be used for ALPN

const char *clientkey_password
  Client key decryption password string

int clientkey_password_len
  String length of the password pointed to by clientkey_password

esp_mqtt_protocol_ver_t protocol_ver
  MQTT protocol version used for connection, defaults to value from menuconfig

int out_buffer_size
  size of MQTT output buffer. If not defined, both output and input buffers have the same size defined as buffer_size

bool skip_cert_common_name_check
  Skip any validation of server certificate CN field, this reduces the security of TLS and makes the mqtt client susceptible to MITM attacks

bool use_secure_element
  enable secure element for enabling SSL connection

void *ds_data
  carrier of handle for digital signature parameters

int network_timeout_ms
  Abort network operation if it is not completed after this value, in milliseconds (defaults to 10s)

bool disable_keepalive
  Set disable_keepalive=true to turn off keep-alive mechanism, false by default (keepalive is active by default). Note: setting the config value keepalive to 0 doesn’t disable keepalive feature, but uses a default keepalive period

const char *path
  Path in the URI

int message_retransmit_timeout
  timeout for retransmit of faulded packet

Macros
Chapter 2. API Reference

MQTT_ERROR_TYPE_ESP_TLS
MQTT_ERROR_TYPE_TCP_TRANSPORT error type hold all sorts of transport layer errors, including ESP-TLS error, but in the past only the errors from MQTT_ERROR_TYPE_ESP_TLS layer were reported, so the ESP-TLS error type is re-defined here for backward compatibility

Type Definitions
typedef struct esp_mqtt_client * esp_mqtt_client_handle_t
typedef struct esp_mqtt_error_codes esp_mqtt_error_codes_t
MQTT error code structure to be passed as a contextual information into ERROR event.

Important: This structure extends esp_tls_last_error error structure and is backward compatible with it (so might be down-casted and treated as esp_tls_last_error error, but recommended to update applications if used this way previously)

Use this structure directly checking error_type first and then appropriate error code depending on the source of the error:

<table>
<thead>
<tr>
<th>error_type</th>
<th>related member variables</th>
<th>note</th>
</tr>
</thead>
<tbody>
<tr>
<td>MQTT_ERROR_TYPE_TCP_TRANSPORT</td>
<td>esp_tls_last_esp_err, esp_tls_stack_err, esp_tls_cert_verify_flags, sock_errno</td>
<td>Error reported from tcp_transport/esp-tls</td>
</tr>
<tr>
<td>MQTT_ERROR_TYPE_CONNECTION_REFUSED</td>
<td>connect_return_code</td>
<td>Internal error reported from MQTT broker on connection</td>
</tr>
</tbody>
</table>

typedef esp_mqtt_event_t * esp_mqtt_event_handle_t

typedef esp_err_t (* esp_mqtt_event_callback_t)(esp_mqtt_event_handle_t event)

Enumerations
typedef enum esp_mqtt_event_id_t
MQTT event types.

User event handler receives context data in esp_mqtt_event_t structure with

• user_context - user data from esp_mqtt_client_config_t
• client - mqtt client handle
• various other data depending on event type

Values:

MQTT_EVENT_ANY = -1
MQTT_EVENT_ERROR = 0
on error event, additional context: connection return code, error handle from esp_tls (if supported)

MQTT_EVENT_CONNECTED
connected event, additional context: session_present flag

MQTT_EVENT_DISCONNECTED
disconnected event

MQTT_EVENT_SUBSCRIBED
subscribed event, additional context:
• msg_id message id
• data pointer to the received data
• data_len length of the data for this event

MQTT_EVENT_UNSUBSCRIBED
unsubscribed event

MQTT_EVENT_PUBLISHED
published event, additional context: msg_id

MQTT_EVENT_DATA
data event, additional context:
• msg_id message id
• topic pointer to the received topic
• topic_len length of the topic
• data pointer to the received data
• data_len length of the data for this event
• current_data_offset offset of the current data for this event
• total_data_len total length of the data received
• retain retain flag of the message
• qos qos level of the message
• dup dup flag of the message Note: Multiple MQTT_EVENT_DATA could be fired for one message, if it is longer than internal buffer. In that case only first event contains topic pointer and length, other contain data only with current data length and current data offset updating.

**MQTT_EVENT_BEFORE_CONNECT**
The event occurs before connecting

**MQTT_EVENT_DELETED**
Notification on delete of one message from the internal outbox, if the message couldn’t have been sent and acknowledged before expiring defined in OUTBOX_EXPIRED_TIMEOUT_MS. (events are not posted upon deletion of successfully acknowledged messages)

- This event id is posted only if MQTT_REPORT_DELETED_MESSAGES==1
- Additional context: msg_id (id of the deleted message).

**enum esp_mqtt_connect_return_code_t**
MQTT connection error codes propagated via ERROR event

*Values:*

- **MQTT_CONNECTION_ACCEPTED** = 0
  Connection accepted

- **MQTT_CONNECTION_REFUSE_PROTOCOL**
  MQTT connection refused reason: Wrong protocol

- **MQTT_CONNECTION_REFUSE_ID_REJECTED**
  MQTT connection refused reason: ID rejected

- **MQTT_CONNECTION_REFUSE_SERVER_UNAVAILABLE**
  MQTT connection refused reason: Server unavailable

- **MQTT_CONNECTION_REFUSE_BAD_USERNAME**
  MQTT connection refused reason: Wrong user

- **MQTT_CONNECTION_REFUSE_NOT_AUTHORIZED**
  MQTT connection refused reason: Wrong username or password

**enum esp_mqtt_error_type_t**
MQTT connection error codes propagated via ERROR event

*Values:*

- **MQTT_ERROR_TYPE_NONE** = 0
- **MQTT_ERROR_TYPE_TCP_TRANSPORT**
- **MQTT_ERROR_TYPE_CONNECTION_REFUSED**

**enum esp_mqtt_transport_t**

*Values:*

- **MQTT_TRANSPORT_UNKNOWN** = 0x0
- **MQTT_TRANSPORT_OVER_TCP**
  MQTT over TCP, using scheme: mqtt
- **MQTT_TRANSPORT_OVER_SSL**
  MQTT over SSL, using scheme: mqtts
2.4.3 ESP-TLS

Overview

The ESP-TLS component provides a simplified API interface for accessing the commonly used TLS functionality. It supports common scenarios like CA certification validation, SNI, ALPN negotiation, non-blocking connection among others. All the configuration can be specified in the esp_tls_cfg_t data structure. Once done, TLS communication can be conducted using the following APIs:

- esp_tls_conn_new(): for opening a new TLS connection.
- esp_tls_conn_read(): for reading from the connection.
- esp_tls_conn_write(): for writing into the connection.
- esp_tls_conn_destroy(): for freeing up the connection.

Any application layer protocol like HTTP1, HTTP2 etc can be executed on top of this layer.

Application Example

Simple HTTPS example that uses ESP-TLS to establish a secure socket connection: protocols/https_request.

Tree structure for ESP-TLS component

```
├── esp_tls.c
├── esp_tls.h
├── esp_tls_mbedtls.c
├── esp_tls_wolfssl.c
└── private/include
    ├── esp_tls_mbedtls.h
    └── esp_tls_wolfssl.h
```

The ESP-TLS component has a file esp-tls/esp_tls.h which contain the public API headers for the component. Internally ESP-TLS component uses one of the two SSL/TLS Libraries between mbedtls and wolfssl for its operation. API specific to mbedtls are present in esp-tls/private_include/esp_tls_mbedtls.h and API specific to wolfssl are present in esp-tls/private_include/esp_tls_wolfssl.h.

TLS Server verification

The ESP-TLS provides multiple options for TLS server verification on the client side. The ESP-TLS client can verify the server by validating the peer’s server certificate or with the help of pre-shared keys. The user should select only one of the following options in the esp_tls_cfg_t structure for TLS server verification. If no option is selected then client will return a fatal error by default at the time of the TLS connection setup.
**Chapter 2. API Reference**

- **cacert_buf** and **cacert_bytes**: The CA certificate can be provided in a buffer to the `esp_tls_cfg_t` structure. The ESP-TLS will use the CA certificate present in the buffer to verify the server. The following variables in `esp_tls_cfg_t` structure must be set:
  - `cacert_buf`: pointer to the buffer which contains the CA cert.
  - `cacert_bytes`: size of the CA certificate in bytes.

- **use_global_ca_store**: The global ca store can be initialized and set at once. Then it can be used to verify the server for all the ESP-TLS connections which have set `use_global_ca_store = true` in their respective `esp_tls_cfg_t` structure. See API Reference section below on information regarding different API used for initializing and setting up the global_ca_store.

- **crt_bundle_attach**: The ESP x509 Certificate Bundle API provides an easy way to include a bundle of custom x509 root certificates for TLS server verification. More details can be found at [ESP x509 Certificate Bundle](https://github.com/espressif/esp-wolfssl).

- **psk_hint_key**: To use pre-shared keys for server verification, `CONFIG_ESP_TLS_PSK_VERIFICATION` should be enabled in the ESP-TLS menuconfig. Then the pointer to PSK hint and key should be provided to the `esp_tls_cfg_t` structure. The ESP-TLS will use the PSK for server verification only when no other option regarding the server verification is selected.

- **skip server verification**: This is an insecure option provided in the ESP-TLS for testing purpose. The option can be set by enabling `CONFIG_ESP_TLS_INSECURE` and `CONFIG_ESP_TLS_SKIP_SERVER_CERT_VERIFY` in the ESP-TLS menuconfig. When this option is enabled the ESP-TLS will skip server verification by default when no other options for server verification are selected in the `esp_tls_cfg_t` structure. WARNING: Enabling this option comes with a potential risk of establishing a TLS connection with a server which has a fake identity, provided that the server certificate is not provided either through API or other mechanism like ca_store etc.

**Underlying SSL/TLS Library Options**

The ESP-TLS component has an option to use mbedtls or wolfssl as their underlying SSL/TLS library. By default only mbedtls is available and is used, wolfssl SSL/TLS library is available publicly at https://github.com/espressif/esp-wolfssl. The repository provides wolfssl component in binary format, it also provides few examples which are useful for understanding the API. Please refer the repository README.md for information on licensing and other options. Please see below option for using wolfssl in your project.

| Note: | As the library options are internal to ESP-TLS, switching the libraries will not change ESP-TLS specific code for a project. |

**How to use wolfssl with ESP-IDF**

There are two ways to use wolfssl in your project

1) Directly add wolfssl as a component in your project with following three commands:\n
   ```
   (First change directory (cd) to your project directory)
   mkdir components
   cd components
   git clone https://github.com/espressif/esp-wolfssl.git
   ```

2) Add wolfssl as an extra component in your project.

   • Download wolfssl with:

     ```
     git clone https://github.com/espressif/esp-wolfssl.git
     ```

   • Include esp-wolfssl in ESP-IDF with setting EXTRA_COMPONENT_DIRS in CMakeLists.txt of your project as done in wolfssl/examples. For reference see Optional Project variables in build-system.

After above steps, you will have option to choose wolfssl as underlying SSL/TLS library in configuration menu of your project as follows:

```
idf.py menuconfig -> ESP-TLS -> choose SSL/TLS Library -> mbedtls/wolfssl
```
Comparison between mbedtls and wolfssl

The following table shows a typical comparison between wolfssl and mbedtls when protocols/https_request example (which has server authentication) was run with both SSL/TLS libraries and with all respective configurations set to default. (mbedtls IN_CONTENT length and OUT_CONTENT length were set to 16384 bytes and 4096 bytes respectively)

<table>
<thead>
<tr>
<th>Property</th>
<th>Wolfssl</th>
<th>Mbedtls</th>
</tr>
</thead>
<tbody>
<tr>
<td>Total Heap Consumed</td>
<td>~19 Kb</td>
<td>~37 Kb</td>
</tr>
<tr>
<td>Task Stack Used</td>
<td>~2.2 Kb</td>
<td>~3.6 Kb</td>
</tr>
<tr>
<td>Bin size</td>
<td>~858 Kb</td>
<td>~736 Kb</td>
</tr>
</tbody>
</table>

**Note:** These values are subject to change with change in configuration options and version of respective libraries.

Digital Signature with ESP-TLS

ESP-TLS provides support for using the Digital Signature (DS) with ESP32-S3. Use of the DS for TLS is supported only when ESP-TLS is used with mbedtls (default stack) as its underlying SSL/TLS stack. For more details on Digital Signature, please refer to the Digital Signature Documentation. The technical details of Digital Signature such as how to calculate private key parameters can be found in ESP32-S3 Technical Reference Manual > Digital Signature (DS) [PDF]. The DS peripheral must be configured before it can be used to perform Digital Signature, see Configure the DS Peripheral in Digital Signature.

The DS peripheral must be initialized with the required encrypted private key parameters (obtained when the DS peripheral is configured). ESP-TLS internally initializes the DS peripheral when provided with the required DS context (DS parameters). Please see the below code snippet for passing the DS context to esp-tls context. The DS context passed to the esp-tls context should not be freed till the TLS connection is deleted.

```c
#include "esp_tls.h"
esp_ds_data_ctx_t *ds_ctx;
/* initialize ds_ctx with encrypted private key parameters, which can be read from...
..the nvs or provided through the application code */
esp_tls_cfg_t cfg = {
    .clientcert_buf = /* the client cert */,
    .clientcert_bytes = /* length of the client cert */,
    /* other configurations options */
    .ds_data = (void *)ds_ctx,
};
```

**Note:** When using Digital Signature for the TLS connection, along with the other required params, only the client cert (clientcert_buf) and the DS params (ds_data) are required and the client key (clientkey_buf) can be set to NULL.

- An example of mutual authentication with the DS peripheral can be found at ssl mutual auth which internally uses (ESP-TLS) for the TLS connection.

API Reference

Header File

- components/esp-tls/esp_tls.h
Functions

*esp_tls_t* esp_tls_init (void)

Create TLS connection.

Return: tls Pointer to esp-tls as esp-tls handle if successfully initialized, NULL if allocation error

*esp_tls_t* esp_tls_conn_new (const char *hostname, int hostlen, int port, const esp_tls_cfg_t *cfg)

Create a new blocking TLS/SSL connection.

This function establishes a TLS/SSL connection with the specified host in blocking manner.

Note: This API is present for backward compatibility reasons. Alternative function with the same functionality is esp_tls_conn_new_sync (and its asynchronous version esp_tls_conn_new_async)

Return: pointer to esp_tls_t, or NULL if connection couldn’t be opened.

Parameters
- [in] hostname: Hostname of the host.
- [in] port: Port number of the host.
- [in] cfg: TLS configuration as esp_tls_cfg_t. If you wish to open non-TLS connection, keep this NULL. For TLS connection, a pass pointer to esp_tls_cfg_t. At a minimum, this structure should be zero-initialized.

int esp_tls_conn_new_sync (const char *hostname, int hostlen, int port, const esp_tls_cfg_t *cfg, esp_tls_t *tls)

Create a new blocking TLS/SSL connection.

This function establishes a TLS/SSL connection with the specified host in blocking manner.

Return
- -1 If connection establishment fails.
- 1 If connection establishment is successful.
- 0 If connection state is in progress.

Parameters
- [in] hostname: Hostname of the host.
- [in] port: Port number of the host.
- [in] cfg: TLS configuration as esp_tls_cfg_t. If you wish to open non-TLS connection, keep this NULL. For TLS connection, a pass pointer to esp_tls_cfg_t. At a minimum, this structure should be zero-initialized.
- [in] tls: Pointer to esp-tls as esp-tls handle.

*esp_tls_t* esp_tls_conn_http_new (const char *url, const esp_tls_cfg_t *cfg)

Create a new blocking TLS/SSL connection with a given “HTTP” url.

The behaviour is same as esp_tls_conn_new() API. However this API accepts host’s url.

Return: pointer to esp_tls_t, or NULL if connection couldn’t be opened.

Parameters
- [in] url: url of host.
- [in] cfg: TLS configuration as esp_tls_cfg_t. If you wish to open non-TLS connection, keep this NULL. For TLS connection, a pass pointer to ‘esp_tls_cfg_t’. At a minimum, this structure should be zero-initialized.

int esp_tls_conn_new_async (const char *hostname, int hostlen, int port, const esp_tls_cfg_t *cfg, esp_tls_t *tls)

Create a new non-blocking TLS/SSL connection.

This function initiates a non-blocking TLS/SSL connection with the specified host, but due to its non-blocking nature, it doesn’t wait for the connection to get established.

Return
- -1 If connection establishment fails.
- 0 If connection establishment is in progress.
Chapter 2. API Reference

• If connection establishment is successful.

Parameters
- [in] hostname: Hostname of the host.
- [in] port: Port number of the host.
- [in] cfg: TLS configuration as esp_tls_cfg_t. non_block member of this structure should be set to be true.
- [in] tls: pointer to esp-tls as esp-tls handle.

int esp_tls_conn_http_new_async(const char *url, const esp_tls_cfg_t *cfg, esp_tls_t *tls)
Create a new non-blocking TLS/SSL connection with a given “HTTP” url.

The behaviour is same as esp_tls_conn_new() API. However this API accepts host’s url.

Return
- -1 If connection establishment fails.
- 0 If connection establishment is in progress.
- 1 If connection establishment is successful.

Parameters
- [in] url: url of host.
- [in] cfg: TLS configuration as esp_tls_cfg_t.
- [in] tls: pointer to esp-tls as esp-tls handle.

static ssize_t esp_tls_conn_write(esp_tls_t *tls, void *data, size_t datalen)
Write from buffer ‘data’ into specified tls connection.

Return
- >=0 if write operation was successful, the return value is the number of bytes actually written to the TLS/SSL connection.
- <0 if write operation was not successful, because either an error occured or an action must be taken by the calling process.
- ESP_TLS_ERR_SSL_WANT_READ/ ESP_TLS_ERR_SSL_WANT_WRITE. if the handshake is incomplete and waiting for data to be available for reading. In this case this functions needs to be called again when the underlying transport is ready for operation.

Parameters
- [in] tls: pointer to esp-tls as esp-tls handle.
- [in] data: Buffer from which data will be written.
- [in] datalen: Length of data buffer.

static ssize_t esp_tls_conn_read(esp_tls_t *tls, void *data, size_t datalen)
Read from specified tls connection into the buffer ‘data’.

Return
- >0 if read operation was successful, the return value is the number of bytes actually read from the TLS/SSL connection.
- 0 if read operation was not successful. The underlying connection was closed.
- <0 if read operation was not successful, because either an error occured or an action must be taken by the calling process.

Parameters
- [in] tls: pointer to esp-tls as esp-tls handle.
- [in] data: Buffer to hold read data.
- [in] datalen: Length of data buffer.

void esp_tls_conn_delete(esp_tls_t *tls)
Compatible version of esp_tls_conn_destroy() to close the TLS/SSL connection.

Parameters
- [in] tls: pointer to esp-tls as esp-tls handle.

int esp_tls_conn_destroy(esp_tls_t *tls)
Close the TLS/SSL connection and free any allocated resources.

This function should be called to close each tls connection opened with esp_tls_conn_new() or esp_tls_conn_http_new() APIs.
Chapter 2. API Reference

Return - 0 on success
   • -1 if socket error or an invalid argument

Parameters
   • [in] tls: pointer to esp-tls as esp-tls handle.

ssize_t esp_tls_get_bytes_avail(esp_tls_t *tls)
Return the number of application data bytes remaining to be read from the current record.

This API is a wrapper over mbedtls’s mbedtls_ssl_get_bytes_avail() API.

Return
   • -1 in case of invalid arg
   • bytes available in the application data record read buffer

Parameters
   • [in] tls: pointer to esp-tls as esp-tls handle.

esp_err_t esp_tls_get_conn_sockfd(esp_tls_t *tls, int *sockfd)
Returns the connection socket file descriptor from esp_tls session.

Return
   • ESP_OK on success and value of sockfd will be updated with socket file descriptor for connection
   • ESP_ERR_INVALID_ARG if (tls == NULL || sockfd == NULL)

Parameters
   • [in] tls: handle to esp_tls context
   • [out] sockfd: int pointer to sockfd value.

esp_err_t esp_tls_init_global_ca_store(void)
Create a global CA store, initially empty.

This function should be called if the application wants to use the same CA store for multiple connections. This function initialises the global CA store which can be then set by calling esp_tls_set_global_ca_store(). To be effective, this function must be called before any call to esp_tls_set_global_ca_store().

Return
   • ESP_OK if creating global CA store was successful.
   • ESP_ERR_NO_MEM if an error occurred when allocating the mbedtls resources.

esp_err_t esp_tls_set_global_ca_store(const unsigned char *cacert_pem_buf, const unsigned int cacert_pem_bytes)
Set the global CA store with the buffer provided in pem format.

This function should be called if the application wants to set the global CA store for multiple connections i.e. to add the certificates in the provided buffer to the certificate chain. This function implicitly calls esp_tls_init_global_ca_store() if it has not already been called. The application must call this function before calling esp_tls_conn_new().

Return
   • ESP_OK if adding certificates was successful.
   • Other if an error occurred or an action must be taken by the calling process.

Parameters
   • [in] cacert_pem_buf: Buffer which has certificates in pem format. This buffer is used for creating a global CA store, which can be used by other tls connections.

void esp_tls_free_global_ca_store(void)
Free the global CA store currently being used.

The memory being used by the global CA store to store all the parsed certificates is freed up. The application can call this API if it no longer needs the global CA store.

esp_err_t esp_tls_get_and_clear_last_error(esp_tls_error_handle_t h, int *esp_tls_code, int *esp_tls_flags)
Returns last error in esp_tls with detailed mbedtls related error codes. The error information is cleared internally upon return.

Return
   • ESP_ERR_INVALID_STATE if invalid parameters
Chapter 2. API Reference

- ESP_OK (0) if no error occurred
- specific error code (based on ESP_ERR_ESP_TLS_BASE) otherwise

**Parameters**
- [in] `h`: esp-tls error handle.
- [out] `esp_tls_code`: last error code returned from mbedtls api (set to zero if none) This pointer could be NULL if caller does not care about esp_tls_code
- [out] `esp_tls_flags`: last certification verification flags (set to zero if none) This pointer could be NULL if caller does not care about esp_tls_code

```c
esp_err_t esp_tls_get_and_clear_error_type(esp_tls_error_handle_t h, esp_tls_error_type_t err_type, int* error_code)
```

Returns the last error captured in esp_tls of a specific type. The error information is cleared internally upon return.

**Return**
- ESP_ERR_INVALID_STATE if invalid parameters
- ESP_OK if a valid error returned and was cleared

**Parameters**
- [in] `h`: esp-tls error handle.
- [in] `err_type`: specific error type
- [out] `error_code`: last error code returned from mbedtls api (set to zero if none) This pointer could be NULL if caller does not care about esp_tls_code

```c
mbedtls_x509_crt* esp_tls_get_global_ca_store(void)
```

Get the pointer to the global CA store currently being used.

The application must first call esp_tls_set_global_ca_store(). Then the same CA store could be used by the application for APIs other than esp_tls.

**Note** Modifying the pointer might cause a failure in verifying the certificates.

**Return**
- Pointer to the global CA store currently being used if successful.
- NULL if there is no global CA store set.

```c
esp_err_t esp_tls_plain_tcp_connect(const char* host, int hostlen, int port, const esp_tls_cfg_t* cfg, esp_tls_error_handle_t error_handle, int* sockfd)
```

Creates a plain TCP connection, returning a valid socket fd on success or an error handle.

**Return** ESP_OK on success ESP_ERR_INVALID_ARG if invalid output parameters ESP-TLS based error codes on failure

**Parameters**
- [in] `host`: Hostname of the host.
- [in] `port`: Port number of the host.
- [in] `cfg`: ESP-TLS configuration as esp_tls_cfg_t.
- [out] `error_handle`: ESP-TLS error handle holding potential errors occurred during connection
- [out] `sockfd`: Socket descriptor if successfully connected on TCP layer

**Structures**

```c
struct psk_key_hint
```

ESP-TLS preshared key and hint structure.

**Public Members**

```c
cconst uint8_t* key
```

key in PSK authentication mode in binary format

```c
cconst size_t key_size
```

length of the key
const char *hint
  hint in PSK authentication mode in string format

struct tls_keep_alive_cfg
  esp-tls client session ticket ctx

  Keep alive parameters structure

Public Members

bool keep_alive_enable
  Enable keep-alive timeout

int keep_alive_idle
  Keep-alive idle time (second)

int keep_alive_interval
  Keep-alive interval time (second)

int keep_alive_count
  Keep-alive packet retry send count

struct esp_tls_cfg
  ESP-TLS configuration parameters.

Note
  Note about format of certificates:
  • This structure includes certificates of a Certificate Authority, of client or server as well as private
    keys, which may be of PEM or DER format. In case of PEM format, the buffer must be NULL
    terminated (with NULL character included in certificate size).
  • Certificate Authority’s certificate may be a chain of certificates in case of PEM format, but could
    be only one certificate in case of DER format.
  • Variables names of certificates and private key buffers and sizes are defined as unions providing
    backward compatibility for legacy *_pem_buf and *_pem_bytes names which suggested only PEM
    format was supported. It is encouraged to use generic names such as cacert_buf and cacert_bytes.

Public Members

const char **alpn_protos
  Application protocols required for HTTP2. If HTTP2/ALPN support is required, a list of protocols that
  should be negotiated. The format is length followed by protocol name. For the most common cases the
  following is ok: const char **alpn_protos = { "h2", NULL };
  • where ‘h2’ is the protocol name

const unsigned char *cacert_buf
  Certificate Authority’s certificate in a buffer. Format may be PEM or DER, depending on mbedtls-
  support This buffer should be NULL terminated in case of PEM

const unsigned char *cacert_pem_buf
  CA certificate buffer legacy name

unsigned int cacert_bytes
  Size of Certificate Authority certificate pointed to by cacert_buf (including NULL-terminator in case of
  PEM format)

unsigned int cacert_pem_bytes
  Size of Certificate Authority certificate legacy name

const unsigned char *clientcert_buf
  Client certificate in a buffer Format may be PEM or DER, depending on mbedtls-support This buffer
  should be NULL terminated in case of PEM

const unsigned char *clientcert_pem_buf
  Client certificate legacy name
unsigned int \texttt{clientcert\_bytes}
Size of client certificate pointed to by \texttt{clientcert\_pem\_buf} (including NULL-terminator in case of PEM format)

unsigned int \texttt{clientcert\_pem\_bytes}
Size of client certificate legacy name

\texttt{const unsigned char *clientkey\_buf}
Client key in a buffer Format may be PEM or DER, depending on mbedtls-support This buffer should be NULL terminated in case of PEM

\texttt{const unsigned char *clientkey\_pem\_buf}
Client key legacy name

unsigned int \texttt{clientkey\_bytes}
Size of client key pointed to by \texttt{clientkey\_pem\_buf} (including NULL-terminator in case of PEM format)

unsigned int \texttt{clientkey\_pem\_bytes}
Size of client key legacy name

\texttt{const unsigned char *clientkey\_password}
Client key decryption password string

unsigned int \texttt{clientkey\_password\_len}
String length of the password pointed to by \texttt{clientkey\_password}

\texttt{bool non\_block}
Configure non-blocking mode. If set to true the underneath socket will be configured in non blocking mode after tls session is established

\texttt{bool use\_secure\_element}
Enable this option to use secure element or atecc608a chip (Integrated with ESP32-WROOM-32SE)

\texttt{int timeout\_ms}
Network timeout in milliseconds

\texttt{bool use\_global\_ca\_store}
Use a global ca_store for all the connections in which this bool is set.

\texttt{const char *common\_name}
If non-NULL, server certificate CN must match this name. If NULL, server certificate CN must match hostname.

\texttt{bool skip\_common\_name}
Skip any validation of server certificate CN field

\texttt{tls\_keep\_alive\_cfg\_t *keep\_alive\_cfg}
Enable TCP keep-alive timeout for SSL connection

\texttt{const psk\_hint\_key\_t *psk\_hint\_key}
Pointer to PSK hint and key. if not NULL (and certificates are NULL) then PSK authentication is enabled with configured setup. Important note: the pointer must be valid for connection

\texttt{esp\_err\_t (*crt\_bundle\_attach) (void *conf)}
Function pointer to \texttt{esp\_crt\_bundle\_attach}. Enables the use of certification bundle for server verification, must be enabled in menuconfig

\texttt{void *ds\_data}
Pointer for digital signature peripheral context

\texttt{bool is\_plain\_tcp}
Use non-TLS connection: When set to true, the esp-tls uses plain TCP transport rather then TLS/SSL connection. Note, that it is possible to connect using a plain tcp transport directly with \texttt{esp\_tls\_plain\_tcp\_connect()} API

\texttt{struct ifreq *if\_name}
The name of interface for data to go through. Use the default interface without setting
struct esp_tls
ESP-TLS Connection Handle.

Public Members

mbedtls_ssl_context ssl
TLS/SSL context

mbedtls_entropy_context entropy
mbedTLS entropy context structure

mbedtls_ctr_drbg_context ctr_drbg
mbedTLS ctr drbg context structure. CTR_DRBG is deterministic random bit generation based on AES-256

mbedtls_ssl_config conf
TLS/SSL configuration to be shared between mbedtls_ssl_context structures

mbedtls_net_context server_fd
mbedTLS wrapper type for sockets

mbedtls_x509_crt cacert
Container for the X.509 CA certificate

mbedtls_x509_crt *cacert_ptr
Pointer to the cacert being used.

mbedtls_x509_crt clientcert
Container for the X.509 client certificate

mbedtls_pk_context clientkey
Container for the private key of the client certificate

int sockfd
Underlying socket file descriptor.

ssize_t (*read)(struct esp_tls *tls, char *data, size_t datalen)
Callback function for reading data from TLS/SSL connection.

ssize_t (*write)(struct esp_tls *tls, const char *data, size_t datalen)
Callback function for writing data to TLS/SSL connection.

esp_tls_conn_state_t conn_state
ESP-TLS Connection state

fd_set rset
read file descriptors

fd_set wset
write file descriptors

bool is_tls
indicates connection type (TLS or NON-TLS)

esp_tls_role_t role
esp-tls role

  • ESP_TLS_CLIENT
  • ESP_TLS_SERVER

esp_tls_error_handle_t error_handle
handle to error descriptor
Type Definitions

typedef enum esp_tls_conn_state esp_tls_conn_state_t
    ESP-TLS Connection State.

typedef enum esp_tls_role esp_tls_role_t

typedef struct psk_key_hint psk_hint_key_t
    ESP-TLS pre-shared key and hint structure.

typedef struct tls_keep_alive_cfg tls_keep_alive_cfg_t
    esp-tls client session ticket ctx
    Keep alive parameters structure

typedef struct esp_tls_cfg esp_tls_cfg_t
    ESP-TLS configuration parameters.

Note: Note about format of certificates:

- This structure includes certificates of a Certificate Authority, of client or server as well as private keys, which may be of PEM or DER format. In case of PEM format, the buffer must be NULL terminated (with NULL character included in certificate size).
- Certificate Authority’s certificate may be a chain of certificates in case of PEM format, but could be only one certificate in case of DER format.
- Variables names of certificates and private key buffers and sizes are defined as unions providing backward compatibility for legacy *_pem_buf and *_pem_bytes names which suggested only PEM format was supported. It is encouraged to use generic names such as cacert_buf and cacert_bytes.

typedef struct esp_tls esp_tls_t
    ESP-TLS Connection Handle.

Enumerations

enum esp_tls_conn_state
    ESP-TLS Connection State.
    Values:
    ESP_TLS_INIT = 0
    ESP_TLS_CONNECTING
    ESP_TLS_HANDSHAKE
    ESP_TLS_FAIL
    ESP_TLS_DONE

enum esp_tls_role
    Values:
    ESP_TLS_CLIENT = 0
    ESP_TLS_SERVER

2.4.4 OpenSSL-APIs

Note: The OpenSSL-API will be discontinued in ESP-IDF from v5.0. Please use ESP-TLS <esp_tls> instead.

The code of this API (located in openssl directory), does not contain OpenSSL itself but is intended as a wrapper for applications using the OpenSSL API. It uses mbedTLS to do the actual work, so anyone compiling openssl code needs the mbedtls library and header file.

OpenSSL APIs not mentioned in this article are not open to public for the time, also do not have the corresponding function. If user calls it directly, it will always return an error or may show cannot link at compiling time.
## Chapter Introduction

- Chapter 1. SSL Context Method Create
- Chapter 2. SSL Context Function
- Chapter 3. SSL Function
- Chapter 4. SSL X509 Certification and Private Key Function

## Chapter 1. SSL Context Method Create

### 1.1 const SSL_METHOD* SSLv3_client_method (void)

**Arguments:**

```
none
```

**Return:**

SSLV3.0 version SSL context client method point

**Description:**

create the target SSL context method

**Example:**

```c
void example(void)
{
    const SSL_METHOD *method = SSLv3_client_method();
    ...
}
```

### 1.2 const SSL_METHOD* TLSv1_client_method (void)

**Arguments:**

```
none
```

**Return:**

TLSV1.0 version SSL context client method point

**Description:**

create the target SSL context method

**Example:**

```c
void example(void)
{
    const SSL_METHOD *method = TLSv1_client_method();
    ...
}
```

### 1.3 const SSL_METHOD* TLSv1_1_client_method (void)

**Arguments:**

```
none
```

**Return:**

...
Chapter 2. API Reference

### TLSV1.1 version SSL context client method point

**Description:**
create the target SSL context method

**Example:**
```c
void example(void)
{
    const SSL_METHOD *method = TLSv1_1_client_method();
    ...
}
```

#### 1.4 const SSL_METHOD* TLSv1_2_client_method (void)

**Arguments:**
one

**Return:**
TLSV1.2 version SSL context client method point

**Description:**
create the target SSL context method

**Example:**
```c
void example(void)
{
    const SSL_METHOD *method = TLSv1_2_client_method();
    ...
}
```

#### 1.5 const SSL_METHOD* TLS_client_method (void)

**Arguments:**
one

**Return:**
TLSV1.2 version SSL context client method point

**Description:**
create the default SSL context method, it's always to be TLSV1.2

**Example:**
```c
void example(void)
{
    const SSL_METHOD *method = TLSv1_2_client_method();
    ...
}
```

#### 1.6 const SSL_METHOD* SSLv3_server_method (void)
Arguments:

none

Return:

SSLV3.0 version SSL context server method point

Description:

create the target SSL context method

Example:

```c
void example(void)
{
    const SSL_METHOD *method = SSLv3_server_method();
    ...
}
```

1.7 const SSL_METHOD* TLSv1_server_method (void)

Arguments:

none

Return:

TLSV1.0 version SSL context server method point

Description:

create the target SSL context method

Example:

```c
void example(void)
{
    const SSL_METHOD *method = TLSv1_server_method();
    ...
}
```

1.8 const SSL_METHOD* TLSv1_1_server_method (void)

Arguments:

none

Return:

TLSV1.1 version SSL context server method point

Description:

create the target SSL context method

Example:

```c
void example(void)
{
    const SSL_METHOD *method = TLSv1_1_server_method();
    ...
}
```
1.9 const SSL_METHOD* TLSv1_2_server_method (void)

Arguments:
none

Return:
TLSV1.2 version SSL context server method point

Description:
create the target SSL context method

Example:

```c
void example(void)
{
    const SSL_METHOD *method = TLSv1_2_server_method();
    ...
}
```

1.10 const SSL_METHOD* TLS_server_method (void)

Arguments:
none

Return:
TLSV1.2 version SSL context server method point

Description:
create the default SSL context method, it's always to be TLSv1.2

Example:

```c
void example(void)
{
    const SSL_METHOD *method = TLSv1_2_server_method();
    ...
}
```
context point

Description:
create a SSL context

Example:

```c
void example(void)
{
    SSL_CTX *ctx = SSL_CTX_new(SSLv3_server_method());
    ...
}
```

2.2 void SSL_CTX_free (SSL_CTX * ctx)

Arguments:
ctx - the SSL context point

Return:
none

Description:
free a SSL context

Example:

```c
void example(void)
{
    SSL_CTX *ctx;
    ...
    SSL_CTX_free(ctx);
}
```

2.3 int SSL_CTX_set_ssl_version (SSL_CTX * ctx, const SSL_METHOD * meth)

Arguments:
ctx - SSL context point
meth - SSL method point

Return:
1 : OK
0 : failed

Description:
set the SSL context version

Example:

```c
void example(void)
{
    SSL_CTX *ctx;
    const SSL_METHOD *meth;
    ...
}
```
... ... 
SSL_CTX_set_ssl_version(ctx, meth);
}

2.4 const SSL_METHOD* SSL_CTX_get_ssl_method (SSL_CTX * ctx)

Arguments:
ctx - SSL context point

Return:
SSL context method

Description:
get the SSL context method

Example:

```c
void example(void)
{
    const SSL_METHOD *method;
    SSL_CTX *ctx;
    ...
    method = SSL_CTX_get_ssl_method(ctx);
}
```

Chapter 3. SSL Function

3.1 SSL* SSL_new (SSL_CTX * ctx)

Arguments:
ctx - SSL context point

Return:
SSL method

Description:
create a SSL

Example:

```c
void example(void)
{
    SSL *ssl;
    SSL_CTX *ctx;
    ...
    ssl = SSL_new(ctx);
}
```

3.2 void SSL_free (SSL * ssl)
Arguments:
ssl - SSL point

Return:
none

Description:
free SSL

Example:
void example(void)
{
    SSL *ssl;
    ...
    SSL_free(ssl);
}

3.3 int SSL_do_handshake (SSL * ssl)

Arguments:
ssl - SSL point

Return:
1 : OK
0 : failed, connect is close by remote
-1 : a error catch

Description:
perform the SSL handshake

Example:
void example(void)
{
    SSL *ssl;
    int ret;
    ...
    ret = SSL_do_handshake(ssl);
}

3.4 int SSL_connect (SSL * ssl)

Arguments:
ssl - SSL point

Return:
1 : OK
0 : failed, connect is close by remote
-1 : a error catch

Description:
connect to the remote SSL server

Example:

```c
void example(void)
{
    SSL *ssl;
    int ret;
    ...
    ret = SSL_connect(ssl);
}
```

3.5 int SSL_accept (SSL * ssl)

Arguments:

ssl - SSL point

Return:

1 : OK
0 : failed, connect is close by remote
-1 : a error catch

Description:

accept the remote connection

Example:

```c
void example(void)
{
    SSL *ssl;
    int ret;
    ...
    ret = SSL_accept(ssl);
}
```

3.6 int SSL_shutdown (SSL * ssl)

Arguments:

ssl - SSL point

Return:

1 : OK
0 : failed, connect is close by remote
-1 : a error catch

Description:

shutdown the connection

Example:

```c
void example(void)
{
    ...
}
```

(continues on next page)
Chapter 2. API Reference

3.7 int SSL_clear (SSL * ssl)

Arguments:

ssl - SSL point

Return:

1 : OK
0 : failed

Description:

shutdown the connection

Example:

```c
void example(void)
{
    SSL *ssl;
    int ret;
    ...
    ret = SSL_clear(ssl);
}
```

3.8 int SSL_read (SSL * ssl, void * buffer, int len)

Arguments:

ssl - point
buffer - data buffer point
len - data length

Return:

> 0 : OK, and return received data bytes
= 0 : no data received or connection is closed
< 0 : an error catch

Description:

read data from remote

Example:

```c
void example(void)
{
    SSL *ssl;
    char *buf;
    int len;
    int ret;
    ...
    ret = SSL_read(ssl, buf, len);
}
```
... ...
ret = SSL_read(ssl, buf, len);
}

3.9 int SSL_write (SSL * ssl, const void * buffer, int len)
Arguments:

ssl  - SSL point
buffer - data buffer point
len   - data length

Return:

> 0 : OK, and return received data bytes
= 0 : no data sent or connection is closed
< 0 : an error catch

Description:

send the data to remote

Example:

```c
void example(void)
{
SSL *ssl;
char *buf;
int len;
int ret;
...
ret = SSL_write(ssl, buf, len);
}
```

3.10 SSL_CTX *SSL_get_SSL_CTX (const SSL * ssl)
Arguments:

ssl - SSL point

Return:

SSL context

Description:

get SSL context of the SSL

Example:

```c
void example(void)
{
SSL *ssl;
SSL_CTX *ctx;
...
...
```
3.11 `int SSL_get_shutdown (const SSL * ssl)`

**Arguments:**
- `ssl` - SSL point

**Return:**
- shutdown mode

**Description:**
get SSL shutdown mode

**Example:**

```c
void example(void)
{
    SSL *ssl;
    int mode;
    ...
    mode = SSL_get_SSL_CTX(ssl);
}
```

3.12 `void SSL_set_shutdown (SSL * ssl, int mode)`

**Arguments:**
- `ssl` - SSL point

**Return:**
- shutdown mode

**Description:**
set SSL shutdown mode

**Example:**

```c
void example(void)
{
    SSL *ssl;
    int mode = 0;
    ...
    SSL_set_shutdown(ssl, mode);
}
```

3.13 `const SSL_METHOD* SSL_get_ssl_method (SSL * ssl)`

**Arguments:**
- `ssl` - SSL point

**Return:**
- SSL METHOD
Chapter 2. API Reference

SSL method

Description:
set SSL shutdown mode

Example:

```c
void example(void)
{
    SSL *ssl;
    const SSL_METHOD *method;
    ...
    method = SSL_get_ssl_method(ssl);
}
```

3.14 int SSL_set_ssl_method (SSL * ssl, const SSL_METHOD * method)

Arguments:

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ssl</td>
<td>SSL point</td>
</tr>
<tr>
<td>meth</td>
<td>SSL method point</td>
</tr>
</tbody>
</table>

Return:

- 1 : OK
- 0 : failed

Description:
set the SSL method

Example:

```c
void example(void)
{
    int ret;
    SSL *ssl;
    const SSL_METHOD *method;
    ...
    ret = SSL_set_ssl_method(ssl, method);
}
```

3.15 int SSL_pending (const SSL * ssl)

Arguments:

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ssl</td>
<td>SSL point</td>
</tr>
</tbody>
</table>

Return:

data bytes

Description:
get received data bytes

Example:
void example(void)
{
    int ret;
    SSL *ssl;
    ...
    ret = SSL_pending(ssl);
}

3.16 int SSL_has_pending (const SSL * ssl)

Arguments:

ssl - SSL point

Return:

1 : Yes
0 : No

Description:

check if data is received

Example:

void example(void)
{
    int ret;
    SSL *ssl;
    ...
    ret = SSL_has_pending(ssl);
}

3.17 int SSL_get_fd (const SSL * ssl)

Arguments:

ssl - SSL point

Return:

>= 0 : socket id
< 0 : a error catch

Description:

get the socket of the SSL

Example:

void example(void)
{
    int ret;
    SSL *ssl;
    ...
    ret = SSL_get_fd(ssl);
}
3.18 int SSL_get_rfd (const SSL * ssl)

Arguments:

ssl - SSL point

Return:

>= 0 : socket id
< 0 : an error catch

Description:

get the read only socket of the SSL

Example:

```c
void example(void)
{
    int ret;
    SSL *ssl;
    ...
    ret = SSL_get_rfd(ssl);
}
```

3.19 int SSL_get_wfd (const SSL * ssl)

Arguments:

ssl - SSL point

Return:

>= 0 : socket id
< 0 : an error catch

Description:

get the write only socket of the SSL

Example:

```c
void example(void)
{
    int ret;
    SSL *ssl;
    ...
    ret = SSL_get_wfd(ssl);
}
```

3.20 int SSL_set_fd (SSL * ssl, int fd)

Arguments:

ssl - SSL point
fd - socket id

Return:
Chapter 2. API Reference

1: OK
0: failed

Description:
set socket to SSL

Example:

```c
void example(void)
{
    int ret;
    SSL *ssl;
    int socket;
    ...
    ret = SSL_set_fd(ssl, socket);
}
```

3.21 `int SSL_set_rfd (SSL * ssl, int fd)`

Arguments:

<table>
<thead>
<tr>
<th>SSL</th>
<th>SSL point</th>
</tr>
</thead>
<tbody>
<tr>
<td>fd</td>
<td>socket id</td>
</tr>
</tbody>
</table>

Return:

1: OK
0: failed

Description:
set read only socket to SSL

Example:

```c
void example(void)
{
    int ret;
    SSL *ssl;
    int socket;
    ...
    ret = SSL_set_rfd(ssl, socket);
}
```

3.22 `int SSL_set_wfd (SSL * ssl, int fd)`

Arguments:

<table>
<thead>
<tr>
<th>SSL</th>
<th>SSL point</th>
</tr>
</thead>
<tbody>
<tr>
<td>fd</td>
<td>socket id</td>
</tr>
</tbody>
</table>

Return:

1: OK
0: failed

Description:
set write only socket to SSL

Example:

```c
void example(void)
{
    int ret;
    SSL *ssl;
    int socket;
    ...
    ret = SSL_set_wfd(ssl, socket);
}
```

### 3.23 int SSL_version (const SSL * ssl)

**Arguments:**

ssl - SSL point

**Return:**

SSL version

**Description:**

get SSL version

**Example:**

```c
void example(void)
{
    int version;
    SSL *ssl;
    ...
    version = SSL_version(ssl);
}
```

### 3.24 const char* SSL_get_version (const SSL * ssl)

**Arguments:**

ssl - SSL point

**Return:**

SSL version string

**Description:**

get the SSL current version string

**Example:**

```c
void example(void)
{
    char *version;
    SSL *ssl;
    ...

    version = SSL_get_version(ssl);
}
```
... ...  
    version = SSL_get_version(ssl);  
}

3.25 OSSL_HANDSHAKE_STATE SSL_get_state (const SSL * ssl)

Arguments:
ssl - SSL point

Return:
SSL state

Description:
get the SSL state

Example:

```c
void example(void)
{
    OSSL_HANDSHAKE_STATE state;
    SSL *ssl;
    ... ...
    state = SSL_get_state(ssl);
}
```

3.26 const char* SSL_alert_desc_string (int value)

Arguments:
value - SSL description

Return:
alert value string

Description:
get alert description string

Example:

```c
void example(void)
{
    int val;
    char *str;
    ... ...
    str = SSL_alert_desc_string(val);
}
```

3.27 const char* SSL_alert_desc_string_long (int value)

Arguments:
value - SSL description

Return:

alert value long string

Description:

get alert description long string

Example:

```c
void example(void)
{
    int val;
    char *str;
    ...
    str = SSL_alert_desc_string_long(val);
}
```

3.28 `const char* SSL_alert_type_string (int value)`

Arguments:

value - SSL type description

Return:

alert type string

Description:

get alert type string

Example:

```c
void example(void)
{
    int val;
    char *str;
    ...
    str = SSL_alert_type_string(val);
}
```

3.29 `const char* SSL_alert_type_string_long (int value)`

Arguments:

value - SSL type description

Return:

alert type long string

Description:

get alert type long string

Example:
Chapter 2. API Reference

```c
void example(void)
{
    int val;
    char *str;
    ...
    str = SSL_alert_type_string_long(val);
}
```

### 3.30 const char* SSL_rstate_string (SSL * ssl)

**Arguments:**

- ssl - SSL point

**Return:**

- state string

**Description:**

get the state string where SSL is reading

**Example:**

```c
void example(void)
{
    SSL *ssl;
    char *str;
    ...
    str = SSL_rstate_string(ssl);
}
```

### 3.31 const char* SSL_rstate_string_long (SSL * ssl)

**Arguments:**

- ssl - SSL point

**Return:**

- state long string

**Description:**

get the state long string where SSL is reading

**Example:**

```c
void example(void)
{
    SSL *ssl;
    char *str;
    ...
    str = SSL_rstate_string_long(ssl);
}
```

### 3.32 const char* SSL_state_string (const SSL * ssl)
Chapter 2. API Reference

### 3.33 `char* SSL_state_string_long (const SSL *ssl)`

**Arguments:**

- `ssl` - SSL point

**Return:**

- state long string

**Description:**

get the state long string

**Example:**

```c
void example(void)
{
  SSL *ssl;
  const char *str;
  ...
  str = SSL_state_string_long(ssl);
}
```

### 3.34 `int SSL_get_error (const SSL *ssl, int ret_code)`

**Arguments:**

- `ssl` - SSL point
- `ret_code` - SSL return code

**Return:**

- SSL error number

**Description:**

get the error number
get SSL error code

Example:

```c
void example(void)
{
    SSL *ssl;
    int ret;
    int err;
    ...
    err = SSL_get_error(ssl, ret);
}
```

3.35 int SSL_want (const SSL * ssl)

Arguments:

ssl - SSL point

Return:

specific statement

Description:

going the SSL specific statement

Example:

```c
void example(void)
{
    SSL *ssl;
    int state;
    ...
    state = SSL_want(ssl);
}
```

3.36 int SSL_want_nothing (const SSL * ssl)

Arguments:

ssl - SSL point

Return:

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>false</td>
</tr>
<tr>
<td>1</td>
<td>true</td>
</tr>
</tbody>
</table>

Description:

check if SSL want nothing

Example:

```c
void example(void)
{
    SSL *ssl;
    int ret;
    ... ...
    ret = SSL_want_nothing(ssl);
}
```
... ...
ret = SSL_want(ssl);
}

3.37 int SSL_want_read (const SSL * ssl)

Arguments:
ssl - SSL point

Return:
0 : false
1 : true

Description:
check if SSL want to read

Example:
void example(void)
{
    SSL *ssl;
    int ret;
    ...
    ret = SSL_want_read(ssl);
}

3.38 int SSL_want_write (const SSL * ssl)

Arguments:
ssl - SSL point

Return:
0 : false
1 : true

Description:
check if SSL want to write

Example:
void example(void)
{
    SSL *ssl;
    int ret;
    ...
    ret = SSL_want_write(ssl);
}
Chapter 4. SSL X509 Certification and Private Key Function

4.1 X509 * d2i_X509 (X509 ** cert, const unsigned char * buffer, long len)

Arguments:

 cert - a point pointed to X509 certification
 buffer - a point pointed to the certification context memory point
 length - certification bytes

Return:

 X509 certification object point

Description:

load a character certification context into system context. If '*cert' is
→ pointed to the certification, then load certification into it. Or create a new X509-
→ certification object

Example:

```c
void example(void)
{
    X509 *new;
    X509 *cert;
    unsigned char *buffer;
    long len;
    ...
    new = d2i_X509(&cert, buffer, len);
}
```

4.2 int SSL_add_client_CA (SSL * ssl, X509 * x)

Arguments:

 ssl - SSL point
 x   - CA certification point

Return:

 1 : OK
 0 : failed

Description:

add CA client certification into the SSL

Example:

```c
void example(void)
{
    int ret;
    SSL *ssl;
    X509 *new;
    ...
    ret = SSL_add_client_CA(ssl, new);
}
```

4.3 int SSL_CTX_add_client_CA (SSL_CTX * ctx, X509 * x)
Arguments:

ctx - SSL context point
x - CA certification point

Return:

1 : OK
0 : failed

Description:

add CA client certification into the SSL context

Example:

```c
void example(void)
{
    int ret;
    SSL_CTX *ctx;
    X509 *new;
    ...
    ret = SSL_add_client_CA(ctx, new);
}
```

4.4 **X509**

4.4 X509* SSL_get_certificate (const SSL * ssl)

Arguments:

ssl - SSL point

Return:

SSL certification point

Description:

get the SSL certification point

Example:

```c
void example(void)
{
    SSL *ssl;
    X509 *cert;
    ...
    cert = SSL_get_certificate(ssl);
}
```

4.5 **long** SSL_get_verify_result (const SSL * ssl)

Arguments:

ssl - SSL point

Return:

the result of verifying

Description:
get the verifying result of the SSL certification

Example:

```c
void example(void)
{
    SSL *ssl;
    long ret;
    ...
    ret = SSL_get_verify_result(ssl);
}
```

4.6 int SSL_CTX_use_certificate (SSL_CTX * ctx, X509 * x)

Arguments:

cxt - the SSL context point
pkey - certification object point

Return:

1 : OK
0 : failed

Description:

load the certification into the SSL_CTX or SSL object

Example:

```c
void example(void)
{
    int ret;
    SSL_CTX *ctx
    X509 *new;
    ...
    ret = SSL_CTX_use_certificate(ctx, new);
}
```

4.7 int SSL_CTX_use_certificate_ASN1 (SSL_CTX * ctx, int len, const unsigned char * d)

Arguments:

cxt - SSL context point
len - certification length
d - data point

Return:

1 : OK
0 : failed

Description:

load the ASN1 certification into SSL context

Example:
void example(void)
{
    int ret;
    SSL_CTX *ctx;
    const unsigned char *buf;
    int len;
    ...
    ret = SSL_CTX_use_certificate_ASN1(ctx, len, buf);
}

4.8 int SSL_CTX_use_PrivateKey (SSL_CTX *ctx, EVP_PKEY *pkey)

Arguments:
- ctx - SSL context point
- pkey - private key object point

Return:
- 1 : OK
- 0 : failed

Description:
load the private key into the context object

Example:
void example(void)
{
    int ret;
    SSL_CTX *ctx;
    EVP_PKEY *pkey;
    ...
    ret = SSL_CTX_use_PrivateKey(ctx, pkey);
}

4.9 int SSL_CTX_use_PrivateKey_ASN1 (int pk, SSL_CTX *ctx, const unsigned char *d, long len)

Arguments:
- ctx - SSL context point
- d - data point
- len - private key length

Return:
- 1 : OK
- 0 : failed

Description:
load the ASN1 private key into SSL context

Example:
void example(void)
{
    (continues on next page)
4.10 int SSL_CTX_use_RSAPrivateKey_ASN1 (SSL_CTX * ctx, const unsigned char * d, long len)

Arguments:

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ctx</td>
<td>SSL context point</td>
</tr>
<tr>
<td>d</td>
<td>data point</td>
</tr>
<tr>
<td>len</td>
<td>private key length</td>
</tr>
</tbody>
</table>

Return:

<table>
<thead>
<tr>
<th>Return Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>OK</td>
</tr>
<tr>
<td>0</td>
<td>failed</td>
</tr>
</tbody>
</table>

Description:

load the RSA ASN1 private key into SSL context

Example:

```c
void example(void)
{
    int ret;
    SSL_CTX *ctx;
    const unsigned char *buf;
    long len;
    ...
    ret = SSL_CTX_use_RSAPrivateKey_ASN1(pk, ctx, buf, len);
}
```

4.11 int SSL_use_certificate_ASN1 (SSL * ssl, int len, const unsigned char * d)

Arguments:

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ssl</td>
<td>SSL point</td>
</tr>
<tr>
<td>len</td>
<td>data bytes</td>
</tr>
<tr>
<td>d</td>
<td>data point</td>
</tr>
</tbody>
</table>

Return:

<table>
<thead>
<tr>
<th>Return Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>OK</td>
</tr>
<tr>
<td>0</td>
<td>failed</td>
</tr>
</tbody>
</table>

Description:

load certification into the SSL

Example:
void example(void)
{
    int ret;
    SSL *ssl;
    const unsigned char *buf;
    long len;
    ...
    ret = SSL_use_certificate_ASN1(ssl, len, buf);
}

4.12 X509\* SSL_get_peer_certificate (const SSL\* ssl)

Arguments:

ssl - SSL point

Return:

peer certification

Description:

get peer certification

Example:

void example(void)
{
    SSL *ssl;
    X509 *peer;
    ...
    peer = SSL_get_peer_certificate(ssl);
}

2.4.5 ESP HTTP Client

Overview

esp_http_client provides an API for making HTTP/S requests from ESP-IDF applications. The steps to use this API are as follows:

• esp_http_client_init(): Creates an esp_http_client_config_t instance i.e. a HTTP client handle based on the given esp_http_client_config_t configuration. This function must be the first to be called; default values will be assumed for the configuration values that are not explicitly defined by the user.

• esp_http_client_perform(): Performs all operations of the esp_http_client - opening the connection, exchanging data and closing the connection (as required), while blocking the current task until its completion. All related events will be invoked through the event handler (as specified in esp_http_client_config_t).

• esp_http_client_cleanup(): Closes the connection (if any) and frees up all the memory allocated to the HTTP client instance. This must be the last function to be called after the completion of operations.

Application Example

Simple example that uses ESP HTTP Client to make HTTP/S requests at protocols/esp_http_client.
Basic HTTP request

Check out the example functions `http_rest_with_url` and `http_rest_with_hostname_path` in the application example for implementation details.

Persistent Connections

Persistent connection means that the HTTP client can re-use the same connection for several exchanges. If the server does not request to close the connection with the `Connection: close` header, the connection is not dropped but is instead kept open and used for further requests.

To allow ESP HTTP client to take full advantage of persistent connections, one should make as many requests as possible using the same handle instance.

Check out the example functions `http_rest_with_url` and `http_rest_with_hostname_path` in the application example. Here, once the connection is created, multiple requests (GET, POST, PUT, etc.) are made before the connection is closed.

HTTPS Request

ESP HTTP client supports SSL connections using `mbedTLS`, with the `url` configuration starting with `https` scheme or `transport_type` set to `HTTP_TRANSPORT_OVER_SSL`. HTTPS support can be configured via `CONFIG_ESP_HTTP_CLIENT_ENABLEHTTPS` (enabled by default).

**Note:** While making HTTPS requests, if server verification is needed, additional root certificate (in PEM format) needs to be provided to the `cert_pem` member in `esp_http_client_config_t` configuration. Users can also use the ESP x509 Certificate Bundle for server verification using the `crt_bundle_attach` member of the `esp_http_client_config_t` configuration.

Check out the example functions `https_with_url` and `https_with_hostname_path` in the application example. (Implementation details of the above note are found here)

HTTP Stream

Some applications need to open the connection and control the exchange of data actively (data streaming). In such cases, the application flow is different from regular requests. Example flow is given below:

- `esp_http_client_init()`: Create a HTTP client handle
- `esp_http_client_set_*` or `esp_http_client_delete_*`: Modify the HTTP connection parameters (optional)
- `esp_http_client_open()`: Open the HTTP connection with `write_len` parameter (content length that needs to be written to server), set `write_len=0` for read-only connection
- `esp_http_client_write()`: Write data to server with a maximum length equal to `write_len` of `esp_http_client_open()` function; no need to call this function for `write_len=0`
- `esp_http_client_fetch_headers()`: Read the HTTP Server response headers, after sending the request headers and server data (if any). Returns the `content-length` from the server and can be succeeded by `esp_http_client_get_status_code()` for getting the HTTP status of the connection.
- `esp_http_client_read()`: Read the HTTP stream
- `esp_http_client_close()`: Close the connection
- `esp_http_client_cleanup()`: Release allocated resources

Check out the example function `http_perform_as_stream_reader` in the application example for implementation details.
HTTP Authentication

ESP HTTP client supports both Basic and Digest Authentication.

- Users can provide the username and password in the url or the username and password members of the esp_http_client_config_t configuration. For auth_type = HTTP_AUTH_TYPE_BASIC, the HTTP client takes only 1 perform operation to pass the authentication process.
- If auth_type = HTTP_AUTH_TYPE_NONE, but the username and password fields are present in the configuration, the HTTP client takes 2 perform operations. The client will receive the 401 Unauthorized header in its first attempt to connect to the server. Based on this information, it decides which authentication method to choose and performs it in the second operation.
- Check out the example functions http_auth_basic, http_auth_basic_redirect (for Basic authentication) and http_auth_digest (for Digest authentication) in the application example for implementation details.

Examples of Authentication Configuration

- Authentication with URI

```c
esp_http_client_config_t config = {
   .url = "http://user:passwd@httpbin.org/basic-auth/user/passwd",
   .auth_type = HTTP_AUTH_TYPE_BASIC,
};
```

- Authentication with username and password entry

```c
esp_http_client_config_t config = {
   .url = "http://httpbin.org/basic-auth/user/passwd",
   .username = "user",
   .password = "passwd",
   .auth_type = HTTP_AUTH_TYPE_BASIC,
};
```

API Reference

Header File

- components/esp_http_client/include/esp_http_client.h

Functions

```c
esp_http_client_handle_t esp_http_client_init(const esp_http_client_config_t *config)
```

Start a HTTP session. This function must be the first function to call, and it returns a esp_http_client_handle_t that you must use as input to other functions in the interface. This call MUST have a corresponding call to esp_http_client_cleanup when the operation is complete.

**Return**

- esp_http_client_handle_t
- NULL if any errors

**Parameters**

- [in] config: The configurations, see http_client_config_t

```c
esp_err_t esp_http_client_perform(esp_http_client_handle_t client)
```

Invoke this function after esp_http_client_init and all the options calls are made, and will perform the transfer as described in the options. It must be called with the same esp_http_client_handle_t as input as the esp_http_client_init call returned. esp_http_client_perform performs the entire request in either blocking or non-blocking manner. By default, the API performs request in a blocking manner and returns when done, or if it failed, and in non-blocking manner, it returns if EAGAIN/EWOULDBLOCK or EINPROGRESS is encountered, or if it failed. And in case of non-blocking request, the user may call this API multiple times unless request & response is complete or there is a failure. To enable non-blocking esp_http_client_perform(), is_async member of esp_http_client_config_t must be set while making a call to esp_http_client_init() API.
You can do any amount of calls to esp_http_client_perform while using the same esp_http_client_handle_t. The underlying connection may be kept open if the server allows it. If you intend to transfer more than one file, you are even encouraged to do so. esp_http_client will then attempt to re-use the same connection for the following transfers, thus making the operations faster, less CPU intense and using less network resources. Just note that you will have to use esp_http_client_set_* between the invocations to set options for the following esp_http_client_perform.

**Note** You must never call this function simultaneously from two places using the same client handle. Let the function return first before invoking it another time. If you want parallel transfers, you must use several esp_http_client_handle_t. This function include esp_http_client_open -> esp_http_client_write -> esp_http_client_fetch_headers -> esp_http_client_read (and option) esp_http_client_close.

**Return**
- ESP_OK on successful
- ESP_FAIL on error

**Parameters**
- client: The esp_http_client handle

```c
esp_err_t esp_http_client_set_url (esp_http_client_handle_t client, const char *url)
```
Set URL for client, when performing this behavior, the options in the URL will replace the old ones.

**Return**
- ESP_OK
- ESP_FAIL

**Parameters**
- [in] client: The esp_http_client handle
- [in] url: The url

```c
esp_err_t esp_http_client_set_post_field (esp_http_client_handle_t client, const char *data, int len)
```
Set post data, this function must be called before esp_http_client_perform. Note: The data parameter passed to this function is a pointer and this function will not copy the data.

**Return**
- ESP_OK
- ESP_FAIL

**Parameters**
- [in] client: The esp_http_client handle
- [in] data: post data pointer
- [in] len: post length

```c
int esp_http_client_get_post_field (esp_http_client_handle_t client, char **data)
```
Get current post field information.

**Return** Size of post data

**Parameters**
- [in] client: The client
- [out] data: Point to post data pointer

```c
esp_err_t esp_http_client_set_header (esp_http_client_handle_t client, const char *key, const char *value)
```
Set http request header, this function must be called after esp_http_client_init and before any perform function.

**Return**
- ESP_OK
- ESP_FAIL

**Parameters**
- [in] client: The esp_http_client handle
- [in] key: The header key
- [in] value: The header value

```c
esp_err_t esp_http_client_get_header (esp_http_client_handle_t client, const char *key, char **value)
```
Get http request header. The value parameter will be set to NULL if there is no header which is same as the
key specified, otherwise the address of header value will be assigned to value parameter. This function must be called after `esp_http_client_init`.

**Return**
- ESP_OK
- ESP_FAIL

**Parameters**
- [in] client: The esp_http_client handle
- [in] key: The header key
- [out] value: The header value

```c
esp_err_t esp_http_client_get_username(esp_http_client_handle_t client, char **value)
```

Get http request username. The address of username buffer will be assigned to value parameter. This function must be called after `esp_http_client_init`.

**Return**
- ESP_OK
- ESP_ERR_INVALID_ARG

**Parameters**
- [in] client: The esp_http_client handle
- [out] value: The username value

```c
esp_err_t esp_http_client_set_username(esp_http_client_handle_t client, const char *username)
```

Set http request username. The value of username parameter will be assigned to username buffer. If the username parameter is NULL then username buffer will be freed.

**Return**
- ESP_OK
- ESP_ERR_INVALID_ARG

**Parameters**
- [in] client: The esp_http_client handle
- [in] username: The username value

```c
esp_err_t esp_http_client_get_password(esp_http_client_handle_t client, char **value)
```

Get http request password. The address of password buffer will be assigned to value parameter. This function must be called after `esp_http_client_init`.

**Return**
- ESP_OK
- ESP_ERR_INVALID_ARG

**Parameters**
- [in] client: The esp_http_client handle
- [out] value: The password value

```c
esp_err_t esp_http_client_set_password(esp_http_client_handle_t client, const char *password)
```

Set http request password. The value of password parameter will be assigned to password buffer. If the password parameter is NULL then password buffer will be freed.

**Return**
- ESP_OK
- ESP_ERR_INVALID_ARG

**Parameters**
- [in] client: The esp_http_client handle
- [in] password: The password value

```c
esp_err_t esp_http_client_set_authtype(esp_http_client_handle_t client, esp_http_client_auth_type_t auth_type)
```

Set http request auth_type.

**Return**
- ESP_OK
- ESP_ERR_INVALID_ARG
Parameters
- \([\text{in}]\) client: The esp_http_client handle
- \([\text{in}]\) auth_type: The esp_http_client auth type

\textbf{int esp_http_client_get_errno (esp_http_client_handle_t client)}

Get HTTP client session errno.

\textbf{Return}
- (-1) if invalid argument
- errno

\textbf{Parameters}
- \([\text{in}]\) client: The esp_http_client handle

\textbf{esp_err_t esp_http_client_set_method (esp_http_client_handle_t client, esp_http_client_method_t method)}

Set http request method.

\textbf{Return}
- ESP_OK
- ESP_ERR_INVALID_ARG

\textbf{Parameters}
- \([\text{in}]\) client: The esp_http_client handle
- \([\text{in}]\) method: The method

\textbf{esp_err_t esp_http_client_set_timeout_ms (esp_http_client_handle_t client, int timeout_ms)}

Set http request timeout.

\textbf{Return}
- ESP_OK
- ESP_ERR_INVALID_ARG

\textbf{Parameters}
- \([\text{in}]\) client: The esp_http_client handle
- \([\text{in}]\) timeout_ms: The timeout value

\textbf{esp_err_t esp_http_client_delete_header (esp_http_client_handle_t client, const char* key)}

Delete http request header.

\textbf{Return}
- ESP_OK
- ESP_FAIL

\textbf{Parameters}
- \([\text{in}]\) client: The esp_http_client handle
- \([\text{in}]\) key: The key

\textbf{esp_err_t esp_http_client_open (esp_http_client_handle_t client, int write_len)}

This function will be open the connection, write all header strings and return.

\textbf{Return}
- ESP_OK
- ESP_FAIL

\textbf{Parameters}
- \([\text{in}]\) client: The esp_http_client handle
- \([\text{in}]\) write_len: HTTP Content length need to write to the server

\textbf{int esp_http_client_write (esp_http_client_handle_t client, const char* buffer, int len)}

This function will write data to the HTTP connection previously opened by esp_http_client_open().

\textbf{Return}
- (-1) if any errors
- Length of data written

\textbf{Parameters}
- \([\text{in}]\) client: The esp_http_client handle
- buffer: The buffer
Chapter 2. API Reference

- [in] len: This value must not be larger than the write_len parameter provided to esp_http_client_open()

int64_t esp_http_client_fetch_headers (esp_http_client_handle_t client)

This function need to call after esp_http_client_open, it will read from http stream, process all receive headers.

Return
- (0) if stream doesn’t contain content-length header, or chunked encoding (checked by esp_http_client_is_chunked_response)
- (-1: ESP_FAIL) if any errors
- Download data length defined by content-length header

Parameters
- [in] client: The esp_http_client handle

bool esp_http_client_is_chunked_response (esp_http_client_handle_t client)

Check response data is chunked.

Return true or false

Parameters
- [in] client: The esp_http_client handle

int esp_http_client_read (esp_http_client_handle_t client, char* buffer, int len)

Read data from http stream.

Return
- (-1) if any errors
- Length of data was read

Parameters
- [in] client: The esp_http_client handle
- buffer: The buffer
- [in] len: The length

int esp_http_client_get_status_code (esp_http_client_handle_t client)

Get http response status code, the valid value if this function invoke after esp_http_client_perform

Return Status code

Parameters
- [in] client: The esp_http_client handle

int64_t esp_http_client_get_content_length (esp_http_client_handle_t client)

Get http response content length (from header Content-Length) the valid value if this function invoke after esp_http_client_perform

Return
- (-1) Chunked transfer
- Content-Length value as bytes

Parameters
- [in] client: The esp_http_client handle

esp_err_t esp_http_client_close (esp_http_client_handle_t client)

Close http connection, still kept all http request resources.

Return
- ESP_OK
- ESP_FAIL

Parameters
- [in] client: The esp_http_client handle

esp_err_t esp_http_client_cleanup (esp_http_client_handle_t client)

This function must be the last function to call for an session. It is the opposite of the esp_http_client_init function and must be called with the same handle as input that a esp_http_client_init call returned. This might close all connections this handle has used and possibly has kept open until now. Don’t call this function if you intend to transfer more files, re-using handles is a key to good performance with esp_http_client.

Return
API Reference

- ESP_OK
- ESP_FAIL

**Parameters**

- [in] client: The esp_http_client handle

 construed to ESP_OK or ESP_FAIL.

**esp_http_client_transport_t esp_http_client_get_transport_type (esp_http_client_handle_t client)**

Get transport type.

**Return**

- HTTP_TRANSPORT_UNKNOWN
- HTTP_TRANSPORT_OVER_TCP
- HTTP_TRANSPORT_OVER_SSL

**Parameters**

- [in] client: The esp_http_client handle

**esp_err_t esp_http_client_set_redirection (esp_http_client_handle_t client)**

Set redirection URL. When received the 30x code from the server, the client stores the redirect URL provided by the server. This function will set the current URL to redirect to enable client to execute the redirection request.

**Return**

- ESP_OK
- ESP_FAIL

**Parameters**

- [in] client: The esp_http_client handle

**void esp_http_client_add_auth (esp_http_client_handle_t client)**

On receiving HTTP Status code 401, this API can be invoked to add authorization information.

**Note** There is a possibility of receiving body message with redirection status codes, thus make sure to flush off body data after calling this API.

**Parameters**

- [in] client: The esp_http_client handle

**bool esp_http_client_is_complete_data_received (esp_http_client_handle_t client)**

Checks if entire data in the response has been read without any error.

**Return**

- true
- false

**Parameters**

- [in] client: The esp_http_client handle

**int esp_http_client_read_response (esp_http_client_handle_t client, char *buffer, int len)**

Helper API to read larger data chunks. This is a helper API which internally calls esp_http_client_read multiple times till the end of data is reached or till the buffer gets full.

**Return**

- Length of data was read

**Parameters**

- [in] client: The esp_http_client handle
- buffer: The buffer
- [in] len: The buffer length

**esp_err_t esp_http_client_flush_response (esp_http_client_handle_t client, int *len)**

Process all remaining response data. This uses an internal buffer to repeatedly receive, parse, and discard response data until complete data is processed. As no additional user-supplied buffer is required, this may be preferrable to esp_http_client_read_response in situations where the content of the response may be ignored.

**Return**

- ESP_OK If successful, len will have discarded length
- ESP_FAIL If failed to read response
• ESP_ERR_INVALID_ARG If the client is NULL

Parameters
• [in] client: The esp_http_client handle
• len: Length of data discarded

esp_err_t esp_http_client_get_url (esp_http_client_handle_t client, char *url, const int len)
Get URL from client.

Return
• ESP_OK
• ESP_FAIL

Parameters
• [in] client: The esp_http_client handle
• [inout] url: The buffer to store URL
• [in] len: The buffer length

esp_err_t esp_http_client_get_chunk_length (esp_http_client_handle_t client, int *len)
Get Chunk-Length from client.

Return
• ESP_OK If successful, len will have length of current chunk
• ESP_FAIL If the server is not a chunked server
• ESP_ERR_INVALID_ARG If the client or len are NULL

Parameters
• [in] client: The esp_http_client handle
• [out] len: Variable to store length

Structures

struct esp_http_client_event
HTTP Client events data.

Public Members

esp_http_client_event_id_t event_id
event_id, to know the cause of the event

esp_http_client_handle_t client
esp_http_client_handle_t context

void *data
data of the event

int data_len
data length of data

void *user_data
user_data context, from esp_http_client_config_t user_data

char *header_key
For HTTP_EVENT_ON_HEADER event_id, it’s store current http header key

char *header_value
For HTTP_EVENT_ON_HEADER event_id, it’s store current http header value

struct esp_http_client_config_t
HTTP configuration.

Public Members

const char *url
HTTP URL, the information on the URL is most important, it overrides the other fields below, if any
const char *host
   Domain or IP as string

int port
   Port to connect, default depend on esp_http_client_transport_t (80 or 443)

const char *username
   Using for Http authentication

const char *password
   Using for Http authentication

esp_http_client_auth_type_t auth_type
   Http authentication type, see esp_http_client_auth_type_t

const char *path
   HTTP Path, if not set, default is /

const char *query
   HTTP query

const char *cert_pem
   SSL server certification, PEM format as string, if the client requires to verify server

size_t cert_len
   Length of the buffer pointed to by cert_pem. May be 0 for null-terminated pem

const char *client_cert_pem
   SSL client certification, PEM format as string, if the server requires to verify client

size_t client_cert_len
   Length of the buffer pointed to by client_cert_pem. May be 0 for null-terminated pem

const char *client_key_pem
   SSL client key, PEM format as string, if the server requires to verify client

size_t client_key_len
   Length of the buffer pointed to by client_key_pem. May be 0 for null-terminated pem

const char *client_key_password
   Client key decryption password string

size_t client_key_password_len
   String length of the password pointed to by client_key_password

const char *user_agent
   The User Agent string to send with HTTP requests

esp_http_client_method_t method
   HTTP Method

int timeout_ms
   Network timeout in milliseconds

bool disable_auto_redirect
   Disable HTTP automatic redirects

int max_redirection_count
   Max number of redirections on receiving HTTP redirect status code, using default value if zero

int max_authorization_retries
   Max connection retries on receiving HTTP unauthorized status code, using default value if zero. Disables authorization retry if -1

http_event_handle_cb event_handler
   HTTP Event Handle

esp_http_client_transport_t transport_type
   HTTP transport type, see esp_http_client_transport_t
int buffer_size
   HTTP receive buffer size

int buffer_size_tx
   HTTP transmit buffer size

void *user_data
   HTTP user_data context

bool is_async
   Set asynchronous mode, only supported with HTTPS for now

bool use_global_ca_store
   Use a global ca_store for all the connections in which this bool is set.

bool skip_cert_common_name_check
   Skip any validation of server certificate CN field

esp_err_t (*crt_bundle_attach)(void *conf)
   Function pointer to esp_crt_bundle_attach. Enables the use of certification bundle for server verification, must be enabled in menuconfig

bool keep_alive_enable
   Enable keep-alive timeout

int keep_alive_idle
   Keep-alive idle time. Default is 5 (second)

int keep_alive_interval
   Keep-alive interval time. Default is 5 (second)

int keep_alive_count
   Keep-alive packet retry send count. Default is 3 counts

struct ifreq *if_name
   The name of interface for data to go through. Use the default interface without setting

Macros
DEFAULT_HTTP_BUF_SIZE
ESP_ERR_HTTP_BASE
   Starting number of HTTP error codes

ESP_ERR_HTTP_MAX_REDIRECT
   The error exceeds the number of HTTP redirects

ESP_ERR_HTTP_CONNECT
   Error open the HTTP connection

ESP_ERR_HTTP_WRITE_DATA
   Error write HTTP data

ESP_ERR_HTTP_FETCH_HEADER
   Error read HTTP header from server

ESP_ERR_HTTP_INVALID_TRANSPORT
   There are no transport support for the input scheme

ESP_ERR_HTTP_CONNECTING
   HTTP connection hasn’t been established yet

ESP_ERR_HTTP_EAGAIN
   Mapping of errno EAGAIN to esp_err_t

ESP_ERR_HTTP_CONNECTION_CLOSED
   Read FIN from peer and the connection closed
Type Definitions

typedef struct esp_http_client *esp_http_client_handle_t

typedef struct esp_http_client_event *esp_http_client_event_handle_t

typedef struct esp_http_client_event esp_http_client_event_t

HTTP Client events data.

typedef esp_err_t (*http_event_handle_cb)(esp_http_client_event_t *evt)

Enumerations

enum esp_http_client_event_id_t

HTTP Client events id.

Values:

HTTP_EVENT_ERROR = 0
This event occurs when there are any errors during execution

HTTP_EVENT_ON_CONNECTED
Once the HTTP has been connected to the server, no data exchange has been performed

HTTP_EVENT_HEADERS_SENT
After sending all the headers to the server

HTTP_EVENT_HEADER_SENT = HTTP_EVENT_HEADERS_SENT
This header has been kept for backward compatibility and will be deprecated in future versions esp-idf

HTTP_EVENT_ON_HEADER
Occurs when receiving each header sent from the server

HTTP_EVENT_ON_DATA
Occurs when receiving data from the server, possibly multiple portions of the packet

HTTP_EVENT_ON_FINISH
Occurs when finish a HTTP session

HTTP_EVENT_DISCONNECTED
The connection has been disconnected

HTTP_EVENT_REDIRECT
Intercepting HTTP redirects to handle them manually

enum esp_http_client_transport_t

HTTP Client transport.

Values:

HTTP_TRANSPORT_UNKNOWN = 0x0
Unknown

HTTP_TRANSPORT_OVER_TCP
Transport over tcp

HTTP_TRANSPORT_OVER_SSL
Transport over ssl

enum esp_http_client_method_t

HTTP method.

Values:

HTTP_METHOD_GET = 0
HTTP GET Method

HTTP_METHOD_POST
HTTP POST Method

HTTP_METHOD_PUT
HTTP PUT Method
HTTP_METHOD_PATCH
    HTTP PATCH Method

HTTP_METHOD_DELETE

enum esp_http_client_auth_type_t
    HTTP Authentication type.

    Values:

    HTTP_AUTH_TYPE_NONE = 0
        No authentication

    HTTP_AUTH_TYPE_BASIC
        HTTP Basic authentication

    HTTP_AUTH_TYPE_DIGEST
        HTTP Digest authentication

enum HttpStatus_Code
    Enum for the HTTP status codes.

    Values:

    HttpStatus_Ok = 200
    HttpStatus_MultipleChoices = 300
    HttpStatus_MovedPermanently = 301
    HttpStatus_Found = 302
HttpStatus_TemporaryRedirect = 307
HttpStatus_BadRequest = 400
HttpStatus_Unauthorized = 401
HttpStatus_Forbidden = 403
HttpStatus_NotFound = 404
HttpStatus_InternalError = 500

2.4.6 HTTP Server

Overview

The HTTP Server component provides an ability for running a lightweight web server on ESP32-S3. Following are detailed steps to use the API exposed by HTTP Server:

- **httpd_start()**: Creates an instance of HTTP server, allocate memory/resources for it depending upon the specified configuration and outputs a handle to the server instance. The server has both, a listening socket (TCP) for HTTP traffic, and a control socket (UDP) for control signals, which are selected in a round robin fashion in the server task loop. The task priority and stack size are configurable during server instance creation by passing httpd_config_t structure to httpd_start(). TCP traffic is parsed as HTTP requests and, depending on the requested URI, user registered handlers are invoked which are supposed to send back HTTP response packets.

- **httpd_stop()**: This stops the server with the provided handle and frees up any associated memory/resources. This is a blocking function that first signals a halt to the server task and then waits for the task to terminate. While stopping, the task will close all open connections, remove registered URI handlers and reset all session context data to empty.

- **httpd_register_uri_handler()**: A URI handler is registered by passing object of type httpd_uri_t structure which has members including uri name, method type (eg. HTTPD_GET/HTTPD_POST/HTTPD_PUT etc.), function pointer of type esp_err_t *handler (httpd_req_t *req) and user_ctx pointer to user context data.

Application Example

```c
/* Our URI handler function to be called during GET /uri request */
esp_err_t get_handler(httpd_req_t *req)
{
    /* Send a simple response */
    const char resp[] = "URI GET Response";
    httpd_resp_send(req, resp, HTTPD_RESP_USE_STRLEN);
    return ESP_OK;
}

/* Our URI handler function to be called during POST /uri request */
esp_err_t post_handler(httpd_req_t *req)
{
    /* Destination buffer for content of HTTP POST request.
    * httpd_req_recv() accepts char* only, but content could
    * as well be any binary data (needs type casting).
    * In case of string data, null termination will be absent, and
    * content length would give length of string */
    char content[100];

    /* Truncate if content length larger than the buffer */
    size_t recv_size = MIN(req->content_len, sizeof(content));

    int ret = httpd_req_recv(req, content, recv_size);
}
```
(continues on next page)
if (ret <= 0) {
    /* 0 return value indicates connection closed */
    /* Check if timeout occurred */
    if (ret == HTTPD_SOCK_ERR_TIMEOUT) {
        /* In case of timeout one can choose to retry calling
        * httpd_req_recv(), but to keep it simple, here we
        * respond with an HTTP 408 (Request Timeout) error */
        httpd_resp_send_408(req);
    }
    /* In case of error, returning ESP_FAIL will
    * ensure that the underlying socket is closed */
    return ESP_FAIL;
}

/* Send a simple response */
const char resp[] = "URI POST Response";
httpd_resp_send(req, resp, HTTPD_RESP_USE_STRLEN);
return ESP_OK;

/* URI handler structure for GET /uri */
httpd_uri_t uri_get = {
    .uri = "/uri",
    .method = HTTP_GET,
    .handler = get_handler,
    .user_ctx = NULL
};

/* URI handler structure for POST /uri */
httpd_uri_t uri_post = {
    .uri = "/uri",
    .method = HTTP_POST,
    .handler = post_handler,
    .user_ctx = NULL
};

/* Function for starting the webserver */
httpd_handle_t start_webserver(void)
{
    /* Generate default configuration */
    httpd_config_t config = HTTPD_DEFAULT_CONFIG();

    /* Empty handle to esp_http_server */
    httpd_handle_t server = NULL;

    /* Start the httpd server */
    if (httpd_start(&server, &config) == ESP_OK) {
        /* Register URI handlers */
        httpd_register_uri_handler(server, &uri_get);
        httpd_register_uri_handler(server, &uri_post);
    }
    /* If server failed to start, handle will be NULL */
    return server;
}

/* Function for stopping the webserver */
void stop_webserver(httpd_handle_t server)
{
    if (server) {
        /* Stop the httpd server */
        httpd_stop(server);
    }
}
Simple HTTP server example Check HTTP server example under protocols/http_server/simple where handling of arbitrary content lengths, reading request headers and URL query parameters, and setting response headers is demonstrated.

Persistent Connections

HTTP server features persistent connections, allowing for the re-use of the same connection (session) for several transfers, all the while maintaining context specific data for the session. Context data may be allocated dynamically by the handler in which case a custom function may need to be specified for freeing this data when the connection/session is closed.

Persistent Connections Example

```c
/* Custom function to free context */
void free_ctx_func(void *ctx)
{
    /* Could be something other than free */
    free(ctx);
}

esp_err_t adder_post_handler(httpd_req_t *req)
{
    /* Create session's context if not already available */
    if (!req->sess_ctx) {
        req->sess_ctx = malloc(sizeof(ANY_DATA_TYPE)); /*< Pointer to context data */
        req->free_ctx = free_ctx_func; /*< Function to free context data */
    }

    /* Access context data */
    ANY_DATA_TYPE *ctx_data = (ANY_DATA_TYPE *)req->sess_ctx;
    /* Respond */
    ..........
    ..........
    return ESP_OK;
}
```

Check the example under protocols/http_server/persistent_sockets.

Websocket server

HTTP server provides a simple websocket support if the feature is enabled in menuconfig, please see CONFIG_HTTPD_WS_SUPPORT. Please check the example under protocols/http_server/ws_echo_server

API Reference

Header File

- components/esp_http_server/include/esp_http_server.h
Functions

```c
esp_err_t httpd_register_uri_handler(httpd_handle_t handle, const httpd_uri_t *uri_handler)
```

Registers a URI handler.

Example usage:

```c
esp_err_t my_uri_handler(httpd_req_t * req)
{
    // Recv, Process and Send
    ....
    ....
    ....

    // Fail condition
    if (...)
    {
        // Return fail to close session //
        return ESP_FAIL;
    }

    // On success
    return ESP_OK;
}
```

```c
// URI handler structure
httpd_uri_t my_uri {
    .uri = "/my_uri/path/xyz",
    .method = HTTPD_GET,
    .handler = my_uri_handler,
    .user_ctx = NULL
};
```

```c
// Register handler
if (httpd_register_uri_handler(server_handle, &my_uri) != ESP_OK) {
    // If failed to register handler
    ....
}
```

Note: URI handlers can be registered in real time as long as the server handle is valid.

Return:
- ESP_OK: On successfully registering the handler
- ESP_ERR_INVALID_ARG: Null arguments
- ESP_ERR_HTTPD_HANDLERS_FULL: If no slots left for new handler
- ESP_ERR_HTTPD_HANDLER_EXISTS: If handler with same URI and method is already registered

Parameters:
- [in] handle: handle to HTTPD server instance
- [in] uri_handler: pointer to handler that needs to be registered

```c
esp_err_t httpd_unregister_uri_handler(httpd_handle_t handle, const char *uri, httpd_method_t method)
```

Unregister a URI handler.

Return:
- ESP_OK: On successfully deregistering the handler
- ESP_ERR_INVALID_ARG: Null arguments
- ESP_ERR_NOT_FOUND: Handler with specified URI and method not found

Parameters:
- [in] handle: handle to HTTPD server instance
- [in] uri: URI string
- [in] method: HTTP method

```c
esp_err_t httpd_unregister_uri(httpd_handle_t handle, const char *uri)
```

Unregister all URI handlers with the specified uri string.
Return

• ESP_OK : On successfully deregistering all such handlers
• ESP_ERR_INVALID_ARG : Null arguments
• ESP_ERR_NOT_FOUND : No handler registered with specified uri string

Parameters

• [in] handle: handle to HTTPD server instance
• [in] uri: uri string specifying all handlers that need to be deregistered

\[ \text{esp_err_t } \text{httpd_sess_set_recv_override}(\text{httpd_handle_t } \text{hd}, \text{ int sockfd, httpd_recv_func_t recv_func}) \]

Override web server’s receive function (by session FD)

This function overrides the web server’s receive function. This same function is used to read HTTP request packets.

Note This API is supposed to be called either from the context of
• an http session APIs where sockfd is a valid parameter
• a URI handler where sockfd is obtained using httpd_req_to_sockfd()

Return

• ESP_OK : On successfully registering override
• ESP_ERR_INVALID_ARG : Null arguments

Parameters

• [in] hd: HTTPD instance handle
• [in] sockfd: Session socket FD
• [in] recv_func: The receive function to be set for this session

\[ \text{esp_err_t } \text{httpd_sess_set_send_override}(\text{httpd_handle_t } \text{hd}, \text{ int sockfd, httpd_send_func_t send_func}) \]

Override web server’s send function (by session FD)

This function overrides the web server’s send function. This same function is used to send out any response to any HTTP request.

Note This API is supposed to be called either from the context of
• an http session APIs where sockfd is a valid parameter
• a URI handler where sockfd is obtained using httpd_req_to_sockfd()

Return

• ESP_OK : On successfully registering override
• ESP_ERR_INVALID_ARG : Null arguments

Parameters

• [in] hd: HTTPD instance handle
• [in] sockfd: Session socket FD
• [in] send_func: The send function to be set for this session

\[ \text{esp_err_t } \text{httpd_sess_set_pending_override}(\text{httpd_handle_t } \text{hd}, \text{ int sockfd, httpd_pending_func_t pending_func}) \]

Override web server’s pending function (by session FD)

This function overrides the web server’s pending function. This function is used to test for pending bytes in a socket.

Note This API is supposed to be called either from the context of
• an http session APIs where sockfd is a valid parameter
• a URI handler where sockfd is obtained using httpd_req_to_sockfd()

Return

• ESP_OK : On successfully registering override
• ESP_ERR_INVALID_ARG : Null arguments

Parameters

• [in] hd: HTTPD instance handle
• [in] sockfd: Session socket FD
• [in] pending_func: The receive function to be set for this session

\[ \text{int } \text{httpd_req_to_sockfd}(\text{httpd_req_t } *r) \]

Get the Socket Descriptor from the HTTP request.
This API will return the socket descriptor of the session for which URI handler was executed on reception of HTTP request. This is useful when user wants to call functions that require session socket fd, from within a URI handler, i.e. : httpd_sess_get_ctx(), httpd_sess_trigger_close(), httpd_sess_update_lru_counter().

**Note** This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.

**Return**
- Socket descriptor : The socket descriptor for this request
- -1 : Invalid/NULL request pointer

**Parameters**
- [in] r: The request whose socket descriptor should be found

```c
int httpd_req_recv (httpd_req_t *r, char *buf, size_t buf_len)
```

API to read content data from the HTTP request.

This API will read HTTP content data from the HTTP request into provided buffer. Use content_len provided in httpd_req_t structure to know the length of data to be fetched. If content_len is too large for the buffer then user may have to make multiple calls to this function, each time fetching ‘buf_len’ number of bytes, while the pointer to content data is incremented internally by the same number.

**Note**
- This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.
- If an error is returned, the URI handler must further return an error. This will ensure that the erroneous socket is closed and cleaned up by the web server.
- Presently Chunked Encoding is not supported

**Return**
- Bytes: Number of bytes read into the buffer successfully
- 0 : Buffer length parameter is zero / connection closed by peer
- HTTPD_SOCK_ERR_INVALID : Invalid arguments
- HTTPD_SOCK_ERR_TIMEOUT : Timeout/interrupted while calling socket recv()
- HTTPD_SOCK_ERR_FAIL : Unrecoverable error while calling socket recv()

**Parameters**
- [in] r: The request being responded to
- [in] buf: Pointer to a buffer that the data will be read into
- [in] buf_len: Length of the buffer

```c
size_t httpd_req_get_hdr_value_len (httpd_req_t *r, const char *field)
```

Search for a field in request headers and return the string length of its value.

**Note**
- This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.
- Once httpd_resp_send() API is called all request headers are purged, so request headers need be copied into separate buffers if they are required later.

**Return**
- Length : If field is found in the request URL
- Zero : Field not found / Invalid request / Null arguments

**Parameters**
- [in] r: The request being responded to
- [in] field: The header field to be searched in the request

```c
esp_err_t httpd_req_get_hdr_value_str (httpd_req_t *r, const char *field, char *val, size_t val_size)
```

Get the value string of a field from the request headers.

**Note**
- This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.
- Once httpd_resp_send() API is called all request headers are purged, so request headers need be copied into separate buffers if they are required later.
Chapter 2. API Reference

- If output size is greater than input, then the value is truncated, accompanied by truncation error as return value.
- Use `httpd_req_get_hdr_value_len()` to know the right buffer length

**Return**
- ESP_OK: Field found in the request header and value string copied
- ESP_ERR_NOT_FOUND: Key not found
- ESP_ERR_INVALID_ARG: Null arguments
- ESP_ERR_HTTPD_INVALID_REQ: Invalid HTTP request pointer
- ESP_ERR_HTTPD_RESULT_TRUNC: Value string truncated

**Parameters**
- [in] `r`: The request being responded to
- [in] `field`: The field to be searched in the header
- [out] `val`: Pointer to the buffer into which the value will be copied if the field is found
- [in] `val_size`: Size of the user buffer

```c
size_t httpd_req_get_url_query_len(httpd_req_t *r)
```
Get Query string length from the request URL.

**Note**
This API is supposed to be called only from the context of a URI handler where `httpd_req_t*` request pointer is valid

**Return**
- `Length`: Query is found in the request URL
- `Zero`: Query not found / Null arguments / Invalid request

**Parameters**
- [in] `r`: The request being responded to

```c
esp_err_t httpd_req_get_url_query_str(httpd_req_t *r, char* buf, size_t buf_len)
```
Get Query string from the request URL.

**Note**
- Presently, the user can fetch the full URL query string, but decoding will have to be performed by the user. Request headers can be read using `httpd_req_get_hdr_value_str()` to know the `'Content-Type'` (eg. Content-Type: application/x-www-form-urlencoded) and then the appropriate decoding algorithm needs to be applied.
- This API is supposed to be called only from the context of a URI handler where `httpd_req_t*` request pointer is valid
- If output size is greater than input, then the value is truncated, accompanied by truncation error as return value
- Prior to calling this function, one can use `httpd_req_get_url_query_len()` to know the query string length beforehand and hence allocate the buffer of right size (usually query string length + 1 for null termination) for storing the query string

**Return**
- ESP_OK: Query is found in the request URL and copied to buffer
- ESP_ERR_NOT_FOUND: Query not found
- ESP_ERR_INVALID_ARG: Null arguments
- ESP_ERR_HTTPD_INVALID_REQ: Invalid HTTP request pointer
- ESP_ERR_HTTPD_RESULT_TRUNC: Query string truncated

**Parameters**
- [in] `r`: The request being responded to
- [out] `buf`: Pointer to the buffer into which the query string will be copied (if found)
- [in] `buf_len`: Length of output buffer

```c
esp_err_t httpd_query_key_value(const char *qry, const char *key, char *val, size_t val_size)
```
Helper function to get a URL query tag from a query string of the type param1=val1&param2=val2.

**Note**
- The components of URL query string (keys and values) are not URL decoded. The user must check for `'Content-Type'` field in the request headers and then depending upon the specified encoding (URLencoded or otherwise) apply the appropriate decoding algorithm.
- If actual value size is greater than `val_size`, then the value is truncated, accompanied by truncation error as return value.
### Chapter 2. API Reference

#### Return
- **ESP_OK**: Key is found in the URL query string and copied to buffer
- **ESP_ERR_NOT_FOUND**: Key not found
- **ESP_ERR_INVALID_ARG**: Null arguments
- **ESP_ERR_HTTPD_RESULT_TRUNC**: Value string truncated

#### Parameters
- **[in]** `qry`: Pointer to query string
- **[in]** `key`: The key to be searched in the query string
- **[out]** `val`: Pointer to the buffer into which the value will be copied if the key is found
- **[in]** `val_size`: Size of the user buffer

```c
esp_err_t httpd_req_get_cookie_val(httpd_req_t *req, const char *cookie_name, char *val, size_t *val_size)
```

Get the value string of a cookie value from the “Cookie” request headers by cookie name.

#### Return
- **ESP_OK**: Key is found in the cookie string and copied to buffer
- **ESP_ERR_NOT_FOUND**: Key not found
- **ESP_ERR_INVALID_ARG**: Null arguments
- **ESP_ERR_HTTPD_RESULT_TRUNC**: Value string truncated
- **ESP_ERR_NO_MEM**: Memory allocation failure

#### Parameters
- **[in]** `req`: Pointer to the HTTP request
- **[in]** `cookie_name`: The cookie name to be searched in the request
- **[out]** `val`: Pointer to the buffer into which the value of cookie will be copied if the cookie is found
- **[inout]** `val_size`: Pointer to size of the user buffer

```c
bool httpd_uri_matchWildcard(const char *uri_template, const char *uri_to_match, size_t match_upto)
```

Test if a URI matches the given wildcard template.

Template may end with “?” to make the previous character optional (typically a slash), “*” for a wildcard match, and “?*” to make the previous character optional, and if present, allow anything to follow.

Example:
- * matches everything
- /foo/? matches /foo and /foo/
- /foo/* (sans the backslash) matches /foo/ and /foo/bar, but not /foo or /fo
- /foo/?* or /foo/? (sans the backslash) matches /foo/, /foo/bar, and also /foo, but not /foox or /fo

The special characters “?” and “*” anywhere else in the template will be taken literally.

#### Return
true if a match was found

#### Parameters
- **[in]** `uri_template`: URI template (pattern)
- **[in]** `uri_to_match`: URI to be matched
- **[in]** `match_upto`: how many characters of the URI buffer to test (there may be trailing query string etc.)

```c
esp_err_t httpd_resp_send(httpd_req_t *r, const char *buf, ssize_t buf_len)
```

API to send a complete HTTP response.

This API will send the data as an HTTP response to the request. This assumes that you have the entire response ready in a single buffer. If you wish to send response in incremental chunks use `httpd_resp_send_chunk()` instead.

If no status code and content-type were set, by default this will send 200 OK status code and content type as text/html. You may call the following functions before this API to configure the response headers:

- `httpd Resp Set Status()` for setting the HTTP status string
- `httpd Resp Set Type()` for setting the Content Type
- `httpd Resp Set Hdr()` for appending any additional field value entries in the response header
Note

- This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.
- Once this API is called, the request has been responded to.
- No additional data can then be sent for the request.
- Once this API is called, all request headers are purged, so request headers need be copied into separate buffers if they are required later.

Return

- ESP_OK: On successfully sending the response packet
- ESP_ERR_INVALID_ARG: Null request pointer
- ESP_ERR_HTTPD_RESP_HDR: Essential headers are too large for internal buffer
- ESP_ERR_HTTPD_RESP_SEND: Error in raw send
- ESP_ERR_HTTPD_INVALID_REQ: Invalid request

Parameters

- [in] r: The request being responded to
- [in] buf: Buffer from where the content is to be fetched
- [in] buf_len: Length of the buffer, HTTPD_RESP_USE_STRLEN to use strlen()

```
static esp_err_t httpd_resp_sendstr(httpd_req_t *r, const char *str)
```

API to send a complete string as HTTP response.

This API simply calls httpd_resp_send with buffer length set to string length assuming the buffer contains a null terminated string.

Return

- ESP_OK: On successfully sending the response packet
- ESP_ERR_INVALID_ARG: Null request pointer
- ESP_ERR_HTTPD_RESP_HDR: Essential headers are too large for internal buffer
- ESP_ERR_HTTPD_RESP_SEND: Error in raw send
- ESP_ERR_HTTPD_INVALID_REQ: Invalid request

Parameters

- [in] r: The request being responded to
- [in] str: String to be sent as response body
static esp_err_t httpd_resp_sendstr_chunk(httpd_req_t *r, const char *str)

API to send a string as an HTTP response chunk.

This API simply calls http_resp_send_chunk with buffer length set to string length assuming the buffer contains a null terminated string

Return

• ESP_OK : On successfully sending the response packet
• ESP_ERR_INVALID_ARG : Null request pointer
• ESP_ERR_HTTPD_RESP_HDR : Essential headers are too large for internal buffer
• ESP_ERR_HTTPD_RESP_SEND : Error in raw send
• ESP_ERR_HTTPD_INVALID_REQ : Invalid request

Parameters

• [in] r: The request being responded to
• [in] str: String to be sent as response body (NULL to finish response packet)

esp_err_t httpd_resp_set_status(httpd_req_t *r, const char *status)

API to set the HTTP status code.

This API sets the status of the HTTP response to the value specified. By default, the ‘200 OK’ response is sent as the response.

Note

• This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.
• This API only sets the status to this value. The status isn’t sent out until any of the send APIs is executed.
• Make sure that the lifetime of the status string is valid till send function is called.

Return

• ESP_OK : On success
• ESP_ERR_INVALID_ARG : Null arguments
• ESP_ERR_HTTPD_INVALID_REQ : Invalid request pointer

Parameters

• [in] r: The request being responded to
• [in] status: The HTTP status code of this response

esp_err_t httpd_resp_set_type(httpd_req_t *r, const char *type)

API to set the HTTP content type.

This API sets the ‘Content Type’ field of the response. The default content type is ‘text/html’.

Note

• This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.
• This API only sets the content type to this value. The type isn’t sent out until any of the send APIs is executed.
• Make sure that the lifetime of the type string is valid till send function is called.

Return

• ESP_OK : On success
• ESP_ERR_INVALID_ARG : Null arguments
• ESP_ERR_HTTPD_INVALID_REQ : Invalid request pointer

Parameters

• [in] r: The request being responded to
• [in] type: The Content Type of the response

esp_err_t httpd_resp_set_hdr(httpd_req_t *r, const char *field, const char *value)

API to append any additional headers.

This API sets any additional header fields that need to be sent in the response.

Note

• This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.
• The header isn’t sent out until any of the send APIs is executed.
• The maximum allowed number of additional headers is limited to value of max_resp_headers in config structure.
• Make sure that the lifetime of the field value strings are valid till send function is called.

Return
• ESP_OK : On successfully appending new header
• ESP_ERR_INVALID_ARG : Null arguments
• ESP_ERR_HTTPD_RESP_HDR : Total additional headers exceed max allowed
• ESP_ERR_HTTPD_INVALID_REQ : Invalid request pointer

Parameters
• [in] r: The request being responded to
• [in] field: The field name of the HTTP header
• [in] value: The value of this HTTP header

`esp_err_t httpd_resp_send_err(httpd_req_t *req, httpd_err_code_t error, const char *msg)`
For sending out error code in response to HTTP request.

Note
• This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.
• Once this API is called, all request headers are purged, so request headers need be copied into separate buffers if they are required later.
• If you wish to send additional data in the body of the response, please use the lower-level functions directly.

Return
• ESP_OK : On successfully sending the response packet
• ESP_ERR_INVALID_ARG : Null arguments
• ESP_ERR_HTTPD_RESP_SEND : Error in raw send
• ESP_ERR_HTTPD_INVALID_REQ : Invalid request pointer

Parameters
• [in] req: Pointer to the HTTP request for which the response needs to be sent
• [in] error: Error type to send
• [in] msg: Error message string (pass NULL for default message)

static `esp_err_t httpd_resp_send_404(httpd_req_t *r)`
Helper function for HTTP 404.

Send HTTP 404 message. If you wish to send additional data in the body of the response, please use the lower-level functions directly.

Note
• This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.
• Once this API is called, all request headers are purged, so request headers need be copied into separate buffers if they are required later.

Return
• ESP_OK : On successfully sending the response packet
• ESP_ERR_INVALID_ARG : Null arguments
• ESP_ERR_HTTPD_RESP_SEND : Error in raw send
• ESP_ERR_HTTPD_INVALID_REQ : Invalid request pointer

Parameters
• [in] r: The request being responded to

static `esp_err_t httpd_resp_send_408(httpd_req_t *r)`
Helper function for HTTP 408.

Send HTTP 408 message. If you wish to send additional data in the body of the response, please use the lower-level functions directly.

Note
• This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.
Chapter 2. API Reference

Once this API is called, all request headers are purged, so request headers need be copied into separate buffers if they are required later.

**Return**
- ESP_OK : On successfully sending the response packet
- ESP_ERR_INVALID_ARG : Null arguments
- ESP_ERR_HTTPD_RESP_SEND : Error in raw send
- ESP_ERR_HTTPD_INVALID_REQ : Invalid request pointer

**Parameters**
- [in] r: The request being responded to

---

**static esp_err_t httpd_resp_send_500(httpd_req_t *r)**

Helper function for HTTP 500.

Send HTTP 500 message. If you wish to send additional data in the body of the response, please use the lower-level functions directly.

**Note**
- This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.
- Once this API is called, all request headers are purged, so request headers need be copied into separate buffers if they are required later.

**Return**
- ESP_OK : On successfully sending the response packet
- ESP_ERR_INVALID_ARG : Null arguments
- ESP_ERR_HTTPD_RESP_SEND : Error in raw send
- ESP_ERR_HTTPD_INVALID_REQ : Invalid request pointer

**Parameters**
- [in] r: The request being responded to

---

**int httpd_send(httpd_req_t *r, const char *buf, size_t buf_len)**

Raw HTTP send.

Call this API if you wish to construct your custom response packet. When using this, all essential header, eg. HTTP version, Status Code, Content Type and Length, Encoding, etc. will have to be constructed manually, and HTTP delimeters (CRLF) will need to be placed correctly for separating sub-sections of the HTTP response packet.

If the send override function is set, this API will end up calling that function eventually to send data out.

**Note**
- This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.
- Unless the response has the correct HTTP structure (which the user must now ensure) it is not guaranteed that it will be recognized by the client. For most cases, you wouldn’t have to call this API, but you would rather use either of : httpd_resp_send(), httpd_resp_send_chunk()

**Return**
- Bytes : Number of bytes that were sent successfully
- HTTPD_SOCK_ERR_INVALID : Invalid arguments
- HTTPD_SOCK_ERR_TIMEOUT : Timeout/interrupted while calling socket send()
- HTTPD_SOCK_ERR_FAIL : Unrecoverable error while calling socket send()

**Parameters**
- [in] r: The request being responded to
- [in] buf: Buffer from where the fully constructed packet is to be read
- [in] buf_len: Length of the buffer

---

**int httpd_socket_send(httpd_handle_t hd, int sockfd, const char *buf, size_t buf_len, int flags)**

A low level API to send data on a given socket

This internally calls the default send function, or the function registered by httpd_sess_set_send_override().

**Note** This API is not recommended to be used in any request handler. Use this only for advanced use cases, wherein some asynchronous data is to be sent over a socket.

**Return**
• **Bytes**: The number of bytes sent successfully
• **HTTPD_SOCK_ERR_INVALID**: Invalid arguments
• **HTTPD_SOCK_ERR_TIMEOUT**: Timeout/interrupted while calling socket send()
• **HTTPD_SOCK_ERR_FAIL**: Unrecoverable error while calling socket send()

**Parameters**
- `[in] hd`: server instance
- `[in] sockfd`: session socket file descriptor
- `[in] buf`: buffer with bytes to send
- `[in] buf_len`: data size
- `[in] flags`: flags for the send() function

```c
int httpd_socket_recv(httpd_handle_t hd, int sockfd, char* buf, size_t buf_len, int flags)
```

A low-level API to receive data from a given socket

This internally calls the default recv function, or the function registered by httpd_sess_set_recv_override().

**Note** This API is not recommended to be used in any request handler. Use this only for advanced use cases, wherein some asynchronous communication is required.

**Return**
- **Bytes**: The number of bytes received successfully
- **0**: Buffer length parameter is zero / connection closed by peer
- **HTTPD_SOCK_ERR_INVALID**: Invalid arguments
- **HTTPD_SOCK_ERR_TIMEOUT**: Timeout/interrupted while calling socket recv()
- **HTTPD_SOCK_ERR_FAIL**: Unrecoverable error while calling socket recv()

**Parameters**
- `[in] hd`: server instance
- `[in] sockfd`: session socket file descriptor
- `[in] buf`: buffer with bytes to send
- `[in] buf_len`: data size
- `[in] flags`: flags for the send() function

```c
esp_err_t httpd_register_err_handler(httpd_handle_t handle, httpd_err_code_t error, httpd_err_handler_func_t handler_fn)
```

Function for registering HTTP error handlers.

This function maps a handler function to any supported error code given by `httpd_err_code_t`. See prototype `httpd_err_handler_func_t` above for details.

**Return**
- **ESP_OK**: handler registered successfully
- **ESP_ERR_INVALID_ARG**: invalid error code or server handle

**Parameters**
- `[in] handle`: HTTP server handle
- `[in] error`: Error type
- `[in] handler_fn`: User implemented handler function (Pass NULL to unset any previously set handler)

```c
esp_err_t httpd_start(httpd_handle_t *handle, const httpd_config_t *config)
```

Starts the web server.

Create an instance of HTTP server and allocate memory/resources for it depending upon the specified configuration.

Example usage:

```c
// Function for starting the webserver
httpd_handle_t start_webserver(void)
{
    // Generate default configuration
    httpd_config_t config = HTTPD_DEFAULT_CONFIG();

    // Empty handle to http_server
```

(continues on next page)
httpd_handle_t server = NULL;

    // Start the httpd server
if (httpd_start(&server, &config) == ESP_OK) {
    // Register URI handlers
    httpd_register_uri_handler(server, &uri_get);
    httpd_register_uri_handler(server, &uri_post);
}
// If server failed to start, handle will be NULL
return server;
}

Return
• ESP_OK : Instance created successfully
• ESP_ERR_INVALID_ARG : Null argument(s)
• ESP_ERR_HTTPD_ALLOC_MEM : Failed to allocate memory for instance
• ESP_ERR_HTTPD_TASK : Failed to launch server task

Parameters
• [in] config: Configuration for new instance of the server
• [out] handle: Handle to newly created instance of the server. NULL on error

esp_err_t httpd_stop(httpd_handle_t handle)

Stop the web server.

Deallocates memory/resources used by an HTTP server instance and deletes it. Once deleted the handle can no longer be used for accessing the instance.

Example usage:

    // Function for stopping the webserver
void stop_webserver(httpd_handle_t server)
{
    // Ensure handle is non NULL
    if (server != NULL) {
        // Stop the httpd server
        httpd_stop(server);
    }
}

Return
• ESP_OK : Server stopped successfully
• ESP_ERR_INVALID_ARG : Handle argument is Null

Parameters
• [in] handle: Handle to server returned by httpd_start

esp_err_t httpd_queue_work(httpd_handle_t handle, httpd_work_fn_t work, void *arg)

Queue execution of a function in HTTPD’s context.

This API queues a work function for asynchronous execution.

Note Some protocols require that the web server generate some asynchronous data and send it to the persistently opened connection. This facility is for use by such protocols.

Return
• ESP_OK : On successfully queueing the work
• ESP_FAIL : Failure in ctrl socket
• ESP_ERR_INVALID_ARG : Null arguments

Parameters
• [in] handle: Handle to server returned by httpd_start
• [in] work: Pointer to the function to be executed in the HTTPD’s context
• [in] arg: Pointer to the arguments that should be passed to this function
void *httpd_sess_get_ctx (httpd_handle_t handle, int sockfd)
Get session context from socket descriptor.

Typically if a session context is created, it is available to URI handlers through the httpd_req_t structure. But, there are cases where the web server’s send/receive functions may require the context (for example, for accessing keying information etc). Since the send/receive function only have the socket descriptor at their disposal, this API provides them with a way to retrieve the session context.

Return
• void*: Pointer to the context associated with this session
• NULL: Empty context / Invalid handle / Invalid socket fd

Parameters
• [in] handle: Handle to server returned by httpd_start
• [in] sockfd: The socket descriptor for which the context should be extracted.

void httpd_sess_set_ctx (httpd_handle_t handle, int sockfd, void *ctx, httpd_free_ctx_fn_t free_fn)
Set session context by socket descriptor.

Parameters
• [in] handle: Handle to server returned by httpd_start
• [in] sockfd: The socket descriptor for which the context should be extracted.
• [in] ctx: Context object to assign to the session
• [in] free_fn: Function that should be called to free the context

void *httpd_sess_get_transport_ctx (httpd_handle_t handle, int sockfd)
Get session ‘transport’ context by socket descriptor.

This context is used by the send/receive functions, for example to manage SSL context.

See httpd_sess_get_ctx()

Return
• void*: Pointer to the transport context associated with this session
• NULL: Empty context / Invalid handle / Invalid socket fd

Parameters
• [in] handle: Handle to server returned by httpd_start
• [in] sockfd: The socket descriptor for which the context should be extracted.

void httpd_sess_set_transport_ctx (httpd_handle_t handle, int sockfd, void *ctx, httpd_free_ctx_fn_t free_fn)
Set session ‘transport’ context by socket descriptor.

See httpd_sess_set_ctx()

Parameters
• [in] handle: Handle to server returned by httpd_start
• [in] sockfd: The socket descriptor for which the context should be extracted.
• [in] ctx: Transport context object to assign to the session
• [in] free_fn: Function that should be called to free the transport context

void *httpd_get_global_user_ctx (httpd_handle_t handle)
Get HTTPD global user context (it was set in the server config struct)

Return global user context

Parameters
• [in] handle: Handle to server returned by httpd_start

void *httpd_get_global_transport_ctx (httpd_handle_t handle)
Get HTTPD global transport context (it was set in the server config struct)

Return global transport context

Parameters
• [in] handle: Handle to server returned by httpd_start

esp_err_t httpd_sess_trigger_close (httpd_handle_t handle, int sockfd)
Trigger an httpd session close externally.
Chapter 2. API Reference

**Note** Calling this API is only required in special circumstances wherein some application requires to close an httpd client session asynchronously.

**Return**
- ESP_OK : On successfully initiating closure
- ESP_FAIL : Failure to queue work
- ESP_ERR_NOT_FOUND : Socket fd not found
- ESP_ERR_INVALID_ARG : Null arguments

**Parameters**
- **handle** [in]: Handle to server returned by httpd_start
- **sockfd** [in]: The socket descriptor of the session to be closed

```c
esp_err_t httpd_sess_update_lru_counter (httpd_handle_t handle, int sockfd)
```

Update LRU counter for a given socket.

LRU Counters are internally associated with each session to monitor how recently a session exchanged traffic. When LRU purge is enabled, if a client is requesting for connection but maximum number of sockets/sessions is reached, then the session having the earliest LRU counter is closed automatically.

Updating the LRU counter manually prevents the socket from being purged due to the Least Recently Used (LRU) logic, even though it might not have received traffic for some time. This is useful when all open sockets/session are frequently exchanging traffic but the user specifically wants one of the sessions to be kept open, irrespective of when it last exchanged a packet.

**Note** Calling this API is only necessary if the LRU Purge Enable option is enabled.

**Return**
- ESP_OK : Socket found and LRU counter updated
- ESP_ERR_NOT_FOUND : Socket not found
- ESP_ERR_INVALID_ARG : Null arguments

**Parameters**
- **handle** [in]: Handle to server returned by httpd_start
- **sockfd** [in]: The socket descriptor of the session for which LRU counter is to be updated

```c
esp_err_t httpd_get_client_list (httpd_handle_t handle, size_t* fds, int* client_fds)
```

Returns list of current socket descriptors of active sessions.

**Note** Size of provided array has to be equal or greater than maximum number of opened sockets, configured upon initialization with max_open_sockets field in httpd_config_t structure.

**Return**
- ESP_OK : Successfully retrieved session list
- ESP_ERR_INVALID_ARG : Wrong arguments or list is longer than provided array

**Parameters**
- **handle** [in]: Handle to server returned by httpd_start
- **fds** [inout]: In: Size of provided client_fds array Out: Number of valid client fds returned in client_fds,
- **client_fds** [out]: Array of client fds

**Structures**

```c
struct httpd_config
```

HTTP Server Configuration Structure.

**Note** Use HTTPD_DEFAULT_CONFIG() to initialize the configuration to a default value and then modify only those fields that are specifically determined by the use case.

**Public Members**

```c
unsigned task_priority
```

Priority of FreeRTOS task which runs the server

```c
size_t stack_size
```

The maximum stack size allowed for the server task
Chapter 2. API Reference

BaseType_t core_id
The core the HTTP server task will run on

uint16_t server_port
TCP Port number for receiving and transmitting HTTP traffic

uint16_t ctrl_port
UDP Port number for asynchronously exchanging control signals between various components of the server

uint16_t max_open_sockets
Max number of sockets/clients connected at any time

uint16_t max_uri_handlers
Maximum allowed uri handlers

uint16_t max_resp_headers
Maximum allowed additional headers in HTTP response

uint16_t backlog_conn
Number of backlog connections

bool lru_purge_enable
Purge “Least Recently Used” connection

uint16_t recv_wait_timeout
Timeout for recv function (in seconds)

uint16_t send_wait_timeout
Timeout for send function (in seconds)

void *global_user_ctx
Global user context.

This field can be used to store arbitrary user data within the server context. The value can be retrieved using the server handle, available e.g. in the httpd_req_t struct.

When shutting down, the server frees up the user context by calling free() on the global_user_ctx field. If you wish to use a custom function for freeing the global user context, please specify that here.

httpd_free_ctx_fn_t global_user_ctx_free_fn
Free function for global user context

void *global_transport_ctx
Global transport context.

Similar to global_user_ctx, but used for session encoding or encryption (e.g. to hold the SSL context). It will be freed using free(), unless global_transport_ctx_free_fn is specified.

httpd_free_ctx_fn_t global_transport_ctx_free_fn
Free function for global transport context

httpd_open_func_t open_fn
Custom session opening callback.

Called on a new session socket just after accept(), but before reading any data.

This is an opportunity to set up e.g. SSL encryption using global_transport_ctx and the send/recv/pending session overrides.

If a context needs to be maintained between these functions, store it in the session using httpd_sess_set_transport_ctx() and retrieve it later with httpd_sess_get_transport_ctx()

Returning a value other than ESP_OK will immediately close the new socket.

httpd_close_func_t close_fn
Custom session closing callback.

Called when a session is deleted, before freeing user and transport contexts and before closing the socket. This is a place for custom de-init code common to all sockets.
The server will only close the socket if no custom session closing callback is set. If a custom callback is used, close(sockfd) should be called in here for most cases.

Set the user or transport context to NULL if it was freed here, so the server does not try to free it again.

This function is run for all terminated sessions, including sessions where the socket was closed by the network stack - that is, the file descriptor may not be valid anymore.

### `httpd_uri_match_func_t uri_match_fn`

URI matcher function.

Called when searching for a matching URI: 1) whose request handler is to be executed right after an HTTP request is successfully parsed 2) in order to prevent duplication while registering a new URI handler using `httpd_register_uri_handler()`

Available options are: 1) NULL : Internally do basic matching using `strncmp()` 2) `httpd_uri_match_wildcard()` : URI wildcard matcher

Users can implement their own matching functions (See description of the `httpd_uri_match_func_t` function prototype)

### `struct httpd_req`

HTTP Request Data Structure.

#### Public Members

- **`httpd_handle_t handle`**
  Handle to server instance

- **`int method`**
  The type of HTTP request, -1 if unsupported method

- **`const char uri[HTTPD_MAX_URI_LEN + 1]`**
  The URI of this request (1 byte extra for null termination)

- **`size_t content_len`**
  Length of the request body

- **`void *aux`**
  Internally used members

- **`void *user_ctx`**
  User context pointer passed during URI registration.

- **`void *sess_ctx`**
  Session Context Pointer

  A session context. Contexts are maintained across ‘sessions’ for a given open TCP connection. One session could have multiple request responses. The web server will ensure that the context persists across all these request and responses.

  By default, this is NULL. URI Handlers can set this to any meaningful value.

  If the underlying socket gets closed, and this pointer is non-NULL, the web server will free up the context by calling free(), unless free_ctx function is set.

- **`httpd_free_ctx_fn_t free_ctx`**
  Pointer to free context hook

  Function to free session context

  If the web server’s socket closes, it frees up the session context by calling free() on the sess_ctx member.

  If you wish to use a custom function for freeing the session context, please specify that here.

- **`bool ignore_sess_ctx_changes`**
  Flag indicating if Session Context changes should be ignored
By default, if you change the sess_ctx in some URI handler, the http server will internally free the earlier context (if non NULL), after the URI handler returns. If you want to manage the allocation/reallocation/freeing of sess_ctx yourself, set this flag to true, so that the server will not perform any checks on it. The context will be cleared by the server (by calling free_ctx or free()) only if the socket gets closed.

struct httpd_uri
   Structure for URI handler.

Public Members

   const char *uri
      The URI to handle

httpd_method_t method
   Method supported by the URI

esp_err_t (*handler)(httpd_req_t *r)
   Handler to call for supported request method. This must return ESP_OK, or else the underlying socket will be closed.

void *user_ctx
   Pointer to user context data which will be available to handler

Macros

HTTPD_MAX_REQ_HDR_LEN
HTTPD_MAX_URI_LEN
HTTPD_SOCK_ERR_FAIL
HTTPD_SOCK_ERR_INVALID
HTTPD_SOCK_ERR_TIMEOUT
HTTPD_200
   HTTP Response 200
HTTPD_204
   HTTP Response 204
HTTPD_207
   HTTP Response 207
HTTPD_400
   HTTP Response 400
HTTPD_404
   HTTP Response 404
HTTPD_408
   HTTP Response 408
HTTPD_500
   HTTP Response 500
HTTPD_TYPE_JSON
   HTTP Content type JSON
HTTPD_TYPE_TEXT
   HTTP Content type text/HTML
HTTPD_TYPE_OCTET
   HTTP Content type octet-stream
HTTPD_DEFAULT_CONFIG()
Chapter 2. API Reference

ESP_ERR_HTTPD_BASE
Starting number of HTTPD error codes

ESP_ERR_HTTPD_HANDLERS_FULL
All slots for registering URI handlers have been consumed

ESP_ERR_HTTPD_HANDLER_EXISTS
URI handler with same method and target URI already registered

ESP_ERR_HTTPD_INVALID_REQ
Invalid request pointer

ESP_ERR_HTTPD_RESULT_TRUNC
Result string truncated

ESP_ERR_HTTPD_RESP_HDR
Response header field larger than supported

ESP_ERR_HTTPD_RESP_SEND
Error occurred while sending response packet

ESP_ERR_HTTPD_ALLOC_MEM
Failed to dynamically allocate memory for resource

ESP_ERR_HTTPD_TASK
Failed to launch server task/thread

HTTPD_RESP_USE_STRLEN

Type Definitions
typedef struct httpd_req httpd_req_t
HTTPRequest Data Structure.

typedef struct httpd_uri httpd_uri_t
Structure for URI handler.

typedef int (*httpd_send_func_t) (httpd_handle_t hd, int sockfd, const char *buf, size_t buf_len, int flags)
Prototype for HTTPDs low-level send function.

Note User specified send function must handle errors internally, depending upon the set value of errno, and return specific HTTPD_SOCK_ERR_ codes, which will eventually be conveyed as return value of httpd_send() function

Return
- Bytes : The number of bytes sent successfully
- HTTPD_SOCK_ERR_INVALID : Invalid arguments
- HTTPD_SOCK_ERR_TIMEOUT : Timeout/interrupted while calling socket send()
- HTTPD_SOCK_ERR_FAIL : Unrecoverable error while calling socket send()

Parameters
- [in] hd: server instance
- [in] sockfd: session socket file descriptor
- [in] buf: buffer with bytes to send
- [in] buf_len: data size
- [in] flags: flags for the send() function

typedef int (*httpd_recv_func_t) (httpd_handle_t hd, int sockfd, char *buf, size_t buf_len, int flags)
Prototype for HTTPDs low-level recv function.

Note User specified recv function must handle errors internally, depending upon the set value of errno, and return specific HTTPD_SOCK_ERR_ codes, which will eventually be conveyed as return value of httpd_req_recv() function

Return
- Bytes : The number of bytes received successfully
- 0 : Buffer length parameter is zero / connection closed by peer

Submit Document Feedback
Chapter 2. API Reference

• HTTPD_SOCK_ERR_INVALID: Invalid arguments
• HTTPD_SOCK_ERR_TIMEOUT: Timeout/interrupted while calling socket recv()
• HTTPD_SOCK_ERR_FAIL: Unrecoverable error while calling socket recv()

Parameters
• [in] hd: server instance
• [in] sockfd: session socket file descriptor
• [in] buf: buffer with bytes to send
• [in] buf_len: data size
• [in] flags: flags for the send() function

typedef int (*httpd_pending_func_t)(httpd_handle_t hd, int sockfd)
Prototype for HTTPDs low-level “get pending bytes” function.

Note
User specified pending function must handle errors internally, depending upon the set value of errno, and return specific HTTPD_SOCK_ERR_ codes, which will be handled accordingly in the server task.

Return
• Bytes: The number of bytes waiting to be received
• HTTPD_SOCK_ERR_INVALID: Invalid arguments
• HTTPD_SOCK_ERR_TIMEOUT: Timeout/interrupted while calling socket pending()
• HTTPD_SOCK_ERR_FAIL: Unrecoverable error while calling socket pending()

Parameters
• [in] hd: server instance
• [in] sockfd: session socket file descriptor

typedef esp_err_t (*httpd_err_handler_func_t)(httpd_req_t *req, httpd_err_code_t error)
Function prototype for HTTP error handling.

This function is executed upon HTTP errors generated during internal processing of an HTTP request. This is used to override the default behavior on error, which is to send HTTP error response and close the underlying socket.

Note
• If implemented, the server will not automatically send out HTTP error response codes, therefore, httpd_resp_send_err() must be invoked inside this function if user wishes to generate HTTP error responses.
• When invoked, the validity of uri, method, content_len and user_ctx fields of the httpd_req_t parameter is not guaranteed as the HTTP request may be partially received/parsed.
• The function must return ESP_OK if underlying socket needs to be kept open. Any other value will ensure that the socket is closed. The return value is ignored when error is of type HTTPD_500_INTERNAL_SERVER_ERROR and the socket closed anyway.

Return
• ESP_OK: error handled successful
• ESP_FAIL: failure indicates that the underlying socket needs to be closed

Parameters
• [in] req: HTTP request for which the error needs to be handled
• [in] error: Error type

typedef void *httpd_handle_t
HTTP Server Instance Handle.

Every instance of the server will have a unique handle.

typedef enum http_method httpd_method_t
HTTP Method Type wrapper over “enum http_method” available in “http_parser” library.

typedef void (*httpd_free_ctx_fn_t)(void *ctx)
Prototype for freeing context data (if any)

Parameters
• [in] ctx: object to free

typedef esp_err_t (*httpd_open_func_t)(httpd_handle_t hd, int sockfd)
Function prototype for opening a session.
Called immediately after the socket was opened to set up the send/recv functions and other parameters of the socket.

**Return**
- ESP_OK: On success
- Any value other than ESP_OK will signal the server to close the socket immediately

**Parameters**
- [in] hd: server instance
- [in] sockfd: session socket file descriptor

```c
typedef void (*httpd_close_func_t) (httpd_handle_t hd, int sockfd)
```
Function prototype for closing a session.

**Note** It’s possible that the socket descriptor is invalid at this point, the function is called for all terminated sessions. Ensure proper handling of return codes.

**Parameters**
- [in] hd: server instance
- [in] sockfd: session socket file descriptor

```c
typedef bool (*httpd_uri_match_func_t) (const char *reference_uri, const char *uri_to_match, size_t match_upto)
```
Function prototype for URI matching.

**Return** true on match

**Parameters**
- [in] reference_uri: URI/template with respect to which the other URI is matched
- [in] uri_to_match: URI/template being matched to the reference URI/template
- [in] match_upto: For specifying the actual length of uri_to_match up to which the matching algorithm is to be applied (The maximum value is strlen(uri_to_match), independent of the length of reference_uri)

```c
typedef struct httpd_config httpd_config_t
```
HTTP Server Configuration Structure.

**Note** Use HTTPD_DEFAULT_CONFIG() to initialize the configuration to a default value and then modify only those fields that are specifically determined by the use case.

```c
typedef void (*httpd_work_fn_t) (void *arg)
```
Prototype of the HTTPD work function Please refer to httpd_queue_work() for more details.

**Parameters**
- [in] arg: The arguments for this work function

**Enumerations**

```c
eenum httpd_err_code_t
```
Error codes sent as HTTP response in case of errors encountered during processing of an HTTP request.

**Values:**
- HTTPD_500_INTERNAL_SERVER_ERROR = 0
- HTTPD_501_METHOD_NOT_IMPLEMENTED
- HTTPD_505_VERSION_NOT_SUPPORTED
- HTTPD_400_BAD_REQUEST
- HTTPD_401_UNAUTHORIZED
- HTTPD_403_FORBIDDEN
- HTTPD_404_NOT_FOUND
- HTTPD_405_METHOD_NOT_ALLOWED
- HTTPD_408_REQ_TIMEOUT
- HTTPD_411_LENGTH_REQUIRED
HTTPD_414_URI_TOO_LONG
HTTPD_431_REQ_HDR_FIELDS_TOO_LARGE
HTTPD_ERR_CODE_MAX

2.4.7 HTTPS server

Overview

This component is built on top of esp_http_server. The HTTPS server takes advantage of hooks and function overrides in the regular HTTP server to provide encryption using OpenSSL.

All documentation for esp_http_server applies also to a server you create this way.

Used APIs

The following API of esp_http_server should not be used with esp_https_server, as they are used internally to handle secure sessions and to maintain internal state:

- “send”, “receive” and “pending” function overrides - secure socket handling
  - httpd_sess_set_send_override()
  - httpd_sess_set_recv_override()
  - httpd_sess_set_pending_override()
- “transport context” - both global and session
  - httpd_sess_get_transport_ctx() - returns SSL used for the session
  - httpd_sess_set_transport_ctx()
  - httpd_get_global_transport_ctx() - returns the shared SSL context
  - httpd_config_t.global_transport_ctx
  - httpd_config_t.global_transport_ctx_free_fn
  - httpd_config_t.open_fn - used to set up secure sockets

Everything else can be used without limitations.

Usage

Please see the example protocols/https_server to learn how to set up a secure server.

Basically all you need is to generate a certificate, embed it in the firmware, and provide its pointers and lengths to the start function via the init struct.

The server can be started with or without SSL by changing a flag in the init struct - httpd_ssl_config.transport_mode. This could be used e.g. for testing or in trusted environments where you prefer speed over security.

Performance

The initial session setup can take about two seconds, or more with slower clock speeds or more verbose logging. Subsequent requests through the open secure socket are much faster (down to under 100 ms).

API Reference

Header File

- components/esp_https_server/include/esp_https_server.h
**Functions**

*esp_err_t* `httpd_ssl_start (httpd_handle_t *handle, httpd_ssl_config_t *config)`

Create a SSL capable HTTP server (secure mode may be disabled in config)

**Return** success

**Parameters**

- [inout] `config`: server config, must not be const. Does not have to stay valid after calling this function.
- [out] `handle`: storage for the server handle, must be a valid pointer

*void* `httpd_ssl_stop (httpd_handle_t handle)`

Stop the server. Blocks until the server is shut down.

**Parameters**

- [in] `handle`:

**Structures**

*struct esp_https_server_user_cb_arg*

Callback data struct, contains the ESP-TLS connection handle.

*struct httpd_ssl_config*

HTTPS server config struct

Please use HTTPD_SSL_CONFIG_DEFAULT() to initialize it.

**Public Members**

*httpd_config_t* `httpd`

Underlying HTTPD server config

Parameters like task stack size and priority can be adjusted here.

*const uint8_t* `*servercert`

Server certificate

*size_t* `servercert_len`

Server certificate byte length

*const uint8_t* `*cacert_pem`

CA certificate ((CA used to sign clients, or client cert itself)

*size_t* `cacert_len`

CA certificate byte length

*const uint8_t* `*prvtkey_pem`

Private key

*size_t* `prvtkey_len`

Private key byte length

*httpd_ssl_transport_mode_t* `transport_mode`

Transport Mode (default secure)

*uint16_t* `port_secure`

Port used when transport mode is secure (default 443)

*uint16_t* `port_insecure`

Port used when transport mode is insecure (default 80)

*bool* `session_tickets`

Enable tls session tickets

*esp_https_server_user_cb * `user_cb`

User callback for esp_https_server
Chapter 2. API Reference

Macros

**HTTPD_SSL_CONFIG_DEFAULT**

Default config struct init

(http_server default config had to be copied for customization)

Notes:

- port is set when starting the server, according to `transport_mode`
- one socket uses ~ 40kB RAM with SSL, we reduce the default socket count to 4
- SSL sockets are usually long-lived, closing LRU prevents pool exhaustion DOS
- Stack size may need adjustments depending on the user application

Type Definitions

```c
typedef struct esp_https_server_user_cb_arg esp_https_server_user_cb_arg_t
Callback data struct, contains the ESP-TLS connection handle.
```

```c
typedef void esp_https_server_user_cb (esp_https_server_user_cb_arg_t *user_cb)
Callback function prototype Can be used to get connection or client information (SSL context) E.g. Client certificate, Socket FD, Connection state, etc.
```

Parameters

- `user_cb`: Callback data struct

```c
typedef struct httpd_ssl_config httpd_ssl_config_t
```

Enumerations

```c
enum httpd_ssl_transport_mode_t
```

Values:

- HTTPD_SSL_TRANSPORT_SECURE
- HTTPD_SSL_TRANSPORT_INSECURE

### 2.4.8 ICMP Echo

#### Overview

ICMP (Internet Control Message Protocol) is used for diagnostic or control purposes or generated in response to errors in IP operations. The common network util `ping` is implemented based on the ICMP packets with the type field value of 0, also called **Echo Reply**.

During a ping session, the source host firstly sends out an ICMP echo request packet and wait for an ICMP echo reply with specific times. In this way, it also measures the round-trip time for the messages. After receiving a valid ICMP echo reply, the source host will generate statistics about the IP link layer (e.g. packet loss, elapsed time, etc).

It is common that IoT device needs to check whether a remote server is alive or not. The device should show the warnings to users when it got offline. It can be achieved by creating a ping session and sending/parsing ICMP echo packets periodically.

To make this internal procedure much easier for users, ESP-IDF provides some out-of-box APIs.

**Create a new ping session** To create a ping session, you need to fill in the `esp_ping_config_t` configuration structure firstly, specifying target IP address, interval times, and etc. Optionally, you can also register some callback functions with the `esp_ping_callbacks_t` structure.

Example method to create a new ping session and register callbacks:
static void test_on_ping_success(esp_ping_handle_t hdl, void *args)
{
    // optionally, get callback arguments
    // const char * str = (const char*) args;
    // printf("%s\r\n", str); // "foo"
    uint8_t ttl;
    uint16_t seqno;
    uint32_t elapsed_time, recv_len;
    ip_addr_t target_addr;
    esp_ping_get_profile(hdl, ESP_PING_PROF_SEQNO, &seqno, sizeof(seqno));
    esp_ping_get_profile(hdl, ESP_PING_PROF_TTL, &ttl, sizeof(ttl));
    esp_ping_get_profile(hdl, ESP_PING_PROF_IPADDR, &target_addr, sizeof(target_addr));
    esp_ping_get_profile(hdl, ESP_PING_PROF_SIZE, &recv_len, sizeof(recv_len));
    esp_ping_get_profile(hdl, ESP_PING_PROF_TIMEGAP, &elapsed_time, sizeof(elapsed_time));
    printf("%d bytes from %s icmp_seq=%d ttl=%d time=%d ms\n", recv_len, inet_ntoa(target_addr.u_addr.ip4), seqno, ttl, elapsed_time);
}

static void test_on_ping_timeout(esp_ping_handle_t hdl, void *args)
{
    uint16_t seqno;
    ip_addr_t target_addr;
    esp_ping_get_profile(hdl, ESP_PING_PROF_SEQNO, &seqno, sizeof(seqno));
    esp_ping_get_profile(hdl, ESP_PING_PROF_IPADDR, &target_addr, sizeof(target_addr));
    printf("From %s icmp_seq=%d timeout\n", inet_ntoa(target_addr.u_addr.ip4), seqno);
}

static void test_on_ping_end(esp_ping_handle_t hdl, void *args)
{
    uint32_t transmitted;
    uint32_t received;
    uint32_t total_time_ms;
    esp_ping_get_profile(hdl, ESP_PING_PROF_REQUEST, &transmitted, sizeof(transmitted));
    esp_ping_get_profile(hdl, ESP_PING_PROF_REPLY, &received, sizeof(received));
    esp_ping_get_profile(hdl, ESP_PING_PROF_DURATION, &total_time_ms, sizeof(total_time_ms));
    printf("%d packets transmitted, %d received, time %dms\n", transmitted, received, total_time_ms);
}

void initialize_ping()
{
    /* convert URL to IP address */
    ip_addr_t target_addr;
    struct addrinfo hint;
    struct addrinfo *res = NULL;
    memset(&hint, 0, sizeof(hint));
    memset(&target_addr, 0, sizeof(target_addr));
    getaddrinfo("www.espressif.com", NULL, &hint, &res);
    struct sockaddr_in addr4 = ((struct sockaddr_in *) (res->ai_addr))->sin_addr;
    inet_addr_to_ip4addr(&target_addr.u_addr.ip4, &addr4);
    freeaddrinfo(res);

    esp_ping_config_t ping_config = ESP_PING_DEFAULT_CONFIG();
    ping_config.target_addr = target_addr; // target IP address
    ping_config.count = ESP_PING_COUNT_INFINITE; // ping in infinite mode, esp_ping_stop can stop it
}
Chapter 2. API Reference

(continued from previous page)

```c
/* set callback functions */
esp_ping_callbacks_t cbs;
    cbs.on_ping_success = test_on_ping_success;
    cbs.on_ping_timeout = test_on_ping_timeout;
    cbs.on_ping_end = test_on_ping_end;
    cbs.cb_args = "foo"; // arguments that will feed to all callback functions,
cbs.cb_args = eth_event_group;

    esp_ping_handle_t ping;
    esp_ping_new_session(&ping_config, &cbs, &ping);
```

Start and Stop ping session You can start and stop ping session with the handle returned by `esp_ping_new_session`. Note that, the ping session won’t start automatically after creation. If the ping session is stopped, and restart again, the sequence number in ICMP packets will recount from zero again.

Delete a ping session If a ping session won’t be used any more, you can delete it with `esp_ping_delete_session`. Please make sure the ping session is in stop state (i.e. you have called `esp_ping_stop` before or the ping session has finished all the procedures) when you call this function.

Get runtime statistics As the example code above, you can call `esp_ping_get_profile` to get different runtime statistics of ping session in the callback function.

Application Example

ICMP echo example: `protocols/icmp_echo`

API Reference

Header File

- `components/lwip/include/apps/ping/ping_sock.h`

Functions

```c
esp_err_t esp_ping_new_session(const esp_ping_config_t *config, const esp_ping_callbacks_t *cbs, esp_ping_handle_t *hdl_out)
Create a ping session.
```

Return

- `ESP_ERR_INVALID_ARG`: invalid parameters (e.g. configuration is null, etc)
- `ESP_ERR_NO_MEM`: out of memory
- `ESP_FAIL`: other internal error (e.g. socket error)
- `ESP_OK`: create ping session successfully, user can take the ping handle to do follow-on jobs

Parameters

- `config`: ping configuration
- `cbs`: a bunch of callback functions invoked by internal ping task
- `hdl_out`: handle of ping session

```c
esp_err_t esp_ping_delete_session(esp_ping_handle_t hdl)
Delete a ping session.
```

Return

- `ESP_ERR_INVALID_ARG`: invalid parameters (e.g. ping handle is null, etc)
- `ESP_OK`: delete ping session successfully
**Chapter 2. API Reference**

### Parameters
- **hdl**: handle of ping session

#### esp_err_t esp_ping_start (esp_ping_handle_t hdl)
Start the ping session.

**Return**
- ESP_ERR_INVALID_ARG: invalid parameters (e.g. ping handle is null, etc)
- ESP_OK: start ping session successfully

#### Parameters
- **hdl**: handle of ping session

#### esp_err_t esp_ping_stop (esp_ping_handle_t hdl)
Stop the ping session.

**Return**
- ESP_ERR_INVALID_ARG: invalid parameters (e.g. ping handle is null, etc)
- ESP_OK: stop ping session successfully

#### Parameters
- **hdl**: handle of ping session

#### esp_err_t esp_ping_get_profile (esp_ping_handle_t hdl, esp_ping_profile_t profile, void *data, uint32_t size)
Get runtime profile of ping session.

**Return**
- ESP_ERR_INVALID_ARG: invalid parameters (e.g. ping handle is null, etc)
- ESP_ERR_INVALID_SIZE: the actual profile data size doesn’t match the “size” parameter
- ESP_OK: get profile successfully

**Parameters**
- **hdl**: handle of ping session
- **profile**: type of profile
- **data**: profile data
- **size**: profile data size

### Structures

#### struct esp_ping_callbacks_t
Type of “ping” callback functions.

**Public Members**

- void **cb_args**
  arguments for callback functions

  void (*on_ping_success) (esp_ping_handle_t hdl, void *args)
  Invoked by internal ping thread when received ICMP echo reply packet.

  void (*on_ping_timeout) (esp_ping_handle_t hdl, void *args)
  Invoked by internal ping thread when receive ICMP echo reply packet timeout.

  void (*on_ping_end) (esp_ping_handle_t hdl, void *args)
  Invoked by internal ping thread when a ping session is finished.

#### struct esp_ping_config_t
Type of “ping” configuration.

**Public Members**

- uint32_t **count**
  A “ping” session contains count procedures
## Chapter 2. API Reference

### Macros

- **ESP_PING_DEFAULT_CONFIG**
  
  Default ping configuration.

- **ESP_PING_COUNT_INFINITE**
  
  Set ping count to zero will ping target infinitely

### Type Definitions

- **typedef void *esp_ping_handle_t**
  
  Type of ping session handle.

### Enumerations

- **enum esp_ping_profile_t**
  
  Profile of ping session.

  **Values:**

  - **ESP_PING_PROF_SEQNO**
    
    Sequence number of a ping procedure
  
  - **ESP_PING_PROF_TTL**
    
    Time to live of a ping procedure
  
  - **ESP_PING_PROF_REQUEST**
    
    Number of request packets sent out
  
  - **ESP_PING_PROF_REPLY**
    
    Number of reply packets received
  
  - **ESP_PING_PROF_IPADDR**
    
    IP address of replied target
  
  - **ESP_PING_PROF_SIZE**
    
    Size of received packet
  
  - **ESP_PING_PROF_TIMEGAP**
    
    Elapsed time between request and reply packet
  
  - **ESP_PING_PROF_DURATION**
    
    Elapsed time of the whole ping session
2.4.9 ESP Local Control

Overview

ESP Local Control (esp_local_ctrl) component in ESP-IDF provides capability to control an ESP device over Wi-Fi + HTTPS or BLE. It provides access to application defined properties that are available for reading / writing via a set of configurable handlers.

Initialization of the esp_local_ctrl service over BLE transport is performed as follows:

```c
esp_local_ctrl_config_t config = {
    .transport = ESP_LOCAL_CTRL_TRANSPORT_BLE,
    .transport_config = {
        .ble = & (protocom_ble_config_t) {
            .device_name = SERVICE_NAME,
            .service_uuid = {
                /* LSB <--------------------------- '----------> MSB */
                0x21, 0xd5, 0x3b, 0x8d, 0xbd, 0x75, 0x68, 0x8a,
                0xb4, 0x42, 0xeb, 0x31, 0x4a, 0x1e, 0x98, 0x3d
            }
        },
        .proto_sec = {
            .version = PROTOCOM_SEC0,
            .custom_handle = NULL,
            .pop = NULL,
        },
        .handlers = {
            /* User defined handler functions */
            .get_prop_values = get_property_values,
            .set_prop_values = set_property_values,
            .usr_ctx = NULL,
            .usr_ctx_free_fn = NULL
        },
        /* Maximum number of properties that may be set */
        .max_properties = 10
    },
    /* Start esp_local_ctrl service */
    ESP_ERROR_CHECK(esp_local_ctrl_start(&config));
};
```

Similarly for HTTPS transport:

```c
/* Set the configuration */
httpd_ssl_config_t https_conf = HTTPD_SSL_CONFIG_DEFAULT();

/* Load server certificate */
extern const unsigned char cacert_pem_start[] asm("_binary_cacert_pem_start");
extern const unsigned char cacert_pem_end[] asm("_binary_cacert_pem_end");
https_conf.cacert_pem = cacert_pem_start;
https_conf.cacert_len = cacert_pem_end - cacert_pem_start;

/* Load server private key */
extern const unsigned char prvtkey_pem_start[] asm("_binary_prvtkey_pem_start");
extern const unsigned char prvtkey_pem_end[] asm("_binary_prvtkey_pem_end");
https_conf.prvtkey_pem = prvtkey_pem_start;
https_conf.prvtkey_len = prvtkey_pem_end - prvtkey_pem_start;
```

(continues on next page)
esp_local_ctrl_config_t config = {
  .transport = ESP_LOCAL_CTRL_TRANSPORT_HTTPD,
  .transport_config = {
    .httpd = &https_conf
  },
  .proto_sec = {
    .version = PROTOCOM_SEC0,
    .custom_handle = NULL,
    .pop = NULL,
  },
  .handlers = {
    /* User defined handler functions */
    .get_prop_values = get_property_values,
    .set_prop_values = set_property_values,
    .usr_ctx = NULL,
    .usr_ctx_free_fn = NULL
  },
  /* Maximum number of properties that may be set */
  .max_properties = 10
};

/* Start esp_local_ctrl service */
ESP_ERROR_CHECK(esp_local_ctrl_start(&config));

You may set security for transport in ESP local control using following options:

1. PROTOCOM_SEC1: specifies that end to end encryption is used.
2. PROTOCOM_SEC0: specifies that data will be exchanged as a plain text.
3. PROTOCOM_SEC_CUSTOM: you can define your own security requirement. Please note that you will also have to provide custom_handle of type protocomm_security_t * in this context.

Creating a property

Now that we know how to start the esp_local_ctrl service, let’s add a property to it. Each property must have a unique name (string), a type (e.g. enum), flags (bit fields) and size.

The size is to be kept 0, if we want our property value to be of variable length (e.g. if its a string or bytestream). For fixed length property value data-types, like int, float, etc., setting the size field to the right value, helps esp_local_ctrl to perform internal checks on arguments received with write requests.

The interpretation of type and flags fields is totally up to the application, hence they may be used as enumerations, bit-fields, or even simple integers. One way is to use type values to classify properties, while flags to specify characteristics of a property.

Here is an example property which is to function as a timestamp. It is assumed that the application defines TYPE_TIMESTAMP and READONLY, which are used for setting the type and flags fields here.

```c
/* Create a timestamp property */
esp_local_ctrl_prop_t timestamp = {
  .name = "timestamp",
  .type = TYPE_TIMESTAMP,
  .size = sizeof(int32_t),
  .flags = READONLY,
  .ctx = func_get_time,
  .ctx_free_fn = NULL
};

/* Now register the property */
esp_local_ctrl_add_property(&timestamp);
```
Also notice that there is a ctx field, which is set to point to some custom `func_get_time()`. This can be used inside the property get / set handlers to retrieve timestamp.

Here is an example of `get_prop_values()` handler, which is used for retrieving the timestamp.

```c
static esp_err_t get_property_values(size_t props_count,
                                    const esp_local_ctrl_prop_t *props,
                                    esp_local_ctrl_prop_val_t *prop_values,
                                    void *usr_ctx)
{
    for (uint32_t i = 0; i < props_count; i++) {
        ESP_LOGI(TAG, "Reading %s", props[i].name);
        if (props[i].type == TYPE_TIMESTAMP) {
            int32_t (*func_get_time)(void) = props[i].ctx;
            /* Use static variable for saving the value.
               * This is essential because the value has to be valid even after this function returns.
               * Alternative is to use dynamic allocation and set the free_fn field */
            static int32_t ts = func_get_time();
            prop_values[i].data = &ts;
        }
    }
    return ESP_OK;
}
```

Here is an example of `set_prop_values()` handler. Notice how we restrict from writing to read-only properties.

```c
static esp_err_t set_property_values(size_t props_count,
                                     const esp_local_ctrl_prop_t *props,
                                     const esp_local_ctrl_prop_val_t *prop_values,
                                     void *usr_ctx)
{
    for (uint32_t i = 0; i < props_count; i++) {
        if (props[i].flags & READONLY) {
            ESP_LOGE(TAG, "Cannot write to read-only property %s", props[i].name);
            return ESP_ERR_INVALID_ARG;
        } else {
            ESP_LOGI(TAG, "Setting %s", props[i].name);
            /* For keeping it simple, lets only log the incoming data */
            ESP_LOG_BUFFER_HEX_LEVEL(TAG, prop_values[i].data,
                                      prop_values[i].size, ESP_LOG_INFO);
        }
    }
    return ESP_OK;
}
```

For complete example see `protocols/esp_local_ctrl`

**Client Side Implementation**

The client side implementation will have establish a protocomm session with the device first, over the supported mode of transport, and then send and receive protobuf messages understood by the `esp_local_ctrl` service. The service will translate these messages into requests and then call the appropriate handlers (set / get). Then, the generated response for each handler is again packed into a protobuf message and transmitted back to the client.

See below the various protobuf messages understood by the `esp_local_ctrl` service:
1. **get_prop_count**: This should simply return the total number of properties supported by the service.
2. **get_prop_values**: This accepts an array of indices and should return the information (name, type, flags) and values of the properties corresponding to those indices.
3. **set_prop_values**: This accepts an array of indices and an array of new values, which are used for setting the values of the properties corresponding to the indices.

Note that indices may or may not be the same for a property, across multiple sessions. Therefore, the client must only use the names of the properties to uniquely identify them. So, every time a new session is established, the client should first call `get_prop_count` and then `get_prop_values`, hence form an index to name mapping for all properties. Now when calling `set_prop_values` for a set of properties, it must first convert the names to indexes, using the created mapping. As emphasized earlier, the client must refresh the index to name mapping every time a new session is established with the same device.

The various protocomm endpoints provided by `esp_local_ctrl` are listed below:

<table>
<thead>
<tr>
<th>Endpoint Name (BLE + GATT Server)</th>
<th>URI (HTTPS Server + mDNS)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>esp_local_ctrl/version</td>
<td>https://&lt;mdns-hostname&gt;.local/esp_local_ctrl/version</td>
<td>Endpoint used for retrieving version string</td>
</tr>
<tr>
<td>esp_local_ctrl/control</td>
<td>https://&lt;mdns-hostname&gt;.local/esp_local_ctrl/control</td>
<td>Endpoint used for sending / receiving control messages</td>
</tr>
</tbody>
</table>

**API Reference**

**Header File**

- components/esp_local_ctrl/include/esp_local_ctrl.h

**Functions**

```c
const esp_local_ctrl_transport_t *esp_local_ctrl_get_transport_ble(void)
Function for obtaining BLE transport mode.

const esp_local_ctrl_transport_t *esp_local_ctrl_get_transport_httpd(void)
Function for obtaining HTTPD transport mode.

esp_err_t esp_local_ctrl_start(const esp_local_ctrl_config_t *config)
Start local control service.

Return
- ESP_OK : Success
- ESP_FAIL : Failure

Parameters
- [in] config: Pointer to configuration structure

esp_err_t esp_local_ctrl_stop(void)
Stop local control service.

esp_err_t esp_local_ctrl_add_property(const esp_local_ctrl_prop_t *prop)
Add a new property.

This adds a new property and allocates internal resources for it. The total number of properties that could be added is limited by configuration option `max_properties`

Return
- ESP_OK : Success
- ESP_FAIL : Failure

Parameters
```
Chapter 2. API Reference

- [in] prop: Property description structure

```c
esp_err_t esp_local_ctrl_remove_property(const char *name)
```

Remove a property.

This finds a property by name, and releases the internal resources which are associated with it.

Return
- ESP_OK : Success
- ESP_ERR_NOT_FOUND : Failure

Parameters
- [in] name: Name of the property to remove

```c
const esp_local_ctrl_prop_t *esp_local_ctrl_get_property(const char *name)
```

Get property description structure by name.

This API may be used to get a property’s context structure esp_local_ctrl_prop_t when its name is known

Return
- Pointer to property
- NULL if not found

Parameters
- [in] name: Name of the property to find

```c
esp_err_t esp_local_ctrl_set_handler(const char *ep_name, protocomm_req_handler_t handler, void *user_ctx)
```

Register protocomm handler for a custom endpoint.

This API can be called by the application to register a protocomm handler for an endpoint after the local control service has started.

Note In case of BLE transport the names and uuids of all custom endpoints must be provided beforehand as a part of the protocomm_ble_config_t structure set in esp_local_ctrl_config_t, and passed to esp_local_ctrl_start().

Return
- ESP_OK : Success
- ESP_FAIL : Failure

Parameters
- [in] ep_name: Name of the endpoint
- [in] handler: Endpoint handler function
- [in] user_ctx: User data

Unions

```c
union esp_local_ctrl_transport_config_t
#include <esp_local_ctrl.h> Transport mode (BLE/HTTPD) configuration.
```

Public Members

```c
esp_local_ctrl_transport_config_ble_t *ble
```

This is same as protocomm_ble_config_t. See protocomm_ble.h for available configuration parameters.

```c
esp_local_ctrl_transport_config_httpd_t *httpd
```

This is same as httpd_ssl_config_t. See esp_https_server.h for available configuration parameters.

Structures

```c
struct esp_local_ctrl_prop
```

Property description data structure, which is to be populated and passed to the esp_local_ctrl_add_property() function.
Once a property is added, its structure is available for read-only access inside `get_prop_values()` and `set_prop_values()` handlers.

**Public Members**

`char *name`
Unique name of property

`uint32_t type`
Type of property. This may be set to application defined enums

`size_t size`
Size of the property value, which:
- if zero, the property can have values of variable size
- if non-zero, the property can have values of fixed size only, therefore, checks are performed internally by `esp_local_ctrl` when setting the value of such a property

`uint32_t flags`
Flags set for this property. This could be a bit field. A flag may indicate property behavior, e.g. read-only / constant

`void *ctx`
Pointer to some context data relevant for this property. This will be available for use inside the `get_prop_values()` and `set_prop_values()` handlers as a part of this property structure. When set, this is valid throughout the lifetime of a property, till either the property is removed or the `esp_local_ctrl` service is stopped.

`void (*ctx_free_fn)(void *ctx)`
Function used by `esp_local_ctrl` to internally free the property context when `esp_local_ctrl_remove_property()` or `esp_local_ctrl_stop()` is called.

`struct esp_local_ctrl_prop_val`
Property value data structure. This gets passed to the `get_prop_values()` and `set_prop_values()` handlers for the purpose of retrieving or setting the present value of a property.

**Public Members**

`void *data`
Pointer to memory holding property value

`size_t size`
Size of property value

`void (*free_fn)(void *data)`
This may be set by the application in `get_prop_values()` handler to tell `esp_local_ctrl` to call this function on the data pointer above, for freeing its resources after sending the `get_prop_values` response.

`struct esp_local_ctrl_handlers`
Handlers for receiving and responding to local control commands for getting and setting properties.

**Public Members**

`esp_err_t (*get_prop_values)(size_t props_count, const esp_local_ctrl_prop_t props[], const esp_local_ctrl_prop_val_t prop_values[], void *usr_ctx)`
Handler function to be implemented for retrieving current values of properties.

**Note** If any of the properties have fixed sizes, the size field of corresponding element in `prop_values` need to be set.

**Return** Returning different error codes will convey the corresponding protocol level errors to the client.
• ESP_OK: Success
• ESP_ERR_INVALID_ARG: InvalidArgument
• ESP_ERR_INVALID_STATE: InvalidProto
• All other error codes: InternalError

**Parameters**

- **[in] props_count**: Total elements in the props array
- **[in] props**: Array of properties, the current values for which have been requested by the client
- **[out] prop_values**: Array of empty property values, the elements of which need to be populated with the current values of those properties specified by props argument
- **[in] usr_ctx**: This provides value of the usr_ctx field of esp_local_ctrl_handlers_t structure

`esp_err_t(*set_prop_values)(size_t props_count, const esp_local_ctrl_prop_t props[], const esp_local_ctrl_prop_val_t prop_values[], void *usr_ctx)`

Handler function to be implemented for changing values of properties.

**Note** If any of the properties have variable sizes, the size field of the corresponding element in prop_values must be checked explicitly before making any assumptions on the size.

**Return** Returning different error codes will convey the corresponding protocol level errors to the client:

- ESP_OK: Success
- ESP_ERR_INVALID_ARG: InvalidArgument
- ESP_ERR_INVALID_STATE: InvalidProto
- All other error codes: InternalError

**Parameters**

- **[in] props_count**: Total elements in the props array
- **[in] props**: Array of properties, the values for which the client requests to change
- **[in] prop_values**: Array of property values, the elements of which need to be used for updating those properties specified by props argument
- **[in] usr_ctx**: This provides value of the usr_ctx field of esp_local_ctrl_handlers_t structure

`void *usr_ctx`

Context pointer to be passed to above handler functions upon invocation. This is different from the property level context, as this is valid throughout the lifetime of the esp_local_ctrl service, and freed only when the service is stopped.

`void (*usr_ctx_free_fn)(void *usr_ctx)`

Pointer to function which will be internally invoked on usr_ctx for freeing the context resources when esp_local_ctrl_stop() is called.

**struct esp_local_ctrl_proto_sec_cfg**

Protocom security configs

**Public Members**

`esp_local_ctrl_proto_sec_t version`

This sets protocom security version, sec0/sec1 or custom If custom, user must provide handle via proto_sec_custom_handle below

`void *custom_handle`

Custom security handle if security is set custom via proto_sec above This handle must follow protocomm_security_t signature

`void *pop`

Proof of possession to be used for local control. Could be NULL.

**struct esp_local_ctrl_config**

Configuration structure to pass to esp_local_ctrl_start()
Public Members

```c
const esp_local_ctrl_transport_t *transport
    Transport layer over which service will be provided
```  
```c
esp_local_ctrl_transport_config_t transport_config
    Transport layer over which service will be provided
```  
```c
esp_local_ctrl_proto_sec_cfg_t proto_sec
    Security version and POP
```  
```c
esp_local_ctrl_handlers_t handlers
    Register handlers for responding to get/set requests on properties
```  
```c
size_t max_properties
    This limits the number of properties that are available at a time
```  
Macros

```c
ESP_LOCAL_CTRL_TRANSPORT_BLE
ESP_LOCAL_CTRL_TRANSPORT_HTTPD
```  
Type Definitions

```c
typedef struct esp_local_ctrl_prop esp_local_ctrl_prop_t
    Property description data structure, which is to be populated and passed to the
    esp_local_ctrl_add_property() function.
```

```
    Once a property is added, its structure is available for read-only access inside get_prop_values() and
    set_prop_values() handlers.
```  
```c
typedef struct esp_local_ctrl_prop_val esp_local_ctrl_prop_val_t
    Property value data structure. This gets passed to the get_prop_values() and set_prop_values() handlers
    for the purpose of retrieving or setting the present value of a property.
```  
```c
typedef struct esp_local_ctrl_handlers esp_local_ctrl_handlers_t
    Handlers for receiving and responding to local control commands for getting and setting properties.
```  
```c
typedef struct esp_local_ctrl_transport esp_local_ctrl_transport_t
    Transport mode (BLE/HTTPD) over which the service will be provided.
```

```
    This is forward declaration of a private structure, implemented internally by esp_local_ctrl.
```  
```c
typedef struct protocomm_ble_config esp_local_ctrl_transport_config_ble_t
    Configuration for transport mode BLE.
```

```
    This is a forward declaration for protocomm_ble_config_t. To use this, application must set CON-
    FIG_BT_BLUEDROID_ENABLED and include protocomm_ble.h.
```  
```c
typedef struct httpd_ssl_config esp_local_ctrl_transport_config_httpd_t
    Configuration for transport mode HTTPD.
```

```
    This is a forward declaration for httpd_ssl_config_t. To use this, application must set CON-
    FIG_ESP_HTTPS_SERVER_ENABLE and include esp_https_server.h
```  
```c
typedef enum esp_local_ctrl_proto_sec esp_local_ctrl_proto_sec_t
    Security types for esp_local_control.
```  
```c
typedef struct esp_local_ctrl_proto_sec_cfg esp_local_ctrl_proto_sec_cfg_t
    Protocom security configs
```  
```c
typedef struct esp_local_ctrl_config esp_local_ctrl_config_t
    Configuration structure to pass to esp_local_ctrl_start()
```
### Enumerations

```c
enum esp_local_ctrl_proto_sec
    Security types for esp_local_control.

Values:

- PROTOCOM_SEC0 = 0
- PROTOCOM_SEC1
- PROTOCOM_SEC_CUSTOM
```

### 2.4.10 mDNS Service

#### Overview

mDNS is a multicast UDP service that is used to provide local network service and host discovery.

mDNS is installed by default on most operating systems or is available as separate package. On Mac OS it is installed by default and is called Bonjour. Apple releases an installer for Windows that can be found on Apple’s support page. On Linux, mDNS is provided by avahi and is usually installed by default.

#### mDNS Properties

- **hostname**: the hostname that the device will respond to. If not set, the hostname will be read from the interface. Example: my-esp32s3 will resolve to my-esp32s3.local
- **default_instance**: friendly name for your device, like Jhon's ESP32-S3 Thing. If not set, hostname will be used.

Example method to start mDNS for the STA interface and set hostname and default_instance:

```c
void start_mdns_service()
{
    //initialize mDNS service
    esp_err_t err = mdns_init();
    if (err) {
        printf("MDNS Init failed: %d\n", err);
        return;
    }

    //set hostname
    mdns_hostname_set("my-esp32s3");
    //set default instance
    mdns_instance_name_set("Jhon's ESP32-S3 Thing");
}
```

#### mDNS Services

mDNS can advertise information about network services that your device offers. Each service is defined by a few properties.

- **instance_name**: friendly name for your service, like Jhon's ESP32-S3 Web Server. If not defined, default_instance will be used.
- **service_type**: (required) service type, prepended with underscore. Some common types can be found here.
- **proto**: (required) protocol that the service runs on, prepended with underscore. Example: _tcp or _udp
- **port**: (required) network port that the service runs on
- **txt**: \{var, val\} array of strings, used to define properties for your service

Example method to add a few services and different properties:
Chapter 2. API Reference

```c
void add_mdns_services()
{
    // add our services
    mdns_service_add(NULL, "_http", "_tcp", 80, NULL, 0);
    mdns_service_add(NULL, "_arduino", "_tcp", 3232, NULL, 0);
    mdns_service_add(NULL, "_myservice", "_udp", 1234, NULL, 0);

    // NOTE: services must be added before their properties can be set
    // use custom instance for the web server
    mdns_service_instance_name_set("_http", "_tcp", "Jhon's ESP32-S3 Web Server");

    mdns_txt_item_t serviceTxtData[3] = {
        {"board", "esp32s3"},
        {"u", "user"},
        {"p", "password"}
    };
    // set txt data for service (will free and replace current data)
    mdns_service_txt_set("_http", "_tcp", serviceTxtData, 3);

    // change service port
    mdns_service_port_set("_myservice", "_udp", 4321);
}
```

**mDNS Query**

mDNS provides methods for browsing for services and resolving host’s IP/IPv6 addresses.

Results for services are returned as a linked list of `mdns_result_t` objects.

Example method to resolve host IPs:

```c
void resolve_mdns_host(const char * host_name)
{
    printf("Query A: %s.local\n", host_name);

    struct ip4_addr addr;
    addr.addr = 0;

    esp_err_t err = mdns_query_a(host_name, 2000, &addr);
    if(err){
        if(err == ESP_ERR_NOT_FOUND){
            printf("Host was not found!\n");
            return;
        }
        printf("Query Failed\n");
        return;
    }

    printf(IPSTR, IP2STR(&addr));
}
```

Example method to resolve local services:

```c
static const char * if_str[] = {"STA", "AP", "ETH", "MAX"};
static const char * ip_protocol_str[] = {"V4", "V6", "MAX"};

void mdns_print_results(mdns_result_t * results){
    mdns_result_t * r = results;
    mdns_ip_addr_t * a = NULL;
    int i = 1, t;
    while(r){
        printf("%d: Interface: %s, Type: %s\n", i++, if_str[r->tcpip_if], ip_protocol_str[r->ip_protocol]);
    }
}
```

(continues on next page)
```c
if(r->instance_name){
    printf(" PTR : %s\n", r->instance_name);
}
if(r->hostname){
    printf(" SRV : %s.local:%u\n", r->hostname, r->port);
}
if(r->txt_count){
    printf(" TXT : [%u] \n", r->txt_count);
    for(t=0; t<r->txt_count; t++){
        printf("%s=%s; ", r->txt[t].key, r->txt[t].value);
    }
    printf("\n");
}
}
a = r->addr;
while(a){
    if(a->addr.type == IPADDR_TYPE_V6){
        printf(" AAAA: " IPV6STR "\n", IPV62STR(a->addr.u_addr.ip6));
    } else {
        printf(" A : " IPSTR "\n", IP2STR(&a->addr.u_addr.ip4));
    }
    a = a->next;
} r = r->next;

void find_mdns_service(const char * service_name, const char * proto)
{
    ESP_LOGI(TAG, "Query PTR: %s.%s.local\n", service_name, proto);
    mdns_result_t * results = NULL;
    esp_err_t err = mdns_query_ptr(service_name, proto, 3000, 20, &results);
    if(err){
        ESP_LOGE(TAG, "Query Failed");
        return;
    }
    if(!results){
        ESP_LOGW(TAG, "No results found!");
        return;
    }
    mdns_print_results(results);
    mdns_query_results_free(results);
}
```

Example of using the methods above:

```c
void my_app_some_method(){
    //search for esp32s3-mdns.local
    resolve_mdns_host("esp32s3-mdns");

    //search for HTTP servers
    find_mdns_service("_http", "_tcp");
    //or file servers
    find_mdns_service("_smb", "_tcp"); //windows sharing
    find_mdns_service("_afpovertcp", "_tcp"); //apple sharing
    find_mdns_service("_nfs", "_tcp"); //NFS server
    find_mdns_service("_ftp", "_tcp"); //FTP server
    //or networked printer
    find_mdns_service("_printer", "_tcp");
}
```
find_mdns_service("_ipp", "_tcp");
}

Application Example

mDNS server/scanner example: protocols/mdns.

API Reference

Header File

- components/mdns/include/mdns.h

Functions

```c
esp_err_t mdns_init(void)
{
  Initialize mDNS on given interface.

  Return
  • ESP_OK on success
  • ESP_ERR_INVALID_STATE when failed to register event handler
  • ESP_ERR_NO_MEM on memory error
  • ESP_FAIL when failed to start mdns task

void mdns_free(void)
{
  Stop and free mDNS server.
}

esp_err_t mdns_hostname_set(const char* hostname)
{
  Set the hostname for mDNS server required if you want to advertise services.

  Return
  • ESP_OK success
  • ESP_ERR_INVALID_ARG Parameter error
  • ESP_ERR_NO_MEM memory error

Parameters
  • hostname: Hostname to set

esp_err_t mdns_delegate_hostname_add(const char *hostname, const mdns_ip_addr_t *address_list)
{
  Adds a hostname and address to be delegated A/AAAA queries will be replied for the hostname and services can be added to this host.

  Return
  • ESP_OK success
  • ESP_ERR_INVALID_STATE mDNS is not running
  • ESP_ERR_INVALID_ARG Parameter error
  • ESP_ERR_NO_MEM memory error

Parameters
  • hostname: Hostname to add
  • address_list: The IP address list of the host

esp_err_t mdns_delegate_hostname_remove(const char *hostname)
{
  Remove a delegated hostname All the services added to this host will also be removed.

  Return
  • ESP_OK success
  • ESP_ERR_INVALID_STATE mDNS is not running
  • ESP_ERR_INVALID_ARG Parameter error
  • ESP_ERR_NO_MEM memory error

Parameters
```
Chapter 2. API Reference

- hostname: Hostname to remove

bool mdns_hostname_exists(const char *hostname)

Query whether a hostname has been added.

Return
- true The hostname has been added.
- false The hostname has not been added.

Parameters
- hostname: Hostname to query

esp_err_t mdns_instance_name_set(const char *instance_name)

Set the default instance name for mDNS server.

Return
- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NO_MEM memory error

Parameters
- instance_name: Instance name to set

esp_err_t mdns_service_add(const char *instance_name, const char *service_type, const char *proto, uint16_t port, mdns_txt_item_t txt[], size_t num_items)

Add service to mDNS server.

Note The value length of txt items will be automatically decided by strlen

Return
- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NO_MEM memory error
- ESP_FAIL failed to add service

Parameters
- instance_name: Instance name to set. If NULL, global instance name or hostname will be used.
  Note that MDNS_MULTIPLEINSTANCE config option needs to be enabled for adding multiple instances with the same instance type.
- service_type: service type (_http, _ftp, etc)
- proto: service protocol (_tcp, _udp)
- port: service port
- txt: string array of TXT data (eg. {{"var","val"},{"other","2"}})
- num_items: number of items in TXT data

esp_err_t mdns_service_add_for_host(const char *instance_name, const char *service_type, const char *proto, const char *hostname, uint16_t port, mdns_txt_item_t txt[], size_t num_items)

Add service to mDNS server with a delegated hostname.

Note The value length of txt items will be automatically decided by strlen

Return
- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NO_MEM memory error
- ESP_FAIL failed to add service

Parameters
- instance_name: instance name to set. If NULL, global instance name or hostname will be used.
  Note that MDNS_MULTIPLEINSTANCE config option needs to be enabled for adding multiple instances with the same instance type.
- service_type: service type (_http, _ftp, etc)
- proto: service protocol (_tcp, _udp)
- hostname: service hostname. If NULL, localhostname will be used.
- port: service port
- txt: string array of TXT data (eg. {{"var","val"},{"other","2"}})
- num_items: number of items in TXT data
bool mdns_service_exists (const char *service_type, const char *proto, const char *hostname)
Check whether a service has been added.

Return
- true Corresponding service has been added.
- false Service not found.

Parameters
- service_type: service type (_http, _ftp, etc)
- proto: service protocol (_tcp, _udp)
- hostname: service hostname. If NULL, checks for the local hostname.

bool mdns_service_exists_with_instance (const char *instance, const char *service_type, const char *proto, const char *hostname)
Check whether a service has been added.

Return
- true Corresponding service has been added.
- false Service not found.

Parameters
- instance: instance name
- service_type: service type (_http, _ftp, etc)
- proto: service protocol (_tcp, _udp)
- hostname: service hostname. If NULL, checks for the local hostname.

esp_err_t mdns_service_remove (const char *service_type, const char *proto)
Remove service from mDNS server.

Return
- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NOT_FOUND Service not found
- ESP_ERR_NO_MEM memory error

Parameters
- service_type: service type (_http, _ftp, etc)
- proto: service protocol (_tcp, _udp)

esp_err_t mdns_service_remove_for_host (const char *instance, const char *service_type, const char *proto, const char *hostname)
Remove service from mDNS server with hostname.

Return
- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NOT_FOUND Service not found
- ESP_ERR_NO_MEM memory error

Parameters
- instance: instance name
- service_type: service type (_http, _ftp, etc)
- proto: service protocol (_tcp, _udp)
- hostname: service hostname. If NULL, local hostname will be used.

esp_err_t mdns_service_instance_name_set (const char *service_type, const char *proto, const char *instance_name)
Set instance name for service.

Return
- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NOT_FOUND Service not found
- ESP_ERR_NO_MEM memory error

Parameters
- service_type: service type (_http, _ftp, etc)
- proto: service protocol (_tcp, _udp)
• instance_name: instance name to set

```c
esp_err_t mdns_service_instance_name_set_for_host(const char *instance_old, const char *service_type, const char *proto, const char *hostname, const char *instance_name)
```

Set instance name for service with hostname.

### Return
- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NOT_FOUND Service not found
- ESP_ERR_NO_MEM memory error

### Parameters
- instance_old: original instance name
- service_type: service type (_http, _ftp, etc)
- proto: service protocol (_tcp, _udp)
- hostname: service hostname. If NULL, local hostname will be used.
- instance_name: instance name to set

```c
esp_err_t mdns_service_port_set(const char *service_type, const char *proto, uint16_t port)
```

Set service port.

### Return
- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NOT_FOUND Service not found
- ESP_ERR_NO_MEM memory error

### Parameters
- service_type: service type (_http, _ftp, etc)
- proto: service protocol (_tcp, _udp)
- port: service port

```c
esp_err_t mdns_service_port_set_for_host(const char *instance, const char *service_type, const char *proto, const char *hostname, uint16_t port)
```

Set service port with hostname.

### Return
- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NOT_FOUND Service not found
- ESP_ERR_NO_MEM memory error

### Parameters
- instance: instance name
- service_type: service type (_http, _ftp, etc)
- proto: service protocol (_tcp, _udp)
- hostname: service hostname. If NULL, local hostname will be used.
- port: service port

```c
esp_err_t mdns_service_txt_set(const char *service_type, const char *proto, mdns_txt_item_t txt[], uint8_t num_items)
```

Replace all TXT items for service.

### Note
The value length of txt items will be automatically decided by strlen

### Return
- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NOT_FOUND Service not found
- ESP_ERR_NO_MEM memory error

### Parameters
- service_type: service type (_http, _ftp, etc)
- proto: service protocol (_tcp, _udp)
Chapter 2. API Reference

- **txt**: array of TXT data (e.g., `{{ "var","val" },{ "other","2" }}`)
- **num_items**: number of items in TXT data

```c
esp_err_t mdns_service_txt_set_for_host(const char *instance, const char *service_type, const char *proto, const char *hostname, mdns_txt_item_t txt[], uint8_t num_items)
```

Replace all TXT items for service with hostname.

**Note** The value length of txt items will be automatically decided by `strlen`

**Return**
- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NOT_FOUND Service not found
- ESP_ERR_NO_MEM memory error

**Parameters**
- **instance**: instance name
- **service_type**: service type (_http, _ftp, etc)
- **proto**: service protocol (_tcp, _udp)
- **hostname**: service hostname. If NULL, local hostname will be used.
- **txt**: array of TXT data (e.g., `{{ "var","val" },{ "other","2" }}`)
- **num_items**: number of items in TXT data

```c
esp_err_t mdns_service_txt_item_set(const char *service_type, const char *proto, const char *key, const char *value)
```

Set/Add TXT item for service TXT record.

**Note** The value length will be automatically decided by `strlen`

**Return**
- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NOT_FOUND Service not found
- ESP_ERR_NO_MEM memory error

**Parameters**
- **service_type**: service type (_http, _ftp, etc)
- **proto**: service protocol (_tcp, _udp)
- **key**: the key that you want to add/update
- **value**: the new value of the key

```c
esp_err_t mdns_service_txt_item_set_with_explicit_value_len(const char *service_type, const char *proto, const char *key, const char *value, uint8_t value_len)
```

Set/Add TXT item for service TXT record.

**Parameters**
- **service_type**: service type (_http, _ftp, etc)
- **proto**: service protocol (_tcp, _udp)
- **key**: the key that you want to add/update
- **value**: the new value of the key
- **value_len**: the length of the value

```c
esp_err_t mdns_service_txt_item_set_for_host(const char *instance, const char *service_type, const char *proto, const char *hostname, const char *key, const char *value)
```

Espressif Systems 906 Release v5.0-dev-1648-g94089edbc3

Submit Document Feedback
Set/Add TXT item for service TXT record with hostname.

**Note** The value length will be automatically decided by strlen

**Return**
- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NOT_FOUND Service not found
- ESP_ERR_NO_MEM memory error

**Parameters**
- `instance`: instance name
- `service_type`: service type (http, ftp, etc)
- `proto`: service protocol (_tcp, _udp)
- `hostname`: service hostname. If NULL, local hostname will be used.
- `key`: the key that you want to add/update
- `value`: the new value of the key

```c
esp_err_t mdns_service_txt_item_set_for_host_with_explicit_value_len(const char *instance, const char *service_type, const char *proto, const char *hostname, const char *key, const char *value, const uint8_t value_len)
```

Set/Add TXT item for service TXT record with hostname and txt value length.

**Return**
- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NOT_FOUND Service not found
- ESP_ERR_NO_MEM memory error

**Parameters**
- `instance`: instance name
- `service_type`: service type (_http, _ftp, etc)
- `proto`: service protocol (_tcp, _udp)
- `hostname`: service hostname. If NULL, local hostname will be used.
- `key`: the key that you want to add/update
- `value`: the new value of the key
- `value_len`: the length of the value

```c
esp_err_t mdns_service_txt_item_remove(const char *service_type, const char *proto, const char *key)
```

Remove TXT item for service TXT record.

**Return**
- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NOT_FOUND Service not found
- ESP_ERR_NO_MEM memory error
Parameters

- **service_type**: service type (http, ftp, etc)
- **proto**: service protocol (tcp, udp)
- **key**: the key that you want to remove

```c
esp_err_t mdns_service_txt_item_remove_for_host(const char *instance, const char *service_type, const char *proto, const char *hostname, const char *key)
```

Remove TXT item for service TXT record with hostname.

Return

- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NOT_FOUND Service not found
- ESP_ERR_NO_MEM memory error

Parameters

- **instance**: instance name
- **service_type**: service type (http, ftp, etc)
- **proto**: service protocol (tcp, udp)
- **hostname**: service hostname. If NULL, localhost name will be used.
- **key**: the key that you want to remove

```c
esp_err_t mdns_service_subtype_add_for_host(const char *instance_name, const char *service_type, const char *proto, const char *hostname, const char *subtype)
```

Add subtype for service.

Return

- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NOT_FOUND Service not found
- ESP_ERR_NO_MEM memory error

Parameters

- **instance_name**: instance name. If NULL, will find the first service with the same service type and protocol.
- **service_type**: service type (http, ftp, etc)
- **proto**: service protocol (tcp, udp)
- **hostname**: service hostname. If NULL, local hostname will be used.
- **subtype**: The subtype to add.

```c
esp_err_t mdns_service_remove_all(void)
```

Remove and free all services from mDNS server.

Return

- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error

```c
esp_err_t mdns_query_async_delete(mdns_search_once_t *search)
```

Deletes the finished query. Call this only after the search has ended!

Return

- ESP_OK success
- ESP_ERR_INVALID_STATE search has not finished
- ESP_ERR_INVALID_ARG pointer to search object is NULL

Parameters

- **search**: pointer to search object

```c
bool mdns_query_async_get_results(mdns_search_once_t *search, uint32_t timeout, mdns_result_t **results, uint8_t *num_results)
```

Get results from search pointer. Results available as a pointer to the output parameter. Pointer to search object has to be deleted via `mdns_query_async_delete` once the query has finished. The results although have to be freed manually.
Return True if search has finished before or at timeout False if search timeout is over

Parameters
• search: pointer to search object
• timeout: time in milliseconds to wait for answers
• results: pointer to the results of the query
• num_results: pointer to the number of the actual result items (set to NULL to ignore this return value)

`mdns_search_once_t *mdns_query_async_new(const char *name, const char *service_type, const char *proto, uint16_t type, uint32_t timeout, size_t max_results, mdns_query_notify_t notifier)`

Query mDNS for host or service asynchronously. Search has to be tested for progress and deleted manually!

Return `mdns_search_once_s` pointer to new search object if query initiated successfully. NULL otherwise.

Parameters
• name: service instance or host name (NULL for PTR queries)
• service_type: service type (http, _arduino, _ftp etc.) (NULL for host queries)
• proto: service protocol (_tcp, _udp, etc.) (NULL for host queries)
• type: type of query (MDNS_TYPE_*)
• timeout: time in milliseconds during which mDNS query is active
• max_results: maximum results to be collected
• notifier: Notification function to be called when the result is ready, can be NULL

`esp_err_t mdns_query_generic(const char *name, const char *service_type, const char *proto, uint16_t type, mdns_query_transmission_type_t transmission_type, uint32_t timeout, size_t max_results, mdns_result_t **results)`

Generic mDNS query. All following query methods are derived from this one.

Return
• ESP_OK success
• ESP_ERR_INVALID_STATE mDNS is not running
• ESP_ERR_NO_MEM memory error
• ESP_ERR_INVALID_ARG timeout was not given

Parameters
• name: service instance or host name (NULL for PTR queries)
• service_type: service type (http, _arduino, _ftp etc.) (NULL for host queries)
• proto: service protocol (_tcp, _udp, etc.) (NULL for host queries)
• type: type of query (MDNS_TYPE_*)
• transmission_type: either Unicast query, or Multicast query
• timeout: time in milliseconds to wait for answers.
• max_results: maximum results to be collected
• results: pointer to the results of the query results must be freed using `mdns_query_results_free` below

`esp_err_t mdns_query(const char *name, const char *service_type, const char *proto, uint16_t type, uint32_t timeout, size_t max_results, mdns_result_t **results)`

Query mDNS for host or service.

Note that querying PTR types sends Multicast query, all other types send Unicast queries

Return
• ESP_OK success
• ESP_ERR_INVALID_STATE mDNS is not running
• ESP_ERR_NO_MEM memory error
• ESP_ERR_INVALID_ARG timeout was not given

Parameters
• name: service instance or host name (NULL for PTR queries)
• service_type: service type (http, _arduino, _ftp etc.) (NULL for host queries)
• proto: service protocol (_tcp, _udp, etc.) (NULL for host queries)
• type: type of query (MDNS_TYPE_*)
• timeout: time in milliseconds to wait for answers.
• max_results: maximum results to be collected
- **results**: pointer to the results of the query results must be freed using `mdns_query_results_free` below

```c
void mdns_query_results_free (mdns_result_t *results)
```

Free query results.

**Parameters**
- **results**: linked list of results to be freed

```c
esp_err_t mdns_query_ptr (const char *service_type, const char *proto, uint32_t timeout, size_t max_results, mdns_result_t **results)
```

Query mDNS for service.

**Return**
- ESP_OK success
- ESP_ERR_INVALID_STATE mDNS is not running
- ESP_ERR_NO_MEM memory error
- ESP_ERR_INVALID_ARG parameter error

**Parameters**
- **service_type**: service type (HTTP, _arduino, _ftp etc.)
- **proto**: service protocol (TCP, UDP, etc.)
- **timeout**: time in milliseconds to wait for answer.
- **max_results**: maximum results to be collected
- **results**: pointer to the results of the query

```c
esp_err_t mdns_query_srv (const char *instance_name, const char *service_type, const char *proto, uint32_t timeout, mdns_result_t **result)
```

Query mDNS for SRV record.

**Return**
- ESP_OK success
- ESP_ERR_INVALID_STATE mDNS is not running
- ESP_ERR_NO_MEM memory error
- ESP_ERR_INVALID_ARG parameter error

**Parameters**
- **instance_name**: service instance name
- **service_type**: service type (HTTP, _arduino, _ftp etc.)
- **proto**: service protocol (TCP, UDP, etc.)
- **timeout**: time in milliseconds to wait for answer.
- **result**: pointer to the result of the query

```c
esp_err_t mdns_query_txt (const char *instance_name, const char *service_type, const char *proto, uint32_t timeout, mdns_result_t **result)
```

Query mDNS for TXT record.

**Return**
- ESP_OK success
- ESP_ERR_INVALID_STATE mDNS is not running
- ESP_ERR_NO_MEM memory error
- ESP_ERR_INVALID_ARG parameter error

**Parameters**
- **instance_name**: service instance name
- **service_type**: service type (HTTP, _arduino, _ftp etc.)
- **proto**: service protocol (TCP, UDP, etc.)
- **timeout**: time in milliseconds to wait for answer.
- **result**: pointer to the result of the query

```c
esp_err_t mdns_query_a (const char *host_name, uint32_t timeout, esp_ip4_addr_t *addr)
```

Query mDNS for A record.

**Return**
- ESP_OK success
- ESP_ERR_INVALID_STATE mDNS is not running
- ESP_ERR_NO_MEM memory error
• ESP_ERR_INVALID_ARG parameter error

Parameters
• host_name: host name to look for
• timeout: time in milliseconds to wait for answer.
• addr: pointer to the resulting IP4 address

```c
esp_err_t mdns_query_aaaa(const char *host_name, uint32_t timeout, esp_ip6_addr_t *addr)
```

Query mDNS for A record.

Please note that hostname must not contain domain name, as mDNS uses ‘.local’ domain.

Return
• ESP_OK success
• ESP_ERR_INVALID_STATE mDNS is not running
• ESP_ERR_NO_MEM memory error
• ESP_ERR_INVALID_ARG parameter error

Parameters
• host_name: host name to look for
• timeout: time in milliseconds to wait for answer. If 0, max_results needs to be defined
• addr: pointer to the resulting IP6 address

```c
esp_err_t mdns_handle_system_event (void *ctx, system_event_t *event)
```

System event handler This method controls the service state on all active interfaces and applications are required to call it from the system event handler for normal operation of mDNS service.

Please note that hostname must not contain domain name, as mDNS uses ‘.local’ domain.

Parameters
• ctx: The system event context
• event: The system event

Structures
```c
struct mdns_txt_item_t
```

mDNS basic text item structure Used in mdns_service_add()

Public Members
```c
const char *key
```
item key name

```c
const char *value
```
item value string

```c
struct mdns_ip_addr_s
```

mDNS query linked list IP item

Public Members
```c
esp_ip_addr_t addr
```
IP address

```c
struct mdns_ip_addr_s *next
```
next IP, or NULL for the last IP in the list

```c
struct mdns_result_s
```

mDNS query result structure

Public Members
```c
struct mdns_result_s *next
```
next result, or NULL for the last result in the list
Chapter 2. API Reference

```c
mdns_if_t tcpip_if
    interface index

uint32_t ttl
time to live

mdns_ip_protocol_t ip_protocol
    ip_protocol type of the interface (v4/v6)

char *instance_name
    instance name

char *service_type
    service type

char *proto
    service protocol

char *hostname
    hostname

uint16_t port
    service port

mdns_txt_item_t *txt
    txt record

uint8_t *txt_value_len
    array of txt value len of each record

size_t txt_count
    number of txt items

mdns_ip_addr_t *addr
    linked list of IP addresses found
```

**Macros**

- `MDNS_TYPE_A`
- `MDNS_TYPE_PTR`
- `MDNS_TYPE_TXT`
- `MDNS_TYPE_AAAA`
- `MDNS_TYPE_SRV`
- `MDNS_TYPE_OPT`
- `MDNS_TYPE_NSEC`
- `MDNS_TYPE_ANY`

**Type Definitions**

```c
typedef struct mdns_search_once_s mdns_search_once_t
    Asynchronous query handle.

typedef struct mdns_ip_addr_s mdns_ip_addr_t
    mDNS query linked list IP item

typedef enum mdns_if_internal mdns_if_t

typedef struct mdns_result_s mdns_result_t
    mDNS query result structure

typedef void (*mdns_query_notify_t)(mdns_search_once_t *search)
```
Chapter 2. API Reference

Enumerations

`enum mdns_ip_protocol_t`

mDNS enum to specify the ip_protocol type

Values:

- **MDNS_IP_PROTOCOL_V4**
- **MDNS_IP_PROTOCOL_V6**
- **MDNS_IP_PROTOCOL_MAX**

`enum mdns_if_internal`

Values:

- **MDNS_IF_STA** = 0
- **MDNS_IF_AP** = 1
- **MDNS_IF_ETH** = 2
- **MDNS_IF_MAX**

`enum mdns_query_transmission_type_t`

mDNS query type to be explicitly set to either Unicast or Multicast

Values:

- **MDNS_QUERY_UNICAST**
- **MDNS_QUERY_MULTICAST**

2.4.11 ESP-Modbus

Overview

The Modbus serial communication protocol is de facto standard protocol widely used to connect industrial electronic devices. Modbus allows communication among many devices connected to the same network, for example, a system that measures temperature and humidity and communicates the results to a computer. The Modbus protocol uses several types of data: Holding Registers, Input Registers, Coils (single bit output), Discrete Inputs. Versions of the Modbus protocol exist for serial port and for Ethernet and other protocols that support the Internet protocol suite. There are many variants of Modbus protocols, some of them are:

- **Modbus RTU** — This is used in serial communication and makes use of a compact, binary representation of the data for protocol communication. The RTU format follows the commands/data with a cyclic redundancy check checksum as an error check mechanism to ensure the reliability of data. Modbus RTU is the most common implementation available for Modbus. A Modbus RTU message must be transmitted continuously without inter-character hesitations. Modbus messages are framed (separated) by idle (silent) periods. The RS-485 interface communication is usually used for this type.

- **Modbus ASCII** — This is used in serial communication and makes use of ASCII characters for protocol communication. The ASCII format uses a longitudinal redundancy check checksum. Modbus ASCII messages are framed by leading colon (":" ) and trailing newline (CR/LF).

- **Modbus TCP/IP or Modbus TCP** — This is a Modbus variant used for communications over TCP/IP networks, connecting over port 502. It does not require a checksum calculation, as lower layers already provide checksum protection.

The following document (and included code snippets) requires some familiarity with the Modbus protocol. Refer to the Modbus Organization’s with protocol specifications for specifics.

Messaging Model And Data Mapping

Modbus is an application protocol that defines rules for messaging structure and data organization that are independent of the data transmission medium. Traditional serial Modbus is a register-based protocol that defines message transactions that occur between master(s) and slave devices (multiple masters are allowed on using Modbus TCP/IP).
The slave devices listen for communication from the master and simply respond as instructed. The master(s) always controls communication and may communicate directly to one slave, or all connected slaves, but the slaves cannot communicate directly with each other.

The register map of each slave device is usually part of its device manual. A Slave device usually permits configuration of its short slave address and communication options that are used within the device’s network segment.

The Modbus protocol allows devices to map data to four types of registers (Holding, Input, Discrete, Coil). The figure below illustrates an example mapping of a device’s data to the four types of registers.

The following sections give an overview of how to use the ESP_Modbus component found under components/freemodbus. The sections cover initialization of a Modbus port, and the setup a master or slave device accordingly:

- Modbus Port Initialization
- Modbus Slave API Overview
- Modbus Master API Overview
**Modbus Port Initialization**  
The ESP_Modbus supports Modbus SERIAL and TCP ports and a port must be initialized before calling any other Modbus API. The functions below are used to create and then initialize Modbus controller interface (either master or slave) over a particular transmission medium (either Serial or TCP/IP):

- `mbc_slave_init()`
- `mbc_master_init()`
- `mbc_slave_init_tcp()`
- `mbc_master_init_tcp()`

The API call uses the first parameter to recognize the type of port being initialized. Supported enumeration for different ports: `MB_PORT_SERIAL_MASTER`, `MB_PORT_SERIAL_SLAVE` accordingly. The parameters `MB_PORT_TCP_MASTER`, `MB_PORT_TCP_SLAVE` are reserved for internal usage.

```c
void* master_handler = NULL; // Pointer to allocate interface structure
// Initialization of Modbus master for serial port
esp_err_t err = mbc_master_init(MB_PORT_SERIAL_MASTER, &master_handler);
if (master_handler == NULL || err != ESP_OK) {
    ESP_LOGE(TAG, "mb controller initialization fail.");
}
```

This example code to initialize slave port:

```c
void* slave_handler = NULL; // Pointer to allocate interface structure
// Initialization of Modbus slave for TCP
esp_err_t err = mbc_slave_init_tcp(&slave_handler);
if (slave_handler == NULL || err != ESP_OK) {
    // Error handling is performed here
    ESP_LOGE(TAG, "mb controller initialization fail.");
}
```

**Modbus Master API Overview**

The following overview describes how to setup Modbus master communication. The overview reflects a typical programming workflow and is broken down into the sections provided below:

1. **Modbus Port Initialization** - Initialization of Modbus controller interface for the selected port.
2. **Configuring Master Data Access** - Configure data descriptors to access slave parameters.
3. **Master Communication Options** - Allows to setup communication options for selected port.
4. **Master Communication** - Start stack and sending / receiving data.
5. **Modbus Master Teardown** - Destroy Modbus controller and its resources.

**Configuring Master Data Access**   The architectural approach of ESP_Modbus includes one level above standard Modbus IO driver. The additional layer is called Modbus controller and its goal is to add an abstraction such as CID - characteristic identifier. The CID is linked to a corresponding Modbus registers through the table called Data Dictionary and represents device physical parameter (such as temperature, humidity, etc.) in specific Modbus slave device. This approach allows the upper layer (e.g., MESH or MQTT) to be isolated from Modbus specifics thus simplify Modbus integration with other protocols/networks.

The Data Dictionary is the list in the Modbus master which shall be defined by user to link each CID to its corresponding Modbus registers representation using Register Mapping table of the Modbus slave being used. Each element in this data dictionary is of type `mb_parameter_descriptor_t` and represents the description of one physical characteristic:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
<th>Detailed Information</th>
</tr>
</thead>
<tbody>
<tr>
<td>cid</td>
<td>Character ID</td>
<td>The identifier of characteristic (must be unique).</td>
</tr>
<tr>
<td>param_key</td>
<td>Character Name</td>
<td>String description of the characteristic.</td>
</tr>
<tr>
<td>param_units</td>
<td>_characteristic Units</td>
<td>Physical Units of the characteristic.</td>
</tr>
<tr>
<td>mb_slave_addr</td>
<td>Slave Address</td>
<td>The short address of the device with correspond parameter UID.</td>
</tr>
<tr>
<td>mb_param_type</td>
<td>Register Type</td>
<td>Type of Modbus register area. MB_PARAM_INPUT, MB_PARAM_HOLDING, MB_PARAM_COIL, MB_PARAM_DISCRETE - represents Input, Holding, Coil and Discrete input register area accordingly;</td>
</tr>
<tr>
<td>mb_reg_start</td>
<td>Register Start</td>
<td>Relative register address of the characteristic in the register area.</td>
</tr>
<tr>
<td>mb_size</td>
<td>Register Size</td>
<td>Length of characteristic in registers.</td>
</tr>
<tr>
<td>param_instance_offset</td>
<td>Offset</td>
<td>Offset to instance of the characteristic in bytes. It is used to calculate the absolute address to the characteristic in the storage structure. It is optional field and can be set to zero if the parameter is not used in the application.</td>
</tr>
<tr>
<td>param_type</td>
<td>Data Type</td>
<td>Specifies type of the characteristic. PARAM_TYPE_U8, PARAM_TYPE_U16, PARAM_TYPE_U32 - Unsigned integer 8/16/32 bit type; PARAM_TYPE_FLOAT - IEEE754 floating point format; PARAM_TYPE_ASCII - ASCII string or binary data;</td>
</tr>
<tr>
<td>param_size</td>
<td>Data Size</td>
<td>The storage size of the characteristic (bytes).</td>
</tr>
<tr>
<td>param_opts</td>
<td>Parameter Options</td>
<td>Limits, options of characteristic used during processing of alarm in user application (optional)</td>
</tr>
<tr>
<td>access_type</td>
<td>Can be used in user application to define the behavior of the characteristic during processing of data in user application; PAR_PERMS_READ_WRITE_TRIGGER, PAR_PERMS_READ, PAR_PERMS_READ_WRITE_TRIGGER;</td>
<td></td>
</tr>
</tbody>
</table>

**Note:** The `cid` and `param_key` have to be unique. Please use the prefix to the parameter key if you have several similar parameters in your register map table.

    { CID_SER_NUM2, STR("Serial_number_2"), STR("--"), MBDEVICE_ADDR2, MB_PARAM_INPUT, 0, 2, 0, PARAM_TYPE_U32, 4, OPTS( 0, 0, 0 ), PAR_PERMS_READ_WRITE_INPUT_TRIGGER },
    { CID_SW_VER2, STR("Software_version_2"), STR("--"), MBDEVICE_ADDR2, MB_PARAM_INPUT, 2, 1, 0, PARAM_TYPE_U16, 2, OPTS( 0, 0, 0 ), PAR_PERMS_READ_WRITE_INPUT_TRIGGER },
    { CID_TEMP_DATA_2, STR("Temperature_2"), STR("C"), MBDEVICE_ADDR2, MB_PARAM_HOLDING, 0, 2, 0, PARAM_TYPE_FLOAT, 4, OPTS( 20, 30, 1 ), PAR_PERMS_READ_WRITE_TRIGGER },
};

// Calculate number of parameters in the table
(continues on next page)
During initialization of the Modbus stack, a pointer to the Data Dictionary (called descriptor) must be provided as the parameter of the function below.

\textit{mbc\_master\_set\_descriptor()}: Initialization of master descriptor.

```c
void *
mbc_master_set_descriptor(void *device_parameters[0], num_device_parameters);
```

The Data Dictionary can be initialized from SD card, MQTT or other source before start of stack. Once the initialization and setup is done, the Modbus controller allows the reading of complex parameters from any slave included in descriptor table using its CID.

**Master Communication Options** Calling the setup function allows for specific communication options to be defined for port.

\textit{mbc\_master\_setup()}

The communication structure provided as a parameter is different for serial and TCP communication mode.

Example setup for serial port:

```c
mb_communication_info_t comm_info = {
    .port = MB_PORT_NUM,  // Serial port number
    .mode = MB_MODE_RTU,   // Modbus mode of communication (MB\_MODE\_RTU or MB\_MODE\_ASCII)
    .baudrate = 9600,      // Modbus communication baud rate
    .parity = MB_PARITY_NONE // parity option for serial port
};
ESP_ERROR_CHECK(mbc_master_setup((void*) &comm_info));
```

Modbus master TCP port requires additional definition of IP address table where number of addresses should be equal to number of unique slave addresses in master Modbus Data Dictionary:

The order of IP address string corresponds to short slave address in the Data Dictionary.

```c
#define MB_SLAVE_COUNT 2  // Number of slaves in the segment being accessed (as defined in Data Dictionary)
char *slave_ip_address_table[MB_SLAVE_COUNT] = {
    "192.168.1.2",  // Address corresponds to UID1 and set to predefined value by user
    "192.168.1.3",  // corresponds to UID2 in the segment
    NULL};  // end of table

mb_communication_info_t comm_info = {
    .ip_port = MB_TCP_PORT,  // Modbus TCP port number (default = 502)
    .ip_addr_type = MB_IPV4,  // version of IP protocol
    .ip_mode = MB_MODE_TCP,   // Port communication mode
    .ip_addr = (void*)slave_ip_address_table,  // assign table of IP addresses
    .ip_netif_ptr = esp_netif_ptr // esp_netif_ptr pointer to the corresponding network interface
};
ESP_ERROR_CHECK(mbc_master_setup((void*) &comm_info));
```
Chapter 2. API Reference

Note: Refer to esp_netif component for more information about network interface initialization.

The slave IP addresses in the table can be assigned automatically using mDNS service as described in the example. Refer to protocols/modbus/tcp/mb_tcp_master for more information.

Note: RS485 communication requires call to UART specific APIs to setup communication mode and pins. Refer to Running UART Communication section of UART documentation.

Master Communication

The starting of the Modbus controller is the final step in enabling communication. This is performed using function below:

```c
mbc_master_start()
```

```c
esp_err_t err = mbc_master_start();
if (err != ESP_OK) {
    ESP_LOGE(TAG, "mb controller start fail, err=%x.", err);
}
```

The list of functions below are used by the Modbus master stack from a user’s application:

- `mbc_master_send_request()`: This function executes a blocking Modbus request. The master sends a data request (as defined in parameter request structure `mb_param_request_t`) and then blocks until a response from the corresponding slave and returns the status of command execution. This function provides a standard way for read/write access to Modbus devices in the network.

- `mbc_master_get_cid_info()`: The function gets information about each characteristic supported in the data dictionary and returns the characteristic’s description in the form of the `mb_parameter_descriptor_t` structure. Each characteristic is accessed using its CID.

- `mbc_master_get_parameter()`: The function reads the data of a characteristic defined in the parameters of a Modbus slave device. The additional data for request is taken from parameter description table.

Example:

```c
const mb_parameter_descriptor_t* param_descriptor = NULL;
uint8_t temp_data[4] = {0}; // temporary buffer to hold maximum CID size
uint8_t type = 0;
....

// Get the information for characteristic cid from data dictionary
esp_err_t err = mbc_master_get_cid_info(cid, &param_descriptor);
if ((err != ESP_ERR_NOT_FOUND) && (param_descriptor != NULL)) {
    err = mbc_master_get_parameter(param_descriptor->cid, (char*)param_descriptor->param_key, (uint8_t*)temp_data, &type);
    if (err == ESP_OK) {
        ESP_LOGI(TAG, "Characteristic #%d %s (%s) value = (0x%08x) read successful.
        " param_descriptor->cid,
               (char*)param_descriptor->param_key,
               (char*)param_descriptor->param_units,
               *(uint32_t*)temp_data);
    } else {
        ESP_LOGE(TAG, "Characteristic #%d (%s) read fail, err = 0x%x (%s).",
               param_descriptor->cid,
               (char*)param_descriptor->param_key,
               (int)err,
               (char*)esp_err_to_name(err));
    }
} else {
```

(continues on next page)
mbc_master_set_parameter()

The function writes characteristic's value defined as a name and cid parameter in corresponded slave device. The additional data for parameter request is taken from master parameter description table.

```c
uint8_t type = 0; // Type of parameter
temp_data[4] = {0}; // temporary buffer

esp_err_t err = mbc_master_set_parameter(CID_TEMP_DATA_2, "Temperature_2", (uint8_t*)temp_data, &type);
if (err == ESP_OK) {
    ESP_LOGI(TAG, "Set parameter data successfully.");
} else {
    ESP_LOGE(TAG, "Set data fail, err = 0x%x (%s).", (int)err, esp_err_to_name(err));
}
```

Modbus Master Teardown  This function stops Modbus communication stack and destroys controller interface and free all used active objects.

```c
mbc_master_destroy();
```

Modbus Slave API Overview

The sections below represent typical programming workflow for the slave API which should be called in following order:

1. **Modbus Port Initialization** - Initialization of Modbus controller interface for the selected port.
2. **Configuring Slave Data Access** - Configure data descriptors to access slave parameters.
3. **Slave Communication Options** - Allows to setup communication options for selected port.
4. **Slave Communication** - Start stack and sending / receiving data. Filter events when master accesses the register areas.
5. **Modbus Slave Teardown** - Destroy Modbus controller and its resources.

**Configuring Slave Data Access**  The following functions must be called when the Modbus controller slave port is already initialized. Refer to **Modbus Port Initialization**.

The slave stack requires the user to define structures (memory storage areas) that store the Modbus parameters accessed by stack. These structures should be prepared by the user and be assigned to the Modbus controller interface using `mbc_slave_set_descriptor()` API call before the start of communication. The slave task can call the `mbc_slave_check_event()` function which will block until the Modbus master access the slave. The slave task can then get information about the data being accessed.

**Note:** One slave can define several area descriptors per each type of Modbus register area with different start_offset.

Register area is defined by using the `mb_register_area_descriptor_t` structure.
### Table 10: Table 3 Modbus register area descriptor

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>start_offset</td>
<td>Zero based register relative offset for defined register area. Example: register address = 40002 ( 4x register area - Function 3 - holding register ), start_offset = 2</td>
</tr>
<tr>
<td>type</td>
<td>Type of the Modbus register area. Refer to <code>mb_param_type_t</code> for more information.</td>
</tr>
<tr>
<td>address</td>
<td>A pointer to the memory area which is used to store the register data for this area descriptor.</td>
</tr>
<tr>
<td>size</td>
<td>The size of the memory area in bytes which is used to store register data.</td>
</tr>
</tbody>
</table>

#### `mbc_slave_set_descriptor()`

The function initializes Modbus communication descriptors for each type of Modbus register area (Holding Registers, Input Registers, Coils (single bit output), Discrete Inputs). Once areas are initialized and the `mbc_slave_start()` API is called the Modbus stack can access the data in user data structures by request from master.

```c
#define MB_REG_INPUT_START_AREA0 (0)
#define MB_REG_HOLDING_START_AREA0 (0)
#define MB_REG_HOLD_CNT (100)
#define MB_REG_INPUT_CNT (100)

mb_register_area_descriptor_t reg_area; // Modbus register area descriptor

~structure

unit16_t * holding_reg_area[MB_REG_HOLD_CNT] = {0}; // storage area for holding
~registers

unit16_t * input_reg_area[MB_REG_INPUT_CNT] = {0}; // storage area for input
~registers

reg_area.type = MB_PARAM_HOLDING; // Set type of
~register area
reg_area.start_offset = MB_REG_HOLDING_START_AREA0; // Offset of
~register area in Modbus protocol
reg_area.address = (void *)&holding_reg_area[0]; // Set pointer to
~storage instance
reg_area.size = sizeof(holding_reg_area) << 1; // Set the size of
~register storage area in bytes
ESP_ERROR_CHECK(mbc_slave_set_descriptor(reg_area));

reg_area.type = MB_PARAM_INPUT;
reg_area.start_offset = MB_REG_INPUT_START_AREA0;
reg_area.address = (void *)&input_reg_area[0];
reg_area.size = sizeof(input_reg_area) << 1;
ESP_ERROR_CHECK(mbc_slave_set_descriptor(reg_area));
```

At least one area descriptor per each Modbus register type must be set in order to provide register access to its area. If the master tries to access an undefined area, the stack will generate a Modbus exception.

Direct access to register area from user application must be protected by critical section:

```c
portENTER_CRITICAL(&param_lock);
holding_reg_area[2] += 10;
portEXIT_CRITICAL(&param_lock);
```

#### Slave Communication Options

The function initializes the Modbus controller interface and its active context (tasks, RTOS objects and other resources).

#### `mbc_slave_setup()`

The function is used to setup communication parameters of the Modbus stack.

Example initialization of Modbus TCP communication:
Chapter 2. API Reference

```
esp_netif_init();
...

mb_communication_info_t comm_info = {
    .ip_port = MB_TCP_PORT,  // Modbus TCP port number (default = 502)
    .ip_addr_type = MB_IPV4,  // version of IP protocol
    .ip_mode = MB_MODE_TCP,  // Port communication mode
    .ip_addr = NULL,         // This field keeps the client IP
    .ip_netif_ptr = esp_netif_ptr,  // esp_netif_ptr - pointer to the corresponding network interface
};

// Setup communication parameters and start stack
ESP_ERROR_CHECK(mbc_slave_setup((void*)comm_info));
```

Example initialization of Modbus serial communication:

```
#define MB_SLAVE_DEV_SPEED 9600
#define MB_SLAVE_ADDR 1
#define MB_SLAVE_PORT_NUM 2
...

// Setup communication parameters and start stack
mb_communication_info_t comm_info = {
    .mode = MB_MODE_RTU,    // Communication type
    .slave_addr = MB_SLAVE_ADDR,  // Short address of the slave
    .port = MB_SLAVE_PORT_NUM,  // UART physical port number
    .baudrate = MB_SLAVE_DEV_SPEED,  // Baud rate for communication
    .parity = MB_PARITY_NONE  // Parity option
};
ESP_ERROR_CHECK(mbc_slave_setup((void*)comm_info));
```

**Slave Communication**  The function below is used to start Modbus controller interface and allows communication.

```
mbc_slave_start()
ESP_ERROR_CHECK(mbc_slave_start());
```

```
mbc_slave_check_event()
The blocking call to function waits for a event specified (represented as an event mask parameter). Once the master accesses the parameter and the event mask matches the parameter type, the application task will be unblocked and function will return the corresponding event mb_event_group_t which describes the type of register access being done.

mbc_slave_get_param_info()
The function gets information about accessed parameters from the Modbus controller event queue. The KConfig CONFIG_FMB_CONTROLLER_NOTIFY_QUEUE_SIZE key can be used to configure the notification queue size. The timeout parameter allows a timeout to be specified when waiting for a notification. The mb_param_info_t structure contains information about accessed parameter.
```
Table 11: Description of the register info structure:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>time_stamp</td>
<td>the timestamp of the event when defined parameter is accessed</td>
</tr>
<tr>
<td>mb_offset</td>
<td>start Modbus register accessed by master</td>
</tr>
<tr>
<td>type</td>
<td>type of the Modbus register area being accessed (See the mb_event_group_t for more information)</td>
</tr>
<tr>
<td>address</td>
<td>memory address that corresponds to accessed register in defined area descriptor</td>
</tr>
<tr>
<td>size</td>
<td>number of registers being accessed by master</td>
</tr>
</tbody>
</table>

Example to get event when holding or input registers accessed in the slave:

```c
#define MB_READ_MASK    (MB_EVENT_INPUT_REG_RD | MB_EVENT_HOLDING_REG_RD)
#define MB_WRITE_MASK    (MB_EVENT_HOLDING_REG_WR)
#define MB_READ_WRITE_MASK (MB_READ_MASK | MB_WRITE_MASK)
#define MB_PAR_INFO_GET_TOUT (10 / portTICK_PERIOD_MS)

// The function blocks while waiting for register access
mb_event_group_t event = mbc_slave_check_event(MB_READ_WRITE_MASK);

// Get information about data accessed from master
ESP_ERROR_CHECK(mbc_slave_get_param_info(reg_info, MB_PAR_INFO_GET_TOUT));
const char* rw_str = (event & MB_READ_MASK) ? "READ" : "WRITE";

// Filter events and process them accordingly
if (event & (MB_EVENT_HOLDING_REG_WR | MB_EVENT_HOLDING_REG_RD)) {
    ESP_LOGI(TAG, "HOLDING %s (%u us), ADDR:%u, TYPE:%u, INST_ADDR:0x%.4x, SIZE:%u",
             rw_str,
             (uint32_t)reg_info.time_stamp,
             (uint32_t)reg_info.mb_offset,
             (uint32_t)reg_info.type,
             (uint32_t)reg_info.address,
             (uint32_t)reg_info.size);
} else if (event & (MB_EVENT_INPUT_REG_RD)) {
    ESP_LOGI(TAG, "INPUT %s (%u us), ADDR:%u, TYPE:%u, INST_ADDR:0x%.4x, SIZE:%u",
             rw_str,
             (uint32_t)reg_info.time_stamp,
             (uint32_t)reg_info.mb_offset,
             (uint32_t)reg_info.type,
             (uint32_t)reg_info.address,
             (uint32_t)reg_info.size);
}
```

Modbus Slave Teardown  This function stops the Modbus communication stack, destroys the controller interface, and frees all used active objects allocated for the slave.

`mbc_slave_destroy()`

ESP_ERROR_CHECK(mbc_slave_destroy());

Possible Communication Issues And Solutions

If the examples do not work as expected and slave and master boards are not able to communicate correctly, it is possible to find the reason for errors. The most important errors are described in master example output and formatted as below:
Table 12: Table 5 Modbus error codes and troubleshooting

<table>
<thead>
<tr>
<th>Error Code</th>
<th>Description</th>
<th>Possible solution</th>
</tr>
</thead>
<tbody>
<tr>
<td>0x106</td>
<td>ESP_ERR_NOT_SUPPORTED</td>
<td>- Invalid register request - slave returned an exception because the requested register is not supported. Refer to slave register map. Check the master data dictionary for correctness.</td>
</tr>
<tr>
<td>0x107</td>
<td>ESP_ERR_TIMEOUT</td>
<td>- Slave response timeout - Modbus slave did not send response during configured slave response timeout. Measure and increase the maximum slave response timeout idf.py menu-config, option CONFIG_FMB_MASTER_TIMEOUT_MS_RESPOND. Check physical connection or network configuration and make sure that the slave response can reach the master side. If the application has some high performance tasks with higher priority than CONFIG_FMB_PORT_TASK_PRIO it is recommended to place Modbus tasks on the other core using an option CONFIG_FMB_PORT_TASK_AFFINITY. Configure the Modbus task’s priority CONFIG_FMB_PORT_TASK_PRIO to ensure that the task gets sufficient processing time to handle Modbus stack events.</td>
</tr>
<tr>
<td>0x108</td>
<td>ESP_ERR_INVALID_RESPONSE</td>
<td>- Received unsupported response from slave or frame check failure. Master can not execute command handler because the command is either not supported or is incorrect. Check the physical connection then refer to register map of your slave to configure the master data dictionary properly.</td>
</tr>
<tr>
<td>0x109</td>
<td>ESP_ERR_INVALID_STATE</td>
<td>- Critical failure or FSM sequence failure or master FSM is busy processing previous request. Make sure your physical connection is working properly. Increase task stack size and check Modbus initialization sequence.</td>
</tr>
</tbody>
</table>

Application Example

The examples below use the FreeModbus library port for serial TCP slave and master implementations accordingly. The selection of stack is performed through KConfig menu option “Enable Modbus stack support…” for appropriate communication mode and related configuration keys.

- protocols/modbus/serial/mb_slave
- protocols/modbus/serial/mb_master
- protocols/modbus/tcp/mb_tcp_slave
- protocols/modbus/tcp/mb_tcp_master

Please refer to the specific example README.md for details.

Enumerations

enum mb_port_type_t
  Types of actual Modbus implementation.
  
  Values:

  MB_PORT_SERIAL_MASTER = 0x00
    Modbus port type serial master.

  MB_PORT_SERIAL_SLAVE
    Modbus port type serial slave.

  MB_PORT_TCP_MASTER
    Modbus port type TCP master.

  MB_PORT_TCP_SLAVE
    Modbus port type TCP slave.

  MB_PORT_COUNT
    Modbus port count.

  MB_PORT_INACTIVE = 0xFF

enum mb_event_group_t
  Event group for parameters notification.
  
  Values:

  MB_EVENT_NO_EVENTS = 0x00

  MB_EVENT_HOLDING_REG_WR = BIT0
    Modbus Event Write Holding registers.

  MB_EVENT_HOLDING_REG_RD = BIT1
    Modbus Event Read Holding registers.

  MB_EVENT_INPUT_REG_RD = BIT3
    Modbus Event Read Input registers.

  MB_EVENT_COILS_WR = BIT4
    Modbus Event Write Coils.

  MB_EVENT_COILS_RD = BIT5
    Modbus Event Read Coils.

  MB_EVENT_DISCRETE_RD = BIT6
    Modbus Event Read Discrete bits.

  MB_EVENT_STACK_STARTED = BIT7
    Modbus Event Stack started

enum mb_param_type_t
  Type of Modbus parameter.
  
  Values:
Chapter 2. API Reference

\textbf{MB_PARAM_HOLDING} = 0x00
Modbus Holding register.

\textbf{MB_PARAM_INPUT}
Modbus Input register.

\textbf{MB_PARAM_COIL}
Modbus Coils.

\textbf{MB_PARAM_DISCRETE}
Modbus Discrete bits.

\textbf{MB_PARAM_COUNT}
\textbf{MB_PARAM_UNKNOWN} = 0xFF

\textbf{enum mb_mode_type_t}
Modbus serial transmission modes (RTU/ASCII).

\textbf{Values:}

\textbf{MB_MODE_RTU}
RTU transmission mode.

\textbf{MB_MODE_ASCII}
ASCII transmission mode.

\textbf{MB_MODE_TCP}
TCP communication mode.

\textbf{MB_MODE_UDP}
UDP communication mode.

\textbf{enum mb_tcp_addr_type_t}
Modbus TCP type of address.

\textbf{Values:}

\textbf{MB_IPV4} = 0
TCP IPV4 addressing

\textbf{MB_IPV6} = 1
TCP IPV6 addressing

\textbf{Header File}

- components/freemodbus/common/include/esp_modbus_master.h

\textbf{Functions}

\textbf{esp_err_t mbc_master_init_tcp} (void **\textit{handler})
Initialize Modbus controller and stack for TCP port.

\textbf{Return}

- ESP_OK Success
- ESP_ERR_NO_MEM Parameter error
- ESP_ERR_NOT_SUPPORTED Port type not supported
- ESP_ERR_INVALID_STATE Initialization failure

\textbf{Parameters}

- [out] \textit{handler}: handler(pointer) to master data structure

\textbf{esp_err_t mbc_master_init} (mb_port_type_t \textit{port_type}, void **\textit{handler})
Initialize Modbus Master controller and stack for Serial port.

\textbf{Return}

- ESP_OK Success
- ESP_ERR_NO_MEM Parameter error
- ESP_ERR_NOT_SUPPORTED Port type not supported
• ESP_ERR_INVALID_STATE Initialization failure

**Parameters**
- [out] handler: handler(pointer) to master data structure
- [in] port_type: type of stack

void **mbc_master_init_iface** (void *handler)
Initialize Modbus Master controller interface handle.

**Parameters**
- [in] handler: - pointer to master data structure

**esp_err_t** **mbc_master_destroy** (void)
Destroy Modbus controller and stack.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_STATE Parameter error

**esp_err_t** **mbc_master_start** (void)
Start Modbus communication stack.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Modbus stack start error

**esp_err_t** **mbc_master_setup** (void *comm_info)
Set Modbus communication parameters for the controller.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Incorrect parameter data

**Parameters**
- comm_info: Communication parameters structure.

**esp_err_t** **mbc_master_set_descriptor** (const mb_parameter_descriptor_t *descriptor, const uint16_t num_elements)
Assign parameter description table for Modbus controller interface.

**Return**
- esp_err_t ESP_OK - set descriptor successfully
- esp_err_t ESP_ERR_INVALID_ARG - invalid argument in function call

**Parameters**
- [in] descriptor: pointer to parameter description table
- num_elements: number of elements in the table

**esp_err_t** **mbc_master_send_request** (mb_param_request_t *request, void *data_ptr)
Send data request as defined in parameter request, waits response from slave and returns status of command execution. This function provides standard way for read/write access to Modbus devices in the network.

**Return**
- esp_err_t ESP_OK - request was successful
- esp_err_t ESP_ERR_INVALID_ARG - invalid argument of function
- esp_err_t ESP_ERR_INVALID_RESPONSE - an invalid response from slave
- esp_err_t ESP_ERR_TIMEOUT - operation timeout or no response from slave
- esp_err_t ESP_ERR_NOT_SUPPORTED - the request command is not supported by slave
- esp_err_t ESP_FAIL - slave returned an exception or other failure

**Parameters**
- [in] request: pointer to request structure of type mb_param_request_t
- [in] data_ptr: pointer to data buffer to send or received data (dependent of command field in request)

**esp_err_t** **mbc_master_get_cid_info** (uint16_t cid, const mb_parameter_descriptor_t **param_info)
Get information about supported characteristic defined as cid. Uses parameter description table to get this
information. The function will check if characteristic defined as a cid parameter is supported and returns its description in param_info. Returns ESP_ERR_NOT_FOUND if characteristic is not supported.

Return
- esp_err_t ESP_OK - request was successful and buffer contains the supported characteristic name
- esp_err_t ESP_ERR_INVALID_ARG - invalid argument of function
- esp_err_t ESP_ERR_NOT_FOUND - the characteristic (cid) not found
- esp_err_t ESP_FAIL - unknown error during lookup table processing

Parameters
- [in] cid: characteristic id
- param_info: pointer to pointer of characteristic data.

`esp_err_t mbc_master_get_parameter (uint16_t cid, char *name, uint8_t *value, uint8_t *type)`
Read parameter from modbus slave device whose name is defined by name and has cid. The additional data for request is taken from parameter description (lookup) table.

Return
- esp_err_t ESP_OK - request was successful and value buffer contains representation of actual parameter data from slave
- esp_err_t ESP_ERR_INVALID_ARG - invalid argument of function or parameter descriptor
- esp_err_t ESP_ERR_INVALID_RESPONSE - an invalid response from slave
- esp_err_t ESP_ERR_INVALID_STATE - invalid state during data processing or allocation failure
- esp_err_t ESP_ERR_TIMEOUT - operation timed out and no response from slave
- esp_err_t ESP_ERR_NOT_SUPPORTED - the request command is not supported by slave
- esp_err_t ESP_ERR_NOT_FOUND - the parameter is not found in the parameter description table
- esp_err_t ESP_FAIL - slave returned an exception or other failure

Parameters
- [in] cid: id of the characteristic for parameter
- [in] name: pointer into string name (key) of parameter (null terminated)
- [out] value: pointer to data buffer of parameter
- [out] type: parameter type associated with the name returned from parameter description table.

`esp_err_t mbc_master_set_parameter (uint16_t cid, char *name, uint8_t *value, uint8_t *type)`
Set characteristic’s value defined as a name and cid parameter. The additional data for cid parameter request is taken from master parameter lookup table.

Return
- esp_err_t ESP_OK - request was successful and value was saved in the slave device registers
- esp_err_t ESP_ERR_INVALID_ARG - invalid argument of function or parameter descriptor
- esp_err_t ESP_ERR_INVALID_RESPONSE - an invalid response from slave during processing of parameter
- esp_err_t ESP_ERR_INVALID_STATE - invalid state during data processing or allocation failure
- esp_err_t ESP_ERR_TIMEOUT - operation timed out and no response from slave
- esp_err_t ESP_ERR_NOT_SUPPORTED - the request command is not supported by slave
- esp_err_t ESP_FAIL - slave returned an exception or other failure

Parameters
- [in] cid: id of the characteristic for parameter
- [in] name: pointer into string name (key) of parameter (null terminated)
- [out] value: pointer to data buffer of parameter (actual representation of json value field in binary form)
- [out] type: pointer to parameter type associated with the name returned from parameter lookup table.

Unions

```c
union mb_parameter_opt_t
    #include <esp_modbus_master.h> Modbus parameter options for description table.
```
### Public Members

```c
int opt1
   Parameter option1

int opt2
   Parameter option2

int opt3
   Parameter option3

struct mb_parameter_opt_t::[anonymous] [anonymous]

int min
   Parameter minimum value

int max
   Parameter maximum value

int step
   Step of parameter change tracking

struct mb_parameter_opt_t::[anonymous] [anonymous]
```

### Structures

```c
struct mb_parameter_descriptor_t
   Characteristics descriptor type is used to describe characteristic and link it with Modbus parameters that reflect its data.

Public Members

```c
uint16_t cid
   Characteristic cid

const char *param_key
   The key (name) of the parameter

const char *param_units
   The physical units of the parameter

uint8_t mb_slave_addr
   Slave address of device in the Modbus segment

mb_param_type_t mb_param_type
   Type of modbus parameter

uint16_t mb_reg_start
   This is the Modbus register address. This is the 0 based value.

uint16_t mb_size
   Size of mb parameter in registers

uint16_t param_offset
   Parameter name (OFFSET in the parameter structure)

mb_descr_type_t param_type
   Float, U8, U16, U32, ASCII, etc.

mb_descr_size_t param_size
   Number of bytes in the parameter.

mb_parameter_opt_t::param_opts
   Parameter options used to check limits and etc.

mb_param_perms_t access
   Access permissions based on mode
```
**struct mb_param_request_t**
Modbus register request type structure.

**Public Members**

- `uint8_t slave_addr`: Modbus slave address
- `uint8_t command`: Modbus command to send
- `uint16_t reg_start`: Modbus start register
- `uint16_t reg_size`: Modbus number of registers

**Macros**

- `MB_MASTER_CHECK(a, err_code, format, ...)`
- `MB_MASTER_ASSERT(con)`

**Enumerations**

**enum mb_descr_type_t**
Modbus descriptor table parameter type defines.

**Values:**

- `PARAM_TYPE_U8 = 0x00`: Unsigned 8
- `PARAM_TYPE_U16 = 0x01`: Unsigned 16
- `PARAM_TYPE_U32 = 0x02`: Unsigned 32
- `PARAM_TYPE_FLOAT = 0x03`: Float type
- `PARAM_TYPE_ASCII = 0x04`: ASCII type

**enum mb_descr_size_t**
Modbus descriptor table parameter size in bytes.

**Values:**

- `PARAM_SIZE_U8 = 0x01`: Unsigned 8
- `PARAM_SIZE_U16 = 0x02`: Unsigned 16
- `PARAM_SIZE_U32 = 0x04`: Unsigned 32
- `PARAM_SIZE_FLOAT = 0x04`: Float size
- `PARAM_SIZE_ASCII = 0x08`: ASCII size
- `PARAM_SIZE_ASCII24 = 0x18`: ASCII24 size
enum mb_param_perms_t
Permissions for the characteristics.

Values:

PAR_PERMS_READ = 1 << BIT0
the characteristic of the device are readable

PAR_PERMS_WRITE = 1 << BIT1
the characteristic of the device are writable

PAR_PERMS_TRIGGER = 1 << BIT2
the characteristic of the device are triggerable

PAR_PERMS_READ_WRITE = PAR_PERMS_READ | PAR_PERMS_WRITE
the characteristic of the device are readable & writable

PAR_PERMS_READ_TRIGGER = PAR_PERMS_READ | PAR_PERMS_TRIGGER
the characteristic of the device are readable & triggerable

PAR_PERMS_WRITE_TRIGGER = PAR_PERMS_WRITE | PAR_PERMS_TRIGGER
the characteristic of the device are writable & triggerable

PAR_PERMS_READ_WRITE_TRIGGER = PAR_PERMS_READ_WRITE | PAR_PERMS_TRIGGER
the characteristic of the device are readable & writable & triggerable

Header File

- components/freemodbus/common/include/esp_modbus_slave.h

Functions

esp_err_t mbc_slave_init_tcp (void **handler)
Initialize Modbus Slave controller and stack for TCP port.

Return
- ESP_OK Success
- ESP_ERR_NO_MEM Parameter error
- ESP_ERR_NOT_SUPPORTED Port type not supported
- ESP_ERR_INVALID_STATE Initialization failure

Parameters
- [out] handler: handler(pointer) to master data structure

esp_err_t mbc_slave_init (mb_port_type_t port_type, void **handler)
Initialize Modbus Slave controller and stack for Serial port.

Return
- ESP_OK Success
- ESP_ERR_NO_MEM Parameter error
- ESP_ERR_NOT_SUPPORTED Port type not supported
- ESP_ERR_INVALID_STATE Initialization failure

Parameters
- [out] handler: handler(pointer) to master data structure
- [in] port_type: the type of port

void mbc_slave_init_iface (void *handler)
Initialize Modbus Slave controller interface handle.

Parameters
- [in] handler: pointer to slave interface data structure

esp_err_t mbc_slave_destroy (void)
Destroy Modbus controller and stack.

Return
• ESP_OK Success
• ESP_ERR_INVALID_STATE Parameter error

`esp_err_t mbc_slave_start (void)`
Start Modbus communication stack.

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG Modbus stack start error

`esp_err_t mbc_slave_setup (void *comm_info)`
Set Modbus communication parameters for the controller.

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG Incorrect parameter data

Parameters
*comm_info: Communication parameters structure.

`mb_event_group_t mbc_slave_check_event (mb_event_group_t group)`
Wait for specific event on parameter change.

Return
• mb_event_group_t event bits triggered

Parameters
*group: Group event bit mask to wait for change

`esp_err_t mbc_slave_get_param_info (mb_param_info_t *reg_info, uint32_t timeout)`
Get parameter information.

Return
• ESP_OK Success
• ESP_ERR_TIMEOUT Cannot get data from parameter queue or queue overflow

Parameters
*[out] reg_info: parameter info structure
*timeout: Timeout in milliseconds to read information from parameter queue

`esp_err_t mbc_slave_set_descriptor (mb_register_area_descriptor_t descr_data)`
Set Modbus area descriptor.

Return
• ESP_OK: The appropriate descriptor is set
• ESP_ERR_INVALID_ARG: The argument is incorrect

Parameters
*descr_data: Modbus registers area descriptor structure

Structures

`struct mb_param_info_t`
Parameter access event information type.

Public Members

`uint32_t time_stamp`
Timestamp of Modbus Event (uS)

`uint16_t mb_offset`
Modbus register offset

`mb_event_group_t type`
Modbus event type

`uint8_t *address`
Modbus data storage address
Chapter 2. API Reference

```c
size_t size
    Modbus event register size (number of registers)

struct mb_register_area_descriptor_t
    Parameter storage area descriptor.
```

### Public Members

```c
uint16_t start_offset
    Modbus start address for area descriptor

mb_param_type_t type
    Type of storage area descriptor

void *address
    Instance address for storage area descriptor

size_t size
    Instance size for area descriptor (bytes)
```

### Macros

- `MB_SLAVE_CHECK(a, err_code, format, ...)`
- `MB_SLAVE_ASSERT(con)`

## 2.4.12 ESP WebSocket Client

### Overview

The ESP WebSocket client is an implementation of WebSockets for ESP32-S3.

### Features

- Supports WebSocket over TCP, TLS with mbedtls
- Easy to setup with URI
- Multiple instances (Multiple clients in one application)

### Configuration

#### URI

- Supports ws, wss schemes
- WebSocket samples:
  - `ws://echo.websocket.org`: WebSocket over TCP, default port 80
  - `wss://echo.websocket.org`: WebSocket over SSL, default port 443

Minimal configurations:

```c
const esp_websocket_client_config_t ws_cfg = {
    .uri = "ws://echo.websocket.org",
};
```

The WebSocket client supports the use of both path and query in the URI. Sample:

```c
const esp_websocket_client_config_t ws_cfg = {
    .uri = "ws://echo.websocket.org/connectionhandler?id=104",
};
```

If there are any options related to the URI in `esp_websocket_client_config_t`, the option defined by the URI will be overridden. Sample:
const esp_websocket_client_config_t ws_cfg = {
    .uri = "ws://echo.websocket.org:123",
    .port = 4567,
};
//WebSocket client will connect to websocket.org using port 4567

**TLS Configuration:**

const esp_websocket_client_config_t ws_cfg = {
    .uri = "wss://echo.websocket.org",
    .cert_pem = (const char *)websocket_org_pem_start,
};

**Note:** If you want to verify the server, then you need to provide a certificate in PEM format, and provide to cert_pem in websocket_client_config_t. If no certificate is provided then the TLS connection will default to not requiring verification.

PEM certificate for this example could be extracted from an openssl s_client command connecting to websocket.org. In case a host operating system has openssl and sed packages installed, one could execute the following command to download and save the root or intermediate root certificate to a file (Note for Windows users: Both Linux like environment or Windows native packages may be used).

```
  ` echo "" | openssl s_client -showcerts -connect websocket.org:443 | sed -n "1,/Root/d; /BEGIN/,/END/p" | openssl x509 -outform PEM >websocket_org.pem`
```

This command will extract the second certificate in the chain and save it as a pem-file.

**Subprotocol** The subprotocol field in the config struct can be used to request a subprotocol

const esp_websocket_client_config_t ws_cfg = {
    .uri = "ws://websocket.org",
    .subprotocol = "soap",
};

**Note:** The client is indifferent to the subprotocol field in the server response and will accept the connection no matter what the server replies.

For more options on esp_websocket_client_config_t, please refer to API reference below

**Events**

- **WEBSOCKET_EVENT_CONNECTED:** The client has successfully established a connection to the server. The client is now ready to send and receive data. Contains no event data.
- **WEBSOCKET_EVENT_DISCONNECTED:** The client has aborted the connection due to the transport layer failing to read data, e.g. because the server is unavailable. Contains no event data.
- **WEBSOCKET_EVENT_DATA:** The client has successfully received and parsed a WebSocket frame. The event data contains a pointer to the payload data, the length of the payload data as well as the opcode of the received frame. A message may be fragmented into multiple events if the length exceeds the buffer size. This event will also be posted for non-payload frames, e.g. pong or connection close frames.
- **WEBSOCKET_EVENT_ERROR:** Not used in the current implementation of the client.

If the client handle is needed in the event handler it can be accessed through the pointer passed to the event handler:

```c
esp_websocket_client_handle_t client = (esp_websocket_client_handle_t)handler_args;
```
Limitations and Known Issues

- The client is able to request the use of a subprotocol from the server during the handshake, but does not do any subprotocol related checks on the response from the server.

Application Example

A simple WebSocket example that uses esp_websocket_client to establish a websocket connection and send/receive data with the websocket.org server can be found here: protocols/websocket.

Sending Text Data

The WebSocket client supports sending data as a text data frame, which informs the application layer that the payload data is text data encoded as UTF-8. Example:

```c
esp_websocket_client_send_text(client, data, len, portMAX_DELAY);
```

API Reference

Header File

- components/esp_websocket_client/include/esp_websocket_client.h

Functions

```c
esp_websocket_client_handle_t esp_websocket_client_init(const esp_websocket_client_config_t *config)
```

Start a Websocket session. This function must be the first function to call, and it returns a esp_websocket_client_handle_t that you must use as input to other functions in the interface. This call MUST have a corresponding call to esp_websocket_client_destroy when the operation is complete.

Return

- esp_websocket_client_handle_t
- NULL if any errors

Parameters

- [in] config: The configuration

```c
esp_err_t esp_websocket_client_set_uri(esp_websocket_client_handle_t client, const char *uri)
```

Set URL for client, when performing this behavior, the options in the URL will replace the old ones. Must stop the WebSocket client before set URI if the client has been connected.

Return

esp_err_t

Parameters

- [in] client: The client
- [in] uri: The uri

```c
esp_err_t esp_websocket_client_start(esp_websocket_client_handle_t client)
```

Open the WebSocket connection.

Return

esp_err_t

Parameters

- [in] client: The client

```c
esp_err_t esp_websocket_client_stop(esp_websocket_client_handle_t client)
```

Stopping the WebSocket connection without websocket closing handshake.

This API stops ws client and closes TCP connection directly without sending close frames. It is a good practice to close the connection in a clean way using esp_websocket_client_close().

Notes

- Cannot be called from the websocket event handler
Return `esp_err_t`
Parameters
- `[in] client`: The client

`esp_err_t esp_websocket_client_destroy (esp_websocket_client_handle_t client)`
Destroy the WebSocket connection and free all resources. This function must be the last function to call for an session. It is the opposite of the `esp_websocket_client_init` function and must be called with the same handle as input that a `esp_websocket_client_init` call returned. This might close all connections this handle has used.

Notes:
- Cannot be called from the websocket event handler

Return `esp_err_t`
Parameters
- `[in] client`: The client

`int esp_websocket_client_send_bin (esp_websocket_client_handle_t client, const char *data, int len, TickType_t timeout)`
Write binary data to the WebSocket connection (data send with WS OPCODE=02, i.e. binary)

Return
- Number of data was sent
- (-1) if any errors
Parameters
- `[in] client`: The client
- `[in] data`: The data
- `[in] len`: The length
- `[in] timeout`: Write data timeout in RTOS ticks

`int esp_websocket_client_send_text (esp_websocket_client_handle_t client, const char *data, int len, TickType_t timeout)`
Write textual data to the WebSocket connection (data send with WS OPCODE=01, i.e. text)

Return
- Number of data was sent
- (-1) if any errors
Parameters
- `[in] client`: The client
- `[in] data`: The data
- `[in] len`: The length
- `[in] timeout`: Write data timeout in RTOS ticks

`esp_err_t esp_websocket_client_close (esp_websocket_client_handle_t client, TickType_t timeout)`
Close the WebSocket connection in a clean way.

Sequence of clean close initiated by client:
- Client sends CLOSE frame
- Client waits until server echoes the CLOSE frame
- Client waits until server closes the connection
- Client is stopped the same way as by the `esp_websocket_client_stop()`

Notes:
- Cannot be called from the websocket event handler

Return `esp_err_t`
Parameters
- `[in] client`: The client
- `[in] timeout`: Timeout in RTOS ticks for waiting

`esp_err_t esp_websocket_client_close_with_code (esp_websocket_client_handle_t client, int code, const char *data, int len, TickType_t timeout)`
Close the WebSocket connection in a clean way with custom code/data Closing sequence is the same as for
Chapter 2. API Reference

esp_websocket_client_close()

Notes:
• Cannot be called from the websocket event handler

Return esp_err_t
Parameters
• [in] client: The client
• [in] code: Close status code as defined in RFC6455 section-7.4
• [in] data: Additional data to closing message
• [in] len: The length of the additional data
• [in] timeout: Timeout in RTOS ticks for waiting

bool esp_websocket_client_is_connected(esp_websocket_client_handle_t client)
Check the WebSocket client connection state.

Return
• true
• false
Parameters
• [in] client: The client handle

esp_err_t esp_websocket_register_events(esp_websocket_client_handle_t client,
esp_websocket_event_id_t event, esp_event_handler_t event_handler,
void *event_handler_arg)

Register the Websocket Events.

Return esp_err_t
Parameters
• client: The client handle
• event: The event id
• event_handler: The callback function
• event_handler_arg: User context

Structures
struct esp_websocket_event_data_t
Websocket event data.

Public Members

const char *data_ptr
Data pointer

int data_len
Data length

uint8_t op_code
Received opcode

esp_websocket_client_handle_t client
esp_websocket_client_handle_t context

void *user_context
user_data context, from esp_websocket_client_config_t user_data

int payload_len
Total payload length, payloads exceeding buffer will be posted through multiple events

int payload_offset
Actual offset for the data associated with this event

struct esp_websocket_client_config_t
Websocket client setup configuration.
Public Members

**const char* `uri`**  
Websocket URI, the information on the URI can be overrides the other fields below, if any

**const char* `host`**  
Domain or IP as string

**int `port`**  
Port to connect, default depend on esp_websocket_transport_t (80 or 443)

**const char* `username`**  
Using for Http authentication - Not supported for now

**const char* `password`**  
Using for Http authentication - Not supported for now

**const char* `path`**  
HTTP Path, if not set, default is /

**bool `disable_auto_reconnect`**  
Disable the automatic reconnect function when disconnected

**void* `user_context`**  
HTTP user data context

**int `task_prio`**  
Websocket task priority

**int `task_stack`**  
Websocket task stack

**int `buffer_size`**  
Websocket buffer size

**const char* `cert_pem`**  
Pointer to certificate data in PEM or DER format for server verify (with SSL), default is NULL, not required to verify the server. PEM-format must have a terminating NULL-character. DER-format requires the length to be passed in `cert_len`.

**size_t `cert_len`**  
Length of the buffer pointed to by `cert_pem`. May be 0 for null-terminated pem

**const char* `client_cert`**  
Pointer to certificate data in PEM or DER format for SSL mutual authentication, default is NULL, not required if mutual authentication is not needed. If it is not NULL, also `client_key` has to be provided. PEM-format must have a terminating NULL-character. DER-format requires the length to be passed in `client_cert_len`.

**size_t `client_cert_len`**  
Length of the buffer pointed to by `client_cert`. May be 0 for null-terminated pem

**const char* `client_key`**  
Pointer to private key data in PEM or DER format for SSL mutual authentication, default is NULL, not required if mutual authentication is not needed. If it is not NULL, also `client_cert` has to be provided. PEM-format must have a terminating NULL-character. DER-format requires the length to be passed in `client_key_len`.

**size_t `client_key_len`**  
Length of the buffer pointed to by `client_key_pem`. May be 0 for null-terminated pem

**esp_websocket_transport_t `transport`**  
Websocket transport type, see `esp_websocket_transport_t`

**const char* `subprotocol`**  
Websocket subprotocol
**const** char *user_agent
Websocket user-agent

**const** char *headers
Websocket additional headers

**int** pong_timeout_sec
Period before connection is aborted due to no PONGs received

**bool** disable_pingpong_discon
Disable auto-disconnect due to no PONG received within pong_timeout_sec

**bool** use_global_ca_store
Use a global ca_store for all the connections in which this bool is set.

**bool** skip_cert_common_name_check
Skip any validation of server certificate CN field

**bool** keep_alive_enable
Enable keep-alive timeout

**int** keep_alive_idle
Keep-alive idle time. Default is 5 (second)

**int** keep_alive_interval
Keep-alive interval time. Default is 5 (second)

**int** keep_alive_count
Keep-alive packet retry send count. Default is 3 counts

**int** reconnect_timeout_ms
Reconnect after this value in milliseconds if disable_auto_reconnect is not enabled (defaults to 10s)

**int** network_timeout_ms
Abort network operation if it is not completed after this value, in milliseconds (defaults to 10s)

**size_t** ping_interval_sec
Websocket ping interval, defaults to 10 seconds if not set

**struct** ifreq *if_name
The name of interface for data to go through. Use the default interface without setting

**Type Definitions**

typedef **struct** esp_websocket_client *esp_websocket_client_handle_t

**Enumerations**

defined in esp_websocket.h

enum esp_websocket_event_id_t
Websocket Client events id.

*Values:*

**WEBSOCKET_EVENT_ANY** = -1

**WEBSOCKET_EVENT_ERROR** = 0
This event occurs when there are any errors during execution

**WEBSOCKET_EVENT_CONNECTED**
Once the Websocket has been connected to the server, no data exchange has been performed

**WEBSOCKET_EVENT_DISCONNECTED**
The connection has been disconnected

**WEBSOCKET_EVENT_DATA**
When receiving data from the server, possibly multiple portions of the packet

**WEBSOCKET_EVENT_CLOSED**
The connection has been closed cleanly
WEBSOCKET_EVENT_MAX
enum esp_websocket_transport_t
Websocket Client transport.
Values:
WEB_SOCKET_TRANSPORT_UNKNOWN = 0x0
Transport unknown
WEB_SOCKET_TRANSPORT_OVER_TCP
Transport over tcp
WEB_SOCKET_TRANSPORT_OVER_SSL
Transport over ssl

2.4.13 ESP Serial Slave Link

Overview
Espressif provides several chips that can work as slaves. These slave devices rely on some common buses, and have their own communication protocols over those buses. The esp_serial_slave_link component is designed for the master to communicate with ESP slave devices through those protocols over the bus drivers.
After an esp_serial_slave_link device is initialized properly, the application can use it to communicate with the ESP slave devices conveniently.

Espressif Device protocols
For more details about Espressif device protocols, see the following documents.

ESP SPI Slave HD (Half Duplex) Mode Protocol

Introduction  In the half duplex mode, the master has to use the protocol defined by the slave to communicate with the slave. Each transaction may consist of the following phases (list by the order they should exist):

- Command: 8-bit, master to slave
  This phase determines the rest phases of the transactions. See Supported Commands.
- Address: 8-bit, master to slave, optional
  For some commands (WRBUF, RDBUF), this phase specifies the address of the shared buffer to write to/read from. For other commands with this phase, they are meaningless but still have to exist in the transaction.
- Dummy: 8-bit, floating, optional
  This phase is the turnaround time between the master and the slave on the bus, and also provides enough time for the slave to prepare the data to send to the master.
- Data: variable length, the direction is also determined by the command.
  This may be a data OUT phase, in which the direction is slave to master, or a data IN phase, in which the direction is master to slave.

The direction means which side (master or slave) controls the MOSI, MISO, WP, and HD pins.
Data IO Modes In some IO modes, more data wires can be used to send the data. As a result, the SPI clock cycles required for the same amount of data will be less than in the 1-bit mode. For example, in QIO mode, address and data (IN and OUT) should be sent on all 4 data wires (MOSI, MISO, WP, and HD). Here are the modes supported by the ESP32-S2 SPI slave and the wire number used in corresponding modes.

<table>
<thead>
<tr>
<th>Mode</th>
<th>command WN</th>

<td>4</td>
<td>4</td>
<td>4</td>
<td>4</td>
</tr>
</tbody>
</table>

Normally, which mode is used is determined by the command sent by the master (See Supported Commands), except the QPI mode.

QPI Mode The QPI mode is a special state of the SPI Slave. The master can send the ENQPI command to put the slave into the QPI mode state. In the QPI mode, the command is also sent in 4-bit, thus it’s not compatible with the normal modes. The master should only send QPI commands when the slave is in QPI mode. To exit from the QPI mode, master can send the EXQPI command.

Supported Commands

Note: The command name is in a master-oriented direction. For example, WRBUF means master writes the buffer of slave.
Moreover, WRBUF, RDBUF, WRDMA, RDDMA commands have their 2-bit and 4-bit version. To do transactions in 2-bit or 4-bit mode, send the original command ORed by the corresponding command mask below. For example, command 0xA1 means WRBUF in QIO mode.

<table>
<thead>

<td>0xA0</td>
</tr>
</tbody>
</table>

**Segment Transaction Mode** Segment transaction mode is the only mode supported by the SPI Slave HD driver for now. In this mode, for a transaction the slave load onto the DMA, the master is allowed to read or write in segments. This way the master doesn’t have to prepare a large buffer as the size of data provided by the slave. After the master finishes reading/writing a buffer, it has to send the corresponding termination command to the slave as a synchronization signal. The slave driver will update new data (if exist) onto the DMA upon seeing the termination command.

The termination command is WR_DONE (0x07) for the WRDMA and CMD8 (0x08) for the RDDMA.

Here’s an example for the flow the master read data from the slave DMA:

1. The slave loads 4092 bytes of data onto the RDDMA
2. The master do seven RDDMA transactions, each of them is 512 bytes long, and reads the first 3584 bytes from the slave
3. The master do the last RDDMA transaction of 512 bytes (equal, longer, or shorter than the total length loaded by the slave are all allowed). The first 508 bytes are valid data from the slave, while the last 4 bytes are meaningless bytes.
4. The master sends CMD8 to the slave
5. The slave loads another 4092 bytes of data onto the RDDMA
6. The master can start new reading transactions after it sends the CMD8

**Terminology**

- **ESSL:** Abbreviation for ESP Serial Slave Link, the component described by this document.
- **Master:** The device running the `esp_serial_slave_link` component.
- **ESSL device:** a virtual device on the master associated with an ESP slave device. The device context has the knowledge of the slave protocol above the bus, relying on some bus drivers to communicate with the slave.
- **ESSL device handle:** a handle to ESSL device context containing the configuration, status and data required by the ESSL component. The context stores the driver configurations, communication state, data shared by master and slave, etc.
  The context should be initialized before it is used, and get deinitialized if not used any more. The master application operates on the ESSL device through this handle.
- **ESP slave:** the slave device connected to the bus, which ESSL component is designed to communicate with.
- **Bus:** The bus over which the master and the slave communicate with each other.
- **Slave protocol:** The special communication protocol specified by Espressif HW/SW over the bus.
- **TX buffer num:** a counter, which is on the slave and can be read by the master, indicates the accumulated buffer numbers that the slave has loaded to the hardware to receive data from the master.
- **RX data size:** a counter, which is on the slave and can be read by the master, indicates the accumulated data size that the slave has loaded to the hardware to send to the master.

**Services provided by ESP slave**

There are some common services provided by the Espressif slaves:

1. Tohost Interrupts: The slave can inform the master about certain events by the interrupt line. (optional)
2. Frhost Interrupts: The master can inform the slave about certain events.

3. Tx FIFO (master to slave): the slave can send data in stream to the master. The SDIO slave can also indicate it has new data to send to master by the interrupt line.
   The slave updates the TX buffer num to inform the master how much data it can receive, and the master then read the TX buffer num, and take off the used buffer number to know how many buffers are remaining.

4. Rx FIFO (slave to master): the slave can receive data from the master in units of receiving buffers.
   The slave updates the RX data size to inform the master how much data it has prepared to send, and then the master read the data size, and take off the data length it has already received to know how many data is remaining.

5. Shared registers: the master can read some part of the registers on the slave, and also write these registers to let the slave read.

The services provided by the slave depends on the slave’s model. See *SPI Slave Capabilities of Espressif chips* for more details.

**Initialization of ESP Serial Slave Link**

**ESP SDIO Slave** The ESP SDIO slave link (ESSL SDIO) devices relies on the sdmmc component. It includes the usage of communicating with ESP SDIO Slave device via SDSPI feature. The ESSL device should be initialized as below:

1. Initialize a sdmmc card (see `Document of SDMMC driver` in `Storage` section) structure.
2. Call `sdmmc_card_init()` to initialize the card.
3. Initialize the ESSL device with `essl_sdio_config_t`. The `card` member should be the `sdmmc_card_t` got in step 2, and the `recv_buffer_size` member should be filled correctly according to pre-negotiated value.
4. Call `essi_init()` to do initialization of the SDIO part.
5. Call `essi_wait_for_ready()` to wait for the slave to be ready.

**ESP SPI Slave**

*Note:* If you are communicating with the ESP SDIO Slave device through SPI interface, you should use the *SDIO interface* instead.

Hasn’t been supported yet.

**APIs**

After the initialization process above is performed, you can call the APIs below to make use of the services provided by the slave:

**Tohost Interrupts (optional)**

1. Call `essl_get_intr_ena()` to know which events will trigger the interrupts to the master.
2. Call `essl_set_intr_ena()` to set the events that will trigger interrupts to the master.
3. Call `essl_wait_int()` to wait until interrupt from the slave, or timeout.
4. When interrupt is triggered, call `essl_get_intr()` to know which events are active, and call `essl_clear_intr()` to clear them.

**Frhost Interrupts**

1. Call `essl_send_slave_intr()` to trigger general purpose interrupt of the slave.
TX FIFO

1. Call `essl_get_tx_buffer_num()` to know how many buffers the slave has prepared to receive data from the master. This is optional. The master will poll `tx_buffer_num` when it try to send packets to the slave, until the slave has enough buffer or timeout.
2. Call `essl_send_packet()` to send data to the slave.

RX FIFO

1. Call `essl_get_rx_data_size()` to know how many data the slave has prepared to send to the master. This is optional. When the master tries to receive data from the slave, it will update the `rx_data_size` for once, if the current `rx_data_size` is shorter than the buffer size the master prepared to receive. And it may poll the `rx_data_size` if the `rx_data` keeps 0, until timeout.
2. Call `essl_get_packet()` to receive data from the slave.

Reset counters (Optional)  Call `essl_reset_cnt()` to reset the internal counter if you find the slave has reset its counter.

Application Example

The example below shows how ESP32-S3 SDIO host and slave communicate with each other. The host use the ESSL SDIO.

Please refer to the specific example README.md for details.

esp_err_t essl_init (essl_handle_t handle, uint32_t wait_ms)
```

Initialize the slave.

**Return**

- ESP_OK: If success
- ESP_ERR_NOT_SUPPORTED: Current device does not support this function.
- Other value returned from lower layer init.

**Parameters**

- handle: Handle of an ESSL device.
- wait_ms: Millisecond to wait before timeout, will not wait at all if set to 0-9.

```c
esp_err_t essl_wait_for_ready (essl_handle_t handle, uint32_t wait_ms)
```

Wait for interrupt of an ESSL slave device.

**Return**

- ESP_OK: If success
- ESP_ERR_NOT_SUPPORTED: Current device does not support this function.
- One of the error codes from SDMMC host controller

**Parameters**

- handle: Handle of an ESSL device.
- wait_ms: Millisecond to wait before timeout, will not wait at all if set to 0-9.

```c
esp_err_t essl_get_tx_buffer_num (essl_handle_t handle, uint32_t *out_tx_num, uint32_t wait_ms)
```

Get buffer num for the host to send data to the slave. The buffers are size of `buffer_size`.

**Return**
Chapter 2. API Reference

- ESP_OK: Success
- ESP_ERR_NOT_SUPPORTED: This API is not supported in this mode
- One of the error codes from SDMMC/SPI host controller

Parameters
- handle: Handle of an ESSL device.
- out_tx_num: Output of buffer num that host can send data to ESSL slave.
- wait_ms: Millisecond to wait before timeout, will not wait at all if set to 0-9.

```c
esp_err_t essl_get_rx_data_size(essl_handle_t handle, uint32_t* out_rx_size, uint32_t wait_ms)
```

Get the size, in bytes, of the data that the ESSL slave is ready to send

Return
- ESP_OK: Success
- ESP_ERR_NOT_SUPPORTED: This API is not supported in this mode
- One of the error codes from SDMMC/SPI host controller

Parameters
- handle: Handle of an ESSL device.
- out_rx_size: Output of data size to read from slave, in bytes
- wait_ms: Millisecond to wait before timeout, will not wait at all if set to 0-9.

```c
esp_err_t essl_reset_cnt(essl_handle_t handle)
```

Reset the counters of this component. Usually you don’t need to do this unless you know the slave is reset.

Return
- ESP_OK: Success
- ESP_ERR_NOT_SUPPORTED: This API is not supported in this mode
- ESP_ERR_INVALID_ARG: Invalid argument, handle is not init.

Parameters
- handle: Handle of an ESSL device.

```c
esp_err_t essl_send_packet(essl_handle_t handle, const void* start, size_t length, uint32_t wait_ms)
```

Send a packet to the ESSL Slave. The Slave receives the packet into buffers whose size is buffer_size (configured during initialization).

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG: Invalid argument, handle is not init or other argument is not valid.
- ESP_ERR_TIMEOUT: No buffer to use, or error from SDMMC host controller.
- ESP_ERR_NOT_FOUND: Slave is not ready for receiving.
- ESP_ERR_NOT_SUPPORTED: This API is not supported in this mode
- One of the error codes from SDMMC/SPI host controller.

Parameters
- handle: Handle of an ESSL device.
- start: Start address of the packet to send
- length: Length of data to send, if the packet is over-size, the it will be divided into blocks and hold into different buffers automatically.
- wait_ms: Millisecond to wait before timeout, will not wait at all if set to 0-9.

```c
esp_err_t essl_get_packet(essl_handle_t handle, void *out_data, size_t size, size_t *out_length, uint32_t wait_ms)
```

Get a packet from ESSL slave.

Return
- ESP_OK Success: All the data has been read from the slave.
- ESP_ERR_INVALID_ARG: Invalid argument, The handle is not initialized or the other arguments are invalid.
- ESP_ERR_NOT_FINISHED: Read was successful, but there is still data remaining.
- ESP_ERR_NOT_FOUND: Slave is not ready to send data.
- ESP_ERR_NOT_SUPPORTED: This API is not supported in this mode
- One of the error codes from SDMMC/SPI host controller.

Parameters
- handle: Handle of an ESSL device.
• [out] out_data: Data output address
• size: The size of the output buffer, if the buffer is smaller than the size of data to receive from
slave, the driver returns ESP_ERR_NOT_FINISHED
• [out] out_length: Output of length the data actually received from slave.
• wait_ms: Millisecond to wait before timeout, will not wait at all if set to 0-9.

```
esp_err_t essl_write_reg (essl_handle_t handle, uint8_t addr, uint8_t value, uint8_t* value_o, uint32_t wait_ms)
```
Write general purpose R/W registers (8-bit) of ESSL slave.

**Note** sdio 28-31 are reserved, the lower API helps to skip.

**Return**
- ESP_OK Success
- One of the error codes from SDMMC/SPI host controller

**Parameters**
- handle: Handle of an ESSL device.
- addr: Address of register to write. For SDIO, valid address: 0-59. For SPI, see `essl_spi.h`
- value: Value to write to the register.
- value_o: Output of the returned written value.
- wait_ms: Millisecond to wait before timeout, will not wait at all if set to 0-9.

```
esp_err_t essl_read_reg (essl_handle_t handle, uint8_t add, uint8_t* value_o, uint32_t wait_ms)
```
Read general purpose R/W registers (8-bit) of ESSL slave.

**Return**
- ESP_OK Success
- One of the error codes from SDMMC/SPI host controller

**Parameters**
- handle: Handle of an ESSL device.
- add: Address of register to read. For SDIO, Valid address: 0-27, 32-63 (28-31 reserved, return
interrupt bits on read). For SPI, see `essl_spi.h`
- value_o: Output value read from the register.
- wait_ms: Millisecond to wait before timeout, will not wait at all if set to 0-9.

```
esp_err_t essl_wait_int (essl_handle_t handle, uint32_t wait_ms)
```
wait for an interrupt of the slave

**Return**
- ESP_OK: If interrupt is triggered.
- ESP_ERR_NOT_SUPPORTED: Current device does not support this function.
- ESP_ERR_TIMEOUT: No interrupts before timeout.

**Parameters**
- handle: Handle of an ESSL device.
- wait_ms: Millisecond to wait before timeout, will not wait at all if set to 0-9.

```
esp_err_t essl_clear_intr (essl_handle_t handle, uint32_t intr_mask, uint32_t wait_ms)
```
Clear interrupt bits of ESSL slave. All the bits set in the mask will be cleared, while other bits will stay the
same.

**Return**
- ESP_OK: Success
- ESP_ERR_NOT_SUPPORTED: Current device does not support this function.
- One of the error codes from SDMMC host controller

**Parameters**
- handle: Handle of an ESSL device.
- intr_mask: Mask of interrupt bits to clear.
- wait_ms: Millisecond to wait before timeout, will not wait at all if set to 0-9.

```
esp_err_t essl_get_intr (essl_handle_t handle, uint32_t* intr_raw, uint32_t* intr_st, uint32_t wait_ms)
```
Get interrupt bits of ESSL slave.

**Return**
- ESP_OK: Success
Chapter 2. API Reference

- ESP_INVALID_ARG: If both intr_raw and intr_st are NULL.
- ESP_ERR_NOT_SUPPORTED: Current device does not support this function.
- One of the error codes from SDMMC host controller

**Parameters**

- handle: Handle of an ESSL device.
- intr_raw: Output of the raw interrupt bits. Set to NULL if only masked bits are read.
- intr_st: Output of the masked interrupt bits. Set to NULL if only raw bits are read.
- wait_ms: Millisecond to wait before timeout, will not wait at all if set to 0-9.

```c
esp_err_t essl_set_intr_ena (essl_handle_t handle, uint32_t ena_mask, uint32_t wait_ms)
```

Set interrupt enable bits of ESSL slave. The slave only sends interrupt on the line when there is a bit both the raw status and the enable are set.

**Return**

- ESP_OK: Success
- ESP_ERR_NOT_SUPPORTED: Current device does not support this function.
- One of the error codes from SDMMC host controller

**Parameters**

- handle: Handle of an ESSL device.
- ena_mask: Mask of the interrupt bits to enable.
- wait_ms: Millisecond to wait before timeout, will not wait at all if set to 0-9.

```c
esp_err_t essl_get_intr_ena (essl_handle_t handle, uint32_t *ena_mask_o, uint32_t wait_ms)
```

Get interrupt enable bits of ESSL slave.

**Return**

- ESP_OK: Success
- One of the error codes from SDMMC host controller

**Parameters**

- handle: Handle of an ESSL device.
- ena_mask_o: Output of interrupt bit enable mask.
- wait_ms: Millisecond to wait before timeout, will not wait at all if set to 0-9.

```c
esp_err_t essl_send_slave_intr (essl_handle_t handle, uint32_t intr_mask, uint32_t wait_ms)
```

Send interrupts to slave. Each bit of the interrupt will be triggered.

**Return**

- ESP_OK: Success
- ESP_ERR_NOT_SUPPORTED: Current device does not support this function.
- One of the error codes from SDMMC host controller

**Parameters**

- handle: Handle of an ESSL device.
- intr_mask: Mask of interrupt bits to send to slave.
- wait_ms: Millisecond to wait before timeout, will not wait at all if set to 0-9.

**Type Definitions**

```c
typedef struct essl_dev_t *essl_handle_t
```

Handle of an ESSL device.

**Header File**

- components/esp_serial_slave_link/include/esp_serial_slave_link/essl_sdio.h

**Functions**

```c
esp_err_t essl_sdio_init_dev (essl_handle_t *out_handle, const essl_sdio_config_t *config)
```

Initialize the ESSL SDIO device and get its handle.

**Return**

- ESP_OK: on success
- ESP_ERR_NO_MEM: memory exhausted.
Parameters
• out_handle: Output of the handle.
• config: Configuration for the ESSL SDIO device.

`esp_err_t essl_sdio_deinit_dev (essl_handle_t handle)`
Deinitialize and free the space used by the ESSL SDIO device.

Return
• ESP_OK: on success
• ESP_ERR_INVALID_ARG: wrong handle passed

Parameters
• handle: Handle of the ESSL SDIO device to deinit.

Structures

`struct essl_sdio_config_t`  
Configuration for the ESSL SDIO device.

Public Members

`sdmmc_card_t *card`
The initialized sdmmc card pointer of the slave.

`int recv_buffer_size`
The pre-negotiated recv buffer size used by both the host and the slave.

Header File

`components/esp_serial_slave_link/include/esp_serial_slave_link/essl_spi.h`

Functions

`esp_err_t essl_spi_init_dev (essl_handle_t *out_handle, const essl_spi_config_t *init_config)`
Initialize the ESSL SPI device function list and get its handle.

Return
• ESP_OK: On success
• ESP_ERR_NO_MEM: Memory exhausted
• ESP_ERR_INVALID_STATE: SPI driver is not initialized
• ESP_ERR_INVALID_ARG: Wrong register ID

Parameters
• [out] out_handle: Output of the handle
• init_config: Configuration for the ESSL SPI device

`esp_err_t essl_spi_deinit_dev (essl_handle_t handle)`
Deinitialize the ESSL SPI device and free the memory used by the device.

Return
• ESP_OK: On success
• ESP_ERR_INVALID_STATE: ESSL SPI is not in use

Parameters
• handle: Handle of the ESSL SPI device

`esp_err_t essl_spi_read_reg (void *arg, uint8_t addr, uint8_t *out_value, uint32_t wait_ms)`
Read from the shared registers.

Note  The registers for Master/Slave synchronization are reserved. Do not use them. (see rx_sync_reg in `essl_spi_config_t`)

Return
• ESP_OK: success
• ESP_ERR_INVALID_STATE: ESSL SPI has not been initialized.
• ESP_ERR_INVALID_ARG: The address argument is not valid. See note 1.
• or other return value from :cpp:func:spi_device_transmit.
Parameters
- `arg`: Context of the component. (Member `arg` from `essl_handle_t`)
- `addr`: Address of the shared registers. (Valid: 0 ~ SOC_SPI_MAXIMUM_BUFFER_SIZE, registers for M/S sync are reserved, see note1).
- `[out] out_value`: Read buffer for the shared registers.
- `wait_ms`: Time to wait before timeout (reserved for future use, user should set this to 0).

`esp_err_t` `essl_spi_get_packet` (void *`arg`, void *`out_data`, size_t `size`, uint32_t `wait_ms`)
Get a packet from Slave.

Return
- ESP_OK: On Success
- ESP_ERR_INVALID_STATE: ESSL SPI has not been initialized.
- ESP_ERR_INVALID_ARG: The output data address is neither DMA capable nor 4 byte-aligned
- ESP_ERR_INVALID_SIZE: Master requires size bytes of data but Slave did not load enough bytes.

Parameters
- `arg`: Context of the component. (Member `arg` from `essl_handle_t`)
- `[out] out_data`: Output data address
- `size`: The size of the output data.
- `wait_ms`: Time to wait before timeout (reserved for future use, user should set this to 0).

`esp_err_t` `essl_spi_write_reg` (void *`arg`, uint8_t `addr`, uint8_t `value`, uint8_t *`out_value`, uint32_t `wait_ms`)
Write to the shared registers.

Note  The registers for Master/Slave synchronization are reserved. Do not use them. (see `tx_sync_reg` in `essl_spi_config_t`)

Note  Feature of checking the actual written value (`out_value`) is not supported.

Return
- ESP_OK: success
- ESP_ERR_INVALID_STATE: ESSL SPI has not been initialized.
- ESP_ERR_INVALID_ARG: The address argument is not valid. See note 1.
- ESP_ERR_NOT_SUPPORTED: Should set `out_value` to NULL. See note 2.
- or other return value from :cpp:func:`spi_device_transmit`.

Parameters
- `arg`: Context of the component. (Member `arg` from `essl_handle_t`)
- `addr`: Address of the shared registers. (Valid: 0 ~ SOC_SPI_MAXIMUM_BUFFER_SIZE, registers for M/S sync are reserved, see note1)
- `value`: Buffer for data to send, should be align to 4.
- `[out] out_value`: Not supported, should be set to NULL.
- `wait_ms`: Time to wait before timeout (reserved for future use, user should set this to 0).

`esp_err_t` `essl_spi_send_packet` (void *`arg`, const void *`data`, size_t `size`, uint32_t `wait_ms`)
Send a packet to Slave.

Return
- ESP_OK: On success
- ESP_ERR_INVALID_STATE: ESSL SPI has not been initialized.
- ESP_ERR_INVALID_ARG: The data address is not DMA capable
- ESP_ERR_INVALID_SIZE: Master will send size bytes of data but Slave did not load enough RX buffer

Parameters
- `arg`: Context of the component. (Member `arg` from `essl_handle_t`)
- `data`: Address of the data to send
- `size`: Size of the data to send.
- `wait_ms`: Time to wait before timeout (reserved for future use, user should set this to 0).

`void` `essl_spi_reset_cnt` (void *`arg`)
Reset the counter in Master context.

Note  Shall only be called if the slave has reset its counter. Else, Slave and Master would be desynchronized
**Parameters**
- **arg**: Context of the component. (Member arg from essl_handle_t)

```c
esp_err_t essl_spi_rdbuf(spi_device_handle_t spi, uint8_t *out_data, int addr, int len, uint32_t flags)
```
Read the shared buffer from the slave in ISR way.

**Note** The slave’s HW doesn’t guarantee the data in one SPI transaction is consistent. It sends data in unit of byte. In other words, if the slave SW attempts to update the shared register when a rdbuf SPI transaction is in-flight, the data got by the master will be the combination of bytes of different writes of slave SW.

**Note** out_data should be prepared in words and in the DRAM. The buffer may be written in words by the DMA. When a byte is written, the remaining bytes in the same word will also be overwritten, even the len is shorter than a word.

**Return**
- ESP_OK: on success
- or other return value from :cpp:func:spi_device_transmit.

**Parameters**
- **spi**: SPI device handle representing the slave
- [out] **out_data**: Buffer for read data, strongly suggested to be in the DRAM and aligned to 4
- **addr**: Address of the slave shared buffer
- **len**: Length to read
- **flags**: SPI_TRANS_* flags to control the transaction mode of the transaction to send.

```c
esp_err_t essl_spi_rdbuf_polling(spi_device_handle_t spi, uint8_t *out_data, int addr, int len, uint32_t flags)
```
Read the shared buffer from the slave in polling way.

**Note** out_data should be prepared in words and in the DRAM. The buffer may be written in words by the DMA. When a byte is written, the remaining bytes in the same word will also be overwritten, even the len is shorter than a word.

**Return**
- ESP_OK: on success
- or other return value from :cpp:func:spi_device_transmit.

**Parameters**
- **spi**: SPI device handle representing the slave
- [out] **data**: Buffer for data to send, strongly suggested to be in the DRAM
- **addr**: Address of the slave shared buffer
- **len**: Length to write
- **flags**: SPI_TRANS_* flags to control the transaction mode of the transaction to send.

```c
esp_err_t essl_spi_wrbuf(spi_device_handle_t spi, const uint8_t *data, int addr, int len, uint32_t flags)
```
Write the shared buffer of the slave in ISR way.

**Note** out_data should be prepared in words and in the DRAM. The buffer may be written in words by the DMA. When a byte is written, the remaining bytes in the same word will also be overwritten, even the len is shorter than a word.

**Return**
- ESP_OK: success
- or other return value from :cpp:func:spi_device_transmit.

**Parameters**
- **spi**: SPI device handle representing the slave
- **data**: Buffer for data to send, strongly suggested to be in the DRAM
- **addr**: Address of the slave shared buffer
- **len**: Length to write
- **flags**: SPI_TRANS_* flags to control the transaction mode of the transaction to send.

```c
esp_err_t essl_spi_wrbuf_polling(spi_device_handle_t spi, const uint8_t *data, int addr, int len, uint32_t flags)
```
Write the shared buffer of the slave in polling way.

**Note** out_data should be prepared in words and in the DRAM. The buffer may be written in words by the DMA. When a byte is written, the remaining bytes in the same word will also be overwritten, even the len is shorter than a word.
Return
- ESP_OK: success
- or other return value from `cpp:func:spx_device_polling_transmit`.

Parameters
- `spi`: SPI device handle representing the slave
- `data`: Buffer for data to send, strongly suggested to be in the DRAM
- `addr`: Address of the slave shared buffer,
- `len`: Length to write
- `flags`: SPI_TRANS_* flags to control the transaction mode of the transaction to send.

```c
void essl_spi_rddma(spi_device_handle_t spi, uint8_t *out_data, int len, int seg_len, uint32_t flags)
```

Receive long buffer in segments from the slave through its DMA.

**Note** This function combines several `cpp:func:essl_spi_rddma_seg` and one `cpp:func:essl_spi_rddma_done` at the end. Used when the slave is working in segment mode.

Return
- ESP_OK: success
- or other return value from `cpp:func:spx_device_transmit`.

Parameters
- `spi`: SPI device handle representing the slave
- `[out] out_data`: Buffer to hold the received data, strongly suggested to be in the DRAM and aligned to 4
- `len`: Total length of data to receive.
- `seg_len`: Length of each segment, which is not larger than the maximum transaction length allowed for the spi device. Suggested to be multiples of 4. When set < 0, means send all data in one segment (the `rddma_done` will still be sent.)
- `flags`: SPI_TRANS_* flags to control the transaction mode of the transaction to send.

```c
esp_err_t essl_spi_rddma_seg(spi_device_handle_t spi, uint8_t *out_data, int seg_len, uint32_t flags)
```

Read one data segment from the slave through its DMA.

**Note** To read long buffer, call `cpp:func:essl_spi_rddma` instead.

Return
- ESP_OK: success
- or other return value from `cpp:func:spx_device_transmit`.

Parameters
- `spi`: SPI device handle representing the slave
- `[out] out_data`: Buffer to hold the received data. strongly suggested to be in the DRAM and aligned to 4
- `seg_len`: Length of this segment
- `flags`: SPI_TRANS_* flags to control the transaction mode of the transaction to send.

```c
esp_err_t essl_spi_rddma_done(spi_device_handle_t spi, uint32_t flags)
```

Send the `rddma_done` command to the slave. Upon receiving this command, the slave will stop sending the current buffer even there are data unsent, and maybe prepare the next buffer to send.

**Note** This is required only when the slave is working in segment mode.

Return
- ESP_OK: success
- or other return value from `cpp:func:spx_device_transmit`.

Parameters
- `spi`: SPI device handle representing the slave
- `flags`: SPI_TRANS_* flags to control the transaction mode of the transaction to send.

```c
esp_err_t essl_spi_wrdma(spx_device_handle_t spi, const uint8_t *data, int len, int seg_len, uint32_t flags)
```

Send long buffer in segments to the slave through its DMA.

**Note** This function combines several `cpp:func:essl_spi_wrdma_seg` and one `cpp:func:essl_spi_wrdma_done` at the end. Used when the slave is working in segment mode.
mode.

Return
• ESP_OK: success

or other return value from :cpp:func:spi_device_transmit.

Parameters
• spi: SPI device handle representing the slave
• data: Buffer for data to send, strongly suggested to be in the DRAM
• len: Total length of data to send.
• seg_len: Length of each segment, which is not larger than the maximum transaction length allowed for the spi device. Suggested to be multiples of 4. When set < 0, means send all data in one segment (the wrdma_done will still be sent.)
• flags: SPI_TRANS_* flags to control the transaction mode of the transaction to send.

```c
esp_err_t essl_spi_wrdma_seg(spi_device_handle_t spi, const uint8_t *data, int seg_len, uint32_t flags)
```

Send one data segment to the slave through its DMA.

Note To send long buffer, call :cpp:func:essl_spi_wrdma instead.

Return
• ESP_OK: success

or other return value from :cpp:func:spi_device_transmit.

Parameters
• spi: SPI device handle representing the slave
• data: Buffer for data to send, strongly suggested to be in the DRAM
• seg_len: Length of this segment
• flags: SPI_TRANS_* flags to control the transaction mode of the transaction to send.

```c
esp_err_t essl_spi_wrdma_done(spi_device_handle_t spi, uint32_t flags)
```

Send the wrdma_done command to the slave. Upon receiving this command, the slave will stop receiving, process the received data, and maybe prepare the next buffer to receive.

Note This is required only when the slave is working in segment mode.

Return
• ESP_OK: success

or other return value from :cpp:func:spi_device_transmit.

Parameters
• spi: SPI device handle representing the slave
• flags: SPI_TRANS_* flags to control the transaction mode of the transaction to send.

Structures

```c
struct essl_spi_config_t
```

Configuration of ESSL SPI device.

**Public Members**

```c
spi_device_handle_t *spi
```  
Pointer to SPI device handle.

```c
uint32_t tx_buf_size
```  
The pre-negotiated Master TX buffer size used by both the host and the slave.

```c
uint8_t tx_sync_reg
```  
The pre-negotiated register ID for Master-TX-SLAVE-RX synchronization. 1 word (4 Bytes) will be reserved for the synchronization.

```c
uint8_t rx_sync_reg
```  
The pre-negotiated register ID for Master-RX-Slave-TX synchronization. 1 word (4 Bytes) will be reserved for the synchronization.
Chapter 2. API Reference

2.4.14 ESP x509 Certificate Bundle

Overview

The ESP x509 Certificate Bundle API provides an easy way to include a bundle of custom x509 root certificates for TLS server verification.

Note: The bundle is currently not available when using WolfSSL.

The bundle comes with the complete list of root certificates from Mozilla’s NSS root certificate store. Using the gen_crt_bundle.py python utility the certificates’ subject name and public key are stored in a file and embedded in the ESP32-S3 binary.

When generating the bundle you may choose between:

- The full root certificate bundle from Mozilla, containing more than 130 certificates. The current bundle was updated Tue Oct 5 09:35:35 2021 GMT.
- A pre-selected filter list of the name of the most commonly used root certificates, reducing the amount of certificates to around 35 while still having around 90% coverage according to market share statistics.

In addition it is possible to specify a path to a certificate file or a directory containing certificates which then will be added to the generated bundle.

Note: Trusting all root certificates means the list will have to be updated if any of the certificates are retracted. This includes removing them from cacrt_all.pem.

Configuration

Most configuration is done through menuconfig. CMake will generate the bundle according to the configuration and embed it.

- `CONFIG_MBEDTLS_CERTIFICATE_BUNDLE`: automatically build and attach the bundle.
- `CONFIG_MBEDTLS_DEFAULT_CERTIFICATE_BUNDLE`: decide which certificates to include from the complete root list.
- `CONFIG_MBEDTLS_CUSTOM_CERTIFICATE_BUNDLE_PATH`: specify the path of any additional certificates to embed in the bundle.

To enable the bundle when using ESP-TLS simply pass the function pointer to the bundle attach function:

```c
esp_tls_cfg_t cfg = {
    .crt_bundle_attach = esp_crt_bundle_attach,
};
```

This is done to avoid embedding the certificate bundle unless activated by the user.

If using mbedTLS directly then the bundle may be activated by directly calling the attach function during the setup process:

```c
mbedtls_ssl_config conf;
mbedtls_ssl_config_init(&conf);
esp_crt_bundle_attach(&conf);
```

Generating the List of Root Certificates

The list of root certificates comes from Mozilla’s NSS root certificate store, which can be found here. The list can be downloaded and created by running the script `mk-ca-bundle.pl` that is distributed as a part of curl. Another
alternative would be to download the finished list directly from the curl website: CA certificates extracted from Mozilla

The common certificates bundle were made by selecting the authorities with a market share of more than 1% from w3tech’s SSL Survey. These authorities were then used to pick the names of the certificates for the filter list, cmn_crtAuthorities.csv, from this list provided by Mozilla.

**Updating the Certificate Bundle**

The bundle is embedded into the app and can be updated along with the app by an OTA update. If you want to include a more up-to-date bundle than the bundle currently included in IDF, then the certificate list can be downloaded from Mozilla as described in *Updating the Certificate Bundle*.

**Application Example**

Simple HTTPS example that uses ESP-TLS to establish a secure socket connection using the certificate bundle with two custom certificates added for verification: protocols/https_x509_bundle.

HTTPS example that uses ESP-TLS and the default bundle: protocols/https_request.

HTTPS example that uses mbedTLS and the default bundle: protocols/https_mbedtls.

**API Reference**

**Header File**

- components/mbedtls/esp_crt_bundle/include/esp_crt_bundle.h

**Functions**

* esp_err_t esp_crt_bundle_attach(void *conf)

  Attach and enable use of a bundle for certificate verification.

  Attach and enable use of a bundle for certificate verification through a verification callback. If no specific bundle has been set through esp_crt_bundle_set() it will default to the bundle defined in menuconfig and embedded in the binary.

  **Return**

  - ESP_OK if adding certificates was successful.
  - Other if an error occurred or an action must be taken by the calling process.

  **Parameters**

  - [in] conf: The config struct for the SSL connection.

* esp_err_t esp_crt_bundle_detach(mbedtls_ssl_config *conf)

  Disable and deallocate the certification bundle.

  **Parameters**

  - [in] conf: The config struct for the SSL connection.

* esp_err_t esp_crt_bundle_set(const uint8_t *x509_bundle)

  Set the default certificate bundle used for verification.

  Overrides the default certificate bundle. In most use cases the bundle should be set through menuconfig. The bundle needs to be sorted by subject name since binary search is used to find certificates.

  **Parameters**

  - [in] x509_bundle: A pointer to the certificate bundle.

Code examples for this API section are provided in the protocols directory of ESP-IDF examples.
2.4.15 IP Network Layer

Documentation for IP Network Layer protocols (below the Application Protocol layer) are provided in Networking APIs.

2.5 Provisioning API

2.5.1 Protocol Communication

Overview

Protocol Communication (protocomm) component manages secure sessions and provides framework for multiple transports. The application can also use protocomm layer directly to have application specific extensions for the provisioning (or non-provisioning) use cases.

Following features are available for provisioning:

- Communication security at application level -
  - protocomm_security0 (no security)
  - protocomm_security1 (curve25519 key exchange + AES-CTR encryption)
- Proof-of-possession (support with protocomm_security1 only)

Protocomm internally uses protobuf (protocol buffers) for secure session establishment. Though users can implement their own security (even without using protobuf). One can even use protocomm without any security layer.

Protocomm provides framework for various transports - WiFi (SoftAP+HTTPD), BLE, console - in which case the handler invocation is automatically taken care of on the device side (see Transport Examples below for code snippets).

Note that the client still needs to establish session (only for protocomm_security1) by performing the two way handshake. See Unified Provisioning for more details about the secure handshake logic.

Transport Example (SoftAP + HTTP) with Security 1

For sample usage, see wifi_provisioning/src/scheme_softap.c

```c
/* Endpoint handler to be registered with protocomm. */
/* This simply echoes back the received data. */
esp_err_t echo_req_handler (uint32_t session_id,
const uint8_t *inbuf, ssize_t inlen,
uint8_t *outbuf, ssize_t *outlen,
void *priv_data)
{
  /* Session ID may be used for persistence */
  printf("Session ID : %d", session_id);

  /* Echo back the received data */
  *outlen = inlen; /* Output data length updated */
  *outbuf = malloc(inlen); /* This will be deallocated outside */
  memcpy(*outbuf, inbuf, inlen);

  /* Private data that was passed at the time of endpoint creation */
  uint32_t *priv = (uint32_t *) priv_data;
  if (priv) {
    printf("Private data : %d", *priv);
  }

  return ESP_OK;
}

/* Example function for launching a protocomm instance over HTTP */
```

(continues on next page)
protocomm_t *start_pc(const char *pop_string)
{
    protocomm_t *pc = protocomm_new();

    /* Config for protocomm_httpd_start() */
    protocomm_httpd_config_t pc_config = {
        .data = {
            .config = PROTOCOMM_HTTPD_DEFAULT_CONFIG()
        }
    };

    /* Start protocomm server on top of HTTP */
    protocomm_httpd_start(pc, &pc_config);

    /* Create Proof of Possession object from pop_string. It must be valid
    * throughout the scope of protocomm endpoint. This need not be
    * static,
    * ie. could be dynamically allocated and freed at the time of
    * endpoint
    * removal */
    const static protocomm_security_pop_t pop_obj = {
        .data = (const uint8_t *) strdup(pop_string),
        .len = strlen(pop_string)
    };

    /* Set security for communication at application level. Just like for
    * request handlers, setting security creates an endpoint and
    * registers
    * the handler provided by protocomm_security1. One can similarly use
    * protocomm_security0. Only one type of security can be set for a
    * protocomm instance at a time. */
    protocomm_set_security(pc, "security_endpoint", &protocomm_security1, &pop_obj);

    /* Private data passed to the endpoint must be valid throughout the
    * scope of protocomm endpoint. This need not be static, ie. could be
    * dynamically
    * allocated and freed at the time of endpoint removal */
    static uint32_t priv_data = 1234;

    /* Add a new endpoint for the protocomm instance, identified by a
    * unique name
    * and register a handler function along with private data to be
    * passed at the
    * time of handler execution. Multiple endpoints can be added as long
    * as they
    * are identified by unique names */
    protocomm_add_endpoint(pc, "echo_req_endpoint",
        echo_req_handler, (void *) &priv_data);

    return pc;
}

/* Example function for stopping a protocomm instance */
void stop_pc(protocomm_t *pc)
{
    /* Remove endpoint identified by it's unique name */
    protocomm_remove_endpoint(pc, "echo_req_endpoint");
    /* Remove security endpoint identified by it's name */
}
Transport Example (BLE) with Security 0

For sample usage, see wifi_provisioning/src/scheme_ble.c

```c
/* Example function for launching a secure protocomm instance over BLE */
protocomm_t *start_pc()
{
    protocomm_t *pc = protocomm_new();

    /* Endpoint UUIDs */
    protocomm_ble_name_uuid_t nu_lookup_table[] = {
        {"security_endpoint", 0xFF51},
        {"echo_req_endpoint", 0xFF52}
    };

    /* Config for protocomm_ble_start() */
    protocomm_ble_config_t config = {
        .service_uuid = {
            /* LSB <---------------------------------------
             * ---------------------------------------> MSB */
            0xfb, 0x34, 0x9b, 0x5f, 0x80, 0x00, 0x80, 0x00, 0x00, 0x00, 0xFF, 0xFF, 0x00, 0x00,
            0x00, 0x00, 0x00, 0x00, 0x00, 0xFF, 0xFF, 0x00, 0x00,
        },
        .nu_lookup_count = sizeof(nu_lookup_table)/sizeof(nu_lookup_table[0]),
        .nu_lookup = nu_lookup_table
    };

    /* Start protocomm layer on top of BLE */
    protocomm_ble_start(pc, &config);

    /* For protocomm_security0, Proof of Possession is not used, and can be kept NULL */
    protocomm_set_security(pc, "security_endpoint", prtocomm_security0, NULL);
    protocomm_add_endpoint(pc, "echo_req_endpoint", echo_req_handler, NULL);
    return pc;
}

/* Example function for stopping a protocomm instance */
void stop_pc(protocomm_t *pc)
{
    protocomm_remove_endpoint(pc, "echo_req_endpoint");
    protocomm_unset_security(pc, "security_endpoint");

    /* Stop BLE protocomm service */
    protocomm_BLE_stop(pc);
    protocomm_delete(pc);
}
```
Chapter 2. API Reference

API Reference

Header File

- components/protocomm/include/common/protocomm.h

Functions

protocomm_t *protocomm_new (void)
Create a new protocomm instance.

This API will return a new dynamically allocated protocomm instance with all elements of the protocomm_t
structure initialized to NULL.

Return

- protocomm_t*: On success
- NULL: No memory for allocating new instance

void protocomm_delete (protocomm_t *pc)
Delete a protocomm instance.

This API will deallocate a protocomm instance that was created using protocomm_new().

Parameters

- [in] pc: Pointer to the protocomm instance to be deleted

esp_err_t protocomm_add_endpoint (protocomm_t *pc, const char *ep_name, protocomm_reg_handler_t h, void *priv_data)
Add endpoint request handler for a protocomm instance.

This API will bind an endpoint handler function to the specified endpoint name, along with any private data
that needs to be pass to the handler at the time of call.

Note

- An endpoint must be bound to a valid protocomm instance, created using protocomm_new().
- This function internally calls the registered add_endpoint() function of the selected transport
which is a member of the protocomm_t instance structure.

Return

- ESP_OK : Success
- ESP_FAIL : Error adding endpoint / Endpoint with this name already exists
- ESP_ERR_NO_MEM : Error allocating endpoint resource
- ESP_ERR_INVALID_ARG : Null instance/name/handler arguments

Parameters

- [in] pc: Pointer to the protocomm instance
- [in] ep_name: Endpoint identifier(name) string
- [in] h: Endpoint handler function
- [in] priv_data: Pointer to private data to be passed as a parameter to the handler function on
call. Pass NULL if not needed.

esp_err_t protocomm_remove_endpoint (protocomm_t *pc, const char *ep_name)
Remove endpoint request handler for a protocomm instance.

This API will remove a registered endpoint handler identified by an endpoint name.

Note

- This function internally calls the registered remove_endpoint() function which is a member
of the protocomm_t instance structure.

Return

- ESP_OK : Success
- ESP_ERR_NOT_FOUND : Endpoint with specified name doesn’t exist
- ESP_ERR_INVALID_ARG : Null instance/name arguments

Parameters

- [in] pc: Pointer to the protocomm instance
- [in] ep_name: Endpoint identifier(name) string

**esp_err_t protocomm_open_session**(protocomm_t *pc, uint32_t session_id)

Allocates internal resources for new transport session.

**Note**
- An endpoint must be bound to a valid protocomm instance, created using `protocomm_new()`.

**Return**
- ESP_OK : Request handled successfully
- ESP_ERR_NO_MEM : Error allocating internal resource
- ESP_ERR_INVALID_ARG : Null instance/name arguments

**Parameters**
- [in] pc: Pointer to the protocomm instance
- [in] session_id: Unique ID for a communication session

**esp_err_t protocomm_close_session**(protocomm_t *pc, uint32_t session_id)

Frees internal resources used by a transport session.

**Note**
- An endpoint must be bound to a valid protocomm instance, created using `protocomm_new()`.

**Return**
- ESP_OK : Request handled successfully
- ESP_ERR_INVALID_ARG : Null instance/name arguments

**Parameters**
- [in] pc: Pointer to the protocomm instance
- [in] session_id: Unique ID for a communication session

**esp_err_t protocomm_req_handle**(protocomm_t *pc, const char *ep_name, uint32_t session_id, const uint8_t *inbuf, ssize_t inlen, uint8_t **outbuf, ssize_t *outlen)

Calls the registered handler of an endpoint session for processing incoming data and generating the response.

**Note**
- An endpoint must be bound to a valid protocomm instance, created using `protocomm_new()`.
- Resulting output buffer must be deallocated by the caller.

**Return**
- ESP_OK : Request handled successfully
- ESP_FAIL : Internal error in execution of registered handler
- ESP_ERR_NO_MEM : Error allocating internal resource
- ESP_ERR_NOT_FOUND : Endpoint with specified name doesn’t exist
- ESP_ERRINVALID_ARG : Null instance/name arguments

**Parameters**
- [in] pc: Pointer to the protocomm instance
- [in] ep_name: Endpoint identifier(name) string
- [in] session_id: Unique ID for a communication session
- [in] inbuf: Input buffer contains input request data which is to be processed by the registered handler
- [in] inlen: Length of the input buffer
- [out] outbuf: Pointer to internally allocated output buffer, where the resulting response data output from the registered handler is to be stored
- [out] outlen: Buffer length of the allocated output buffer

**esp_err_t protocomm_set_security**(protocomm_t *pc, const char *ep_name, const protocomm_security_t *sec, const protocomm_security_pop_t *pop)

Add endpoint security for a protocomm instance.

This API will bind a security session establisher to the specified endpoint name, along with any proof of possession that may be required for authenticating a session client.

**Note**
- An endpoint must be bound to a valid protocomm instance, created using `protocomm_new()`.
- The choice of security can be any `protocomm_security_t` instance. Choices `protocomm_security0` and `protocomm_security1` are readily available.
Return

- ESP_OK : Success
- ESP_FAIL : Error adding endpoint / Endpoint with this name already exists
- ESP_ERR_INVALID_STATE : Security endpoint already set
- ESP_ERR_NO_MEM : Error allocating endpoint resource
- ESP_ERR_INVALID_ARG : Null instance/name/handler arguments

Parameters

- [in] pc: Pointer to the protocomm instance
- [in] ep_name: Endpoint identifier(name) string
- [in] sec: Pointer to endpoint security instance
- [in] pop: Pointer to proof of possession for authenticating a client

```
esp_err_t protocomm_unset_security(protocomm_t *pc, const char *ep_name);
```

Remove endpoint security for a protocomm instance.

This API will remove a registered security endpoint identified by an endpoint name.

Return

- ESP_OK : Success
- ESP_ERR_NOT_FOUND: Endpoint with specified name doesn’t exist
- ESP_ERR_INVALID_ARG: Null instance/name arguments

Parameters

- [in] pc: Pointer to the protocomm instance
- [in] ep_name: Endpoint identifier(name) string

```
esp_err_t protocomm_set_version(protocomm_t *pc, const char *ep_name, const char *version);
```

Set endpoint for version verification.

This API can be used for setting an application specific protocol version which can be verified by clients through the endpoint.

Note

- An endpoint must be bound to a valid protocomm instance, created using protocomm_new().

Return

- ESP_OK : Success
- ESP_FAIL : Error adding endpoint / Endpoint with this name already exists
- ESP_ERR_INVALID_STATE : Version endpoint already set
- ESP_ERR_NO_MEM : Error allocating endpoint resource
- ESP_ERR_INVALID_ARG: Null instance/name/handler arguments

Parameters

- [in] pc: Pointer to the protocomm instance
- [in] ep_name: Endpoint identifier(name) string
- [in] version: Version identifier(name) string

```
esp_err_t protocomm_unset_version(protocomm_t *pc, const char *ep_name);
```

Remove version verification endpoint from a protocomm instance.

This API will remove a registered version endpoint identified by an endpoint name.

Return

- ESP_OK : Success
- ESP_ERR_NOT_FOUND: Endpoint with specified name doesn’t exist
- ESP_ERR_INVALID_ARG: Null instance/name arguments

Parameters

- [in] pc: Pointer to the protocomm instance
- [in] ep_name: Endpoint identifier(name) string

Type Definitions

```
typedef esp_err_t(*protocomm_req_handler_t)(uint32_t session_id, const uint8_t *inbuf, ssize_t inlen, uint8_t *outbuf, ssize_t *outlen, void *priv_data);
```

Function prototype for protocomm endpoint handler.
typedef struct protocomm protocomm_t

This structure corresponds to a unique instance of protocomm returned when the API protocomm_new() is called. The remaining Protocomm APIs require this object as the first parameter.

Note Structure of the protocomm object is kept private

Header File

- components/protocomm/include/security/protocomm_security.h

Structures

struct protocomm_security_pop

Proof Of Possession for authenticating a secure session.

Public Members

const uint8_t *data

Pointer to buffer containing the proof of possession data

uint16_t len

Length (in bytes) of the proof of possession data

struct protocomm_security

Protocomm security object structure.

The member functions are used for implementing secure protocomm sessions.

Note This structure should not have any dynamic members to allow re-entrancy

Public Members

int ver

Unique version number of security implementation

esp_err_t(*init)(protocomm_security_handle_t *handle)

Function for initializing/allocating security infrastructure

esp_err_t(*cleanup)(protocomm_security_handle_t handle)

Function for deallocating security infrastructure

esp_err_t(*new_transport_session)(protocomm_security_handle_t handle, uint32_t session_id)

Starts new secure transport session with specified ID

esp_err_t(*close_transport_session)(protocomm_security_handle_t handle, uint32_t session_id)

Closes a secure transport session with specified ID

esp_err_t(*security_req_handler)(protocomm_security_handle_t handle, const protocomm_security_pop_t *pop, uint32_t session_id, const uint8_t *inbuf, ssize_t inlen, uint8_t **outbuf, ssize_t *outlen, void *priv_data)

Handler function for authenticating connection request and establishing secure session

esp_err_t(*encrypt)(protocomm_security_handle_t handle, uint32_t session_id, const uint8_t *inbuf, ssize_t inlen, uint8_t *outbuf, ssize_t *outlen)

Function which implements the encryption algorithm

esp_err_t(*decrypt)(protocomm_security_handle_t handle, uint32_t session_id, const uint8_t *inbuf, ssize_t inlen, uint8_t *outbuf, ssize_t *outlen)

Function which implements the decryption algorithm
Type Definitions

typedef struct protocomm_security_pop protocomm_security_pop_t
    ProofOfPossession for authenticating a secure session.

typedef void *protocomm_security_handle_t

typedef struct protocomm_security protocomm_security_t
    Protocomm security object structure.

    The member functions are used for implementing secure protocomm sessions.

    Note  This structure should not have any dynamic members to allow re-entrancy.

Header File

- components/protocomm/include/security/protocomm_security0.h

Header File

- components/protocomm/include/security/protocomm_security1.h

Header File

- components/protocomm/include/transports/protocomm_httpd.h

Functions

esp_err_t protocomm_httpd_start (protocomm_t *pc, const protocomm_httpd_config_t *config)
    Start HTTPD protocomm transport.

    This API internally creates a framework to allow endpoint registration and security configuration for the protocomm.

    Note  This is a singleton. ie. Protocomm can have multiple instances, but only one instance can be bound to an HTTP transport layer.

    Return

    - ESP_OK : Success
    - ESP_ERR_INVALID_ARG : Null arguments
    - ESP_ERR_NOT_SUPPORTED : Transport layer bound to another protocomm instance
    - ESP_ERR_INVALID_STATE : Transport layer already bound to this protocomm instance
    - ESP_ERR_NO_MEM : Memory allocation for server resource failed
    - ESP_ERR_HTTPD_* : HTTP server error on start

    Parameters

    - [in] pc: Protocomm instance pointer obtained from protocomm_new()
    - [in] config: Pointer to config structure for initializing HTTP server

esp_err_t protocomm_httpd_stop (protocomm_t *pc)
    Stop HTTPD protocomm transport.

    This API cleans up the HTTPD transport protocomm and frees all the handlers registered with the protocomm.

    Return

    - ESP_OK : Success
    - ESP_ERR_INVALID_ARG : Null / incorrect protocomm instance pointer

    Parameters

    - [in] pc: Same protocomm instance that was passed to protocomm_httpd_start()

Unions

union protocomm_httpd_config_data_t
    #include <protocomm_httpd.h> Protocomm HTTPD Configuration Data
Public Members

void *handle
HTTP Server Handle, if ext_handle_provided is set to true

protocomm_http_server_config_t config
HTTP Server Configuration, if a server is not already active

Structures
struct protocomm_http_server_config_t
Config parameters for protocomm HTTP server.

Public Members

uint16_t port
Port on which the HTTP server will listen

size_t stack_size
Stack size of server task, adjusted depending upon stack usage of endpoint handler

unsigned task_priority
Priority of server task

struct protocomm_httpd_config_t
Config parameters for protocomm HTTP server.

Public Members

bool ext_handle_provided
Flag to indicate of an external HTTP Server Handle has been provided. In such case, protocomm will use the same HTTP Server and not start a new one internally.

protocomm_httpd_config_data_t data
Protocomm HTTPD Configuration Data

Macros

PROTOCOL_HTTPD_DEFAULT_CONFIG()

Header File

• components/protocomm/include/transports/protocomm_ble.h

Functions

esp_err_t protocomm_ble_start (protocomm_t *pc, const protocomm_ble_config_t *config)
Start Bluetooth Low Energy based transport layer for provisioning.

Initialize and start required BLE service for provisioning. This includes the initialization for characteristics/service for BLE.

Return

• ESP_OK : Success
• ESP_FAIL : Simple BLE start error
• ESP_ERR_NO_MEM : Error allocating memory for internal resources
• ESP_ERR_INVALID_STATE : Error in ble config
• ESP_ERR_INVALID_ARG : Null arguments

Parameters

• [in] pc: Protocomm instance pointer obtained from protocomm_new()
• [in] config: Pointer to config structure for initializing BLE
**protocomm_ble_stop** *(protocomm_t *)pc*

Stop Bluetooth Low Energy based transport layer for provisioning.

**Note** You might want to optionally reclaim memory from Bluetooth. Refer to the documentation of `esp_bt_mem_release` in that case.

**Return**
- ESP_OK: Success
- ESP_FAIL: Simple BLE stop error
- ESP_ERR_INVALID_ARG: Null / incorrect protocomm instance

**Parameters**
- **[in]** pc: Same protocomm instance that was passed to `protocomm_ble_start()`

**Structures**

**struct name_uuid**

This structure maps handler required by protocomm layer to UUIDs which are used to uniquely identify BLE characteristics from a smartphone or a similar client device.

**Public Members**

- **const char *name**
  Name of the handler, which is passed to protocomm layer

- **uint16_t uuid**
  UUID to be assigned to the BLE characteristic which is mapped to the handler

**struct protocomm_ble_config**

Config parameters for protocomm BLE service.

**Public Members**

- **char [MAX_BLE_DEVNAME_LEN] device_name**
  BLE device name being broadcast at the time of provisioning

- **uint8_t [BLE_UUID128_VAL_LENGTH] serviceUuid**
  128 bit UUID of the provisioning service

- **uint8_t *manufacturer_data**
  BLE device manufacturer data pointer in advertisement

- **ssize_t manufacturer_data_len**
  BLE device manufacturer data length in advertisement

- **ssize_t nu_lookup_count**
  Number of entries in the Name-UUID lookup table

**protocomm_ble_name_uuid_t *nu_lookup**

Pointer to the Name-UUID lookup table

**Macros**

- **MAX_BLE_DEVNAME_LEN**
  BLE device name cannot be larger than this value 31 bytes (max scan response size) - 1 byte (length) - 1 byte (type) = 29 bytes

- **BLE_UUID128_VAL_LENGTH**
  Theoretically, the limit for max manufacturer length remains same as BLE device name i.e. 31 bytes (max scan response size) - 1 byte (length) - 1 byte (type) = 29 bytes However, manufacturer data goes along with BLE device name in scan response. So, it is important to understand the actual length should be smaller than (29 - (BLE device name length) - 2).
Type Definitions

typedef struct name_uuid protocomm_ble_name_uuid_t
    This structure maps handler required by protocomm layer to UUIDs which are used to uniquely identify BLE characteristics from a smartphone or a similar client device.

typedef struct protocomm_ble_config protocomm_ble_config_t
    Config parameters for protocomm BLE service.

2.5.2 Unified Provisioning

Overview

Unified provisioning support in the ESP-IDF provides an extensible mechanism to the developers to configure the device with the Wi-Fi credentials and/or other custom configuration using various transports and different security schemes. Depending on the use-case it provides a complete and ready solution for Wi-Fi network provisioning along with example iOS and Android applications. Or developers can extend the device-side and phone-app side implementations to accommodate their requirements for sending additional configuration data. Following are the important features of this implementation.

1. **Extensible Protocol**: The protocol is completely flexible and it offers the ability for the developers to send custom configuration in the provisioning process. The data representation too is left to the application to decide.

2. **Transport Flexibility**: The protocol can work on Wi-Fi (SoftAP + HTTP server) or on BLE as a transport protocol. The framework provides an ability to add support for any other transport easily as long as command-response behaviour can be supported on the transport.

3. **Security Scheme Flexibility**: It’s understood that each use-case may require different security scheme to secure the data that is exchanged in the provisioning process. Some applications may work with SoftAP that’s WPA2 protected or BLE with “just-works” security. Or the applications may consider the transport to be insecure and may want application level security. The unified provisioning framework allows application to choose the security as deemed suitable.

4. **Compact Data Representation**: The protocol uses Google Protobufs as a data representation for session setup and Wi-Fi provisioning. They provide a compact data representation and ability to parse the data in multiple programming languages in native format. Please note that this data representation is not forced on application specific data and the developers may choose the representation of their choice.

Typical Provisioning Process

Deciding on Transport

Unified provisioning subsystem supports Wi-Fi (SoftAP+HTTP server) and BLE (GATT based) transport schemes. Following points need to be considered while selecting the best possible transport for provisioning.

1. BLE based transport has an advantage that in the provisioning process, the BLE communication channel stays intact between the device and the client. That provides reliable provisioning feedback.

2. BLE based provisioning implementation makes the user-experience better from the phone apps as on Android and iOS both, the phone app can discover and connect to the device without requiring user to go out of the phone app.

3. BLE transport however consumes ~110KB memory at runtime. If the product does not use the BLE or BT functionality after provisioning is done, almost all the memory can be reclaimed back and can be added into the heap.

4. SoftAP based transport is highly interoperable; however as the same radio is shared between SoftAP and Station interface, the transport is not reliable in the phase when the Wi-Fi connection to external AP is attempted. Also, the client may roam back to different network when the SoftAP changes the channel at the time of Station connection.

5. SoftAP transport does not require much additional memory for the Wi-Fi use-cases.

6. SoftAP based provisioning requires the phone app user to go to “System Settings” to connect to Wi-Fi network hosted by the device in case of iOS. The discovery (scanning) as well as connection API is not available for the iOS applications.

Wi-Fi GetStatus cmd (repeated)

Wi-Fi GetStatus resp (repeated)

4. Close connection

Close Connection
Deciding on Security

Depending on the transport and other constraints the security scheme needs to be selected by the application developers. Following considerations need to be given from the provisioning security perspective: 1. The configuration data sent from the client to the device and the response has to be secured. 2. The client should authenticate the device it is connected to. 3. The device manufacturer may choose proof-of-possession - a unique per device secret to be entered on the provisioning client as a security measure to make sure that the user can provisions the device in the possession.

There are two levels of security schemes. The developer may select one or combination depending on requirements.

1. **Transport Security:** SoftAP provisioning may choose WPA2 protected security with unique per-device passphrase. Per-device unique passphrase can also act as a proof-of-possession. For BLE, “just-works” security can be used as a transport level security after understanding the level of security it provides.

2. **Application Security:** The unified provisioning subsystem provides application level security (security1) that provides data protection and authentication (through proof-of-possession) if the application does not use the transport level security or if the transport level security is not sufficient for the use-case.

Device Discovery

The advertisement and device discovery is left to the application and depending on the protocol chosen, the phone apps and device firmware application can choose appropriate method to advertise and discovery.

For the SoftAP+HTTP transport, typically the SSID (network name) of the AP hosted by the device can be used for discovery.

For the BLE transport device name or primary service included in the advertisement or combination of both can be used for discovery.

Architecture

The below diagram shows architecture of unified provisioning.

It relies on the base layer called **Protocol Communication** (Protocol Communication) which provides a framework for security schemes and transport mechanisms. Wi-Fi Provisioning layer uses Protools to provide simple callbacks to the application for setting the configuration and getting the Wi-Fi status. The application has control over implementation of these callbacks. In addition application can directly use protocomm to register custom handlers.

Application creates a protocomm instance which is mapped to a specific transport and specific security scheme. Each transport in the protocomm has a concept of an “end-point” which corresponds to logical channel for communication for specific type of information. For example security handshake happens on a different endpoint than the Wi-Fi configuration endpoint. Each end-point is identified using a string and depending on the transport internal representation of the end-point changes. In case of SoftAP+HTTP transport the end-point corresponds to URI whereas in case of BLE the end-point corresponds to GATT characteristic with specific UUID. Developers can create custom end-points and implement handler for the data that is received or sent over the same end-point.

Security Schemes

At present unified provisioning supports two security schemes: 1. Security0 - No security (No encryption) 2. Security1 - Curve25519 based key exchange, shared key derivation and AES256-CTR mode encryption of the data. It supports two modes:

a. Authorized - Proof of Possession (PoP) string used to authorize session and derive shared key

b. No Auth (Null PoP) - Shared key derived through key exchange only

Security1 scheme details are shown in the below sequence diagram
Sample Code

Please refer to Protocol Communication and Wi-Fi Provisioning for API guides and code snippets on example usage. Application implementation can be found as an example under provisioning.

Provisioning Tools

Provisioning applications are available for various platforms, along with source code:

- **Android:**
  - BLE Provisioning app on Play Store.
  - SoftAP Provisioning app on Play Store.
  - Source code on GitHub: esp-idf-provisioning-android.

- **iOS:**
  - BLE Provisioning app on app store.
  - SoftAP Provisioning app on app Store.
  - Source code on GitHub: esp-idf-provisioning-ios.

- **Linux/MacOS/Windows:** tools/esp_prov (a python based command line tool for provisioning)

The phone applications offer simple UI and thus more user centric, while the command line application is useful as a debugging tool for developers.

2.5.3 Wi-Fi Provisioning

Overview

This component provides APIs that control Wi-Fi provisioning service for receiving and configuring Wi-Fi credentials over SoftAP or BLE transport via secure Protocol Communication (protocomm) sessions. The set of
Fig. 28: Security

Diagram showing the process of generating key pairs and verifying devices. The process involves:
1. Generating key pair:
   - `(cli_privkey, cli_pubkey) = curve25519.keygen()`
   - `(dev_privkey, dev_pubkey) = curve25519.keygen()`
2. SessionCmd0 with `cli_pubkey`
3. SessionCmd1 with `cli_verify`
4. Verifying client with `check (dev_pubkey == aes_ctr_dec(cli_verify))`
5. Verifying device with `check (cli_pubkey == aes_ctr_dec(dev_verify))`
6. Shared key generation:
   - `shared_key(No PoP) = curve25519(dev_privkey, cli_pubkey)`
   - `shared_key(with PoP) = curve25519(dev_privkey, cli_pubkey) ^ SHA256(pop)`
7. SessionResp0 with `dev_pubkey, dev_rand`
8. SessionResp1 with `dev_verify`
**Chapter 2. API Reference**

`wifi_prov_mgr_` APIs help in quickly implementing a provisioning service having necessary features with minimal amount of code and sufficient flexibility.

**Initialization**  `wifi_prov_mgr_init()` is called to configure and initialize the provisioning manager and thus this must be called prior to invoking any other `wifi_prov_mgr_` APIs. Note that the manager relies on other components of IDF, namely NVS, TCP/IP, Event Loop and Wi-Fi (and optionally mDNS), hence these must be initialized beforehand. The manager can be de-initialized at any moment by making a call to `wifi_prov_mgr_deinit()`.

```c
wifi_prov_mgr_config_t config = {
    .scheme = wifi_prov_scheme_ble,
    .scheme_event_handler = WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BTDM
};
ESP_ERROR_CHECK( wifi_prov_mgr_init(config) );
```

The configuration structure `wifi_prov_mgr_config_t` has a few fields to specify the behavior desired of the manager:

- **scheme**: This is used to specify the provisioning scheme. Each scheme corresponds to one of the modes of transport supported by protocomm. Hence, we have three options:
  - `wifi_prov_scheme_ble`: BLE transport and GATT Server for handling provisioning commands
  - `wifi_prov_scheme_softap`: Wi-Fi SoftAP transport and HTTP Server for handling provisioning commands
  - `wifi_prov_scheme_console`: Serial transport and console for handling provisioning commands

- **scheme_event_handler**: An event handler defined along with scheme. Choosing appropriate scheme specific event handler allows the manager to take care of certain matters automatically. Presently this is not used for either SoftAP or Console based provisioning, but is very convenient for BLE. To understand how, we must recall that Bluetooth requires quite some amount of memory to function and once provisioning is finished, the main application may want to reclaim back this memory (or part of it, if it needs to use either BLE or classic BT). Also, upon every future reboot of a provisioned device, this reclamation of memory needs to be performed again. To reduce this complication in using `wifi_prov_scheme_ble`, the scheme specific handlers have been defined, and depending upon the chosen handler, the BLE / classic BT / BTDM memory will be freed automatically when the provisioning manager is de-initialized. The available options are:
  - `WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BTDM` - Free both classic BT and BLE (BTDM) memory. Used when main application doesn’t require Bluetooth at all.
  - `WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BLE` - Free only BLE memory. Used when main application requires classic BT.
  - `WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BT` - Free only classic BT. Used when main application requires BLE. In this case freeing happens right when the manager is initialized.
  - `WIFI_PROV_EVENT_HANDLER_NONE` - Don’t use any scheme specific handler. Used when provisioning scheme is not BLE (i.e. SoftAP or Console), or when main application wants to handle the memory reclaiming on its own, or needs both BLE and classic BT to function.

- **app_event_handler** (Deprecated): It is now recommended to catch `WIFI_PROV_EVENT`'s that are emitted to the default event loop handler. See definition of `wifi_prov_cb_event_t` for the list of events that are generated by the provisioning service. Here is an excerpt showing some of the provisioning events:

```c
static void event_handler(void* arg, esp_event_base_t event_base, int event_id, void* event_data)
{
    if (event_base == WIFI_PROV_EVENT) {
        switch (event_id) {
            case WIFI_PROV_START:
                ESP_LOGI(TAG, "Provisioning started");
        }
    }
}
```

(continues on next page)
break;
case WIFI_PROV_CRED_RECV: {
    wifi_sta_config_t *wifi_sta_cfg = (wifi_sta_config_t *)event_data;
    ESP_LOGI(TAG, "Received Wi-Fi credentials
    \n    SSID : %s
    Password : %s",
    (const char *) wifi_sta_cfg->ssid,
    (const char *) wifi_sta_cfg->password);
    break;
}
case WIFI_PROV_CRED_FAIL: {
    wifi_prov_sta_fail_reason_t *reason = (wifi_prov_sta_fail_reason_t *)event_data;
    ESP_LOGE(TAG, "Provisioning failed!\n    Reason : %s"
    "\n    Please reset to factory and retry"
    "\n    provision",
    ("reason == WIFI_PROV_STA_AUTH_ERROR") ?
    "Wi-Fi station authentication failed" : "Wi-Fi_
    access-point not found");
    break;
}
case WIFI_PROV_CRED_SUCCESS: ESP_LOGI(TAG, "Provisioning successful");
    break;
case WIFI_PROV_END: /* De-initialize manager once provisioning is finished */
    wifi_prov_mgr_deinit();
    break;
default:
    break;
}
}

The manager can be de-initialized at any moment by making a call to `wifi_prov_mgr_deinit()`.

**Check Provisioning State** Whether device is provisioned or not can be checked at runtime by calling `wifi_prov_mgr_is_provisioned()`. This internally checks if the Wi-Fi credentials are stored in NVS.

Note that presently manager does not have its own NVS namespace for storage of Wi-Fi credentials, instead it relies on the `esp_wifi_` APIs to set and get the credentials stored in NVS from the default location.

If provisioning state needs to be reset, any of the following approaches may be taken:

- the associated part of NVS partition has to be erased manually
- main application must implement some logic to call `esp_wifi_` APIs for erasing the credentials at runtime
- main application must implement some logic to force start the provisioning irrespective of the provisioning state

```c
bool provisioned = false;
ESP_ERROR_CHECK( wifi_prov_mgr_is_provisioned(&provisioned) );
```

**Start Provisioning Service** At the time of starting provisioning we need to specify a service name and the corresponding key. These translate to:

- Wi-Fi SoftAP SSID and passphrase, respectively, when scheme is `wifi_prov_scheme_softap`
- BLE Device name (service key is ignored) when scheme is `wifi_prov_scheme_ble`

Also, since internally the manager uses `protocomm`, we have the option of choosing one of the security features provided by it:
• Security 1 is secure communication which consists of a prior handshake involving X25519 key exchange along with authentication using a proof of possession (pop), followed by AES-CTR for encryption/decryption of subsequent messages
• Security 0 is simply plain text communication. In this case the pop is simply ignored

See Provisioning for details about the security features.

```c
const char *service_name = "my_device";
const char *service_key = "password";

wifi_prov_security_t security = WIFI_PROV_SECURITY_1;
const char *pop = "abcd1234";
ESP_ERROR_CHECK( wifi_prov_mgr_start_provisioning(security, pop, service_name, service_key) );
```

The provisioning service will automatically finish only if it receives valid Wi-Fi AP credentials followed by successfully connection of device to the AP (IP obtained). Regardless of that, the provisioning service can be stopped at any moment by making a call to `wifi_prov_mgr_stop_provisioning()`.

**Note:** If the device fails to connect with the provided credentials, it won’t accept new credentials anymore, but the provisioning service will keep on running (only to convey failure to the client), until the device is restarted. Upon restart the provisioning state will turn out to be true this time (as credentials will be found in NVS), but device will again fail to connect with those same credentials (unless an AP with the matching credentials somehow does become available). This situation can be fixed by resetting the credentials in NVS or force starting the provisioning service. This has been explained above in Check Provisioning State.

### Waiting For Completion

Typically, the main application will wait for the provisioning to finish, then de-initialize the manager to free up resources and finally start executing its own logic.

There are two ways for making this possible. The simpler way is to use a blocking call to `wifi_prov_mgr_wait()`.

```c
// Start provisioning service
ESP_ERROR_CHECK( wifi_prov_mgr_start_provisioning(security, pop, service_name, service_key) );

// Wait for service to complete
wifi_prov_mgr_wait();

// Finally de-initialize the manager
wifi_prov_mgr_deinit();
```

The other way is to use the default event loop handler to catch WIFI_PROV_EVENT’s and call :cpp:func:`wifi_prov_mgr_deinit()` when event ID is `WIFI_PROV_END`:

```c
static void event_handler(void* arg, esp_event_base_t event_base, int event_id, void* event_data)
{
    if (event_base == WIFI_PROV_EVENT && event_id == WIFI_PROV_END) {
        /* De-initialize manager once provisioning is finished */
        wifi_prov_mgr_deinit();
    }
}
```

### User Side Implementation

When the service is started, the device to be provisioned is identified by the advertised service name which, depending upon the selected transport, is either the BLE device name or the SoftAP SSID.
When using SoftAP transport, for allowing service discovery, mDNS must be initialized before starting provisioning. In this case the hostname set by the main application is used, and the service type is internally set to _esp_wifi_prov.

When using BLE transport, a custom 128 bit UUID should be set using wifi_prov_scheme_ble_set_service_uuid(). This UUID will be included in the BLE advertisement and will correspond to the primary GATT service that provides provisioning endpoints as GATT characteristics. Each GATT characteristic will be formed using the primary service UUID as base, with different auto assigned 12th and 13th bytes (assume counting starts from 0th byte). Since, an endpoint characteristic UUID is auto assigned, it shouldn’t be used to identify the endpoint. Instead, client side applications should identify the endpoints by reading the User Characteristic Description (0x2901) descriptor for each characteristic, which contains the endpoint name of the characteristic. For example, if the service UUID is set to 55cc035e-fb27-4f80-be02-3c60828b7451, each endpoint characteristic will be assigned a UUID like 55cc_____–fb27-4f80-be02-3c60828b7451, with unique values at the 12th and 13th bytes.

Once connected to the device, the provisioning related protocomm endpoints can be identified as follows:

<table>
<thead>
<tr>
<th>Endpoint Name</th>
<th>URI (SoftAP + HTTP Server + mDNS)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>prov-session</td>
<td>http://&lt;mdns-hostname&gt;.local/prov-session</td>
<td>Security endpoint used for session establishment</td>
</tr>
<tr>
<td>prov-scan</td>
<td><a href="http://wifi-prov.local/prov-scan">http://wifi-prov.local/prov-scan</a></td>
<td>Endpoint used for starting Wi-Fi scan and receiving scan results</td>
</tr>
<tr>
<td>prov-config</td>
<td>http://&lt;mdns-hostname&gt;.local/prov-config</td>
<td>Endpoint used for configuring Wi-Fi credentials on device</td>
</tr>
<tr>
<td>proto-ver</td>
<td>http://&lt;mdns-hostname&gt;.local/proto-ver</td>
<td>Endpoint for retrieving version info</td>
</tr>
</tbody>
</table>

Immediately after connecting, the client application may fetch the version / capabilities information from the proto-ver endpoint. All communications to this endpoint are un-encrypted, hence necessary information (that may be relevant for deciding compatibility) can be retrieved before establishing a secure session. The response is in JSON format and looks like: prov: { ver: v1.1, cap: [no_pop] }, my_app: { ver: 1.345, cap: [cloud, local_ctrl] },...... Here label prov provides provisioning service version (ver) and capabilities (cap). For now, only no_pop capability is supported, which indicates that the service doesn’t require proof of possession for authentication. Any application related version / capabilities will be given by other labels (like my_app in this example). These additional fields are set using wifi_prov_mgr_set_app_info().

User side applications need to implement the signature handshaking required for establishing and authenticating secure protocomm sessions as per the security scheme configured for use (this is not needed when manager is configured to use protocomm security 0).

See Unified Provisioning for more details about the secure handshake and encryption used. Applications must use the .proto files found under protocomm/proto, which define the Protobuf message structures supported by prov-session endpoint.

Once a session is established, Wi-Fi credentials are configured using the following set of wifi_config commands, serialized as Protobuf messages (the corresponding .proto files can be found under wifi_provisioning/proto) :

- **get_status** - For querying the Wi-Fi connection status. The device will respond with a status which will be one of connecting / connected / disconnected. If status is disconnected, a disconnection reason will also be included in the status response.
- **set_config** - For setting the Wi-Fi connection credentials
- **apply_config** - For applying the credentials saved during set_config and start the Wi-Fi station

After session establishment, client can also request Wi-Fi scan results from the device. The results returned is a list of AP SSIDs, sorted in descending order of signal strength. This allows client applications to display APs nearby to the device at the time of provisioning, and users can select one of the SSIDs and provide the password which is
then sent using the `wifi_config` commands described above. The `wifi_scan` endpoint supports the following protobuf commands:

- **scan_start** - For starting Wi-Fi scan with various options:
  - **blocking** (input) - If true, the command returns only when the scanning is finished
  - **passive** (input) - If true scan is started in passive mode (this may be slower) instead of active mode
  - **group_channels** (input) - This specifies whether to scan all channels in one go (when zero) or perform scanning of channels in groups, with 120ms delay between scanning of consecutive groups, and the value of this parameter sets the number of channels in each group. This is useful when transport mode is SoftAP, where scanning all channels in one go may not give the Wi-Fi driver enough time to send out beacons, and hence may cause disconnection with any connected stations. When scanning in groups, the manager will wait for at least 120ms after completing scan on a group of channels, and thus allow the driver to send out the beacons. For example, given that the total number of Wi-Fi channels is 14, then setting `group_channels` to 4, will create 5 groups, with each group having 3 channels, except the last one which will have 14 % 3 = 2 channels. So, when scan is started, the first 3 channels will be scanned, followed by a 120ms delay, and then the next 3 channels, and so on, until all the 14 channels have been scanned. One may need to adjust this parameter as having only few channels in a group may slow down the overall scan time, while having too many may again cause disconnection. Usually a value of 4 should work for most cases. Note that for any other mode of transport, e.g. BLE, this can be safely set to 0, and hence achieve the fastest overall scanning time.
  - **period_ms** (input) - Scan parameter specifying how long to wait on each channel
- **scan_status** - Gives the status of scanning process:
  - **scan_finished** (output) - When scan has finished this returns true
  - **result_count** (output) - This gives the total number of results obtained till now. If scan is yet happening this number will keep on updating
- **scan_result** - For fetching scan results. This can be called even if scan is still on going
  - **start_index** (input) - Starting index from where to fetch the entries from the results list
  - **count** (input) - Number of entries to fetch from the starting index
  - **entries** (output) - List of entries returned. Each entry consists of `ssid`, `channel` and `rssi` information

### Additional Endpoints
In case users want to have some additional protocomm endpoints customized to their requirements, this is done in two steps. First is creation of an endpoint with a specific name, and the second step is the registration of a handler for this endpoint. See `protocomm` for the function signature of an endpoint handler. A custom endpoint must be created after initialization and before starting the provisioning service. Whereas, the protocomm handler is registered for this endpoint only after starting the provisioning service.

```c
void wifi_prov_mgr_init(config);
void wifi_prov_mgr_endpoint_create("custom-endpoint");
void wifi_prov_mgr_start_provisioning(security, pop, service_name, service_key);
void wifi_prov_mgr_endpoint_register("custom-endpoint", custom_ep_handler, custom_ep_data);
```

When the provisioning service stops, the endpoint is unregistered automatically.

One can also choose to call `wifi_prov_mgr_endpoint_unregister()` to manually deactivate an endpoint at runtime. This can also be used to deactivate the internal endpoints used by the provisioning service.

### When / How To Stop Provisioning Service?

The default behavior is that once the device successfully connects using the Wi-Fi credentials set by the `apply_config` command, the provisioning service will be stopped (and BLE / SoftAP turned off) automatically after responding to the next `get_status` command. If `get_status` command is not received by the device, the service will be stopped after a 30s timeout.

On the other hand, if device was not able to connect using the provided Wi-Fi credentials, due to incorrect SSID / passphrase, the service will keep running, and `get_status` will keep responding with disconnected status and reason for disconnection. Any further attempts to provide another set of Wi-Fi credentials, will be rejected. These credentials will be preserved, unless the provisioning service is force started, or NVS erased.

If this default behavior is not desired, it can be disabled by calling `wifi_prov_mgr_disable_auto_stop()`. Now the provisioning service will only be stopped after an explicit call to
wifi_prov_mgr_stop_provisioning(), which returns immediately after scheduling a task for stopping
the service. The service stops after a certain delay and WIFI_PROV_END event gets emitted. This delay is specified
by the argument to wifi_prov_mgr_disable_auto_stop().

The customized behavior is useful for applications which want the provisioning service to be stopped some
time after the Wi-Fi connection is successfully established. For example, if the application requires the de-
vice to connect to some cloud service and obtain another set of credentials, and exchange this credentials
over a custom protocomm endpoint, then after successfully doing so stop the provisioning service by calling
wifi_prov_mgr_stop_provisioning() inside the protocomm handler itself. The right amount of de-
lay ensures that the transport resources are freed only after the response from the protocomm handler reaches the
client side application.

Application Examples

For complete example implementation see provisioning/wifi_prov_mgr

Provisioning Tools

Provisioning applications are available for various platforms, along with source code:

- **Android:**
  - BLE Provisioning app on Play Store.
  - SoftAP Provisioning app on Play Store.
  - Source code on GitHub: esp-idf-provisioning-android.

- **iOS:**
  - BLE Provisioning app on App Store.
  - SoftAP Provisioning app on App Store.
  - Source code on GitHub: esp-idf-provisioning-ios.

- **Linux/MacOS/Windows:** tools/esp_prov (a python based command line tool for provisioning)

The phone applications offer simple UI and thus more user centric, while the command line application is useful as
a debugging tool for developers.

API Reference

Header File

- components/wifi_provisioning/include/wifi_provisioning/manager.h

Functions

`esp_err_t wifi_prov_mgr_init(wifi_prov_mgr_config_t config)`

Initialize provisioning manager instance.

Configures the manager and allocates internal resources

Configuration specifies the provisioning scheme (transport) and event handlers

Event WIFI_PROV_INIT is emitted right after initialization is complete

Return

- ESP_OK : Success
- ESP_FAIL : Fail

Parameters

- [in] config: Configuration structure

`void wifi_prov_mgr_deinit(void)`

Stop provisioning (if running) and release resource used by the manager.

Event WIFI_PROV_DEINIT is emitted right after de-initialization is finished
If provisioning service is still active when this API is called, it first stops the service, hence emitting WIFI_PROV_END, and then performs the de-initialization

```c
esp_err_t wifi_prov_mgr_is_provisioned (bool *provisioned)
```

Checks if device is provisioned.

This checks if Wi-Fi credentials are present on the NVS

The Wi-Fi credentials are assumed to be kept in the same NVS namespace as used by esp_wifi component

If one were to call esp_wifi_set_config() directly instead of going through the provisioning process, this function will still yield true (i.e. device will be found to be provisioned)

**Note** Calling wifi_prov_mgr_start_provisioning() automatically resets the provision state, irrespective of what the state was prior to making the call.

**Return**

- **ESP_OK**: Retrieved provision state successfully
- **ESP_FAIL**: Wi-Fi not initialized
- **ESP_ERR_INVALID_ARG**: Null argument supplied
- **ESP_ERR_INVALID_STATE**: Manager not initialized

**Parameters**

- **[out]** provisioned: True if provisioned, else false

```c
esp_err_t wifi_prov_mgr_start_provisioning (wifi_prov_security_t security, const char *pop, const char *service_name, const char *service_key)
```

Start provisioning service.

This starts the provisioning service according to the scheme configured at the time of initialization. For scheme :

- **wifi_prov_scheme_ble**: This starts protocomm_ble, which internally initializes BLE transport and starts GATT server for handling provisioning requests
- **wifi_prov_scheme_softap**: This activates SoftAP mode of Wi-Fi and starts protocomm_httpd, which internally starts an HTTP server for handling provisioning requests (If mDNS is active it also starts advertising service with type _esp_wifi_prov._tcp)

Event WIFI_PROV_START is emitted right after provisioning starts without failure

**Note** This API will start provisioning service even if device is found to be already provisioned, i.e. wifi_prov_mgr_is_provisioned() yields true

**Return**

- **ESP_OK**: Provisioning started successfully
- **ESP_FAIL**: Failed to start provisioning service
- **ESP_ERR_INVALID_STATE**: Provisioning manager not initialized or already started

**Parameters**

- **[in]** security: Specify which protocomm security scheme to use :
  - WIFI_PROV_SECURITY_0: For no security
  - WIFI_PROV_SECURITY_1: x25519 secure handshake for session establishment followed by AES-CTR encryption of provisioning messages
- **[in]** pop: Pointer to proof of possession string (NULL if not needed). This is relevant only for protocomm security 1, in which case it is used for authenticating secure session
- **[in]** service_name: Unique name of the service. This translates to:
  - Wi-Fi SSID when provisioning mode is softAP
  - Device name when provisioning mode is BLE
- **[in]** service_key: Key required by client to access the service (NULL if not needed). This translates to:
  - Wi-Fi password when provisioning mode is softAP
  - ignored when provisioning mode is BLE

```c
void wifi_prov_mgr_stop_provisioning (void)
```

Stop provisioning service.
If provisioning service is active, this API will initiate a process to stop the service and return. Once the service actually stops, the event WIFI_PROV_END will be emitted.

If wifi_prov_mgr_deinit() is called without calling this API first, it will automatically stop the provisioning service and emit the WIFI_PROV_END, followed by WIFI_PROV_DEINIT, before returning.

This API will generally be used along with wifi_prov_mgr_disable_auto_stop() in the scenario when the main application has registered its own endpoints, and wishes that the provisioning service is stopped only when some protocomm command from the client side application is received.

Calling this API inside an endpoint handler, with sufficient cleanup_delay, will allow the response / acknowledgment to be sent successfully before the underlying protocomm service is stopped.

Cleanup_delay is set when calling wifi_prov_mgr_disable_auto_stop(). If not specified, it defaults to 1000ms.

For straightforward cases, using this API is usually not necessary as provisioning is stopped automatically once WIFI_PROV_CRED_SUCCESS is emitted. Stopping is delayed (maximum 30 seconds) thus allowing the client side application to query for Wi-Fi state, i.e. after receiving the first query and sending Wi-Fi state connected response the service is stopped immediately.

```c
void wifi_prov_mgr_wait (void)
    // Wait for provisioning service to finish.

    // Calling this API will block until provisioning service is stopped i.e. till event WIFI_PROV_END is emitted.
    // This will not block if provisioning is not started or not initialized.
```

```c
esp_err_t wifi_prov_mgr_disable_auto_stop (uint32_t cleanup_delay)
    // Disable auto stopping of provisioning service upon completion.

    // By default, once provisioning is complete, the provisioning service is automatically stopped, and all endpoints
    // (along with those registered by main application) are deactivated.

    // This API is useful in the case when main application wishes to close provisioning service only after it receives
    // some protocomm command from the client side app. For example, after connecting to Wi-Fi, the device may
    // want to connect to the cloud, and only once that is successfully, the device is said to be fully configured. But,
    // then it is up to the main application to explicitly call wifi_prov_mgr_stop_provisioning() later when the device
    // is fully configured and the provisioning service is no longer required.

    // Note This must be called before executing wifi_prov_mgr_start_provisioning()

    // Return
    // • ESP_OK : Success
    // • ESP_ERR_INVALID_STATE : Manager not initialized or provisioning service already started

    // Parameters
    // • [in] cleanup_delay: Sets the delay after which the actual cleanup of transport related resources is done after a call to wifi_prov_mgr_stop_provisioning() returns. Minimum allowed value is 100ms. If not specified, this will default to 1000ms.
```

```c
esp_err_t wifi_prov_mgr_set_app_info (const char *label, const char *version, const char **capabilities, size_t total_capabilities)
    // Set application version and capabilities in the JSON data returned by proto-ver endpoint.

    // This function can be called multiple times, to specify information about the various application specific services
    // running on the device, identified by unique labels.

    // The provisioning service itself registers an entry in the JSON data, by the label “prov”, containing only
    // provisioning service version and capabilities. Application services should use a label other than “prov” so as
    // not to overwrite this.

    // Note This must be called before executing wifi_prov_mgr_start_provisioning()

    // Return
    // • ESP_OK : Success
    // • ESP_ERR_INVALID_STATE : Manager not initialized or provisioning service already started
    // • ESP_ERR_NO_MEM : Failed to allocate memory for version string
    // • ESP_ERR_INVALID_ARG : Null argument

    // Parameters
```
Chapter 2. API Reference

- [in] label: String indicating the application name.
- [in] version: String indicating the application version. There is no constraint on format.
- [in] capabilities: Array of strings with capabilities. These could be used by the client side app to know the application registered endpoint capabilities
- [in] total_capabilities: Size of capabilities array

```c
esp_err_t wifi_prov_mgr_endpoint_create(const char *ep_name)
```

Create an additional endpoint and allocate internal resources for it.

This API is to be called by the application if it wants to create an additional endpoint. All additional endpoints will be assigned UUIDs starting from 0xFF54 and so on in the order of execution.

proto comm handler for the created endpoint is to be registered later using wifi_prov_mgr_endpoint_register() after provisioning has started.

Note This API can only be called BEFORE provisioning is started

Note Additional endpoints can be used for configuring client provided parameters other than Wi-Fi credentials, that are necessary for the main application and hence must be set prior to starting the application

Note After session establishment, the additional endpoints must be targeted first by the client side application before sending Wi-Fi configuration, because once Wi-Fi configuration finishes the provisioning service is stopped and hence all endpoints are unregistered

Return
- ESP_OK : Success
- ESP_FAIL : Failure

Parameters
- [in] ep_name: unique name of the endpoint

```c
esp_err_t wifi_prov_mgr_endpoint_register(const char *ep_name, proto comm_req_handler_t handler, void *user_ctx)
```

Register a handler for the previously created endpoint.

This API can be called by the application to register a protocomm handler to any endpoint that was created using wifi_prov_mgr_endpoint_create().

Note This API can only be called AFTER provisioning has started

Note Additional endpoints can be used for configuring client provided parameters other than Wi-Fi credentials, that are necessary for the main application and hence must be set prior to starting the application

Note After session establishment, the additional endpoints must be targeted first by the client side application before sending Wi-Fi configuration, because once Wi-Fi configuration finishes the provisioning service is stopped and hence all endpoints are unregistered

Return
- ESP_OK : Success
- ESP_FAIL : Failure

Parameters
- [in] ep_name: Name of the endpoint
- [in] handler: Endpoint handler function
- [in] user_ctx: User data

```c
void wifi_prov_mgr_endpoint_unregister(const char *ep_name)
```

Unregister the handler for an endpoint.

This API can be called if the application wants to selectively unregister the handler of an endpoint while the provisioning is still in progress.

All the endpoint handlers are unregistered automatically when the provisioning stops.

Parameters
- [in] ep_name: Name of the endpoint

```c
esp_err_t wifi_prov_mgr_event_handler(void *ctx, system_event_t *event)
```

Event handler for provisioning manager.

This is called from the main event handler and controls the provisioning manager’s internal state machine depending on incoming Wi-Fi events
Chapter 2. API Reference

Note: This function is DEPRECATED, because events are now handled internally using the event loop library, esp_event. Calling this will do nothing and simply return ESP_OK.

Return
- ESP_OK: Event handled successfully

Parameters
- [in] ctx: Event context data
- [in] event: Event info

```c
esp_err_t wifi_prov_mgr_get_wifi_state (wifi_prov_sta_state_t *state)
```
Get state of Wi-Fi Station during provisioning.

Return
- ESP_OK: Successfully retrieved Wi-Fi state
- ESP_FAIL: Provisioning app not running

Parameters
- [out] state: Pointer to wifi_prov_sta_state_t variable to be filled

```c
esp_err_t wifi_prov_mgr_get_wifi_disconnect_reason (wifi_prov_sta_fail_reason_t *reason)
```
Get reason code in case of Wi-Fi station disconnection during provisioning.

Return
- ESP_OK: Successfully retrieved Wi-Fi disconnect reason
- ESP_FAIL: Provisioning app not running

Parameters
- [out] reason: Pointer to wifi_prov_sta_fail_reason_t variable to be filled

```c
esp_err_t wifi_prov_mgr_configure_sta (wifi_config_t *wifi_cfg)
```
Runs Wi-Fi as Station with the supplied configuration.

Configures the Wi-Fi station mode to connect to the AP with SSID and password specified in config structure and sets Wi-Fi to run as station.

This is automatically called by provisioning service upon receiving new credentials.

If credentials are to be supplied to the manager via a different mode other than through proto comm, then this API needs to be called.

Event WIFI_PROV_CRED_RECV is emitted after credentials have been applied and Wi-Fi station started

Return
- ESP_OK: Wi-Fi configured and started successfully
- ESP_FAIL: Failed to set configuration

Parameters
- [in] wifi_cfg: Pointer to Wi-Fi configuration structure

```c
esp_err_t wifi_prov_mgr_reset_provisioning (void)
```
Reset Wi-Fi provisioning config.

Calling this API will restore WiFi stack persistent settings to default values.

Return
- ESP_OK: Reset provisioning config successfully
- ESP_FAIL: Failed to reset provisioning config

```c
esp_err_t wifi_prov_mgr_reset_sm_state_on_failure (void)
```
Reset internal state machine and clear provisioned credentials.

This API can be used to restart provisioning in case invalid credentials are entered.

Return
- ESP_OK: Reset provisioning state machine successfully
- ESP_FAIL: Failed to reset provisioning state machine
- ESP_ERR_INVALID_STATE: Manager not initialized
Structures

`struct wifi_prov_event_handler_t`
- Event handler that is used by the manager while provisioning service is active.

**Public Members**

`wifi_prov_cb_func_t event_cb`
- Callback function to be executed on provisioning events

`void *user_data`
- User context data to pass as parameter to callback function

`struct wifi_prov_scheme`
- Structure for specifying the provisioning scheme to be followed by the manager.

**Note** Ready to use schemes are available:
- `wifi_prov_scheme_ble`: for provisioning over BLE transport + GATT server
- `wifi_prov_scheme_softap`: for provisioning over SoftAP transport + HTTP server
- `wifi_prov_scheme_console`: for provisioning over Serial UART transport + Console (for debugging)

**Public Members**

`esp_err_t (*prov_start)(protocomm_t *pc, void *config)`
- Function which is to be called by the manager when it is to start the provisioning service associated with a protocomm instance and a scheme specific configuration

`esp_err_t (*prov_stop)(protocomm_t *pc)`
- Function which is to be called by the manager to stop the provisioning service previously associated with a protocomm instance

`void *(*new_config)(void)`
- Function which is to be called by the manager to generate a new configuration for the provisioning service, that is to be passed to `prov_start()`

`void *(*delete_config)(void *config)`
- Function which is to be called by the manager to delete a configuration generated using `new_config()`

`esp_err_t (*set_config_service)(void *config, const char *service_name, const char *service_key)`
- Function which is to be called by the manager to set the service name and key values in the configuration structure

`esp_err_t (*set_config_endpoint)(void *config, const char *endpoint_name, uint16_t uuid)`
- Function which is to be called by the manager to set a protocomm endpoint with an identifying name and UUID in the configuration structure

`wifi_mode_t wifi_mode`
- Sets mode of operation of Wi-Fi during provisioning This is set to :
  - `WIFI_MODE_APSTA` for SoftAP transport
  - `WIFI_MODE_STA` for BLE transport

`struct wifi_prov_mgr_config_t`
- Structure for specifying the manager configuration.

**Public Members**

`wifi_prov_scheme_t scheme`
- Provisioning scheme to use. Following schemes are already available:
  - `wifi_prov_scheme_ble`: for provisioning over BLE transport + GATT server
• wifi_prov_scheme_softap: for provisioning over SoftAP transport + HTTP server + mDNS (optional)
• wifi_prov_scheme_console: for provisioning over Serial UART transport + Console (for debugging)

`wifi_prov_scheme_softap` scheme_event_handler
Event handler required by the scheme for incorporating scheme specific behavior while provisioning manager is running. Various options may be provided by the scheme for setting this field. Use WIFI_PROV_EVENT_HANDLER_NONE when not used. When using scheme wifi_prov_scheme_ble, the following options are available:

• WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BTDM
• WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BLE
• WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BT

`wifi_prov_scheme_console` app_event_handler
Event handler that can be set for the purpose of incorporating application specific behavior. Use WIFI_PROV_EVENT_HANDLER_NONE when not used.

Macros

WIFI_PROV_EVENT_HANDLER_NONE
Event handler can be set to none if not used.

Type Definitions

typedef void (*wifi_prov_cb_func_t)(void *user_data, wifi_prov_cb_event_t event, void *event_data)
typedef struct wifi_prov_scheme wifi_prov_scheme_t
Structure for specifying the provisioning scheme to be followed by the manager.

Note Ready to use schemes are available:
• wifi_prov_scheme_ble: for provisioning over BLE transport + GATT server
• wifi_prov_scheme_softap: for provisioning over SoftAP transport + HTTP server
• wifi_prov_scheme.console: for provisioning over Serial UART transport + Console (for debugging)

typedef enum wifi_prov_security wifi_prov_security_t
Security modes supported by the Provisioning Manager.
These are same as the security modes provided by protocomm

Enumerations

enum wifi_prov_cb_event_t
Events generated by manager.
These events are generated in order of declaration and, for the stretch of time between initialization and de-initialization of the manager, each event is signaled only once

Values:

WIFI_PROV_INIT
Emitted when the manager is initialized

WIFI_PROV_START
Indicates that provisioning has started

WIFI_PROV_CRED_RECV
Emitted when Wi-Fi AP credentials are received via protocomm endpoint wifi_config. The event data in this case is a pointer to the corresponding wifi_sta_config_t structure

WIFI_PROV_CRED_FAIL
Emitted when device fails to connect to the AP of which the credentials were received earlier on event WIFI_PROV_CRED_RECV. The event data in this case is a pointer to the disconnection reason code with type wifi_prov_sta_fail_reason_t
**WIFI_PROV_CRED_SUCCESS**
Emitted when device successfully connects to the AP of which the credentials were received earlier on event WIFI_PROV_CRED_RECV

**WIFI_PROV_END**
Signals that provisioning service has stopped

**WIFI_PROV_DEINIT**
Signals that manager has been de-initialized

```c
enum wifi_prov_security
Security modes supported by the Provisioning Manager.
These are same as the security modes provided by protocomm

Values:

WIFI_PROV_SECURITY_0 = 0
No security (plain-text communication)

WIFI_PROV_SECURITY_1
This secure communication mode consists of X25519 key exchange
• proof of possession (pop) based authentication
• AES-CTR encryption
```

**Header File**

- components/wifi_provisioning/include/wifi_provisioning/scheme_ble.h

**Functions**

```c
void wifi_prov_scheme_ble_event_cb_free_btdm (void *user_data, wifi_prov_cb_event_t event, void *event_data)

void wifi_prov_scheme_ble_event_cb_free_ble (void *user_data, wifi_prov_cb_event_t event, void *event_data)

void wifi_prov_scheme_ble_event_cb_free_bt (void *user_data, wifi_prov_cb_event_t event, void *event_data)

esp_err_t wifi_prov_scheme_ble_set_service_uuid (uint8_t *uuid128)
Set the 128 bit GATT service UUID used for provisioning.

This API is used to override the default 128 bit provisioning service UUID, which is 0000fff8-0000-1000-8000-00805f9b34fb.

This must be called before starting provisioning, i.e. before making a call to wifi_prov_mgr_start_provisioning(), otherwise the default UUID will be used.

**Note** The data being pointed to by the argument must be valid atleast till provisioning is started. Upon start, the manager will store an internal copy of this UUID, and this data can be freed or invalidated afterwords.

**Return**

- ESP_OK : Success
- ESP_ERR_INVALID_ARG : Null argument

**Parameters**

- [in] uuid128: A custom 128 bit UUID

```c
esp_err_t wifi_prov_scheme_ble_set_mfg_data (uint8_t *mfg_data, ssize_t mfg_data_len)
Set manufacturer specific data in scan response.

This must be called before starting provisioning, i.e. before making a call to wifi_prov_mgr_start_provisioning().

**Note** It is important to understand that length of custom manufacturer data should be within limits. The manufacturer data goes into scan response along with BLE device name. By default, BLE device name length is of 11 Bytes, however it can vary as per application use case. So, one has to honour the scan
response data size limits i.e. \((mfg\_data\_len + 2) < 31 - (device\_name\_length + 2)\). If the \(mfg\_data\_len\) length exceeds this limit, the length will be truncated.

**Return**
- ESP_OK: Success
- ESP_ERR_INVALID_ARG: Null argument

**Parameters**
- \[\text{in}\] \text{mfg\_data}: Custom manufacturer data
- \[\text{in}\] \text{mfg\_data\_len}: Manufacturer data length

**Macros**
- WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BTDM
- WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BLE
- WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BT
