## 1 Get Started
1.1 Introduction .......................................................... 3
1.2 What You Need ..................................................... 3
1.3 Development Board Overviews .................................... 4
  1.3.1 ESP32-S3-DevKitC-1 ........................................ 4
  1.3.2 ESP32-S3-DevKitM-1 ........................................ 9
1.4 Installation Step by Step ......................................... 15
  1.4.1 Setting up Development Environment .......................... 15
  1.4.2 Creating Your First Project ................................. 16
1.5 Step 1. Install prerequisites ...................................... 16
  1.5.1 Standard Setup of Toolchain for Windows .................. 16
  1.5.2 Standard Setup of Toolchain for Linux ..................... 21
  1.5.3 Standard Setup of Toolchain for MacOS ................... 21
1.6 Step 2. Get ESP-IDF ................................................ 23
  1.6.1 Linux and macOS ............................................. 23
  1.6.2 Windows ...................................................... 23
1.7 Step 3. Set up the tools .......................................... 23
  1.7.1 Windows ...................................................... 24
  1.7.2 Linux and macOS ............................................. 24
  1.7.3 Alternative File Downloads .................................. 24
  1.7.4 Customizing the tools installation path .................... 25
1.8 Step 4. Set up the environment variables ....................... 25
  1.8.1 Windows ...................................................... 25
  1.8.2 Linux and macOS ............................................. 25
1.9 Step 5. Start a Project ............................................ 26
  1.9.1 Linux and macOS ............................................. 26
  1.9.2 Windows ...................................................... 26
1.10 Step 6. Connect Your Device ..................................... 26
1.11 Step 7. Configure ............................................... 26
  1.11.1 Linux and macOS ............................................. 26
  1.11.2 Windows ...................................................... 27
1.12 Step 8. Build the Project ....................................... 27
1.13 Step 9. Flash onto the Device .................................. 28
  1.13.1 Encountered Issues While Flashing? ......................... 28
  1.13.2 Normal Operation ........................................... 29
1.14 Step 10. Monitor .................................................. 30
1.15 Updating ESP-IDF ................................................ 31
1.16 Related Documents ................................................ 31
  1.16.1 Establish Serial Connection with ESP32-S3 ................ 31
  1.16.2 Build and Flash with Eclipse IDE ......................... 37
  1.16.3 Getting Started with VS Code IDE ......................... 37
  1.16.4 IDF Monitor ................................................. 38
  1.16.5 Customized Setup of Toolchain ............................ 42

## 2 API Reference

---

i
## 2.1 Bluetooth API

- 2.1.1 Controller && VHCI .................................................. 49
- 2.1.2 BT COMMON ...................................................... 56
- 2.1.3 BT LE ............................................................... 61
- 2.1.4 NimBLE-based host APIs ........................................ 153
- 2.1.5 ESP-BLE-MESH .................................................. 156

## 2.2 Networking APIs

- 2.2.1 Wi-Fi ............................................................. 368
- 2.2.2 Ethernet .......................................................... 450
- 2.2.3 Thread ........................................................... 473
- 2.2.4 ESP-NETIF ....................................................... 478
- 2.2.5 IP Network Layer ................................................ 495
- 2.2.6 Application Layer ................................................ 498

## 2.3 Peripherals API

- 2.3.1 Analog to Digital Converter (ADC) .......................... 499
- 2.3.2 General Purpose Timer ......................................... 518
- 2.3.3 GPIO & RTC GPIO ............................................... 529
- 2.3.4 Dedicated GPIO .................................................. 548
- 2.3.5 Hash-based Message Authentication Code (HMAC) .... 551
- 2.3.6 Digital Signature (DS) ......................................... 555
- 2.3.7 Inter-Integrated Circuit (I2C) ................................ 560
- 2.3.8 Inter-IC Sound (I2S) ............................................ 575
- 2.3.9 LCD ................................................................. 591
- 2.3.10 LED Control (LEDC) ......................................... 603
- 2.3.11 Motor Control Pulse Width Modulator (MCPWM) ..... 616
- 2.3.12 Pulse Counter (PCNT) ......................................... 640
- 2.3.13 Remote Control (RMT) ........................................ 649
- 2.3.14 SD Pull-up Requirements ...................................... 668
- 2.3.15 SDMMC Host Driver ........................................... 671
- 2.3.16 SD SPI Host Driver ............................................. 676
- 2.3.17 Sigma-delta Modulation ...................................... 681
- 2.3.18 SPI Master Driver .............................................. 684
- 2.3.19 SPI Slave Driver .............................................. 702
- 2.3.20 Touch Sensor ..................................................... 708
- 2.3.21 Two-Wire Automotive Interface (TWAI) .................. 729
- 2.3.22 Universal Asynchronous Receiver/Transmitter (UART) 744
- 2.3.23 USB Device Driver ............................................ 767
- 2.3.24 USB Host ........................................................ 774

## 2.4 Application Protocols

- 2.4.1 ASIO port ........................................................ 794
- 2.4.2 ESP-MQTT ......................................................... 794
- 2.4.3 ESP-TLS .......................................................... 805
- 2.4.4 OpenSSL-APIs .................................................. 816
- 2.4.5 ESP HTTP Client ................................................ 844
- 2.4.6 HTTP Server ..................................................... 856
- 2.4.7 HTTPS server .................................................... 878
- 2.4.8 ICMP Echo ........................................................ 881
- 2.4.9 ESP Local Control .............................................. 885
- 2.4.10 mDNS Service ................................................... 894
- 2.4.11 ESP-Modbus ..................................................... 907
- 2.4.12 ESP WebSocket Client ........................................ 929
- 2.4.13 ESP Serial Slave Link ....................................... 936
- 2.4.14 ESP x509 Certificate Bundle .............................. 948
- 2.4.15 IP Network Layer ............................................. 950

## 2.5 Provisioning API

- 2.5.1 Protocol Communication ....................................... 951
- 2.5.2 Unified Provisioning ............................................ 961
- 2.5.3 Wi-Fi Provisioning .............................................. 964

This is the documentation for Espressif IoT Development Framework (esp-idf). ESP-IDF is the official development framework for the ESP32, ESP32-S and ESP32-C Series SoCs.

This document describes using ESP-IDF with the ESP32-S3 SoC.

**Warning:** Not all documents are updated for ESP32-S3 yet.
Chapter 1

Get Started

This document is intended to help you set up the software development environment for the hardware based on the ESP32-S3 chip by Espressif. After that, a simple example will show you how to use ESP-IDF (Espressif IoT Development Framework) for menu configuration, then for building and flashing firmware onto an ESP32-S3 board.

Note: This is documentation for the master branch (latest version) of ESP-IDF. This version is under continual development. Stable version documentation is available, as well as other ESP-IDF Versions.

1.1 Introduction

ESP32-S3 is a system on a chip that integrates the following features:

- Wi-Fi (2.4 GHz band)
- Bluetooth Low Energy
- Dual high performance Xtensa® 32-bit LX7 CPU cores
- Ultra Low Power co-processor running either RISC-V or FSM core
- Multiple peripherals
- Built-in security hardware
- USB OTG interface
- USB Serial/JTAG Controller

Powered by 40 nm technology, ESP32-S3 provides a robust, highly integrated platform, which helps meet the continuous demands for efficient power usage, compact design, security, high performance, and reliability.

Espressif provides basic hardware and software resources to help application developers realize their ideas using the ESP32-S3 series hardware. The software development framework by Espressif is intended for development of Internet-of-Things (IoT) applications with Wi-Fi, Bluetooth, power management and several other system features.

1.2 What You Need

Hardware:

- An ESP32-S3 board
- USB cable - USB A / micro USB B
- Computer running Windows, Linux, or macOS

Software:

You have a choice to either download and install the following software manually

- Toolchain to compile code for ESP32-S3
Chapter 1. Get Started

- **Build tools** - CMake and Ninja to build a full **Application** for ESP32-S3
- **ESP-IDF** that essentially contains API (software libraries and source code) for ESP32-S3 and scripts to operate the **Toolchain**

or get through the onboarding process using the following official plugins for integrated development environments (IDE) described in separate documents

- Eclipse Plugin (installation link)
- VS Code Extension (setup)

![Fig. 1: Development of applications for ESP32-S3](image)

1.3 Development Board Overviews

If you have one of ESP32-S3 development boards listed below, you can click on the link to learn more about its hardware.

1.3.1 ESP32-S3-DevKitC-1

This user guide will help you get started with ESP32-S3-DevKitC-1 and will also provide more in-depth information.

The ESP32-S3-DevKitC-1 is an entry-level development board equipped with either ESP32-S3-WROOM-1 or ESP32-S3-WROOM-1U, a general-purpose Wi-Fi + Bluetooth® LE MCU module that integrates complete Wi-Fi and Bluetooth LE functions.

Most of the I/O pins on the module are broken out to the pin headers on both sides of this board for easy interfacing. Developers can either connect peripherals with jumper wires or mount ESP32-S3-DevKitC-1 on a breadboard.

The document consists of the following major sections:
• **Getting started**: Overview of the board and hardware/software setup instructions to get started.
• **Hardware Reference**: More detailed information about the board’s hardware.
• **Hardware Revision Details**: Revision history, known issues, and links to user guides for previous versions (if any) of the board.
• **Related Documents**: Links to related documentation.

Getting Started

This section provides a brief introduction of ESP32-S3-DevKitC-1, instructions on how to do the initial hardware setup and how to flash firmware onto it.

![ESP32-S3-DevKitC-1 front](image)

**Fig. 3: ESP32-S3-DevKitC-1 - front**

**Description of Components**  
The key components of the board are described in a counter-clockwise direction.
<table>

</tbody>
</table>

Start Application Development  Before powering up your board, please make sure that it is in good condition with no obvious signs of damage.

Required Hardware

- ESP32-S3-DevKitC-1
- USB 2.0 cable (Standard-A to Micro-B)
- Computer running Windows, Linux, or macOS

Note: Be sure to use an appropriate USB cable. Some cables are for charging only and do not provide the needed data lines nor work for programming the boards.

Hardware Setup  Connect the board with the computer using USB-to-UART Port. Connection using ESP32-S3 USB Port is not fully implemented in software. In subsequent steps, USB-to-UART Port will be used by default.

Software Setup  Please proceed to Get Started, where Section Installation Step by Step will quickly help you set up the development environment and then flash an application example onto your board.

Contents and Packaging

Retail orders  If you order a few samples, each board comes in an individual package in either antistatic bag or any packaging depending on your retailer.

For retail orders, please go to https://www.espressif.com/en/company/contact/buy-a-sample.

Wholesale Orders  If you order in bulk, the boards come in large cardboard boxes.

For wholesale orders, please go to https://www.espressif.com/en/contact-us/sales-questions.
Chapter 1. Get Started

Hardware Reference

Block Diagram  The block diagram below shows the components of ESP32-S3-DevKitC-1 and their interconnections.

![Block Diagram](fig_4)

**Power Supply Options**  There are three mutually exclusive ways to provide power to the board:

- USB-to-UART Port and ESP32-S3 USB Port (either one or both), default power supply (recommended)
- 5V and G (GND) pins
- 3V3 and G (GND) pins

**Header Block**  The two tables below provide the **Name** and **Function** of the pins on both sides of the board (J1 and J3). The pin names are shown in *ESP32-S3-DevKitC-1 - front*. The numbering is the same as in the Board Schematic (PDF).

1.3.2 ESP32-S3-DevKitM-1

This user guide will help you get started with ESP32-S3-DevKitM-1 and will also provide more in-depth information. The ESP32-S3-DevKitM-1 is an entry-level development board equipped with either ESP32-S3-MINI-1 or ESP32-S3-MINI-1U, a module named for its small size. This board integrates complete Wi-Fi and Bluetooth Low Energy functions.

Most of the I/O pins on the module are broken out to the pin headers on both sides of this board for easy interfacing. Developers can either connect peripherals with jumper wires or mount ESP32-S3-DevKitM-1 on a breadboard.
Fig. 6: ESP32-S3-DevKitM-1 with ESP32-S3-MINI-1 Module
The document consists of the following major sections:

- **Getting Started**: Overview of the board and hardware/software setup instructions to get started.
- **Hardware Reference**: More detailed information about the board’s hardware.
- **Related Documents**: Links to related documentation.

**Getting Started**

This section provides a brief introduction of ESP32-S3-DevKitM-1, instructions on how to do the initial hardware setup and how to flash firmware onto it.

![ESP32-S3-DevKitM-1 diagram](image)

**Description of Components**  The key components of the board are described in a counter-clockwise direction, starting from the ESP32-S3-MINI-1/1U module.
ESP32-S3-MINI-1/1U are two general-purpose Wi-Fi and Bluetooth LE combo modules that have a rich set of peripherals. ESP32-S3-MINI-1 comes with a PCB antenna. ESP32-S3-MINI-1U comes with an external antenna connector. At the core of the modules is ESP32-S3FN8, a chip equipped with an 8 MB flash. Since flash is packaged in the chip, rather than integrated into the module, ESP32-S3-MINI-1/1U has a smaller package size.

5 V to 3.3 V LDO: Power regulator that converts a 5 V supply into a 3.3 V output.
Pin Headers: All available GPIO pins (except for the SPI bus for flash) are broken out to the pin headers on the board for easy interfacing and programming. For details, please see Header Block.
USB-to-UART Port: A Micro-USB port used for power supply to the board, for flashing applications to the chip, as well as for communication with the chip via the on-board USB-to-UART bridge.
Boot Button: Download button. Holding down Boot and then pressing Reset initiates Firmware Download mode for downloading firmware through the serial port.
Reset Button: Press this button to restart ESP32-S3.
ESP32-S3 USB Port: ESP32-S3 full-speed USB OTG interface, compliant with the USB 1.1 specification. The interface is used for power supply to the board, for flashing applications to the chip, for communication with the chip using USB 1.1 protocols, as well as for JTAG debugging.
USB-to-UART Bridge: Single USB-to-UART bridge chip provides transfer rates up to 3 Mbps.
RGB LED: Addressable RGB LED, driven by GPIO48.
3.3 V Power On LED: Turns on when the USB power is connected to the board.

Start Application Development: Before powering up your board, please make sure that it is in good condition with no obvious signs of damage.

Required Hardware:
- ESP32-S3-DevKitM-1
- USB 2.0 cable (Standard-A to Micro-B)
- Computer running Windows, Linux, or macOS

Note: Be sure to use an appropriate USB cable. Some cables are for charging only and do not provide the needed data lines nor work for programming the boards.

Hardware Setup: Connect the board with the computer using USB-to-UART Port. Connection using ESP32-S3 USB Port is not fully implemented in software. In subsequent steps, USB-to-UART Port will be used by default.

Software Setup: Please proceed to Get Started, where Section Installation Step by Step will quickly help you set up the development environment and then flash an application example onto your board.

Contents and Packaging:

Retail Orders: If you order a few samples, each board comes in an individual package in either antistatic bag or any packaging depending on your retailer.

For retail orders, please go to https://www.espressif.com/en/company/contact/buy-a-sample.
**Wholesale Orders**  If you order in bulk, the boards come in large cardboard boxes. For wholesale orders, please go to [https://www.espressif.com/en/contact-us/sales-questions](https://www.espressif.com/en/contact-us/sales-questions).

1.4 Installation Step by Step
This is a detailed roadmap to walk you through the installation process.

1.4.1 Setting up Development Environment

- Step 1. Install prerequisites for Windows, Linux, or macOS
- Step 2. Get ESP-IDF
Chapter 1. Get Started

- Step 3. Set up the tools
- Step 4. Set up the environment variables

1.4.2 Creating Your First Project

- Step 5. Start a Project
- Step 6. Connect Your Device
- Step 7. Configure
- Step 8. Build the Project
- Step 9. Flash onto the Device
- Step 10. Monitor

1.5 Step 1. Install prerequisites

Some tools need to be installed on the computer before proceeding to the next steps. Follow the links below for the instructions for your OS:

1.5.1 Standard Setup of Toolchain for Windows

Introduction

ESP-IDF requires some prerequisite tools to be installed so you can build firmware for supported chips. The prerequisite tools include Python, Git, cross-compilers, CMake and Ninja build tools.

For this Getting Started we’re going to use the Command Prompt, but after ESP-IDF is installed you can use Eclipse or another graphical IDE with CMake support instead.

**Note:** Limitations: - The installation path of ESP-IDF and ESP-IDF Tools must not be longer than 90 characters. Too long installation paths might result in a failed build. - The installation path of Python or ESP-IDF must not contain white spaces or parentheses. - The installation path of Python or ESP-IDF should not contain special characters (non-ASCII) unless the operating system is configured with “Unicode UTF-8” support.

System Administrator can enable the support via Control Panel - Change date, time, or number formats - Administrative tab - Change system locale - check the option “Beta: Use Unicode UTF-8 for worldwide language support” - Ok and reboot the computer.

ESP-IDF Tools Installer

The easiest way to install ESP-IDF’s prerequisites is to download one of ESP-IDF Tools Installers from this URL: https://dl.espressif.com/dl/esp-idf/?idf=4.4

**What is the usecase for Online and Offline Installer** Online Installer is very small and allows the installation of all available releases of ESP-IDF. The installer will download only necessary dependencies including Git For Windows during the installation process. The installer stores downloaded files in the cache directory %userprofile%\espressif

Offline Installer does not require any network connection. The installer contains all required dependencies including Git For Windows.
Chapter 1. Get Started

Components of the installation The installer deploys the following components:

- Embedded Python
- Cross-compilers
- OpenOCD
- CMake and Ninja build tools
- ESP-IDF

The installer also allows reusing the existing directory with ESP-IDF. The recommended directory is `%userprofile%\Desktop\esp-idf` where `%userprofile%` is your home directory.

Launching ESP-IDF Environment At the end of the installation process you can check out option Run ESP-IDF PowerShell Environment or Run ESP-IDF Command Prompt (cmd.exe). The installer will launch ESP-IDF environment in selected prompt.

Run ESP-IDF PowerShell Environment:

Fig. 10: Completing the ESP-IDF Tools Setup Wizard with Run ESP-IDF PowerShell Environment

Run ESP-IDF Command Prompt (cmd.exe):

Using the Command Prompt

For the remaining Getting Started steps, we’re going to use the Windows Command Prompt.

ESP-IDF Tools Installer also creates a shortcut in the Start menu to launch the ESP-IDF Command Prompt. This shortcut launches the Command Prompt (cmd.exe) and runs `export.bat` script to set up the environment variables (PATH, IDF_PATH and others). Inside this command prompt, all the installed tools are available.
Chapter 1. Get Started

C:\Users\test\esp\idf\tools\idf-exe\1.0.1\bin
C:\Users\test\esp\idf\tools\ccache\3.7\bin
C:\Users\test\esp\idf\tools\dfu-util\0.9\dfu-util\0.9-win64\bin
C:\Users\test\esp\idf\tools\python_env\idfp4.5_py3.7_env\Scripts\\Users\test\esp\idf\tools\bin

Checking if Python packages are up to date...
Python requirements from C:\Users\test\esp\esp-idf\requirements.txt are satisfied.

Done! You can now compile ESP-IDF projects.
Go to the project directory and run:

```
\ idf.py build
```

C:\Users\test\esp\esp-idf>
```
Chapter 1. Get Started

Note that this shortcut is specific to the ESP-IDF directory selected in the ESP-IDF Tools Installer. If you have multiple ESP-IDF directories on the computer (for example, to work with different versions of ESP-IDF), you have two options to use them:

1. Create a copy of the shortcut created by the ESP-IDF Tools Installer, and change the working directory of the new shortcut to the ESP-IDF directory you wish to use.
2. Alternatively, run `cmd.exe`, then change to the ESP-IDF directory you wish to use, and run `export.bat`. Note that unlike the previous option, this way requires Python and Git to be present in PATH. If you get errors related to Python or Git not being found, use the first option.

Next Steps

If the ESP-IDF Tools Installer has finished successfully, then the development environment setup is complete. Proceed directly to Step 5. Start a Project.

Related Documents

For advanced users who want to customize the install process:

Updating ESP-IDF tools on Windows

**Install ESP-IDF tools using a script** From the Windows Command Prompt, change to the directory where ESP-IDF is installed. Then run:

```
install.bat
```

For Powershell, change to the directory where ESP-IDF is installed. Then run:

```
install.ps1
```

This will download and install the tools necessary to use ESP-IDF. If the specific version of the tool is already installed, no action will be taken. The tools are downloaded and installed into a directory specified during ESP-IDF Tools Installer process. By default, this is `C:\Users\username\.espressif`.

**Add ESP-IDF tools to PATH using an export script** ESP-IDF tools installer creates a Start menu shortcut for “ESP-IDF Command Prompt”. This shortcut opens a Command Prompt window where all the tools are already available.

In some cases, you may want to work with ESP-IDF in a Command Prompt window which wasn’t started using that shortcut. If this is the case, follow the instructions below to add ESP-IDF tools to PATH.

In the command prompt where you need to use ESP-IDF, change to the directory where ESP-IDF is installed, then execute `export.bat`:

```
cd %userprofile%\esp\esp-idf
export.bat
```

Alternatively in the Powershell where you need to use ESP-IDF, change to the directory where ESP-IDF is installed, then execute `export.ps1`:

```
cd ~/esp/esp-idf
export.ps1
```

When this is done, the tools will be available in this command prompt.
1.5.2 Standard Setup of Toolchain for Linux

Install Prerequisites

To compile with ESP-IDF you need to get the following packages. The command to run depends on which distribution of Linux you are using:

• Ubuntu and Debian:

```bash
sudo apt-get install git wget flex bison gperf python3 python3-pip python3-setuptools cmake ninja-build ccache libffi-dev libssl-dev dfu-util libusb1.0-0
```

• CentOS 7 & 8:

```bash
sudo yum -y update && sudo yum install git wget flex bison gperf python3-pip python3-setuptools cmake ninja-build ccache dfu-util libusb
```

CentOS 7 is still supported but CentOS version 8 is recommended for a better user experience.

• Arch:

```bash
sudo pacman -S --needed gcc git make flex bison gperf python-pip cmake ninja-ccache dfu-util libusb
```

Note:

• CMake version 3.5 or newer is required for use with ESP-IDF. Older Linux distributions may require updating, enabling of a “backports” repository, or installing of a “cmake3” package rather than “cmake”.
• If you do not see your Linux distribution in the above list then please check its documentation to find out which command to use for package installation.

Additional Tips

Permission issues /dev/ttyUSB0 With some Linux distributions you may get the Failed to open port /dev/ttyUSB0 error message when flashing the ESP32-S3. This can be solved by adding the current user to the dialout group.

Python compatibility

ESP-IDF supports Python 3.6 or newer. It is recommended to upgrade your operating system to a recent version satisfying this requirement. Other options include the installation of Python from sources or the use of a Python version management system such as pyenv.

Next Steps

To carry on with development environment setup, proceed to Step 2. Get ESP-IDF.

1.5.3 Standard Setup of Toolchain for Mac OS

Install Prerequisites

ESP-IDF will use the version of Python installed by default on macOS.

• install pip:
Chapter 1. Get Started

```bash
sudo easy_install pip
```

- **install CMake & Ninja build:**
  - If you have HomeBrew, you can run:
    ```bash
    brew install cmake ninja dfu-util
    ```
  - If you have MacPorts, you can run:
    ```bash
    sudo port install cmake ninja dfu-util
    ```
  - Otherwise, consult the CMake and Ninja home pages for macOS installation downloads.

- It is strongly recommended to also install ccache for faster builds. If you have HomeBrew, this can be done via `brew install ccache` or `sudo port install ccache` on MacPorts.

**Note:** If an error like this is shown during any step:

```bash
```

Then you will need to install the XCode command line tools to continue. You can install these by running `xcode-select --install`.

---

**Installing Python 3** Basing on macOS Catalina 10.15 release notes, use of Python 2.7 is not recommended and Python 2.7 will not be included by default in future versions of macOS. Check what Python you currently have:

```bash
python --version
```

If the output is like `Python 2.7.17`, your default interpreter is Python 2.7. If so, also check if Python 3 isn’t already installed on your computer:

```bash
python3 --version
```

If above command returns an error, it means Python 3 is not installed.

Below is an overview of steps to install Python 3.

- Installing with HomeBrew can be done as follows:
  ```bash
  brew install python3
  ```
  - If you have MacPorts, you can run:
    ```bash
    sudo port install python38
    ```

**Next Steps**

To carry on with development environment setup, proceed to Step 2, Get ESP-IDF.
## Chapter 1. Get Started

<table>
<thead>
<tr>
<th>Windows</th>
<th>Linux</th>
<th>Mac OS</th>
</tr>
</thead>
</table>

**Note:** This guide uses the directory `~/esp` on Linux and macOS or `%userprofile%\esp` on Windows as an installation folder for ESP-IDF. You can use any directory, but you will need to adjust paths for the commands respectively. Keep in mind that ESP-IDF does not support spaces in paths.

### 1.6 Step 2. Get ESP-IDF

To build applications for the ESP32-S3, you need the software libraries provided by Espressif in ESP-IDF repository. To get ESP-IDF, navigate to your installation directory and clone the repository with `git clone`, following instructions below specific to your operating system.

#### 1.6.1 Linux and macOS

Open Terminal, and run the following commands:

```bash
mkdir -p ~/esp
cd ~/esp
git clone --recursive https://github.com/espressif/esp-idf.git
```

ESP-IDF will be downloaded into `~/esp/esp-idf`.

Consult ESP-IDF Versions for information about which ESP-IDF version to use in a given situation.

#### 1.6.2 Windows

In addition to installing the tools, ESP-IDF Tools Installer for Windows introduced in Step 1 can also download a copy of ESP-IDF. Consult ESP-IDF Versions for information about which ESP-IDF version to use in a given situation.

If you wish to download ESP-IDF without the help of ESP-IDF Tools Installer, refer to these instructions.

### 1.7 Step 3. Set up the tools

Aside from the ESP-IDF, you also need to install the tools used by ESP-IDF, such as the compiler, debugger, Python packages, etc.
Chapter 1. Get Started

1.7.1 Windows

*ESP-IDF Tools Installer* for Windows introduced in Step 1 installs all the required tools.

If you want to install the tools without the help of ESP-IDF Tools Installer, open the Command Prompt and follow these steps:

```
cd %userprofile%\esp\esp-idf
install.bat esp32s3
```

or with Windows PowerShell

```
cd ~/esp/esp-idf
./install.ps1 esp32s3
```

1.7.2 Linux and macOS

```
cd ~/esp/esp-idf
./install.sh esp32s3
```

or with Fish shell

```
cd ~/esp/esp-idf
./install.fish esp32s3
```

**Note:** To install tools for multiple targets you can specify those targets at once. For example: `./install.sh esp32,esp32c3,esp32s3`. To install tools for all supported targets, run the script without specifying targets `./install.sh` or use `./install.sh all`.

1.7.3 Alternative File Downloads

The tools installer downloads a number of files attached to GitHub Releases. If accessing GitHub is slow then it is possible to set an environment variable to prefer Espressif’s download server for GitHub asset downloads.

**Note:** This setting only controls individual tools downloaded from GitHub releases, it doesn’t change the URLs used to access any Git repositories.

**Windows**

To prefer the Espressif download server when running the ESP-IDF Tools Installer, mark the **Use Espressif download mirror instead of GitHub** in the screen **Select Components** section **Optimization**.

**Linux and macOS**

To prefer the Espressif download server when installing tools, use the following sequence of commands when running `install.sh`:

```
cd ~/esp/esp-idf
export IDF_GITHUB_ASSETS="dl.espressif.com/github_assets"
./install.sh
```
1.7.4 Customizing the tools installation path

The scripts introduced in this step install compilation tools required by ESP-IDF inside the user home directory: 
$HOME/.espressif on Linux and macOS, %USERPROFILE%\espressif on Windows. If you wish to install the tools into a different directory, set the environment variable IDF_TOOLS_PATH before running the installation scripts. Make sure that your user account has sufficient permissions to read and write this path.

If changing the IDF_TOOLS_PATH, make sure it is set to the same value every time the Install script (install.bat, install.ps1 or install.sh) and an Export script (export.bat, export.ps1 or export.sh) are executed.

1.8 Step 4. Set up the environment variables

The installed tools are not yet added to the PATH environment variable. To make the tools usable from the command line, some environment variables must be set. ESP-IDF provides another script which does that.

1.8.1 Windows

ESP-IDF Tools Installer for Windows creates an “ESP-IDF Command Prompt” shortcut in the Start Menu. This shortcut opens the Command Prompt and sets up all the required environment variables. You can open this shortcut and proceed to the next step.

Alternatively, if you want to use ESP-IDF in an existing Command Prompt window, you can run:

```bash
%userprofile%\esp\esp-idf\export.bat
```

or with Windows PowerShell:

```bash
$HOME/esp/esp-idf/export.ps1
```

1.8.2 Linux and macOS

In the terminal where you are going to use ESP-IDF, run:

```bash
$HOME/esp/esp-idf/export.sh
```

or for fish (supported only since fish version 3.0.0):

```bash
$HOME/esp/esp-idf/export.fish
```

Note the space between the leading dot and the path!

If you plan to use esp-idf frequently, you can create an alias for executing export.sh:

1. Copy and paste the following command to your shell’s profile (.profile, .bashrc, .zprofile, etc.):

```bash
alias get_idf=' $HOME/esp/esp-idf/export.sh'
```

2. Refresh the configuration by restarting the terminal session or by running source [path to profile], for example, `source ~/.bashrc`.

Now you can run get_idf to set up or refresh the esp-idf environment in any terminal session.

Technically, you can add export.sh to your shell’s profile directly; however, it is not recommended. Doing so activates IDF virtual environment in every terminal session (including those where IDF is not needed), defeating the purpose of the virtual environment and likely affecting other software.
1.9 Step 5. Start a Project

Now you are ready to prepare your application for ESP32-S3. You can start with `get-started/hello_world` project from `examples` directory in IDF.

Copy the project `get-started/hello_world` to `~/esp` directory:

1.9.1 Linux and macOS

```bash
cd ~/esp
cp -r $IDF_PATH/examples/get-started/hello_world .
```

1.9.2 Windows

```bash
cd %userprofile%\esp
xcopy /e /i %IDF_PATH%\examples\get-started\hello_world hello_world
```

There is a range of example projects in the `examples` directory in ESP-IDF. You can copy any project in the same way as presented above and run it. It is also possible to build examples in-place, without copying them first.

**Important:** The ESP-IDF build system does not support spaces in the paths to either ESP-IDF or to projects.

1.10 Step 6. Connect Your Device

Now connect your ESP32-S3 board to the computer and check under what serial port the board is visible. Serial ports have the following patterns in their names:

- **Windows:** names like `COM1`
- **Linux:** starting with `/dev/tty`
- **macOS:** starting with `/dev/cu`

If you are not sure how to check the serial port name, please refer to *Establish Serial Connection with ESP32-S3* for full details.

**Note:** Keep the port name handy as you will need it in the next steps.

1.11 Step 7. Configure

Navigate to your `hello_world` directory from *Step 5. Start a Project*, set ESP32-S3 chip as the target and run the project configuration utility `menuconfig`.

1.11.1 Linux and macOS

```bash
cd ~/esp/hello_world
idf.py set-target esp32s3
idf.py menuconfig
```
1.11.2  Windows

```bash
cd %userprofile%\esp\hello_world
idf.py set-target esp32s3
idf.py menuconfig
```

Setting the target with `idf.py set-target esp32s3` should be done once, after opening a new project. If the project contains some existing builds and configuration, they will be cleared and initialized. The target may be saved in environment variable to skip this step at all. See Selecting the Target for additional information.

If the previous steps have been done correctly, the following menu appears:

![Menu Configuration](image)

You are using this menu to set up project specific variables, e.g. Wi-Fi network name and password, the processor speed, etc. Setting up the project with menuconfig may be skipped for "hello_world". This example will run with default configuration.

---

**Note:** The colors of the menu could be different in your terminal. You can change the appearance with the option `--style`. Please run `idf.py menuconfig --help` for further information.

---

1.12  Step 8. Build the Project

Build the project by running:

```bash
idf.py build
```

This command will compile the application and all ESP-IDF components, then it will generate the bootloader, partition table, and application binaries.

```bash
$ idf.py build
Running cmake in directory /path/to/hello_world/build
Executing "cmake -G Ninja --warn-uninitialized /path/to/hello_world"...
Warn about uninitialized values.
-- Found Git: /usr/bin/git (found version "2.17.0")
-- Building empty aws_iot component due to configuration
```

(continues on next page)
1.13 Step 9. Flash onto the Device

Flash the binaries that you just built (bootloader.bin, partition-table.bin and hello_world.bin) onto your ESP32-S3 board by running:

```
$idf.py -p PORT [-b BAUD] flash
```

Replace PORT with your ESP32-S3 board’s serial port name from Step 6. Connect Your Device.

You can also change the flasher baud rate by replacing BAUD with the baud rate you need. The default baud rate is 460800.

For more information on idf.py arguments, see `idf.py`.

**Note:** The option `flash` automatically builds and flashes the project, so running `idf.py build` is not necessary.

1.13.1 Encountered Issues While Flashing?

If you run the given command and see errors such as “Failed to connect”, there might be several reasons for this. One of the reasons might be issues encountered by `esptool.py`, the utility that is called by the build system to reset the chip, interact with the ROM bootloader, and flash firmware. One simple solution to try is manual reset described below, and if it does not help you can find more details about possible issues in Troubleshooting.

`esptool.py` resets ESP32-S3 automatically by asserting DTR and RTS control lines of the USB to serial converter chip, i.e., FTDI or CP210x (for more information, see Establish Serial Connection with ESP32-S3). The DTR and RTS control lines are in turn connected to GPIO0 and CHIP PU (EN) pins of ESP32-S3, thus changes in the voltage levels of DTR and RTS will boot ESP32-S3 into Firmware Download mode. As an example, check the schematic for the ESP32 DevKitC development board.

In general, you should have no problems with the official esp-idf development boards. However, `esptool.py` is not able to reset your hardware automatically in the following cases:

- Your hardware does not have the DTR and RTS lines connected to GPIO0 and CHIP PU
- The DTR and RTS lines are configured differently
- There are no such serial control lines at all

Depending on the kind of hardware you have, it may also be possible to manually put your ESP32-S3 board into Firmware Download mode (reset).
For development boards produced by Espressif, this information can be found in the respective getting started guides or user guides. For example, to manually reset an esp-idf development board, hold down the **Boot button (GPIO0)** and press the **EN button (CHIP_PU)**.

For other types of hardware, try pulling GPIO0 down.

### 1.13.2 Normal Operation

When flashing, you will see the output log similar to the following:

```
...  
esptool.py esp32s3 -p /dev/ttyUSB0 -b 460800 --before=default_reset --after=hard_reset  
      --reset write_flash --flash_mode dio --flash_freq 80m --flash_size 2MB 0x0  
      bootloader/bootloader.bin 0x10000 hello_world.bin 0x8000 partition_table/  
      partition-table.bin  
esptool.py v3.2-dev  
Serial port /dev/ttyUSB0  
Connecting....

```

If there are no issues by the end of the flash process, the board will reboot and start up the ‘‘hello_world’’ application. If you’d like to use the Eclipse or VS Code IDE instead of running `idf.py`, check out the *Eclipse guide, VS Code guide.*
1.14 Step 10. Monitor

To check if “hello_world” is indeed running, type `idf.py -p PORT monitor` (Do not forget to replace PORT with your serial port name).

This command launches the **IDF Monitor** application:

```
$ idf.py -p /dev/ttyUSB0 monitor
Running idf_monitor in directory [...]/esp/hello_world/build
Executing "python [...]/esp-idf/tools/idf_monitor.py -b 115200 [...]/esp/hello_world/build/hello_world.elf"
--- idf_monitor on /dev/ttyUSB0 115200 ---
--- Quit: Ctrl+] | Menu: Ctrl+T | Help: Ctrl+T followed by Ctrl+H ---
ets Jun 8 2016 00:22:57
rst:0x1 (POWERON_RESET),boot:0x13 (SPI_FAST_FLASH_BOOT)
```

After startup and diagnostic logs scroll up, you should see “Hello world!” printed out by the application.

```
Hello world!
Restarting in 10 seconds...
This is esp32s3 chip with 2 CPU core(s), This is esp32s3 chip with 2 CPU core(s),
-WiFi/BLE, silicon revision 0, 2MB external flash
Minimum free heap size: 390684 bytes
```

To exit IDF monitor use the shortcut Ctrl+]).

**Note:** You can combine building, flashing and monitoring into one step by running:

```
idf.py -p PORT flash monitor
```

**Note:** If a board with Octal Flash resets before the second-stage bootloader, please refer to *Octal Flash Error Handling*.

See also:

- **IDF Monitor** for handy shortcuts and more details on using IDF monitor.
- **idf.py** for a full reference of `idf.py` commands and options.

That’s all that you need to get started with ESP32-S3!

Now you are ready to try some other examples, or go straight to developing your own applications.

**Important:** Some of examples do not support ESP32-S3 because required hardware is not included in ESP32-S3 so it cannot be supported.

If building an example, please check the README file for the `Supported Targets` table. If this is present including ESP32-S3 target, or the table does not exist at all, the example will work on ESP32-S3.
1.15 Updating ESP-IDF

You should update ESP-IDF from time to time, as newer versions fix bugs and provide new features. The simplest way to do the update is to delete the existing `esp-idf` folder and clone it again, as if performing the initial installation described in Step 2. Get ESP-IDF.

Another solution is to update only what has changed. *The update procedure depends on the version of ESP-IDF you are using.*

After updating ESP-IDF, execute the Install script again, in case the new ESP-IDF version requires different versions of tools. See instructions at Step 3. Set up the tools.

Once the new tools are installed, update the environment using the Export script. See instructions at Step 4. Set up the environment variables.

1.16 Related Documents

1.16.1 Establish Serial Connection with ESP32-S3

This section provides guidance how to establish serial connection between ESP32-S3 and PC.

**Connect ESP32-S3 to PC**

Connect the ESP32-S3 board to the PC using the USB cable. If device driver does not install automatically, identify USB to serial converter chip on your ESP32-S3 board (or external converter dongle), search for drivers in internet and install them.

Below is the list of USB to serial converter chips installed on most of the ESP32-S3 boards produced by Espressif together with links to the drivers:

- CP210x: [CP210x USB to UART Bridge VCP Drivers](#)
- FTDI: [FTDI Virtual COM Port Drivers](#)

Please check the board user guide for specific USB to serial converter chip used. The drivers above are primarily for reference. Under normal circumstances, the drivers should be bundled with an operating system and automatically installed upon connecting the board to the PC.

**Check port on Windows**

Check the list of identified COM ports in the Windows Device Manager. Disconnect ESP32-S3 and connect it back, to verify which port disappears from the list and then shows back again.

Figures below show serial port for ESP32 DevKitC and ESP32 WROVER KIT

**Check port on Linux and macOS**

To check the device name for the serial port of your ESP32-S3 board (or external converter dongle), run this command two times, first with the board / dongle unplugged, then with plugged in. The port which appears the second time is the one you need:

- Linux
  ```bash
  ls /dev/tty*
  ```

- macOS
  ```bash
  ls /dev/cu.*
  ```
Chapter 1. Get Started

Fig. 15: USB to UART bridge of ESP32-DevKitC in Windows Device Manager
Fig. 16: Two USB Serial Ports of ESP-WROVER-KIT in Windows Device Manager
Chapter 1. Get Started

**Note:** macOS users: if you don’t see the serial port then check you have the USB/serial drivers installed as shown in the Getting Started guide for your particular development board. For macOS High Sierra (10.13), you may also have to explicitly allow the drivers to load. Open System Preferences -> Security & Privacy -> General and check if there is a message shown here about “System Software from developer ...” where the developer name is Silicon Labs or FTDI.

### Adding user to dialout on Linux

The currently logged user should have read and write access to the serial port over USB. On most Linux distributions, this is done by adding the user to dialout group with the following command:

```bash
sudo usermod -a -G dialout $USER
```

On Arch Linux this is done by adding the user to uucp group with the following command:

```bash
sudo usermod -a -G uucp $USER
```

Make sure you re-login to enable read and write permissions for the serial port.

### Verify serial connection

Now verify that the serial connection is operational. You can do this using a serial terminal program by checking if you get any output on the terminal after reseting ESP32-S3.

**Windows and Linux** In this example we will use PuTTY SSH Client that is available for both Windows and Linux. You can use other serial program and set communication parameters like below.

Run terminal, set identified serial port, baud rate = 115200, data bits = 8, stop bits = 1, and parity = N. Below are example screen shots of setting the port and such transmission parameters (in short described as 115200-8-1-N) on Windows and Linux. Remember to select exactly the same serial port you have identified in steps above.

Then open serial port in terminal and check, if you see any log printed out by ESP32-S3. The log contents will depend on application loaded to ESP32-S3, see Example Output.

**Note:** Close the serial terminal after verification that communication is working. If you keep the terminal session open, the serial port will be inaccessible for uploading firmware later.

**macOS** To spare you the trouble of installing a serial terminal program, macOS offers the `screen` command.

- As discussed in Check port on Linux and macOS, run:

  ```bash
  ls /dev/cu.*
  ```

- You should see similar output:

  ```bash
  /dev/cu.Bluetooth-Incoming-Port /dev/cu.SLAB_USBtoUART /dev/cu.SLAB_USBtoUART
  ```

- The output will vary depending on the type and the number of boards connected to your PC. Then pick the device name of your board and run:

  ```bash
  screen /dev/cu.device_name 115200
  ```

  Replace `device_name` with the name found running `ls /dev/cu.*`.

- What you are looking for is some log displayed by the `screen`. The log contents will depend on application loaded to ESP32-S3, see Example Output. To exit the `screen` session type Ctrl-A + \\.
Fig. 17: Setting Serial Communication in PuTTY on Windows
Fig. 18: Setting Serial Communication in PuTTY on Linux
Chapter 1. Get Started

**Note:** Do not forget to **exit the screen session** after verifying that the communication is working. If you fail to do it and just close the terminal window, the serial port will be inaccessible for uploading firmware later.

**Example Output**  An example log by ESP32-S3 is shown below. Reset the board if you do not see anything.

```
ets Jun 8 2016 00:22:57
rst:0x5 (DEEPSLEEP_RESET),boot:0x13 (SPI_FAST_FLASH_BOOT)
ets Jun 8 2016 00:22:57
rst:0x7 (TG0WDT_SYS_RESET),boot:0x13 (SPI_FAST_FLASH_BOOT)
config: 0, SPIWP:0x00
clock_dv:0x000, config: 0, q_dr:0x00, d_drv:0x80, cs0_drv:0x00, hd_drv:0x00, wp_drv:0x00
mode:DIO, clock div:2
load:0x3ff0000, len:8
load:0x3fff0010, len:3464
load:0x40078000, len:7828
load:0x4007f000, len:252
entry 0x40080034
I (44) boot: ESP-IDF v2.0-rc1-401-gf9fba35 2nd stage bootloader
I (45) boot: compile time 18:48:10
```

If you can see readable log output, it means serial connection is working and you are ready to proceed with installation and finally upload of application to ESP32-S3.

**Note:** For some serial port wiring configurations, the serial RTS & DTR pins need to be disabled in the terminal program before the ESP32-S3 will boot and produce serial output. This depends on the hardware itself, most development boards (including all Espressif boards) do not have this issue. The issue is present if RTS & DTR are wired directly to the EN & GPIO0 pins. See the [esptool documentation](#) for more details.

If you got here from *Step 6. Connect Your Device* when installing s/w for ESP32-S3 development, then you can continue with *Step 7. Configure.*

### 1.16.2 Build and Flash with Eclipse IDE

ESP-IDF V4.0 has a new CMake-based build system as the default build system.

There is a new ESP-IDF Eclipse Plugin that works with the CMake-based build system. Please refer to [Espressif IDF Eclipse Plugins](#) IDF for further instructions.

**Note:** In [Espressif IDF Eclipse Plugins](#), though screenshots are captured from macOS, installation instructions are applicable for Windows, Linux and macOS.

### 1.16.3 Getting Started with VS Code IDE

We have official support for VS Code and we aim to provide complete end to end support for all actions related to ESP-IDF namely build, flash, monitor, debug, tracing, core-dump, System Trace Viewer, etc.
Chapter 1. Get Started

Quick Install Guide

Recommended way to install ESP-IDF Visual Studio Code Extension is by downloading it from VS Code Marketplace or following Quick Installation Guide.

Supported Features

- **Setup**, will help you to quickly install ESP-IDF and its relevant toolchain with just few clicks.
- **Build**, with one click build and multi target build, you can easily build and deploy your applications.
- **Flash**, with both UART and JTAG flash out of the box.
- **Monitoring** comes with built-in terminal where you can trigger IDF Monitor Commands from within VS Code as you are used to in traditional terminals.
- **Debugging** <https://github.com/espressif/vscode-esp-idf-extension/blob/master/docs/tutorial/debugging.md>, with out of box hardware debugging and also support for postmortem debugging like core-dump, you can analyze the bugs with convenience.
- **GUI Menu Config**, provides with simplified UI for configuring your chip.
- **App & Heap Tracing**, provides support for collecting traces from your application and simplified UI for analyzing them.
- **System View Tracing Viewer**, aims to read and display the .svdat files into trace UI, we also support multiple core tracing views.
- **IDF Size Analysis Overview** presents an UI for binary size analysis.
- **Rainmaker Cloud**, we have inbuilt Rainmaker Cloud support where you can edit/read state of your connected IoT devices easily.
- **Code Coverage**, we have inbuilt code coverage support which shall highlight in color which line have been covered. We also render the existing HTML report directly inside the IDE.

Bugs & Feature Requests

If you face an issue with certain feature of VS Code or VS Code in general we recommend to ask your question in the forum, or open a github issue for our dev teams to review.

We also welcome new feature request, most of the features we have today is result of people asking it to implement, or improve certain aspect of the extension, raise your feature request on github.

1.16.4 IDF Monitor

The IDF monitor tool is mainly a serial terminal program which relays serial data to and from the target device’s serial port. It also provides some IDF-specific features.

This tool can be launched from an IDF project by running `idf.py monitor`.

Keyboard Shortcuts

For easy interaction with IDF Monitor, use the keyboard shortcuts given in the table.
### Keyboard Shortcut | Action | Description
--- | --- | ---
Ctrl+] | Exit the program | Press and follow it by one of the keys given below.
Ctrl+T | Menu escape key | Send the menu character itself to remote
- Ctrl+T | Send the menu character itself to remote
- Ctrl+] | Send the exit character itself to remote
- Ctrl+P | Reset target into bootloader to pause app via RTS line | Resets the target, into bootloader via the RTS line (if connected), so that the board runs nothing. Useful when you need to wait for another device to startup.
- Ctrl+R | Reset target board via RTS | Resets the target board and re-starts the application via the RTS line (if connected).
- Ctrl+F | Build and flash the project | Pauses idf_monitor to run the project flash target, then re-starts the application via the project debugger. Any changed source files are recompiled and then re-flashed. Target encrypted-flash is run if idf_monitor was started with argument -E.
- Ctrl+A (or A) | Build and flash the app only | Pauses idf_monitor to run the app-flash target, then resumes idf_monitor. Similar to the flash target, but only the main app is built and re-flashed. Target encrypted-app-flash is run if idf_monitor was started with argument -E.
- Ctrl+Y | Stop/resume log output printing on screen | Discards all incoming serial data while activated. Allows to quickly pause and examine log output without quitting the monitor.
- Ctrl+L | Stop/resume log output saved to file | Creates a file in the project directory and the output is written to that file until this is disabled with the same keyboard shortcut (or IDF Monitor exits).
- Ctrl+I (or I) | Stop/resume printing timestamps | IDF Monitor can print a timestamp in the beginning of each line. The timestamp format can be changed by the --timestamp-format command line argument.
- Ctrl+H (or H) | Display all keyboard shortcuts |
- Ctrl+X (or X) | Exit the program |
- Ctrl+C | Interrupt running application | Pauses IDF monitor and run GDB project debugger to debug the application at runtime. This requires :ref:CONFIG_ESP_SYSTEM_GDBSTUB_RUNTIME option to be enabled.

Any keys pressed, other than Ctrl-] and Ctrl-T, will be sent through the serial port.

### IDF-specific features

**Automatic Address Decoding** Whenever ESP-IDF outputs a hexadecimal code address of the form 0x4_______, IDF Monitor uses addr2line to look up the location in the source code and find the function name.

If an ESP-IDF app crashes and panics, a register dump and backtrace is produced, such as the following:

Guru Meditation Error of type StoreProhibited occurred on core 0. Exception was... unhandled.
Register dump:

(continues on next page)
Guru Meditation Error of type StoreProhibited occurred on core 0. Exception was unhandled.

Register dump:

Backtrace:

To decode each address, IDF Monitor runs the following command in the background:

tensa-esp32s3-elf-addr2line -pfiaC -e build/PROJECT.elf ADDRESS

Note: Set environment variable ESP_MONITOR_DECODE to 0 or call idf_monitor.py with specific command line option: idf_monitor.py --disable-address-decoding to disable address decoding.
Chapter 1. Get Started

**Launching GDB with GDBStub** By default, if esp-idf crashes, the panic handler prints relevant registers and the stack dump (similar to the ones above) over the serial port. Then it resets the board.

Furthermore, the application can be configured to run GDBStub in the background and handle the Ctrl+C event from the monitor.

Optionally, the panic handler can be configured to run GDBStub, the tool which can communicate with GDB project debugger. GDBStub allows to read memory, examine call stack frames and variables, etc. It is not as versatile as JTAG debugging, but this method does not require any special hardware.

To enable GDBStub on panic, open the project configuration menu (`idf.py menuconfig`) and set `CONFIG_ESP_SYSTEM_PANIC` to GDBStub on panic or set `CONFIG_ESP_SYSTEM_PANIC` to GDBStub on runtime.

In this case, if the panic handler or Ctrl+C command is triggered, as soon as IDF Monitor sees that GDBStub has loaded, it automatically pauses serial monitoring and runs GDB with necessary arguments. After GDB exits, the board is reset via the RTS serial line. If this line is not connected, please reset the board manually by pressing its Reset button.

In the background, IDF Monitor runs the following command:

```
xtensa-esp32s3-elf-gdb -ex "set serial baud BAUD" -ex "target remote PORT" -ex __interrupt build/PROJECT.elf :idf_target:`Hello NAME chip`
```

**Output Filtering** IDF monitor can be invoked as `idf.py monitor --print-filter="xyz"`, where `--print-filter` is the parameter for output filtering. The default value is an empty string, which means that everything is printed.

Restrictions on what to print can be specified as a series of `<tag>:<log_level>` items where `<tag>` is the tag string and `<log_level>` is a character from the set `{N, E, W, I, D, V, *}` referring to a level for logging.

For example, `PRINT_FILTER="tag1:W"` matches and prints only the outputs written with `ESP_LOGW("tag1", ...) or at lower verbosity level, i.e. ESP_LOGE("tag1", ...)`. Not specifying a `<log_level>` or using `*` defaults to Verbose level.

**Note:** Use primary logging to disable at compilation the outputs you do not need through the `logging library`. Output filtering with IDF Monitor is a secondary solution which can be useful for adjusting the filtering options without recompiling the application.

Your app tags must not contain spaces, asterisks `*`, or colons `:` to be compatible with the output filtering feature.

If the last line of the output in your app is not followed by a carriage return, the output filtering might get confused, i.e., the monitor starts to print the line and later finds out that the line should not have been written. This is a known issue and can be avoided by always adding a carriage return (especially when no output follows immediately afterwards).

**Examples Of Filtering Rules:**

- `*` can be used to match any tags. However, the string `PRINT_FILTER="*:I tag1:E"` with regards to `tag1` prints errors only, because the rule for `tag1` has a higher priority over the rule for `*`.
- The default (empty) rule is equivalent to `*:V` because matching every tag at the Verbose level or lower means matching everything.
- `*:N` suppresses not only the outputs from logging functions, but also the prints made by `printf`, etc. To avoid this, use `*:E` or a higher verbosity level.
- Rules "tag1:V", "tag1:V", "tag1:", "tag1:*", and "tag1" are equivalent.
- Rule "tag1: W tag1:E" is equivalent to "tag1:E" because any consequent occurrence of the same tag name overwrites the previous one.
- Rule "tag1: I tag2:W" only prints `tag1` at the Info verbosity level or lower and `tag2` at the Warning verbosity level or lower.
- Rule "tag1: I tag2:W tag3:N" is essentially equivalent to the previous one because `tag3:N` specifies that `tag3` should not be printed.
• tag3:N in the rule "tag1:I tag2:W tag3:N *:V" is more meaningful because without tag3:N the tag3 messages could have been printed; the errors for tag1 and tag2 will be printed at the specified (or lower) verbosity level and everything else will be printed by default.

A More Complex Filtering Example  The following log snippet was acquired without any filtering options:

```plaintext
load:0x40078000,len:13564
entry 0x40078d4c
E (31) esp_image: image at 0x30000 has invalid magic byte
W (31) esp_image: image at 0x30000 has invalid SPI mode 255
E (39) boot: Factory app partition is not bootable
I (568) cpu_start: Pro cpu up.
I (569) heap_init: Initializing. RAM available for dynamic allocation:
I (603) cpu_start: Pro cpu start user code
D (309) light_driver: [light_init, 74]:status: 1, mode: 2
D (318) vfs: esp_vfs_register_fd_range is successful for range <54; 64) and VFS ID_..._1
I (328) wifi: wifi driver task: 3ffdbf84, prio:23, stack:4096, core=0
```

The captured output for the filtering options PRINT_FILTER="wifi esp_image:E light_driver:I" is given below:

```plaintext
E (31) esp_image: image at 0x30000 has invalid magic byte
I (328) wifi: wifi driver task: 3ffdbf84, prio:23, stack:4096, core=0
```

The options `PRINT_FILTER="light_driver:D esp_image:N boot:N cpu_start:N vfs:N wifi:N *:V"` show the following output:

```plaintext
load:0x40078000,len:13564
entry 0x40078d4c
I (569) heap_init: Initializing. RAM available for dynamic allocation:
D (309) light_driver: [light_init, 74]:status: 1, mode: 2
```

Known Issues with IDF Monitor

Issues Observed on Windows

• Arrow keys, as well as some other keys, do not work in GDB due to Windows Console limitations.
• Occasionally, when “idf.py” exits, it might stall for up to 30 seconds before IDF Monitor resumes.
• When “gdb” is run, it might stall for a short time before it begins communicating with the GDBStub.

1.16.5 Customized Setup of Toolchain

Instead of downloading binary toolchain from Espressif website (see Step 3. Set up the tools) you may build the toolchain yourself.

If you can’t think of a reason why you need to build it yourself, then probably it’s better to stick with the binary version. However, here are some of the reasons why you might want to compile it from source:

• if you want to customize toolchain build configuration
• if you want to use a different GCC version (such as 4.8.5)
• if you want to hack gcc or newlib or libstdc++
• if you are curious and/or have time to spare
• if you don’t trust binaries downloaded from the Internet

In any case, here are the instructions to compile the toolchain yourself.
Chapter 1. Get Started

Setup Windows Toolchain from Scratch

This is a step-by-step alternative to running the ESP-IDF Tools Installer for the CMake-based build system. Installing all of the tools by hand allows more control over the process, and also provides the information for advanced users to customize the install.

To quickly setup the toolchain and other tools in standard way, using the ESP-IDF Tools installer, proceed to section Standard Setup of Toolchain for Windows.

Get ESP-IDF

Note: Previous versions of ESP-IDF used the MSYS2 bash terminal command line. The current cmake-based build system can run in the regular Windows Command Prompt which is used here.

If you use PowerShell, please note that some command syntax will be different to what is shown below.

Open Command Prompt and run the following commands:

```bash
mkdir %userprofile%\esp
cd %userprofile%\esp
git clone --recursive https://github.com/espressif/esp-idf.git
```

ESP-IDF will be downloaded into %userprofile%\esp\esp-idf.

Consult ESP-IDF Versions for information about which ESP-IDF version to use in a given situation.

Note: This command will clone the master branch, which has the latest development ("bleeding edge") version of ESP-IDF. It is fully functional and updated on weekly basis with the most recent features and bug fixes.

Note: GitHub’s “Download zip file” feature does not work with ESP-IDF, a git clone is required. As a fallback, Stable version can be installed without Git.

Note: Do not miss the --recursive option. If you have already cloned ESP-IDF without this option, run another command to get all the submodules:

```bash
cd esp-idf
git submodule update --init
```

Tools

CMake  Download the latest stable release of CMake for Windows and run the installer.

When the installer asks for Install Options, choose either “Add CMake to the system PATH for all users” or “Add CMake to the system PATH for the current user”.

Ninja build  Note: Ninja currently only provides binaries for 64-bit Windows.

Download the Ninja latest stable Windows release from the (download page).

The Ninja for Windows download is a .zip file containing a single ninja.exe file which needs to be unzipped to a directory which is then added to your Path (or you can choose a directory which is already on your Path).
Chapter 1. Get Started

Python  Download the latest Python for Windows installer, and run it. The “Customise” step of the Python installer gives a list of options. The last option is “Add python.exe to Path”. Change this option to select “Will be installed”.

Once Python is installed, open a Windows Command Prompt from the Start menu and run the following command:

```
pip install --user pyserial
```

Toolchain Setup  Download the precompiled Windows toolchain:

Unzip the file to C:\Program Files (or some other location). The zip file contains a single directory xtensa-esp32s3-elf.

Next, the bin subdirectory of this directory must be added to your Path. For example, the directory to add may be C:\Program Files\xtensa-esp32s3-elf\bin.

Adding Directory to Path  To add any new directory to your Windows Path environment variable:

Open the System control panel and navigate to the Environment Variables dialog. (On Windows 10, this is found under Advanced System Settings).

Double-click the Path variable (either User or System Path, depending if you want other users to have this directory on their path.) Go to the end of the value, and append ;<new value>.

Next Steps  To carry on with development environment setup, proceed to Step 3. Set up the tools.

Setup Linux Toolchain from Scratch

The following instructions are alternative to downloading binary toolchain from Espressif website. To quickly setup the binary toolchain, instead of compiling it yourself, backup and proceed to section Standard Setup of Toolchain for Linux.

Note:  The reason you might need to build your own toolchain is to solve the Y2K38 problem (time_t expand to 64 bits instead of 32 bits).

Install Prerequisites  To compile with ESP-IDF you need to get the following packages:

- CentOS 7:

```
sudo yum -y update && sudo yum install git wget ncurses-devel flex bison gperf--python3 python3-pip cmake ninja-build ccache dfu-util libusbx
```

CentOS 7 is still supported but CentOS version 8 is recommended for a better user experience.

- Ubuntu and Debian:

```
sudo apt-get install git wget libncurses-dev flex bison gperf python3 python3--pip python3-setuptools python3-serial python3-cryptography python3-future--python3-pyparsing python3-pyelftools cmake ninja-build ccache libffi-dev--libssl-dev dfu-util libusb-1.0-0
```

- Arch:

```
sudo pacman -Sy --needed gcc git make ncurses flex bison gperf python-pyserial--python-cryptography python-future python-pyparsing python-pyelftools cmake--ninja ccache dfu-util libusb
```
Chapter 1. Get Started

**Note:** CMake version 3.5 or newer is required for use with ESP-IDF. Older Linux distributions may require updating, enabling of a “backports” repository, or installing of a “cmake3” package rather than “cmake”.

### Compile the Toolchain from Source

- **Install dependencies:**
  - **CentOS 7:**
    ```
    sudo yum install gawk gperf grep gettext ncurses-devel python3 python3-devel automake bison flex texinfo help2man libtool make
    ```
  - **Ubuntu pre-16.04:**
    ```
    sudo apt-get install gawk gperf grep gettext libncurses-dev python python-dev automake bison flex texinfo help2man libtool make
    ```
  - **Ubuntu 16.04 or newer:**
    ```
    sudo apt-get install gawk gperf grep gettext python python-dev automake bison flex texinfo help2man libtool libtool-bin make
    ```
  - **Debian 9:**
    ```
    sudo apt-get install gawk gperf grep gettext libncurses-dev python python-dev automake bison flex texinfo help2man libtool libtool-bin make
    ```
  - **Arch:**
    ```
    sudo pacman -Sy --needed python-pip
    ```

Create the working directory and go into it:

```
mkdir -p ~/esp
cd ~/esp
```

Download crosstool-NG and build it:

```
git clone https://github.com/espressif/crosstool-NG.git
cd crosstool-NG
git checkout esp-2021r2
git submodule update --init
./bootstrap && ./configure --enable-local && make
```

**Note:** To create a toolchain with support for 64-bit time_t, you need to remove the `--enable-newlib-long-time_t` option from the `crosstool-NG/samples/xtensa-esp32-elf/crosstool.config` file in 33 and 43 lines.

Build the toolchain:

```
./ct-ng xtensa-esp32s3-elf
./ct-ng build
chmod -R u+w builds/xtensa-esp32s3-elf
```

Toolchain will be built in `~/esp/crosstool-NG/builds/xtensa-esp32s3-elf`.

**Add Toolchain to PATH** The custom toolchain needs to be copied to a binary directory and added to the PATH. Choose a directory, for example `~/esp/xtensa-esp32s3-elf/`, and copy the build output to this directory.

To use it, you will need to update your PATH environment variable in `~/.profile` file. To make `xtensa-esp32s3-elf` available for all terminal sessions, add the following line to your `~/.profile` file:
Chapter 1. Get Started

```bash
export PATH="$HOME/esp/xtensa-esp32s3-elf/bin:$PATH"
```

**Note:** If you have `/bin/bash` set as login shell, and both `.bash_profile` and `.profile` exist, then update `.bash_profile` instead. In CentOS, alias should set in `.bashrc`.

Log off and log in back to make the `.profile` changes effective. Run the following command to verify if `PATH` is correctly set:

```bash
printenv PATH
```

You are looking for similar result containing toolchain’s path at the beginning of displayed string:

```bash
$ printenv PATH
/home/user-name/esp/xtensa-esp32s3-elf/bin:/home/user-name/bin:/home/user-name/. --local/bin:/usr/local/sbin:/usr/local/bin:/usr/local/bin:/usr/sbin:/usr/bin:/sbin:/bin:/usr/ --games:/usr/local/games:/snap/bin
```

Instead of `/home/user-name` there should be a home path specific to your installation.

**Next Steps**  To carry on with development environment setup, proceed to *Step 2. Get ESP-IDF*.

**Setup Toolchain for Mac OS from Scratch**

**Package Manager**  To set up the toolchain from scratch, rather than *downloading a pre-compiled toolchain*, you will need to install either the MacPorts or Homebrew package manager.

MacPorts needs a full XCode installation, while Homebrew only needs XCode command line tools.

See *Customized Setup of Toolchain* section for some of the reasons why installing the toolchain from scratch may be necessary.

**Install Prerequisites**

- install pip:
  ```bash
  sudo easy_install pip
  ```
- install pyserial:
  ```bash
  pip install --user pyserial
  ```
- install CMake & Ninja build:
  - If you have Homebrew, you can run:
    ```bash
    brew install cmake ninja dfu-util
    ```
  - If you have MacPorts, you can run:
    ```bash
    sudo port install cmake ninja dfu-util
    ```

**Compile the Toolchain from Source**  Install dependencies:

- with MacPorts:
  ```bash
  sudo port install gsed gawk binutils gperf grep gettext wget libtool autoconf... --automake make
  ```
- with Homebrew:
Chapter 1. Get Started

```bash
brew install gnu-sed gawk binutils gperftools gettext wget help2man libtool
         autoconf automake
```

Create a case-sensitive filesystem image:

```bash
hdiutil create ~/esp/crosstool.dmg -volname "ctng" -size 10g -fs "Case-sensitive...
         HFS+"
```

Mount it:

```bash
hdiutil mount ~/esp/crosstool.dmg
```

Create a symlink to your work directory:

```bash
mkdir -p ~/esp
ln -s /Volumes/ctng ~/esp/ctng-volume
```

Go into the newly created directory:

```bash
cd ~/esp/ctng-volume
```

Download crosstool-NG and build it:

```bash
git clone https://github.com/espressif/crosstool-NG.git
cd crosstool-NG
git checkout esp-2021r2
git submodule update --init
   ./bootstrap && ./configure --enable-local && make
```

Build the toolchain:

```bash
./ct-ng xtensa-esp32s3-elf
./ct-ng build
chmod -R u+w builds/xtensa-esp32s3-elf
```

Toolchain will be built in ~/esp/ctng-volume/crosstool-NG/builds/xtensa-esp32s3-elf. To use it, you need to add ~/esp/ctng-volume/crosstool-NG/builds/xtensa-esp32s3-elf/bin to PATH environment variable.

Next Steps: To carry on with development environment setup, proceed to Step 2. Get ESP-IDF.
Chapter 2

API Reference

2.1 Bluetooth API

2.1.1 Controller & VHCI

Overview

Instructions

Application Example

Check bluetooth/hci folder in ESP-IDF examples, which contains the following application:

- This is a BLE advertising demo with virtual HCI interface. Send Reset/ADV_PARAM/ADV_DATA/ADV_ENABLE HCI command for BLE advertising - bluetooth/hci/controller_vhci_ble_adv.

API Reference

Header File

- components/bt/include/esp32/include/esp_bt.h

Functions

esp_err_t esp_ble_tx_power_set (esp_ble_power_type_t power_type, esp_power_level_t power_level)

Set BLE TX power Connection Tx power should only be set after connection created.

Return ESP_OK - success, other - failed

Parameters

- power_type: : The type of which tx power, could set Advertising/Connection/Default and etc
- power_level: Power level(index) corresponding to absolute value(dbm)

esp_power_level_t esp_ble_tx_power_get (esp_ble_power_type_t power_type)

Get BLE TX power Connection Tx power should only be get after connection created.

Return >= 0 - Power level, < 0 - Invalid

Parameters

- power_type: : The type of which tx power, could set Advertising/Connection/Default and etc

esp_err_t esp_bredr_tx_power_set (esp_power_level_t min_power_level, esp_power_level_t max_power_level)

Set BR/EDR TX power BR/EDR power control will use the power in range of minimum value and maximum value. The power level will effect the global BR/EDR TX power, such inquire, page, connection and so on.
Please call the function after esp_bt_controller_enable and before any function which cause RF do TX. So you can call the function before doing discovery, profile init and so on. For example, if you want BR/EDR use the new TX power to do inquire, you should call this function before inquire. Another word, If call this function when BR/EDR is in inquire(ING), please do inquire again after call this function. Default minimum power level is ESP_PWR_LVL_N0, and maximum power level is ESP_PWR_LVL_P3.

**Return** ESP_OK - success, other - failed

**Parameters**

- **min_power_level**: The minimum power level
- **max_power_level**: The maximum power level

```c
esp_err_t esp_bredr_tx_power_get (esp_power_level_t *min_power_level, esp_power_level_t *max_power_level)
```

Get BR/EDR TX power If the argument is not NULL, then store the corresponding value.

**Return** ESP_OK - success, other - failed

**Parameters**

- **min_power_level**: The minimum power level
- **max_power_level**: The maximum power level

```c
esp_err_t esp_bredr_sco_datapath_set (esp_sco_data_path_t data_path)
```

Set default SCO data path Should be called after controller is enabled, and before (e)SCO link is established.

**Return** ESP_OK - success, other - failed

**Parameters**

- **data_path**: SCO data path

```c
esp_err_t esp_bt_controller_init (esp_bt_controller_config_t *cfg)
```

Initialize BT controller to allocate task and other resource. This function should be called only once, before any other BT functions are called.

**Return** ESP_OK - success, other - failed

**Parameters**

- **cfg**: Initial configuration of BT controller. Different from previous version, there’s a mode and some connection configuration in “cfg” to configure controller work mode and allocate the resource which is needed.

```c
esp_err_t esp_bt_controller_deinit (void)
```

De-initialize BT controller to free resource and delete task.

This function should be called only once, after any other BT functions are called.

**Return** ESP_OK - success, other - failed

```c
esp_err_t esp_bt_controller_enable (esp_bt_mode_t mode)
```

Enable BT controller. Due to a known issue, you cannot call esp_bt_controller_enable() a second time to change the controller mode dynamically. To change controller mode, call esp_bt_controller_disable() and then call esp_bt_controller_enable() with the new mode.

**Return** ESP_OK - success, other - failed

**Parameters**

- **mode**: the mode(BLE/BT/BTDM) to enable. For compatible of API, retain this argument. This mode must be equal as the mode in “cfg” of esp_bt_controller_init().

```c
esp_err_t esp_bt_controller_disable (void)
```

Disable BT controller.

**Return** ESP_OK - success, other - failed

```c
esp_bt_controller_status_t esp_bt_controller_get_status (void)
```

Get BT controller is initialised/de-initialised/enabled/disabled.

**Return** status value

```c
bool esp_vhci_host_check_send_available (void)
```

esp_vhci_host_check_send_available used for check actively if the host can send packet to controller or not.
Return  true for ready to send, false means cannot send packet

void esp_vhci_host_send_packet (uint8_t *data, uint16_t len)
    esp_vhci_host_send_packet host send packet to controller

Should not call this function from within a critical section or when the scheduler is suspended.

Parameters
   • data: the packet point
   • len: the packet length

esp_err_t esp_vhci_host_register_callback (const esp_vhci_host_callback_t *callback)
    esp_vhci_host_register_callback register the vhci reference callback struct defined by vhci_host_callback structure.

Return  ESP_OK - success, ESP_FAIL - failed

Parameters
   • callback: esp_vhci_host_callback type variable

esp_err_t esp_bt_controller_mem_release (esp_bt_mode_t mode)
    esp_bt_controller_mem_release release the controller memory as per the mode

This function releases the BSS, data and other sections of the controller to heap. The total size is about 70k bytes.

esp_bt_controller_mem_release(mode) should be called only before esp_bt_controller_init() or after esp_bt_controller_deinit().

Note that once BT controller memory is released, the process cannot be reversed. It means you cannot use the bluetooth mode which you have released by this function.

If your firmware will later upgrade the Bluetooth controller mode (BLE -> BT Classic or disabled -> enabled) then do not call this function.

If the app calls esp_bt_controller_enable(ESP_BT_MODE_BLE) to use BLE only then it is safe to call esp_bt_controller_mem_release(ESP_BT_MODE_CLASSIC_BT) at initialization time to free unused BT Classic memory.

If the mode is ESP_BT_MODE_BTDM, then it may be useful to call API esp_bt_mem_release(ESP_BT_MODE_BTDM) instead, which internally calls esp_bt_controller_mem_release(ESP_BT_MODE_BTDM) and additionally releases the BSS and data consumed by the BT/BLE host stack to heap. For more details about usage please refer to the documentation of esp_bt_mem_release() function

Return  ESP_OK - success, other - failed

Parameters
   • mode: the mode want to release memory

esp_err_t esp_bt_mem_release (esp_bt_mode_t mode)
    esp_bt_mem_release release controller memory and BSS and data section of the BT/BLE host stack as per the mode

This function first releases controller memory by internally calling esp_bt_controller_mem_release(). Additionally, if the mode is set to ESP_BT_MODE_BTDM, it also releases the BSS and data consumed by the BT/BLE host stack to heap.

Note that once BT memory is released, the process cannot be reversed. It means you cannot use the bluetooth mode which you have released by this function.

If your firmware will later upgrade the Bluetooth controller mode (BLE -> BT Classic or disabled -> enabled) then do not call this function.

If you never intend to use bluetooth in a current boot-up cycle, you can call esp_bt_mem_release(ESP_BT_MODE_BTDM) before esp_bt_controller_init or after esp_bt_controller_deinit.
For example, if a user only uses Bluetooth for setting the WiFi configuration, and does not use Bluetooth in the rest of the product operation. In such cases, after receiving the WiFi configuration, you can disable/deinit Bluetooth and release its memory. Below is the sequence of APIs to be called for such scenarios:

```c
esp_bluedroid_disable();
esp_bluedroid_deinit();
esp_bt_controller_disable();
esp_bt_controller_deinit();
esp_bt_mem_release(ESP_BT_MODE_BTDM);
```

**Note** In case of NimBLE host, to release BSS and data memory to heap, the mode needs to be set to ESP_BT_MODE_BTDM as controller is dual mode.

**Return** ESP_OK - success, other - failed

**Parameters**
- `mode`: the mode whose memory is to be released

```c
esp_err_t esp_bt_sleep_enable(void)
```

enable Bluetooth to enter modem sleep

Note that this function shall not be invoked before esp bt_controller_enable()

There are currently two options for Bluetooth modem sleep, one is ORIG mode, and another is EVED Mode. EVED Mode is intended for BLE only.

For ORIG mode: Bluetooth modem sleep is enabled in controller start up by default if CONFIG_CTRL_BTDM_MODEM_SLEEP is set and “ORIG mode” is selected. In ORIG modem sleep mode, Bluetooth controller will switch off some components and pause to work every now and then, if there is no event to process; and wakeup according to the scheduled interval and resume the work. It can also wakeup earlier upon external request using function “esp bt_controller_wakeup_request”.

**Return**
- ESP_OK : success
- other : failed

```c
esp_err_t esp_bt_sleep_disable(void)
```

disable Bluetooth modem sleep

Note that this function shall not be invoked before esp bt_controller_enable()

If esp bt_sleep_disable() is called, Bluetooth controller will not be allowed to enter modem sleep;

If ORIG modem sleep mode is in use, if this function is called, Bluetooth controller may not immediately wake up if it is dormant then. In this case, esp bt_controller_wakeup_request() can be used to shorten the time for wakeup.

**Return**
- ESP_OK : success
- other : failed

```c
esp_err_t esp_ble_scan_duplicate_list_flush(void)
```

Manually clear scan duplicate list.

Note that scan duplicate list will be automatically cleared when the maximum amount of device in the filter is reached the amount of device in the filter can be configured in menuconfig.

**Note** This function name is incorrectly spelled, it will be fixed in release 5.x version.

**Return**
- ESP_OK : success
- other : failed

```c
void esp_wifi_bt_power_domain_on(void)
```

bt Wi-Fi power domain power on

```c
void esp_wifi_bt_power_domain_off(void)
```

bt Wi-Fi power domain power off
Chapter 2. API Reference

Structures

struct esp_bt_controller_config_t

Controller config options, depend on config mask. Config mask indicate which functions enabled, this means some options or parameters of some functions enabled by config mask.

Public Members

uint16_t controller_task_stack_size
Bluetooth controller task stack size

uint8_t controller_task_prio
Bluetooth controller task priority

uint8_t hci_uart_no
If use UART1/2 as HCI IO interface, indicate UART number

uint32_t hci_uart_baudrate
If use UART1/2 as HCI IO interface, indicate UART baudrate

uint8_t scan_duplicate_mode
scan duplicate mode

uint8_t scan_duplicate_type
scan duplicate type

uint16_t normal_adv_size
Normal adv size for scan duplicate

uint16_t mesh_adv_size
Mesh adv size for scan duplicate

uint16_t send_adv_reserved_size
Controller minimum memory value

uint32_t controller_debug_flag
Controller debug log flag

uint8_t mode
Controller mode: BR/EDR, BLE or Dual Mode

uint8_t ble_max_conn
BLE maximum connection numbers

uint8_t bt_max_acl_conn
BR/EDR maximum ACL connection numbers

uint8_t bt_sco_datapath
SCO data path, i.e. HCI or PCM module

bool auto_latency
BLE auto latency, used to enhance classic BT performance

bool bt_legacy_auth_vs_evt
BR/EDR Legacy auth complete event required to protect from BIAS attack

uint8_t bt_max_sync_conn
BR/EDR maximum ACL connection numbers. Effective in menuconfig

uint8_t ble_sca
BLE low power crystal accuracy index

uint8_t pcm_role
PCM role (master & slave)

uint8_t pcm_polar
PCM polar trig (falling clk edge & rising clk edge)
bool hli
   Using high level interrupt or not

uint32_t magic
   Magic number

struct esp_vhci_host_callback
   esp_vhci_host_callback used for vhci call host function to notify what host need to do

Public Members

void (*notify_host_send_available)(void)
   callback used to notify that the host can send packet to controller

int (*notify_host_recv)(uint8_t *data, uint16_t len)
   callback used to notify that the controller has a packet to send to the host

Macros

ESP_BT_CONTROLLER_CONFIG_MAGIC_VAL
BT_CONTROLLER_INIT_CONFIG_DEFAULT()

Type Definitions

typedef struct esp_vhci_host_callback esp_vhci_host_callback_t
   esp_vhci_host_callback used for vhci call host function to notify what host need to do

Enumerations

enum esp_bt_mode_t
   Bluetooth mode for controller enable/disable.

Values:

ESP_BT_MODE_IDLE = 0x00
   Bluetooth is not running

ESP_BT_MODE_BLE = 0x01
   Run BLE mode

ESP_BT_MODE_CLASSIC_BT = 0x02
   Run Classic BT mode

ESP_BT_MODE_BTDM = 0x03
   Run dual mode

enum [anonymous]
   BLE sleep clock accuracy(SCA), values for ble_sca field in esp_bt_controller_config_t, currently only
   ESP_BLE_SCA_500PPM and ESP_BLE_SCA_250PPM are supported.

Values:

ESP_BLE_SCA_500PPM = 0
   BLE SCA at 500ppm

ESP_BLE_SCA_250PPM
   BLE SCA at 250ppm

ESP_BLE_SCA_150PPM
   BLE SCA at 150ppm

ESP_BLE_SCA_100PPM
   BLE SCA at 100ppm

ESP_BLE_SCA_75PPM
   BLE SCA at 75ppm
### ESP_BLE_SCA_50PPM
BLE SCA at 50ppm

### ESP_BLE_SCA_30PPM
BLE SCA at 30ppm

### ESP_BLE_SCA_20PPM
BLE SCA at 20ppm

```c
enum esp_bt_controller_status_t

Bluetooth controller enable/disable/initialised/de-initialised status.

Values:

- `ESP_BT_CONTROLLER_STATUS_IDLE` = 0
- `ESP_BT_CONTROLLER_STATUS_INITED`
- `ESP_BT_CONTROLLER_STATUS_ENABLED`
- `ESP_BT_CONTROLLER_STATUS_NUM`
```

### enum esp_ble_power_type_t

BLE tx power type ESP_BLE_PWR_TYPE_CONN_HDL0-8: for each connection, and only be set after connection completed. When disconnect, the correspond TX power is not effected. ESP_BLE_PWR_TYPE_ADV: for advertising/scan response. ESP_BLE_PWR_TYPE_SCAN: for scan. ESP_BLE_PWR_TYPE_DEFAULT: if each connection’s TX power is not set, it will use this default value. If neither in scan mode nor in adv mode, it will use this default value. If none of power type is set, system will use ESP_PWR_LVL_P3 as default for ADV/SCAN/CONN0-9.

Values:

```c
- `ESP_BLE_PWR_TYPE_CONN_HDL0` = 0
  For connection handle 0
- `ESP_BLE_PWR_TYPE_CONN_HDL1` = 1
  For connection handle 1
- `ESP_BLE_PWR_TYPE_CONN_HDL2` = 2
  For connection handle 2
- `ESP_BLE_PWR_TYPE_CONN_HDL3` = 3
  For connection handle 3
- `ESP_BLE_PWR_TYPE_CONN_HDL4` = 4
  For connection handle 4
- `ESP_BLE_PWR_TYPE_CONN_HDL5` = 5
  For connection handle 5
- `ESP_BLE_PWR_TYPE_CONN_HDL6` = 6
  For connection handle 6
- `ESP_BLE_PWR_TYPE_CONN_HDL7` = 7
  For connection handle 7
- `ESP_BLE_PWR_TYPE_CONN_HDL8` = 8
  For connection handle 8
- `ESP_BLE_PWR_TYPE_ADV` = 9
  For advertising
- `ESP_BLE_PWR_TYPE_SCAN` = 10
  For scan
- `ESP_BLE_PWR_TYPE_DEFAULT` = 11
  For default, if not set other, it will use default value
- `ESP_BLE_PWR_TYPE_NUM` = 12
  TYPE numbers
```
enum esp_power_level_t
    Bluetooth TX power level(index), it’s just a index corresponding to power(dbm).
    Values:

    ESP_PWR_LVL_N12 = 0
    Corresponding to -12dbm

    ESP_PWR_LVL_N9 = 1
    Corresponding to -9dbm

    ESP_PWR_LVL_N6 = 2
    Corresponding to -6dbm

    ESP_PWR_LVL_N3 = 3
    Corresponding to -3dbm

    ESP_PWR_LVL_N0 = 4
    Corresponding to 0dbm

    ESP_PWR_LVL_P3 = 5
    Corresponding to +3dbm

    ESP_PWR_LVL_P6 = 6
    Corresponding to +6dbm

    ESP_PWR_LVL_P9 = 7
    Corresponding to +9dbm

    ESP_PWR_LVL_N14 = ESP_PWR_LVL_N12
    Backward compatibility! Setting to -14dbm will actually result to -12dbm

    ESP_PWR_LVL_N11 = ESP_PWR_LVL_N9
    Backward compatibility! Setting to -11dbm will actually result to -9dbm

    ESP_PWR_LVL_N8 = ESP_PWR_LVL_N6
    Backward compatibility! Setting to -8dbm will actually result to -6dbm

    ESP_PWR_LVL_N5 = ESP_PWR_LVL_N3
    Backward compatibility! Setting to -5dbm will actually result to -3dbm

    ESP_PWR_LVL_N2 = ESP_PWR_LVL_N0
    Backward compatibility! Setting to -2dbm will actually result to 0dbm

    ESP_PWR_LVL_P1 = ESP_PWR_LVL_P3
    Backward compatibility! Setting to +1dbm will actually result to +3dbm

    ESP_PWR_LVL_P4 = ESP_PWR_LVL_P6
    Backward compatibility! Setting to +4dbm will actually result to +6dbm

    ESP_PWR_LVL_P7 = ESP_PWR_LVL_P9
    Backward compatibility! Setting to +7dbm will actually result to +9dbm

enum esp_sco_data_path_t
    Bluetooth audio data transport path.
    Values:

    ESP_SCO_DATA_PATH_HCI = 0
    data over HCI transport

    ESP_SCO_DATA_PATH_PCM = 1
    data over PCM interface

- ESP_BLE_CONN_PARAM_UNDEF
- ESP_BLE_SCAN_PARAM_UNDEF
- ESP_BLE_IS_VALID_PARAM(x, min, max)
  - Check the param is valid or not.
ESP_UUID_LEN_16
ESP_UUID_LEN_32
ESP_UUID_LEN_128

ESP_BD_ADDR_LEN
  Bluetooth address length.

ESP_BLE_ENC_KEY_MASK
  Used to exchange the encryption key in the init key & response key.

ESP_BLE_ID_KEY_MASK
  Used to exchange the IRK key in the init key & response key.

ESP_BLE_CSR_KEY_MASK
  Used to exchange the CSRK key in the init key & response key.

ESP_BLE_LINK_KEY_MASK
  Used to exchange the link key (this key just used in the BLE & BR/EDR coexist mode) in the init key & response key.

ESP_APP_ID_MIN
  Minimum of the application id.

ESP_APP_ID_MAX
  Maximum of the application id.

ESP_BD_ADDR_STR
ESP_BD_ADDR_HEX (addr)

Type Definitions
typedef uint8_t esp_bt_octet16_t[ESP_BT_OCTET16_LEN]
typedef uint8_t esp_bt_octet8_t[ESP_BT_OCTET8_LEN]
typedef uint8_t esp_link_key[ESP_BT_OCTET16_LEN]
typedef uint8_t esp_bd_addr_t[ESP_BD_ADDR_LEN]
  Bluetooth device address.

typedef uint8_t esp_ble_key_mask_t

Enumerations
enum esp_bt_status_t
  Status Return Value.

Values:

ESP_BT_STATUS_SUCCESS = 0
ESP_BT_STATUS_FAIL
ESP_BT_STATUS_NOT_READY
ESP_BT_STATUS_NOMEM
ESP_BT_STATUS_BUSY
ESP_BT_STATUS_DONE = 5
ESP_BT_STATUS_UNSUPPORTED
ESP_BT_STATUS_PARM_INVALID

ESP_BT_STATUS_ERR_ILLEGAL_PARAMETER_FMT
ESP_BT_STATUS_MEMORY_FULL = 20
ESP_BT_STATUS_EIR_TOO_LARGE
enum esp_bt_dev_type_t
    Bluetooth device type.
    Values:
    ESP_BT_DEVICE_TYPE_BREDR = 0x01
    ESP_BT_DEVICE_TYPE_BLE = 0x02
    ESP_BT_DEVICE_TYPE_DUMO = 0x03
enum esp_ble_addr_type_t
    BLE device address type.
    Values:
    BLE_ADDR_TYPE_PUBLIC = 0x00
    BLE_ADDR_TYPE_RANDOM = 0x01
    BLE_ADDR_TYPE_RPA_PUBLIC = 0x02
    BLE_ADDR_TYPE_RPA_RANDOM = 0x03
enum esp_ble_wl_addr_type_t
    White list address type
    Values:
    BLE_WL_ADDR_TYPE_PUBLIC = 0x00
    BLE_WL_ADDR_TYPE_RANDOM = 0x01

BT MAIN API

Overview    Instructions

Application Example    Instructions

API Reference

Header File

- components/bt/host/bluedroid/api/include/api/esp_bt_main.h
functions

`esp_bluedroid_status_t esp_bluedroid_get_status(void)`
Get bluetooth stack status.

**Return**
- Bluetooth stack status

`esp_err_t esp_bluedroid_enable(void)`
Enable bluetooth, must after esp_bluedroid_init().

**Return**
- ESP_OK : Succeed
- Other : Failed

`esp_err_t esp_bluedroid_disable(void)`
Disable bluetooth, must prior to esp_bluedroid_deinit().

**Return**
- ESP_OK : Succeed
- Other : Failed

`esp_err_t esp_bluedroid_init(void)`
Init and alloc the resource for bluetooth, must be prior to every bluetooth stuff.

**Return**
- ESP_OK : Succeed
- Other : Failed

`esp_err_t esp_bluedroid_deinit(void)`
Deinit and free the resource for bluetooth, must be after every bluetooth stuff.

**Return**
- ESP_OK : Succeed
- Other : Failed

Enumerations

`enum esp_bluedroid_status_t` Bluetooth stack status type, to indicate whether the bluetooth stack is ready.

**Values:**
- `ESP_BLUEDROID_STATUS_UNINITIALIZED` = 0
  Bluetooth not initialized
- `ESP_BLUEDROID_STATUS_INITIALIZED`
  Bluetooth initialized but not enabled
- `ESP_BLUEDROID_STATUS_ENABLED`
  Bluetooth initialized and enabled

BT DEVICE APIs

**Overview**
Bluetooth device reference APIs.

**Instructions**

**Application Example**

**Instructions**

**API Reference**

**Header File**
- `components/bt/host/bluedroid/api/include/api/esp_bt_device.h`
Functions

**const uint8_t* esp_bt_dev_get_address (void)**
Get bluetooth device address. Must use after “esp_bluedroid_enable”.

Return: bluetooth device address (six bytes), or NULL if bluetooth stack is not enabled

**esp_err_t esp_bt_dev_set_device_name (const char *name)**
Set bluetooth device name. This function should be called after esp_bluedroid_enable() completes successfully.

A BR/EDR/LE device type shall have a single Bluetooth device name which shall be identical irrespective of the physical channel used to perform the name discovery procedure.

Return:
- ESP_OK: Succeed
- ESP_ERR_INVALID_ARG: if name is NULL pointer or empty, or string length out of limit
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled
- ESP_FAIL: others

Parameters
- [in] name: device name to be set

### 2.1.3 BT LE

**GAP API**

**Overview**

### Application Example
Check bluetooth/bluedroid/ble folder in ESP-IDF examples, which contains the following demos and their tutorials:

- This is a SMP security client demo and its tutorial. This demo initiates its security parameters and acts as a GATT client, which can send a security request to the peer device and then complete the encryption procedure.
  - [bluetooth/bluedroid/ble/gatt_security_client](#)
  - GATT Security Client Example Walkthrough
- This is a SMP security server demo and its tutorial. This demo initiates its security parameters and acts as a GATT server, which can send a pair request to the peer device and then complete the encryption procedure.
  - [bluetooth/bluedroid/ble/gatt_security_server](#)
  - GATT Security Server Example Walkthrough

**API Reference**

**Header File**

- components/bt/host/bluedroid/api/include/api/esp_gap_ble_api.h

**Functions**

**esp_err_t esp_ble_gap_register_callback (esp_gap_ble_cb_t callback)**
This function is called to occur gap event, such as scan result.

Return
- ESP_OK : success
- other : failed

Parameters
- [in] callback: callback function

**esp_err_t esp_ble_gap_config_adv_data (esp_ble_adv_data_t *adv_data)**
This function is called to override the BTA default ADV parameters.

Return
- ESP_OK : success
- other : failed
Parameters
• [in] adv_data: Pointer to User defined ADV data structure. This memory space can not be freed until callback of config_adv_data is received.

`esp_err_t esp_ble_gap_set_scan_params (esp_ble_scan_params_t *scan_params)`
This function is called to set scan parameters.

Return
• ESP_OK : success
• other : failed

Parameters
• [in] scan_params: Pointer to User defined scan_params data structure. This memory space can not be freed until callback of set_scan_params

`esp_err_t esp_ble_gap_start_scanning (uint32_t duration)`
This procedure keep the device scanning the peer device which advertising on the air.

Return
• ESP_OK : success
• other : failed

Parameters
• [in] duration: Keeping the scanning time, the unit is second.

`esp_err_t esp_ble_gap_stop_scanning (void)`
This function call to stop the device scanning the peer device which advertising on the air.

Return
• ESP_OK : success
• other : failed

`esp_err_t esp_ble_gap_start_advertising (esp_ble_adv_params_t *adv_params)`
This function is called to start advertising.

Return
• ESP_OK : success
• other : failed

Parameters
• [in] adv_params: pointer to User defined adv_params data structure.

`esp_err_t esp_ble_gap_stop_advertising (void)`
This function is called to stop advertising.

Return
• ESP_OK : success
• other : failed

`esp_err_t esp_ble_gap_update_conn_params (esp_ble_conn_update_params_t *params)`
Update connection parameters, can only be used when connection is up.

Return
• ESP_OK : success
• other : failed

Parameters
• [in] params: -connection update parameters

`esp_err_t esp_ble_gap_set_pkt_data_len (esp_bd_addr_t remote_device, uint16_t tx_data_length)`
This function is to set maximum LE data packet size.

Return
• ESP_OK : success
• other : failed

`esp_err_t esp_ble_gap_set_rand_addr (esp_bd_addr_t rand_addr)`
This function sets the static Random Address and Non-Resolvable Private Address for the application.
Return
• ESP_OK: success
• other: failed

Parameters
• [in] rand_addr: the random address which should be setting

`esp_err_t esp_ble_gap_clear_rand_addr (void)`
This function clears the random address for the application.

Return
• ESP_OK: success
• other: failed

`esp_err_t esp_ble_gap_config_local_privacy (bool privacy_enable)`
Enable/disable privacy on the local device.

Return
• ESP_OK: success
• other: failed

Parameters
• [in] privacy_enable: - enable/disable privacy on remote device.

`esp_err_t esp_ble_gap_config_local_icon (uint16_t icon)`
set local gap appearance icon

Return
• ESP_OK: success
• other: failed

Parameters
• [in] icon: - External appearance value, these values are defined by the Bluetooth SIG, please refer to https://www.bluetooth.com/specifications/gatt/viewer?attributeXmlFile=org.bluetooth.characteristic.gap.appearance.xml

`esp_err_t esp_ble_gap_update_whitelist (bool add_remove, esp_bd_addr_t remote_bda, esp_ble_wl_addr_type_t wl_addr_type)`
Add or remove device from white list.

Return
• ESP_OK: success
• other: failed

Parameters
• [in] add_remove: the value is true if added the ble device to the white list, and false remove to the white list.
• [in] remote_bda: the remote device address add/remove from the white list.
• [in] wl_addr_type: whitelist address type

`esp_err_t esp_ble_gap_clear_whitelist (void)`
Clear all white list.

Return
• ESP_OK: success
• other: failed

`esp_err_t esp_ble_gap_get_whitelist_size (uint16_t *length)`
Get the whitelist size in the controller.

Return
• ESP_OK: success
• other: failed

Parameters
• [out] length: the white list length.
**esp_err_t esp_ble_gap_set_prefer_conn_params**

\[
\text{esp_ble_gap_set_prefer_conn_params}(\text{bd_addr}, \text{min_conn_int}, \text{max_conn_int}, \text{slave_latency}, \text{supervision_tout})
\]

This function is called to set the preferred connection parameters when default connection parameter is not desired before connecting. This API can only be used in the master role.

**Return**

- ESP_OK : success
- other : failed

**Parameters**

- [in] bd_addr: BD address of the peripheral
- [in] min_conn_int: minimum preferred connection interval
- [in] max_conn_int: maximum preferred connection interval
- [in] slave_latency: preferred slave latency
- [in] supervision_tout: preferred supervision timeout

**esp_err_t esp_ble_gap_set_device_name**

\[
\text{esp_ble_gap_set_device_name}(\text{name})
\]

Set device name to the local device.

**Return**

- ESP_OK : success
- other : failed

**Parameters**

- [in] name: device name.

**esp_err_t esp_ble_gap_get_local_used_addr**

\[
\text{esp_ble_gap_get_local_used_addr}(\text{local_used_addr}, \text{addr_type})
\]

This function is called to get local used address and address type.

**Return**

- ESP_OK : success
- other : failed

**Parameters**

- [in] local_used_addr: current local used ble address (six bytes)
- [in] addr_type: ble address type

**uint8_t *esp_ble_resolve_adv_data**

\[
\text{esp_ble_resolve_adv_data}(\text{adv_data}, \text{type}, \text{length})
\]

This function is called to get ADV data for a specific type.

**Return**

pointer of ADV data

**Parameters**

- [in] adv_data: pointer of ADV data which to be resolved
- [in] type: finding ADV data type
- [out] length: return the length of ADV data not including type

**esp_err_t esp_ble_gap_config_adv_data_raw**

\[
\text{esp_ble_gap_config_adv_data_raw}(\text{raw_data}, \text{raw_data_len})
\]

This function is called to set raw advertising data. User need to fill ADV data by self.

**Return**

- ESP_OK : success
- other : failed

**Parameters**

- [in] raw_data: raw advertising data
- [in] raw_data_len: raw advertising data length, less than 31 bytes

**esp_err_t esp_ble_gap_config_scan_rsp_data_raw**

\[
\text{esp_ble_gap_config_scan_rsp_data_raw}(\text{raw_data}, \text{raw_data_len})
\]

This function is called to set raw scan response data. User need to fill scan response data by self.

**Return**

- ESP_OK : success
- other : failed

**Parameters**
Chapter 2. API Reference

- [in] raw_data:: raw scan response data
- [in] raw_data_len:: raw scan response data length, less than 31 bytes

**esp_err_t esp_ble_gap_read_rssi (esp_bd_addr_t remote_addr)**

This function is called to read the RSSI of remote device. The address of link policy results are returned in the gap callback function with ESP_GAP_BLE_READ_RSSI_COMPLETE_EVT event.

**Return**
- ESP_OK : success
- other : failed

**Parameters**
- [in] remote_addr:: The remote connection device address.

**esp_err_t esp_ble_gap_add_duplicate_scan_exceptional_device (esp_ble_duplicate_exceptional_info_type_t type, esp_duplicate_info_t device_info)**

This function is called to add a device info into the duplicate scan exceptional list.

**Return**
- ESP_OK : success
- other : failed

**Parameters**
- [in] type: device info type, it is defined in esp_ble_duplicate_exceptional_info_type_t when type is MESH_BEACON_TYPE, MESH_PROV_SRV_ADV or MESH_PROXY_SRV_ADV, device_info is invalid.

**esp_err_t esp_ble_gap_remove_duplicate_scan_exceptional_device (esp_ble_duplicate_exceptional_info_type_t type, esp_duplicate_info_t device_info)**

This function is called to remove a device info from the duplicate scan exceptional list.

**Return**
- ESP_OK : success
- other : failed

**Parameters**
- [in] type: device info type, it is defined in esp_ble_duplicate_exceptional_info_type_t when type is MESH_BEACON_TYPE, MESH_PROV_SRV_ADV or MESH_PROXY_SRV_ADV, device_info is invalid.

**esp_err_t esp_ble_gap_clean_duplicate_scan_exceptional_list (esp_duplicate_scan_exceptional_list_type_t list_type)**

This function is called to clean the duplicate scan exceptional list. This API will delete all device information in the duplicate scan exceptional list.

**Return**
- ESP_OK : success
- other : failed

**Parameters**
- [in] list_type: duplicate scan exceptional list type, the value can be one or more of esp_duplicate_scan_exceptional_list_type_t.

**esp_err_t esp_ble_gap_set_security_param (esp_ble_sm_param_t param_type, void *value, uint8_t len)**

Set a GAP security parameter value. Overrides the default value.

Secure connection is highly recommended to avoid some major vulnerabilities like ‘Impersonation in the Pin Pairing Protocol’ (CVE-2020-26555) and ‘Authentication of the LE Legacy Pairing Protocol’.

To accept only secure connection mode, it is necessary do as following:
Chapter 2. API Reference

1. Set bit **ESP_LE_AUTH_REQ_SC_ONLY** (param_type is **ESP_BLE_SM_AUTHEN_REQ_MODE**), bit **ESP_LE_AUTH_BOND** and bit **ESP_LE_AUTH_REQ_MITM** is optional as required.

2. Set to **ESP_BLE_ONLY_ACCEPT_SPECIFIED_AUTH_ENABLE** (param_type is **ESP_BLE_SM_ONLY_ACCEPT_SPECIFIED_SEC_AUTH**).

Return - ESP_OK : success
- other : failed

Parameters
- [in] param_type :: the type of the param which to be set
- [in] value :: the param value
- [in] len :: the length of the param value

```c
esp_err_t esp_ble_gap_security_rsp (esp_bd_addr_t bd_addr, bool accept)
```

Grant security request access.

Return - ESP_OK : success
- other : failed

Parameters
- [in] bd_addr :: BD address of the peer
- [in] accept :: accept the security request or not

```c
esp_err_t esp_ble_set_encryption (esp_bd_addr_t bd_addr, esp_ble_sec_act_t sec_act)
```

Set a gap parameter value. Use this function to change the default GAP parameter values.

Return - ESP_OK : success
- other : failed

Parameters
- [in] bd_addr :: the address of the peer device need to encryption
- [in] sec_act :: This is the security action to indicate what kind of BLE security level is required for the BLE link if the BLE is supported

```c
esp_err_t esp_ble_passkey_reply (esp_bd_addr_t bd_addr, bool accept, uint32_t passkey)
```

Reply the key value to the peer device in the legacy connection stage.

Return - ESP_OK : success
- other : failed

Parameters
- [in] bd_addr :: BD address of the peer
- [in] accept :: passkey entry successful or declined.
- [in] passkey :: passkey value, must be a 6 digit number, can be lead by 0.

```c
esp_err_t esp_ble_confirm_reply (esp_bd_addr_t bd_addr, bool accept)
```

Reply the confirm value to the peer device in the secure connection stage.

Return - ESP_OK : success
- other : failed

Parameters
- [in] bd_addr :: BD address of the peer device
- [in] accept :: numbers to compare are the same or different.

```c
esp_err_t esp_ble_remove_bond_device (esp_bd_addr_t bd_addr)
```

Removes a device from the security database list of peer device. It manages unpairing event while connected.

Return - ESP_OK : success
- other : failed

Parameters
- [in] bd_addr :: BD address of the peer device

```c
int esp_ble_get_bond_device_num (void)
```

Get the device number from the security database list of peer device. It will return the device bonded number immediately.

Return - >= 0 : bonded devices number.
- ESP_FAIL : failed
**esp_err_t esp_ble_get_bond_device_list (int *dev_num, esp_ble_bond_dev_t *dev_list)**

Get the device from the security database list of peer device. It will return the device bonded information immediately.

**Return**  
- ESP_OK: success  
- other: failed

**Parameters**  
- [inout] dev_num: Indicate the dev_list array(buffer) size as input. If dev_num is large enough, it means the actual number as output. Suggest that dev_num value equal to esp_ble_get_bond_device_num().  
- [out] dev_list: an array(buffer) of esp_ble_bond_dev_t type. Use for storing the bonded devices address. The dev_list should be allocated by who call this API.

**esp_err_t esp_ble_oob_req_reply (esp_bd_addr_t bd_addr, uint8_t* TK, uint8_t len)**

This function is called to provide the OOB data for SMP in response to ESP_GAP_BLE_OOB_REQ_EVT.

**Return**  
- ESP_OK: success  
- other: failed

**Parameters**  
- [in] bd_addr: BD address of the peer device.  
- [in] TK: TK value, the TK value shall be a 128-bit random number  
- [in] len: length of tk, should always be 128-bit

**esp_err_t esp_ble_gap_disconnect (esp_bd_addr_t remote_device)**

This function is to disconnect the physical connection of the peer device gattc may have multiple virtual GATT server connections when multiple app_id registered. esp_ble_gattc_close (esp_gatt_if_t gattc_if, uint16_t conn_id) only close one virtual GATT server connection. if there exist other virtual GATT server connections, it does not disconnect the physical connection. esp_ble_gap_disconnect(esp_bd_addr_t remote_device) disconnect the physical connection directly.

**Return**  
- ESP_OK: success  
- other: failed

**Parameters**  
- [in] remote_device: BD address of the peer device

**esp_err_t esp_ble_get_current_conn_params (esp_bd_addr_t bd_addr, esp_gap_conn_params_t *conn_params)**

This function is called to read the connection parameters information of the device.

**Return**  
- ESP_OK: success  
- other: failed

**Parameters**  
- [in] bd_addr: BD address of the peer device.  
- [out] conn_params: the connection parameters information

**esp_err_t esp_gap_ble_set_channels (esp_gap_ble_channels channels)**

BLE set channels.

**Return**  
- ESP_OK: success  
- ESP_ERR_INVALID_STATE: if bluetooth stack is not yet enabled  
- other: failed

**Parameters**  
- [in] channels: The n th such field (in the range 0 to 36) contains the value for the link layer channel index n. 0 means channel n is bad. 1 means channel n is unknown. The most significant bits are reserved and shall be set to 0. At least one channel shall be marked as unknown.

**esp_err_t esp_gap_ble_set_authorization (esp_bd_addr_t bd_addr, bool authorize)**

This function is called to authorized a link after Authentication(MITM protection)

**Return**  
- ESP_OK: success  
- other: failed

**Parameters**  
- [in] bd_addr: BD address of the peer device.  
- [out] authorize: Authorized the link or not.
**esp_err_t esp_ble_gap_read_phy(esp_bd_addr_t bd_addr)**

This function is used to read the current transmitter PHY and receiver PHY on the connection identified by remote address.

**Return**
- ESP_OK : success
- other : failed

**Parameters**
- [in] bd_addr: BD address of the peer device

**esp_err_t esp_ble_gap_set_preferred_default_phy(esp_ble_gap_phy_mask_t tx_phy_mask, esp_ble_gap_phy_mask_t rx_phy_mask)**

This function is used to allows the Host to specify its preferred values for the transmitter PHY and receiver PHY to be used for all subsequent connections over the LE transport.

**Return**
- ESP_OK : success
- other : failed

**Parameters**
- [in] tx_phy_mask: indicates the transmitter PHYs that the Host prefers the Controller to use
- [in] rx_phy_mask: indicates the receiver PHYs that the Host prefers the Controller to use

**esp_err_t esp_ble_gap_set_preferred_phy(esp_bd_addr_t bd_addr, esp_ble_gap_all_phys_t all_phys_mask, esp_ble_gap_phy_mask_t tx_phy_mask, esp_ble_gap_phy_mask_t rx_phy_mask, esp_ble_gap_prefer_phy_options_t phy_options)**

This function is used to set the PHY preferences for the connection identified by the remote address. The Controller might not be able to make the change (e.g. because the peer does not support the requested PHY) or may decide that the current PHY is preferable.

**Return**
- ESP_OK : success
- other : failed

**Parameters**
- [in] bd_addr: remote address
- [in] all_phys_mask: a bit field that allows the Host to specify
- [in] tx_phy_mask: a bit field that indicates the transmitter PHYs that the Host prefers the Controller to use
- [in] rx_phy_mask: a bit field that indicates the receiver PHYs that the Host prefers the Controller to use
- [in] phy_options: a bit field that allows the Host to specify options for PHYs

**esp_err_t esp_ble_gap_ext_adv_set_rand_addr(uint8_t instance, esp_bd_addr_t rand_addr)**

This function is used by the Host to set the random device address specified by the Random_Address parameter.

**Return**
- ESP_OK : success
- other : failed

**Parameters**
- [in] instance: Used to identify an advertising set
- [in] rand_addr: Random Device Address

**esp_err_t esp_ble_gap_ext_adv_set_params(uint8_t instance, esp_ble_gap_ext_adv_params_t *params)**

This function is used by the Host to set the advertising parameters.

**Return**
- ESP_OK : success
- other : failed

**Parameters**
- [in] instance: identifies the advertising set whose parameters are being configured.
- [in] params: advertising parameters

**esp_err_t esp_ble_gap_config_ext_adv_data_raw(uint8_t instance, uint16_t length, const uint8_t *data)**

This function is used to set the data used in advertising PDUs that have a data field.

**Return**
- ESP_OK : success
Chapter 2. API Reference

• other : failed

Parameters
• [in] instance: identifies the advertising set whose data are being configured
• [in] length: data length
• [in] data: data information

esp_err_t esp_ble_gap_config_ext_scan_rsp_data_raw(uint8_t instance, uint16_t length, const uint8_t* scan_rsp_data)

This function is used to provide scan response data used in scanning response PDUs.

Return
- ESP_OK : success
- other : failed

Parameters
• [in] instance: identifies the advertising set whose response data are being configured.
• [in] length: responsedata length
• [in] scan_rsp_data: response data information

esp_err_t esp_ble_gap_ext_adv_start(uint8_t num_adv, const esp_ble_gap_ext_adv_t* ext_adv)

This function is used to request the Controller to enable one or more advertising sets using the advertising sets identified by the instance parameter.

Return
- ESP_OK : success
- other : failed

Parameters
• [in] num_adv: Number of advertising sets to enable or disable
• [in] ext_adv: adv parameters

esp_err_t esp_ble_gap_ext_adv_stop(uint8_t num_adv, const uint8_t* ext_adv_inst)

This function is used to request the Controller to disable one or more advertising sets using the advertising sets identified by the instance parameter.

Return
- ESP_OK : success
- other : failed

Parameters
• [in] num_adv: Number of advertising sets to enable or disable
• [in] ext_adv_inst: ext adv instance

esp_err_t esp_ble_gap_ext_adv_set_remove(uint8_t instance)

This function is used to remove an advertising set from the Controller.

Return
- ESP_OK : success
- other : failed

Parameters
• [in] instance: Used to identify an advertising set

esp_err_t esp_ble_gap_ext_adv_set_clear(void)

This function is used to remove all existing advertising sets from the Controller.

Return
- ESP_OK : success
- other : failed

Parameters
• [in] instance:Used to identify an advertising set

esp_err_t esp_ble_gap_periodic_adv_set_params(uint8_t instance, const esp_ble_gap_periodic_adv_params_t* params)

This function is used by the Host to set the parameters for periodic advertising.

Return
- ESP_OK : success
- other : failed

Parameters
• [in] instance: identifies the advertising set whose periodic advertising parameters are being configured.
• [in] params: periodic adv parameters
esp_err_t esp_ble_gap_config_periodic_adv_data_raw(uint8_t instance, uint16_t length, const uint8_t *data)

This function is used to set the data used in periodic advertising PDUs.

Return  - ESP_OK : success
          • other : failed

Parameters
• [in] instance: identifies the advertising set whose periodic advertising parameters are being configured.
• [in] length: the length of periodic data
• [in] data: periodic data information

esp_err_t esp_ble_gap_periodic_adv_start(uint8_t instance)

This function is used to request the Controller to enable the periodic advertising for the advertising set specified.

Return  - ESP_OK : success
          • other : failed

Parameters
• [in] instance: Used to identify an advertising set

esp_err_t esp_ble_gap_periodic_adv_stop(uint8_t instance)

This function is used to request the Controller to disable the periodic advertising for the advertising set specified.

Return  - ESP_OK : success
          • other : failed

Parameters
• [in] instance: Used to identify an advertising set

esp_err_t esp_ble_gap_set_ext_scan_params(const esp_ble_ext_scan_params_t *params)

This function is used to set the extended scan parameters to be used on the advertising channels.

Return  - ESP_OK : success
          • other : failed

Parameters
• [in] params: scan parameters

esp_err_t esp_ble_gap_start_ext_scan(uint32_t duration, uint16_t period)

This function is used to enable scanning.

Return  - ESP_OK : success
          • other : failed

Parameters
• [in] duration: Scan duration
• [in] period: Time interval from when the Controller started its last Scan Duration until it begins the subsequent Scan Duration.

esp_err_t esp_ble_gap_stop_ext_scan(void)

This function is used to disable scanning.

Return  - ESP_OK : success
          • other : failed

esp_err_t esp_ble_gap_periodic_adv_create_sync(const esp_ble_gap_periodic_adv_sync_params_t *params)

This function is used to synchronize with periodic advertising from an advertiser and begin receiving periodic advertising packets.

Return  - ESP_OK : success
          • other : failed

Parameters
• [in] params: sync parameters

esp_err_t esp_ble_gap_periodic_adv_sync_cancel(void)

This function is used to cancel the LE_Periodic_Advertising_Create_Sync command while it is pending.

Return  - ESP_OK : success
**esp_err_t** **esp_ble_gap_periodic_adv_sync_terminate**(uint16_t *sync_handle)

This function is used to stop reception of the periodic advertising identified by the Sync Handle parameter.

- **Return**: ESP_OK : success
  - other : failed
- **Parameters**
  - **[in]** sync_handle: : identify the periodic advertiser

**esp_err_t** **esp_ble_gap_periodic_adv_add_dev_to_list**(esp_ble_addr_type_t **addr_type**, esp_bd_addr_t **addr**, uint8_t **sid**)

This function is used to add a single device to the Periodic Advertiser list stored in the Controller.

- **Return**: ESP_OK : success
  - other : failed
- **Parameters**
  - **[in]** addr_type: : address type
  - **[in]** addr: : Device Address
  - **[in]** sid: : Advertising SID subfield in the ADI field used to identify the Periodic Advertising

**esp_err_t** **esp_ble_gap_periodic_adv_remove_dev_from_list**(esp_ble_addr_type_t **addr_type**, esp_bd_addr_t **addr**, uint8_t **sid**)

This function is used to remove one device from the list of Periodic Advertisers stored in the Controller. Removals from the Periodic Advertisers List take effect immediately.

- **Return**: ESP_OK : success
  - other : failed
- **Parameters**
  - **[in]** addr_type: : address type
  - **[in]** addr: : Device Address
  - **[in]** sid: : Advertising SID subfield in the ADI field used to identify the Periodic Advertising

**esp_err_t** **esp_ble_gap_periodic_adv_clear_dev**(void)

This function is used to remove all devices from the list of Periodic Advertisers in the Controller.

- **Return**: ESP_OK : success
  - other : failed
- **Parameters**
  - **[in]** addr: : device address

**esp_err_t** **esp_ble_gap_prefer_ext_connect_params_set**(esp_bd_addr_t **addr**, esp_ble_gap_phy_mask_t **phy_mask**, const esp_ble_gap_conn_params_t *phy_1m_conn_params, const esp_ble_gap_conn_params_t *phy_2m_conn_params, const esp_ble_gap_conn_params_t *phy_coded_conn_params)

This function is used to set aux connection parameters.

- **Return**: ESP_OK : success
  - other : failed
- **Parameters**
  - **[in]** addr: : device address
  - **[in]** phy_mask: : indicates the PHY(s) on which the advertising packets should be received on the primary advertising channel and the PHYs for which connection parameters have been specified.
  - **[in]** phy_1m_conn_params: : Scan connectable advertisements on the LE 1M PHY. Connection parameters for the LE 1M PHY are provided.
  - **[in]** phy_2m_conn_params: : Connection parameters for the LE 2M PHY are provided.
  - **[in]** phy_coded_conn_params: : Scan connectable advertisements on the LE Coded PHY. Connection parameters for the LE Coded PHY are provided.

\texttt{#include <esp_gap_ble_api.h>} \texttt{ESP\_GAP\_BLE\_SET\_CHANNELS\__EVT.}

\textbf{Public Members}

\texttt{esp\_bt\_status\_t stat}  
BLE set channel status

\textbf{struct ble_set_ext_scan_params_cmpl_param}  
\texttt{#include <esp_gap_ble_api.h>} \texttt{ESP\_GAP\_BLE\_SET\_EXT\_SCAN\_PARAMS\_COMPLETE\__EVT.}

\textbf{Public Members}

\texttt{esp\_bt\_status\_t status}  
Indicate extend advertising parameters set status

\textbf{struct ble_set_perf_def_phy_cmpl_evt_param}  
\texttt{#include <esp_gap_ble_api.h>} \texttt{ESP\_GAP\_BLE\_SET\_PREFERED\_DEFAULT\_PHY\_COMPLETE\__EVT.}

\textbf{Public Members}

\texttt{esp\_bt\_status\_t status}  
Indicate perf default phy set status

\textbf{struct ble_set_perf_phy_cmpl_evt_param}  
\texttt{#include <esp_gap_ble_api.h>} \texttt{ESP\_GAP\_BLE\_SET\_PREFERED\_PHY\_COMPLETE\__EVT.}
Public Members

*esp_bt_status_t* **status**

Indicate perf phy set status

**struct ble_set_rand_cmpl_evt_param**

```c
#include <esp_gap_ble_api.h> ESP_GAP_BLE_SET_STATIC_RAND_ADDR_EVT.
```

Public Members

*esp_bt_status_t* **status**

Indicates set static rand address operation success status

**struct ble_update_conn_params_evt_param**

```c
#include <esp_gap_ble_api.h> ESP_GAP_BLE_UPDATE_CONN_PARAMS_EVT.
```

Public Members

*esp_bt_status_t* **status**

Indicate update connection parameters success status

*esp_bd_addr_t* **bda**

Bluetooth device address

*uint16_t* **min_int**

Min connection interval

*uint16_t* **max_int**

Max connection interval

*uint16_t* **latency**

Slave latency for the connection in number of connection events. Range: 0x0000 to 0x01F3

*uint16_t* **conn_int**

Current connection interval

*uint16_t* **timeout**

Supervision timeout for the LE Link. Range: 0x000A to 0x0C80. Mandatory Range: 0x000A to 0x0C80. Time = N * 10 msec

**struct ble_update_duplicate_exceptional_list_cmpl_evt_param**

```c
#include <esp_gap_ble_api.h> ESP_GAP_BLE_UPDATE_DUPLICATE_EXCEPTIONAL_LIST_COMPLETE_EVT.
```

Public Members

*esp_bt_status_t* **status**

Indicate update duplicatescan exceptional list operation success status

*uint8_t* **subcode**

Define in esp_bt_duplicate_exceptional_subcode_type_t

*uint16_t* **length**

The length of device_info

*esp_duplicate_info_t* **device_info**

device information, when subcode is ESP_BLE_DUPLICATE_EXCEPTIONAL_LIST_CLEAN, the value is invalid

**struct ble_update_whitelist_cmpl_evt_param**

```c
#include <esp_gap_ble_api.h> ESP_GAP_BLE_UPDATE_WHITELIST_COMPLETE_EVT.
```
Public Members

`esp_bt_status_t status`
Indicate the add or remove whitelist operation success status

`esp_ble_wl_opration_t wl_opration`
The value is `ESP_BLE_WHITELIST_ADD` if add address to whitelist operation success,
`ESP_BLE_WHITELIST_REMOVE` if remove address from the whitelist operation success

Structures

`struct esp_ble_adv_params_t`
Advertising parameters.

Public Members

uint16_t `adv_int_min`
Minimum advertising interval for undirected and low duty cycle directed advertising. Range: 0x0020 to 0x4000 Default: N = 0x0800 (1.28 second) Time = N * 0.625 msec Time Range: 20 ms to 10.24 sec

uint16_t `adv_int_max`
Maximum advertising interval for undirected and low duty cycle directed advertising. Range: 0x0020 to 0x4000 Default: N = 0x0800 (1.28 second) Time = N * 0.625 msec Time Range: 20 ms to 10.24 sec

`esp_ble_adv_type_t adv_type`
Advertising type

`esp_ble_addr_type_t own_addr_type`
Owner bluetooth device address type

`esp_bd_addr_t peer_addr`
Peer device bluetooth device address

`esp_ble_addr_type_t peer_addr_type`
Peer device bluetooth device address type, only support public address type and random address type

`esp_ble_adv_channel_t channel_map`
Advertising channel map

`esp_ble_adv_filter_t adv_filter_policy`
Advertising filter policy

`struct esp_ble_adv_data_t`
Advertising data content, according to “Supplement to the Bluetooth Core Specification”.

Public Members

bool `set_scan_rsp`
Set this advertising data as scan response or not

bool `include_name`
Advertising data include device name or not

bool `include_txpower`
Advertising data include TX power

int `min_interval`
Advertising data show slave preferred connection min interval. The connection interval in the following manner: connIntervalmin = Conn_Interval_Min * 1.25 ms Conn_Interval_Min range: 0x0006 to 0x0C80 Value of 0xFFFF indicates no specific minimum. Values not defined above are reserved for future use.
int max_interval
Advertising data show slave preferred connection max interval. The connection interval in the following manner: connIntervalmax = Conn_Interval_Max * 1.25 ms Conn_Interval_Max range: 0x0006 to 0x0C80 Conn_Interval_Max shall be equal to or greater than the Conn_Interval_Min. Value of 0xFFFF indicates no specific maximum. Values not defined above are reserved for future use.

int appearance
External appearance of device

uint16_t manufacturer_len
Manufacturer data length

uint8_t * p_manufacturer_data
Manufacturer data point

uint16_t service_data_len
Service data length

uint8_t * p_service_data
Service data point

uint16_t service_uuid_len
Service uuid length

uint8_t * p_service_uuid
Service uuid array point

uint8_t flag
Advertising flag of discovery mode, see BLE_ADV_DATA_FLAG detail

struct esp_ble_scan_params_t
Ble scan parameters.

Public Members

 esp_ble_scan_type_t scan_type
 Scan type

 esp_ble_addr_type_t own_addr_type
 Owner address type

 esp_ble_scan_filter_t scan_filter_policy
 Scan filter policy

uint16_t scan_interval
Scan interval. This is defined as the time interval from when the Controller started its last LE scan until it begins the subsequent LE scan. Range: 0x0004 to 0x4000 Default: 0x0010 (10 ms) Time = N * 0.625 msec Time Range: 2.5 msec to 10.24 seconds

uint16_t scan_window
Scan window. The duration of the LE scan. LE_Scan_Window shall be less than or equal to LE_Scan_Interval Range: 0x0004 to 0x4000 Default: 0x0010 (10 ms) Time = N * 0.625 msec Time Range: 2.5 msec to 10240 msec

 esp_ble_scan_duplicate_t scan_duplicate
The Scan_Duplicates parameter controls whether the Link Layer should filter out duplicate advertising reports (BLE_SCAN_DUPLICATE_ENABLE) to the Host, or if the Link Layer should generate advertising reports for each packet received

struct esp_gap_conn_params_t
connection parameters information
Public Members

uint16_t interval
    connection interval

uint16_t latency
    Slave latency for the connection in number of connection events. Range: 0x0000 to 0x01F3

uint16_t timeout
    Supervision timeout for the LE Link. Range: 0x000A to 0x0C80. Mandatory Range: 0x000A to 0x0C80
    Time = N * 10 msec Time Range: 100 msec to 32 seconds

struct esp_ble_conn_update_params_t
    Connection update parameters.

Public Members

esp_bd_addr_t bda
    Bluetooth device address

uint16_t min_int
    Min connection interval

uint16_t max_int
    Max connection interval

uint16_t latency
    Slave latency for the connection in number of connection events. Range: 0x0000 to 0x01F3

uint16_t timeout
    Supervision timeout for the LE Link. Range: 0x000A to 0x0C80. Mandatory Range: 0x000A to 0x0C80
    Time = N * 10 msec Time Range: 100 msec to 32 seconds

struct esp_ble_pkt_data_length_params_t
    BLE pkt data length keys.

Public Members

uint16_t rx_len
    pkt rx data length value

uint16_t tx_len
    pkt tx data length value

struct esp_ble_penc_keys_t
    BLE encryption keys.

Public Members

esp_bt_octet16_t ltk
    The long term key

esp_bt_octet8_t rand
    The random number

uint16_t ediv
    The ediv value

uint8_t sec_level
    The security level of the security link

uint8_t key_size
    The key size(7~16) of the security link
struct esp_ble_pcsrk_keys_t
  BLE CSRK keys.

  **Public Members**

  uint32_t counter
  The counter

  esp_bt_octet16_t csrk
  The csrk key

  uint8_t sec_level
  The security level

struct esp_ble_pid_keys_t
  BLE pid keys.

  **Public Members**

  esp_bt_octet16_t irk
  The irk value

  esp_ble_addr_type_t addr_type
  The address type

  esp_bd_addr_t static_addr
  The static address

struct esp_ble_lenc_keys_t
  BLE Encryption reproduction keys.

  **Public Members**

  esp_bt_octet16_t ltk
  The long term key

  uint16_t div
  The div value

  uint8_t key_size
  The key size of the security link

  uint8_t sec_level
  The security level of the security link

struct esp_ble_lcsrk_keys
  BLE SRK keys.

  **Public Members**

  uint32_t counter
  The counter value

  uint16_t div
  The div value

  uint8_t sec_level
  The security level of the security link

  esp_bt_octet16_t csrk
  The csrk key value
struct esp_ble_sec_keynotif_t
    Structure associated with ESP_KEY_NOTIF_EVT.

Public Members

    esp_bd_addr_t bd_addr
        peer address

    uint32_t passkey
        the numeric value for comparison. If just_works, do not show this number to UI

struct esp_ble_sec_req_t
    Structure of the security request.

Public Members

    esp_bd_addr_t bd_addr
        peer address

struct esp_ble_bond_key_info_t
    struct type of the bond key information value

Public Members

    esp_ble_key_mask_t key_mask
        the key mask to indicate which key is present

    esp_ble_penc_keys_t penc_key
        received peer encryption key

    esp_ble_pcsrk_keys_t pcsrk_key
        received peer device SRK

    esp_ble_pid_keys_t pid_key
        peer device ID key

struct esp_ble_bond_dev_t
    struct type of the bond device value

Public Members

    esp_bd_addr_t bd_addr
        peer address

    esp_ble_bond_key_info_t bond_key
        the bond key information

struct esp_ble_key_t
    union type of the security key value

Public Members

    esp_bd_addr_t bd_addr
        peer address

    esp_ble_key_type_t key_type
        key type of the security link

    esp_ble_key_value_t p_key_value
        the pointer to the key value
struct esp_ble_local_id_keys_t
    structure type of the ble local id keys value

Public Members

esp_bt_octet16_t ir
    the 16 bits of the ir value

esp_bt_octet16_t irk
    the 16 bits of the ir key value

esp_bt_octet16_t dhk
    the 16 bits of the dh key value

struct esp_ble_auth_cmpl_t
    Structure associated with ESP_AUTH_CMPL_EVT.

Public Members

esp_bd_addr_t bd_addr
    BD address peer device.

bool key_present
    Valid link key value in key element

esp_link_key key
    Link key associated with peer device.

uint8_t key_type
    The type of Link Key

bool success
    TRUE of authentication succeeded, FALSE if failed.

uint8_t fail_reason
    The HCI reason/error code for when success=FALSE

esp_ble_addr_type_t addr_type
    Peer device address type

exp bt dev type_t dev_type
    Device type

exp ble auth req_t auth_mode
    authentication mode

struct esp_ble_gap_ext_adv_params_t
    ext adv parameters

Public Members

exp_ble_ext_adv_type_mask_t type
    ext adv type

uint32_t interval_min
    ext adv minimum interval

uint32_t interval_max
    ext adv maximum interval

exp_ble_adv_channel_t channel_map
    ext adv channel map
```
// esp_ble_addr_type_t own_addr_type
// ext adv own address type

// esp_ble_addr_type_t peer_addr_type
// ext adv peer address type

// esp_bd_addr_t peer_addr
// ext adv peer address

// esp_ble_adv_filter_t filter_policy
// ext adv filter policy

int8_t tx_power
  ext adv tx power

// esp_ble_gap_pri phy_t primary_phy
// ext adv primary phy

uint8_t max_skip
  ext adv maximum skip

// esp_ble_gap_phy_t secondary_phy
// ext adv secondary phy

uint8_t sid
  ext adv sid

bool scan_req_notif
  ext adv scan request event notify

struct esp_ble_ext_scan_cfg_t
  ext scan config

Public Members

// esp_ble_scan_type_t scan_type
// ext scan type

uint16_t scan_interval
  ext scan interval

uint16_t scan_window
  ext scan window

struct esp_ble_ext_scan_params_t
  ext scan parameters

Public Members

// esp_ble_addr_type_t own_addr_type
// ext scan own addresss type

// esp_ble_scan_filter_t filter_policy
// ext scan filter policy

// esp_ble_scan_duplicate_t scan_duplicate
// ext scan duplicate scan

// esp_ble_ext_scan_cfg_mask_t cfg_mask
// ext scan config mask

// esp_ble_ext_scan_cfg_t uncoded_cfg
// ext scan uncoded config parameters

// esp_ble_ext_scan_cfg_t coded_cfg
// ext scan coded config parameters
```
struct esp_ble_gap_conn_params_t
create extend connection parameters

Public Members

uint16_t scan_interval
init scan interval

uint16_t scan_window
init scan window

uint16_t interval_min
minimum interval

uint16_t interval_max
maximum interval

uint16_t latency
ext scan type

uint16_t supervision_timeout
connection supervision timeout

uint16_t min_ce_len
minimum ce length

uint16_t max_ce_len
maximum ce length

struct esp_ble_gap_ext_adv_t
extend adv enable parameters

Public Members

uint8_t instance
advertising handle

int duration
advertising duration

int max_events
maximum number of extended advertising events

struct esp_ble_gap_periodic_adv_params_t
periodic adv parameters

Public Members

uint16_t interval_min
periodic advertising minimum interval

uint16_t interval_max
periodic advertising maximum interval

uint8_t properties
periodic advertising properties

struct esp_ble_gap_periodic_adv_sync_params_t
periodic adv sync parameters
Public Members

*esp_ble_gap_sync_t* \textbf{filter\_policy}
periodic advertising sync filter policy

\textbf{uint8\_t sid}
periodic advertising sid

*esp_ble_addr_type_t* \textbf{addr\_type}
periodic advertising address type

*esp_bd_addr_t* \textbf{addr}
periodic advertising address

\textbf{uint16\_t skip}
the maximum number of periodic advertising events that can be skipped

\textbf{uint16\_t sync\_timeout}
synchronization timeout

\textbf{struct esp\_ble\_gap\_ext\_adv\_report\_t}
extend adv report parameters

Public Members

*esp_ble_gap_adv_type_t* \textbf{event\_type}
extend advertising type

\textbf{uint8\_t addr\_type}

typedef uint8_t esp_ble_gap_ext_adv_data_status_t

typedef void (*esp_gap_ble_cb_t)(esp_gap_ble_cb_event_t event, esp_gap_ble_cb_param_t *param)

GAP callback function type.
Parameters

- event:: Event type
- param:: Point to callback parameter, currently is union type

Enumerations

define esp_gap_ble_cb_event_t

GAP BLE callback event type.

Values:

- ESP_GAP_BLE_ADV_DATA_SET_COMPLETE_EVT = 0
  When advertising data set complete, the event comes
- ESP_GAP_BLE_SCAN_RSP_DATA_SET_COMPLETE_EVT
  When scan response data set complete, the event comes
- ESP_GAP_BLE_SCAN_PARAM_SET_COMPLETE_EVT
  When scan parameters set complete, the event comes
- ESP_GAP_BLE_SCAN_RESULT_EVT
  When one scan result ready, the event comes each time
- ESP_GAP_BLE_ADV_DATA_RAW_SET_COMPLETE_EVT
  When raw advertising data set complete, the event comes
- ESP_GAP_BLE_SCAN_RSP_DATA_RAW_SET_COMPLETE_EVT
  When raw advertising data set complete, the event comes
- ESP_GAP_BLE_ADV_START_COMPLETE_EVT
  When start advertising complete, the event comes
- ESP_GAP_BLE_SCAN_START_COMPLETE_EVT
  When start scan complete, the event comes
- ESP_GAP_BLE_AUTH_CMPL_EVT = 8
- ESP_GAP_BLE_KEY_EVT
- ESP_GAP_BLE_SEC_REQ_EVT
- ESP_GAP_BLE_PASSKEY_NOTIF_EVT
- ESP_GAP_BLE_PASSKEY_REQ_EVT
- ESP_GAP_BLE_OOB_REQ_EVT
- ESP_GAP_BLE_LOCAL_IR_EVT
- ESP_GAP_BLE_LOCAL_ER_EVT
- ESP_GAP_BLE_NC_REQ_EVT
- ESP_GAP_BLE_ADV_STOP_COMPLETE_EVT
  When stop adv complete, the event comes
- ESP_GAP_BLE_SCAN_STOP_COMPLETE_EVT
  When stop scan complete, the event comes
- ESP_GAP_BLE_SET_STATIC_RAND_ADDR_EVT = 19
  When set the static rand address complete, the event comes
- ESP_GAP_BLE_UPDATE_CONN_PARAMS_EVT
  When update connection parameters complete, the event comes
- ESP_GAP_BLE_SET_PKT_LENGTH_COMPLETE_EVT
  When pkt length complete, the event comes
- ESP_GAP_BLE_SET_LOCAL_PRIVACY_COMPLETE_EVT
  When Enable/disable privacy on the local device complete, the event comes
ESP_GAP_BLE_REMOVE_BOND_DEV_COMPLETE_EVT
   When remove the bond device complete, the event comes

ESP_GAP_BLE_CLEAR_BOND_DEV_COMPLETE_EVT
   When clear the bond device clear complete, the event comes

ESP_GAP_BLE_GET_BOND_DEV_COMPLETE_EVT
   When get the bond device list complete, the event comes

ESP_GAP_BLE_READRSSI_COMPLETE_EVT
   When read the rssi complete, the event comes

ESP_GAP_BLE_UPDATE_WHITELIST_COMPLETE_EVT
   When add or remove whitelist complete, the event comes

ESP_GAP_BLE_UPDATE_DUPLICATE_EXCEPTIONAL_LIST_COMPLETE_EVT
   When update duplicate exceptional list complete, the event comes

ESP_GAP_BLE_SET_CHANNELS_EVT = 29
   When setting BLE channels complete, the event comes

ESP_GAP_BLE_READ_PHY_COMPLETE_EVT
ESP_GAP_BLE_SET_PREFERED_DEFAULT_PHY_COMPLETE_EVT
ESP_GAP_BLE_SET_PREFERED_PHY_COMPLETE_EVT
ESP_GAP_BLE_EXT_ADV_SET_RAND_ADDR_COMPLETE_EVT
ESP_GAP_BLE_EXT_ADV_SET_PARAMS_COMPLETE_EVT
ESP_GAP_BLE_EXT_ADV_DATA_SET_COMPLETE_EVT
ESP_GAP_BLE_EXT_SCAN_RSP_DATA_SET_COMPLETE_EVT
ESP_GAP_BLE_EXT_ADV_START_COMPLETE_EVT
ESP_GAP_BLE_EXT_ADV_STOP_COMPLETE_EVT
ESP_GAP_BLE_EXT_ADV_SET_REMOVE_COMPLETE_EVT
ESP_GAP_BLE_EXT_ADV_SET_CLEAR_COMPLETE_EVT
ESP_GAP_BLE_PERIODIC_ADV_SET_PARAMS_COMPLETE_EVT
ESP_GAP_BLE_PERIODIC_ADV_DATA_SET_COMPLETE_EVT
ESP_GAP_BLE_PERIODIC_ADV_START_COMPLETE_EVT
ESP_GAP_BLE_PERIODIC_ADV_STOP_COMPLETE_EVT
ESP_GAP_BLE_PERIODIC_ADV_CREATE_SYNC_COMPLETE_EVT
ESP_GAP_BLE_PERIODIC_ADV_SYNC_CANCEL_COMPLETE_EVT
ESP_GAP_BLE_PERIODIC_ADV_SYNC_TERMINATE_COMPLETE_EVT
ESP_GAP_BLE_PERIODIC_ADV_CREATE_SYNC_COMPLETE_EVT
ESP_GAP_BLE_PERIODIC_ADV_SYNC_CANCEL_COMPLETE_EVT
ESP_GAP_BLE_PERIODIC_ADV_SYNC_TERMINATE_COMPLETE_EVT
ESP_GAP_BLE_PERIODIC_ADV_ADD_DEV_COMPLETE_EVT
ESP_GAP_BLE_PERIODIC_ADV_REMOVE_DEV_COMPLETE_EVT
ESP_GAP_BLE_PERIODIC_ADV_CLEAR_DEV_COMPLETE_EVT
ESP_GAP_BLE_SET_EXT_SCAN_PARAMS_COMPLETE_EVT
ESP_GAP_BLE_EXT_SCAN_START_COMPLETE_EVT
ESP_GAP_BLE_EXT_SCAN_STOP_COMPLETE_EVT
ESP_GAP_BLE_PREFER_EXT_CONN_PARAMS_SET_COMPLETE_EVT
ESP_GAP_BLE_PHY_UPDATE_COMPLETE_EVT
ESP_GAP_BLE_EXT_ADV_REPORT_EVT
ESP_GAP_BLE_SCAN_TIMEOUT_EVT
ESP_GAP_BLE_ADV_TERMINATED_EVT
ESP_GAP_BLE_SCAN_REQ_RECEIVED_EVT
ESP_GAP_BLE_CHANNEL_SELECT_ALGORITHM_EVT
ESP_GAP_BLE_PERIODIC_ADV_REPORT_EVT
ESP_GAP_BLE_PERIODIC_ADV_SYNC_LOST_EVT
ESP_GAP_BLE_PERIODIC_ADV_SYNC_ESTABLISHED_EVT
ESP_GAP_BLE_EVT_MAX

enum esp_ble_adv_data_type
The type of advertising data (not adv_type)

Values:

ESP_BLE_AD_TYPE_FLAG = 0x01
ESP_BLE_AD_TYPE_16SRV_PART = 0x02
ESP_BLE_AD_TYPE_16SRV_CMPL = 0x03

enum esp_ble_adv_type_t
Advertising mode.
Values:
ADV_TYPE_IND = 0x00
ADV_TYPE_DIRECT_IND_HIGH = 0x01
ADV_TYPE_SCAN_IND = 0x02
ADV_TYPE_NONCONN_IND = 0x03
ADV_TYPE_DIRECT_IND_LOW = 0x04

enum esp_ble_adv_channel_t
Advertising channel mask.
Values:
ADV_CHNL_37 = 0x01
ADV_CHNL_38 = 0x02
ADV_CHNL_39 = 0x04
ADV_CHNL_ALL = 0x07

enum esp_ble_adv_filter_t
Values:
ADV_FILTER_ALLOW_SCAN_ANY_CON_ANY = 0x00
  Allow both scan and connection requests from anyone.
ADV_FILTER_ALLOW_SCAN_WLST_CON_ANY
  Allow both scan req from White List devices only and connection req from anyone.
ADV_FILTER_ALLOW_SCAN_ANY_CON_WLST
  Allow both scan req from anyone and connection req from White List devices only.
ADV_FILTER_ALLOW_SCAN_WLST_CON_WLST
  Allow scan and connection requests from White List devices only.

enum esp_ble_sec_act_t
Values:
ESP_BLE_SEC_ENCRYPT = 1
ESP_BLE_SEC_ENCRYPT_NO_MITM
ESP_BLE_SEC_ENCRYPT_MITM

enum esp_ble_sm_param_t
Values:
ESP_BLE_SM_PASSKEY = 0
ESP_BLE_SM_AUTHEN_REQ_MODE
ESP_BLE_SM_IOCAP_MODE
Chapter 2. API Reference

`ESP_BLE_SM_SET_INIT_KEY`
`ESP_BLE_SM_SET_RSP_KEY`
`ESP_BLE_SM_MAX_KEY_SIZE`
`ESP_BLE_SM_MIN_KEY_SIZE`
`ESP_BLE_SM_SET_STATIC_PASSKEY`
`ESP_BLE_SM_CLEAR_STATIC_PASSKEY`
`ESP_BLE_SM_ONLY_ACCEPT_SPECIFIED_SEC_AUTH`
`ESP_BLE_SM_OOB_SUPPORT`
`ESP_BLE_SM_APP_ENC_KEY_SIZE`
`ESP_BLE_SM_MAX_PARAM`

```c
enum esp_ble_scan_type_t
{  
    BLE_SCAN_TYPE_PASSIVE = 0x0,  
    Passive scan
    BLE_SCAN_TYPE_ACTIVE = 0x1,  
    Active scan
};
```

```c
enum esp_ble_scan_filter_t
{  
    BLE_SCAN_FILTER_ALLOW_ALL = 0x0,  
    Accept all:
    1. advertisement packets except directed advertising packets not addressed to this device (default).
    BLE_SCAN_FILTER_ALLOW_ONLY_WLST = 0x1,  
    Accept only:
    1. advertisement packets from devices where the advertiser’s address is in the Whitelist.
    2. Directed advertising packets which are not addressed for this device shall be ignored.
    BLE_SCAN_FILTER_ALLOW_UND_RPA_DIR = 0x2,  
    Accept all:
    1. undirected advertisement packets, and
    2. directed advertising packets where the initiator address is a resolvable private address, and
    3. directed advertising packets addressed to this device.
    BLE_SCAN_FILTER_ALLOW_WLIST_RPA_DIR = 0x3,  
    Accept all:
    1. advertisement packets from devices where the advertiser’s address is in the Whitelist, and
    2. directed advertising packets where the initiator address is a resolvable private address, and
    3. directed advertising packets addressed to this device.
};
```

```c
enum esp_ble_scan_duplicate_t
{  
    BLE_SCAN_DUPLICATE_DISABLE = 0x0,  
    the Link Layer should generate advertising reports to the host for each packet received
    BLE_SCAN_DUPLICATE_ENABLE = 0x1,  
    the Link Layer should filter out duplicate advertising reports to the Host
};
```
BLE_SCAN_DUPLICATE_MAX = 0x2
0x02~0xFF, Reserved for future use

enum esp_gap_search_evt_t
Sub Event of ESP_GAP_BLE_SCAN_RESULT_EVT.
Values:

ESP_GAP_SEARCH_INQ_RES_EVT = 0
Inquiry result for a peer device.

ESP_GAP_SEARCH_INQ_CMPL_EVT = 1
Inquiry complete.

ESP_GAP_SEARCH_DISC_RES_EVT = 2
Discovery result for a peer device.

ESP_GAP_SEARCH_DISC_BLE_RES_EVT = 3
Discovery result for BLE GATT based service on a peer device.

ESP_GAP_SEARCH_DISC_CMPL_EVT = 4
Discovery complete.

ESP_GAP_SEARCH_DI_DISC_CMPL_EVT = 5
Discovery complete.

ESP_GAP_SEARCH_SEARCH_CANCEL_CMPL_EVT = 6
Search cancelled

ESP_GAP_SEARCH_INQ_DISCARD_NUM_EVT = 7
The number of pkt discarded by flow control

enum esp_ble_evt_type_t
Ble scan result event type, to indicate the result is scan response or advertising data or other.
Values:

ESP_BLE_EVT_CONN_ADV = 0x00
Connectable undirected advertising (ADV_IND)

ESP_BLE_EVT_CONN_DIR_ADV = 0x01
Connectable directed advertising (ADV_DIRECT_IND)

ESP_BLE_EVT_DISC_ADV = 0x02
Scannable undirected advertising (ADV_SCAN_IND)

ESP_BLE_EVT_NON_CONN_ADV = 0x03
Non connectable undirected advertising (ADV_NONCONN_IND)

ESP_BLE_EVT_SCAN_RSP = 0x04
Scan Response (SCAN_RSP)

enum esp_ble_wl_opration_t
Values:

ESP_BLE_WHITELIST_REMOVE = 0X00
remove mac from whitelist

ESP_BLE_WHITELIST_ADD = 0X01
add address to whitelist

enum esp_bt_duplicate_exceptional_subcode_type_t
Values:

ESP_BLE_DUPLICATE_EXCEPTIONAL_LIST_ADD = 0
Add device info into duplicate scan exceptional list

ESP_BLE_DUPLICATE_EXCEPTIONAL_LIST_REMOVE
Remove device info from duplicate scan exceptional list
Chapter 2. API Reference

### ESP_BLE_DUPLICATE_EXCEPTIONAL_LIST_CLEAN
Clean duplicate scan exceptional list

#### enum esp_ble_duplicate_exceptional_info_type_t

**Values:**

- ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_INFO_ADV_ADDR = 0
  
  BLE advertising address, device info will be added into ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_ADDR_LIST

- ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_INFO_MESH_LINK_ID
  
  BLE mesh link ID, it is for BLE mesh, device info will be added into ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_MESH_LINK_ID_LIST

- ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_INFO_MESH_BEACON_TYPE
  
  BLE mesh beacon AD type, the format is | Len | 0x2B | Beacon Type | Beacon Data |

- ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_INFO_MESH_PROV_SRV_ADV
  
  BLE mesh provisioning service uuid, the format is | 0x02 | 0x01 | flags | 0x03 | 0x03 | 0x1827 | ...

- ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_INFO_MESH_PROXY_SRV_ADV
  
  BLE mesh adv with proxy service uuid, the format is | 0x02 | 0x01 | flags | 0x03 | 0x03 | 0x1828 | ...

#### enum esp_duplicate_scan_exceptional_list_type_t

**Values:**

- ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_ADDR_LIST = BLE_BIT(0)
  
  duplicate scan exceptional addr list

- ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_MESH_LINK_ID_LIST = BLE_BIT(1)
  
  duplicate scan exceptional mesh link ID list

- ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_MESH_BEACON_TYPE_LIST = BLE_BIT(2)
  
  duplicate scan exceptional mesh beacon type list

- ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_MESH_PROV_SRV_ADV_LIST = BLE_BIT(3)
  
  duplicate scan exceptional mesh adv with provisioning service uuid

- ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_MESH_PROXY_SRV_ADV_LIST = BLE_BIT(4)
  
  duplicate scan exceptional mesh adv with provisionning service uuid

- ESP_BLE_DUPLICATE_SCAN_EXCEPTIONAL_ALL_LIST = 0xFFFF
  
  duplicate scan exceptional all list

---

**GATT DEFINES**

**Overview**

Instructions

**Application Example**

Instructions

**API Reference**

**Header File**

- components/bt/host/bluedroid/api/include/api/esp_gatt_defs.h

**Unions**

```c
union esp_gatt_rsp_t
{
  #include <esp_gatt_defs.h> GATT remote read request response type.
}
```
Chapter 2. API Reference

Public Members

`esp_gatt_value_t attr_value`
Gatt attribute structure

`uint16_t handle`
Gatt attribute handle

Structures

`struct esp_gatt_id_t`
Gatt id, include uuid and instance id.

Public Members

`esp_bt_uuid_t uuid`
UUID

`uint8_t inst_id`
Instance id

`struct esp_gatt_srvc_id_t`
Gatt service id, include id (uuid and instance id) and primary flag.

Public Members

`esp_gatt_id_t id`
Gatt id, include uuid and instance

`bool is_primary`
This service is primary or not

`struct esp_attr_desc_t`
Attribute description (used to create database)

Public Members

`uint16_t uuid_length`
UUID length

`uint8_t* uuid_p`
UUID value

`uint16_t perm`
Attribute permission

`uint16_t max_length`
Maximum length of the element

`uint16_t length`
Current length of the element

`uint8_t* value`
Element value array

`struct esp_attr_control_t`
attribute auto response flag
Chapter 2. API Reference

Public Members

uint8_t *auto_rsp
if auto_rsp set to ESP_GATT_RSP_BY_APP, means the response of Write/Read operation will be replied by application. if auto_rsp set to ESP_GATT_AUTO_RSP, means the response of Write/Read operation will be replied by GATT stack automatically.

struct esp_gatts_attr_db_t
attribute type added to the gatt server database

Public Members

esp_attr_control_t attr_control
The attribute control type

esp_attr_desc_t att_desc
The attribute type

struct esp_attr_value_t
set the attribute value type

Public Members

uint16_t attr_max_len
attribute max value length

uint16_t attr_len
attribute current value length

uint8_t *attr_value
the pointer to attribute value

struct esp_gatts_incl_svc_desc_t
Gatt include service entry element.

Public Members

uint16_t start_hdl
Gatt start handle value of included service

uint16_t end_hdl
Gatt end handle value of included service

uint16_t uuid
Gatt attribute value UUID of included service

struct esp_gatts_incl128_svc_desc_t
Gatt include 128 bit service entry element.

Public Members

uint16_t start_hdl
Gatt start handle value of included 128 bit service

uint16_t end_hdl
Gatt end handle value of included 128 bit service

struct esp_gatt_value_t
Gatt attribute value.
Public Members

uint8_t value[ESP_GATT_MAX_ATTR_LEN]
   Gatt attribute value

uint16_t handle
   Gatt attribute handle

uint16_t offset
   Gatt attribute value offset

uint16_t len
   Gatt attribute value length

uint8_t auth_req
   Gatt authentication request

struct esp_gatt_conn_params_t
   Connection parameters information.

Public Members

uint16_t interval
   connection interval

uint16_t latency
   Slave latency for the connection in number of connection events. Range: 0x0000 to 0x01F3

uint16_t timeout
   Supervision timeout for the LE Link. Range: 0x0000A to 0x0C80. Mandatory Range: 0x0000A to 0x0C80
   Time = N * 10 msec Time Range: 100 msec to 32 seconds

struct esp_gattc_multi_t
   read multiple attribute

Public Members

uint8_t num_attr
   The number of the attribute

uint16_t handles[ESP_GATT_MAX_READ_MULTI_HANDLES]
   The handles list

struct esp_gattc_db_elem_t
   data base attribute element

Public Members

esp_gatt_db_attr_type_t type
   The attribute type

uint16_t attribute_handle
   The attribute handle, it’s valid for all of the type

uint16_t start_handle
   The service start handle, it’s valid only when the type = ESP_GATT_DB_PRIMARY_SERVICE or
   ESP_GATT_DB_SECONDARY_SERVICE

uint16_t end_handle
   The service end handle, it’s valid only when the type = ESP_GATT_DB_PRIMARY_SERVICE or
   ESP_GATT_DB_SECONDARY_SERVICE
Chapter 2. API Reference

`esp_gatt_char_prop_t` **properties**
The characteristic properties, it’s valid only when the type = ESP_GATT_DB_CHARACTERISTIC

`esp_bt_uuid_t` **uuid**
The attribute uuid, it’s valid for all of the type

**struct esp_gattc_service_elem_t**
Service element

**Public Members**

`bool is_primary`  
The service flag, true if the service is primary service, else is secondary service

`uint16_t start_handle`  
The start handle of the service

`uint16_t end_handle`  
The end handle of the service

`esp_bt_uuid_t uuid`  
The uuid of the service

**struct esp_gattc_char_elem_t**
Characteristic element

**Public Members**

`uint16_t char_handle`  
The characteristic handle

`esp_gatt_char_prop_t` **properties**  
The characteristic properties

`esp_bt_uuid_t uuid`  
The characteristic uuid

**struct esp_gattc_descr_elem_t**
Descriptor element

**Public Members**

`uint16_t handle`  
The descriptor handle

`esp_bt_uuid_t uuid`  
The characteristic descriptor uuid

**struct esp_gattc_incl_svc_elem_t**
Include service element

**Public Members**

`uint16_t handle`  
The include service current attribute handle

`uint16_t incl_srvc_s_handle`  
The start handle of the service which has been included

`uint16_t incl_srvc_e_handle`  
The end handle of the service which has been included
`esp_bt_uuid_t uuid`

The include service uuid.

**Macros**

- `ESP_GATT_UUID_IMMEDIATE_ALERT_SVC`
- `ESP_GATT_UUID_LINK_LOSS_SVC`
- `ESP_GATT_UUID_TX_POWER_SVC`
- `ESP_GATT_UUID_CURRENT_TIME_SVC`

ESP_GATT_CHAR_PROP_BIT_READ
ESP_GATT_CHAR_PROP_BIT_WRITE_NR
ESP_GATT_CHAR_PROP_BIT_WRITE
ESP_GATT_CHAR_PROP_BIT_NOTIFY
ESP_GATT_CHAR_PROP_BIT_INDICATE
ESP_GATT_CHAR_PROP_BIT_AUTH
ESP_GATT_CHAR_PROP_BIT_EXT_PROP
ESP_GATT_MAX_ATTR_LEN
  GATT maximum attribute length.
ESP_GATT_RSP_BY_APP
ESP_GATT_AUTO_RSP
ESP_GATT_IF_NONE
  If callback report gatc_if/gatts_if as this macro, means this event is not correspond to any app

Type Definitions
typedef uint16_t esp_gatt_perm_t
typedef uint8_t esp_gatt_char_prop_t
typedef uint8_t esp_gatt_if_t
  Gatt interface type, different application on GATT client use different gatt_if

Enumerations
enum esp_gatt_prep_write_type
  Attribute write data type from the client.
  Values:
  ESP_GATT_PREP_WRITE_CANCEL = 0x00
    Prepare write cancel
  ESP_GATT_PREP_WRITE_EXEC = 0x01
    Prepare write execute
enum esp_gatt_status_t
  GATT success code and error codes.
  Values:
  ESP_GATT_OK = 0x0
  ESP_GATT_INVALID_HANDLE = 0x01
  ESP_GATT_READ_NOT_PERMIT = 0x02
  ESP_GATT_WRITE_NOT_PERMIT = 0x03
  ESP_GATT_INVALID_PDU = 0x04
  ESP_GATT_INSUF_AUTHENTICATION = 0x05
  ESP_GATT_REQ_NOT_SUPPORTED = 0x06
  ESP_GATT_INVALID_OFFSET = 0x07
  ESP_GATT_INSUF_AUTHORIZATION = 0x08
  ESP_GATT_PREPARE_Q_FULL = 0x09
  ESP_GATT_NOT_FOUND = 0x0a
ESP_GATT_NOT_LONG = 0x0b
ESP_GATT_INSUF_KEY_SIZE = 0x0c
ESP_GATT_INVALID_ATTR_LEN = 0x0d
ESP_GATT_ERR_UNLIKELY = 0x0e
ESP_GATT_INSUF_ENCRYPTION = 0x0f
ESP_GATT_UNSUPPORT_GRP_TYPE = 0x10
ESP_GATT_INSUF_RESOURCE = 0x11
ESP_GATT_NO_RESOURCES = 0x80
ESP_GATT_INTERNAL_ERROR = 0x81
ESP_GATT_WRONG_STATE = 0x82
ESP_GATT_DB_FULL = 0x83
ESP_GATT_BUSY = 0x84
ESP_GATT_ERROR = 0x85
ESP_GATT_CMD_STARTED = 0x86
ESP_GATT_ILLEGAL_PARAMETER = 0x87
ESP_GATT_PENDING = 0x88
ESP_GATT_AUTH_FAIL = 0x89
ESP_GATT_MORE = 0x8a

ESP_GATT_SERVICE_STARTED = 0x8c
ESP_GATT_ENCRYPED_MITM = ESP_GATT_OK
ESP_GATT_ENCRYPED_NO_MITM = 0x8d
ESP_GATT_NOT_ENCRYPTED = 0x8e
ESP_GATT_CONGESTED = 0x8f
ESP_GATT_DUP_REG = 0x90
ESP_GATT_ALREADY_OPEN = 0x91
ESP_GATT_CANCEL = 0x92
ESP_GATT_STACK_RSP = 0xe0
ESP_GATT_APP_RSP = 0xe1
ESP_GATT_UNKNOWN_ERROR = 0xef
ESP_GATT_CCC_CFG_ERR = 0xfd
ESP_GATT_PRC_IN_PROGRESS = 0xfe
ESP_GATT_OUT_OF_RANGE = 0xff

enum esp_gatt_conn_reason_t
Gatt Connection reason enum.

Values:
ESP_GATTCONN_UNKNOWN = 0
Gatt connection unknown
ESP_GATT_CONN_L2C_FAILURE = 1
General L2cap failure
ESP_GATT_CONN_TIMEOUT = 0x08
  Connection timeout

ESP_GATT_CONN_TERMINATE_PEER_USER = 0x13
  Connection terminate by peer user

ESP_GATT_CONN_TERMINATE_LOCAL_HOST = 0x16
  Connection terminated by local host

ESP_GATT_CONN_FAIL_ESTABLISH = 0x3e
  Connection fail to establish

ESP_GATT_CONN_LMP_TIMEOUT = 0x22
  Connection fail for LMP response tout

ESP_GATT_CONN_CONN_CANCEL = 0x0100
  L2CAP connection cancelled

ESP_GATT_CONN_NONE = 0x0101
  No connection to cancel

enum esp_gatt_auth_req_t
  Gatt authentication request type.

  Values:

  ESP_GATT_AUTH_REQ_NONE = 0
  ESP_GATT_AUTH_REQ_NO_MITM = 1
  ESP_GATT_AUTH_REQ_MITM = 2
  ESP_GATT_AUTH_REQ_SIGNED_NO_MITM = 3
  ESP_GATT_AUTH_REQ_SIGNED_MITM = 4

enum esp_service_source_t
  Values:

  ESP_GATT_SERVICE_FROM_REMOTE_DEVICE = 0
  ESP_GATT_SERVICE_FROM_NVS_FLASH = 1
  ESP_GATT_SERVICE_FROM_UNKNOWN = 2

enum esp_gatt_write_type_t
  Gatt write type.

  Values:

  ESP_GATT_WRITE_TYPE_NO_RSP = 1
    Gatt write attribute need no response

  ESP_GATT_WRITE_TYPE_RSP
    Gatt write attribute need remote response

enum esp_gatt_db_attr_type_t
  the type of attribute element

  Values:

  ESP_GATT_DB_PRIMARY_SERVICE
    Gatt primary service attribute type in the cache

  ESP_GATT_DB_SECONDARY_SERVICE
    Gatt secondary service attribute type in the cache

  ESP_GATT_DB_CHARACTERISTIC
    Gatt characteristic attribute type in the cache

  ESP_GATT_DB_DESCRIPTOR
    Gatt characteristic descriptor attribute type in the cache
ESP_GATT_DB_INCLUDED_SERVICE
  Gattc include service attribute type in the cache

ESP_GATT_DB_ALL
  Gattc all the attribute (primary service & secondary service & include service & char & descriptor) type in the cache

GATT SERVER API

Overview

Instructions

Application Example

Check bluetooth/bluedroid/ble folder in ESP-IDF examples, which contains the following demos and their tutorials:

- This is a GATT sever demo and its tutorial. This demo creates a GATT service with an attribute table, which releases the user from adding attributes one by one. This is the recommended method of adding attributes.
  - bluetooth/bluedroid/ble/gatt_server_service_table
  - GATT Server Service Table Example Walkthrough
- This is a GATT server demo and its tutorial. This demo creates a GATT service by adding attributes one by one as defined by Bluedroid. The recommended method of adding attributes is presented in example above.
  - bluetooth/bluedroid/ble/gatt_server
  - GATT Server Example Walkthrough
- This is a BLE SPP-Like demo. This demo, which acts as a GATT server, can receive data from UART and then send the data to the peer device automatically.
  - bluetooth/bluedroid/ble/ble_spp_server

API Reference

Header File

- components/bt/host/bluedroid/api/include/api/esp_gatts_api.h

Functions

esp_err_t esp_ble_gatts_register_callback (esp_gatts_cb_t callback)
  This function is called to register application callbacks with BTA GATTS module.

  Return
  - ESP_OK : success
  - other : failed

esp_err_t esp_ble_gatts_app_register (uint16_t app_id)
  This function is called to register application identifier.

  Return
  - ESP_OK : success
  - other : failed

esp_err_t esp_ble_gatts_app_unregister (esp_gatt_if_t gatts_if)
  unregister with GATT Server.

  Return
  - ESP_OK : success
  - other : failed

Parameters
  - [in] gatts_if: GATT server access interface

esp_err_t esp_ble_gatts_create_service (esp_gatt_if_t gatts_if, esp_gatt_srvc_id_t *service_id, uint16_t num_handle)
  Create a service. When service creation is done, a callback event ESP_GATTS_CREATE_EVT is called to
report status and service ID to the profile. The service ID obtained in the callback function needs to be used when adding included service and characteristics/descriptors into the service.

**Return**
- ESP_OK: success
- other: failed

**Parameters**
- [in] `gatts_if`: GATT server access interface
- [in] `service_id`: service ID
- [in] `num_handle`: number of handle requested for this service.

```c
esp_err_t esp_ble_gatts_create_attr_tab(const esp_gatts_attr_db_t *gatts_attr_db, esp_gatt_if_t gatts_if, uint8_t max_nb_attr, uint8_t srvc_inst_id)
```

Create a service attribute tab.

**Return**
- ESP_OK: success
- other: failed

**Parameters**
- [in] `gatts_attr_db`: the pointer to the service attr tab
- [in] `gatts_if`: GATT server access interface
- [in] `max_nb_attr`: the number of attribute to be added to the service database.
- [in] `srvc_inst_id`: the instance id of the service

```c
esp_err_t esp_ble_gatts_add_included_service(uint16_t service_handle, uint16_t included_service_handle)
```

This function is called to add an included service. This function have to be called between `esp_ble_gatts_create_service` and `esp_ble_gatts_add_char`. After included service is included, a callback event ESP_GATTS_ADD_INCL_SRVC_EVT is reported the included service ID.

**Return**
- ESP_OK: success
- other: failed

**Parameters**
- [in] `service_handle`: service handle to which this included service is to be added.
- [in] `included_service_handle`: the service ID to be included.

```c
esp_err_t esp_ble_gatts_add_char(uint16_t service_handle, esp_bt_uuid_t *char_uuid, esp_gatt_perm_t perm, esp_gatt_char_prop_t property, esp_attr_value_t *char_val, esp_attr_control_t *control)
```

This function is called to add a characteristic into a service.

**Return**
- ESP_OK: success
- other: failed

**Parameters**
- [in] `service_handle`: service handle to which this included service is to be added.
- [in] `char_uuid`: Characteristic UUID.
- [in] `perm`: Characteristic value declaration attribute permission.
- [in] `property`: Characteristic Properties
- [in] `char_val`: Characteristic value
- [in] `control`: attribute response control byte

```c
esp_err_t esp_ble_gatts_add_char_descr(uint16_t service_handle, esp_bt_uuid_t *descr_uuid, esp_gatt_perm_t perm, esp_gatt_desc_prop_t property, esp_attr_value_t *char_descr_val, esp_attr_control_t *control)
```

This function is called to add characteristic descriptor. When it’s done, a callback event ESP_GATTS_ADD_DESCR_EVT is called to report the status and an ID number for this descriptor.

**Return**
- ESP_OK: success
- other: failed
Chapter 2. API Reference

Parameters
- [in] service_handle: service handle to which this characteristic descriptor is to be added.
- [in] perm: descriptor access permission.
- [in] descr_uuid: descriptor UUID.
- [in] chardescr_val: Characteristic descriptor value
- [in] control:: attribute response control byte

`esp_err_t esp_ble_gatts_delete_service(uint16_t service_handle)`
This function is called to delete a service. When this is done, a callback event ESP_GATTS_DELETE_EVT is report with the status.

Return
- ESP_OK : success
- other : failed

Parameters
- [in] service_handle: service_handle to be deleted.

`esp_err_t esp_ble_gatts_start_service(uint16_t service_handle)`
This function is called to start a service.

Return
- ESP_OK : success
- other : failed

Parameters
- [in] service_handle: the service handle to be started.

`esp_err_t esp_ble_gatts_stop_service(uint16_t service_handle)`
This function is called to stop a service.

Return
- ESP_OK : success
- other : failed

Parameters
- [in] service_handle: service to be topped.

`esp_err_t esp_ble_gatts_send_indicate(esp_gatt_if_t gatts_if, uint16_t conn_id, uint16_t attr_handle, uint16_t value_len, uint8_t *value, bool need_confirm)`
Send indicate or notify to GATT client. Set param need_confirm as false will send notification, otherwise indication.

Return
- ESP_OK : success
- other : failed

Parameters
- [in] gatts_if: GATT server access interface
- [in] conn_id: - connection id to indicate.
- [in] attr_handle: - attribute handle to indicate.
- [in] value_len: - indicate value length.
- [in] value: value to indicate.
- [in] need_confirm: - Whether a confirmation is required. false sends a GATT notification, true sends a GATT indication.

`esp_err_t esp_ble_gatts_send_response(esp_gatt_if_t gatts_if, uint16_t conn_id, uint32_t trans_id, esp_gatt_status_t status, esp_gatt_rsp_t *rsp)`
This function is called to send a response to a request.

Return
- ESP_OK : success
- other : failed

Parameters
- [in] gatts_if: GATT server access interface
Chapter 2. API Reference

- [in] trans_id: transfer id
- [in] status: response status

**esp_err_t esp_ble_gatts_set_attr_value**(uint16_t attr_handle, uint16_t length, const uint8_t *value)

This function is called to set the attribute value by the application.

**Return**
- ESP_OK: success
- other: failed

**Parameters**
- [in] attr_handle: the attribute handle which to be set
- [in] length: the value length
- [in] value: the pointer to the attribute value

**esp_gatt_status_t esp_ble_gatts_get_attr_value**(uint16_t attr_handle, uint16_t *length, const uint8_t **value)

Retrieve attribute value.

**Return**
- ESP_GATT_OK: success
- other: failed

**Parameters**
- [in] attr_handle: Attribute handle.
- [out] length: pointer to the attribute value length
- [out] value: Pointer to attribute value payload, the value cannot be modified by user

**esp_err_t esp_ble_gatts_open**(esp_gatt_if_t gatts_if, esp_bd_addr_t remote_bda, bool is_direct)

Open a direct open connection or add a background auto connection.

**Return**
- ESP_OK: success
- other: failed

**Parameters**
- [in] gatts_if: GATT server access interface
- [in] remote_bda: remote device bluetooth device address.
- [in] is_direct: direct connection or background auto connection

**esp_err_t esp_ble_gatts_close**(esp_gatt_if_t gatts_if, uint16_t conn_id)

Close a connection a remote device.

**Return**
- ESP_OK: success
- other: failed

**Parameters**
- [in] gatts_if: GATT server access interface
- [in] conn_id: connection ID to be closed.

**esp_err_t esp_ble_gatts_send_service_change_indication**(esp_gatt_if_t gatts_if, esp_bd_addr_t remote_bda)

Send service change indication.

**Return**
- ESP_OK: success
- other: failed

**Parameters**
- [in] gatts_if: GATT server access interface
- [in] remote_bda: remote device bluetooth device address. If remote_bda is NULL then it will send service change indication to all the connected devices and if not then to a specific device

**Unions**
union esp_ble_gatts_cb_param_t
#include <esp_gatts_api.h> Gatt server callback parameters union.

Public Members

struct esp_ble_gatts_cb_param_t::gatts_reg_evt_param reg
Gatt server callback param of ESP_GATTS_REG_EVT

struct esp_ble_gatts_cb_param_t::gatts_read_evt_param read
Gatt server callback param of ESP_GATTS_READ_EVT

struct esp_ble_gatts_cb_param_t::gatts_write_evt_param write
Gatt server callback param of ESP_GATTS_WRITE_EVT

struct esp_ble_gatts_cb_param_t::gatts_exec_write_evt_param exec_write
Gatt server callback param of ESP_GATTS_EXEC_WRITE_EVT

struct esp_ble_gatts_cb_param_t::gatts_mtu_evt_param mtu
Gatt server callback param of ESP_GATTS_MTU_EVT

struct esp_ble_gatts_cb_param_t::gatts_conf_evt_param conf
Gatt server callback param of ESP_GATTS_CONF_EVT (confirm)

struct esp_ble_gatts_cb_param_t::gatts_create_evt_param create
Gatt server callback param of ESP_GATTS_CREATE_EVT

struct esp_ble_gatts_cb_param_t::gatts_add_incl_srvc_evt_param add_incl_srvc
Gatt server callback param of ESP_GATTS_ADD_INCL_SRVRC_EVT

struct esp_ble_gatts_cb_param_t::gatts_add_char_evt_param add_char
Gatt server callback param of ESP_GATTS_ADD_CHAR_EVT

struct esp_ble_gatts_cb_param_t::gatts_add_char_descr_evt_param add_char_descr
Gatt server callback param of ESP_GATTS_ADD_CHAR_DESCR_EVT

struct esp_ble_gatts_cb_param_t::gatts_delete_evt_param del
Gatt server callback param of ESP_GATTS_DELETE_EVT

struct esp_ble_gatts_cb_param_t::gatts_start_evt_param start
Gatt server callback param of ESP_GATTS_START_EVT

struct esp_ble_gatts_cb_param_t::gatts_stop_evt_param stop
Gatt server callback param of ESP_GATTS_STOP_EVT

struct esp_ble_gatts_cb_param_t::gatts_connect_evt_param connect
Gatt server callback param of ESP_GATTS_CONNECT_EVT

struct esp_ble_gatts_cb_param_t::gatts_disconnect_evt_param disconnect
Gatt server callback param of ESP_GATTS_DISCONNECT_EVT

struct esp_ble_gatts_cb_param_t::gatts_open_evt_param open
Gatt server callback param of ESP_GATTS_OPEN_EVT

struct esp_ble_gatts_cb_param_t::gatts_cancel_open_evt_param cancel_open
Gatt server callback param of ESP_GATTS_CANCEL_OPEN_EVT

struct esp_ble_gatts_cb_param_t::gatts_close_evt_param close
Gatt server callback param of ESP_GATTS_CLOSE_EVT

struct esp_ble_gatts_cb_param_t::gatts_congest_evt_param congest
Gatt server callback param of ESP_GATTS_CONGEST_EVT

struct esp_ble_gatts_cb_param_t::gatts_rsp_evt_param rsp
Gatt server callback param of ESP_GATTS_RESPONSE_EVT

struct esp_ble_gatts_cb_param_t::gatts_add_attr_tab_evt_param add_attr_tab
Gatt server callback param of ESP_GATTS_CREAT_ATTR_TAB_EVT
struct esp_ble_gatts_cb_param_t::gatts_set_attr_val_evt_param set_attr_val
Gatt server callback param of ESP_GATTS_SET_ATTR_VAL_EVT

struct esp_ble_gatts_cb_param_t::gatts_send_service_change_evt_param service_change
Gatt server callback param of ESP_GATTS_SEND_SERVICE_CHANGE_EVT

struct gatts_add_attr_tab_evt_param
#include <esp_gatts_api.h> ESP_GATTS_CREAT_ATTR_TAB_EVT.

uint16_t offset
```
Offset of the value, if the value is too long

```c
bool need_rsp
```
The write operation need to do response

```c
bool is_prep
```
This write operation is prepare write

```c
uint16_t len
```
The write attribute value length

```c
uint8_t* value
```
The write attribute value

Macros

```c
ESP_GATT_PREP_WRITE_CANCEL
```
Prepare write flag to indicate cancel prepare write

```c
ESP_GATT_PREP_WRITE_EXEC
```
Prepare write flag to indicate execute prepare write

Type Definitions

```c
typedef void (*esp_gatts_cb_t)(esp_gatts_cb_event_t event, esp_gatt_if_t gatts_if, esp_ble_gatts_cb_param_t *param)
```
GATT Server callback function type.

Parameters

- `event`:: Event type
- `gatts_if`:: GATT server access interface, normally different gatts_if correspond to different profile
- `param`:: Point to callback parameter, currently is union type

Enumerations
enum esp_gatts_cb_event_t
GATT Server callback function events.

Values:

ESP_GATTS_REG_EVT = 0
When register application id, the event comes

ESP_GATTS_READ_EVT = 1
When gatt client request read operation, the event comes

ESP_GATTS_WRITE_EVT = 2
When gatt client request write operation, the event comes

ESP_GATTS_EXEC_WRITE_EVT = 3
When gatt client request execute write, the event comes

ESP_GATTS_MTU_EVT = 4
When set mtu complete, the event comes

ESP_GATTS_CONF_EVT = 5
When receive confirm, the event comes

ESP_GATTS_UNREG_EVT = 6
When unregister application id, the event comes

ESP_GATTS_CREATE_EVT = 7
When create service complete, the event comes

ESP_GATTS_ADD_INCL_SRVC_EVT = 8
When add included service complete, the event comes

ESP_GATTS_ADD_CHAR_EVT = 9
When add characteristic complete, the event comes

ESP_GATTS_ADD_CHAR_DESCR_EVT = 10
When add descriptor complete, the event comes

ESP_GATTS_DELETE_EVT = 11
When delete service complete, the event comes

ESP_GATTS_START_EVT = 12
When start service complete, the event comes

ESP_GATTS_STOP_EVT = 13
When stop service complete, the event comes

ESP_GATTS_CONNECT_EVT = 14
When gatt client connect, the event comes

ESP_GATTS_DISCONNECT_EVT = 15
When gatt client disconnect, the event comes

ESP_GATTS_OPEN_EVT = 16
When connect to peer, the event comes

ESP_GATTS_CANCEL_OPEN_EVT = 17
When disconnect from peer, the event comes

ESP_GATTS_CLOSE_EVT = 18
When gatt server close, the event comes

ESP_GATTS_LISTEN_EVT = 19
When gatt listen to be connected the event comes

ESP_GATTS_CONGEST_EVT = 20
When congest happen, the event comes

ESP_GATTS_RESPONSE_EVT = 21
When gatt send response complete, the event comes
Chapter 2. API Reference

ESP_GATTS_CREAT_ATTR_TAB_EVT = 22
When gatt create table complete, the event comes

ESP_GATTS_SET_ATTR_VAL_EVT = 23
When gatt set attr value complete, the event comes

ESP_GATTS_SEND_SERVICE_CHANGE_EVT = 24
When gatt send service change indication complete, the event comes

GATT CLIENT API

Overview

Application Example   Check bluetooth/bluedroid/ble folder in ESP-IDF examples, which contains the following demos and their tutorials:

• This is a GATT client demo and its tutorial. This demo can scan for devices, connect to the GATT server and discover its services.
  – bluetooth/bluedroid/ble/gatt_client
  – GATT Client Example Walkthrough
• This is a multiple connection demo and its tutorial. This demo can connect to multiple GATT server devices and discover their services.
  – bluetooth/bluedroid/ble/gatc_multi_connect
  – GATT Client Multi-connection Example Walkthrough
• This is a BLE SPP-Like demo. This demo, which acts as a GATT client, can receive data from UART and then send the data to the peer device automatically.
  – bluetooth/bluedroid/ble/ble_spp_client

API Reference

Header File

• components/bt/host/bluedroid/api/include/api/esp_gatte_api.h

Functions

esp_err_t esp_ble_gattc_register_callback (esp_gattc_cb_t callback)
This function is called to register application callbacks with GATTC module.

Return
• ESP_OK: success
• other: failed

Parameters
• [in] callback: pointer to the application callback function.

esp_err_t esp_ble_gattc_app_register (uint16_t app_id)
This function is called to register application callbacks with GATTC module.

Return
• ESP_OK: success
• other: failed

Parameters
• [in] app_id: Application Identify (UUID), for different application

esp_err_t esp_ble_gattc_app_unregister (esp_gatt_if_t gattc_if)
This function is called to unregister an application from GATTC module.

Return
• ESP_OK: success
• other: failed
### Parameters

- **in** `gattc_if`: Gatt client access interface.

```c
esp_err_t esp_ble_gattc_open(esp_gatt_if_t gattc_if, esp_bd_addr_t remote_bda,
                            esp_ble_addr_type_t remote_addr_type, bool is_direct)
```

Open a direct connection or add a background auto connection.

**Return**

- `ESP_OK`: success
- Other: failed

### Parameters

- **in** `gattc_if`: Gatt client access interface.
- **in** `remote_bda`: remote device Bluetooth device address.
- **in** `remote_addr_type`: remote device Bluetooth device the address type.
- **in** `is_direct`: direct connection or background auto connection(by now, background auto connection is not supported).

```c
esp_err_t esp_ble_gattc_aux_open(esp_gatt_if_t gattc_if, esp_bd_addr_t remote_bda,
                                  esp_ble_addr_type_t remote_addr_type, bool is_direct)
```

```c
esp_err_t esp_ble_gattc_close(esp_gatt_if_t gattc_if, uint16_t conn_id)
```

Close the virtual connection to the GATT server. `gattc` may have multiple virtual GATT server connections when multiple `app_id` registered, this API only close one virtual GATT server connection. If there exist other virtual GATT server connections, it does not disconnect the physical connection. If you want to disconnect the physical connection directly, you can use `esp_ble_gap_disconnect(esp_bd_addr_t remote_device)`.

**Return**

- `ESP_OK`: success
- Other: failed

### Parameters

- **in** `gattc_if`: Gatt client access interface.
- **in** `conn_id`: connection ID to be closed.

```c
esp_err_t esp_ble_gattc_send_mtu_req(esp_gatt_if_t gattc_if, uint16_t conn_id)
```

Configure the MTU size in the GATT channel. This can be done only once per connection. Before using, use `esp_ble_gatt_set_local_mtu()` to configure the local MTU size.

**Return**

- `ESP_OK`: success
- Other: failed

### Parameters

- **in** `gattc_if`: Gatt client access interface.
- **in** `conn_id`: connection ID.
- **in** `filter_uuid`: a UUID of the service application is interested in. If null, discover all services.

```c
esp_gatt_status_t esp_ble_gattc_get_service(esp_gatt_if_t gattc_if, uint16_t conn_id,
                                           esp_bt_uuid_t *svc_uuid, esp_gattc_service_elem_t *result, uint16_t *count, uint16_t *offset)
```

Find all the service with the given service uuid in the gattc cache, if the svc uuid is NULL, find all the service. Note: It just get service from local cache, won’t get from remote devices. If want to get it from remote device, need to used the `esp_ble_gattc_cache_refresh`, then call `esp_ble_gattc_get_service` again.
Return
• ESP_OK: success
• other: failed

Parameters
• [in] gattc_if: Gatt client access interface.
• [in] conn_id: connection ID which identify the server.
• [in] svc_uuid: the pointer to the service uuid.
• [out] result: The pointer to the service which has been found in the gattc cache.
• [inout] count: input the number of service want to find, it will output the number of service has been found in the gattc cache with the given service uuid.
• [in] offset: Offset of the service position to get.

Esp_gatt_status_t esp_ble_gattc_get_all_char (esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t start_handle, uint16_t end_handle, esp_gatt_char_elem_t *result, uint16_t *count, uint16_t offset)

Find all the characteristic with the given service in the gattc cache Note: It just get characteristic from local cache, won’t get from remote devices.

Return
• ESP_OK: success
• other: failed

Parameters
• [in] gattc_if: Gatt client access interface.
• [in] conn_id: connection ID which identify the server.
• [in] start_handle: the attribute start handle.
• [in] end_handle: the attribute end handle
• [out] result: The pointer to the characteristic in the service.
• [inout] count: input the number of characteristic want to find, it will output the number of characteristic has been found in the gattc cache with the given service.
• [in] offset: Offset of the characteristic position to get.

Esp_gatt_status_t esp_ble_gattc_get_all_descr (esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t char_handle, esp_gatt_descr_elem_t *result, uint16_t *count, uint16_t offset)

Find all the descriptor with the given characteristic in the gattc cache Note: It just get descriptor from local cache, won’t get from remote devices.

Return
• ESP_OK: success
• other: failed

Parameters
• [in] gattc_if: Gatt client access interface.
• [in] conn_id: connection ID which identify the server.
• [in] char_handle: the given characteristic handle
• [out] result: The pointer to the descriptor in the characteristic.
• [inout] count: input the number of descriptor want to find, it will output the number of descriptor has been found in the gattc cache with the given characteristic.
• [in] offset: Offset of the descriptor position to get.

Esp_gatt_status_t esp_ble_gattc_get_char_by_uuid (esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t start_handle, uint16_t end_handle, esp_bt_uuid_t char_uuid, esp_gatt_char_elem_t *result, uint16_t *count)

Find the characteristic with the given characteristic uuid in the gattc cache Note: It just get characteristic from local cache, won’t get from remote devices.

Return
• ESP_OK: success
• other: failed

Parameters
• [in] `gattc_if`: Gatt client access interface.
• [in] `conn_id`: connection ID which identify the server.
• [in] `start_handle`: the attribute start handle
• [in] `end_handle`: the attribute end handle
• [in] `char_uuid`: the characteristic uuid
  • [out] `result`: The pointer to the characteristic in the service.
• [inout] `count`: input the number of characteristic want to find, it will output the number of characteristic has been found in the gattc cache with the given service.

```c
esp_gatt_status_t esp_ble_gattc_get_descr_by_uuid(esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t start_handle, uint16_t end_handle, esp_bt_uuid_t char_uuid, esp_bt_uuid_t descr_uuid, esp_gattc_descr_elem_t *result, uint16_t *count)
```

Find the descriptor with the given characteristic uuid in the gattc cache Note: It just get descriptor from local cache, won’t get from remote devices.

**Return**
- ESP_OK: success
- other: failed

**Parameters**
- [in] `gattc_if`: Gatt client access interface.
- [in] `conn_id`: connection ID which identify the server.
- [in] `start_handle`: the attribute start handle
- [in] `end_handle`: the attribute end handle
- [in] `char_uuid`: the characteristic uuid.
- [out] `result`: The pointer to the descriptor in the given characteristic.
- [inout] `count`: input the number of descriptor want to find, it will output the number of descriptor has been found in the gattc cache with the given characteristic.

```c
esp_gatt_status_t esp_ble_gattc_get_descr_by_char_handle(esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t char_handle, esp_bt_uuid_t descr_uuid, esp_gattc_descr_elem_t *result, uint16_t *count)
```

Find the descriptor with the given characteristic handle in the gattc cache Note: It just get descriptor from local cache, won’t get from remote devices.

**Return**
- ESP_OK: success
- other: failed

**Parameters**
- [in] `gattc_if`: Gatt client access interface.
- [in] `conn_id`: connection ID which identify the server.
- [in] `char_handle`: the characteristic handle.
- [out] `result`: The pointer to the descriptor in the given characteristic.
- [inout] `count`: input the number of descriptor want to find, it will output the number of descriptor has been found in the gattc cache with the given characteristic.

```c
esp_gatt_status_t esp_ble_gattc_get_include_service(esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t start_handle, uint16_t end_handle, esp_bt_uuid_t *incl_uuid, esp_gattc_incl_svc_elem_t *result, uint16_t *count)
```

Find the include service with the given service handle in the gattc cache Note: It just get include service from local cache, won’t get from remote devices.

**Return**
- ESP_OK: success
other: failed

Parameters

- [in] gattc_if: Gatt client access interface.
- [in] conn_id: connection ID which identify the server.
- [in] start_handle: the attribute start handle
- [in] end_handle: the attribute end handle
- [in] incl_uuid: the include service uuid
- [out] result: The pointer to the include service in the given service.
- [inout] count: input the number of include service want to find, it will output the number of include service has been found in the gattc cache with the given service.

esp_gatt_status_t esp_ble_gattc_get_attr_count (esp_gatt_if_t gattc_if, uint16_t conn_id, esp_gatt_db_attr_type_t type, uint16_t start_handle, uint16_t end_handle, uint16_t char_handle, uint16_t *count)

Find the attribute count with the given service or characteristic in the gattc cache.

Return

- ESP_OK: success
- other: failed

Parameters

- [in] gattc_if: Gatt client access interface.
- [in] type: the attribute type.
- [in] start_handle: the attribute start handle, if the type is ESP_GATT_DB_DESCRIPTOR, this parameter should be ignored
- [in] end_handle: the attribute end handle, if the type is ESP_GATT_DB_DESCRIPTOR, this parameter should be ignored
- [in] char_handle: the characteristic handle, this parameter valid when the type is ESP_GATT_DB_DESCRIPTOR. If the type isn’t ESP_GATT_DB_DESCRIPTOR, this parameter should be ignored.
- [out] count: output the number of attribute has been found in the gattc cache with the given attribute type.

esp_gatt_status_t esp_ble_gattc_get_db (esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t start_handle, uint16_t end_handle, esp_gattc_db_elem_t *db, uint16_t *count)

This function is called to get the GATT database. Note: It just get attribute data base from local cache, won’t get from remote devices.

Return

- ESP_OK: success
- other: failed

Parameters

- [in] gattc_if: Gatt client access interface.
- [in] start_handle: the attribute start handle
- [in] end_handle: the attribute end handle
- [in] conn_id: connection ID which identify the server.
- [in] db: output parameter which will contain the GATT database copy. Caller is responsible for freeing it.
- [in] count: number of elements in database.

esp_err_t esp_ble_gattc_read_char (esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t handle, esp_gatt_auth_req_t auth_req)

This function is called to read a service’s characteristics of the given characteristic handle.

Return

- ESP_OK: success
- other: failed

Parameters

- [in] gattc_if: Gatt client access interface.
- [in] conn_id: connection ID.
• [in] handle: characteristic handle to read.
• [in] auth_req: authenticate request type

```c
esp_err_t esp_ble_gattc_read_by_type(esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t start_handle, uint16_t end_handle, esp_bt_uuid_t *uuid, esp_gatt_auth_req_t auth_req)
```

This function is called to read a service’s characteristics of the given characteristic UUID.

Return
• ESP_OK: success
• other: failed

Parameters
• [in] gattc_if: Gatt client access interface.
• [in] conn_id: connection ID.
• [in] start_handle: the attribute start handle.
• [in] end_handle: the attribute end handle
• [in] uuid: The UUID of attribute which will be read.
• [in] auth_req: authenticate request type

```c
esp_err_t esp_ble_gattc_read_multiple(esp_gatt_if_t gattc_if, uint16_t conn_id, esp_gattc_multi_t *read_multi, esp_gatt_auth_req_t auth_req)
```

This function is called to read multiple characteristic or characteristic descriptors.

Return
• ESP_OK: success
• other: failed

Parameters
• [in] gattc_if: Gatt client access interface.
• [in] conn_id: connection ID.
• [in] read_multi: pointer to the read multiple parameter.
• [in] auth_req: authenticate request type

```c
esp_err_t esp_ble_gattc_read_char_descr(esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t handle, esp_gatt_auth_req_t auth_req)
```

This function is called to read a characteristics descriptor.

Return
• ESP_OK: success
• other: failed

Parameters
• [in] gattc_if: Gatt client access interface.
• [in] conn_id: connection ID.
• [in] handle: descriptor handle to read.
• [in] auth_req: authenticate request type

```c
esp_err_t esp_ble_gattc_write_char(esp_gatt_if_t gattc_if, uint16_t conn_id, uint16_t handle, uint16_t value_len, uint8_t *value, esp_gatt_write_type_t write_type, esp_gatt_auth_req_t auth_req)
```

This function is called to write characteristic value.

Return
• ESP_OK: success
• other: failed

Parameters
• [in] gattc_if: Gatt client access interface.
• [in] conn_id: connection ID.
• [in] handle: characteristic handle to write.
• [in] value_len: length of the value to be written.
• [in] value: the value to be written.
• [in] write_type: the type of attribute write operation.
• [in] auth_req: authentication request.
```c
esp_err_t esp_ble_gattc_write_char_descr(esp_gatt_if_t gattc_if, uint16_t conn_id,
                           uint16_t handle, uint16_t value_len, uint8_t *value,
                           esp_gatt_write_type_t write_type,
                           esp_gatt_auth_req_t auth_req)
```

This function is called to write characteristic descriptor value.

**Return**
- ESP_OK: success
- other: failed

**Parameters**
- [in] `gattc_if`: Gatt client access interface.
- [in] `conn_id`: connection ID.
- [in] `handle`: descriptor handle to write.
- [in] `value_len`: length of the value to be written.
- [in] `value`: the value to be written.
- [in] `write_type`: the type of attribute write operation.
- [in] `auth_req`: authentication request.

```c
esp_err_t esp_ble_gattc_prepare_write(esp_gatt_if_t gattc_if, uint16_t conn_id,
                           uint16_t handle, uint16_t offset, uint16_t value_len, uint8_t *value,
                           esp_gatt_auth_req_t auth_req)
```

This function is called to prepare write a characteristic value.

**Return**
- ESP_OK: success
- other: failed

**Parameters**
- [in] `gattc_if`: Gatt client access interface.
- [in] `conn_id`: connection ID.
- [in] `handle`: characteristic handle to prepare write.
- [in] `offset`: offset of the write value.
- [in] `value_len`: length of the value to be written.
- [in] `value`: the value to be written.
- [in] `auth_req`: authentication request.

```c
esp_err_t esp_ble_gattc_prepare_write_char_descr(esp_gatt_if_t gattc_if, uint16_t conn_id,
                           uint16_t handle, uint16_t offset, uint16_t value_len, uint8_t *value,
                           esp_gatt_auth_req_t auth_req)
```

This function is called to prepare write a characteristic descriptor value.

**Return**
- ESP_OK: success
- other: failed

**Parameters**
- [in] `gattc_if`: Gatt client access interface.
- [in] `conn_id`: connection ID.
- [in] `handle`: characteristic descriptor handle to prepare write.
- [in] `offset`: offset of the write value.
- [in] `value_len`: length of the value to be written.
- [in] `value`: the value to be written.
- [in] `auth_req`: authentication request.

```c
esp_err_t esp_ble_gattc_execute_write(esp_gatt_if_t gattc_if, uint16_t conn_id,
                           bool is_execute)
```

This function is called to execute write a prepare write sequence.

**Return**
- ESP_OK: success
- other: failed

**Parameters**
- [in] `gattc_if`: Gatt client access interface.
- [in] `conn_id`: connection ID.
• [in] \texttt{is\_execute}: execute or cancel.

\begin{verbatim}
\begin{verbatim}
\texttt{esp\_err\_t esp\_ble\_gattc\_register\_for\_notify (esp\_gatt\_if\_t gatt\_if, esp\_bd\_addr\_t server\_bda, uint16\_t handle)}

This function is called to register for notification of a service.

\textbf{Return}
• ESP_OK: registration succeeds
• other: failed

\textbf{Parameters}
• [in] \texttt{gattc\_if}: Gatt client access interface.
• [in] \texttt{server\_bda}: target GATT server.
• [in] \texttt{handle}: GATT characteristic handle.

\begin{verbatim}
\texttt{esp\_err\_t esp\_ble\_gattc\_unregister\_for\_notify (esp\_gatt\_if\_t gatt\_if, esp\_bd\_addr\_t server\_bda, uint16\_t handle)}

This function is called to de-register for notification of a service.

\textbf{Return}
• ESP_OK: unregister succeeds
• other: failed

\textbf{Parameters}
• [in] \texttt{gattc\_if}: Gatt client access interface.
• [in] \texttt{server\_bda}: target GATT server.
• [in] \texttt{handle}: GATT characteristic handle.

\begin{verbatim}
\texttt{esp\_err\_t esp\_ble\_gattc\_cache\_refresh (esp\_bd\_addr\_t remote\_bda)}

Refresh the server cache store in the gattc stack of the remote device. If the device is connected, this API will restart the discovery of service information of the remote device.

\textbf{Return}
• ESP_OK: success
• other: failed

\textbf{Parameters}
• [in] \texttt{remote\_bda}: remote device BD address.

\begin{verbatim}
\texttt{esp\_err\_t esp\_ble\_gattc\_cache\_assoc (esp\_gatt\_if\_t gatt\_if, esp\_bd\_addr\_t src\_addr, esp\_bd\_addr\_t assoc\_addr, bool is\_assoc)}

Add or delete the associated address with the source address. Note: The role of this API is mainly when the client side has stored a server-side database, when it needs to connect another device, but the device’s attribute database is the same as the server database stored on the client-side, calling this API can use the database that the device has stored used as the peer server database to reduce the attribute database search and discovery process and speed up the connection time. The associated address means that device want to used the database has stored in the local cache. The source address means that device want to share the database to the associated address device.

\textbf{Return}
• ESP_OK: success
• other: failed

\textbf{Parameters}
• [in] \texttt{gattc\_if}: Gatt client access interface.
• [in] \texttt{src\_addr}: the source address which provide the attribute table.
• [in] \texttt{assoc\_addr}: the associated device address which went to share the attribute table with the source address.
• [in] \texttt{is\_assoc}: true add the associated device address, false remove the associated device address.

\begin{verbatim}
\texttt{esp\_err\_t esp\_ble\_gattc\_cache\_get\_addr\_list (esp\_gatt\_if\_t gatt\_if)}

Get the address list which has store the attribute table in the gattc cache. There will callback ESP\_GATTC\_GET\_ADDR\_LIST\_EVT event when get address list complete.

\textbf{Return}
• ESP_OK: success
• other: failed
Chapter 2. API Reference

Parameters
• [in] gattc_if: Gatt client access interface.

**esp_err_t esp_ble_gattc_cache_clean(esp_bd_addr_t remote_bda)**
Clean the service cache of this device in the gattc stack.

Return
• ESP_OK: success
• other: failed

Parameters
• [in] remote_bda: remote device BD address.

Unions
**union esp_ble_gattc_cb_param_t**
#include <esp_gattc_api.h> Gatt client callback parameters union.

Public Members

    The prepare write offset, this value is valid only when prepare write

Type Definitions
typedef void (*esp_gattc_cb_t) (esp_gattc_cb_event_t event, esp_gatt_if_t gattc_if,
                                esp_ble_gattc_cb_param_t *param)
    GATT Client callback function type.

Parameters
• event:: Event type
• gattc_if:: GATT client access interface, normally different gattc_if correspond to different
  profile
• param:: Point to callback parameter, currently is union type

Enumerations
enum esp_gattc_cb_event_t
    GATT Client callback function events.

Values:
ESP_GATTC_REG_EVT = 0
    When GATT client is registered, the event comes
ESP_GATTC_UNREG_EVT = 1
    When GATT client is unregistered, the event comes
ESP_GATTC_OPEN_EVT = 2
    When GATT virtual connection is set up, the event comes
ESP_GATTC_READ_CHAR_EVT = 3
    When GATT characteristic is read, the event comes
ESP_GATTC_WRITE_CHAR_EVT = 4
    When GATT characteristic write operation completes, the event comes
ESP_GATTC_CLOSE_EVT = 5
    When GATT virtual connection is closed, the event comes
ESP_GATTC_SEARCH_CMPL_EVT = 6
    When GATT service discovery is completed, the event comes
ESP_GATTC_SEARCH_RES_EVT = 7
    When GATT service discovery result is got, the event comes
ESP_GATTC_READ_DESCR_EVT = 8
    When GATT characteristic descriptor read completes, the event comes
ESP_GATTC_WRITE_DESCR_EVT = 9
    When GATT characteristic descriptor write completes, the event comes
ESP_GATTC NOTIFY_EVT = 10
    When GATT notification or indication arrives, the event comes
ESP_GATTC PREP_WRITE_EVT = 11
    When GATT prepare-write operation completes, the event comes
ESP_GATTC EXEC_EVT = 12
    When write execution completes, the event comes
ESP_GATTC ACL_EVT = 13
    When ACL connection is up, the event comes
ESP_GATTC CANCEL_OPEN_EVT = 14
    When GATT client ongoing connection is cancelled, the event comes
ESP_GATTC_SRVC_CHG_EVT = 15
When “service changed” occurs, the event comes

ESP_GATTC_ENC_CMPL_CB_EVT = 17
When encryption procedure completes, the event comes

ESP_GATTC_CFG_MTU_EVT = 18
When configuration of MTU completes, the event comes

ESP_GATTC_ADV_DATA_EVT = 19
When advertising of data, the event comes

ESP_GATTC_MULT_ADV_ENB_EVT = 20
When multi-advertising is enabled, the event comes

ESP_GATTC_MULT_ADV_UPD_EVT = 21
When multi-advertising parameters are updated, the event comes

ESP_GATTC_MULT_ADV_DATA_EVT = 22
When multi-advertising data arrives, the event comes

ESP_GATTC_MULT_ADV_DIS_EVT = 23
When multi-advertising is disabled, the event comes

ESP_GATTC_CONGEST_EVT = 24
When GATT connection congestion comes, the event comes

ESP_GATTC_BTH_SCAN_ENB_EVT = 25
When batch scan is enabled, the event comes

ESP_GATTC_BTH_SCAN_CFG_EVT = 26
When batch scan storage is configured, the event comes

ESP_GATTC_BTH_SCAN_RD_EVT = 27
When Batch scan read event is reported, the event comes

ESP_GATTC_BTH_SCAN_THR_EVT = 28
When Batch scan threshold is set, the event comes

ESP_GATTC_BTH_SCAN_PARAM_EVT = 29
When Batch scan parameters are set, the event comes

ESP_GATTC_BTH_SCAN_DIS_EVT = 30
When Batch scan is disabled, the event comes

ESP_GATTC_SCAN_FLT_CFG_EVT = 31
When Scan filter configuration completes, the event comes

ESP_GATTC_SCAN_FLT_PARAM_EVT = 32
When Scan filter parameters are set, the event comes

ESP_GATTC_SCAN_FLT_STATUS_EVT = 33
When Scan filter status is reported, the event comes

ESP_GATTC_ADV_VSC_EVT = 34
When advertising vendor spec content event is reported, the event comes

ESP_GATTC_REG_FOR_NOTIFY_EVT = 38
When register for notification of a service completes, the event comes

ESP_GATTC_UNREG_FOR_NOTIFY_EVT = 39
When unregister for notification of a service completes, the event comes

ESP_GATTC_CONNECT_EVT = 40
When the ble physical connection is set up, the event comes

ESP_GATTC_DISCONNECT_EVT = 41
When the ble physical connection disconnected, the event comes
**BLUFI API**

**Overview**  
BLUFI is a profile based GATT to configure ESP32 WIFI to connect/disconnect AP or setup a softap and etc. Use should concern these things:

1. The event sent from profile. Then you need to do something as the event indicate.
2. Security reference. You can write your own Security functions such as symmetrical encryption/decryption and checksum functions. Even you can define the “Key Exchange/Negotiation” procedure.

**Application Example**  
Check `bluetooth` folder in ESP-IDF examples, which contains the following application:

- This is the BLUFI demo. This demo can set ESP32’s wifi to softap/station/softap&station mode and configure wifi connections - `bluetooth/blufi`

**API Reference**

**Header File**

- `components/bt/common/api/include/api/esp_blufi_api.h`

**Functions**

`esp_err_t esp_blufi_register_callbacks (esp_blufi_callbacks_t *callbacks)`  
This function is called to receive blufi callback event.

- **Return** ESP_OK - success, other - failed
- **Parameters**  
  - `[in] callbacks`: callback functions

`esp_err_t esp_blufi_profile_init (void)`  
This function is called to initialize blufi_profile.

- **Return** ESP_OK - success, other - failed

`esp_err_t esp_blufi_profile_deinit (void)`  
This function is called to de-initialize blufi_profile.

- **Return** ESP_OK - success, other - failed

`esp_err_t esp_blufi_send_wifi_conn_report (wifi_mode_t opmode, esp_blufi_sta_conn_state_t sta_conn_state, uint8_t softap_conn_num, esp_blufi_extra_info_t *extra_info)`  
This function is called to send wifi connection report.

- **Return** ESP_OK - success, other - failed
- **Parameters**  
  - `opmode`: wifi opmode
  - `sta_conn_state`: station is already in connection or not
Chapter 2. API Reference

- `softap_conn_num`: softap connection number
- `extra_info`: extra information, such as sta_ssid, softap_ssid and etc.

```c
esp_err_t esp_blufi_send_wifi_list(uint16_t apCount, esp_blufi_ap_record_t *list)
```
This function is called to send wifi list.

**Return**
ESP_OK - success, other - failed

**Parameters**
- `apCount`: wifi list count
- `list`: wifi list

```c
uint16_t esp_blufi_get_version(void)
```
Get BLUFI profile version.

**Return**
Most 8bit significant is Great version, Least 8bit is Sub version

```c
esp_err_t esp_blufi_send_error_info(esp_blufi_error_state_t state)
```
This function is called to send blufi error information.

**Return**
ESP_OK - success, other - failed

**Parameters**
- `state`: error state

```c
esp_err_t esp_blufi_send_custom_data(uint8_t *data, uint32_t data_len)
```
This function is called to send custom data.

**Return**
ESP_OK - success, other - failed

**Parameters**
- `data`: custom data value
- `data_len`: the length of custom data

**Unions**
```c
union esp_blufi_cb_param_t
#include <esp_blufi_api.h> BLUFI callback parameters union.
```

**Public Members**
```c
struct esp_blufi_cb_param_t.blufi_init_finish_evt_param init_finish
BLufi callback param of ESP_BLUFI_EVENT_INIT_FINISH
```
```c
struct esp_blufi_cb_param_t.blufi_deinit_finish_evt_param deinit_finish
BLufi callback param of ESP_BLUFI_EVENT_DEINIT_FINISH
```
```c
struct esp_blufi_cb_param_t.blufi_set_wifi_mode_evt_param wifi_mode
BLufi callback param of ESP_BLUFI_EVENT_INIT_FINISH
```
```c
struct esp_blufi_cb_param_t.blufi_connect_evt_param connect
BLufi callback param of ESP_BLUFI_EVENT_CONNECT
```
```c
struct esp_blufi_cb_param_t.blufi_disconnect_evt_param disconnect
BLufi callback param of ESP_BLUFI_EVENT_DISCONNECT
```
```c
struct esp_blufi_cb_param_t.blufi_recv_sta_bssid_evt_param sta_bssid
BLufi callback param of ESP_BLUFI_EVENT_RECV_STA_BSSID
```
```c
struct esp_blufi_cb_param_t.blufi_recv_sta_ssid_evt_param sta_ssid
BLufi callback param of ESP_BLUFI_EVENT_RECV_STA_SSID
```
```c
struct esp_blufi_cb_param_t.blufi_recv_sta_passwd_evt_param sta_passwd
BLufi callback param of ESP_BLUFI_EVENT_RECV_STA_PASSWD
```
```c
struct esp_blufi_cb_param_t.blufi_recv_softap_ssid_evt_param softap_ssid
BLufi callback param of ESP_BLUFI_EVENT_RECV_SOFTAP_SSID
```
Chapter 2. API Reference

```c
struct esp_blufi_cb_param_t::blufi_recv_softap_passwd_evt_param softap_passwd
    Blufi callback param of ESP_BLUFI_EVENT_RECV_SOFTAP_PASSWD

struct esp_blufi_cb_param_t::blufi_recv_softap_max_conn_num_evt_param softap_max_conn_num
    Blufi callback param of ESP_BLUFI_EVENT_RECV_SOFTAP_MAX_CONN_NUM

struct esp_blufi_cb_param_t::blufi_recv_softap_auth_mode_evt_param softap_auth_mode
    Blufi callback param of ESP_BLUFI_EVENT_RECV_SOFTAP_AUTH_MODE

 esp_blufi_event_cb_t event_cb
BLUFI event callback

 esp_blufi_negotiate_data_handler_t negotiate_data_handler
BLUFI negotiate data function for negotiate share key

 esp_blufi_encrypt_func_t encrypt_func
BLUFI encrypt data function with share key generated by negotiate_data_handler

 esp_blufi_decrypt_func_t decrypt_func
BLUFI decrypt data function with share key generated by negotiate_data_handler

 esp_blufi_checksum_func_t checksum_func
BLUFI checksum function (FCS)

Macros

ESP_BD_ADDR_LEN
Bluetooth address length.

Type Definitions

typedef uint8_t esp_bd_addr_t[ESP_BD_ADDR_LEN]
Bluetooth device address.

typedef void (*esp_blufi_event_cb_t)(esp_blufi_event_t event, esp_blufi_cb_param_t *param)
BLUFI event callback function type.

Parameters

• event:: Event type
• param:: Point to callback parameter, currently is union type

typedef void (*esp_blufi_negotiate_data_handler_t)(uint8_t *data, int len, uint8_t *output_data, int *output_len, bool *need_free)
BLUFI negotiate data handler.

Parameters

• data:: data from phone
• len:: length of data from phone
• output_data:: data want to send to phone
• output_len:: length of data want to send to phone
• need_free:: output reporting if memory needs to be freed or not *

typedef int (*esp_blufi_encrypt_func_t)(uint8_t iv8, uint8_t *crypt_data, int crypt_len)
BLUFI encrypt the data after negotiate a share key.
Chapter 2. API Reference

**Return** Nonnegative number is encrypted length, if error, return negative number;

**Parameters**
- iv8: initial vector(8bit), normally, blufi core will input packet sequence number
- crypt_data: plain text and encrypted data, the encrypt function must support autochthonous encrypt
- crypt_len: length of plain text

```c
typedef int (*esp_blufi_decrypt_func_t) (uint8_t iv8, uint8_t *crypt_data, int crypt_len)
```

BLUFI decrypt the data after negotiate a share key.

**Return** Nonnegative number is decrypted length, if error, return negative number;

**Parameters**
- iv8: initial vector(8bit), normally, blufi core will input packet sequence number
- crypt_data: encrypted data and plain text, the encrypt function must support autochthonous decrypt
- crypt_len: length of encrypted text

```c
typedef uint16_t (*esp_blufi_checksum_func_t) (uint8_t iv8, uint8_t *data, int len)
```

BLUFI checksum.

**Parameters**
- iv8: initial vector(8bit), normally, blufi core will input packet sequence number
- data: data need to checksum
- len: length of data

**Enumerations**

```c
enum esp_blufi_cb_event_t
```

**Values:**
- `ESP_BLUFI_EVENT_INIT_FINISH = 0`
- `ESP_BLUFI_EVENT_DEINIT_FINISH`
- `ESP_BLUFI_EVENT_SET_WIFI_OPMODE`
- `ESP_BLUFI_EVENT_BLE_CONNECT`
- `ESP_BLUFI_EVENT_BLE_DISCONNECT`
- `ESP_BLUFI_EVENT_REQ_CONNECT_TO_AP`
- `ESP_BLUFI_EVENT_REQ_DISCONNECT_FROM_AP`
- `ESP_BLUFI_EVENT_GET_WIFI_STATUS`
- `ESP_BLUFI_EVENT_DEAUTHENTICATE_STA`
- `ESP_BLUFI_EVENT_RECV_STA_BSSID`
- `ESP_BLUFI_EVENT_RECV_STA_SSID`
- `ESP_BLUFI_EVENT_RECV_SOFTAP_SSID`
- `ESP_BLUFI_EVENT_RECV_SOFTAP_PASSWD`
- `ESP_BLUFI_EVENT_RECV_SOFTAP_BSSID`
- `ESP_BLUFI_EVENT_RECV_SOFTAP_PASSWD`
- `ESP_BLUFI_EVENT_RECV_SOFTAP_MAX_CONN_NUM`
- `ESP_BLUFI_EVENT_RECV_SOFTAP_AUTH_MODE`
- `ESP_BLUFI_EVENT_RECV_SOFTAP_CHANNEL`
- `ESP_BLUFI_EVENT_RECV_USERNAME`
- `ESP_BLUFI_EVENT_RECV_CA_CERT`
- `ESP_BLUFI_EVENT_RECV_CLIENT_CERT`
- `ESP_BLUFI_EVENT_RECV_SERVER_CERT`
Chapter 2. API Reference

2.1.4 NimBLE-based host APIs

Overview

Apache MyNewt NimBLE is a highly configurable and BT SIG qualifiable BLE stack providing both host and controller functionalities. ESP-IDF supports NimBLE host stack which is specifically ported for ESP32 platform and FreeRTOS. The underlying controller is still the same (as in case of Bluedroid) providing VHCI interface. Refer to NimBLE user guide for a complete list of features and additional information on NimBLE stack. Most features of NimBLE including BLE Mesh are supported by ESP-IDF. The porting layer is kept cleaner by maintaining all

```c
enum esp_blufi_sta_conn_state_t
BLUFI config status.

Values:
ESP_BLUFI_STA_CONN_SUCCESS = 0x00
ESP_BLUFI_STA_CONN_FAIL = 0x01

enum esp_blufi_init_state_t
BLUFI init status.

Values:
ESP_BLUFI_INIT_OK
ESP_BLUFI_INIT_FAILED

enum esp_blufi_deinit_state_t
BLUFI deinit status.

Values:
ESP_BLUFI_DEINIT_OK
ESP_BLUFI_DEINIT_FAILED

enum esp_blufi_error_state_t

Values:
ESP_BLUFI_SEQUENCE_ERROR = 0
ESP_BLUFI_CHECKSUM_ERROR
ESP_BLUFI_DECRYPT_ERROR
ESP_BLUFI_ENCRYPT_ERROR
ESP_BLUFI_INIT_SECURITY_ERROR
ESP_BLUFI_DH_MALLOC_ERROR
ESP_BLUFI_DH_PARAM_ERROR
ESP_BLUFI_READ_PARAM_ERROR
ESP_BLUFI_MAKE_PUBLIC_ERROR
ESP_BLUFI_DATA_FORMAT_ERROR
```
the existing APIs of NimBLE along with a single ESP-NimBLE API for initialization, making it simpler for the application developers.

Architecture

Currently, NimBLE host and controller support different transports such as UART and RAM between them. However, RAM transport cannot be used as is in case of ESP as ESP controller supports VHCI interface and buffering schemes used by NimBLE host is incompatible with that used by ESP controller. Therefore, a new transport between NimBLE host and ESP controller has been added. This is depicted in the figure below. This layer is responsible for maintaining pool of transport buffers and formatting buffers exchanges between host and controller as per the requirements.

![Fig. 1: ESP NimBLE Stack](image)

Threading Model

The NimBLE host can run inside the application thread or can have its own independent thread. This flexibility is inherently provided by NimBLE design. By default, a thread is spawned by the porting function `nimble_port_freertos_init`. This behavior can be changed by overriding the same function. For BLE Mesh, additional thread (advertising thread) is used which keeps on feeding advertisement events to the main thread.

Programming Sequence

To begin with, make sure that the NimBLE stack is enabled from menuconfig choose NimBLE for the Bluetooth host. Typical programming sequence with NimBLE stack consists of the following steps:

- Initialize NVS flash using `nvs_flash_init()` API. This is because ESP controller uses NVS during initialization.
- Call `esp_nimble_hci_and_controller_init()` to initialize ESP controller as well as transport layer. This will also link the host and controller modules together. Alternatively, if ESP controller is already initialized, then `esp_nimble_hci_init()` can be called for the remaining initialization.
- Initialize the host stack using `nimble_port_init`.
- Initialize the required NimBLE host configuration parameters and callbacks
- Perform application specific tasks/initialization
- Run the thread for host stack using `nimble_port_freertos_init`

This documentation does not cover NimBLE APIs. Refer to NimBLE tutorial for more details on the programming sequence/NimBLE APIs for different scenarios.

API Reference

Header File

- `components/bt/host/nimble/esp-hci/include/esp_nimble_hci.h`
Chapter 2. API Reference

Functions

**esp_err_t esp_nimble_hci_init**(void)

Initialize VHCI transport layer between NimBLE Host and ESP Bluetooth controller.

This function initializes the transport buffers to be exchanged between NimBLE host and ESP controller. It also registers required host callbacks with the controller.

**Return**

- ESP_OK if the initialization is successful
- Appropriate error code from esp_err_t in case of an error

**esp_err_t esp_nimble_hci_and_controller_init**(void)

Initialize ESP Bluetooth controller (link layer) and VHCI transport layer between NimBLE Host and ESP Bluetooth controller.

This function initializes ESP controller in BLE only mode and the transport buffers to be exchanged between NimBLE host and ESP controller. It also registers required host callbacks with the controller.

Below is the sequence of APIs to be called to init/enable NimBLE host and ESP controller:

```c
void ble_host_task(void *param)
{
    nimble_port_run(); // This function will return only when nimble_port_--stop() is executed.
    nimble_port_freertos_deinit();
}

int ret = esp_nimble_hci_and_controller_init();
if (ret != ESP_OK) {
    ESP_LOGE(TAG, "esp_nimble_hci_and_controller_init() failed with error: %d", ret);
    return;
}

nimble_port_init();

// Initialize the NimBLE Host configuration
nimble_port_freertos_init(ble_host_task);
```

nimble_port_freertos_init() is an optional call that creates a new task in which the NimBLE host will run. The task function should have a call to nimble_port_run(). If a separate task is not required, calling nimble_port_run() will run the NimBLE host in the current task.

**Return**

- ESP_OK if the initialization is successful
- Appropriate error code from esp_err_t in case of an error

**esp_err_t esp_nimble_hci_deinit**(void)

Deinitialize VHCI transport layer between NimBLE Host and ESP Bluetooth controller.

**Note** This function should be called after the NimBLE host is deinitialized.

**Return**

- ESP_OK if the deinitialization is successful
- Appropriate error codes from esp_err_t in case of an error

**esp_err_t esp_nimble_hci_and_controller_deinit**(void)

Deinitialize VHCI transport layer between NimBLE Host and ESP Bluetooth controller and disable and deinitialize the controller.

Below is the sequence of APIs to be called to disable/deinit NimBLE host and ESP controller:

**Note** This function should not be executed in the context of Bluetooth host task.

**Note** This function should be called after the NimBLE host is deinitialized.
int ret = nimble_port_stop();
if (ret == 0) {
    nimble_port_deinit();
    ret = esp_nimble_hci_and_controller_deinit();
    if (ret != ESP_OK) {
        ESP_LOGE(TAG, "esp_nimble_hci_and_controller_deinit() failed with error: ", ret);
    }
}

If nimble_port_freertos_init() is used during initialization, then nimble_port_freertos_deinit() should be called in the host task after nimble_port_run().

Return
• ESP_OK if the deinitialization is successful
• Appropriate error codes from esp_err_t in case of an error

Macros
BLE_HCI_UART_H4_NONE
BLE_HCI_UART_H4_CMD
BLE_HCI_UART_H4_ACL
BLE_HCI_UART_H4_SCO
BLE_HCI_UART_H4_EVT

2.1.5 ESP-BLE-MESH

With various features of ESP-BLE-MESH, users can create a managed flooding mesh network for several scenarios, such as lighting, sensor and etc.

For an ESP32 to join and work on a ESP-BLE-MESH network, it must be provisioned firstly. By provisioning, the ESP32, as an unprovisioned device, will join the ESP-BLE-MESH network and become a ESP-BLE-MESH node, communicating with other nodes within or beyond the radio range.

Apart from ESP-BLE-MESH nodes, inside ESP-BLE-MESH network, there is also ESP32 that works as ESP-BLE-MESH Provisioner, which could provision unprovisioned devices into ESP-BLE-MESH nodes and configure the nodes with various features.

For information how to start using ESP32 and ESP-BLE-MESH, please see the Section Getting Started with ESP-BLE-MESH. If you are interested in information on ESP-BLE-MESH architecture, including some details of software implementation, please see Section ESP-BLE-MESH Architecture.

Application Examples and Demos

Please refer to Sections ESP-BLE-MESH Examples and ESP-BLE-MESH Demo Videos.

API Reference

ESP-BLE-MESH APIs are divided into the following parts:
• ESP-BLE-MESH Definitions
• ESP-BLE-MESH Core API Reference
• ESP-BLE-MESH Models API Reference
Chapter 2. API Reference

ESP-BLE-MESH Definitions

This section contains only one header file, which lists the following items of ESP-BLE-MESH.

- ID of all the models and related message opcodes
- Structs of model, element and Composition Data
- Structs of used by ESP-BLE-MESH Node/Provisioner for provisioning
- Structs used to transmit/receive messages
- Event types and related event parameters

Header File

- components/bt/esp_ble_mesh/api/esp_ble_mesh_defs.h

Unions

union esp_ble_mesh_prov_cb_param_t

#include <esp_ble_mesh_defs.h> BLE Mesh Node/Provisioner callback parameters union.

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_provisioner_update_local_net_key_comp_param provisioner_update_net_key_comp
Event parameter of ESP_BLE_MESH_PROVISIONER_UPDATE_LOCAL_NET_KEY_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_provisioner_store_node_comp_data_comp_param provisioner_store_node_comp_data_comp
Event parameter of ESP_BLE_MESH_PROVISIONER_STORE_NODE_COMP_DATA_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_provisioner_delete_node_with_uuid_comp_param provisioner_delete_node_with_uuid_comp
Event parameter of ESP_BLE_MESH_PROVISIONER_DELETE_NODE_WITH_UUID_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::ble_mesh_provisioner_delete_node_with_addr_comp_param provisioner_delete_node_with_addr_comp
Event parameter of ESP_BLE_MESH_PROVISIONER_DELETE_NODE_WITH_ADDR_COMP_EVT

int err_code
Indicate the result of enabling/disabling to receive heartbeat messages by the Provisioner
Indicate the result of setting the heartbeat filter type by the Provisioner
Indicate the result of setting the heartbeat filter address by the Provisioner
Indicate the result of directly erasing settings by the Provisioner
Indicate the result of opening settings with index by the Provisioner
Indicate the result of opening settings with user id by the Provisioner
Indicate the result of closing settings with index by the Provisioner
Indicate the result of closing settings with user id by the Provisioner
Indicate the result of deleting settings with index by the Provisioner
Indicate the result of deleting settings with user id by the Provisioner

bool enable
Indicate enabling or disabling receiving heartbeat messages

struct esp_ble_mesh_prov_cb_param_t::[anonymous] provisioner_enable_heartbeat_recv_comp
ESP_BLE_MESH_PROVISIONER_ENABLE_HEARTBEAT_RECV_COMP_EVT.
Event parameters of ESP_BLE_MESH_PROVISIONER_ENABLE_HEARTBEAT_RECV_COMP_EVT

uint8_t type
Type of the filter used for receiving heartbeat messages

struct esp_ble_mesh_prov_cb_param_t::[anonymous] provisioner_set_heartbeat_filter_type_comp
ESP_BLE_MESH_PROVISIONER_SET_HEARTBEAT_FILTER_TYPE_COMP_EVT.
Event parameters of ESP_BLE_MESH_PROVISIONER_SET_HEARTBEAT_FILTER_TYPE_COMP_EVT

uint8_t op
Operation (add, remove, clean)

uint16_t hb_src
Heartbeat source address
uint16_t hb_dst
    Heartbeat destination address

struct esp_ble_mesh_prov_cb_param_t::[anonymous] provisioner_set_heartbeat_filter_info_comp
    ESP_BLE_MESH_PROVISIONER_SET_HEARTBEAT_FILTER_INFO_COMP_EVT.
    Event parameters of ESP_BLE_MESH_PROVISIONER_SET_HEARTBEAT_FILTER_INFO_COMP_EVT

uint8_t init_ttl
    Heartbeat InitTTL

uint8_t rx_ttl
    Heartbeat RxTTL

uint8_t hops
    Heartbeat hops (InitTTL - RxTTL + 1)

uint16_t feature
    Bit field of currently active features of the node

int8_t rssi
    RSSI of the heartbeat message

struct esp_ble_mesh_prov_cb_param_t::[anonymous] provisioner_recv_heartbeat
    ESP_BLE_MESH_PROVISIONER_RECV_HEARTBEAT_MESSAGE_EVT.
    Event parameters of ESP_BLE_MESH_PROVISIONER_RECV_HEARTBEAT_MESSAGE_EVT

struct esp_ble_mesh_prov_cb_param_t::[anonymous] provisioner_direct_erase_settings_comp
    ESP_BLE_MESH_PROVISIONER_DRIECT_ERASE_SETTINGS_COMP_EVT.
    Event parameters of ESP_BLE_MESH_PROVISIONER_DRIECT_ERASE_SETTINGS_COMP_EVT

uint8_t index
    Index of Provisioner settings

struct esp_ble_mesh_prov_cb_param_t::[anonymous] provisioner_open_settings_with_index_comp
    ESP_BLE_MESH_PROVISIONER_OPEN_SETTINGS_WITH_INDEX_COMP_EVT.
    Event parameter of ESP_BLE_MESH_PROVISIONER_OPEN_SETTINGS_WITH_INDEX_COMP_EVT

char uid[ESP_BLE_MESH_SETTINGS_UID_SIZE + 1]
    Provisioner settings user id

struct esp_ble_mesh_prov_cb_param_t::[anonymous] provisioner_open_settings_with_uid_comp
    ESP_BLE_MESH_PROVISIONER_OPEN_SETTINGS_WITH_UID_COMP_EVT.
    Event parameters of ESP_BLE_MESH_PROVISIONER_OPEN_SETTINGS_WITH_UID_COMP_EVT

struct esp_ble_mesh_prov_cb_param_t::[anonymous] provisioner_close_settings_with_index_comp
    ESP_BLE_MESH_PROVISIONER_CLOSE_SETTINGS_WITH_INDEX_COMP_EVT.
    Event parameter of ESP_BLE_MESH_PROVISIONER_CLOSE_SETTINGS_WITH_INDEX_COMP_EVT

Chapter 2. API Reference

Public Members

```c
int err_code
```
Indicate the result of BLE Mesh deinitialization

```c
struct ble_mesh_friend_friendship_establish_param
#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_FRIEND_FRIENDSHIP_ESTABLISH_EVT.
```

Public Members

```c
uint16_t lpn_addr
```
Low Power Node unicast address

```c
struct ble_mesh_friend_friendship_terminate_param
#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_FRIEND_FRIENDSHIP_TERMINATE_EVT.
```

Public Types

```c
enum [anonymous]
```
This enum value is the reason of friendship termination on the friend node side

Values:

- **ESP_BLE_MESH_FRND_FRIENDSHIP_TERMINATE_ESTABLISH_FAIL**
  Friend Offer has been sent, but Friend Offer is not received within 1 second, friendship fails to be established

- **ESP_BLE_MESH_FRND_FRIENDSHIP_TERMINATE_POLL_TIMEOUT**
  Friendship is established, PollTimeout timer expires and no Friend Poll/Sub Add/Sub Remove is received

- **ESP_BLE_MESH_FRND_FRIENDSHIP_TERMINATE_RECV_FRND_REQ**
  Receive Friend Request from existing Low Power Node

- **ESP_BLE_MESH_FRND_FRIENDSHIP_TERMINATE_RECV_FRND_CLEAR**
  Receive Friend Clear from other friend node

- **ESP_BLE_MESH_FRND_FRIENDSHIP_TERMINATE_DISABLE**
  Friend feature disabled or corresponding NetKey is deleted

Public Members

```c
uint16_t lpn_addr
```
Low Power Node unicast address

```c
esp_ble_mesh_prov_cb_param_t::ble_mesh_friend_friendship_terminate_param::[anonymous] reason
```
This enum value is the reason of friendship termination on the friend node side Friendship terminated reason

```c
struct ble_mesh_heartbeat_msg_recv_param
#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_HEARTBEAT_MESSAGE_RECV_EVT.
```

Public Members

Chapter 2. API Reference

Public Members

int **err_code**
Indicate the result of setting OOB Public Key

```c
#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_NODE_SET_UNPROV_DEV_NAME_COMP_EVT.
```

Public Members

int **err_code**
Indicate the result of setting BLE Mesh device name

```c
union esp_ble_mesh_server_state_value_t
#include <esp_ble_mesh_defs.h> Server model state value union.
```

Public Members

```c
uint8_t **onoff**
The value of the Generic OnOff state
The value of the Light LC Light OnOff state
```

```c
struct esp_ble_mesh_server_state_value_t::*[anonymous] gen_onoff
The Generic OnOff state
```

```c
int16_t **level**
The value of the Generic Level state
```

```c
struct esp_ble_mesh_server_state_value_t::*[anonymous] gen_level
The Generic Level state
```

```c
uint8_t **onpowerup**
The value of the Generic OnPowerUp state
```

```c
struct esp_ble_mesh_server_state_value_t::*[anonymous] gen_onpowerup
The Generic OnPowerUp state
```

```c
uint16_t **power**
The value of the Generic Power Actual state
```

```c
struct esp_ble_mesh_server_state_value_t::*[anonymous] gen_power_actual
The Generic Power Actual state
```

```c
uint16_t **lightness**
The value of the Light Lightness Actual state
The value of the Light Lightness Linear state
The value of the Light CTL Lightness state
The value of the Light HSL Lightness state
The value of the Light xyL Lightness state
```

```c
struct esp_ble_mesh_server_state_value_t::*[anonymous] light_lightness_actual
The Light Lightness Actual state
```

```c
struct esp_ble_mesh_server_state_value_t::*[anonymous] light_lightness_linear
The Light Lightness Linear state
```

```c
struct esp_ble_mesh_server_state_value_t::*[anonymous] light_ctl_lightness
The Light CTL Lightness state
```

```c
uint16_t **temperature**
The value of the Light CTL Temperature state
```
The value of the Light CTL Delta UV state

The value of the Light CTL Temperature & Delta UV states

The value of the Light HSL Hue state

The value of the Light HSL Saturation state

The Light HSL Hue state

The Light HSL Saturation state

The Light xyL Lightness state

The Light LC Light OnOff state

union esp_ble_mesh_model_cb_param_t

#include <esp_ble_mesh_defs.h> BLE Mesh model callback parameters union.

Public Members

Event parameter of ESP_BLE_MESH_MODEL_OPERATION_EVT

Event parameter of ESP_BLE_MESH_MODEL_SEND_COMP_EVT

Event parameter of ESP_BLE_MESH_MODEL_PUBLISH_COMP_EVT

Event parameter of ESP_BLE_MESH_CLIENT_MODEL_RECV_PUBLISH_MSG_EVT

Event parameter of ESP_BLE_MESH_SERVER_MODEL_UPDATE_STATE_COMP_EVT

#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_CLIENT_MODEL_SEND_TIMEOUT_EVT.

Public Members

Opcode of the previously sent message
Chapter 2. API Reference

`esp_ble_mesh_model_t *model`
Pointer to the model which sends the previous message

`esp_ble_mesh_msg_ctx_t *ctx`
Pointer to the context of the previous message

`struct ble_mesh_mod_recv_publish_msg_param`
#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_CLIENT_MODEL_RECV_PUBLISH_MSG_EVT.

**Public Members**

`uint32_t opcode`
Opcode of the unsolicited received message

`esp_ble_mesh_model_t *model`
Pointer to the model which receives the message

`esp_ble_mesh_msg_ctx_t *ctx`
Pointer to the context of the received message

`uint16_t length`
Length of the received message

`uint8_t *msg`
Value of the received message

`struct ble_mesh_model_operation_evt_param`
#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_MODEL_OPERATION_EVT.

**Public Members**

`uint32_t opcode`
Opcode of the received message

`esp_ble_mesh_model_t *model`
Pointer to the model which receives the message

`esp_ble_mesh_msg_ctx_t *ctx`
Pointer to the context of the received message

`uint16_t length`
Length of the received message

`uint8_t *msg`
Value of the received message

`struct ble_mesh_model_publish_comp_param`
#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_MODEL_PUBLISH_COMP_EVT.

**Public Members**

`int err_code`
Indicate the result of publishing a message

`esp_ble_mesh_model_t *model`
Pointer to the model which publishes the message

`struct ble_mesh_model_publish_update_evt_param`
#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_MODEL_PUBLISH_UPDATE_EVT.
Public Members

```c
esp_ble_mesh_model_t *model
```
Pointer to the model which is going to update its publish message

```c
struct ble_mesh_model_send_comp_param
#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_MODEL_SEND_COMP_EVT.
```

Public Members

```c
int err_code
```
Indicate the result of sending a message

```c
uint32_t opcode
```
Opcode of the message

```c
esp_ble_mesh_model_t *model
```
Pointer to the model which sends the message

```c
esp_ble_mesh_msg_ctx_t *ctx
```
Context of the message

```c
struct ble_mesh_server_model_update_state_comp_param
#include <esp_ble_mesh_defs.h> ESP_BLE_MESH_SERVER_MODEL_UPDATE_STATE_COMP_EVT.
```

Public Members

```c
int err_code
```
Indicate the result of updating server model state

```c
esp_ble_mesh_model_t *model
```
Pointer to the server model which state value is updated

```c
esp_ble_mesh_server_state_type_t type
```
Type of the updated server state

Structures

```c
struct esp_ble_mesh_deinit_param_t
```
BLE Mesh deinit parameters

Public Members

```c
bool erase_flash
```
Indicate if erasing flash when deinit mesh stack

```c
struct esp_ble_mesh_elem_t
```
Abstraction that describes a BLE Mesh Element. This structure is associated with struct bt_mesh_elem in mesh_access.h

Public Members

```c
uint16_t element_addr
```
Element Address, assigned during provisioning.

```c
const uint16_t location
```
Location Descriptor (GATT Bluetooth Namespace Descriptors)

```c
const uint8_t sig_model_count
```
SIG Model count
const uint8_t vnd_model_count
  Vendor Model count

*esp_ble_mesh_model_t* sig_models
  SIG Models

*esp_ble_mesh_model_t* vnd_models
  Vendor Models

**struct esp_ble_mesh_model_pub_t**

Abstraction that describes a model publication context. This structure is associated with struct bt_mesh_model_pub in mesh_access.h

**Public Members**

*esp_ble_mesh_model_t* model
  Pointer to the model to which the context belongs. Initialized by the stack.

uint16_t publish_addr
  Publish Address.

uint16_t app_idx : 12
  Publish AppKey Index.

uint16_t cred : 1
  Friendship Credentials Flag.

uint16_t send_rel : 1
  Force reliable sending (segment acks)

uint8_t ttl
  Publish Time to Live.

uint8_t retransmit
  Retransmit Count & Interval Steps.

uint8_t period
  Publish Period.

uint8_t period_div : 4
  Divisor for the Period.

uint8_t fast_period : 1
  Use FastPeriodDivisor

uint8_t count : 3
  Retransmissions left.

uint32_t period_start
  Start of the current period.

**struct net_buf_simple** *msg
  Publication buffer, containing the publication message.

  This will get correctly created when the publication context has been defined using the
  ESP_BLE_MESH_MODEL_PUB_DEFINE macro.

  ESP_BLE_MESH_MODEL_PUB_DEFINE(name, size);

*esp_ble_mesh_cb_t* update
  Callback used to update publish message. Initialized by the stack.

**struct k_delayed_work** timer
  Publish Period Timer. Initialized by the stack.

uint8_t dev_role
  Role of the device that is going to publish messages
struct esp_ble_mesh_model_op_t
Abstraction that describes a model operation context. This structure is associated with struct bt_mesh_model_op in mesh_access.h

Public Members

const uint32_t opcode
Message opcode

const size_t min_len
Message minimum length

esp_ble_mesh_cb_t param_cb
Callback used to handle message. Initialized by the stack.

struct esp_ble_mesh_model_cbs_t
Abstraction that describes a model callback structure. This structure is associated with struct bt_mesh_model_cb in mesh_access.h.

Public Members

esp_ble_mesh_cb_t init_cb
Callback used during model initialization. Initialized by the stack.

struct esp_ble_mesh_model
Abstraction that describes a Mesh Model instance. This structure is associated with struct bt_mesh_model in mesh_access.h

Public Members

const uint16_t model_id
16-bit model identifier

uint16_t company_id
16-bit company identifier

uint16_t model_id
16-bit model identifier

struct esp_ble_mesh_model::[anonymous]::[anonymous] vnd
Structure encapsulating a model ID with a company ID

union esp_ble_mesh_model::[anonymous] [anonymous]
Model ID

uint8_t element_idx
Internal information, mainly for persistent storage Belongs to Nth element

uint8_t model_idx
Is the Nth model in the element

uint16_t flags
Information about what has changed

esp_ble_mesh_elem_t *element
The Element to which this Model belongs

esp_ble_mesh_model_pub_t *const pub
Model Publication

uint16_t keys[CONFIG_BLE_MESH_MODEL_KEY_COUNT]
AppKey List
uint16_t groups[CONFIG_BLE_MESH_MODEL_GROUP_COUNT]
   Subscription List (group or virtual addresses)

esp_ble_mesh_model_op_t *op
   Model operation context

esp_ble_mesh_model_cbs_t *cb
   Model callback structure

void *user_data
   Model-specific user data

**struct esp_ble_mesh_msg_ctx_t**
   Message sending context. This structure is associated with struct bt_mesh_msg_ctx in mesh_access.h

**Public Members**

uint16_t net_idx
   NetKey Index of the subnet through which to send the message.

uint16_t app_idx
   AppKey Index for message encryption.

uint16_t addr
   Remote address.

uint16_t recv_dst
   Destination address of a received message. Not used for sending.

int8_t recv_rssi
   RSSI of received packet. Not used for sending.

uint8_t recv_ttl : 7
   Received TTL value. Not used for sending.

uint8_t send_rel : 1
   Force sending reliably by using segment acknowledgement

uint8_t send_ttl
   TTL, or ESP_BLE_MESH_TTL_DEFAULT for default TTL.

uint32_t recv_op
   Opcode of a received message. Not used for sending message.

esp_ble_mesh_model_t *model
   Model corresponding to the message, no need to be initialized before sending message

bool srv_send
   Indicate if the message is sent by a node server model, no need to be initialized before sending message

**struct esp_ble_mesh_prov_t**
   Provisioning properties & capabilities. This structure is associated with struct bt_mesh_prov in mesh_access.h

**struct esp_ble_mesh Comp_t**
   Node Composition data context. This structure is associated with struct bt_mesh_comp in mesh_access.h

**Public Members**

uint16_t cid
   16-bit SIG-assigned company identifier

uint16_t pid
   16-bit vendor-assigned product identifier

uint16_t vid
   16-bit vendor-assigned product version identifier
size_t element_count
   Element count

*esp_ble_mesh_elem_t *elements
   A sequence of elements

struct esp_ble_mesh_unprov_dev_add_t
   Information of the device which is going to be added for provisioning.

Public Members

*esp_ble_mesh_bd_addr_t addr
   Device address

*esp_ble_mesh_addr_type_t addr_type
   Device address type

uint8_t uuid[16]
   Device UUID

uint16_t oob_info
   Device OOB Info ADD_DEV_START_PROV_NOW_FLAG shall not be set if the bearer has both PB-ADV and PB-GATT enabled

*esp_ble_mesh_prov_bearer_t bearer
   Provisioning Bearer

struct esp_ble_mesh_device_delete_t
   Information of the device which is going to be deleted.

Public Members

*esp_ble_mesh_bd_addr_t addr
   Device address

*esp_ble_mesh_addr_type_t addr_type
   Device address type

uint8_t uuid[16]
   Device UUID

uint8_t flag
   BIT0: device address; BIT1: device UUID

struct esp_ble_mesh_prov_data_info_t
   Information of the provisioner which is going to be updated.

Public Members

uint16_t net_idx
   NetKey Index

uint8_t flags
   Flags

uint32_t iv_index
   IV Index

uint8_t flag
   BIT0: net_idx; BIT1: flags; BIT2: iv_index

struct esp_ble_mesh_node_t
   Information of the provisioned node
Public Members

```
esp_ble_mesh_bd_addr_t addr
    Node device address

esp_ble_mesh_addr_type_t addr_type
    Node device address type

uint8_t dev_uuid[16]
    Device UUID

uint16_t oob_info
    Node OOB information

uint16_t unicast_addr
    Node unicast address

uint8_t element_num
    Node element number

uint16_t net_idx
    Node Net Key Index

uint8_t flags
    Node key refresh flag and iv update flag

uint32_t iv_index
    Node IV Index

uint8_t dev_key[16]
    Node device key

char name[ESP_BLE_MESH_NODE_NAME_MAX_LEN + 1]
    Node name

uint16_t comp_length
    Length of Composition Data

uint8_t* comp_data
    Value of Composition Data
```

```
struct esp_ble_mesh_fast_prov_info_t
    Context of fast provisioning which need to be set.
```

Public Members

```
uint16_t unicast_min
    Minimum unicast address used for fast provisioning

uint16_t unicast_max
    Maximum unicast address used for fast provisioning

uint16_t net_idx
    Netkey idx used for fast provisioning

uint8_t flags
    Flags used for fast provisioning

uint32_t iv_index
    IV Index used for fast provisioning

uint8_t offset
    Offset of the UUID to be compared

uint8_t match_len
    Length of the UUID to be compared
```

`uint8_t match_val[16]`
Value of UUID to be compared

**struct esp_ble_mesh_heartbeat_filter_info_t**
Context of Provisioner heartbeat filter information to be set

**Public Members**

`uint16_t hb_src`
Heartbeat source address (unicast address)

`uint16_t hb_dst`
Heartbeat destination address (unicast address or group address)

**struct esp_ble_mesh_client_op_pair_t**
BLE Mesh client models related definitions.
Client model Get/Set message opcode and corresponding Status message opcode

**Public Members**

`uint32_t cli_op`
The client message opcode

`uint32_t status_op`
The server status opcode corresponding to the client message opcode

**struct esp_ble_mesh_client_t**
Client Model user data context.

**Public Members**

`esp_ble_mesh_model_t *model`
Pointer to the client model. Initialized by the stack.

`int op_pair_size`
Size of the op_pair

`const esp_ble_mesh_client_op_pair_t *op_pair`
Table containing get/set message opcode and corresponding status message opcode

`uint32_t publish_status`
Callback used to handle the received unsolicited message. Initialized by the stack.

`void *internal_data`
Pointer to the internal data of client model

`uint8_t msg_role`
Role of the device (Node/Provisioner) that is going to send messages

**struct esp_ble_mesh_client_common_param_t**
Common parameters of the messages sent by Client Model.

**Public Members**

`esp_ble_mesh_opcode_t opcode`
Message opcode

`esp_ble_mesh_model_t *model`
Pointer to the client model structure
esp_ble_mesh_msg_ctx_t
cx
The context used to send message

int32_t msg_timeout
Timeout value (ms) to get response to the sent message Note: if using default timeout value in menuconfig, make sure to set this value to 0

uint8_t msg_role
Role of the device - Node/Provisioner

struct esp_ble_mesh_state_transition_t
Parameters of the server model state transition

Public Functions

BLE_MESH_ATOMIC_DEFINE (flag, ESP_BLE_MESH_SERVER_FLAG_MAX)
Flag used to indicate if the transition timer has been started internally.

If the model which contains esp_ble_mesh_state_transition_t sets “set_auto_rsp” to ESP_BLE_MESH_SERVER_RSP_BY_APP, the handler of the timer shall be initialized by the users.

And users can use this flag to indicate whether the timer is started or not.

Public Members

bool just_started
Indicate if the state transition has just started

uint8_t trans_time
State transition time

uint8_t remain_time
Remaining time of state transition

uint8_t delay
Delay before starting state transition

uint32_t quo_tt
Duration of each divided transition step

uint32_t counter
Number of steps which the transition duration is divided

uint32_t total_duration
State transition total duration

int64_t start_timestamp
Time when the state transition is started

struct k_delayed_work timer
Timer used for state transition

struct esp_ble_mesh_last_msg_info_t
Parameters of the server model received last same set message.

Public Members

uint8_t tid
Transaction number of the last message

uint16_t src
Source address of the last message
```c
uint16_t dst
Destination address of the last message

int64_t timestamp
Time when the last message is received
```

```c
struct esp_ble_mesh_server_rsp_ctrl_t
Parameters of the Server Model response control
```

### Public Members

```c
uint8_t get_auto_rsp : 1
BLE Mesh Server Response Option.
```

1. If `get_auto_rsp` is set to ESP_BLE_MESH_SERVER_RSP_BY_APP, then the response of Client Get messages need to be replied by the application;
2. If `get_auto_rsp` is set to ESP_BLE_MESH_SERVER_AUTO_RSP, then the response of Client Get messages will be replied by the server models;
3. If `set_auto_rsp` is set to ESP_BLE_MESH_SERVER_RSP_BY_APP, then the response of Client Set messages need to be replied by the application;
4. If `set_auto_rsp` is set to ESP_BLE_MESH_SERVER_AUTO_RSP, then the response of Client Set messages will be replied by the server models;
5. If `status_auto_rsp` is set to ESP_BLE_MESH_SERVER_RSP_BY_APP, then the response of Server Status messages need to be replied by the application;
6. If `status_auto_rsp` is set to ESP_BLE_MESH_SERVER_AUTO_RSP, then the response of Server Status messages will be replied by the server models;

```c
uint8_t set_auto_rsp : 1
Response control for Client Set messages
```

```c
uint8_t status_auto_rsp : 1
Response control for Server Status messages
```

### Macros

```c
ESP_BLE_MESH_SDU_MAX_LEN
< The maximum length of a BLE Mesh message, including Opcode, Payload and TransMIC Length of a short Mesh MIC.
```

```c
ESP_BLE_MESH_MIC_SHORT
Length of a long Mesh MIC.
```

```c
ESP_BLE_MESH_MIC_LONG
The maximum length of a BLE Mesh provisioned node name
```

```c
ESP_BLE_MESH_NODE_NAME_MAX_LEN
The maximum length of a BLE Mesh unprovisioned device name
```

```c
ESP_BLE_MESH_DEVICE_NAME_MAX_LEN
The maximum length of settings userid
```

```c
ESP_BLE_MESH_SETTINGS_UID_SIZE
Invalid settings index
```

```c
ESP_BLE_MESH_INVALID_SETTINGS_IDX
Define the BLE Mesh octet 16 bytes size
```

```c
ESP_BLE_MESH_OCTET16_LEN
ESP_BLE_MESH_OCTET8_LEN
ESP_BLE_MESH_CID_NVAL
Special TTL value to request using configured default TTL
```

```c
ESP_BLE_MESH_TTL_DEFAULT
Maximum allowed TTL value
```

ESP_BLE_MESH_INVALID_NODE_INDEX

ESP_BLE_MESH_TRANSMIT (count, int_ms)
Encode transmission count & interval steps.

Note For example, ESP_BLE_MESH_TRANSMIT(2, 20) means that the message will be sent about
90ms(count is 3, step is 1, interval is 30 ms which includes 10ms of advertising interval random de-
lay).

Return BLE Mesh transmit value that can be used e.g. for the default values of the Configuration Model data.

Parameters
• count: Number of retransmissions (first transmission is excluded).
• int_ms: Interval steps in milliseconds. Must be greater than 0 and a multiple of 10.

ESP_BLE_MESH_GET_TRANSMIT_COUNT (transmit)
Decode transmit count from a transmit value.

Return Transmission count (actual transmissions equal to N + 1).

Parameters
• transmit: Encoded transmit count & interval value.

ESP_BLE_MESH_GET_TRANSMIT_INTERVAL (transmit)
Decode transmit interval from a transmit value.

Return Transmission interval in milliseconds.

Parameters
• transmit: Encoded transmit count & interval value.

ESP_BLE_MESH_PUBLISH_TRANSMIT (count, int_ms)
Encode Publish Retransmit count & interval steps.

Return BLE Mesh transmit value that can be used e.g. for the default values of the Configuration Model data.

Parameters
• count: Number of retransmissions (first transmission is excluded).
• int_ms: Interval steps in milliseconds. Must be greater than 0 and a multiple of 50.

ESP_BLE_MESH_GET_PUBLISH_TRANSMIT_COUNT (transmit)
Decode Publish Retransmit count from a given value.

Return Retransmission count (actual transmissions equal to N + 1).

Parameters
• transmit: Encoded Publish Retransmit count & interval value.

ESP_BLE_MESH_GET_PUBLISH_TRANSMIT_INTERVAL (transmit)
Decode Publish Retransmit interval from a given value.

Callbacks which are not needed to be initialized by users (set with 0 and will be initialized internally)

Return Transmission interval in milliseconds.

Parameters
• transmit: Encoded Publish Retransmit count & interval value.

ESP_BLE_MESH_PROV_STATIC_OOB_MAX_LEN
Maximum length of string used by Output OOB authentication.

ESP_BLE_MESH_PROV_OUTPUT_OOB_MAX_LEN
Maximum length of string used by Output OOB authentication.

ESP_BLE_MESH_PROV_INPUT_OOB_MAX_LEN
Macros used to define message opcode.

ESP_BLE_MESH_MODEL_OP_1 (b0)

ESP_BLE_MESH_MODEL_OP_2 (b0, b1)

ESP_BLE_MESH_MODEL_OP_3 (b0, cid)
This macro is associated with BLE_MESH_MODEL_CB in mesh_access.h
Chapter 2. API Reference

ESP_BLE_MESH_SIG_MODEL (_id, _op, _pub, _user_data)
This macro is associated with BLE_MESH_MODEL_VND_CB in mesh_access.h

ESP_BLE_MESH_VENDOR_MODEL (_company, _id, _op, _pub, _user_data)

ESP_BLE_MESH_ELEMENT (_loc, _mods, _vnd_mods)
Helper to define a BLE Mesh element within an array.
In case the element has no SIG or Vendor models, the helper macro ESP_BLE_MESH_MODEL_NONE can be given instead.

Note  This macro is associated with BLE_MESH_ELEM in mesh_access.h
Parameters
•  _loc: Location Descriptor.
•  _mods: Array of SIG models.
•  _vnd_mods: Array of vendor models.

ESP_BLE_MESH_PROV (uuid, sta_val, sta_val_len, out_size, out_act, in_size, in_act)

BT_OCTET32_LEN

BD_ADDR_LEN

ESP_BLE_MESH_ADDR_TYPE_PUBLIC

ESP_BLE_MESH_ADDR_TYPE_RANDOM

ESP_BLE_MESH_ADDR_TYPE_RPA_PUBLIC

ESP_BLE_MESH_ADDR_TYPE_RPA_RANDOM

ESP_BLE_MESH_MODEL_PUB_DEFINE (_name, _msg_len, _role)
Define a model publication context.
Parameters
•  _name: Variable name given to the context.
•  _msg_len: Length of the publication message.
•  _role: Role of the device which contains the model.

ESP_BLE_MESH_MODEL_OP (_opcode, _min_len)
Define a model operation context.
Parameters
•  _opcode: Message opcode.
•  _min_len: Message minimum length.

ESP_BLE_MESH_MODEL_OP_END
Define the terminator for the model operation table. Each model operation struct array must use this terminator as the end tag of the operation unit.

ESP_BLE_MESH_MODEL_NONE
Helper to define an empty model array. This structure is associated with BLE_MESH_MODEL_NONE in mesh_access.h

ADD_DEV_RM_AFTER_PROV_FLAG
Device will be removed from queue after provisioned successfully

ADD_DEV_START_PROV_NOW_FLAG
Start provisioning device immediately

ADD_DEV_FLUSHABLE_DEV_FLAG
Device can be remove when queue is full and new device is going to added

DEL_DEV_ADDR_FLAG

DEL_DEV_UUID_FLAG

PROV_DATA_NET_IDX_FLAG

PROV_DATA_FLAGS_FLAG

typedef uint8_t esp_ble_mesh_bd_addr_t[BD_ADDR_LEN]

typedef uint8_t esp_ble_mesh_addr_type_t
  BLE device address type.

typedef struct esp_ble_mesh_model esp_ble_mesh_model_t

typedef uint8_t esp_ble_mesh_dev_add_flag_t

typedef uint32_t esp_ble_mesh_opcode_config_client_get_t
  esp_ble_mesh_opcode_config_client_get_t belongs to esp_ble_mesh_opcode_t, this typedef is only used to locate the opcodes used by esp_ble_mesh_config_client_get_state. The following opcodes will only be used in the esp_ble_mesh_config_client_get_state function.

typedef uint32_t esp_ble_mesh_opcode_config_client_set_t
  esp_ble_mesh_opcode_config_client_set_t belongs to esp_ble_mesh_opcode_t, this typedef is only used to locate the opcodes used by esp_ble_mesh_config_client_set_state. The following opcodes will only be used in the esp_ble_mesh_config_client_set_state function.

typedef uint32_t esp_ble_mesh_opcode_config_status_t
  esp_ble_mesh_opcode_config_status_t belongs to esp_ble_mesh_opcode_t, this typedef is only used to locate the opcodes used by the Config Model messages. The following opcodes are used by the BLE Mesh Config Server Model internally to respond to the Config Client Model’s request messages.

typedef uint8_t esp_ble_mesh_cfg_status_t
  This typedef is only used to indicate the status code contained in some of the Configuration Server Model status message.

typedef uint32_t esp_ble_mesh_opcode_health_client_get_t
  esp_ble_mesh_opcode_health_client_get_t belongs to esp_ble_mesh_opcode_t, this typedef is only used to locate the opcodes used by esp_ble_mesh_health_client_get_state. The following opcodes will only be used in the esp_ble_mesh_health_client_get_state function.

typedef uint32_t esp_ble_mesh_opcode_health_client_set_t
  esp_ble_mesh_opcode_health_client_set_t belongs to esp_ble_mesh_opcode_t, this typedef is only used to locate the opcodes used by esp_ble_mesh_health_client_set_state. The following opcodes will only be used in the esp_ble_mesh_health_client_set_state function.

typedef uint32_t esp_ble_mesh_health_model_status_t
  esp_ble_mesh_health_model_status_t belongs to esp_ble_mesh_opcode_t, this typedef is only used to locate the opcodes used by the Health Model messages. The following opcodes are used by the BLE Mesh Health Server Model internally to respond to the Health Client Model’s request messages.

typedef uint32_t esp_ble_mesh_generic_message_opcode_t
  esp_ble_mesh_generic_message_opcode_t belongs to esp_ble_mesh_opcode_t, this typedef is only used to locate the opcodes used by functions esp_ble_mesh_generic_client_get_state & esp_ble_mesh_generic_client_set_state. Generic OnOff Message Opcode.
typedef uint32_t esp_ble_mesh_sensor_message_opcode_t

esp_ble_mesh_sensor_message_opcode_t belongs to esp_ble_mesh_opcode_t, this typedef is only used to locate the opcodes used by functions esp_ble_mesh_sensor_client_get_state & esp_ble_mesh_sensor_client_set_state. Sensor Message Opcode

typedef uint32_t esp_ble_mesh_time_scene_message_opcode_t

esp_ble_mesh_time_scene_message_opcode_t belongs to esp_ble_mesh_opcode_t, this typedef is only used to locate the opcodes used by functions esp_ble_mesh_time_scene_client_get_state & esp_ble_mesh_time_scene_client_set_state. Time Message Opcode

typedef uint32_t esp_ble_mesh_light_message_opcode_t

esp_ble_mesh_light_message_opcode_t belongs to esp_ble_mesh_opcode_t, this typedef is only used to locate the opcodes used by functions esp_ble_mesh_light_client_get_state & esp_ble_mesh_light_client_set_state. Light Message Opcode

typedef uint32_t esp_ble_mesh_opcode_t

End of defines of esp_ble_mesh_opcode_t

typedef uint8_t esp_ble_mesh_model_status_t

This typedef is only used to indicate the status code contained in some of the server models (e.g. Generic Server Model) status message.

Enumerations

enum esp_ble_mesh_cb_type_t

Values:

ESP_BLE_MESH_TYPE_PROV_CB
ESP_BLE_MESH_TYPE_OUTPUT_NUM_CB
ESP_BLE_MESH_TYPE_OUTPUT_STR_CB
ESP_BLE_MESH_TYPE_INPUT_CB
ESP_BLE_MESH_TYPE_LINK_OPEN_CB

enum esp_ble_mesh_dev_role_t
Values:
ROLE_NODE = 0
ROLE_PROVISIONER
ROLE_FAST_PROV

enum esp_ble_mesh_fast_prov_action_t
Values:
FAST_PROV_ACT_NONE
FAST_PROV_ACT_ENTER
FAST_PROV_ACT_SUSPEND
FAST_PROV_ACT_EXIT
FAST_PROV_ACT_MAX

enum esp_ble_mesh_proxy_filter_type_t
Values:
PROXY_FILTER_WHITELIST
PROXY_FILTER_BLACKLIST

enum esp_ble_mesh_prov_cb_event_t
Values:
ESP_BLE_MESH_PROV_REGISTER_COMP_EVT
Initialize BLE Mesh provisioning capabilities and internal data information completion event

ESP_BLE_MESH_NODE_SET_UNPROV_DEV_NAME_COMP_EVT
Set the unprovisioned device name completion event

ESP_BLE_MESH_NODE_PROV_ENABLE_COMP_EVT
Enable node provisioning functionality completion event

ESP_BLE_MESH_NODE_PROV_DISABLE_COMP_EVT
Disable node provisioning functionality completion event

ESP_BLE_MESH_NODE_PROV_LINK_OPEN_EVT
Establish a BLE Mesh link event

ESP_BLE_MESH_NODE_PROV_LINK_CLOSE_EVT
Close a BLE Mesh link event

ESP_BLE_MESH_NODE_PROV_OOB_PUB_KEY_EVT
Generate Node input OOB public key event

ESP_BLE_MESH_NODE_PROV_OUTPUT_NUMBER_EVT
Generate Node Output Number event

ESP_BLE_MESH_NODE_PROV_OUTPUT_STRING_EVT
Generate Node Output String event

ESP_BLE_MESH_NODE_PROV_INPUT_EVT
Event requiring the user to input a number or string

ESP_BLE_MESH_NODE_PROV_COMPLETE_EVT
Provisioning done event

ESP_BLE_MESH_NODE_PROV_RESET_EVT
Provisioning reset event

ESP_BLE_MESH_NODE_PROV_SET_OOB_PUB_KEY_COMP_EVT
Node set oob public key completion event

ESP_BLE_MESH_NODE_PROV_INPUT_NUMBER_COMP_EVT
Node input number completion event

ESP_BLE_MESH_NODE_PROV_INPUT_STRING_COMP_EVT
Node input string completion event

ESP_BLE_MESH_NODE_PROXY_IDENTITY_ENABLE_COMP_EVT
Enable BLE Mesh Proxy Identity advertising completion event

ESP_BLE_MESH_NODE_PROXY_GATT_ENABLE_COMP_EVT
Enable BLE Mesh GATT Proxy Service completion event

ESP_BLE_MESH_NODE_PROXY_GATT_DISABLE_COMP_EVT
Disable BLE Mesh GATT Proxy Service completion event

ESP_BLE_MESH_NODE_ADD_LOCAL_NET_KEY_COMP_EVT
Node add NetKey locally completion event

ESP_BLE_MESH_NODE_ADD_LOCAL_APP_KEY_COMP_EVT
Node add AppKey locally completion event

ESP_BLE_MESH_NODE_BIND_APP_KEY_TO_MODEL_COMP_EVT
Node bind AppKey to model locally completion event

ESP_BLE_MESH_PROVISIONER_PROV_ENABLE_COMP_EVT
Provisioner enable provisioning functionality completion event

ESP_BLE_MESH_PROVISIONER_PROV_DISABLE_COMP_EVT
Provisioner disable provisioning functionality completion event
ESP_BLE_MESH_PROVISIONER_RECV_UNPROV_ADV_PKG_EVT
Provisioner receives unprovisioned device beacon event

ESP_BLE_MESH_PROVISIONER_PROV_READ_OOB_PUB_KEY_EVT
Provisioner read unprovisioned device OOB public key event

ESP_BLE_MESH_PROVISIONER_PROV_INPUT_EVT
Provisioner input value for provisioning procedure event

ESP_BLE_MESH_PROVISIONER_PROV_OUTPUT_EVT
Provisioner output value for provisioning procedure event

ESP_BLE_MESH_PROVISIONER_PROV_LINK_OPEN_EVT
Provisioner establish a BLE Mesh link event

ESP_BLE_MESH_PROVISIONER_PROV_LINK_CLOSE_EVT
Provisioner close a BLE Mesh link event

ESP_BLE_MESH_PROVISIONER_PROV_COMPLETE_EVT
Provisioner provisioning done event

ESP_BLE_MESH_PROVISIONER_ADD_UNPROV_DEV_COMP_EVT
Provisioner add a device to the list which contains devices that are waiting/going to be provisioned completion event

ESP_BLE_MESH_PROVISIONER_PROV_DEV_WITH_ADDR_COMP_EVT
Provisioner start to provision an unprovisioned device completion event

ESP_BLE_MESH_PROVISIONER_DELETE_DEV_COMP_EVT
Provisioner delete a device from the list, close provisioning link with the device completion event

ESP_BLE_MESH_PROVISIONER_SET_DEV_UUID_MATCH_COMP_EVT
Provisioner set the value to be compared with part of the unprovisioned device UUID completion event

ESP_BLE_MESH_PROVISIONER_SET_PROV_DATA_INFO_COMP_EVT
Provisioner set net_idx/flags/iv_index used for provisioning completion event

ESP_BLE_MESH_PROVISIONER_SET_STATIC_OOB_VALUE_COMP_EVT
Provisioner set static oob value used for provisioning completion event

ESP_BLE_MESH_PROVISIONER_SET_PRIMARY_ELEM_ADDR_COMP_EVT
Provisioner set unicast address of primary element completion event

ESP_BLE_MESH_PROVISIONER_PROV_READ_OOB_PUB_KEY_COMP_EVT
Provisioner read unprovisioned device OOB public key completion event

ESP_BLE_MESH_PROVISIONER_PROV_INPUT_NUMBER_COMP_EVT
Provisioner input number completion event

ESP_BLE_MESH_PROVISIONER_PROV_INPUT_STRING_COMP_EVT
Provisioner input string completion event

ESP_BLE_MESH_PROVISIONER_SET_NODE_NAME_COMP_EVT
Provisioner set node name completion event

ESP_BLE_MESH_PROVISIONER_ADD_LOCAL_APP_KEY_COMP_EVT
Provisioner add local app key completion event

ESP_BLE_MESH_PROVISIONER_UPDATE_LOCAL_APP_KEY_COMP_EVT
Provisioner update local app key completion event

ESP_BLE_MESH_PROVISIONER_BIND_APP_KEY_TO_MODEL_COMP_EVT
Provisioner bind local model with local app key completion event

ESP_BLE_MESH_PROVISIONER_ADD_LOCAL_NET_KEY_COMP_EVT
Provisioner add local network key completion event

ESP_BLE_MESH_PROVISIONER_UPDATE_LOCAL_NET_KEY_COMP_EVT
Provisioner update local network key completion event
Chapter 2. API Reference

**ESP_BLE_MESH_PROVISIONER_STORE_NODE_COMP_DATA_COMP_EVT**
Provisioner store node composition data completion event

**ESP_BLE_MESH_PROVISIONER_DELETE_NODE_WITH_UUID_COMP_EVT**
Provisioner delete node with uuid completion event

**ESP_BLE_MESH_PROVISIONER_DELETE_NODE_WITH_ADDR_COMP_EVT**
Provisioner delete node with unicast address completion event

**ESP_BLE_MESH_PROVISIONER_ENABLE_HEARTBEAT_RECV_COMP_EVT**
Provisioner start to receive heartbeat message completion event

**ESP_BLE_MESH_PROVISIONER_SET_HEARTBEAT_FILTER_TYPE_COMP_EVT**
Provisioner set the heartbeat filter type completion event

**ESP_BLE_MESH_PROVISIONER_SET_HEARTBEAT_FILTER_INFO_COMP_EVT**
Provisioner set the heartbeat filter information completion event

**ESP_BLE_MESH_PROVISIONER_RECV_HEARTBEAT_MESSAGE_EVT**
Provisioner receive heartbeat message event

**ESP_BLE_MESH_PROVISIONER_DRIECT_ERASE_SETTINGS_COMP_EVT**
Provisioner directly erase settings completion event

**ESP_BLE_MESH_PROVISIONER_OPEN_SETTINGS_WITH_INDEX_COMP_EVT**
Provisioner open settings with index completion event

**ESP_BLE_MESH_PROVISIONER_OPEN_SETTINGS_WITH_UID_COMP_EVT**
Provisioner open settings with user id completion event

**ESP_BLE_MESH_PROVISIONER_CLOSE_SETTINGS_WITH_INDEX_COMP_EVT**
Provisioner close settings with index completion event

**ESP_BLE_MESH_PROVISIONER_CLOSE_SETTINGS_WITH_UID_COMP_EVT**
Provisioner close settings with user id completion event

**ESP_BLE_MESH_PROVISIONER_DELETE_SETTINGS_WITH_INDEX_COMP_EVT**
Provisioner delete settings with index completion event

**ESP_BLE_MESH_PROVISIONER_DELETE_SETTINGS_WITH_UID_COMP_EVT**
Provisioner delete settings with user id completion event

**ESP_BLE_MESH_SET_FAST_PROV_INFO_COMP_EVT**
Set fast provisioning information (e.g. unicast address range, net_idx, etc.) completion event

**ESP_BLE_MESH_SET_FAST_PROV_ACTION_COMP_EVT**
Set fast provisioning action completion event

**ESP_BLE_MESH_HEARTBEAT_MESSAGE_RECV_EVT**
Receive Heartbeat message event

**ESP_BLE_MESH_LPN_ENABLE_COMP_EVT**
Enable Low Power Node completion event

**ESP_BLE_MESH_LPN_DISABLE_COMP_EVT**
Disable Low Power Node completion event

**ESP_BLE_MESH_LPN_POLL_COMP_EVT**
Low Power Node send Friend Poll completion event

**ESP_BLE_MESH_LPN_FRIENDSHIP_ESTABLISH_EVT**
Low Power Node establishes friendship event

**ESP_BLE_MESH_LPN_FRIENDSHIP_TERMINATE_EVT**
Low Power Node terminates friendship event

**ESP_BLE_MESH_FRIEND_FRIENDSHIP_ESTABLISH_EVT**
Friend Node establishes friendship event
ESP_BLE_MESH_FRIEND_FRIENDSHIP_TERMINATE_EVT
Friend Node terminates friendship event

ESP_BLE_MESH_PROXY_CLIENT_RECV_ADV_PKT_EVT
Proxy Client receives Network ID advertising packet event

ESP_BLE_MESH_PROXY_CLIENT_CONNECTED_EVT
Proxy Client establishes connection successfully event

ESP_BLE_MESH_PROXY_CLIENT_DISCONNECTED_EVT
Proxy Client terminates connection successfully event

ESP_BLE_MESH_PROXY_CLIENT_RECV_FILTER_STATUS_EVT
Proxy Client receives Proxy Filter Status event

ESP_BLE_MESH_PROXY_CLIENT_CONNECT_COMP_EVT
Proxy Client connect completion event

ESP_BLE_MESH_PROXY_CLIENT_DISCONNECT_COMP_EVT
Proxy Client disconnect completion event

ESP_BLE_MESH_PROXY_CLIENT_SET_FILTER_TYPE_COMP_EVT
Proxy Client set filter type completion event

ESP_BLE_MESH_PROXY_CLIENT_ADD_FILTER_ADDR_COMP_EVT
Proxy Client add filter address completion event

ESP_BLE_MESH_PROXY_CLIENT_REMOVE_FILTER_ADDR_COMP_EVT
Proxy Client remove filter address completion event

ESP_BLE_MESH_MODEL_SUBSCRIBE_GROUP_ADDR_COMP_EVT
Local model subscribes group address completion event

ESP_BLE_MESH_MODEL_UNSUBSCRIBE_GROUP_ADDR_COMP_EVT
Local model unsubscribes group address completion event

ESP_BLE_MESH_DEINIT_MESH_COMP_EVT
De-initialize BLE Mesh stack completion event

ESP_BLE_MESH_PROV_EVT_MAX

enum [anonymous]
BLE Mesh server models related definitions.
This enum value is the flag of transition timer operation
Values:

ESP_BLE_MESH_SERVER_TRANS_TIMER_START
ESP_BLE_MESH_SERVER_FLAG_MAX

enum esp_ble_mesh_server_state_type_t
This enum value is the type of server model states
Values:

ESP_BLE_MESH_GENERIC_ONOFF_STATE
ESP_BLE_MESH_GENERIC_LEVEL_STATE
ESP_BLE_MESH_GENERIC_ONPOWERUP_STATE
ESP_BLE_MESH_GENERIC_POWER_actual_STATE
ESP_BLE_MESH_LIGHT_LIGHTNESS_actual_STATE
ESP_BLE_MESH_LIGHT_LIGHTNESS_LINEAR_STATE
ESP_BLE_MESH_LIGHT_CTL_LIGHTNESS_STATE
ESP_BLE_MESH_LIGHT_CTL_TEMP_DELTA_UV_STATE
ESP_BLE_MESH_LIGHT_HSL_STATE
ESP_BLE_MESH_LIGHT_HSL_LIGHTNESS_STATE
ESP_BLE_MESH_LIGHT_HSL_HUE_STATE
ESP_BLE_MESH_LIGHT_HSL_SATURATION_STATE
ESP_BLE_MESH_LIGHT_XYL_LIGHTNESS_STATE
ESP_BLE_MESH_LIGHT_LC_LIGHT_ONOFF_STATE
ESP_BLE_MESH_SERVER_MODEL_STATE_MAX

enum esp_ble_mesh_model_cb_event_t
Values:
ESP_BLE_MESH_MODEL_OPERATION_EVT
User-defined models receive messages from peer devices (e.g. get, set, status, etc) event
ESP_BLE_MESH_MODEL_SEND_COMP_EVT
User-defined models send messages completion event
ESP_BLE_MESH_MODEL_PUBLISH_COMP_EVT
User-defined models publish messages completion event
ESP_BLE_MESH_CLIENT_MODEL_RECV_PUBLISH_MSG_EVT
User-defined client models receive publish messages event
ESP_BLE_MESH_CLIENT_MODEL_SEND_TIMEOUT_EVT
Timeout event for the user-defined client models that failed to receive response from peer server models
ESP_BLE_MESH_MODEL_PUBLISH_UPDATE_EVT
When a model is configured to publish messages periodically, this event will occur during every publish period
ESP_BLE_MESH_SERVER_MODEL_UPDATE_STATE_COMP_EVT
Server models update state value completion event
ESP_BLE_MESH_MODEL_EVT_MAX

ESP-BLE-MESH Core API Reference

This section contains ESP-BLE-MESH Core related APIs, which can be used to initialize ESP-BLE-MESH stack, provision, send/publish messages, etc.

This API reference covers six components:

- ESP-BLE-MESH Stack Initialization
- Reading of Local Data Information
- Low Power Operation (Updating)
- Send/Publish Messages, add Local AppKey, etc.
- ESP-BLE-MESH Node/Provisioner Provisioning
- ESP-BLE-MESH GATT Proxy Server

ESP-BLE-MESH Stack Initialization

Header File

- components/bt/esp_ble_mesh/api/core/include/esp_ble_mesh_common_api.h
Chapter 2. API Reference

Functions

\texttt{esp\_err\_t \textbf{esp\_ble\_mesh\_init}(esp\_ble\_mesh\_prov\_t \ast prov, esp\_ble\_mesh\_comp\_t \ast comp)}

Initialize BLE Mesh module. This API initializes provisioning capabilities and composition data information.

\textbf{Note} After calling this API, the device needs to call \texttt{esp\_ble\_mesh\_prov\_enable()} to enable provisioning functionality again.

\textbf{Return} ESP_OK on success or error code otherwise.

\textbf{Parameters}

- \[\text{[in]}\ \text{prov}:\ \text{Pointer to the device provisioning capabilities. This pointer must remain valid during}\]
- \[\text{the lifetime of the BLE Mesh device.}\]
- \[\text{[in]}\ \text{comp}:\ \text{Pointer to the device composition data information. This pointer must remain valid}\]
- \[\text{during the lifetime of the BLE Mesh device.}\]

\texttt{esp\_err\_t \textbf{esp\_ble\_mesh\_deinit}(esp\_ble\_mesh\_deinit\_param\_t \ast param)}

De-initialize BLE Mesh module.

\textbf{Note} This function shall be invoked after \texttt{esp\_ble\_mesh\_client\_model\_deinit()}.

\textbf{Return} ESP_OK on success or error code otherwise.

\textbf{Parameters}

- \[\text{[in]}\ \text{param}:\ \text{Pointer to the structure of BLE Mesh deinit parameters.}\]

Reading of Local Data Information

Header File

- \texttt{components/bt/esp\_ble\_mesh/api/core/include/esp\_ble\_mesh\_local\_data\_operation\_api.h}

Functions

\texttt{int32\_t \textbf{esp\_ble\_mesh\_get\_model\_publish\_period}(esp\_ble\_mesh\_model\_t \ast model)}

Get the model publish period, the unit is ms.

\textbf{Return} Publish period value on success, 0 or (negative) error code from \texttt{errno.h} on failure.

\textbf{Parameters}

- \[\text{[in]}\ \text{model}:\ \text{Model instance pointer.}\]

\texttt{uint16\_t \textbf{esp\_ble\_mesh\_get\_primary\_element\_address}()}\n
Get the address of the primary element.

\textbf{Return} Address of the primary element on success, or ESP\_BLE\_MESH\_ADDR\_UNASSIGNED on failure which means the device has not been provisioned.

\texttt{uint16\_t \ast \textbf{esp\_ble\_mesh\_is\_model\_subscribed\_to\_group}(esp\_ble\_mesh\_model\_t \ast model, uint16\_t group\_addr)}

Check if the model has subscribed to the given group address. Note: E.g., once a status message is received and the destination address is a group address, the model uses this API to check if it is successfully subscribed to the given group address.

\textbf{Return} Pointer to the group address within the Subscription List of the model on success, or NULL on failure which means the model has not subscribed to the given group address. Note: With the pointer to the group address returned, you can reset the group address to 0x0000 in order to unsubscribe the model from the group.

\textbf{Parameters}

- \[\text{[in]}\ \text{model}:\ \text{Pointer to the model.}\]
- \[\text{[in]}\ \text{group\_addr}:\ \text{Group address.}\]

\texttt{esp\_ble\_mesh\_elem\_t \ast \textbf{esp\_ble\_mesh\_find\_element}(uint16\_t element\_addr)}

Find the BLE Mesh element pointer via the element address.

\textbf{Return} Pointer to the element on success, or NULL on failure.

\textbf{Parameters}

- \[\text{[in]}\ \text{element\_addr}:\ \text{Element address.}\]
uint8_t esp_ble_mesh_get_element_count (void)

Get the number of elements that have been registered.

**Return** Number of elements.

esp_ble_mesh_model_t *esp_ble_mesh_find_vendor_model(const esp_ble_mesh_elem_t *element, uint16_t company_id, uint16_t model_id)

Find the Vendor specific model with the given element, the company ID and the Vendor Model ID.

**Return** Pointer to the Vendor Model on success, or NULL on failure which means the Vendor Model is not found.

**Parameters**

- [in] element: Element to which the model belongs.
- [in] company_id: A 16-bit company identifier assigned by the Bluetooth SIG.

esp_ble_mesh_model_t *esp_ble_mesh_find_sig_model(const esp_ble_mesh_elem_t *element, uint16_t model_id)

Find the SIG model with the given element and Model id.

**Return** Pointer to the SIG Model on success, or NULL on failure which means the SIG Model is not found.

**Parameters**

- [in] element: Element to which the model belongs.

const esp_ble_mesh_comp_t *esp_ble_mesh_get_composition_data (void)

Get the Composition data which has been registered.

**Return** Pointer to the Composition data on success, or NULL on failure which means the Composition data is not initialized.

esp_err_t esp_ble_mesh_model_subscribe_group_addr (uint16_t element_addr, uint16_t company_id, uint16_t model_id, uint16_t group_addr)

A local model of node or Provisioner subscribes a group address.

**Note** This function shall not be invoked before node is provisioned or Provisioner is enabled.

**Return** ESP_OK on success or error code otherwise.

**Parameters**

- [in] element_addr: Unicast address of the element to which the model belongs.
- [in] group_addr: The group address to be subscribed.

esp_err_t esp_ble_mesh_model_unsubscribe_group_addr (uint16_t element_addr, uint16_t company_id, uint16_t model_id, uint16_t group_addr)

A local model of node or Provisioner unsubscribes a group address.

**Note** This function shall not be invoked before node is provisioned or Provisioner is enabled.

**Return** ESP_OK on success or error code otherwise.

**Parameters**

- [in] element_addr: Unicast address of the element to which the model belongs.
- [in] group_addr: The subscribed group address.

const uint8_t *esp_ble_mesh_node_get_local_net_key (uint16_t net_idx)

This function is called by Node to get the local NetKey.

**Return** NetKey on success, or NULL on failure.

**Parameters**

- [in] net_idx: NetKey index.
const uint8_t *esp_ble_mesh_node_get_local_app_key(uint16_t app_idx)
This function is called by Node to get the local AppKey.

Return AppKey on success, or NULL on failure.
Parameters
• [in] app_idx: AppKey index.

esp_err_t esp_ble_mesh_node_add_local_net_key(const uint8_t net_key[16], uint16_t net_idx)
This function is called by Node to add a local NetKey.

Note This function can only be called after the device is provisioned.
Return ESP_OK on success or error code otherwise.
Parameters
• [in] net_key: NetKey to be added.
• [in] net_idx: NetKey Index.

esp_err_t esp_ble_mesh_node_add_local_app_key(const uint8_t app_key[16], uint16_t net_idx, uint16_t app_idx)
This function is called by Node to add a local AppKey.

Note The net_idx must be an existing one. This function can only be called after the device is provisioned.
Return ESP_OK on success or error code otherwise.
Parameters
• [in] app_key: AppKey to be added.
• [in] net_idx: NetKey Index.
• [in] app_idx: AppKey Index.

esp_err_t esp_ble_mesh_node_bind_app_key_to_local_model(uint16_t element_addr, uint16_t company_id, uint16_t model_id, uint16_t app_idx)
This function is called by Node to bind AppKey to model locally.

Note If going to bind app_key with local vendor model, the company_id shall be set to 0xFFFF. This function can only be called after the device is provisioned.
Return ESP_OK on success or error code otherwise.
Parameters
• [in] element_addr: Node local element address
• [in] company_id: Node local company id
• [in] model_id: Node local model id
• [in] app_idx: Node local appkey index

Low Power Operation (Updating)

Header File
• components/bt/esp_ble_mesh/api/core/include/esp_ble_mesh_low_power_api.h

Functions
esp_err_t esp_ble_mesh_lpn_enable(void)
Enable BLE Mesh device LPN functionality.

Note This API enables LPN functionality. Once called, the proper Friend Request will be sent.
Return ESP_OK on success or error code otherwise.

esp_err_t esp_ble_mesh_lpn_disable(bool force)
Disable BLE Mesh device LPN functionality.

Return ESP_OK on success or error code otherwise.
Parameters
• [in] force: when disabling LPN functionality, use this flag to indicate whether directly clear corresponding information or just send friend clear to disable it if friendship has already been established.

```c
esp_err_t esp_ble_mesh_lpn_poll(void)
```

LPN tries to poll messages from the Friend Node.

**Note** The Friend Poll message is sent by a Low Power node to ask the Friend node to send a message that it has stored for the Low Power node. Users can call this API to send Friend Poll message manually. If this API is not invoked, the bottom layer of the Low Power node will send Friend Poll before the PollTimeout timer expires. If the corresponding Friend Update is received and MD is set to 0, which means there are no messages for the Low Power node, then the Low Power node will stop scanning.

**Return** ESP_OK on success or error code otherwise.

### Send/Publish Messages, add Local AppKey, etc.

#### Header File

- components/bt/esp_ble_mesh/api/core/include/esp_ble_mesh_networking_api.h

#### Functions

```c
esp_err_t esp_ble_mesh_register_custom_model_callback(esp_ble_mesh_model_cb_t callback)
```

Register BLE Mesh callback for user-defined models’ operations. This callback can report the following events generated for the user-defined models:

- Call back the messages received by user-defined client and server models to the application layer;
- If users call esp_ble_mesh_server/client_model_send, this callback notifies the application layer of the send_complete event;
- If user-defined client model sends a message that requires response, and the response message is received after the timer expires, the response message will be reported to the application layer as published by a peer device;
- If the user-defined client model fails to receive the response message during a specified period of time, a timeout event will be reported to the application layer.

**Note** The client models (i.e. Config Client model, Health Client model, Generic Client models, Sensor Client model, Scene Client model and Lighting Client models) that have been realized internally have their specific register functions. For example, esp_ble_mesh_register_config_client_callback is the register function for Config Client Model.

**Return** ESP_OK on success or error code otherwise.

**Parameters**

- [in] callback: Pointer to the callback function.

```c
esp_err_t esp_ble_mesh_model_msg_opcode_init(uint8_t* data, uint32_t opcode)
```

Add the message opcode to the beginning of the model message before sending or publishing the model message.

**Note** This API is only used to set the opcode of the message.

**Return** ESP_OK on success or error code otherwise.

**Parameters**

- [in] data: Pointer to the message data.

```c
esp_err_t esp_ble_mesh_client_model_init(esp_ble_mesh_model_t *model)
```

Initialize the user-defined client model. All user-defined client models shall call this function to initialize the client model internal data. Node: Before calling this API, the op_pair_size and op_pair variabled within the user_data(defined using esp_ble_mesh_client_t_) of the client model need to be initialized.

**Return** ESP_OK on success or error code otherwise.

**Parameters**

- [in] model: BLE Mesh Client model to which the message belongs.
esp_err_t esp_ble_mesh_client_model_deinit(esp_ble_mesh_model_t *model)
De-initialize the user-defined client model.

Note  This function shall be invoked before esp_ble_mesh_deinit() is called.
Return  ESP_OK on success or error code otherwise.

Parameters

esp_err_t esp_ble_mesh_server_model_send_msg(esp_ble_mesh_model_t *model, esp_ble_mesh_msg_ctx_t *ctx, uint32_t opcode, uint16_t length, uint8_t *data)
Send server model messages (such as server model status messages).

Return  ESP_OK on success or error code otherwise.

Parameters
•  [in] model: BLE Mesh Server Model to which the message belongs.
•  [in] ctx: Message context, includes keys, TTL, etc.
•  [in] length: Message length (exclude the message opcode).
•  [in] data: Parameters of Access Payload (exclude the message opcode) to be sent.

esp_err_t esp_ble_mesh_client_model_send_msg(esp_ble_mesh_model_t *model, esp_ble_mesh_msg_ctx_t *ctx, uint32_t opcode, int32_t msg_timeout, bool need_rsp, esp_ble_mesh_dev_role_t device_role)
Send client model message (such as model get, set, etc).

Return  ESP_OK on success or error code otherwise.

Parameters
•  [in] model: BLE Mesh Client Model to which the message belongs.
•  [in] ctx: Message context, includes keys, TTL, etc.
•  [in] length: Message length (exclude the message opcode).
•  [in] data: Parameters of the Access Payload (exclude the message opcode) to be sent.
•  [in] msg_timeout: Time to get response to the message (in milliseconds).
•  [in] need_rsp: TRUE if the opcode requires the peer device to reply, FALSE otherwise.
•  [in] device_role: Role of the device (Node/Provisioner) that sends the message.

esp_err_t espble_mesh_model_publish(esp_ble_mesh_model_t *model, uint32_t opcode, uint16_t length, uint8_t *data, esp_ble_mesh_dev_role_t device_role)
Send a model publication message.

Note  Before calling this function, the user needs to ensure that the model publication message (esp_ble_mesh_model_pub_t::msg) contains a valid message to be sent. And if users want to update the publishing message, this API should be called in ESP_BLE_MESH_MODEL_PUBLISH_UPDATE_EVT with the message updated.

Return  ESP_OK on success or error code otherwise.

Parameters
•  [in] model: Mesh (client) Model publishing the message.
•  [in] length: Message length (exclude the message opcode).
•  [in] data: Parameters of the Access Payload (exclude the message opcode) to be sent.
•  [in] device_role: Role of the device (node/provisioner) publishing the message of the type espble_mesh_dev_role_t.

esp_err_t esp_ble_mesh_server_model_update_state(esp_ble_mesh_model_t *model, esp_ble_mesh_server_state_type_t type, esp_ble_mesh_server_state_value_t *value)
Update a server model state value. If the model publication state is set properly (e.g. publish address is set to a valid address), it will publish corresponding status message.
Chapter 2. API Reference

**Note** Currently this API is used to update bound state value, not for all server model states.

**Return** ESP_OK on success or error code otherwise.

**Parameters**
- `[in] model`: Server model which is going to update the state.
- `[in] value`: Server model state value.

```c
esp_err_t esp_ble_mesh_node_local_reset (void)
```

Reset the provisioning procedure of the local BLE Mesh node.

**Note** All provisioning information in this node will be deleted and the node needs to be reprovisioned. The API function esp_ble_mesh_node_prov_enable() needs to be called to start a new provisioning procedure.

**Return** ESP_OK on success or error code otherwise.

```c
esp_err_t esp_ble_mesh_provisioner_set_node_name (uint16_t index, const char *name)
```

This function is called to set the node (provisioned device) name.

**Note** index is obtained from the parameters of ESP_BLE_MESH_PROVISIONER_PROV_COMPLETE_EVT.

**Return** ESP_OK on success or error code otherwise.

**Parameters**
- `[in] index`: Index of the node in the node queue.
- `[in] name`: Name (end by ‘\0’) to be set for the node.

```c
const char *esp_ble_mesh_provisioner_get_node_name (uint16_t index)
```

This function is called to get the node (provisioned device) name.

**Note** index is obtained from the parameters of ESP_BLE_MESH_PROVISIONER_PROV_COMPLETE_EVT.

**Return** Node name on success, or NULL on failure.

**Parameters**
- `[in] index`: Index of the node in the node queue.

```c
uint16_t esp_ble_mesh_provisioner_get_node_index (const char *name)
```

This function is called to get the node (provisioned device) index.

**Return** Node index on success, or an invalid value (0xFFFF) on failure.

**Parameters**
- `[in] name`: Name of the node (end by ‘\0’).

```c
esp_err_t esp_ble_mesh_provisioner_store_node_comp_data (uint16_t unicast_addr, uint8_t *data, uint16_t length)
```

This function is called to store the Composition Data of the node.

**Return** ESP_OK on success or error code otherwise.

**Parameters**
- `[in] unicast_addr`: Element address of the node
- `[in] data`: Pointer of Composition Data
- `[in] length`: Length of Composition Data

```c
esp_ble_mesh_node_t *esp_ble_mesh_provisioner_get_node_with_uuid (const uint8_t uuid[16])
```

This function is called to get the provisioned node information with the node device uuid.

**Return** Pointer of the node info struct or NULL on failure.

**Parameters**
- `[in] uuid`: Device UUID of the node

```c
esp_ble_mesh_node_t *esp_ble_mesh_provisioner_get_node_with_addr (uint16_t unicast_addr)
```

This function is called to get the provisioned node information with the node unicast address.

**Return** Pointer of the node info struct or NULL on failure.

**Parameters**
- `[in] unicast_addr`: Unicast address of the node
**esp_ble_mesh_node_t** *esp_ble_mesh_provisioner_get_node_with_name (const char *name)*

This function is called to get the provisioned node information with the node name.

**Return** Pointer of the node info struct or NULL on failure.

**Parameters**
- **[in]** name: Name of the node (end by ‘\0’).

**uint16_t esp_ble_mesh_provisioner_get_prov_node_count (void)**

This function is called by Provisioner to get provisioned node count.

**Return** Number of the provisioned nodes.

**const esp_ble_mesh_node_t** **esp_ble_mesh_provisioner_get_node_table_entry (void)**

This function is called by Provisioner to get the entry of the node table.

**Note** After invoking the function to get the entry of nodes, users can use the “for” loop combined with the macro CONFIG_BLE_MESH_MAX_PROV_NODES to get each node’s information. Before trying to read the node’s information, users need to check if the node exists, i.e. if the *(*(esp_ble_mesh_node_t **)node) is NULL. For example: ``` const esp_ble_mesh_node_t **entry = esp_ble_mesh_provisioner_get_node_table_entry(); for (int i = 0; i < CONFIG_BLE_MESH_MAX_PROV_NODES; i++) { const esp_ble_mesh_node_t *node = entry[i]; if (node) { …… } } ```

**Return** Pointer to the start of the node table.

**esp_err_t esp_ble_mesh_provisioner_delete_node_with_uuid (const uint8_t uuid[16])**

This function is called to delete the provisioned node information with the node device uuid.

**Return** ESP_OK on success or error code otherwise.

**Parameters**
- **[in]** uuid: Device UUID of the node

**esp_err_t esp_ble_mesh_provisioner_delete_node_with_addr (uint16_t unicast_addr)**

This function is called to delete the provisioned node information with the node unicast address.

**Return** ESP_OK on success or error code otherwise.

**Parameters**
- **[in]** unicast_addr: Unicast address of the node

**esp_err_t esp_ble_mesh_provisioner_add_local_app_key (const uint8_t app_key[16],
 uint16_t net_idx, uint16_t app_idx)**

This function is called to add a local AppKey for Provisioner.

**Note** app_key: If set to NULL, app_key will be generated internally. net_idx: Should be an existing one. app_idx: If it is going to be generated internally, it should be set to 0xFFFF, and the new app_idx will be reported via an event.

**Return** ESP_OK on success or error code otherwise.

**Parameters**
- **[in]** app_key: The app key to be set for the local BLE Mesh stack.
- **[in]** net_idx: The network key index.
- **[in]** app_idx: The app key index.

**esp_err_t esp_ble_mesh_provisioner_update_local_app_key (const uint8_t app_key[16],
 uint16_t net_idx, uint16_t app_idx)**

This function is used to update a local AppKey for Provisioner.

**Return** ESP_OK on success or error code otherwise.

**Parameters**
- **[in]** app_key: Value of the AppKey.
- **[in]** net_idx: Corresponding NetKey Index.
- **[in]** app_idx: The AppKey Index
const uint8_t* esp_ble_mesh_provisioner_get_local_app_key(uint16_t net_idx, uint16_t app_idx)

This function is called by Provisioner to get the local app key value.

Return  App key on success, or NULL on failure.

Parameters
•  [in] app_idx: Application key index.

esp_err_t esp_ble_mesh_provisioner_bind_app_key_to_local_model(uint16_t element_addr, uint16_t app_idx, uint16_t model_id, uint16_t company_id)

This function is called by Provisioner to bind own model with proper app key.

Note  company_id: If going to bind app_key with local vendor model, company_id should be set to 0xFFFF.

Return ESP_OK on success or error code otherwise.

Parameters
•  [in] element_addr: Provisioner local element address
•  [in] app_idx: Provisioner local app key index
•  [in] model_id: Provisioner local model id
•  [in] company_id: Provisioner local company id

esp_err_t esp_ble_mesh_provisioner_add_local_net_key(const uint8_t net_key[16], uint16_t net_idx)

This function is called by Provisioner to add local network key.

Note  net_key: If set to NULL, net_key will be generated internally. net_idx: If it is going to be generated internally, it should be set to 0xFFFF, and the new net_idx will be reported via an event.

Return ESP_OK on success or error code otherwise.

Parameters
•  [in] net_key: The network key to be added to the Provisioner local BLE Mesh stack.
•  [in] net_idx: The network key index.

esp_err_t esp_ble_mesh_provisioner_update_local_net_key(const uint8_t net_key[16], uint16_t net_idx)

This function is called by Provisioner to update a local network key.

Return ESP_OK on success or error code otherwise.

Parameters
•  [in] net_key: Value of the NetKey.
•  [in] net_idx: The NetKey Index.

const uint8_t* esp_ble_mesh_provisioner_get_local_net_key(uint16_t net_idx)

This function is called by Provisioner to get the local network key value.

Return Network key on success, or NULL on failure.

Parameters

esp_err_t esp_ble_mesh_provisioner_recv_heartbeat(bool enable)

This function is called by Provisioner to enable or disable receiving heartbeat messages.

Note  If enabling receiving heartbeat message successfully, the filter will be an empty rejectlist by default, which means all heartbeat messages received by the Provisioner will be reported to the application layer.

Return ESP_OK on success or error code otherwise.

Parameters
•  [in] enable: Enable or disable receiving heartbeat messages.

esp_err_t esp_ble_mesh_provisioner_set_heartbeat_filter_type(uint8_t type)

This function is called by Provisioner to set the heartbeat filter type.
Chapter 2. API Reference

Note 1. If the filter type is not the same with the current value, then all the filter entries will be cleaned.

1. If the previous type is rejectlist, and changed to acceptlist, then the filter will be an empty acceptlist, which means no heartbeat messages will be reported. Users need to add SRC or DST into the filter entry, then heartbeat messages from the SRC or to the DST will be reported.

Return ESP_OK on success or error code otherwise.

Parameters

• [in] type: Heartbeat filter type (acceptlist or rejectlist).

esp_err_t esp_ble_mesh_provisioner_set_heartbeat_filter_info(uint8_t op, esp_ble_mesh_heartbeat_filter_info_t *info)

This function is called by Provisioner to add or remove a heartbeat filter entry.

1. If the operation is "REMOVE", the "hb_src" can be set to the SRC (can only be a unicast address) of heartbeat messages, and the "hb_dst" can be set to the DST (unicast address or group address), at least one of them needs to be set.
   • The filter entry with the same SRC or DST will be removed.

Note 1. If the operation is "ADD", the "hb_src" can be set to the SRC (can only be a unicast address) of heartbeat messages, and the "hb_dst" can be set to the DST (unicast address or group address), at least one of them needs to be set.
   • If only one of them is set, the filter entry will only use the configured SRC or DST to filter heartbeat messages.
   • If both of them are set, the SRC and DST will both be used to decide if a heartbeat message will be handled.
   • If SRC or DST already exists in some filter entry, then the corresponding entry will be cleaned firstly, then a new entry will be allocated to store the information.

Return ESP_OK on success or error code otherwise.

Parameters

• [in] op: Add or REMOVE
• [in] info: Heartbeat filter entry information, including: hb_src - Heartbeat source address; hb_dst - Heartbeat destination address;

esp_err_t esp_ble_mesh_provisioner_direct_erase_settings(void)

This function is called by Provisioner to directly erase the mesh information from nvs namespace.

Note This function can be invoked when the mesh stack is not initialized or has been de-initialized.

Return ESP_OK on success or error code otherwise.

esp_err_t esp_ble_mesh_provisioner_open_settings_with_index(uint8_t index)

This function is called by Provisioner to open a nvs namespace for storing mesh information.

Note Before open another nvs namespace, the previously opened nvs namespace must be closed firstly.

Return ESP_OK on success or error code otherwise.

Parameters

• [in] index: Settings index.

esp_err_t esp_ble_mesh_provisioner_open_settings_with_uid(const char *uid)

This function is called by Provisioner to open a nvs namespace for storing mesh information.

Note Before open another nvs namespace, the previously opened nvs namespace must be closed firstly.

Return ESP_OK on success or error code otherwise.

Parameters

• [in] uid: Settings user id.

esp_err_t esp_ble_mesh_provisioner_close_settings_with_index(uint8_t index, bool erase)

This function is called by Provisioner to close a nvs namespace which is opened previously for storing mesh information.

Note 1. Before closing the nvs namespace, it must be open.

1. When the function is invoked, the Provisioner functionality will be disabled firstly, and: a) If the "erase" flag is set to false, the mesh information will be cleaned (e.g. removing NetKey, AppKey,
nodes, etc) from the mesh stack. b) If the “erase” flag is set to true, the mesh information stored in the nvs namespace will also be erased besides been cleaned from the mesh stack.

2. If Provisioner tries to work properly again, we can invoke the open function to open a new nvs namespace or a previously added one, and restore the mesh information from it if not erased.

3. The working process shall be as following: a) Open settings A b) Start to provision and control nodes c) Close settings A d) Open settings B e) Start to provision and control other nodes f) Close settings B g) …

Return ESP_OK on success or error code otherwise.

Parameters
- [in] index: Settings index.
- [in] erase: Indicate if erasing mesh information.

`esp_err_t esp_ble_mesh_provisioner_close_settings_with_uid(const char *uid, bool erase)`

This function is called by Provisioner to close a nvs namespace which is opened previously for storing mesh information.

Note 1. Before closing the nvs namespace, it must be open.

1. When the function is invoked, the Provisioner functionality will be disabled firstly, and: a) If the “erase” flag is set to false, the mesh information will be cleaned (e.g. removing NetKey, AppKey, nodes, etc) from the mesh stack. b) If the “erase” flag is set to true, the mesh information stored in the nvs namespace will also be erased besides been cleaned from the mesh stack.

2. If Provisioner tries to work properly again, we can invoke the open function to open a new nvs namespace or a previously added one, and restore the mesh information from it if not erased.

3. The working process shall be as following: a) Open settings A b) Start to provision and control nodes c) Close settings A d) Open settings B e) Start to provision and control other nodes f) Close settings B g) …

Return ESP_OK on success or error code otherwise.

Parameters
- [in] uid: Settings user id.
- [in] erase: Indicate if erasing mesh information.

`esp_err_t esp_ble_mesh_provisioner_delete_settings_with_index(uint8_t index)`

This function is called by Provisioner to erase the mesh information and settings user id from a nvs namespace.

Note When this function is called, the nvs namespace must not be open. This function is used to erase the mesh information and settings user id which are not used currently.

Return ESP_OK on success or error code otherwise.

Parameters
- [in] index: Settings index.

`esp_err_t esp_ble_mesh_provisioner_delete_settings_with_uid(const char *uid)`

This function is called by Provisioner to erase the mesh information and settings user id from a nvs namespace.

Note When this function is called, the nvs namespace must not be open. This function is used to erase the mesh information and settings user id which are not used currently.

Return ESP_OK on success or error code otherwise.

Parameters
- [in] uid: Settings user id.

`const char *esp_ble_mesh_provisioner_get_settings_uid(uint8_t index)`

This function is called by Provisioner to get settings user id.

Return Setting user id on success or NULL on failure.

Parameters
- [in] index: Settings index.

`uint8_t esp_ble_mesh_provisioner_get_settings_index(const char *uid)`

This function is called by Provisioner to get settings index.

Return Settings index.

Parameters
- [in] uid: Settings user id.
uint8_t esp_ble_mesh_provisioner_get_free_settings_count (void)

This function is called by Provisioner to get the number of free settings user id.

Return Number of free settings user id.

const uint8_t *esp_ble_mesh_get_fast_prov_app_key (uint16_t net_idx, uint16_t app_idx)

This function is called to get fast provisioning application key.

Return Application key on success, or NULL on failure.

Parameters
  • [in] app_idx: Application key index.

Type Definitions
typedef void (*esp_ble_mesh_model_cb_t) (esp_ble_mesh_model_cb_event_t event, esp_ble_mesh_model_cb_param_t *param)

: event, event code of user-defined model events; param, parameters of user-defined model events

ESP-BLE-MESH Node/Provisioner Provisioning

Header File
  • components/bt/esp_ble_mesh/api/core/include/esp_ble_mesh_provisioning_api.h

Functions
esp_err_t esp_ble_mesh_register_prov_callback (esp_ble_mesh_prov.cb_t callback)

Register BLE Mesh provisioning callback.

Return ESP_OK on success or error code otherwise.

Parameters
  • [in] callback: Pointer to the callback function.

bool esp_ble_mesh_node_is_provisioned (void)

Check if a device has been provisioned.

Return TRUE if the device is provisioned, FALSE if the device is unprovisioned.

esp_err_t esp_ble_mesh_node_prov_enable (esp_ble_mesh_prov.bearer_t bearers)

Enable specific provisioning bearers to get the device ready for provisioning.

Note PB-ADV: send unprovisioned device beacon. PB-GATT: send connectable advertising packets.

Return ESP_OK on success or error code otherwise.

Parameters
  • bearers: Bit-wise OR of provisioning bearers.

esp_err_t esp_ble_mesh_node_prov_disable (esp_ble_mesh_prov.bearer_t bearers)

Disable specific provisioning bearers to make a device inaccessible for provisioning.

Return ESP_OK on success or error code otherwise.

Parameters
  • bearers: Bit-wise OR of provisioning bearers.

esp_err_t esp_ble_mesh_node_set_oob_pub_key (uint8_t pub_key_x[32], uint8_t pub_key_y[32], uint8_t private_key[32])

Unprovisioned device set own oob public key & private key pair.

Note In order to avoid suffering brute-forcing attack (CVE-2020-26559). The Bluetooth SIG recommends that potentially vulnerable mesh provisioners use an out-of-band mechanism to exchange the public keys. So as an unprovisioned device, it should use this function to input the Public Key exchanged through the out-of-band mechanism.

Return ESP_OK on success or error code otherwise.

Parameters
  • [in] pub_key_x: Unprovisioned device’s Public Key X
• [in] `pub_key_y`: Unprovisioned device’s Public Key Y
• [in] `private_key`: Unprovisioned device’s Private Key

```c
esp_err_t esp_ble_mesh_node_input_number(uint32_t number)
```

Provide provisioning input OOB number.

**Note** This is intended to be called if the user has received ESP_BLE_MESH_NODE_PROV_INPUT_EVT with ESP_BLE_MESH_ENTER_NUMBER as the action.

**Return** ESP_OK on success or error code otherwise.

**Parameters**

• [in] `number`: Number input by device.

```c
esp_err_t esp_ble_mesh_node_input_string(const char *string)
```

Provide provisioning input OOB string.

**Note** This is intended to be called if the user has received ESP_BLE_MESH_NODE_PROV_INPUT_EVT with ESP_BLE_MESH_ENTER_STRING as the action.

**Return** ESP_OK on success or error code otherwise.

**Parameters**

• [in] `string`: String input by device.

```c
esp_err_t esp_ble_mesh_set_unprovisioned_device_name(const char *name)
```

Using this function, an unprovisioned device can set its own device name, which will be broadcasted in its advertising data.

**Note** This API applicable to PB-GATT mode only by setting the name to the scan response data, it doesn’t apply to PB-ADV mode.

**Return** ESP_OK on success or error code otherwise.

**Parameters**

• [in] `name`: Unprovisioned device name

```c
esp_err_t esp_ble_mesh_provisioner_read_oob_pub_key(uint8_t link_idx, uint8_t pub_key_x[32], uint8_t pub_key_y[32])
```

Provisioner inputs unprovisioned device’s oob public key.

**Note** In order to avoid suffering brute-forcing attack (CVE-2020-26559). The Bluetooth SIG recommends that potentially vulnerable mesh provisioners use an out-of-band mechanism to exchange the public keys.

**Return** ESP_OK on success or error code otherwise.

**Parameters**

• [in] `link_idx`: The provisioning link index
• [in] `pub_key_x`: Unprovisioned device’s Public Key X
• [in] `pub_key_y`: Unprovisioned device’s Public Key Y

```c
esp_err_t esp_ble_mesh_provisioner_input_string(const char *string, uint8_t link_idx)
```

Provide provisioning input OOB string.

This is intended to be called after the `esp_ble_mesh_prov.t` `prov_input_num` callback has been called with ESP_BLE_MESH_ENTER_STRING as the action.

**Return** ESP_OK on success or error code otherwise.

**Parameters**

• [in] `string`: String input by Provisioner.
• [in] `link_idx`: The provisioning link index.

```c
esp_err_t esp_ble_mesh_provisioner_input_number(uint32_t number, uint8_t link_idx)
```

Provide provisioning input OOB number.

This is intended to be called after the `esp_ble_mesh_prov.t` `prov_input_num` callback has been called with ESP_BLE_MESH_ENTER_NUMBER as the action.

**Return** ESP_OK on success or error code otherwise.

**Parameters**

• [in] `number`: Number input by Provisioner.
• [in] `link_idx`: The provisioning link index.
esp_err_t esp_ble_mesh_provisioner_prov_enable(esp_ble_mesh_prov_bearer_t bearers)
Enable one or more provisioning bearers.

Note PB-ADV: Enable BLE scan. PB-GATT: Initialize corresponding BLE Mesh Proxy info.
Return ESP_OK on success or error code otherwise.
Parameters
• [in] bearers: Bit-wise OR of provisioning bearers.

esp_err_t esp_ble_mesh_provisioner_prov_disable(esp_ble_mesh_prov_bearer_t bearers)
Disable one or more provisioning bearers.

Note PB-ADV: Disable BLE scan. PB-GATT: Break any existing BLE Mesh Provisioning connections.
Return ESP_OK on success or error code otherwise.
Parameters
• [in] bearers: Bit-wise OR of provisioning bearers.

esp_err_t esp_ble_mesh_provisioner_add_unprov_dev(esp_ble_mesh_unprov_dev_add_t *add_dev,
                                           esp_ble_mesh_dev_add_flag_t flags)
Add unprovisioned device info to the unprov_dev queue.

Return ESP_OK on success or error code otherwise.
Note: 1. Currently address type only supports public address and static random address.
   1. If device UUID and/or device address as well as address type already exist in the device queue, but
      the bearer is different from the existing one, add operation will also be successful and it will update
      the provision bearer supported by the device.
   2. For example, if the Provisioner wants to add an unprovisioned device info before receiving its un-
      provisioned device beacon or Mesh Provisioning advertising packets, the Provisioner can use this
      API to add the device info with each one or both of device UUID and device address added. When
      the Provisioner gets the device’s advertising packets, it will start provisioning the device internally.
      • In this situation, the Provisioner can set bearers with each one or both of
        ESP_BLE_MESH_PROV_ADV and ESP_BLE_MESH_PROV_GATT enabled, and
        cannot set flags with ADD_DEV_START_PROV_NOW_FLAG enabled.
   3. Another example is when the Provisioner receives the unprovisioned device’s beacon or Mesh
      Provisioning advertising packets, the advertising packets will be reported on to the application layer
      using the callback registered by the function esp_ble_mesh_register_prov_callback. And in the call-
      back, the Provisioner can call this API to start provisioning the device.
      • If the Provisioner uses PB-ADV to provision, either one or both of device UUID and device
        address can be added, bearers shall be set with ESP_BLE_MESH_PROV_ADV enabled and
        the flags shall be set with ADD_DEV_START_PROV_NOW_FLAG enabled.
      • If the Provisioner uses PB-GATT to provision, both the device UUID and device address need to
        be added, bearers shall be set with ESP_BLE_MESH_PROV_GATT enabled, and the flags
        shall be set with ADD_DEV_START_PROV_NOW_FLAG enabled.
      • If the Provisioner just wants to store the unprovisioned device info when receiving its
        advertising packets and start to provision it the next time (e.g. after receiving its ad-
        vertising packets again), then it can add the device info with either one or both of de-
        vice UUID and device address included. Bearers can be set with either one or both of
        ESP_BLE_MESH_PROV_ADV and ESP_BLE_MESH_PROV_GATT enabled (recommend
        to enable the bearer which will receive its advertising packets, because if the other bearer is
        enabled, the Provisioner is not aware if the device supports the bearer), and flags cannot be set
        with ADD_DEV_START_PROV_NOW_FLAG enabled.
      • Note: ESP_BLE_MESH_PROV_ADV, ESP_BLE_MESH_PROV_GATT and
        ADD_DEV_START_PROV_NOW_FLAG can not be enabled at the same time.

Parameters
• [in] add_dev: Pointer to a struct containing the device information
• [in] flags: Flags indicate several operations on the device information
  – Remove device information from queue after device has been provisioned (BIT0)
  – Start provisioning immediately after device is added to queue (BIT1)
  – Device can be removed if device queue is full (BIT2)
esp_err_t esp_ble_mesh_provisioner_prov_device_with_addr(const uint8_t *uuid[16],
    esp_ble_mesh_bd_addr_t addr,
    esp_ble_mesh_addr_type_t addr_type,
    esp_ble_mesh_prov_bearer_t bearer, uint16_t oob_info,
    uint16_t *unicast_addr)

Provision an unprovisioned device and assign a fixed unicast address for it in advance.

Return: Zero on success or (negative) error code otherwise.

Note:
1. Currently address type only supports public address and static random address.
2.Bearer must be equal to ESP_BLE_MESH_PROV_ADV or ESP_BLE_MESH_PROV_GATT, since Provisioner will start to provision a device immediately once this function is invoked. And the input bearer must be identical with the one within the parameters of the ESP_BLE_MESH_PROVISIONER_RECV_UNPROV_ADV_PKT_EVT event.
3. If this function is used by a Provisioner to provision devices, the application should take care of the assigned unicast address and avoid overlap of the unicast addresses of different nodes.
4. Recommend to use only one of the functions “esp_ble_mesh_provisioner_add_unprov_dev” and “esp_ble_mesh_provisioner_prov_device_with_addr” by a Provisioner.

Parameters:
- [in] uuid: Device UUID of the unprovisioned device
- [in] addr: Device address of the unprovisioned device
- [in] addr_type: Device address type of the unprovisioned device
- [in] bearer: Provisioning bearer going to be used by Provisioner
- [in] oob_info: OOB info of the unprovisioned device
- [in] unicast_addr: Unicast address going to be allocated for the unprovisioned device

esp_err_t esp_ble_mesh_provisioner_delete_dev(esp_ble_mesh_device_delete_t *del_dev)

Delete device from queue, and reset current provisioning link with the device.

Note: If the device is in the queue, remove it from the queue; if the device is being provisioned, terminate the provisioning procedure. Either one of the device address or device UUID can be used as input.

Return: ESP_OK on success or error code otherwise.

Parameters:
- [in] del_dev: Pointer to a struct containing the device information.

esp_err_t esp_ble_mesh_provisioner_set_dev_uuid_match(const uint8_t *match_val,
    uint8_t match_len, uint8_t offset, bool prov_after_match)

This function is called by Provisioner to set the part of the device UUID to be compared before starting to provision.

Return: ESP_OK on success or error code otherwise.

Parameters:
- [in] match_val: Value to be compared with the part of the device UUID.
- [in] match_len: Length of the compared match value.
- [in] offset: Offset of the device UUID to be compared (based on zero).
- [in] prov_after_match: Flag used to indicate whether provisioner should start to provision the device immediately if the part of the UUID matches.

esp_err_t esp_ble_mesh_provisioner_set_prov_data_info(esp_ble_mesh_prov_data_info_t *prov_data_info)

This function is called by Provisioner to set provisioning data information before starting to provision.

Return: ESP_OK on success or error code otherwise.

Parameters:
- [in] prov_data_info: Pointer to a struct containing net_idx or flags or iv_index.

esp_err_t esp_ble_mesh_provisioner_set_static_oob_value(const uint8_t *value,
    uint8_t *length)

This function is called by Provisioner to set static oob value used for provisioning.
AuthValues selected using a cryptographically secure random or pseudorandom number generator and having the maximum permitted entropy (128-bits) will be most difficult to brute-force. AuthValues with reduced entropy or generated in a predictable manner will not grant the same level of protection against this vulnerability. Selecting a new AuthValue with each provisioning attempt can also make it more difficult to launch a brute-force attack by requiring the attacker to restart the search with each provisioning attempt (CVE-2020-26556).

**Note** The Bluetooth SIG recommends that mesh implementations enforce a randomly selected AuthValue using all of the available bits, where permitted by the implementation. A large entropy helps ensure that a brute-force of the AuthValue, even a static AuthValue, cannot normally be completed in a reasonable time (CVE-2020-26557).

**Return** ESP_OK on success or error code otherwise.

**Parameters**
- **[in]** value: Pointer to the static oob value.
- **[in]** length: Length of the static oob value.

```c
esp_err_t esp_ble_mesh_provisioner_set_primary_elem_addr(uint16_t addr)
```

This function is called by Provisioner to set own Primary element address.

**Note** This API must be invoked when BLE Mesh initialization is completed successfully, and can be invoked before Provisioner functionality is enabled. Once this API is invoked successfully, the prov_unicast_addr value in the struct esp_ble_mesh_prov_t will be ignored, and Provisioner will use this address as its own primary element address. And if the unicast address going to assigned for the next unprovisioned device is smaller than the input address + element number of Provisioner, then the address for the next unprovisioned device will be recalculated internally.

**Return** ESP_OK on success or error code otherwise.

**Parameters**
- **[in]** addr: Unicast address of the Primary element of Provisioner.

```c
esp_err_t esp_ble_mesh_set_fast_prov_info(esp_ble_mesh_fast_prov_info_t *fast_prov_info)
```

This function is called to set provisioning data information before starting fast provisioning.

**Return** ESP_OK on success or error code otherwise.

**Parameters**
- **[in]** fast_prov_info: Pointer to a struct containing unicast address range, net_idx, etc.

```c
esp_err_t esp_ble_mesh_set_fast_prov_action(esp_ble_mesh_fast_prov_action_t action)
```

This function is called to start/suspend/exit fast provisioning.

**Return** ESP_OK on success or error code otherwise.

**Parameters**
- **[in]** action: Fast provisioning action (i.e. enter, suspend, exit).

**Type Definitions**

```c
typedef void (*esp_ble_mesh_prov_cb_t)(esp_ble_mesh_prov_cb_event_t event,
                                      esp_ble_mesh_prov_cb_param_t *param)
```

Callback for Provisioner that received advertising packets from unprovisioned devices which are not in the unprovisioned device queue.

Report on the unprovisioned device beacon and mesh provisioning service adv data to application.

**Parameters**
- **[in]** addr: Pointer to the unprovisioned device address.
- **[in]** addr_type: Unprovisioned device address type.
- **[in]** adv_type: Adv packet type(ADV_IND or ADV_NONCONN_IND).
- **[in]** dev_uuid: Unprovisioned device UUID pointer.
- **[in]** oob_info: OOB information of the unprovisioned device.
• [in] bearer: Adv packet received from PB-GATT or PB-ADV bearer.

ESP-BLE-MESH GATT Proxy Server

Header File
• components/bt/esp_ble_mesh/api/core/include/esp_ble_mesh_proxy_api.h

Functions

`esp_err_t esp_ble_mesh_proxy_identity_enable (void)`
Enable advertising with Node Identity.

Note This API requires that GATT Proxy support be enabled. Once called, each subnet starts advertising using Node Identity for the next 60 seconds, and after 60s Network ID will be advertised. Under normal conditions, the BLE Mesh Proxy Node Identity and Network ID advertising will be enabled automatically by BLE Mesh stack after the device is provisioned.

Return ESP_OK on success or error code otherwise.

`esp_err_t esp_ble_mesh_proxy_gatt_enable (void)`
Enable BLE Mesh GATT Proxy Service.

Return ESP_OK on success or error code otherwise.

`esp_err_t esp_ble_mesh_proxy_gatt_disable (void)`
Disconnect the BLE Mesh GATT Proxy connection if there is any, and disable the BLE Mesh GATT Proxy Service.

Return ESP_OK on success or error code otherwise.

`esp_err_t esp_ble_mesh_proxy_client_connect (esp_ble_mesh_bd_addr_t addr, esp_ble_mesh_addr_type_t addr_type, uint16_t net_idx)`
Proxy Client creates a connection with the Proxy Server.

Return ESP_OK on success or error code otherwise.

Parameters
• [in] addr: Device address of the Proxy Server.
• [in] addr_type: Device address type (public or static random).
• [in] net_idx: NetKey Index related with Network ID in the Mesh Proxy advertising packet.

`esp_err_t esp_ble_mesh_proxy_client_disconnect (uint8_t conn_handle)`
Proxy Client terminates a connection with the Proxy Server.

Return ESP_OK on success or error code otherwise.

Parameters
• [in] conn_handle: Proxy connection handle.

`esp_err_t esp_ble_mesh_proxy_client_set_filter_type (uint8_t conn_handle, uint16_t net_idx, esp_ble_mesh_proxy_filter_type_t filter_type)`
Proxy Client sets the filter type of the Proxy Server.

Return ESP_OK on success or error code otherwise.

Parameters
• [in] conn_handle: Proxy connection handle.
• [in] net_idx: Corresponding NetKey Index.
• [in] filter_type: whitelist or blacklist.

`esp_err_t esp_ble_mesh_proxy_client_add_filter_addr (uint8_t conn_handle, uint16_t net_idx, uint16_t *addr, uint16_t addr_num)`
Proxy Client adds address to the Proxy Server filter list.
Return ESP_OK on success or error code otherwise.

Parameters
  • [in] conn_handle: Proxy connection handle.
  • [in] net_idx: Corresponding NetKey Index.
  • [in] addr: Pointer to the filter address.
  • [in] addr_num: Number of the filter address.

esp_err_t esp_ble_mesh_proxy_client_remove_filter_addr
    (uint8_t conn_handle, uint16_t net_idx, uint16_t *addr, uint16_t addr_num)

Proxy Client removes address from the Proxy Server filter list.

Return ESP_OK on success or error code otherwise.

Parameters
  • [in] conn_handle: Proxy connection handle.
  • [in] net_idx: Corresponding NetKey Index.
  • [in] addr: Pointer to the filter address.
  • [in] addr_num: Number of the filter address.

ESP-BLE-MESH Models API Reference

This section contains ESP-BLE-MESH Model related APIs, event types, event parameters, etc.

There are six categories of models:
  • Configuration Client/Server Models
  • Health Client/Server Models
  • Generic Client/Server Models
  • Sensor Client/Server Models
  • Time and Scenes Client/Server Models
  • Lighting Client/Server Models

Note: Definitions related to Server Models are being updated, and will be released soon.

Configuration Client/Server Models

Header File
  • components/bt/esp_ble_mesh/api/models/include/esp_ble_mesh_config_model_api.h

Functions
esp_err_t esp_ble_mesh_register_config_client_callback
    (esp_ble_mesh_cfg_client_cb_t callback)

Register BLE Mesh Config Client Model callback.

Return ESP_OK on success or error code otherwise.

Parameters
  • [in] callback: Pointer to the callback function.

esp_err_t esp_ble_mesh_register_config_server_callback
    (esp_ble_mesh_cfg_server_cb_t callback)

Register BLE Mesh Config Server Model callback.

Return ESP_OK on success or error code otherwise.

Parameters
  • [in] callback: Pointer to the callback function.
esp_err_t esp_ble_mesh_config_client_get_state(esp_ble_mesh_client_common_param_t *params, esp_ble_mesh_cfg_client_get_state_t *get_state)

Get the value of Config Server Model states using the Config Client Model get messages.

**Note** If you want to find the opcodes and corresponding meanings accepted by this API, please refer to esp_ble_mesh_opcode_config_client_get_t in esp_ble_mesh_defs.h

**Return** ESP_OK on success or error code otherwise.

**Parameters**

- **[in]** params: Pointer to BLE Mesh common client parameters.
- **[in]** get_state: Pointer to a union, each kind of opcode corresponds to one structure inside. Shall not be set to NULL.

esp_err_t esp_ble_mesh_config_client_set_state(esp_ble_mesh_client_common_param_t *params, esp_ble_mesh_cfg_client_set_state_t *set_state)

Set the value of the Configuration Server Model states using the Config Client Model set messages.

**Note** If you want to find the opcodes and corresponding meanings accepted by this API, please refer to esp_ble_mesh_opcode_config_client_set_t in esp_ble_mesh_defs.h

**Return** ESP_OK on success or error code otherwise.

**Parameters**

- **[in]** params: Pointer to BLE Mesh common client parameters.
- **[in]** set_state: Pointer to a union, each kind of opcode corresponds to one structure inside. Shall not be set to NULL.

Unions

union esp_ble_mesh_cfg_client_get_state_t

uint16_t model_id
The model id
```

```c
struct esp_ble_mesh_cfg_vnd_model_sub_get_t
Parameters of Config Vendor Model Subscription Get.
```
Public Members

- uint16_t element_addr
  The element address
- uint16_t model_id
  The model id
- uint16_t company_id
  The company id, if not a vendor model, shall set to 0xFFFF

struct esp_ble_mesh_cfg_app_key_get_t
Parameters of Config App Key Get.

Public Members

- uint16_t net_idx
  The network key index

struct esp_ble_mesh_cfg_node_identity_get_t
Parameters of Config Node Identity Get.

Public Members

- uint16_t net_idx
  The network key index

struct esp_ble_mesh_cfg_sig_model_app_get_t
Parameters of Config SIG Model App Get.

Public Members

- uint16_t element_addr
  The element address
- uint16_t model_id
  The model id

struct esp_ble_mesh_cfg_vnd_model_app_get_t
Parameters of Config Vendor Model App Get.

Public Members

- uint16_t element_addr
  The element address
- uint16_t model_id
  The model id
- uint16_t company_id
  The company id, if not a vendor model, shall set to 0xFFFF

struct esp_ble_mesh_cfg_kr_phase_get_t
Parameters of Config Key Refresh Phase Get.
Public Members

uint16_t net_idx
The network key index

struct esp_ble_mesh_cfg_lpn_polltimeout_get_t
Parameters of Config Low Power Node PollTimeout Get.

Public Members

uint16_t lpn_addr
The unicast address of the Low Power node

struct esp_ble_mesh_cfg_beacon_set_t
Parameters of Config Beacon Set.

Public Members

uint8_t beacon
New Secure Network Beacon state

struct esp_ble_mesh_cfg_default_ttl_set_t
Parameters of Config Default TTL Set.

Public Members

uint8_t friend_state
The friend state value

struct esp_ble_mesh_cfg_gatt_proxy_set_t
Parameters of Config GATT Proxy Set.

Public Members

uint8_t gatt_proxy
The GATT Proxy state value

struct esp_ble_mesh_cfg_relay_set_t
Parameters of Config Relay Set.

Public Members

uint8_t relay
The relay value
uint8_t relay_retransmit
The relay retransmit value

struct esp_ble_mesh_cfg_net_key_add_t
Parameters of Config NetKey Add.
Chapter 2. API Reference

Public Members

uint16_t net_idx
The network key index

uint8_t net_key[16]
The network key value

struct esp_ble_mesh_cfg_app_key_add_t
Parameters of Config AppKey Add.

Public Members

uint16_t net_idx
The network key index

uint16_t app_idx
The app key index

uint8_t app_key[16]
The app key value

struct esp_ble_mesh_cfg_model_app_bind_t
Parameters of Config Model App Bind.

Public Members

uint16_t element_addr
The element address

uint16_t model_app_idx
Index of the app key to bind with the model

uint16_t model_id
The model id

uint16_t company_id
The company id, if not a vendor model, shall set to 0xFFFF

struct esp_ble_mesh_cfg_model_pub_set_t
Parameters of Config Model Publication Set.

Public Members

uint16_t element_addr
The element address

uint16_t publish_addr
Value of the publish address

uint16_t publish_app_idx
Index of the application key

bool cred_flag
Value of the Friendship Credential Flag

uint8_t publish_ttl
Default TTL value for the publishing messages

uint8_t publish_period
Period for periodic status publishing
uint8_t *publish_retransmit
    Number of retransmissions and number of 50-millisecond steps between retransmissions

uint16_t *model_id
    The model id

uint16_t *company_id
    The company id, if not a vendor model, shall set to 0xFFFF

struct esp_ble_mesh_cfg_model_sub_add_t
    Parameters of Config Model Subscription Add.

Public Members

uint16_t *element_addr
    The element address

uint16_t *sub_addr
    The address to be added to the Subscription List

uint16_t *model_id
    The model id

uint16_t *company_id
    The company id, if not a vendor model, shall set to 0xFFFF

struct esp_ble_mesh_cfg_model_sub_delete_t
    Parameters of Config Model Subscription Delete.

Public Members

uint16_t *element_addr
    The element address

uint16_t *sub_addr
    The address to be removed from the Subscription List

uint16_t *model_id
    The model id

uint16_t *company_id
    The company id, if not a vendor model, shall set to 0xFFFF

struct esp_ble_mesh_cfg_model_sub_overwrite_t
    Parameters of Config Model Subscription Overwrite.

Public Members

uint16_t *element_addr
    The element address

uint16_t *sub_addr
    The address to be added to the Subscription List

uint16_t *model_id
    The model id

uint16_t *company_id
    The company id, if not a vendor model, shall set to 0xFFFF

struct esp_ble_mesh_cfg_model_sub_va_add_t
    Parameters of Config Model Subscription Virtual Address Add.
Public Members

`uint16_t element_addr`
The element address

`uint8_t label_uuid[16]`
The Label UUID of the virtual address to be added to the Subscription List

`uint16_t model_id`
The model id

`uint16_t company_id`
The company id, if not a vendor model, shall set to 0xFFFF

`struct esp_ble_mesh_cfg_model_sub_va_delete_t`
Parameters of Config Model Subscription Virtual Address Delete.

Public Members

`uint16_t element_addr`
The element address

`uint8_t label_uuid[16]`
The Label UUID of the virtual address to be removed from the Subscription List

`uint16_t model_id`
The model id

`uint16_t company_id`
The company id, if not a vendor model, shall set to 0xFFFF

`struct esp_ble_mesh_cfg_model_sub_va_overwrite_t`
Parameters of Config Model Subscription Virtual Address Overwrite.

Public Members

`uint16_t element_addr`
The element address

`uint8_t label_uuid[16]`
The Label UUID of the virtual address to be added to the Subscription List

`uint16_t model_id`
The model id

`uint16_t company_id`
The company id, if not a vendor model, shall set to 0xFFFF

`struct esp_ble_mesh_cfg_model_pub_va_set_t`
Parameters of Config Model Publication Virtual Address Set.

Public Members

`uint16_t element_addr`
The element address

`uint8_t label_uuid[16]`
Value of the Label UUID publish address

`uint16_t publish_app_idx`
Index of the application key
bool cred_flag
   Value of the Friendship Credential Flag

uint8_t publish_ttl
   Default TTL value for the publishing messages

uint8_t publish_period
   Period for periodic status publishing

uint8_t publish_retransmit
   Number of retransmissions and number of 50-millisecond steps between retransmissions

uint16_t model_id
   The model id

uint16_t company_id
   The company id, if not a vendor model, shall set to 0xFFFF

struct esp_ble_mesh_cfg_model_sub_delete_all_t
   Parameters of Config Model Subscription Delete All.

Public Members

uint16_t element_addr
   The element address

uint16_t model_id
   The model id

uint16_t company_id
   The company id, if not a vendor model, shall set to 0xFFFF

struct esp_ble_mesh_cfg_net_key_update_t
   Parameters of Config NetKey Update.

Public Members

uint16_t net_idx
   The network key index

uint8_t net_key[16]
   The network key value

struct esp_ble_mesh_cfg_net_key_delete_t
   Parameters of Config NetKey Delete.

Public Members

uint16_t net_idx
   The network key index

struct esp_ble_mesh_cfg_app_key_update_t
   Parameters of Config AppKey Update.

Public Members

uint16_t net_idx
   The network key index

uint16_t app_idx
   The app key index
`uint8_t app_key[16]`
The app key value

**struct esp_ble_mesh_cfg_app_key_delete_t**
Parameters of Config AppKey Delete.

**Public Members**

`uint16_t net_idx`
The network key index

`uint16_t app_idx`
The app key index

**struct esp_ble_mesh_cfg_node_identity_set_t**
Parameters of Config Node Identity Set.

**Public Members**

`uint16_t net_idx`
The network key index

`uint8_t identity`
New Node Identity state

**struct esp_ble_mesh_cfg_model_app_unbind_t**
Parameters of Config Model App Unbind.

**Public Members**

`uint16_t element_addr`
The element address

`uint16_t model_app_idx`
Index of the app key to bind with the model

`uint16_t model_id`
The model id

`uint16_t company_id`
The company id, if not a vendor model, shall set to 0xFFFF

**struct esp_ble_mesh_cfg_kr_phase_set_t**
Parameters of Config Key Refresh Phase Set.

**Public Members**

`uint16_t net_idx`
The network key index

`uint8_t transition`
New Key Refresh Phase Transition

**struct esp_ble_mesh_cfg_net_transmit_set_t**
Parameters of Config Network Transmit Set.

**Public Members**

`uint16_t net_idx`
The network key index

`uint8_t transition`
New Key Refresh Phase Transition
Public Members

uint8_t \textit{net\_transmit}  
Network Transmit State

\textbf{struct esp\_ble\_mesh\_cfg\_heartbeat\_pub\_set\_t}  
Parameters of Config Model Heartbeat Publication Set.

\textbf{Public Members}

uint16_t \textit{dst}  
Destination address for Heartbeat messages

uint8_t \textit{count}  
Number of Heartbeat messages to be sent

uint8_t \textit{period}  
Period for sending Heartbeat messages

uint8_t \textit{ttl}  
TTL to be used when sending Heartbeat messages

uint16_t \textit{feature}  
Bit field indicating features that trigger Heartbeat messages when changed

uint16_t \textit{net\_idx}  
NetKey Index

\textbf{struct esp\_ble\_mesh\_cfg\_heartbeat\_sub\_set\_t}  
Parameters of Config Model Heartbeat Subscription Set.

\textbf{Public Members}

uint16_t \textit{src}  
Source address for Heartbeat messages

uint16_t \textit{dst}  
Destination address for Heartbeat messages

uint8_t \textit{period}  
Period for receiving Heartbeat messages

\textbf{struct esp\_ble\_mesh\_cfg\_beacon\_status\_cb\_t}  
Parameter of Config Beacon Status

\textbf{Public Members}

uint8_t \textit{beacon}  
Secure Network Beacon state value

\textbf{struct esp\_ble\_mesh\_cfg\_comp\_data\_status\_cb\_t}  
Parameters of Config Composition Data Status

\textbf{Public Members}

uint8_t \textit{page}  
Page number of the Composition Data

\textbf{struct net\_buf\_simple} *\textit{composition\_data}  
Pointer to Composition Data for the identified page
struct esp_ble_mesh_cfg_default_ttl_status_cb_t
Parameter of Config Default TTL Status

Public Members

uint8_t default_ttl
Default TTL state value

struct esp_ble_mesh_cfg_gatt_proxy_status_cb_t
Parameter of Config GATT Proxy Status

Public Members

uint8_t gatt_proxy
GATT Proxy state value

struct esp_ble_mesh_cfg_relay_status_cb_t
Parameters of Config Relay Status

Public Members

uint8_t relay
Relay state value

uint8_t retransmit
Relay retransmit value (number of retransmissions and number of 10-millisecond steps between retransmissions)

struct esp_ble_mesh_cfg_model_pub_status_cb_t
Parameters of Config Model Publication Status

Public Members

uint8_t status
Status Code for the request message

uint16_t element_addr
Address of the element

uint16_t publish_addr
Value of the publish address

uint16_t app_idx
Index of the application key

bool cred_flag
Value of the Friendship Credential Flag

uint8_t ttl
Default TTL value for the outgoing messages

uint8_t period
Period for periodic status publishing

uint8_t transmit
Number of retransmissions and number of 50-millisecond steps between retransmissions

uint16_t company_id
Company ID

uint16_t model_id
Model ID
struct esp_ble_mesh_cfg_model_sub_status_cb_t
Parameters of Config Model Subscription Status

Public Members

uint8_t status
Status Code for the request message

uint16_t element_addr
Address of the element

uint16_t sub_addr
Value of the address

uint16_t company_id
Company ID

uint16_t model_id
Model ID

struct esp_ble_mesh_cfg_net_key_status_cb_t
Parameters of Config NetKey Status

Public Members

uint8_t status
Status Code for the request message

uint16_t net_idx
Index of the NetKey

struct esp_ble_mesh_cfg_app_key_status_cb_t
Parameters of Config AppKey Status

Public Members

uint8_t status
Status Code for the request message

uint16_t net_idx
Index of the NetKey

uint16_t app_idx
Index of the application key

struct esp_ble_mesh_cfg_mod_app_status_cb_t
Parameters of Config Model App Status

Public Members

uint8_t status
Status Code for the request message

uint16_t element_addr
Address of the element

uint16_t app_idx
Index of the application key

uint16_t company_id
Company ID
uint16_t model_id
Model ID

struct esp_ble_mesh_cfg_friend_status_cb_t
Parameter of Config Friend Status

Public Members

uint8_t friend_state
Friend state value

struct esp_ble_mesh_cfg_hb_pub_status_cb_t
Parameters of Config Heartbeat Publication Status

Public Members

uint8_t status
Status Code for the request message
uint16_t dst
Destination address for Heartbeat messages
uint8_t count
Number of Heartbeat messages remaining to be sent
uint8_t period
Period for sending Heartbeat messages
uint8_t ttl
TTL to be used when sending Heartbeat messages
uint16_t features
Features that trigger Heartbeat messages when changed
uint16_t net_idx
Index of the NetKey

struct esp_ble_mesh_cfg_hb_sub_status_cb_t
Parameters of Config Heartbeat Subscription Status

Public Members

uint8_t status
Status Code for the request message
uint16_t src
Source address for Heartbeat messages
uint16_t dst
Destination address for Heartbeat messages
uint8_t period
Remaining Period for processing Heartbeat messages
uint8_t count
Number of Heartbeat messages received
uint8_t min_hops
Minimum hops when receiving Heartbeat messages
uint8_t max_hops
Maximum hops when receiving Heartbeat messages
struct esp_ble_mesh_cfg_net_trans_status_cb_t
Parameters of Config Network Transmit Status

Public Members

uint8_t net_trans_count : 3
Number of transmissions for each Network PDU originating from the node

uint8_t net_trans_step : 5
Maximum hops when receiving Heartbeat messages

struct esp_ble_mesh_cfg_model_sub_list_cb_t
Parameters of Config SIG/Vendor Subscription List

Public Members

uint8_t status
Status Code for the request message

uint16_t element_addr
Address of the element

uint16_t company_id
Company ID

uint16_t model_id
Model ID

struct net_buf_simple *sub_addr
A block of all addresses from the Subscription List

struct esp_ble_mesh_cfg_net_key_list_cb_t
Parameter of Config NetKey List

Public Members

struct net_buf_simple *net_idx
A list of NetKey Indexes known to the node

struct esp_ble_mesh_cfg_app_key_list_cb_t
Parameters of Config AppKey List

Public Members

uint8_t status
Status Code for the request message

uint16_t net_idx
NetKey Index of the NetKey that the AppKeys are bound to

struct net_buf_simple *app_idx
A list of AppKey indexes that are bound to the NetKey identified by NetKeyIdx

struct esp_ble_mesh_cfg_node_id_status_cb_t
Parameters of Config Node Identity Status
### Public Members

```
uint8_t status
    Status Code for the request message
```

```
uint16_t net_idx
    Index of the NetKey
```

```
uint8_t identity
    Node Identity state
```

```c
struct esp_ble_mesh_cfg_model_app_list_cb_t
    Parameters of Config SIG/Vendor Model App List
```

### Public Members

```
uint8_t status
    Status Code for the request message
```

```
uint16_t element_addr
    Address of the element
```

```
uint16_t company_id
    Company ID
```

```
uint16_t model_id
    Model ID
```

```c
struct net_buf_simple *app_idx
    All AppKey indexes bound to the Model
```

```c
struct esp_ble_mesh_cfg_kr_phase_status_cb_t
    Parameters of Config Key Refresh Phase Status
```

### Public Members

```
uint8_t status
    Status Code for the request message
```

```
uint16_t net_idx
    Index of the NetKey
```

```
uint8_t phase
    Key Refresh Phase state
```

```c
struct esp_ble_mesh_cfg_lpn_pollto_status_cb_t
    Parameters of Config Low Power Node PollTimeout Status
```

### Public Members

```
uint16_t lpn_addr
    The unicast address of the Low Power node
```

```
int32_t poll_timeout
    The current value of the PollTimeout timer of the Low Power node
```

```c
struct esp_ble_mesh_cfg_client_cb_param_t
    Configuration Client Model callback parameters
```
**Public Members**

`int error_code`
Appropriate error code

`esp_ble_mesh_client_common_param_t *params`
The client common parameters

`esp_ble_mesh_cfg_client_common_cb_param_t status_cb`
The config status message callback values

`struct esp_ble_mesh_state_change_cfg_mod_pub_set_t`
Configuration Server model related context.

**Public Members**

`uint16_t element_addr`
Element Address

`uint16_t pub_addr`
Publish Address

`uint16_t app_idx`
AppKey Index

`bool cred_flag`
Friendship Credential Flag

`uint8_t pub_ttl`
Publish TTL

`uint8_t pub_period`
Publish Period

`uint8_t pub_retransmit`
Publish Retransmit

`uint16_t company_id`
Company ID

`uint16_t model_id`
Model ID

`struct esp_ble_mesh_state_change_cfg_model_sub_add_t`
Parameters of Config Model Subscription Add

**Public Members**

`uint16_t element_addr`
Element Address

`uint16_t sub_addr`
Subscription Address

`uint16_t company_id`
Company ID

`uint16_t model_id`
Model ID

`struct esp_ble_mesh_state_change_cfg_model_sub_delete_t`
Parameters of Config Model Subscription Delete
Chapter 2. API Reference

Public Members

uint16_t element_addr
Element Address

uint16_t sub_addr
Subscription Address

uint16_t company_id
Company ID

uint16_t model_id
Model ID

struct esp_ble_mesh_state_change_cfg_netkey_add_t
Parameters of Config NetKey Add

Public Members

uint16_t net_idx
NetKey Index

uint8_t net_key[16]
NetKey

struct esp_ble_mesh_state_change_cfg_netkey_update_t
Parameters of Config NetKey Update

Public Members

uint16_t net_idx
NetKey Index

uint8_t net_key[16]
NetKey

struct esp_ble_mesh_state_change_cfg_netkey_delete_t
Parameter of Config NetKey Delete

Public Members

uint16_t net_idx
NetKey Index

struct esp_ble_mesh_state_change_cfg_appkey_add_t
Parameters of Config AppKey Add

Public Members

uint16_t net_idx
NetKey Index

uint16_t app_idx
AppKey Index

uint8_t app_key[16]
AppKey

struct esp_ble_mesh_state_change_cfg_appkey_update_t
Parameters of Config AppKey Update
Public Members

uint16_t net_idx
NetKey Index

uint16_t app_idx
AppKey Index

uint8_t app_key[16]
AppKey

struct esp_ble_mesh_state_change_cfg_appkey_delete_t
Parameters of Config AppKey Delete

Public Members

uint16_t net_idx
NetKey Index

uint16_t app_idx
AppKey Index

struct esp_ble_mesh_state_change_cfg_model_app_bind_t
Parameters of Config Model App Bind

Public Members

uint16_t element_addr
Element Address

uint16_t app_idx
AppKey Index

uint16_t company_id
Company ID

uint16_t model_id
Model ID

struct esp_ble_mesh_state_change_cfg_model_app_unbind_t
Parameters of Config Model App Unbind

Public Members

uint16_t element_addr
Element Address

uint16_t app_idx
AppKey Index

uint16_t company_id
Company ID

uint16_t model_id
Model ID

struct esp_ble_mesh_state_change_cfg_kr_phase_set_t
Parameters of Config Key Refresh Phase Set
Public Members

uint16_t net_idx
NetKey Index

uint8_t kr_phase
New Key Refresh Phase Transition

**struct esp_ble_mesh_cfg_server_cb_param_t**
Configuration Server model callback parameters

Public Members

*esp_ble_mesh_model_t* model
Pointer to the server model structure

*esp_ble_mesh_msg_ctx_t* ctx
Context of the received message

*esp_ble_mesh_cfg_server_cb_value_t* value
Value of the received configuration messages

Macros

```c
ESP_BLE_MESH_MODEL_CFG_SRV(srv_data)
```
Define a new Config Server Model.

**Note** The Config Server Model can only be included by a Primary Element.

**Return** New Config Server Model instance.

**Parameters**

- `srv_data`: Pointer to a unique Config Server Model user_data.

```c
ESP_BLE_MESH_MODEL_CFG_CLI(cli_data)
```
Define a new Config Client Model.

**Note** The Config Client Model can only be included by a Primary Element.

**Return** New Config Client Model instance.

**Parameters**

- `cli_data`: Pointer to a unique struct `esp_ble_mesh_client_t`.

Type Definitions

```c
typedef struct esp_ble_mesh_cfg_srv esp_ble_mesh_cfg_srv_t
```
Configuration Server Model context

```c
typedef void (*esp_ble_mesh_cfg_client_cb_t)(esp_ble_mesh_cfg_client_cb_event_t event,
                                          esp_ble_mesh_cfg_client_cb_param_t *param)
```
Bluetooth Mesh Config Client and Server Model functions.

Configuration Client Model callback function type

**Parameters**

- `event`: Event type
- `param`: Pointer to callback parameter

```c
typedef void (*esp_ble_mesh_cfg_server_cb_t)(esp_ble_mesh_cfg_server_cb_event_t event,
                                           esp_ble_mesh_cfg_server_cb_param_t *param)
```
Configuration Server Model callback function type.

**Parameters**

- `event`: Event type
- `param`: Pointer to callback parameter
Enumerations

**enum esp_ble_mesh_cfg_client_cb_event_t**

This enum value is the event of Configuration Client Model

*Values:*

- ESP_BLE_MESH_CFG_CLIENT_GET_STATE_EVT
- ESP_BLE_MESH_CFG_CLIENT_SET_STATE_EVT
- ESP_BLE_MESH_CFG_CLIENT_PUBLISH_EVT
- ESP_BLE_MESH_CFG_CLIENT_TIMEOUT_EVT
- ESP_BLE_MESH_CFG_CLIENT_EVT_MAX

**enum esp_ble_mesh_cfg_server_cb_event_t**

This enum value is the event of Configuration Server model

*Values:*

- ESP_BLE_MESH_CFG_SERVER_STATE_CHANGE_EVT
- ESP_BLE_MESH_CFG_SERVER_EVT_MAX

Health Client/Server Models

Header File

*components/bt/esp_ble_mesh/api/models/include/esp_ble_mesh_health_model_api.h*

Functions

**esp_err_t esp_ble_mesh_register_health_client_callback**(esp_ble_mesh_health_client_cb_t callback)

Register BLE Mesh Health Model callback, the callback will report Health Client & Server Model events.

*Return* ESP_OK on success or error code otherwise.

*Parameters*

- [in] callback: Pointer to the callback function.

**esp_err_t esp_ble_mesh_register_health_server_callback**(esp_ble_mesh_health_server_cb_t callback)

Register BLE Mesh Health Server Model callback.

*Return* ESP_OK on success or error code otherwise.

*Parameters*

- [in] callback: Pointer to the callback function.

**esp_err_t esp_ble_mesh_health_client_get_state**(esp_ble_mesh_client_common_param_t *params, esp_ble_mesh_health_client_get_state_t *get_state)

This function is called to get the Health Server states using the Health Client Model get messages.

*Note* If you want to find the opcodes and corresponding meanings accepted by this API, please refer to esp_ble_mesh_opcode_health_client_get_t in esp_ble_mesh_defs.h

*Return* ESP_OK on success or error code otherwise.

*Parameters*

- [in] get_state: Pointer to a union, each kind of opcode corresponds to one structure inside. Shall not be set to NULL.

**esp_err_t esp_ble_mesh_health_client_set_state**(esp_ble_mesh_client_common_param_t *params, esp_ble_mesh_health_client_set_state_t *set_state)

This function is called to set the Health Server states using the Health Client Model set messages.
Note: If you want to find the opcodes and corresponding meanings accepted by this API, please refer to esp_ble_mesh_opcode_health_client_set_t in esp_ble_mesh_defs.h

Return: ESP_OK on success; error code otherwise.

Parameters:
- [in] set_state: Pointer to a union, each kind of opcode corresponds to one structure inside. Shall not be set to NULL.

Esp_err_t esp_ble_mesh_health_server_fault_update (esp_ble_mesh_elem_t *element)

This function is called by the Health Server Model to update the context of its Health Current status.

Return: ESP_OK on success; error code otherwise.

Parameters:
- [in] element: The element to which the Health Server Model belongs.

Unions:

**Union esp_ble_mesh_health_client_get_state_t**
#include <esp_ble_mesh_health_model_api.h>

For ESP_BLE_MESH_MODEL_OP_HEALTH_FAULT_GET
ESP_BLE_MESH_MODEL_OP_ATTENTION_GET
ESP_BLE_MESH_MODEL_OP_HEALTH_PERIOD_GET

the get_state parameter in the esp_ble_mesh_health_client_get_state function should not be set to NULL.

Public Members:

esp_ble_mesh_health_fault_get_t fault_get
For ESP_BLE_MESH_MODEL_OP_HEALTH_FAULT_GET.

union esp_ble_mesh_health_client_set_state_t
#include <esp_ble_mesh_health_model_api.h>

For ESP_BLE_MESH_MODEL_OP_HEALTH_FAULT_CLEAR
ESP_BLE_MESH_MODEL_OP_HEALTH_FAULT_TEST
ESP_BLE_MESH_MODEL_OP_HEALTH_FAULT_CLEAR_UNACK
ESP_BLE_MESH_MODEL_OP_HEALTH_FAULT_TEST_UNACK
ESP_BLE_MESH_MODEL_OP_HEALTH_PERIOD

Structures

struct esp_ble_mesh_health_srv_cb_t
ESP BLE Mesh Health Server callback

Public Members

esp_ble_mesh_cb_t fault_clear
Clear health registered faults. Initialized by the stack.

esp_ble_mesh_cb_t fault_test
Run a specific health test. Initialized by the stack.

esp_ble_mesh_cb_t attention_on
Health attention on callback. Initialized by the stack.

esp_ble_mesh_cb_t attention_off
Health attention off callback. Initialized by the stack.

struct esp_ble_mesh_health_test_t
ESP BLE Mesh Health Server test Context

Public Members

uint8_t id_count
Number of Health self-test ID

const uint8_t *test_ids
Array of Health self-test IDs

uint16_t company_id
Company ID used to identify the Health Fault state

uint8_t prev_test_id
Current test ID of the health fault test
```
uint8_t current_faults[ESP_BLE_MESH_HEALTH_FAULT_ARRAY_SIZE]
Array of current faults

uint8_t registered_faults[ESP_BLE_MESH_HEALTH_FAULT_ARRAY_SIZE]
Array of registered faults

struct esp_ble_mesh_health_srv_t
ESP BLE Mesh Health Server Model Context

Public Members

esp_ble_mesh_model_t *model
Pointer to Health Server Model

esp_ble_mesh_health_srv_cb_t health_cb
Health callback struct

struct k_delayed_work attention_timer
Attention Timer state

bool attention_timer_start
Attention Timer start flag

esp_ble_mesh_health_test_t health_test
Health Server fault test

struct esp_ble_mesh_health_fault_get_t
Parameter of Health Fault Get

Public Members

uint16_t company_id
Bluetooth assigned 16-bit Company ID

struct esp_ble_mesh_health_attention_set_t
Parameter of Health Attention Set

Public Members

uint8_t attention
Value of the Attention Timer state

struct esp_ble_mesh_health_period_set_t
Parameter of Health Period Set

Public Members

uint8_t fast_period_divisor
Divider for the Publish Period

struct esp_ble_mesh_health_fault_test_t
Parameter of Health Fault Test

Public Members

uint16_t company_id
Bluetooth assigned 16-bit Company ID

uint8_t test_id
ID of a specific test to be performed
struct esp_ble_mesh_health_fault_clear_t
  Parameter of Health Fault Clear

Public Members

uint16_t company_id
  Bluetooth assigned 16-bit Company ID

struct esp_ble_mesh_health_current_status_cb_t
  Parameters of Health Current Status

Public Members

uint8_t test_id
  ID of a most recently performed test

uint16_t company_id
  Bluetooth assigned 16-bit Company ID

struct net_buf_simple *fault_array
  FaultArray field contains a sequence of 1-octet fault values

struct esp_ble_mesh_health_fault_status_cb_t
  Parameters of Health Fault Status

Public Members

uint8_t test_id
  ID of a most recently performed test

uint16_t company_id
  Bluetooth assigned 16-bit Company ID

struct net_buf_simple *fault_array
  FaultArray field contains a sequence of 1-octet fault values

struct esp_ble_mesh_health_period_status_cb_t
  Parameter of Health Period Status

Public Members

uint8_t fast_period_divisor
  Divider for the Publish Period

struct esp_ble_mesh_health_attention_status_cb_t
  Parameter of Health Attention Status

Public Members

uint8_t attention
  Value of the Attention Timer state

struct esp_ble_mesh_health_client_cb_param_t
  Health Client Model callback parameters
Public Members

int error_code
    Appropriate error code

esp_ble_mesh_client_common_param_t *params
    The client common parameters.

esp_ble_mesh_health_client_common_cb_param_t status_cb
    The health message status callback values

struct esp_ble_mesh_health_fault_update_comp_cb_t
    Parameter of publishing Health Current Status completion event

Public Members

int error_code
    The result of publishing Health Current Status

esp_ble_mesh_elem_t *element
    Pointer to the element which contains the Health Server Model

struct esp_ble_mesh_health_fault_clear_cb_t
    Parameters of Health Fault Clear event

Public Members

esp_ble_mesh_model_t *model
    Pointer to the Health Server Model

uint16_t company_id
    Bluetooth assigned 16-bit Company ID

struct esp_ble_mesh_health_fault_test_cb_t
    Parameters of Health Fault Test event

Public Members

esp_ble_mesh_model_t *model
    Pointer to the Health Server Model

uint8_t test_id
    ID of a specific test to be performed

uint16_t company_id
    Bluetooth assigned 16-bit Company ID

struct esp_ble_mesh_health_attention_on_cb_t
    Parameter of Health Attention On event

Public Members

esp_ble_mesh_model_t *model
    Pointer to the Health Server Model

uint8_t time
    Duration of attention timer on (in seconds)

struct esp_ble_mesh_health_attention_off_cb_t
    Parameter of Health Attention Off event
Public Members

\texttt{esp\_ble\_mesh\_model\_t *model}

Pointer to the Health Server Model

Macros

\textbf{ESP\_BLE\_MESH\_MODEL\_HEALTH\_SRV (srv, pub)}

Define a new Health Server Model.

\textbf{Note} The Health Server Model can only be included by a Primary Element.

\textbf{Return} New Health Server Model instance.

\textbf{Parameters}

\begin{itemize}
  \item \texttt{srv}: Pointer to the unique struct \texttt{esp\_ble\_mesh\_health\_srv\_t}.
  \item \texttt{pub}: Pointer to the unique struct \texttt{esp\_ble\_mesh\_model\_pub\_t}.
\end{itemize}

\textbf{ESP\_BLE\_MESH\_MODEL\_HEALTH\_CLI (cli\_data)}

Define a new Health Client Model.

\textbf{Note} This API needs to be called for each element on which the application needs to have a Health Client Model.

\textbf{Return} New Health Client Model instance.

\textbf{Parameters}

\begin{itemize}
  \item \texttt{cli\_data}: Pointer to the unique struct \texttt{esp\_ble\_mesh\_client\_t}.
\end{itemize}

\textbf{ESP\_BLE\_MESH\_HEALTH\_PUB\_DEFINE (_name, _max, _role)}

A helper to define a health publication context

\textbf{Parameters}

\begin{itemize}
  \item \texttt{_name}: Name given to the publication context variable.
  \item \texttt{_max}: Maximum number of faults the element can have.
  \item \texttt{_role}: Role of the device which contains the model.
\end{itemize}

\textbf{ESP\_BLE\_MESH\_HEALTH\_STANDARD\_TEST}

SIG identifier of Health Fault Test. 0x01 ~ 0xFF: Vendor Specific Test.

\textbf{ESP\_BLE\_MESH\_NO\_FAULT}

Fault values of Health Fault Test. 0x33 ~ 0x7F: Reserved for Future Use. 0x80 ~ 0xFF: Vendor Specific Warning/Error.

\textbf{ESP\_BLE\_MESH\_BATTERY\_LOW\_WARNING}

\textbf{ESP\_BLE\_MESH\_BATTERY\_LOW\_ERROR}

\textbf{ESP\_BLE\_MESH\_SUPPLY\_VOLTAGE\_TOO\_LOW\_WARNING}

Type Definitions

typedef void (*esp_ble_mesh_health_client_cb_t)(esp_ble_mesh_health_client_cb_event_t event, esp_ble_mesh_health_client_cb_param_t *param)

Bluetooth Mesh Health Client and Server Model function.

Health Client Model callback function type

Parameters
  • event: Event type
  • param: Pointer to callback parameter

typedef void (*esp_ble_mesh_health_server_cb_t)(esp_ble_mesh_health_server_cb_event_t event, esp_ble_mesh_health_server_cb_param_t *param)

Health Server Model callback function type.

Parameters
  • event: Event type
  • param: Pointer to callback parameter

Enumerations

typedef enum esp_ble_mesh_health_client_cb_event_t

This enum value is the event of Health Client Model

Values:

- ESP_BLE_MESH_HEALTH_CLIENT_GET_STATE_EVT
- ESP_BLE_MESH_HEALTH_CLIENT_SET_STATE_EVT
- ESP_BLE_MESH_HEALTH_CLIENT_PUBLISH_EVT
- ESP_BLE_MESH_HEALTH_CLIENT_TIMEOUT_EVT
- ESP_BLE_MESH_HEALTH_CLIENT_EVT_MAX

typedef enum esp_ble_mesh_health_server_cb_event_t

This enum value is the event of Health Server Model

Values:

- ESP_BLE_MESH_HEALTH_SERVER_FAULT_UPDATE_COMP_EVT
- ESP_BLE_MESH_HEALTH_SERVER_FAULT_CLEAR_EVT
- ESP_BLE_MESH_HEALTH_SERVER_FAULT_TEST_EVT
- ESP_BLE_MESH_HEALTH_SERVER_ATTENTION_ON_EVT
- ESP_BLE_MESH_HEALTH_SERVER_ATTENTION_OFF_EVT
- ESP_BLE_MESH_HEALTH_SERVER_EVT_MAX

Generic Client/Server Models

Header File

- components/bt/esp_ble_mesh/api/models/include/esp_ble_mesh_generic_model_api.h

Functions

esp_err_t esp_ble_mesh_register_generic_client_callback(esp_ble_mesh_generic_client_cb_t callback)

Register BLE Mesh Generic Client Model callback.

Return

ESP_OK on success or error code otherwise.

Parameters
• [in] callback: Pointer to the callback function.

```c
esp_err_t esp_ble_mesh_generic_client_get_state(esp_ble_mesh_client_common_param_t *params,
                                              esp_ble_mesh_generic_client_get_state_t *get_state)
```

Get the value of Generic Server Model states using the Generic Client Model get messages.

**Note** If you want to find the opcodes and corresponding meanings accepted by this API, please refer to `esp_ble_mesh_generic_message_opcode_t` in `esp_ble_mesh_defs.h`

**Return** ESP_OK on success or error code otherwise.

**Parameters**

- [in] get_state: Pointer to generic get message value. Shall not be set to NULL.

```c
esp_err_t esp_ble_mesh_generic_client_set_state(esp_ble_mesh_client_common_param_t *params,
                                               esp_ble_mesh_generic_client_set_state_t *set_state)
```

Set the value of Generic Server Model states using the Generic Client Model set messages.

**Note** If you want to find the opcodes and corresponding meanings accepted by this API, please refer to `esp_ble_mesh_generic_message_opcode_t` in `esp_ble_mesh_defs.h`

**Return** ESP_OK on success or error code otherwise.

**Parameters**

- [in] set_state: Pointer to generic set message value. Shall not be set to NULL.

```c
esp_err_t esp_ble_mesh_register_generic_server_callback(esp_ble_mesh_generic_server_cb_t callback)
```

Register BLE Mesh Generic Server Model callback.

**Return** ESP_OK on success or error code otherwise.

**Parameters**

- [in] callback: Pointer to the callback function.

Unions

```c
union esp_ble_mesh_generic_client_get_state_t
#include <esp_ble_mesh_generic_model_api.h> Generic Client Model get message union.
```

```c
union esp_ble_mesh_generic_server_cb_value_t
    #include <esp_ble_mesh_generic_model_api.h> Generic Server Model callback value union.
```

### Public Members

```c
esp_ble_mesh_generic_server_state_change_t
    ESP_BLE_MESH_GENERIC_SERVER_STATE_CHANGE_EVT

esp_ble_mesh_generic_server_recv_get_msg_t
    ESP_BLE_MESH_GENERIC_SERVER_RECV_GET_MSG_EVT

esp_ble_mesh_generic_server_recv_set_msg_t
    ESP_BLE_MESH_GENERIC_SERVER_RECV_SET_MSG_EVT
```

### Structures

```c
struct esp_ble_mesh_gen_onoff_set_t
    Bluetooth Mesh Generic Client Model Get and Set parameters structure.
```

#### Public Members

- `bool op_en`
  - Indicate if optional parameters are included

- `uint8_t onoff`
  - Target value of Generic OnOff state

- `uint8_t tid`
  - Transaction ID

- `uint8_t trans_time`
  - Time to complete state transition (optional)

- `uint8_t delay`
  - Indicate message execution delay (C.1)

```c
struct esp_ble_mesh_gen_level_set_t
    Parameters of Generic Level Set.
```

#### Public Members

- `bool op_en`
  - Indicate if optional parameters are included
Chapter 2. API Reference

```c
int16_t level
    Target value of Generic Level state

uint8_t tid
    Transaction ID

uint8_t trans_time
    Time to complete state transition (optional)

uint8_t delay
    Indicate message execution delay (C.1)
```

**struct esp_ble_mesh_gen_delta_set_t**
Parameters of Generic Delta Set.

**Public Members**

```c
bool op_en
    Indicate if optional parameters are included

int32_t level
    Delta change of Generic Level state

uint8_t tid
    Transaction ID

uint8_t trans_time
    Time to complete state transition (optional)

uint8_t delay
    Indicate message execution delay (C.1)
```

**struct esp_ble_mesh_gen_move_set_t**
Parameters of Generic Move Set.

**Public Members**

```c
bool op_en
    Indicate if optional parameters are included

int16_t delta_level
    Delta Level step to calculate Move speed for Generic Level state

uint8_t tid
    Transaction ID

uint8_t trans_time
    Time to complete state transition (optional)

uint8_t delay
    Indicate message execution delay (C.1)
```

**struct esp_ble_mesh_gen_def_trans_time_set_t**
Parameter of Generic Default Transition Time Set.

**Public Members**

```c
uint8_t trans_time
    The value of the Generic Default Transition Time state
```

**struct esp_ble_mesh_gen_onpowerup_set_t**
Parameter of Generic OnPowerUp Set.
Public Members

uint8_t onpowerup
The value of the Generic OnPowerUp state

struct esp_ble_mesh_gen_power_level_set_t
Parameters of Generic Power Level Set.

Public Members

bool op_en
Indicate if optional parameters are included

uint16_t power
Target value of Generic Power Actual state

uint8_t tid
Transaction ID

uint8_t trans_time
Time to complete state transition (optional)

uint8_t delay
Indicate message execution delay (C.1)

struct esp_ble_mesh_gen_power_default_set_t
Parameter of Generic Power Default Set.

Public Members

uint16_t power
The value of the Generic Power Default state

struct esp_ble_mesh_gen_power_range_set_t
Parameters of Generic Power Range Set.

Public Members

uint16_t range_min
Value of Range Min field of Generic Power Range state

uint16_t range_max
Value of Range Max field of Generic Power Range state

struct esp_ble_mesh_gen_loc_global_set_t
Parameters of Generic Location Global Set.

Public Members

int32_t global_latitude
Global Coordinates (Latitude)

int32_t global_longitude
Global Coordinates (Longitude)

int16_t global_altitude
Global Altitude

struct esp_ble_mesh_gen_loc_local_set_t
Parameters of Generic Location Local Set.
Public Members

`int16_t local_north`  
Local Coordinates (North)

`int16_t local_east`  
Local Coordinates (East)

`int16_t local_altitude`  
Local Altitude

`uint8_t floor_number`  
Floor Number

`uint16_t uncertainty`  
Uncertainty

```
struct esp_ble_mesh_gen_user_property_get_t
```
Parameter of Generic User Property Get.

Public Members

`uint16_t property_id`  
Property ID identifying a Generic User Property

```
struct esp_ble_mesh_gen_user_property_set_t
```
Parameters of Generic User Property Set.

Public Members

`uint16_t property_id`  
Property ID identifying a Generic User Property

```
struct net_buf_simple *property_value
```
Raw value for the User Property

```
struct esp_ble_mesh_gen_admin_property_get_t
```
Parameter of Generic Admin Property Get.

Public Members

`uint16_t property_id`  
Property ID identifying a Generic Admin Property

```
struct esp_ble_mesh_gen_admin_property_set_t
```
Parameters of Generic Admin Property Set.

Public Members

`uint16_t property_id`  
Property ID identifying a Generic Admin Property

`uint8_t user_access`  
Enumeration indicating user access

```
struct net_buf_simple *property_value
```
Raw value for the Admin Property

```
struct esp_ble_mesh_gen_manufacturer_property_get_t
```
Parameter of Generic Manufacturer Property Get.
Public Members

`uint16_t property_id`
- Property ID identifying a Generic Manufacturer Property

`struct esp_ble_mesh_gen_manufacturer_property_set_t`
- Parameters of Generic Manufacturer Property Set.

Public Members

`uint16_t property_id`
- Property ID identifying a Generic Manufacturer Property

`uint8_t user_access`
- Enumeration indicating user access

`struct esp_ble_mesh_gen_client_properties_get_t`
- Parameter of Generic Client Properties Get.

Public Members

`uint16_t property_id`
- A starting Client Property ID present within an element

`struct esp_ble_mesh_gen_onoff_status_cb_t`
- Bluetooth Mesh Generic Client Model Get and Set callback parameters structure.
- Parameters of Generic OnOff Status.

Public Members

`bool op_en`
- Indicate if optional parameters are included

`uint8_t present_onoff`
- Current value of Generic OnOff state

`uint8_t target_onoff`
- Target value of Generic OnOff state (optional)

`uint8_t remain_time`
- Time to complete state transition (C.1)

`struct esp_ble_mesh_gen_level_status_cb_t`
- Parameters of Generic Level Status.

Public Members

`bool op_en`
- Indicate if optional parameters are included

`int16_t present_level`
- Current value of Generic Level state

`int16_t target_level`
- Target value of the Generic Level state (optional)

`uint8_t remain_time`
- Time to complete state transition (C.1)

`struct esp_ble_mesh_gen_def_trans_time_status_cb_t`
- Parameter of Generic Default Transition Time Status.
Public Members

uint8_t trans_time
The value of the Generic Default Transition Time state

struct esp_ble_mesh_gen_onpowerup_status_cb_t

Public Members

uint8_t onpowerup
The value of the Generic OnPowerUp state

struct esp_ble_mesh_gen_power_level_status_cb_t
Parameters of Generic Power Level Status.

Public Members

bool op_en
Indicate if optional parameters are included

uint16_t present_power
Current value of Generic Power Actual state

uint16_t target_power
Target value of Generic Power Actual state (optional)

uint8_t remain_time
Time to complete state transition (C.1)

struct esp_ble_mesh_gen_power_last_status_cb_t
Parameter of Generic Power Last Status.

Public Members

uint16_t power
The value of the Generic Power Last state

struct esp_ble_mesh_gen_power_default_status_cb_t
Parameter of Generic Power Default Status.

Public Members

uint16_t power
The value of the Generic Default Last state

struct esp_ble_mesh_gen_power_range_status_cb_t
Parameters of Generic Power Range Status.

Public Members

uint8_t status_code
StatusCode for the request message

uint16_t range_min
Value of Range Min field of Generic Power Range state

uint16_t range_max
Value of Range Max field of Generic Power Range state
struct esp_ble_mesh_gen_battery_status_cb_t
Parameters of Generic Battery Status.

Public Members

uint32_t battery_level: 8
Value of Generic Battery Level state

uint32_t time_to_discharge: 24
Value of Generic Battery Time to Discharge state

uint32_t time_to_charge: 24
Value of Generic Battery Time to Charge state

uint32_t flags: 8
Value of Generic Battery Flags state

struct esp_ble_mesh_gen_loc_global_status_cb_t
Parameters of Generic Location Global Status.

Public Members

int32_t global_latitude
Global Coordinates (Latitude)

int32_t global_longitude
Global Coordinates (Longitude)

int16_t global_altitude
Global Altitude

struct esp_ble_mesh_gen_loc_local_status_cb_t
Parameters of Generic Location Local Status.

Public Members

int16_t local_north
Local Coordinates (North)

int16_t local_east
Local Coordinates (East)

int16_t local_altitude
Local Altitude

uint8_t floor_number
Floor Number

uint16_t uncertainty
Uncertainty

struct esp_ble_mesh_gen_user_properties_status_cb_t
Parameter of Generic User Properties Status.

Public Members

struct net_buf_simple *property_ids
Buffer contains a sequence of N User Property IDs

struct esp_ble_mesh_gen_user_property_status_cb_t
Parameters of Generic User Property Status.
Public Members

bool op_en
Indicate if optional parameters are included

uint16_t property_id
Property ID identifying a Generic User Property

uint8_t user_access
Enumeration indicating user access (optional)

struct net_buf_simple *property_value
Raw value for the User Property (C.1)

struct esp_ble_mesh_gen_admin_properties_status_cb_t
Parameter of Generic Admin Properties Status.

Public Members

struct net_buf_simple *property_ids
Buffer contains a sequence of N Admin Property IDs

struct esp_ble_mesh_gen_admin_property_status_cb_t
Parameters of Generic Admin Property Status.

Public Members

bool op_en
Indicate if optional parameters are included

uint16_t property_id
Property ID identifying a Generic Admin Property

uint8_t user_access
Enumeration indicating user access (optional)

struct net_buf_simple *property_value
Raw value for the Admin Property (C.1)

struct esp_ble_mesh_gen_manufacturer_properties_status_cb_t
Parameter of Generic Manufacturer Properties Status.

Public Members

struct net_buf_simple *property_ids
Buffer contains a sequence of N Manufacturer Property IDs

struct esp_ble_mesh_gen_manufacturer_property_status_cb_t
Parameters of Generic Manufacturer Property Status.

Public Members

bool op_en
Indicate if optional parameters are included

uint16_t property_id
Property ID identifying a Generic Manufacturer Property

uint8_t user_access
Enumeration indicating user access (optional)
struct net_buf_simple *property_value
    Raw value for the Manufacturer Property (C.1)

struct esp_ble_mesh_gen_client_properties_status_cb_t
    Parameter of Generic Client Properties Status.

Public Members

struct net_buf_simple *property_ids
    Buffer contains a sequence of N Client Property IDs

struct esp_ble_mesh_generic_client_cb_param_t
    Generic Client Model callback parameters

Public Members

int error_code
    Appropriate error code

esp_ble_mesh_client_common_param_t *params
    The client common parameters.

esp_ble_mesh_gen_client_status_cb_t status_cb
    The generic status message callback values

struct esp_ble_mesh_gen_onoff_state_t
    Parameters of Generic OnOff state

Public Members

uint8_t onoff
    The present value of the Generic OnOff state

uint8_t target_onoff
    The target value of the Generic OnOff state

struct esp_ble_mesh_gen_onoff_srv_t
    User data of Generic OnOff Server Model

Public Members

esp_ble_mesh_model_t *model
    Pointer to the Generic OnOff Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t rsp_ctrl
    Response control of the server model received messages

esp_ble_mesh_gen_onoff_state_t state
    Parameters of the Generic OnOff state

esp_ble_mesh_last_msg_info_t last
    Parameters of the last received set message

esp_ble_mesh_state_transition_t transition
    Parameters of state transition

struct esp_ble_mesh_gen_level_state_t
    Parameters of Generic Level state
Chapter 2. API Reference

Public Members

int16_t level
The present value of the Generic Level state

int16_t target_level
The target value of the Generic Level state

int16_t last_level
When a new transaction starts, level should be set to last_last, and use “level + incoming delta” to calculate the target level. In another word, “last_level” is used to record “level” of the last transaction, and “last_delta” is used to record the previously received delta_level value. The last value of the Generic Level state

int32_t last_delta
The last delta change of the Generic Level state

bool move_start
Indicate if the transition of the Generic Level state has been started

bool positive
Indicate if the transition is positive or negative

struct esp_ble_mesh_gen_level_srv_t
User data of Generic Level Server Model

Public Members

esp_ble_mesh_model_t *model
Pointer to the Generic Level Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl
Response control of the server model received messages

esp_ble_mesh_gen_level_state_t *state
Parameters of the Generic Level state

esp_ble_mesh_last_msg_info_t last
Parameters of the last received set message

esp_ble_mesh_state_transition_t *transition
Parameters of state transition

int32_t tt_delta_level
Delta change value of level state transition

struct esp_ble_mesh_gen_def_trans_time_state_t
Parameter of Generic Default Transition Time state

Public Members

uint8_t trans_time
The value of the Generic Default Transition Time state

struct esp_ble_mesh_gen_def_trans_time_srv_t
User data of Generic Default Transition Time Server Model

Public Members

esp_ble_mesh_model_t *model
Pointer to the Generic Default Transition Time Server Model. Initialized internally.
**Public Members**

- `uint8_t onpowerup`
  The value of the Generic OnPowerUp state

**Public Members**

- `esp_ble_mesh_gen_power_level_state_t` Public Members
  - `uint16_t power_actual`
    The present value of the Generic Power Actual state
  - `uint16_t target_power_actual`
    The target value of the Generic Power Actual state
  - `uint16_t power_last`
    The value of the Generic Power Last state
  - `uint16_t power_default`
    The value of the Generic Power Default state
  - `uint8_t status_code`
    The status code of setting Generic Power Range state
uint16_t power_range_min
    The minimum value of the Generic Power Range state

uint16_t power_range_max
    The maximum value of the Generic Power Range state

struct esp_ble_mesh_gen_power_level_srv_t
    User data of Generic Power Level Server Model

Public Members

    esp_ble_mesh_model_t *model
        Pointer to the Generic Power Level Server Model. Initialized internally.

    esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl
        Response control of the server model received messages

    esp_ble_mesh_gen_power_level_state_t *state
        Parameters of the Generic Power Level state

    esp_ble_mesh_last_msg_info_t last
        Parameters of the last received set message

    esp_ble_mesh_state_transition_t *transition
        Parameters of state transition

    int32_t tt_delta_level
        Delta change value of level state transition

struct esp_ble_mesh_gen_power_level_setup_srv_t
    User data of Generic Power Level Setup Server Model

Public Members

    esp_ble_mesh_model_t *model
        Pointer to the Generic Power Level Setup Server Model. Initialized internally.

    esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl
        Response control of the server model received messages

    esp_ble_mesh_gen_power_level_state_t *state
        Parameters of the Generic Power Level state

struct esp_ble_mesh_gen_battery_srv_t
    User data of Generic Battery Server Model

Public Members

    uint32_t battery_level : 8
        The value of the Generic Battery Level state

    uint32_t time_to_discharge : 24
        The value of the Generic Battery Time to Discharge state

    uint32_t time_to_charge : 24
        The value of the Generic Battery Time to Charge state

    uint32_t battery_flags : 8
        The value of the Generic Battery Flags state

struct esp_ble_mesh_gen_battery_srv_t
    User data of Generic Battery Server Model
Public Members

`esp_ble_mesh_model_t *model`
    Pointer to the Generic Battery Server Model. Initialized internally.

`esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl`
    Response control of the server model received messages

`esp_ble_mesh_gen_battery_state_t *state`
    Parameters of the Generic Battery state

`struct esp_ble_mesh_gen_location_state_t`
    Parameters of Generic Location state

Public Members

`int32_t global_latitude`
    The value of the Global Latitude field

`int32_t global_longitude`
    The value of the Global Longitude field

`int16_t global_altitude`
    The value of the Global Altitude field

`int16_t local_north`
    The value of the Local North field

`int16_t local_east`
    The value of the Local East field

`int16_t local_altitude`
    The value of the Local Altitude field

`uint8_t floor_number`
    The value of the Floor Number field

`uint16_t uncertainty`
    The value of the Uncertainty field

`struct esp_ble_mesh_gen_location_srv_t`
    User data of Generic Location Server Model

Public Members

`esp_ble_mesh_model_t *model`
    Pointer to the Generic Location Server Model. Initialized internally.

`esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl`
    Response control of the server model received messages

`esp_ble_mesh_gen_location_state_t *state`
    Parameters of the Generic Location state

`struct esp_ble_mesh_gen_location_setup_srv_t`
    User data of Generic Location Setup Server Model

Public Members

`esp_ble_mesh_model_t *model`
    Pointer to the Generic Location Setup Server Model. Initialized internally.
**esp_ble_mesh_server_rsp_ctrl_t**

Response control of the server model received messages

**esp_ble_mesh_gen_location_state_t**

Parameters of the Generic Location state

**struct esp_ble_mesh_generic_property_t**

Parameters of Generic Property states

### Public Members

- **uint16_t id**
  - The value of User/Admin/Manufacturer Property ID

- **uint8_t user_access**
  - The value of User Access field

- **uint8_t admin_access**
  - The value of Admin Access field

- **uint8_t manu_access**
  - The value of Manufacturer Access field

- **struct net_buf_simple *val**
  - The value of User/Admin/Manufacturer Property

**struct esp_ble_mesh_gen_user_prop_srv_t**

User data of Generic User Property Server Model

### Public Members

- **esp_ble_mesh_model_t *model**
  - Pointer to the Generic User Property Server Model. Initialized internally.

- **esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl**
  - Response control of the server model received messages

- **uint8_t property_count**
  - Generic User Property count

- **esp_ble_mesh_generic_property_t *properties**
  - Parameters of the Generic User Property state

**struct esp_ble_mesh_gen_admin_prop_srv_t**

User data of Generic Admin Property Server Model

### Public Members

- **esp_ble_mesh_model_t *model**
  - Pointer to the Generic Admin Property Server Model. Initialized internally.

- **esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl**
  - Response control of the server model received messages

- **uint8_t property_count**
  - Generic Admin Property count

- **esp_ble_mesh_generic_property_t *properties**
  - Parameters of the Generic Admin Property state

**struct esp_ble_mesh_gen_manu_prop_srv_t**

User data of Generic Manufacturer Property Server Model
Public Members

`esp_ble_mesh_model_t *model`
Pointer to the Generic Manufacturer Property Server Model. Initialized internally.

`esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl`
Response control of the server model received messages

`uint8_t property_count`
Generic Manufacturer Property count

`esp_ble_mesh_generic_property_t *properties`
Parameters of the Generic Manufacturer Property state

`struct esp_ble_mesh_gen_client_prop_srv_t`
User data of Generic Client Property Server Model

Public Members

`esp_ble_mesh_model_t *model`
Pointer to the Generic Client Property Server Model. Initialized internally.

`esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl`
Response control of the server model received messages

`uint8_t id_count`
Generic Client Property ID count

`uint16_t *property_ids`
Parameters of the Generic Client Property state

`struct esp_ble_mesh_state_change_gen_onoff_set_t`
Parameter of Generic OnOff Set state change event

Public Members

`uint8_t onoff`
The value of Generic OnOff state

`struct esp_ble_mesh_state_change_gen_level_set_t`
Parameter of Generic Level Set state change event

Public Members

`int16_t level`
The value of Generic Level state

`struct esp_ble_mesh_state_change_gen_delta_set_t`
Parameter of Generic Delta Set state change event

Public Members

`int16_t level`
The value of Generic Level state

`struct esp_ble_mesh_state_change_gen_move_set_t`
Parameter of Generic Move Set state change event
Public Members

int16_t level
The value of Generic Level state

struct esp_ble_mesh_state_change_gen_def_trans_time_set_t
Parameter of Generic Default Transition Time Set state change event

Public Members

uint8_t trans_time
The value of Generic Default Transition Time state

struct esp_ble_mesh_state_change_gen_onpowerup_set_t
Parameter of Generic OnPowerUp Set state change event

Public Members

uint8_t onpowerup
The value of Generic OnPowerUp state

struct esp_ble_mesh_state_change_gen_power_level_set_t
Parameter of Generic Power Level Set state change event

Public Members

uint16_t power
The value of Generic Power Actual state

struct esp_ble_mesh_state_change_gen_power_default_set_t
Parameter of Generic Power Default Set state change event

Public Members

uint16_t power
The value of Generic Power Default state

struct esp_ble_mesh_state_change_gen_power_range_set_t
Parameters of Generic Power Range Set state change event

Public Members

uint16_t range_min
The minimum value of Generic Power Range state

uint16_t range_max
The maximum value of Generic Power Range state

struct esp_ble_mesh_state_change_gen_loc_global_set_t
Parameters of Generic Location Global Set state change event

Public Members

int32_t latitude
The Global Latitude value of Generic Location state
```c
int32_t longitude
    The Global Longitude value of Generic Location state

int16_t altitude
    The Global Altitude value of Generic Location state

struct esp_ble_mesh_state_change_gen_loc_local_set_t
    Parameters of Generic Location Local Set state change event

Public Members

int16_t north
    The Local North value of Generic Location state

int16_t east
    The Local East value of Generic Location state

int16_t altitude
    The Local Altitude value of Generic Location state

uint8_t floor_number
    The Floor Number value of Generic Location state

uint16_t uncertainty
    The Uncertainty value of Generic Location state

struct esp_ble_mesh_state_change_gen_user_property_set_t
    Parameters of Generic User Property Set state change event

Public Members

uint16_t id
    The property id of Generic User Property state

struct net_buf_simple *value
    The property value of Generic User Property state

struct esp_ble_mesh_state_change_gen_admin_property_set_t
    Parameters of Generic Admin Property Set state change event

Public Members

uint16_t id
    The property id of Generic Admin Property state

uint8_t access
    The property access of Generic Admin Property state

struct net_buf_simple *value
    The property value of Generic Admin Property state

struct esp_ble_mesh_state_change_gen_manu_property_set_t
    Parameters of Generic Manufacturer Property Set state change event

Public Members

uint16_t id
    The property id of Generic Manufacturer Property state

uint8_t access
    The property value of Generic Manufacturer Property state
```
struct esp_ble_mesh_server_recv_gen_user_property_get_t
Context of the received Generic User Property Get message

Public Members

uint16_t property_id
Property ID identifying a Generic User Property

struct esp_ble_mesh_server_recv_gen_admin_property_get_t
Context of the received Generic Admin Property Get message

Public Members

uint16_t property_id
Property ID identifying a Generic Admin Property

struct esp_ble_mesh_server_recv_gen_manufacturer_property_get_t
Context of the received Generic Manufacturer Property message

Public Members

uint16_t property_id
Property ID identifying a Generic Manufacturer Property

struct esp_ble_mesh_server_recv_gen_client_properties_get_t
Context of the received Generic Client Properties Get message

Public Members

uint16_t property_id
A starting Client Property ID present within an element

struct esp_ble_mesh_server_recv_gen_onoff_set_t
Context of the received Generic OnOff Set message

Public Members

bool op_en
Indicate if optional parameters are included

uint8_t onoff
Target value of Generic OnOff state

uint8_t tid
Transaction ID

uint8_t trans_time
Time to complete state transition (optional)

uint8_t delay
Indicate message execution delay (C.1)

struct esp_ble_mesh_server_recv_gen_level_set_t
Context of the received Generic Level Set message
Public Members

bool op_en
   Indicate if optional parameters are included

int16_t level
   Target value of Generic Level state

uint8_t tid
   Transaction ID

uint8_t trans_time
   Time to complete state transition (optional)

uint8_t delay
   Indicate message execution delay (C.1)

struct esp_ble_mesh_server_recv_gen_delta_set_t
   Context of the received Generic Delta Set message

Public Members

bool op_en
   Indicate if optional parameters are included

int32_t delta_level
   Delta change of Generic Level state

uint8_t tid
   Transaction ID

uint8_t trans_time
   Time to complete state transition (optional)

uint8_t delay
   Indicate message execution delay (C.1)

struct esp_ble_mesh_server_recv_gen_move_set_t
   Context of the received Generic Move Set message

Public Members

bool op_en
   Indicate if optional parameters are included

int16_t delta_level
   Delta Level step to calculate Move speed for Generic Level state

uint8_t tid
   Transaction ID

uint8_t trans_time
   Time to complete state transition (optional)

uint8_t delay
   Indicate message execution delay (C.1)

struct esp_ble_mesh_server_recv_gen_def_trans_time_set_t
   Context of the received Generic Default Transition Time Set message
Public Members

`uint8_t trans_time`
The value of the Generic Default Transition Time state

`struct esp_ble_mesh_server_recv_gen_onpowerup_set_t`
Context of the received Generic OnPowerUp Set message

Public Members

`uint8_t onpowerup`
The value of the Generic OnPowerUp state

`struct esp_ble_mesh_server_recv_gen_power_level_set_t`
Context of the received Generic Power Level Set message

Public Members

`bool op_en`
Indicate if optional parameters are included

`uint16_t power`
Target value of Generic Power Actual state

`uint8_t tid`
Transaction ID

`uint8_t trans_time`
Time to complete state transition (optional)

`uint8_t delay`
Indicate message execution delay (C.1)

`struct esp_ble_mesh_server_recv_gen_power_default_set_t`
Context of the received Generic Power Default Set message

Public Members

`uint16_t power`
The value of the Generic Power Default state

`struct esp_ble_mesh_server_recv_gen_power_range_set_t`
Context of the received Generic Power Range Set message

Public Members

`uint16_t range_min`
Value of Range Min field of Generic Power Range state

`uint16_t range_max`
Value of Range Max field of Generic Power Range state

`struct esp_ble_mesh_server_recv_gen_loc_global_set_t`
Context of the received Generic Location Global Set message
Chapter 2. API Reference

Public Members

int32_t global_latitude
Global Coordinates (Latitude)

int32_t global_longitude
Global Coordinates (Longitude)

int16_t global_altitude
Global Altitude

```
struct esp_ble_mesh_server_recv_gen_loc_local_set_t
Context of the received Generic Location Local Set message
```

Public Members

int16_t local_north
Local Coordinates (North)

int16_t local_east
Local Coordinates (East)

int16_t local_altitude
Local Altitude

uint8_t floor_number
Floor Number

uint16_t uncertainty
Uncertainty

```
struct esp_ble_mesh_server_recv_gen_user_property_set_t
Context of the received Generic User Property Set message
```

Public Members

uint16_t property_id
Property ID identifying a Generic User Property

```
struct net_buf_simple *property_value
Raw value for the User Property
```

```
struct esp_ble_mesh_server_recv_gen_admin_property_set_t
Context of the received Generic Admin Property Set message
```

Public Members

uint16_t property_id
Property ID identifying a Generic Admin Property

uint8_t user_access
Enumeration indicating user access

```
struct net_buf_simple *property_value
Raw value for the Admin Property
```

```
struct esp_ble_mesh_server_recv_gen_manufacturer_property_set_t
Context of the received Generic Manufacturer Property Set message
```
Public Members

uint16_t property_id
   Property ID identifying a Generic Manufacturer Property

uint8_t user_access
   Enumeration indicating user access

struct esp_ble_mesh_generic_server_cb_param_t
   Generic Server Model callback parameters

Public Members

esp_ble_mesh_model_t *model
   Pointer to Generic Server Models

esp_ble_mesh_msg_ctx_t ctx
   Context of the received messages

esp_ble_mesh_generic_server_cb_value_t value
   Value of the received Generic Messages

Macros

ESP_BLE_MESH_MODEL_GEN_ONOFF_CLI (cli_pub, cli_data)
   Define a new Generic OnOff Client Model.
   
   Note This API needs to be called for each element on which the application needs to have a Generic OnOff
   Client Model.
   
   Return New Generic OnOff Client Model instance.

   Parameters
   • cli_pub: Pointer to the unique struct esp_ble_mesh_model_pub_t.
   • cli_data: Pointer to the unique struct esp_ble_mesh_client_t.

ESP_BLE_MESH_MODEL_GEN_LEVEL_CLI (cli_pub, cli_data)
   Define a new Generic Level Client Model.
   
   Note This API needs to be called for each element on which the application needs to have a Generic Level
   Client Model.
   
   Return New Generic Level Client Model instance.

   Parameters
   • cli_pub: Pointer to the unique struct esp_ble_mesh_model_pub_t.
   • cli_data: Pointer to the unique struct esp_ble_mesh_client_t.

ESP_BLE_MESH_MODEL_GEN_DEF_TRANS_TIME_CLI (cli_pub, cli_data)
   Define a new Generic Default Transition Time Client Model.
   
   Note This API needs to be called for each element on which the application needs to have a Generic Default
   Transition Time Client Model.
   
   Return New Generic Default Transition Time Client Model instance.

   Parameters
   • cli_pub: Pointer to the unique struct esp_ble_mesh_model_pub_t.
   • cli_data: Pointer to the unique struct esp_ble_mesh_client_t.

ESP_BLE_MESH_MODEL_GEN_POWER_ONOFF_CLI (cli_pub, cli_data)
   Define a new Generic Power OnOff Client Model.
   
   Note This API needs to be called for each element on which the application needs to have a Generic Power
   OnOff Client Model.
   
   Return New Generic Power OnOff Client Model instance.

   Parameters
   • cli_pub: Pointer to the unique struct esp_ble_mesh_model_pub_t.
   • cli_data: Pointer to the unique struct esp_ble_mesh_client_t.
ESP_BLE_MESH_MODEL_GEN_POWER_LEVEL_CLI (cli_pub, cli_data)
Define a new Generic Power Level Client Model.

Note This API needs to be called for each element on which the application needs to have a Generic Power Level Client Model.

Return New Generic Power Level Client Model instance.

Parameters
- cli_pub: Pointer to the unique struct esp_ble_mesh_model_pub_t.
- cli_data: Pointer to the unique struct esp_ble_mesh_client_t.

ESP_BLE_MESH_MODEL_GEN_BATTERY_CLI (cli_pub, cli_data)
Define a new Generic Battery Client Model.

Note This API needs to be called for each element on which the application needs to have a Generic Battery Client Model.

Return New Generic Battery Client Model instance.

Parameters
- cli_pub: Pointer to the unique struct esp_ble_mesh_model_pub_t.
- cli_data: Pointer to the unique struct esp_ble_mesh_client_t.

ESP_BLE_MESH_MODEL_GEN_LOCATION_CLI (cli_pub, cli_data)
Define a new Generic Location Client Model.

Note This API needs to be called for each element on which the application needs to have a Generic Location Client Model.

Return New Generic Location Client Model instance.

Parameters
- cli_pub: Pointer to the unique struct esp_ble_mesh_model_pub_t.
- cli_data: Pointer to the unique struct esp_ble_mesh_client_t.

ESP_BLE_MESH_MODEL_GEN_PROPERTY_CLI (cli_pub, cli_data)
Define a new Generic Property Client Model.

Note This API needs to be called for each element on which the application needs to have a Generic Property Client Model.

Return New Generic Location Client Model instance.

Parameters
- cli_pub: Pointer to the unique struct esp_ble_mesh_model_pub_t.
- cli_data: Pointer to the unique struct esp_ble_mesh_client_t.

ESP_BLE_MESH_MODEL_GEN_ONOFF_SRV (srv_pub, srv_data)
Generic Server Models related context.

Define a new Generic OnOff Server Model.

Note 1. The Generic OnOff Server Model is a root model.
1. This model shall support model publication and model subscription.

Return New Generic OnOff Server Model instance.

Parameters
- srv_pub: Pointer to the unique struct esp_ble_mesh_model_pub_t.
- srv_data: Pointer to the unique struct esp_ble_mesh_gen_onoff_srv_t.

ESP_BLE_MESH_MODEL_GEN_LEVEL_SRV (srv_pub, srv_data)
Define a new Generic Level Server Model.

Note 1. The Generic Level Server Model is a root model.
1. This model shall support model publication and model subscription.

Return New Generic Level Server Model instance.

Parameters
- srv_pub: Pointer to the unique struct esp_ble_mesh_model_pub_t.
- srv_data: Pointer to the unique struct esp_ble_mesh_gen_level_srv_t.

ESP_BLE_MESH_MODEL_GEN_DEF_TRANS_TIME_SRV (srv_pub, srv_data)
Define a new Generic Default Transition Time Server Model.
Chapter 2. API Reference

Note 1. The Generic Default Transition Time Server Model is a root model.
   1. This model shall support model publication and model subscription.

Return New Generic Default Transition Time Server Model instance.

Parameters
   • srv_pub: Pointer to the unique struct esp_ble_mesh_model_pub_t.
   • srv_data: Pointer to the unique struct esp_ble_mesh_gen_def_trans_time_srv_t.

ESP_BLE_MESH_MODEL_GEN_POWER_ONOFF_SRV (srv_pub, srv_data)
Define a new Generic Power OnOff Server Model.

Note 1. The Generic Power OnOff Server model extends the Generic OnOff Server model. When this model
   is present on an element, the corresponding Generic Power OnOff Setup Server model shall also be present.
   1. This model may be used to represent a variety of devices that do not fit any of the model descriptions
      that have been defined but support the generic properties of On/Off.
   2. This model shall support model publication and model subscription.

Parameters
   • srv_pub: Pointer to the unique struct esp_ble_mesh_model_pub_t.
   • srv_data: Pointer to the unique struct esp_ble_mesh_gen_power_onoff_srv_t.

ESP_BLE_MESH_MODEL_GEN_POWER_ONOFF_SETUP_SRV (srv_pub, srv_data)
Define a new Generic Power OnOff Setup Server Model.

Note 1. The Generic Power OnOff Setup Server model extends the Generic Power OnOff Server model and
   the Generic Default Transition Time Server model.
   1. This model shall support model subscription.

Parameters
   • srv_pub: Pointer to the unique struct esp_ble_mesh_model_pub_t.
   • srv_data: Pointer to the unique struct esp_ble_mesh_gen_power_onoff_setup_srv_t.

ESP_BLE_MESH_MODEL_GEN_POWER_LEVEL_SRV (srv_pub, srv_data)
Define a new Generic Power Level Server Model.

Note 1. The Generic Power Level Server model extends the Generic Power OnOff Server model and the
   Generic Level Server model. When this model is present on an Element, the corresponding Generic
   Power Level Setup Server model shall also be present.
   1. This model shall support model publication and model subscription.

Return New Generic Power Level Server Model instance.

Parameters
   • srv_pub: Pointer to the unique struct esp_ble_mesh_model_pub_t.
   • srv_data: Pointer to the unique struct esp_ble_mesh_gen_power_level_srv_t.

ESP_BLE_MESH_MODEL_GEN_POWER_LEVEL_SETUP_SRV (srv_pub, srv_data)
Define a new Generic Power Level Setup Server Model.

Note 1. The Generic Power Level Setup Server model extends the Generic Power Level Server model and the
   Generic Power OnOff Setup Server model.
   1. This model shall support model subscription.

Return New Generic Power Level Setup Server Model instance.

Parameters
   • srv_pub: Pointer to the unique struct esp_ble_mesh_model_pub_t.
   • srv_data: Pointer to the unique struct esp_ble_mesh_gen_power_level_setup_srv_t.

ESP_BLE_MESH_MODEL_GEN_BATTERY_SRV (srv_pub, srv_data)
Define a new Generic Battery Server Model.

Note 1. The Generic Battery Server Model is a root model.
   1. This model shall support model publication and model subscription.
   2. The model may be used to represent an element that is powered by a battery.

Return New Generic Battery Server Model instance.

Parameters
Chapter 2. API Reference

- `srv_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data`: Pointer to the unique struct `esp_ble_mesh_gen_battery_srv_t`.

**ESP_BLE_MESH_MODEL_GEN_LOCATION_SRV** (`srv_pub`, `srv_data`)
Define a new Generic Location Server Model.

**Note**
1. The Generic Location Server model is a root model. When this model is present on an Element, the corresponding Generic Location Setup Server model shall also be present.
   1. This model shall support model publication and model subscription.
   2. The model may be used to represent an element that knows its location (global or local).

**Return**
New Generic Location Server Model instance.

**Parameters**
- `srv_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data`: Pointer to the unique struct `esp_ble_mesh_gen_location_srv_t`.

**ESP_BLE_MESH_MODEL_GEN_LOCATION_SETUP_SRV** (`srv_pub`, `srv_data`)
Define a new Generic Location Setup Server Model.

**Note**
1. The Generic Location Setup Server model extends the Generic Location Server model.
   1. This model shall support model subscription.

**Return**
New Generic Location Setup Server Model instance.

**Parameters**
- `srv_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data`: Pointer to the unique struct `esp_ble_mesh_gen_location_setup_srv_t`.

**ESP_BLE_MESH_MODEL_GEN_USER_PROP_SRV** (`srv_pub`, `srv_data`)
Define a new Generic User Property Server Model.

**Note**
1. The Generic User Property Server model is a root model.
   1. This model shall support model publication and model subscription.

**Return**
New Generic User Property Server Model instance.

**Parameters**
- `srv_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data`: Pointer to the unique struct `esp_ble_mesh_gen_user_prop_srv_t`.

**ESP_BLE_MESH_MODEL_GEN_ADMIN_PROP_SRV** (`srv_pub`, `srv_data`)
Define a new Generic Admin Property Server Model.

**Note**
1. The Generic Admin Property Server model extends the Generic User Property Server model.
   1. This model shall support model publication and model subscription.

**Return**
New Generic Admin Property Server Model instance.

**Parameters**
- `srv_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data`: Pointer to the unique struct `esp_ble_mesh_gen_admin_prop_srv_t`.

**ESP_BLE_MESH_MODEL_GEN_MANUFACTURER_PROP_SRV** (`srv_pub`, `srv_data`)
Define a new Generic Manufacturer Property Server Model.

**Note**
1. The Generic Manufacturer Property Server model extends the Generic User Property Server model.
   1. This model shall support model publication and model subscription.

**Return**
New Generic Manufacturer Property Server Model instance.

**Parameters**
- `srv_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data`: Pointer to the unique struct `esp_ble_mesh_gen_manu_prop_srv_t`.

**ESP_BLE_MESH_MODEL_GEN_CLIENT_PROP_SRV** (`srv_pub`, `srv_data`)
Define a new Generic Client Property Server Model.

**Note**
1. The Generic Client Property Server model is a root model.
   1. This model shall support model publication and model subscription.

**Return**
New Generic Client Property Server Model instance.

**Parameters**
- `srv_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data`: Pointer to the unique struct `esp_ble_mesh_gen_client_prop_srv_t`. 
**Type Definitions**

### `typedef void (*esp_ble_mesh_generic_client_cb_t)(esp_ble_mesh_generic_client_cb_event_t event, esp_ble_mesh_generic_client_cb_param_t *param)`

Bluetooth Mesh Generic Client Model function.

Generic Client Model callback function type

**Parameters**
- **event**: Event type
- **param**: Pointer to callback parameter

### `typedef void (*esp_ble_mesh_generic_server_cb_t)(esp_ble_mesh_generic_server_cb_event_t event, esp_ble_mesh_generic_server_cb_param_t *param)`

Bluetooth Mesh Generic Server Model function.

Generic Server Model callback function type

**Parameters**
- **event**: Event type
- **param**: Pointer to callback parameter

**Enumerations**

### `enum esp_ble_mesh_generic_client_cb_event_t`

This enum value is the event of Generic Client Model

**Values**:
- `ESP_BLE_MESH_GENERIC_CLIENT_GET_STATE_EVT`
- `ESP_BLE_MESH_GENERIC_CLIENT_SET_STATE_EVT`
- `ESP_BLE_MESH_GENERIC_CLIENT_PUBLISH_EVT`
- `ESP_BLE_MESH_GENERIC_CLIENT_TIMEOUT_EVT`
- `ESP_BLE_MESH_GENERIC_CLIENT_EVT_MAX`

### `enum esp_ble_mesh_gen_user_prop_access_t`

This enum value is the access value of Generic User Property

**Values**:
- `ESP_BLE_MESH_GEN_USER_ACCESS_PROHIBIT`
- `ESP_BLE_MESH_GEN_USER_ACCESS_READ`
- `ESP_BLE_MESH_GEN_USER_ACCESS_WRITE`
- `ESP_BLE_MESH_GEN_USER_ACCESS_READ_WRITE`

### `enum esp_ble_mesh_gen_admin_prop_access_t`

This enum value is the access value of Generic Admin Property

**Values**:
- `ESP_BLE_MESH_GEN_ADMIN_NOT_USER_PROP`
- `ESP_BLE_MESH_GEN_ADMIN_ACCESS_READ`
- `ESP_BLE_MESH_GEN_ADMIN_ACCESS_WRITE`
- `ESP_BLE_MESH_GEN_ADMIN_ACCESS_READ_WRITE`

### `enum esp_ble_mesh_gen_manu_prop_access_t`

This enum value is the access value of Generic Manufacturer Property

**Values**:
ESP_BLE_MESH_GEN_MANU_NOT_USER_PROP
ESP_BLE_MESH_GEN_MANU_ACCESS_READ

enum esp_ble_mesh_generic_server_cb_event_t

This enum value is the event of Generic Server Model

Values:

ESP_BLE_MESH_GENERIC_SERVER_STATE_CHANGE_EVT

1. When get_auto_rsp is set to ESP_BLE_MESH_SERVER_AUTO_RSP, no event will be callback to the application layer when Generic Get messages are received.
2. When set_auto_rsp is set to ESP_BLE_MESH_SERVER_AUTO_RSP, this event will be callback to the application layer when Generic Set/Set Unack messages are received.

ESP_BLE_MESH_GENERIC_SERVER_RECV_GET_MSG_EVT

When get_auto_rsp is set to ESP_BLE_MESH_SERVER_RSP_BY_APP, this event will be callback to the application layer when Generic Get messages are received.

ESP_BLE_MESH_GENERIC_SERVER_RECV_SET_MSG_EVT

When set_auto_rsp is set to ESP_BLE_MESH_SERVER_RSP_BY_APP, this event will be callback to the application layer when Generic Set/Set Unack messages are received.

ESP_BLE_MESH_GENERIC_SERVER_EVT_MAX

Sensor Client/Server Models

Header File

• components/bt/esp_ble_mesh/api/models/include/esp_ble_mesh_sensor_model_api.h

Functions

esp_err_t esp_ble_mesh_register_sensor_client_callback(esp_ble_mesh_sensor_client_cb_t callback)

Register BLE Mesh Sensor Client Model callback.

Return ESP_OK on success or error code otherwise.

Parameters

• [in] callback: Pointer to the callback function.

esp_err_t esp_ble_mesh_sensor_client_get_state(esp_ble_mesh_client_common_param_t *params, esp_ble_mesh_sensor_client_get_state_t *get_state)

Get the value of Sensor Server Model states using the Sensor Client Model get messages.

Note If you want to know the opcodes and corresponding meanings accepted by this API, please refer to esp_ble_mesh_sensor_message_opcode_t in esp_ble_mesh_defs.h

Return ESP_OK on success or error code otherwise.

Parameters

• [in] params: Pointer to BLE Mesh common client parameters.
• [in] get_state: Pointer to sensor get message value. Shall not be set to NULL.

esp_err_t esp_ble_mesh_sensor_client_set_state(esp_ble_mesh_client_common_param_t *params, esp_ble_mesh_sensor_client_set_state_t *set_state)

Set the value of Sensor Server Model states using the Sensor Client Model set messages.

Note If you want to know the opcodes and corresponding meanings accepted by this API, please refer to esp_ble_mesh_sensor_message_opcode_t in esp_ble_mesh_defs.h

Return ESP_OK on success or error code otherwise.

Parameters

• [in] params: Pointer to BLE Mesh common client parameters.
• [in] set_state: Pointer to sensor set message value. Shall not be set to NULL.
esp_err_t esp_ble_mesh_register_sensor_server_callback(esp_ble_mesh_sensor_server_cb_t callback)

Register BLE Mesh Sensor Server Model callback.

Return ESP_OK on success or error code otherwise.

Parameters
- [in] callback: Pointer to the callback function.

Unions

union esp_ble_mesh_sensor_client_get_state_t

Structures

`struct esp_ble_mesh_sensor_descriptor_get_t`
Bluetooth Mesh Sensor Client Model Get and Set parameters structure.

Parameters of Sensor Descriptor Get

Public Members

bool `op_en`
Indicate if optional parameters are included

`uint16_t` `property_id`
Property ID of a sensor (optional)

`struct esp_ble_mesh_sensor_cadence_get_t`
Parameter of Sensor Cadence Get

Public Members

`uint16_t` `property_id`
Property ID of a sensor

`struct esp_ble_mesh_sensor_cadence_set_t`
Parameters of Sensor Cadence Set

Public Members

`uint16_t` `property_id`
Property ID for the sensor

`uint8_t` `fast_cadence_period_divisor` : 7
Divisor for the publish period

`uint8_t` `status_trigger_type` : 1
The unit and format of the Status Trigger Delta fields

`struct net_buf_simple*` `status_trigger_delta_down`
Delta down value that triggers a status message

`struct net_buf_simple*` `status_trigger_delta_up`
Delta up value that triggers a status message

`uint8_t` `status_min_interval`
Minimum interval between two consecutive Status messages

`struct net_buf_simple*` `fast_cadence_low`
Low value for the fast cadence range

`struct net_buf_simple*` `fast_cadence_high`
Fast value for the fast cadence range
struct esp_ble_mesh_sensor_settings_get_t
Parameter of Sensor Settings Get

Public Members

uint16_t sensor_property_id
Property ID of a sensor

struct esp_ble_mesh_sensor_setting_get_t
Parameters of Sensor Setting Get

Public Members

uint16_t sensor_property_id
Property ID of a sensor
uint16_t sensor_setting_property_id
Setting ID identifying a setting within a sensor

struct esp_ble_mesh_sensor_setting_set_t
Parameters of Sensor Setting Set

Public Members

uint16_t sensor_property_id
Property ID identifying a sensor
uint16_t sensor_setting_property_id
Setting ID identifying a setting within a sensor
net_buf_simple *sensor_setting_raw
Raw value for the setting

struct esp_ble_mesh_sensor_get_t
Parameters of Sensor Get

Public Members

bool op_en
Indicate if optional parameters are included
uint16_t property_id
Property ID for the sensor (optional)

struct esp_ble_mesh_sensor_column_get_t
Parameters of Sensor Column Get

Public Members

uint16_t property_id
Property identifying a sensor
net_buf_simple *raw_value_x
Raw value identifying a column

struct esp_ble_mesh_sensor_series_get_t
Parameters of Sensor Series Get
Public Members

bool op_en
   Indicate if optional parameters are included

uint16_t property_id
   Property identifying a sensor

struct net_buf_simple *raw_value_x1
   Raw value identifying a starting column (optional)

struct net_buf_simple *raw_value_x2
   Raw value identifying an ending column (C.1)

struct esp_ble_mesh_sensor_descriptor_status_cb_t
   Bluetooth Mesh Sensor Client Model Get and Set callback parameters structure.

   Parameter of Sensor Descriptor Status

Public Members

struct net_buf_simple *descriptor
   Sequence of 8-octet sensor descriptors (optional)

struct esp_ble_mesh_sensor_cadence_status_cb_t
   Parameters of Sensor Cadence Status

Public Members

uint16_t property_id
   Property for the sensor

struct net_buf_simple *sensor_cadence_value
   Value of sensor cadence state

struct esp_ble_mesh_sensor_settings_status_cb_t
   Parameters of Sensor Settings Status

Public Members

uint16_t sensor_property_id
   Property ID identifying a sensor

struct net_buf_simple *sensor_setting_property_ids
   A sequence of N sensor setting property IDs (optional)

struct esp_ble_mesh_sensor_setting_status_cb_t
   Parameters of Sensor Setting Status

Public Members

bool op_en
   Indicate if optional parameters are included

uint16_t sensor_property_id
   Property ID identifying a sensor

uint16_t sensor_setting_property_id
   Setting ID identifying a setting within a sensor
uint8_t sensor_setting_access
Read/Write access rights for the setting (optional)

struct net_buf_simple *sensor_setting_raw
Raw value for the setting

struct esp_ble_mesh_sensor_status_cb_t
Parameter of Sensor Status

Public Members

struct net_buf_simple *marshalled_sensor_data
Value of sensor data state (optional)

struct esp_ble_mesh_sensor_column_status_cb_t
Parameters of Sensor Column Status

Public Members

uint16_t property_id
Property identifying a sensor and the Y axis

struct net_buf_simple *sensor_column_value
Left values of sensor column status

struct esp_ble_mesh_sensor_series_status_cb_t
Parameters of Sensor Series Status

Public Members

uint16_t property_id
Property identifying a sensor and the Y axis

struct net_buf_simple *sensor_series_value
Left values of sensor series status

struct esp_ble_mesh_sensor_client_cb_param_t
Sensor Client Model callback parameters

Public Members

int error_code
0: success, otherwise failure. For the error code values please refer to errno.h file. A negative sign is added to the standard error codes in errno.h.

esp_ble_mesh_client_common_param_t *params
The client common parameters.

esp_ble_mesh_sensor_client_status_cb_t status_cb
The sensor status message callback values

struct esp_ble_mesh_sensor_descriptor_t
Parameters of Sensor Descriptor state

Public Members

uint32_t positive_tolerance : 12
The value of Sensor Positive Tolerance field
# Chapter 2. API Reference

## Structure Definitions

### `uint32_t negative_tolerance : 12`
- The value of Sensor Negative Tolerance field

### `uint32_t sampling_function : 8`
- The value of Sensor Sampling Function field

### `uint8_t measure_period`
- The value of Sensor Measurement Period field

### `uint8_t update_interval`
- The value of Sensor Update Interval field

**struct esp_ble_mesh_sensor_setting_t**

Parameters of Sensor Setting state

### Public Members

### `uint16_t property_id`
- The value of Sensor Setting Property ID field

### `uint8_t access`
- The value of Sensor Setting Access field

**struct net_buf_simple *raw**
- The value of Sensor Setting Raw field

**struct esp_ble_mesh_sensor_cadence_t**

Parameters of Sensor Cadence state

### Public Members

### `uint8_t period_divisor : 7`
- The value of Fast Cadence Period Divisor field

### `uint8_t trigger_type : 1`
- The value of Status Trigger Type field

**struct net_buf_simple *trigger_delta_down**
- Note: The parameter “size” in trigger_delta_down, trigger_delta_up, fast_cadence_low & fast_cadence_high indicates the exact length of these four parameters, and they are associated with the Sensor Property ID. Users need to initialize the “size” precisely. The value of Status Trigger Delta Down field

**struct net_buf_simple *trigger_delta_up**
- The value of Status Trigger Delta Up field

### `uint8_t min_interval`
- The value of Status Min Interval field

**struct net_buf_simple *fast_cadence_low**
- The value of Fast Cadence Low field

**struct net_buf_simple *fast_cadence_high**
- The value of Fast Cadence High field

**struct esp_ble_mesh_sensor_data_t**

Parameters of Sensor Data state

### Public Members

### `uint8_t format : 1`
- Format A: The Length field is a 1-based uint4 value (valid range 0x0–0xF, representing range of 1–16).
Format B: The Length field is a 1-based uint7 value (valid range 0x0–0x7F, representing range of 1–127). The value 0x7F represents a length of zero. The value of the Sensor Data format

```c
uint8_t length : 7
    The value of the Sensor Data length

struct net_buf_simple *raw_value
    The value of Sensor Data raw value
```

```c
struct esp_ble_mesh_sensor_series_column_t
    Parameters of Sensor Series Column state
```

**Public Members**

```c
struct net_buf_simple *raw_value_x
    The value of Sensor Raw Value X field

struct net_buf_simple *column_width
    The value of Sensor Column Width field

struct net_buf_simple *raw_value_y
    The value of Sensor Raw Value Y field
```

```c
struct esp_ble_mesh_sensor_state_t
    Parameters of Sensor states
```

**Public Members**

```c
uint16_t sensor_property_id
    The value of Sensor Property ID field

esp_ble_mesh_sensor_descriptor_t descriptor
    Parameters of the Sensor Descriptor state
```

```c
const uint8_t setting_count
    Multiple Sensor Setting states may be present for each sensor. The Sensor Setting Property ID values shall be unique for each Sensor Property ID that identifies a sensor within an element.
```

```c
esp_ble_mesh_sensor_setting_t *settings
    Parameters of the Sensor Setting state
```

```c
esp_ble_mesh_sensor_cadence_t *cadence
    The Sensor Cadence state may not be supported by sensors based on device properties referencing "non-scalar characteristics" such as "histograms" or "composite characteristics". Parameters of the Sensor Cadence state
```

```c
esp_ble_mesh_sensor_data_t sensor_data
    Parameters of the Sensor Data state
```

```c
esp_ble_mesh_sensor_series_column_t *series_column
    Parameters of the Sensor Series Column state
```

```c
struct esp_ble_mesh_sensor_srv_t
    User data of Sensor Server Model
```

**Public Members**

```c
esp_ble_mesh_model_t *model
    Pointer to the Sensor Server Model. Initialized internally.
```

```c
esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl
    Response control of the server model received messages
```
Chapter 2. API Reference

```c
const uint8_t state_count
Sensor state count

esp_ble_mesh_sensor_state_t *states
Parameters of the Sensor states

struct esp_ble_mesh_sensor_setup_srv_t
User data of Sensor Setup Server Model
```

**Public Members**

```c
esp_ble_mesh_model_t *model
    Pointer to the Sensor Setup Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl
    Response control of the server model received messages

const uint8_t state_count
    Sensor state count

esp_ble_mesh_sensor_state_t *states
    Parameters of the Sensor states
```

```c
struct esp_ble_mesh_state_change_sensor_cadence_set_t
Parameters of Sensor Cadence Set state change event
```

**Public Members**

```c
uint16_t property_id
    The value of Sensor Property ID state

uint8_t period_divisor : 7
    The value of Fast Cadence Period Divisor state

uint8_t trigger_type : 1
    The value of Status Trigger Type state

struct net_buf_simple *trigger_delta_down
    The value of Status Trigger Delta Down state

struct net_buf_simple *trigger_delta_up
    The value of Status Trigger Delta Up state

uint8_t min_interval
    The value of Status Min Interval state

struct net_buf_simple *fast_cadence_low
    The value of Fast Cadence Low state

struct net_buf_simple *fast_cadence_high
    The value of Fast Cadence High state

struct esp_ble_mesh_state_change_sensor_setting_set_t
Parameters of Sensor Setting Set state change event
```

**Public Members**

```c
uint16_t property_id
    The value of Sensor Property ID state

uint16_t setting_property_id
    The value of Sensor Setting Property ID state
```
struct net_buf_simple *setting_value
  The value of Sensor Property Value state

struct esp_ble_mesh_server_recv_sensor_descriptor_get_t
  Context of the received Sensor Descriptor Get message

Public Members

bool op_en
  Indicate if optional parameters are included

  uint16_t property_id
  Property ID of a sensor (optional)

struct esp_ble_mesh_server_recv_sensor_cadence_get_t
  Context of the received Sensor Cadence Get message

Public Members

  uint16_t property_id
  Property ID of a sensor

struct esp_ble_mesh_server_recv_sensor_settings_get_t
  Context of the received Sensor Settings Get message

Public Members

  uint16_t property_id
  Property ID of a sensor

  uint16_t setting_property_id
  Setting ID identifying a setting within a sensor

struct esp_ble_mesh_server_recv_sensor_get_t
  Context of the received Sensor Get message

Public Members

  bool op_en
  Indicate if optional parameters are included

  uint16_t property_id
  Property ID for the sensor (optional)

struct esp_ble_mesh_server_recv_sensor_column_get_t
  Context of the received Sensor Column Get message
Chapter 2. API Reference

Public Members

```c
uint16_t property_id
    Property identifying a sensor
```

```c
struct net_buf_simple *raw_value_x
    Raw value identifying a column
```

```c
struct esp_ble_mesh_server_recv_sensor_series_get_t
    Context of the received Sensor Series Get message
```

Public Members

```c
bool op_en
    Indicate if optional parameters are included
```

```c
uint16_t property_id
    Property identifying a sensor
```

```c
struct net_buf_simple *raw_value
    Raw value containing X1 and X2 (optional)
```

```c
struct esp_ble_mesh_server_recv_sensor_cadence_set_t
    Context of the received Sensor Cadence Set message
```

Public Members

```c
uint16_t property_id
    Property ID for the sensor
```

```c
struct net_buf_simple *cadence
    Value of Sensor Cadence state
```

```c
struct esp_ble_mesh_server_recv_sensor_setting_set_t
    Context of the received Sensor Setting Set message
```

Public Members

```c
uint16_t property_id
    Property ID identifying a sensor
```

```c
uint16_t setting_property_id
    Setting ID identifying a setting within a sensor
```

```c
struct net_buf_simple *setting_raw
    Raw value for the setting
```

```c
struct esp_ble_mesh_sensor_server_cb_param_t
    Sensor Server Model callback parameters
```

Public Members

```c
esp_ble_mesh_model_t *model
    Pointer to Sensor Server Models
```

```c
esp_ble_mesh_msg_ctx_t ctx
    Context of the received messages
```

```c
esp_ble_mesh_sensor_server_cb_value_t value
    Value of the received Sensor Messages
```
**Macros**

**ESP_BLE_MESH_MODEL_SENSOR_CLI** (cli_pub, cli_data)
Define a new Sensor Client Model.

*Note* This API needs to be called for each element on which the application needs to have a Sensor Client Model.

*Return* New Sensor Client Model instance.

*Parameters*
- cli_pub: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- cli_data: Pointer to the unique struct `esp_ble_mesh_client_t`.

**ESP_BLE_MESH_MODEL_SENSOR_SRV** (srv_pub, srv_data)
Sensor Server Models related context.

Define a new Sensor Server Model.

*Note* 1. The Sensor Server model is a root model. When this model is present on an element, the corresponding Sensor Setup Server model shall also be present.

*Return* New Sensor Server Model instance.

*Parameters*
- srv_pub: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- srv_data: Pointer to the unique struct `esp_ble_mesh_sensor_srv_t`.

**ESP_BLE_MESH_MODEL_SENSOR_SETUP_SRV** (srv_pub, srv_data)
Define a new Sensor Setup Server Model.

*Note* 1. The Sensor Setup Server model extends the Sensor Server model.

*Return* New Sensor Setup Server Model instance.

*Parameters*
- srv_pub: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- srv_data: Pointer to the unique struct `esp_ble_mesh_sensor_setup_srv_t`.

**ESP_BLE_MESH_INVALID_SENSOR_PROPERTY_ID**
Invalid Sensor Property ID

**ESP_BLE_MESH_SENSOR_PROPERTY_ID_LEN**
Length of Sensor Property ID

**ESP_BLE_MESH_SENSOR_DESCRIPTOR_LEN**
Length of Sensor Descriptor state

**ESP_BLE_MESH_SENSOR_UNSPECIFIED_POS_TOLERANCE**
Unspecified Sensor Positive Tolerance

**ESP_BLE_MESHSENSOR_UNSPECIFIED_NEG_TOLERANCE**
Unspecified Sensor Negative Tolerance

**ESP_BLE_MESH_SENSOR_NOT_APPL_MEASURE_PERIOD**
Not applicable Sensor Measurement Period

**ESP_BLE_MESH_SENSOR_NOT_APPL_UPDATE_INTERVAL**
Not applicable Sensor Update Interval

**ESP_BLE_MESH_INVALID_SENSOR_SETTING_PROPERTY_ID**
Invalid Sensor Setting Property ID

**ESP_BLE_MESH_SENSOR_SETTING_PROPERTY_ID_LEN**
Length of Sensor Setting Property ID

**ESP_BLE_MESH_SENSOR_SETTING_ACCESS_LEN**
Length of Sensor Setting Access

**ESP_BLE_MESH_SENSOR_SETTING_ACCESS_READ**
Sensor Setting Access - Read
Chapter 2. API Reference

**ESP_BLE_MESHSENSOR_SETTING_ACCESS_READ_WRITE**
Sensor Setting Access - Read & Write

**ESP_BLE_MESHSENSOR_DIVISOR_TRIGGER_TYPE_LEN**
Length of Sensor Divisor Trigger Type

**ESP_BLE_MESHSENSOR_STATUS_MIN_INTERVAL_LEN**
Length of Sensor Status Min Interval

**ESP_BLE_MESHSENSOR_PERIOD_DIVISOR_MAX_VALUE**
Maximum value of Sensor Period Divisor

**ESP_BLE_MESHSENSOR_STATUS_MIN_INTERVAL_MAX**
Maximum value of Sensor Status Min Interval

**ESP_BLE_MESHSENSOR_STATUS_TRIGGER_TYPE_CHAR**
Sensor Status Trigger Type - Format Type of the characteristic that the Sensor Property ID state references

**ESP_BLE_MESHSENSOR_STATUS_TRIGGER_TYPE_UINT16**
Sensor Status Trigger Type - Format Type “uint16”

**ESP_BLE_MESHSENSOR_DATA_FORMAT_A**
Sensor Data Format A

**ESP_BLE_MESHSENSOR_DATA_FORMAT_B**
Sensor Data Format B

**ESP_BLE_MESHSENSOR_DATA_FORMAT_A_MPID_LEN**
MPID length of Sensor Data Format A

**ESP_BLE_MESHSENSOR_DATA_FORMAT_B_MPID_LEN**
MPID length of Sensor Data Format B

**ESP_BLE_MESHSENSOR_DATA_ZERO_LEN**
Zero length of Sensor Data.

Note: The Length field is a 1-based uint7 value (valid range 0x0-0x7F, representing range of 1-127). The value 0x7F represents a length of zero.

**ESP_BLE_MESH_GET_SENSOR_DATA_FORMAT (_data)**
Get format of the sensor data.

Note Multiple sensor data may be concatenated. Make sure the _data pointer is updated before getting the format of the corresponding sensor data.

Return Format of the sensor data.

Parameters
- `_data`: Pointer to the start of the sensor data.

**ESP_BLE_MESH_GET_SENSOR_DATA_LENGTH (_data, _fmt)**
Get length of the sensor data.

Note Multiple sensor data may be concatenated. Make sure the _data pointer is updated before getting the length of the corresponding sensor data.

Return Length (zero-based) of the sensor data.

Parameters
- `_data`: Pointer to the start of the sensor data.
- `_fmt`: Format of the sensor data.

**ESP_BLE_MESH_GET_SENSOR_DATA_PROPERTY_ID (_data, _fmt)**
Get Sensor Property ID of the sensor data.

Note Multiple sensor data may be concatenated. Make sure the _data pointer is updated before getting Sensor Property ID of the corresponding sensor data.

Return Sensor Property ID of the sensor data.

Parameters
- `_data`: Pointer to the start of the sensor data.
- `_fmt`: Format of the sensor data.
ESP_BLE_MESH_SENSOR_DATA_FORMAT_A_MPID (_len, _id)
Generate a MPID value for sensor data with Format A.

**Note**
1. The Format field is 0b0 and indicates that Format A is used.
2. The Length field is a 1-based uint4 value (valid range 0x0–0xF, representing range of 1–16).
3. The Property ID is an 11-bit bit field representing 11 LSbs of a Property ID.
4. This format may be used for Property Values that are not longer than 16 octets and for Property IDs less than 0x0800.

**Return**
2-octet MPID value for sensor data with Format A.

**Parameters**
- _len: Length of Sensor Raw value.
- _id: Sensor Property ID.

ESP_BLE_MESH_SENSOR_DATA_FORMAT_B_MPID (_len, _id)
Generate a MPID value for sensor data with Format B.

**Note**
1. The Format field is 0b1 and indicates Format B is used.
2. The Length field is a 1-based uint7 value (valid range 0x0–0x7F, representing range of 1–127). The value 0x7F represents a length of zero.
3. The Property ID is a 16-bit bit field representing a Property ID.
4. This format may be used for Property Values not longer than 128 octets and for any Property IDs. Property values longer than 128 octets are not supported by the Sensor Status message.
5. Exclude the generated 1-octet value, the 2-octet Sensor Property ID

**Return**
3-octet MPID value for sensor data with Format B.

**Parameters**
- _len: Length of Sensor Raw value.
- _id: Sensor Property ID.

**Type Definitions**

#define esp_ble_mesh_sensor_client_cb_t (*esp_ble_mesh_sensor_client_cb_t)(esp_ble_mesh_sensor_client_cb_event_t event, esp_ble_mesh_sensor_client_cb_param_t *param)

Bluetooth Mesh Sensor Client Model function.
Sensor Client Model callback function type

**Parameters**
- event: Event type
- param: Pointer to callback parameter

#define esp_ble_mesh_sensor_server_cb_t (*esp_ble_mesh_sensor_server_cb_t)(esp_ble_mesh_sensor_server_cb_event_t event, esp_ble_mesh_sensor_server_cb_param_t *param)

Bluetooth Mesh Sensor Server Model function.
Sensor Server Model callback function type

**Parameters**
- event: Event type
- param: Pointer to callback parameter

**Enumerations**

#define esp_ble_mesh_sensor_client_cb_event_t

This enum value is the event of Sensor Client Model

**Values**:

<table>
<thead>
<tr>

Chapter 2. API Reference

ESP_BLE_MESH_SENSOR_CLIENT_EVT_MAX

enum esp_ble_mesh_sensor_sample_func
This enum value is value of Sensor Sampling Function

Values:

ESP_BLE_MESH_SAMPLE_FUNC_UNSPECIFIED
ESP_BLE_MESH_SAMPLE_FUNC_INSTANTANEOUS
ESP_BLE_MESH_SAMPLE_FUNC_ARITHMETIC_MEAN
ESP_BLE_MESH_SAMPLE_FUNC_RMS
ESP_BLE_MESH_SAMPLE_FUNC_MAXIMUM
ESP_BLE_MESH_SAMPLE_FUNC_MINIMUM
ESP_BLE_MESH_SAMPLE_FUNC_ACCUMULATED
ESP_BLE_MESH_SAMPLE_FUNC_COUNT

enum esp_ble_mesh_sensor_server_cb_event_t
This enum value is the event of Sensor Server Model

Values:

ESP_BLE_MESH_SENSOR_SERVER_STATE_CHANGE_EVT
1. When get_auto_rsp is set to ESP_BLE_MESH_SERVER_AUTO_RSP, no event will be callback
to the application layer when Sensor Get messages are received.
2. When set_auto_rsp is set to ESP_BLE_MESH_SERVER_AUTO_RSP, this event will be callback
to the application layer when Sensor Set/Set Unack messages are received.

ESP_BLE_MESH_SENSOR_SERVER_RECV_GET_MSG_EVT
When get_auto_rsp is set to ESP_BLE_MESH_SERVER_RSP_BY_APP, this event will be callback to
the application layer when Sensor Get messages are received.

ESP_BLE_MESH_SENSOR_SERVER_RECV_SET_MSG_EVT
When set_auto_rsp is set to ESP_BLE_MESH_SERVER_RSP_BY_APP, this event will be callback to
the application layer when Sensor Set/Set Unack messages are received.

ESP_BLE_MESH_SENSOR_SERVER_EVT_MAX

Time and Scenes Client/Server Models

Header File

- components/bt/esp_ble_mesh/api/models/include/esp_ble_mesh_time_scene_model_api.h

Functions

esp_err_t esp_ble_mesh_register_time_scene_client_callback(esp_ble_mesh_time_scene_client_cb_t callback)
Register BLE Mesh Time Scene Client Model callback.

Return ESP_OK on success or error code otherwise.

Parameters

- [in] callback: Pointer to the callback function.

esp_err_t esp_ble_mesh_time_scene_client_get_state(esp_ble_mesh_client_common_param_t *params,
esp_ble_mesh_time_scene_client_get_state_t *get_state)
Get the value of Time Scene Server Model states using the Time Scene Client Model get messages.

Note If you want to know the opcodes and corresponding meanings accepted by this API, please refer to
esp_ble_mesh_time_scene_message_opcode_t in esp_ble_mesh_defs.h
Return ESP_OK on success or error code otherwise.

Parameters
• [in] params: Pointer to BLE Mesh common client parameters.
• [in] get_state: Pointer to time scene get message value. Shall not be set to NULL.

```
esp_err_t esp_ble_mesh_time_scene_client_set_state(esp_ble_mesh_client_common_param_t *params, 
                                               esp_ble_mesh_time_scene_client_set_state_t *set_state)
```

Set the value of Time Scene Server Model states using the Time Scene Client Model set messages.

Note If you want to know the opcodes and corresponding meanings accepted by this API, please refer to esp_ble_mesh_time_scene_message_opcode_t in esp_ble_mesh_defs.h

Return ESP_OK on success or error code otherwise.

Parameters
• [in] params: Pointer to BLE Mesh common client parameters.
• [in] set_state: Pointer to time scene set message value. Shall not be set to NULL.

```
esp_err_t esp_ble_mesh_register_time_scene_server_callback(esp_ble_mesh_time_scene_server_cb_t callback)
```

Register BLE Mesh Time and Scenes Server Model callback.

Return ESP_OK on success or error code otherwise.

Parameters
• [in] callback: Pointer to the callback function.

Unions

Structures

```c
struct esp_ble_mesh_time_set_t
```
Bluetooth Mesh Time Scene Client Model Get and Set parameters structure.
Parameters of Time Set

Public Members

```c
uint8_t tai_seconds[5]
// The current TAI time in seconds
```

```c
uint8_t sub_second
// The sub-second time in units of 1/256 second
```

```c
uint8_t uncertainty
// The estimated uncertainty in 10-millisecond steps
```

```c
uint16_t time_authority : 1
// 0 = No Time Authority, 1 = Time Authority
```

```c
uint16_t tai_utc_delta : 15
// Current difference between TAI and UTC in seconds
```

```c
uint8_t time_zone_offset
// The local time zone offset in 15-minute increments
```

```c
struct esp_ble_mesh_time_zone_set_t
```
Parameters of Time Zone Set

Public Members

```c
uint8_t time_zone_offset_new
// Upcoming local time zone offset
```

```c
uint8_t tai_zone_change[5]
// TAI Seconds time of the upcoming Time Zone Offset change
```

```c
struct esp_ble_mesh_tai_utc_delta_set_t
```
Parameters of TAI-UTC Delta Set

Public Members

```c
uint16_t tai_utc_delta_new : 15
// Upcoming difference between TAI and UTC in seconds
```

```c
uint16_t padding : 1
// Always 0b0. Other values are Prohibited.
```

```c
uint8_t tai_delta_change[5]
// TAI Seconds time of the upcoming TAI-UTC Delta change
```

```c
struct esp_ble_mesh_time_role_set_t
```
Parameter of Time Role Set

Public Members

```c
uint8_t time_role
// The Time Role for the element
```

```c
struct esp_ble_mesh_scene_store_t
```
Parameter of Scene Store
Chapter 2. API Reference

Public Members

uint16_t scene_number
The number of scenes to be stored

struct esp_ble_mesh_scene_recall_t
Parameters of Scene Recall

Public Members

bool op_en
Indicate if optional parameters are included

uint16_t scene_number
The number of scenes to be recalled

uint8_t tid
Transaction ID

uint8_t trans_time
Time to complete state transition (optional)

uint8_t delay
Indicate message execution delay (C.1)

struct esp_ble_mesh_scene_delete_t
Parameter of Scene Delete

Public Members

uint16_t scene_number
The number of scenes to be deleted

struct esp_ble_mesh_scheduler_act_get_t
Parameter of Scheduler Action Get

Public Members

uint8_t index
Index of the Schedule Register entry to get

struct esp_ble_mesh_scheduler_act_set_t
Parameters of Scheduler Action Set

Public Members

uint64_t index : 4
Index of the Schedule Register entry to set

uint64_t year : 7
Scheduled year for the action

uint64_t month : 12
Scheduled month for the action

uint64_t day : 5
Scheduled day of the month for the action

uint64_t hour : 5
Scheduled hour for the action

uint64_t minute: 6
   Scheduled minute for the action

uint64_t second: 6
   Scheduled second for the action

uint64_t day_of_week: 7
   Schedule days of the week for the action

uint64_t action: 4
   Action to be performed at the scheduled time

uint64_t trans_time: 8
   Transition time for this action

uint16_t scene_number
   Transition time for this action

struct esp_ble_mesh_time_status_cb_t
   Bluetooth Mesh Time Scene Client Model Get and Set callback parameters structure.

Parameters of Time Status

Public Members

uint8_t tai_seconds[5]
   The current TAI time in seconds

uint8_t sub_second
   The sub-second time in units of 1/256 second

uint8_t uncertainty
   The estimated uncertainty in 10-millisecond steps

uint16_t time_authority: 1
   0 = No Time Authority, 1 = Time Authority

uint16_t tai_utc_delta: 15
   Current difference between TAI and UTC in seconds

uint8_t time_zone_offset
   The local time zone offset in 15-minute increments

struct esp_ble_mesh_time_zone_status_cb_t
   Parameters of Time Zone Status

Public Members

uint8_t time_zone_offset_curr
   Current local time zone offset

uint8_t time_zone_offset_new
   Upcoming local time zone offset

uint8_t tai_zone_change[5]
   TAI Second time of the upcoming Time Zone Offset change

struct esp_ble_mesh_tai_utc_delta_status_cb_t
   Parameters of TAI-UTC Delta Status

Public Members

uint16_t tai_utc_delta_curr: 15
   Current difference between TAI and UTC in seconds
Chapter 2. API Reference

```c
uint16_t padding_1 : 1
    Always 0b0. Other values are Prohibited.
```

```c
uint16_t tai_utc_delta_new : 15
    Upcoming difference between TAI and UTC in seconds
```

```c
uint16_t padding_2 : 1
    Always 0b0. Other values are Prohibited.
```

```c
uint8_t tai_delta_change[5]
    TAI Seconds time of the upcoming TAI-UTC Delta change
```

**Public Members**

```c
struct esp_ble_mesh_time_role_status_cb_t
    Parameter of Time Role Status
```

```c
uint8_t time_role
    The Time Role for the element
```

**Public Members**

```c
struct esp_ble_mesh_scene_status_cb_t
    Parameters of Scene Status
```

```c
bool op_en
    Indicate if optional parameters are included
```

```c
uint8_t status_code
    Status code of the last operation
```

```c
uint16_t current_scene
    Scene Number of the current scene
```

```c
uint16_t target_scene
    Scene Number of the target scene (optional)
```

```c
uint8_t remain_time
    Time to complete state transition (C.1)
```

**Public Members**

```c
struct esp_ble_mesh_scene_register_status_cb_t
    Parameters of Scene Register Status
```

```c
uint8_t status_code
    Status code for the previous operation
```

```c
uint16_t current_scene
    Scene Number of the current scene
```

```
struct net_buf_simple *scenes
    A list of scenes stored within an element
```

**Public Members**

```c
struct esp_ble_mesh_scheduler_status_cb_t
    Parameter of Scheduler Status
```

```c
uint16_t schedules
    Bit field indicating defined Actions in the Schedule Register
```

Submit Document Feedback
struct esp_ble_mesh_scheduler_act_status_cb_t
Parameters of Scheduler Action Status

Public Members

uint64_t index: 4
   Enumerates (selects) a Schedule Register entry

uint64_t year: 7
   Scheduled year for the action

uint64_t month: 12
   Scheduled month for the action

uint64_t day: 5
   Scheduled day of the month for the action

uint64_t hour: 5
   Scheduled hour for the action

uint64_t minute: 6
   Scheduled minute for the action

uint64_t second: 6
   Scheduled second for the action

uint64_t day_of_week: 7
   Schedule days of the week for the action

uint64_t action: 4
   Action to be performed at the scheduled time

uint64_t trans_time: 8
   Transition time for this action

uint16_t scene_number
   Transition time for this action

struct esp_ble_mesh_time_scene_client_cb_param_t
Time Scene Client Model callback parameters

Public Members

int error_code
   Appropriate error code

esp_ble_mesh_client_common_param_t *params
   The client common parameters.

esp_ble_mesh_time_scene_client_status_cb_t *status_cb
   The scene status message callback values

struct esp_ble_mesh_time_state_t
Parameters of Time state

Public Members

uint8_t tai_seconds[5]
   The value of the TAI Seconds state

uint8_t subsecond
   The value of the Subsecond field
uint8_t uncertainty
The value of the Uncertainty field

uint8_t time_zone_offset_curr
The value of the Time Zone Offset Current field

uint8_t time_zone_offset_new
The value of the Time Zone Offset New state

uint8_t tai_zone_change[5]
The value of the TAI of Zone Chaneg field

uint16_t time_authority : 1
The value of the Time Authority bit

uint16_t tai_utc_delta_curr : 15
The value of the TAI-UTC Delta Current state

uint16_t tai_utc_delta_new : 15
The value of the TAI-UTC Delta New state

uint8_t tai_delta_change[5]
The value of the TAI of Delta Change field

struct esp_ble_mesh_time_state_t::{anonymous} time
Parameters of the Time state

uint8_t time_role
The value of the Time Role state

struct esp_ble_mesh_time_srv_t
User data of Time Server Model

Public Members

esp_ble_mesh_model_t *model
Pointer to the Time Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t * rsp_ctrl
Response control of the server model received messages

struct esp_ble_mesh_time_state_t *state
Parameters of the Time state

struct esp_ble_mesh_time_setup_srv_t
User data of Time Setup Server Model

Public Members

esp_ble_mesh_model_t *model
Pointer to the Time Setup Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t * rsp_ctrl
Response control of the server model received messages

struct esp_ble_mesh_time_state_t *state
Parameters of the Time state

struct esp_ble_mesh_scene_register_t
1. Scene Store is an operation of storing values of a present state of an element.
2. The structure and meaning of the stored state is determined by a model. States to be stored are specified by each model.
3. The Scene Store operation shall persistently store all values of all states marked as Stored with Scene for all models present on all elements of a node.
4. If a model is extending another model, the extending model shall determine the Stored with Scene behavior of that model. Parameters of Scene Register state

### Public Members

- `uint16_t scene_number`
  - The value of the Scene Number

- `uint8_t scene_type`
  - The value of the Scene Type

- `struct net_buf_simple *scene_value`
  - Scene value may use a union to represent later, the union contains structures of all the model states which can be stored in a scene. The value of the Scene Value

```
struct esp_ble_mesh_scenes_state_t
```

- Parameters of Scenes state.

Scenes serve as memory banks for storage of states (e.g., a power level or a light level/color). Values of states of an element can be stored as a scene and can be recalled later from the scene memory.

A scene is represented by a Scene Number, which is a 16-bit non-zero, mesh-wide value. (There can be a maximum of 65535 scenes in a mesh network.) The meaning of a scene, as well as the state storage container associated with it, are determined by a model.

The Scenes state change may start numerous parallel model transitions. In that case, each individual model handles the transition internally.

The scene transition is defined as a group of individual model transitions started by a Scene Recall operation. The scene transition is in progress when at least one transition from the group of individual model transitions is in progress.

### Public Members

- `const uint16_t scene_count`
  - The Scenes state’s scene count

- `esp_ble_mesh_scene_register_t *scenes`
  - Parameters of the Scenes state

- `uint16_t current_scene`
  - The Current Scene state is a 16-bit value that contains either the Scene Number of the currently active scene or a value of 0x0000 when no scene is active.

  When a Scene Store operation or a Scene Recall operation completes with success, the Current Scene state value shall be to the Scene Number used during that operation.

  When the Current Scene Number is deleted from a Scene Register state as a result of Scene Delete operation, the Current Scene state shall be set to 0x0000.

  When any of the element’s state that is marked as “Stored with Scene” has changed not as a result of a Scene Recall operation, the value of the Current Scene state shall be set to 0x0000.

  When a scene transition is in progress, the value of the Current Scene state shall be set to 0x0000. The value of the Current Scene state

- `uint16_t target_scene`
  - The Target Scene state is a 16-bit value that contains the target Scene Number when a scene transition is in progress.

  When the scene transition is in progress and the target Scene Number is deleted from a Scene Register state as a result of Scene Delete operation, the Target Scene state shall be set to 0x0000.

  When the scene transition is in progress and a new Scene Number is stored in the Scene Register as a result of Scene Store operation, the Target Scene state shall be set to the new Scene Number.
When the scene transition is not in progress, the value of the Target Scene state shall be set to 0x0000. The value of the Target Scene state

`uint8_t status_code`
- The status code of the last scene operation

`bool in_progress`
- Indicate if the scene transition is in progress

**struct esp_ble_mesh_scene_srv_t**
- User data of Scene Server Model

**Public Members**

- `esp_ble_mesh_model_t *model`
  - Pointer to the Scene Server Model. Initialized internally.

- `esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl`
  - Response control of the server model received messages

- `esp_ble_mesh_scenes_state_t *state`
  - Parameters of the Scenes state

- `esp_ble_mesh_last_msg_info_t last`
  - Parameters of the last received set message

- `esp_ble_mesh_state_transition_t *transition`
  - Parameters of state transition

**struct esp_ble_mesh_scenes_setup_srv_t**
- User data of Scene Setup Server Model

**Public Members**

- `esp_ble_mesh_model_t *model`
  - Pointer to the Scene Setup Server Model. Initialized internally.

- `esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl`
  - Response control of the server model received messages

- `esp_ble_mesh_scenes_state_t *state`
  - Parameters of the Scenes state

**struct esp_ble_mesh_schedule_register_t**
- Parameters of Scheduler Register state

**Public Members**

- `bool in_use`
  - Indicate if the registered schedule is in use

- `uint64_t year : 7`
  - The value of Scheduled year for the action

- `uint64_t month : 12`
  - The value of Scheduled month for the action

- `uint64_t day : 5`
  - The value of Scheduled day of the month for the action

- `uint64_t hour : 5`
  - The value of Scheduled hour for the action
Chapter 2. API Reference

uint64_t minute : 6
  The value of Scheduled minute for the action

uint64_t second : 6
  The value of Scheduled second for the action

uint64_t day_of_week : 7
  The value of Schedule days of the week for the action

uint64_t action : 4
  The value of Action to be performed at the scheduled time

uint64_t trans_time : 8
  The value of Transition time for this action

uint16_t scene_number
  The value of Scene Number to be used for some actions

struct esp_ble_mesh_scheduler_state_t
  Parameters of Scheduler state

  Public Members

  const uint8_t schedule_count
    Scheduler count

  esp_ble_mesh_schedule_register_t *schedules
    Up to 16 scheduled entries

struct esp_ble_mesh_scheduler_srv_t
  User data of Scheduler Server Model

  Public Members

  esp_ble_mesh_model_t *model
    Pointer to the Scheduler Server Model. Initialized internally.

  esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl
    Response control of the server model received messages

  esp_ble_mesh_scheduler_state_t *state
    Parameters of the Scheduler state

struct esp_ble_mesh_scheduler_setup_srv_t
  User data of Scheduler Setup Server Model

  Public Members

  esp_ble_mesh_model_t *model
    Pointer to the Scheduler Setup Server Model. Initialized internally.

  esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl
    Response control of the server model received messages

  esp_ble_mesh_scheduler_state_t *state
    Parameters of the Scheduler state

struct esp_ble_mesh_state_change_time_set_t
  Parameters of Time Set state change event
Public Members

uint8_t tai_seconds[5]
The current TAI time in seconds

uint8_t subsecond
The sub-second time in units of 1/256 second

uint8_t uncertainty
The estimated uncertainty in 10-millisecond steps

uint16_t time_authority : 1
  0 = No Time Authority, 1 = Time Authority

uint16_t tai_utc_delta_curr : 15
Current difference between TAI and UTC in seconds

uint8_t time_zone_offset_curr
The local timezone offset in 15-minute increments

struct esp_ble_mesh_state_change_time_status_t
Parameters of Time Status state change event

Public Members

uint8_t tai_seconds[5]
The current TAI time in seconds

uint8_t subsecond
The sub-second time in units of 1/256 second

uint8_t uncertainty
The estimated uncertainty in 10-millisecond steps

uint16_t time_authority : 1
  0 = No Time Authority, 1 = Time Authority

uint16_t tai_utc_delta_curr : 15
Current difference between TAI and UTC in seconds

uint8_t time_zone_offset_curr
The local timezone offset in 15-minute increments

struct esp_ble_mesh_state_change_time_zone_set_t
Parameters of Time Zone Set state change event

Public Members

uint8_t time_zone_offset_new
Upcoming local time zone offset

uint8_t tai_zone_change[5]
TAI Seconds time of the upcoming Time Zone Offset change

struct esp_ble_mesh_state_change_tai_utc_delta_set_t
Parameters of TAI UTC Delta Set state change event

Public Members

uint16_t tai_utc_delta_new : 15
Upcoming difference between TAI and UTC in seconds
uint8_t tai_delta_change[5]
    TAI Seconds time of the upcoming TAI-UTC Delta change

struct esp_ble_mesh_state_change_time_role_set_t
    Parameter of Time Role Set state change event

Public Members

uint8_t time_role
    The Time Role for the element

struct esp_ble_mesh_state_change_scene_store_t
    Parameter of Scene Store state change event

Public Members

uint16_t scene_number
    The number of scenes to be stored

struct esp_ble_mesh_state_change_scene_recall_t
    Parameter of Scene Recall state change event

Public Members

uint16_t scene_number
    The number of scenes to be recalled

struct esp_ble_mesh_state_change_scene_delete_t
    Parameter of Scene Delete state change event

Public Members

uint64_t index : 4
    Index of the Schedule Register entry to set

uint64_t year : 7
    Scheduled year for the action

uint64_t month : 12
    Scheduled month for the action

uint64_t day : 5
    Scheduled day of the month for the action

uint64_t hour : 5
    Scheduled hour for the action

uint64_t minute : 6
    Scheduled minute for the action

uint64_t second : 6
    Scheduled second for the action
Chapter 2. API Reference

uint64_t day_of_week : 7
    Schedule days of the week for the action

uint64_t action : 4
    Action to be performed at the scheduled time

uint64_t trans_time : 8
    Transition time for this action

uint16_t scene_number
    Scene number to be used for some actions

struct esp_ble_mesh_server_recv_scheduler_act_get_t
    Context of the received Scheduler Action Get message

Public Members

uint8_t index
    Index of the Schedule Register entry to get

struct esp_ble_mesh_server_recv_time_set_t
    Context of the received Time Set message

Public Members

uint8_t tai_seconds[5]
    The current TAI time in seconds

uint8_t subsecond
    The sub-second time in units of 1/256 second

uint8_t uncertainty
    The estimated uncertainty in 10-millisecond steps

uint16_t time_authority : 1
    0 = No Time Authority, 1 = Time Authority

uint16_t tai_utc_delta : 15
    Current difference between TAI and UTC in seconds

uint8_t time_zone_offset
    The local time zone offset in 15-minute increments

struct esp_ble_mesh_server_recv_time_zone_set_t
    Context of the received Time Zone Set message

Public Members

uint8_t time_zone_offset_new
    Upcoming local time zone offset

uint8_t tai_zone_change[5]
    TAI Seconds time of the upcoming Time Zone Offset change

struct esp_ble_mesh_server_recv_tai_utc_delta_set_t
    Context of the received TAI UTC Delta Set message

Public Members

uint16_t tai_utc_delta_new : 15
    Upcoming difference between TAI and UTC in seconds
uint16_t padding : 1
    Always 0b0. Other values are Prohibited.

uint8_t tai_delta_change[5]
    TAI Seconds time of the upcoming TAI-UTC Delta change

**struct esp_ble_mesh_server_recv_time_role_set_t**
    Context of the received Time Role Set message

**Public Members**

uint8_t time_role
    The Time Role for the element

**struct esp_ble_mesh_server_recv_scene_store_t**
    Context of the received Scene Store message

**Public Members**

uint16_t scene_number
    The number of scenes to be stored

**struct esp_ble_mesh_server_recv_scene_recall_t**
    Context of the received Scene Recall message

**Public Members**

bool op_en
    Indicate if optional parameters are included

uint16_t scene_number
    The number of scenes to be recalled

uint8_t tid
    Transaction ID

uint8_t trans_time
    Time to complete state transition (optional)

uint8_t delay
    Indicate message execution delay (C.1)

**struct esp_ble_mesh_server_recv_scene_delete_t**
    Context of the received Scene Delete message

**Public Members**

uint16_t scene_number
    The number of scenes to be deleted

**struct esp_ble_mesh_server_recv_scheduler_act_set_t**
    Context of the received Scheduler Action Set message

**Public Members**

uint64_t index : 4
    Index of the Schedule Register entry to set

uint64_t year : 7
    Scheduled year for the action
Chapter 2. API Reference

```c
uint64_t month: 12
    Scheduled month for the action
uint64_t day: 5
    Scheduled day of the month for the action
uint64_t hour: 5
    Scheduled hour for the action
uint64_t minute: 6
    Scheduled minute for the action
uint64_t second: 6
    Scheduled second for the action
uint64_t day_of_week: 7
    Schedule days of the week for the action
uint64_t action: 4
    Action to be performed at the scheduled time
uint64_t trans_time: 8
    Transition time for this action
uint16_t scene_number
    Scene number to be used for some actions
```

```c
struct esp_ble_mesh_server_recv_time_status_t
    Context of the received Time Status message
```

### Public Members

```c
uint8_t tai_seconds[5]
    The current TAI time in seconds
uint8_t subsecond
    The sub-second time in units of 1/256 second
uint8_t uncertainty
    The estimated uncertainty in 10-millisecond steps
uint16_t time_authority: 1
    0 = No Time Authority, 1 = Time Authority
uint16_t tai_utc_delta: 15
    Current difference between TAI and UTC in seconds
uint8_t time_zone_offset
    The local time zone offset in 15-minute increments
```

```c
struct esp_ble_mesh_time_scene_server_cb_param_t
    Time Scene Server Model callback parameters
```

### Public Members

```c
esp_ble_mesh_model_t *model
    Pointer to Time and Scenes Server Models
esp_ble_mesh_msg_ctx_t ctx
    Context of the received messages
esp_ble_mesh_time_scene_server_cb_value_t value
    Value of the received Time and Scenes Messages
```
Macros

ESP_BLE_MESH_MODEL_TIME_CLI (cli_pub, cli_data)
Define a new Time Client Model.

Note This API needs to be called for each element on which the application needs to have a Time Client Model.

Return New Time Client Model instance.

Parameters
- cli_pub: Pointer to the unique struct esp_ble_mesh_model_pub_t.
- cli_data: Pointer to the unique struct esp_ble_mesh_client_t.

ESP_BLE_MESH_MODEL_SCENE_CLI (cli_pub, cli_data)
Define a new Scene Client Model.

Note This API needs to be called for each element on which the application needs to have a Scene Client Model.

Return New Scene Client Model instance.

Parameters
- cli_pub: Pointer to the unique struct esp_ble_mesh_model_pub_t.
- cli_data: Pointer to the unique struct esp_ble_mesh_client_t.

ESP_BLE_MESH_MODEL_SCHEDULER_CLI (cli_pub, cli_data)
Define a new Scheduler Client Model.

Note This API needs to be called for each element on which the application needs to have a Scheduler Client Model.

Return New Scheduler Client Model instance.

Parameters
- cli_pub: Pointer to the unique struct esp_ble_mesh_model_pub_t.
- cli_data: Pointer to the unique struct esp_ble_mesh_client_t.

ESP_BLE_MESH_MODEL_TIME_SRV (srv_pub, srv_data)
Define a new Time Server Model.

Note 1. The Time Server model is a root model. When this model is present on an Element, the corresponding Time Setup Server model shall also be present.

1. This model shall support model publication and model subscription.

Return New Time Server Model instance.

Parameters
- srv_pub: Pointer to the unique struct esp_ble_mesh_model_pub_t.
- srv_data: Pointer to the unique struct esp_ble_mesh_time_srv_t.

ESP_BLE_MESH_MODEL_TIME_SETUP_SRV (srv_data)
Define a new Time Setup Server Model.

Note 1. The Time Setup Server model extends the Time Server model. Time is sensitive information that is propagated across a mesh network.

1. Only an authorized Time Client should be allowed to change the Time and Time Role states. A dedicated application key Bluetooth SIG Proprietary should be used on the Time Setup Server to restrict access to the server to only authorized Time Clients.

2. This model does not support subscribing nor publishing.

Parameters
- srv_data: Pointer to the unique struct esp_ble_mesh_time_setup_srv_t.

ESP_BLE_MESH_MODEL_SCENE_SRV (srv_pub, srv_data)
Define a new Scene Server Model.

Note 1. The Scene Server model is a root model. When this model is present on an Element, the corresponding Scene Setup Server model shall also be present.

1. This model shall support model publication and model subscription.

2. The model may be present only on the Primary element of a node.

Return New Scene Server Model instance.
Parameters
- `srv_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data`: Pointer to the unique struct `esp_ble_mesh_scene_srv_t`.

ESP_BLE_MESH_MODEL_SCENE_SETUP_SRV (srv_pub, srv_data)
Define a new Scene Setup Server Model.

Note
1. The Scene Setup Server model extends the Scene Server model and the Generic Default Transition Time Server model.
2. This model shall support model subscription.
3. The model may be present only on the Primary element of a node.

Return
New Scene Setup Server Model instance.

Parameters
- `srv_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data`: Pointer to the unique struct `esp_ble_mesh_scene_setup_srv_t`.

ESP_BLE_MESH_MODEL_SCHEDULER_SRV (srv_pub, srv_data)
Define a new Scheduler Server Model.

Note
1. The Scheduler Server model extends the Scene Server model. When this model is present on an Element, the corresponding Scheduler Setup Server model shall also be present.
2. This model shall support model publication and model subscription.
3. The model may be present only on the Primary element of a node.
4. The model requires the Time Server model shall be present on the element.

Return
New Scheduler Server Model instance.

Parameters
- `srv_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data`: Pointer to the unique struct `esp_ble_mesh_scheduler_srv_t`.

ESP_BLE_MESH_MODEL_SCHEDULER_SETUP_SRV (srv_pub, srv_data)
Define a new Scheduler Setup Server Model.

Note
1. The Scheduler Setup Server model extends the Scheduler Server and the Scene Setup Server models.
2. This model shall support model subscription.
3. The model may be present only on the Primary element of a node.

Return
New Scheduler Setup Server Model instance.

Parameters
- `srv_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data`: Pointer to the unique struct `esp_ble_mesh_scheduler_setup_srv_t`.

ESP_BLE_MESH_UNKNOWN_TAI_SECONDS
Unknown TAI Seconds

ESP_BLE_MESH_UNKNOWN_TAI_ZONE_CHANGE
Unknown TAI of Zone Change

ESP_BLE_MESH_UNKNOWN_TAI_DELTA_CHANGE
Unknown TAI of Delta Change

ESP_BLE_MESH_TAI_UTC_DELTA_MAX_VALUE
Maximum TAI-UTC Delta value

ESP_BLE_MESH_TAI_SECONDS_LEN
Length of TAI Seconds

ESP_BLE_MESH_TAI_OF_ZONE_CHANGE_LEN
Length of TAI of Zone Change

ESP_BLE_MESH_TAI_OF_DELTA_CHANGE_LEN
Length of TAI of Delta Change

ESP_BLE_MESH_INVALID_SCENE_NUMBER
Invalid Scene Number

ESP_BLE_MESH_SCENE_NUMBER_LEN
Length of the Scene Number
ESP_BLE_MESH_SCHEDULE_YEAR_ANY_YEAR
   Any year of the Scheduled year
ESP_BLE_MESH_SCHEDULE_DAY_ANY_DAY
   Any day of the Scheduled day
ESP_BLE_MESH_SCHEDULE_HOUR_ANY_HOUR
   Any hour of the Scheduled hour
ESP_BLE_MESH_SCHEDULE_HOUR_ONCE_A_DAY
   Any hour of the Scheduled Day
ESP_BLE_MESH_SCHEDULE_SEC_ANY_OF_HOUR
   Any minute of the Scheduled hour
ESP_BLE_MESH_SCHEDULE_SEC_EVERY_15_MIN
   Every 15 minutes of the Scheduled hour
ESP_BLE_MESH_SCHEDULE_SEC_EVERY_20_MIN
   Every 20 minutes of the Scheduled hour
ESP_BLE_MESH_SCHEDULE_SEC_ONCE_AN_HOUR
   Once of the Scheduled hour
ESP_BLE_MESH_SCHEDULE_SEC_ANY_OF_MIN
   Any second of the Scheduled minute
ESP_BLE_MESH_SCHEDULE_SEC_EVERY_15_SEC
   Every 15 seconds of the Scheduled minute
ESP_BLE_MESH_SCHEDULE_SEC_EVERY_20_SEC
   Every 20 seconds of the Scheduled minute
ESP_BLE_MESH_SCHEDULE_SEC_ONCE_AN_MIN
   Once of the Scheduled minute
ESP_BLE_MESH_SCHEDULE_ACT_TURN_OFF
   Scheduled Action - Turn Off
ESP_BLE_MESH_SCHEDULE_ACT_TURN_ON
   Scheduled Action - Turn On
ESP_BLE_MESH_SCHEDULE_ACT_SCENE_RECALL
   Scheduled Action - Scene Recall
ESP_BLE_MESH_SCHEDULE_ACT_NO_ACTION
   Scheduled Action - No Action
ESP_BLE_MESH_SCHEDULE_SCENE_NO_SCENE
   Scheduled Scene - No Scene
ESP_BLE_MESH_SCHEDULE_ENTRY_MAX_INDEX
   Maximum number of Scheduled entries
ESP_BLE_MESH_TIME_NONE
   Time Role - None
ESP_BLE_MESH_TIME_AUTHORITY
   Time Role - Mesh Time Authority
ESP_BLE_MESH_TIME_RELAY
   Time Role - Mesh Time Relay
ESP_BLE_MESH_TIME_CLIENT
   Time Role - Mesh Time Client
ESP_BLE_MESH_SCENE_SUCCESS
   Scene operation - Success
### ESP_BLE_MESH_SCENE_REG_FULL
Scene operation - Scene Register Full

### ESP_BLE_MESH_SCENE_NOT_FOUND
Scene operation - Scene Not Found

#### Type Definitions

```c
typedef void (*esp_ble_mesh_time_scene_client_cb_t)(
    esp_ble_mesh_time_scene_client_cb_event_t event,
    esp_ble_mesh_time_scene_client_cb_param_t *param)
```

Bluetooth Mesh Time Scene Client Model function.

Time Scene Client Model callback function type

**Parameters**

- `event`: Event type
- `param`: Pointer to callback parameter

```c
typedef void (*esp_ble_mesh_time_scene_server_cb_t)(
    esp_ble_mesh_time_scene_server_cb_event_t event,
    esp_ble_mesh_time_scene_server_cb_param_t *param)
```

Bluetooth Mesh Time and Scenes Server Model function.

Time Scene Server Model callback function type

**Parameters**

- `event`: Event type
- `param`: Pointer to callback parameter

#### Enumerations

```c
enum esp_ble_mesh_time_scene_client_cb_event_t
```

This enum value is the event of Time Scene Client Model

**Values:**

- `ESP_BLE_MESH_TIME_SCENE_CLIENT_GET_STATE_EVT`
- `ESP_BLE_MESH_TIME_SCENE_CLIENT_SET_STATE_EVT`
- `ESP_BLE_MESH_TIME_SCENE_CLIENT_PUBLISH_EVT`
- `ESP_BLE_MESH_TIME_SCENE_CLIENT_TIMEOUT_EVT`
- `ESP_BLE_MESH_TIME_SCENE_CLIENT_EVT_MAX`

```c
enum esp_ble_mesh_time_scene_server_cb_event_t
```

This enum value is the event of Time Scene Server Model

**Values:**

- `ESP_BLE_MESH_TIME_SCENE_SERVER_STATE_CHANGE_EVT`
- `ESP_BLE_MESH_TIME_SCENE_SERVER_RECV_GET_MSG_EVT`
- `ESP_BLE_MESH_TIME_SCENE_SERVER_RECV_SET_MSG_EVT`

1. When `get_auto_rsp` is set to `ESP_BLE_MESH_SERVER_AUTO_RSP`, no event will be callback to the application layer when Time Scene Get messages are received.
2. When `set_auto_rsp` is set to `ESP_BLE_MESH_SERVER_AUTO_RSP`, this event will be callback to the application layer when Time Scene Set/Set Unack messages are received.
Chapter 2. API Reference

**ESP_BLE_MESH_TIME_SCENE_SERVER_RECV_STATUS_MSG_EVT**

When `status_auto_rsp` is set to `ESP_BLE_MESH_SERVER_RSP_BY_APP`, this event will be callback to the application layer when Time Status message is received.

**ESP_BLE_MESH_TIME_SCENE_SERVER_EVT_MAX**

### Lighting Client/Server Models

**Header File**

- components/bt/esp_ble_mesh/api/models/include/esp_ble_mesh_lighting_model_api.h

**Functions**

*esp_err_t* `esp_ble_mesh_register_light_client_callback` *(esp_ble_mesh_light_client_cb_t callback)*

Register BLE Mesh Light Client Model callback.

**Return** ESP_OK on success or error code otherwise.

**Parameters**

- [in] `callback`: pointer to the callback function.

*esp_err_t* `esp_ble_mesh_light_client_get_state` *(esp_ble_mesh_client_common_param_t *params, esp_ble_mesh_light_client_get_state_t *get_state)*

Get the value of Light Server Model states using the Light Client Model get messages.

**Note** If you want to know the opcodes and corresponding meanings accepted by this API, please refer to esp_ble_mesh_light_message_opcode_t in esp_ble_mesh_defs.h

**Return** ESP_OK on success or error code otherwise.

**Parameters**

- [in] `get_state`: Pointer of light get message value. Shall not be set to NULL.

*esp_err_t* `esp_ble_mesh_light_client_set_state` *(esp_ble_mesh_client_common_param_t *params, esp_ble_mesh_light_client_set_state_t *set_state)*

Set the value of Light Server Model states using the Light Client Model set messages.

**Note** If you want to know the opcodes and corresponding meanings accepted by this API, please refer to esp_ble_mesh_light_message_opcode_t in esp_ble_mesh_defs.h

**Return** ESP_OK on success or error code otherwise.

**Parameters**

- [in] `set_state`: Pointer of light set message value. Shall not be set to NULL.

*esp_err_t* `esp_ble_mesh_register_lighting_server_callback` *(esp_ble_mesh_lighting_server_cb_t callback)*

Register BLE Mesh Lighting Server Model callback.

**Return** ESP_OK on success or error code otherwise.

**Parameters**

- [in] `callback`: Pointer to the callback function.

Transaction ID

uint8_t trans_time
Time to complete state transition (optional)

uint8_t delay
Indicate message execution delay (C.1)

struct esp_ble_mesh_light_hsl_saturation_set_t
Parameters of Light HSL Saturation Set

**Public Members**

bool op_en
Indicate if optional parameters are included

uint16_t saturation
Target value of light hsl hue state

uint8_t tid
Transaction ID

uint8_t trans_time
Time to complete state transition (optional)
Chapter 2. API Reference

uint8_t delay
    Indicate message execution delay (C.1)

struct esp_ble_mesh_light_hsl_default_set_t
    Parameters of Light HSL Default Set

Public Members

uint16_t lightness
    Value of light lightness default state

uint16_t hue
    Value of light hue default state

uint16_t saturation
    Value of light saturation default state

struct esp_ble_mesh_light_hsl_range_set_t
    Parameters of Light HSL Range Set

Public Members

uint16_t hue_range_min
    Value of hue range min field of light hsl hue range state

uint16_t hue_range_max
    Value of hue range max field of light hsl hue range state

uint16_t saturation_range_min
    Value of saturation range min field of light hsl saturation range state

uint16_t saturation_range_max
    Value of saturation range max field of light hsl saturation range state

struct esp_ble_mesh_light_xyl_set_t
    Parameters of Light xyL Set

Public Members

bool op_en
    Indicate whether optional parameters included

uint16_t xyl_lightness
    The target value of the Light xyL Lightness state

uint16_t xyl_x
    The target value of the Light xyL x state

uint16_t xyl_y
    The target value of the Light xyL y state

uint8_t tid
    Transaction Identifier

uint8_t trans_time
    Time to complete state transition (optional)

uint8_t delay
    Indicate message execution delay (C.1)

struct esp_ble_mesh_light_xyl_default_set_t
    Parameters of Light xyL Default Set
Chapter 2. API Reference

Public Members

`uint16_t lightness`
- The value of the Light Lightness Default state

`uint16_t xyl_x`
- The value of the Light xyL x Default state

`uint16_t xyl_y`
- The value of the Light xyL y Default state

`struct esp_ble_mesh_light_xyl_range_set_t`
- Parameters of Light xyL Range Set

Public Members

`uint16_t xyl_x_range_min`
- The value of the xyL x Range Min field of the Light xyL x Range state

`uint16_t xyl_x_range_max`
- The value of the xyL x Range Max field of the Light xyL x Range state

`uint16_t xyl_y_range_min`
- The value of the xyL y Range Min field of the Light xyL y Range state

`uint16_t xyl_y_range_max`
- The value of the xyL y Range Max field of the Light xyL y Range state

`struct esp_ble_mesh_light_lc_mode_set_t`
- Parameter of Light LC Mode Set

Public Members

`uint8_t mode`
- The target value of the Light LC Mode state

`struct esp_ble_mesh_light_lc_om_set_t`
- Parameter of Light LC OM Set

Public Members

`uint8_t mode`
- The target value of the Light LC Occupancy Mode state

`struct esp_ble_mesh_light_lc_light_onoff_set_t`
- Parameters of Light LC Light OnOff Set

Public Members

`bool op_en`
- Indicate whether optional parameters included

`uint8_t light_onoff`
- The target value of the Light LC Light OnOff state

`uint8_t tid`
- Transaction Identifier

`uint8_t trans_time`
- Time to complete state transition (optional)
uint8_t delay
    Indicate message execution delay (C.1)

struct esp_ble_mesh_light_lc_property_get_t
    Parameter of Light LC Property Get

Public Members

uint16_t property_id
    Property ID identifying a Light LC Property

struct esp_ble_mesh_light_lc_property_set_t
    Parameters of Light LC Property Set

Public Members

uint16_t property_id
    Property ID identifying a Light LC Property

struct net_buf_simple *property_value
    Raw value for the Light LC Property

struct esp_ble_mesh_light_lightness_status_cb_t
    Bluetooth Mesh Light Lightness Client Model Get and Set callback parameters structure.

Parameters of Light Lightness Status

Public Members

bool op_en
    Indicate if optional parameters are included

uint16_t present_lightness
    Current value of light lightness actual state

uint16_t target_lightness
    Target value of light lightness actual state (optional)

uint8_t remain_time
    Time to complete state transition (C.1)

struct esp_ble_mesh_light_lightness_linear_status_cb_t
    Parameters of Light Lightness Linear Status

Public Members

bool op_en
    Indicate if optional parameters are included

uint16_t present_lightness
    Current value of light lightness linear state

uint16_t target_lightness
    Target value of light lightness linear state (optional)

uint8_t remain_time
    Time to complete state transition (C.1)

struct esp_ble_mesh_light_lightness_last_status_cb_t
    Parameter of Light Lightness Last Status
Public Members

uint16_t lightness
The value of the Light Lightness Last state

struct esp_ble_mesh_light_lightness_default_status_cb_t
Parameter of Light Lightness Default Status

Public Members

uint16_t lightness
The value of the Light Lightness default State

struct esp_ble_mesh_light_lightness_range_status_cb_t
Parameters of Light Lightness Range Status

Public Members

uint8_t status_code
Status Code for the request message
uint16_t range_min
Value of range min field of light lightness range state
uint16_t range_max
Value of range max field of light lightness range state

struct esp_ble_mesh_light_ctl_status_cb_t
Parameters of Light CTL Status

Public Members

bool op_en
Indicate if optional parameters are included
uint16_t present_ctl_lightness
Current value of light ctl lightness state
uint16_t present_ctl_temperature
Current value of light ctl temperature state
uint16_t target_ctl_lightness
Target value of light ctl lightness state (optional)
uint16_t target_ctl_temperature
Target value of light ctl temperature state (C.1)
uint8_t remain_time
Time to complete state transition (C.1)

struct esp_ble_mesh_light_ctl_temperature_status_cb_t
Parameters of Light CTL Temperature Status

Public Members

bool op_en
Indicate if optional parameters are included
uint16_t present_ctl_temperature
Current value of light ctl temperature state
**Chapter 2. API Reference**

```
uint16_t present_ctl_delta_uv
    Current value of light ctl delta UV state

uint16_t target_ctl_temperature
    Target value of light ctl temperature state (optional)

uint16_t target_ctl_delta_uv
    Target value of light ctl delta UV state (C.1)

uint8_t remain_time
    Time to complete state transition (C.1)
```

**struct esp_ble_mesh_light_ctl_temperature_range_status_cb_t**
Parameters of Light CTL Temperature Range Status

**Public Members**

```
uint8_t status_code
    Status code for the request message

uint16_t range_min
    Value of temperature range min field of light ctl temperature range state

uint16_t range_max
    Value of temperature range max field of light ctl temperature range state
```

**struct esp_ble_mesh_light_ctl_default_status_cb_t**
Parameters of Light CTL Default Status

**Public Members**

```
uint16_t lightness
    Value of light lightness default state

uint16_t temperature
    Value of light temperature default state

int16_t delta_uv
    Value of light delta UV default state
```

**struct esp_ble_mesh_light_hsl_status_cb_t**
Parameters of Light HSL Status

**Public Members**

```
bool op_en
    Indicate if optional parameters are included

uint16_t hsl_lightness
    Current value of light hsl lightness state

uint16_t hsl_hue
    Current value of light hsl hue state

uint16_t hsl_saturation
    Current value of light hsl saturation state

uint8_t remain_time
    Time to complete state transition (optional)
```

**struct esp_ble_mesh_light_hsl_target_status_cb_t**
Parameters of Light HSL Target Status

**Public Members**

```
```
## Public Members

```cpp
bool op_en
   Indicate if optional parameters are included
```

```cpp
uint16_t hsl_lightness_target
   Target value of light hsl lightness state
```

```cpp
uint16_t hsl_hue_target
   Target value of light hsl hue state
```

```cpp
uint16_t hsl_saturation_target
   Target value of light hsl saturation state
```

```cpp
uint8_t remain_time
   Time to complete state transition (optional)
```

### struct esp_ble_mesh_light_hsl_hue_status_cb_t
Parameters of Light HSL Hue Status

## Public Members

```cpp
bool op_en
   Indicate if optional parameters are included
```

```cpp
uint16_t present_hue
   Current value of light hsl hue state
```

```cpp
uint16_t target_hue
   Target value of light hsl hue state (optional)
```

```cpp
uint8_t remain_time
   Time to complete state transition (C.1)
```

### struct esp_ble_mesh_light_hsl_saturation_status_cb_t
Parameters of Light HSL Saturation Status

## Public Members

```cpp
bool op_en
   Indicate if optional parameters are included
```

```cpp
uint16_t present_saturation
   Current value of light hsl saturation state
```

```cpp
uint16_t target_saturation
   Target value of light hsl saturation state (optional)
```

```cpp
uint8_t remain_time
   Time to complete state transition (C.1)
```

### struct esp_ble_mesh_light_hsl_default_status_cb_t
Parameters of Light HSL Default Status

## Public Members

```cpp
uint16_t lightness
   Value of light lightness default state
```

```cpp
uint16_t hue
   Value of light hue default state
```
uint16_t saturation
Value of light saturation default state

**struct esp_ble_mesh_light_hsl_range_status_cb_t**
Parameters of Light HSL Range Status

**Public Members**

uint8_t status_code
Status code for the request message

uint16_t hue_range_min
Value of hue range min field of light hsl hue range state

uint16_t hue_range_max
Value of hue range max field of light hsl hue range state

uint16_t saturation_range_min
Value of saturation range min field of light hsl saturation range state

uint16_t saturation_range_max
Value of saturation range max field of light hsl saturation range state

**struct esp_ble_mesh_light_xyl_status_cb_t**
Parameters of Light xyL Status

**Public Members**

bool op_en
Indicate whether optional parameters included

uint16_t xyl_lightness
The present value of the Light xyL Lightness state

uint16_t xyl_x
The present value of the Light xyL x state

uint16_t xyl_y
The present value of the Light xyL y state

uint8_t remain_time
Time to complete state transition (optional)

**struct esp_ble_mesh_light_xyl_target_status_cb_t**
Parameters of Light xyL Target Status

**Public Members**

bool op_en
Indicate whether optional parameters included

uint16_t target_xyl_lightness
The target value of the Light xyL Lightness state

uint16_t target_xyl_x
The target value of the Light xyL x state

uint16_t target_xyl_y
The target value of the Light xyL y state

uint8_t remain_time
Time to complete state transition (optional)
struct esp_ble_mesh_light_xyl_default_status_cb_t
Parameters of Light xyL Default Status

Public Members

uint16_t **lightness**
The value of the Light Lightness Default state

uint16_t **xyl_x**
The value of the Light xyL x Default state

uint16_t **xyl_y**
The value of the Light xyL y Default state

struct esp_ble_mesh_light_xyl_range_status_cb_t
Parameters of Light xyL Range Status

Public Members

uint8_t **status_code**
Status Code for the requesting message

uint16_t **xyl_x_range_min**
The value of the xyL x Range Min field of the Light xyL x Range state

uint16_t **xyl_x_range_max**
The value of the xyL x Range Max field of the Light xyL x Range state

uint16_t **xyl_y_range_min**
The value of the xyL y Range Min field of the Light xyL y Range state

uint16_t **xyl_y_range_max**
The value of the xyL y Range Max field of the Light xyL y Range state

struct esp_ble_mesh_light_lc_mode_status_cb_t
Parameter of Light LC Mode Status

Public Members

uint8_t **mode**
The present value of the Light LC Mode state

struct esp_ble_mesh_light_lc_om_status_cb_t
Parameter of Light LC OM Status

Public Members

uint8_t **mode**
The present value of the Light LC Occupancy Mode state

struct esp_ble_mesh_light_lc_light_onoff_status_cb_t
Parameters of Light LC Light OnOff Status

Public Members

bool **op_en**
Indicate whether optional parameters included

uint8_t **present_light_onoff**
The present value of the Light LC Light OnOff state
uint8_t \texttt{target\_light\_onoff}  
   The target value of the \textit{Light LC Light OnOff} state (Optional)

uint8_t \texttt{remain\_time}  
   Time to complete state transition (C.1)

\textbf{struct esp\_ble\_mesh\_light\_lc\_property\_status\_cb\_t}  
Parameters of \textit{Light LC Property Status}

\textbf{Public Members}

uint16_t \texttt{property\_id}  
   Property ID identifying a \textit{Light LC Property}

\textbf{struct net\_buf\_simple *} \texttt{property\_value}  
   Raw value for the \textit{Light LC Property}

\textbf{struct esp\_ble\_mesh\_light\_client\_cb\_param\_t}  
Lighting Client Model callback parameters

\textbf{Public Members}

int \texttt{error\_code}  
   Appropriate error code

\textbf{esp\_ble\_mesh\_client\_common\_param\_t *} \texttt{params}  
   The client common parameters.

\textbf{esp\_ble\_mesh\_light\_client\_status\_cb\_t} \texttt{status\_cb}  
   The light status message callback values

\textbf{struct esp\_ble\_mesh\_light\_lightness\_state\_t}  
Parameters of \textit{Light Lightness state}

\textbf{Public Members}

uint16_t \texttt{lightness\_linear}  
   The present value of \textit{Light Lightness Linear} state

uint16_t \texttt{target\_lightness\_linear}  
   The target value of \textit{Light Lightness Linear} state

uint16_t \texttt{lightness\_actual}  
   The present value of \textit{Light Lightness Actual} state

uint16_t \texttt{target\_lightness\_actual}  
   The target value of \textit{Light Lightness Actual} state

uint16_t \texttt{lightness\_last}  
   The value of \textit{Light Lightness Last} state

uint16_t \texttt{lightness\_default}  
   The value of \textit{Light Lightness Default} state

uint8_t \texttt{status\_code}  
   The status code of setting \textit{Light Lightness Range} state

uint16_t \texttt{lightness\_range\_min}  
   The minimum value of \textit{Light Lightness Range} state

uint16_t \texttt{lightness\_range\_max}  
   The maximum value of \textit{Light Lightness Range} state
struct esp_ble_mesh_light_lightness_srv_t
User data of Light Lightness Server Model

Public Members

esp_ble_mesh_model_t *model
    Pointer to the Lighting Lightness Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl
    Response control of the server model received messages

esp_ble_mesh_light_lightness_state_t *state
    Parameters of the Light Lightness state

esp_ble_mesh_last_msg_info_t last
    Parameters of the last received set message

esp_ble_mesh_state_transition_t actual_transition
    Parameters of state transition

esp_ble_mesh_state_transition_t linear_transition
    Parameters of state transition

int32_t tt_delta_lightness_actual
    Delta change value of lightness actual state transition

int32_t tt_delta_lightness_linear
    Delta change value of lightness linear state transition

struct esp_ble_mesh_light_lightness_setup_srv_t
User data of Light Lightness Setup Server Model

Public Members

esp_ble_mesh_model_t *model
    Pointer to the Lighting Lightness Setup Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl
    Response control of the server model received messages

esp_ble_mesh_light_lightness_state_t *state
    Parameters of the Light Lightness state

struct esp_ble_mesh_light_ctl_state_t
Parameters of Light CTL state

Public Members

uint16_t lightness
    The present value of Light CTL Lightness state

uint16_t target_lightness
    The target value of Light CTL Lightness state

uint16_t temperature
    The present value of Light CTL Temperature state

uint16_t target_temperature
    The target value of Light CTL Temperature state

int16_t delta_uv
    The present value of Light CTL Delta UV state
**Chapter 2. API Reference**

```c
int16_t target_delta_uv
    The target value of Light CTL Delta UV state

uint8_t status_code
    The status code of setting Light CTL Temperature Range state

uint16_t temperature_range_min
    The minimum value of Light CTL Temperature Range state

uint16_t temperature_range_max
    The maximum value of Light CTL Temperature Range state

uint16_t lightness_default
    The value of Light Lightness Default state

uint16_t temperature_default
    The value of Light CTL Temperature Default state

int16_t delta_uv_default
    The value of Light CTL Delta UV Default state
```

```c
struct esp_ble_mesh_light_ctl_srv_t
    User data of Light CTL Server Model
```

**Public Members**

```c
esp_ble_mesh_model_t *model
    Pointer to the Lighting CTL Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t rsp_ctrl
    Response control of the server model received messages

esp_ble_mesh_light_ctl_state_t *state
    Parameters of the Light CTL state

esp_ble_mesh_last_msg_info_t last
    Parameters of the last received set message

esp_ble_mesh_state_transition_t *transition
    Parameters of state transition

int32_t tt_delta_lightness
    Delta change value of lightness state transition

int32_t tt_delta_temperature
    Delta change value of temperature state transition

int32_t tt_delta_delta_uv
    Delta change value of delta uv state transition
```

```c
struct esp_ble_mesh_light_ctl_setup_srv_t
    User data of Light CTL Setup Server Model
```

**Public Members**

```c
esp_ble_mesh_model_t *model
    Pointer to the Lighting CTL Setup Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t rsp_ctrl
    Response control of the server model received messages

esp_ble_mesh_light_ctl_state_t *state
    Parameters of the Light CTL state
```

```c
struct esp_ble_mesh_light_ctl_temp_srv_t
    User data of Light CTL Temperature Server Model
```
Public Members

`esp_ble_mesh_model_t *model`
Pointer to the Lighting CTL Temperature Server Model. Initialized internally.

`esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl`
Response control of the server model received messages

`esp_ble_mesh_light_ctl_state_t *state`
Parameters of the Light CTL state

`esp_ble_mesh_last_msg_info_t last`
Parameters of the last received set message

`esp_ble_mesh_state_transition_t *transition`
Parameters of state transition

`int32_t tt_delta_temperature`
Delta change value of temperature state transition

`int32_t tt_delta_delta_uv`
Delta change value of delta uv state transition

`struct esp_ble_mesh_light_hsl_state_t`
Parameters of Light HSL state

Public Members

`uint16_t lightness`
The present value of Light HSL Lightness state

`uint16_t target_lightness`
The target value of Light HSL Lightness state

`uint16_t hue`
The present value of Light HSL Hue state

`uint16_t target_hue`
The target value of Light HSL Hue state

`uint16_t saturation`
The present value of Light HSL Saturation state

`uint16_t target_saturation`
The target value of Light HSL Saturation state

`uint16_t lightness_default`
The value of Light Lightness Default state

`uint16_t hue_default`
The value of Light HSL Hue Default state

`uint16_t saturation_default`
The value of Light HSL Saturation Default state

`uint8_t status_code`
The status code of setting Light HSL Hue & Saturation Range state

`uint16_t hue_range_min`
The minimum value of Light HSL Hue Range state

`uint16_t hue_range_max`
The maximum value of Light HSL Hue Range state

`uint16_t saturation_range_min`
The minimum value of Light HSL Saturation state
Chapter 2. API Reference

```c
uint16_t saturation_range_max
    The maximum value of Light HSL Saturation state
```

### struct esp_ble_mesh_light_hsl_srv_t
User data of Light HSL Server Model

#### Public Members

- `esp_ble_mesh_model_t *model`
  Pointer to the Lighting HSL Server Model. Initialized internally.
- `esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl`
  Response control of the server model received messages
- `esp_ble_mesh_light_hsl_state_t *state`
  Parameters of the Light HSL state
- `esp_ble_mesh_last_msg_info_t last`
  Parameters of the last received set message
- `esp_ble_mesh_state_transition_t *transition`
  Parameters of state transition
- `int32_t tt_delta_lightness`
  Delta change value of lightness state transition
- `int32_t tt_delta_hue`
  Delta change value of hue state transition
- `int32_t tt_delta_saturation`
  Delta change value of saturation state transition

### struct esp_ble_mesh_light_hsl_setup_srv_t
User data of Light HSL Setup Server Model

#### Public Members

- `esp_ble_mesh_model_t *model`
  Pointer to the Lighting HSL Setup Server Model. Initialized internally.
- `esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl`
  Response control of the server model received messages
- `esp_ble_mesh_light_hsl_state_t *state`
  Parameters of the Light HSL state

### struct esp_ble_mesh_light_hsl_hue_srv_t
User data of Light HSL Hue Server Model

#### Public Members

- `esp_ble_mesh_model_t *model`
  Pointer to the Lighting HSL Hue Server Model. Initialized internally.
- `esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl`
  Response control of the server model received messages
- `esp_ble_mesh_light_hsl_state_t *state`
  Parameters of the Light HSL state
- `esp_ble_mesh_last_msg_info_t last`
  Parameters of the last received set message
Chapter 2. API Reference

`esp_ble_mesh_state_transition_t` transition
Parameters of state transition

`int32_t tt_delta_hue`
Delta change value of hue state transition

`struct esp_ble_mesh_light_hsl_sat_srv_t`
User data of Light HSL Saturation Server Model

Public Members

`esp_ble_mesh_model_t *model`
Pointer to the Lighting HSL Saturation Server Model. Initialized internally.

`esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl`
Response control of the server model received messages

`esp_ble_mesh_light_hsl_state_t *state`
Parameters of the Light HSL state

`esp_ble_mesh_last_msg_info_t last`
Parameters of the last received set message

`esp_ble_mesh_state_transition_t transition`
Parameters of state transition

`int32_t tt_delta_saturation`
Delta change value of saturation state transition

`struct esp_ble_mesh_light_xyl_state_t`
Parameters of Light xyL state

Public Members

`uint16_t lightness`
The present value of Light xyL Lightness state

`uint16_t target_lightness`
The target value of Light xyL Lightness state

`uint16_t x`
The present value of Light xyL x state

`uint16_t target_x`
The target value of Light xyL x state

`uint16_t y`
The present value of Light xyL y state

`uint16_t target_y`
The target value of Light xyL y state

`uint16_t lightness_default`
The value of Light Lightness Default state

`uint16_t x_default`
The value of Light xyL x Default state

`uint16_t y_default`
The value of Light xyL y Default state

`uint8_t status_code`
The status code of setting Light xyL x & y Range state

`uint16_t x_range_min`
The minimum value of Light xyL x Range state
Chapter 2. API Reference

uint16_t x_range_max
The maximum value of Light xyL x Range state

uint16_t y_range_min
The minimum value of Light xyL y Range state

uint16_t y_range_max
The maximum value of Light xyL y Range state

struct esp_ble_mesh_light_xyl_srv_t
User data of Light xyL Server Model

Public Members

esp_ble_mesh_model_t *model
Pointer to the Lighting xyL Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl
Response control of the server model received messages

esp_ble_mesh_light_xyl_state_t *state
Parameters of the Light xyL state

esp_ble_mesh_last_msg_info_t last
Parameters of the last received set message

esp_ble_mesh_state_transition_t *transition
Parameters of state transition

int32_t tt_delta_lightness
Delta change value of lightness state transition

int32_t tt_delta_x
Delta change value of x state transition

int32_t tt_delta_y
Delta change value of y state transition

struct esp_ble_mesh_light_xyl_setup_srv_t
User data of Light xyL Setup Server Model

Public Members

esp_ble_mesh_model_t *model
Pointer to the Lighting xyL Setup Server Model. Initialized internally.

esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl
Response control of the server model received messages

esp_ble_mesh_light_xyl_state_t *state
Parameters of the Light xyL state

struct esp_ble_mesh_light_lc_state_t
Parameters of Light LC states

Public Members

uint32_t mode
0b0 The controller is turned off.
0b1 The controller is turned on.
• The binding with the Light Lightness state is disabled.
• The binding with the Light Lightness state is enabled. The value of Light LC Mode state
```c
uint32_t occupancy_mode : 1
    The value of Light LC Occupancy Mode state

uint32_t light_onoff : 1
    The present value of Light LC Light OnOff state

uint32_t target_light_onoff : 1
    The target value of Light LC Light OnOff state

uint32_t occupancy : 1
    The value of Light LC Occupancy state

uint32_t ambient_luxlevel : 24
    The value of Light LC Ambient LuxLevel state

uint16_t linear_output

1. Light LC Linear Output = max((Lightness Out)^2/65535, Regulator Output)
2. If the Light LC Mode state is set to 0b1, the binding is enabled and upon a change of the Light LC
   Linear Output state, the following operation shall be performed: Light Lightness Linear = Light LC
   Linear Output
3. If the Light LC Mode state is set to 0b0, the binding is disabled (i.e., upon a change of the Light
   LC Linear Output state, no operation on the Light Lightness Linear state is performed). The value
   of Light LC Linear Output state
```

```c
struct esp_ble_mesh_light_lc_property_state_t
    Parameters of Light Property states. The Light LC Property states are read / write states that determine
    the configuration of a Light Lightness Controller. Each state is represented by a device property and is controlled
    by Light LC Property messages.

    Public Members

    uint32_t time_occupancy_delay
        A timing state that determines the delay for changing the Light LC Occupancy state upon receiving a
        Sensor Status message from an occupancy sensor. The value of Light LC Time Occupancy Delay state

    uint32_t time_fade_on
        A timing state that determines the time the controlled lights fade to the level determined by the Light LC
        Lightness On state. The value of Light LC Time Fade On state

    uint32_t time_run_on
        A timing state that determines the time the controlled lights stay at the level determined by the Light LC
        Lightness On state. The value of Light LC Time Run On state

    uint32_t time_fade
        A timing state that determines the time the controlled lights fade from the level determined by the Light
        LC Lightness On state to the level determined by the Light Lightness Prolong state. The value of Light
        LC Time Fade state

    uint32_t time_prolong
        A timing state that determines the time the controlled lights stay at the level determined by the Light LC
        Lightness Prolong state. The value of Light LC Time Prolong state

    uint32_t time_fade_standby_auto
        A timing state that determines the time the controlled lights fade from the level determined by the Light
        LC Lightness Prolong state to the level determined by the Light LC Lightness Standby state when the
        transition is automatic. The value of Light LC Time Fade Standby Auto state

    uint32_t time_fade_standby_manual
        A timing state that determines the time the controlled lights fade from the level determined by the Light
        LC Lightness Prolong state to the level determined by the Light LC Lightness Standby state when the
        transition is triggered by a change in the Light LC Light OnOff state. The value of Light LC Time Fade
        Standby Manual state
```
uint16_t lightness_on
  A lightness state that determines the perceptive light lightness at the Occupancy and Run internal controller states. The value of Light LC Lightness On state

uint16_t lightness_prolong
  A lightness state that determines the light lightness at the Prolong internal controller state. The value of Light LC Lightness Prolong state

uint16_t lightness_standby
  A lightness state that determines the light lightness at the Standby internal controller state. The value of Light LC Lightness Standby state

uint16_t ambient_luxlevel_on
  A uint16 state representing the Ambient LuxLevel level that determines if the controller transitions from the Light Control Standby state. The value of Light LC Ambient LuxLevel On state

uint16_t ambient_luxlevel_prolong
  A uint16 state representing the required Ambient LuxLevel level in the Prolong state. The value of Light LC Ambient LuxLevel Prolong state

uint16_t ambient_luxlevel_standby
  A uint16 state representing the required Ambient LuxLevel level in the Standby state. The value of Light LC Ambient LuxLevel Standby state

float regulator_kiu
  A float32 state representing the integral coefficient that determines the integral part of the equation defining the output of the Light LC PI Feedback Regulator, when Light LC Ambient LuxLevel is less than LuxLevel Out. Valid range: 0.0 ~ 1000.0. The default value is 250.0. The value of Light LC Regulator Kiu state

float regulator_kid
  A float32 state representing the integral coefficient that determines the integral part of the equation defining the output of the Light LC PI Feedback Regulator, when Light LC Ambient LuxLevel is greater than or equal to the value of the LuxLevel Out state. Valid range: 0.0 ~ 1000.0. The default value is 25.0. The value of Light LC Regulator Kid state

float regulator_kpu
  A float32 state representing the proportional coefficient that determines the proportional part of the equation defining the output of the Light LC PI Feedback Regulator, when Light LC Ambient LuxLevel is less than the value of the LuxLevel Out state. Valid range: 0.0 ~ 1000.0. The default value is 80.0. The value of Light LC Regulator Kpu state

float regulator_kpd
  A float32 state representing the proportional coefficient that determines the proportional part of the equation defining the output of the Light LC PI Feedback Regulator, when Light LC Ambient LuxLevel is greater than or equal to the value of the LuxLevel Out state. Valid range: 0.0 ~ 1000.0. The default value is 80.0. The value of Light LC Regulator Kpd state

int8_t regulator_accuracy
  A int8 state representing the percentage accuracy of the Light LC PI Feedback Regulator. Valid range: 0.0 ~ 100.0. The default value is 2.0. The value of Light LC Regulator Accuracy state

uint32_t set_occupancy_to_1_delay
  If the message Raw field contains a Raw Value for the Time Since Motion Sensed device property, which represents a value less than or equal to the value of the Light LC Occupancy Delay state, it shall delay setting the Light LC Occupancy state to 0b1 by the difference between the value of the Light LC Occupancy Delay state and the received Time Since Motion value. The value of the difference between value of the Light LC Occupancy Delay state and the received Time Since Motion value

struct esp_ble_mesh_light_lc_state_machine_t
  Parameters of Light LC state machine
Public Members

uint8_t **fade_on**
The value of transition time of Light LC Time Fade On

guint8_t **fade**
The value of transition time of Light LC Time Fade

guint8_t **fade_standby_auto**
The value of transition time of Light LC Time Fade Standby Auto

.uint8_t **fade_standby_manual**
The value of transition time of Light LC Time Fade Standby Manual

struct esp_ble_mesh_light_lc_state_machine_t::[anonymous] **trans_time**
The Fade On, Fade, Fade Standby Auto, and Fade Standby Manual states are transition states that define the transition of the Lightness Out and LuxLevel Out states. This transition can be started as a result of the Light LC State Machine change or as a result of receiving the Light LC Light OnOff Set or Light LC Light Set Unacknowledged message. The value of transition time

esp_ble_mesh_lc_state_t **state**
The value of Light LC state machine state

struct k_delayed_work **timer**
Timer of Light LC state machine

struct esp_ble_mesh_light_control_t
Parameters of Light Lightness controller

Public Members

exp_ble_mesh_light_lc_state_t **state**
Parameters of Light LC state

exp_ble_mesh_light_lc_property_state_t **prop_state**
Parameters of Light LC Property state

exp_ble_mesh_light_lc_state_machine_t **state_machine**
Parameters of Light LC state machine

struct esp_ble_mesh_light_lc_srv_t
User data of Light LC Server Model

Public Members

exp_ble_mesh_model_t * **model**
Pointer to the Lighting LC Server Model. Initialized internally.

exp_ble_mesh_server_rsp_ctrl_t **rsp_ctrl**
Response control of the server model received messages

exp_ble_mesh_light_control_t * **lc**
Parameters of the Light controller

exp_ble_mesh_last_msg_info_t **last**
Parameters of the last received set message

exp_ble_mesh_state_transition_t **transition**
Parameters of state transition

struct esp_ble_mesh_light_lc_setup_srv_t
User data of Light LC Setup Server Model
Public Members

`esp_ble_mesh_model_t *model`
Pointer to the Lighting LC Setup Server Model. Initialized internally.

`esp_ble_mesh_server_rsp_ctrl_t *rsp_ctrl`
Response control of the server model received messages

`esp_ble_mesh_light_control_t *lc`
Parameters of the Light controller

`struct esp_ble_mesh_state_change_light_lightness_set_t`
Parameter of Light Lightness Actual state change event

Public Members

`uint16_t lightness`
The value of Light Lightness Actual state

`struct esp_ble_mesh_state_change_light_lightness_linear_set_t`
Parameter of Light Lightness Linear state change event

Public Members

`uint16_t lightness`
The value of Light Lightness Linear state

`struct esp_ble_mesh_state_change_light_lightness_default_set_t`
Parameter of Light Lightness Default state change event

Public Members

`uint16_t lightness`
The value of Light Lightness Default state

`struct esp_ble_mesh_state_change_light_lightness_range_set_t`
Parameters of Light Lightness Range state change event

Public Members

`uint16_t range_min`
The minimum value of Light Lightness Range state

`uint16_t range_max`
The maximum value of Light Lightness Range state

`struct esp_ble_mesh_state_change_light_ctl_set_t`
Parameters of Light CTL state change event

Public Members

`uint16_t lightness`
The value of Light CTL Lightness state

`uint16_t temperature`
The value of Light CTL Temperature state

`int16_t delta_uv`
The value of Light CTL Delta UV state
struct esp_ble_mesh_state_change_light_ctl_temperature_set_t
Parameters of Light CTL Temperature state change event

Public Members

uint16_t temperature
The value of Light CTL Temperature state

int16_t delta_uv
The value of Light CTL Delta UV state

struct esp_ble_mesh_state_change_light_ctl_temperature_range_set_t
Parameters of Light CTL Temperature Range state change event

Public Members

uint16_t range_min
The minimum value of Light CTL Temperature Range state

uint16_t range_max
The maximum value of Light CTL Temperature Range state

struct esp_ble_mesh_state_change_light_ctl_default_set_t
Parameters of Light CTL Default state change event

Public Members

uint16_t lightness
The value of Light Lightness Default state

uint16_t temperature
The value of Light CTL Temperature Default state

int16_t delta_uv
The value of Light CTL Delta UV Default state

struct esp_ble_mesh_state_change_light_hsl_set_t
Parameters of Light HSL state change event

Public Members

uint16_t lightness
The value of Light HSL Lightness state

uint16_t hue
The value of Light HSL Hue state

uint16_t saturation
The value of Light HSL Saturation state

struct esp_ble_mesh_state_change_light_hsl_hue_set_t
Parameter of Light HSL Hue state change event

Public Members

uint16_t hue
The value of Light HSL Hue state

struct esp_ble_mesh_state_change_light_hsl_saturation_set_t
Parameter of Light HSL Saturation state change event
Public Members

uint16_t saturation
The value of Light HSL Saturation state

struct esp_ble_mesh_state_change_light_hsl_default_set_t
Parameters of Light HSL Default state change event

Public Members

uint16_t lightness
The value of Light HSL Lightness Default state

uint16_t hue
The value of Light HSL Hue Default state

uint16_t saturation
The value of Light HSL Saturation Default state

struct esp_ble_mesh_state_change_light_hsl_range_set_t
Parameters of Light HSL Range state change event

Public Members

uint16_t hue_range_min
The minimum hue value of Light HSL Range state

uint16_t hue_range_max
The maximum hue value of Light HSL Range state

uint16_t saturation_range_min
The minimum saturation value of Light HSL Range state

uint16_t saturation_range_max
The maximum saturation value of Light HSL Range state

struct esp_ble_mesh_state_change_light_xyl_set_t
Parameters of Light xyL state change event

Public Members

uint16_t lightness
The value of Light xyL Lightness state

uint16_t x
The value of Light xyL x state

uint16_t y
The value of Light xyL y state

struct esp_ble_mesh_state_change_light_xyl_default_set_t
Parameters of Light xyL Default state change event

Public Members

uint16_t lightness
The value of Light Lightness Default state

uint16_t x
The value of Light xyL x Default state
uint16_t y
The value of Light xyL y Default state

struct esp_ble_mesh_state_change_light_xyl_range_set_t
Parameters of Light xyL Range state change event

Public Members

uint16_t x_range_min
The minimum value of Light xyL x Range state

uint16_t x_range_max
The maximum value of Light xyL x Range state

uint16_t y_range_min
The minimum value of Light xyL y Range state

uint16_t y_range_max
The maximum value of Light xyL y Range state

struct esp_ble_mesh_state_change_light_lc_mode_set_t
Parameter of Light LC Mode state change event

Public Members

uint8_t mode
The value of Light LC Mode state

struct esp_ble_mesh_state_change_light_lc_om_set_t
Parameter of Light LC Occupancy Mode state change event

Public Members

uint8_t mode
The value of Light LC Occupancy Mode state

struct esp_ble_mesh_state_change_light_lc_light_onoff_set_t
Parameter of Light LC Light OnOff state change event

Public Members

uint8_t onoff
The value of Light LC Light OnOff state

struct esp_ble_mesh_state_change_light_lc_property_set_t
Parameters of Light LC Property state change event

Public Members

uint16_t property_id
The property id of Light LC Property state

struct net_buf_simple *property_value
The property value of Light LC Property state

struct esp_ble_mesh_state_change_sensor_status_t
Parameters of Sensor Status state change event
Chapter 2  API Reference

Public Members

uint16_t property_id
The value of Sensor Property ID

uint8_t occupancy
The value of Light LC Occupancy state

uint32_t set_occupancy_to_1_delay
The value of Light LC Set Occupancy to 1 Delay state

uint32_t ambient_luxlevel
The value of Light LC Ambient Luxlevel state

union esp_ble_mesh_state_change_sensor_status_t::[anonymous] state
Parameters of Sensor Status related state

struct esp_ble_mesh_server_recv_light_lc_property_get_t
Context of the received Light LC Property Get message

Public Members

uint16_t property_id
Property ID identifying a Light LC Property

struct esp_ble_mesh_server_recv_light_lightness_set_t
Context of the received Light Lightness Set message

Public Members

bool op_en
Indicate if optional parameters are included

uint16_t lightness
Target value of light lightness actual state

uint8_t tid
Transaction ID

uint8_t trans_time
Time to complete state transition (optional)

uint8_t delay
Indicate message execution delay (C.1)

struct esp_ble_mesh_server_recv_light_lightness_linear_set_t
Context of the received Light Lightness Linear Set message

Public Members

bool op_en
Indicate if optional parameters are included

uint16_t lightness
Target value of light lightness linear state

uint8_t tid
Transaction ID

uint8_t trans_time
Time to complete state transition (optional)
uint8_t delay
   Indicate message execution delay (C.1)

struct esp_ble_mesh_server_recv_light_lightness_default_set_t
   Context of the received Light Lightness Default Set message

Public Members

uint16_t lightness
   The value of the Light Lightness Default state

struct esp_ble_mesh_server_recv_light_lightness_range_set_t
   Context of the received Light Lightness Range Set message

Public Members

uint16_t range_min
   Value of range min field of light lightness range state

uint16_t range_max
   Value of range max field of light lightness range state

struct esp_ble_mesh_server_recv_light_ctl_set_t
   Context of the received Light CTL Set message

Public Members

bool op_en
   Indicate if optional parameters are included

uint16_t lightness
   Target value of light ctl lightness state

uint16_t temperature
   Target value of light ctl temperature state

int16_t delta_uv
   Target value of light ctl delta UV state

uint8_t tid
   Transaction ID

uint8_t trans_time
   Time to complete state transition (optional)

uint8_t delay
   Indicate message execution delay (C.1)

struct esp_ble_mesh_server_recv_light_ctl_temperature_set_t
   Context of the received Light CTL Temperature Set message

Public Members

bool op_en
   Indicate if optional parameters are included

uint16_t temperature
   Target value of light ctl temperature state

int16_t delta_uv
   Target value of light ctl delta UV state
Chapter 2. API Reference

```c
uint8_t tid
    Transaction ID
uint8_t trans_time
    Time to complete state transition (optional)
uint8_t delay
    Indicate message execution delay (C.1)
```

```c
struct esp_ble_mesh_server_recv_light_ctl_temperature_range_set_t
    Context of the received Light CTL Temperature Range Set message
```

**Public Members**

```c
uint16_t range_min
    Value of temperature range min field of light ctl temperature range state
uint16_t range_max
    Value of temperature range max field of light ctl temperature range state
```

```c
struct esp_ble_mesh_server_recv_light_ctl_default_set_t
    Context of the received Light CTL Default Set message
```

**Public Members**

```c
uint16_t lightness
    Value of light lightness default state
uint16_t temperature
    Value of light temperature default state
int16_t delta_uv
    Value of light delta UV default state
```

```c
struct esp_ble_mesh_server_recv_light_hsl_set_t
    Context of the received Light HSL Set message
```

**Public Members**

```c
bool op_en
    Indicate if optional parameters are included
uint16_t lightness
    Target value of light hsl lightness state
uint16_t hue
    Target value of light hsl hue state
uint16_t saturation
    Target value of light hsl saturation state
uint8_t tid
    Transaction ID
uint8_t trans_time
    Time to complete state transition (optional)
uint8_t delay
    Indicate message execution delay (C.1)
```

```c
struct esp_ble_mesh_server_recv_light_hsl_hue_set_t
    Context of the received Light HSL Hue Set message
```
Public Members

bool op_en
   Indicate if optional parameters are included

uint16_t hue
   Target value of light hsl hue state

uint8_t tid
   Transaction ID

uint8_t trans_time
   Time to complete state transition (optional)

uint8_t delay
   Indicate message execution delay (C.1)

struct esp_ble_mesh_server_recv_light_hsl_saturation_set_t
   Context of the received Light HSL Saturation Set message

Public Members

bool op_en
   Indicate if optional parameters are included

uint16_t saturation
   Target value of light hsl hue state

uint8_t tid
   Transaction ID

uint8_t trans_time
   Time to complete state transition (optional)

uint8_t delay
   Indicate message execution delay (C.1)

struct esp_ble_mesh_server_recv_light_hsl_default_set_t
   Context of the received Light HSL Default Set message

Public Members

uint16_t lightness
   Value of light lightness default state

uint16_t hue
   Value of light hue default state

uint16_t saturation
   Value of light saturation default state

struct esp_ble_mesh_server_recv_light_hsl_range_set_t
   Context of the received Light HSL Range Set message

Public Members

uint16_t hue_range_min
   Value of hue range min field of light hsl hue range state

uint16_t hue_range_max
   Value of hue range max field of light hsl hue range state
Chapter 2. API Reference

uint16_t saturation_range_min
Value of saturation range min field of light hsl saturation range state

uint16_t saturation_range_max
Value of saturation range max field of light hsl saturation range state

struct esp_ble_mesh_server_recv_light_xyl_set_t
Context of the received Light xyl Set message

Public Members

bool op_en
Indicate whether optional parameters included

uint16_t lightness
The target value of the Light xyl Lightness state

uint16_t x
The target value of the Light xyl x state

uint16_t y
The target value of the Light xyl y state

uint8_t tid
Transaction Identifier

uint8_t trans_time
Time to complete state transition (optional)

uint8_t delay
Indicate message execution delay (C.1)

struct esp_ble_mesh_server_recv_light_xyl_default_set_t
Context of the received Light xyl Default Set message

Public Members

uint16_t lightness
The value of the Light Lightness Default state

uint16_t x
The value of the Light xyl x Default state

uint16_t y
The value of the Light xyl y Default state

struct esp_ble_mesh_server_recv_light_xyl_range_set_t
Context of the received Light xyl Range Set message

Public Members

uint16_t x_range_min
The value of the xyl x Range Min field of the Light xyl x Range state

uint16_t x_range_max
The value of the xyl x Range Max field of the Light xyl x Range state

uint16_t y_range_min
The value of the xyl y Range Min field of the Light xyl y Range state

uint16_t y_range_max
The value of the xyl y Range Max field of the Light xyl y Range state
**struct esp_ble_mesh_server_recv_light_lc_mode_set_t**
Context of the received Light LC Mode Set message

**Public Members**

```plaintext
uint8_t mode
The target value of the Light LC Mode state
```

**struct esp_ble_mesh_server_recv_light_lc_om_set_t**
Context of the received Light OM Set message

**Public Members**

```plaintext
uint8_t mode
The target value of the Light LC Occupancy Mode state
```

**struct esp_ble_mesh_server_recv_light_lc_light_onoff_set_t**
Context of the received Light LC Light OnOff Set message

**Public Members**

```plaintext
bool op_en
Indicate whether optional parameters included

uint8_t light_onoff
The target value of the Light LC Light OnOff state

uint8_t tid
Transaction Identifier

uint8_t trans_time
Time to complete state transition (optional)

uint8_t delay
Indicate message execution delay (C.1)
```

**struct esp_ble_mesh_server_recv_light_lc_property_set_t**
Context of the received Light LC Property Set message

**Public Members**

```plaintext
uint16_t property_id
Property ID identifying a Light LC Property

struct net_buf_simple *property_value
Raw value for the Light LC Property
```

**struct esp_ble_mesh_server_recv_sensor_status_t**
Context of the received Sensor Status message

**Public Members**

```plaintext
struct net_buf_simple *data
Value of sensor data state (optional)
```

**struct esp_ble_mesh_lighting_server_cb_param_t**
Lighting Server Model callback parameters
Public Members

- `esp_ble_mesh_model_t* model`
  Pointer to Lighting Server Models

- `esp_ble_mesh_msg_ctx_t ctx`
  Context of the received messages

- `esp_ble_mesh_lighting_server_cb_value_t value`
  Value of the received Lighting Messages

Macros

**ESP_BLE_MESH_MODEL_LIGHT_LIGHTNESS_CLI** (cli_pub, cli_data)
Define a new Light Lightness Client Model.

**Note** This API needs to be called for each element on which the application needs to have a Light Lightness Client Model.

**Return** New Light Lightness Client Model instance.

**Parameters**
- `cli_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `cli_data`: Pointer to the unique struct `esp_ble_mesh_client_t`.

**ESP_BLE_MESH_MODEL_LIGHT_CTL_CLI** (cli_pub, cli_data)
Define a new Light CTL Client Model.

**Note** This API needs to be called for each element on which the application needs to have a Light CTL Client Model.

**Return** New Light CTL Client Model instance.

**Parameters**
- `cli_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `cli_data`: Pointer to the unique struct `esp_ble_mesh_client_t`.

**ESP_BLE_MESH_MODEL_LIGHT_HSL_CLI** (cli_pub, cli_data)
Define a new Light HSL Client Model.

**Note** This API needs to be called for each element on which the application needs to have a Light HSL Client Model.

**Return** New Light HSL Client Model instance.

**Parameters**
- `cli_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `cli_data`: Pointer to the unique struct `esp_ble_mesh_client_t`.

**ESP_BLE_MESH_MODEL_LIGHT_XYL_CLI** (cli_pub, cli_data)
Define a new Light xyL Client Model.

**Note** This API needs to be called for each element on which the application needs to have a Light xyL Client Model.

**Return** New Light xyL Client Model instance.

**Parameters**
- `cli_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `cli_data`: Pointer to the unique struct `esp_ble_mesh_client_t`.

**ESP_BLE_MESH_MODEL_LIGHT_LC_CLI** (cli_pub, cli_data)
Define a new Light LC Client Model.

**Note** This API needs to be called for each element on which the application needs to have a Light LC Client Model.

**Return** New Light LC Client Model instance.

**Parameters**
- `cli_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `cli_data`: Pointer to the unique struct `esp_ble_mesh_client_t`.

**ESP_BLE_MESH_MODEL_LIGHT_LIGHTNESS_SRV** (srv_pub, srv_data)
Lighting Server Models related context.
Define a new Lightness Server Model.

**Note** 1. The Lightness Server model extends the Generic Power OnOff Server model and the Generic Level Server model. When this model is present on an Element, the corresponding Lightness Setup Server model shall also be present.
   1. This model shall support model publication and model subscription.
**Return** New Lightness Server Model instance.

**Parameters**
- `srv_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data`: Pointer to the unique struct `esp_ble_mesh_lightness_srv_t`.

**ESP_BLE_MESH_MODEL_LIGHT_LIGHTNESS_SRV** (`srv_pub`, `srv_data`)

Define a new Lightness Server Model.

**Note** 1. The Lightness Server model extends the Generic Power OnOff Server model.
   1. This model shall support model publication and model subscription.
**Return** New Lightness Server Model instance.

**Parameters**
- `srv_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data`: Pointer to the unique struct `esp_ble_mesh_lightness_srv_t`.

**ESP_BLE_MESH_MODEL_LIGHT_LIGHTNESS_SETUP_SRV** (`srv_pub`, `srv_data`)

Define a new Lightness Setup Server Model.

**Note** 1. The Lightness Setup Server model extends the Lightness Server model and the Generic Power OnOff Setup Server model.
   1. This model shall support model subscription.
**Return** New Lightness Setup Server Model instance.

**Parameters**
- `srv_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data`: Pointer to the unique struct `esp_ble_mesh_lightness_setup_srv_t`.

**ESP_BLE_MESH_MODEL_LIGHT_CTL_SRV** (`srv_pub`, `srv_data`)

Define a new CTL Server Model.

**Note** 1. The CTL Server model extends the Lightness Server model. When this model is present on an Element, the corresponding CTL Temperature Server model and the corresponding CTL Setup Server model shall also be present.
   1. This model shall support model publication and model subscription.
   2. The model requires two elements: the main element and the Temperature element. The Temperature element contains the corresponding CTL Temperature Server model and an instance of a Generic Level state bound to the Light CTL Temperature state on the Temperature element. The Light CTL Temperature state on the Temperature element is bound to the Light CTL state on the main element.
**Return** New CTL Server Model instance.

**Parameters**
- `srv_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data`: Pointer to the unique struct `esp_ble_mesh_light_ctl_srv_t`.

**ESP_BLE_MESH_MODEL_LIGHT_CTL_SETUP_SRV** (`srv_pub`, `srv_data`)

Define a new CTL Setup Server Model.

**Note** 1. The CTL Setup Server model extends the CTL Server and the Lightness Setup Server.
   1. This model shall support model subscription.
**Return** New CTL Setup Server Model instance.

**Parameters**
- `srv_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data`: Pointer to the unique struct `esp_ble_mesh_light_ctl_setup_srv_t`.

**ESP_BLE_MESH_MODEL_LIGHT_CTL_TEMP_SRV** (`srv_pub`, `srv_data`)

Define a new CTL Temperature Server Model.

**Note** 1. The CTL Temperature Server model extends the Generic Level Server model.
   1. This model shall support model publication and model subscription.
**Return** New CTL Temperature Server Model instance.

**Parameters**
- `srv_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data`: Pointer to the unique struct `esp_ble_mesh_light_ctl_temp_srv_t`.

**ESP_BLE_MESH_MODEL_LIGHT_HSL_SRV** (`srv_pub`, `srv_data`)

Define a new HSL Server Model.
Note 1. The Light HSL Server model extends the Light Lightness Server model. When this model is present on an Element, the corresponding Light HSL Hue Server model and the corresponding Light HSL Saturation Server model and the corresponding Light HSL Setup Server model shall also be present.

1. This model shall support model publication and model subscription.
2. The model requires three elements: the main element and the Hue element and the Saturation element. The Hue element contains the corresponding Light HSL Hue Server model and an instance of a Generic Level state bound to the Light HSL Hue state on the Hue element. The Saturation element contains the corresponding Light HSL Saturation Server model and an instance of a Generic Level state bound to the Light HSL Saturation state on the Saturation element. The Light HSL Hue state on the Hue element is bound to the Light HSL state on the main element and the Light HSL Saturation state on the Saturation element is bound to the Light HSL state on the main element.

Return New Light HSL Server Model instance.

Parameters
- srv_pub: Pointer to the unique struct esp_ble_mesh_model_pub_t.
- srv_data: Pointer to the unique struct esp_ble_mesh_light_hsl_srv_t.

ESP_BLE_MESH_MODEL_LIGHT_HSL_SETUP_SRV (srv_pub, srv_data)
Define a new Light HSL Setup Server Model.

Note 1. The Light HSL Setup Server model extends the Light HSL Server and the Light Lightness Setup Server.

Return New Light HSL Setup Server Model instance.

Parameters
- srv_pub: Pointer to the unique struct esp_ble_mesh_model_pub_t.
- srv_data: Pointer to the unique struct esp_ble_mesh_light_hsl_setup_srv_t.

ESP_BLE_MESH_MODEL_LIGHT_HSL_HUE_SRV (srv_pub, srv_data)
Define a new Light HSL Hue Server Model.

Note 1. The Light HSL Hue Server model extends the Generic Level Server model. This model is associated with the Light HSL Server model.

1. This model shall support model publication and model subscription.

Return New Light HSL Hue Server Model instance.

Parameters
- srv_pub: Pointer to the unique struct esp_ble_mesh_model_pub_t.
- srv_data: Pointer to the unique struct esp_ble_mesh_light_hsl_hue_srv_t.

ESP_BLE_MESH_MODEL_LIGHT_HSL_SAT_SRV (srv_pub, srv_data)
Define a new Light HSL Saturation Server Model.

Note 1. The Light HSL Saturation Server model extends the Generic Level Server model. This model is associated with the Light HSL Server model.

1. This model shall support model publication and model subscription.

Return New Light HSL Saturation Server Model instance.

Parameters
- srv_pub: Pointer to the unique struct esp_ble_mesh_model_pub_t.
- srv_data: Pointer to the unique struct esp_ble_mesh_light_hsl_sat_srv_t.

ESP_BLE_MESH_MODEL_LIGHT_XYL_SRV (srv_pub, srv_data)
Define a new Light xyL Server Model.

Note 1. The Light xyL Server model extends the Light Lightness Server model. When this model is present on an Element, the corresponding Light xyL Setup Server model shall also be present.

1. This model shall support model publication and model subscription.

Return New Light xyL Server Model instance.

Parameters
- srv_pub: Pointer to the unique struct esp_ble_mesh_model_pub_t.
- srv_data: Pointer to the unique struct esp_ble_mesh_light_xyl_srv_t.

ESP_BLE_MESH_MODEL_LIGHT_XYL_SETUP_SRV (srv_pub, srv_data)
Define a new Light xyL Setup Server Model.
Note 1. The Light xY L Setup Server model extends the Light xY L Server and the Light Lightness Setup Server.
1. This model shall support model subscription.

Return New Light xY L Setup Server Model instance.

Parameters
- `srv_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data`: Pointer to the unique struct `esp_ble_mesh_light_xyl_setup_srv_t`.

`ESP_BLE_MESH_MODEL_LIGHT_XYL_SETUP_SRV` (srv_pub, srv_data)
Define a new Light xY L Setup Server Model.

Note 1. The Light xY L (Lightness Control) Setup Server model extends the Light Lightness Server model and the
Generic OnOff Server model. When this model is present on an Element, the corresponding Light xY L Setup Server model shall also be present.
1. This model shall support model publication and model subscription.
2. This model may be used to represent an element that is a client to a Sensor Server model and controls
the Light Lightness Actual state via defined state bindings.

Return New Light xY L Setup Server Model instance.

Parameters
- `srv_pub`: Pointer to the unique struct `esp_ble_mesh_model_pub_t`.
- `srv_data`: Pointer to the unique struct `esp_ble_mesh_light_xyl_setup_srv_t`.

Type Definitions

`typedef` `void` (*`esp_ble_mesh_light_client_cb_t`)(
`esp_ble_mesh_light_client_cb_event_t` event,
`esp_ble_mesh_light_client_cb_param_t` *param)

Bluetooth Mesh Light Client Model function.
Lighting Client Model callback function type

Parameters
- `event`: Event type
- `param`: Pointer to callback parameter

`typedef` `void` (*`esp_ble_mesh_lighting_server_cb_t`)(
`esp_ble_mesh_lighting_server_cb_event_t` event,
`esp_ble_mesh_lighting_server_cb_param_t` *param)

Bluetooth Mesh Lighting Server Model function.
Lighting Server Model callback function type

Parameters
- `event`: Event type
- `param`: Pointer to callback parameter

Enumerations

`enum` `esp_ble_mesh_light_client_cb_event_t`
This enum value is the event of Lighting Client Model

Values:

`ESP_BLE_MESH_LIGHT_CLIENT_GET_STATE_EVT`
Chapter 2. API Reference

```c
enum esp_ble_mesh_lc_state_t
This enum value is the Light LC State Machine states

Values:
- ESP_BLE_MESH_LC_OFF
- ESP_BLE_MESH_LC_STANDBY
- ESP_BLE_MESH_LC_FADE_ON
- ESP_BLE_MESH_LC_RUN
- ESP_BLE_MESH_LC_FADE
- ESP_BLE_MESH_LC_PROLONG
- ESP_BLE_MESH_LC_FADE_STANDBY_AUTO
- ESP_BLE_MESH_LC_FADE_STANDBY_MANUAL

enum esp_ble_mesh_lighting_server_cb_event_t
This enum value is the event of Lighting Server Model

Values:
- ESP_BLE_MESH_LIGHTING_SERVER_STATE_CHANGE_EVT
  1. When get_auto_rsp is set to ESP_BLE_MESH_SERVER_AUTO_RSP, no event will be callback to the application layer when Lighting Get messages are received.
  2. When set_auto_rsp is set to ESP_BLE_MESH_SERVER_AUTO_RSP, this event will be callback to the application layer when Lighting Set/Set Unack messages are received.
- ESP_BLE_MESH_LIGHTING_SERVER_RECV_GET_MSG_EVT
  When get_auto_rsp is set to ESP_BLE_MESH_SERVER_RSP_BY_APP, this event will be callback to the application layer when Lighting Get messages are received.
- ESP_BLE_MESH_LIGHTING_SERVER_RECV_SET_MSG_EVT
  When set_auto_rsp is set to ESP_BLE_MESH_SERVER_RSP_BY_APP, this event will be callback to the application layer when Lighting Set/Set Unack messages are received.
- ESP_BLE_MESH_LIGHTING_SERVER_RECV_STATUS_MSG_EVT
  When status_auto_rsp is set to ESP_BLE_MESH_SERVER_RSP_BY_APP, this event will be callback to the application layer when Sensor Status message is received.
- ESP_BLE_MESH_LIGHTING_SERVER_EVT_MAX

ESP-IDF currently supports two host stacks. The Bluedroid based stack (default) supports classic Bluetooth as well as BLE. On the other hand, Apache NimBLE based stack is BLE only. For users to make a choice:

- For usecases involving classic Bluetooth as well as BLE, Bluedroid should be used.
- For BLE-only usecases, using NimBLE is recommended. It is less demanding in terms of code footprint and runtime memory, making it suitable for such scenarios.

Code examples for this API section are provided in the bluetooth/bluedroid directory of ESP-IDF examples.

The following examples contain detailed walkthroughs:
- GATT Client Example Walkthrough
- GATT Server Service Table Example Walkthrough
- GATT Server Example Walkthrough
- GATT Security Client Example Walkthrough
- GATT Security Server Example Walkthrough
- GATT Client Multi-connection Example Walkthrough
```
2.2 Networking APIs

2.2.1 Wi-Fi

Introduction  The Wi-Fi libraries provide support for configuring and monitoring the ESP32-S3 Wi-Fi networking functionality. This includes configuration for:

- Station mode (aka STA mode or Wi-Fi client mode). ESP32-S3 connects to an access point.
- AP mode (aka Soft-AP mode or Access Point mode). Stations connect to the ESP32-S3.
- Station/AP-coexistence mode (ESP32-S3 is concurrently an access point and a station connected to another access point).
- Various security modes for the above (WPA, WPA2, WEP, etc.).
- Scanning for access points (active & passive scanning).
- Promiscuous mode for monitoring of IEEE802.11 Wi-Fi packets.

Application Examples  The wifi directory of ESP-IDF examples contains the following applications:

- Code examples for Wi-Fi.
- A simple esp-idf-template application to demonstrate a minimal IDF project structure.

API Reference

Header File

- components/esp_wifi/include/esp_wifi.h

Functions

**esp_err_t esp_wifi_init**(const wifi_init_config_t *config)

Initialize WiFi Allocate resource for WiFi driver, such as WiFi control structure, RX/TX buffer, WiFi NVS structure etc. This WiFi also starts WiFi task.

**Attention**  1. This API must be called before all other WiFi API can be called

**Attention**  2. Always use WIFI_INIT_CONFIG_DEFAULT macro to initialize the configuration to default values, this can guarantee all the fields get correct value when more fields are added into wifi_init_config_t in future release. If you want to set your own initial values, overwrite the default values which are set by WIFI_INIT_CONFIG_DEFAULT. Please be notified that the field ‘magic’ of wifi_init_config_t should always be WIFI_INIT_CONFIG_MAGIC!

**Return**

- ESP_OK: succeed
- ESP_ERR_NO_MEM: out of memory
- others: refer to error code esp_err.h

**Parameters**

- config: pointer to WiFi initialized configuration structure; can point to a temporary variable.

**esp_err_t esp_wifi_deinit**(void)

Deinit WiFi Free all resource allocated in esp_wifi_init and stop WiFi task.

**Attention**  1. This API should be called if you want to remove WiFi driver from the system

**Return**

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init

**esp_err_t esp_wifi_set_mode**(wifi_mode_t mode)

Set the WiFi operating mode.

Set the WiFi operating mode as station, soft-AP or station+soft-AP, The default mode is station mode.

**Return**
• ESP_OK: succeed
• ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
• ESP_ERR_INVALID_ARG: invalid argument
• others: refer to error code in esp_err.h

Parameters
• mode: WiFi operating mode

*esp_err_t* esp_wifi_get_mode (wifi_mode_t *mode)

Get current operating mode of WiFi.

Return
• ESP_OK: succeed
• ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
• ESP_ERR_INVALID_ARG: invalid argument

Parameters
• [out] mode: store current WiFi mode

*esp_err_t* esp_wifi_start (void)

Start WiFi according to current configuration If mode is WIFI_MODE_STA, it create station control block and start station If mode is WIFI_MODE_AP, it create soft-AP control block and start soft-AP If mode is WIFI_MODE_APSTA, it create soft-AP and station control block and start soft-AP and station.

Return
• ESP_OK: succeed
• ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
• ESP_ERR_INVALID_ARG: invalid argument
• ESP_ERR_NO_MEM: out of memory
• ESP_ERR_WIFI_CONN: WiFi internal error, station or soft-AP control block wrong
• ESP_FAIL: other WiFi internal errors

*esp_err_t* esp_wifi_stop (void)

Stop WiFi If mode is WIFI_MODE_STA, it stop station and free station control block If mode is WIFI_MODE_AP, it stop soft-AP and free soft-AP control block If mode is WIFI_MODE_APSTA, it stop station/soft-AP and free station/soft-AP control block.

Return
• ESP_OK: succeed
• ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init

*esp_err_t* esp_wifi_restore (void)

Restore WiFi stack persistent settings to default values.

This function will reset settings made using the following APIs:
• esp_wifi_set_bandwidth
• esp_wifi_set_protocol
• esp_wifi_set_config related
• esp_wifi_set_mode

Return
• ESP_OK: succeed
• ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init

*esp_err_t* esp_wifi_connect (void)

Connect the ESP32 WiFi station to the AP.

Attention 1. This API only impact WIFI_MODE_STA or WIFI_MODE_APSTA mode
Attention 2. If the ESP32 is connected to an AP, call esp_wifi_disconnect to disconnect.
Attention 3. The scanning triggered by esp_wifi_start_scan() will not be effective until connection between ESP32 and the AP is established. If ESP32 is scanning and connecting at the same time, ESP32 will abort scanning and return a warning message and error number ESP_FAIL: other WiFi internal errors. If you want to do reconnection after ESP32 received disconnect event, remember to add the maximum retry time, otherwise the called scan will not work. This is especially true when the AP doesn’t exist, and you still try reconnection after ESP32 received disconnect event with the reason code WIFI_REASON_NO_AP_FOUND.
Return

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_NOT_STARTED: WiFi is not started by esp_wifi_start
- ESP_ERR_WIFI_CONN: WiFi internal error, station or soft-AP control block wrong
- ESP_ERR_WIFI_SSID: SSID of AP which station connects is invalid

**esp_err_t esp_wifi_disconnect (void)**
Disconnect the ESP32 WiFi station from the AP.

Return

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi was not initialized by esp_wifi_init
- ESP_ERR_WIFI_NOT_STARTED: WiFi was not started by esp_wifi_start
- ESP_FAIL: other WiFi internal errors

**esp_err_t esp_wifi_clear_fast_connect (void)**
Currently this API is just a stub API.

Return

- ESP_OK: succeed
- others: fail

**esp_err_t esp_wifi_deauth_sta (uint16_t aid)**
deauthenticate all stations or associated id equals to aid

Return

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_NOT_STARTED: WiFi was not started by esp_wifi_start
- ESP_ERR_INVALID_ARG: invalid argument
- ESP_ERR_WIFI_MODE: WiFi mode is wrong

Parameters

- aid: when aid is 0, deauthenticate all stations, otherwise deauthenticate station whose associated id is aid

**esp_err_t esp_wifi_scan_start (const wifi_scan_config_t *config, bool block)**
Scan all available APs.

Attention If this API is called, the found APs are stored in WiFi driver dynamic allocated memory and the will be freed in esp_wifi_scan_get_ap_records, so generally, call esp_wifi_scan_get_ap_records to cause the memory to be freed once the scan is done

Attention The values of maximum active scan time and passive scan time per channel are limited to 1500 milliseconds. Values above 1500ms may cause station to disconnect from AP and are not recommended.

Return

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_NOT_STARTED: WiFi was not started by esp_wifi_start
- ESP_ERR_WIFI_TIMEOUT: blocking scan is timeout
- ESP_ERR_WIFI_STATE: wifi still connecting when invoke esp_wifi_scan_start
- others: refer to error code in esp_err.h

Parameters

- config: configuration of scanning
- block: if block is true, this API will block the caller until the scan is done, otherwise it will return immediately

**esp_err_t esp_wifi_scan_stop (void)**
Stop the scan in process.

Return

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_NOT_STARTED: WiFi is not started by esp_wifi_start
`esp_err_t esp_wifi_scan_get_ap_num(uint16_t *number)`
Get number of APs found in last scan.

**Attention** This API can only be called when the scan is completed, otherwise it may get wrong value.

**Return**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_NOT_STARTED: WiFi is not started by esp_wifi_start
- ESP_ERR_INVALID_ARG: invalid argument

**Parameters**
- `[out]` number: store number of APIs found in last scan

`esp_err_t esp_wifi_scan_get_ap_records(uint16_t *number, wifi_ap_record_t *ap_records)`
Get AP list found in last scan.

**Return**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_NOT_STARTED: WiFi is not started by esp_wifi_start
- ESP_ERR_INVALID_ARG: invalid argument
- ESP_ERR_NO_MEM: out of memory

**Parameters**
- `[inout]` number: As input param, it stores max AP number ap_records can hold. As output param, it receives the actual AP number this API returns.
- `[ap_records]` wifi_ap_record_t array to hold the found APIs

`esp_err_t esp_wifi_sta_get_ap_info(wifi_ap_record_t *ap_info)`
Get information of AP which the ESP32 station is associated with.

**Attention** When the obtained country information is empty, it means that the AP does not carry country information

**Return**
- ESP_OK: succeed
- ESP_ERR_WIFI_CONN: The station interface not initialized
- ESP_ERR_WIFI_NOT_CONNECT: The station is in disconnect status

**Parameters**
- `ap_info`: the wifi_ap_record_t to hold AP information sta can get the connected ap’s phy mode info through the struct member phy_11b, phy_11g, phy_11n, phy_1 in the wifi_ap_record_t struct. For example, phy_11b = 1 imply that ap support 802.11b mode

`esp_err_t esp_wifi_set_ps(wifi_ps_type_t type)`
Set current WiFi power save type.

**Attention** Default power save type is WIFI_PS_MIN_MODEM.

**Return**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_IF: invalid interface

**Parameters**
- `type`: power save type

`esp_err_t esp_wifi_get_ps(wifi_ps_type_t *type)`
Get current WiFi power save type.

**Attention** Default power save type is WIFI_PS_MIN_MODEM.

**Return**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_IF: invalid interface

**Parameters**
- `[out]` type: store current power save type

`esp_err_t esp_wifi_set_protocol(wifi_interface_t ifx, uint8_t protocol_bitmap)`
Set protocol type of specified interface The default protocol is (WIFI_PROTOCOL_11B|WIFI_PROTOCOL_11G|WIFI_PROTOCOL_11N)

**Attention** Currently we only support 802.11b or 802.11bg or 802.11bgn mode

**Return**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_IF: invalid interface
Chapter 2. API Reference

- others: refer to error codes in esp_err.h

Parameters
- ifx: interfaces
- protocol_bitmap: WiFi protocol bitmap

```c
esp_err_t esp_wifi_get_protocol(wifi_interface_t ifx, uint8_t* protocol_bitmap)
```
Get the current protocol bitmap of the specified interface.

Return
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_IF: invalid interface
- ESP_ERR_INVALID_ARG: invalid argument
- others: refer to error codes in esp_err.h

Parameters
- ifx: interface
- [out] protocol_bitmap: store current WiFi protocol bitmap of interface ifx

```c
esp_err_t esp_wifi_set_bandwidth(wifi_interface_t ifx, wifi_bandwidth_t bw)
```
Set the bandwidth of ESP32 specified interface.

Attention 1. API return false if try to configure an interface that is not enabled
Attention 2. WIFI_BW_HT40 is supported only when the interface support 11N

Return
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_IF: invalid interface
- ESP_ERR_INVALID_ARG: invalid argument
- others: refer to error codes in esp_err.h

Parameters
- ifx: interface to be configured
- bw: bandwidth

```c
esp_err_t esp_wifi_get_bandwidth(wifi_interface_t ifx, wifi_bandwidth_t* bw)
```
Get the bandwidth of ESP32 specified interface.

Attention 1. API return false if try to get a interface that is not enable

Return
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_IF: invalid interface
- ESP_ERR_INVALID_ARG: invalid argument

Parameters
- ifx: interface to be configured
- [out] bw: store bandwidth of interface ifx

```c
esp_err_t esp_wifi_set_channel(uint8_t primary, wifi_second_chan_t second)
```
Set primary/secondary channel of ESP32.

Attention 1. This API should be called after esp_wifi_start()
Attention 2. When ESP32 is in STA mode, this API should not be called when STA is scanning or connecting to an external AP
Attention 3. When ESP32 is in softAP mode, this API should not be called when softAP has connected to external STAs
Attention 4. When ESP32 is in STA+softAP mode, this API should not be called when in the scenarios described above

Return
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_IF: invalid interface
- ESP_ERR_INVALID_ARG: invalid argument

Parameters
Chapter 2. API Reference

- **primary**: for HT20, primary is the channel number, for HT40, primary is the primary channel
- **second**: for HT20, second is ignored, for HT40, second is the second channel

```c
esp_err_t esp_wifi_get_channel(uint8_t* primary, wifi_second_chan_t* second)
```

Get the primary/secondary channel of ESP32.

**Attention** 1. API return false if try to get an interface that is not enable

**Return**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument

**Parameters**
- **primary**: store current primary channel
- **[out]** second: store current second channel

```c
esp_err_t esp_wifi_set_country(const wifi_country_t* country)
```

configure country info

**Attention** 1. It is discouraged to call this API since this doesn’t validate the per-country rules, it’s up to the user to fill in all fields according to local regulations. Please use esp_wifi_set_country_code instead.

**Attention** 2. The default country is CHINA {.cc=”CN”, .schan=1, .nchan=13, policy=WIFI_COUNTRY_POLICY_AUTO}

**Attention** 3. When the country policy is WIFI_COUNTRY_POLICY_AUTO, the country info of the AP to which the station is connected is used. E.g. if the configured country info is {.cc=”USA”, .schan=1, .nchan=1} and the country info of the AP to which the station is connected is {.cc=”JP”, .schan=1, .nchan=14} then the country info that will be used is {.cc=”JP”, .schan=1, .nchan=14}. If the station disconnected from the AP the country info is set back to the country info of the station automatically, {.cc=”US”, .schan=1, .nchan=11} in the example.

**Attention** 4. When the country policy is WIFI_COUNTRY_POLICY_MANUAL, then the configured country info is used always.

**Attention** 5. When the country info is changed because of configuration or because the station connects to a different external AP, the country IE in probe response/beacon of the soft-AP is also changed.

**Attention** 6. The country configuration is stored into flash.

**Attention** 7. When this API is called, the PHY init data will switch to the PHY init data type corresponding to the country info.

**Return**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument

**Parameters**
- **country**: the configured country info

```c
esp_err_t esp_wifi_get_country(wifi_country_t* country)
```

get the current country info

**Return**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument

**Parameters**
- **country**: country info

```c
esp_err_t esp_wifi_set_mac(wifi_interface_t ifx, const uint8_t mac[6])
```

Set MAC address of the ESP32 WiFi station or the soft-AP interface.

**Attention** 1. This API can only be called when the interface is disabled

**Attention** 2. ESP32 soft-AP and station have different MAC addresses, do not set them to be the same.

**Attention** 3. The bit 0 of the first byte of ESP32 MAC address can not be 1. For example, the MAC address can set to be “1a:XX:XX:XX:XX:XX”, but can not be “15:XX:XX:XX:XX:XX”.

**Return**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
Chapter 2. API Reference

- ESP_ERR_INVALID_ARG: invalid argument
- ESP_ERR_WIFI_IF: invalid interface
- ESP_ERR_WIFI_MAC: invalid mac address
- ESP_ERR_WIFI_MODE: WiFi mode is wrong
- others: refer to error codes in esp_err.h

**Parameters**
- ifx: interface
- mac: the MAC address

```
*esp_err_t esp_wifi_get_mac(wifi_interface_t ifx, uint8_t mac[6])*
```

Get mac of specified interface.

**Return**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument
- ESP_ERR_WIFI_IF: invalid interface

**Parameters**
- ifx: interface
- [out] mac: store mac of the interface ifx

```
*esp_err_t esp_wifi_set_promiscuous_rx_cb(wifi_promiscuous_cb_t cb)*
```

Register the RX callback function in the promiscuous mode.

Each time a packet is received, the registered callback function will be called.

**Return**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init

**Parameters**
- cb: callback

```
*esp_err_t esp_wifi_set_promiscuous(bool en)*
```

Enable the promiscuous mode.

**Return**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init

**Parameters**
- en: false - disable, true - enable

```
*esp_err_t esp_wifi_get_promiscuous(bool *en)*
```

Get the promiscuous mode.

**Return**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init

**Parameters**
- [out] en: store the current status of promiscuous mode

```
*esp_err_t esp_wifi_set_promiscuous_filter(const wifi_promiscuous_filter_t *filter)*
```

Enable the promiscuous mode packet type filter.

**Note** The default filter is to filter all packets except WIFI_PKT_MISC

**Return**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init

**Parameters**
- filter: the packet type filtered in promiscuous mode.

```
*esp_err_t esp_wifi_get_promiscuous_filter(wifi_promiscuous_filter_t *filter)*
```

Get the promiscuous filter.

**Return**
Chapter 2. API Reference

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument

Parameters
- [out] filter: store the current status of promiscuous filter

```
esp_err_t esp_wifi_set_promiscuous_ctrl_filter(const wifi_promiscuous_filter_t *filter)
```

Enable subtype filter of the control packet in promiscuous mode.

Note
The default filter is to filter none control packet.

Return
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init

Parameters
- filter: the subtype of the control packet filtered in promiscuous mode.

```
esp_err_t esp_wifi_get_promiscuous_ctrl_filter(wifi_promiscuous_filter_t *filter)
```

Get the subtype filter of the control packet in promiscuous mode.

```
 esp_err_t esp_wifi_set_config(wifi_interface_t interface, wifi_config_t *conf)
```

Set the configuration of the ESP32 STA or AP.

Attention
1. This API can be called only when specified interface is enabled, otherwise, API fail
Attention
2. For station configuration, bssid_set needs to be 0; and it needs to be 1 only when users need to check the MAC address of the AP.
Attention
3. ESP32 is limited to only one channel, so when in the soft-AP+station mode, the soft-AP will adjust its channel automatically to be the same as the channel of the ESP32 station.

Return
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument
- ESP_ERR_WIFI_IF: invalid interface
- ESP_ERR_WIFI_MODE: invalid mode
- ESP_ERR_WIFI_PASSWORD: invalid password
- ESP_ERR_WIFI_NVS: WiFi internal NVS error
- others: refer to the erro code in esp_err.h

Parameters
- interface: interface
- conf: station or soft-AP configuration

```
 esp_err_t esp_wifi_get_config(wifi_interface_t interface, wifi_config_t *conf)
```

Get configuration of specified interface.

Return
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument
- ESP_ERR_WIFI_IF: invalid interface

Parameters
- interface: interface
- [out] conf: station or soft-AP configuration

```
 esp_err_t esp_wifi_ap_get_sta_list(wifi_sta_list_t *sta)
```

Get STAs associated with soft-AP.
Attention  SSC only API

Return
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument
- ESP_ERR_WIFI_MODE: WiFi mode is wrong
- ESP_ERR_WIFI_CONN: WiFi internal error, the station/soft-AP control block is invalid

Parameters
- [out] sta: station list ap can get the connected sta’s phy mode info through the struct member phy_11b, phy_11g, phy_11n, phy_lr in the wifi_sta_info_t struct. For example, phy_11b = 1 imply that sta support 802.11b mode

```c
esp_err_t esp_wifi_ap_get_sta_aid(const uint8_t mac[6], uint16_t *aid)
```

Get AID of STA connected with soft-AP.

Return
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument
- ESP_ERR_NOT_FOUND: Requested resource not found
- ESP_ERR_WIFI_MODE: WiFi mode is wrong
- ESP_ERR_WIFI_CONN: WiFi internal error, the station/soft-AP control block is invalid

Parameters
- mac: STA’s mac address
- [out] aid: Store the AID corresponding to STA mac

```c
esp_err_t esp_wifi_set_storage(wifi_storage_t storage)
```

Set the WiFi API configuration storage type.

Attention 1. The default value is WIFI_STORAGE_FLASH

Return
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument

Parameters
- storage: storage type

```c
esp_err_t esp_wifi_set_vendor_ie(bool enable, wifi_vendor_ie_type_t type, wifi_vendor_ie_id_t idx, const void *vnd_ie)
```

Set 802.11 Vendor-Specific Information Element.

Return
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init()
- ESP_ERR_INVALID_ARG: Invalid argument, including if first byte of vnd_ie is not WIFI_VENDOR_IE_ELEMENT_ID (0xDD) or second byte is an invalid length.
- ESP_ERR_NO_MEM: Out of memory

Parameters
- enable: If true, specified IE is enabled. If false, specified IE is removed.
- type: Information Element type. Determines the frame type to associate with the IE.
- idx: Index to set or clear. Each IE type can be associated with up to two elements (indices 0 & 1).
- vnd_ie: Pointer to vendor specific element data. First 6 bytes should be a header with fields matching vendor_ie_data_t. If enable is false, this argument is ignored and can be NULL. Data does not need to remain valid after the function returns.

```c
esp_err_t esp_wifi_set_vendor_ie_cb(esp_vendor_ie_cb_t cb, void *ctx)
```

Register Vendor-Specific Information Element monitoring callback.

Return
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init

Parameters
• **cb**: Callback function
• **ctx**: Context argument, passed to callback function.

```c
esp_err_t esp_wifi_set_max_tx_power(int8_t power)
```

Set maximum transmitting power after WiFi start.

**Attention** 1. Maximum power before wifi startup is limited by PHY init data bin.
**Attention** 2. The value set by this API will be mapped to the max_tx_power of the structure `wifi_country_t` variable.
**Attention** 3. Mapping Table `{Power, max_tx_power} = {{8, 2}, {20, 5}, {28, 7}, {34, 8}, {44, 11}, {52, 13}, {56, 14}, {60, 15}, {66, 16}, {72, 18}, {80, 20}}.
**Attention** 4. Param power unit is 0.25dBm, range is [8, 84] corresponding to 2dBm - 20dBm.
**Attention** 5. Relationship between set value and actual value. As follows: `{set value range, actual value} = {{[8, 19],8}, {[20, 27],20}, {[28, 33],28}, {[34, 43],34}, {[44, 51],44}, {[52, 55],52}, {[56, 59],56}, {[60, 65],60}, {[66, 71],66}, {[72, 79],72}, {[80, 84],80}}.

**Return**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_NOT_START: WiFi is not started by esp_wifi_start
- ESP_ERR_WIFI_ARG: invalid argument, e.g. parameter is out of range

**Parameters**
- **power**: Maximum WiFi transmitting power.

```c
esp_err_t esp_wifi_get_max_tx_power(int8_t *power)
```

Get maximum transmitting power after WiFi start.

**Return**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_NOT_START: WiFi is not started by esp_wifi_start
- ESP_ERR_WIFI_ARG: invalid argument

**Parameters**
- **power**: Maximum WiFi transmitting power, unit is 0.25dBm.

```c
esp_err_t esp_wifi_set_event_mask(uint32_t mask)
```

Set mask to enable or disable some WiFi events.

**Attention** 1. Mask can be created by logical OR of various WIFI_EVENT_MASK constants. Events which have corresponding bit set in the mask will not be delivered to the system event handler.
**Attention** 2. Default WiFi event mask is WIFI_EVENT_MASK_AP_PROBEREQRECVED.
**Attention** 3. There may be lots of stations sending probe request data around. Don’t unmask this event unless you need to receive probe request data.

**Return**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init

**Parameters**
- **mask**: WiFi event mask.

```c
esp_err_t esp_wifi_get_event_mask(uint32_t *mask)
```

Get mask of WiFi events.

**Return**
- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init

**Parameters**
- **mask**: WiFi event mask.

```c
esp_err_t esp_wifi_80211_rx(wifi_interface_t ifx, const void *buffer, int len, bool en_sys_seq)
```

Send raw ieee80211 data.

**Attention** Currently only support for sending beacon/probe request/probe response/action and non-QoS data frame
Return

- ESP_OK: success
- ESP_ERR_WIFI_IF: Invalid interface
- ESP_ERR_INVALID_ARG: Invalid parameter
- ESP_ERR_WIFI_NO_MEM: out of memory

Parameters

- ifx: interface if the Wi-Fi mode is Station, the ifx should be WIFI_IF_STA. If the Wi-Fi mode is SoftAP, the ifx should be WIFI_IF_AP. If the Wi-Fi mode is Station+SoftAP, the ifx should be WIFI_IF_STA or WIFI_IF_AP. If the ifx is wrong, the API returns ESP_ERR_WIFI_IF.
- buffer: raw ieee80211 buffer
- len: the length of raw buffer, the len must be <= 1500 Bytes and >= 24 Bytes
- en_sys_seq: indicate whether use the internal sequence number. If en_sys_seq is false, the sequence in raw buffer is unchanged, otherwise it will be overwritten by WiFi driver with the system sequence number. Generally, if esp_wifi_80211_tx is called before the Wi-Fi connection has been set up, both en_sys_seq==true and en_sys_seq==false are fine. However, if the API is called after the Wi-Fi connection has been set up, en_sys_seq must be true, otherwise ESP_ERR_WIFI_ARG is returned.

```c
esp_err_t esp_wifi_set_csi_rx_cb (wifi_csi_cb_t cb, void *ctx)
```
Register the RX callback function of CSI data.
Each time a CSI data is received, the callback function will be called.

Return

- ESP_OK: succeed

Parameters

- cb: callback
- ctx: context argument, passed to callback function

```c
esp_err_t esp_wifi_set_csi_config (const wifi_csi_config_t *config)
```
Set CSI data configuration.

Return

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_INVALID_ARG: invalid argument

Parameters

- config: configuration

```c
esp_err_t esp_wifi_set_csi (bool en)
```
Enable or disable CSI.

Return

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_NOT_START: WiFi is not started by esp_wifi_start or promiscuous mode is not enabled
- ESP_ERR_INVALID_ARG: invalid argument

Parameters

- en: true - enable, false - disable

```c
esp_err_t esp_wifi_set_ant_gpio (const wifi_ant_gpio_config_t *config)
```
Set antenna GPIO configuration.

Return

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_ARG: Invalid argument, e.g. parameter is NULL, invalid GPIO number etc
Parameters
- **config**: Antenna GPIO configuration.

```c
esp_err_t esp_wifi_get_ant_gpio(wifi_ant_gpio_config_t *config)
```
Get current antenna GPIO configuration.

Return
- **ESP_OK**: succeed
- **ESP_ERR_WIFI_NOT_INIT**: WiFi is not initialized by esp_wifi_init
- **ESP_ERR_WIFI_ARG**: invalid argument, e.g. parameter is NULL

Parameters
- **config**: Antenna GPIO configuration.

```c
esp_err_t esp_wifi_set_ant(const wifi_ant_config_t *config)
```
Set antenna configuration.

Return
- **ESP_OK**: succeed
- **ESP_ERR_WIFI_NOT_INIT**: WiFi is not initialized by esp_wifi_init
- **ESP_ERR_WIFI_ARG**: Invalid argument, e.g. parameter is NULL, invalid antenna mode or invalid GPIO number

Parameters
- **config**: Antenna configuration.

```c
int64_t esp_wifi_get_tsf_time(wifi_interface_t interface)
```
Get the TSF time. In Station mode or SoftAP+Station mode if station is not connected or station doesn’t receive at least one beacon after connected, will return 0.

Attention
Enabling power save may cause the return value inaccurate, except WiFi modem sleep

Return
0 or the TSF time

Parameters
- **interface**: The interface whose tsf_time is to be retrieved.

```c
esp_err_t esp_wifi_set_inactive_time(wifi_interface_t ifx, uint16_t sec)
```
Set the inactive time of the ESP32 STA or AP.

Attention
1. For Station, If the station does not receive a beacon frame from the connected SoftAP during the inactive time, disconnect from SoftAP. Default 6s.
2. For SoftAP, If the softAP doesn’t receive any data from the connected STA during inactive time, the softAP will force deauth the STA. Default is 300s.
3. The inactive time configuration is not stored into flash

Return
- **ESP_OK**: succeed
- **ESP_ERR_WIFI_NOT_INIT**: WiFi is not initialized by esp_wifi_init
- **ESP_ERR_WIFI_NOT_STARTED**: WiFi is not started by esp_wifi_start
- **ESP_ERR_WIFI_ARG**: invalid argument, For Station, if sec is less than 3. For SoftAP, if sec is less than 10.

Parameters
- **ifx**: interface to be configured.
- **sec**: Inactive time. Unit seconds.

```c
esp_err_t esp_wifi_get_inactive_time(wifi_interface_t ifx, uint16_t *sec)
```
Get inactive time of specified interface.
Chapter 2. API Reference

Return

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_ARG: invalid argument

Parameters

- ifx: Interface to be configured.
- sec: Inactive time. Unit seconds.

esp_err_t esp_wifi_stats_dump(uint32_t modules)

Dump WiFi statistics.

Return

- ESP_OK: succeed
- others: failed

Parameters

- modules: statistic modules to be dumped

esp_err_t esp_wifi_set_rssi_threshold(int32_t rssi)

Set RSSI threshold below which APP will get an event.

Attention This API needs to be called every time after WIFI_EVENT_STA_BSS_RSSI_LOW event is received.

Return

- ESP_OK: succeed
- ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
- ESP_ERR_WIFI_ARG: invalid argument

Parameters

- rssi: threshold value in dbm between -100 to 0

esp_err_t esp_wifi_ftm_initiate_session(wifi_ftm_initiator_cfg_t *cfg)

Start an FTM Initiator session by sending FTM request If successful, event WIFI_EVENT_FTM_REPORT is generated with the result of the FTM procedure.

Attention Use this API only in Station mode

Return

- ESP_OK: succeed
- others: failed

Parameters

- cfg: FTM Initiator session configuration

esp_err_t esp_wifi_ftm_end_session(void)

End the ongoing FTM Initiator session.

Attention This API works only on FTM Initiator

Return

- ESP_OK: succeed
- others: failed

esp_err_t esp_wifi_ftm_resp_set_offset(int16_t offset_cm)

Set offset in cm for FTM Responder. An equivalent offset is calculated in picoseconds and added in TOD of FTM Measurement frame (T1).

Attention Use this API only in AP mode before performing FTM as responder

Return

- ESP_OK: succeed
- others: failed

Parameters

- offset_cm: T1 Offset to be added in centimeters

esp_err_t esp_wifi_config_11b_rate(wifi_interface_t ifx, bool disable)

Enable or disable 11b rate of specified interface.

Attention 1. This API should be called after esp_wifi_init() and before esp_wifi_start().

Attention 2. Only when really need to disable 11b rate call this API otherwise don’t call this.
Return
• ESP_OK: succeed
• others: failed

Parameters
• ifx: Interface to be configured.
• disable: true means disable 11b rate while false means enable 11b rate.

*esp_err_t* `esp_wifi_config_espnow_rate`(wifi_interface_t ifx, wifi_phy_rate_t rate)
Config ESPNOW rate of specified interface.

Attention 1. This API should be called after esp_wifi_init() and before esp_wifi_start().

Return
• ESP_OK: succeed
• others: failed

Parameters
• ifx: Interface to be configured.
• rate: Phy rate to be configured.

*esp_err_t* `esp_wifi_set_connectionless_wake_interval`(uint16_t interval)
Set interval for station to wake up periodically at disconnected.

Attention 1. Only when ESP_WIFI_STA_DISCONNECTED_PM_ENABLE is enabled, this configuration could work
Attention 2. This configuration only works for station mode and disconnected status.
Attention 3. This configuration would influence nothing until some module configure wake_window
Attention 4. A sensible interval which is not too small is recommended (e.g. 100ms)

Parameters
• interval: how much microsecond would the chip wake up, from 1 to 65535.

*esp_err_t* `esp_wifi_set_country_code`(const char* country, bool ieee80211d_enabled)
configure country

Attention 1. When ieee80211d_enabled, the country info of the AP to which the station is connected is used.
E.g. if the configured country is US and the country info of the AP to which the station is connected is JP then the country info that will be used is JP. If the station disconnected from the AP the country info is set back to the country info of the station automatically, US in the example.
Attention 2. When ieee80211d_enabled is disabled, then the configured country info is used always.
Attention 3. When the country info is changed because of configuration or because the station connects to a different external AP, the country IE in probe response/beacon of the soft-AP is also changed.
Attention 4. The country configuration is stored into flash.
Attention 5. When this API is called, the PHY init data will switch to the PHY init data type corresponding to the country info.
Attention 7. When country code “01” (world safe mode) is set, SoftAP mode won’t contain country IE.
Attention 8. The default country is “CN” and ieee80211d_enabled is TRUE.

Return
• ESP_OK: succeed
• ESP_ERROR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
• ESP_ERROR_INVALID_ARG: invalid argument

Parameters
• country: the configured country ISO code
• ieee80211d_enabled: 802.11d is enabled or not

*esp_err_t* `esp_wifi_get_country_code`(char *country)
get the current country code

Return
• ESP_OK: succeed
• ESP_ERR_WIFI_NOT_INIT: WiFi is not initialized by esp_wifi_init
• ESP_ERR_INVALID_ARG: invalid argument

Parameters
• country: country code

```c
esp_err_t esp_wifi_config_80211_tx_rate(wifi_interface_t ifx, wifi_phy_rate_t rate)
```
Config 80211 tx rate of specified interface.

Attention 1. This API should be called after esp_wifi_init() and before esp_wifi_start().

Return
• ESP_OK: succeed
• others: failed

Parameters
• ifx: Interface to be configured.
• rate: Phy rate to be configured.

Structures
```c
struct wifi_init_config_t
```
WiFi stack configuration parameters passed to esp_wifi_init call.

Public Members
```c
system_event_handler_t event_handler
```
WiFi event handler

```c
wifi_osi_funcs_t *osi_funcs
```
WiFi OS functions

```c
wpa_crypto_funcs_t *wpa_crypto_funcs
```
WiFi station crypto functions when connect

```c
int static_rx_buf_num
```
WiFi static RX buffer number

```c
int dynamic_rx_buf_num
```
WiFi dynamic RX buffer number

```c
int tx_buf_type
```
WiFi TX buffer type

```c
int static_tx_buf_num
```
WiFi static TX buffer number

```c
int dynamic_tx_buf_num
```
WiFi dynamic TX buffer number

```c
int cache_tx_buf_num
```
WiFi TX cache buffer number

```c
int csi_enable
```
WiFi channel state information enable flag

```c
int ampdu_rx_enable
```
WiFi AMPDU RX feature enable flag

```c
int ampdu_tx_enable
```
WiFi AMPDU TX feature enable flag

```c
int amsdu_tx_enable
```
WiFi AMSDU TX feature enable flag

```c
int nvs_enable
```
WiFi NVS flash enable flag
int **nano_enable**  
Nano option for printf/scan family enable flag

int **rx_ba_win**  
WiFi Block Ack RX window size

int **wifi_task_core_id**  
WiFi Task Core ID

int **beacon_max_len**  
WiFi softAP maximum length of the beacon

int **mgmt_sbuf_num**  
WiFi management short buffer number, the minimum value is 6, the maximum value is 32

uint64_t **feature_caps**  
Enables additional WiFi features and capabilities

bool **sta_disconnected_pm**  
WiFi Power Management for station at disconnected status

int **magic**  
WiFi init magic number, it should be the last field

**Macros**

ESP_ERR_WIFI_NOT_INIT  
WiFi driver was not installed by esp_wifi_init

ESP_ERR_WIFI_NOT_STARTED  
WiFi driver was not started by esp_wifi_start

ESP_ERR_WIFI_NOT_STOPPED  
WiFi driver was not stopped by esp_wifi_stop

ESP_ERR_WIFI_IF  
WiFi interface error

ESP_ERR_WIFI_MODE  
WiFi mode error

ESP_ERR_WIFI_STATE  
WiFi internal state error

ESP_ERR_WIFI_CONN  
WiFi internal control block of station or soft-AP error

ESP_ERR_WIFI_NVSD  
WiFi internal NVS module error

ESP_ERR_WIFI_MAC  
MAC address is invalid

ESP_ERR_WIFI_SSID  
SSID is invalid

ESP_ERR_WIFI_PASSWORD  
Password is invalid

ESP_ERR_WIFI_TIMEOUT  
Timeout error

ESP_ERR_WIFI_WAKE_FAIL  
WiFi is in sleep state(RF closed) and wakeup fail

ESP_ERR_WIFI_WOULD_BLOCK  
The caller would block
ESP_ERR_WIFI_NOT_CONNECT  
Station still in disconnect status

ESP_ERR_WIFI_POST  
Failed to post the event to WiFi task

ESP_ERR_WIFI_INIT_STATE  
Invalid WiFi state when init/deinit is called

ESP_ERR_WIFI_STOP_STATE  
Returned when WiFi is stopping

ESP_ERR_WIFI_NOT_ASSOC  
The WiFi connection is not associated

ESP_ERR_WIFI_TX_DISALLOW  
The WiFi TX is disallowed

Type Definitions

typedef void (*wifi_promiscuous_cb_t) (void *buf, wifi_promiscuous_pkt_type_t type)  
The RX callback function in the promiscuous mode. Each time a packet is received, the callback function will be called.

Parameters
  • buf: Data received. Type of data in buffer (wifi_promiscuous_pkt_t or wifi_pkt_rx_ctrl_t) indicated by ‘type’ parameter.
  • type: promiscuous packet type.

typedef void (*esp_vendor_ie_cb_t) (void *ctx, wifi_vendor_ie_type_t type, const uint8_t sa[6],
                                   const vendor_ie_data_t *vnd_ie, int rssi)  
Function signature for received Vendor-Specific Information Element callback.
Parameters

- **ctx**: Context argument, as passed to esp_wifi_set_vendor_ie_cb() when registering callback.
- **type**: Information element type, based on frame type received.
- **sa**: Source 802.11 address.
- **vnd_ie**: Pointer to the vendor specific element data received.
- **rssi**: Received signal strength indication.

```c
typedef void (*wifi_csi_cb_t)(void *ctx, wifi_csi_info_t *data)
```

The RX callback function of Channel State Information (CSI) data.

Each time a CSI data is received, the callback function will be called.

Parameters

- **ctx**: Context argument, passed to esp_wifi_set_csi_rx_cb() when registering callback function.
- **data**: CSI data received. The memory that it points to will be deallocated after callback function returns.

Header File

- `components/esp_wifi/include/esp_wifi_types.h`

Unions

```c
union wifi_config_t
#include <esp_wifi_types.h> Configuration data for ESP32 AP or STA.
```

The usage of this union (for ap or sta configuration) is determined by the accompanying interface argument passed to esp_wifi_set_config() or esp_wifi_get_config()

Public Members

```c
wifi_ap_config_t ap
configuration of AP
```

```c
wifi_sta_config_t sta
configuration of STA
```

Structures

```c
struct wifi_country_t
Structure describing WiFi country-based regional restrictions.
```

Public Members

```c
char cc[3]
country code string
```

```c
uint8_t schan
start channel
```

```c
uint8_t nchan
total channel number
```

```c
int8_t max_tx_power
This field is used for getting WiFi maximum transmitting power, call esp_wifi_set_max_tx_power to set the maximum transmitting power.
```

```c
wifi_country_policy_t policy
country policy
```

```c
struct wifi_active_scan_time_t
Range of active scan times per channel.
```
Public Members

uint32_t \texttt{min}
minimum active scan time per channel, units: millisecond

uint32_t \texttt{max}
maximum active scan time per channel, units: millisecond, values above 1500ms may cause station to disconnect from AP and are not recommended.

\textbf{struct wifi\_scan\_time\_t}
Aggregate of active & passive scan time per channel.

Public Members

\texttt{wifi\_active\_scan\_time\_t \texttt{active}}
active scan time per channel, units: millisecond.

uint32_t \texttt{passive}
passive scan time per channel, units: millisecond, values above 1500ms may cause station to disconnect from AP and are not recommended.

\textbf{struct wifi\_scan\_config\_t}
Parameters for an SSID scan.

Public Members

uint8_t* \texttt{ssid}
SSID of AP

uint8_t* \texttt{bssid}
MAC address of AP

uint8_t \texttt{channel}
channel, scan the specific channel

bool \texttt{show\_hidden}
enable to scan AP whose SSID is hidden

\texttt{wifi\_scan\_type\_t \texttt{scan\_type}}
scan type, active or passive

\texttt{wifi\_scan\_time\_t \texttt{scan\_time}}
scan time per channel

\textbf{struct wifi\_ap\_record\_t}
Description of a WiFi AP.

Public Members

uint8_t \texttt{bssid}[6]
MAC address of AP

uint8_t \texttt{ssid}[33]
SSID of AP

uint8_t \texttt{primary}
channel of AP

\texttt{wifi\_second\_chan\_t \texttt{second}}
secondary channel of AP

int8_t \texttt{rssi}
signal strength of AP
```c
wifi_auth_mode_t authmode
    authmode of AP

wifi_cipher_type_t pairwise_cipher
    pairwise cipher of AP

wifi_cipher_type_t group_cipher
    group cipher of AP

wifi_ant_t ant
    antenna used to receive beacon from AP

uint32_t phy_11b : 1
    bit: 0 flag to identify if 11b mode is enabled or not

uint32_t phy_11g : 1
    bit: 1 flag to identify if 11g mode is enabled or not

uint32_t phy_11n : 1
    bit: 2 flag to identify if 11n mode is enabled or not

uint32_t phy_lr : 1
    bit: 3 flag to identify if low rate is enabled or not

uint32_t wps : 1
    bit: 4 flag to identify if WPS is supported or not

uint32_t ftm_responder : 1
    bit: 5 flag to identify if FTM is supported in responder mode

uint32_t ftm_initiator : 1
    bit: 6 flag to identify if FTM is supported in initiator mode

uint32_t reserved : 25
    bit: 7..31 reserved

wifi_country_t country
    country information of AP

struct wifi_scan_threshold_t
    Structure describing parameters for a WiFi fast scan.

    Public Members

    int8_t rssi
        The minimum rssi to accept in the fast scan mode

    wifi_auth_mode_t authmode
        The weakest authmode to accept in the fast scan mode

struct wifi_pmf_config_t
    Configuration structure for Protected Management Frame

    Public Members

    bool capable
        Advertizes support for Protected Management Frame. Device will prefer to connect in PMF mode if
        other device also advertizes PMF capability.

    bool required
        Advertizes that Protected Management Frame is required. Device will not associate to non-PMF capable
        devices.

struct wifi_ap_config_t
    Soft-AP configuration settings for the ESP32.
```
Chapter 2. API Reference

Public Members

**uint8_t ssid[32]**
SSID of ESP32 soft-AP. If ssid_len field is 0, this must be a Null terminated string. Otherwise, length is set according to ssid_len.

**uint8_t password[64]**
Password of ESP32 soft-AP.

**uint8_t ssid_len**
Optional length of SSID field.

**uint8_t channel**
Channel of ESP32 soft-AP.

**wifi_auth_mode_t authmode**
Auth mode of ESP32 soft-AP. Do not support AUTH_WEP in soft-AP mode.

**uint8_t ssid_hidden**
Broadcast SSID or not, default 0, broadcast the SSID.

**uint8_t max_connection**
Max number of stations allowed to connect in, default 4, max 10.

**uint16_t beacon_interval**
Beacon interval which should be multiples of 100. Unit: TU(time unit, 1 TU = 1024 us). Range: 100 ~ 60000. Default value: 100.

**wifi_cipher_type_t pairwise_cipher**
pairwise cipher of SoftAP, group cipher will be derived using this. cipher values are valid starting from WIFI_CIPHER_TYPE_TKIP, enum values before that will be considered as invalid and default cipher suites (TKIP+CCMP) will be used. Valid cipher suites in softAP mode are WIFI_CIPHER_TYPE_TKIP, WIFI_CIPHER_TYPE_CCMP and WIFI_CIPHER_TYPE_TKIP_CCMP.

**bool ftm_responder**
Enable FTM Responder mode.

```c
struct wifi_sta_config_t
```
STA configuration settings for the ESP32.

Public Members

**uint8_t ssid[32]**
SSID of target AP.

**uint8_t password[64]**
Password of target AP.

**wifi_scan_method_t scan_method**
do all channel scan or fast scan

**bool bssid_set**
whether set MAC address of target AP or not. Generally, station_config.bssid_set needs to be 0; and it needs to be 1 only when users need to check the MAC address of the AP.

**uint8_t bssid[6]**
MAC address of target AP

**uint8_t channel**
channel of target AP. Set to 1~13 to scan starting from the specified channel before connecting to AP. If the channel of AP is unknown, set it to 0.
uint16_t listen_interval
Listen interval for ESP32 station to receive beacon when WIFI_PS_MAX_MODEM is set. Units: AP beacon intervals. Defaults to 3 if set to 0.

wifi_sort_method_t sort_method
sort the connect AP in the list by rssi or security mode

wifi_scan_threshold_t threshold
When sort_method is set, only APs which have an auth mode that is more secure than the selected auth mode and a signal stronger than the minimum RSSI will be used.

wifi_pmf_config_t pmf_cfg
Configuration for Protected Management Frame. Will be advertised in RSN Capabilities in RSN IE.

uint32_t rm_enabled : 1
Whether Radio Measurements are enabled for the connection

uint32_t btm_enabled : 1
Whether BSS Transition Management is enabled for the connection

uint32_t mbo_enabled : 1
Whether MBO is enabled for the connection

uint32_t reserved : 29
Reserved for future feature set

struct wifi_sta_info_t
Description of STA associated with AP.

Public Members

uint8_t mac[6]
mac address

int8_t rssi
current average rssi of sta connected

uint32_t phy_11b : 1
bit: 0 flag to identify if 11b mode is enabled or not

uint32_t phy_11g : 1
bit: 1 flag to identify if 11g mode is enabled or not

uint32_t phy_11n : 1
bit: 2 flag to identify if 11n mode is enabled or not

uint32_t phy_lr : 1
bit: 3 flag to identify if low rate is enabled or not

uint32_t is_mesh_child : 1
bit: 4 flag to identify mesh child

uint32_t reserved : 27
bit: 5..31 reserved

struct wifi_sta_list_t
List of stations associated with the ESP32 Soft-AP.

Public Members

wifi_sta_info_t sta[ESP_WIFI_MAX_CONN_NUM]
station list

int num
number of stations in the list (other entries are invalid)
struct vendor_ie_data_t

Vendor Information Element header.

The first bytes of the Information Element will match this header. Payload follows.

Public Members

uint8_t element_id
Should be set to WIFI_VENDOR_IE_ELEMENT_ID (0xDD)

uint8_t length
Length of all bytes in the element data following this field. Minimum 4.

uint8_t vendor_oui[3]
Vendor identifier (OUI).

uint8_t vendor_oui_type
Vendor-specific OUI type.

uint8_t payload[0]
Payload. Length is equal to value in ‘length’ field, minus 4.

struct wifi_pkt_rx_ctrl_t

Received packet radio metadata header, this is the common header at the beginning of all promiscuous mode RX callback buffers.

Public Members

signed rssi : 8
Received Signal Strength Indicator (RSSI) of packet. unit: dBm

unsigned rate : 5
PHY rate encoding of the packet. Only valid for non HT(11bg) packet

unsigned __pad0__ : 1
reserved

unsigned sig_mode : 2
0: non HT(11bg) packet; 1: HT(11n) packet; 3: VHT(11ac) packet

unsigned __pad1__ : 16
reserved

unsigned mcs : 7
Modulation Coding Scheme. If is HT(11n) packet, shows the modulation, range from 0 to 76(MSC0 ~ MCS76)

unsigned cwb : 1
Channel Bandwidth of the packet. 0: 20MHz; 1: 40MHz

unsigned __pad2__ : 16
reserved

unsigned smoothing : 1
reserved

unsigned not_sounding : 1
reserved

unsigned __pad3__ : 1
reserved

unsigned aggregation : 1
Aggregation. 0: MPDU packet; 1: AMPDU packet
unsigned stbc : 2  
   Space Time Block Code(STBC). 0: non STBC packet; 1: STBC packet

unsigned fec_coding : 1  
   Flag is set for 11n packets which are LDPC

unsigned sgi : 1  
   Short Guide Interval(SGI). 0: Long GI; 1: Short GI

unsigned __pad4__ : 8  
   reserved

unsigned ampdu_cnt : 8  
   ampdu cnt

unsigned channel : 4  
   primary channel on which this packet is received

unsigned secondary_channel : 4  
   secondary channel on which this packet is received. 0: none; 1: above; 2: below

unsigned __pad5__ : 8  
   reserved

unsigned timestamp : 32  
   timestamp. The local time when this packet is received. It is precise only if modem sleep or light sleep
   is not enabled. unit: microsecond

unsigned __pad6__ : 32  
   reserved

signed noise_floor : 8  
   noise floor of Radio Frequency Module(RF). unit: 0.25dBm

unsigned __pad7__ : 24  
   reserved

unsigned __pad8__ : 32  
   reserved

unsigned __pad9__ : 31  
   reserved

unsigned ant : 1  
   antenna number from which this packet is received. 0: WiFi antenna 0; 1: WiFi antenna 1

unsigned __pad10__ : 32  
   reserved

unsigned __pad11__ : 32  
   reserved

unsigned __pad12__ : 32  
   reserved

unsigned sig_len : 12  
   length of packet including Frame Check Sequence(FCS)

unsigned __pad13__ : 12  
   reserved

unsigned rx_state : 8  
   state of the packet. 0: no error; others: error numbers which are not public

**struct wifi_promiscuous_pkt_t**  
   Payload passed to ‘buf’ parameter of promiscuous mode RX callback.
Public Members

* * *

**wifi_pkt_rx_ctrl_t** `rx_ctrl`  
metadata header

**uint8_t** `payload[0]`  
Data or management payload. Length of payload is described by `rx_ctrl.sig_len`. Type of content determined by packet type argument of callback.

**struct wifi_promiscuous_filter_t**  
Mask for filtering different packet types in promiscuous mode.

Public Members

**uint32_t** `filter_mask`  
OR of one or more filter values WIFI_PROMIS_FILTER_.*

**struct wifi_csi_config_t**  
Channel state information(CSI) configuration type.

Public Members

**bool** `lltf_en`  
enable to receive legacy long training field(lltf) data. Default enabled

**bool** `htltf_en`  
enable to receive HT long training field(htltf) data. Default enabled

**bool** `stbc_htltf2_en`  
enable to receive space time block code HT long training field(stbc-htltf2) data. Default enabled

**bool** `ltf_merge_en`  
enable to generate httlft data by averaging lltf and ht_ltf data when receiving HT packet. Otherwise, use ht_ltf data directly. Default enabled

**bool** `channel_filter_en`  
enable to turn on channel filter to smooth adjacent sub-carrier. Disable it to keep independence of adjacent sub-carrier. Default enabled

**bool** `manu_scale`  
manually scale the CSI data by left shifting or automatically scale the CSI data. If set true, please set the shift bits. false: automatically. true: manually. Default false

**uint8_t** `shift`  
manually left shift bits of the scale of the CSI data. The range of the left shift bits is 0~15

**struct wifi_csi_info_t**  
CSI data type.

Public Members

**wifi_pkt_rx_ctrl_t** `rx_ctrl`  
received packet radio metadata header of the CSI data

**uint8_t** `mac[6]`  
source MAC address of the CSI data

**bool** `first_word_invalid`  
first four bytes of the CSI data is invalid or not

**int8_t** `buf`  
buffer of CSI data
Chapter 2. API Reference

```c
uint16_t len
    length of CSI data

struct wifi_ant_gpio_t
    WiFi GPIO configuration for antenna selection.

    Public Members

    uint8_t gpio_select : 1
        Whether this GPIO is connected to external antenna switch

    uint8_t gpio_num : 7
        The GPIO number that connects to external antenna switch

struct wifi_ant_gpio_config_t
    WiFi GPIOs configuration for antenna selection.

    Public Members

    wifi_ant_gpio_t gpio_cfg[4]
        The configurations of GPIOs that connect to external antenna switch

struct wifi_ant_config_t
    WiFi antenna configuration.

    Public Members

    wifi_ant_mode_t rx_ant_mode
        WiFi antenna mode for receiving

    wifi_ant_mode_t tx_ant_mode
        WiFi antenna mode for transmission, it can be set to WIFI_ANT_MODE_AUTO only if rx_ant_mode is set to WIFI_ANT_MODE_AUTO

    uint8_t enabled_ant0 : 4
        Index (in antenna GPIO configuration) of enabled WIFI_ANT_MODE_ANT0

    uint8_t enabled_ant1 : 4
        Index (in antenna GPIO configuration) of enabled WIFI_ANT_MODE_ANT1

struct wifi_action_tx_req_t
    Action Frame Tx Request.

    Public Members

    wifi_interface_t ifx
        WiFi interface to send request to

    uint8_t dest_mac[6]
        Destination MAC address

    bool no_ack
        Indicates no ack required

    wifi_action_rx_cb_t rx_cb
        Rx Callback to receive any response

    uint32_t data_len
        Length of the appended Data
```
Chapter 2. API Reference

uint8_t data[0]
    Appended Data payload

struct wifi_ftm_initiator_cfg_t
    FTM Initiator configuration.

Public Members

uint8_t resp_mac[6]
    MAC address of the FTM Responder

uint8_t channel
    Primary channel of the FTM Responder

uint8_t frm_count
    No. of FTM frames requested in terms of 4 or 8 bursts (allowed values - 0(No pref), 16, 24, 32, 64)

uint16_t burst_period
    Requested time period between consecutive FTM bursts in 100’s of milliseconds (0 - No pref)

struct wifi_event_sta_scan_done_t
    Argument structure for WIFI_EVENT_SCAN_DONE event

Public Members

uint32_t status
    status of scanning APs: 0 — success, 1 - failure

uint8_t number
    number of scan results

uint8_t scan_id
    scan sequence number, used for block scan

struct wifi_event_sta_connected_t
    Argument structure for WIFI_EVENT_STA_CONNECTED event

Public Members

uint8_t ssid[32]
    SSID of connected AP

uint8_t ssid_len
    SSID length of connected AP

uint8_t bssid[6]
    BSSID of connected AP

uint8_t channel
    channel of connected AP

wifi_auth_mode_t authmode
    authentication mode used by AP

struct wifi_event_sta_disconnected_t
    Argument structure for WIFI_EVENT_STA_DISCONNECTED event

Public Members

uint8_t ssid[32]
    SSID of disconnected AP
Chapter 2. API Reference

```
uint8_t ssid_len  
    SSID length of disconnected AP
uint8_t bssid[6]  
    BSSID of disconnected AP
uint8_t reason  
    reason of disconnection

struct wifi_event_sta_authmode_change_t 
    Argument structure for WIFI_EVENT_STA_AUTHMODE_CHANGE event

Public Members

    wifi_auth_mode_t old_mode  
        the old auth mode of AP
    wifi_auth_mode_t new_mode  
        the new auth mode of AP

struct wifi_event_sta_wps_er_pin_t 
    Argument structure for WIFI_EVENT_STA_WPS_ER_PIN event

Public Members

    uint8_t pin_code[8]  
        PIN code of station in enrollee mode

struct wifi_event_sta_wps_er_success_t 
    Argument structure for WIFI_EVENT_STA_WPS_ER_SUCCESS event

Public Members

    uint8_t ap_cred_cnt  
        Number of AP credentials received
    uint8_t ssid[MAX_SSID_LEN]  
        SSID of AP
    uint8_t passphrase[MAX_PASSPHRASE_LEN]  
        Passphrase for the AP

struct wifi_event_sta_wps_er_success_t::[anonymous] ap_cred[MAX_WPS_AP_CRED]  
    All AP credentials received from WPS handshake

struct wifi_event_ap_staconnected_t 
    Argument structure for WIFI_EVENT_AP_STACONNECTED event

Public Members

    uint8_t mac[6]  
        MAC address of the station connected to ESP32 soft-AP
    uint8_t aid  
        the aid that ESP32 soft-AP gives to the station connected to
    bool is_mesh_child  
        flag to identify mesh child

struct wifi_event_ap_stadisconnected_t 
    Argument structure for WIFI_EVENT_AP_STADISCONNECTED event
```
Public Members

- `uint8_t mac[6]`
  MAC address of the station disconnects to ESP32 soft-AP

- `uint8_t aid`
  The aid that ESP32 soft-AP gave to the station disconnects to

- `bool is_mesh_child`
  Flag to identify mesh child

`struct wifi_event_ap_probe_req_rx_t`
Argument structure for WIFI_EVENT_AP_PROBE_REQ.RECVED event

Public Members

- `int rssi`
  Received probe request signal strength

- `uint8_t mac[6]`
  MAC address of the station which send probe request

`struct wifi_event_bss_rssi_low_t`
Argument structure for WIFI_EVENT_STA_BSS_RSSI_LOW event

Public Members

- `int32_t rssi`
  RSSI value of bss

`struct wifi_ftm_report_entry_t`
Argument structure for

Public Members

- `uint8_t dlog_token`
  Dialog Token of the FTM frame

- `int8_t rssi`
  RSSI of the FTM frame received

- `uint32_t rtt`
  Round Trip Time in pSec with a peer

- `uint64_t t1`
  Time of departure of FTM frame from FTMResponder in pSec

- `uint64_t t2`
  Time of arrival of FTM frame at FTM Initiator in pSec

- `uint64_t t3`
  Time of departure of ACK from FTM Initiator in pSec

- `uint64_t t4`
  Time of arrival of ACK at FTM Responder in pSec

`struct wifi_event_ftm_report_t`
Argument structure for WIFI_EVENT_FTM_REPORT event
Public Members

```c
uint8_t peer_mac[6]
MAC address of the FTM Peer
```

```c
wifi_ftm_status_t status
Status of the FTM operation
```

```c
uint32_t rtt_raw
Raw average Round-Trip-Time with peer in Nano-Seconds
```

```c
uint32_t rtt_est
Estimated Round-Trip-Time with peer in Nano-Seconds
```

```c
uint32_t dist_est
Estimated one-way distance in Centi-Meters
```

```c
wifi_ftm_report_entry_t *ftm_report_data
Pointer to FTM Report with multiple entries, should be freed after use
```

```c
uint8_t ftm_report_num_entries
Number of entries in the FTM Report data
```

```c
struct wifi_event_action_tx_status_t
Argument structure for WIFI_EVENT_ACTION_TX_STATUS event
```

Public Members

```c
wifi_interface_t ifx
WiFi interface to send request to
```

```c
uint32_t context
Context to identify the request
```

```c
uint8_t da[6]
Destination MAC address
```

```c
uint8_t status
Status of the operation
```

```c
struct wifi_event_roc_done_t
Argument structure for WIFI_EVENT_ROC_DONE event
```

Public Members

```c
uint32_t context
Context to identify the request
```

Macros

```c
WIFI_OFFCHAN_TX_REQ
WIFI_OFFCHAN_TX_CANCEL
WIFI_ROC_REQ
WIFI_ROC_CANCEL
WIFI_PROTOCOL_11B
WIFI_PROTOCOL_11G
WIFI_PROTOCOL_11N
WIFI_PROTOCOL_LR
```
ESP_WIFI_MAX_CONN_NUM
max number of stations which can connect to ESP32 soft-AP

WIFI_VENDOR_IE_ELEMENT_ID

WIFI_PROMIS_FILTER_MASK_ALL
filter all packets

WIFI_PROMIS_FILTER_MASK_MGMT
filter the packets with type of WIFI_PKT_MGMT

WIFI_PROMIS_FILTER_MASK_CTRL
filter the packets with type of WIFI_PKT_CTRL

WIFI_PROMIS_FILTER_MASK_DATA
filter the packets with type of WIFI_PKT_DATA

WIFI_PROMIS_FILTER_MASK_MISC
filter the packets with type of WIFI_PKT_MISC

WIFI_PROMIS_FILTER_MASK_DATA_MPDU
filter the MPDU which is a kind of WIFI_PKT_DATA

WIFI_PROMIS_FILTER_MASK_DATA_AMPDU
filter the AMPDU which is a kind of WIFI_PKT_DATA

WIFI_PROMIS_FILTER_MASK_FCSFAIL
filter the FCS failed packets, do not open it in general

WIFI_PROMIS_CTRL_FILTER_MASK_ALL
filter all control packets

WIFI_PROMIS_CTRL_FILTER_MASK_WRAPPER
filter the control packets with subtype of Control Wrapper

WIFI_PROMIS_CTRL_FILTER_MASK_BAR
filter the control packets with subtype of Block Ack Request

WIFI_PROMIS_CTRL_FILTER_MASK_BA
filter the control packets with subtype of Block Ack

WIFI_PROMIS_CTRL_FILTER_MASK_PSPOLL
filter the control packets with subtype of PS-Poll

WIFI_PROMIS_CTRL_FILTER_MASK_RTS
filter the control packets with subtype of RTS

WIFI_PROMIS_CTRL_FILTER_MASK_CTS
filter the control packets with subtype of CTS

WIFI_PROMIS_CTRL_FILTER_MASK_ACK
filter the control packets with subtype of ACK

WIFI_PROMIS_CTRL_FILTER_MASK_CFEND
filter the control packets with subtype of CF-END

WIFI_PROMIS_CTRL_FILTER_MASK_CFENDACK
filter the control packets with subtype of CF-END+CF-ACK

WIFI_EVENT_MASK_ALL
mask all WiFi events

WIFI_EVENT_MASK_NONE
mask none of the WiFi events

WIFI_EVENT_MASK_AP_PROBEREQRECVED
mask SYSTEM_EVENT_AP_PROBEREQRECVED event

MAX_SSID_LEN
**MAX_PASSPHRASE_LEN**
**MAX_WPS_AP_CRED**
**WIFI_STATIS_BUFFER**
**WIFI_STATIS_RXTX**
**WIFI_STATIS_HW**
**WIFI_STATIS_DIAG**
**WIFI_STATIS_PS**
**WIFI_STATIS_ALL**

**Type Definitions**

```c
typedef int (*wifi_action_rx_cb_t)(uint8_t*hdr, uint8_t*payload, size_t len, uint8_t channel)
```

The Rx callback function of Action Tx operations.

**Parameters**

- **hdr**: pointer to the IEEE 802.11 Header structure
- **payload**: pointer to the Payload following 802.11 Header
- **len**: length of the Payload
- **channel**: channel number the frame is received on

**Enumerations**

```c
enum wifi_mode_t
{
    WIFI_MODE_NULL = 0,  
    WIFI_MODE_STA,       
    WIFI_MODE_AP,        
    WIFI_MODE_APSTA,     
    WIFI_MODE_MAX
}
```

**Values**:

- WIFI_MODE_NULL = 0: null mode
- WIFI_MODE_STA: WiFi station mode
- WIFI_MODE_AP: WiFi soft-AP mode
- WIFI_MODE_APSTA: WiFi station + soft-AP mode
- WIFI_MODE_MAX

```c
enum wifi_interface_t
{
    WIFI_IF_STA = ESP_IF_WIFI_STA,
    WIFI_IF_AP = ESP_IF_WIFI_AP
}
```

**Values**:

- WIFI_IF_STA = ESP_IF_WIFI_STA
- WIFI_IF_AP = ESP_IF_WIFI_AP

```c
enum wifi_country_policy_t
{
    WIFI_COUNTRY_POLICY_AUTO,
    WIFI_COUNTRY_POLICY_MANUAL
}
```

**Values**:

- WIFI_COUNTRY_POLICY_AUTO: Country policy is auto, use the country info of AP to which the station is connected
- WIFI_COUNTRY_POLICY_MANUAL: Country policy is manual, always use the configured country info

```c
enum wifi_auth_mode_t
{
    WIFI_AUTH_OPEN = 0,
    WIFI_AUTH_WEP
}
```

**Values**:

- WIFI_AUTH_OPEN = 0: authenticate mode : open
- WIFI_AUTH_WEP: authenticate mode : WEP
WIFI_AUTH_WPA_PSK
authenticate mode: WPA_PSK

WIFI_AUTH_WPA2_PSK
authenticate mode: WPA2_PSK

WIFI_AUTH_WPA_WPA2_PSK
authenticate mode: WPA_WPA2_PSK

WIFI_AUTH_WPA2_ENTERPRISE
authenticate mode: WPA2_ENTERPRISE

WIFI_AUTH_WPA3_PSK
authenticate mode: WPA3_PSK

WIFI_AUTH_WPA2_WPA3_PSK
authenticate mode: WPA2_WPA3_PSK

WIFI_AUTH_WAPI_PSK
authenticate mode: WAPI_PSK

WIFI_AUTH_MAX

      passive scan

enum wifi_cipher_type_t
Values:
  WIFI_CIPHER_TYPE_NONE = 0
      the cipher type is none
  WIFI_CIPHER_TYPE_WEP40
      the cipher type is WEP40
  WIFI_CIPHER_TYPE_WEP104
      the cipher type is WEP104
  WIFI_CIPHER_TYPE_TKIP
      the cipher type is TKIP
  WIFI_CIPHER_TYPE_CCMP
      the cipher type is CCMP
  WIFI_CIPHER_TYPE_TKIP_CCMP
      the cipher type is TKIP and CCMP
  WIFI_CIPHER_TYPE_AES_CMAC128
      the cipher type is AES-CMAC-128
  WIFI_CIPHER_TYPE_SMS4
      the cipher type is SMS4
  WIFI_CIPHER_TYPE_GCMP
      the cipher type is GCMP
  WIFI_CIPHER_TYPE_GCMP256
      the cipher type is GCMP-256
WIFI_CIPHER_TYPE_AES_GMAC128
the cipher type is AES-GMAC-128

WIFI_CIPHER_TYPE_AES_GMAC256
the cipher type is AES-GMAC-256

WIFI_CIPHER_TYPE_UNKNOWN
the cipher type is unknown

enum wifi_ant_t
WiFi antenna.

Values:

WIFI_ANT_ANT0
WiFi antenna 0

WIFI_ANT_ANT1
WiFi antenna 1

WIFI_ANT_MAX
Invalid WiFi antenna

enum wifi_scan_method_t

Values:

WIFI_FAST_SCAN = 0
Do fast scan, scan will end after find SSID match AP

WIFI_ALL_CHANNEL_SCAN
All channel scan, scan will end after scan all the channel

enum wifi_sort_method_t

Values:

WIFI_CONNECT_AP_BY_SIGNAL = 0
Sort match AP in scan list by RSSI

WIFI_CONNECT_AP_BY_SECURITY
Sort match AP in scan list by security mode

enum wifi_ps_type_t

Values:

WIFI_PS_NONE
No power save

WIFI_PS_MIN_MODEM
Minimum modem power saving. In this mode, station wakes up to receive beacon every DTIM period

WIFI_PS_MAX_MODEM
Maximum modem power saving. In this mode, interval to receive beacons is determined by the listen_interval parameter in wifi_sta_config_t

enum wifi_bandwidth_t

Values:

WIFI_BW_HT20 = 1

WIFI_BW_HT40

enum wifi_storage_t

Values:

WIFI_STORAGE_FLASH
all configuration will store in both memory and flash

WIFI_STORAGE_RAM
all configuration will only store in the memory
enum wifi_vendor_ie_type_t
Vendor Information Element type.

Determines the frame type that the IE will be associated with.

Values:
- WIFI_VND_IE_TYPE_BEACON
- WIFI_VND_IE_TYPE_PROBE_REQ
- WIFI_VND_IE_TYPE_PROBE_RESP
- WIFI_VND_IE_TYPE_ASSOC_REQ
- WIFI_VND_IE_TYPE_ASSOC_RESP

enum wifi_vendor_ie_id_t
Vendor Information Element index.

Each IE type can have up to two associated vendor ID elements.

Values:
- WIFI_VND_IE_ID_0
- WIFI_VND_IE_ID_1

enum wifi_promiscuous_pkt_type_t
Promiscuous frame type.

Passed to promiscuous mode RX callback to indicate the type of parameter in the buffer.

Values:
- WIFI_PKT_MGMT
  Management frame, indicates ‘buf’ argument is wifi_promiscuous_pkt_t
- WIFI_PKT_CTRL
  Control frame, indicates ‘buf’ argument is wifi_promiscuous_pkt_t
- WIFI_PKT_DATA
  Data frame, indicates ‘buf’ argument is wifi_promiscuous_pkt_t
- WIFI_PKT_MISC
  Other type, such as MIMO etc. ‘buf’ argument is wifi_promiscuous_pkt_t but the payload is zero length.

enum wifi_ant_mode_t
WiFi antenna mode.

Values:
- WIFI_ANT_MODE_ANT0
  Enable WiFi antenna 0 only
- WIFI_ANT_MODE_ANT1
  Enable WiFi antenna 1 only
- WIFI_ANT_MODE_AUTO
  Enable WiFi antenna 0 and 1, automatically select an antenna
- WIFI_ANT_MODE_MAX
  Invalid WiFi enabled antenna

enum wifi_phy_rate_t
WiFi PHY rate encodings.

Values:
- WIFI_PHY_RATE_1M_L = 0x00
  1 Mbps with long preamble
WIFI_PHY_RATE_2M_L = 0x01
2 Mbps with long preamble

WIFI_PHY_RATE_5M_L = 0x02
5.5 Mbps with long preamble

WIFI_PHY_RATE_11M_L = 0x03
11 Mbps with long preamble

WIFI_PHY_RATE_2M_S = 0x05
2 Mbps with short preamble

WIFI_PHY_RATE_5M_S = 0x06
5.5 Mbps with short preamble

WIFI_PHY_RATE_11M_S = 0x07
11 Mbps with short preamble

WIFI_PHY_RATE_48M = 0x08
48 Mbps

WIFI_PHY_RATE_24M = 0x09
24 Mbps

WIFI_PHY_RATE_12M = 0x0A
12 Mbps

WIFI_PHY_RATE_6M = 0x0B
6 Mbps

WIFI_PHY_RATE_54M = 0x0C
54 Mbps

WIFI_PHY_RATE_36M = 0x0D
36 Mbps

WIFI_PHY_RATE_18M = 0x0E
18 Mbps

WIFI_PHY_RATE_9M = 0x0F
9 Mbps

WIFI_PHY_RATE_MCS0_LGI = 0x10
MCS0 with long GI, 6.5 Mbps for 20MHz, 13.5 Mbps for 40MHz

WIFI_PHY_RATE_MCS1_LGI = 0x11
MCS1 with long GI, 13 Mbps for 20MHz, 27 Mbps for 40MHz

WIFI_PHY_RATE_MCS2_LGI = 0x12
MCS2 with long GI, 19.5 Mbps for 20MHz, 40.5 Mbps for 40MHz

WIFI_PHY_RATE_MCS3_LGI = 0x13
MCS3 with long GI, 26 Mbps for 20MHz, 54 Mbps for 40MHz

WIFI_PHY_RATE_MCS4_LGI = 0x14
MCS4 with long GI, 39 Mbps for 20MHz, 81 Mbps for 40MHz

WIFI_PHY_RATE_MCS5_LGI = 0x15
MCS5 with long GI, 52 Mbps for 20MHz, 108 Mbps for 40MHz

WIFI_PHY_RATE_MCS6_LGI = 0x16
MCS6 with long GI, 58.5 Mbps for 20MHz, 121.5 Mbps for 40MHz

WIFI_PHY_RATE_MCS7_LGI = 0x17
MCS7 with long GI, 65 Mbps for 20MHz, 135 Mbps for 40MHz

WIFI_PHY_RATE_MCS0_SGI = 0x18
MCS0 with short GI, 7.2 Mbps for 20MHz, 15 Mbps for 40MHz
WIFI_PHY_RATE_MCS1_SGI = 0x19
    MCS1 with short GI, 14.4 Mbps for 20MHz, 30 Mbps for 40MHz
WIFI_PHY_RATE_MCS2_SGI = 0x1A
    MCS2 with short GI, 21.7 Mbps for 20MHz, 45 Mbps for 40MHz
WIFI_PHY_RATE_MCS3_SGI = 0x1B
    MCS3 with short GI, 28.9 Mbps for 20MHz, 60 Mbps for 40MHz
WIFI_PHY_RATE_MCS4_SGI = 0x1C
    MCS4 with short GI, 43.3 Mbps for 20MHz, 90 Mbps for 40MHz
WIFI_PHY_RATE_MCS5_SGI = 0x1D
    MCS5 with short GI, 57.8 Mbps for 20MHz, 120 Mbps for 40MHz
WIFI_PHY_RATE_MCS6_SGI = 0x1E
    MCS6 with short GI, 65 Mbps for 20MHz, 135 Mbps for 40MHz
WIFI_PHY_RATE_MCS7_SGI = 0x1F
    MCS7 with short GI, 72.2 Mbps for 20MHz, 150 Mbps for 40MHz
WIFI_PHY_RATE_LORA_250K = 0x29
    250 Kbps
WIFI_PHY_RATE_LORA_500K = 0x2A
    500 Kbps
WIFI_PHY_RATE_MAX

enum wifi_event_t
    WiFi event declarations

Values:

WIFI_EVENT_WIFI_READY = 0
    ESP32 WiFi ready
WIFI_EVENT_SCAN_DONE
    ESP32 finish scanning AP
WIFI_EVENT_STA_START
    ESP32 station start
WIFI_EVENT_STA_STOP
    ESP32 station stop
WIFI_EVENT_STA_CONNECTED
    ESP32 station connected to AP
WIFI_EVENT_STA_DISCONNECTED
    ESP32 station disconnected from AP
WIFI_EVENT_STA_AUTHMODE_CHANGE
    the auth mode of AP connected by ESP32 station changed
WIFI_EVENT_STA_WPS_ER_SUCCESS
    ESP32 station wps succeeds in enrollee mode
WIFI_EVENT_STA_WPS_ER_FAILED
    ESP32 station wps fails in enrollee mode
WIFI_EVENT_STA_WPS_ER_TIMEOUT
    ESP32 station wps timeout in enrollee mode
WIFI_EVENT_STA_WPS_ER_PIN
    ESP32 station wps pin code in enrollee mode
WIFI_EVENT_STA_WPS_ER_PBC_OVERLAP
    ESP32 station wps overlap in enrollee mode
**WIFI_EVENT_AP_START**
ESP32 soft-AP start

**WIFI_EVENT_AP_STOP**
ESP32 soft-AP stop

**WIFI_EVENT_AP_STACONNECTED**
a station connected to ESP32 soft-AP

**WIFI_EVENT_AP_STADISCONNECTED**
a station disconnected from ESP32 soft-AP

**WIFI_EVENT_AP_PROBEREQRECVED**
Receive probe request packet in soft-AP interface

**WIFI_EVENT_FTM_REPORT**
Receive report of FTM procedure

**WIFI_EVENT_STA_BSS_RSSI_LOW**
AP’s RSSI crossed configured threshold

**WIFI_EVENT_ACTION_TX_STATUS**
Status indication of Action Tx operation

**WIFI_EVENT_ROC_DONE**
Remain-on-Channel operation complete

**WIFI_EVENT_STA_BEACON_TIMEOUT**
ESP32 station beacon timeout

**WIFI_EVENT_MAX**
Invalid WiFi event ID

---

```c
enum wifi_event_sta_wps_fail_reason_t
Argument structure for WIFI_EVENT_STA_WPS_ER_FAILED event

Values:

WPS_FAIL_REASON_NORMAL = 0
ESP32 WPS normal fail reason

WPS_FAIL_REASON_RECV_M2D
ESP32 WPS receive M2D frame

WPS_FAIL_REASON_MAX
```

---

```c
enum wifi_ftm_status_t
FTM operation status types.

Values:

FTM_STATUS_SUCCESS = 0
FTM exchange is successful

FTM_STATUS_UNSUPPORTED
Peer does not support FTM

FTM_STATUS_CONF_REJECTED
Peer rejected FTM configuration in FTM Request

FTM_STATUS_NO_RESPONSE
Peer did not respond to FTM Requests

FTM_STATUS_FAIL
Unknown error during FTM exchange
```
SmartConfig

The SmartConfig™ is a provisioning technology developed by TI to connect a new Wi-Fi device to a Wi-Fi network. It uses a mobile app to broadcast the network credentials from a smartphone, or a tablet, to an un-provisioned Wi-Fi device.

The advantage of this technology is that the device does not need to directly know SSID or password of an Access Point (AP). This information is provided using the smartphone. This is particularly important to headless device and systems, due to their lack of a user interface.

If you are looking for other options to provision your ESP32-S3 devices, check Provisioning API.

Application Example  Connect ESP32-S3 to target AP using SmartConfig: wifi/smart_config.

API Reference

Header File

- components/esp_wifi/include/esp_smartconfig.h

Functions

const char *esp_smartconfig_get_version (void)
Get the version of SmartConfig.

Return
- SmartConfig version const char.

esp_err_t esp_smartconfig_start (const smartconfig_start_config_t *config)
Start SmartConfig, config ESP device to connect AP. You need to broadcast information by phone APP. Device sniffer special packets from the air that containing SSID and password of target AP.

Attention 1. This API can be called in station or softAP-station mode.
Attention 2. Can not call esp_smartconfig_start twice before it finish, please call esp_smartconfig_stop first.

Return
- ESP_OK: succeed
- others: fail

Parameters
- config: pointer to smartconfig start configure structure

esp_err_t esp_smartconfig_stop (void)
Stop SmartConfig, free the buffer taken by esp_smartconfig_start.

Attention Whether connect to AP succeed or not, this API should be called to free memory taken by smartconfig_start.

Return
- ESP_OK: succeed
- others: fail

esp_err_t esp_esptouch_set_timeout (uint8_t time_s)
Set timeout of SmartConfig process.

Attention Timing starts from SC_STATUS_FIND_CHANNEL status. SmartConfig will restart if timeout.

Return
- ESP_OK: succeed
- others: fail

Parameters
- time_s: range 15s~255s, offset:45s.

esp_err_t esp_smartconfig_set_type (smartconfig_type_t type)
Set protocol type of SmartConfig.

Attention If users need to set the SmartConfig type, please set it before calling esp_smartconfig_start.
Return
• ESP_OK: succeed
• others: fail

Parameters
• type: Choose from the smartconfig_type_t.

`esp_err_t esp_smartconfig_fast_mode (bool enable)`
Set mode of SmartConfig. default normal mode.

Attention 1. Please call it before API esp_smartconfig_start.
Attention 2. Fast mode have corresponding APP(phone).
Attention 3. Two mode is compatible.

Return
• ESP_OK: succeed
• others: fail

Parameters
• enable: false-disable(default); true-enable;

`esp_err_t esp_smartconfig_get_rvd_data (uint8_t *rvd_data, uint8_t len)`
Get reserved data of ESPTouch v2.

Return
• ESP_OK: succeed
• others: fail

Parameters
• rvd_data: reserved data
• len: length of reserved data

Structures

`struct smartconfig_event_got_ssid_pswd_t`
Argument structure for SC_EVENT_GOT_SSID_PSWD event

Public Members

uint8_t ssid[32]
SSID of the AP. Null terminated string.

uint8_t password[64]
Password of the AP. Null terminated string.

bool bssid_set
whether set MAC address of target AP or not.

uint8_t bssid[6]
MAC address of target AP.

smartconfig_type_t type
Type of smartconfig(ESPTouch or AirKiss).

uint8_t token
Token from cellphone which is used to send ACK to cellphone.

uint8_t cellphone_ip[4]
IP address of cellphone.

`struct smartconfig_start_config_t`
Configure structure for esp_smartconfig_start

Public Members

bool enable_log
Enable smartconfig logs.
bool esp_touch_v2_enable_crypt
Enable ESPTouch v2 crypt.

char *esp_touch_v2_key
ESPTouch v2 crypt key, len should be 16.

Macros
SMARTCONFIG_START_CONFIG_DEFAULT()
• Organization Identifier: The Organization Identifier contains a unique identifier (0x18fe34), which is the first three bytes of MAC address applied by Espressif.
• Random Value: The Random Value filed is used to prevents relay attacks.
• Vendor Specific Content: The Vendor Specific Content contains vendor-specific fields as follows:

<table>
<thead>
<tr>
<th>Element ID</th>
<th>Length</th>
<th>Organization Identifier</th>
<th>Type</th>
<th>Version</th>
<th>Body</th>
</tr>
</thead>
<tbody>
<tr>
<td>1 byte</td>
<td>1 byte</td>
<td>3 bytes</td>
<td>1 byte</td>
<td>1 byte</td>
<td>0~250 bytes</td>
</tr>
</tbody>
</table>

- Element ID: The Element ID field is set to the value (221), indicating the vendor-specific element.
- Length: The length is the total length of Organization Identifier, Type, Version and Body.
- Organization Identifier: The Organization Identifier contains a unique identifier (0x18fe34), which is the first three bytes of MAC address applied by Espressif.
- Type: The Type field is set to the value (4) indicating ESP-NOW.
- Version: The Version field is set to the version of ESP-NOW.
- Body: The Body contains the ESP-NOW data.

As ESP-NOW is connectionless, the MAC header is a little different from that of standard frames. The FromDS and ToDS bits of FrameControl field are both 0. The first address field is set to the destination address. The second address field is set to the source address. The third address field is set to broadcast address (0xff:0xff:0xff:0xff:0xff:0xff).

Security

ESP-NOW uses the CCMP method, which is described in IEEE Std. 802.11-2012, to protect the vendor-specific action frame. The CCMP method uses a primary master key (PMK) and several local master keys (LMKs) to encrypt data. The lengths of both PMK and LMK are 16 bytes.

- PMK is used to encrypt LMK with the AES-128 algorithm. Call esp_now_set_pmk() to set PMK. If PMK is not set, a default PMK will be used.
- LMK of the paired device is used to encrypt the vendor-specific action frame with the CCMP method. The maximum number of different LMKs is six. If the LMK of the paired device is not set, the vendor-specific action frame will not be encrypted.

Encrypting multicast vendor-specific action frame is not supported.

Initialization and De-initialization Call esp_now_init() to initialize ESP-NOW and esp_now_deinit() to de-initialize ESP-NOW. ESP-NOW data must be transmitted after Wi-Fi is started, so it is recommended to start Wi-Fi before initializing ESP-NOW and stop Wi-Fi after de-initializing ESP-NOW. When esp_now_deinit() is called, all of the information of paired devices will be deleted.

Add Paired Device Call esp_now_add_peer() to add the device to the paired device list before you send data to this device. The maximum number of paired devices is twenty. If security is enabled, the LMK must be set. You can send ESP-NOW data via both the Station and the SoftAP interface. Make sure that the interface is enabled before sending ESP-NOW data. A device with a broadcast MAC address must be added before sending broadcast data. The range of the channel of paired devices is from 0 to 14. If the channel is set to 0, data will be sent on the current channel. Otherwise, the channel must be set as the channel that the local device is on.

Send ESP-NOW Data Call esp_now_send() to send ESP-NOW data and esp_now_register_send_cb to register sending callback function. It will return ESP_NOW_SEND_SUCCESS in sending callback function if the data is received successfully on the MAC layer. Otherwise, it will return ESP_NOW_SEND_FAIL. Several reasons can lead to ESP-NOW fails to send data. For example, the destination device doesn’t exist; the channels of the devices are not the same; the action frame is lost when transmitting on the air, etc. It is not guaranteed that application layer can receive the data. If necessary, send back ack data when receiving ESP-NOW data. If receiving ack data timeouts, retransmit the ESP-NOW data. A sequence number can also be assigned to ESP-NOW data to drop the duplicate data.

If there is a lot of ESP-NOW data to send, call esp_now_send() to send less than or equal to 250 bytes of data once a time. Note that too short interval between sending two ESP-NOW data may lead to disorder of sending callback function. So, it is recommended that sending the next ESP-NOW data after the sending callback function
of the previous sending has returned. The sending callback function runs from a high-priority Wi-Fi task. So, do not
do lengthy operations in the callback function. Instead, post the necessary data to a queue and handle it from a lower
priority task.

**Receiving ESP-NOW Data** Call `esp_now_register_recv_cb` to register receiving callback function. Call
the receiving callback function when receiving ESP-NOW. The receiving callback function also runs from the Wi-Fi
task. So, do not do lengthy operations in the callback function. Instead, post the necessary data to a queue and handle
it from a lower priority task.

**API Reference**

**Header File**

- `components/esp_wifi/include/esp_now.h`

**Functions**

```c
esp_err_t esp_now_init (void)
Initialize ESPNOW function.
Return
• ESP_OK: succeed
• ESP_ERR_ESPNOW_INTERNAL: Internal error
```

```c
esp_err_t esp_now_deinit (void)
De-initialize ESPNOW function.
Return
• ESP_OK: succeed
```

```c
esp_err_t esp_now_get_version (uint32_t *version)
Get the version of ESPNOW.
Return
• ESP_OK: succeed
• ESP_ERR_ESPNOW_ARG: invalid argument
Parameters
• version: ESPNOW version
```

```c
esp_err_t esp_now_register_recv_cb (esp_now_recv_cb_t cb)
Register callback function of receiving ESPNOW data.
Return
• ESP_OK: succeed
• ESP_ERR_ESPNOW_NOT_INIT: ESPNOW is not initialized
• ESP_ERR_ESPNOW_INTERNAL: internal error
Parameters
• cb: callback function of receiving ESPNOW data
```

```c
esp_err_t esp_now_unregister_recv_cb (void)
Unregister callback function of receiving ESPNOW data.
Return
• ESP_OK: succeed
• ESP_ERR_ESPNOW_NOT_INIT: ESPNOW is not initialized
```

```c
esp_err_t esp_now_register_send_cb (esp_now_send_cb_t cb)
Register callback function of sending ESPNOW data.
Return
• ESP_OK: succeed
• ESP_ERR_ESPNOW_NOT_INIT: ESPNOW is not initialized
• ESP_ERR_ESPNOW_INTERNAL: internal error
```
Chapter 2. API Reference

Parameters
• cb: callback function of sending ESPNOW data

```c
esp_err_t esp_now_unregister_send_cb (void)
```
Unregister callback function of sending ESPNOW data.

Return
• ESP_OK : succeed
• ESP_ERR_ESPNOW_NOT_INIT : ESPNOW is not initialized

```c
esp_err_t esp_now_send (const uint8_t* peer_addr, const uint8_t* data, size_t len)
```
Send ESPNOW data.

Attention 1. If peer_addr is not NULL, send data to the peer whose MAC address matches peer_addr
Attention 2. If peer_addr is NULL, send data to all of the peers that are added to the peer list
Attention 3. The maximum length of data must be less than ESP_NOW_MAX_DATA_LEN
Attention 4. The buffer pointed to by data argument does not need to be valid after esp_now_send returns

Return
• ESP_OK : succeed
• ESP_ERR_ESPNOW_NOT_INIT : ESPNOW is not initialized
• ESP_ERR_ESPNOW_ARG : invalid argument
• ESP_ERR_ESPNOW_INTERNAL : internal error
• ESP_ERR_ESPNOW_NO_MEM : out of memory
• ESP_ERR_ESPNOW_NOT_FOUND : peer is not found
• ESP_ERR_ESPNOW_IF : current WiFi interface doesn’t match that of peer

Parameters
• peer_addr: peer MAC address
• data: data to send
• len: length of data

```c
esp_err_t esp_now_add_peer (const esp_now_peer_info_t* peer)
```
Add a peer to peer list.

Return
• ESP_OK : succeed
• ESP_ERR_ESPNOW_NOT_INIT : ESPNOW is not initialized
• ESP_ERR_ESPNOW_ARG : invalid argument
• ESP_ERR_ESPNOW_FULL : peer list is full
• ESP_ERR_ESPNOW_NO_MEM : out of memory
• ESP_ERR_ESPNOW_EXIST : peer has existed

Parameters
• peer: peer information

```c
esp_err_t esp_now_del_peer (const uint8_t* peer_addr)
```
delete a peer from peer list.

Return
• ESP_OK : succeed
• ESP_ERR_ESPNOW_NOT_INIT : ESPNOW is not initialized
• ESP_ERR_ESPNOW_ARG : invalid argument
• ESP_ERR_ESPNOW_NOT_FOUND : peer is not found

Parameters
• peer_addr: peer MAC address

```c
esp_err_t esp_now_mod_peer (const esp_now_peer_info_t* peer)
```
Modify a peer.

Return
• ESP_OK : succeed
• ESP_ERR_ESPNOW_NOT_INIT : ESPNOW is not initialized
• ESP_ERR_ESPNOW_ARG : invalid argument
• ESP_ERR_ESPNOW_FULL : peer list is full

Parameters
Chapter 2. API Reference

• peer: peer information

```c
esp_err_t esp_now_get_peer (const uint8_t* peer_addr, esp_now_peer_info_t* peer)
```

Get a peer whose MAC address matches peer_addr from peer list.

**Return**
- ESP_OK : succeed
- ESP_ERR_ESPNOW_NOT_INIT : ESPNOW is not initialized
- ESP_ERR_ESPNOW_ARG : invalid argument
- ESP_ERR_ESPNOW_NOT_FOUND : peer is not found

**Parameters**
- peer_addr: peer MAC address
- peer: peer information

```c
esp_err_t esp_now_fetch_peer (bool from_head, esp_now_peer_info_t* peer)
```

Fetch a peer from peer list. Only return the peer which address is unicast, for the multicast/broadcast address, the function will ignore and try to find the next in the peer list.

**Return**
- ESP_OK : succeed
- ESP_ERR_ESPNOW_NOT_INIT : ESPNOW is not initialized
- ESP_ERR_ESPNOW_ARG : invalid argument
- ESP_ERR_ESPNOW_NOT_FOUND : peer is not found

**Parameters**
- from_head: fetch from head of list or not
- peer: peer information

```c
bool esp_now_is_peer_exist (const uint8_t* peer_addr)
```

Peer exists or not.

**Return**
- true : peer exists
- false : peer not exists

**Parameters**
- peer_addr: peer MAC address

```c
esp_err_t esp_now_get_peer_num (esp_now_peer_num_t* num)
```

Get the number of peers.

**Return**
- ESP_OK : succeed
- ESP_ERR_ESPNOW_NOT_INIT : ESPNOW is not initialized
- ESP_ERR_ESPNOW_ARG : invalid argument

**Parameters**
- num: number of peers

```c
esp_err_t esp_now_set_pmk (const uint8_t* pmk)
```

Set the primary master key.

**Attention** 1. primary master key is used to encrypt local master key

**Return**
- ESP_OK : succeed
- ESP_ERR_ESPNOW_NOT_INIT : ESPNOW is not initialized
- ESP_ERR_ESPNOW_ARG : invalid argument

**Parameters**
- pmk: primary master key

```c
esp_err_t esp_now_set_wake_window (uint16_t window)
```

Set esp_now wake window for sta_disconnected power management.

**Attention** 1. Only when ESP_WIFI_STA_DISCONNECTED_PM_ENABLE is enabled, this configuration could work

**Attention** 2. This configuration only work for station mode and disconnected status
**Attention** 3. If more than one module has configured its `wake_window`, the chip would choose the largest one to stay waked.

**Attention** 4. If the gap between interval and window is smaller than 5ms, the chip would keep waked all the time.

**Attention** 5. If never configured `wake_window`, the chip would keep waked at disconnected once it uses `esp_now`.

**Return**
- ESP_OK : succeed
- ESP_ERR_ESPNOW_NOT_INIT : ESPNOW is not initialized

**Parameters**
- `window`: how much microsecond would the chip keep waked each interval, vary from 0 to 65535

**Structures**

```c
struct esp_now_peer_info
```

ESPNOW peer information parameters.

**Public Members**

- `uint8_t peer_addr[ESP_NOW_ETH_ALEN]`  
  ESPNOW peer MAC address that is also the MAC address of station or softap.

- `uint8_t lmk[ESP_NOW_KEY_LEN]`  
  ESPNOW peer local master key that is used to encrypt data.

- `uint8_t channel`  
  Wi-Fi channel that peer uses to send/receive ESPNOW data. If the value is 0, use the current channel which station or softap is on. Otherwise, it must be set as the channel that station or softap is on.

- `wifi_interface_t ifidx`  
  Wi-Fi interface that peer uses to send/receive ESPNOW data.

- `bool encrypt`  
  ESPNOW data that this peer sends/receives is encrypted or not.

- `void *priv`  
  ESPNOW peer private data.

**struct esp_now_peer_num**

Number of ESPNOW peers which exist currently.

**Public Members**

- `int total_num`  
  Total number of ESPNOW peers, maximum value is ESP_NOW_MAX_TOTAL_PEER_NUM.

- `int encrypt_num`  
  Number of encrypted ESPNOW peers, maximum value is ESP_NOW_MAX_ENCRYPT_PEER_NUM.

**Macros**

```c
ESP_ERR_ESPNOW_BASE
```

ESPNOW error number base.

```c
ESP_ERR_ESPNOW_NOT_INIT
```

ESPNOW is not initialized.

```c
ESP_ERR_ESPNOW_ARG
```

Invalid argument.

```c
ESP_ERR_ESPNOW_NO_MEM
```

Out of memory.
Chapter 2. API Reference

ESP_ERR_ESPNOW_FULL
- ESPNOW peer list is full

ESP_ERR_ESPNOW_NOT_FOUND
- ESPNOW peer is not found

ESP_ERR_ESPNOW_INTERNAL
- Internal error

ESP_ERR_ESPNOW_EXIST
- ESPNOW peer has existed

ESP_ERR_ESPNOW_IF
- Interface error

ESP_NOW_ETH_ALEN
- Length of ESPNOW peer MAC address

ESP_NOW_KEY_LEN
- Length of ESPNOW peer local master key

ESP_NOW_MAX_TOTAL_PEER_NUM
- Maximum number of ESPNOW total peers

ESP_NOW_MAX_ENCRYPT_PEER_NUM
- Maximum number of ESPNOW encrypted peers

ESP_NOW_MAX_DATA_LEN
- Maximum length of ESPNOW data which is sent very time

**Type Definitions**

typedef struct esp_now_peer_info esp_now_peer_info_t
- ESPNOW peer information parameters.

typedef struct esp_now_peer_num esp_now_peer_num_t
- Number of ESPNOW peers which exist currently.

typedef void (*esp_now_recv_cb_t)(const uint8_t *mac_addr, const uint8_t *data, int data_len)
- Callback function of receiving ESPNOW data.

Parameters
- mac_addr: peer MAC address
- data: received data
- data_len: length of received data

typedef void (*esp_now_send_cb_t)(const uint8_t *mac_addr, esp_now_send_status_t status)
- Callback function of sending ESPNOW data.

Parameters
- mac_addr: peer MAC address
- status: status of sending ESPNOW data (succeed or fail)

**Enumerations**

enum esp_now_send_status_t
- Status of sending ESPNOW data.

Values:

ESP_NOW_SEND_SUCCESS = 0
- Send ESPNOW data successfully

ESP_NOW_SEND_FAIL
- Send ESPNOW data fail
Chapter 2. API Reference

ESP-WIFI-MESH Programming Guide

This is a programming guide for ESP-WIFI-MESH, including the API reference and coding examples. This guide is split into the following parts:

1. ESP-WIFI-MESH Programming Model
2. Writing an ESP-WIFI-MESH Application
3. Self Organized Networking
4. Application Examples
5. API Reference

For documentation regarding the ESP-WIFI-MESH protocol, please see the ESP-WIFI-MESH API Guide. For more information about ESP-WIFI-MESH Development Framework, please see ESP-WIFI-MESH Development Framework.

ESP-WIFI-MESH Programming Model

Software Stack  The ESP-WIFI-MESH software stack is built atop the Wi-Fi Driver/FreeRTOS and may use the LwIP Stack in some instances (i.e. the root node). The following diagram illustrates the ESP-WIFI-MESH software stack.

![Software Stack Diagram](image)

Fig. 2: ESP-WIFI-MESH Software Stack

System Events  An application interfaces with ESP-WIFI-MESH via ESP-WIFI-MESH Events. Since ESP-WIFI-MESH is built atop the Wi-Fi stack, it is also possible for the application to interface with the Wi-Fi driver via the Wi-Fi Event Task. The following diagram illustrates the interfaces for the various System Events in an ESP-WIFI-MESH application.

![System Events Diagram](image)

Fig. 3: ESP-WIFI-MESH System Events Delivery
The `mesh_event_id_t` defines all possible ESP-WIFI-MESH events and can indicate events such as the connection/disconnection of parent/child. Before ESP-WIFI-MESH events can be used, the application must register a Mesh Events handler via `esp_event_handler_register()` to the default event task. The Mesh Events handler that is registered contain handlers for each ESP-WIFI-MESH event relevant to the application.

Typical use cases of mesh events include using events such as `MESH_EVENT_PARENT_CONNECTED` and `MESH_EVENT_CHILD_CONNECTED` to indicate when a node can begin transmitting data upstream and downstream respectively. Likewise, `IP_EVENT_STA_GOT_IP` and `IP_EVENT_STA_LOST_IP` can be used to indicate when the root node can and cannot transmit data to the external IP network.

**Warning:** When using ESP-WIFI-MESH under self-organized mode, users must ensure that no calls to Wi-Fi API are made. This is due to the fact that the self-organizing mode will internally make Wi-Fi API calls to connect/disconnect/scan etc. Any Wi-Fi calls from the application (including calls from callbacks and handlers of Wi-Fi events) may interfere with ESP-WIFI-MESH’s self-organizing behavior. Therefore, user’s should not call Wi-Fi APIs after `esp_mesh_start()` is called, and before `esp_mesh_stop()` is called.

**LwIP & ESP-WIFI-MESH** The application can access the ESP-WIFI-MESH stack directly without having to go through the LwIP stack. The LwIP stack is only required by the root node to transmit/receive data to/from an external IP network. However, since every node can potentially become the root node (due to automatic root node selection), each node must still initialize the LwIP stack.

Each node is required to initialize LwIP by calling `tcpip_adapter_init()`. In order to prevent non-root node access to LwIP, the application should stop the following services after LwIP initialization:

- DHCP server service on the softAP interface.
- DHCP client service on the station interface.

The following code snippet demonstrates how to initialize LwIP for ESP-WIFI-MESH applications.

```c
/* tcpip initialization */
tcpip_adapter_init();
/*
 * for mesh
 * stop DHCP server on softAP interface by default
 * stop DHCP client on station interface by default
 */
ESP_ERROR_CHECK(tcpip_adapter_dhcps_stop(TCPIP_ADAPTER_IF_AP));
ESP_ERROR_CHECK(tcpip_adapter_dhcpc_stop(TCPIP_ADAPTER_IF_STA));
```

**Note:** ESP-WIFI-MESH requires a root node to be connected with a router. Therefore, in the event that a node becomes the root, the corresponding handler must start the DHCP client service and immediately obtain an IP address. Doing so will allow other nodes to begin transmitting/receiving packets to/from the external IP network. However, this step is unnecessary if static IP settings are used.

**Writing an ESP-WIFI-MESH Application** The prerequisites for starting ESP-WIFI-MESH is to initialize LwIP and Wi-Fi. The following code snippet demonstrates the necessary prerequisite steps before ESP-WIFI-MESH itself can be initialized.

```c
tcpip_adapter_init();
/*
 * for mesh
 * stop DHCP server on softAP interface by default
 * stop DHCP client on station interface by default
 */
ESP_ERROR_CHECK(tcpip_adapter_dhcps_stop(TCPIP_ADAPTER_IF_AP));
```

(continues on next page)
After initializing LwIP and Wi-Fi, the process of getting an ESP-WIFI-MESH network up and running can be summarized into the following three steps:

1. **Initialize Mesh**
2. **Configuring an ESP-WIFI-MESH Network**
3. **Start Mesh**

### Initialize Mesh

The following code snippet demonstrates how to initialize ESP-WIFI-MESH:

```c
/* mesh initialization */
ESP_ERROR_CHECK(esp_mesh_init());
/* register mesh events handler */
ESP_ERROR_CHECK(esp_event_handler_register(MESH_EVENT, ESP_EVENT_ANY_ID, &mesh_, event_handler, NULL));
```

### Configuring an ESP-WIFI-MESH Network

ESP-WIFI-MESH is configured via `esp_mesh_set_config()` which receives its arguments using the `mesh_cfg_t` structure. The structure contains the following parameters used to configure ESP-WIFI-MESH:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Channel</td>
<td>Range from 1 to 14</td>
</tr>
<tr>
<td>Mesh ID</td>
<td>ID of ESP-WIFI-MESH Network, see <code>mesh_addr_t</code></td>
</tr>
<tr>
<td>Router</td>
<td>Router Configuration, see <code>mesh_router_t</code></td>
</tr>
<tr>
<td>Mesh AP</td>
<td>Mesh AP Configuration, see <code>mesh_ap_cfg_t</code></td>
</tr>
<tr>
<td>Crypto Functions</td>
<td>Crypto Functions for Mesh IE, see <code>mesh_crypto_funcs_t</code></td>
</tr>
</tbody>
</table>

The following code snippet demonstrates how to configure ESP-WIFI-MESH:

```c
/* Enable the Mesh IE encryption by default */
mesh_cfg_t cfg = MESH_INIT_CONFIG_DEFAULT();
/* mesh ID */
memcpy((uint8_t *)&cfg.mesh_id, MESH_ID, 6);
/* channel (must match the router's channel) */
cfg.channel = CONFIG_MESH_CHANNEL;
/* router */
cfg.router.ssid_len = strlen(CONFIG_MESH_ROUTER_SSID);
memcpy((uint8_t *)&cfg.router.ssid, CONFIG_MESH_ROUTER_SSID, cfg.router.ssid_len);
memcpy((uint8_t *)&cfg.router.password, CONFIG_MESH_ROUTER_PASSWD, strlen(CONFIG_MESH_ROUTER_PASSWD));
/* mesh softAP */
cfg.mesh_ap.max_connection = CONFIG_MESH_AP_CONNECTIONS;
memcpy((uint8_t *)&cfg.mesh_ap.password, CONFIG_MESH_AP_PASSWD, strlen(CONFIG_MESH_AP_PASSWD));
ESP_ERROR_CHECK(esp_mesh_set_config(&cfg));
```
Chapter 2. API Reference

Start Mesh  The following code snippet demonstrates how to start ESP-WIFI-MESH.

```c
/* mesh start */
ESP_ERROR_CHECK(esp_mesh_start());
```

After starting ESP-WIFI-MESH, the application should check for ESP-WIFI-MESH events to determine when it has connected to the network. After connecting, the application can start transmitting and receiving packets over the ESP-WIFI-MESH network using `esp_mesh_send()` and `esp_mesh_recv()`.

Self Organized Networking  Self organized networking is a feature of ESP-WIFI-MESH where nodes can autonomously scan/select/connect/reconnect to other nodes and routers. This feature allows an ESP-WIFI-MESH network to operate with high degree of autonomy by making the network robust to dynamic network topologies and conditions. With self organized networking enabled, nodes in an ESP-WIFI-MESH network are able to carry out the following actions without autonomously:

- Selection or election of the root node (see Automatic Root Node Selection in Building a Network)
- Selection of a preferred parent node (see Parent Node Selection in Building a Network)
- Automatic reconnection upon detecting a disconnection (see Intermediate Parent Node Failure in Managing a Network)

When self organized networking is enabled, the ESP-WIFI-MESH stack will internally make calls to Wi-Fi APIs. Therefore, the application layer should not make any calls to Wi-Fi APIs whilst self organized networking is enabled as doing so would risk interfering with ESP-WIFI-MESH.

Toggling Self Organized Networking  Self organized networking can be enabled or disabled by the application at runtime by calling the `esp_mesh_set_self_organized()` function. The function has the two following parameters:

- `bool enable` specifies whether to enable or disable self organized networking.
- `bool select_parent` specifies whether a new parent node should be selected when enabling self organized networking. Selecting a new parent has different effects depending the node type and the node’s current state. This parameter is unused when disabling self organized networking.

Disabling Self Organized Networking  The following code snippet demonstrates how to disable self organized networking.

```c
//disable self organized networking
esp_mesh_set_self_organized(true, true);
```

ESP-WIFI-MESH will attempt to maintain the node’s current Wi-Fi state when disabling self organized networking.

- If the node was previously connected to other nodes, it will remain connected.
- If the node was previously disconnected and was scanning for a parent node or router, it will stop scanning.
- If the node was previously attempting to reconnect to a parent node or router, it will stop reconnecting.

Enabling Self Organized Networking  ESP-WIFI-MESH will attempt to maintain the node’s current Wi-Fi state when enabling self organized networking. However, depending on the node type and whether a new parent is selected, the Wi-Fi state of the node can change. The following table shows effects of enabling self organized networking.
### Select Parent | Is Root Node | Effects
--- | --- | ---
N | N | • Nodes already connected to a parent node will remain connected.  
   - Nodes previously scanning for a parent nodes will stop scanning. Call `esp_mesh_connect()` to restart.
Y |  | • A root node already connected to router will stay connected.  
   - A root node disconnected from router will need to call `esp_mesh_connect()` to reconnect.
Y | N | • Nodes without a parent node will automatically select a preferred parent and connect.  
   - Nodes already connected to a parent node will disconnect, reselect a preferred parent node, and connect.
Y |  | • For a root node to connect to a parent node, it must give up its role as root. Therefore, a root node will disconnect from the router and all child nodes, select a preferred parent node, and connect.

The following code snippet demonstrates how to enable self-organized networking.

```c
// Enable self-organized networking and select a new parent
esp_mesh_set_self_organized(true, true);
...
// Enable self-organized networking and manually reconnect
esp_mesh_set_self_organized(true, false);
esp_mesh_connect();
```

**Calling Wi-Fi API** There can be instances in which an application may want to directly call Wi-Fi API whilst using ESP-WIFi-MESH. For example, an application may want to manually scan for neighboring APs. However, self-organized networking must be disabled before the application calls any Wi-Fi APIs. This will prevent the ESP-WIFI-MESH stack from attempting to call any Wi-Fi APIs and potentially interfering with the application’s calls.

Therefore, application calls to Wi-Fi APIs should be placed in between calls of `esp_mesh_set_self_organized()` which disable and enable self-organized networking. The following code snippet demonstrates how an application can safely call `esp_wifi_scan_start()` whilst using ESP-WIFI-MESH.
ESP-WIFI-MESH.

//Disable self organized networking
esp_mesh_set_self_organized(0, 0);

//Stop any scans already in progress
esp_wifi_scan_stop();

//Manually start scan. Will automatically stop when run to completion
esp_wifi_scan_start();

//Process scan results
...

//Re-enable self organized networking if still connected
esp_mesh_set_self_organized(1, 0);
...

//Re-enable self organized networking if non-root and disconnected
esp_mesh_set_self_organized(1, 1);
...

//Re-enable self organized networking if root and disconnected
esp_mesh_set_self_organized(1, 0);  // Don't select new parent
esp_mesh_connect();  // Manually reconnect to router

Application Examples  ESP-IDF contains these ESP-WIFI-MESH example projects:

The Internal Communication Example demonstrates how to set up an ESP-WIFI-MESH network and have the root node send a data packet to every node within the network.

The Manual Networking Example demonstrates how to use ESP-WIFI-MESH without the self-organizing features. This example shows how to program a node to manually scan for a list of potential parent nodes and select a parent node based on custom criteria.

API Reference

Header File

- components/esp_wifi/include/esp_mesh.h

Functions

- esp_err_t esp_mesh_init (void)
  Mesh initialization.
  - Check whether Wi-Fi is started.
  - Initialize mesh global variables with default values.
  
  Attention  This API shall be called after Wi-Fi is started.

  Return
  - ESP_OK
  - ESP_FAIL

- esp_err_t esp_mesh_deinit (void)
  Mesh de-initialization.
  - Release resources and stop the mesh

  Return
  - ESP_OK
**esp_err_t esp_mesh_start** (void)

Start mesh.
- Initialize mesh IE.
- Start mesh network management service.
- Create TX and RX queues according to the configuration.
- Register mesh packets receive callback.

**Attention** This API shall be called after mesh initialization and configuration.

**Return**
- ESP_OK
- ESP_FAIL
- ESP_ERR_MESH_NOT_INIT
- ESP_ERR_MESH_NOT_CONFIG
- ESP_ERR_MESH_NO_MEMORY

**esp_err_t esp_mesh_stop** (void)

Stop mesh.
- Deinitialize mesh IE.
- Disconnect with current parent.
- Disassociate all currently associated children.
- Stop mesh network management service.
- Unregister mesh packets receive callback.
- Delete TX and RX queues.
- Release resources.
- Restore Wi-Fi softAP to default settings if Wi-Fi dual mode is enabled.
- Set Wi-Fi Power Save type to WIFI_PS_NONE.

**Return**
- ESP_OK
- ESP_FAIL

**esp_err_t esp_mesh_send** (const mesh_addr_t *to, const mesh_data_t *data, int flag, const mesh_opt_t opt[], int opt_count)

Send a packet over the mesh network.
- Send a packet to any device in the mesh network.
- Send a packet to external IP network.

**Attention** This API is not reentrant.

**Return**
- ESP_OK
- ESP_FAIL
- ESP_ERR_MESH_ARGUMENT
- ESP_ERR_MESH_NOT_START
- ESP_ERR_MESH_DISCONNECTED
- ESP_ERR_MESH_OPT_UNKNOWN
- ESP_ERR_MESH_EXCEED_MTU
- ESP_ERR_MESH_NO_MEMORY
- ESP_ERR_MESH_TIMEOUT
- ESP_ERR_MESH_QUEUE_FULL
- ESP_ERR_MESH_NO_ROUTE_FOUND
- ESP_ERR_MESH_DISCARD

**Parameters**
- **[in]** to: the address of the final destination of the packet
  - If the packet is to the root, set this parameter to NULL.
  - If the packet is to an external IP network, set this parameter to the IPv4:PORT combination.
  This packet will be delivered to the root firstly, then the root will forward this packet to the final IP server address.
- **[in]** data: pointer to a sending mesh packet
Field size should not exceed MESH_MPS. Note that the size of one mesh packet should not exceed MESH_MTU.

Field proto should be set to data protocol in use (default is MESH_PROTO_BIN for binary).

Field tos should be set to transmission tos (type of service) in use (default is MESH_TOS_P2P for point-to-point reliable).

- **[in]** flag: bitmap for data sent
  - Speed up the route search
    * If the packet is to the root and “to” parameter is NULL, set this parameter to 0.
    * If the packet is to an internal device, MESH_DATA_P2P should be set.
    * If the packet is to the root (“to” parameter isn’t NULL) or to external IP network, MESH_DATA_TODS should be set.
    * If the packet is from the root to an internal device, MESH_DATA_FROMDS should be set.
  - Specify whether this API is block or non-block, block by default
    * If needs non-blocking, MESH_DATA_NONBLOCK should be set. Otherwise, may use esp_mesh_send_block_time() to specify a blocking time.
  - In the situation of the root change, MESH_DATA_DROP identifies this packet can be dropped by the new root for upstream data to external IP network, we try our best to avoid data loss caused by the root change, but there is a risk that the new root is running out of memory because most of memory is occupied by the pending data which isn’t read out in time by esp_mesh_recv_toDS(). Generally, we suggest esp_mesh_recv_toDS() is called after a connection with IP network is created. Thus data outgoing to external IP network via socket is just from reading esp_mesh_recv_toDS() which avoids unnecessary memory copy.

- **[in]** opt: options
  - In case of sending a packet to a certain group, MESH_OPT_SEND_GROUP is a good choice.
    In this option, the value field should be set to the target receiver addresses in this group.
  - Root sends a packet to an internal device, this packet is from external IP network in case the receiver device responds this packet, MESH_OPT_RECV_DS_ADDR is required to attach the target DS address.

- **[in]** opt_count: option count
  - Currently, this API only takes one option, so opt_count is only supported to be 1.

```c
esp_err_t esp_mesh_send_block_time(uint32_t time_ms)

Set blocking time of esp_mesh_send()

Attention This API shall be called before mesh is started.
Return
  * ESP_OK
Parameters
  * [in] time_ms: blocking time of esp_mesh_send(), unit:ms
```

```c
esp_err_t esp_mesh_recv(mesh_addr_t *from, mesh_data_t *data, int timeout_ms, int *flag, mesh_opt_t opt[], int opt_count)

Receive a packet targeted to self over the mesh network.
flag could be MESH_DATA_FROMDS or MESH_DATA_TODS.

Attention Mesh RX queue should be checked regularly to avoid running out of memory.
  * Use esp_mesh_get_rx_pending() to check the number of packets available in the queue waiting to be received by applications.
Return
  * ESP_OK
  * ESP_ERR_MESH_ARGUMENT
  * ESP_ERR_MESH_NOT_START
  * ESP_ERR_MESH_TIMEOUT
  * ESP_ERR_MESH_DISCARD
Parameters
  * [out] from: the address of the original source of the packet
  * [out] data: pointer to the received mesh packet
    - Field proto is the data protocol in use. Should follow it to parse the received data.
    - Field tos is the transmission tos (type of service) in use.
```
Chapter 2. API Reference

• [in] timeout_ms: wait time if a packet isn’t immediately available (0:no wait, port-MAX_DELAY:wait forever)
• [out] flag: bitmap for data received
  – MESH_DATA_FROMDS represents data from external IP network
  – MESH_DATA_TODS represents data directed upward within the mesh network

Parameters
• [out] opt: options desired to receive
  – MESH_OPT_RECV_DS_ADDR attaches the DS address
• [in] opt_count: option count desired to receive
  – Currently, this API only takes one option, so opt_count is only supported to be 1.

esp_err_t esp_mesh_recv_toDS(mesh_addr_t *from, mesh_addr_t *to, mesh_data_t *data, int timeout_ms, int *flag, mesh_opt_t opt[], int opt_count)

Receive a packet targeted to external IP network.

• Root uses this API to receive packets destined to external IP network
• Root forwards the received packets to the final destination via socket.
• If no socket connection is ready to send out the received packets and this esp_mesh_recv_toDS() hasn’t been called by applications, packets from the whole mesh network will be pending in toDS queue.

Use esp_mesh_get_rx_pending() to check the number of packets available in the queue waiting to be received by applications in case of running out of memory in the root.

Using esp_mesh_set_xon_qsize() users may configure the RX queue size, default:32. If this size is too large, and esp_mesh_recv_toDS() isn’t called in time, there is a risk that a great deal of memory is occupied by the pending packets. If this size is too small, it will impact the efficiency on upstream. How to decide this value depends on the specific application scenarios.

flag could be MESH_DATA_TODS.

Attention This API is only called by the root.

Return
• ESP_OK
• ESP_ERR_MESH_ARGUMENT
• ESP_ERR_MESH_NOT_START
• ESP_ERR_MESH_TIMEOUT
• ESP_ERR_MESH_DISCARD
• ESP_ERR_MESH_RECV_RELEASE

Parameters
• [out] from: the address of the original source of the packet
• [out] to: the address contains remote IP address and port (IPv4:PORT)
• [out] data: pointer to the received packet
  – Contain the protocol and applications should follow it to parse the data.
• [in] timeout_ms: wait time if a packet isn’t immediately available (0:no wait, port-MAX_DELAY:wait forever)
• [out] flag: bitmap for data received
  – MESH_DATA_TODS represents the received data target to external IP network. Root shall forward this data to external IP network via the association with router.

Parameters
• [out] opt: options desired to receive
• [in] opt_count: option count desired to receive

esp_err_t esp_mesh_set_config(const mesh_cfg_t *config)

Set mesh stack configuration.

• Use MESH_INIT_CONFIG_DEFAULT() to initialize the default values, mesh IE is encrypted by default.
• Mesh network is established on a fixed channel (1-14).
• Mesh event callback is mandatory.
• Mesh ID is an identifier of an MBSS. Nodes with the same mesh ID can communicate with each other.
• Regarding to the router configuration, if the router is hidden, BSSID field is mandatory.

If BSSID field isn’t set and there exists more than one router with same SSID, there is a risk that more roots
than one connected with different BSSID will appear. It means more than one mesh network is established with the same mesh ID.

Root conflict function could eliminate redundant roots connected with the same BSSID, but couldn’t handle roots connected with different BSSID. Because users might have such requirements of setting up routers with same SSID for the future replacement. But in that case, if the above situations happen, please make sure applications implement forward functions on the root to guarantee devices in different mesh networks can communicate with each other. max_connection of mesh softAP is limited by the max number of Wi-Fi softAP supported (max:10).

**Attention** This API shall be called before mesh is started after mesh is initialized.

**Return**
- ESP_OK
- ESP_ERR_MESH_ARGUMENT
- ESP_ERR_MESH_NOT_ALLOWED

**Parameters**
- **[in]** config: pointer to mesh stack configuration

```c
esp_err_t esp_mesh_get_config(mesh_cfg_t *config)
```
Get mesh stack configuration.

**Return**
- ESP_OK
- ESP_ERR_MESH_ARGUMENT

**Parameters**
- **[out]** config: pointer to mesh stack configuration

```c
esp_err_t esp_mesh_set_router(const mesh_router_t *router)
```
Get router configuration.

**Attention** This API is used to dynamically modify the router configuration after mesh is configured.

**Return**
- ESP_OK
- ESP_ERR_MESH_ARGUMENT

**Parameters**
- **[in]** router: pointer to router configuration

```c
esp_err_t esp_mesh_get_router(mesh_router_t *router)
```
Get router configuration.

**Return**
- ESP_OK
- ESP_ERR_MESH_ARGUMENT

**Parameters**
- **[out]** router: pointer to router configuration

```c
esp_err_t esp_mesh_set_id(const mesh_addr_t *id)
```
Set mesh network ID.

**Attention** This API is used to dynamically modify the mesh network ID.

**Return**
- ESP_OK
- ESP_ERR_MESH_ARGUMENT: invalid argument

**Parameters**
- **[in]** id: pointer to mesh network ID

```c
esp_err_t esp_mesh_get_id(mesh_addr_t *id)
```
Get mesh network ID.

**Return**
- ESP_OK
- ESP_ERR_MESH_ARGUMENT

**Parameters**
- **[out]** id: pointer to mesh network ID
**esp_err_t esp_mesh_set_type (mesh_type_t type)**
Designate device type over the mesh network.
- MESH_IDLE: designates a device as a self-organized node for a mesh network
- MESH_ROOT: designates the root node for a mesh network
- MESH_LEAF: designates a device as a standalone Wi-Fi station that connects to a parent
- MESH_STA: designates a device as a standalone Wi-Fi station that connects to a router

**Return**
- ESP_OK
- ESP_ERR_MESH_NOT_ALLOWED

**Parameters**
- [in] type: device type

**mesh_type_t esp_mesh_get_type (void)**
Get device type over mesh network.

**Attention** This API shall be called after having received the event MESH_EVENT_PARENT_CONNECTED.

**Return** mesh type

**esp_err_t esp_mesh_set_max_layer (int max_layer)**
Set network max layer value.
- for tree topology, the max is 25.
- for chain topology, the max is 1000.
- Network max layer limits the max hop count.

**Attention** This API shall be called before mesh is started.

**Return**
- ESP_OK
- ESP_ERR_MESH_ARGUMENT
- ESP_ERR_MESH_NOT_ALLOWED

**Parameters**
- [in] max_layer: max layer value

**int esp_mesh_get_max_layer (void)**
Get max layer value.

**Return** max layer value

**esp_err_t esp_mesh_set_ap_password (const uint8_t *pwd, int len)**
Set mesh softAP password.

**Attention** This API shall be called before mesh is started.

**Return**
- ESP_OK
- ESP_ERR_MESH_ARGUMENT
- ESP_ERR_MESH_NOT_ALLOWED

**Parameters**
- [in] pwd: pointer to the password
- [in] len: password length

**esp_err_t esp_mesh_set_ap_authmode (wifi_auth_mode_t authmode)**
Set mesh softAP authentication mode.

**Attention** This API shall be called before mesh is started.

**Return**
- ESP_OK
- ESP_ERR_MESH_ARGUMENT
- ESP_ERR_MESH_NOT_ALLOWED

**Parameters**
- [in] authmode: authentication mode
**wifi_auth_mode_t esp_mesh_get_ap_authmode (void)**

Get mesh softAP authentication mode.

**Return**

authentication mode

**esp_err_t esp_mesh_set_ap_connections (int connections)**

Set mesh max connection value.

- Set mesh softAP max connection = mesh max connection + non-mesh max connection

**Attention** This API shall be called before mesh is started.

**Return**

- ESP_OK
- ESP_ERR_MESH_ARGUMENT

**Parameters**

- [in] connections: the number of max connections

**int esp_mesh_get_ap_connections (void)**

Get mesh max connection configuration.

**Return**

the number of mesh max connections

**int esp_mesh_get_non_mesh_connections (void)**

Get non-mesh max connection configuration.

**Return**

the number of non-mesh max connections

**int esp_mesh_get_layer (void)**

Get current layer value over the mesh network.

**Attention** This API shall be called after having received the event MESH_EVENT_PARENT_CONNECTED.

**Return**

layer value

**esp_err_t esp_mesh_get_parent_bssid (mesh_addr_t *bssid)**

Get the parent BSSID.

**Attention** This API shall be called after having received the event MESH_EVENT_PARENT_CONNECTED.

**Return**

- ESP_OK
- ESP_FAIL

**Parameters**

- [out] bssid: pointer to parent BSSID

**bool esp_mesh_is_root (void)**

Return whether the device is the root node of the network.

**Return**

true/false

**esp_err_t esp_mesh_set_self_organized (bool enable, bool select_parent)**

Enable/disable self-organized networking.

- Self-organized networking has three main functions: select the root node; find a preferred parent; initiate reconnection if a disconnection is detected.
- Self-organized networking is enabled by default.
- If self-organized is disabled, users should set a parent for the device via esp_mesh_set_parent().

**Attention** This API is used to dynamically modify whether to enable the self organizing.

**Return**

- ESP_OK
- ESP_FAIL

**Parameters**

- [in] enable: enable or disable self-organized networking
- [in] select_parent: Only valid when self-organized networking is enabled.
  - if select_parent is set to true, the root will give up its mesh root status and search for a new parent like other non-root devices.
bool esp_mesh_get_self_organized (void)
Return whether enable self-organized networking or not.

Return true/false

esp_err_t esp_mesh_waive_root (const mesh_vote_t *vote, int reason)
Cause the root device to give up (waive) its mesh root status.

- A device is elected root primarily based on RSSI from the external router.
- If external router conditions change, users can call this API to perform a root switch.
- In this API, users could specify a desired root address to replace itself or specify an attempts value to ask current root to initiate a new round of voting. During the voting, a better root candidate would be expected to find to replace the current one.
- If no desired root candidate, the vote will try a specified number of attempts (at least 15). If no better root candidate is found, keep the current one. If a better candidate is found, the new better one will send a root switch request to the current root, current root will respond with a root switch acknowledgment.
- After that, the new candidate will connect to the router to be a new root, the previous root will disconnect with the router and choose another parent instead.

Root switch is completed with minimal disruption to the whole mesh network.

Attention This API is only called by the root.

Return
- ESP_OK
- ESP_ERR_MESH_QUEUE_FULL
- ESP_ERR_MESH_DISCARD
- ESP_FAIL

Parameters
- [in] vote: vote configuration
  - If this parameter is set NULL, the vote will perform the default 15 times.
  - Field percentage threshold is 0.9 by default.
  - Field is_rc_specified shall be false.
  - Field attempts shall be at least 15 times.
- [in] reason: only accept MESH_VOTE_REASON_ROOT_INITIATED for now

esp_err_t esp_mesh_set_vote_percentage (float percentage)
Set vote percentage threshold for approval of being a root (default:0.9)

Attention This API shall be called before mesh is started.

Return
- ESP_OK
- ESP_FAIL

Parameters
- [in] percentage: vote percentage threshold

float esp_mesh_get_vote_percentage (void)
Get vote percentage threshold for approval of being a root.

Return percentage threshold

esp_err_t esp_mesh_set_ap_assoc_expire (int seconds)
Set mesh softAP associate expired time (default:10 seconds)

- If mesh softAP hasn’t received any data from an associated child within this time, mesh softAP will take this child inactive and disassociate it.
- If mesh softAP is encrypted, this value should be set a greater value, such as 30 seconds.

Return
- ESP_OK
- ESP_FAIL

Parameters
- [in] seconds: the expired time
Chapter 2. API Reference

int esp_mesh_get_ap_assoc_expire (void)
Get mesh softAP associate expired time.

Return seconds

int esp_mesh_get_total_node_num (void)
Get total number of devices in current network (including the root)

Attention The returned value might be incorrect when the network is changing.

Return total number of devices (including the root)

int esp_mesh_get_routing_table_size (void)
Get the number of devices in this device’s sub-network (including self)

Return the number of devices over this device’s sub-network (including self)

esp_err_t esp_mesh_get_routing_table (mesh_addr_t *mac, int len, int *size)
Get routing table of this device’s sub-network (including itself)

Return
• ESP_OK
• ESP_ERR_MESH_ARGUMENT

Parameters
• [out] mac: pointer to routing table
• [in] len: routing table size(in bytes)
• [out] size: pointer to the number of devices in routing table (including itself)

esp_err_t esp_mesh_post_toDS_state (bool reachable)
Post the toDS state to the mesh stack.

Attention This API is only for the root.

Return
• ESP_OK
• ESP_FAIL

Parameters
• [in] reachable: this state represents whether the root is able to access external IP network

esp_err_t esp_mesh_get_tx_pending (mesh_tx_pending_t *pending)
Return the number of packets pending in the queue waiting to be sent by the mesh stack.

Return
• ESP_OK
• ESP_FAIL

Parameters
• [out] pending: pointer to the TX pending

esp_err_t esp_mesh_get_rx_pending (mesh_rx_pending_t *pending)
Return the number of packets available in the queue waiting to be received by applications.

Return
• ESP_OK
• ESP_FAIL

Parameters
• [out] pending: pointer to the RX pending

int esp_mesh_available_txupQ_num (const mesh_addr_t *addr, uint32_t *xseqno_in)
Return the number of packets could be accepted from the specified address.

Return the number of upQ for a certain address

Parameters
• [in] addr: self address or an associate children address
• [out] xseqno_in: sequence number of the last received packet from the specified address

esp_err_t esp_mesh_set_xon_qsize (int qsize)
Set the number of queue.

Attention This API shall be called before mesh is started.
Return

- ESP_OK
- ESP_FAIL

Parameters

- **[in]** qsize: default:32 (min:16)

```c
int esp_mesh_get_xon_qsize(void)
```

Get queue size.

Return the number of queue

```c
esp_err_t esp_mesh_allow_root_conflicts(bool allowed)
```

Set whether allow more than one root existing in one network.

Return

- ESP_OK
- ESP_WIFI_ERR_NOT_INIT
- ESP_WIFI_ERR_NOT_START

Parameters

- **[in]** allowed: allow or not

```c
bool esp_mesh_is_root_conflicts_allowed(void)
```

Check whether allow more than one root to exist in one network.

Return true/false

```c
esp_err_t esp_mesh_set_group_id(const mesh_addr_t *addr, int num)
```

Set group ID addresses.

Return

- ESP_OK
- ESP_MESH_ERR_ARGUMENT

Parameters

- **[in]** addr: pointer to new group ID addresses
- **[in]** num: the number of group ID addresses

```c
esp_err_t esp_mesh_delete_group_id(const mesh_addr_t *addr, int num)
```

Delete group ID addresses.

Return

- ESP_OK
- ESP_MESH_ERR_ARGUMENT

Parameters

- **[in]** addr: pointer to deleted group ID address
- **[in]** num: the number of group ID addresses

```c
int esp_mesh_get_group_num(void)
```

Get the number of group ID addresses.

Return the number of group ID addresses

```c
esp_err_t esp_mesh_get_group_list(mesh_addr_t *addr, int num)
```

Get group ID addresses.

Return

- ESP_OK
- ESP_MESH_ERR_ARGUMENT

Parameters

- **[out]** addr: pointer to group ID addresses
- **[in]** num: the number of group ID addresses

```c
bool esp_mesh_is_my_group(const mesh_addr_t *addr)
```

Check whether the specified group address is my group.

Return true/false
**esp_err_t esp_mesh_set_capacity_num (int num)**
Set mesh network capacity (max:1000, default:300)

**Attention** This API shall be called before mesh is started.

**Return**
- ESP_OK
- ESP_ERR_MESH_NOT_ALLOWED
- ESP_MESH_ERR_ARGUMENT

**Parameters**
- [in] num: mesh network capacity

```c
int esp_mesh_get_capacity_num (void)
```
Get mesh network capacity.

**esp_err_t esp_mesh_set_ie_crypto_funcs (const mesh_crypto_funcs_t *crypto_funcs)**
Set mesh IE crypto functions.

**Attention** This API can be called at any time after mesh is initialized.

**Return**
- ESP_OK

**Parameters**
- [in] crypto_funcs: crypto functions for mesh IE
  - If crypto_funcs is set to NULL, mesh IE is no longer encrypted.

```c
esp_err_t esp_mesh_set_ie_crypto_key (const char *key, int len)
```
Set mesh IE crypto key.

**Attention** This API can be called at any time after mesh is initialized.

**Return**
- ESP_OK

**Parameters**
- [in] key: ASCII crypto key
- [in] len: length in bytes, range:8~64

```c
esp_err_t esp_mesh_get_ie_crypto_key (char *key, int len)
```
Get mesh IE crypto key.

**Return**
- ESP_OK

**Parameters**
- [out] key: ASCII crypto key
- [in] len: length in bytes, range:8~64

```c
esp_err_t esp_mesh_set_root_healing_delay (int delay_ms)
```
Set delay time before starting root healing.

**Return**
- ESP_OK

**Parameters**
- [in] delay_ms: delay time in milliseconds

```c
int esp_mesh_get_root_healing_delay (void)
```
Get delay time before network starts root healing.

**Return** delay time in milliseconds

```c
esp_err_t esp_mesh_fix_root (bool enable)
```
Enable network Fixed Root Setting.

- Enabling fixed root disables automatic election of the root node via voting.
- All devices in the network shall use the same Fixed Root Setting (enabled or disabled).
- If Fixed Root is enabled, users should make sure a root node is designated for the network.
Chapter 2. API Reference

Return
• ESP_OK

Parameters
• [in] enable: enable or not

bool esp_mesh_is_root_fixed(void)
Check whether network Fixed Root Setting is enabled.

• Enable/disable network Fixed Root Setting by API esp_mesh_fix_root().
• Network Fixed Root Setting also changes with the “flag” value in parent networking IE.

Return true/false

esp_err_t esp_mesh_set_parent(const wifi_config_t *parent, const mesh_addr_t *parent_mesh_id, mesh_type_t my_type, int my_layer)
Set a specified parent for the device.

Attention This API can be called at any time after mesh is configured.

Return
• ESP_OK
• ESP_ERR_ARGUMENT
• ESP_ERR_MESH_NOT_CONFIG

Parameters
• [in] parent: parent configuration, the SSID and the channel of the parent are mandatory.
  – If the BSSID is set, make sure that the SSID and BSSID represent the same parent, otherwise
    the device will never find this specified parent.
• [in] parent_mesh_id: parent mesh ID.
  – If this value is not set, the original mesh ID is used.
• [in] my_type: mesh type
  – MESH_STA is not supported.
  – If the parent set for the device is the same as the router in the network configuration, then
    my_type shall set MESH_ROOT and my_layer shall set MESH_ROOT_LAYER.
• [in] my_layer: mesh layer
  – my_layer of the device may change after joining the network.
  – If my_type is set MESH_NODE, my_layer shall be greater than MESH_ROOT_LAYER.
  – If my_type is set MESH_LEAF, the device becomes a standalone Wi-Fi station and no longer
    has the ability to extend the network.

esp_err_t esp_mesh_scan_get_ap_ie_len(int *len)
Get mesh networking IE length of one AP.

Return
• ESP_OK
• ESP_ERR_WIFI_NOT_INIT
• ESP_ERR_WIFI_ARG
• ESP_ERR_WIFI_FAIL

Parameters
• [out] len: mesh networking IE length

esp_err_t esp_mesh_scan_get_ap_record(wifi_ap_record_t *ap_record, void *buffer)
Get AP record.

Attention Different from esp_wifi_scan_get_ap_records(), this API only gets one of APs scanned each time.
See “manual_networking” example.

Return
• ESP_OK
• ESP_ERR_WIFI_NOT_INIT
• ESP_ERR_WIFI_ARG
• ESP_ERR_WIFI_FAIL

Parameters
• [out] ap_record: pointer to one AP record
• [out] buffer: pointer to the mesh networking IE of this AP
**esp_err_t** **esp_mesh_flush_upstream_packets** (void)
Flush upstream packets pending in to_parent queue and to_parent_p2p queue.

**Return**
- ESP_OK

**esp_err_t** **esp_mesh_get_subnet_nodes_num** (const mesh_addr_t *child_mac, int *nodes_num)
Get the number of nodes in the subnet of a specific child.

**Return**
- ESP_OK
- ESP_ERR_MESH_NOT_START
- ESP_ERR_MESH_ARGUMENT

**Parameters**
- [in] child_mac: an associated child address of this device
- [out] nodes_num: pointer to the number of nodes in the subnet of a specific child

**esp_err_t** **esp_mesh_get_subnet_nodes_list** (const mesh_addr_t *child_mac, mesh_addr_t *nodes, int nodes_num)
Get nodes in the subnet of a specific child.

**Return**
- ESP_OK
- ESP_ERR_MESH_NOT_START
- ESP_ERR_MESH_ARGUMENT

**Parameters**
- [in] child_mac: an associated child address of this device
- [out] nodes: pointer to nodes in the subnet of a specific child
- [in] nodes_num: the number of nodes in the subnet of a specific child

**esp_err_t** **esp_mesh_disconnect** (void)
Disconnect from current parent.

**Return**
- ESP_OK

**esp_err_t** **esp_mesh_connect** (void)
Connect to current parent.

**Return**
- ESP_OK

**esp_err_t** **esp_mesh_flush_scan_result** (void)
Flush scan result.

**Return**
- ESP_OK

**esp_err_t** **esp_mesh_switch_channel** (const uint8_t *new_bssid, int csa_newchan, int csa_count)
Cause the root device to add Channel Switch Announcement Element (CSA IE) to beacon.

- Set the new channel
- Set how many beacons with CSA IE will be sent before changing a new channel
- Enable the channel switch function

**Attention** This API is only called by the root.

**Return**
- ESP_OK

**Parameters**
- [in] new_bssid: the new router BSSID if the router changes
- [in] csa_newchan: the new channel number to which the whole network is moving
- [in] csa_count: channel switch period(beacon count), unit is based on beacon interval of its softAP, the default value is 15.

**esp_err_t** **esp_mesh_get_router_bssid** (uint8_t *router_bssid)
Get the router BSSID.
Return

• ESP_OK
• ESP_ERR_WIFI_NOT_INIT
• ESP_ERR_WIFI_ARG

Parameters

• [out] router_bssid: pointer to the router BSSID

int64_t esp_mesh_get_tsf_time (void)

Get the TSF time.

Return the TSF time

eesp_err_t esp_mesh_set_topology (esp_mesh_topology_t topo)

Set mesh topology. The default value is MESH_TOPO_TREE.

• MESH_TOPO_CHAIN supports up to 1000 layers

Attention This API shall be called before mesh is started.

Return

• ESP_OK
• ESP_MESH_ERR_ARGUMENT
• ESP_ERR_MESH_NOT_ALLOWED

Parameters

• [in] topo: MESH_TOPO_TREE or MESH_TOPO_CHAIN

esp_mesh_topology_t esp_mesh_get_topology (void)

Get mesh topology.

Return MESH_TOPO_TREE or MESH_TOPO_CHAIN

eesp_err_t esp_mesh_enable_ps (void)

Enable mesh Power Save function.

Attention This API shall be called before mesh is started.

Return

• ESP_OK
• ESP_ERR_WIFI_NOT_INIT
• ESP_ERR_MESH_NOT_ALLOWED

eesp_err_t esp_mesh_disable_ps (void)

Disable mesh Power Save function.

Attention This API shall be called before mesh is started.

Return

• ESP_OK
• ESP_ERR_WIFI_NOT_INIT
• ESP_ERR_MESH_NOT_ALLOWED

bool esp_mesh_is_ps_enabled (void)

Check whether the mesh Power Save function is enabled.

Return true/false

bool esp_mesh_is_device_active (void)

Check whether the device is in active state.

• If the device is not in active state, it will neither transmit nor receive frames.

Return true/false

eesp_err_t esp_mesh_set_active_duty_cycle (int dev_duty, int dev_duty_type)

Set the device duty cycle and type.

• The range of dev_duty values is 1 to 100. The default value is 10.
• dev_duty = 100, the PS will be stopped.
• dev_duty is better to not less than 5.
dev_duty_type could be MESH_PS_DEVICE_DUTY_REQUEST or MESH_PS_DEVICE_DUTY_DEMAND.

- If dev_duty_type is set to MESH_PS_DEVICE_DUTY_REQUEST, the device will use a nwk_duty provided by the network.
- If dev_duty_type is set to MESH_PS_DEVICE_DUTY_DEMAND, the device will use the specified dev_duty.

Attention This API can be called at any time after mesh is started.

Return
- ESP_OK
- ESP_FAIL

Parameters
- [in] dev_duty: device duty cycle
- [in] dev_duty_type: device PS duty cycle type, not accept MESH_PS_NETWORK_DUTY_MASTER

```c
esp_err_t esp_mesh_get_active_duty_cycle (int *dev_duty, int *dev_duty_type)
```

Get device duty cycle and type.

Return
- ESP_OK

Parameters
- [out] dev_duty: device duty cycle
- [out] dev_duty_type: device PS duty cycle type

```c
esp_err_t esp_mesh_set_network_duty_cycle (int nwk_duty, int duration_mins, int applied_rule)
```

Set the network duty cycle, duration and rule.

- The range of nwk_duty values is 1 to 100. The default value is 10.
- nwk_duty is the network duty cycle the entire network or the up-link path will use. A device that successfully sets the nwk_duty is known as a NWK-DUTY-MASTER.
- duration_mins specifies how long the specified nwk_duty will be used. Once duration_mins expires, the root will take over as the NWK-DUTY-MASTER. If an existing NWK-DUTY-MASTER leaves the network, the root will take over as the NWK-DUTY-MASTER again.
- duration_mins = (-1) represents nwk_duty will be used until a new NWK-DUTY-MASTER with a different nwk_duty appears.
- Only the root can set duration_mins to (-1).
- If applied_rule is set to MESH_PS_NETWORK_DUTY_APPLIED_ENTIRE, the nwk_duty will be used by the entire network.
- If applied_rule is set to MESH_PS_NETWORK_DUTY_APPLIED_UPLINK, the nwk_duty will only be used by the up-link path nodes.
- The root does not accept MESH_PS_NETWORK_DUTY_APPLIED_UPLINK.
- A nwk_duty with duration_mins(-1) set by the root is the default network duty cycle used by the entire network.

Attention This API can be called at any time after mesh is started.

- In self-organized network, if this API is called before mesh is started in all devices, (1)nwk_duty shall be set to the same value for all devices; (2)duration_mins shall be set to (-1); (3)applied_rule shall be set to MESH_PS_NETWORK_DUTY_APPLIED_ENTIRE; after the voted root appears, the root will become the NWK-DUTY-MASTER and broadcast the nwk_duty and its identity of NWK-DUTY-MASTER.
- If the root is specified (FIXED-ROOT), call this API in the root to provide a default nwk_duty for the entire network.
- After joins the network, any device can call this API to change the nwk_duty, duration_mins or applied_rule.

Return
- ESP_OK
- ESP_FAIL

Parameters
- [in] nwk_duty: network duty cycle
- [in] duration_mins: duration (unit: minutes)
• [in] applied_rule: only support MESH_PS_NETWORK_DUTY_APPLIED_ENTIRE

```c
esp_err_t esp_mesh_get_network_duty_cycle(int *nwk_duty, int *duration_mins, int *dev_duty_type, int *applied_rule)
```

Get the network duty cycle, duration, type and rule.

**Return**
• ESP_OK

**Parameters**
• [out] nwk_duty: current network duty cycle
• [out] duration_mins: the duration of current nwk_duty
• [out] dev_duty_type: if it includes MESH_PS_DEVICE_DUTY_MASTER, this device is the current NWK-DUTY-MASTER.
• [out] applied_rule: MESH_PS_NETWORK_DUTY_APPLIED_ENTIRE

```c
int esp_mesh_get_running_active_duty_cycle(void)
```

Get the running active duty cycle.

• The running active duty cycle of the root is 100.
• If duty type is set to MESH_PS_DEVICE_DUTY_REQUEST, the running active duty cycle is nwk_duty provided by the network.
• If duty type is set to MESH_PS_DEVICE_DUTY_DEMAND, the running active duty cycle is dev_duty specified by the users.
• In a mesh network, devices are typically working with a certain duty-cycle (transmitting, receiving and sleep) to reduce the power consumption. The running active duty cycle decides the amount of awake time within a beacon interval. At each start of beacon interval, all devices wake up, broadcast beacons, and transmit packets if they do have pending packets for their parents or for their children. Note that Low-duty-cycle means devices may not be active in most of the time, the latency of data transmission might be greater.

**Return** the running active duty cycle

```c
esp_err_t esp_mesh_ps_duty_signaling(int fwd_times)
```

Duty signaling.

**Return**
• ESP_OK

**Parameters**
• [in] fwd_times: the times of forwarding duty signaling packets

**Unions**

```c
union mesh_addr_t

#include <esp_mesh.h> Mesh address.
```

**Public Members**

```c
uint8_t addr[6]
mac address

mip_t mip
mip address
```

```c
union mesh_event_info_t

#include <esp_mesh.h> Mesh event information.
```

**Public Members**

```c
mesh_event_channel_switch_t channel_switch
channel switch

mesh_event_child_connected_t child_connected
child connected
```
Chapter 2. API Reference

```
mesh_event_child_disconnected_t child_disconnected
child disconnected

mesh_event_routing_table_change_t routing_table
routing table change

mesh_event_connected_t connected
parent connected

mesh_event_disconnected_t disconnected
parent disconnected

mesh_event_no_parent_found_t no_parent
no parent found

mesh_event_layer_change_t layer_change
layer change

mesh_event_toDS_state_t toDS_state
ToDS state, devices shall check this state firstly before trying to send packets to external IP network. This state indicates right now whether the root is capable of sending packets out. If not, devices had better to wait until this state changes to MESH_TODS_REACHABLE.

mesh_event_vote_started_t vote_started
vote started

mesh_event_root_address_t root_addr
root address

mesh_event_root_switch_req_t switch_req
root switch request

mesh_event_root_conflict_t root_conflict
other powerful root

mesh_event_root_fixed_t root_fixed
fixed root

mesh_event_scan_done_t scan_done
scan done

mesh_event_network_state_t network_state
network state, such as whether current mesh network has a root.

mesh_event_find_network_t find_network
network found that can join

mesh_event_router_switch_t router_switch
new router information

mesh_event_ps_duty_t ps_duty
PS duty information

union mesh_rc_config_t
#include <esp_mesh.h> Vote address configuration.

Public Members

int attempts
max vote attempts before a new root is elected automatically by mesh network. (min:15, 15 by default)

mesh_addr_t rc_addr
a new root address specified by users for API esp_mesh_waive_root()
Chapter 2. API Reference

**Structures**

**struct mip_t**

IP address and port.

**Public Members**

ip4_addr_t ip4

IP address

uint16_t port

port

**struct mesh_event_channel_switch_t**

Channel switch information.

**Public Members**

uint8_t channel

new channel

**struct mesh_event_connected_t**

Parent connected information.

**Public Members**

wifi_event_sta_connected_t connected

parent information, same as Wi-Fi event SYSTEM_EVENT_STA_CONNECTED does

uint16_t self_layer

layer

uint8_t duty

parent duty

**struct mesh_event_no_parent_found_t**

No parent found information.

**Public Members**

int scan_times

scan times being through

**struct mesh_event_layer_change_t**

Layer change information.

**Public Members**

uint16_t new_layer

new layer

**struct mesh_event_vote_started_t**

vote started information

**Public Members**

int reason

vote reason, vote could be initiated by children or by the root itself
int attempts
    max vote attempts before stopped

mesh_addr_t rc_addr
    root address specified by users via API esp_mesh_waive_root()

struct mesh_event_find_network_t
    find a mesh network that this device can join

Public Members

uint8_t channel
    channel number of the new found network

uint8_t router_bssid[6]
    router BSSID

struct mesh_event_root_switch_req_t
    Root switch request information.

Public Members

int reason
    root switch reason, generally root switch is initialized by users via API esp_mesh_waive_root()

mesh_addr_t rc_addr
    the address of root switch requester

struct mesh_event_root_conflict_t
    Other powerful root address.

Public Members

int8_t rssi
    rssi with router

uint16_t capacity
    the number of devices in current network

uint8_t addr[6]
    other powerful root address

struct mesh_event_routing_table_change_t
    Routing table change.

Public Members

uint16_t rt_size_new
    the new value

uint16_t rt_size_change
    the changed value

struct mesh_event_root_fixed_t
    Root fixed.
Public Members

bool **is_fixed**
status

**struct mesh_event_scan_done_t**
Scan done event information.

Public Members

uint8_t **number**
the number of APs scanned

**struct mesh_event_network_state_t**
Network state information.

Public Members

bool **is_rootless**
whether current mesh network has a root

**struct mesh_event_ps_duty_t**
PS duty information.

Public Members

uint8_t **duty**
parent or child duty

**mesh_event_child_connected_t**
child info

**struct mesh_opt_t**
Mesh option.

Public Members

uint8_t **type**
option type
uint16_t **len**
option length
uint8_t **val**
option value

**struct mesh_data_t**
Mesh data for esp_mesh_send() and esp_mesh_recv()

Public Members

uint8_t **data**
data
uint16_t **size**
data size

**mesh_proto_t**
data protocol
**mesh_tos**
- data type of service

**struct mesh_router_t**
- Router configuration.

**Public Members**

- `uint8_t ssid[32]`
  - SSID
- `uint8_t ssid_len`
  - length of SSID
- `uint8_t bssid[6]`
  - BSSID, if this value is specified, users should also specify “allow_router_switch”.
- `uint8_t password[64]`
  - password
- `bool allow_router_switch`
  - if the BSSID is specified and this value is also set, when the router of this specified BSSID fails to be found after “fail” (mesh_attempts_t) times, the whole network is allowed to switch to another router with the same SSID. The new router might also be on a different channel. The default value is false. There is a risk that if the password is different between the new switched router and the previous one, the mesh network could be established but the root will never connect to the new switched router.

**struct mesh_ap_cfg_t**
- Mesh softAP configuration.

**Public Members**

- `uint8_t password[64]`
  - mesh softAP password
- `uint8_t max_connection`
  - max number of stations allowed to connect in, default 6, max 10 = max_connection + non-mesh_max_connection
- `uint8_t nonmesh_max_connection`
  - max non-mesh connections

**struct mesh_cfg_t**
- Mesh initialization configuration.

**Public Members**

- `uint8_t channel`
  - channel, the mesh network on
- `bool allow_channel_switch`
  - if this value is set, when “fail” (mesh_attempts_t) times is reached, device will change to a full channel scan for a network that could join. The default value is false.

- `mesh_addr_t mesh_id`
  - mesh network identification
- `mesh_router_t router`
  - router configuration
- `mesh_ap_cfg_t mesh_ap`
  - mesh softAP configuration
const mesh_crypto_funcs_t *crypto_funcs

crypto functions

struct mesh_vote_t
Vote.

Public Members

float percentage
vote percentage threshold for approval of being a root

bool is_rc_specified
if true, rc_addr shall be specified (Unimplemented). if false, attempts value shall be specified to make
network start root election.

mesh_rc_config_t config
vote address configuration

struct mesh_tx_pending_t
The number of packets pending in the queue waiting to be sent by the mesh stack.

Public Members

int to_parent
to parent queue

int to_parent_p2p
to parent (P2P) queue

int to_child
to child queue

int to_child_p2p
to child (P2P) queue

int mgmt
management queue

int broadcast
broadcast and multicast queue

struct mesh_rx_pending_t
The number of packets available in the queue waiting to be received by applications.

Public Members

int toDS
to external DS

int toSelf
to self

Macros

MESH_ROOT_LAYER
root layer value

MESH_MTU
max transmit unit(in bytes)

MESH_MPS
max payload size(in bytes)
ESP_ERR_MESH_WIFI_NOT_START
Mesh error code definition.
Wi-Fi isn’t started

ESP_ERR_MESH_NOT_INIT
mesh isn’t initialized

ESP_ERR_MESH_NOT_CONFIG
mesh isn’t configured

ESP_ERR_MESH_NOT_START
mesh isn’t started

ESP_ERR_MESH_NOT_SUPPORT
not supported yet

ESP_ERR_MESH_NOT_ALLOWED
operation is not allowed

ESP_ERR_MESH_NO_MEMORY
out of memory

ESP_ERR_MESH_ARGUMENT
illegal argument

ESP_ERR_MESH_EXCEED_MTU
packet size exceeds MTU

ESP_ERR_MESH_TIMEOUT
timeout

ESP_ERR_MESH_DISCONNECTED
disconnected with parent on station interface

ESP_ERR_MESH_QUEUE_FAIL
queue fail

ESP_ERR_MESH_QUEUE_FULL
queue full

ESP_ERR_MESH_NO_PARENT_FOUND
no parent found to join the mesh network

ESP_ERR_MESH_NO_ROUTE_FOUND
no route found to forward the packet

ESP_ERR_MESH_OPTION_NULL
no option found

ESP_ERR_MESH_OPTION_UNKNOWN
unknown option

ESP_ERR_MESH_XON_NO_WINDOW
no window for software flow control on upstream

ESP_ERR_MESH_INTERFACE
low-level Wi-Fi interface error

ESP_ERR_MESH_DISCARD_DUPLICATE
discard the packet due to the duplicate sequence number

ESP_ERR_MESH_DISCARD
discard the packet

ESP_ERR_MESH_VOTING
vote in progress

ESP_ERR_MESH_XMIT
XMIT
Chapter 2. API Reference

ESP_ERR_MESH_QUEUE_READ
- error in reading queue

ESP_ERR_MESH_PS
- mesh PS is not specified as enable or disable

ESP_ERR_MESH_RECV_RELEASE
- release esp_mesh_recv_toDS

MESH_DATA_ENC
- Flags bitmap for esp_mesh_send() and esp_mesh_recv()
  - data encrypted (Unimplemented)

MESH_DATA_P2P
- point-to-point delivery over the mesh network

MESH_DATA_FROMDS
- receive from external IP network

MESH_DATA_TODS
- identify this packet is target to external IP network

MESH_DATA_NONBLOCK
- esp_mesh_send() non-block

MESH_DATA_DROP
- in the situation of the root having been changed, identify this packet can be dropped by new root

MESH_DATA_GROUP
- identify this packet is target to a group address

MESH_OPT_SEND_GROUP
- Option definitions for esp_mesh_send() and esp_mesh_recv()
  - data transmission by group; used with esp_mesh_send() and shall have payload

MESH_OPT_RECV_DS_ADDR
- return a remote IP address; used with esp_mesh_send() and esp_mesh_recv()

MESH_ASSOC_FLAG_VOTE_IN_PROGRESS
- Flag of mesh networking IE.
  - vote in progress

MESH_ASSOC_FLAG_NETWORK_FREE
- no root in current network

MESH_ASSOC_FLAG_ROOTS_FOUND
- root conflict is found

MESH_ASSOC_FLAG_ROOT_FIXED
- fixed root

MESH_PS_DEVICE_DUTY_REQUEST
- Mesh PS (Power Save) duty cycle type.
  - requests to join a network PS without specifying a device duty cycle. After the device joins the network, a
  - network duty cycle will be provided by the network

MESH_PS_DEVICE_DUTY_DEMAND
- requests to join a network PS and specifies a demanded device duty cycle

MESH_PS_NETWORK_DUTY_MASTER
- indicates the device is the NWK-DUTY-MASTER (network duty cycle master)

MESH_PS_NETWORK_DUTY_APPLIED_ENTIRE
- Mesh PS (Power Save) duty cycle applied rule.
MESH_INIT_CONFIG_DEFAULT()

Type Definitions

typedef mesh_addr_t mesh_event_root_address_t
Root address.
typedef wifi_event_sta_disconnected_t mesh_event_disconnected_t
Parent disconnected information.
typedef wifi_event_ap_staconnected_t mesh_event_child_connected_t
Child connected information.
typedef wifi_event_ap_stadisconnected_t mesh_event_child_disconnected_t
Child disconnected information.
typedef wifi_event_sta_connected_t mesh_event_router_switch_t
New router information.

Enumerations
enum mesh_event_id_t
Enumerated list of mesh event id.
Values:

MESH_EVENT_STARTED
mesh is started

MESH_EVENT_STOPPED
mesh is stopped

MESH_EVENT_CHANNEL_SWITCH
channel switch

MESH_EVENT_CHILD_CONNECTED
a child is connected on softAP interface

MESH_EVENT_CHILD_DISCONNECTED
a child is disconnected on softAP interface

MESH_EVENT_ROUTING_TABLE_ADD
routing table is changed by adding newly joined children

MESH_EVENT_ROUTING_TABLE_REMOVE
routing table is changed by removing leave children

MESH_EVENT_PARENT_CONNECTED
parent is connected on station interface

MESH_EVENT_PARENT_DISCONNECTED
parent is disconnected on station interface

MESH_EVENT_NO_PARENT_FOUND
no parent found

MESH_EVENT_LAYER_CHANGE
layer changes over the mesh network

MESH_EVENT_TODS_STATE
state represents whether the root is able to access external IP network

MESH_EVENT_VOTE_STARTED
the process of voting a new root is started either by children or by the root

MESH_EVENT_VOTE_STOPPED
the process of voting a new root is stopped
**MESH_EVENT_ROOT_ADDRESS**

the root address is obtained. It is posted by mesh stack automatically.

**MESH_EVENT_ROOT_SWITCH_REQ**

root switch request sent from a new voted root candidate

**MESH_EVENT_ROOT_SWITCH_ACK**

root switch acknowledgment responds the above request sent from current root

**MESH_EVENT_ROOT_ASKED_YIELD**

the root is asked yield by a more powerful existing root. If self organized is disabled and this device is specified to be a root by users, users should set a new parent for this device. If self organized is enabled, this device will find a new parent by itself, users could ignore this event.

**MESH_EVENT_ROOT_FIXED**

when devices join a network, if the setting of Fixed Root for one device is different from that of its parent, the device will update the setting the same as its parent’s. Fixed Root Setting of each device is variable as that setting changes of the root.

**MESH_EVENT_SCAN_DONE**

if self-organized networking is disabled, user can call esp_wifi_scan_start() to trigger this event, and add the corresponding scan done handler in this event.

**MESH_EVENT_NETWORK_STATE**

network state, such as whether current mesh network has a root.

**MESH_EVENT_STOP_RECONNECTION**

the root stops reconnecting to the router and non-root devices stop reconnecting to their parents.

**MESH_EVENT_FIND_NETWORK**

when the channel field in mesh configuration is set to zero, mesh stack will perform a full channel scan to find a mesh network that can join, and return the channel value after finding it.

**MESH_EVENT_ROUTER_SWITCH**

if users specify BSSID of the router in mesh configuration, when the root connects to another router with the same SSID, this event will be posted and the new router information is attached.

**MESH_EVENT_PS_PARENT_DUTY**

parent duty

**MESH_EVENT_PS_CHILD_DUTY**

child duty

**MESH_EVENT_PS_DEVICE_DUTY**

device duty

**MESH_EVENT_MAX**

enum mesh_type_t

Device type.

*Values:*

**MESH_IDLE**

hasn’t joined the mesh network yet

**MESH_ROOT**

the only sink of the mesh network. Has the ability to access external IP network

**MESH_NODE**

intermediate device. Has the ability to forward packets over the mesh network

**MESH_LEAF**

has no forwarding ability

**MESH_STA**

connect to router with a standalone Wi-Fi station mode, no network expansion capability

enum mesh_proto_t
Protocol of transmitted application data.

Values:
MESH_PROTO_BIN
    binary
MESH_PROTO_HTTP
    HTTP protocol
MESH_PROTO_JSON
    JSON format
MESH_PROTO_MQTT
    MQTT protocol
MESH_PROTO_AP
    IP network mesh communication of node’s AP interface
MESH_PROTO_STA
    IP network mesh communication of node’s STA interface

enum mesh_tos_t
For reliable transmission, mesh stack provides three type of services.

Values:
MESH_TOS_P2P
    provide P2P (point-to-point) retransmission on mesh stack by default
MESH_TOS_E2E
    provide E2E (end-to-end) retransmission on mesh stack (Unimplemented)
MESH_TOS_DEF
    no retransmission on mesh stack

enum mesh_vote_reason_t
Vote reason.

Values:
MESH_VOTE_REASON_ROOT_INITIATED = 1
    vote is initiated by the root
MESH_VOTE_REASON_CHILD_INITIATED
    vote is initiated by children

enum mesh_disconnect_reason_t
Mesh disconnect reason code.

Values:
MESH_REASON_CYCLIC = 100
    cyclic is detected
MESH_REASON_PARENT_IDLE
    parent is idle
MESH_REASON_LEAF
    the connected device is changed to a leaf
MESH_REASON_DIFF_ID
    in different mesh ID
MESH_REASON_ROOTS
    root conflict is detected
MESH_REASON_PARENT_STOPPED
    parent has stopped the mesh
**Chapter 2. API Reference**

**MESH_REASON_SCAN_FAIL**
- scan fail

**MESH_REASON_IE_UNKNOWN**
- unknown IE

**MESH_REASON_WAIVE_ROOT**
- waive root

**MESH_REASON_PARENT_WORSE**
- parent with very poor RSSI

**MESH_REASON_EMPTY_PASSWORD**
- use an empty password to connect to an encrypted parent

**MESH_REASON_PARENT_UNENCRYPTED**
- connect to an unencrypted parent/router

**enum esp_mesh_topology_t**

Mesh topology.

**Values:**

- **MESH_TOPO_TREE**
  - tree topology

- **MESH_TOPO_CHAIN**
  - chain topology

**enum mesh_event_toDS_state_t**

The reachability of the root to a DS (distribute system)

**Values:**

- **MESH_TODS_UNREACHABLE**
  - the root is not able to access external IP network

- **MESH_TODS_REACHABLE**
  - the root is able to access external IP network

---

**Wi-Fi Easy Connect™ (DPP)**

Wi-Fi Easy Connect™, also known as Device Provisioning Protocol (DPP) or Easy Connect, is a provisioning protocol certified by Wi-Fi Alliance. It is a secure and standardized provisioning protocol for configuration of Wi-Fi Devices. With Easy Connect adding a new device to a network is as simple as scanning a QR Code. This reduces complexity and enhances user experience while onboarding devices without UI like Smart Home and IoT products. Unlike old protocols like WiFi Protected Setup (WPS), Wi-Fi Easy Connect incorporates strong encryption through public key cryptography to ensure networks remain secure as new devices are added. Easy Connect brings many benefits in the User Experience:

- Simple and intuitive to use: no lengthy instructions to follow for new device setup
- No need to remember and enter passwords into the device being provisioned
- Works with electronic or printed QR codes, or human-readable strings
- Supports both WPA2 and WPA3 networks

Please refer to Wi-Fi Alliance’s official page on Easy Connect for more information.

ESP32-S3 supports Enrollee mode of Easy Connect with QR Code as the provisioning method. A display is required to display this QR Code. Users can scan this QR Code using their capable device and provision the ESP32-S3 to their Wi-Fi network. The provisioning device needs to be connected to the AP which need not support Wi-Fi Easy Connect™. Easy Connect is still an evolving protocol. Of known platforms that support the QR Code method are some Android smartphones with Android 10 or higher. To use Easy Connect no additional App needs to be installed on the supported smartphone.
Application Example  Example on how to provision ESP32-S3 using a supported smartphone: wifi/wifi_easy_connect/dpp-enrollee.

API Reference

Header File

- components/wpa_supplicant/esp_supplicant/include/esp_dpp.h

Functions

```c
void esp_supp_dpp_deinit (void)
De-initialize DPP Supplicant.
void esp_supp_dpp_start_listen (void)
Start listening on Channels provided during esp_supp_dpp_bootstrap_gen.
```

`esp_err_t esp_supp_dpp_init (esp_supp_dpp_event_cb_t evt_cb)`
Initialize DPP Supplicant.

- ESP_OK: Success
- ESP_FAIL: Failure

**Parameters**

- `evt_cb`: Callback function to receive DPP related events

```c
esp_err_t esp_supp_dpp_bootstrap_gen (const char *chan_list, esp_supp_dpp_bootstrap_t type, const char *key, const char *info)
Generates Bootstrap Information as an Enrollee.
```

- `chan_list`: List of channels device will be available on for listening
- `type`: Bootstrap method type, only QR Code method is supported for now.
- `key`: (Optional) Private Key used to generate a Bootstrapping Public Key
- `info`: (Optional) Ancillary Device Information like Serial Number

**Return**

- ESP_OK: Success
- ESP_FAIL: Failure

```c
esp_err_t esp_supp_dpp_start_listen (void)
Start listening on Channels provided during esp_supp_dpp_bootstrap_gen.
```

- ESP_OK: Success
- ESP_FAIL: Generic Failure
- ESP_ERR_INVALID_STATE: ROC attempted before WiFi is started
- ESP_ERR_NO_MEM: Memory allocation failed while posting ROC request

```c
void esp_supp_dpp_stop_listen (void)
Stop listening on Channels.
```

- Stops listening on Channels and cancels ongoing listen operation.

Macros

`ESP_ERR_DPP_FAILURE`
Generic failure during DPP Operation
Chapter 2. API Reference

ESP_ERR_DPP_TX_FAILURE
DPP Frame Tx failed OR not Acked

ESP_ERR_DPP_INVALID_ATTR
Encountered invalid DPP Attribute

Type Definitions
typedef enum dpp_bootstrap_type esp_supp_dpp_bootstrap_t
Types of Bootstrap Methods for DPP.
typedef void (*esp_supp_dpp_event_cb_t)(esp_supp_dpp_event_t evt, void *data)
Callback function for receiving DPP Events from Supplicant.

Callback function will be called with DPP related information.

Parameters
• evt: DPP event ID
• data: Event data payload

Enumerations
enum dpp_bootstrap_type
Types of Bootstrap Methods for DPP.

Values:
DPP_BOOTSTRAP_QR_CODE
QR Code Method
DPP_BOOTSTRAP_PKEX
Proof of Knowledge Method
DPP_BOOTSTRAP_NFC_URI
NFC URI record Method

enum esp_supp_dpp_event_t
Types of Callback Events received from DPP Supplicant.

Values:
ESP_SUPP_DPP_URI_READY
URI is ready through Bootstrapping
ESP_SUPP_DPP_CFG_RECVD
Config received via DPP Authentication
ESP_SUPP_DPP_FAIL
DPP Authentication failure

Code examples for the Wi-Fi API are provided in the wifi directory of ESP-IDF examples.
Code examples for ESP-WIFI-MESH are provided in the mesh directory of ESP-IDF examples.

2.2.2 Ethernet

Ethernet

Overview
ESP-IDF provides a set of consistent and flexible APIs to support both internal Ethernet MAC (EMAC) controller and external SPI-Ethernet modules.

This programming guide is split into the following sections:

1. Basic Ethernet Concepts
2. Configure MAC and PHY
3. Connect Driver to TCP/IP Stack
4. Misc control of Ethernet driver
Basic Ethernet Concepts  Ethernet is an asynchronous Carrier Sense Multiple Access with Collision Detect (CSMA/CD) protocol/interface. It is generally not well suited for low power applications. However, with ubiquitous deployment, internet connectivity, high data rates and limitless range expandability, Ethernet can accommodate nearly all wired communications.

Normal IEEE 802.3 compliant Ethernet frames are between 64 and 1518 bytes in length. They are made up of five or six different fields: a destination MAC address (DA), a source MAC address (SA), a type/length field, data payload, an optional padding field and a Cyclic Redundancy Check (CRC). Additionally, when transmitted on the Ethernet medium, a 7-byte preamble field and Start-of-Frame (SOF) delimiter byte are appended to the beginning of the Ethernet packet.

Thus the traffic on the twist-pair cabling will appear as shown blow:

![Ethernet Data Frame Format](image)

**Preamble and Start-of-Frame Delimiter**  The preamble contains seven bytes of $\text{55H}$, it allows the receiver to lock onto the stream of data before the actual frame arrives. The Start-of-Frame Delimiter (SFD) is a binary sequence $\text{10101011}$ (as seen on the physical medium). It is sometimes considered to be part of the preamble.

When transmitting and receiving data, the preamble and SFD bytes will automatically be generated or stripped from the packets.

**Destination Address**  The destination address field contains a 6-byte length MAC address of the device that the packet is directed to. If the Least Significant bit in the first byte of the MAC address is set, the address is a multi-cast destination. For example, 01-00-00-00-F0-00 and 33-45-67-89-AB-CD are multi-cast addresses, while 00-00-00-00-F0-00 and 32-45-67-89-AB-CD are not. Packets with multi-cast destination addresses are designed to arrive and be important to a selected group of Ethernet nodes. If the destination address field is the reserved multi-cast address, i.e. FF-FF-FF-FF-FF, the packet is a broadcast packet and it will be directed to everyone sharing the network. If the Least Significant bit in the first byte of the MAC address is clear, the address is a uni-cast address and will be designed for usage by only the addressed node.
Normally the EMAC controller incorporates receive filters which can be used to discard or accept packets with multicast, broadcast and/or uni-cast destination addresses. When transmitting packets, the host controller is responsible for writing the desired destination address into the transmit buffer.

**Source Address**  The source address field contains a 6-byte length MAC address of the node which created the Ethernet packet. Users of Ethernet must generate a unique MAC address for each controller used. MAC addresses consist of two portions. The first three bytes are known as the Organizationally Unique Identifier (OUI). OUIs are distributed by the IEEE. The last three bytes are address bytes at the discretion of the company that purchased the OUI. More information about MAC Address used in ESP-IDF, please see [MAC Address Allocation](#).

When transmitting packets, the assigned source MAC address must be written into the transmit buffer by the host controller.

**Type / Length**  The type/length field is a 2-byte field, if the value in this field is $\leq 1500$ (decimal), it is considered a length field and it specifies the amount of non-padding data which follows in the data field. If the value is $\geq 1536$, it represents the protocol the following packet data belongs to. The following are the most common type values:

- IPv4 = 0800H
- IPv6 = 86DDH
- ARP = 0806H

Users implementing proprietary networks may choose to treat this field as a length field, while applications implementing protocols such as the Internet Protocol (IP) or Address Resolution Protocol (ARP), should program this field with the appropriate type defined by the protocol’s specification when transmitting packets.

**Payload**  The payload field is a variable length field, anywhere from 0 to 1500 bytes. Larger data packets will violate Ethernet standards and will be dropped by most Ethernet nodes. This field contains the client data, such as an IP datagram.

**Padding and FCS**  The padding field is a variable length field added to meet IEEE 802.3 specification requirements when small data payloads are used. The DA, SA, type, payload and padding of an Ethernet packet must be no smaller than 60 bytes. Adding the required 4-byte FCS field, packets must be no smaller than 64 bytes. If the data field is less than 46 bytes long, a padding field is required.

The FCS field is a 4-byte field which contains an industry standard 32-bit CRC calculated with the data from the DA, SA, type, payload and padding fields. Given the complexity of calculating a CRC, the hardware normally will automatically generate a valid CRC and transmit it. Otherwise, the host controller must generate the CRC and place it in the transmit buffer.

Normally, the host controller does not need to concern itself with padding and the CRC which the hardware EMAC will also be able to automatically generate when transmitting and verify when receiving. However, the padding and CRC fields will be written into the receive buffer when packets arrive, so they may be evaluated by the host controller if needed.

**Note:** Besides the basic data frame described above, there’re two other common frame types in 10/100 Mbps Ethernet: control frames and VLAN tagged frames. They’re not supported in ESP-IDF.

**Configure MAC and PHY**  Ethernet driver is composed of two parts: MAC and PHY.

We need to setup necessary parameters for MAC and PHY respectively based on your Ethernet board design and then combine the two together, completing the driver installation.

Configuration for MAC is described in `eth_mac_config_t`, including:

- `sw_reset_timeout_ms`: software reset timeout value, in milliseconds, typically MAC reset should be finished within 100ms.
• \texttt{rx\_task\_stack\_size} and \texttt{rx\_task\_prio}: the MAC driver creates a dedicated task to process incoming packets, these two parameters are used to set the stack size and priority of the task.

• \texttt{flags}: specifying extra features that the MAC driver should have, it could be useful in some special situations. The value of this field can be OR’d with macros prefixed with \texttt{ETH\_MAC\_FLAG\_}. For example, if the MAC driver should work when cache is disabled, then you should configure this field with \texttt{ETH\_MAC\_FLAG\_WORK\_WITH\_CACHE\_DISABLE}.

Configuration for PHY is described in \texttt{eth\_phy\_config\_t}, including:

• \texttt{phy\_addr}: multiple PHY device can share the same SMI bus, so each PHY needs a unique address. Usually this address is configured during hardware design by pulling up/down some PHY strapping pins. You can set the value from 0 to 15 based on your Ethernet board. Especially, if the SMI bus is shared by only one PHY device, setting this value to -1 can enable the driver to detect the PHY address automatically.

• \texttt{reset\_timeout\_ms}: reset timeout value, in milliseconds, typically PHY reset should be finished within 100ms.

• \texttt{autonego\_timeout\_ms}: auto-negotiation timeout value, in milliseconds. Ethernet driver will start negotiation with the peer Ethernet node automatically, to determine to duplex and speed mode. This value usually depends on the ability of the PHY device on your board.

• \texttt{reset\_gpio\_num}: if your board also connect the PHY reset pin to one of the GPIO, then set it here. Otherwise, set this field to -1.

ESP-IDF provides a default configuration for MAC and PHY in macro \texttt{ETH\_MAC\_DEFAULT\_CONFIG} and \texttt{ETH\_PHY\_DEFAULT\_CONFIG}.

Create MAC and PHY Instance  Ethernet driver is implemented in an Object-Oriented style. Any operation on MAC and PHY should be based on the instance of them two.

SPI-Ethernet Module

```c
eth_mac_config_t mac_config = ETH_MAC_DEFAULT_CONFIG(); // apply default MAC configuration
eth_phy_config_t phy_config = ETH_PHY_DEFAULT_CONFIG(); // apply default PHY configuration
phy_config.phy_addr = CONFIG_EXAMPLE_ETH_PHY_ADDR; // alter the PHY address according to your board design
phy_config.reset_gpio_num = CONFIG_EXAMPLE_ETH_PHY_RST_GPIO; // alter the GPIO used for PHY reset
// Install GPIO interrupt service (as the SPI-Ethernet module is interrupt driven)
gpio_install_isr_service(0);
// SPI bus configuration
spi_device_handle_t spi_handle = NULL;
spi_bus_config_t buscfg = {
    .miso_io_num = CONFIG_EXAMPLE_ETH_SPI_MISO_GPIO,
    .mosi_io_num = CONFIG_EXAMPLE_ETH_SPI_MOSI_GPIO,
    .sclk_io_num = CONFIG_EXAMPLE_ETH_SPI_SCLK_GPIO,
    .quadwp_io_num = -1,
    .quadhd_io_num = -1,
};
ESP_ERROR_CHECK(spi_bus_initialize(CONFIG_EXAMPLE_ETH_SPI_HOST, &buscfg, 1));
// Allocate SPI device from the bus
spi_device_interface_config_t devcfg = {
    .command_bits = 1,
    .address_bits = 7,
    .mode = 0,
    .clock_speed_hz = CONFIG_EXAMPLE_ETH_SPI_CLOCK_MHZ * 1000 * 1000,
    .spics_io_num = CONFIG_EXAMPLE_ETH_SPI_CS_GPIO,
    .queue_size = 20
};
ESP_ERROR_CHECK(spi_bus_add_device(CONFIG_EXAMPLE_ETH_SPI_HOST, &devcfg, &spi_handle));
// dm9051 ethernet driver is based on spi driver */
```
eth_dm9051_config_t dm9051_config = ETH_DM9051_DEFAULT_CONFIG(spi_handle);
dm9051_config.int_gpio_num = CONFIG_EXAMPLE_ETH_SPI_INT_GPIO;
esp_eth_mac_t *mac = esp_eth_mac_new_dm9051(&dm9051_config, &mac_config);
esp_eth_phy_t *phy = esp_eth_phy_new_dm9051(sphy_config);

Note:

- When creating MAC and PHY instance for SPI-Ethernet modules (e.g. DM9051), the constructor function must have the same suffix (e.g. esp_eth_mac_new_dm9051 and esp_eth_phy_new_dm9051). This is because we don’t have other choices but the integrated PHY.
- We have to create an SPI device handle firstly and then pass it to the MAC constructor function. More instructions on creating SPI device handle, please refer to SPI Master.
- The SPI device configuration (i.e. spi_device_interface_config_t) can be different for other Ethernet modules. Please check out your module’s spec and the examples in esp-idf.

Install Driver  To install the Ethernet driver, we need to combine the instance of MAC and PHY and set some additional high-level configurations (i.e. not specific to either MAC or PHY) in esp_eth_config_t:

- mac: instance that created from MAC generator (e.g. esp_eth_mac_new_esp32()).
- phy: instance that created from PHY generator (e.g. esp_eth_phy_new_ip101()).
- check_link_period_ms: Ethernet driver starts an OS timer to check the link status periodically, this field is used to set the interval, in milliseconds.
- stack_input: In most of Ethernet IoT applications, any Ethernet frame that received by driver should be passed to upper layer (e.g. TCP/IP stack). This field is set to a function which is responsible to deal with the incoming frames. You can even update this field at runtime via function esp_eth_update_input_path() after driver installation.
- on_lowlevel_init_done and on_lowlevel_deinit_done: These two fields are used to specify the hooks which get invoked when low level hardware has been initialized or de-initialized.

ESP-IDF provides a default configuration for driver installation in macro ETH_DEFAULT_CONFIG.

```c
esp_eth_config_t config = ETH_DEFAULT_CONFIG(mac, phy); // apply default driver configuration
esp_eth_handle_t eth_handle = NULL; // after driver installed, we will get the handle of the driver
esp_eth_driver_install(&config, &eth_handle); // install driver
```

Ethernet driver also includes event-driven model, which will send useful and important event to user space. We need to initialize the event loop before installing the Ethernet driver. For more information about event-driven programming, please refer to ESP Event.

```c
/** Event handler for Ethernet events */
static void eth_event_handler(void *arg, esp_event_base_t event_base, int32_t event_id, void *event_data) {
    uint8_t mac_addr[6] = {0};
    // we can get the ethernet driver handle from event data */
    esp_eth_handle_t eth_handle = *(esp_eth_handle_t *)event_data;

    switch (event_id) {
    case ETHERNET_EVENT_CONNECTED:
        esp_eth_ioctl(eth_handle, ETH_CMD_G_MAC_ADDR, mac_addr);
        ESP_LOGI(TAG, "Ethernet Link Up");
        ESP_LOGI(TAG, "Ethernet HW Addr %02x:%02x:%02x:%02x:%02x:%02x", 
          mac_addr[0], mac_addr[1], mac_addr[2], mac_addr[3], mac_addr[4], mac_addr[5]);
        break;
    }
```

(continues on next page)
*case ETHERNET_EVENT_DISCONNECTED:*
  ESP_LOGI(TAG, "Ethernet Link Down");
  break;
*case ETHERNET_EVENT_START:*
  ESP_LOGI(TAG, "Ethernet Started");
  break;
*case ETHERNET_EVENT_STOP:*
  ESP_LOGI(TAG, "Ethernet Stopped");
  break;
*default:
  break;
*}

esp_event_loop_create_default(); // create a default event loop that running in
~background
esp_event_handler_register(ETH_EVENT, ESP_EVENT_ANY_ID, &eth_event_handler, NULL);...
// register Ethernet event handler (to deal with user specific stuffs when event...
~like link up/down happened)

**Start Ethernet Driver**    After driver installation, we can start Ethernet immediately.

```
esp_eth_start(eth_handle); // start Ethernet driver state machine
```

**Connect Driver to TCP/IP Stack**    Up until now, we have installed the Ethernet driver. From the view of OSI (Open System Interconnection), we’re still on level 2 (i.e. Data Link Layer). We can detect link up and down event, we can gain MAC address in user space, but we can’t obtain IP address, let alone send HTTP request. The TCP/IP stack used in ESP-IDF is called LwIP, for more information about it, please refer to [LwIP](#).

To connect Ethernet driver to TCP/IP stack, these three steps need to follow:

1. Create network interface for Ethernet driver
2. Attach the network interface to Ethernet driver
3. Register IP event handlers

More information about network interface, please refer to [Network Interface](#).

```
/** Event handler for IP_EVENT_ETH_GOT_IP */
static void got_ip_event_handler(void *arg, esp_event_base_t event_base,
    int32_t event_id, void *event_data)
{
    ip_event_got_ip_t *event = (ip_event_got_ip_t *) event_data;
    const esp_netif_ip_info_t *ip_info = event->ip_info;

    ESP_LOGI(TAG, "Ethernet Got IP Address");
    ESP_LOGI(TAG, "~~~~~~~~~~~~");
    ESP_LOGI(TAG, "ETHIP:" IPSTR, IP2STR(ip_info->ip));
    ESP_LOGI(TAG, "ETHMASK:" IPSTR, IP2STR(ip_info->netmask));
    ESP_LOGI(TAG, "ETHGW:" IPSTR, IP2STR(ip_info->gw));
    ESP_LOGI(TAG, "~~~~~~~~~~~~");
}
```

esp_netif_init(); // Initialize TCP/IP network interface (should be called only...
~once in application)
esp_netif_config_t cfg = ESP_NETIF_DEFAULT_ETH(); // apply default network...
~interface configuration for Ethernet
esp_netif_t *eth_netif = esp_netif_new(&cfg); // create network interface for...
~Ethernet driver

(continues on next page)
Chapter 2. API Reference

(continued from previous page)

```c
esp_netif_attach(eth_netif, esp_eth_new_netif_glue(eth_handle)); // attach Ethernet driver to TCP/IP stack
esp_event_handler_register(IP_EVENT, IP_EVENT_ETH_GOT_IP, &got_ip_event_handler, NULL); // register user defined IP event handlers
esp_eth_start(eth_handle); // start Ethernet driver state machine
```

**Warning:** It is recommended to fully initialize the Ethernet driver and network interface prior registering user's Ethernet/IP event handlers, i.e. register the event handlers as the last thing prior starting the Ethernet driver. Such approach ensures that Ethernet/IP events get executed first by the Ethernet driver or network interface and so the system is in expected state when executing user's handlers.

**Misc control of Ethernet driver** The following functions should only be invoked after the Ethernet driver has been installed.
- Stop Ethernet driver: `esp_eth_stop()`
- Update Ethernet data input path: `esp_eth_update_input_path()`
- Misc get/set of Ethernet driver attributes: `esp_eth_ioctl()`

```c
/* get MAC address */
uint8_t mac_addr[6];
memset(mac_addr, 0, sizeof(mac_addr));
esp_eth_ioctl(eth_handle, ETH_CMD_G_MAC_ADDR, mac_addr);
ESP_LOGI(TAG, "Ethernet MAC Address: %02x:%02x:%02x:%02x:%02x:%02x",
        mac_addr[0], mac_addr[1], mac_addr[2], mac_addr[3], mac_addr[4], mac_addr[5]);
/* get PHY address */
int phy_addr = -1;
esp_eth_ioctl(eth_handle, ETH_CMD_G_PHY_ADDR, &phy_addr);
ESP_LOGI(TAG, "Ethernet PHY Address: %d", phy_addr);
```

**Flow control** Ethernet on MCU usually has a limitation in the number of frames it can handle during network congestion, because of the limitation in RAM size. A sending station might be transmitting data faster than the peer end can accept it. Ethernet flow control mechanism allows the receiving node to signal the sender requesting suspension of transmissions until the receiver catches up. The magic behind that is the pause frame, which was defined in IEEE 802.3x.

Pause frame is a special Ethernet frame used to carry the pause command, whose EtherType field is 0x8808, with the Control opcode set to 0x0001. Only stations configured for full-duplex operation may send pause frames. When a station wishes to pause the other end of a link, it sends a pause frame to the 48-bit reserved multicast address of 01-80-C2-00-00-01. The pause frame also includes the period of pause time being requested, in the form of a two-byte integer, ranging from 0 to 65535.

After Ethernet driver installation, the flow control feature is disabled by default. You can enable it by:

```c
bool flow_ctrl_enable = true;
esp_eth_ioctl(eth_handle, ETH_CMD_S_FLOW_CTRL, &flow_ctrl_enable);
```

One thing should be kept in mind, is that the pause frame ability will be advertised to peer end by PHY during auto negotiation. Ethernet driver sends pause frame only when both sides of the link support it.

**Application Example**
- Ethernet basic example: `ethernet/basic`
- Ethernet iperf example: `ethernet/iperf`
- Ethernet to Wi-Fi AP “router”: `ethernet/eth2ap`
Most of protocol examples should also work for Ethernet: protocols.

API Reference

Header File

- components/esp_eth/include/esp_eth.h

Functions

`esp_err_t esp_eth_driver_install(const esp_eth_config_t *config, esp_eth_handle_t *out_hdl)`

Install Ethernet driver.

**Return**
- ESP_OK: install esp_eth driver successfully
- ESP_ERR_INVALID_ARG: install esp_eth driver failed because of some invalid argument
- ESP_ERR_NO_MEM: install esp_eth driver failed because there’s no memory for driver
- ESP_FAIL: install esp_eth driver failed because some other error occurred

**Parameters**
- [in] config: configuration of the Ethernet driver
- [out] out_hdl: handle of Ethernet driver

`esp_err_t esp_eth_driver_uninstall(esp_eth_handle_t hdl)`

Uninstall Ethernet driver.

**Note** It’s not recommended to uninstall Ethernet driver unless it won’t get used any more in application code. To uninstall Ethernet driver, you have to make sure, all references to the driver are released. Ethernet driver can only be uninstalled successfully when reference counter equals to one.

**Return**
- ESP_OK: uninstall esp_eth driver successfully
- ESP_ERR_INVALID_ARG: uninstall esp_eth driver failed because of some invalid argument
- ESP_ERR_INVALID_STATE: uninstall esp_eth driver failed because it has more than one reference
- ESP_FAIL: uninstall esp_eth driver failed because some other error occurred

**Parameters**
- [in] hdl: handle of Ethernet driver

`esp_err_t esp_eth_start(esp_eth_handle_t hdl)`

Start Ethernet driver ONLY in standalone mode (i.e. without TCP/IP stack)

**Note** This API will start driver state machine and internal software timer (for checking link status).

**Return**
- ESP_OK: start esp_eth driver successfully
- ESP_ERR_INVALID_ARG: start esp_eth driver failed because of some invalid argument
- ESP_ERR_INVALID_STATE: start esp_eth driver failed because driver has started already
- ESP_FAIL: start esp_eth driver failed because some other error occurred

**Parameters**
- [in] hdl: handle of Ethernet driver

`esp_err_t esp_eth_stop(esp_eth_handle_t hdl)`

Stop Ethernet driver.

**Note** This function does the opposite operation of esp_eth_start.

**Return**
- ESP_OK: stop esp_eth driver successfully
- ESP_ERR_INVALID_ARG: stop esp_eth driver failed because of some invalid argument
- ESP_ERR_INVALID_STATE: stop esp_eth driver failed because driver has not started yet
- ESP_FAIL: stop esp_eth driver failed because some other error occurred

**Parameters**
- [in] hdl: handle of Ethernet driver
esp_err_t esp_eth_update_input_path(esp_eth_handle_t hdl, esp_err_t (*stack_input)(esp_eth_handle_t hdl, uint8_t *buffer, uint32_t length, void *priv), void *priv)

Update Ethernet data input path (i.e., specify where to pass the input buffer)

Note After install driver, Ethernet still doesn’t know where to deliver the input buffer. In fact, this API registers a callback function which get invoked when Ethernet received new packets.

Return
- ESP_OK: update input path successfully
- ESP_ERR_INVALID_ARG: update input path failed because of some invalid argument
- ESP_FAIL: update input path failed because some other error occurred

Parameters
- [in] hdl: handle of Ethernet driver
- [in] stack_input: function pointer, which does the actual process on incoming packets
- [in] priv: private resource, which gets passed to stack_input callback without any modification

esp_err_t esp_eth_transmit(esp_eth_handle_t hdl, void *buf, size_t length)

General Transmit.

Return
- ESP_OK: transmit frame buffer successfully
- ESP_ERR_INVALID_ARG: transmit frame buffer failed because of some invalid argument
- ESP_FAIL: transmit frame buffer failed because some other error occurred

Parameters
- [in] hdl: handle of Ethernet driver
- [in] buf: buffer of the packet to transfer
- [in] length: length of the buffer to transfer

esp_err_t esp_eth_receive(esp_eth_handle_t hdl, uint8_t *buf, uint32_t *length)

General Receive is deprecated and shall not be accessed from app code, as polling is not supported by Ethernet.

Note Before this function got invoked, the value of “length” should set by user, equals the size of buffer. After the function returned, the value of “length” means the real length of received data.

Note This API was exposed by accident, users should not use this API in their applications. Ethernet driver is interrupt driven, and doesn’t support polling mode. Instead, users should register input callback with esp_eth_update_input_path.

Return
- ESP_OK: receive frame buffer successfully
- ESP_ERR_INVALID_ARG: receive frame buffer failed because of some invalid argument
- ESP_ERR_INVALID_SIZE: input buffer size is not enough to hold the incoming data. in this case, value of returned “length” indicates the real size of incoming data.
- ESP_FAIL: receive frame buffer failed because some other error occurred

Parameters
- [in] hdl: handle of Ethernet driver
- [out] buf: buffer to preserve the received packet
- [out] length: length of the received packet

esp_err_t esp_eth_ioctl(esp_eth_handle_t hdl, esp_eth_io_cmd_t cmd, void *data)

Misc IO function of Ethernet driver.

The following IO control commands are supported:
- ETH_CMD_S_MAC_ADDR sets Ethernet interface MAC address. data argument is pointer to MAC address buffer with expected size of 6 bytes.
- ETH_CMD_G_MAC_ADDR gets Ethernet interface MAC address. data argument is pointer to a buffer to which MAC address is to be copied. The buffer size must be at least 6 bytes.
- ETH_CMD_S_PHY_ADDR sets PHY address in range of <0-31>. data argument is pointer to memory of uint32_t datatype from where the configuration option is read.
- ETH_CMD_G_PHY_ADDR gets PHY address. data argument is pointer to memory of uint32_t datatype to which the PHY address is to be stored.
• ETH_CMD_S_AUTONEGO enables or disables Ethernet link speed and duplex mode autonegotiation. data argument is pointer to memory of bool datatype from which the configuration option is read. Preconditions: Ethernet driver needs to be stopped.

• ETH_CMD_G_AUTONEGO gets current configuration of the Ethernet link speed and duplex mode autonegotiation. data argument is pointer to memory of bool datatype to which the current configuration is to be stored.

• ETH_CMD_S_SPEED sets the Ethernet link speed. data argument is pointer to memory of eth_speed_t datatype from which the configuration option is read. Preconditions: Ethernet driver needs to be stopped and auto-negotiation disabled.

• ETH_CMD_G_SPEED gets current Ethernet link speed. data argument is pointer to memory of eth_speed_t datatype to which the speed is to be stored.

• ETH_CMD_S_PROMISCUOUS sets/resets Ethernet interface promiscuous mode. data argument is pointer to memory of bool datatype from which the configuration option is read.

• ETH_CMD_S_FLOW_CTRL sets/resets Ethernet interface flow control. data argument is pointer to memory of bool datatype from which the configuration option is read.

• ETH_CMD_S_DUPLEX_MODE sets the Ethernet duplex mode. data argument is pointer to memory of eth_duplex_t datatype from which the configuration option is read. Preconditions: Ethernet driver needs to be stopped and auto-negotiation disabled.

• ETH_CMD_G_DUPLEX_MODE gets current Ethernet link duplex mode. data argument is pointer to memory of eth_duplex_t datatype to which the duplex mode is to be stored.

• ETH_CMD_S_PHY_LOOPBACK sets/resets PHY to/from loopback mode. data argument is pointer to memory of bool datatype from which the configuration option is read.

Return

- ESP_OK: process io command successfully
- ESP_ERR_INVALID_ARG: process io command failed because of some invalid argument
- ESP_FAIL: process io command failed because some other error occurred
- ESP_ERR_NOT_SUPPORTED: requested feature is not supported

Parameters

- [in] hdl: handle of Ethernet driver
- [in] cmd: IO control command
- [inout] data: address of data for set command or address where to store the data when used with get command

\[\text{esp_err_t esp_eth_increase_reference}(\text{esp_eth_handle_t hdl})\]

Increase Ethernet driver reference.

Note Ethernet driver handle can be obtained by os timer, netif, etc. It’s dangerous when thread A is using Ethernet but thread B uninstall the driver. Using reference counter can prevent such risk, but care should be taken, when you obtain Ethernet driver, this API must be invoked so that the driver won’t be uninstalled during your using time.

Return

- ESP_OK: increase reference successfully
- ESP_ERR_INVALID_ARG: increase reference failed because of some invalid argument

Parameters

- [in] hdl: handle of Ethernet driver

\[\text{esp_err_t esp_eth_decrease_reference}(\text{esp_eth_handle_t hdl})\]

Decrease Ethernet driver reference.

Return

- ESP_OK: increase reference successfully
- ESP_ERR_INVALID_ARG: increase reference failed because of some invalid argument

Parameters

- [in] hdl: handle of Ethernet driver

Structures

\[\text{struct esp_eth_config_t}\]

Configuration of Ethernet driver.
Public Members

`esp_eth_mac_t *mac`
Ethernet MAC object.

`esp_eth_phy_t *phy`
Ethernet PHY object.

`uint32_t check_link_period_ms`
Period time of checking Ethernet link status.

`esp_err_t (*stack_input)(esp_eth_handle_t eth_handle, uint8_t *buffer, uint32_t length, void *priv)`
Input frame buffer to user’s stack.

Return
- ESP_OK: input frame buffer to upper stack successfully
- ESP_FAIL: error occurred when inputting buffer to upper stack

Parameters
- [in] eth_handle: handle of Ethernet driver
- [in] buffer: frame buffer that will get input to upper stack
- [in] length: length of the frame buffer

`esp_err_t (*on_lowlevel_init_done)(esp_eth_handle_t eth_handle)`
Callback function invoked when lowlevel initialization is finished.

Return
- ESP_OK: process extra lowlevel initialization successfully
- ESP_FAIL: error occurred when processing extra lowlevel initialization

Parameters
- [in] eth_handle: handle of Ethernet driver

`esp_err_t (*on_lowlevel_deinit_done)(esp_eth_handle_t eth_handle)`
Callback function invoked when lowlevel deinitialization is finished.

Return
- ESP_OK: process extra lowlevel deinitialization successfully
- ESP_FAIL: error occurred when processing extra lowlevel deinitialization

Parameters
- [in] eth_handle: handle of Ethernet driver

`esp_err_t (*read_phy_reg)(esp_eth_handle_t eth_handle, uint32_t phy_addr, uint32_t phy_reg, uint32_t *reg_value)`
Read PHY register.

Note Usually the PHY register read/write function is provided by MAC (SMI interface), but if the PHY device is managed by other interface (e.g. I2C), then user needs to implement the corresponding read/write. Setting this to NULL means your PHY device is managed by MAC’s SMI interface.

Return
- ESP_OK: read PHY register successfully
- ESP_ERR_INVALID_ARG: read PHY register failed because of invalid argument
- ESP_ERR_TIMEOUT: read PHY register failed because of timeout
- ESP_FAIL: read PHY register failed because some other error occurred

Parameters
- [in] eth_handle: handle of Ethernet driver
- [in] phy_addr: PHY chip address (0-31)
- [in] phy_reg: PHY register index code
- [out] reg_value: PHY register value

`esp_err_t (*write_phy_reg)(esp_eth_handle_t eth_handle, uint32_t phy_addr, uint32_t phy_reg, uint32_t reg_value)`
Write PHY register.
Note Usually the PHY register read/write function is provided by MAC (SMI interface), but if the PHY device is managed by other interface (e.g. I2C), then user needs to implement the corresponding read/write. Setting this to NULL means your PHY device is managed by MAC’s SMI interface.

Return
- ESP_OK: write PHY register successfully
- ESP_ERR_INVALID_ARG: read PHY register failed because of invalid argument
- ESP_ERR_TIMEOUT: write PHY register failed because of timeout
- ESP_FAIL: write PHY register failed because some other error occurred

Parameters
- [in] eth_handle: handle of Ethernet driver
- [in] phy_addr: PHY chip address (0~31)
- [in] phy_reg: PHY register index code
- [in] reg_value: PHY register value

Macros
ETH_DEFAULT_CONFIG (emac, ephy)
Default configuration for Ethernet driver.

Type Definitions
typedef void *esp_eth_handle_t
Handle of Ethernet driver.

Enumerations
enum esp_eth_io_cmd_t
Command list for ioctl API.
Values:
ETH_CMD_G_MAC_ADDR
Get MAC address
ETH_CMD_S_MAC_ADDR
Set MAC address
ETH_CMD_G_PHY_ADDR
Get PHY address
ETH_CMD_S_PHY_ADDR
Set PHY address
ETH_CMD_G_AUTONEGO
Get PHY Auto Negotiation
ETH_CMD_S_AUTONEGO
Set PHY Auto Negotiation
ETH_CMD_G_SPEED
Get Speed
ETH_CMD_S_SPEED
Set Speed
ETH_CMD_S_PROMISCUOUS
Set promiscuous mode
ETH_CMD_S_FLOW_CTRL
Set flow control
ETH_CMD_G_DUPLEX_MODE
Get Duplex mode
ETH_CMD_S_DUPLEX_MODE
Set Duplex mode
ETH_CMD_S_PHY_LOOPBACK

Set PHY loopback

Header File

- components/esp_eth/include/esp_eth_com.h

Functions

**esp_err_t esp_eth_detect_phy_addr(esp_eth_mediator_t *eth, int *detected_addr)**

Detect PHY address.

**Return**

- ESP_OK: detect phy address successfully
- ESP_ERR_INVALID_ARG: invalid parameter
- ESP_ERR_NOT_FOUND: can’t detect any PHY device
- ESP_FAIL: detect phy address failed because some error occurred

**Parameters**

- [in] eth: mediator of Ethernet driver
- [out] detected_addr: a valid address after detection

Structures

**struct esp_eth_mediator_s**

Ethernet mediator.

Public Members

**esp_err_t (*phy_reg_read)(esp_eth_mediator_t *eth, uint32_t phy_addr, uint32_t phy_reg, uint32_t *reg_value)**

Read PHY register.

**Return**

- ESP_OK: read PHY register successfully
- ESP_FAIL: read PHY register failed because some error occurred

**Parameters**

- [in] eth: mediator of Ethernet driver
- [in] phy_addr: PHY Chip address (0~31)
- [in] phy_reg: PHY register index code
- [out] reg_value: PHY register value

**esp_err_t (*phy_reg_write)(esp_eth_mediator_t *eth, uint32_t phy_addr, uint32_t phy_reg, uint32_t *reg_value)**

Write PHY register.

**Return**

- ESP_OK: write PHY register successfully
- ESP_FAIL: write PHY register failed because some error occurred

**Parameters**

- [in] eth: mediator of Ethernet driver
- [in] phy_addr: PHY Chip address (0~31)
- [in] phy_reg: PHY register index code
- [in] reg_value: PHY register value

**esp_err_t (*stack_input)(esp_eth_mediator_t *eth, uint8_t *buffer, uint32_t length)**

Deliver packet to upper stack.

**Return**

- ESP_OK: deliver packet to upper stack successfully
- ESP_FAIL: deliver packet failed because some error occurred

**Parameters**
Chapter 2. API Reference

- [in] `eth`: mediator of Ethernet driver
- [in] `buffer`: packet buffer
- [in] `length`: length of the packet

```c
esp_err_t (*on_state_changed)(esp_eth_mediator_t *eth, esp_eth_state_t state, void *args)
```

Callback on Ethernet state changed.

**Return**

- ESP_OK: process the new state successfully
- ESP_FAIL: process the new state failed because some error occurred

**Parameters**

- [in] `eth`: mediator of Ethernet driver
- [in] `state`: new state
- [in] `args`: optional argument for the new state

**Type Definitions**

```c
typedef struct esp_eth_mediator_s esp_eth_mediator_t
```

Ethernet mediator.

**Enumerations**

```c
enum esp_eth_state_t
```

Ethernet driver state.

**Values:**

- `ETH_STATE_LLINIT`: Low level init done
- `ETH_STATE_DEINIT`: Deinit done
- `ETH_STATE_LINK`: Link status changed
- `ETH_STATE_SPEED`: Speed updated
- `ETH_STATE_DUPLEX`: Duplex updated
- `ETH_STATE_PAUSE`: Pause ability updated

```c
enum eth_event_t
```

Ethernet event declarations.

**Values:**

- `ETHERNET_EVENT_START`: Ethernet driver start
- `ETHERNET_EVENT_STOP`: Ethernet driver stop
- `ETHERNET_EVENT_CONNECTED`: Ethernet got a valid link
- `ETHERNET_EVENT_DISCONNECTED`: Ethernet lost a valid link

**Header File**

- `components/esp_eth/include/esp_eth_mac.h`
Unions

union eth_mac_clock_config_t

RMII Clock GPIO Configuration

struct eth_mac_clock_config_t::[anonymous] rmii
EMAC RMII Clock Configuration

Structures

struct esp_eth_mac_s
Ethernet MAC.

Public Members

esp_err_t (*set_mediator)(esp_eth_mac_t *mac, esp_eth_mediator_t *eth)
Set mediator for Ethernet MAC.

Return
• ESP_OK: set mediator for Ethernet MAC successfully
• ESP_ERR_INVALID_ARG: set mediator for Ethernet MAC failed because of invalid argument

Parameters
• [in] mac: Ethernet MAC instance
• [in] eth: Ethernet mediator

esp_err_t (*init)(esp_eth_mac_t *mac)
Initialize Ethernet MAC.

Return
• ESP_OK: initialize Ethernet MAC successfully
• ESP_ERR_TIMEOUT: initialize Ethernet MAC failed because of timeout
• ESP_FAIL: initialize Ethernet MAC failed because some other error occurred

Parameters
• [in] mac: Ethernet MAC instance

esp_err_t (*deinit)(esp_eth_mac_t *mac)
Deinitialize Ethernet MAC.

Return
• ESP_OK: deinitialize Ethernet MAC successfully
• ESP_FAIL: deinitialize Ethernet MAC failed because some other error occurred

Parameters
• [in] mac: Ethernet MAC instance

esp_err_t (*start)(esp_eth_mac_t *mac)
Start Ethernet MAC.

Return
• ESP_OK: start Ethernet MAC successfully
• ESP_FAIL: start Ethernet MAC failed because some other error occurred

Parameters
**[in] mac**: Ethernet MAC instance

```c
esp_err_t (*stop)(esp_eth_mac_t *mac)
```

Stop Ethernet MAC.

**Return**
- ESP_OK: stop Ethernet MAC successfully
- ESP_FAIL: stop Ethernet MAC failed because some error occurred

**Parameters**
- [in] mac: Ethernet MAC instance

```c
esp_err_t (*transmit)(esp_eth_mac_t *mac, uint8_t *buf, uint32_t length)
```

Transmit packet from Ethernet MAC.

**Return**
- ESP_OK: transmit packet successfully
- ESP_ERR_INVALID_ARG: transmit packet failed because of invalid argument
- ESP_ERR_INVALID_STATE: transmit packet failed because of wrong state of MAC
- ESP_FAIL: transmit packet failed because some other error occurred

**Parameters**
- [in] mac: Ethernet MAC instance
- [in] buf: packet buffer to transmit
- [in] length: length of packet

```c
esp_err_t (*receive)(esp_eth_mac_t *mac, uint8_t *buf, uint32_t *length)
```

Receive packet from Ethernet MAC.

**Note** Memory of buf is allocated in the Layer2, make sure it get free after process.

**Note** Before this function got invoked, the value of “length” should set by user, equals the size of buffer.

After the function returned, the value of “length” means the real length of received data.

**Return**
- ESP_OK: receive packet successfully
- ESP_ERR_INVALID_ARG: receive packet failed because of invalid argument
- ESP_ERR_INVALID_SIZE: input buffer size is not enough to hold the incoming data. in this case, value of returned “length” indicates the real size of incoming data.
- ESP_FAIL: receive packet failed because some other error occurred

**Parameters**
- [in] mac: Ethernet MAC instance
- [out] buf: packet buffer which will preserve the received frame
- [out] length: length of the received packet

```c
esp_err_t (*read_phy_reg)(esp_eth_mac_t *mac, uint32_t phy_addr, uint32_t phy_reg, uint32_t *reg_value)
```

Read PHY register.

**Return**
- ESP_OK: read PHY register successfully
- ESP_ERR_INVALID_ARG: read PHY register failed because of invalid argument
- ESP_ERR_INVALID_STATE: read PHY register failed because of wrong state of MAC
- ESP_ERR_TIMEOUT: read PHY register failed because of timeout
- ESP_FAIL: read PHY register failed because some other error occurred

**Parameters**
- [in] mac: Ethernet MAC instance
- [in] phy_addr: PHY chip address (0~31)
- [in] phy_reg: PHY register index code
- [out] reg_value: PHY register value

```c
esp_err_t (*write_phy_reg)(esp_eth_mac_t *mac, uint32_t phy_addr, uint32_t phy_reg, uint32_t reg_value)
```

Write PHY register.

**Return**
- ESP_OK: write PHY register successfully
• ESP_ERR_INVALID_STATE: write PHY register failed because of wrong state of MAC
• ESP_ERR_TIMEOUT: write PHY register failed because of timeout
• ESP_FAIL: write PHY register failed because some other error occurred

Parameters
- [in] mac: Ethernet MAC instance
- [in] phy_addr: PHY chip address (0~31)
- [in] phy_reg: PHY register index code
- [in] reg_value: PHY register value

\texttt{esp_err_t (*set_addr)(esp_eth_mac_t *mac, uint8_t *addr)}
Set MAC address.

Return
- ESP_OK: set MAC address successfully
- ESP_ERR_INVALID_ARG: set MAC address failed because of invalid argument
- ESP_FAIL: set MAC address failed because some other error occurred

Parameters
- [in] mac: Ethernet MAC instance
- [in] addr: MAC address

\texttt{esp_err_t (*get_addr)(esp_eth_mac_t *mac, uint8_t *addr)}
Get MAC address.

Return
- ESP_OK: get MAC address successfully
- ESP_ERR_INVALID_ARG: get MAC address failed because of invalid argument
- ESP_FAIL: get MAC address failed because some other error occurred

Parameters
- [in] mac: Ethernet MAC instance
- [out] addr: MAC address

\texttt{esp_err_t (*set_speed)(esp_eth_mac_t *mac, eth_speed_t speed)}
Set speed of MAC.

Return
- ESP_OK: set MAC speed successfully
- ESP_ERR_INVALID_ARG: set MAC speed failed because of invalid argument
- ESP_FAIL: set MAC speed failed because some other error occurred

Parameters
- [in] mac: Ethernet MAC instance
- [in] speed: MAC speed

\texttt{esp_err_t (*set_duplex)(esp_eth_mac_t *mac, eth_duplex_t duplex)}
Set duplex mode of MAC.

Return
- ESP_OK: set MAC duplex mode successfully
- ESP_ERR_INVALID_ARG: set MAC duplex failed because of invalid argument
- ESP_FAIL: set MAC duplex failed because some other error occurred

Parameters
- [in] mac: Ethernet MAC instance
- [in] duplex: MAC duplex

\texttt{esp_err_t (*set_link)(esp_eth_mac_t *mac, eth_link_t link)}
Set link status of MAC.

Return
- ESP_OK: set link status successfully
- ESP_ERR_INVALID_ARG: set link status failed because of invalid argument
- ESP_FAIL: set link status failed because some other error occurred

Parameters
- [in] mac: Ethernet MAC instance
- [in] link: Link status
```c
esp_err_t (*set_promiscuous)(esp_eth_mac_t *mac, bool enable)
Set promiscuous of MAC.

Return
- ESP_OK: set promiscuous mode successfully
- ESP_FAIL: set promiscuous mode failed because some error occurred

Parameters
- [in] mac: Ethernet MAC instance
- [in] enable: set true to enable promiscuous mode; set false to disable promiscuous mode

esp_err_t (*enable_flow_ctrl)(esp_eth_mac_t *mac, bool enable)
Enable flow control on MAC layer or not.

Return
- ESP_OK: set flow control successfully
- ESP_FAIL: set flow control failed because some error occurred

Parameters
- [in] mac: Ethernet MAC instance
- [in] enable: set true to enable flow control; set false to disable flow control

esp_err_t (*set_peer_pause_ability)(esp_eth_mac_t *mac, uint32_t ability)
Set the PAUSE ability of peer node.

Return
- ESP_OK: set peer pause ability successfully
- ESP_FAIL: set peer pause ability failed because some error occurred

Parameters
- [in] mac: Ethernet MAC instance
- [in] ability: zero indicates that pause function is supported by link partner; non-zero indicates that pause function is not supported by link partner

esp_err_t (*del)(esp_eth_mac_t *mac)
Free memory of Ethernet MAC.

Return
- ESP_OK: free Ethernet MAC instance successfully
- ESP_FAIL: free Ethernet MAC instance failed because some error occurred

Parameters
- [in] mac: Ethernet MAC instance

struct eth_mac_config_t
Configuration of Ethernet MAC object.

Public Members

uint32_t sw_reset_timeout_ms
Software reset timeout value (Unit: ms)

uint32_t rx_task_stack_size
Stack size of the receive task

uint32_t rx_task_prio
Priority of the receive task

int smi_mdc_gpio_num
SMI MDC GPIO number, set to -1 could bypass the SMI GPIO configuration

int smi_mdio_gpio_num
SMI MDIO GPIO number, set to -1 could bypass the SMI GPIO configuration

uint32_t flags
Flags that specify extra capability for mac driver

eth_data_interface_t interface
EMAC Data interface to PHY (MII/RMII)
```
**eth_mac_clock_config_t** `clock_config`
EMAC Interface clock configuration

**Macros**

- `ETH_MAC_FLAG_WORK_WITH_CACHE_DISABLE`
  MAC driver can work when cache is disabled
- `ETH_MAC_FLAG_PIN_TO_CORE`
  Pin MAC task to the CPU core where driver installation happened
- `ETH_MAC_DEFAULT_CONFIG()`
  Default configuration for Ethernet MAC object.

**Type Definitions**

```c
typedef struct esp_eth_mac_s esp_eth_mac_t
Ethernet MAC.
```

**Enumerations**

- `enum emac_rmii_clock_mode_t`
  RMII Clock Mode Options.
  
  **Values:**
  
  - `EMAC_CLK_DEFAULT`
    Default values configured using Kconfig are going to be used when “Default” selected.
  
  - `EMAC_CLK_EXT_IN`
    Input RMII Clock from external. EMAC Clock GPIO number needs to be configured when this option is selected.
    
    **Note** MAC will get RMII clock from outside. Note that ESP32 only supports GPIO0 to input the RMII clock.
  
  - `EMAC_CLK_OUT`
    Output RMII Clock from internal APLL Clock. EMAC Clock GPIO number needs to be configured when this option is selected.

- `enum emac_rmii_clock_gpio_t`
  RMII Clock GPIO number Options.
  
  **Values:**
  
  - `EMAC_CLK_IN_GPIO = 0`
    MAC will get RMII clock from outside at this GPIO.
    
    **Note** ESP32 only supports GPIO0 to input the RMII clock.
  
  - `EMAC_APPL_CLK_OUT_GPIO = 0`
    Output RMII Clock from internal APLL Clock available at GPIO0.
    
    **Note** GPIO0 can be set to output a pre-divided PLL clock (test only!). Enabling this option will configure GPIO0 to output a 50MHz clock. In fact this clock doesn’t have directly relationship with EMAC peripheral. Sometimes this clock won’t work well with your PHY chip. You might need to add some extra devices after GPIO0 (e.g. inverter). Note that outputting RMII clock on GPIO0 is an experimental practice. If you want the Ethernet to work with WiFi, don’t select GPIO0 output mode for stability.
  
  - `EMAC_CLK_OUT_GPIO = 16`
    Output RMII Clock from internal APLL Clock available at GPIO16.
  
  - `EMAC_CLK_OUT_180_GPIO = 17`
    Inverted Output RMII Clock from internal APLL Clock available at GPIO17.
Chapter 2. API Reference

Header File

- components/esp_eth/include/esp_eth_phy.h

Functions

`esp_eth_phy_t * esp_eth_phy_new_ip101(const eth_phy_config_t *config)`

Create a PHY instance of IP101.

Return

- instance: create PHY instance successfully
- NULL: create PHY instance failed because some error occurred

Parameters

- [in] config: configuration of PHY

`esp_eth_phy_t * esp_eth_phy_new_rtl8201(const eth_phy_config_t *config)`

Create a PHY instance of RTL8201.

Return

- instance: create PHY instance successfully
- NULL: create PHY instance failed because some error occurred

Parameters

- [in] config: configuration of PHY

`esp_eth_phy_t * esp_eth_phy_new_lan87xx(const eth_phy_config_t *config)`

Create a PHY instance of LAN87xx.

Return

- instance: create PHY instance successfully
- NULL: create PHY instance failed because some error occurred

Parameters

- [in] config: configuration of PHY

`esp_eth_phy_t * esp_eth_phy_new_dp83848(const eth_phy_config_t *config)`

Create a PHY instance of DP83848.

Return

- instance: create PHY instance successfully
- NULL: create PHY instance failed because some error occurred

Parameters

- [in] config: configuration of PHY

`esp_eth_phy_t * esp_eth_phy_new_ksz80xx(const eth_phy_config_t *config)`

Create a PHY instance of KSZ80xx.

The phy model from the KSZ80xx series is detected automatically. If the driver is unable to detect a supported model, NULL is returned.

Currently, the following models are supported: KSZ8001, KSZ8021, KSZ8031, KSZ8041, KSZ8051, KSZ8061, KSZ8081, KSZ8091

Return

- instance: create PHY instance successfully
- NULL: create PHY instance failed because some error occurred

Parameters

- [in] config: configuration of PHY

Structures

`struct esp_eth_phy_s`

Ethernet PHY.
Public Members

```c
esp_err_t (*set_mediator)(esp_eth_phy_t *phy, esp_eth_mediator_t *mediator)
```
Set mediator for PHY.

Return
- ESP_OK: set mediator for Ethernet PHY instance successfully
- ESP_ERR_INVALID_ARG: set mediator for Ethernet PHY instance failed because of some invalid arguments

Parameters
- [in] phy: Ethernet PHY instance
- [in] mediator: mediator of Ethernet driver

```c
esp_err_t (*reset)(esp_eth_phy_t *phy)
```
Software Reset Ethernet PHY.

Return
- ESP_OK: reset Ethernet PHY successfully
- ESP_FAIL: reset Ethernet PHY failed because some error occurred

Parameters
- [in] phy: Ethernet PHY instance

```c
esp_err_t (*reset_hw)(esp_eth_phy_t *phy)
```
Hardware Reset Ethernet PHY.

Note Hardware reset is mostly done by pull down and up PHY’s nRST pin

Return
- ESP_OK: reset Ethernet PHY successfully
- ESP_FAIL: reset Ethernet PHY failed because some error occurred

Parameters
- [in] phy: Ethernet PHY instance

```c
esp_err_t (*init)(esp_eth_phy_t *phy)
```
Initialize Ethernet PHY.

Return
- ESP_OK: initialize Ethernet PHY successfully
- ESP_FAIL: initialize Ethernet PHY failed because some error occurred

Parameters
- [in] phy: Ethernet PHY instance

```c
esp_err_t (*deinit)(esp_eth_phy_t *phy)
```
Deinitialize Ethernet PHY.

Return
- ESP_OK: deinitialize Ethernet PHY successfully
- ESP_FAIL: deinitialize Ethernet PHY failed because some error occurred

Parameters
- [in] phy: Ethernet PHY instance

```c
esp_err_t (*autonego_ctrl)(esp_eth_phy_t *phy, eth_phy_autoneg_cmd_t cmd, bool *autonego_en_stat)
```
Configure auto negotiation.

Return
- ESP_OK: restart auto negotiation successfully
- ESP_FAIL: restart auto negotiation failed because some error occurred
- ESP_ERR_INVALID_ARG: invalid command

Parameters
- [in] phy: Ethernet PHY instance
- [in] cmd: Configuration command, it is possible to Enable (restart), Disable or get current status of PHY auto negotiation
- [out] autonego_en_stat: Address where to store current status of auto negotiation configuration
**esp_err_t** (*get_link*) *(esp_eth_phy_t *phy)*

Get Ethernet PHY link status.

**Return**
- ESP_OK: get Ethernet PHY link status successfully
- ESP_FAIL: get Ethernet PHY link status failed because some error occurred

**Parameters**
- [in] phy: Ethernet PHY instance

**esp_err_t** (*pwrctl*) *(esp_eth_phy_t *phy, bool enable)*

Power control of Ethernet PHY.

**Return**
- ESP_OK: control Ethernet PHY power successfully
- ESP_FAIL: control Ethernet PHY power failed because some error occurred

**Parameters**
- [in] phy: Ethernet PHY instance
- [in] enable: set true to power on Ethernet PHY, set false to power off Ethernet PHY

**esp_err_t** (*set_addr*) *(esp_eth_phy_t *phy, uint32_t addr)*

Set PHY chip address.

**Return**
- ESP_OK: set Ethernet PHY address successfully
- ESP_FAIL: set Ethernet PHY address failed because some error occurred

**Parameters**
- [in] phy: Ethernet PHY instance
- [in] addr: PHY chip address

**esp_err_t** (*get_addr*) *(esp_eth_phy_t *phy, uint32_t *addr)*

Get PHY chip address.

**Return**
- ESP_OK: get Ethernet PHY address successfully
- ESP_ERR_INVALID_ARG: get Ethernet PHY address failed because of invalid argument

**Parameters**
- [in] phy: Ethernet PHY instance
- [out] addr: PHY chip address

**esp_err_t** (*advertise_pause_ability*) *(esp_eth_phy_t *phy, uint32_t ability)*

Advertise pause function supported by MAC layer.

**Return**
- ESP_OK: Advertise pause ability successfully
- ESP_ERR_INVALID_ARG: Advertise pause ability failed because of invalid argument

**Parameters**
- [in] phy: Ethernet PHY instance
- [out] addr: Pause ability

**esp_err_t** (*loopback*) *(esp_eth_phy_t *phy, bool enable)*

Sets the PHY to loopback mode.

**Return**
- ESP_OK: PHY instance loopback mode has been configured successfully
- ESP_FAIL: PHY instance loopback configuration failed because some error occurred

**Parameters**
- [in] phy: Ethernet PHY instance
- [in] enable: enables or disables PHY loopback

**esp_err_t** (*set_speed*) *(esp_eth_phy_t *phy, eth_speed_t speed)*

Sets PHY speed mode.

**Note** Autonegotiation feature needs to be disabled prior to calling this function for the new setting to be applied

**Return**
• ESP_OK: PHY instance speed mode has been configured successfully
• ESP_FAIL: PHY instance speed mode configuration failed because some error occurred

**Parameters**

- [in] phy: Ethernet PHY instance
- [in] speed: Speed mode to be set

```c
esp_err_t (*set_duplex)(esp_eth_phy_t *phy, eth_duplex_t duplex)
```

Sets PHY duplex mode.

**Note** Autonegotiation feature needs to be disabled prior to calling this function for the new setting to be applied.

**Return**

- ESP_OK: PHY instance duplex mode has been configured successfully
- ESP_FAIL: PHY instance duplex mode configuration failed because some error occurred

**Parameters**

- [in] phy: Ethernet PHY instance
- [in] duplex: Duplex mode to be set

```c
esp_err_t (*del)(esp_eth_phy_t *phy)
```

Free memory of Ethernet PHY instance.

**Return**

- ESP_OK: free PHY instance successfully
- ESP_FAIL: free PHY instance failed because some error occurred

**Parameters**

- [in] phy: Ethernet PHY instance

```c
struct eth_phy_config_t
```

Ethernet PHY configuration.

### Public Members

- `int32_t phy_addr`
  
  PHY address, set -1 to enable PHY address detection at initialization stage

- `uint32_t reset_timeout_ms`
  
  Reset timeout value (Unit: ms)

- `uint32_t autonego_timeout_ms`
  
  Auto-negotiation timeout value (Unit: ms)

- `int reset_gpio_num`
  
  Reset GPIO number, -1 means no hardware reset

### Macros

- `ESP_ETH_PHY_ADDR_AUTO`
- `ETH_PHY_DEFAULT_CONFIG()`
  
  Default configuration for Ethernet PHY object.

### Type Definitions

- `typedef struct esp_eth_phy_s esp_eth_phy_t`
  
  Ethernet PHY.

### Enumerations

- `enum eth_phy_autoneg_cmd_t`
  
  Auto-negotiation control commands.
  
  **Values:**

  - `ESP_ETH_PHY_AUTONEGO_RESTART`
Chapter 2. API Reference

**ESP_ETH_PHY_AUTONEGO_EN**

**ESP_ETH_PHY_AUTONEGO_DIS**

**ESP_ETH_PHY_AUTONEGO_G_STAT**

**Header File**

- components/esp_eth/include/esp_eth_netif_glue.h

**Functions**

```c
esp_eth_netif_glue_handle_t esp_eth_new_netif_glue(esp_eth_handle_t eth_hdl)
```

Create a netif glue for Ethernet driver.

**Note** netif glue is used to attach io driver to TCP/IP netif

**Return** glue object, which inherits esp_netif_driver_base_t

**Parameters**

- `eth_hdl`: Ethernet driver handle

```c
esp_err_t esp_eth_del_netif_glue(esp_eth_netif_glue_handle_t eth_netif_glue)
```

Delete netif glue of Ethernet driver.

**Return** -ESP_OK: delete netif glue successfully

**Parameters**

- `eth_netif_glue`: netif glue

**Type Definitions**

```c
typedef struct esp_eth_netif_glue_t* esp_eth_netif_glue_handle_t
```

Handle of netif glue - an intermediate layer between netif and Ethernet driver.

Code examples for the Ethernet API are provided in the `ethernet` directory of ESP-IDF examples.

### 2.2.3 Thread

**Thread**

**Introduction** Thread is a IP-based mesh networking protocol. It’s based on the 802.15.4 physical and MAC layer.

**Application Examples** The openthread directory of ESP-IDF examples contains the following applications:

- The OpenThread interactive shell `openthread/ot_cli`
- The Thread border router `openthread/ot_br`
- The Thread radio co-processor `openthread/ot_rcp`

**API Reference** For manipulating the Thread network, the OpenThread api shall be used. The OpenThread api docs can be found at the [OpenThread official website](https://openthread.io).

ESP-IDF provides extra apis for launching and managing the OpenThread stack, binding to network interfaces and border routing features.

**Header File**

- components/openthread/include/esp_openthread.h
Functions

```c
esp_err_t esp_openthread_init(const esp_openthread_platform_config_t *init_config)
```

Initializes the full OpenThread stack.

**Note** The OpenThread instance will also be initialized in this function.

**Return**

- ESP_OK on success
- ESP_ERR_NO_MEM if allocation has failed
- ESP_ERR_INVALID_ARG if radio or host connection mode not supported
- ESP_ERR_INVALID_STATE if already initialized

**Parameters**

- **[in]** `init_config`: The initialization configuration.

```c
esp_err_t esp_openthread_launch_mainloop(void)
```

Launches the OpenThread mainloop.

**Note** This function will not return unless error happens when running the OpenThread stack.

**Return**

- ESP_OK on success
- ESP_ERR_NO_MEM if allocation has failed
- ESP_FAIL on other failures

```c
esp_err_t esp_openthread_deinit(void)
```

This function performs OpenThread stack and platform driver deinitialization.

**Return**

- ESP_OK on success
- ESP_ERR_INVALID_STATE if not initialized

```c
otInstance *esp_openthread_get_instance(void)
```

This function acquires the underlying OpenThread instance.

**Note** This function can be called on other tasks without lock.

**Return** The OpenThread instance pointer

**Header File**

- `components/openthread/include/esp_openthread_types.h`

**Structures**

```c
struct esp_openthread_mainloop_context_t
```

This structure represents a context for a select() based mainloop.

**Public Members**

- **fd_set** `read_fds`
  The read file descriptors
- **fd_set** `write_fds`
  The write file descriptors
- **fd_set** `error_fds`
  The error file descriptors
- **int** `max_fd`
  The max file descriptor
- **struct** `timeval` `timeout`
  The timeout

```c
struct esp_openthread_uart_config_t
```

The uart port config for OpenThread.
Public Members

`uart_port_t port`
UART port number

`uart_config_t uart_config`
UART configuration, see `uart_config_t` docs

`int rx_pin`
UART RX pin

`int tx_pin`
UART TX pin

`struct esp_openthread_radio_config_t`
The OpenThread radio configuration.

Public Members

`esp_openthread_radio_mode_t radio_mode`
The radio mode

`esp_openthread_uart_config_t radio_uart_config`
The uart configuration to RCP

`struct esp_openthread_host_connection_config_t`
The OpenThread host connection configuration.

Public Members

`esp_openthread_host_connection_mode_t host_connection_mode`
The host connection mode

`esp_openthread_uart_config_t host_uart_config`
The uart configuration to host

`struct esp_openthread_port_config_t`
The OpenThread port specific configuration.

Public Members

`const char *storage_partition_name`
The partition for storing OpenThread dataset

`uint8_t netif_queue_size`
The packet queue size for the network interface

`uint8_t task_queue_size`
The task queue size

`struct esp_openthread_platform_config_t`
The OpenThread platform configuration.

Public Members

`esp_openthread_radio_config_t radio_config`
The radio configuration

`esp_openthread_host_connection_config_t host_config`
The host connection configuration
**esp_openthread_port_config_t** `port_config`  
The port configuration

### Enumerations

**enum esp_openthread_event_t**
OpenThread event declarations.

Values:

- **OPENTHREAD_EVENT_START**  
  OpenThread stack start
- **OPENTHREAD_EVENT_STOP**  
  OpenThread stack stop
- **OPENTHREAD_EVENT_IF_UP**  
  OpenThread network interface up
- **OPENTHREAD_EVENT_IF_DOWN**  
  OpenThread network interface down
- **OPENTHREAD_EVENT_GOT_IP6**  
  OpenThread stack added IPv6 address
- **OPENTHREAD_EVENT_LOST_IP6**  
  OpenThread stack removed IPv6 address
- **OPENTHREAD_EVENT_MULTICAST_GROUP_JOIN**  
  OpenThread stack joined IPv6 multicast group
- **OPENTHREAD_EVENT_MULTICAST_GROUP_LEAVE**  
  OpenThread stack left IPv6 multicast group
- **OPENTHREAD_EVENT_TREL_ADD_IP6**  
  OpenThread stack added TREL IPv6 address
- **OPENTHREAD_EVENT_TREL_REMOVE_IP6**  
  OpenThread stack removed TREL IPv6 address
- **OPENTHREAD_EVENT_TREL_MULTICAST_GROUP_JOIN**  
  OpenThread stack joined TREL IPv6 multicast group

**enum esp_openthread_radio_mode_t**
The radio mode of OpenThread.

Values:

- **RADIO_MODE_NATIVE** = 0x0  
  Use the native 15.4 radio
- **RADIO_MODE_UART_RCP** = 0x1  
  UART connection to a 15.4 capable radio co-processor (RCP)
- **RADIO_MODE_SPI_RCP** = 0x2  
  SPI connection to a 15.4 capable radio co-processor (RCP)

**enum esp_openthread_host_connection_mode_t**
How OpenThread connects to the host.

Values:

- **HOST_CONNECTION_MODE_NONE** = 0x0  
  Disable host connection
- **HOST_CONNECTION_MODE_CLI_UART** = 0x1  
  CLI UART connection to the host
- **HOST_CONNECTION_MODE_RCP_UART** = 0x2  
  RCP UART connection to the host
Chapter 2. API Reference

Header File

• components/openthread/include/esp_openthread_lock.h

Functions

`esp_err_t esp_openthread_lock_init (void)`
This function initializes the OpenThread API lock.

Return
• ESP_OK on success
• ESP_ERR_NO_MEM if allocation has failed
• ESP_ERR_INVALID_STATE if already initialized

void `esp_openthread_lock_deinit (void)`
This function deinitializes the OpenThread API lock.

bool `esp_openthread_lock_acquire (TickType_t block_ticks)`
This function acquires the OpenThread API lock.

Note Every OT APIs that takes an otInstance argument MUST be protected with this API lock except that the call site is in OT callbacks.

Return
• True on lock acquired
• False on failing to acquire the lock with the timeout.

Parameters
• [in] block_ticks: The maximum number of RTOS ticks to wait for the lock.

void `esp_openthread_lock_release (void)`
This function releases the OpenThread API lock.

Header File

• components/openthread/include/esp_openthread_netif_glue.h

Functions

void *`esp_openthread_netif_glue_init (const esp_openthread_platform_config_t *config)`
This function initializes the OpenThread network interface glue.

Return
• glue pointer on success
• NULL on failure

Parameters
• [in] config: The platform configuration.

void `esp_openthread_netif_glue_deinit (void)`
This function deinitializes the OpenThread network interface glue.

esp_netif_t *`esp_openthread_get_netif (void)`
This function acquires the OpenThread netif.

Return The OpenThread netif or NULL if not initialized.

Header File

• components/openthread/include/esp_openthread_border_router.h

Functions

void `esp_openthread_set_backbone_netif (esp_netif_t *backbone_netif)`
Sets the backbone interface used for border routing.

Note This function must be called before esp_openthread_init

Parameters
• [in] backbone_netif: The backbone network interface (WiFi or ethernet)

```c
esp_err_t esp_openthread_border_router_init (void)
```
Initializes the border router features of OpenThread.

**Note** Calling this function will make the device behave as an OpenThread border router. Kconfig option CONFIG_OPENTHREAD Border_ROUTER is required.

**Return**
- ESP_OK on success
- ESP_ERR_NOT_SUPPORTED if feature not supported
- ESP_ERR_INVALID_STATE if already initialized
- ESP_FAIL on other failures

```c
esp_err_t esp_openthread_border_router_deinit (void)
```
Deinitializes the border router features of OpenThread.

**Return**
- ESP_OK on success
- ESP_ERR_INVALID_STATE if not initialized
- ESP_FAIL on other failures

```c
esp_netif_t* esp_openthread_get_backbone_netif (void)
```
Gets the backbone interface of OpenThread border router.

**Return**
- The backbone interface or NULL if border router not initialized.

Thread is an IPv6-based mesh networking technology for IoT. Code examples for the Thread API are provided in the openthread directory of ESP-IDF examples.

### 2.2.4 ESP-NETIF

**ESP-NETIF**

The purpose of ESP-NETIF library is twofold:

- It provides an abstraction layer for the application on top of the TCP/IP stack. This will allow applications to choose between IP stacks in the future.
- The APIs it provides are thread safe, even if the underlying TCP/IP stack APIs are not.

ESP-IDF currently implements ESP-NETIF for the lwIP TCP/IP stack only. However, the adapter itself is TCP/IP implementation agnostic and different implementations are possible.

Some ESP-NETIF API functions are intended to be called by application code, for example to get/set interface IP addresses, configure DHCP. Other functions are intended for internal ESP-IDF use by the network driver layer.

In many cases, applications do not need to call ESP-NETIF APIs directly as they are called from the default network event handlers.

ESP-NETIF component is a successor of the tcpip_adapter, former network interface abstraction, which has become deprecated since IDF v4.1. Please refer to the [TCP/IP Adapter Migration Guide](#) section in case existing applications to be ported to use the esp-netif API instead.

**ESP-NETIF architecture**

```
(A) USER CODE

.............| init     settings     events |

    .
    |
    | new/config get/set | * |
    |
    |-----------------------| * init |
```

(continues on next page)
Data and event flow in the diagram

- . . . . . . . . Initialization line from user code to ESP-NETIF and communication driver
- --<--->-- Data packets going from communication media to TCP/IP stack and back
- ******** Events aggregated in ESP-NETIF propagates to driver, user code and network stack
- | User settings and runtime configuration

ESP-NETIF interaction

A) User code, boiler plate Overall application interaction with a specific IO driver for communication media and configured TCP/IP network stack is abstracted using ESP-NETIF APIs and outlined as below:

A) Initialization code

1) Initializes IO driver
2) Creates a new instance of ESP-NETIF and configure with
   • ESP-NETIF specific options (flags, behaviour, name)
   • Network stack options (netif init and input functions, not publicly available)
   • IO driver specific options (transmit, free rx buffer functions, IO driver handle)
3) Attaches the IO driver handle to the ESP-NETIF instance created in the above steps
4) Configures event handlers
   • use default handlers for common interfaces defined in IO drivers; or define a specific handlers for customised behaviour/new interfaces
   • register handlers for app related events (such as IP lost/acquired)

B) Interaction with network interfaces using ESP-NETIF API

- Getting and setting TCP/IP related parameters (DHCP, IP, etc)
- Receiving IP events (connect/disconnect)
• Controlling application lifecycle (set interface up/down)

B) Communication driver, IO driver, media driver Communication driver plays these two important roles in relation with ESP-NETIF:

1) Event handlers: Define behaviour patterns of interaction with ESP-NETIF (for example: ethernet link-up -> turn netif on)
2) Glue IO layer: Adapts the input/output functions to use ESP-NETIF transmit, receive and free receive buffer
   • Installs driver_transmit to appropriate ESP-NETIF object, so that outgoing packets from network stack are passed to the IO driver
   • Calls `esp_netif_receive()` to pass incoming data to network stack

C) ESP-NETIF, former tcpip_adapter ESP-NETIF is an intermediary between an IO driver and a network stack, connecting packet data path between these two. As that it provides a set of interfaces for attaching a driver to ESP-NETIF object (runtime) and configuring a network stack (compile time). In addition to that a set of API is provided to control network interface lifecycle and its TCP/IP properties. As an overview, the ESP-NETIF public interface could be divided into these 6 groups:

1) Initialization APIs (to create and configure ESP-NETIF instance)
2) Input/Output API (for passing data between IO driver and network stack)
3) Event or Action API
   • Used for network interface lifecycle management
   • ESP-NETIF provides building blocks for designing event handlers
4) Setters and Getters for basic network interface properties
5) Network stack abstraction: enabling user interaction with TCP/IP stack
   • Set interface up or down
   • DHCP server and client API
   • DNS API
6) Driver conversion utilities

D) Network stack Network stack has no public interaction with application code with regard to public interfaces and shall be fully abstracted by ESP-NETIF API.

E) ESP-NETIF L2 TAP Interface The ESP-NETIF L2 TAP interface is ESP-IDF mechanism utilized to access Data Link Layer (L2 per OSI/ISO) for frame reception and transmission from user application. Its typical usage in embedded world might be implementation of non-IP related protocols such as PTP, Wake on LAN and others. Note that only Ethernet (IEEE 802.3) is currently supported.

From user perspective, the ESP-NETIF L2 TAP interface is accessed using file descriptors of VFS which provides a file-like interfacing (using functions like `open()`, `read()`, `write()`, etc). Refer to Virtual filesystem component to learn more.

There is only one ESP-NETIF L2 TAP interface device (path name) available. However multiple file descriptors with different configuration can be opened at a time since the ESP-NETIF L2 TAP interface can be understood as generic entry point to the NETIF internal structure. Important is then specific configuration of particular file descriptor. It can be configured to give an access to specific Network Interface identified by `if_key` (e.g. `ETH_DEF`) and to filter only specific frames based on their type (e.g. Ethernet type in case of IEEE 802.3). Filtering only specific frames is crucial since the ESP-NETIF L2 TAP needs to work along with IP stack and so the IP related traffic (IP, ARP, etc.) should not be passed directly to the user application. Even though such option is still configurable, it is not recommended in standard use cases. Filtering is also advantageous from a perspective the user’s application gets access only to frame types it is interested in and the remaining traffic is either passed to other L2 TAP file descriptors or to IP stack.

ESP-NETIF L2 TAP Interface Usage Manual
Initialization To be able to use the ESP-NETIF L2 TAP interface, it needs to be enabled in Kconfig by `CONFIG_ESP_NETIF_L2_TAP` first and then registered by `esp_vfs_l2tap_intf_register()` prior usage of any VFS function.

(open) Once the ESP-NETIF L2 TAP is registered, it can be opened at path name “/dev/net/tap”. The same path name can be opened multiple times up to `CONFIG_ESP_NETIF_L2_TAP_MAX_FDS` and multiple file descriptors with with different configuration may access the Data Link Layer in the NETIF.

The ESP-NETIF L2 TAP can be opened with `_O_NONBLOCK` file status flag to the `read()` does not block. Note that the `write()` may block in current implementation when accessing a Network interface since it is a shared resource among multiple ESP-NETIF L2 TAP file descriptors and IP stack, and there is currently no queuing mechanism deployed. The file status flag can be retrieved and modified using `fcntl()`.

On success, `open()` returns the new file descriptor (a nonnegative integer). On error, -1 is returned and `errno` is set to indicate the error.

(ioctl) The newly opened ESP-NETIF L2 TAP file descriptor needs to be configured prior its usage since it is not bounded to any specific Network Interface and no frame type filter is configured. The following configuration options are available to do so:

- `L2TAP_S_INTFDEVICE` - bounds the file descriptor to specific Network Interface which is identified by its `if_key`. Network Interface `if_key` is passed to `ioctl()` as the third parameter. Note that default Network Interfaces `if_key`’s used in ESP-IDF can be found in `esp_netif/include/esp_netif_defaults.h`.
- `L2TAP_S_RCV_FILTER` - sets the filter to frames with this type to be passed to the file descriptor. In case of Ethernet frames, the frames are to be filtered based on Length/Ethernet type field. In case the filter value is set less than or equal to 0x05DC, the Ethernet type field is considered to represent IEEE802.3 Length Field and all frames with values in interval <0, 0x05DC> at that field are to be passed to the file descriptor. The IEEE802.2 logical link control (LLC) resolution is then expected to be performed by user’s application. In case the filter value is set greater than 0x05DC, the Ethernet type field is considered to represent protocol identification and only frames which are equal to the set value are to be passed to the file descriptor.

All set configuration options have getter counterpart option to read the current settings.

Note: VLAN tagged frames are currently not recognized. If user needs to process VLAN tagged frames, they need set filter to be equal to VLAN tag (i.e. 0x8100 or 0x88A8) and process the VLAN tagged frames in user application.

On success, `ioctl()` returns 0. On error, -1 is returned, and `errno` is set to indicate the error.

- `EBADF` - not a valid file descriptor.
- `EINVAL` - invalid configuration argument. Ethernet type filter is already used by other file descriptor.
- `ENODEV` - no such Network Interface which is tried to be assigned to the file descriptor exists.
- `ENOSPC` - NETIF L2 receive hook is already taken by other function when trying to assign Network Interface to the file descriptor.
- `ENOSYS` - unsupported operation, passed configuration option does not exists.

(read) Opened and configured ESP-NETIF L2 TAP file descriptor can be accessed by `read()` to get inbound frames. The read operation can be either blocking or non-blocking based on actual state of `_O_NONBLOCK` file status flag. When the file status flag is set blocking, the read operation waits until a frame is received and context is switched to other task. When the file status flag is set non-blocking, the read operation returns immediately. In such case, either a frame is returned if it was already queued or the function indicates the queue is empty. The number of queued frames associated with one file descriptor is limited by `CONFIG_ESP_NETIF_L2_TAP_RX_QUEUE_SIZE` Kconfig option. Once the number of queued frames reach configured threshold, the newly arriving frames are dropped until the queue has enough room to accept incoming traffic (Tail Drop queue management).
On success, `read()` returns the number of bytes read. Zero is returned when size of the destination buffer is 0. On error, -1 is returned, and `errno` is set to indicate the error.

**EBADF** - not a valid file descriptor.

**EAGAIN** - the file descriptor has been marked non-blocking (O_NONBLOCK), and the read would block.

**write()** A raw Data Link Layer frame can be sent to Network Interface via opened and configured ESP-NETIF L2 TAP file descriptor. User’s application is responsible to construct the whole frame except for fields which are added automatically by the physical interface device. The following fields need to be constructed by the user’s application in case of Ethernet link: source/destination MAC addresses, Ethernet type, actual protocol header and user data. See below for more information about Ethernet frame structure.

```
+-------------------+-------------------+-------------+----------------------------
| Destination MAC   | Source MAC        | Type/Length | Payload (protocol header/  
|                   |                   |             | data) ...                   |
+-------------------+-------------------+-------------+----------------------------
| 6B 6B 2B 0-1486B   |                   |             | 0-1486B                     |
```

In other words, there is no additional frame processing performed by the ESP-NETIF L2 TAP interface. It only checks the Ethernet type of the frame is the same as the filter configured in the file descriptor. If the Ethernet type is different, an error is returned and the frame is not sent. Note that the `write()` may block in current implementation when accessing a Network interface since it is a shared resource among multiple ESP-NETIF L2 TAP file descriptors and IP stack, and there is currently no queuing mechanism deployed.

On success, `write()` returns the number of bytes written. Zero is returned when size of the input buffer is 0. On error, -1 is returned, and `errno` is set to indicate the error.

**EBADF** - not a valid file descriptor.

**EBADMSG** - Ethernet type of the frame is different then file descriptor configured filter.

**EIO** - Network interface not available or busy.

**close()** Opened ESP-NETIF L2 TAP file descriptor can be closed by the `close()` to free its allocated resources. The ESP-NETIF L2 TAP implementation of `close()` may block. On the other hand, it is thread safe and can be called from different task than the file descriptor is actually used. If such situation occurs and one task is blocked in I/O operation and another task tries to close the file descriptor, the first task is unblocked. The first’s task read operation then ends with error.

On success, `close()` returns zero. On error, -1 is returned, and `errno` is set to indicate the error.

**EBADF** - not a valid file descriptor.

**select()** Select is used in a standard way, just `CONFIG_VFS_SUPPORT_SELECT` needs to be enabled to be the `select()` function available.

**ESP-NETIF programmer’s manual** Please refer to the example section for basic initialization of default interfaces:

- WiFi Station: [wifi/getting_started/station/main/station_example_main.c](#)
- WiFi Access Point: [wifi/getting_started/softAP/main/softap_example_main.c](#)
- Ethernet: [ethernet/basic/main/ethernet_example_main.c](#)

For more specific cases please consult this guide: [ESP-NETIF Custom I/O Driver](#).

WiFi default initialization  The initialization code as well as registering event handlers for default interfaces, such as softAP and station, are provided in two separate APIs to facilitate simple startup code for most applications:

- `esp_netif_create_default_wifi_ap()`
- `esp_netif_create_default_wifi_sta()`

Please note that these functions return the `esp_netif` handle, i.e. a pointer to a network interface object allocated and configured with default settings, which as a consequence, means that:

- The created object has to be destroyed if a network de-initialization is provided by an application using `esp_netif_destroy_default_wifi()`.
- These default interfaces must not be created multiple times, unless the created handle is deleted using `esp_netif_destroy()`.
- When using Wifi in AP+STA mode, both these interfaces has to be created.

API Reference

Header File

- `components/esp_netif/include/esp_netif.h`

Functions

```c
esp_err_t esp_netif_init (void)
```

Initialize the underlying TCP/IP stack.

**Return**

- ESP_OK on success
- ESP_FAIL if initializing failed

**Note** This function should be called exactly once from application code, when the application starts up.

```c
esp_err_t esp_netif_deinit (void)
```

Deinitialize the esp-netif component (and the underlying TCP/IP stack)

**Note**: Deinitialization is not supported yet

**Return**

- ESP_ERR_INVALID_STATE if esp_netif not initialized
- ESP_ERR_NOT_SUPPORTED otherwise

```c
esp_netif_t* esp_netif_new (const esp_netif_config_t* esp_netif_config)
```

Creates an instance of new esp-netif object based on provided config.

**Return**

- pointer to esp-netif object on success
- NULL otherwise

**Parameters**

- `[in]` esp_netif_config: pointer esp-netif configuration

```c
void esp_netif_destroy (esp_netif_t* esp_netif)
```

Destroys the esp_netif object.

**Parameters**

- `[in]` esp_netif: pointer to the object to be deleted

```c
esp_err_t esp_netif_set_driver_config (esp_netif_t* esp_netif, const esp_netif_driver_ifconfig_t* driver_config)
```

Configures driver related options of esp_netif object.

**Return**

- ESP_OK on success
- ESP_ERR_ESP_NETIF_INVALID_PARAMS if invalid parameters provided

**Parameters**

- `[inout]` esp_netif: pointer to the object to be configured
- `[in]` driver_config: pointer esp-netif io driver related configuration
**esp_err_t esp_netif_attach(esp_netif_t *esp_netif, esp_netif_iodriver_handle driver_handle)**
Attaches esp_netif instance to the io driver handle.

Calling this function enables connecting specific esp_netif object with already initialized io driver to update esp_netif object with driver specific configuration (i.e. calls post_attach callback, which typically sets io driver callbacks to esp_netif instance and starts the driver)

**Return**
- ESP_OK on success
- ESP_ERR_ESP_NETIF_DRIVER_ATTACH_FAILED if driver’s post_attach callback failed

**Parameters**
- [inout] esp_netif: pointer to esp_netif object to be attached
- [in] driver_handle: pointer to the driver handle

**esp_err_t esp_netif_receive(esp_netif_t *esp_netif, void *buffer, size_t len, void *eb)**
PassestherawpacketsfromcommunicationmediatotheappropriateTCP/IPstack.

This function is called from the configured (peripheral) driver layer. The data are then forwarded as frames to the TCP/IP stack.

**Return**
- ESP_OK

**Parameters**
- [in] esp_netif: Handle to esp-netif instance
- [in] buffer: Received data
- [in] len: Length of the data frame
- [in] eb: Pointer to internal buffer (used in Wi-Fi driver)

**esp_err_t esp_netif_transmit_hookAttach(esp_netif_t *esp_netif, void *hook_fn)**
Add transmit hook callback function reference into ESP-NETIF. This callback function is then called just prior the ESP-NETIF passes data to network driver.

**Return**
- ESP_OK - success
- ESP_ERR_INVALID_ARG

**Parameters**
- [in] esp_netif: Handle to esp-netif instance
- [in] hook_fn: reference to transmit hook call-back function

**esp_err_t esp_netif_post_transmit_hookAttach(esp_netif_t *esp_netif, void *hook_fn)**
Add post transmit hook callback function reference into ESP-NETIF. This callback function is then called just after the ESP-NETIF passes data to network driver.

**Note** Intention of this function is either to release resources allocated by transmit hook function or for other use cases such as time stamping, etc.

**Return**
- ESP_OK - success
- ESP_ERR_INVALID_ARG

**Parameters**
- [in] esp_netif: Handle to esp-netif instance
- [in] hook_fn: reference to post transmit hook call-back function

**esp_err_t esp_netif_recv_hookAttach(esp_netif_t *esp_netif, void *hook_fn)**
Add receive hook callback function reference into ESP-NETIF. This callback function is then called when network driver receives data.

**Return**
- ESP_OK - success
- ESP_ERR_INVALID_ARG

**Parameters**
- [in] esp_netif: Handle to esp-netif instance
- [in] hook_fn: reference to receive hook callback function
esp_err_t esp_netif_transmit_hook_detach(esp_netif_t *esp_netif)
Removes reference to previously attached transmit hook callback function.

Return
• ESP_OK - success
• ESP_ERR_INVALID_ARG

Parameters
• [in] esp_netif: Handle to esp-netif instance

esp_err_t esp_netif_post_transmit_hook_detach(esp_netif_t *esp_netif)
Removes reference to previously attached posttransmit hook callback function.

Return
• ESP_OK - success
• ESP_ERR_INVALID_ARG

Parameters
• [in] esp_netif: Handle to esp-netif instance

esp_err_t esp_netif_recv_hook_detach(esp_netif_t *esp_netif)
Removes reference to previously attached receive hook callback function.

Return
• ESP_OK - success
• ESP_ERR_INVALID_ARG

Parameters
• [in] esp_netif: Handle to esp-netif instance

void esp_netif_action_start(void *esp_netif, esp_event_base_t base, int32_t event_id, void *data)
Default building block for network interface action upon IO driver start event. Creates network interface, if AUTOUP enabled turns the interface on, if DHCPS enabled starts dhcp server.

Note This API can be directly used as event handler

Parameters
• [in] esp_netif: Handle to esp-netif instance
• base:
• event_id:
• data:

void esp_netif_action_stop(void *esp_netif, esp_event_base_t base, int32_t event_id, void *data)
Default building block for network interface action upon IO driver stop event.

Note This API can be directly used as event handler

Parameters
• [in] esp_netif: Handle to esp-netif instance
• base:
• event_id:
• data:

void esp_netif_action_connected(void *esp_netif, esp_event_base_t base, int32_t event_id, void *data)
Default building block for network interface action upon IO driver connected event.

Note This API can be directly used as event handler

Parameters
• [in] esp_netif: Handle to esp-netif instance
• base:
• event_id:
• data:

void esp_netif_action_disconnected(void *esp_netif, esp_event_base_t base, int32_t event_id, void *data)
Default building block for network interface action upon IO driver disconnected event.

Note This API can be directly used as event handler

Parameters
Chapter 2. API Reference

- [in] esp_netif: Handle to esp-netif instance
- base:
- event_id:
- data:

```c
void esp_netif_action_got_ip (void *esp_netif, esp_event_base_t base, int32_t event_id, void *data)
```
Default building block for network interface action upon network got IP event.

**Note** This API can be directly used as event handler

**Parameters**
- [in] esp_netif: Handle to esp-netif instance
- base:
- event_id:
- data:

```c
void esp_netif_action_join_ip6_multicast_group (void *esp_netif, esp_event_base_t base, int32_t event_id, void *data)
```
Default building block for network interface action upon IPv6 multicast group join.

**Note** This API can be directly used as event handler

**Parameters**
- [in] esp_netif: Handle to esp-netif instance
- base:
- event_id:
- data:

```c
void esp_netif_action_leave_ip6_multicast_group (void *esp_netif, esp_event_base_t base, int32_t event_id, void *data)
```
Default building block for network interface action upon IPv6 multicast group leave.

**Note** This API can be directly used as event handler

**Parameters**
- [in] esp_netif: Handle to esp-netif instance
- base:
- event_id:
- data:

```c
void esp_netif_action_add_ip6_address (void *esp_netif, esp_event_base_t base, int32_t event_id, void *data)
```
Default building block for network interface action upon IPv6 address added by the underlying stack.

**Note** This API can be directly used as event handler

**Parameters**
- [in] esp_netif: Handle to esp-netif instance
- base:
- event_id:
- data:

```c
void esp_netif_action_remove_ip6_address (void *esp_netif, esp_event_base_t base, int32_t event_id, void *data)
```
Default building block for network interface action upon IPv6 address removed by the underlying stack.

**Note** This API can be directly used as event handler

**Parameters**
- [in] esp_netif: Handle to esp-netif instance
- base:
- event_id:
- data:

```c
esp_err_t esp_netif_set_mac (esp_netif_t *esp_netif, uint8_t mac[])
```
Set the mac address for the interface instance.

**Return**
- ESP_OK - success
Chapter 2. API Reference

- ESP_ERR_ESP_NETIF_IF_NOT_READY - interface status error
- ESP_ERR_NOT_SUPPORTED - mac not supported on this interface

Parameters
- [in] esp_netif: Handle to esp-netif instance
- [in] mac: Desired mac address for the related network interface

```c
esp_err_t esp_netif_get_mac(esp_netif_t* esp_netif, uint8_t* mac[])
```

Get the mac address for the interface instance.

Return
- ESP_OK - success
- ESP_ERR_ESP_NETIF_IF_NOT_READY - interface status error
- ESP_ERR_NOT_SUPPORTED - mac not supported on this interface

Parameters
- [in] esp_netif: Handle to esp-netif instance
- [out] mac: Resultant mac address for the related network interface

```c
esp_err_t esp_netif_set_hostname(esp_netif_t* esp_netif, const char* hostname)
```

Set the hostname of an interface.

The configured hostname overrides the default configuration value CONFIG_LWIP_LOCAL_HOSTNAME. Please note that when the hostname is altered after interface started/connected the changes would only be reflected once the interface restarts/reconnects

Return
- ESP_OK - success
- ESP_ERR_ESP_NETIF_IF_NOT_READY - interface status error
- ESP_ERR_ESP_NETIF_INVALID_PARAMS - parameter error

Parameters
- [in] esp_netif: Handle to esp-netif instance

```c
esp_err_t esp_netif_get_hostname(esp_netif_t* esp_netif, const char** hostname)
```

Get interface hostname.

Return
- ESP_OK - success
- ESP_ERR_ESP_NETIF_IF_NOT_READY - interface status error
- ESP_ERR_ESP_NETIF_INVALID_PARAMS - parameter error

Parameters
- [in] esp_netif: Handle to esp-netif instance
- [out] hostname: Returns a pointer to the hostname. May be NULL if no hostname is set. If set non-NULL, pointer remains valid (and string may change if the hostname changes).

```c
bool esp_netif_is_netif_up(esp_netif_t* esp_netif)
```

Test if supplied interface is up or down.

Return
- true - Interface is up
- false - Interface is down

Parameters
- [in] esp_netif: Handle to esp-netif instance

```c
esp_err_t esp_netif_get_ip_info(esp_netif_t* esp_netif, esp_netif_ip_info_t* ip_info)
```

Get interface’s IP address information.

If the interface is up, IP information is read directly from the TCP/IP stack. If the interface is down, IP information is read from a copy kept in the ESP-NETIF instance

Return
- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS

Parameters
- [in] esp_netif: Handle to esp-netif instance
• [out] ip_info: If successful, IP information will be returned in this argument.

`esp_err_t esp_netif_get_old_ip_info(esp_netif_t *esp_netif, esp_netif_ip_info_t *ip_info)`
Get interface’s old IP information.

Returns an “old” IP address previously stored for the interface when the valid IP changed.

If the IP lost timer has expired (meaning the interface was down for longer than the configured interval) then the old IP information will be zero.

Return
- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS

Parameters
- [in] esp_netif: Handle to esp-netif instance
- [out] ip_info: If successful, IP information will be returned in this argument.

`esp_err_t esp_netif_set_ip_info(esp_netif_t *esp_netif, const esp_netif_ip_info_t *ip_info)`
Set interface’s IP address information.

This function is mainly used to set a static IP on an interface.

If the interface is up, the new IP information is set directly in the TCP/IP stack.

The copy of IP information kept in the ESP-NETIF instance is also updated (this copy is returned if the IP is queried while the interface is still down.)

Note DHCP client/server must be stopped (if enabled for this interface) before setting new IP information.

Note Calling this interface for may generate a SYSTEM_EVENT_STA_GOT_IP or SYSTEM_EVENT_ETH_GOT_IP event.

Return
- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS
- ESP_ERR_ESP_NETIF_DHCP_NOT_STOPPED If DHCP server or client is still running

Parameters
- [in] esp_netif: Handle to esp-netif instance
- [in] ip_info: IP information to set on the specified interface

`esp_err_t esp_netif_set_old_ip_info(esp_netif_t *esp_netif, const esp_netif_ip_info_t *ip_info)`
Set interface old IP information.

This function is called from the DHCP client (if enabled), before a new IP is set. It is also called from the default handlers for the SYSTEM_EVENT_STA_CONNECTED and SYSTEM_EVENT_ETH_CONNECTED events.

Calling this function stores the previously configured IP, which can be used to determine if the IP changes in the future.

If the interface is disconnected or down for too long, the “IP lost timer” will expire (after the configured interval) and set the old IP information to zero.

Return
- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS

Parameters
- [in] esp_netif: Handle to esp-netif instance
- [in] ip_info: Store the old IP information for the specified interface

`int esp_netif_get_netif_impl_index(esp_netif_t *esp_netif)`
Get net interface index from network stack implementation.

Note This index could be used in setsockopt() to bind socket with multicast interface

Return implementation specific index of interface represented with supplied esp_netif

Parameters
- [in] esp_netif: Handle to esp-netif instance
**esp_err_t esp_netif_get_netif_impl_name**(esp_netif_t *esp_netif, char *name)
Get net interface name from network stack implementation.

**Note** This name could be used in `setsockopt()` to bind socket with appropriate interface

**Return**
- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS

**Parameters**
- [in] esp_netif: Handle to esp-netif instance
- [out] name: Interface name as specified in underlying TCP/IP stack. Note that the actual name will be copied to the specified buffer, which must be allocated to hold maximum interface name size (6 characters for lwIP)

**esp_err_t esp_netif_dhcps_option**(esp_netif_t *esp_netif, esp_netif_dhcp_option_mode_t opt_op, esp_netif_dhcp_option_id_t opt_id, void *opt_val, uint32_t opt_len)
Set or Get DHCP server option.

**Return**
- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS
- ESP_ERR_ESP_NETIF_DHCP_ALREADY_STOPPED
- ESP_ERR_ESP_NETIF_DHCP_ALREADY_STARTED

**Parameters**
- [in] esp_netif: Handle to esp-netif instance
- [in] opt_op: ESP_NETIF_OP_SET to set an option, ESP_NETIF_OP_GET to get an option.
- [in] opt_id: Option index to get or set, must be one of the supported enum values.
- [inout] opt_val: Pointer to the option parameter.
- [in] opt_len: Length of the option parameter.

**esp_err_t esp_netif_dhcp_c_option**(esp_netif_t *esp_netif, esp_netif_dhcp_option_mode_t opt_op, esp_netif_dhcp_option_id_t opt_id, void *opt_val, uint32_t opt_len)
Set or Get DHCP client option.

**Return**
- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS
- ESP_ERR_ESP_NETIF_DHCP_ALREADY_STOPPED
- ESP_ERR_ESP_NETIF_DHCP_ALREADY_STARTED

**Parameters**
- [in] esp_netif: Handle to esp-netif instance
- [in] opt_op: ESP_NETIF_OP_SET to set an option, ESP_NETIF_OP_GET to get an option.
- [in] opt_id: Option index to get or set, must be one of the supported enum values.
- [inout] opt_val: Pointer to the option parameter.
- [in] opt_len: Length of the option parameter.

**esp_err_t esp_netif_dhcpc_start**(esp_netif_t *esp_netif)
Start DHCP client (only if enabled in interface object)

**Note** The default event handlers for the SYSTEM_EVENT_STA_CONNECTED and SYSTEM_EVENT_ETH_CONNECTED events call this function.

**Return**
- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS
- ESP_ERR_ESP_NETIF_DHCP_ALREADY_STARTED
- ESP_ERR_ESP_NETIF_DHCP_START_FAILED

**Parameters**
- [in] esp_netif: Handle to esp-netif instance

**esp_err_t esp_netif_dhcpc_stop**(esp_netif_t *esp_netif)
Stop DHCP client (only if enabled in interface object)
Note: Calling `action_netif_stop()` will also stop the DHCP Client if it is running.

Return
- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS
- ESP_ERR_ESP_NETIF_DHCP_ALREADY_STOPPED
- ESP_ERR_ESP_NETIF_IF_NOT_READY

Parameters
- `[in]` `esp_netif`: Handle to `esp_netif` instance

`esp_err_t esp_netif_dhcpc_get_status(esp_netif_t *esp_netif, esp_netif_dhcp_status_t *status)`
Get DHCP client status.

Return
- ESP_OK

Parameters
- `[in]` `esp_netif`: Handle to `esp_netif` instance
- `[out]` `status`: If successful, the status of DHCP client will be returned in this argument.

`esp_err_t esp_netif_dhcps_get_status(esp_netif_t *esp_netif, esp_netif_dhcp_status_t *status)`
Get DHCP Server status.

Return
- ESP_OK

Parameters
- `[in]` `esp_netif`: Handle to `esp_netif` instance
- `[out]` `status`: If successful, the status of the DHCP server will be returned in this argument.

`esp_err_t esp_netif_dhcps_start(esp_netif_t *esp_netif)`
Start DHCP server (only if enabled in interface object)

Return
- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS
- ESP_ERR_ESP_NETIF_DHCP_ALREADY_STARTED

Parameters
- `[in]` `esp_netif`: Handle to `esp_netif` instance

`esp_err_t esp_netif_dhcps_stop(esp_netif_t *esp_netif)`
Stop DHCP server (only if enabled in interface object)

Return
- ESP_OK
- ESP_ERR_ESP_NETIF_INVALID_PARAMS
- ESP_ERR_ESP_NETIF_DHCP_ALREADY_STOPPED
- ESP_ERR_ESP_NETIF_IF_NOT_READY

Parameters
- `[in]` `esp_netif`: Handle to `esp_netif` instance

`esp_err_t esp_netif_set_dns_info(esp_netif_t *esp_netif, esp_netif_dns_type_t type, esp_netif_dns_info_t *dns)`
Set DNS Server information.

This function behaves differently if DHCP server or client is enabled

If DHCP client is enabled, main and backup DNS servers will be updated automatically from the DHCP lease if the relevant DHCP options are set. Fallback DNS Server is never updated from the DHCP lease and is designed to be set via this API. If DHCP client is disabled, all DNS server types can be set via this API only.

If DHCP server is enabled, the Main DNS Server setting is used by the DHCP server to provide a DNS Server option to DHCP clients (Wi-Fi stations).

- The default Main DNS server is typically the IP of the Wi-Fi AP interface itself.
- This function can override it by setting server type `ESP_NETIF_DNS_MAIN`.
- Other DNS Server types are not supported for the Wi-Fi AP interface.
Return
• ESP_OK on success
• ESP_ERR_ESP_NETIF_INVALID_PARAMS invalid params

Parameters
• [in] esp_netif: Handle to esp-netif instance
• [in] type: Type of DNS Server to set: ESP_NETIF_DNS_MAIN, ESP_NETIF_DNS_BACKUP, ESP_NETIF_DNS_FALLBACK
• [in] dns: DNS Server address to set

`esp_err_t esp_netif_get_dns_info(esp_netif_t *esp_netif, esp_netif_dns_type_t type, esp_netif_dns_info_t *dns)`

Get DNS Server information.

Return the currently configured DNS Server address for the specified interface and Server type.

This may be result of a previous call to `esp_netif_set_dns_info()`. If the interface’s DHCP client is enabled, the Main or Backup DNS Server may be set by the current DHCP lease.

Return
• ESP_OK on success
• ESP_ERR_ESP_NETIF_INVALID_PARAMS invalid params

Parameters
• [in] esp_netif: Handle to esp-netif instance
• [in] type: Type of DNS Server to get: ESP_NETIF_DNS_MAIN, ESP_NETIF_DNS_BACKUP, ESP_NETIF_DNS_FALLBACK
• [out] dns: DNS Server result is written here on success

`esp_err_t esp_netif_create_ip6_linklocal(esp_netif_t *esp_netif)`

Create interface link-local IPv6 address.

Cause the TCP/IP stack to create a link-local IPv6 address for the specified interface.

This function also registers a callback for the specified interface, so that if the link-local address becomes verified as the preferred address then a SYSTEM_EVENT_GOT_IP6 event will be sent.

Return
• ESP_OK
• ESP_ERR_ESP_NETIF_INVALID_PARAMS

Parameters
• [in] esp_netif: Handle to esp-netif instance

`esp_err_t esp_netif_get_ip6_linklocal(esp_netif_t *esp_netif, esp_ipv6_addr_t *if_ip6)`

Get interface link-local IPv6 address.

If the specified interface is up and a preferred link-local IPv6 address has been created for the interface, return a copy of it.

Return
• ESP_OK
• ESP_FAIL If interface is down, does not have a link-local IPv6 address, or the link-local IPv6 address is not a preferred address.

Parameters
• [in] esp_netif: Handle to esp-netif instance
• [out] if_ip6: IPv6 information will be returned in this argument if successful.

`esp_err_t esp_netif_get_ip6_global(esp_netif_t *esp_netif, esp_ipv6_addr_t *if_ip6)`

Get interface global IPv6 address.

If the specified interface is up and a preferred global IPv6 address has been created for the interface, return a copy of it.

Return
• ESP_OK
• ESP_FAIL If interface is down, does not have a global IPv6 address, or the global IPv6 address is not a preferred address.
Parameters
• [in] esp_netif: Handle to esp-netif instance
• [out] if_ip6: IPv6 information will be returned in this argument if successful.

int esp_netif_get_all_ip6(esp_netif_t *esp_netif, esp_ip6_addr_t if_ip6[])
Get all IPv6 addresses of the specified interface.

Return  number of returned IPv6 addresses

Parameters
• [in] esp_netif: Handle to esp-netif instance
• [out] if_ip6: Array of IPv6 addresses will be copied to the argument

void esp_netif_set_ip4_addr(esp_ip4_addr_t *addr, uint8_t a, uint8_t b, uint8_t c, uint8_t d)
Sets IPv4 address to the specified octets.

Parameters
• [out] addr: IP address to be set
• a: the first octet (127 for IP 127.0.0.1)
• b:
• c:
• d:

char *esp_ip4addr_ntoa(const esp_ip4_addr_t *addr, char *buf, int buflen)
Converts numeric IP address into decimal dotted ASCII representation.

Return  either pointer to buf which now holds the ASCII representation of addr or NULL if buf was too small

Parameters
• addr: ip address in network order to convert
• buf: target buffer where the string is stored
• buflen: length of buf

uint32_t esp_ip4addr_aton(const char *addr)
Ascii internet address interpretation routine The value returned is in network order.

Return  ip address in network order

Parameters
• addr: IP address in ascii representation (e.g. “127.0.0.1”)

esp_err_t esp_netif_str_to_ip4(const char *src, esp_ip4_addr_t *dst)
Converts Ascii internet IPv4 address into esp_ip4_addr_t.

Return  
• ESP_OK on success
• ESP_FAIL if conversion failed
• ESP_ERR_INVALID_ARG if invalid parameter is passed into

Parameters
• [in] src: IPv4 address in ascii representation (e.g. “127.0.0.1”)
• [out] dst: Address of the target esp_ip4_addr_t structure to receive converted address

esp_err_t esp_netif_str_to_ip6(const char *src, esp_ip6_addr_t *dst)
Converts Ascii internet IPv6 address into esp_ip6_addr_t Zeros in the IP address can be stripped or completely ommited: “2001:db8:85a3:0:0:0:0:2:1” or “2001:db8::2:1”

Return  
• ESP_OK on success
• ESP_FAIL if conversion failed
• ESP_ERR_INVALID_ARG if invalid parameter is passed into

Parameters
• [in] src: IPv6 address in ascii representation (e.g. 2001:db8:85a3:0:0:0:0:0:0:0:0:0:0:0:0:0:2:1)
• [out] dst: Address of the target esp_ip6_addr_t structure to receive converted address

esp_netif_iodriver_handle esp_netif_get_io_driver(esp_netif_t *esp_netif)
Gets media driver handle for this esp-netif instance.
Return opaque pointer of related IO driver

Parameters

• [in] esp_netif: Handle to esp-netif instance

```c
esp_netif_t *esp_netif_get_handle_from_ifkey(const char *if_key)
```

Searches over a list of created objects to find an instance with supplied if key.

Return Handle to esp-netif instance

Parameters

• if_key: Textual description of network interface

```c
esp_netif_flags_t esp_netif_get_flags(esp_netif_t *esp_netif)
```

Returns configured flags for this interface.

Return Configuration flags

Parameters

• [in] esp_netif: Handle to esp-netif instance

```c
const char *esp_netif_get_ifkey(esp_netif_t *esp_netif)
```

Returns configured interface key for this esp-netif instance.

Return Textual description of related interface

Parameters

• [in] esp_netif: Handle to esp-netif instance

```c
const char *esp_netif_get_desc(esp_netif_t *esp_netif)
```

Returns configured interface type for this esp-netif instance.

Return Enumerated type of this interface, such as station, AP, ethernet

Parameters

• [in] esp_netif: Handle to esp-netif instance

```c
int esp_netif_get_route_prio(esp_netif_t *esp_netif)
```

Returns configured routing priority number.

Return Integer representing the instance’s route-prio, or -1 if invalid parameters

Parameters

• [in] esp_netif: Handle to esp-netif instance

```c
int32_t esp_netif_get_event_id(esp_netif_t *esp_netif, esp_netif_ip_event_type_t event_type)
```

Returns configured event for this esp-netif instance and supplied event type.

Return specific event id which is configured to be raised if the interface lost or acquired IP address -1 if supplied event_type is not known

Parameters

• [in] esp_netif: Handle to esp-netif instance

• event_type: (either get or lost IP)

```c
esp_netif_t *esp_netif_next(esp_netif_t *esp_netif)
```

Iterates over list of interfaces. Returns first netif if NULL given as parameter.

Return First netif from the list if supplied parameter is NULL, next one otherwise

Parameters

• [in] esp_netif: Handle to esp-netif instance

```c
size_t esp_netif_get_nr_of_ifs(void)
```

Returns number of registered esp_netif objects.

Return Number of esp_netifs

```c
void esp_netif_netstack_buf_ref(void *netstack_buf)
```

Increase the reference counter of net stack buffer

Parameters

• [in] netstack_buf: the net stack buffer

```c
void esp_netif_netstack_buf_free(void *netstack_buf)
```

Free the net stack buffer
Parameters
  • [in] netstack_buf: the net stack buffer

Macros
_ESP_NETIF_SUPPRESS_LEGACY_WARNING_

WiFi default API reference

Header File
  • components/esp_wifi/include/esp_wifi_default.h

Functions

esp_err_t esp_netif_attach_wifi_station (esp_netif_t *esp_netif)
Attaches wifi station interface to supplied netif.

  Return
  • ESP_OK on success
  • ESP_FAIL if attach failed

  Parameters
  • esp_netif: instance to attach the wifi station to

esp_err_t esp_netif_attach_wifi_ap (esp_netif_t *esp_netif)
Attaches wifi soft AP interface to supplied netif.

  Return
  • ESP_OK on success
  • ESP_FAIL if attach failed

  Parameters
  • esp_netif: instance to attach the wifi AP to

esp_err_t esp_wifi_set_default_wifi_sta_handlers (void)
Sets default wifi event handlers for STA interface.

  Return
  • ESP_OK on success, error returned from esp_event_handler_register if failed

esp_err_t esp_wifi_set_default_wifi_ap_handlers (void)
Sets default wifi event handlers for AP interface.

  Return
  • ESP_OK on success, error returned from esp_event_handler_register if failed

esp_err_t esp_wifi_clear_default_wifi_driver_and_handlers (void *esp_netif)
Clears default wifi event handlers for supplied network interface.

  Return
  • ESP_OK on success, error returned from esp_event_handler_register if failed

  Parameters
  • esp_netif: instance of corresponding if object

esp_netif_t *esp_netif_create_default_wifi_ap (void)
Creates default WIFI AP. In case of any init error this API aborts.

  Note  The API creates esp_netif object with default WiFi access point config, attaches the netif to wifi and registers default wifi handlers.

  Return  pointer to esp-netif instance

esp_netif_t *esp_netif_create_default_wifi_sta (void)
Creates default WIFI STA. In case of any init error this API aborts.

  Note  The API creates esp_netif object with default WiFi station config, attaches the netif to wifi and registers default wifi handlers.
Return pointer to esp-netif instance

```c
void esp_netif_destroy_default_wifi(void *esp_netif)
```

Destroys default WIFI netif created with `esp_netif_create_default_wifi()` API.

**Note** This API unregisters wifi handlers and detaches the created object from the wifi. (this function is a no-operation if esp_netif is NULL)

**Parameters**

- `[in]` esp_netif: object to detach from WiFi and destroy

```c
esp_netif_t *esp_netif_create_wifi(wifi_interface_t wifi_if, esp_netif_inherent_config_t *esp_netif_config)
```

Creates esp_netif WiFi object based on the custom configuration.

**Attention** This API DOES NOT register default handlers!

**Return** pointer to esp-netif instance

**Parameters**

- `[in]` wifi_if: type of wifi interface
- `[in]` esp_netif_config: inherent esp-netif configuration pointer

```c
esp_err_t esp_netif_create_default_wifi_mesh_netifs(esp_netif_t **p_netif_sta, esp_netif_t **p_netif_ap)
```

Creates default STA and AP network interfaces for esp-mesh.

Both netifs are almost identical to the default station and softAP, but with DHCP client and server disabled. Please note that the DHCP client is typically enabled only if the device is promoted to a root node.

Returns created interfaces which could be ignored setting parameters to NULL if an application code does not need to save the interface instances for further processing.

**Return** ESP_OK on success

**Parameters**

- `[out]` p_netif_sta: pointer where the resultant STA interface is saved (if non NULL)
- `[out]` p_netif_ap: pointer where the resultant AP interface is saved (if non NULL)

### 2.2.5 IP Network Layer

**TCP/IP Adapter Migration Guide**

TCP/IP Adapter is a network interface abstraction component used in IDF prior to v4.1. This page outlines migration from tcpip_adapter API to its successor **ESP-NETIF**.

**Updating network connection code**

**Network stack initialization** Simply replace `tcpip_adapter_init()` with `esp_netif_init()`. Please note that the **ESP-NETIF** initialization API returns standard error code and the `esp_netif_deinit()` for un-initialization is available.

Also replace `#include "tcpip_adapter.h"` with `#include "esp_netif.h"`.

**Network interface creation** TCP/IP Adapter defined these three interfaces statically:

- WiFi Station
- WiFi Access Point
- Ethernet

Network interface instance shall be explicitly constructed for the **ESP-NETIF** to enable its connection to the TCP/IP stack. For example initialization code for WiFi has to explicitly call `esp_netif_create_default_wifi_sta();` or `esp_netif_create_default_wifi_ap();` after the TCP/IP stack and the event loop have been initialized. Please consult an example initialization code for these three interfaces:
Chapter 2. API Reference

- WiFi Station: wifi/getting_started/station/main/station_example_main.c
- WiFi Access Point: wifi/getting_started/softAP/main/softap_example_main.c
- Ethernet: ethernet/basic/main/ethernet_example_main.c

Replacing other tcpip_adapter API All the tcpip_adapter functions have their esp-netif counter-part. Please refer to the esp_netif.h grouped into these sections:

- Setters/Getters
- DHCP
- DNS
- IP address

Default event handlers Event handlers are moved from tcpip_adapter to appropriate driver code. There is no change from application code perspective, all events shall be handled in the same way. Please note that within IP related event handlers, application code usually receives IP addresses in a form of esp-netif specific struct (not the LwIP structs, but binary compatible). This is the preferred way of printing the address:

```c
ESP_LOGI(TAG, "got ip: \n", IPSTR(ip), IP2STR(&event->ip_info.ip));
```

Instead of

```c
ESP_LOGI(TAG, "got ip:%s\n", ip4addr_ntoa(&event->ip_info.ip));
```

Since ip4addr_ntoa() is a LwIP API, the esp-netif provides esp_ip4addr_ntoa() as a replacement, but the above method is generally preferred.

IP addresses It is preferred to use esp-netif defined IP structures. Please note that the LwIP structs will still work when default compatibility enabled. *esp-netif IP address definitions*

Next steps Additional step in porting an application to fully benefit from the ESP-NETIF is to disable the tcpip_adapter compatibility layer in the component configuration: ESP NETIF Adapter -> Enable backward compatible tcpip_adapter interface and check if the project compiles. TCP/IP adapter brings many include dependencies and this step might help in decoupling the application from using specific TCP/IP stack API directly.

ESP-NETIF Custom I/O Driver

This section outlines implementing a new I/O driver with esp-netif connection capabilities. By convention the I/O driver has to register itself as an esp-netif driver and thus holds a dependency on esp-netif component and is responsible for providing data path functions, post-attach callback and in most cases also default event handlers to define network interface actions based on driver’s lifecycle transitions.

Packet input/output As shown in the diagram, the following three API functions for the packet data path must be defined for connecting with esp-netif:

- `esp_netif_transmit()`
- `esp_netif_free_rx_buffer()`
- `esp_netif_receive()`

The first two functions for transmitting and freeing the rx buffer are provided as callbacks, i.e. they get called from esp-netif (and its underlying TCP/IP stack) and I/O driver provides their implementation.

The receiving function on the other hand gets called from the I/O driver, so that the driver’s code simply calls `esp_netif_receive()` on a new data received event.
**Post attach callback**  A final part of the network interface initialization consists of attaching the esp-netif instance to the I/O driver, by means of calling the following API:

```c
esp_err_t esp_netif_attach(esp_netif_t *esp_netif, esp_netif_iodriver_handle_t *driver_handle);
```

It is assumed that the `esp_netif_iodriver_handle_t` is a pointer to driver’s object, a struct derived from `struct esp_netif_driver_base_s`, so that the first member of I/O driver structure must be this base structure with pointers to

- post-attach function callback
- related esp-netif instance

As a consequence the I/O driver has to create an instance of the struct per below:

```c
typedef struct my_netif_driver_s {
    esp_netif_driver_base_t base; /*!< base structure reserved as_esp-netif driver */
    driver_impl_t *h; /*!< handle of driver_implementation */
} my_netif_driver_t;
```

with actual values of `my_netif_driver_t::base.post_attach` and the actual drivers handle `my_netif_driver_t::h`. So when the `esp_netif_attach()` gets called from the initialization code, the post-attach callback from I/O driver’s code gets executed to mutually register callbacks between esp-netif and I/O driver instances. Typically the driver is started as well in the post-attach callback. An example of a simple post-attach callback is outlined below:

```c
static esp_err_t my_post_attach_start(esp_netif_t *esp_netif, void *args)
{
    my_netif_driver_t *driver = args;
    const esp_netif_driver_ifconfig_t driver_ifconfig = {
        .driver_free_rx_buffer = my_free_rx_buf,
        .transmit = my_transmit,
        .handle = driver->driver_impl
    };
    driver->base.netif = esp_netif;
    ESP_ERROR_CHECK(esp_netif_set_driver_config(esp_netif, &driver_ifconfig));
    my_driver_start(driver->driver_impl);
    return ESP_OK;
}
```

**Default handlers**  I/O drivers also typically provide default definitions of lifecycle behaviour of related network interfaces based on state transitions of I/O drivers. For example `driver start` -> `network start`, etc. An example of such a default handler is provided below:

```c
esp_err_t my_driver_netif_set_default_handlers(my_netif_driver_t *driver, esp_netif_t *esp_netif)
{
    driver_set_event_handler(driver->driver_impl, esp_netif_action_start, MY_DRV_EVENT_START, esp_netif);
    driver_set_event_handler(driver->driver_impl, esp_netif_action_stop, MY_DRV_EVENT_STOP, esp_netif);
    return ESP_OK;
}
```

**Network stack connection**  The packet data path functions for transmitting and freeing the rx buffer (defined in the I/O driver) are called from the esp-netif, specifically from its TCP/IP stack connecting layer. The following API reference outlines these network stack interaction with the esp-netif.
Chapter 2. API Reference

Header File

- components/esp_netif/include/esp_netif_net_stack.h

Functions

```
esp_netif_t* esp_netif_get_handle_from_netif_impl (void *dev)
```

Returns esp-netif handle.

- Return handle to related esp-netif instance

```
void *esp_netif_get_netif_impl (esp_netif_t *esp_netif)
```

Returns network stack specific implementation handle (if supported)

Note that it is not supported to acquire PPP netif impl pointer and this function will return NULL for esp_netif instances configured to PPP mode

- Return handle to related network stack netif handle

```
esp_err_t esp_netif_transmit (esp_netif_t *esp_netif, void *data, size_t len)
```

Output packets from the TCP/IP stack to the media to be transmitted.

This function gets called from network stack to output packets to IO driver.

- Return ESP_OK on success, an error passed from the I/O driver otherwise

```
esp_err_t esp_netif_transmit_wrap (esp_netif_t *esp_netif, void *data, size_t len, void *netstack_buf)
```

Output packets from the TCP/IP stack to the media to be transmitted.

This function gets called from network stack to output packets to IO driver.

- Return ESP_OK on success, an error passed from the I/O driver otherwise

```
void esp_netif_free_rx_buffer (void *esp_netif, void *buffer)
```

Free the rx buffer allocated by the media driver.

This function gets called from network stack when the rx buffer to be freed in IO driver context, i.e. to deallocate a buffer owned by io driver (when data packets were passed to higher levels to avoid copying)

- Parameters

```
void esp_netif_free_rx_buffer (void *esp_netif, void *buffer)
```

Free the rx buffer allocated by the media driver.

- Parameters

```
Code examples for TCP/IP socket APIs are provided in the protocols/sockets directory of ESP-IDF examples.
```

The TCP/IP Adapter (legacy network interface library) has been deprecated, please consult the TCP/IP Adapter Migration Guide to update existing IDF applications.

2.2.6 Application Layer

Documentation for Application layer network protocols (above the IP Network layer) are provided in Application Protocols.
2.3 Peripherals API

2.3.1 Analog to Digital Converter (ADC)

ADC Channels

The ESP32-S3 integrates 2 SAR (Successive Approximation Register) ADCs, supporting a total of 20 measurement channels (analog enabled pins).

These channels are supported:

ADC1:
- 10 channels: GPIO1 - GPIO10

ADC2:
- 10 channels: GPIO11 - GPIO20

ADC Attenuation

Vref is the reference voltage used internally by ESP32-S3 ADCs for measuring the input voltage. The ESP32-S3 ADCs can measure analog voltages from 0 V to Vref. Among different chips, the Vref varies, the median is 1.1 V. In order to convert voltages larger than Vref, input voltages can be attenuated before being input to the ADCs. There are 4 available attenuation options, the higher the attenuation is, the higher the measurable input voltage could be.

<table>
<thead>
<tr>
<th>Attenuation</th>
<th>Measurable input voltage range</th>
</tr>
</thead>
<tbody>
<tr>
<td>ADC_ATTEN_DB_0</td>
<td>0 mV ~ 950 mV</td>
</tr>
<tr>
<td>ADC_ATTEN_DB_2_5</td>
<td>0 mV ~ 1250 mV</td>
</tr>
<tr>
<td>ADC_ATTEN_DB_6</td>
<td>0 mV ~ 1750 mV</td>
</tr>
<tr>
<td>ADC_ATTEN_DB_11</td>
<td>0 mV ~ 3100 mV</td>
</tr>
</tbody>
</table>

ADC Conversion

An ADC conversion is to convert the input analog voltage to a digital value. The ADC conversion results provided by the ADC driver APIs are raw data. Resolution of ESP32-S3 ADC raw results under Single Read mode is 12-bit.

- `adc1_get_raw()`
- `adc2_get_raw()`

To calculate the voltage based on the ADC raw results, this formula can be used:

\[
V_{out} = D_{out} \times \frac{V_{max}}{D_{max}} \quad (1)
\]

where:

<table>
<thead>
<tr>
<th>Vout</th>
<th>Digital output result, standing for the voltage.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Dout</td>
<td>ADC raw digital reading result.</td>
</tr>
<tr>
<td>Vmax</td>
<td>Maximum measurable input analog voltage, see ADC Attenuation.</td>
</tr>
<tr>
<td>Dmax</td>
<td>Maximum of the output ADC raw digital reading result, which is 4095 under Single Read mode, 8191 under Continuous Read mode.</td>
</tr>
</tbody>
</table>

For boards with eFuse ADC calibration bits, `esp_adc_cal_raw_to_voltage()` can be used to get the calibrated conversion results. These results stand for the actual voltage (in mV). No need to transform these data via the formula (1). If ADC calibration APIs are used on boards without eFuse ADC calibration bits, warnings will be generated. See ADC Calibration.
Chapter 2. API Reference

ADC Limitations

Note:

• Since the ADC2 module is also used by the Wi-Fi, reading operation of `adc2_get_raw()` may fail between `esp_wifi_start()` and `esp_wifi_stop()`. Use the return code to see whether the reading is successful.

Driver Usage

Both of the ADC units support single read mode, which is suitable for low-frequency sampling operations.

Note: ADC readings from a pin not connected to any signal are random.

ADC Single Read mode  The ADC should be configured before reading is taken.

• For ADC1, configure desired precision and attenuation by calling functions `adc1_config_width()` and `adc1_config_channel_atten()`.
• For ADC2, configure the attenuation by `adc2_config_channel_atten()`. The reading width of ADC2 is configured every time you take the reading.

Attenuation configuration is done per channel, see `adc1_channel_t` and `adc2_channel_t`, set as a parameter of above functions.

Then it is possible to read ADC conversion result with `adc1_get_raw()` and `adc2_get_raw()`. Reading width of ADC2 should be set as a parameter of `adc2_get_raw()` instead of in the configuration functions.

Single Read mode ADC example can be found in `peripherals/adc/single_read` directory of ESP-IDF examples.

This API provides convenient way to configure ADC1 for reading from ULP. To do so, call function `adc1_ulp_enable()` and then set precision and attenuation as discussed above.

Note: See ADC Limitations for the limitation of using ADC single read mode.

Minimizing Noise

The ESP32-S3 ADC can be sensitive to noise leading to large discrepancies in ADC readings. Depending on the usage scenario, users may connect a bypass capacitor (e.g. a 100 nF ceramic capacitor) to the ADC input pad in use, to minimize noise. Besides, multisampling may also be used to further mitigate the effects of noise.

ADC Calibration

ESP32-S3 ADC Calibration contains 2 steps: Hardware Calibration and Software Calibration.

Hardware Calibration  Based on series of comparisons with the reference voltage, ESP32-S3 ADC determines each bit of the output digital result. Per design the ESP32-S3 ADC reference voltage is 1100 mV, however the true reference voltage can range from 1000 mV to 1200 mV among different chips. To minimize this difference, hardware calibration is introduced.

Hardware calibration contains 2 steps:

1. Set an auto-calibration parameter of bandgap voltage reference. In this way, the difference mentioned above can be minimized.
2. Correct the offset of the ADC Vin-Dout characteristics. ADC characteristics is generally a function: \( f(x) = A \cdot x + B \), where \( B \) is the offset.

An uncalibrated ADC characteristics is as follows:

![ADC Characteristics Before Calibration](image)

The offset in the uncalibrated characteristics is significant. Step 2 is to correct the offset to 0.

After hardware calibration, the ADC characteristics would be like:

Hardware calibration is done internally by the ADC driver. The consequent results are raw data. A transformation is needed to get the final result, see *ADC Conversion*.

**Software Calibration**  
To convert ADC raw data to calibrated digital data, following steps should be followed:

1. Check the eFuse to know if the software calibration is supported via \( \text{esp_adc_cal_check_efuse()} \).
2. Calculate the ADC calibration characteristics via \( \text{esp_adc_cal_characterize()} \). The ADC software calibration characteristics are per ADC module and per attenuation. For example, characteristics of ADC1 channel 0 under 11 dB attenuation are the same as characteristics of ADC1 channel 2 under 11 dB attenuation. But characteristics of ADC1 channel 0 under 11 dB attenuation are different with characteristics of ADC2 channel 0 under 11 dB attenuation. Also characteristics of ADC1 channel 0 under 11 dB attenuation are different with characteristics of ADC1 channel 0 under 6 dB attenuation.
3. Get the actual voltage value via \( \text{esp_adc_cal_raw_to_voltage()} \).

After software calibration, the ADC characteristics would be like:

The results provided by the ADC calibration APIs indicate the actual voltage values. ADC software calibration example can be found in *peripherals/adc/single_read* directory of ESP-IDF examples.

**GPIO Lookup Macros**

There are macros available to specify the GPIO number of a ADC channel, or vice versa. e.g.

1. \( \text{ADC1\_CHANNEL\_0\_GPIO\_NUM} \) is the GPIO number of ADC1 channel 0.
2. \( \text{ADC1\_GPIO\_n\_CHANNEL} \) is the ADC1 channel number of GPIO n.
Chapter 2. API Reference

ADC Characteristics After HW Calibration

ADC Characteristics After HW and SW Calibration

Espressif Systems

Submit Document Feedback
API Reference

This reference covers three components:

- **ADC driver**
- **ADC Calibration**
- **GPIO Lookup Macros**

### ADC driver

**Header File**

- components/driver/include/driver/adc.h

**Functions**

- `void adc_power_on(void)`  
  Enable ADC power.
- `void adc_power_off(void)`  
  Power off SAR ADC.
- `void adc_power_acquire(void)`  
  Increment the usage counter for ADC module. ADC will stay powered on while the counter is greater than 0. Call `adc_power_release` when done using the ADC.
- `void adc_power_release(void)`  
  Decrement the usage counter for ADC module. ADC will stay powered on while the counter is greater than 0. Call this function when done using the ADC.
- `esp_err_t adc1_pad_get_io_num(adc1_channel_t channel, gpio_num_t *gpio_num)`  
  Get the GPIO number of a specific ADC1 channel.

  **Return**
  - ESP_OK if success
  - ESP_ERR_INVALID_ARG if channel not valid

  **Parameters**
  - `channel`: Channel to get the GPIO number
  - `gpio_num`: output buffer to hold the GPIO number

- `esp_err_t adc1_config_channel_atten(adc1_channel_t channel, adc_atten_t atten)`  
  Set the attenuation of a particular channel on ADC1, and configure its associated GPIO pin mux.

  The default ADC voltage is for attenuation 0 dB and listed in the table below. By setting higher attenuation it is possible to read higher voltages.

  Due to ADC characteristics, most accurate results are obtained within the “suggested range” shown in the following table.

<table>
<thead>
<tr>
<th>SoC</th>
<th>attenuation (dB)</th>
<th>suggested range (mV)</th>
</tr>
</thead>
<tbody>
<tr>
<td>ESP32</td>
<td>0</td>
<td>100 ~ 950</td>
</tr>
<tr>
<td></td>
<td>2.5</td>
<td>100 ~ 1250</td>
</tr>
<tr>
<td></td>
<td>6</td>
<td>150 ~ 1750</td>
</tr>
<tr>
<td></td>
<td>11</td>
<td>150 ~ 2450</td>
</tr>
<tr>
<td></td>
<td>0</td>
<td>0 ~ 750</td>
</tr>
</tbody>
</table>

(continues on next page)
For maximum accuracy, use the ADC calibration APIs and measure voltages within these recommended ranges.

**Note** For any given channel, this function must be called before the first time `adc1_get_raw()` is called for that channel.

**Note** This function can be called multiple times to configure multiple ADC channels simultaneously. You may call `adc1_get_raw()` only after configuring a channel.

**Return**
- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- channel: ADC1 channel to configure
- atten: Attenuation level

```c
esp_err_t adc1_config_width(adc_bits_width_t width_bit)
```
Configure ADC1 capture width, meanwhile enable output invert for ADC1. The configuration is for all channels of ADC1.

**Return**
- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- width_bit: Bit capture width for ADC1

```c
int adc1_get_raw(adc1_channel_t channel)
```
Take an ADC1 reading from a single channel.

**Note** ESP32: When the power switch of SARADC1, SARADC2, HALL sensor and AMP sensor is turned on, the input of GPIO36 and GPIO39 will be pulled down for about 80ns. When enabling power for any of these peripherals, ignore input from GPIO36 and GPIO39. Please refer to section 3.11 of ‘ECO_and_Workarounds_for_Bugs_in_ESP32’ for the description of this issue. As a workaround, call `adc_power_acquire()` in the app. This will result in higher power consumption (by ~1mA), but will remove the glitches on GPIO36 and GPIO39.

**Note** Call `adc1_config_width()` before the first time this function is called.

**Note** For any given channel, `adc1_config_channel_atten(channel)` must be called before the first time this function is called. Configuring a new channel does not prevent a previously configured channel from being read.

**Return**
- -1: Parameter error
- Other: ADC1 channel reading.

**Parameters**
- channel: ADC1 channel to read

```c
esp_err_t adc_set_data_inv(adc_unit_t adc_unit, bool inv_en)
```
Set ADC data invert.

**Return**
- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- adc_unit: ADC unit index
- inv_en: whether enable data invert

```c
esp_err_t adc_set_clk_div(uint8_t clk_div)
```
Set ADC source clock.

Return
• ESP_OK success

Parameters
• clk_div: ADC clock divider, ADC clock is divided from APB clock

\[ \text{esp_err_t} \text{ esp_err_t} \text{ adc2_config_channel_atten}(mV) \]
Configure ADC capture width.

Return
• ESP_OK success
• ESP_ERR_INVALID_ARG Parameter error

Parameters
• adc_unit: ADC unit index
• width_bit: Bit capture width for ADC unit.

void adc1_ulp_enable (void)
Configure ADC1 to be usable by the ULP.

This function reconfigures ADC1 to be controlled by the ULP. Effect of this function can be reverted using adc1_get_raw() function.

Note that adc1_config_channel_atten, adc1_config_width() functions need to be called to configure ADC1 channels, before ADC1 is used by the ULP.

\[ \text{esp_err_t} \text{ adc2_pad_get_io_num}(\text{adc2_channel_t} \text{ channel, gpio_num_t *gpio_num}) \]
Get the GPIO number of a specific ADC2 channel.

Return
• ESP_OK if success
• ESP_ERR_INVALID_ARG if channel not valid

Parameters
• channel: Channel to get the GPIO number
• gpio_num: output buffer to hold the GPIO number

\[ \text{esp_err_t} \text{ adc2_config_channel_atten}(\text{adc2_channel_t} \text{ channel, adc_atten_t atten}) \]
Configure the ADC2 channel, including setting attenuation.

The default ADC voltage is for attenuation 0 dB and listed in the table below. By setting higher attenuation it is possible to read higher voltages.

Due to ADC characteristics, most accurate results are obtained within the “suggested range” shown in the following table.

<table>
<thead>
<tr>
<th>SoC</th>
<th>attenuation (dB)</th>
<th>suggested range (mV)</th>
</tr>

</tr>
<tr>
<td></td>
<td>11</td>
<td>0 ~ 2500</td>
</tr>
</tbody>
</table>
For maximum accuracy, use the ADC calibration APIs and measure voltages within these recommended ranges.

**Note** This function also configures the input GPIO pin mux to connect it to the ADC2 channel. It must be called before calling `adc2_get_raw()` for this channel.

**Note** For any given channel, this function must be called before the first time `adc2_get_raw()` is called for that channel.

**Return**
- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- `channel`: ADC2 channel to configure
- `atten`: Attenuation level

```c
esp_err_t adc2_get_raw (adc2_channel_t channel, adc_bits_width_t width_bit, int *raw_out)
```

Take an ADC2 reading on a single channel.

**Note** ESP32: When the power switch of SARADC1, SARADC2, HALL sensor and AMP sensor is turned on, the input of GPIO36 and GPIO39 will be pulled down for about 80ns. When enabling power for any of these peripherals, ignore input from GPIO36 and GPIO39. Please refer to section 3.11 of 'ECO_and_Workarounds_for_Bugs_in_ESP32' for the description of this issue. As a workaround, call `adc_power_acquire()` in the app. This will result in higher power consumption (by ~1mA), but will remove the glitches on GPIO36 and GPIO39.

**Note** ESP32: For a given channel, `adc2_config_channel_atten()` must be called before the first time this function is called. If Wi-Fi is started via `esp_wifi_start()`, this function will always fail with ESP_ERR_TIMEOUT.

**Note** ESP32-S2: ADC2 supports hardware arbiter. The arbiter is to improve the use efficiency of ADC2. After the control right is robbed by the high priority, the low priority controller will read the invalid ADC2 data. Default priority: Wi-Fi > RTC > Digital;

**Return**
- ESP_OK if success
- ESP_ERR_TIMEOUT ADC2 is being used by other controller and the request timed out.
- ESP_ERR_INVALID_STATE The controller status is invalid. Please try again.

**Parameters**
- `channel`: ADC2 channel to read
- `width_bit`: Bit capture width for ADC2
- `raw_out`: the variable to hold the output data.

```c
esp_err_t adc_vref_to_gpio (adc_unit_t adc_unit, gpio_num_t gpio)
```

Output ADC1 or ADC2’ s reference voltage to adc2_channe_t’ s IO.

This function routes the internal reference voltage of ADCn to one of ADC2’ s channels. This reference voltage can then be manually measured for calibration purposes.

**Note** ESP32 only supports output of ADC2’ s internal reference voltage.

**Return**
- ESP_OK: v_ref successfully routed to selected GPIO
- ESP_ERR_INVALID_ARG: Unsupported GPIO

**Parameters**
- `[in]` `adc_unit`: ADC unit index
- `[in]` `gpio`: GPIO number (Only ADC2’ s channels IO are supported)

```c
esp_err_t adc2_vref_to_gpio (gpio_num_t gpio)
```

Output ADC2 reference voltage to adc2_channe_t’ s IO.

This function routes the internal reference voltage of ADCn to one of ADC2’ s channels. This reference voltage can then be manually measured for calibration purposes.

**Return**
- ESP_OK: v_ref successfully routed to selected GPIO
- ESP_ERR_INVALID_ARG: Unsupported GPIO

**Parameters**
- `[in]` `gpio`: GPIO number (ADC2’ s channels are supported)
**esp_err_t** *adc_digi_initialize*(const *adc_digi_init_config_t* init_config)

Initialize the Digital ADC.

**Return**
- ESP_ERR_INVALID_ARG If the combination of arguments is invalid.
- ESP_ERR_NOT_FOUND No free interrupt found with the specified flags.
- ESP_ERR_NO_MEM If out of memory.
- ESP_OK On success.

**Parameters**
- init_config: Pointer to Digital ADC initialization config. Refer to *adc_digi_init_config_t*.

**esp_err_t** *adc_digi_read_bytes*(uint8_t *buf, uint32_t length_max, uint32_t *out_length, uint32_t timeout_ms)

Read bytes from Digital ADC through DMA.

**Return**
- ESP_ERR_INVALID_STATE Driver state is invalid. Usually it means the ADC sampling rate is faster than the task processing rate.
- ESP_ERR_TIMEOUT Operation timed out.
- ESP_OK On success.

**Parameters**
- [out] buf: Buffer to read from ADC.
- [in] length_max: Expected length of data read from the ADC.
- [out] out_length: Real length of data read from the ADC via this API.
- [in] timeout_ms: Time to wait for data via this API, in millisecond.

**esp_err_t** *adc_digi_start*(void)

Start the Digital ADC and DMA peripherals. After this, the hardware starts working.

**Return**
- ESP_ERR_INVALID_STATE Driver state is invalid.
- ESP_OK On success.

**esp_err_t** *adc_digi_stop*(void)

Stop the Digital ADC and DMA peripherals. After this, the hardware stops working.

**Return**
- ESP_ERR_INVALID_STATE Driver state is invalid.
- ESP_OK On success.

**esp_err_t** *adc_digi_deinitialize*(void)

Deinitialize the Digital ADC.

**Return**
- ESP_ERR_INVALID_STATE Driver state is invalid.
- ESP_OK On success.

**esp_err_t** *adc_digi_controller_configure*(const *adc_digi_configuration_t* config)

Setting the digital controller.

**Return**
- ESP_ERR_INVALID_STATE Driver state is invalid.
- ESP_ERR_INVALID_ARG If the combination of arguments is invalid.
- ESP_OK On success.

**Parameters**
- config: Pointer to digital controller paramter. Refer to *adc_digi_config_t*.

**Structures**

**struct adc_digi_init_config_s**

ADC DMA driver configuration.
Public Members

```c
uint32_t max_store_buf_size
Max length of the converted data that driver can store before they are processed.
```

```c
uint32_t conv_num_each_intr
Bytes of data that can be converted in 1 interrupt.
```

```c
uint32_t adc1_chan_mask
Channel list of ADC1 to be initialized.
```

```c
uint32_t adc2_chan_mask
Channel list of ADC2 to be initialized.
```

```c
struct adc_digi_configuration_t
ADC digital controller settings.
```

Public Members

```c
bool conv_limit_en
To limit ADC conversion times. Conversion stops after finishing conv_limit_num times conversion.
```

```c
uint32_t conv_limit_num
Set the upper limit of the number of ADC conversion triggers. Range: 1 ~ 255.
```

```c
uint32_t pattern_num
Number of ADC channels that will be used.
```

```c
adc_digi_pattern_config_t *adc_pattern
List of configs for each ADC channel that will be used.
```

```c
uint32_t sample_freq_hz
The expected ADC sampling frequency in Hz. Range: 611Hz ~ 83333Hz Fs = Fd / interval / 2 Fs:
interval between 2 measurement trigger signal, the smallest interval should not be smaller than the ADC
measurement period, the largest interval should not be larger than 4095
```

```c
adc_digi_convert_mode_t conv_mode
ADC DMA conversion mode, see adc_digi_convert_mode_t.
```

```c
adc_digi_output_format_t format
ADC DMA conversion output format, see adc_digi_output_format_t.
```

Macros

```c
ADC_ATTEN_0db
ADC rtc controller attenuation option.
```

Note This definitions are only for being back-compatible

```c
ADC_ATTEN_2_5db
ADC_ATTEN_6db
ADC_ATTEN_11db
ADC_WIDTH_BIT_DEFAULT
The default (max) bit width of the ADC of current version. You can also get the maximum bitwidth by
SOC_ADC_MAX_BITWIDTH defined in soc_caps.h.
```

```c
ADC_WIDTH_9Bit
ADC_WIDTH_10Bit
ADC_WIDTH_11Bit
ADC_WIDTH_12Bit
```
**ADC_MAX_DELAY**

Digital ADC DMA read max timeout value, it may make the `adc_digi_read_bytes` block forever if the OS supports.

**Type Definitions**

```c
typedef struct adc_digi_init_config_s adc_digi_init_config_t
ADC DMA driver configuration.
```

**Enumerations**

```c
eenum adc1_channel_t
Values:
  ADC1_CHANNEL_0 = 0
  ADC1 channel 0 is GPIO1
  ADC1_CHANNEL_1
  ADC1 channel 1 is GPIO2
  ADC1_CHANNEL_2
  ADC1 channel 2 is GPIO3
  ADC1_CHANNEL_3
  ADC1 channel 3 is GPIO4
  ADC1_CHANNEL_4
  ADC1 channel 4 is GPIO5
  ADC1_CHANNEL_5
  ADC1 channel 5 is GPIO6
  ADC1_CHANNEL_6
  ADC1 channel 6 is GPIO7
  ADC1_CHANNEL_7
  ADC1 channel 7 is GPIO8
  ADC1_CHANNEL_8
  ADC1 channel 8 is GPIO9
  ADC1_CHANNEL_9
  ADC1 channel 9 is GPIO10

eenum adc2_channel_t
Values:
  ADC2_CHANNEL_0 = 0
  ADC2 channel 0 is GPIO4 (ESP32), GPIO11 (ESP32-S2)
  ADC2_CHANNEL_1
  ADC2 channel 1 is GPIO0 (ESP32), GPIO12 (ESP32-S2)
  ADC2_CHANNEL_2
  ADC2 channel 2 is GPIO2 (ESP32), GPIO13 (ESP32-S2)
  ADC2_CHANNEL_3
  ADC2 channel 3 is GPIO15 (ESP32), GPIO14 (ESP32-S2)
  ADC2_CHANNEL_4
  ADC2 channel 4 is GPIO13 (ESP32), GPIO15 (ESP32-S2)
  ADC2_CHANNEL_5
  ADC2 channel 5 is GPIO12 (ESP32), GPIO16 (ESP32-S2)
  ADC2_CHANNEL_6
  ADC2 channel 6 is GPIO14 (ESP32), GPIO17 (ESP32-S2)
```
Chapter 2. API Reference

ADC2_CHANNEL_7
ADC2 channel 7 is GPIO27 (ESP32), GPIO18 (ESP32-S2)

ADC2_CHANNEL_8
ADC2 channel 8 is GPIO25 (ESP32), GPIO19 (ESP32-S2)

ADC2_CHANNEL_9
ADC2 channel 9 is GPIO26 (ESP32), GPIO20 (ESP32-S2)

ADC2_CHANNEL_MAX

enum adc_i2s_encode_t
ADC digital controller encode option.
Values:

ADC_ENCODE_12BIT
ADC to DMA data format, [15:12]-channel[11:0]-12 bits ADC data

ADC_ENCODE_11BIT
ADC to DMA data format, [15]-unit,[14:11]-channel[10:0]-11 bits ADC data

ADC_ENCODE_MAX

Header File

- components/hal/include/hal/adc_types.h

Structures

struct adc_digi_pattern_config_t
ADC digital controller pattern configuration.

Public Members

uint8_t atten
Attenuation of this ADC channel.

uint8_t channel
ADC channel.

uint8_t unit
ADC unit.

uint8_t bit_width
ADC output bit width.

struct adc_digi_output_data_t
ADC digital controller (DMA mode) output data format. Used to analyze the acquired ADC (DMA) data.

Public Members

uint32_t data: 13
ADC real output data info. Resolution: 13 bit.

uint32_t channel: 4
ADC channel index info. If (channel < ADC_CHANNEL_MAX), The data is valid. If (channel > ADC_CHANNEL_MAX), The data is invalid.

uint32_t unit: 1
ADC unit index info. 0: ADC1; 1: ADC2.

uint32_t reserved17_31: 14
Reserved17.
```c
struct adc_digi_output_data_t {
    // When the configured output format is 12bit. ADC_DIGI_FORMAT_11BIT
    uint32_t val
    // Raw data value
}
```

```c
struct adc_arbiter_t
// ADC arbiter work mode and priority setting.

// Note ESP32-S2: Only ADC2 support arbiter.

Public Members

```c
adc_arbiter_mode_t mode
// Refer to adc_arbiter_mode_t. Note: only support ADC2.

uint8_t rtc_pri
// RTC controller priority. Range: 0 ~ 2.

uint8_t dig_pri
// Digital controller priority. Range: 0 ~ 2.

uint8_t pwdet_pri
// Wi-Fi controller priority. Range: 0 ~ 2.
```

```c
struct adc_digi_filter_t
// ADC digital controller (DMA mode) filter configuration.

// Note For ESP32-S2, The filter object of the ADC is fixed.
// Note For ESP32-S2, The filter object is always all enabled channels.

Public Members

```c
adc_unit_t adc_unit
// Set adc unit number for filter. For ESP32-S2, Filter IDX0/IDX1 can only be used to filter all enabled channels of ADC1/ADC2 unit at the same time.

adc_channel_t channel
// Set adc channel number for filter. For ESP32-S2, it’s always ADC_CHANNEL_MAX

adc_digi_filter_mode_t mode
// Set adc filter mode for filter. See adc_digi_filter_mode_t.
```

```c
struct adc_digi_monitor_t
// ADC digital controller (DMA mode) monitor configuration.

// Note For ESP32-S2, The monitor object of the ADC is fixed.
// Note For ESP32-S2, The monitor object is always all enabled channels.

Public Members

```c
adc_unit_t adc_unit
// Set adc unit number for monitor. For ESP32-S2, monitor IDX0/IDX1 can only be used to monitor all enabled channels of ADC1/ADC2 unit at the same time.

adc_channel_t channel
// Set adc channel number for monitor. For ESP32-S2, it’s always ADC_CHANNEL_MAX

adc_digi_monitor_mode_t mode
// Set adc monitor mode. See adc_digi_monitor_mode_t.

uint32_t threshold
// Set monitor threshold of adc digital controller.
```
Macros

ADC_ARBITER_CONFIG_DEFAULT()
ADC arbiter default configuration.

Note ESP32S2: Only ADC2 supports (needs) an arbiter.

Enumerations

class adc_unit_t
ADC unit enumeration.

Note For ADC digital controller (DMA mode), ESP32 doesn’t support ADC_UNIT_2, ADC_UNIT_BOTH, ADC_UNIT_ALTER.

Values:

ADC_UNIT_1 = 1
SAR ADC 1.

ADC_UNIT_2 = 2
SAR ADC 2.

ADC_UNIT_BOTH = 3
SAR ADC 1 and 2.

ADC_UNIT_ALTER = 7
SAR ADC 1 and 2 alternative mode.

ADC_UNIT_MAX

class adc_channel_t
ADC channels handle. See adc1_channel_t, adc2_channel_t.

Note For ESP32 ADC1, don’t use ADC_CHANNEL_8, ADC_CHANNEL_9. See adc1_channel_t.

Values:

ADC_CHANNEL_0 = 0
ADC channel

ADC_CHANNEL_1
ADC channel

ADC_CHANNEL_2
ADC channel

ADC_CHANNEL_3
ADC channel

ADC_CHANNEL_4
ADC channel

ADC_CHANNEL_5
ADC channel

ADC_CHANNEL_6
ADC channel

ADC_CHANNEL_7
ADC channel

ADC_CHANNEL_8
ADC channel

ADC_CHANNEL_9
ADC channel

ADC_CHANNEL_MAX
enum adc_atten_t
ADC attenuation parameter. Different parameters determine the range of the ADC. See
adc1_config_channel_atten.

Values:

ADC_ATTEN_DB_0 = 0
No input attenuation, ADC can measure up to approx. 800 mV.

ADC_ATTEN_DB_2_5 = 1
The input voltage of ADC will be attenuated extending the range of measurement by about 2.5 dB (1.33 x)

ADC_ATTEN_DB_6 = 2
The input voltage of ADC will be attenuated extending the range of measurement by about 6 dB (2 x)

ADC_ATTEN_DB_11 = 3
The input voltage of ADC will be attenuated extending the range of measurement by about 11 dB (3.55 x)

ADC_ATTEN_MAX

enum adc_bits_width_t
ADC resolution setting option.

Note Only used in single read mode

Values:

ADC_WIDTH_BIT_12 = 3
ADC capture width is 12Bit.

ADC_WIDTH_MAX

enum adc_digi_convert_mode_t
ADC digital controller (DMA mode) work mode.

Values:

ADC_CONV_SINGLE_UNIT_1 = 1
Only use ADC1 for conversion.

ADC_CONV_SINGLE_UNIT_2 = 2
Only use ADC2 for conversion.

ADC_CONV_BOTH_UNIT = 3
Use Both ADC1 and ADC2 for conversion simultaneously.

ADC_CONV_ALTER_UNIT = 7
Use both ADC1 and ADC2 for conversion by turn. e.g. ADC1 -> ADC2 -> ADC1 -> ADC2 ...

ADC_CONV_UNIT_MAX

enum adc_digi_output_format_t
ADC digital controller (DMA mode) output data format option.

Values:

ADC_DIGI_FORMAT_12BIT
ADC to DMA data format, [15:12]-channel, [11: 0]-12 bits ADC data (adc_digi_output_data_t). Note: For single convert mode.

ADC_DIGI_FORMAT_11BIT
ADC to DMA data format, [15]-adc unit, [14:11]-channel, [10: 0]-11 bits ADC data (adc_digi_output_data_t). Note: For multi or alter convert mode.

ADC_DIGI_FORMAT_MAX

ADC_DIGI_OUTPUT_FORMAT_TYPE1
See adc_digi_output_data_t.type1
**ADC_DIGI_OUTPUT_FORMAT_TYPE2**
See `adc_digi_output_data_t.type2`

**enum adc_arbiter_mode_t**
ADC arbiter work mode option.

**Note** ESP32-S2: Only ADC2 support arbiter.

**Values:**

- **ADC_ARB_MODE_SHIELD**
  Force shield arbiter, Select the highest priority controller to work.

- **ADC_ARB_MODE_FIX**
  Fixed priority switch controller mode.

- **ADC_ARB_MODE_LOOP**
  Loop priority switch controller mode. Each controller has the same priority, and the arbiter will switch to the next controller after the measurement is completed.

**enum adc_digi_filter_idx_t**
ADC digital controller (DMA mode) filter index options.

**Note** For ESP32-S2, The filter object of the ADC is fixed.

**Values:**

- **ADC_DIGI_FILTER_IDX0 = 0**
  The filter index 0. For ESP32-S2, It can only be used to filter all enabled channels of ADC1 unit at the same time.

- **ADC_DIGI_FILTER_IDX1**
  The filter index 1. For ESP32-S2, It can only be used to filter all enabled channels of ADC2 unit at the same time.

- **ADC_DIGI_FILTER_IDX_MAX**

**enum adc_digi_filter_mode_t**
ADC digital controller (DMA mode) filter type options. Expression: filter_data = (k-1)/k * last_data + new_data / k.

**Values:**

- **ADC_DIGI_FILTER_IIR_2 = 0**
  The filter mode is first-order IIR filter. The coefficient is 2.

- **ADC_DIGI_FILTER_IIR_4**
  The filter mode is first-order IIR filter. The coefficient is 4.

- **ADC_DIGI_FILTER_IIR_8**
  The filter mode is first-order IIR filter. The coefficient is 8.

- **ADC_DIGI_FILTER_IIR_16**
  The filter mode is first-order IIR filter. The coefficient is 16.

- **ADC_DIGI_FILTER_IIR_64**
  The filter mode is first-order IIR filter. The coefficient is 64.

- **ADC_DIGI_FILTER_IIR_MAX**

**enum adc_digi_monitor_idx_t**
ADC digital controller (DMA mode) monitor index options.

**Note** For ESP32-S2, The monitor object of the ADC is fixed.

**Values:**

- **ADC_DIGI_MONITOR_IDX0 = 0**
  The monitor index 0. For ESP32-S2, It can only be used to monitor all enabled channels of ADC1 unit at the same time.
ADC_DIGI_MONITOR_IDX1
The monitor index 1. For ESP32-S2, it can only be used to monitor all enabled channels of ADC2 unit at the same time.

ADC_DIGI_MONITOR_IDX_MAX
enum adc_digi_monitor_mode_t
Set monitor mode of adc digital controller. MONITOR_HIGH: If ADC_OUT > threshold, Generates monitor interrupt. MONITOR_LOW: If ADC_OUT < threshold, Generates monitor interrupt.

Values:
ADC_DIGI_MONITOR_HIGH = 0
If ADC_OUT > threshold, Generates monitor interrupt.

ADC_DIGI_MONITOR_LOW
If ADC_OUT < threshold, Generates monitor interrupt.

ADC_DIGI_MONITOR_MAX
enum adc_i2s_source_t
ESP32 ADC DMA source selection.

Values:
ADC_I2S_DATA_SRC_IO_SIG = 0
I2S data from GPIO matrix signal

ADC_I2S_DATA_SRC_ADC = 1
I2S data from ADC

ADC_I2S_DATA_SRC_MAX
ADC Calibration

Header File
• components/esp_adc_cal/include/esp_adc_cal.h

Functions
esp_err_t esp_adc_cal_check_efuse(esp_adc_cal_value_t value_type)
Checks if ADC calibration values are burned into eFuse.

This function checks if ADC reference voltage or Two Point values have been burned to the eFuse of the current ESP32

Note in ESP32S2, only ESP_ADC_CAL_VAL_EFUSE_TP is supported. Some old ESP32S2s do not support this, either. In which case you have to calibrate it manually, possibly by performing your own two-point calibration on the chip.

Return
• ESP_OK: The calibration mode is supported in eFuse
• ESP_ERR_NOT_SUPPORTED: Error, eFuse values are not burned
• ESP_ERR_INVALID_ARG: Error, invalid argument (ESP_ADC_CAL_VAL_DEFAULT_VREF)

Parameters
• value_type: Type of calibration value (ESP_ADC_CAL_VAL_EFUSE_VREF or ESP_ADC_CAL_VAL_EFUSE_TP)

esp_adc_cal_value_t esp_adc_cal_characterize(adc_unit_t adc_num, adc_atten_t atten, adc_bits_width_t bit_width, uint32_t default_vref, esp_adc_cal_characteristics_t *chars)
Characterize an ADC at a particular attenuation.

This function will characterize the ADC at a particular attenuation and generate the ADC-Voltage curve in the form of \[ y = \text{coeff}_a \times x + \text{coeff}_b \]. Characterization can be based on Two Point values, eFuse Vref, or default Vref and the calibration values will be prioritized in that order.
Note For ESP32, Two Point values and eFuse Vref calibration can be enabled/disabled using menuconfig. For ESP32s2, only Two Point values calibration and only ADC_WIDTH_BIT_13 is supported. The parameter default_vref is unused.

Return
- ESP_ADC_CAL_VAL_EFUSE_VREF: eFuse Vref used for characterization
- ESP_ADC_CAL_VAL_EFUSE_TP: Two Point value used for characterization (only in Linear Mode)
- ESP_ADC_CAL_VAL_DEFAULT_VREF: Default Vref used for characterization

Parameters
- \[\text{in}\] adc_num: ADC to characterize (ADC_UNIT_1 or ADC_UNIT_2)
- \[\text{in}\] atten: Attenuation to characterize
- \[\text{in}\] bit_width: Bit width configuration of ADC
- \[\text{in}\] default_vref: Default ADC reference voltage in mV (Only in ESP32, used if eFuse values is not available)
- \[\text{out}\] chars: Pointer to empty structure used to store ADC characteristics

```
uint32_t esp_adc_cal_raw_to_voltage(uint32_t adc_reading, const esp_adc_cal_characteristics_t *chars)
```

Convert an ADC reading to voltage in mV.

This function converts an ADC reading to a voltage in mV based on the ADC’s characteristics.

Note Characteristics structure must be initialized before this function is called (call esp_adc_cal_characterize())

Return Voltage in mV

Parameters
- \[\text{in}\] adc_reading: ADC reading
- \[\text{in}\] chars: Pointer to initialized structure containing ADC characteristics

```
esp_err_t esp_adc_cal_get_voltage(adc_channel_t channel, const esp_adc_cal_characteristics_t *chars, uint32_t *voltage)
```

Reads an ADC and converts the reading to a voltage in mV.

This function reads an ADC then converts the raw reading to a voltage in mV based on the characteristics provided. The ADC that is read is also determined by the characteristics.

Note The Characteristics structure must be initialized before this function is called (call esp_adc_cal_characterize())

Return
- ESP_OK: ADC read and converted to mV
- ESP_ERR_INVALID_ARG: Error due to invalid arguments
- ESP_ERR_INVALID_STATE: Reading result is invalid. Try to read again.

Parameters
- \[\text{in}\] channel: ADC Channel to read
- \[\text{in}\] chars: Pointer to initialized ADC characteristics structure
- \[\text{out}\] voltage: Pointer to store converted voltage

Structures

```
struct esp_adc_cal_characteristics_t
```

Structure storing characteristics of an ADC.

Note Call esp_adc_cal_characterize() to initialize the structure

Public Members

```
adc_unit_t adc_num
ADC number

adc_atten_t atten
ADC attenuation
```
Chapter 2. API Reference

```c
adc_bits_width_t bit_width
ADC bit width

uint32_t coeff_a
Gradient of ADC-Voltage curve

uint32_t coeff_b
Offset of ADC-Voltage curve

uint32_t vref
Vref used by lookup table

const uint32_t* low_curve
Pointer to low Vref curve of lookup table (NULL if unused)

const uint32_t* high_curve
Pointer to high Vref curve of lookup table (NULL if unused)

uint8_t version
ADC Calibration
```

**Enumerations**

```c
define esp_adc_cal_value_t
Type of calibration value used in characterization.

Values:

- ESP_ADC_CAL_VAL_EFUSE_VREF = 0
  Characterization based on reference voltage stored in eFuse

- ESP_ADC_CAL_VAL_EFUSE_TP = 1
  Characterization based on Two Point values stored in eFuse

- ESP_ADC_CAL_VAL_DEFAULT_VREF = 2
  Characterization based on default reference voltage

- ESP_ADC_CAL_VAL_EFUSE_TP_FIT = 3
  Characterization based on Two Point values and fitting curve coefficients stored in eFuse

- ESP_ADC_CAL_VAL_MAX
- ESP_ADC_CAL_VAL_NOT_SUPPORTED = ESP_ADC_CAL_VAL_MAX
```

2.3.2 General Purpose Timer

Introduction

The ESP32-S3 chip contains two hardware timer group(s). Each group has two general-purpose hardware timer(s). They are all 54-bit generic timers based on 16-bit pre-scalers and 54-bit up / down counters which are capable of being auto-reloaded.
Functional Overview

The following sections of this document cover the typical steps to configure and operate a timer:

- **Timer Initialization** - covers which parameters should be set up to get the timer working, and also what specific functionality is provided depending on the timer configuration.
- **Timer Control** - describes how to read a timer’s value, pause or start a timer, and change how it operates.
- **Alarms** - shows how to set and use alarms.
- **Interrupts** - explains how to use interrupt callbacks.

**Timer Initialization**  The two ESP32-S3 timer group(s), with two timer(s) in each, provide the total of four individual timers for use. An ESP32-S3 timer group should be identified using `timer_group_t`. An individual timer in a group should be identified with `timer_idx_t`.

First of all, the timer should be initialized by calling the function `timer_init()` and passing a structure `timer_config_t` to it to define how the timer should operate. In particular, the following timer parameters can be set:

- **Clock Source**: Select the clock source, which together with the Divider define the resolution of the working timer.
- **Divider**: Sets how quickly the timer’s counter is “ticking”. The setting divider is used as a divisor of the clock source that by default is APB_CLK running at 80 MHz. For more information of APB_CLK frequency, please check ESP32-S3 Technical Reference Manual > Reset and Clock [PDF] chapter for more details.
- **Mode**: Sets if the counter should be incrementing or decrementing. It can be defined using `counter_dir` by selecting one of the values from `timer_count_dir_t`.
- **Counter Enable**: If the counter is enabled, it will start incrementing / decrementing immediately after calling `timer_init()`. You can change the behavior with `counter_en` by selecting one of the values from `timer_start_t`.
- **Alarm Enable**: Can be set using `alarm_en`.
- **Auto Reload**: Sets if the counter should auto_reload the initial counter value on the timer’s alarm or continue incrementing or decrementing.

To get the current values of the timer’s settings, use the function `timer_get_config()`.

**Timer Control**  Once the timer is enabled, its counter starts running. To enable the timer, call the function `timer_init()` with `counter_en` set to true, or call `timer_start()`. You can specify the timer’s initial counter value by calling `timer_set_counter_value()`. To check the timer’s current value, call `timer_get_counter_value()` or `timer_get_counter_time_sec()`.

To pause the timer at any time, call `timer_pause()`. To resume it, call `timer_start()`.

To reconfigure the timer, you can call `timer_init()`. This function is described in Section **Timer Initialization**.

You can also reconfigure the timer by using dedicated functions to change individual settings:

<table>
<thead>
<tr>
<th>Setting</th>
<th>Dedicated Function</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Divider</td>
<td><code>timer_set_divider()</code></td>
<td>Change the rate of ticking. To avoid unpredictable results, the timer should be paused when changing the divider. If the timer is running, <code>timer_set_divider()</code> pauses it, change the setting, and start the timer again.</td>
</tr>
<tr>
<td>Mode</td>
<td><code>timer_set_counter_mode()</code></td>
<td>Set if the counter should be incrementing or decrementing</td>
</tr>
<tr>
<td>Auto Reload</td>
<td><code>timer_set_auto_reload()</code></td>
<td>Set if the initial counter value should be reload on the timer’s alarm</td>
</tr>
</tbody>
</table>

**Alarms**  To set an alarm, call the function `timer_set_alarm_value()` and then enable the alarm using `timer_set_alarm()`. The alarm can also be enabled during the timer initialization stage, when `timer_init()` is called.
Chapter 2. API Reference

After the alarm is enabled, and the timer reaches the alarm value, the following two actions can occur depending on the configuration:

- An interrupt will be triggered if previously configured. See Section Interrupts on how to configure interrupts.
- When auto_reload is enabled, the timer’s counter will automatically be reloaded to start counting again from a previously configured value. This value should be set in advance with timer_set_counter_value().

**Note:**

- If an alarm value is set and the timer has already reached this value, the alarm is triggered immediately.
- Once triggered, the alarm is disabled automatically and needs to be re-enabled to trigger again.

To check the specified alarm value, call timer_get_alarm_value().

**Interrupts** Registration of an interrupt callback for a specific timer can be done by calling timer_isr_callback_add() and passing in the group ID, timer ID, callback handler and user data. The callback handler will be invoked in ISR context, so user shouldn’t put any blocking API in the callback function.

The benefit of using interrupt callback instead of precessing interrupt from scratch is, you don’t have to deal with interrupt status check and clean stuffs, they are all addressed before the callback got run in driver’s default interrupt handler.

For more information on how to use interrupts, please see the application example below.

**Application Example**

The 54-bit hardware timer example: peripherals/timer_group.

**API Reference**

**Header File**

- components/driver/include/driver/timer.h

**Functions**

`esp_err_t timer_get_counter_value(timer_group_t group_num, timer_idx_t timer_num, uint64_t *timer_val)`

Read the counter value of hardware timer.

**Return**

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**

- **group_num**: Timer group, 0 for TIMERG0 or 1 for TIMERG1
- **timer_num**: Timer index, 0 for hw_timer[0] & 1 for hw_timer[1]
- **timer_val**: Pointer to accept timer counter value.

`esp_err_t timer_get_counter_time_sec(timer_group_t group_num, timer_idx_t timer_num, double *time)`

Read the counter value of hardware timer, in unit of a given scale.

**Return**

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**

- **group_num**: Timer group, 0 for TIMERG0 or 1 for TIMERG1
- **timer_num**: Timer index, 0 for hw_timer[0] & 1 for hw_timer[1]
• **time**: Pointer, type of double*, to accept timer counter value, in seconds.

```c
esp_err_t timer_set_counter_value(timer_group_t group_num, timer_idx_t timer_num, uint64_t load_val)
```

Set counter value to hardware timer.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- **group_num**: Timer group, 0 for TIMEG0 or 1 for TIMEG1
- **timer_num**: Timer index, 0 for hw_timer[0] & 1 for hw_timer[1]
- **load_val**: Counter value to write to the hardware timer.

```c
esp_err_t timer_start(timer_group_t group_num, timer_idx_t timer_num)
```

Start the counter of hardware timer.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- **group_num**: Timer group number, 0 for TIMEG0 or 1 for TIMEG1
- **timer_num**: Timer index, 0 for hw_timer[0] & 1 for hw_timer[1]

```c
esp_err_t timer_pause(timer_group_t group_num, timer_idx_t timer_num)
```

Pause the counter of hardware timer.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- **group_num**: Timer group number, 0 for TIMEG0 or 1 for TIMEG1
- **timer_num**: Timer index, 0 for hw_timer[0] & 1 for hw_timer[1]

```c
esp_err_t timer_set_counter_mode(timer_group_t group_num, timer_idx_t timer_num, timer_count_dir_t counter_dir)
```

Set counting mode for hardware timer.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- **group_num**: Timer group number, 0 for TIMEG0 or 1 for TIMEG1
- **timer_num**: Timer index, 0 for hw_timer[0] & 1 for hw_timer[1]
- **counter_dir**: Counting direction of timer, count-up or count-down

```c
esp_err_t timer_set_auto_reload(timer_group_t group_num, timer_idx_t timer_num, timer_autoreload_t reload)
```

Enable or disable counter reload function when alarm event occurs.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- **group_num**: Timer group number, 0 for TIMEG0 or 1 for TIMEG1
- **timer_num**: Timer index, 0 for hw_timer[0] & 1 for hw_timer[1]
- **reload**: Counter reload mode.

```c
esp_err_t timer_set_divider(timer_group_t group_num, timer_idx_t timer_num, uint32_t divider)
```

Set hardware divider of the source clock to the timer group. By default, the source clock is APB clock running at 80 MHz. For more information, please check Chapter Reset and Clock in Chip Technical Reference Manual.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
Parameters

- **group_num**: Timer group number, 0 for TIMERG0 or 1 for TIMERG1
- **timer_num**: Timer index, 0 for hw_timer[0] & 1 for hw_timer[1]
- **divider**: Timer clock divider value. The divider’s range is from 2 to 65536.

```c
esp_err_t timer_set_alarm_value(timer_group_t group_num, timer_idx_t timer_num, uint64_t alarm_value)
```
Set timer alarm value.

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- **group_num**: Timer group, 0 for TIMERG0 or 1 for TIMERG1
- **timer_num**: Timer index, 0 for hw_timer[0] & 1 for hw_timer[1]
- **alarm_value**: A 64-bit value to set the alarm value.

```c
esp_err_t timer_get_alarm_value(timer_group_t group_num, timer_idx_t timer_num, uint64_t *alarm_value)
```
Get timer alarm value.

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- **group_num**: Timer group, 0 for TIMERG0 or 1 for TIMERG1
- **timer_num**: Timer index, 0 for hw_timer[0] & 1 for hw_timer[1]
- **alarm_value**: Pointer of A 64-bit value to accept the alarm value.

```c
esp_err_t timer_set_alarm(timer_group_t group_num, timer_idx_t timer_num, timer_alarm_t alarm_en)
```
Enable or disable generation of timer alarm events.

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters

- **group_num**: Timer group, 0 for TIMERG0 or 1 for TIMERG1
- **timer_num**: Timer index, 0 for hw_timer[0] & 1 for hw_timer[1]
- **alarm_en**: To enable or disable timer alarm function.

```c
esp_err_t timer_isr_callback_add(timer_group_t group_num, timer_idx_t timer_num, timer_isr_t isr_handler, void *arg, int intr_alloc_flags)
```
Add ISR handle callback for the corresponding timer.

The callback should return a bool value to determine whether need to do YIELD at the end of the ISR.

**Note** This ISR handler will be called from an ISR. This ISR handler do not need to handle interrupt status, and should be kept short. If you want to realize some specific applications or write the whole ISR, you can call timer_isr_register(...) to register ISR.

Parameters

- **group_num**: Timer group number
- **timer_num**: Timer index of timer group
- **isr_handler**: Interrupt handler function, it is a callback function.
- **arg**: Parameter for handler function
- **intr_alloc_flags**: Flags used to allocate the interrupt. One or multiple (ORred) ESP_INTR_FLAG_* values. See esp_intr_alloc.h for more info.

If the intr_alloc_flags value ESP_INTR_FLAG_IRAM is set, the handler function must be declared with IRAM_ATTR attribute and can only call functions in IRAM or ROM. It cannot call other timer APIs.

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
**esp_err_t** \texttt{timer_isr_callback_remove} (\texttt{timer_group_t group_num, timer_idx_t timer_num})

Remove ISR handle callback for the corresponding timer.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- \texttt{group_num}: Timer group number
- \texttt{timer_num}: Timer index of timer group

**esp_err_t** \texttt{timer_isr_register} (\texttt{timer_group_t group_num, timer_idx_t timer_num, void (*fn) (void*) arg, int intr_alloc_flags, timer_isr_handle_t *handle})

Register timer interrupt handler, the handler is an ISR. The handler will be attached to the same CPU core that this function is running on.

If the \texttt{intr_alloc_flags} value ESP_INTR_FLAG_IRAM is set, the handler function must be declared with IRAM\_ATTR attribute and can only call functions in IRAM or ROM. It cannot call other timer APIs. Use direct register access to configure timers from inside the ISR in this case.

**Note** If use this function to register ISR, you need to write the whole ISR. In the interrupt handler, you need to call \texttt{timer_spinlock\_take(…)} before your handling, and call \texttt{timer_spinlock\_give(…)} after your handling.

**Parameters**
- \texttt{group_num}: Timer group number
- \texttt{timer_num}: Timer index of timer group
- \texttt{fn}: Interrupt handler function.
- \texttt{arg}: Parameter for handler function
- \texttt{intr_alloc_flags}: Flags used to allocate the interrupt. One or multiple (ORed) ESP_INTR\_FLAG\_\* values. See esp\_intr\_alloc.h for more info.
- \texttt{handle}: Pointer to return handle. If non-NULL, a handle for the interrupt will be returned here.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**esp_err_t** \texttt{timer_init} (\texttt{timer_group_t group_num, timer_idx_t timer_num, const timer_config_t *config})

Initializes and configure the timer.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- \texttt{group_num}: Timer group number, 0 for TIMERG0 or 1 for TIMERG1
- \texttt{timer_num}: Timer index, 0 for hw\_timer[0] & 1 for hw\_timer[1]
- \texttt{config}: Pointer to timer initialization parameters.

**esp_err_t** \texttt{timer_deinit} (\texttt{timer_group_t group_num, timer_idx_t timer_num})

Deinitializes the timer.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- \texttt{group_num}: Timer group number, 0 for TIMERG0 or 1 for TIMERG1
- \texttt{timer_num}: Timer index, 0 for hw\_timer[0] & 1 for hw\_timer[1]

**esp_err_t** \texttt{timer_get_config} (\texttt{timer_group_t group_num, timer_idx_t timer_num, timer_config_t *config})

Get timer configure value.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- \texttt{group_num}: Timer group number, 0 for TIMERG0 or 1 for TIMERG1
- \texttt{timer_num}: Timer index, 0 for hw\_timer[0] & 1 for hw\_timer[1]
**config**: Pointer of struct to accept timer parameters.

```c
esp_err_t timer_group_intr_enable(timer_group_t group_num, timer_intr_t intr)
```

Enable timer group interrupt, by enable mask.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- `group_num`: Timer group number, 0 for TIMERG0 or 1 for TIMERG1
- `intr`: Timer interrupt enable mask.
  - TIMER_INTR_T0: t0 interrupt
  - TIMER_INTR_T1: t1 interrupt
  - TIMER_INTR_WDT: watchdog interrupt

```c
esp_err_t timer_group_intr_disable(timer_group_t group_num, timer_intr_t intr)
```

Disable timer group interrupt, by disable mask.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- `group_num`: Timer group number, 0 for TIMERG0 or 1 for TIMERG1
- `intr`: Timer interrupt disable mask.
  - TIMER_INTR_T0: t0 interrupt
  - TIMER_INTR_T1: t1 interrupt
  - TIMER_INTR_WDT: watchdog interrupt

```c
esp_err_t timer_enable_intr(timer_group_t group_num, timer_idx_t timer_num)
```

Enable timer interrupt.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- `group_num`: Timer group number, 0 for TIMERG0 or 1 for TIMERG1
- `timer_num`: Timer index.

```c
esp_err_t timer_disable_intr(timer_group_t group_num, timer_idx_t timer_num)
```

Disable timer interrupt.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- `group_num`: Timer group number, 0 for TIMERG0 or 1 for TIMERG1
- `timer_num`: Timer index.

```c
void timer_group_intr_clr_in_isr(timer_group_t group_num, timer_idx_t timer_num)
```

Clear timer interrupt status, just used in ISR.

**Parameters**
- `group_num`: Timer group number, 0 for TIMERG0 or 1 for TIMERG1
- `timer_num`: Timer index.

```c
void timer_group_clr_intr_status_in_isr(timer_group_t group_num, timer_idx_t timer_num)
```

Clear timer interrupt status, just used in ISR.

**Parameters**
- `group_num`: Timer group number, 0 for TIMERG0 or 1 for TIMERG1
- `timer_num`: Timer index.

```c
void timer_group_enable_alarm_in_isr(timer_group_t group_num, timer_idx_t timer_num)
```

Enable alarm interrupt, just used in ISR.
Chapter 2. API Reference

Parameters
- **group_num**: Timer group number, 0 for TIMERG0 or 1 for TIMERG1
- **timer_num**: Timer index.

```c
uint64_t timer_group_get_counter_value_in_isr(timer_group_t group_num, timer_idx_t timer_num)
```
Get the current counter value, just used in ISR.

Return
- Counter value

Parameters
- **group_num**: Timer group number, 0 for TIMERG0 or 1 for TIMERG1
- **timer_num**: Timer index.

```c
void timer_group_set_alarm_value_in_isr(timer_group_t group_num, timer_idx_t timer_num, uint64_t alarm_val)
```
Set the alarm threshold for the timer, just used in ISR.

Parameters
- **group_num**: Timer group number, 0 for TIMERG0 or 1 for TIMERG1
- **timer_num**: Timer index.
- **alarm_val**: Alarm threshold.

```c
void timer_group_set_counter_enable_in_isr(timer_group_t group_num, timer_idx_t timer_num, timer_start_t counter_en)
```
Enable/disable a counter, just used in ISR.

Parameters
- **group_num**: Timer group number, 0 for TIMERG0 or 1 for TIMERG1
- **timer_num**: Timer index.
- **counter_en**: Enable/disable.

```c
timer_intr_t timer_group_intr_get_in_isr(timer_group_t group_num)
```
Get the masked interrupt status, just used in ISR.

Return
- Interrupt status

Parameters
- **group_num**: Timer group number, 0 for TIMERG0 or 1 for TIMERG1

```c
uint32_t timer_group_get_intr_status_in_isr(timer_group_t group_num)
```
Get interrupt status, just used in ISR.

Return
- Interrupt status

Parameters
- **group_num**: Timer group number, 0 for TIMERG0 or 1 for TIMERG1

```c
void timer_group_clr_intr_sta_in_isr(timer_group_t group_num, timer_intr_t intr_mask)
```
Clear the masked interrupt status, just used in ISR.

Parameters
- **group_num**: Timer group number, 0 for TIMERG0 or 1 for TIMERG1
- **intr_mask**: Masked interrupt.

```c
bool timer_group_get_auto_reload_in_isr(timer_group_t group_num, timer_idx_t timer_num)
```
Get auto reload enable status, just used in ISR.

Return
- True Auto reload enabled
- False Auto reload disabled

Parameters
- **group_num**: Timer group number, 0 for TIMERG0 or 1 for TIMERG1
- **timer_num**: Timer index
Esp_err_t timer_spinlock_take(timer_group_t group_num)
    Take timer spinlock to enter critical protect.
    Note Depreciated, the recommended way is to use ISR callbacks instead, see timer_group_example_main
    Return
    • ESP_OK Success
    • ESP_ERR_INVALID_ARG Parameter error
    Parameters
    • group_num: Timer group number, 0 for TIMERG0 or 1 for TIMERG1

Esp_err_t timer_spinlock_give(timer_group_t group_num)
    Give timer spinlock to exit critical protect.
    Note Depreciated, the recommended way is to use ISR callbacks instead, see timer_group_example_main
    Return
    • ESP_OK Success
    • ESP_ERR_INVALID_ARG Parameter error
    Parameters
    • group_num: Timer group number, 0 for TIMERG0 or 1 for TIMERG1

Structures
struct timer_config_t
    Data structure with timer’s configuration settings.

Public Members

    timer_alarm_t alarm_en
        Timer alarm enable
    timer_start_t counter_en
        Counter enable
    timer_intr_mode_t intr_type
        Interrupt mode
    timer_count_dir_t counter_dir
        Counter direction
    timer_autoreload_t auto_reload
        Timer auto-reload
    timer_src_clk_t clk_src
        Selects source clock.
    uint32_t divider
        Counter clock divider

Macros

    TIMER_BASE_CLK
        Frequency of the clock on the input of the timer groups.
        Note This macro is not correct for Timer Groups with multiple clock sources (e.g. APB, XTAL) So please
don’t use it in your application, we keep it here only for backward compatible

Type Definitions

typedef bool (*timer_isr_t)(void *)
    Interrupt handle callback function. User need to retrun a bool value in callback.
    Return
    • True Do task yield at the end of ISR
    • False Not do task yield at the end of ISR
Note If you called FreeRTOS functions in callback, you need to return true or false based on the return value of argument `pxHigherPriorityTaskWoken`. For example, `xQueueSendFromISR` is called in callback, if the return value `pxHigherPriorityTaskWoken` of any FreeRTOS calls is `pdTRUE`, return true; otherwise return false.

**typedef** ` intr_handle_t | timer_isr_handle_t |

Interrupt handle, used in order to free the isr after use. Aliases to an int handle for now.

**Enumerations**

*enum timer_group_t*

Selects a Timer-Group out of 2 available groups.

*Values:*

- `TIMER_GROUP_0 = 0`
  - Hw timer group 0
- `TIMER_GROUP_1 = 1`
  - Hw timer group 1
- `TIMER_GROUP_MAX` – Maximum number of Hw timer groups

*enum timer_idx_t*

Select a hardware timer from timer groups.

*Values:*

- `TIMER_0 = 0`
  - Select timer0 of GROUPx
- `TIMER_1 = 1`
  - Select timer1 of GROUPx
- `TIMER_MAX`

*enum timer_intr_t*

Interrupt types of the timer.

*Values:*

- `TIMER_INTR_T0 = 1 << 0`
  - interrupt of timer 0
- `TIMER_INTR_T1 = 1 << 1`
  - interrupt of timer 1
- `TIMER_INTR_WDT = 1 << 2`
  - interrupt of watchdog
- `TIMER_INTR_NONE = 0`

*enum timer_count_dir_t*

Decides the direction of counter.

*Values:*

- `TIMER_COUNT_DOWN = GPTIMER_COUNT_DOWN`
  - Descending Count from cnt.high|cnt.low
- `TIMER_COUNT_UP = GPTIMER_COUNT_UP`
  - Ascending Count from Zero
- `TIMER_COUNT_MAX` – Maximum number of timer count directions

*enum timer_start_t*

Decides whether timer is on or paused.

*Values:*

**TIMER_PAUSE**
Pause timer counter

**TIMER_START**
Start timer counter

**enum timer_alarm_t**
Decides whether to enable alarm mode.

Values:

- **TIMER_ALARM_DIS** = 0
  Disable timer alarm

- **TIMER_ALARM_EN** = 1
  Enable timer alarm

**TIMER_ALARM_MAX**

**enum timer_intr_mode_t**
Select interrupt type if running in alarm mode.

Values:

- **TIMER_INTR_LEVEL** = 0
  Interrupt mode: level mode

**TIMER_INTR_MAX**

**enum timer_autoreload_t**
Select if Alarm needs to be loaded by software or automatically reload by hardware.

Values:

- **TIMER_AUTORELOAD_DIS** = 0
  Disable auto-reload: hardware will not load counter value after an alarm event

- **TIMER_AUTORELOAD_EN** = 1
  Enable auto-reload: hardware will load counter value after an alarm event

**TIMER_AUTORELOAD_MAX**

**enum timer_src_clk_t**
Select timer source clock.

Values:

- **TIMER_SRC_CLK_APB** = `GPTIMER_CLK_SRC_APB`
  Select APB as the source clock

- **TIMER_SRC_CLK_XTAL** = `GPTIMER_CLK_SRC_XTAL`
  Select XTAL as the source clock

**Header File**

- `components/hal/include/hal/timer_types.h`

**Enumerations**

**enum gptimer_clock_source_t**
GPTimer clock source.

**Note** The clock source listed here is not supported on all targets

**Note** User should select the clock source based on real requirements:
### Chapter 2. API Reference

#### GPTimer clock source

</tr>
</tbody>
</table>

**Values:**

- **GPTIMER_CLK_SRC_APB**
  Select APB as the source clock

- **GPTIMER_CLK_SRC_XTAL**
  Select XTAL as the source clock

#### enum gptimer_count_direction_t

GPTimer count direction.

**Values:**

- **GPTIMER_COUNT_DOWN**
  Decrease count value

- **GPTIMER_COUNT_UP**
  Increase count value

### 2.3.3 GPIO & RTC GPIO

#### Overview

The ESP32-S3 chip features 45 physical GPIO pads. Some GPIO pads cannot be used or do not have the corresponding pin on the chip package. For more details, see *ESP32-S3 Technical Reference Manual > IO MUX and GPIO Matrix (GPIO, IO_MUX) [PDF]*. Each pad can be used as a general purpose I/O or can be connected to an internal peripheral signal.

The table below provides more information on pin usage, and please note the comments in the table for GPIOs with restrictions.

</tbody>
</table>

Note:
- Strapping pin: GPIO0, GPIO3, GPIO45, and GPIO46 are strapping pins.
- SPI0/1: GPIO26-32 are usually used for SPI flash and PSRAM and not recommended for other uses. When using Octal Flash or Octal PSRAM or both, GPIO33-37 are connected to SPIIO4 ~ SPIIO7 and SPIDQS. Therefore on ESP32-S3R8 / ESP32-S3R8V board GPIO33~37 are also not recommended for other uses.
- USB-JTAG: GPIO 19 and 20 are used by USB-JTAG by default. In order to use them as GPIOs, USB-JTAG will be disabled by the drivers.

There is also separate “RTC GPIO” support, which functions when GPIOs are routed to the “RTC” low-power and analog subsystem. These pin functions can be used when:
- In deep sleep
- The *Ultra Low Power co-processor* is running
- Analog functions such as ADC/DAC/etc are in use.

**Application Example**

GPIO output and input interrupt example: *peripherals/gpio/generic_gpio*.

**API Reference - Normal GPIO**

**Header File**
- *components/driver/include/driver/gpio.h*

**Functions**
esp_err_t gpio_config(const gpio_config_t *pGPIOConfig)
    GPIO common configuration.
    Configure GPIO’s Mode, pull-up, pull-down, IntrType

    Return
    • ESP_OK success
    • ESP_ERR_INVALID_ARG Parameter error

    Parameters
    • pGPIOConfig: Pointer to GPIO configure struct

esp_err_t gpio_reset_pin(gpio_num_t gpio_num)
    Reset an gpio to default state (select gpio function, enable pullup and disable input and output).

    Note This function also configures the IOMUX for this pin to the GPIO function, and disconnects any other
    peripheral output configured via GPIO Matrix.
    Return Always return ESP_OK.
    Parameters
    • gpio_num: GPIO number.

esp_err_t gpio_set_intr_type(gpio_num_t gpio_num, gpio_int_type_t intr_type)
    GPIO set interrupt trigger type.

    Return
    • ESP_OK Success
    • ESP_ERR_INVALID_ARG Parameter error

    Parameters
    • gpio_num: GPIO number. If you want to set the trigger type of e.g. of GPIO16, gpio_num should
      be GPIO_NUM_16 (16);
    • intr_type: Interrupt type, select from gpio_int_type_t

esp_err_t gpio_intr_enable(gpio_num_t gpio_num)
    Enable GPIO module interrupt signal.

    Note Please do not use the interrupt of GPIO36 and GPIO39 when using ADC or Wi-Fi with sleep
    mode enabled. Please refer to the comments of adc1_get_raw. Please refer to section 3.11 of
    ‘ECO_and_Workarounds_for_Bugs_in_ESP32’ for the description of this issue. As a workaround, call
    adc_power_acquire() in the app. This will result in higher power consumption (by ~1mA), but will re-
    move the glitches on GPIO36 and GPIO39.
    Return
    • ESP_OK Success
    • ESP_ERR_INVALID_ARG Parameter error

    Parameters
    • gpio_num: GPIO number. If you want to enable an interrupt on e.g. GPIO16, gpio_num should
      be GPIO_NUM_16 (16);

esp_err_t gpio_intr_disable(gpio_num_t gpio_num)
    Disable GPIO module interrupt signal.

    Return
    • ESP_OK success
    • ESP_ERR_INVALID_ARG Parameter error

    Parameters
    • gpio_num: GPIO number. If you want to disable the interrupt of e.g. GPIO16, gpio_num should
      be GPIO_NUM_16 (16);

esp_err_t gpio_set_level(gpio_num_t gpio_num, uint32_t level)
    GPIO set output level.

    Return
    • ESP_OK Success
    • ESP_ERR_INVALID_ARG GPIO number error

    Parameters
    • gpio_num: GPIO number. If you want to set the output level of e.g. GPIO16, gpio_num should
      be GPIO_NUM_16 (16);
Chapter 2. API Reference

- level: Output level. 0: low; 1: high

```c
int gpio_get_level(gpio_num_t gpio_num)
```

GPIO get input level.

**Warning** If the pad is not configured for input (or input and output) the returned value is always 0.

**Return**
- 0 the GPIO input level is 0
- 1 the GPIO input level is 1

**Parameters**
- `gpio_num`: GPIO number. If you want to get the logic level of e.g. pin GPIO16, `gpio_num` should be GPIO_NUM_16 (16);

```c
esp_err_t gpio_set_direction(gpio_num_t gpio_num, gpio_mode_t mode)
```

GPIO set direction.

Configure GPIO direction, such as output_only, input_only, output_and_input

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG GPIO error

**Parameters**
- `gpio_num`: Configure GPIO pins number, it should be GPIO number. If you want to set direction of e.g. GPIO16, `gpio_num` should be GPIO_NUM_16 (16);
- `mode`: GPIO direction

```c
esp_err_t gpio_set_pull_mode(gpio_num_t gpio_num, gpio_pull_mode_t pull)
```

Configure GPIO pull-up/pull-down resistors.

Only pins that support both input & output have integrated pull-up and pull-down resistors. Input-only GPIOs 34-39 do not.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG : Parameter error

**Parameters**
- `gpio_num`: GPIO number. If you want to set pull up or down mode for e.g. GPIO16, `gpio_num` should be GPIO_NUM_16 (16);
- `pull`: GPIO pull up/down mode.

```c
esp_err_t gpio_wakeup_enable(gpio_num_t gpio_num, gpio_int_type_t intr_type)
```

Enable GPIO wake-up function.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- `gpio_num`: GPIO number.
- `intr_type`: GPIO wake-up type. Only GPIO_INTR_LOW_LEVEL or GPIO_INTR_HIGH_LEVEL can be used.

```c
esp_err_t gpio_wakeup_disable(gpio_num_t gpio_num)
```

Disable GPIO wake-up function.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- `gpio_num`: GPIO number

```c
esp_err_t gpio_isr_register(void (*fn)(void *) void *
, void *arg, int intr_alloc_flags, gpio_isr_handle_t *handle)
```

Register GPIO interrupt handler, the handler is an ISR. The handler will be attached to the same CPU core that this function is running on.
This ISR function is called whenever any GPIO interrupt occurs. See the alternative gpio_install_isr_service() and gpio_isr_handler_add() API in order to have the driver support per-GPIO ISRs.

To disable or remove the ISR, pass the returned handle to the interrupt allocation functions.

**Parameters**
- fn: Interrupt handler function.
- arg: Parameter for handler function
- intr_alloc_flags: Flags used to allocate the interrupt. One or multiple (ORred) ESP_INTR_FLAG_* values. See esp_intr_alloc.h for more info.
- handle: Pointer to return handle. If non-NULL, a handle for the interrupt will be returned here.

**Return**
- ESP_OK Success;
- ESP_ERR_INVALID_ARG GPIO error
- ESP_ERR_NOT_FOUND No free interrupt found with the specified flags

```c
esp_err_t gpio_pullup_en(gpio_num_t gpio_num)
```
Enable pull-up on GPIO.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- gpio_num: GPIO number

```c
esp_err_t gpio_pullup_dis(gpio_num_t gpio_num)
```
Disable pull-up on GPIO.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- gpio_num: GPIO number

```c
esp_err_t gpio_pulldown_en(gpio_num_t gpio_num)
```
Enable pull-down on GPIO.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- gpio_num: GPIO number

```c
esp_err_t gpio_pulldown_dis(gpio_num_t gpio_num)
```
Disable pull-down on GPIO.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- gpio_num: GPIO number

```c
esp_err_t gpio_install_isr_service(int intr_alloc_flags)
```
Install the driver’s GPIO ISR handler service, which allows per-pin GPIO interrupt handlers.

This function is incompatible with gpio_isr_register() - if that function is used, a single global ISR is registered for all GPIO interrupts. If this function is used, the ISR service provides a global GPIO ISR and individual pin handlers are registered via the gpio_isr_handler_add() function.

**Return**
- ESP_OK Success
- ESP_ERR_NO_MEM No memory to install this service
- ESP_ERR_INVALID_STATE ISR service already installed.
- ESP_ERR_NOT_FOUND No free interrupt found with the specified flags
• ESP_ERR_INVALID_ARG_GPIO error

Parameters
• intr_alloc_flags: Flags used to allocate the interrupt. One or multiple (ORred) ESP_INTR_FLAG_* values. See esp_intr_alloc.h for more info.

void gpio_uninstall_isr_service(void)
Uninstall the driver’s GPIO ISR service, freeing related resources.

gpio_isr_handler_add (gpio_num_t gpio_num, gpio_isr_t isr_handler, void *args)
Add ISR handler for the corresponding GPIO pin.

Call this function after using gpio_install_isr_service() to install the driver’s GPIO ISR handler service.

The pin ISR handlers no longer need to be declared with IRAM_ATTR, unless you pass the ESP_INTR_FLAG_IRAM flag when allocating the ISR in gpio_install_isr_service().

This ISR handler will be called from an ISR. So there is a stack size limit (configurable as “ISR stack size” in menuconfig). This limit is smaller compared to a global GPIO interrupt handler due to the additional level of indirection.

Return
• ESP_OK Success
• ESP_ERR_INVALID_STATE Wrong state, the ISR service has not been initialized.
• ESP_ERR_INVALID_ARG Parameter error

Parameters
• gpio_num: GPIO number
• isr_handler: ISR handler function for the corresponding GPIO number.
• args: parameter for ISR handler.

gpio_isr_handler_remove (gpio_num_t gpio_num)
Remove ISR handler for the corresponding GPIO pin.

Return
• ESP_OK Success
• ESP_ERR_INVALID_STATE Wrong state, the ISR service has not been initialized.
• ESP_ERR_INVALID_ARG Parameter error

Parameters
• gpio_num: GPIO number

gpio_set_drive_capability (gpio_num_t gpio_num, gpio_drive_cap_t strength)
Set GPIO pad drive capability.

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

Parameters
• gpio_num: GPIO number, only support output GPIOs
• strength: Drive capability of the pad

gpio_get_drive_capability (gpio_num_t gpio_num, gpio_drive_cap_t *strength)
Get GPIO pad drive capability.

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

Parameters
• gpio_num: GPIO number, only support output GPIOs
• strength: Pointer to accept drive capability of the pad

gpio_hold_en (gpio_num_t gpio_num)
Enable gpio pad hold function.

The gpio pad hold function works in both input and output modes, but must be output-capable gpios. If pad hold enabled: in output mode: the output level of the pad will be force locked and can not be changed. in input mode: the input value read will not change, regardless the changes of input signal.
The state of digital gpio cannot be held during Deep-sleep, and it will resume the hold function when the chip wakes up from Deep-sleep. If the digital gpio also needs to be held during Deep-sleep, `gpio_deep_sleep_hold_en` should also be called.

Power down or call `gpio_hold_dis` will disable this function.

Return
- ESP_OK Success
- ESP_ERR_NOT_SUPPORTED Not support pad hold function

Parameters
- `gpio_num`: GPIO number, only support output-capable GPIOs

```
esp_err_t gpio_hold_dis (gpio_num_t gpio_num)
```
Disable gpio pad hold function.

When the chip is woken up from Deep-sleep, the gpio will be set to the default mode, so, the gpio will output the default level if this function is called. If you don’t want the level changes, the gpio should be configured to a known state before this function is called. e.g. If you hold gpio18 high during Deep-sleep, after the chip is woken up and `gpio_hold_dis` is called, gpio18 will output low level (because gpio18 is input mode by default). If you don’t want this behavior, you should configure gpio18 as output mode and set it to high level before calling `gpio_hold_dis`.

Return
- ESP_OK Success
- ESP_ERR_NOT_SUPPORTED Not support pad hold function

Parameters
- `gpio_num`: GPIO number, only support output-capable GPIOs

```
void gpio_deep_sleep_hold_en (void)
```
Enable all digital gpio pad hold function during Deep-sleep.

When the chip is in Deep-sleep mode, all digital gpio will hold the state before sleep, and when the chip is woken up, the status of digital gpio will not be held. Note that the pad hold feature only works when the chip is in Deep-sleep mode, when not in sleep mode, the digital gpio state can be changed even you have called this function.

Power down or call `gpio_hold_dis` will disable this function, otherwise, the digital gpio hold feature works as long as the chip enter Deep-sleep.

```
void gpio_deep_sleep_hold_dis (void)
```
Disable all digital gpio pad hold function during Deep-sleep.

```
void gpio_iomux_in (uint32_t gpio_num, uint32_t signal_idx)
```
Set pad input to a peripheral signal through the IOMUX.

Parameters
- `gpio_num`: GPIO number of the pad.
- `signal_idx`: Peripheral signal id to input. One of the *_IN_IDX signals in soc/gpio_sig_map.h.

```
void gpio_iomux_out (uint8_t gpio_num, int func, bool oen_inv)
```
Set peripheral output to an GPIO pad through the IOMUX.

Parameters
- `gpio_num`: gpio_num GPIO number of the pad.
- `func`: The function number of the peripheral pin to output pin. One of the FUNC_X_* of specified pin (X) in soc/io_mux_reg.h.
- `oen_inv`: True if the output enable needs to be inverted, otherwise False.

```
esp_err_t gpio_force_hold_all (void)
```
Force hold digital and rtc gpio pad.

Note GPIO force hold, whether the chip in sleep mode or wakeup mode.

```
esp_err_t gpio_force_unhold_all (void)
```
Force unhold digital and rtc gpio pad.
Note GPIO force unhold, whether the chip in sleep mode or wakeup mode.

```c
esp_err_t gpio_sleep_sel_en(gpio_num_t gpio_num)
```

Enable SLP_SEL to change GPIO status automatically in lightsleep.

**Return**
- ESP_OK Success

**Parameters**
- `gpio_num`: GPIO number of the pad.

```c
esp_err_t gpio_sleep_sel_dis(gpio_num_t gpio_num)
```

Disable SLP_SEL to change GPIO status automatically in lightsleep.

**Return**
- ESP_OK Success

**Parameters**
- `gpio_num`: GPIO number of the pad.

```c
esp_err_t gpio_sleep_set_direction(gpio_num_t gpio_num, gpio_mode_t mode)
```

GPIO set direction at sleep.

Configure GPIO direction, such as output_only, input_only, output_and_input

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG GPIO error

**Parameters**
- `gpio_num`: Configure GPIO pins number, it should be GPIO number. If you want to set direction of e.g. GPIO16, gpio_num should be GPIO_NUM_16 (16);
- `mode`: GPIO direction

```c
esp_err_t gpio_sleep_set_pull_mode(gpio_num_t gpio_num, gpio_pull_mode_t pull)
```

Configure GPIO pull-up/pull-down resistors at sleep.

Only pins that support both input & output have integrated pull-up and pull-down resistors. Input-only GPIOs 34-39 do not.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG : Parameter error

**Parameters**
- `gpio_num`: GPIO number. If you want to set pull up or down mode for e.g. GPIO16, gpio_num should be GPIO_NUM_16 (16);
- `pull`: GPIO pull up/down mode.

**Macros**

- `GPIO_PIN_COUNT`
- `GPIO_IS_VALID_GPIO(gpio_num)`
  
  Check whether it is a valid GPIO number.

- `GPIO_IS_VALID_OUTPUT_GPIO(gpio_num)`
  
  Check whether it can be a valid GPIO number of output mode.

**Type Definitions**

typedef `intr_handle_t gpio_isr_handle_t`

**Header File**

- `components/hal/include/hal/gpio_types.h`
Structures

`struct gpio_config_t`

Configuration parameters of GPIO pad for `gpio_config` function.

Public Members

`uint64_t pin_bit_mask`

GPIO pin: set with bit mask, each bit maps to a GPIO

### API Reference - RTC GPIO

#### Header File

- components/driver/include/driver/rtc_io.h

#### Functions

- **static bool rtc_gpio_is_valid_gpio (gpio_num_t gpio_num)**
  
  Determine if the specified GPIO is a valid RTC GPIO.

  **Return**
  - true if GPIO is valid for RTC GPIO use.
  - false otherwise.

  **Parameters**
  - gpio_num: GPIO number

- **static int rtc_io_number_get (gpio_num_t gpio_num)**
  
  Get RTC IO index number by gpio number.

  **Return**
  - >=0: Index of rtcio.
  - -1: The gpio is not rtcio.

  **Parameters**
  - gpio_num: GPIO number

- **esp_err_t rtc_gpio_init (gpio_num_t gpio_num)**
  
  Init a GPIO as RTC GPIO.

  This function must be called when initializing a pad for an analog function.

  **Return**
  - ESP_OK success
  - ESP_ERR_INVALID_ARG GPIO is not an RTC IO

  **Parameters**
  - gpio_num: GPIO number (e.g. GPIO_NUM_12)

- **esp_err_t rtc_gpio_deinit (gpio_num_t gpio_num)**
  
  Init a GPIO as digital GPIO.

  **Return**
  - ESP_OK success
  - ESP_ERR_INVALID_ARG GPIO is not an RTC IO

  **Parameters**
  - gpio_num: GPIO number (e.g. GPIO_NUM_12)

- **uint32_t rtc_gpio_get_level (gpio_num_t gpio_num)**
  
  Get the RTC IO input level.

  **Return**
  - 1 High level
  - 0 Low level
  - ESP_ERR_INVALID_ARG GPIO is not an RTC IO

  **Parameters**
  - gpio_num: GPIO number (e.g. GPIO_NUM_12)

- **esp_err_t rtc_gpio_set_level (gpio_num_t gpio_num, uint32_t level)**
  
  Set the RTC IO output level.
Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG GPIO is not an RTC IO

Parameters
• gpio_num: GPIO number (e.g. GPIO_NUM_12)
• level: output level

```
esp_err_t rtc_gpio_set_direction (gpio_num_t gpio_num, rtc_gpio_mode_t mode)
```

RTC GPIO set direction.
Configure RTC GPIO direction, such as output only, input only, output and input.

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG GPIO is not an RTC IO

Parameters
• gpio_num: GPIO number (e.g. GPIO_NUM_12)
• mode: GPIO direction

```
esp_err_t rtc_gpio_set_direction_in_sleep (gpio_num_t gpio_num, rtc_gpio_mode_t mode)
```

RTC GPIO set direction in deep sleep mode or disable sleep status (default). In some application scenarios, IO needs to have another states during deep sleep.

NOTE: ESP32 support INPUT_ONLY mode. ESP32S2 support INPUT_ONLY, OUTPUT_ONLY, INPUT_OUTPUT mode.

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG GPIO is not an RTC IO

Parameters
• gpio_num: GPIO number (e.g. GPIO_NUM_12)
• mode: GPIO direction

```
esp_err_t rtc_gpio_pullup_en (gpio_num_t gpio_num)
```

RTC GPIO pullup enable.
This function only works for RTC IOs. In general, call gpio_pullup_en, which will work both for normal GPIOs and RTC IOs.

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG GPIO is not an RTC IO

Parameters
• gpio_num: GPIO number (e.g. GPIO_NUM_12)

```
esp_err_t rtc_gpio_pulldown_en (gpio_num_t gpio_num)
```

RTC GPIO pulldown enable.
This function only works for RTC IOs. In general, call gpio_pulldown_en, which will work both for normal GPIOs and RTC IOs.

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG GPIO is not an RTC IO

Parameters
• gpio_num: GPIO number (e.g. GPIO_NUM_12)

```
esp_err_t rtc_gpio_pullup_dis (gpio_num_t gpio_num)
```

RTC GPIO pullup disable.
This function only works for RTC IOs. In general, call gpio_pullup_dis, which will work both for normal GPIOs and RTC IOs.

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG GPIO is not an RTC IO
Parameters
- gpio_num: GPIO number (e.g. GPIO_NUM_12)

esp_err_t rtc_gpio_pulldown_dis (gpio_num_t gpio_num)

RTC GPIO pulldown disable.
This function only works for RTC IOs. In general, call gpio_pulldown_dis, which will work both for normal
GPIOs and RTC IOs.

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG GPIO is not an RTC IO

Parameters
- gpio_num: GPIO number (e.g. GPIO_NUM_12)

esp_err_t rtc_gpio_set_drive_capability (gpio_num_t gpio_num, gpio_drive_cap_t strength)

Set RTC GPIO pad drive capability.

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters
- gpio_num: GPIO number, only support output GPIOs
- strength: Drive capability of the pad

esp_err_t rtc_gpio_get_drive_capability (gpio_num_t gpio_num, gpio_drive_cap_t *strength)

Get RTC GPIO pad drive capability.

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters
- gpio_num: GPIO number, only support output GPIOs
- strength: Pointer to accept drive capability of the pad

esp_err_t rtc_gpio_hold_en (gpio_num_t gpio_num)

Enable hold function on an RTC IO pad.
Enabling HOLD function will cause the pad to latch current values of input enable, output enable, output value,
function, drive strength values. This function is useful when going into light or deep sleep mode to prevent the
pin configuration from changing.

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG GPIO is not an RTC IO

Parameters
- gpio_num: GPIO number (e.g. GPIO_NUM_12)

esp_err_t rtc_gpio_hold_dis (gpio_num_t gpio_num)

Disable hold function on an RTC IO pad.
Disabling hold function will allow the pad receive the values of input enable, output enable, output value,
function, drive strength from RTC_IO peripheral.

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG GPIO is not an RTC IO

Parameters
- gpio_num: GPIO number (e.g. GPIO_NUM_12)

esp_err_t rtc_gpio_isolate (gpio_num_t gpio_num)

Helper function to disconnect internal circuits from an RTC IO This function disables input, output, pullup,
pulldown, and enables hold feature for an RTC IO. Use this function if an RTC IO needs to be disconnected
from internal circuits in deep sleep, to minimize leakage current.
In particular, for ESP32-WROVER module, call \texttt{rtc_gpio_isolate(GPIO\_NUM\_12)} before entering deep sleep, to reduce deep sleep current.

**Return**
- ESP\_OK on success
- ESP\_ERR\_INVALID\_ARG if GPIO is not an RTC IO

**Parameters**
- \texttt{gpio\_num}: GPIO number (e.g. GPIO\_NUM\_12).

\begin{verbatim}
esp_err_t rtc_gpio_force_hold_all (void)
Enable force hold signal for all RTC IOs.

Each RTC pad has a “force hold” input signal from the RTC controller. If this signal is set, pad latches current values of input enable, function, output enable, and other signals which come from the RTC mux. Force hold signal is enabled before going into deep sleep for pins which are used for EXT1 wakeup.
\end{verbatim}

\begin{verbatim}
esp_err_t rtc_gpio_force_hold_dis_all (void)
Disable force hold signal for all RTC IOs.
\end{verbatim}

\begin{verbatim}
esp_err_t rtc_gpio_wakeup_enable (gpio_num_t gpio_num, gpio_int_type_t intr_type)
Enable wakeup from sleep mode using specific GPIO.

Return
- ESP\_OK on success
- ESP\_ERR\_INVALID\_ARG if gpio\_num is not an RTC IO, or intr\_type is not one of GPIO\_INTR\_HIGH\_LEVEL, GPIO\_INTR\_LOW\_LEVEL.

Parameters
- \texttt{gpio\_num}: GPIO number
- \texttt{intr\_type}: Wakeup on high level (GPIO\_INTR\_HIGH\_LEVEL) or low level (GPIO\_INTR\_LOW\_LEVEL)
\end{verbatim}

\begin{verbatim}
esp_err_t rtc_gpio_wakeup_disable (gpio_num_t gpio_num)
Disable wakeup from sleep mode using specific GPIO.

Return
- ESP\_OK on success
- ESP\_ERR\_INVALID\_ARG if gpio\_num is not an RTC IO

Parameters
- \texttt{gpio\_num}: GPIO number
\end{verbatim}

**Macros**

\texttt{RTC\_GPIO\_IS\_VALID\_GPIO (gpio\_num)}

**Header File**

- \texttt{components/hal/include/hal/rtc\_io\_types.h}

**Enumerations**

\begin{verbatim}
enum rtc_gpio_mode_t

RTCIO output/input mode type.

Values:

RTC\_GPIO\_MODE\_INPUT\_ONLY
Pad input

RTC\_GPIO\_MODE\_OUTPUT\_ONLY
Pad output

RTC\_GPIO\_MODE\_INPUT\_OUTPUT
Pad input + output
\end{verbatim}
### Chapter 2. API Reference

**RTC_GPIO_MODE_DISABLED**
- Pad (output + input) disable

**RTC_GPIO_MODE_OUTPUT_OD**
- Pad open-drain output

**RTC_GPIO_MODE_INPUT_OUTPUT_OD**
- Pad input + open-drain output

#### 2.3.4 Dedicated GPIO

**Overview**

The dedicated GPIO is designed for CPU interaction with GPIO matrix and IOMUX. Any GPIO that is configured as “dedicated” can be accessed by CPU instructions directly, which makes it easy to achieve a high GPIO flip speed, and simulate serial/parallel interface in a bit-banging way. As toggling a GPIO in this “CPU Dedicated” way costs few overhead, it would be great for cases like performance measurement using an oscilloscope.

**Create/Destroy GPIO Bundle**

A GPIO bundle is a group of GPIOs, which can be manipulated at the same time in one CPU cycle. The maximal number of GPIOs that a bundle can contain is limited by each CPU. What’s more, the GPIO bundle has a strong relevance to the CPU which it derives from. **Any operations on the GPIO bundle should be put inside a task which is running on the same CPU core to the GPIO bundle belongs to.** Likewise, only those ISRs who are installed on the same CPU core are allowed to do operations on that GPIO bundle.

**Note:** Dedicated GPIO is more of a CPU peripheral, so it has a strong relationship with CPU core. It’s highly recommended to install and operate GPIO bundle in a pin-to-core task. For example, if GPIOA is connected to CPU0, and the dedicated GPIO instruction is issued from CPU1, then it’s impossible to control GPIOA.

To install a GPIO bundle, one needs to call `dedic_gpio_new_bundle()` to allocate the software resources and connect the dedicated channels to user selected GPIOs. Configurations for a GPIO bundle are covered in `dedic_gpio_bundle_config_t` structure:

- `gpio_array`: An array that contains GPIO number.
- `array_size`: Element number of `gpio_array`.
- `flags`: Extra flags to control the behavior of GPIO Bundle.
  - `in_en` and `out_en` are used to select whether to enable the input and output function (note, they can be enabled together).
  - `in_invert` and `out_invert` are used to select whether to invert the GPIO signal.

The following code shows how to install a output only GPIO bundle:

```c
// configure GPIO
const int bundleA_gpios[] = {0, 1};
gpio_config_t io_conf = {
    .mode = GPIO_MODE_OUTPUT,
};
for (int i = 0; i < sizeof(bundleA_gpios) / sizeof(bundleA_gpios[0]); i++) {
    io_conf.pin_bit_mask = 1ULL << bundleA_gpios[i];
    gpio_config(&io_conf);
}
// Create bundleA, output only
dedic_gpio_bundle_handle_t bundleA = NULL;
dedic_gpio_bundle_config_t bundleA_config = {
    .gpio_array = bundleA_gpios,
    .array_size = sizeof(bundleA_gpios) / sizeof(bundleA_gpios[0]),
    .flags = {
        in_en, out_en, in_invert, out_invert
    }
};
```
To uninstall the GPIO bundle, one needs to call `dedic_gpio_del_bundle()`.

**Note:** `dedic_gpio_new_bundle()` doesn’t cover any GPIO pad configuration (e.g. pull up/down, drive ability, output/input enable), so before installing a dedicated GPIO bundle, you have to configure the GPIO separately using GPIO driver API (e.g. `gpio_config()`). For more information about GPIO driver, please refer to **GPIO API Reference**.

### GPIO Bundle Operations

<table>
<thead>
<tr>
<th>Operations</th>
<th>Functions</th>
</tr>
</thead>
<tbody>
<tr>
<td>Write to GPIOs in the bundle by mask</td>
<td><code>dedic_gpio_bundle_write()</code></td>
</tr>
<tr>
<td>Read the value that input to bundle</td>
<td><code>dedic_gpio_bundle_read_out()</code></td>
</tr>
<tr>
<td>Read the value that output from bundle</td>
<td><code>dedic_gpio_bundle_read_in()</code></td>
</tr>
</tbody>
</table>

**Note:** The functions above just wrap the customized instructions defined for ESP32-S3, for the details of those instructions, please refer to **ESP32-S3 Technical Reference Manual > IO MUX and GPIO Matrix (GPIO, IO_MUX)** [PDF].

### Manipulate GPIOs by Writing Assembly Code

For advanced users, they can always manipulate the GPIOs by writing assembly code or invoking CPU Low Level APIs. The usual procedure could be:

1. Allocate a GPIO bundle: `dedic_gpio_new_bundle()`
2. Query the mask occupied by that bundle: `dedic_gpio_get_out_mask()` or/and `dedic_gpio_get_in_mask()`
3. Call CPU LL api(s e.g. `cpu_ll_write_dedic_gpio_mask`) or write assembly code with that mask
4. The fastest way of toggling IO is to use the dedicated “set/clear” instructions:

<table>
<thead>
<tr>
<th>CPU Arch</th>
<th>Set bits of GPIO</th>
<th>Clear bits of GPIO</th>
<th>Remarks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Xtensa</td>
<td>set_bit_gpio_out imm[7:0]</td>
<td>clr_bit_gpio_out imm[7:0]</td>
<td>immediate value width depends on the number of dedicated GPIO channels</td>
</tr>
<tr>
<td>RISC-V</td>
<td>csrri rd, csr, imm[4:0]</td>
<td>csrrc rd, csr, imm[4:0]</td>
<td>can only control the lowest 4 GPIO channels</td>
</tr>
</tbody>
</table>

For details of supported dedicated GPIO instructions, please refer to **ESP32-S3 Technical Reference Manual > IO MUX and GPIO Matrix (GPIO, IO_MUX)** [PDF]. The supported dedicated CPU instructions are also wrapped inside `soc/cpu_ll.h` as helper inline functions.

**Note:** Writing assembly code in application could make your code hard to port between targets, because those customized instructions are not guaranteed to remain the same format on different targets.
Chapter 2. API Reference

Application Example

Matrix keyboard example based on dedicated GPIO: peripherals/gpio/matrix_keyboard.

API Reference

Header File

- components/driver/include/driver/dedic_gpio.h

Functions

```c
esp_err_t dedic_gpio_get_out_mask(dedic_gpio_bundle_handle_t bundle, uint32_t* mask)
```

Get allocated channel mask.

**Return**
- ESP_OK: Get channel mask successfully
- ESP_ERR_INVALID_ARG: Get channel mask failed because of invalid argument
- ESP_FAIL: Get channel mask failed because of other error

**Note** Each bundle should have at least one mask (in or/and out), based on bundle configuration.

**Note** With the returned mask, user can directly invoke LL function like “cpu_ll_write_dedic_gpio_mask” or write assembly code with dedicated GPIO instructions, to get better performance on GPIO manipulation.

**Parameters**
- [in] bundle: Handle of GPIO bundle that returned from “dedic_gpio_new_bundle”
- [out] mask: Returned mask value for on specific direction (in or out)

```c
esp_err_t dedic_gpio_get_in_mask(dedic_gpio_bundle_handle_t bundle, uint32_t* mask)
```

```c
esp_err_t dedic_gpio_new_bundle(const dedic_gpio_bundle_config_t* config, dedic_gpio_bundle_handle_t* ret_bundle)
```

Create GPIO bundle and return the handle.

**Return**
- ESP_OK: Create GPIO bundle successfully
- ESP_ERR_INVALID_ARG: Create GPIO bundle failed because of invalid argument
- ESP_ERR_NO_MEM: Create GPIO bundle failed because of no capable memory
- ESP_ERR_NOT_FOUND: Create GPIO bundle failed because of no enough continuous dedicated channels
- ESP_FAIL: Create GPIO bundle failed because of other error

**Note** One has to enable at least input or output mode in “config” parameter.

**Parameters**
- [in] config: Configuration of GPIO bundle
- [out] ret_bundle: Returned handle of the new created GPIO bundle

```c
esp_err_t dedic_gpio_del_bundle(dedic_gpio_bundle_handle_t bundle)
```

Destory GPIO bundle.

**Return**
- ESP_OK: Destory GPIO bundle successfully
- ESP_ERR_INVALID_ARG: Destory GPIO bundle failed because of invalid argument
- ESP_FAIL: Destory GPIO bundle failed because of other error

**Parameters**
- [in] bundle: Handle of GPIO bundle that returned from “dedic_gpio_new_bundle”

```c
void dedic_gpio_bundle_write(dedic_gpio_bundle_handle_t bundle, uint32_t mask, uint32_t value)
```

Write value to GPIO bundle.

**Note** The mask is seen from the view of GPIO bundle. For example, bundleA contains [GPIO10, GPIO12, GPIO17], to set GPIO17 individually, the mask should be 0x04.

**Note** For performance reasons, this function doesn’t check the validity of any parameters, and is placed in IRAM.

**Parameters**
Chapter 2. API Reference

- [in] `bundle`: Handle of GPIO bundle that returned from “dedic_gpio_new_bundle”
- [in] `mask`: Mask of the GPIOs to be written in the given bundle
- [in] `value`: Value to write to given GPIO bundle, low bit represents low member in the bundle

```c
uint32_t dedic_gpio_bundle_read_out (dedic_gpio_bundle_handle_t bundle)
```
Read the value that output from the given GPIO bundle.

**Return** Value that output from the GPIO bundle, low bit represents low member in the bundle

**Note** For performance reasons, this function doesn’t check the validity of any parameters, and is placed in IRAM.

**Parameters**
- [in] `bundle`: Handle of GPIO bundle that returned from “dedic_gpio_new_bundle”

```c
uint32_t dedic_gpio_bundle_read_in (dedic_gpio_bundle_handle_t bundle)
```
Read the value that input to the given GPIO bundle.

**Return** Value that input to the GPIO bundle, low bit represents low member in the bundle

**Note** For performance reasons, this function doesn’t check the validity of any parameters, and is placed in IRAM.

**Parameters**
- [in] `bundle`: Handle of GPIO bundle that returned from “dedic_gpio_new_bundle”

**Structures**

```c
struct dedic_gpio_bundle_config_t
```
Type of Dedicated GPIO bundle configuration.

**Public Members**

```c
const int *gpio_array
```
Array of GPIO numbers, gpio_array[0] ~ gpio_array[size-1] <=> low_dedic_channel_num ~ high_dedic_channel_num

```c
size_t array_size
```
Number of GPIOs in gpio_array

```c
unsigned int in_en : 1
```
Enable input

```c
unsigned int in_invert : 1
```
Invert input signal

```c
unsigned int out_en : 1
```
Enable output

```c
unsigned int out_invert : 1
```
Invert output signal

```c
struct dedic_gpio_bundle_config_t::[anonymous] flags
```
Flags to control specific behaviour of GPIO bundle

**Type Definitions**

```c
typedef struct dedic_gpio_bundle_t *dedic_gpio_bundle_handle_t
```
Type of Dedicated GPIO bundle.

### 2.3.5 Hash-based Message Authentication Code (HMAC)

The HMAC (Hash-based Message Authentication Code) module provides hardware acceleration for SHA256-HMAC generation using a key burned into an eFuse block. HMACs work with pre-shared secret keys and provide authenticity and integrity to a message.
For more detailed information on the application workflow and the HMAC calculation process, see ESP32-S3 Technical Reference Manual > HMAC Accelerator (HMAC) [PDF].

**Generalized Application Scheme**

Let there be two parties, A and B. They want to verify the authenticity and integrity of messages sent between each other. Before they can start sending messages, they need to exchange the secret key via a secure channel. To verify A’s messages, B can do the following:

- A calculates the HMAC of the message it wants to send.
- A sends the message and the HMAC to B.
- B calculates HMAC of the received message itself.
- B checks whether the received and calculated MACs match. If they do match, the message is authentic.

However, the HMAC itself isn’t bound to this use case. It can also be used for challenge-response protocols supporting HMAC or as a key input for further security modules (see below), etc.

**HMAC on the ESP32-S3**

On the ESP32-S3, the HMAC module works with a secret key burnt into the eFuses. This eFuse key can be made completely inaccessible for any resources outside the cryptographic modules, thus avoiding key leakage.

Furthermore, the ESP32-S3 has three different application scenarios for its HMAC module:

1. HMAC is generated for software use
2. HMAC is used as a key for the Digital Signature (DS) module
3. HMAC is used for enabling the soft-disabled JTAG interface

The first mode is also called *Upstream* mode, while the last two modes are also called *Downstream* modes.

**eFuse Keys for HMAC**  Six physical eFuse blocks can be used as keys for the HMAC module: block 4 up to block 9. The enum `hmac_key_id_t` in the API maps them to `HMAC_KEY0 · · · HMAC_KEY5`. Each key has a corresponding eFuse parameter *key purpose* determining for which of the three HMAC application scenarios (see below) the key may be used:

<table>
<thead>
<tr>
<th>Key Purpose</th>
<th>Application Scenario</th>
</tr>
</thead>
<tbody>
<tr>
<td>8</td>
<td>HMAC generated for software use</td>
</tr>
<tr>
<td>7</td>
<td>HMAC used as a key for the Digital Signature (DS) module</td>
</tr>
<tr>
<td>6</td>
<td>HMAC used for enabling the soft-disabled JTAG interface</td>
</tr>
<tr>
<td>5</td>
<td>HMAC both as a key for the DS module and for enabling JTAG</td>
</tr>
</tbody>
</table>

This is to prevent the usage of a key for a different function than originally intended.

To calculate an HMAC, the software has to provide the ID of the key block containing the secret key as well as the *key purpose* (see ESP32-S3 Technical Reference Manual > eFuse Controller (eFuse) [PDF]). Before the HMAC key calculation, the HMAC module looks up the purpose of the provided key block. The calculation only proceeds if the provided key purpose matches the purpose stored in the eFuses of the key block provided by the ID.

**HMAC Generation for Software**  Key Purpose value: 8

In this case, the HMAC is given out to the software (e.g. to authenticate a message).

The API to calculate the HMAC is `esp_hmac_calculate()`. Only the message, message length and the eFuse key block ID have to be provided to that function. The rest, like setting the key purpose, is done automatically.
HMAC for Digital Signature  Key Purpose values: 7, 5

The HMAC can be used as a key derivation function to decrypt private key parameters which are used by the Digital Signature module. A standard message is used by the hardware in that case. The user only needs to provide the eFuse key block and purpose on the HMAC side (additional parameters are required for the Digital Signature component in that case). Neither the key nor the actual HMAC are ever exposed to outside the HMAC module and DS component. The calculation of the HMAC and its hand-over to the DS component happen internally.

For more details, see ESP32-S3 Technical Reference Manual > Digital Signature (DS) [PDF].

HMAC for Enabling JTAG  Key Purpose values: 6, 5

The third application is using the HMAC as a key to enable JTAG if it was soft-disabled before. Following is the procedure to re-enable the JTAG

Setup

1. Generate a 256-bit HMAC secret key to use for JTAG re-enable.
2. Write the key to an eFuse block with key purpose HMAC_DOWN_ALL (5) or HMAC_DOWN_JTAG (6). This can be done using the ets_efuse_write_key() function in the firmware or using espfuse.py from the host.
3. Configure the eFuse key block to be read protected using the esp_efuse_set_read_protect(), so that software cannot read back the value.
4. Burn the “soft JTAG disable” bit by esp_efuse_write_field_bit(ESP_EFUSE_SOFT_DIS_JTAG). This will permanently disable JTAG unless the correct key value is provided by software.

JTAG enable

1. The key to re-enable JTAG is the output of the HMAC-SHA256 function using the secret key in eFuse and 32 0x00 bytes as the message.
2. Pass this key value when calling the esp_hmac_jtag_enable() function from the firmware.
3. To re-disable JTAG in the firmware, reset the system or call esp_hmac_jtag_disable().

For more details, see ESP32-S3 Technical Reference Manual > HMAC Accelerator (HMAC) [PDF].

Application Outline

Following code is an outline of how to set an eFuse key and then use it to calculate an HMAC for software usage. We use ets_efuse_write_key to set physical key block 4 in the eFuse for the HMAC module together with its purpose. ETS_EFUSE_KEY_PURPOSE_HMAC_UP (8) means that this key can only be used for HMAC generation for software usage:

```c
#include "esp32s3/rom/efuse.h"

const uint8_t key_data[32] = { ... };

int ets_status = ets_efuse_write_key(ETS_EFUSE_BLOCK_KEY4,
ETS_EFUSE_KEY_PURPOSE_HMAC_UP,
key_data, sizeof(key_data));

if (ets_status == ESP_OK) {
    // written key
} else {
    // writing key failed, maybe written already
}
```

Now we can use the saved key to calculate an HMAC for software usage.

```c
#include "esp_hmac.h"

uint8_t hmac[32];

const char *message = "Hello, HMAC!";
```

(continues on next page)
```c
const size_t msg_len = 12;

esp_err_t result = esp_hmac_calculate(HMAC_KEY4, message, msg_len, hmac);

if (result == ESP_OK) {
    // HMAC written to hmac now
} else {
    // failure calculating HMAC
}
```

**API Reference**

**Header File**

- components/esp_hw_support/include/soc/esp32s3/esp_hmac.h

**Functions**

`esp_err_t esp_hmac_calculate(hmac_key_id_t key_id, const void *message, size_t message_len, uint8_t *hmac)`

Calculate the HMAC of a given message.

Calculate the HMAC hmac of a given message `message` with length `message_len`. SHA256 is used for the calculation (fixed on ESP32S3).

**Note** Uses the HMAC peripheral in “upstream” mode.

**Return**

- ESP_OK, if the calculation was successful,
- ESP_ERR_INVALID_ARG if message or hmac is a nullptr or if key_id out of range
- ESP_FAIL, if the hmac calculation failed

**Parameters**

- `key_id`: Determines which of the 6 key blocks in the efuses should be used for the HMAC calculation. The corresponding purpose field of the key block in the efuse must be set to the HMAC upstream purpose value.
- `message`: the message for which to calculate the HMAC
- `message_len`: message length
- `[out] hmac`: the hmac result; the buffer behind the provided pointer must be 32 bytes long

`esp_err_t esp_hmac_jtag_enable(hmac_key_id_t key_id, const uint8_t *token)`

Use HMAC peripheral in Downstream mode to re-enable the JTAG, if it is not permanently disabled by HW. In downstream mode, HMAC calculations performed by peripheral are used internally and not provided back to user.

**Return**

- ESP_OK, if the calculation was successful, if the calculated HMAC value matches with provided token, JTAG will be re-enable otherwise JTAG will remain disabled. Return value does not indicate the JTAG status.
- ESP_FAIL, if the hmac calculation failed or JTAG is permanently disabled by EFUSE_HARD_DIS_JTAG eFuse parameter.
- ESP_ERR_INVALID_ARG, invalid input arguments

**Parameters**

- `key_id`: Determines which of the 6 key blocks in the efuses should be used for the HMAC calculation. The corresponding purpose field of the key block in the efuse must be set to HMAC downstream purpose.
- `token`: Pre calculated HMAC value of the 32-byte 0x00 using SHA-256 and the known private HMAC key. The key is already programmed to a eFuse key block. The key block number is provided as the first parameter to this function.

`esp_err_t esp_hmac_jtag_disable(void)`

Disable the JTAG which might be enabled using the HMAC downstream mode. This function just clears the
result generated by calling esp_hmac_jtag_enable() API.

Return

- ESP_OK return ESP_OK after writing the HMAC_SET_INVALIDATE_JTAG_REG with value 1.

Enumerations

```c
enum hmac_key_id_t
{
    HMAC_KEY0 = 0,
    HMAC_KEY1,
    HMAC_KEY2,
    HMAC_KEY3,
    HMAC_KEY4,
    HMAC_KEY5,
    HMAC_KEY_MAX
};
```

2.3.6 Digital Signature (DS)

The Digital Signature (DS) module provides hardware acceleration of signing messages based on RSA. It uses pre-encrypted parameters to calculate a signature. The parameters are encrypted using HMAC as a key-derivation function. In turn, the HMAC uses eFuses as input key. The whole process happens in hardware so that neither the decryption key for the RSA parameters nor the input key for the HMAC key derivation function can be seen by the software while calculating the signature.

For more detailed information on the hardware involved in signature calculation and the registers used, see ESP32-S3 Technical Reference Manual > Digital Signature (DS) [PDF].

Private Key Parameters

The private key parameters for the RSA signature are stored in flash. To prevent unauthorized access, they are AES-encrypted. The HMAC module is used as a key-derivation function to calculate the AES encryption key for the private key parameters. In turn, the HMAC module uses a key from the eFuses key block which can be read-protected to prevent unauthorized access as well.

Upon signature calculation invocation, the software only specifies which eFuse key to use, the corresponding eFuse key purpose, the location of the encrypted RSA parameters and the message.

Key Generation

Both the HMAC key and the RSA private key have to be created and stored before the DS peripheral can be used. This needs to be done in software on the ESP32-S3 or alternatively on a host. For this context, the IDF provides esp_efuse_write_block() to set the HMAC key and esp_hmac_calculate() to encrypt the private RSA key parameters.

You can find instructions on how to calculate and assemble the private key parameters in ESP32-S3 Technical Reference Manual > Digital Signature (DS) [PDF].
Chapter 2. API Reference

Signature Calculation with IDF

For more detailed information on the workflow and the registers used, see ESP32-S3 Technical Reference Manual > Digital Signature (DS) [PDF].

Three parameters need to be prepared to calculate the digital signature:

1. the eFuse key block ID which is used as key for the HMAC,
2. the location of the encrypted private key parameters,
3. and the message to be signed.

Since the signature calculation takes some time, there are two possible API versions to use in IDF. The first one is esp_ds_sign() and simply blocks until the calculation is finished. If software needs to do something else during the calculation, esp_ds_start_sign() can be called, followed by periodic calls to esp_ds_is_busy() to check when the calculation has finished. Once the calculation has finished, esp_ds_finish_sign() can be called to get the resulting signature.

Note: Note that this is only the basic DS building block, the message length is fixed. To create signatures of arbitrary messages, the input is normally a hash of the actual message, padded up to the required length. An API to do this is planned in the future.

Configure the DS peripheral for a TLS connection

The DS peripheral on ESP32-S3 chip must be configured before it can be used for a TLS connection. The configuration involves the following steps -

1) Randomly generate a 256 bit value called the Initialization Vector (IV).
2) Randomly generate a 256 bit value called the HMAC_KEY.
3) Calculate the encrypted private key parameters from the client private key (RSA) and the parameters generated in the above steps.
4) Then burn the 256 bit HMAC_KEY on the eFuse, which can only be read by the DS peripheral.

For more details, see ESP32-S3 Technical Reference Manual > Digital Signature (DS) [PDF].

To configure the DS peripheral for development purposes, you can use the python script configure_ds.py. More details about the configure_ds.py script can be found at mqtt example README.

The encrypted private key parameters obtained after the DS peripheral configuration are then to be kept in flash. Furthermore, they are to be passed to the DS peripheral which makes use of those parameters for the Digital Signature operation. Non Volatile Storage can be used to store the encrypted private key parameters in flash. The script configure_ds.py creates an NVS partition for the encrypted private key parameters. Then the script flashes this partition onto the ESP32-S3. The application then needs to read the DS data from NVS, which can be done with the function esp_read_ds_data_from_nvs in file ssl Mutual_auth/main/app_main.c

The process of initializing the DS peripheral and then performing the Digital Signature operation is done internally with help of ESP-TLS. Please refer to Digital Signature with ESP-TLS in ESP-TLS for more details. As mentioned in the ESP-TLS documentation, the application only needs to provide the encrypted private key parameters to the esp_tls context (as ds_data), which internally performs all necessary operations for initializing the DS peripheral and then performing the DS operation.

Example for SSL Mutual Authentication using DS

The example ssl ds shows how to use the DS peripheral for mutual authentication. The example uses mqtt_client (Implemented through ESP-MQTT) to connect to broker test.mosquitto.org using ssl transport with mutual authentication. The ssl part is internally performed with ESP-TLS. See example README for more details.
Chapter 2. API Reference

API Reference

Header File

- components/esp_hw_support/include/soc/esp32s3/esp_ds.h

Functions

```c
esp_err_t esp_ds_sign(const void *message, const esp_ds_data_t *data, hmac_key_id_t key_id, void *signature)
```

Sign the message.

This function is a wrapper around `esp_ds_finish_sign()` and `esp_ds_start_sign()`, so do not use them in parallel. It blocks until the signing is finished and then returns the signature.

**Note** This function locks the HMAC, SHA, AES and RSA components during its entire execution time.

**Return**

- ESP_OK if successful, the signature was written to the parameter `signature`
- ESP_ERR_INVALID_ARG if one of the parameters is NULL or `data->rsa_length` is too long or 0
- ESP_ERR_HW_CRYPTO_DS_HMAC_FAIL if there was an HMAC failure during retrieval of the decryption key
- ESP_ERR_NO_MEM if there hasn’t been enough memory to allocate the context object
- ESP_ERR_HW_CRYPTO_DS_INVALID_KEY if there’s a problem with passing the HMAC key to the DS component
- ESP_ERR_HW_CRYPTO_DS_INVALID_DIGEST if the message digest didn’t match; the signature is invalid.
- ESP_ERR_HW_CRYPTO_DS_INVALID_PADDING if the message padding is incorrect, the signature can be read though since the message digest matches.

**Parameters**

- message: the message to be signed; its length is determined by `data->rsa_length`
- data: the encrypted signing key data (AES encrypted RSA key + IV)
- key_id: the HMAC key ID determining the HMAC key of the HMAC which will be used to decrypt the signing key data
- signature: the destination of the signature, should be `(data->rsa_length + 1)*4` bytes long

```c
esp_err_t esp_ds_start_sign(const void *message, const esp_ds_data_t *data, hmac_key_id_t key_id, esp_ds_context_t **esp_ds_ctx)
```

Start the signing process.

This function yields a context object which needs to be passed to `esp_ds_finish_sign()` to finish the signing process.

**Note** This function locks the HMAC, SHA, AES and RSA components, so the user has to ensure to call `esp_ds_finish_sign()` in a timely manner.

**Return**

- ESP_OK if successful, the ds operation was started now and has to be finished with `esp_ds_finish_sign()`
- ESP_ERR_INVALID_ARG if one of the parameters is NULL or `data->rsa_length` is too long or 0
- ESP_ERR_HW_CRYPTO_DS_HMAC_FAIL if there was an HMAC failure during retrieval of the decryption key
- ESP_ERR_NO_MEM if there hasn’t been enough memory to allocate the context object
- ESP_ERR_HW_CRYPTO_DS_INVALID_KEY if there’s a problem with passing the HMAC key to the DS component

**Parameters**

- message: the message to be signed; its length is determined by `data->rsa_length`
- data: the encrypted signing key data (AES encrypted RSA key + IV)
- key_id: the HMAC key ID determining the HMAC key of the HMAC which will be used to decrypt the signing key data
- esp_ds_ctx: the context object which is needed for finishing the signing process later

```c
bool esp_ds_is_busy(void)
```

Return true if the DS peripheral is busy, otherwise false.
Note Only valid if `esp_ds_start_sign()` was called before.

`esp_err_t esp_ds_finish_sign(void *signature, esp_ds_context_t *esp_ds_ctx)`

Finish the signing process.

Return

- ESP_OK if successful, the ds operation has been finished and the result is written to signature.
- ESP_ERR_INVALID_ARG if one of the parameters is NULL
- ESP_ERR_HW_CRYPTO_DS_INVALID_DIGEST if the message digest didn’t match; the signature is invalid.
- ESP_ERR_HW_CRYPTO_DS_INVALID_PADDING if the message padding is incorrect, the signature can be read though since the message digest matches.

Parameters

- `signature`: the destination of the signature, should be (data->rsa_length + 1) * 4 bytes long
- `esp_ds_ctx`: the context object retrieved by `esp_ds_start_sign()`

`esp_err_t esp_ds_encrypt_params(esp_ds_data_t *data, const void *iv, const esp_ds_p_data_t *p_data, const void *key)`

Encrypt the private key parameters.

Return

- ESP_OK if successful, the ds operation has been finished and the result is written to signature.
- ESP_ERR_INVALID_ARG if one of the parameters is NULL or p_data->rsa_length is too long

Parameters

- `data`: Output buffer to store encrypted data, suitable for later use generating signatures. The allocated memory must be in internal memory and word aligned since it’s filled by DMA. Both is asserted at run time.
- `iv`: Pointer to 16 byte IV buffer, will be copied into ‘data’. Should be randomly generated bytes each time.
- `p_data`: Pointer to input plaintext key data. The expectation is this data will be deleted after this process is done and ‘data’ is stored.
- `key`: Pointer to 32 bytes of key data. Type determined by key_type parameter. The expectation is the corresponding HMAC key will be stored to efuse and then permanently erased.

Structures

`struct esp_digital_signature_data`

Encrypted private key data. Recommended to store in flash in this format.

Note This struct has to match to one from the ROM code! This documentation is mostly taken from there.

Public Members

`esp_digital_signature_length_t rsa_length`

RSA LENGTH register parameters (number of words in RSA key & operands, minus one).

Max value 127 (for RSA 4096).

This value must match the length field encrypted and stored in ‘c’, or invalid results will be returned. (The DS peripheral will always use the value in ‘c’, not this value, so an attacker can’t alter the DS peripheral results this way, it will just truncate or extend the message and the resulting signature in software.)

Note In IDF, the enum type length is the same as of type unsigned, so they can be used interchangably. See the ROM code for the original declaration of struct ets_ds_data_t.

uint8_t iv[ESP_DS_IV_LEN]

IV value used to encrypt ‘c’

uint8_t c[ESP_DS_C_LEN]

Encrypted Digital Signature parameters. Result of AES-CBC encryption of plaintext values. Includes an encrypted message digest.
Chapter 2. API Reference

struct esp_ds_p_data_t
Plain text parameters used by Digital Signature.
Not used for signing with DS peripheral, but can be encrypted in-device by calling esp_ds_encrypt_params()

Note This documentation is mostly taken from the ROM code.

Public Members

uint32_t Y[(4096) / 32]
RSA exponent.

uint32_t M[(4096) / 32]
RSA modulus.

uint32_t Rb[(4096) / 32]
RSA r inverse operand.

uint32_t M_prime
RSA M prime operand.

esp_digital_signature_length_t length
RSA length.

Macros

ESP32S3_ERR_HW_CRYPTO_DS_HMAC_FAIL
HMAC peripheral problem

ESP32S3_ERR_HW_CRYPTO_DS_INVALID_KEY
given HMAC key isn’t correct, HMAC peripheral problem

ESP32S3_ERR_HW_CRYPTO_DS_INVALID_DIGEST
message digest check failed, result is invalid

ESP32S3_ERR_HW_CRYPTO_DS_INVALID_PADDING
padding check failed, but result is produced anyway and can be read

ESP_DS_IV_LEN
ESP_DS_C_LEN

Type Definitions

typedef struct esp_ds_context esp_ds_context_t
Encrypted private key data. Recommended to store in flash in this format.

Note This struct has to match to one from the ROM code! This documentation is mostly taken from there.

Enumerations

enum esp_digital_signature_length_t

Values:

ESP_DS_RSA_1024 = (1024 / 32) - 1
ESP_DS_RSA_2048 = (2048 / 32) - 1
ESP_DS_RSA_3072 = (3072 / 32) - 1
ESP_DS_RSA_4096 = (4096 / 32) - 1
2.3.7 Inter-Integrated Circuit (I2C)

Overview

I2C is a serial, synchronous, half-duplex communication protocol that allows coexistence of multiple masters and slaves on the same bus. The I2C bus consists of two lines: serial data line (SDA) and serial clock (SCL). Both lines require pull-up resistors.

With such advantages as simplicity and low manufacturing cost, I2C is mostly used for communication of low-speed peripheral devices over short distances (within one foot).

ESP32-S3 has two I2C controllers (also referred to as ports) which are responsible for handling communications on the I2C bus. Each I2C controller can operate as master or slave. As an example, one controller can act as a master and the other as a slave at the same time.

Driver Features

I2C driver governs communications of devices over the I2C bus. The driver supports the following features:

- Reading and writing bytes in Master mode
- Slave mode
- Reading and writing to registers which are in turn read/written by the master

Driver Usage

The following sections describe typical steps of configuring and operating the I2C driver:

1. **Configuration** - set the initialization parameters (master or slave mode, GPIO pins for SDA and SCL, clock speed, etc.)
2. **Install Driver** - activate the driver on one of the two I2C controllers as a master or slave
3. Depending on whether you configure the driver for a master or slave, choose the appropriate item
   a) **Communication as Master** - handle communications (master)
   b) **Communication as Slave** - respond to messages from the master (slave)
4. **Interrupt Handling** - configure and service I2C interrupts
5. **Customized Configuration** - adjust default I2C communication parameters (timings, bit order, etc.)
6. **Error Handling** - how to recognize and handle driver configuration and communication errors
7. **Delete Driver** - release resources used by the I2C driver when communication ends

Configuration

To establish I2C communication, start by configuring the driver. This is done by setting the parameters of the structure `i2c_config_t`:

- Set I2C mode of operation - slave or master from `i2c_mode_t`
- Configure communication pins
  - Assign GPIO pins for SDA and SCL signals
  - Set whether to enable ESP32-S3’s internal pull-ups
- (Master only) Set I2C clock speed
- (Slave only) Configure the following
  - Whether to enable 10 bit address mode
  - Define slave address

After that, initialize the configuration for a given I2C port. For this, call the function `i2c_param_config()` and pass to it the port number and the structure `i2c_config_t`.

Configuration example (master):

```c
int i2c_master_port = 0;
i2c_config_t conf = {
    .mode = I2C_MODE_MASTER,
    .sda_io_num = I2C_MASTER_SDA_IO, // select GPIO specific to your project
    .scl_io_num = I2C_MASTER_SCL_IO,
    .scl_pullup = 1,
    .sda_pullup = 1,
    .clock_speed_hz = 100000,
    .bit_order = I2C_BIT_ORDER_MSBFIRST,
    .addr = I2C_ADDR_DEFAULT,
    .timeout = I2C_TIMEOUT_DEFAULT
};
```
Chapter 2. API Reference

(continued from previous page)

```c
.sda_pullup_en = GPIO_PULLUP_ENABLE,
.scl_io_num = I2C_MASTER_SCL_IO,  // select GPIO specific to your...
// project
.scl_pullup_en = GPIO_PULLUP_ENABLE,
.master.clk_speed = I2C_MASTER_FREQ_HZ,  // select frequency specific to your...
// project
// .clk_flags = 0,  /*! Optional, you can use I2C_SCLK_SRC_FLAG_*
// flags to choose 12c source clock here. */
```

Configuration example (slave):

```c
int i2c_slave_port = I2C_SLAVE_NUM;
i2c_config_t conf_slave = {
  .sda_io_num = I2C_SLAVE_SDA_IO,  // select GPIO specific to your...
  .sda_pullup_en = GPIO_PULLUP_ENABLE,
  .scl_io_num = I2C_SLAVE_SCL_IO,  // select GPIO specific to your...
  .scl_pullup_en = GPIO_PULLUP_ENABLE,
  .mode = I2C_MODE_SLAVE,
  .slave.addr_10bit_en = 0,
  .slave.slave_addr = ESP_SLAVE_ADDR,  // address of your project
};
```

At this stage, `i2c_param_config()` also sets a few other I2C configuration parameters to default values that are defined by the I2C specification. For more details on the values and how to modify them, see Customized Configuration.

**Source Clock Configuration**  
Clock sources allocator is added for supporting different clock sources. The clock allocator will choose one clock source that meets all the requirements of frequency and capability (as requested in `i2c_config_t::clk_flags`).

When `i2c_config_t::clk_flags` is 0, the clock allocator will select only according to the desired frequency. If no special capabilities are needed, such as APB, you can configure the clock allocator to select the source clock only according to the desired frequency. For this, set `i2c_config_t::clk_flags` to 0. For clock characteristics, see the table below.

Note: A clock is not a valid option, if it doesn’t meet the requested capabilities, i.e. any bit of requested capabilities (clk_flags) is 0 in the clock’s capabilities.

<table>
<thead>
<tr>
<th>Clock name</th>
<th>Clock frequency</th>
<th>MAX freq for SCL</th>
<th>Clock capabilities</th>
</tr>
</thead>
<tbody>
<tr>
<td>XTAL clock</td>
<td>40 MHz</td>
<td>2 MHz</td>
<td>/</td>
</tr>
<tr>
<td>RTC clock</td>
<td>20 MHz</td>
<td>1 MHz</td>
<td>I2C_SCLK_SRC_FLAG_AWARE_DFS, I2C_SCLK_SRC_FLAG_LIGHT_SLEEP</td>
</tr>
</tbody>
</table>

Explanations for `i2c_config_t::clk_flags` are as follows:

1. `I2C_SCLK_SRC_FLAG_AWARE_DFS`: Clock’s baud rate will not change while APB clock is changing.
2. `I2C_SCLK_SRC_FLAG_LIGHT_SLEEP`: It supports Light-sleep mode, which APB clock cannot do.
3. Some flags may not be supported on ESP32-S3, reading technical reference manual before using it.
Note: The clock frequency of SCL in master mode should not be larger than max frequency for SCL mentioned in the table above.

Install Driver  
After the I2C driver is configured, install it by calling the function `i2c_driver_install()` with the following parameters:

- Port number, one of the two port numbers from `i2c_port_t`
- Master or slave, selected from `i2c_mode_t`
- (Slave only) Size of buffers to allocate for sending and receiving data. As I2C is a master-centric bus, data can only go from the slave to the master at the master’s request. Therefore, the slave will usually have a send buffer where the slave application writes data. The data remains in the send buffer to be read by the master at the master’s own discretion.
- Flags for allocating the interrupt (see `ESP_INTR_FLAG_*` values in `esp_hw_support/include/esp_intr_alloc.h`)

Communication as Master  
After installing the I2C driver, ESP32-S3 is ready to communicate with other I2C devices.

ESP32-S3’s I2C controller operating as master is responsible for establishing communication with I2C slave devices and sending commands to trigger a slave to action, for example, to take a measurement and send the readings back to the master.

For better process organization, the driver provides a container, called a “command link”, that should be populated with a sequence of commands and then passed to the I2C controller for execution.

Master Write  
The example below shows how to build a command link for an I2C master to send n bytes to a slave.

![Fig. 5: I2C command link - master write example](image)

The following describes how a command link for a “master write” is set up and what comes inside:

1. Create a command link with `i2c_cmd_link_create()`. Then, populate it with the series of data to be sent to the slave:
   a) Start bit - `i2c_master_start()`
   b) Slave address - `i2c_master_write_byte()`. The single byte address is provided as an argument of this function call.
   c) Data - One or more bytes as an argument of `i2c_master_write()`
   d) Stop bit - `i2c_master_stop()`
Both functions `i2c_master_write_byte()` and `i2c_master_write()` have an additional argument specifying whether the master should ensure that it has received the ACK bit.

2. Trigger the execution of the command link by I2C controller by calling `i2c_master_cmd_begin()`. Once the execution is triggered, the command link cannot be modified.

3. After the commands are transmitted, release the resources used by the command link by calling `i2c_cmd_link_delete()`.

**Master Read**  The example below shows how to build a command link for an I2C master to read \( n \) bytes from a slave.

![Fig. 6: I2C command link - master read example](image)

Compared to writing data, the command link is populated in Step 4 not with `i2c_master_write()` functions but with `i2c_master_read_byte()` and/or `i2c_master_read()`. Also, the last read in Step 5 is configured so that the master does not provide the ACK bit.

**Indicating Write or Read**  After sending a slave address (see Step 3 on both diagrams above), the master either writes or reads from the slave.

The information on what the master will actually do is hidden in the least significant bit of the slave’s address.

For this reason, the command link sent by the master to write data to the slave contains the address `(ESP_SLAVE_ADDR << 1) | I2C_MASTER_WRITE` and looks as follows:

```c
i2c_master_write_byte(cmd, (ESP_SLAVE_ADDR << 1) | I2C_MASTER_WRITE, ACK_EN);
```

Likewise, the command link to read from the slave looks as follows:

```c
i2c_master_write_byte(cmd, (ESP_SLAVE_ADDR << 1) | I2C_MASTER_READ, ACK_EN);
```

**Communication as Slave**  After installing the I2C driver, ESP32-S3 is ready to communicate with other I2C devices.

The API provides the following functions for slaves

- `i2c_slave_read_buffer()`  Whenever the master writes data to the slave, the slave will automatically store it in the receive buffer. This allows the slave application to call the function `i2c_slave_read_buffer()` at its own discretion. This function also has a parameter to specify block time if no data is in the receive buffer. This will allow the slave application to wait with a specified timeout for data to arrive to the buffer.

- `i2c_slave_write_buffer()`
The send buffer is used to store all the data that the slave wants to send to the master in FIFO order. The data stays there until the master requests for it. The function `i2c_slave_write_buffer()` has a parameter to specify block time if the send buffer is full. This will allow the slave application to wait with a specified timeout for the adequate amount of space to become available in the send buffer.

A code example showing how to use these functions can be found in `peripherals/i2c`.

**Interrupt Handling**  During driver installation, an interrupt handler is installed by default. However, you can register your own interrupt handler instead of the default one by calling the function `i2c_isr_register()`. When implementing your own interrupt handler, refer to [ESP32-S3 Technical Reference Manual > I2C Controller (I2C) > Interrupts][1] for the description of interrupts triggered by the I2C controller.

To delete an interrupt handler, call `i2c_isr_free()`.

**Customized Configuration**  As mentioned at the end of Section *Configuration*, when the function `i2c_param_config()` initializes the driver configuration for an I2C port, it also sets several I2C communication parameters to default values defined in the *I2C specification*. Some other related parameters are pre-configured in registers of the I2C controller.

All these parameters can be changed to user-defined values by calling dedicated functions given in the table below. Please note that the timing values are defined in APB clock cycles. The frequency of APB is specified in `I2C_APB_CLK_FREQ`.

<table>
<thead>
<tr>
<th>Parameters to Change</th>
<th>Function</th>
</tr>
</thead>
<tbody>
<tr>
<td>High time and low time for SCL pulses</td>
<td><code>i2c_set_period()</code></td>
</tr>
<tr>
<td>SCL and SDA signal timing used during generation of <strong>start</strong> signals</td>
<td><code>i2c_set_start_timing()</code></td>
</tr>
<tr>
<td>SCL and SDA signal timing used during generation of <strong>stop</strong> signals</td>
<td><code>i2c_set_stop_timing()</code></td>
</tr>
<tr>
<td>Timing relationship between SCL and SDA signals when slave samples, as well as when master toggles</td>
<td><code>i2c_set_data_timing()</code></td>
</tr>
<tr>
<td>I2C timeout</td>
<td><code>i2c_set_timeout()</code></td>
</tr>
<tr>
<td>Choice between transmitting / receiving the LSB or MSB first, choose one of the modes defined in <code>i2c_trans_mode_t</code></td>
<td><code>i2c_set_data_mode()</code></td>
</tr>
</tbody>
</table>

Each of the above functions has a `_get_` counterpart to check the currently set value. For example, to check the I2C timeout value, call `i2c_get_timeout()`.

To check the default parameter values which are set during the driver configuration process, please refer to the file `driver/i2c.c` and look for defines with the suffix `_DEFAULT`.

You can also select different pins for SDA and SCL signals and alter the configuration of pull-ups with the function `i2c_set_pin()`. If you want to modify already entered values, use the function `i2c_param_config()`.

**Note:** ESP32-S3’s internal pull-ups are in the range of tens of kOhm, which is, in most cases, insufficient for use as I2C pull-ups. Users are advised to use external pull-ups with values described in the *I2C specification*.

**Error Handling**  The majority of I2C driver functions either return `ESP_OK` on successful completion or a specific error code on failure. It is a good practice to always check the returned values and implement error handling. The driver also prints out log messages that contain error details, e.g., when checking the validity of entered configuration. For details please refer to the file `driver/i2c.c` and look for defines with the suffix `_ERR_STR`.

Use dedicated interrupts to capture communication failures. For instance, if a slave stretches the clock for too long while preparing the data to send back to master, the interrupt `I2C_TIME_OUT_INT` will be triggered. For detailed information, see *Interrupt Handling*.
In case of a communication failure, you can reset the internal hardware buffers by calling the functions `i2c_reset_tx_fifo()` and `i2c_reset_rx_fifo()` for the send and receive buffers respectively.

**Delete Driver** When the I2C communication is established with the function `i2c_driver_install()` and is not required for some substantial amount of time, the driver may be deinitialized to release allocated resources by calling `i2c_driver_delete()`.

Before calling `i2c_driver_delete()` to remove i2c driver, please make sure that all threads have stopped using the driver in any way, because this function does not guarantee thread safety.

**Application Example**

I2C master and slave example: `peripherals/i2c`.

**API Reference**

**Header File**

- components/driver/include/driver/i2c.h

**Functions**

- `esp_err_t i2c_driver_install(i2c_port_t i2c_num, i2c_mode_t mode, size_t slv_rx_buf_len, size_t slv_tx_buf_len, int intr_alloc_flags)`
  - Install an I2C driver.
  - **Note** In master mode, if the cache is likely to be disabled (such as write flash) and the slave is time-sensitive, ESP_INTR_FLAG_IRAM is suggested to be used. In this case, please use the memory allocated from internal RAM in i2c read and write function, because we cannot access the psram (if psram is enabled) in interrupt handle function when cache is disabled.
  - **Return**
    - ESP_OK Success
    - ESP_ERR_INVALID_ARG Parameter error
    - ESP_FAIL Driver installation error
  - **Parameters**
    - `i2c_num`: I2C port number
    - `mode`: I2C mode (either master or slave)
    - `slv_rx_buf_len`: Receiving buffer size. Only slave mode will use this value, it is ignored in master mode.
    - `slv_tx_buf_len`: Sending buffer size. Only slave mode will use this value, it is ignored in master mode.
    - `intr_alloc_flags`: Flags used to allocate the interrupt. One or multiple (ORred) ESP_INTR_FLAG_* values. See esp_intr_alloc.h for more info.

- `esp_err_t i2c_driver_delete(i2c_port_t i2c_num)`
  - Delete I2C driver.
  - **Note** This function does not guarantee thread safety. Please make sure that no thread will continuously hold semaphores before calling the delete function.
  - **Return**
    - ESP_OK Success
    - ESP_ERR_INVALID_ARG Parameter error
  - **Parameters**
    - `i2c_num`: I2C port to delete

- `esp_err_t i2c_param_config(i2c_port_t i2c_num, const i2c_config_t *i2c_conf)`
  - Configure an I2C bus with the given configuration.
  - **Return**
    - ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

Parameters
• i2c_num: I2C port to configure
• i2c_conf: Pointer to the I2C configuration

`esp_err_t i2c_reset_tx_fifo(i2c_port_t i2c_num)`
reset I2C tx hardware fifo

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

Parameters
• i2c_num: I2C port number

`esp_err_t i2c_reset_rx_fifo(i2c_port_t i2c_num)`
reset I2C rx fifo

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

Parameters
• i2c_num: I2C port number

`esp_err_t i2c_isr_register(i2c_port_t i2c_num, void(*fn)(void *arg, int intr_alloc_flags, intr_handle_t *handle), void *arg, int intr_alloc_flags, intr_handle_t *handle)`
Register an I2C ISR handler.

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

Parameters
• i2c_num: I2C port number to attach handler to
• fn: ISR handler function
• arg: Parameter for the ISR handler
• intr_alloc_flags: Flags used to allocate the interrupt. One or multiple (ORred) ESP_INTR_FLAG_* values. See esp_intr_alloc.h for more info.
• handle: Handle return from esp_intr_alloc.

`esp_err_t i2c_isr_free(intr_handle_t handle)`
Delete and free I2C ISR handle.

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

Parameters
• handle: Handle of isr to delete.

`esp_err_t i2c_set_pin(i2c_port_t i2c_num, int sda_io_num, int scl_io_num, bool sda_pullup_en, bool scl_pullup_en, i2c_mode_t mode)`
Configure GPIO pins for I2C SCK and SDA signals.

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

Parameters
• i2c_num: I2C port number
• sda_io_num: GPIO number for I2C SDA signal
• scl_io_num: GPIO number for I2C SCL signal
• sda_pullup_en: Enable the internal pullup for SDA pin
• scl_pullup_en: Enable the internal pullup for SCL pin
• mode: I2C mode

`esp_err_t i2c_master_write_to_device(i2c_port_t i2c_num, uint8_t device_address, const uint8_t *write_buffer, size_t write_size, TickType_t ticks_to_wait)`
Perform a write to a device connected to a particular I2C port. This function is a wrapper to `i2c_master_start()`, `i2c_master_write()`, `i2c_master_read()`, etc—It shall only be called in I2C master mode.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_FAIL Sending command error, slave hasn’t ACK the transfer.
- ESP_ERR_INVALID_STATE I2C driver not installed or not in master mode.
- ESP_ERR_TIMEOUT Operation timeout because the bus is busy.

**Parameters**
- `i2c_num`: I2C port number to perform the transfer on
- `device_address`: I2C device’s 7-bit address
- `write_buffer`: Bytes to send on the bus
- `write_size`: Size, in bytes, of the write buffer
- `ticks_to_wait`: Maximum ticks to wait before issuing a timeout.

```c
esp_err_t i2c_master_read_from_device(i2c_port_t i2c_num, uint8_t device_address, uint8_t *read_buffer, size_t read_size, TickType_t ticks_to_wait)
```

Perform a read to a device connected to a particular I2C port. This function is a wrapper to `i2c_master_start()`, `i2c_master_write()`, `i2c_master_read()`, etc—It shall only be called in I2C master mode.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_FAIL Sending command error, slave hasn’t ACK the transfer.
- ESP_ERR_INVALID_STATE I2C driver not installed or not in master mode.
- ESP_ERR_TIMEOUT Operation timeout because the bus is busy.

**Parameters**
- `i2c_num`: I2C port number to perform the transfer on
- `device_address`: I2C device’s 7-bit address
- `read_buffer`: Buffer to store the bytes received on the bus
- `read_size`: Size, in bytes, of the read buffer
- `ticks_to_wait`: Maximum ticks to wait before issuing a timeout.

```c
esp_err_t i2c_master_write_read_device(i2c_port_t i2c_num, uint8_t device_address, const uint8_t *write_buffer, size_t write_size, uint8_t *read_buffer, size_t read_size, TickType_t ticks_to_wait)
```

Perform a write followed by a read to a device on the I2C bus. A repeated start signal is used between the write and read, thus, the bus is not released until the two transactions are finished. This function is a wrapper to `i2c_master_start()`, `i2c_master_write()`, `i2c_master_read()`, etc—It shall only be called in I2C master mode.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_FAIL Sending command error, slave hasn’t ACK the transfer.
- ESP_ERR_INVALID_STATE I2C driver not installed or not in master mode.
- ESP_ERR_TIMEOUT Operation timeout because the bus is busy.

**Parameters**
- `i2c_num`: I2C port number to perform the transfer on
- `device_address`: I2C device’s 7-bit address
- `write_buffer`: Bytes to send on the bus
- `write_size`: Size, in bytes, of the write buffer
- `read_buffer`: Buffer to store the bytes received on the bus
- `read_size`: Size, in bytes, of the read buffer
- `ticks_to_wait`: Maximum ticks to wait before issuing a timeout.

```c
i2c_cmd_handle_t i2c_cmd_link_create_static(uint8_t *buffer, uint32_t size)
```
Create and initialize an I2C commands list with a given buffer. All the allocations for data or signals (START, STOP, ACK, ...) will be performed within this buffer. This buffer must be valid during the whole transaction. After finishing the I2C transactions, it is required to call \texttt{i2c\_cmd\_link\_delete\_static()}.

\textbf{Note} It is highly advised to not allocate this buffer on the stack. The size of the data used underneath may increase in the future, resulting in a possible stack overflow as the macro \texttt{I2C\_LINK\_RECOMMENDED\_SIZE} would also return a bigger value. A better option is to use a buffer allocated statically or dynamically (with \texttt{malloc}).

\textbf{Return} Handle to the I2C command link or NULL if the buffer provided is too small, please use \texttt{I2C\_LINK\_RECOMMENDED\_SIZE} macro to get the recommended size for the buffer.

\begin{itemize}
  \item \texttt{buffer}: Buffer to use for commands allocations
  \item \texttt{size}: Size in bytes of the buffer
\end{itemize}

\begin{verbatim}
\textbf{int} \texttt{i2c\_cmd\_link\_create}(\texttt{void})
\end{verbatim}
Create and initialize an I2C commands list with a given buffer. After finishing the I2C transactions, it is required to call \texttt{i2c\_cmd\_link\_delete()} to release and return the resources. The required bytes will be dynamically allocated.

\textbf{Return} Handle to the I2C command link or NULL in case of insufficient dynamic memory.

\begin{verbatim}
\textbf{void} \texttt{i2c\_cmd\_link\_delete\_static}(\texttt{i2c\_cmd\_handle\_t cmd\_handle})
\end{verbatim}
Free the I2C commands list allocated statically with \texttt{i2c\_cmd\_link\_create\_static()}.

\begin{itemize}
  \item \texttt{cmd\_handle}: I2C commands list allocated statically. This handle should be created thanks to \texttt{i2c\_cmd\_link\_create\_static()} function
\end{itemize}

\begin{verbatim}
\textbf{void} \texttt{i2c\_cmd\_link\_delete}(\texttt{i2c\_cmd\_handle\_t cmd\_handle})
\end{verbatim}
Free the I2C commands list.

\begin{itemize}
  \item \texttt{cmd\_handle}: I2C commands list. This handle should be created thanks to \texttt{i2c\_cmd\_link\_create()} function
\end{itemize}

\begin{verbatim}
\textbf{esp\_err\_t} \texttt{i2c\_master\_start}(\texttt{i2c\_cmd\_handle\_t cmd\_handle})
\end{verbatim}
Queue a “START signal” to the given commands list. This function shall only be called in I2C master mode. Call \texttt{i2c\_master\_cmd\_begin()} to send all the queued commands.

\begin{itemize}
  \item \texttt{cmd\_handle}: I2C commands list
\end{itemize}

\begin{verbatim}
\textbf{esp\_err\_t} \texttt{i2c\_master\_write\_byte}(\texttt{i2c\_cmd\_handle\_t cmd\_handle}, \texttt{uint8\_t data}, \texttt{bool ack\_en})
\end{verbatim}
Queue a “write byte” command to the commands list. A single byte will be sent on the I2C port. This function shall only be called in I2C master mode. Call \texttt{i2c\_master\_cmd\_begin()} to send all queued commands.

\begin{itemize}
  \item \texttt{cmd\_handle}: I2C commands list
  \item \texttt{data}: Byte to send on the port
  \item \texttt{ack\_en}: Enable ACK signal
\end{itemize}

\begin{verbatim}
\textbf{esp\_err\_t} \texttt{i2c\_master\_write}(\texttt{i2c\_cmd\_handle\_t cmd\_handle}, \texttt{const uint8\_t *data}, \texttt{size\_t data\_len}, \texttt{bool ack\_en})
\end{verbatim}
Queue a “write (multiple) bytes” command to the commands list. This function shall only be called in I2C master mode. Call \texttt{i2c\_master\_cmd\_begin()} to send all queued commands.

\begin{itemize}
  \item \texttt{cmd\_handle}: I2C commands list
  \item \texttt{data}: Byte to send on the port
  \item \texttt{ack\_en}: Enable ACK signal
\end{itemize}
master mode. Call `i2c_master_cmd_begin()` to send all queued commands.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NO_MEM The static buffer used to create `cmd_handler` is too small
- ESP_FAIL No more memory left on the heap

**Parameters**
- `cmd_handle`: I2C commands list
- `data`: Bytes to send. This buffer shall remain valid until the transaction is finished. If the PSRAM is enabled and `intr_flag` is set to ESP_INTR_FLAG_IRAM, `data` should be allocated from internal RAM.
- `data_len`: Length, in bytes, of the data buffer
- `ack_en`: Enable ACK signal

```c
esp_err_t i2c_master_read_byte(i2c_cmd_handle_t cmd_handle, uint8_t* data, i2c_ack_type_t ack)
```

Queue a “read byte” command to the commands list. A single byte will be read on the I2C bus. This function shall only be called in I2C master mode. Call `i2c_master_cmd_begin()` to send all queued commands.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NO_MEM The static buffer used to create `cmd_handler` is too small
- ESP_FAIL No more memory left on the heap

**Parameters**
- `cmd_handle`: I2C commands list
- `data`: Pointer where the received byte will be stored. This buffer shall remain valid until the transaction is finished.
- `ack`: ACK signal

```c
esp_err_t i2c_master_read(i2c_cmd_handle_t cmd_handle, uint8_t* data, size_t data_len, i2c_ack_type_t ack)
```

Queue a “read (multiple) bytes” command to the commands list. Multiple bytes will be read on the I2C bus. This function shall only be called in I2C master mode. Call `i2c_master_cmd_begin()` to send all queued commands.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NO_MEM The static buffer used to create `cmd_handler` is too small
- ESP_FAIL No more memory left on the heap

**Parameters**
- `cmd_handle`: I2C commands list
- `data`: Pointer where the received bytes will be stored. This buffer shall remain valid until the transaction is finished.
- `data_len`: Size, in bytes, of the data buffer
- `ack`: ACK signal

```c
esp_err_t i2c_master_stop(i2c_cmd_handle_t cmd_handle)
```

Queue a “STOP signal” to the given commands list. This function shall only be called in I2C master mode. Call `i2c_master_cmd_begin()` to send all the queued commands.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NO_MEM The static buffer used to create `cmd_handler` is too small
- ESP_FAIL No more memory left on the heap

**Parameters**
- `cmd_handle`: I2C commands list

```c
esp_err_t i2c_master_cmd_begin(i2c_port_t i2c_num, i2c_cmd_handle_t cmd_handle, TickType_t ticks_to_wait)
```
Send all the queued commands on the I2C bus, in master mode. The task will be blocked until all the commands have been sent out. The I2C APIs are not thread-safe, if you want to use one I2C port in different tasks, you need to take care of the multi-thread issue. This function shall only be called in I2C master mode.

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_FAIL Sending command error, slave hasn’t ACK the transfer.
- ESP_ERR_INVALID_STATE I2C driver not installed or not in master mode.
- ESP_ERR_TIMEOUT Operation timeout because the bus is busy.

Parameters
- i2c_num: I2C port number
- cmd_handle: I2C commands list
- ticks_to_wait: Maximum ticks to wait before issuing a timeout.

int i2c_slave_write_buffer (i2c_port_t i2c_num, const uint8_t *data, int size, TickType_t ticks_to_wait)
Write bytes to internal ringbuffer of the I2C slave data. When the TX fifo empty, the ISR will fill the hardware FIFO with the internal ringbuffer’s data.

Note This function shall only be called in I2C slave mode.

Return
- ESP_FAIL (-1) Parameter error
- Other (>=0) The number of data bytes pushed to the I2C slave buffer.

Parameters
- i2c_num: I2C port number
- data: Bytes to write into internal buffer
- size: Size, in bytes, of data buffer
- ticks_to_wait: Maximum ticks to wait.

int i2c_slave_read_buffer (i2c_port_t i2c_num, uint8_t *data, size_t max_size, TickType_t ticks_to_wait)
Read bytes from I2C internal buffer. When the I2C bus receives data, the ISR will copy them from the hardware RX FIFO to the internal ringbuffer. Calling this function will then copy bytes from the internal ringbuffer to the data user buffer.

Note This function shall only be called in I2C slave mode.

Return
- ESP_FAIL(-1) Parameter error
- Others(>=0) The number of data bytes read from I2C slave buffer.

Parameters
- i2c_num: I2C port number
- data: Buffer to fill with ringbuffer’s bytes
- max_size: Maximum bytes to read
- ticks_to_wait: Maximum waiting ticks

esp_err_t i2c_set_period (i2c_port_t i2c_num, int high_period, int low_period)
Set I2C master clock period.

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters
- i2c_num: I2C port number
- high_period: Clock cycle number during SCL is high level, high_period is a 14 bit value
- low_period: Clock cycle number during SCL is low level, low_period is a 14 bit value

esp_err_t i2c_get_period (i2c_port_t i2c_num, int *high_period, int *low_period)
Get I2C master clock period.

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
### Parameters

- **i2c_num**: I2C port number
- **high_period**: pointer to get clock cycle number during SCL is high level, will get a 14 bit value
- **low_period**: pointer to get clock cycle number during SCL is low level, will get a 14 bit value

#### esp_err_t i2c_filter_enable(i2c_port_t i2c_num, uint8_t cyc_num)

Enable hardware filter on I2C bus. Sometimes the I2C bus is disturbed by high frequency noise (about 20ns), or the rising edge of the SCL clock is very slow, these may cause the master state machine to break. Enable hardware filter can filter out high frequency interference and make the master more stable.

**Note**

Enable filter will slow down the SCL clock.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**

- **i2c_num**: I2C port number to filter
- **cyc_num**: the APB cycles need to be filtered \((0 <= cyc\_num <= 7)\). When the period of a pulse is less than cyc_num \* APB\_cycle, the I2C controller will ignore this pulse.

#### esp_err_t i2c_filter_disable(i2c_port_t i2c_num)

Disable filter on I2C bus.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**

- **i2c_num**: I2C port number

#### esp_err_t i2c_set_start_timing(i2c_port_t i2c_num, int setup_time, int hold_time)

Set I2C master start signal timing.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**

- **i2c_num**: I2C port number
- **setup_time**: clock number between the falling-edge of SDA and rising-edge of SCL for start mark, it’s a 10-bit value.
- **hold_time**: clock number between the falling-edge of SDA and falling-edge of SCL for start mark, it’s a 10-bit value.

#### esp_err_t i2c_get_start_timing(i2c_port_t i2c_num, int* setup_time, int* hold_time)

Get I2C master start signal timing.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**

- **i2c_num**: I2C port number
- **setup_time**: pointer to get setup time
- **hold_time**: pointer to get hold time

#### esp_err_t i2c_set_stop_timing(i2c_port_t i2c_num, int setup_time, int hold_time)

Set I2C master stop signal timing.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**

- **i2c_num**: I2C port number
- **setup_time**: clock number between the rising-edge of SCL and the rising-edge of SDA, it’s a 10-bit value.
- **hold_time**: clock number after the STOP bit’s rising-edge, it’s a 14-bit value.

```c
esp_err_t i2c_get_stop_timing(i2c_port_t i2c_num, int *setup_time, int *hold_time)

get I2C master stop signal timing

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

Parameters
• i2c_num: I2C port number
• setup_time: pointer to get setup time.
• hold_time: pointer to get hold time.

esp_err_t i2c_set_data_timing(i2c_port_t i2c_num, int sample_time, int hold_time)

set I2C data signal timing

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

Parameters
• i2c_num: I2C port number
• sample_time: clock number I2C used to sample data on SDA after the rising-edge of SCL, it’s a 10-bit value
• hold_time: clock number I2C used to hold the data after the falling-edge of SCL, it’s a 10-bit value

esp_err_t i2c_get_data_timing(i2c_port_t i2c_num, int *sample_time, int *hold_time)

get I2C data signal timing

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

Parameters
• i2c_num: I2C port number
• sample_time: pointer to get sample time
• hold_time: pointer to get hold time

esp_err_t i2c_set_timeout(i2c_port_t i2c_num, int timeout)

set I2C timeout value

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

Parameters
• i2c_num: I2C port number
• timeout: timeout value for I2C bus (unit: APB 80Mhz clock cycle)

esp_err_t i2c_get_timeout(i2c_port_t i2c_num, int *timeout)

get I2C timeout value

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

Parameters
• i2c_num: I2C port number
• timeout: pointer to get timeout value

esp_err_t i2c_set_data_mode(i2c_port_t i2c_num, i2c_trans_mode_t tx_trans_mode, i2c_trans_mode_t rx_trans_mode)

set I2C data transfer mode

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

Parameters
• i2c_num: I2C port number
```
• **tx_trans_mode**: I2C sending data mode
• **rx_trans_mode**: I2C receiving data mode

```c
esp_err_t i2c_get_data_mode(i2c_port_t i2c_num, i2c_trans_mode_t *tx_trans_mode,
                            i2c_trans_mode_t *rx_trans_mode)
```

get I2C data transfer mode

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- `i2c_num`: I2C port number
- `tx_trans_mode`: pointer to get I2C sending data mode
- `rx_trans_mode`: pointer to get I2C receiving data mode

**Structures**

```c
struct i2c_config_t
I2C initialization parameters.
```

**Public Members**

```c
i2c_mode_t mode
I2C mode
```

```c
int sda_io_num
GPIO number for I2C sda signal
```

```c
int scl_io_num
GPIO number for I2C scl signal
```

```c
bool sda_pullup_en
Internal GPIO pull mode for I2C sda signal
```

```c
bool scl_pullup_en
Internal GPIO pull mode for I2C scl signal
```

```c
uint32_t clk_speed
I2C clock frequency for master mode, (no higher than 1MHz for now)
```

```c
struct i2c_config_t::[anonymous]::[anonymous] master
I2C master config
```

```c
uint8_t addr_10bit_en
I2C 10bit address mode enable for slave mode
```

```c
uint16_t slave_addr
I2C address for slave mode
```

```c
uint32_t maximum_speed
I2C expected clock speed from SCL.
```

```c
struct i2c_config_t::[anonymous]::[anonymous] slave
I2C slave config
```

```c
uint32_t clk_flags
Bitwise of I2C_SCLK_SRC_FLAG::*FOR_DFS** for clk source choice
```

**Macros**

```c
I2C_APB_CLK_FREQ
I2C source clock is APB clock, 80MHz
```

```c
I2C_NUM_MAX
I2C port max
```
**I2C_NUM_0**
I2C port 0

**I2C_NUM_1**
I2C port 1

**I2C_SCLK_SRC_FLAG_FOR_NORMAL**
Any one clock source that is available for the specified frequency may be chosen.

**I2C_SCLK_SRC_FLAG_AWARE_DFS**
For REF tick clock, it won’t change with APB.

**I2C_SCLK_SRC_FLAG_LIGHT_SLEEP**
For light sleep mode.

**I2C_INTERNAL_STRUCT_SIZE**
Minimum size, in bytes, of the internal private structure used to describe I2C commands link.

**I2C_LINK_RECOMMENDED_SIZE**(TRANSACTIONS)
The following macro is used to determine the recommended size of the buffer to pass to i2c_cmd_link_create_static() function. It requires one parameter, TRANSACTIONS, describing the number of transactions intended to be performed on the I2C port. For example, if one wants to perform a read on an I2C device register, TRANSACTIONS must be at least 2, because the commands required are the following:

- write device register
- read register content

Signals such as “(repeated) start”, “stop”, “nack”, “ack” shall not be counted.

**Type Definitions**

typedef void *i2c_cmd_handle_t
I2C command handle

**Header File**

- components/hal/include/hal/i2c_types.h

**Macros**

**I2C_CLK_FREQ_MAX**
Use the highest speed that is available for the clock source picked by clk_flags.

**Type Definitions**

typedef int i2c_port_t
I2C port number, can be I2C_NUM_0~(I2C_NUM_MAX-1).

**Enumerations**

enum i2c_mode_t
Values:

- I2C_MODE_SLAVE = 0
  I2C slave mode
- I2C_MODE_MASTER
  I2C master mode
- I2C_MODE_MAX

enum i2c_rw_t
Values:
I2C_MASTER_WRITE = 0
I2C write data

I2C_MASTER_READ
I2C read data

enum i2c_trans_mode_t
Values:
I2C_DATA_MODE_MSB_FIRST = 0
I2C data msb first
I2C_DATA_MODE_LSB_FIRST = 1
I2C data lsb first
I2C_DATA_MODE_MAX

enum i2c_addr_mode_t
Values:
I2C_ADDR_BIT_7 = 0
I2C 7bit address for slave mode
I2C_ADDR_BIT_10
I2C 10bit address for slave mode
I2C_ADDR_BIT_MAX

enum i2c_ack_type_t
Values:
I2C_MASTER_ACK = 0x0
I2C ack for each byte read
I2C_MASTER_NACK = 0x1
I2C nack for each byte read
I2C_MASTER_LAST_NACK = 0x2
I2C nack for the last byte
I2C_MASTER_ACK_MAX

enum i2c_sclk_t
I2C clock source, sorting from smallest to largest, place them in order. This can be expanded in the future use.

Values:
I2C_SCLK_DEFAULT = 0
I2C source clock not selected
I2C_SCLK_XTAL
I2C source clock from XTAL, 40M
I2C_SCLK_RTC
I2C source clock from 8M RTC, 8M
I2C_SCLK_MAX

## 2.3.8 Inter-IC Sound (I2S)

### Overview

I2S (Inter-IC Sound) is a serial, synchronous communication protocol that is usually used for transmitting audio data between two digital audio devices.

ESP32-S3 contains two I2S peripheral(s). These peripherals can be configured to input and output sample data via the I2S driver.
An I2S bus consists of the following lines:

- Master clock line (operational)
- Bit clock line
- Channel select line
- Serial data line

Each I2S controller has the following features that can be configured using the I2S driver:

- Operation as system master or slave
- Capable of acting as transmitter or receiver
- DMA controller that allows for streaming sample data without requiring the CPU to copy each data sample

Each controller can operate in half-duplex communication mode. Thus, the two controllers can be combined to establish full-duplex communication.

Functional Overview

Installing the Driver

Install the I2S driver by calling the function `i2s_driver_install` and passing the following arguments:

- Port number
- The structure `i2s_config_t` with defined communication parameters
- Event queue size and handle

Once `i2s_driver_install` returns `ESP_OK`, it means I2S has started.

Configuration example:

```c
static const int i2s_num = 0; // I2S port number

i2s_config_t i2s_config = {
  .mode = I2S_MODE_MASTER | I2S_MODE_TX,
  .sample_rate = 44100,
  .bits_per_sample = I2S_BITS_PER_SAMPLE_16BIT,
  .channel_format = I2S_CHANNEL_FMT_RIGHT_LEFT,
  .communication_format = I2S_COMM_FORMAT_STAND_I2S,
  .tx_desc_auto_clear = false,
  .dma_desc_num = 8,
  .dma_frame_num = 64,
  .bits_per_chan = I2S_BITS_PER_SAMPLE_16BIT
};

i2s_driver_install(I2S_NUM, &i2s_config, 0, NULL);
```

Setting Communication Pins

Once the driver is installed, configure physical GPIO pins to which signals will be routed. For this, call the function `i2s_set_pin` and pass the following arguments to it:

- Port number
- The structure `i2s_pin_config_t` defining the GPIO pin numbers to which the driver should route the MCK, BCK, WS, DATA out, and DATA in signals. If you want to keep a currently allocated pin number for a specific signal, or if this signal is unused, then pass the macro `I2S_PIN_NO_CHANGE`. See the example below.

**Note:** MCK only takes effect in `I2S_MODE_MASTER` mode.

```c
static const i2s_pin_config_t pin_config = {
  .mck_io_num = 0,
  .bck_io_num = 4,
  .ws_io_num = 5,
};
```

(continues on next page)
Running I2S Communication  To perform a transmission:

- Prepare the data for sending
- Call the function `i2s_write()` and pass the data buffer address and data length to it

The function will write the data to the DMA Tx buffer, and then the data will be transmitted automatically.

```c
i2s_write(I2S_NUM, samples_data, ((bits+8)/16)*SAMPLE_PER_CYCLE*4, &i2s_bytes_write, 100);
```

To retrieve received data, use the function `i2s_read()`. It will retrieve the data from the DMA Rx buffer, once the data is received by the I2S controller.

```c
i2s_read(I2S_NUM, data_recv, ((bits+8)/16)*SAMPLE_PER_CYCLE*4, &i2s_bytes_read, 100);
```

You can temporarily stop the I2S driver by calling the function `i2s_stop()`, which will disable the I2S Tx/Rx units until the function `i2s_start()` is called. If the function `cpp:func`i2s_driver_install` is used, the driver will start up automatically eliminating the need to call `i2s_start()`.

Deleting the Driver  If the established communication is no longer required, the driver can be removed to free allocated resources by calling `i2s_driver_uninstall()`.

Application Example

A code example for the I2S driver can be found in the directory `peripherals/i2s`.

In addition, there is a short configuration examples for the I2S driver.

I2S configuration  Example for general usage.

```c
#include "driver/i2s.h"

static const int i2s_num = 0;  // I2S port number

static const i2s_config_t i2s_config = {
    .mode = I2S_MODE_MASTER | I2S_MODE_TX,
    .sample_rate = 44100,
    .bits_per_sample = I2S_BITS_PER_SAMPLE_16BIT,
    .channel_format = I2S_CHANNEL_FMT_RIGHT_LEFT,
    .communication_format = I2S_COMM_FORMAT_STAND_I2S
    .tx_desc_auto_clear = false,
    .dma_desc_num = 8,
    .dma_frame_num = 64
};

static const i2s_pin_config_t pin_config = {
    .bck_io_num = 4,
    .ws_io_num = 5,
    .data_out_num = 18,
    .data_in_num = I2S_PIN_NO_CHANGE
};
```
Chapter 2. API Reference

(continued from previous page)

```c
};
i2s_driver_install(i2s_num, &i2s_config, 0, NULL); //install and start i2s driver
i2s_set_pin(i2s_num, &pin_config);
...
/* You can reset parameters by calling 'i2s_set_clk'
   * The low 16 bits are the valid data bits in one chan and the high 16 bits are
   * the total bits in one chan. If high 16 bits is smaller than low 16 bits, it will
   * be set to a same value as low 16 bits.
   */
uint32_t bits_cfg = (I2S_BITS_PER_CHAN_32BIT << 16) | I2S_BITS_PER_SAMPLE_16BIT;
i2s_set_clk(i2s_num, 22050, bits_cfg, I2S_CHANNEL_STEREO);
...
i2s_driver_uninstall(i2s_num); //stop & destroy i2s driver
```

I2S on ESP32-S3 support TDM mode, up to 16 channels are available in TDM mode. If you want to use TDM mode, set field `channel_format` of `i2s_config_t` to `I2S_CHANNEL_FMT_MULTIPLE`. Then enable the channels by setting `chan_mask` using masks in `i2s_channel_t`, the number of active channels and total channels will be calculated automatically. Also you can set a particular total channel number for it, but it shouldn’t be smaller than the largest channel you use.

If active channels are discrete, the inactive channels within total channels will be filled by a constant automatically. But if `skip_mask` is enabled, these inactive channels will be skipped.

```c
#include "driver/i2s.h"
static const int i2s_num = 0; // i2s port number
i2s_config_t i2s_config = {
    .mode = I2S_MODE_MASTER | I2S_MODE_TX,
    .sample_rate = 44100,
    .bits_per_sample = I2S_BITS_PER_SAMPLE_16BIT,
    .channel_format = I2S_CHANNEL_FMT_MULTIPLE,
    .communication_format = I2S_COMM_FORMAT_STAND_I2S
    .tx_desc_auto_clear = false,
    .dma_desc_num = 8,
    .dma_frame_num = 64,
    .chan_mask = I2S_TDM_ACTIVE_CH0 | I2S_TDM_ACTIVE_CH2
};
static const i2s_pin_config_t pin_config = {
    .bck_io_num = 4,
    .ws_io_num = 5,
    .data_out_num = 18,
    .data_in_num = I2S_PIN_NO_CHANGE
};
i2s_driver_install(i2s_num, &i2s_config, 0, NULL); //install and start i2s driver
i2s_set_pin(i2s_num, &pin_config);
...
/* You can reset parameters by calling 'i2s_set_clk'
   * The low 16 bits are the valid data bits in one chan and the high 16 bits are
   * the total bits in one chan. If high 16 bits is smaller than low 16 bits, it will
   * be set to a same value as low 16 bits.
   */
uint32_t bits_cfg = (I2S_BITS_PER_CHAN_32BIT << 16) | I2S_BITS_PER_SAMPLE_16BIT;
```

(continues on next page)
Chapter 2. API Reference

(continued from previous page)

```c
i2s_set_clk(i2s_port_t i2s_num, 22050, bits_cfg, I2S_TDM_ACTIVE_CH0 | I2S_TDM_!
-ACTIVE_CH1); // set clock
...
```

```c
i2s_driver_uninstall(i2s_num); // stop & destroy i2s driver
```

**Application Notes**  If you are using a high sample rate like more than 48 kHz or see the data being lost, the following information might help.

Considering different applications have different requirements, `dma_desc_num` and `dma_frame_num` are made public. Here is the detailed explanation to these two fields:

- **`dma_desc_num`**: The total number of descriptors used by I2S DMA to receive/transmit data. A descriptor includes some information such as buffer address, the address of the next descriptor, and the buffer length. Since one descriptor points to one buffer, therefore, `dma_desc_num` can be interpreted as the total number of DMA buffers used to store data from DMA interrupt. Notice that these buffers are internal to `i2s_read()` and descriptors are created automatically inside of the I2S driver. Users only need to set the buffer number while the length is derived from the parameter described below.

- **`dma_frame_num`**: The number of frames for one-time sampling. The frame here means the total data from all the channels in one WS cycle. For example, if two channels in stereo mode (i.e., `channel_format` is set to `I2S_CHANNEL_FMT_RIGHT_LEFT`) are active, and each channel transfers 32 bits (i.e., `bits_per_sample` is set to `I2S_BITS_PER_CHAN_32BIT`), then the total number of bytes of a frame is `channel_format * bits_per_sample = 2 * 32 / 8 = 8` bytes. For example, we assume that the current `dma_frame_num` is 100, then the length of the DMA buffer is `8 * 100 = 800` bytes. Note that the length of an internal DMA buffer shouldn’t be greater than 4092.

When the data received by DMA reach the size of internal DMA buffer, a receive interrupt is triggered, and an internal message queue will transport this buffer to `i2s_read()`. The main task of `i2s_read()` is to copy the data in the internal DMA buffer into the user given buffer. Since the internal DMA buffer is usually not equal to the user given buffer size, there are two cases:

- If the size of internal DMA buffers is smaller than the user given buffer size, `i2s_read()` will consume several internal DMA buffers to fill up the user given buffer. If the message queue of DMA buffer is not long enough, `i2s_read()` will be blocked on receive message queue until getting enough data. You can estimate the time `i2s_read()` function is blocked by the formula `block_time (sec) = (given_buffer_size) / (sample_rate * channel_num * channel_bytes)`. If we place `i2s_read()` in a while together with other functions we should also consider the time the loop execution is blocked by the other functions before `i2s_read()` is executed again. It is not allowed to exceed the `max_wait_time (sec) = ((dma_desc_num - 1) * dma_buffer_size)/(sample_rate)`, otherwise the internal message queue will overflow and in consequence some data will be lost.

- If the DMA buffer size is greater than the user given buffer size, it means `i2s_read()` would need to be called in a loop several times to take all the data, the `max_wait_time` may be exceeded, and the message queue overflow is likely to happen. Therefore it is quite risky to use a small user buffer for data receiving.

Here are a couple of tips when the sample rate is high:

1. Increasing `dma_frame_num` can help to reduce the I2S DMA interrupt frequency;
2. Increasing `dma_desc_num` can help to allow a longer `max_wait_time` to be spent by the other functions in the loop containing `i2s_read()`;
   ```c
   while (1) {
       ...
       i2s_read(I2S_NUM, user_given_buffer, user_given_buffer_size, &i2s_
        bytes_read, 100);
       ...
   }
   ```
   ```c
   ... // Other operations (e.g. Sending the data to another thread...
         // Avoid any data processing here.)
   ```
3. Increasing the size of the buffer internal to `i2s_read()` can help to increase the `max_wait_time`. When you process I2S data (like storing the data to an SD card) in another thread, the time spent in processing thread
for one loop should not exceed the max_wait_time otherwise some data will be lost. So if the processing of
the received data received is rather slow, please allow \texttt{i2s\_read()} a big internal buffer for storing the read
data;

4. Allocating at least two user given buffers can improve the data receipt efficiency. One buffer can continue to
receive data while the other one is under processing. But we have to guarantee the buffer that is going to read
data is not under processing in the other thread. We can use a semaphore or another lock to avoid overwriting
the data in the buffer while it is still under processing;

```c
uint8_t *user\_given\_buffers = \texttt{(uint8\_t **)calloc(buffer\_num, \texttt{sizeof}}(uint8\_t \_*)));
// Don't forget to check if user\_given\_buffers is NULL here
for (int\ _i = 0;\ _i < \texttt{buffer\_num};\ _i++) {
  user\_given\_buffers[\_i] = \texttt{(uint8\_t \_*)calloc(user\_given\_buffer\_size, \texttt{sizeof}}(uint8\_t \_*));
  // Don't forget to check if user\_given\_buffers[\_i] is NULL here
}
int\ \_cnt = 0;
while (1) {
  ... // Other operations (e.g. Waiting on a semaphore)
  i2s\_read(I2S\_NUM,\ user\_given\_buffer[\_cnt],\ user\_given\_buffer\_size, &
  \_\texttt{i2s\_bytes\_read},\ 100);
  ... // Other operations (e.g. Sending the data to another thread...\n  \texttt{Avoid any data processing here.})
  \_cnt++;
  \_cnt \%= \texttt{buffer\_num};
}
```

5. Increasing the priority of the thread that contains \texttt{i2s\_read()} can help the data in the message queue to be
taken more timely.

To check whether there are data lost, you can offer an event queue handler to the driver during installation:

```c
Queue\_Handle\_t\ \_evt\_que;
\texttt{i2s\_driver\_install(i2s\_num, &i2s\_config, 10, \&evt\_que)};
```

You will receive I2S\_EVENT\_RX\_Q\_OVF event when there are data lost.

**API Reference**

**Header File**

- components/driver/include/driver/i2s.h

**Functions**

\texttt{esp\_err\_t i2s\_set\_pin(i2s\_port\_t i2s\_num, const i2s\_pin\_config\_t *pin)}

Set I2S pin number.

Inside the pin configuration structure, set I2S\_PIN\_NO\_CHANGE for any pin where the current configuration
should not be changed.

**Note** The I2S peripheral output signals can be connected to multiple GPIO pads. However, the I2S peripheral
input signal can only be connected to one GPIO pad.

**Parameters**

- \texttt{i2s\_num}: I2S port number
- \texttt{pin}: I2S Pin structure, or NULL to set 2-channel 8-bit internal DAC pin configuration (GPIO25 &
  GPIO26)

**Note** if *pin is set as NULL, this function will initialize both of the built-in DAC channels by default. if
you don’t want this to happen and you want to initialize only one of the DAC channels, you can call
\texttt{i2s\_set\_dac\_mode} instead.

**Return**

- ESP\_OK Success
**ESP_ERR_INVALID_ARG** Parameter error
**ESP_FAIL** IO error

```c
esp_err_t i2s_set_pdm_rx_down_sample(i2s_port_t i2s_num, i2s_pdm_dsr_t downsample)
```

Set PDM mode down-sample rate. In PDM RX mode, there would be 2 rounds of downsample process in hardware. In the first downsample process, the sampling number can be 16 or 8. In the second downsample process, the sampling number is fixed as 8. So the clock frequency in PDM RX mode would be \(f_{pcm} \times 64\) or \(f_{pcm} \times 128\) accordingly.

**Note** After calling this function, it would call `i2s_set_clk` inside to update the clock frequency. Please call this function after I2S driver has been initialized.

**Return**
- **ESP_OK** Success
- **ESP_ERR_INVALID_ARG** Parameter error
- **ESP_ERR_NO_MEM** Out of memory

**Parameters**
- `i2s_num`: I2S port number
- `downsample`: I2S RX down sample rate for PDM mode.

```c
esp_err_t i2s_set_pdm_tx_up_sample(i2s_port_t i2s_num, const i2s_pdm_tx_upsample_cfg_t *upsample_cfg)
```

Set TX PDM mode up-sample rate.

**Note** If you have set PDM mode while calling `i2s_driver_install`, default PDM TX upsample parameters have already been set, no need to call this function again if you don’t have to change the default configuration

**Return**
- **ESP_OK** Success
- **ESP_ERR_INVALID_ARG** Parameter error
- **ESP_ERR_NO_MEM** Out of memory

**Parameters**
- `i2s_num`: I2S port number
- `upsample_cfg`: Set I2S PDM up-sample rate configuration

```c
esp_err_t i2s_driver_install(i2s_port_t i2s_num, const i2s_config_t *i2s_config, int queue_size, void *i2s_queue)
```

Install and start I2S driver.

This function must be called before any I2S driver read/write operations.

**Parameters**
- `i2s_num`: I2S port number
- `i2s_config`: I2S configurations - see `i2s_config_t` struct
- `queue_size`: I2S event queue size/depth.
- `i2s_queue`: I2S event queue handle, if set NULL, driver will not use an event queue.

**Return**
- **ESP_OK** Success
- **ESP_ERR_INVALID_ARG** Parameter error
- **ESP.ERR_NO_MEM** Out of memory
- **ESP_ERR_INVALID_STATE** Current I2S port is in use

```c
esp_err_t i2s_driver_uninstall(i2s_port_t i2s_num)
```

Uninstall I2S driver.

**Parameters**
- `i2s_num`: I2S port number

```c
esp_err_t i2s_write(i2s_port_t i2s_num, const void *src, size_t size, size_t *bytes_written, TickType_t ticks_to_wait)
```

Write data to I2S DMA transmit buffer.
Chapter 2. API Reference

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters
- i2s_num: I2S port number
- src: Source address to write from
- size: Size of data in bytes
- [out] bytes_written: Number of bytes written, if timeout, the result will be less than the size passed in.
- ticks_to_wait: TX buffer wait timeout in RTOS ticks. If this many ticks pass without space becoming available in the DMA transmit buffer, then the function will return (note that if the data is written to the DMA buffer in pieces, the overall operation may still take longer than this timeout.) Pass portMAX_DELAY for no timeout.

```c
esp_err_t i2s_write_expand(i2s_port_t i2s_num, const void *src, size_t size, size_t src_bits, size_t aim_bits, size_t *bytes_written, TickType_t ticks_to_wait)
```

Write data to I2S DMA transmit buffer while expanding the number of bits per sample. For example, expanding 16-bit PCM to 32-bit PCM.

Format of the data in source buffer is determined by the I2S configuration (see i2s_config_t).

Parameters
- i2s_num: I2S port number
- src: Source address to write from
- size: Size of data in bytes
- src_bits: Source audio bit
- aim_bits: Bit wanted, no more than 32, and must be greater than src_bits
- [out] bytes_written: Number of bytes written, if timeout, the result will be less than the size passed in.
- ticks_to_wait: TX buffer wait timeout in RTOS ticks. If this many ticks pass without space becoming available in the DMA transmit buffer, then the function will return (note that if the data is written to the DMA buffer in pieces, the overall operation may still take longer than this timeout.) Pass portMAX_DELAY for no timeout.

```c
esp_err_t i2s_read(i2s_port_t i2s_num, void *dest, size_t size, size_t *bytes_read, TickType_t ticks_to_wait)
```

Read data from I2S DMA receive buffer.

Note If the built-in ADC mode is enabled, we should call i2s_adc_enable and i2s_adc_disable around the whole reading process, to prevent the data getting corrupted.

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters
- i2s_num: I2S port number
- dest: Destination address to read into
- size: Size of data in bytes
- [out] bytes_read: Number of bytes read, if timeout, bytes read will be less than the size passed in.
- ticks_to_wait: RX buffer wait timeout in RTOS ticks. If this many ticks pass without bytes becoming available in the DMA receive buffer, then the function will return (note that if data is read from the DMA buffer in pieces, the overall operation may still take longer than this timeout.) Pass portMAX_DELAY for no timeout.

```c
esp_err_t i2s_set_sample_rates(i2s_port_t i2s_num, uint32_t rate)
```

Set sample rate used for I2S RX and TX.

The bit clock rate is determined by the sample rate and i2s_config_t configuration parameters (number of
channels, bits_per_sample).

\[ \text{bit\_clock} = \text{rate} \times (\text{number of channels}) \times \text{bits\_per\_sample} \]

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NO_MEM Out of memory

**Parameters**
- `i2s_num`: I2S port number
- `rate`: I2S sample rate (ex: 8000, 44100…)

```c
esp_err_t i2s_stop(i2s_port_t i2s_num)
```

Stop I2S driver.

There is no need to call `i2s_stop()` before calling `i2s_driver_uninstall()`.

Disables I2S TX/RX, until `i2s_start()` is called.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- `i2s_num`: I2S port number

```c
esp_err_t i2s_start(i2s_port_t i2s_num)
```

Start I2S driver.

It is not necessary to call this function after `i2s_driver_install()` (it is started automatically), however it is necessary to call it after `i2s_stop()`.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- `i2s_num`: I2S port number

```c
esp_err_t i2s_zero_dma_buffer(i2s_port_t i2s_num)
```

Zero the contents of the TX DMA buffer.

Pushes zero-byte samples into the TX DMA buffer, until it is full.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- `i2s_num`: I2S port number

```c
esp_err_t i2s_pcm_config(i2s_port_t i2s_num, const i2s_pcm_cfg_t *pcm_cfg)
```

Configure I2S a/u-law decompress or compress.

**Note**
This function should be called after i2s driver installed Only take effective when the i2s `communication_format` is set to `I2S_COMM_FORMAT_STAND_PCM_SHORT` or `I2S_COMM_FORMAT_STAND_PCM_LONG`

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- `i2s_num`: I2S port number
- `pcm_cfg`: including mode selection and a/u-law decompress or compress configuration parameter

```c
esp_err_t i2s_set_clk(i2s_port_t i2s_num, uint32_t rate, uint32_t bits_cfg, i2s_channel_t ch)
```

Set clock & bit width used for I2S RX and TX.

Similar to `i2s_set_sample_rates()`, but also sets bit width.

1. stop `i2s`;
2. calculate mclk, bck, bck_factor
3. malloc dma buffer;
4. start i2s

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NO_MEM Out of memory

Parameters
- i2s_num: I2S port number
- rate: I2S sample rate (ex: 8000, 44100…)
- bits_cfg: I2S bits configuration the low 16 bits is for data bits per sample in one channel (see ‘i2s_bits_per_sample_t’) the high 16 bits is for total bits in one channel (see ‘i2s_bits_per_chan_t’) high 16bits =0 means same as the bits per sample.
- ch: I2S channel, (I2S_CHANNEL_MONO, I2S_CHANNEL_STEREO or specific channel in TDM mode)

float i2s_get_clk (i2s_port_t i2s_num)
get clock set on particular port number.

Return
- actual clock set by i2s driver

Parameters
- i2s_num: I2S port number

Structures
struct i2s_pcm_cfg_t
I2S PCM configuration.

Public Members

i2s_pcm_compress_t pcm_type
I2S PCM a/u-law decompress or compress type

struct i2s_pdm_tx_upsample_cfg_t
I2S PDM up-sample rate configuration.

Note TX PDM can only be set to the following two upsampling rate configurations: 1: fp = 960, fs = sample_rate / 100, in this case, Fpdm = 128*48000 2: fp = 960, fs = 480, in this case, Fpdm = 128*Fpcm = 128*sample_rate If the pdm receiver do not care the pdm serial clock, it’s recommended set Fpdm = 128*48000. Otherwise, the second configuration should be applied.

Public Members

int sample_rate
I2S PDM sample rate

int fp
I2S PDM TX upsampling paramater. Normally it should be set to 960

int fs
I2S PDM TX upsampling paramater. When it is set to 480, the pdm clock frequency Fpdm = 128 * sample_rate, when it is set to sample_rate / 100, Fpdm will be fixed to 128*48000

struct i2s_pin_config_t
I2S pin number for i2s_set_pin.
Chapter 2. API Reference

Public Members

int mck_io_num
MCK in out pin. Note that ESP32 supports setting MCK on GPIO0/GPIO1/GPIO3 only

int bck_io_num
BCK in out pin

int ws_io_num
WS in out pin

int data_out_num
DATA out pin

int data_in_num
DATA in pin

struct i2s_driver_config_t
I2S driver configuration parameters.

Public Members

i2s_mode_t mode
I2S work mode

uint32_t sample_rate
I2S sample rate

i2s_bits_per_sample_t bits_per_sample
I2S sample bits in one channel

i2s_channel_fmt_t channel_format
I2S channel format.

i2s_comm_format_t communication_format
I2S communication format

int intr_alloc_flags
Flags used to allocate the interrupt. One or multiple (ORred) ESP_INTR_FLAG_* values. See esp_intr_alloc.h for more info

int dma_desc_num
The total number of descriptors used by I2S DMA to receive/transmit data

int dma_buf_count
This is an alias to ‘dma_desc_num’ for backward compatibility

int dma_frame_num
Number of frames for one-time sampling. The frame here means the total data from all the channels in a WS cycle

int dma_buf_len
This is an alias to ‘dma_frame_num’ for backward compatibility

bool use_apll
I2S using APPLL as main I2S clock, enable it to get accurate clock

bool tx_desc_auto_clear
I2S auto clear tx descriptor if there is underflow condition (helps in avoiding noise in case of data unavailability)

int fixed_mclk
I2S using fixed MCLK output. If use_apll = true and fixed_mclk > 0, then the clock output for i2s is fixed and equal to the fixed_mclk value. If fixed_mclk set, mclk_multiple won’t take effect
i2s_mclk_multiple_t
  The multiple of I2S master clock(MCLK) to sample rate

i2s_bits_per_chan_t/bits_per_chan
  I2S total bits in one channel, only take effect when larger than ‘bits_per_sample’. default ‘0’ means equal to ‘bits_per_sample’

i2s_channel_t/chann_mask
  I2S active channel bit mask, set value in i2s_channel_t to enable specific channel, the bit map of active channel can not exceed (0x1<<total_chan).

uint32_t/total_chan
  I2S Total number of channels. If it is smaller than the biggest active channel number, it will be set to this number automatically.

bool left_align
  Set to enable left alignment

bool big_edin
  Set to enable big edin

bool bit_order_msb
  Set to enable msb order

bool skip_msk
  Set to enable skip mask. If it is enabled, only the data of the enabled channels will be sent, otherwise all data stored in DMA TX buffer will be sent

struct i2s_event_t
  Event structure used in I2S event queue.

  Public Members

  i2s_event_type_t/type
    I2S event type

  size_t/size
    I2S data size for I2S_DATA event

  Macros

  I2S_PIN_NO_CHANGE
    Use in i2s_pin_config_t for pins which should not be changed

  I2S_PDM_DEFAULT_UPSAMPLE_CONFIG(rate)
    Default I2S PDM Up-Sampling Rate configuration.

  Type Definitions

typedef i2s_driver_config_t i2s_config_t

typedef intr_handle_t i2s_isr_handle_t

  Enumerations

enum i2s_port_t
  I2S port number, the max port number is (I2S_NUM_MAX -1).

  Values:

  I2S_NUM_0 = 0
    I2S port 0

  I2S_NUM_1 = 1
    I2S port 1
Chapter 2. API Reference

I2S_NUM_MAX
   I2S port max

enum i2s_event_type_t
   I2S event queue types.
   
   Values:
   
   I2S_EVENT_DMA_ERROR
   I2S DMA finish sent 1 buffer
   I2S_EVENT_TX_DONE
   I2S DMA finish received 1 buffer
   I2S_EVENT_RX_DONE
   I2S DMA finish received 1 buffer
   I2S_EVENT_TX_Q_OVF
   I2S DMA sent queue overflow
   I2S_EVENT_RX_Q_OVF
   I2S DMA receive queue overflow
   I2S_EVENT_MAX
   I2S event max index

Header File

   • components/hal/include/hal/i2s_types.h

Enumerations

enum i2s_bits_per_sample_t
   I2S bit width per sample.
   
   Values:
   
   I2S_BITS_PER_SAMPLE_8BIT = 8
      data bit-width: 8
   I2S_BITS_PER_SAMPLE_16BIT = 16
      data bit-width: 16
   I2S_BITS_PER_SAMPLE_24BIT = 24
      data bit-width: 24
   I2S_BITS_PER_SAMPLE_32BIT = 32
      data bit-width: 32

enum i2s_bits_per_chan_t
   I2S bit width per chan.
   
   Values:
   
   I2S_BITS_PER_CHAN_DEFAULT = (0)
      channel bit-width equals to data bit-width
   I2S_BITS_PER_CHAN_8BIT = (8)
      channel bit-width: 8
   I2S_BITS_PER_CHAN_16BIT = (16)
      channel bit-width: 16
   I2S_BITS_PER_CHAN_24BIT = (24)
      channel bit-width: 24
   I2S_BITS_PER_CHAN_32BIT = (32)
      channel bit-width: 32
enum i2s_channel_t
    I2S channel.
Values:
    I2S_CHANNEL_MONO = (0x01 << 31) | 0x03
        I2S channel (mono), two channel enabled. In this mode, you only need to send one channel data but the fifo will copy same data for another channel automatically, then both channels will transmit same data. The highest bit is for differentiating I2S_CHANNEL_STEREO since they both use two channels
    I2S_CHANNEL_STEREO = 0x03
        I2S channel (stereo), two channel enabled. In this mode, two channels will transmit different data.
    I2S_TDM_ACTIVE_CH0 = (0x1 << 0)
        I2S channel 0 enabled
    I2S_TDM_ACTIVE_CH1 = (0x1 << 1)
        I2S channel 1 enabled
    I2S_TDM_ACTIVE_CH2 = (0x1 << 2)
        I2S channel 2 enabled
    I2S_TDM_ACTIVE_CH3 = (0x1 << 3)
        I2S channel 3 enabled
    I2S_TDM_ACTIVE_CH4 = (0x1 << 4)
        I2S channel 4 enabled
    I2S_TDM_ACTIVE_CH5 = (0x1 << 5)
        I2S channel 5 enabled
    I2S_TDM_ACTIVE_CH6 = (0x1 << 6)
        I2S channel 6 enabled
    I2S_TDM_ACTIVE_CH7 = (0x1 << 7)
        I2S channel 7 enabled
    I2S_TDM_ACTIVE_CH8 = (0x1 << 8)
        I2S channel 8 enabled
    I2S_TDM_ACTIVE_CH9 = (0x1 << 9)
        I2S channel 9 enabled
    I2S_TDM_ACTIVE_CH10 = (0x1 << 10)
        I2S channel 10 enabled
    I2S_TDM_ACTIVE_CH11 = (0x1 << 11)
        I2S channel 11 enabled
    I2S_TDM_ACTIVE_CH12 = (0x1 << 12)
        I2S channel 12 enabled
    I2S_TDM_ACTIVE_CH13 = (0x1 << 13)
        I2S channel 13 enabled
    I2S_TDM_ACTIVE_CH14 = (0x1 << 14)
        I2S channel 14 enabled
    I2S_TDM_ACTIVE_CH15 = (0x1 << 15)
        I2S channel 15 enabled

enum i2s_comm_format_t
    I2S communication standard format.
Values:
    I2S_COMM_FORMAT_STAND_I2S = 0X01
        I2S communication I2S Philips standard, data launch at second BCK
I2S_COMM_FORMAT_STAND_MSB = 0x02
  I2S communication MSB alignment standard, data launch at first BCK

I2S_COMM_FORMAT_STAND_PCM_SHORT = 0x04
  PCM Short standard, also known as DSP mode. The period of synchronization signal (WS) is 1 bck cycle.

I2S_COMM_FORMAT_STAND_PCM_LONG = 0x0C
  PCM Long standard. The period of synchronization signal (WS) is channel_bit*bck cycles.

I2S_COMM_FORMAT_STAND_MAX
  standard max

I2S_COMM_FORMAT_I2S = 0x01
  I2S communication format I2S, correspond to I2S_COMM_FORMAT_STAND_I2S

I2S_COMM_FORMAT_I2S_MSB = 0x01
  I2S format MSB, (I2S_COMM_FORMAT_I2S | I2S_COMM_FORMAT_I2S_MSB) correspond to I2S_COMM_FORMAT_STAND_I2S

I2S_COMM_FORMAT_I2S_LSB = 0x02
  I2S format LSB, (I2S_COMM_FORMAT_I2S | I2S_COMM_FORMAT_I2S_LSB) correspond to I2S_COMM_FORMAT_STAND_MSB

I2S_COMM_FORMAT_PCM = 0x04
  I2S communication format PCM, correspond to I2S_COMM_FORMAT_STAND_PCM_SHORT

I2S_COMM_FORMAT_PCM_SHORT = 0x04
  PCM Short, (I2S_COMM_FORMAT_PCM | I2S_COMM_FORMAT_PCM_SHORT) correspond to I2S_COMM_FORMAT_STAND_PCM_SHORT

I2S_COMM_FORMAT_PCM_LONG = 0x08
  PCM Long, (I2S_COMM_FORMAT_PCM | I2S_COMM_FORMAT_PCM_LONG) correspond to I2S_COMM_FORMAT_STAND_PCM_LONG

enum i2s_channel_fmt_t
  I2S channel format type.

Values:

I2S_CHANNEL_FMT_RIGHT_LEFT
  Separated left and right channel

I2S_CHANNEL_FMT_ALL_RIGHT
  Load right channel data in both two channels

I2S_CHANNEL_FMT_ALL_LEFT
  Load left channel data in both two channels

I2S_CHANNEL_FMT_ONLY_RIGHT
  Only load data in right channel (mono mode)

I2S_CHANNEL_FMT_ONLY_LEFT
  Only load data in left channel (mono mode)

I2S_CHANNEL_FMT_MULTIPLE
  More than two channels are used

enum i2s_mode_t
  I2S Mode.

Values:

I2S_MODE_MASTER = (0x1 << 0)
  Master mode

I2S_MODE_SLAVE = (0x1 << 1)
  Slave mode
I2S_MODE_TX = (0x1 << 2)
  TX mode
I2S_MODE_RX = (0x1 << 3)
  RX mode
I2S_MODE_PDM = (0x1 << 6)
  I2S PDM mode

enum i2s_clock_src_t
  I2S source clock.
  Values:
  I2S_CLK_D2CLK = 0
    Clock from PLL_D2_CLK(160M)

enum i2s_mclk_multiple_t
  The multiple of mclk to sample rate.
  Values:
  I2S_MCLK_MULTIPLE_DEFAULT = 0
    Default value. mclk = sample_rate * 256
  I2S_MCLK_MULTIPLE_128 = 128
    mclk = sample_rate * 128
  I2S_MCLK_MULTIPLE_256 = 256
    mclk = sample_rate * 256
  I2S_MCLK_MULTIPLE_384 = 384
    mclk = sample_rate * 384

enum i2s_pcm_compress_t
  A/U-law decompress or compress configuration.
  Values:
  I2S_PCM_DISABLE = 0
    Disable A/U law decompress or compress
  I2S_PCM_A_DECOMPRESS
    A-law decompress
  I2S_PCM_A_COMPRESS
    A-law compress
  I2S_PCM_U_DECOMPRESS
    U-law decompress
  I2S_PCM_U_COMPRESS
    U-law compress

enum i2s_pdm_dsr_t
  I2S PDM RX downsample mode.
  Values:
  I2S_PDM_DSR_8S = 0
    downsampling number is 8 for PDM RX mode
  I2S_PDM_DSR_16S
    downsampling number is 16 for PDM RX mode
  I2S_PDM_DSR_MAX

enum i2s_pdm_sig_scale_t
  Values:
Chapter 2. API Reference

I2S_PDM_SIG_SCALING_DIV_2 = 0
I2S TX PDM sigmadelta signal scaling: /2

I2S_PDM_SIG_SCALING_MUL_1 = 1
I2S TX PDM sigmadelta signal scaling: x1

I2S_PDM_SIG_SCALING_MUL_2 = 2
I2S TX PDM sigmadelta signal scaling: x2

I2S_PDM_SIG_SCALING_MUL_4 = 3
I2S TX PDM sigmadelta signal scaling: x4

2.3.9 LCD

Introduction

ESP chips can generate various kinds of timings that needed by common LCDs on the market, like SPI LCD, I80 LCD (a.k.a Intel 8080 parallel LCD), RGB LCD, I2C LCD, etc. The esp_lcd component is officially to support those LCDs with a group of universal APIs across chips.

Functional Overview

In esp_lcd, an LCD panel is represented by esp_lcd_panel_handle_t, which plays the role of an abstract frame buffer, regardless of the frame memory is allocated inside ESP chip or in external LCD controller. Based on the location of the frame buffer, the LCD panel allocation functions are mainly grouped into the following categories:

- **RGB LCD panel** - is simply based on a group of specific synchronous signals indicating where to start and stop a frame.
- **Controller based LCD panel** involves multiple steps to get a panel handle, like bus allocation, IO device registration and controller driver install.

After we get the LCD handle, the remaining LCD operations are the same for different LCD interfaces and vendors.

Application Example

LCD examples are located under: peripherals/lcd:

- Jpeg decoding and LCD display - peripherals/lcd/tjpgd
- LVGL porting and animation UI - peripherals/lcd/lvgl
- GC9A01 user customized driver and dash board UI - peripherals/lcd/gc9a01

API Reference

Header File

- components/hal/include/hal/lcd_types.h

Enumerations

**enum lcd_clock_source_t**

LCD clock source.

**Note** User should select the clock source based on the real requirement:

<table>
<thead>
<tr>
<th>LCD clock source</th>
<th>Features</th>
<th>Power Management</th>
</tr>
</thead>
<tbody>
<tr>
<td>LCD_CLK_SRC_PLL160M</td>
<td>High resolution</td>
<td>ESP_PM_APB_FREQ_MAX lock</td>
</tr>
<tr>
<td>LCD_CLK_SRC_APLL</td>
<td>Configurable resolution</td>
<td>ESP_PM_NO_LIGHT_SLEEP lock</td>
</tr>
<tr>
<td>LCD_CLK_SRC_XTAL</td>
<td>Medium resolution</td>
<td>No PM lock</td>
</tr>
</tbody>
</table>
Values:

LCD_CLK_SRC_PLL160M
Select PLL160M as the source clock

LCD_CLK_SRC_APLL
Select APLL as the source clock

LCD_CLK_SRC_XTAL
Select XTAL as the source clock

Header File

- components/esp_lcd/include/esp_lcd_types.h

Type Definitions

typedef struct esp_lcd_panel_io_t *esp_lcd_panel_io_handle_t
Type of LCD panel IO handle

typedef struct esp_lcd_panel_t *esp_lcd_panel_handle_t
Type of LCD panel handle

Enumerations

enum esp_lcd_color_space_t
LCD color space type definition.

Values:

ESP_LCD_COLOR_SPACE_RGB
Color space: RGB

ESP_LCD_COLOR_SPACE_BGR
Color space: BGR

ESP_LCD_COLOR_SPACE_MONOCHROME
Color space: monochrome

Header File

- components/esp_lcd/include/esp_lcd_panel_io.h

Functions

esp_err_t esp_lcd_panel_io_tx_param(esp_lcd_panel_io_handle_t io, int lcd_cmd, const void *param, size_t param_size)
Transmit LCD command and corresponding parameters.

Note Commands sent by this function are short, so they are sent using polling transactions. The function does not return before the command transfer is completed. If any queued transactions sent by esp_lcd_panel_io_tx_color() are still pending when this function is called, this function will wait until they are finished and the queue is empty before sending the command(s).

Return

- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_OK on success

Parameters

- [in] io: LCD panel IO handle, which is created by other factory API like esp_lcd_new_panel_io_spi()
- [in] lcd_cmd: The specific LCD command
- [in] param: Buffer that holds the command specific parameters, set to NULL if no parameter is needed for the command
- [in] param_size: Size of param in memory, in bytes, set to zero if no parameter is needed for the command
Chapter 2. API Reference

**esp_err_t esp_lcd_panel_io_tx_color(esp_lcd_panel_io_handle_t io, int lcd_cmd, const void *color, size_t color_size)**

Transmit LCD RGB data.

**Note** This function will package the command and RGB data into a transaction, and push into a queue. The real transmission is performed in the background (DMA+interrupt). The caller should take care of the lifecycle of the color buffer. Recycling of color buffer should be done in the callback on_color_trans_done().

**Return**
- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_OK on success

**Parameters**
- [in] io: LCD panel IO handle, which is created by factory API like esp_lcd_new_panel_io_spi()
- [in] lcd_cmd: The specific LCD command
- [in] color: Buffer that holds the RGB color data
- [in] color_size: Size of color in memory, in bytes

**esp_err_t esp_lcd_panel_io_del(esp_lcd_panel_io_handle_t io)**

Destroy LCD panel IO handle (deinitialize panel and free all corresponding resource)

**Return**
- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_OK on success

**Parameters**
- [in] io: LCD panel IO handle, which is created by factory API like esp_lcd_new_panel_io_spi()

**esp_err_t esp_lcd_new_panel_io_spi(esp_lcd_spi_bus_handle_t bus, const esp_lcd_panel_io_spi_config_t *io_config, esp_lcd_panel_io_handle_t *ret_io)**

Create LCD panel IO handle, for SPI interface.

**Return**
- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_NO_MEM if out of memory
- ESP_OK on success

**Parameters**
- [in] bus: SPI bus handle
- [in] io_config: IO configuration, for SPI interface
- [out] ret_io: Returned IO handle

**esp_err_t esp_lcd_new_panel_io_i2c(esp_lcd_i2c_bus_handle_t bus, const esp_lcd_panel_io_i2c_config_t *io_config, esp_lcd_panel_io_handle_t *ret_io)**

Create LCD panel IO handle, for I2C interface.

**Return**
- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_NO_MEM if out of memory
- ESP_OK on success

**Parameters**
- [in] bus: I2C bus handle
- [in] io_config: IO configuration, for I2C interface
- [out] ret_io: Returned IO handle

**esp_err_t esp_lcd_new_i80_bus(const esp_lcd_i80_bus_config_t *bus_config, esp_lcd_i80_bus_handle_t *ret_bus)**

Create Intel 8080 bus handle.

**Return**
- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_NO_MEM if out of memory
Chapter 2. API Reference

- ESP_ERR_NOT_FOUND if no free bus is available
- ESP_OK on success

**Parameters**
- [in] bus_config: Bus configuration
- [out] ret_bus: Returned bus handle

`esp_err_t esp_lcd_del_i80_bus(esp_lcd_i80_bus_handle_t bus)`
Destory Intel 8080 bus handle.

**Return**
- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_INVALID_STATE if there still be some device attached to the bus
- ESP_OK on success

**Parameters**
- [in] bus: Intel 8080 bus handle, created by `esp_lcd_new_i80_bus()`

`esp_err_t esp_lcd_new_panel_io_i80(esp_lcd_i80_bus_handle_t bus, const esp_lcd_panel_io_i80_config_t *io_config, esp_lcd_panel_io_handle_t *ret_io)`
Create LCD panel IO, for Intel 8080 interface.

**Return**
- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_NOT_SUPPORTED if some configuration can’t be satisfied, e.g. pixel clock out of the range
- ESP_ERR_NO_MEM if out of memory
- ESP_OK on success

**Parameters**
- [in] bus: Intel 8080 bus handle, created by `esp_lcd_new_i80_bus()`
- [in] io_config: IO configuration, for i80 interface
- [out] ret_io: Returned panel IO handle

**Structures**

`struct esp_lcd_panel_io_event_data_t`
Type of LCD panel IO event data.

`struct esp_lcd_panel_io_spi_config_t`
Panel IO configuration structure, for SPI interface.

**Public Members**

- `int cs_gpio_num`
  GPIO used for CS line

- `int dc_gpio_num`
  GPIO used to select the D/C line, set this to -1 if the D/C line not controlled by manually pulling high/low GPIO

- `int spi_mode`
  Traditional SPI mode (0~3)

- `unsigned int pclk_hz`
  Frequency of pixel clock

- `size_t trans_queue_depth`
  Size of internal transaction queue

`esp_lcd_panel_io_color_trans_done_cb_t on_color_trans_done`
Callback invoked when color data transfer has finished

- `void *user_ctx`
  User private data, passed directly to on_color_trans_done’s user_ctx
int `lcd_cmd_bits`
   Bit-width of LCD command

int `lcd_param_bits`
   Bit-width of LCD parameter

unsigned int `dc_as_cmd_phase` : 1
   D/C line value is encoded into SPI transaction command phase

unsigned int `dc_low_on_data` : 1
   If this flag is enabled, DC line = 0 means transfer data, DC line = 1 means transfer command; vice versa

unsigned int `octal_mode` : 1
   Transmit with octal mode (8 data lines), this mode is used to simulate Intel 8080 timing

`struct esp_lcd_panel_io_i2c_config_t`

**Public Members**

`uint32_t dev_addr`
   I2C device address

`esp_lcd_panel_io_color_trans_done_cb_t on_color_trans_done`
   Callback invoked when color data transfer has finished

void *`user_ctx`
   User private data, passed directly to on_color_trans_done’s user_ctx

`size_t control_phase_bytes`
   I2C LCD panel will encode control information (e.g. D/C selection) into control phase, in several bytes

unsigned int `dc_bit_offset`
   Offset of the D/C selection bit in control phase

int `lcd_cmd_bits`
   Bit-width of LCD command

int `lcd_param_bits`
   Bit-width of LCD parameter

unsigned int `dc_low_on_data` : 1
   If this flag is enabled, DC line = 0 means transfer data, DC line = 1 means transfer command; vice versa

`struct esp_lcd_i80_bus_config_t`

**Public Members**

int `dc_gpio_num`
   GPIO used for D/C line

int `wr_gpio_num`
   GPIO used for WR line

`lcd_clock_source_t clk_src`
   Clock source for the I80 LCD peripheral

int `data_gpio_nums[(16)]`
   GPIOs used for data lines

`size_t bus_width`
   Number of data lines, 8 or 16

`size_t max_transfer_bytes`
   Maximum transfer size, this determines the length of internal DMA link
struct esp_lcd_panel_io_i80_config_t
Panel IO configuration structure, for intel 8080 interface.

Public Members

int cs_gpio_num
GPIO used for CS line, set to -1 will declaim exclusively use of I80 bus

unsigned int pclk_hz
Frequency of pixel clock

size_t trans_queue_depth
Transaction queue size, larger queue, higher throughput

esp_lcd_panel_io_color_trans_done_cb_t on_color_trans_done
Callback invoked when color data was transferred done

void *user_ctx
User private data, passed directly to on_color_trans_done’s user_ctx

int lcd_cmd_bits
Bit-width of LCD command

int lcd_param_bits
Bit-width of LCD parameter

unsigned int dc_idle_level : 1
Level of DC line in IDLE phase

unsigned int dc_cmd_level : 1
Level of DC line in CMD phase

unsigned int dc_dummy_level : 1
Level of DC line in DUMMY phase

unsigned int dc_data_level : 1
Level of DC line in DATA phase

struct esp_lcd_panel_io_i80_config_t: [anonymous] dc_levels
Each I80 device might have its own D/C control logic

unsigned int cs_active_high : 1
If set, a high level of CS line will select the device, otherwise, CS line is low level active

unsigned int reverse_color_bits : 1
Reverse the data bits, D[N:0] -> D[0:N]

unsigned int swap_color_bytes : 1
Swap adjacent two color bytes

unsigned int pclk_active_neg : 1
The display will write data lines when there’s a falling edge on WR signal (a.k.a the PCLK)

unsigned int pclk_idle_low : 1
The WR signal (a.k.a the PCLK) stays at low level in IDLE phase

Type Definitions

typedef void *esp_lcd_spi_bus_handle_t
Type of LCD SPI bus handle

typedef void *esp_lcd_i2c_bus_handle_t
Type of LCD I2C bus handle

typedef struct esp_lcd_i80_bus_t *esp_lcd_i80_bus_handle_t
Type of LCD intel 8080 bus handle
typedef bool (esp_lcd_panel_io_color_trans_done_cb_t)(esp_lcd_panel_io_handle_t panel_io, esp_lcd_panel_io_event_data_t *edata, void *user_ctx)

Declare the prototype of the function that will be invoked when panel IO finishes transferring color data.

Return Whether a high priority task has been woken up by this function
Parameters
• [in] panel_io: LCD panel IO handle, which is created by factory API like esp_lcd_new_panel_io_spi()
• [in] edata: Panel IO event data, fed by driver
• [in] user_ctx: User data, passed from esp_lcd_panel_io_xxx_config_t

Header File
• components/esp_lcd/include/esp_lcd_panel_ops.h

Functions

esp_err_t esp_lcd_panel_reset (esp_lcd_panel_handle_t panel)
Reset LCD panel.

Note Panel reset must be called before attempting to initialize the panel using esp_lcd_panel_init().
Return • ESP_OK on success
Parameters
• [in] panel: LCD panel handle, which is created by other factory API like esp_lcd_new_panel_st7789()

esp_err_t esp_lcd_panel_init (esp_lcd_panel_handle_t panel)
Initialize LCD panel.

Note Before calling this function, make sure the LCD panel has finished the reset stage by esp_lcd_panel_reset().
Return • ESP_OK on success
Parameters
• [in] panel: LCD panel handle, which is created by other factory API like esp_lcd_new_panel_st7789()

esp_err_t esp_lcd_panel_del (esp_lcd_panel_handle_t panel)
Deinitialize the LCD panel.

Return • ESP_OK on success
Parameters
• [in] panel: LCD panel handle, which is created by other factory API like esp_lcd_new_panel_st7789()

esp_err_t esp_lcd_panel_draw_bitmap (esp_lcd_panel_handle_t panel, int x_start, int y_start, int x_end, int y_end, const void *color_data)
Draw bitmap on LCD panel.

Return • ESP_OK on success
Parameters
• [in] panel: LCD panel handle, which is created by other factory API like esp_lcd_new_panel_st7789()
• [in] x_start: Start index on x-axis (x_start included)
• [in] y_start: Start index on y-axis (y_start included)
• [in] x_end: End index on x-axis (x_end not included)
• [in] y_end: End index on y-axis (y_end not included)
• [in] color_data: RGB color data that will be dumped to the specific window range
**esp_err_t esp_lcd_panel_mirror (esp_lcd_panel_handle_t panel, bool mirror_x, bool mirror_y)**

Mirror the LCD panel on specific axis.

**Note** Combined with esp_lcd_panel_swap_xy(), one can realize screen rotation

**Return**
- ESP_OK on success
- ESP_ERR_NOT_SUPPORTED if this function is not supported by the panel

**Parameters**
- [in] panel: LCD panel handle, which is created by other factory API like esp_lcd_new_panel_st7789()
- [in] mirror_x: Whether the panel will be mirrored about the x axis
- [in] mirror_y: Whether the panel will be mirrored about the y axis

**esp_err_t esp_lcd_panel_swap_xy (esp_lcd_panel_handle_t panel, bool swap_axes)**

Swap/Exchange x and y axis.

**Note** Combined with esp_lcd_panel_mirror(), one can realize screen rotation

**Return**
- ESP_OK on success
- ESP_ERR_NOT_SUPPORTED if this function is not supported by the panel

**Parameters**
- [in] panel: LCD panel handle, which is created by other factory API like esp_lcd_new_panel_st7789()
- [in] swap_axes: Whether to swap the x and y axis

**esp_err_t esp_lcd_panel_set_gap (esp_lcd_panel_handle_t panel, int x_gap, int y_gap)**

Set extra gap in x and y axis.

The gap is the space (in pixels) between the left/top sides of the LCD panel and the first row/column respectively of the actual contents displayed.

**Note** Setting a gap is useful when positioning or centering a frame that is smaller than the LCD.

**Return**
- ESP_OK on success

**Parameters**
- [in] panel: LCD panel handle, which is created by other factory API like esp_lcd_new_panel_st7789()
- [in] x_gap: Extra gap on x axis, in pixels
- [in] y_gap: Extra gap on y axis, in pixels

**esp_err_t esp_lcd_panel_invert_color (esp_lcd_panel_handle_t panel, bool invert_color_data)**

Invert the color (bit-wise invert the color data line)

**Return**
- ESP_OK on success

**Parameters**
- [in] panel: LCD panel handle, which is created by other factory API like esp_lcd_new_panel_st7789()
- [in] invert_color_data: Whether to invert the color data

**esp_err_t esp_lcd_panel_disp_off (esp_lcd_panel_handle_t panel, bool off)**

Turn off the display.

**Return**
- ESP_OK on success
- ESP_ERR_NOT_SUPPORTED if this function is not supported by the panel

**Parameters**
- [in] panel: LCD panel handle, which is created by other factory API like esp_lcd_new_panel_st7789()
- [in] off: Whether to turn off the screen

**Header File**

Espressif Systems
Components/esp_lcd/include/esp_lcd_panel_rgb.h

Functions

`esp_err_t esp_lcd_new_rgb_panel(const esp_lcd_rgb_panel_config_t *rgb_panel_config, esp_lcd_panel_handle_t *ret_panel)`

Create RGB LCD panel.

Return

- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_NO_MEM if out of memory
- ESP_ERR_NOT_FOUND if no free RGB panel is available
- ESP_OK on success

Parameters

- `rgb_panel_config`: RGB panel configuration
- `ret_panel`: Returned LCD panel handle

Structures

`struct esp_lcd_rgb_timing_t`

LCD RGB timing structure.

Public Members

unsigned int \texttt{pclk\_hz}
Frequency of pixel clock

unsigned int \texttt{h\_res}
Horizontal resolution, i.e. the number of pixels in a line

unsigned int \texttt{v\_res}
Vertical resolution, i.e. the number of lines in the frame

unsigned int \texttt{hsync\_pulse\_width}
Horizontal sync width, unit: PCLK period

unsigned int \texttt{hsync\_back\_porch}
Horizontal back porch, number of PCLK between hsync and start of line active data

unsigned int \texttt{hsync\_front\_porch}
Horizontal front porch, number of PCLK between the end of active data and the next hsync

unsigned int \texttt{vsync\_pulse\_width}
Vertical sync width, unit: number of lines

unsigned int \texttt{vsync\_back\_porch}
Vertical back porch, number of invalid lines between vsync and start of frame

unsigned int \texttt{vsync\_front\_porch}
Vertical front porch, number of invalid lines between then end of frame and the next vsync

unsigned int \texttt{hsync\_idle\_low}
The hsync signal is low in IDLE state

unsigned int \texttt{vsync\_idle\_low}
The vsync signal is low in IDLE state

unsigned int \texttt{de\_idle\_high}
The de signal is high in IDLE state

unsigned int \texttt{pclk\_active\_neg}
The display will write data lines when there’s a falling edge on PCLK

unsigned int \texttt{pclk\_idle\_high}
The PCLK stays at high level in IDLE phase

\textbf{struct esp\_lcd\_rgb\_panel\_event\_data\_t}
Type of RGB LCD panel event data.
struct esp_lcd_rgb_panel_config_t

LCD RGB panel configuration structure.

Public Members

`lcd_clock_source_t clk_src`
Clock source for the RGB LCD peripheral

`esp_lcd_rgb_timing_t timings`
RGB timing parameters

`size_t data_width`
Number of data lines

`int hsync_gpio_num`
GPIO used for HSYNC signal

`int vsync_gpio_num`
GPIO used for VSYNC signal

`int de_gpio_num`
GPIO used for DE signal, set to -1 if it’s not used

`int pclk_gpio_num`
GPIO used for PCLK signal

`int data_gpio_nums[(16)]`
GPIOs used for data lines

`int disp_gpio_num`
GPIO used for display control signal, set to -1 if it’s not used

`esp_lcd_rgb_panel_frame_trans_done_cb_t on_frame_trans_done`
Callback invoked when one frame buffer has transferred done

`void *user_ctx`
User data which would be passed to on_frame_trans_done’s user_ctx

`unsigned int disp_active_low : 1`
If this flag is enabled, a low level of display control signal can turn the screen on; vice versa

`unsigned int relax_on_idle : 1`
If this flag is enabled, the host won’t refresh the LCD if nothing changed in host’s frame buffer (this is usefull for LCD with built-in GRAM)

`unsigned int fb_in_psram : 1`
If this flag is enabled, the frame buffer will be allocated from PSRAM preferentially

Type Definitions

typedef bool (*esp_lcd_rgb_panel_frame_trans_done_cb_t)(esp_lcd_panel_handle_t panel,
               esp_lcd_rgb_panel_event_data_t *edata, void *user_ctx)

Declare the prototype of the function that will be invoked when panel IO finishes transferring color data.

Return Whether a high priority task has been waken up by this function

Parameters

• [in] panel: LCD panel handle, returned from esp_lcd_new_rgb_panel
• [in] edata: Panel event data, fed by driver
• [in] user_ctx: User data, passed from esp_lcd_rgb_panel_config_t

Header File

• components/esp_lcd/include/esp_lcd_panel_vendor.h
Functions

```c
esp_err_t esp_lcd_new_panel_st7789(const esp_lcd_panel_io_handle_t io, const esp_lcd_panel_dev_config_t *panel_dev_config, esp_lcd_panel_handle_t *ret_panel)
```

Create LCD panel for model ST7789.

Return

- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_NO_MEM if out of memory
- ESP_OK on success

Parameters

- [in] io: LCD panel IO handle
- [in] panel_dev_config: general panel device configuration
- [out] ret_panel: Returned LCD panel handle

```c
esp_err_t esp_lcd_new_panel_nt35510(const esp_lcd_panel_io_handle_t io, const esp_lcd_panel_dev_config_t *panel_dev_config, esp_lcd_panel_handle_t *ret_panel)
```

Create LCD panel for model NT35510.

Return

- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_NO_MEM if out of memory
- ESP_OK on success

Parameters

- [in] io: LCD panel IO handle
- [in] panel_dev_config: general panel device configuration
- [out] ret_panel: Returned LCD panel handle

```c
esp_err_t esp_lcd_new_panel_ssd1306(const esp_lcd_panel_io_handle_t io, const esp_lcd_panel_dev_config_t *panel_dev_config, esp_lcd_panel_handle_t *ret_panel)
```

Create LCD panel for model SSD1306.

Return

- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_NO_MEM if out of memory
- ESP_OK on success

Parameters

- [in] io: LCD panel IO handle
- [in] panel_dev_config: general panel device configuration
- [out] ret_panel: Returned LCD panel handle

Structures

```c
struct esp_lcd_panel_dev_config_t
```

Configuration structure for panel device.

Public Members

```c
int reset_gpio_num
```

GPIO used to reset the LCD panel, set to -1 if it’s not used

```c
esp_lcd_color_space_t color_space
```

Set the color space used by the LCD panel

```c
unsigned int bits_per_pixel
```

Color depth, in bpp

```c
unsigned int reset_active_high : 1
```

Setting this if the panel reset is high level active
2.3.10 LED Control (LEDC)

Introduction

The LED control (LEDC) peripheral is primarily designed to control the intensity of LEDs, although it can also be used to generate PWM signals for other purposes. It has 8 channels which can generate independent waveforms that can be used, for example, to drive RGB LED devices.

The PWM controller can automatically increase or decrease the duty cycle gradually, allowing for fades without any processor interference.

Functionality Overview

Setting up a channel of the LEDC is done in three steps. Note that unlike ESP32, ESP32-S3 only supports configuring channels in “low speed” mode.

1. **Timer Configuration** by specifying the PWM signal’s frequency and duty cycle resolution.
2. **Channel Configuration** by associating it with the timer and GPIO to output the PWM signal.
3. **Change PWM Signal** that drives the output in order to change LED’s intensity. This can be done under the full control of software or with hardware fading functions.

As an optional step, it is also possible to set up an interrupt on fade end.

![Fig. 7: Key Settings of LED PWM Controller’s API](image)

**Timer Configuration** Setting the timer is done by calling the function `ledc_timer_config()` and passing the data structure `ledc_timer_config_t` that contains the following configuration settings:

- Speed mode (value must be `LEDC_LOW_SPEED_MODE`)
- Timer number `ledc_timer_t`
- PWM signal frequency
- Resolution of PWM duty

The frequency and the duty resolution are interdependent. The higher the PWM frequency, the lower the duty resolution which is available, and vice versa. This relationship might be important if you are planning to use this API for purposes other than changing the intensity of LEDs. For more details, see Section **Supported Range of Frequency and Duty Resolutions**.
Channel Configuration  When the timer is set up, configure the desired channel (one out of `ledc_channel_t`). This is done by calling the function `ledc_channel_config()`.

Similar to the timer configuration, the channel setup function should be passed a structure `ledc_channel_config_t` that contains the channel’s configuration parameters.

At this point, the channel should start operating and generating the PWM signal on the selected GPIO, as configured in `ledc_channel_config_t`, with the frequency specified in the timer settings and the given duty cycle. The channel operation (signal generation) can be suspended at any time by calling the function `ledc_stop()`.

Change PWM Signal  Once the channel starts operating and generating the PWM signal with the constant duty cycle and frequency, there are a couple of ways to change this signal. When driving LEDs, primarily the duty cycle is changed to vary the light intensity.

The following two sections describe how to change the duty cycle using software and hardware fading. If required, the signal’s frequency can also be changed; it is covered in Section `Change PWM Frequency`.

Change PWM Duty Cycle Using Software  To set the duty cycle, use the dedicated function `ledc_set_duty()`. After that, call `ledc_update_duty()` to activate the changes. To check the currently set value, use the corresponding `_get_` function `ledc_get_duty()`.

Another way to set the duty cycle, as well as some other channel parameters, is by calling `ledc_channel_config()` covered in Section `Channel Configuration`.

The range of the duty cycle values passed to functions depends on selected `duty_resolution` and should be from 0 to \((2^{**}\text{duty\_resolution}) - 1\). For example, if the selected duty resolution is 10, then the duty cycle values can range from 0 to 1023. This provides the resolution of ~0.1%.

Change PWM Duty Cycle using Hardware  The LEDC hardware provides the means to gradually transition from one duty cycle value to another. To use this functionality, enable fading with `ledc_fade_func_install()` and then configure it by calling one of the available fading functions:

- `ledc_set_fade_with_time()`
- `ledc_set_fade_with_step()`
- `ledc_set_fade()`

Finally start fading with `ledc_fade_start()`.

If not required anymore, fading and an associated interrupt can be disabled with `ledc_fade_func_uninstall()`.

Change PWM Frequency  The LEDC API provides several ways to change the PWM frequency “on the fly”:

- Set the frequency by calling `ledc_set_freq()`. There is a corresponding function `ledc_get_freq()` to check the current frequency.
- Change the frequency and the duty resolution by calling `ledc_bind_channel_timer()` to bind some other timer to the channel.
- Change the channel’s timer by calling `ledc_channel_config()`.

More Control Over PWM  There are several lower level timer-specific functions that can be used to change PWM settings:

- `ledc_timer_set()`
- `ledc_timer_rst()`
- `ledc_timer_pause()`
- `ledc_timer_resume()`

The first two functions are called “behind the scenes” by `ledc_channel_config()` to provide a startup of a timer after it is configured.
Use Interrupts When configuring an LEDC channel, one of the parameters selected within `ledc_channel_config_t` is `ledc_intr_type_t` which triggers an interrupt on fade completion. For registration of a handler to address this interrupt, call `ledc_isr_register()`.

Supported Range of Frequency and Duty Resolutions

The LED PWM Controller is designed primarily to drive LEDs. It provides a large flexibility of PWM duty cycle settings. For instance, the PWM frequency of 5 kHz can have the maximum duty resolution of 13 bits. This means that the duty can be set anywhere from 0 to 100% with a resolution of ~0.012% (2 ** 13 = 8192 discrete levels of the LED intensity). Note, however, that these parameters depend on the clock signal clocking the LED PWM Controller timer which in turn clocks the channel (see timer configuration and the ESP32-S3 Technical Reference Manual > LED PWM Controller (LEDC) [PDF]).

The LEDC can be used for generating signals at much higher frequencies that are sufficient enough to clock other devices, e.g., a digital camera module. In this case, the maximum available frequency is 40 MHz with duty resolution of 1 bit. This means that the duty cycle is fixed at 50% and cannot be adjusted.

The LEDC API is designed to report an error when trying to set a frequency and a duty resolution that exceed the range of LEDC’s hardware. For example, an attempt to set the frequency to 20 MHz and the duty resolution to 3 bits will result in the following error reported on a serial monitor:

```
E (196) ledc: requested frequency and duty resolution cannot be achieved, try_reducing freq_hz or duty_resolution. div_param=128
```

In such a situation, either the duty resolution or the frequency must be reduced. For example, setting the duty resolution to 2 will resolve this issue and will make it possible to set the duty cycle at 25% steps, i.e., at 25%, 50% or 75%.

The LEDC driver will also capture and report attempts to configure frequency / duty resolution combinations that are below the supported minimum, e.g.:

```
E (196) ledc: requested frequency and duty resolution cannot be achieved, try_increasing freq_hz or duty_resolution. div_param=128000000
```

The duty resolution is normally set using `ledc_timer_bit_t`. This enumeration covers the range from 10 to 15 bits. If a smaller duty resolution is required (from 10 down to 1), enter the equivalent numeric values directly.

Application Example

The LEDC change duty cycle and fading control example: `peripherals/ledc/ledc_fade`

The LEDC basic example: `peripherals/ledc/ledc_basic`

API Reference

Header File

- components/driver/include/driver/ledc.h

Functions

```
esp_err_t ledc_channel_config(const ledc_channel_config_t *ledc_conf)
```

LEDC channel configuration Configure LEDC channel with the given channel/output gpio_num/interrupt/source timer/frequency(Hz)/LEDC duty resolution.

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters
Chapter 2. API Reference

- **ledc_conf**: Pointer of LEDC channel configure struct

  ```c
  esp_err_t ledc_timer_config(const ledc_timer_config_t *timer_conf)
  ```

  LEDC timer configuration. Configure LEDC timer with the given source timer/frequency(Hz)/duty_resolution.

  **Return**

  - ESP_OK Success
  - ESP_ERR_INVALID_ARG Parameter error
  - ESP_FAIL Can not find a proper pre-divider number base on the given frequency and the current duty_resolution.

  **Parameters**

  - **timer_conf**: Pointer of LEDC timer configure struct

- **ledc_update_duty**: LEDC update channel parameters.

  ```c
  esp_err_t ledc_update_duty(ledc_mode_t speed_mode, ledc_channel_t channel)
  ```

  Note Call this function to activate the LEDC updated parameters. After ledc_set_duty, we need to call this function to update the settings.

  Note ledc_set_duty, ledc_set_duty_with_hpoint and ledc_update_duty are not thread-safe, do not call these functions to control one LEDC channel in different tasks at the same time. A thread-safe version of API is ledc_set_duty_and_update

  **Return**

  - ESP_OK Success
  - ESP_ERR_INVALID_ARG Parameter error

  **Parameters**

  - **speed_mode**: Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
  - **channel**: LEDC channel (0 - LEDC_CHANNEL_MAX-1), select from ledc_channel_t

- **ledc_set_pin**: Set LEDC output gpio.

  ```c
  esp_err_t ledc_set_pin(int gpio_num, ledc_mode_t speed_mode, ledc_channel_t ledc_channel)
  ```

  **Return**

  - ESP_OK Success
  - ESP_ERR_INVALID_ARG Parameter error

  **Parameters**

  - **gpio_num**: The LEDC output gpio
  - **speed_mode**: Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
  - **ledc_channel**: LEDC channel (0 - LEDC_CHANNEL_MAX-1), select from ledc_channel_t

- **ledc_stop**: Disable LEDC output, and set idle level.

  ```c
  esp_err_t ledc_stop(ledc_mode_t speed_mode, ledc_channel_t channel, uint32_t idle_level)
  ```

  **Return**

  - ESP_OK Success
  - ESP_ERR_INVALID_ARG Parameter error

  **Parameters**

  - **speed_mode**: Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
  - **channel**: LEDC channel (0 - LEDC_CHANNEL_MAX-1), select from ledc_channel_t
  - **idle_level**: Set output idle level after LEDC stops.

- **ledc_set_freq**: LEDC set channel frequency (Hz)

  ```c
  esp_err_t ledc_set_freq(ledc_mode_t speed_mode, ledc_timer_t timer_num, uint32_t freq_hz)
  ```

  **Return**

  - ESP_OK Success
  - ESP_ERR_INVALID_ARG Parameter error
  - ESP_FAIL Can not find a proper pre-divider number base on the given frequency and the current duty_resolution.

  **Parameters**

  - **speed_mode**: Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
Chapter 2. API Reference

- timer_num: LEDC timer index (0-3), select from ledc_timer_t
- freq_hz: Set the LEDC frequency

```c
uint32_t ledc_get_freq(ledc_mode_t speed_mode, ledc_timer_t timer_num)
```

LEDG get channel frequency (Hz)

**Return**
- 0 error
- Others Current LEDC frequency

**Parameters**
- speed_mode: Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- timer_num: LEDC timer index (0-3), select from ledc_timer_t

```c
esp_err_t ledc_set_duty_with_hpoint(ledc_mode_t speed_mode, ledc_channel_t channel, uint32_t duty, uint32_t hpoint)
```

LEDG set duty and hpoint value Only after calling ledc_update_duty will the duty update.

**Note**
ledc_set_duty, ledc_set_duty_with_hpoint and ledc_update_duty are not thread-safe, do not call these functions to control one LEDC channel in different tasks at the same time. A thread-safe version of API is ledc_set_duty_and_update

**Note**
If a fade operation is running in progress on that channel, the driver would not allow it to be stopped. Other duty operations will have to wait until the fade operation has finished.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- speed_mode: Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- channel: LEDC channel (0 - LEDC_CHANNEL_MAX-1), select from ledc_channel_t
- duty: Set the LEDC duty, the range of duty setting is [0, (2**duty_resolution) - 1]
- hpoint: Set the LEDC hpoint value(max: 0xfffff)

```c
int ledc_get_hpoint(ledc_mode_t speed_mode, ledc_channel_t channel)
```

LEDG get hpoint value, the counter value when the output is set high level.

**Return**
- LEDC_ERR_VAL if parameter error
- Others Current hpoint value of LEDC channel

**Parameters**
- speed_mode: Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- channel: LEDC channel (0 - LEDC_CHANNEL_MAX-1), select from ledc_channel_t

```c
esp_err_t ledc_set_duty(ledc_mode_t speed_mode, ledc_channel_t channel, uint32_t duty)
```

LEDC set duty This function do not change the hpoint value of this channel. if needed, please call ledc_set_duty_with_hpoint. only after calling ledc_update_duty will the duty update.

**Note**
ledc_set_duty, ledc_set_duty_with_hpoint and ledc_update_duty are not thread-safe, do not call these functions to control one LEDC channel in different tasks at the same time. A thread-safe version of API is ledc_set_duty_and_update.

**Note**
If a fade operation is running in progress on that channel, the driver would not allow it to be stopped. Other duty operations will have to wait until the fade operation has finished.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- speed_mode: Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- channel: LEDC channel (0 - LEDC_CHANNEL_MAX-1), select from ledc_channel_t
- duty: Set the LEDC duty, the range of duty setting is [0, (2**duty_resolution) - 1]
uint32_t ledc_get_duty (ledc_mode_t speed_mode, ledc_channel_t channel)

LEDG get duty.

Return
• LEDC_ERR_DUTY if parameter error
• Others Current LEDC duty

Parameters
• speed_mode: Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
• channel: LEDC channel (0 - LEDC_CHANNEL_MAX-1), select from ledc_channel_t

esp_err_t ledc_setFade (ledc_mode_t speed_mode, ledc_channel_t channel, uint32_t duty, ledc_duty_direction_t fade_direction, uint32_t step_num, uint32_t duty_cycle_num, uint32_t duty_scale)

LEDG set gradient Set LEDG gradient, After the function calls the ledc_update_duty function, the function can take effect.

Note If a fade operation is running in progress on that channel, the driver would not allow it to be stopped. Other duty operations will have to wait until the fade operation has finished.

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error

Parameters
• speed_mode: Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
• channel: LEDC channel (0 - LEDC_CHANNEL_MAX-1), select from ledc_channel_t
• duty: Set the start of the gradient duty, the range of duty setting is [0, (2**duty_resolution) - 1]
• fade_direction: Set the direction of the gradient
• step_num: Set the number of the gradient
• duty_cycle_num: Set how many LEDG tick each time the gradient lasts
• duty_scale: Set gradient change amplitude

esp_err_t ledc_isr_register (void (*fn)(), void *arg, int intr_alloc_flags, ledc_isr_handle_t *handle)

Register LEDG interrupt handler, the handler is an ISR. The handler will be attached to the same CPU core that this function is running on.

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG Function pointer error

Parameters
• fn: Interrupt handler function.
• arg: User-supplied argument passed to the handler function.
• intr_alloc_flags: Flags used to allocate the interrupt. One or multiple (ORred) ESP_INTR_FLAG_* values. See esp_intr_alloc.h for more info.
• handle: Pointer to return handle. If non-NULL, a handle for the interrupt will be returned here.

esp_err_t ledc_timer_set (ledc_mode_t speed_mode, ledc_timer_t timer_sel, uint32_t clock_divider, uint32_t duty_resolution, ledc_clk_src_t clk_src)

Configure LEDG settings.

Return
• (-1) Parameter error
• Others Current LEDG duty

Parameters
• speed_mode: Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
• timer_sel: Timer index (0-3), there are 4 timers in LEDG module
• clock_divider: Timer clock divide value, the timer clock is divided from the selected clock source
• duty_resolution: Resolution of duty setting in number of bits. The range of duty values is [0, (2**duty_resolution)]
• clk_src: Select LEDG source clock.
**esp_err_t** `ledc_timer_rst` (*ledc_mode_t speed_mode, ledc_timer_t timer_sel*)

Reset LEDC timer.

**Return**
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

**Parameters**
- `speed_mode`: Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- `timer_sel`: LEDC timer index (0-3), select from ledc_timer_t

**esp_err_t** `ledc_timer_pause` (*ledc_mode_t speed_mode, ledc_timer_t timer_sel*)

Pause LEDC timer counter.

**Return**
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

**Parameters**
- `speed_mode`: Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- `timer_sel`: LEDC timer index (0-3), select from ledc_timer_t

**esp_err_t** `ledc_timer_resume` (*ledc_mode_t speed_mode, ledc_timer_t timer_sel*)

Resume LEDC timer.

**Return**
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

**Parameters**
- `speed_mode`: Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- `timer_sel`: LEDC timer index (0-3), select from ledc_timer_t

**esp_err_t** `ledc_bind_channel_timer` (*ledc_mode_t speed_mode, ledc_channel_t channel, ledc_timer_t timer_sel*)

Bind LEDC channel with the selected timer.

**Return**
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

**Parameters**
- `speed_mode`: Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- `channel`: LEDC channel index (0 - LEDC_CHANNEL_MAX-1), select from ledc_channel_t
- `timer_sel`: LEDC timer index (0-3), select from ledc_timer_t

**esp_err_t** `ledc_set_fade_with_step` (*ledc_mode_t speed_mode, ledc_channel_t channel, uint32_t target_duty, uint32_t scale, uint32_t cycle_num*)

Set LEDC fade function.

**Note** Call `ledc_fade_func_install()` once before calling this function. Call `ledc_fade_start()` after this to start fading.

**Note** `ledc_set_fade_with_step`, `ledc_set_fade_with_time` and `ledc_fade_start` are not thread-safe, do not call these functions to control one LEDC channel in different tasks at the same time. A thread-safe version of API is `ledc_set_fade_step_and_start`.

**Note** If a fade operation is running in progress on that channel, the driver would not allow it to be stopped. Other duty operations will have to wait until the fade operation has finished.

**Return**
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success
- ESP_ERR_INVALID_STATE Fade function not installed.
- ESP_FAIL Fade function init error

**Parameters**
**Chapter 2. API Reference**

- **speed_mode**: Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel**: LEDC channel index (0 - LEDC_CHANNEL_MAX-1), select from ledc_channel_t
- **target_duty**: Target duty of fading \([0, (2^{*duty\_resolution}) - 1]\)
- **scale**: Controls the increase or decrease step scale.
- **cycle_num**: Increase or decrease the duty every cycle_num cycles

```c
esp_err_t ledc_set_fade_with_time(ledc_mode_t speed_mode, ledc_channel_t channel, uint32_t target_duty, int max_fade_time_ms)
```

Set LEDC fade function, with a limited time.

**Note** Call ledc_fade_func_install() once before calling this function. Call ledc_fade_start() after this to start fading.

**Note** ledc_set_fade_with_step, ledc_set_fade_with_time and ledc_fade_start are not thread-safe, do not call these functions to control one LEDC channel in different tasks at the same time. A thread-safe version of API is ledc_set_fade_step_and_start

**Note** If a fade operation is running in progress on that channel, the driver would not allow it to be stopped. Other duty operations will have to wait until the fade operation has finished.

**Return**
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success
- ESP_ERR_INVALID_STATE Fade function not installed.
- ESP_FAIL Fade function init error

**Parameters**
- **speed_mode**: Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel**: LEDC channel index (0 - LEDC_CHANNEL_MAX-1), select from ledc_channel_t
- **target_duty**: Target duty of fading \([0, (2^{*duty\_resolution}) - 1]\)
- **max_fade_time_ms**: The maximum time of the fading (ms).

```c
esp_err_t ledc_fade_func_install(int intr_alloc_flags)
```

Install LEDC fade function. This function will occupy interrupt of LEDC module.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_STATE Fade function already installed.

**Parameters**
- **intr_alloc_flags**: Flags used to allocate the interrupt. One or multiple (ORred) ESP_INTR_FLAG_* values. See esp_intr_alloc.h for more info.

```c
void ledc_fade_func_uninstall()
```

Uninstall LEDC fade function.

```c
esp_err_t ledc_fade_start(ledc_mode_t speed_mode, ledc_channel_t channel, ledc_fade_mode_t fade_mode)
```

Start LEDC fading.

**Note** Call ledc_fade_func_install() once before calling this function. Call this API right after ledc_set_fade_with_time or ledc_set_fade_with_step before to start fading.

**Note** If a fade operation is running in progress on that channel, the driver would not allow it to be stopped. Other duty operations will have to wait until the fade operation has finished.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_STATE Fade function not installed.
- ESP_ERR_INVALID_ARG Parameter error.

**Parameters**
- **speed_mode**: Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel**: LEDC channel number
- **fade_mode**: Whether to block until fading done.

```c
esp_err_t ledc_set_duty_and_update(ledc_mode_t speed_mode, ledc_channel_t channel, uint32_t duty, uint32_t hpoint)
```

Espressif Systems 610 Release v5.0-dev-952-g1538009

Submit Document Feedback
A thread-safe API to set duty for LEDC channel and return when duty updated.

**Note** If a fade operation is running in progress on that channel, the driver would not allow it to be stopped. Other duty operations will have to wait until the fade operation has finished.

**Parameters**
- **speed_mode**: Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel**: LEDC channel (0 - LEDC_CHANNEL_MAX-1), select from ledc_channel_t
- **duty**: Set the LEDC duty, the range of duty setting is \([0, (2^{**duty\_resolution}) - 1]\)
- **hpoint**: Set the LEDC hpoint value (max: 0xffffffff)

```c
esp_err_t ledc_setfade_time_and_start
(ledc_mode_t speed_mode, ledc_channel_t channel,
 uint32_t target_duty, uint32_t max_fade_time_ms,
 ledc_fade_mode_t fade_mode)
```

A thread-safe API to set and start LEDC fade function, with a limited time.

**Note** Call ledc_fade_func_install() once, before calling this function.

**Note** If a fade operation is running in progress on that channel, the driver would not allow it to be stopped. Other duty operations will have to wait until the fade operation has finished.

**Return**
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success
- ESP_ERR_INVALID_STATE Fade function not installed.
- ESP_FAIL Fade function init error

**Parameters**
- **speed_mode**: Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel**: LEDC channel index (0 - LEDC_CHANNEL_MAX-1), select from ledc_channel_t
- **target_duty**: Target duty of fading \([0, (2^{*duty\_resolution}) - 1]\)
- **max_fade_time_ms**: The maximum time of the fading (ms).
- **fade_mode**: choose blocking or non-blocking mode

```c
esp_err_t ledc_setfade_step_and_start
(ledc_mode_t speed_mode, ledc_channel_t channel,
 uint32_t target_duty, uint32_t scale, uint32_t cycle_num,
 ledc_fade_mode_t fade_mode)
```

A thread-safe API to set and start LEDC fade function.

**Note** Call ledc_fade_func_install() once, before calling this function.

**Note** If a fade operation is running in progress on that channel, the driver would not allow it to be stopped. Other duty operations will have to wait until the fade operation has finished.

**Return**
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success
- ESP_ERR_INVALID_STATE Fade function not installed.
- ESP_FAIL Fade function init error

**Parameters**
- **speed_mode**: Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
- **channel**: LEDC channel index (0 - LEDC_CHANNEL_MAX-1), select from ledc_channel_t
- **target_duty**: Target duty of fading \([0, (2^{*duty\_resolution}) - 1]\)
- **scale**: Controls the increase or decrease step scale.
- **cycle_num**: increase or decrease the duty every cycle_num cycles
- **fade_mode**: choose blocking or non-blocking mode

```c
esp_err_t ledc_cb_register
(ledc_mode_t speed_mode, ledc_channel_t channel, ledc_cbs_t *cbs, void *user_arg)
```

LEDC callback registration function.

**Note** The callback is called from an ISR, it must never attempt to block, and any FreeRTOS API called must be ISR capable.

**Return**
- ESP_ERR_INVALID_ARG Parameter error
• ESP_OK Success
• ESP_ERR_INVALID_STATE Fade function not installed.
• ESP_FAIL Fade function init error

Parameters
• speed_mode: Select the LEDC channel group with specified speed mode. Note that not all targets support high speed mode.
• channel: LEDC channel index (0 - LEDC_CHANNEL_MAX-1), select from ledc_channel_t
• cbs: Group of LEDC callback functions
• user_arg: user registered data for the callback function

Structures

`struct ledc_channel_config_t`
Configuration parameters of LEDC channel for `ledc_channel_config` function.

Public Members

- `int gpio_num`
  the LEDC output gpio_num, if you want to use gpio16, gpio_num = 16

- `lede_mode_t speed_mode`
  LEDC speed speed_mode, high-speed mode or low-speed mode

- `lede_channel_t channel`
  LEDC channel (0 - 7)

- `lede_intr_type_t intr_type`
  configure interrupt, Fade interrupt enable or Fade interrupt disable

- `lede_timer_t timer_sel`
  Select the timer source of channel (0 - 3)

- `uint32_t duty`
  LEDC channel duty, the range of duty setting is [0, (2**duty_resolution)]

- `int hpoint`
  LEDC channel hpoint value, the max value is 0xfffff

- `unsigned int output_invert`: 1
  Enable (1) or disable (0) gpio output invert

`struct ledc_channel_config_t::[anonymous]flags`
LEDC flags

`struct ledc_timer_config_t`
Configuration parameters of LEDC Timer timer for `ledc_timer_config` function.

Public Members

- `lede_mode_t speed_mode`
  LEDC speed speed_mode, high-speed mode or low-speed mode

- `lede_timer_bit_t duty_resolution`
  LEDC channel duty resolution

- `lede_timer_bit_t bit_num`
  Deprecated in ESP-IDF 3.0. This is an alias to ‘duty_resolution’ for backward compatibility with ESP-IDF 2.1

- `lede_timer_t timer_num`
  The timer source of channel (0 - 3)

- `uint32_t freq_hz`
  LEDC timer frequency (Hz)
Configure LEDC source clock. For low speed channels and high speed channels, you can specify the source clock using `LEDC_USE_REF_TICK`, `LEDC_USE_APB_CLK` or `LEDC_AUTO_CLK`. For low speed channels, you can also specify the source clock using `LEDC_USE_RTC8M_CLK`, in this case, all low speed channel’s source clock must be `RTC8M_CLK`.

**Public Members**

```c
struct ledc_cb_param_t
    LEDC callback parameter.
```

- **`ledc_cb_event_t event`**
  - Event name
- **`uint32_t speed_mode`**
  - Speed mode of the LEDC channel group
- **`uint32_t channel`**
  - LEDC channel (0 - `LEDC_CHANNEL_MAX-1`)
- **`uint32_t duty`**
  - LEDC current duty of the channel, the range of duty is `[0, (2**duty_resolution) - 1]`

**Public Members**

```c
struct ledc_cbs_t
    Group of supported LEDC callbacks.
```

**Note** The callbacks are all running under ISR environment

**Macros**

```
LEDC_APB_CLK_HZ
LEDC_REF_CLK_HZ
LEDC_ERR_DUTY
LEDC_ERR_VAL
```

**Type Definitions**

```c
typedef intr_handle_t ledc_isr_handle_t
```

Type of LEDC event callback.

**Parameters**

- **`param`**: LEDC callback parameter
- **`user_arg`**: User registered data

**Enumerations**

```c
enum ledc_cb_event_t
    LEDC callback event type.
```

**Values:**

- **`LEDC_FADE_END_EVT`**
  - LEDC fade end event
Header File

- components/hal/include/hal/ledc_types.h

Enumerations

enum ledc_mode_t

Values:

LEDC_LOW_SPEED_MODE

LEDC low speed speed_mode

LEDC_SPEED_MODE_MAX

LEDC speed limit

enum ledc_intr_type_t

Values:

LEDC_INTR_DISABLE = 0

Disable LEDC interrupt

LEDC_INTR_FADE_END

Enable LEDC interrupt

LEDC_INTR_MAX

enum ledc_duty_direction_t

Values:

LEDC_DUTY_DIR_DECREASE = 0

LEDC duty decrease direction

LEDC_DUTY_DIR_INCREASE = 1

LEDC duty increase direction

LEDC_DUTY_DIR_MAX

enum ledc_slow_clk_sel_t

Values:

LEDC_SLOW_CLK_RTC8M = 0

LEDC low speed timer clock source is 8MHz RTC clock

LEDC_SLOW_CLK_APB

LEDC low speed timer clock source is 80MHz APB clock

LEDC_SLOW_CLK_XTAL

LEDC low speed timer clock source XTAL clock

enum ledc_clk_cfg_t

In theory, the following enumeration shall be placed in LEDC driver’s header. However, as the next enumeration, ledc_clk_src_t, makes the use of some of these values and to avoid mutual inclusion of the headers, we must define it here.

Values:

LEDC_AUTO_CLK = 0

The driver will automatically select the source clock(REF_TICK or APB) based on the giving resolution and duty parameter when init the timer

LEDC_USE_APB_CLK

LEDC timer select APB clock as source clock

LEDC_USE_RTC8M_CLK

LEDC timer select RTC8M_CLK as source clock. Only for low speed channels and this parameter must be the same for all low speed channels

LEDC_USE_XTAL_CLK

LEDC timer select XTAL clock as source clock
enum ledc_clk_src_t
Values:

LEDC_APB_CLK = LEDC_USE_APB_CLK
LEDC timer clock divided from APB clock (80Mhz)

LEDC_SCLK = LEDC_USE_APB_CLK
Selecting this value for LEDC_TICK_SEL_TIMER let the hardware take its source clock from LEDC_APB_CLK_SEL

enum ledc_timer_t
Values:

LEDC_TIMER_0 = 0
LEDC timer 0

      LEDC fade function will return immediately
    LEDC_FADE_WAITDONE
      LEDC fade function will block until fading to the target duty
    LEDC_FADE_MAX

2.3.11 Motor Control Pulse Width Modulator (MCPWM)

ESP32-S3 has two MCPWM units which can be used to control different types of motors. Each unit has three pairs of PWM outputs.

Further in documentation the outputs of a single unit are labeled PWMxA / PWMxB.

More detailed block diagram of the MCPWM unit is shown below. Each A/B pair may be clocked by any one of the three timers Timer 0, 1 and 2. The same timer may be used to clock more than one pair of PWM outputs. Each unit is also able to collect inputs such as SYNC SIGNALS, detect FAULT SIGNALS like motor overcurrent or overvoltage, as well as obtain feedback with CAPTURE SIGNALS on e.g. a rotor position.

Description of this API starts with configuration of MCPWM’s Timer and Generator submodules to provide the basic motor control functionality. Then it discusses more advanced submodules and functionalities of a Fault Handler, signal Capture and Carrier.

Contents

• Configure a basic functionality of the outputs
• Operate the outputs to drive a motor
• Adjust how the motor is driven
• Synchronize sync timers to work together
Chapter 2. API Reference

Fig. 8: MCPWM Overview

Fig. 9: MCPWM Block Diagram
Chapter 2. API Reference

- **Capture** external signals to provide additional control over the outputs
- Use **Fault Handler** to detect and manage faults
- Add a higher frequency **Carrier**, if output signals are passed through an isolation transformer
- Extra configuration of **Resolution**.

**Configure**

The scope of configuration depends on the motor type, in particular how many outputs and inputs are required, and what will be the sequence of signals to drive the motor.

In this case we will describe a simple configuration to control a brushed DC motor that is using only some of the available MCPWM’s resources. An example circuit is shown below. It includes a **H-Bridge** to switch polarization of a voltage applied to the motor (M) and to provide sufficient current to drive it.

![Fig. 10: Example of Brushed DC Motor Control with MCPWM](image)

Configuration covers the following steps:

1. Selection of a MCPWM unit that will be used to drive the motor. There are two units available on-board of ESP32-S3 and enumerated in `mcpwm_unit_t`.
2. Initialization of two GPIOs as output signals within selected unit by calling `mcpwm_gpio_init()`. The two output signals are typically used to command the motor to rotate right or left. All available signal options are listed in `mcpwm_io_signals_t`. To set more than a single pin at a time, use function `mcpwm_set_pin()` together with `mcpwm_pin_config_t`.
3. Selection of a timer. There are three timers available within the unit. The timers are listed in `mcpwm_timer_t`.
4. Setting of the timer frequency and initial duty within `mcpwm_config_t` structure.
5. Setting timer resolution if necessary, by calling `mcpwm_group_set_resolution()` and `mcpwm_timer_set_resolution()`.
6. Calling of `mcpwm_init()` with the above parameters to make the configuration effective.

**Operate**

To operate a motor connected to the MCPWM unit, e.g. turn it left or right, or vary the speed, we should apply some control signals to the unit’s outputs. The outputs are organized into three pairs. Within a pair they are labeled “A” and “B” and each driven by a submodule called an “Generator”. To provide a PWM signal, the Operator itself, which contains two Generator, should be clocked by one of three available Timers. To make the API simpler, each Timer is automatically associated by the API to drive an Operator of the same index, e.g. Timer 0 is associated with Operator 0.
There are the following basic ways to control the outputs:

- We can drive particular signal steady high or steady low with function `mcpwm_set_signal_high()` or `mcpwm_set_signal_low()`. This will make the motor to turn with a maximum speed or stop. Depending on selected output A or B the motor will rotate either right or left.
- Another option is to drive the outputs with the PWM signal by calling `mcpwm_start()` or `mcpwm_stop()`. The motor speed will be proportional to the PWM duty.
- To vary PWM’s duty call `mcpwm_set_duty()` and provide the duty value in %. Optionally, you may call `mcpwm_set_duty_in_us()`, if you prefer to set the duty in microseconds. Checking of currently set value is possible by calling `mcpwm_get_duty()`. Phase of the PWM signal may be altered by calling `mcpwm_set_duty_type()`. The duty is set individually for each A and B output using `mcpwm_generator_t` in specific function calls. The duty value refers either to high or low output signal duration. This is configured when calling `mcpwm_init()`, as discussed in section Configure, and selecting one of options from `mcpwm_duty_type_t`.

**Note:** Call function `mcpwm_set_duty_type()` every time after `mcpwm_set_signal_high()` or `mcpwm_set_signal_low()` to resume with previously set duty cycle.

**Adjust**

There are couple of ways to adjust a signal on the outputs and changing how the motor operates.

- Set specific PWM frequency by calling `mcpwm_set_frequency()`. This may be required to adjust to electrical or mechanical characteristics of particular motor and driver. To check what frequency is set, use function `mcpwm_get_frequency()`.
- Introduce a dead time between outputs A and B when they are changing the state to reverse direction of the motor rotation. This is to make up for on/off switching delay of the motor driver FETs. The dead time options are defined in `mcpwm_deadtime_type_t` and enabled by calling `mcpwm_deadtime_enable()`. To disable this functionality call `mcpwm_deadtime_disable()`.
- Synchronize outputs of operator submodules, e.g. to get raising edge of PWM0A/B and PWM1A/B to start exactly at the same time, or shift them between each other by a given phase. Synchronization is triggered by SYNC SIGNALS shown on the block diagram of the MCPWM above, and defined in `mcpwm_sync_signal_t`. To attach the signal to a GPIO call `mcpwm_gpio_init()`. You can then enable synchronization with function `mcpwm_sync_configure()`. As input parameters provide MCPWM unit, timer to synchronize, the synchronization signal and a phase to delay the timer.

**Note:** Synchronization signals are referred to using two different enumerations. First one `mcpwm_io_signals_t` is used together with function `mcpwm_gpio_init()` when selecting a GPIO as the signal input source. The second one `mcpwm_sync_signal_t` is used when enabling or disabling synchronization with `mcpwm_sync_configure()` or `mcpwm_sync_disable()`.

- Vary the pattern of the A/B output signals by getting MCPWM counters to count up, down and up/down (automatically changing the count direction). Respective configuration is done when calling `mcpwm_init()`, as discussed in section Configure, and selecting one of counter types from `mcpwm_counter_type_t`. For explanation of how A/B PWM output signals are generated, see ESP32-S3 Technical Reference Manual > Motor Control PWM (MCPWM) [PDF].

**Synchronize**

Each PWM timer has a synchronization input and a synchronization output. The synchronization input can be selected from other timers’ synchronization outputs or GPIO signals via the GPIO matrix. Timer’s synchronization signal can be generated from either the input sync signal or when the count value reaches peak/zero. Thus, the PWM timers can be chained together with their phase-locked. During synchronization, the PWM timer clock prescaler will reset its counter in order to synchronize the PWM timer clock.

The functionality is enabled in following steps:
1. Make sure the PWM timer and operator are already configured so that sync will inherit its config (count mode, freq and duty).

2. Enabling sync input of the timer by invoking `mcpwm_sync_configure()`, selecting desired signal input from `mcpwm_sync_signal_t`, and setting the desired phase range from 0 to 999 which is mapped to 0%-99.9%. 0 means zero phase is applied and output is fired at the same time. And selecting desired counting direction.

3. Enabling one of sync event source from another timer or from external GPIO input.

To sync with another timer:

Enabling sync output of another timer by invoking `mcpwm_set_timer_sync_output()` and selecting desired event to generate sync output from `mcpwm_timer_sync_trigger_t`.

To sync with GPIO positive edge input (negative edge requires `mcpwm_sync_invert_gpio_synchronize()`):

Configuring GPIOs to act as the sync signal inputs by calling functions `mcpwm_gpio_init()` or `mcpwm_set_pin()`, which were described in section Configure.

It’s normal condition that chained sync signal may have tens or even hundreds of nanoseconds of delay between each timer output due to hardware limitation. To sync two timers accurately it is required to have the third timer occupied to produce sync event that can be consumed parallel by other two timer, so that those two timer will have no delay between each other but have the same delay between the timer which provides events. Another solution is introducing an external GPIO event source so that all three timers can be synced together with no delay.

Software sync event which triggered on one timer can be propagated to other timers on ESP32-S3, which can be used as a tricky way to get all three timers synced without any extra requirement.

```c
// configure timer0 as trigger source
mcpwm_set_timer_sync_output(MCPWM_UNIT_0, MCPWM_TIMER_0, MCPWM_SWSYNC_SOURCE_SYNCIN);
mcpwm_sync_config_t sync_conf = {
    .sync_sig = MCPWM_SELECT_TIMER0_SYNC,
    .timer_val = 0,
    .count_direction = MCPWM_TIMER_DIRECTION_UP,
};
mcpwm_sync_configure(TARGET_MCPWM_UNIT, MCPWM_TIMER_0, &sync_conf);
mcpwm_sync_configure(TARGET_MCPWM_UNIT, MCPWM_TIMER_1, &sync_conf);
mcpwm_sync_configure(TARGET_MCPWM_UNIT, MCPWM_TIMER_2, &sync_conf);
// then send soft sync event to timer0
mcpwm_timer_trigger_soft_sync(MCPWM_UNIT_0, MCPWM_TIMER_0);
```

If not required anymore, the capture functionality may be disabled with `mcpwm_sync_disable()`.

Capture

One of requirements of BLDC (Brushless DC, see figure below) motor control is sensing of the rotor position. To facilitate this task each MCPWM unit provides three sensing inputs together with dedicated hardware. The hardware is able to detect the input signal’s edge and measure time between signals. As result the control software is simpler and the CPU power may be used for other tasks.

The capture functionality may be used for other types of motors or tasks. The functionality is enabled in two steps:

1. Configuration of GPIOs to act as the capture signal inputs by calling functions `mcpwm_gpio_init()` or `mcpwm_set_pin()`, that were described in section Configure.

2. Enabling of the functionality itself by invoking `mcpwm_capture_enable_channel()`, selecting desired signal input from `mcpwm_capture_channel_id_t`, setting the signal edge, signal count prescaler and user callback within `mcpwm_capture_config_t`.

Within the second step above a 32-bit capture timer is enabled. The timer runs continuously driven by the APB clock. The clock frequency is typically 80 MHz. On each capture event the capture timer’s value is stored in timestamp register that may be then checked by calling `mcpwm_capture_signal_get_value()`. The edge of the last signal may be checked with `mcpwm_capture_signal_get_edge()`. Those data are also provided inside callback function as event data `cap_event_data_t`
If not required anymore, the capture functionality may be disabled with `mcpwm_capture_disable_channel()`.

Capture prescale is different from other modules as it is applied to the input signal, not the timer source. Prescaler has maintained its own level state with the initial value set to low and is detecting the positive edge of the input signal to change its internal state. That means if two pairs of positive and negative edges are passed to input, the prescaler’s internal state will change twice. ISR will report on this internal state change, not the input signal. For example, setting prescale to 2 will generate ISR callback on each positive edge of input if both edge is selected via `mcpwm_capture_config_t`. Or each 2 positive edges of input if only one edge is selected though `mcpwm_capture_config_t`.

**Fault Handler**

Each unit of the MCPWM is able to sense external signals with information about failure of the motor, the motor driver or any other device connected to the MCPWM. There are three fault inputs per unit that may be routed to user selectable GPIOs. The MCPWM may be configured to perform one of four predefined actions on A/B outputs when a fault signal is received:

- lock current state of the output
- set the output low
- set the output high
- toggle the output

The user should determine possible failure modes of the motor and what action should be performed on detection of particular fault, e.g. drive all outputs low for a brushed motor, or lock current state for a stepper motor, etc. As result of this action the motor should be put into a safe state to reduce likelihood of a damage caused by the fault.

The fault handler functionality is enabled in two steps:

1. Configuration of GPIOs to act as fault signal inputs. This is done in analogous way as described for capture signals in section above. It includes setting the signal level to trigger the fault as defined in `mcpwm_fault_input_level_t`. 

![Fig. 11: Example of Brushless DC Motor Control with MCPWM](image)
2. Initialization of the fault handler by calling either `mcpwm_fault_set_oneshot_mode()` or `mcpwm_fault_set_cyc_mode()`. These functions set the mode that MCPWM should operate once fault signal becomes inactive. There are two modes possible:
   - State of MCPWM unit will be locked until reset - `mcpwm_fault_set_oneshot_mode()`.
   - The MCPWM will resume operation once fault signal becoming inactive - `mcpwm_fault_set_cyc_mode()`.

The function call parameters include selection of one of three fault inputs defined in `mcpwm_fault_signal_t` and specific action on outputs A and B defined in `mcpwm_action_on_pwmxa_t` and `mcpwm_action_on_pwmxb_t`.

Particular fault signal may be disabled at the runtime by calling `mcpwm_fault_deinit()`.

Carrier

The MCPWM has a carrier submodule used if galvanic isolation from the motor driver is required by passing the A/B output signals through transformers. Any of A and B output signals may be at 100% duty and not changing whenever motor is required to run steady at the full load. Coupling of non alternating signals with a transformer is problematic, so the signals are modulated by the carrier submodule to create an AC waveform, to make the coupling possible.

To use the carrier submodule, it should be first initialized by calling `mcpwm_carrier_init()`. The carrier parameters are defined in `mcpwm_carrier_config_t` structure invoked within the function call. Then the carrier functionality may be enabled by calling `mcpwm_carrier_enable()`.

The carrier parameters may be then altered at a runtime by calling dedicated functions to change individual fields of the `mcpwm_carrier_config_t` structure, like `mcpwm_carrier_set_period()`, `mcpwm_carrier_set_duty_cycle()`, `mcpwm_carrier_output_invert()`, etc.

This includes enabling and setting duration of the first pulse of the career with `mcpwm_carrier_oneshot_mode_enable()`. For more details, see ESP32-S3 Technical Reference Manual > Motor Control PWM (MCPWM) > PWM Carrier Submodule [PDF].

To disable carrier functionality call `mcpwm_carrier_disable()`.

Interrupts

Registering of the MCPWM interrupt handler is possible by calling `mcpwm_isr_register()`. Note if `mcpwm_capture_enable_channel()` is used then a default ISR routine will be installed hence please do not call this function to register any more.

Resolution

The default resolution for MCPWM group and MCPWM timer are configured to 10MHz and 1MHz in `mcpwm_init()`, which might be not enough for some applications. The driver also provides two APIs that can be used to override the default resolution: `mcpwm_group_set_resolution()` and `mcpwm_timer_set_resolution()`.

Note that, these two APIs won’t update the frequency and duty automatically, to achieve that, one has to call `mcpwm_set_frequency()` and `mcpwm_set_duty()` accordingly.

To get PWM pulse that is below 15Hz, please set the resolution to a lower value. For high frequency PWM with limited step range, please set them with higher value.

Application Example

MCPWM example are located under: peripherals/mcpwm:

- Control of BLDC (brushless DC) motor with hall sensor feedback - peripherals/mcpwm/mcpwm_blde_hall_control

Enumerations

enum mcpwm_timer_direction_t
Values:

MCPWM_TIMER_DIRECTION_UP
Counting direction: Increase

MCPWM_TIMER_DIRECTION_DOWN
Counting direction: Decrease

enum mcpwm_timer_event_t
Values:

MCPWM_TIMER_EVENT_ZERO
MCPWM timer counts to zero

MCPWM_TIMER_EVENT_PEAK
MCPWM timer counts to peak

enum mcpwm_timer_count_mode_t
Values:

MCPWM_TIMER_COUNT_MODE_PAUSE
MCPWM timer paused

MCPWM_TIMER_COUNT_MODE_UP
MCPWM timer counting up

MCPWM_TIMER_COUNT_MODE_DOWN
MCPWM timer counting down

MCPWM_TIMER_COUNT_MODE_UP_DOWN
MCPWM timer counting up and down

enum mcpwm_timer_execute_cmd_t
Values:

MCPWM_TIMER_STOP_AT_ZERO
MCPWM timer stops when counting to zero

MCPWM_TIMER_STOP_AT_PEAK
MCPWM timer stops when counting to peak

MCPWM_TIMER_START_NO_STOP
MCPWM timer starts counting

MCPWM_TIMER_START_STOP_AT_ZERO
MCPWM timer starts counting and stops when counting to zero

MCPWM_TIMER_START_STOP_AT_PEAK
MCPWM timer starts counting and stops when counting to peak

enum mcpwm_generator_action_t
Values:

MCPWM_GEN_ACTION_KEEP
Generator action: Keep the same level
Chapter 2. API Reference

MCPWM_GEN_ACTION_LOW
Generator action: Force to low level

MCPWM_GEN_ACTION_HIGH
Generator action: Force to high level

MCPWM_GEN_ACTION_TOGGLE
Generator action: Toggle level

enum mcpwm_trip_type_t
Values:

MCPWM_TRIP_TYPE_CBC
CBC trip type, shut down the operator cycle by cycle

MCPWM_TRIP_TYPE_OST
OST trip type, shut down the operator in one shot

Functions
esp_err_t mcpwm_gpio_init(mcpwm_unit_t mcpwm_num, mcpwm_io_signals_t io_signal, int gpio_num)
This function initializes each gpio signal for MCPWM.
Note This function initializes one gpio at a time.
Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error
Parameters
• mcpwm_num: set MCPWM unit (0-1)
• io_signal: set MCPWM signals, each MCPWM unit has 6 output (MCPWMXA, MCPWMXB) and 9 input (SYNC_X, FAULT_X, CAP_X) ‘X’ is timer_num (0-2)
• gpio_num: set this to configure gpio for MCPWM, if you want to use gpio16, gpio_num = 16

esp_err_t mcpwm_set_pin(mcpwm_unit_t mcpwm_num, const mcpwm_pin_config_t *mcpwm_pin)
Initialize MCPWM gpio structure.
Note This function initialize a group of MCPWM GPIOs at a time.
Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error
Parameters
• mcpwm_num: set MCPWM unit (0-1)
• mcpwm_pin: MCPWM pin structure

esp_err_t mcpwm_init(mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num, const mcpwm_config_t *mcpwm_conf)
Initialize MCPWM parameters.
Note The default resolution configured for MCPWM group and timer are 160M / 16 = 10M and 10M / 10 = 1M The default resolution can be changed by calling mcpwm_group_set_resolution() and mcpwm_timer_set_resolution(), before calling this function.
Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG Parameter error
Parameters
• mcpwm_num: set MCPWM unit (0-1)
• timer_num: set timer number (0-2) of MCPWM, each MCPWM unit has 3 timers.
• mcpwm_conf: configure structure mcpwm_config_t
\textbf{esp_err_t mcpwm_group_set_resolution (mcpwm_unit_t mcpwm_num, unsigned long int resolution)}

Set resolution of the MCPWM group.

\textbf{Note} This will override default resolution of group(=10,000,000). This WILL NOT automatically update frequency and duty. Call mcpwm_set_frequency() and mcpwm_set_duty() manually to set them back.

\textbf{Return}

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

\textbf{Parameters}

- mcpwm_num: set MCPWM unit(0-1)
- resolution: set expected frequency resolution

\textbf{esp_err_t mcpwm_timer_set_resolution (mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num, unsigned long int resolution)}

Set resolution of each timer.

\textbf{Note} This WILL override default resolution of timer(=1,000,000). This WILL NOT automatically update frequency and duty. Call mcpwm_set_frequency() and mcpwm_set_duty() manually to set them back.

\textbf{Return}

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

\textbf{Parameters}

- mcpwm_num: set MCPWM unit(0-1)
- timer_num: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
- resolution: set expected frequency resolution

\textbf{esp_err_t mcpwm_set_frequency (mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num, uint32_t frequency)}

Set frequency(in Hz) of MCPWM timer.

\textbf{Return}

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

\textbf{Parameters}

- mcpwm_num: set MCPWM unit(0-1)
- timer_num: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
- frequency: set the frequency in Hz of each timer

\textbf{esp_err_t mcpwm_set_duty (mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num, mcpwm_generator_t gen, float duty)}

Set duty cycle of each operator(MCPWMXA/MCPWMXB)

\textbf{Return}

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

\textbf{Parameters}

- mcpwm_num: set MCPWM unit(0-1)
- timer_num: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
- gen: set the generator(MCPWMXA/MCPWMXB), ‘X’ is operator number selected
- duty: set duty cycle in % (i.e for 62.3% duty cycle, duty = 62.3) of each operator

\textbf{esp_err_t mcpwm_set_duty_in_us (mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num, mcpwm_generator_t gen, uint32_t duty_in_us)}

Set duty cycle of each operator(MCPWMXA/MCPWMXB) in us.

\textbf{Return}

- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

\textbf{Parameters}

- mcpwm_num: set MCPWM unit(0-1)
- timer_num: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
- gen: set the generator(MCPWMXA/MCPWMXB), ‘X’ is operator number selected
- duty_in_us: set duty value in microseconds of each operator
**esp_err_t mcpwm_set_duty_type**

```c
mcpwm_set_duty_type(mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num, mcpwm_generator_t gen, mcpwm_duty_type_t duty_type)
```

Set duty either active high or active low (out of phase/inverted)

**Note**
Call this function every time after mcpwm_set_signal_high or mcpwm_set_signal_low to resume with previously set duty cycle

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- mcpwm_num: set MCPWM unit (0-1)
- timer_num: set timer number (0-2) of MCPWM, each MCPWM unit has 3 timers
- gen: set the generator(MCPWMXA/MCPWMXB), ‘x’ is operator number selected
- duty_type: set active low or active high duty type

**uint32_t mcpwm_get_frequency**

```c
mcpwm_get_frequency(mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num)
```

Get frequency of timer.

**Return**
- frequency of timer

**Parameters**
- mcpwm_num: set MCPWM unit (0-1)
- timer_num: set timer number (0-2) of MCPWM, each MCPWM unit has 3 timers

**float mcpwm_get_duty**

```c
mcpwm_get_duty(mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num, mcpwm_operator_t gen)
```

Get duty cycle of each operator.

**Return**
- duty cycle in % of each operator (56.7 means duty is 56.7%) 

**Parameters**
- mcpwm_num: set MCPWM unit (0-1)
- timer_num: set timer number (0-2) of MCPWM, each MCPWM unit has 3 timers
- gen: set the generator(MCPWMXA/MCPWMXB), ‘x’ is operator number selected

**uint32_t mcpwm_get_duty_in_us**

```c
mcpwm_get_duty_in_us(mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num, mcpwm_operator_t gen)
```

Get duty cycle of each operator in us.

**Return**
- duty cycle in us of each operator

**Parameters**
- mcpwm_num: set MCPWM unit (0-1)
- timer_num: set timer number (0-2) of MCPWM, each MCPWM unit has 3 timers
- gen: set the generator(MCPWMXA/MCPWMXB), ‘x’ is operator number selected

**esp_err_t mcpwm_set_signal_high**

```c
mcpwm_set_signal_high(mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num, mcpwm_generator_t gen)
```

Use this function to set MCPWM signal high.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- mcpwm_num: set MCPWM unit (0-1)
- timer_num: set timer number (0-2) of MCPWM, each MCPWM unit has 3 timers
- gen: set the operator(MCPWMXA/MCPWMXB), ‘x’ is timer number selected

**esp_err_t mcpwm_set_signal_low**

```c
mcpwm_set_signal_low(mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num, mcpwm_generator_t gen)
```

Use this function to set MCPWM signal low.

**Return**
- ESP_OK Success
Chapter 2. API Reference

- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- `mcpwm_num`: set MCPWM unit(0-1)
- `timer_num`: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
- `gen`: set the operator(MCPWMXA/MCPWMXB), ‘x’ is timer number selected

```c
esp_err_t mcpwm_start(mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num)
```
Start MCPWM signal on timer ‘x’.

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- `mcpwm_num`: set MCPWM unit(0-1)
- `timer_num`: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers

```c
esp_err_t mcpwm_stop(mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num)
```
Start MCPWM signal on timer ‘x’.

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- `mcpwm_num`: set MCPWM unit(0-1)
- `timer_num`: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers

```c
esp_err_t mcpwm_carrier_init(mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num, const mcpwm_carrier_config_t *carrier_conf)
```
Initialize carrier configuration.

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- `mcpwm_num`: set MCPWM unit(0-1)
- `timer_num`: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers
- `carrier_conf`: configure structure `mcpwm_carrier_config_t`

```c
esp_err_t mcpwm_carrier_enable(mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num)
```
Enable MCPWM carrier submodule, for respective timer.

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- `mcpwm_num`: set MCPWM unit(0-1)
- `timer_num`: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers

```c
esp_err_t mcpwm_carrier_disable(mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num)
```
Disable MCPWM carrier submodule, for respective timer.

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- `mcpwm_num`: set MCPWM unit(0-1)
- `timer_num`: set timer number(0-2) of MCPWM, each MCPWM unit has 3 timers

```c
esp_err_t mcpwm_carrier_set_period(mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num, uint8_t carrier_period)
```
Set period of carrier.

Return
- ESP_OK Success
Chapter 2. API Reference

- ESP.ERR_INVALID_ARG Parameter error

**Parameters**
- mcpwm_num: set MCPWM unit (0-1)
- timer_num: set timer number (0-2) of MCPWM, each MCPWM unit has 3 timers
- carrier_period: set the carrier period of each timer, carrier period = (carrier_period + 1) * 800ns (carrier_period <= 15)

```c
esp_err_t mcpwm_carrier_set_duty_cycle (mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num, uint8_t carrier_duty)
```

Set duty_cycle of carrier.

**Return**
- ESP_OK Success
- ESP.ERR.INVALID_ARG Parameter error

**Parameters**
- mcpwm_num: set MCPWM unit (0-1)
- timer_num: set timer number (0-2) of MCPWM, each MCPWM unit has 3 timers
- carrier_duty: set duty_cycle of carrier, carrier duty cycle = carrier_duty * 12.5% (chop_duty <= 7)

```c
esp_err_t mcpwm_carrier_oneshot_mode_enable (mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num, uint8_t pulse_width)
```

Enable and set width of first pulse in carrier oneshot mode.

**Return**
- ESP_OK Success
- ESP.ERR.INVALID_ARG Parameter error

**Parameters**
- mcpwm_num: set MCPWM unit (0-1)
- timer_num: set timer number (0-2) of MCPWM, each MCPWM unit has 3 timers
- pulse_width: set pulse width of first pulse in oneshot mode, width = (carrier period) * (pulse_width + 1) (pulse_width <= 15)

```c
esp_err_t mcpwm_carrier_oneshot_mode_disable (mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num)
```

Disable oneshot mode, width of first pulse = carrier period.

**Return**
- ESP_OK Success
- ESP.ERR.INVALID_ARG Parameter error

**Parameters**
- mcpwm_num: set MCPWM unit (0-1)
- timer_num: set timer number (0-2) of MCPWM, each MCPWM unit has 3 timers
- carrier_ivt_mode: enable or disable carrier output inversion

```c
esp_err_t mcpwm_carrier_output_invert (mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num, mcpwm_carrier_out_ivt_t carrier_ivt_mode)
```

Enable or disable carrier output inversion.

**Return**
- ESP_OK Success
- ESP.ERR.INVALID_ARG Parameter error

**Parameters**
- mcpwm_num: set MCPWM unit (0-1)
- timer_num: set timer number (0-2) of MCPWM, each MCPWM unit has 3 timers
- carrier_ivt_mode: enable or disable carrier output inversion

```c
esp_err_t mcpwm_deadtime_enable (mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num, mcpwm_deadtime_type_t dt_mode, uint32_t red, uint32_t fed)
```

Enable and initialize deadtime for each MCPWM timer.

**Return**
- ESP_OK Success
- ESP.ERR.INVALID_ARG Parameter error

**Parameters**
Chapter 2. API Reference

- `mcpwm_num`: set MCPWM unit (0-1)
- `timer_num`: set timer number (0-2) of MCPWM, each MCPWM unit has 3 timers
- `dt_mode`: set deadtime mode
- `red`: set rising edge delay = red*100ns
- `fed`: set rising edge delay = fed*100ns

`esp_err_t mcpwm_deadt ime_disable(mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num)`

Disable deadtime on MCPWM timer.

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters
- `mcpwm_num`: set MCPWM unit (0-1)
- `timer_num`: set timer number (0-2) of MCPWM, each MCPWM unit has 3 timers

`esp_err_t mcpwm_fault_init (mcpwm_unit_t mcpwm_num, mcpwm_fault_input_level_t input_level, mcpwm_fault_signal_t fault_s ig)`

Initialize fault submodule, currently low level triggering is not supported.

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters
- `mcpwm_num`: set MCPWM unit (0-1)
- `input_level`: set fault signal level, which will cause fault to occur
- `fault_s ig`: set the fault pin, which needs to be enabled

`esp_err_t mcpwm_fault_set_oneshot_mode (mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num, mcpwm_fault_signal_t fault_s ig, mcpwm_output_action_t action_on_pwmxa, mcpwm_output_action_t action_on_pwmxb)`

Set oneshot mode on fault detection, once fault occur in oneshot mode reset is required to resume MCPWM signals.

Note: currently low level triggering is not supported

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters
- `mcpwm_num`: set MCPWM unit (0-1)
- `timer_num`: set timer number (0-2) of MCPWM, each MCPWM unit has 3 timers
- `fault_s ig`: set the fault pin, which needs to be enabled for oneshot mode
- `action_on_pwmxa`: action to be taken on MCPWMXA when fault occurs, either no change or high or low or toggle
- `action_on_pwmxb`: action to be taken on MCPWMXB when fault occurs, either no change or high or low or toggle

`esp_err_t mcpwm_fault_set_cyc_mode (mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num, mcpwm_fault_signal_t fault_s ig, mcpwm_output_action_t action_on_pwmxa, mcpwm_output_action_t action_on_pwmxb)`

Set cycle-by-cycle mode on fault detection, once fault occur in cyc mode MCPWM signal resumes as soon as fault signal becomes inactive.

Note: currently low level triggering is not supported

Return
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

Parameters
- `mcpwm_num`: set MCPWM unit (0-1)
- `timer_num`: set timer number (0-2) of MCPWM, each MCPWM unit has 3 timers
- `fault_s ig`: set the fault pin, which needs to be enabled for cyc mode
• **action_on_pwmxa**: action to be taken on MCPWMXA when fault occurs, either no change or high or low or toggle
• **action_on_pwmxb**: action to be taken on MCPWMXB when fault occurs, either no change or high or low or toggle

```c
esp_err_t mcpwm_fault_deinit(mcpwm_unit_t mcpwm_num, mcpwm_fault_signal_t fault_sig)
```

Disable fault signal.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- `mcpwm_num`: set MCPWM unit(0-1)
- `fault_sig`: fault pin, which needs to be disabled

```c
esp_err_t mcpwm_capture_enable(mcpwm_unit_t mcpwm_num, mcpwm_capture_signal_t cap_sig,
                                mcpwm_capture_on_edge_t cap_edge, uint32_t num_of_pulse)
```

Initialize capture submodule.

**Note** Enabling capture feature would also enable the capture interrupt event, users have to register an interrupt handler by `mcpwm_isr_register`, and in there, query the capture data.

**Note** The capture timer uses APB_CLK (typically 80MHz) as the count source.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- `mcpwm_num`: set MCPWM unit(0-1)
- `cap_edge`: set capture edge, BIT(0) - negative edge, BIT(1) - positive edge
- `cap_sig`: capture pin, which needs to be enabled
- `num_of_pulse`: Input capture signal prescaling, ranges from 0 to 255, representing prescaling from 1 to 256.

```c
esp_err_t mcpwm_capture_disable(mcpwm_unit_t mcpwm_num, mcpwm_capture_signal_t cap_sig)
```

Disable capture signal.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- `mcpwm_num`: set MCPWM unit(0-1)
- `cap_sig`: capture pin, which needs to be disabled

```c
esp_err_t mcpwm_capture_enable_channel(mcpwm_unit_t mcpwm_num,
                                       mcpwm_capture_channel_id_t cap_channel, const mcpwm_capture_config_t *cap_conf)
```

Enable capture channel.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- `mcpwm_num`: set MCPWM unit(0-1)
- `cap_channel`: capture channel, which needs to be enabled
- `cap_conf`: capture channel configuration

```c
esp_err_t mcpwm_capture_disable_channel(mcpwm_unit_t mcpwm_num,
                                         mcpwm_capture_channel_id_t cap_channel)
```

Disable capture channel.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- `mcpwm_num`: set MCPWM unit(0-1)
Chapter 2. API Reference

- `cap_channel`: capture channel, which needs to be disabled

```c
uint32_t mcpwm_capture_signal_get_value(mcpwm_unit_t mcpwm_num, mcpwm_capture_signal_t cap_sig)
```

Get capture value.

**Return** Captured value

**Parameters**
- `mcpwm_num`: set MCPWM unit (0-1)
- `cap_sig`: capture channel on which value is to be measured

```c
uint32_t mcpwm_capture_signal_get_edge(mcpwm_unit_t mcpwm_num, mcpwm_capture_signal_t cap_sig)
```

Get edge of capture signal.

**Return** Capture signal edge: 1 - positive edge, 2 - negative edge

**Parameters**
- `mcpwm_num`: set MCPWM unit (0-1)
- `cap_sig`: capture channel of whose edge is to be determined

```c
esp_err_t mcpwm_sync_enable(mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num, mcpwm_sync_signal_t sync_sig, uint32_t phase_val)
```

Initialize sync submodule and sets the signal that will cause the timer be loaded with pre-defined value.

**Note** Count direction is undefined within this API

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- `mcpwm_num`: set MCPWM unit (0-1)
- `timer_num`: set timer number (0-2) of MCPWM, each MCPWM unit has 3 timers
- `sync_sig`: set the synchronization input signal
- `phase_val`: phase value in 1/1000 (for 86.7%, phase_val = 867) which timer moves to on sync signal

```c
esp_err_t mcpwm_sync_disable(mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num)
```

Disable sync submodule on given timer.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- `mcpwm_num`: set MCPWM unit (0-1)
- `timer_num`: set timer number (0-2) of MCPWM, each MCPWM unit has 3 timers

```c
esp_err_t mcpwm_set_timer_sync_output(mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num, mcpwm_timer_sync_trigger_t trigger)
```

Set sync output on given timer Configures what event triggers MCPWM timer to output a sync signal.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
Chapter 2. API Reference

- `mcpwm_num`: set MCPWM unit (0-1)
- `timer_num`: set timer number (0-2) of MCPWM, each MCPWM unit has 3 timers
- `trigger`: set the trigger that will cause the timer to generate a software sync signal. Specifically, `MCPWM_SWSYNC_SOURCE_DISABLED` will disable the timer from generating sync signal.

```c
esp_err_t mcpwm_timer_trigger_soft_sync (mcpwm_unit_t mcpwm_num, mcpwm_timer_t timer_num)
```

Trigger a software sync event and sends it to a specific timer.

**Note** This software sync event will have the same effect as hw one, except that:
- On esp32s3 the soft sync event can be routed to its output if `MCPWM_SWSYNC_SOURCE_SYNCIN` is selected via `mcpwm_set_timer_sync_output()`.
- On esp32 there is no such behavior and soft sync event will only take effect on this timer and can not be propagated to others.

**Return**
- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Function pointer error.

**Parameters**
- `mcpwm_num`: set MCPWM unit (0-1)
- `timer_num`: set timer number (0-2) of MCPWM, each MCPWM unit has 3 timers

```c
esp_err_t mcpwm_sync_invert_gpio_synchro (mcpwm_unit_t mcpwm_num, mcpwm_sync_signal_t sync_sig, bool invert)
```

Set external GPIO sync input inverter.

**Return**
- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Function pointer error.

**Parameters**
- `mcpwm_num`: set MCPWM unit (0-1)
- `sync_sig`: set sync signal of MCPWM, only supports GPIO sync signal
- `invert`: whether GPIO sync source input is inverted (to get negative edge trigger)

```c
esp_err_t mcpwm_isr_register (mcpwm_unit_t mcpwm_num, void (*fn) (void *, void *, int *intr_alloc_flags, intr_handle_t *handle), int intr_alloc_flags, void **handle)
```

Register MCPWM interrupt handler, the handler is an ISR. The handler will be attached to the same CPU core that this function is running on.

**Return**
- `ESP_OK` Success
- `ESP_ERR_INVALID_ARG` Function pointer error.

**Parameters**
- `mcpwm_num`: set MCPWM unit (0-1)
- `fn`: interrupt handler function.
- `arg`: user-supplied argument passed to the handler function.
- `intr_alloc_flags`: flags used to allocate the interrupt. One or multiple (ORred) `ESP_INTR_FLAG_*` values. see `esp_intr_alloc.h` for more info.
- `handle`: pointer to return handle. If non-NULL, a handle for the interrupt will be returned here.

**Structures**

```c
struct mcpwm_pin_config_t
```

- `pin`: pin number for MCPWM

**Public Members**

```c
int mcpwm0a_out_num
MCPWM0A out pin
```

```c
int mcpwm0b_out_num
MCPWM0A out pin
```
Chapter 2. API Reference

```c
int mcpwm1a_out_num
MCPWM0A out pin
int mcpwm1b_out_num
MCPWM0A out pin
int mcpwm2a_out_num
MCPWM0A out pin
int mcpwm2b_out_num
MCPWM0A out pin
int mcpwm_sync0_in_num
SYNC0 in pin
int mcpwm_sync1_in_num
SYNC1 in pin
int mcpwm_sync2_in_num
SYNC2 in pin
int mcpwm_fault0_in_num
FAULT0 in pin
int mcpwm_fault1_in_num
FAULT1 in pin
int mcpwm_fault2_in_num
FAULT2 in pin
int mcpwm_cap0_in_num
CAP0 in pin
int mcpwm_cap1_in_num
CAP1 in pin
int mcpwm_cap2_in_num
CAP2 in pin

struct cap_event_data_t
  event data that will be passed into ISR callback

Public Members

mcpwm_capture_on_edge_t cap_edge
  Which signal edge is detected

uint32_t cap_value
  Corresponding timestamp when event occurs. Clock rate = APB(usually 80M)

struct mcpwm_config_t
  MCPWM config structure.

Public Members

uint32_t frequency
  Set frequency of MCPWM in Hz

float cmpr_a
  Set % duty cycle for operator a(MCPWMXA), i.e for 62.3% duty cycle, duty_a = 62.3

float cmpr_b
  Set % duty cycle for operator b(MCPWMXB), i.e for 48% duty cycle, duty_b = 48.0

mcpwm_duty_type_t duty_mode
  Set type of duty cycle
```
**Chapter 2. API Reference**

`mcpwm_counter_type_t counter_mode`
Set type of MCPWM counter

**struct mcpwm_carrier_config_t**
MCPWM carrier configuration structure.

**Public Members**

```c
uint8_t carrier_period
    Set carrier period = (carrier_period + 1)*800ns, carrier_period should be < 16
```

```c
uint8_t carrier_duty
    Set carrier duty cycle, carrier_duty should be less than 8 (increment every 12.5%)
```

```c
uint8_t pulse_width_in_os
    Set pulse width of first pulse in one shot mode = (carrier period)*(pulse_width_in_os + 1), should be less then 16
```

```c
mcpwm_carrier_os_t carrier_os_mode
    Enable or disable carrier oneshot mode
```

```c
mcpwm_carrier_out_ivt_t carrier_ivt_mode
    Invert output of carrier
```

**struct mcpwm_capture_config_t**
MCPWM config capture structure.

**Public Members**

```c
mcpwm_capture_on_edge_t cap_edge
    Set capture edge
```

```c
uint32_t cap_prescale
    Prescale of capture signal, ranging from 1 to 256
```

```c
cap_isr_cb_t capture_cb
    User defined capture event callback, running under interrupt context
```

```c
void *user_data
    User defined ISR callback function args
```

**struct mcpwm_sync_config_t**
MCPWM config sync structure.

**Public Members**

```c
mcpwm_sync_signal_t sync_sig
    Set sync input signal that will cause timer to sync
```

```c
uint32_t timer_val
    Counter value to be set after sync, in 0 ~ 999, unit: 1 / 1000 * peak
```

```c
mcpwm_timer_direction_t count_direction
    Counting direction to be set after sync
```

**Macros**

`MCPWM_OPR_A`

`MCPWM_OPR_B`

`MCPWM_OPR_MAX`

`MCPWM_SELCT_SYNC0`
MCPWM_SELCT_SYNC1
MCPWM_SELCT_SYNC2
MCPWM_NO_CHANGE_IN_MCPMXA
MCPWM_FORCE_MCPMXA_LOW
MCPWM_FORCE_MCPMXA_HIGH
MCPWM_TOG_MCPMXA
MCPWM_NO_CHANGE_IN_MCPMXB
MCPWM_FORCE_MCPMXB_LOW
MCPWM_FORCE_MCPMXB_HIGH
MCPWM_TOG_MCPMXB

Type Definitions

typedef mcpwm_generator_t mcpwm_operator_t
typedef mcpwm_output_action_t mcpwm_action_on_pwmxa_t
typedef mcpwm_input_action_t mcpwm_action_on_pwmxb_t
typedef mcpwm_capture_signal_t mcpwm_capture_channel_id_t

MCPWM capture channel ID alias.
typedef bool (*cap_isr_cb_t) (mcpwm_unit_t mcpwm, mcpwm_capture_channel_id_t cap_channel, const cap_event_data_t *edata, void *user_data)

Type of capture event callback.

Note Since this an ISR callback so do not do anything that may block and call APIs that is designed to be used within ISR(usually has ‘_ISR’ postfix)

Return Whether a task switch is needed after the callback function returns, this is usually due to the callback wakes up some high priority task.

Parameters

• mcpwm: MCPWM unit(0-1)
• cap_channel: capture channel ID
• edata: Capture event data, contains capture edge and capture value, fed by the driver
• user_data: User registered data, passed from mcpwm_capture_config_t

Enumerations

enum mcpwm_io_signals_t

IO signals for the MCPWM.

• 6 MCPWM output pins that generate PWM signals
• 3 MCPWM fault input pins to detect faults like overcurrent, overvoltage, etc.
• 3 MCPWM sync input pins to synchronize MCPWM outputs signals
• 3 MCPWM capture input pins to gather feedback from controlled motors, using e.g. hall sensors

Values:

MCPWM0A = 0
PWM0A output pin
MCPWM0B
PWM0B output pin
MCPWM1A
PWM1A output pin
MCPWM1B
PWM1B output pin
MCPWM2A
  PWM2A output pin
MCPWM2B
  PWM2B output pin
MCPWM_SYNC_0
  SYNC0 input pin
MCPWM_SYNC_1
  SYNC1 input pin
MCPWM_SYNC_2
  SYNC2 input pin
MCPWM_FAULT_0
  FAULT0 input pin
MCPWM_FAULT_1
  FAULT1 input pin
MCPWM_FAULT_2
  FAULT2 input pin
MCPWM_CAP_0 = 84
  CAP0 input pin
MCPWM_CAP_1
  CAP1 input pin
MCPWM_CAP_2
  CAP2 input pin

enum mcpwm_unit_t
Select MCPWM unit.

Values:

  MCPWM_UNIT_0
    MCPWM unit0 selected
  MCPWM_UNIT_1
    MCPWM unit1 selected
  MCPWM_UNIT_MAX
    Max number of MCPWM units

enum mcpwm_timer_t
Select MCPWM timer.

Values:

  MCPWM_TIMER_0
    Select MCPWM timer0
  MCPWM_TIMER_1
    Select MCPWM timer1
  MCPWM_TIMER_2
    Select MCPWM timer2
  MCPWM_TIMER_MAX
    Max number of timers in a unit

enum mcpwm_generator_t
Select MCPWM operator.

Values:

  MCPWM_GEN_A
    Select MCPWM_XA, where ‘X’ is operator number
**MCPWM_GEN_B**
Select MCPWMXB, where ‘X’ is operator number

**MCPWM_GEN_MAX**
Num of generators to each operator of MCPWM

```c
enum mcpwm_carrier_os_t
MCPWM carrier oneshot mode, in this mode the width of the first pulse of carrier can be programmed.
Values:

MCPWM_ONESHOT_MODE_DIS
Enable oneshot mode

MCPWM_ONESHOT_MODE_EN
Disable oneshot mode
```

```c
enum mcpwm_carrier_out_ivt_t
MCPWM carrier output inversion, high frequency carrier signal active with MCPWM signal is high.
Values:

MCPWM_CARRIER_OUT_IVT_DIS
Enable carrier output inversion

MCPWM_CARRIER_OUT_IVT_EN
Disable carrier output inversion
```

```c
enum mcpwm_fault_signal_t
MCPWM select fault signal input.
Values:

MCPWM_SELECT_F0
Select F0 as input

MCPWM_SELECT_F1
Select F1 as input

MCPWM_SELECT_F2
Select F2 as input
```

```c
enum mcpwm_sync_signal_t
MCPWM select sync signal input.
Values:

MCPWM_SELECT_NO_INPUT
No sync input selected

MCPWM_SELECT_TIMER0_SYNC
Select software sync signal from timer0 as input

MCPWM_SELECT_TIMER1_SYNC
Select software sync signal from timer1 as input

MCPWM_SELECT_TIMER2_SYNC
Select software sync signal from timer2 as input

MCPWM_SELECT_GPIO_SYNC0
Select GPIO SYNC0 as input

MCPWM_SELECT_GPIO_SYNC1
Select GPIO SYNC1 as input

MCPWM_SELECT_GPIO_SYNC2
Select GPIO SYNC2 as input
```
enum mcppm_timer_sync_trigger_t
MCPWM timer sync event trigger.

Values:
MCPWM_SWSYNC_SOURCE_SYNCIN
the input sync signal will be routed to its sync output path
MCPWM_SWSYNC_SOURCE_TEZ
sync signal generated when timer counts to zero
MCPWM_SWSYNC_SOURCE_TEP
sync signal generated when timer counts to peak
MCPWM_SWSYNC_SOURCE_DISABLED
timer does not generate sync signals

enum mcppm_fault_input_level_t
MCPWM select triggering level of fault signal.

Values:
MCPWM_LOW_LEVEL_TGR
Fault condition occurs when fault input signal goes from high to low
MCPWM_HIGH_LEVEL_TGR
Fault condition occurs when fault input signal goes low to high

enum mcppm_capture_on_edge_t
MCPWM select capture starts from which edge.

Values:
MCPWM_NEG_EDGE = BIT(0)
Capture the negative edge
MCPWM_POS_EDGE = BIT(1)
Capture the positive edge
MCPWM_BOTH_EDGE = BIT(1) | BIT(0)
Capture both edges

enum mcppm_intr_t
Interrupt masks for MCPWM capture.

Values:
MCPWM_LL_INTR_CAP0 = BIT(27)
Capture 0 happened.
MCPWM_LL_INTR_CAP1 = BIT(28)
Capture 1 happened.
MCPWM_LL_INTR_CAP2 = BIT(29)
Capture 2 happened.

enum mcppm_counter_type_t
Select type of MCPWM counter.

Values:
MCPWM_FREEZE_COUNTER
Counter freeze
MCPWM_UP_COUNTER
For asymmetric MCPWM
MCPWM_DOWN_COUNTER
For asymmetric MCPWM
MCPWM_UP_DOWN_COUNTER
For symmetric MCPWM, frequency is half of MCPWM frequency set

MCPWM_COUNTER_MAX
Maximum counter mode

gen mcpwm_duty_type_t
Select type of MCPWM duty cycle mode.
Values:
MCPWM_DUTY_MODE_0 = 0
Active high duty, i.e. duty cycle proportional to high time for asymmetric MCPWM
MCPWM_DUTY_MODE_1
Active low duty, i.e. duty cycle proportional to low time for asymmetric MCPWM, out of phase(inverted) MCPWM
MCPWM_HAL_GENERATOR_MODE_FORCE_LOW
MCPWM_HAL_GENERATOR_MODE_FORCE_HIGH
MCPWM_DUTY_MODE_MAX
Num of duty cycle modes

gen mcpwm_deadtime_type_t
MCPWM deadtime types, used to generate deadtime, RED refers to rising edge delay and FED refers to falling edge delay.
Values:
MCPWM_DEADTIME_BYPASS = 0
Bypass the deadtime
MCPWM_BYPASS_RED
MCPWMXA Out = MCPWMXA In with no delay, MCPWMXB Out = MCPWMXA In with falling edge delay
MCPWM_BYPASS_FED
MCPWMXA Out = MCPWMXA In with rising edge delay, MCPWMXB Out = MCPWMXB In with no delay
MCPWM_ACTIVE_HIGH_MODE
MCPWMXA Out = MCPWMXA In with rising edge delay, MCPWMXB Out = MCPWMXA In with falling edge delay
MCPWM_ACTIVE_LOW_MODE
MCPWMXA Out = MCPWMXA In with compliment of rising edge delay, MCPWMXB Out = MCPWMXB In with compliment of falling edge delay
MCPWM_ACTIVE_HIGH_COMPLIMENT_MODE
MCPWMXA Out = MCPWMXA In with rising edge delay, MCPWMXB = MCPWMXA In with compliment of falling edge delay
MCPWM_ACTIVE_LOW_COMPLIMENT_MODE
MCPWMXA Out = MCPWMXA In with compliment of rising edge delay, MCPWMXB Out = MCPWMXA In with falling edge delay
MCPWM_ACTIVE_RED_FED_FROM_PWMXA
MCPWMXA Out = MCPWMXB Out = MCPWMXA In with rising edge delay as well as falling edge delay
MCPWM_ACTIVE_RED_FED_FROM_PWMXB
MCPWMXA Out = MCPWMXB Out = MCPWMXB In with rising edge delay as well as falling edge delay
MCPWM_DEADTIME_TYPE_MAX
Maximum number of supported dead time modes
enum mcpwm_output_action_t
MCPWM select action to be taken on the output when event happens.

Values:

MCPWM_ACTION_NO_CHANGE = 0
   No change in the output
MCPWM_ACTION_FORCE_LOW
   Make output low
MCPWM_ACTION_FORCE_HIGH
   Make output high
MCPWM_ACTION_TOGGLE
   Make output toggle

enum mcpwm_capture_signal_t
MCPWM select capture signal input.

Values:

MCPWM_SELECT_CAP0
   Select CAP0 as input
MCPWM_SELECT_CAP1
   Select CAP1 as input
MCPWM_SELECT_CAP2
   Select CAP2 as input

2.3.12 Pulse Counter (PCNT)

Introduction

The PCNT (Pulse Counter) module is designed to count the number of rising and/or falling edges of an input signal. Each pulse counter unit has a 16-bit signed counter register and two channels that can be configured to either increment or decrement the counter. Each channel has a signal input that accepts signal edges to be detected, as well as a control input that can be used to enable or disable the signal input. The inputs have optional filters that can be used to discard unwanted glitches in the signal.

Functionality Overview

Description of functionality of this API has been broken down into four sections:

- Configuration - describes counter’s configuration parameters and how to setup the counter.
- Operating the Counter - provides information on control functions to pause, measure and clear the counter.
- Filtering Pulses - describes options to filtering pulses and the counter control signals.
- Using Interrupts - presents how to trigger interrupts on specific states of the counter.

Configuration

The PCNT module has 8 independent counting units numbered from 0 to 7. In the API they are referred to using pcnt_unit_t. Each unit has two independent channels numbered as 0 and 1 and specified with pcnt_channel_t.

The configuration is provided separately per unit’s channel using pcnt_config_t and covers:

- The unit and the channel number this configuration refers to.
- GPIO numbers of the pulse input and the pulse gate input.
• Two pairs of parameters: `pcnt_ctrl_mode_t` and `pcnt_count_mode_t` to define how the counter reacts depending on the status of control signal and how counting is done positive / negative edge of the pulses.
• Two limit values (minimum / maximum) that are used to establish watchpoints and trigger interrupts when the pulse count is meeting particular limit.

Setting up of particular channel is then done by calling a function `pcnt_unit_config()` with above `pcnt_config_t` as the input parameter.

To disable the pulse or the control input pin in configuration, provide `PCNT_PIN_NOT_USED` instead of the GPIO number.

**Operating the Counter**

After doing setup with `pcnt_unit_config()`, the counter immediately starts to operate. The accumulated pulse count can be checked by calling `pcnt_get_counter_value()`.

There are couple of functions that allow to control the counter’s operation: `pcnt_counter_pause()`, `pcnt_counter_resume()` and `pcnt_counter_clear()`.

It is also possible to dynamically change the previously set up counter modes with `pcnt_unit_config()` by calling `pcnt_set_mode()`.

If desired, the pulse input pin and the control input pin may be changed “on the fly” using `pcnt_set_pin()`. To disable particular input provide as a function parameter `PCNT_PIN_NOT_USED` instead of the GPIO number.

**Note:** For the counter not to miss any pulses, the pulse duration should be longer than one APB_CLK cycle (12.5 ns). The pulses are sampled on the edges of the APB_CLK clock and may be missed, if fall between the edges. This applies to counter operation with or without a filter.

**Filtering Pulses**

The PCNT unit features filters on each of the pulse and control inputs, adding the option to ignore short glitches in the signals.

The length of ignored pulses is provided in APB_CLK clock cycles by calling `pcnt_set_filter_value()`. The current filter setting may be checked with `pcnt_get_filter_value()`. The APB_CLK clock is running at 80 MHz.

The filter is put into operation / suspended by calling `pcnt_filter_enable()` / `pcnt_filter_disable()`.

**Using Interrupts**

There are five counter state watch events, defined in `pcnt_evt_type_t`, that are able to trigger an interrupt. The event happens on the pulse counter reaching specific values:

• Minimum or maximum count values: `counter_l_lim` or `counter_h_lim` provided in `pcnt_config_t` as discussed in **Configuration**
• Threshold 0 or Threshold 1 values set using function `pcnt_set_event_value()`.
• Pulse count = 0

To register, enable or disable an interrupt to service the above events, call `pcnt_isr_register()`, `pcnt_intr_enable()`, and `pcnt_intr_disable()`. To enable or disable events on reaching threshold values, you will also need to call functions `pcnt_event_enable()` and `pcnt_event_disable()`.

In order to check what are the threshold values currently set, use function `pcnt_get_event_value()`.
Application Example

• Pulse counter with control signal and event interrupt example: peripherals/pcnt/pulse_count_event.
• Parse the signal generated from rotary encoder: peripherals/pcnt/rotary_encoder.

API Reference

Header File

• components/driver/include/driver/pcnt.h

Functions

- **esp_err_t pcnt_unit_config(const pcnt_config_t *pcnt_config)**
  Configure Pulse Counter unit.
  
  **Note** This function will disable three events: PCNT_EVT_L_LIM, PCNT_EVT_H_LIM, PCNT_EVT_ZERO.
  
  **Return**
  • ESP_OK Success
  • ESP_ERR_INVALID_STATE pcnt driver already initialized
  • ESP_ERR_INVALID_ARG Parameter error
  
  **Parameters**
  • pcnt_config: Pointer of Pulse Counter unit configure parameter

- **esp_err_t pcnt_get_counter_value(pcnt_unit_t pcnt_unit, int16_t *count)**
  Get pulse counter value.
  
  **Return**
  • ESP_OK Success
  • ESP_ERR_INVALID_STATE pcnt driver has not been initialized
  • ESP_ERR_INVALID_ARG Parameter error
  
  **Parameters**
  • pcnt_unit: Pulse Counter unit number
  • count: Pointer to accept counter value

- **esp_err_t pcnt_counter_pause(pcnt_unit_t pcnt_unit)**
  Pause PCNT counter of PCNT unit.
  
  **Return**
  • ESP_OK Success
  • ESP_ERR_INVALID_STATE pcnt driver has not been initialized
  • ESP_ERR_INVALID_ARG Parameter error
  
  **Parameters**
  • pcnt_unit: PCNT unit number

- **esp_err_t pcnt_counter_resume(pcnt_unit_t pcnt_unit)**
  Resume counting for PCNT counter.
  
  **Return**
  • ESP_OK Success
  • ESP_ERR_INVALID_STATE pcnt driver has not been initialized
  • ESP_ERR_INVALID_ARG Parameter error
  
  **Parameters**
  • pcnt_unit: PCNT unit number, select from pcnt_unit_t

- **esp_err_t pcnt_counter_clear(pcnt_unit_t pcnt_unit)**
  Clear and reset PCNT counter value to zero.
  
  **Return**
  • ESP_OK Success
  • ESP_ERR_INVALID_STATE pcnt driver has not been initialized
  • ESP_ERR_INVALID_ARG Parameter error
Parameters
- pcnt_unit: PCNT unit number, select from pcnt_unit_t

```c
esp_err_t pcnt_intr_enable (pcnt_unit_t pcnt_unit)
```
Enable PCNT interrupt for PCNT unit.

**Note** Each Pulse counter unit has five watch point events that share the same interrupt. Configure events with pcnt_event_enable() and pcnt_event_disable()

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_STATE pcnt driver has not been initialized
- ESP_ERR_INVALID_ARG Parameter error

```c
Parameters
- pcnt_unit: PCNT unit number
```

```c
esp_err_t pcnt_intr_disable (pcnt_unit_t pcnt_unit)
```
Disable PCNT interrupt for PCNT unit.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_STATE pcnt driver has not been initialized
- ESP_ERR_INVALID_ARG Parameter error

```c
Parameters
- pcnt_unit: PCNT unit number
```

```c
esp_err_t pcnt_event_enable (pcnt_unit_t unit, pcnt_evt_type_t evt_type)
```
Enable PCNT event of PCNT unit.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_STATE pcnt driver has not been initialized
- ESP_ERR_INVALID_ARG Parameter error

```c
Parameters
- unit: PCNT unit number
- evt_type: Watch point event type. All enabled events share the same interrupt (one interrupt per pulse counter unit).
```

```c
esp_err_t pcnt_event_disable (pcnt_unit_t unit, pcnt_evt_type_t evt_type)
```
Disable PCNT event of PCNT unit.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_STATE pcnt driver has not been initialized
- ESP_ERR_INVALID_ARG Parameter error

```c
Parameters
- unit: PCNT unit number
- evt_type: Watch point event type. All enabled events share the same interrupt (one interrupt per pulse counter unit).
```

```c
esp_err_t pcnt_set_event_value (pcnt_unit_t unit, pcnt_evt_type_t evt_type, int16_t value)
```
Set PCNT event value of PCNT unit.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_STATE pcnt driver has not been initialized
- ESP_ERR_INVALID_ARG Parameter error

```c
Parameters
- unit: PCNT unit number
- evt_type: Watch point event type. All enabled events share the same interrupt (one interrupt per pulse counter unit).
- value: Counter value for PCNT event
```

```c
esp_err_t pcnt_get_event_value (pcnt_unit_t unit, pcnt_evt_type_t evt_type, int16_t *value)
```
Get PCNT event value of PCNT unit.
### Chapter 2. API Reference

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_STATE pcnt driver has not been initialized
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- `unit`: PCNT unit number
- `evt_type`: Watch point event type. All enabled events share the same interrupt (one interrupt per pulse counter unit).
- `value`: Pointer to accept counter value for PCNT event

```c
esp_err_t pcnt_get_event_status(pcnt_unit_t unit, uint32_t *status)
```
Get PCNT event status of PCNT unit.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_STATE pcnt driver has not been initialized
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- `unit`: PCNT unit number
- `status`: Pointer to accept event status word

```c
esp_err_t pcnt_isr_unregister(pcnt_isr_handle_t handle)
```
Unregister PCNT interrupt handler (registered by pcnt_isr_register), the handler is an ISR. The handler will be attached to the same CPU core that this function is running on. If the interrupt service is registered by pcnt_isr_service_install, please call pcnt_isr_service_uninstall instead.

**Return**
- ESP_OK Success
- ESP_ERR_NOT_FOUND Cannot find the interrupt that matches the flags.
- ESP_ERR_INVALID_ARG Function pointer error.

**Parameters**
- `handle`: handle to unregister the ISR service.

```c
esp_err_t pcnt_isr_register(void (*fn) void *, void *arg, int intr_alloc_flags, pcnt_isr_handle_t *handle)
```
Register PCNT interrupt handler, the handler is an ISR. The handler will be attached to the same CPU core that this function is running on. Please do not use pcnt_isr_service_install if this function was called.

**Return**
- ESP_OK Success
- ESP_ERR_NOT_FOUND Cannot find the interrupt that matches the flags.
- ESP_ERR_INVALID_ARG Function pointer error.

**Parameters**
- `fn`: Interrupt handler function.
- `arg`: Parameter for handler function
- `intr_alloc_flags`: Flags used to allocate the interrupt. One or multiple (ORred) ESP_INTR_FLAG_* values. See esp_intr_alloc.h for more info.
- `handle`: Pointer to return handle. If non-NULL, a handle for the interrupt will be returned here. Calling pcnt_isr_unregister to unregister this ISR service if needed, but only if the handle is not NULL.

```c
esp_err_t pcnt_set_pin(pcnt_unit_t unit, pcnt_channel_t channel, int pulse_io, int ctrl_io)
```
Configure PCNT pulse signal input pin and control input pin.

**Note** Set the signal input to PCNT_PIN_NOT_USED if unused.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_STATE pcnt driver has not been initialized
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- `unit`: PCNT unit number
- `channel`: PCNT channel number
Chapter 2. API Reference

- **pulse_io**: Pulse signal input GPIO
- **ctrl_io**: Control signal input GPIO

```c
esp_err_t pcnt_filter_enable (pcnt_unit_t unit)

Enable PCNT input filter.

Return
- ESP_OK Success
- ESP_ERR_INVALID_STATE pcnt driver has not been initialized
- ESP_ERR_INVALID_ARG Parameter error

Parameters
- unit: PCNT unit number
```

```c
esp_err_t pcnt_filter_disable (pcnt_unit_t unit)

Disable PCNT input filter.

Return
- ESP_OK Success
- ESP_ERR_INVALID_STATE pcnt driver has not been initialized
- ESP_ERR_INVALID_ARG Parameter error

Parameters
- unit: PCNT unit number
```

```c
esp_err_t pcnt_set_filter_value (pcnt_unit_t unit, uint16_t filter_val)

Set PCNT filter value.

Note filter_val is a 10-bit value, so the maximum filter_val should be limited to 1023.

Return
- ESP_OK Success
- ESP_ERR_INVALID_STATE pcnt driver has not been initialized
- ESP_ERR_INVALID_ARG Parameter error

Parameters
- unit: PCNT unit number
- filter_val: PCNT signal filter value, counter in APB_CLK cycles. Any pulses lasting shorter than this will be ignored when the filter is enabled.
```

```c
esp_err_t pcnt_get_filter_value (pcnt_unit_t unit, uint16_t* filter_val)

Get PCNT filter value.

Return
- ESP_OK Success
- ESP_ERR_INVALID_STATE pcnt driver has not been initialized
- ESP_ERR_INVALID_ARG Parameter error

Parameters
- unit: PCNT unit number
- filter_val: Pointer to accept PCNT filter value.
```

```c
esp_err_t pcnt_set_mode (pcnt_unit_t unit, pcnt_channel_t channel, pcnt_count_mode_t pos_mode, pcnt_count_mode_t neg_mode, pcnt_ctrl_mode_t hctrl_mode, pcnt_ctrl_mode_t lctrl_mode)

Set PCNT counter mode.

Return
- ESP_OK Success
- ESP_ERR_INVALID_STATE pcnt driver has not been initialized
- ESP_ERR_INVALID_ARG Parameter error

Parameters
- unit: PCNT unit number
- channel: PCNT channel number
- pos_mode: Counter mode when detecting positive edge
- neg_mode: Counter mode when detecting negative edge
- hctrl_mode: Counter mode when control signal is high level
- lctrl_mode: Counter mode when control signal is low level
API Reference

**esp_err_t pcnt_isr_handler_add** *(pcnt_unit_t unit, void (*isr_handler)) void *

Add ISR handler for specified unit.

Call this function after using pcnt_isr_service_install() to install the PCNT driver’s ISR handler service. The ISR handlers do not need to be declared with IRAM_ATTR, unless you pass the ESP_INTR_FLAG_IRAM flag when allocating the ISR in pcnt_isr_service_install().

This ISR handler will be called from an ISR. So there is a stack size limit (configurable as “ISR stack size” in menuconfig). This limit is smaller compared to a global PCNT interrupt handler due to the additional level of indirection.

**Return**

- ESP_OK Success
- ESP_ERR_INVALID_STATE pcnt driver has not been initialized
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**

- **unit**: PCNT unit number
- **isr_handler**: Interrupt handler function.
- **args**: Parameter for handler function

**esp_err_t pcnt_isr_service_install** *(int intr_alloc_flags)*

Install PCNT ISR service.

**Note** We can manage different interrupt service for each unit. This function will use the default ISR handler service. Calling pcnt_isr_service_uninstall to uninstall the default service if needed. Please do not use pcnt_isr_register if this function was called.

**Return**

- ESP_OK Success
- ESP_ERR_INVALID_STATE pcnt driver has not been initialized
- ESP_ERR_NO_MEM No memory to install this service
- ESP_ERR_INVALID_STATE ISR service already installed

**Parameters**

- **intr_alloc_flags**: Flags used to allocate the interrupt. One or multiple (ORred) ESP_INTR_FLAG_* values. See esp_intr_alloc.h for more info.

**void pcnt_isr_service_uninstall** *(void)*

Uninstall PCNT ISR service, freeing related resources.

**esp_err_t pcnt_isr_handler_remove** *(pcnt_unit_t unit)*

Delete ISR handler for specified unit.

**Return**

- ESP_OK Success
- ESP_ERR_INVALID_STATE pcnt driver has not been initialized
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**

- **unit**: PCNT unit number

**Structures**

**struct pcnt_config_t**

Pulse Counter configuration for a single channel.

**Public Members**

- **int pulse_gpio_num**
  
  Pulse input GPIO number, if you want to use GPIO16, enter pulse_gpio_num = 16, a negative value will be ignored

- **int ctrl_gpio_num**
  
  Control signal input GPIO number, a negative value will be ignored
Chapter 2. API Reference

```c
pcnt_ctrl_mode_t lctrl_mode
    PCNT low control mode
pcnt_ctrl_mode_t hctrl_mode
    PCNT high control mode
pcnt_count_mode_t pos_mode
    PCNT positive edge count mode
pcnt_count_mode_t neg_mode
    PCNT negative edge count mode
int16_t counter_h_lim
    Maximum counter value
int16_t counter_l_lim
    Minimum counter value
pcnt_unit_t unit
    PCNT unit number
pcnt_channel_t channel
    the PCNT channel
```

**Macros**

PCNT_PIN_NOT_USED
    When selected for a pin, this pin will not be used
PCNT_MODE_KEEP
    Control mode: won’t change counter mode
PCNT_MODE_REVERSE
    Control mode: invert counter mode(increase -> decrease, decrease -> increase)
PCNT_MODE_DISABLE
    Control mode: Inhibit counter(counter value will not change in this condition)
PCNT_MODE_MAX
PCNT_COUNT_DIS
    Counter mode: Inhibit counter(counter value will not change in this condition)
PCNT_COUNT_INC
    Counter mode: Increase counter value
PCNT_COUNT_DEC
    Counter mode: Decrease counter value
PCNT_COUNT_MAX

**Type Definitions**

typedef intr_handle_t pcnt_isr_handle_t

typedef pcnt_channel_level_action_t pcnt_ctrl_mode_t
    Selection of available modes that determine the counter’s action depending on the state of the control signal’s input GPIO.

    **Note** Configuration covers two actions, one for high, and one for low level on the control input
typedef pcnt_channel_edge_action_t pcnt_count_mode_t
    Selection of available modes that determine the counter’s action on the edge of the pulse signal’s input GPIO.

    **Note** Configuration covers two actions, one for positive, and one for negative edge on the pulse input
Enumerations

enum pcnt_port_t
PCNT port number, the max port number is (PCNT_PORT_MAX - 1).

Values:
PCNT_PORT_0
PCNT port 0
PCNT.PORT_MAX
PCNT port max

enum pcnt_unit_t
Selection of all available PCNT units.

Values:
PCNT_UNIT_0
PCNT unit 0
PCNT.Unit_1
PCNT unit 1
PCNT_UNIT_2
PCNT unit 2
PCNT_UNIT_3
PCNT unit 3
PCNT_UNIT_MAX

enum pcnt_channel_t
Selection of channels available for a single PCNT unit.

Values:
PCNT_CHANNEL_0
PCNT channel 0
PCNT.Channel_1
PCNT channel 1
PCNT_CHANNEL_MAX

enum pcnt_evt_type_t
Selection of counter events the may trigger an interrupt.

Values:
PCNT_EVT_THRES_1 = 1 << 2
PCNT watch point event: threshold1 value event
PCNT_EVT_THRES_0 = 1 << 3
PCNT watch point event: threshold0 value event
PCNT_EVT_L_LIM = 1 << 4
PCNT watch point event: Minimum counter value
PCNT_EVT_H_LIM = 1 << 5
PCNT watch point event: Maximum counter value
PCNT_EVT_ZERO = 1 << 6
PCNT watch point event: counter value zero event
PCNT_EVT_MAX

Header File

- components/hal/include/hal/pcnt_types.h
Enumerations

enum pcnt_channel_level_action_t
PCNT channel action on control level.

Values:

PCNT_CHANNEL_LEVEL_ACTION_KEEP
Keep current count mode

PCNT_CHANNEL_LEVEL_ACTION_INVERSE
Invert current count mode (increase -> decrease, decrease -> increase)

PCNT_CHANNEL_LEVEL_ACTION_HOLD
Hold current count value

enum pcnt_channel_edge_action_t
PCNT channel action on signal edge.

Values:

PCNT_CHANNEL_EDGE_ACTION_HOLD
Hold current count value

PCNT_CHANNEL_EDGE_ACTION_INCREASE
Increase count value

PCNT_CHANNEL_EDGE_ACTION_DECREASE
Decrease count value

enum pcnt_unit_count_sign_t
PCNT unit counter value’s sign.

Values:

PCNT_UNIT_COUNT_SIGN_ZERO_POS
positive value to zero

PCNT_UNIT_COUNT_SIGN_ZERO_NEG
negative value to zero

PCNT_UNIT_COUNT_SIGN_NEG
counter value negative

PCNT_UNIT_COUNT_SIGN_POS
counter value positive

2.3.13 Remote Control (RMT)

The RMT (Remote Control) module driver can be used to send and receive infrared remote control signals. Due to the flexibility of RMT module, the driver can also be used to generate or receive many other types of signals.

The signal, which consists of a series of pulses, is generated by RMT’s transmitter based on a list of values. The values define the pulse duration and a binary level, see below. The transmitter can also provide a carrier and modulate it with provided pulses.

The reverse operation is performed by the receiver, where a series of pulses is decoded into a list of values containing the pulse duration and binary level. A filter may be applied to remove high frequency noise from the input signal.

There couple of typical steps to setup and operate the RMT and they are discussed in the following sections:

1. Configure Driver
2. Transmit Data or Receive Data
3. Change Operation Parameters
4. Use Interrupts

The RMT has eight channels numbered from zero to seven. The first half (i.e. Channel 0 ~ 3) channels can only be configured for transmitting, and the other half (i.e. Channel 4 ~ 7) channels can only be configured for receiving. They are referred to using indexes defined in structure rmt_channel_t.
Fig. 12: RMT Transmitter Overview

Fig. 13: RMT Receiver Overview
Configure Driver

There are several parameters that define how particular channel operates. Most of these parameters are configured by setting specific members of `rmt_config_t` structure. Some of the parameters are common to both transmit or receive mode, and some are mode specific. They are all discussed below.

Common Parameters

- The channel to be configured, select one from the `rmt_channel_t` enumerator.
- The RMT operation mode - whether this channel is used to transmit or receive data, selected by setting a `rmt_mode` member to one of the values from `rmt_mode_t`.
- What is the pin number to transmit or receive RMT signals, selected by setting `gpio_num`.
- How many memory blocks will be used by the channel, set with `mem_block_num`.
- Extra miscellaneous parameters for the channel can be set in the `flags`.
  - When `RMT_CHANNEL_FLAGS_AWARE_DFS` is set, RMT channel will take REF_TICK or XTAL as source clock. The benefit is, RMT channel can continue work even when APB clock is changing. See `power_management` for more information.
  - When `RMT_CHANNEL_FLAGS_INVERT_SIG` is set, the driver will invert the RMT signals sending to or receiving from the channel. It just works like an external inverter connected to the GPIO of certain RMT channel.
- A clock divider, that will determine the range of pulse length generated by the RMT transmitter or discriminated by the receiver. Selected by setting `clk_div` to a value within [1..255] range. The RMT source clock is typically APB CLK, 80Mhz by default. But when `RMT_CHANNEL_FLAGS_AWARE_DFS` is set in `flags`, RMT source clock is changed to REF_TICK or XTAL.

**Note:** The period of a square wave after the clock divider is called a ‘tick’. The length of the pulses generated by the RMT transmitter or discriminated by the receiver is configured in number of ‘ticks’.

There are also couple of specific parameters that should be set up depending if selected channel is configured in *Transmit Mode* or *Receive Mode*:

**Transmit Mode** When configuring channel in transmit mode, set `tx_config` and the following members of `rmt_tx_config_t`:

- Transmit the currently configured data items in a loop - `loop_en`
- Enable the RMT carrier signal - `carrier_en`
- Frequency of the carrier in Hz - `carrier_freq_hz`
- Duty cycle of the carrier signal in percent (%) - `carrier_duty_percent`
- Level of the RMT output, when the carrier is applied - `carrier_level`
- Enable the RMT output if idle - `idle_output_en`
- Set the signal level on the RMT output if idle - `idle_level`
- Specify maximum number of transmissions in a loop - `loop_count`

**Receive Mode** In receive mode, set `rx_config` and the following members of `rmt_rx_config_t`:

- Enable a filter on the input of the RMT receiver - `filter_en`
- A threshold of the filter, set in the number of ticks - `filter_ticks_thresh`. Pulses shorter than this setting will be filtered out. Note, that the range of entered tick values is [0..255].
- A pulse length threshold that will turn the RMT receiver idle, set in number of ticks - `idle_threshold`. The receiver will ignore pulses longer than this setting.
- Enable the RMT carrier demodulation - `carrier_rm`
- Frequency of the carrier in Hz - `carrier_freq_hz`
- Duty cycle of the carrier signal in percent (%) - `carrier_duty_percent`
- Level of the RMT input, where the carrier is modulated to - `carrier_level`
Finalize Configuration  Once the `rmt_config_t` structure is populated with parameters, it should be then invoked with `rmt_config()` to make the configuration effective.

The last configuration step is installation of the driver in memory by calling `rmt_driver_install()`. If `rx_buf_size` parameter of this function is > 0, then a ring buffer for incoming data will be allocated. A default ISR handler will be installed, see a note in Use Interrupts.

Now, depending on how the channel is configured, we are ready to either Transmit Data or Receive Data. This is described in next two sections.

Transmit Data

Before being able to transmit some RMT pulses, we need to define the pulse pattern. The minimum pattern recognized by the RMT controller, later called an `item`, is provided in a structure `rmt_item32_t`. Each item consists of two pairs of two values. The first value in a pair describes the signal duration in ticks and is 15 bits long, the second provides the signal level (high or low) and is contained in a single bit. A block of couple of items and the structure of an item is presented below.

![Diagram of RMT items](image)

For a simple example how to define a block of items see `peripherals/rmt/morse_code`.

The items are provided to the RMT controller by calling function `rmt_write_items()`. This function also automatically triggers start of transmission. It may be called to wait for transmission completion or exit just after transmission start. In such case you can wait for the transmission end by calling `rmt_wait_tx_done()`. This function does not limit the number of data items to transmit. It is using an interrupt to successively copy the new data chunks to RMT’s internal memory as previously provided data are sent out.

Another way to provide data for transmission is by calling `rmt_fill_tx_items()`. In this case transmission is not started automatically. To control the transmission process use `rmt_tx_start()` and `rmt_tx_stop()`. The number of items to send is restricted by the size of memory blocks allocated in the RMT controller’s internal memory, see `rmt_set_mem_block_num()`.

Receive Data

Before starting the receiver we need some storage for incoming items. The RMT controller has 384 x 32-bits of internal RAM shared between all eight channels.

In typical scenarios it is not enough as an ultimate storage for all incoming (and outgoing) items. Therefore this API supports retrieval of incoming items on the fly to save them in a ring buffer of a size defined by the user. The
size is provided when calling `rmt_driver_install()` discussed above. To get a handle to this buffer call `rmt_get_ringbuf_handle()`.

With the above steps complete we can start the receiver by calling `rmt_rx_start()` and then move to checking what’s inside the buffer. To do so, you can use common FreeRTOS functions that interact with the ring buffer. Please see an example how to do it in `peripherals/rmt/ir_protocols`.

To stop the receiver, call `rmt_rx_stop()`.

### Change Operation Parameters

Previously described function `rmt_config()` provides a convenient way to set several configuration parameters in one shot. This is usually done on application start. Then, when the application is running, the API provides an alternate way to update individual parameters by calling dedicated functions. Each function refers to the specific RMT channel provided as the first input parameter. Most of the functions have `_get_` counterpart to read back the currently configured value.

#### Parameters Common to Transmit and Receive Mode

- Selection of a GPIO pin number on the input or output of the RMT - `rmt_set_gpio()`
- Number of memory blocks allocated for the incoming or outgoing data - `rmt_set_mem_pd()`
- Setting of the clock divider - `rmt_set_clk_div()`
- Selection of the clock source, note that currently one clock source is supported, the APB clock which is 80MHz - `rmt_set_source_clk()`

#### Transmit Mode Parameters

- Enable or disable the loop back mode for the transmitter - `rmt_set_tx_loop_mode()`
- Binary level on the output to apply the carrier - `rmt_set_tx_carrier()`, selected from `rmt_carrier_level_t`
- Determines the binary level on the output when transmitter is idle - `rmt_set_idle_level()`, selected from `rmt_idle_level_t`
- Enable or disable loop count feature to automatically transmit items for N iterations, then trigger an ISR callback - `rmt_set_tx_loop_count()`
- Enable automatically stopping when the number of iterations matches the set loop count. Note this is not reliable for target that doesn’t support `SOC_RMT_SUPPORT_TX_LOOP_AUTOSTOP` - `rmt_enable_tx_loop_autostop()`

#### Receive Mode Parameters

- The filter setting - `rmt_set_rx_filter()`
- The receiver threshold setting - `rmt_set_rx_idle_thresh()`
- Whether the transmitter or receiver is entitled to access RMT’s memory - `rmt_set_memory_owner()`, selection is from `rmt_mem_owner_t`.

#### Use Interrupts

Registering of an interrupt handler for the RMT controller is done be calling `rmt_isr_register()`.

**Note:** When calling `rmt_driver_install()` to use the system RMT driver, a default ISR is being installed. In such a case you cannot register a generic ISR handler with `rmt_isr_register()`.

The RMT controller triggers interrupts on four specific events describes below. To enable interrupts on these events, the following functions are provided:

- The RMT receiver has finished receiving a signal - `rmt_set_rx_intr_en()`
Chapter 2. API Reference

- The RMT transmitter has finished transmitting the signal - \texttt{rmt\_set\_tx\_intr\_en()}
- The number of events the transmitter has sent matches a threshold value \texttt{rmt\_set\_tx\_thr\_intr\_en()}
- Ownership to the RMT memory block has been violated - \texttt{rmt\_set\_err\_intr\_en()}

Setting or clearing an interrupt enable mask for specific channels and events may be also done by calling \texttt{rmt\_set\_intr\_enable\_mask()} or \texttt{rmt\_clr\_intr\_enable\_mask()}. When servicing an interrupt within an ISR, the interrupt need to explicitly cleared. To do so, set specific bits described as \texttt{RMT.int\_clr.val.chN\_event\_name} and defined as a volatile struct in \texttt{soc/esp32s3/include/soc/rmt\_struct.h}, where \(N\) is the RMT channel number \([0, n]\) and the \texttt{event\_name} is one of four events described above.

If you do not need an ISR anymore, you can deregister it by calling a function \texttt{rmt\_isr\_deregister()}. \textbf{Warning:} It’s not recommended for users to register an interrupt handler in their applications. RMT driver is highly dependent on interrupt, especially when doing transaction in a ping-pong way, so the driver itself has registered a default handler called \texttt{rmt\_driver\_isr\_default}. Instead, if what you want is to get a notification when transaction is done, go ahead with \texttt{rmt\_register\_tx\_end\_callback()}. 

Uninstall Driver

If the RMT driver has been installed with \texttt{rmt\_driver\_install()} for some specific period of time and then not required, the driver may be removed to free allocated resources by calling \texttt{rmt\_driver\_uninstall()}. 

Application Examples

- Using RMT to send morse code: \texttt{peripherals/rmt/morse\_code}.
- Using RMT to drive RGB LED strip: \texttt{peripherals/rmt/led\_strip}.
- NEC remote control TX and RX example: \texttt{peripherals/rmt/ir\_protocols}.
- Musical buzzer example: \texttt{peripherals/rmt/musical\_buzzer}.

API Reference

Header File

- \texttt{components/driver/include/driver/rmt.h}

Functions

\begin{verbatim}
\textbf{esp\_err\_t rmt\_set\_clk\_div(rmt\_channel\_t channel, uint8\_t div\_cnt)}
Set RMT clock divider, channel clock is divided from source clock.
\end{verbatim}

\textbf{Return}

- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_OK Success

\textbf{Parameters}

- \texttt{channel}: RMT channel
- \texttt{div\_cnt}: RMT counter clock divider

\begin{verbatim}
\textbf{esp\_err\_t rmt\_get\_clk\_div(rmt\_channel\_t channel, uint8\_t *div\_cnt)}
Get RMT clock divider, channel clock is divided from source clock.
\end{verbatim}

\textbf{Return}

- ESP\_ERR\_INVALID\_ARG Parameter error
- ESP\_OK Success

\textbf{Parameters}

- \texttt{channel}: RMT channel
- \texttt{div\_cnt}: pointer to accept RMT counter divider
**esp_err_t rmt_set_rx_idle_thresh(rmt_channel_t channel, uint16_t thresh)**

Set RMT RX idle threshold value.

In receive mode, when no edge is detected on the input signal for longer than idle_thres channel clock cycles, the receive process is finished.

**Return**
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

**Parameters**
- channel: RMT channel
- thresh: RMT RX idle threshold

**esp_err_t rmt_get_rx_idle_thresh(rmt_channel_t channel, uint16_t *thresh)**

Get RMT idle threshold value.

In receive mode, when no edge is detected on the input signal for longer than idle_thres channel clock cycles, the receive process is finished.

**Return**
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

**Parameters**
- channel: RMT channel
- thresh: pointer to accept RMT RX idle threshold value

**esp_err_t rmt_set_mem_block_num(rmt_channel_t channel, uint8_t rmt_mem_num)**

Set RMT memory block number for RMT channel.

This function is used to configure the amount of memory blocks allocated to channel n. The 8 channels share a 512x32-bit RAM block which can be read and written by the processor cores over the APB bus, as well as read by the transmitters and written by the receivers.

The RAM address range for channel n is start_addr.CHn to end_addr.CHn, which are defined by: Memory block start address is RMT_CHANNEL_MEM(n) (in soc/rmt_reg.h), that is, start_addr.CHn = RMT base address + 0x800 + 64 * 4 * n, and end_addr.CHn = RMT base address + 0x800 + 64 * 4 * n + 64 * 4 * RMT_MEM_SIZE.CHn mod 512 * 4

**Note** If memory block number of one channel is set to a value greater than 1, this channel will occupy the memory block of the next channel. Channel 0 can use at most 8 blocks of memory, accordingly channel 7 can only use one memory block.

**Return**
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

**Parameters**
- channel: RMT channel
- rmt_mem_num: RMT RX memory block number, one block has 64 * 32 bits.

**esp_err_t rmt_get_mem_block_num(rmt_channel_t channel, uint8_t *rmt_mem_num)**

Get RMT memory block number.

**Return**
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

**Parameters**
- channel: RMT channel
- rmt_mem_num: Pointer to accept RMT RX memory block number

**esp_err_t rmt_set_tx_carrier(rmt_channel_t channel, bool carrier_en, uint16_t high_level, uint16_t low_level, rmt_carrier_level_t carrier_level)**

Configure RMT carrier for TX signal.

Set different values for carrier_high and carrier_low to set different frequency of carrier. The unit of carrier_high/low is the source clock tick, not the divided channel counter clock.
Return

- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

Parameters

- channel: RMT channel
- carrier_en: Whether to enable output carrier.
- high_level: High level duration of carrier.
- low_level: Low level duration of carrier.
- carrier_level: Configure the way carrier wave is modulated for channel.
  - 1'b1: transmit on low output level
  - 1'b0: transmit on high output level

```c
esp_err_t rmt_set_mem_pd(rmt_channel_t channel, bool pd_en)
```
Set RMT memory in low power mode.

Reduce power consumed by memory. 1: memory is in low power state.

Return

- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

Parameters

- channel: RMT channel
- pd_en: RMT memory low power enable.

```c
esp_err_t rmt_get_mem_pd(rmt_channel_t channel, bool *pd_en)
```
Get RMT memory low power mode.

Return

- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

Parameters

- channel: RMT channel
- pd_en: Pointer to accept RMT memory low power mode.

```c
esp_err_t rmt_tx_start(rmt_channel_t channel, bool tx_idx_rst)
```
Set RMT start sending data from memory.

Return

- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

Parameters

- channel: RMT channel
- tx_idx_rst: Set true to reset memory index for TX. Otherwise, transmitter will continue sending from the last index in memory.

```c
esp_err_t rmt_tx_stop(rmt_channel_t channel)
```
Set RMT stop sending.

Return

- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

Parameters

- channel: RMT channel

```c
esp_err_t rmt_rx_start(rmt_channel_t channel, bool rx_idx_rst)
```
Set RMT start receiving data.

Return

- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

Parameters

- channel: RMT channel
- rx_idx_rst: Set true to reset memory index for receiver. Otherwise, receiver will continue receiving data to the last index in memory.
### esp_err_t rmt_rx_stop (rmt_channel_t channel)
Set RMT stop receiving data.

- **Return**
  - ESP_ERR_INVALID_ARG Parameter error
  - ESP_OK Success

- **Parameters**
  - channel: RMT channel

### esp_err_t rmt_tx_memory_reset (rmt_channel_t channel)
Reset RMT TX memory.

- **Return**
  - ESP_ERR_INVALID_ARG Parameter error
  - ESP_OK Success

- **Parameters**
  - channel: RMT channel

### esp_err_t rmt_rx_memory_reset (rmt_channel_t channel)
Reset RMT RX memory.

- **Return**
  - ESP_ERR_INVALID_ARG Parameter error
  - ESP_OK Success

- **Parameters**
  - channel: RMT channel

### esp_err_t rmt_set_memory_owner (rmt_channel_t channel, rmt_mem_owner_t owner)
Set RMT memory owner.

- **Note** Setting memory is only valid for RX channel.

- **Return**
  - ESP_ERR_INVALID_ARG Parameter error
  - ESP_OK Success

- **Parameters**
  - channel: RMT channel
  - owner: To set when the transmitter or receiver can process the memory of channel.

### esp_err_t rmt_get_memory_owner (rmt_channel_t channel, rmt_mem_owner_t *owner)
Get RMT memory owner.

- **Return**
  - ESP_ERR_INVALID_ARG Parameter error
  - ESP_OK Success

- **Parameters**
  - channel: RMT channel
  - owner: Pointer to get memory owner.

### esp_err_t rmt_set_tx_loop_mode (rmt_channel_t channel, bool loop_en)
Set RMT tx loop mode.

- **Return**
  - ESP_ERR_INVALID_ARG Parameter error
  - ESP_OK Success

- **Parameters**
  - channel: RMT channel
  - loop_en: Enable RMT transmitter loop sending mode. If set true, transmitter will continue sending from the first data to the last data in channel over and over again in a loop.

### esp_err_t rmt_get_tx_loop_mode (rmt_channel_t channel, bool *loop_en)
Get RMT tx loop mode.

- **Return**
  - ESP_ERR_INVALID_ARG Parameter error
  - ESP_OK Success
Parameters
- **channel**: RMT channel
- **loop_en**: Pointer to accept RMT transmitter loop sending mode.

```c
esp_err_t rmt_set_rx_filter(rmt_channel_t channel, bool rx_filter_en, uint8_t thresh)
```
Set RMT RX filter.

In receive mode, channel will ignore input pulse when the pulse width is smaller than threshold. Counted in source clock, not divided counter clock.

Return
- **ESP_ERR_INVALID_ARG**: Parameter error
- **ESP_OK**: Success

Parameters
- **channel**: RMT channel
- **rx_filter_en**: To enable RMT receiver filter.
- **thresh**: Threshold of pulse width for receiver.

```c
esp_err_t rmt_set_source_clk(rmt_channel_t channel, rmt_source_clk_t base_clk)
```
Set RMT source clock.

RMT module has two clock sources:
1. APB clock which is 80Mhz
2. REF tick clock, which would be 1Mhz (not supported in this version).

Return
- **ESP_ERR_INVALID_ARG**: Parameter error
- **ESP_OK**: Success

Parameters
- **channel**: RMT channel
- **base_clk**: To choose source clock for RMT module.

```c
esp_err_t rmt_get_source_clk(rmt_channel_t channel, rmt_source_clk_t *src_clk)
```
Get RMT source clock.

RMT module has two clock sources:
1. APB clock which is 80Mhz
2. REF tick clock, which would be 1Mhz (not supported in this version).

Return
- **ESP_ERR_INVALID_ARG**: Parameter error
- **ESP_OK**: Success

Parameters
- **channel**: RMT channel
- **src_clk**: Pointer to accept source clock for RMT module.

```c
esp_err_t rmt_set_idle_level(rmt_channel_t channel, bool idle_out_en, rmt_idle_level_t level)
```
Set RMT idle output level for transmitter.

Return
- **ESP_ERR_INVALID_ARG**: Parameter error
- **ESP_OK**: Success

Parameters
- **channel**: RMT channel
- **idle_out_en**: To enable idle output.
- **level**: To set the output signal’s level for channel in idle state.

```c
esp_err_t rmt_get_idle_level(rmt_channel_t channel, bool *idle_out_en, rmt_idle_level_t *level)
```
Get RMT idle output level for transmitter.

Return
- **ESP_ERR_INVALID_ARG**: Parameter error
- **ESP_OK**: Success

Parameters
• channel: RMT channel
• idle_out_en: Pointer to accept value of enable idle.
• level: Pointer to accept value of output signal’s level in idle state for specified channel.

```c
esp_err_t rmt_get_status (rmt_channel_t channel, uint32_t *status)
```
Get RMT status.

**Return**
• ESP_ERR_INVALID_ARG Parameter error
• ESP_OK Success

**Parameters**
• channel: RMT channel
• status: Pointer to accept channel status. Please refer to RMT_CHnSTATUS_REG(n=0~7) in rmt_reg.h for more details of each field.

```c
esp_err_t rmt_set_rx_intr_en (rmt_channel_t channel, bool en)
```
Set RMT RX interrupt enable.

**Return**
• ESP_ERR_INVALID_ARG Parameter error
• ESP_OK Success

**Parameters**
• channel: RMT channel
• en: enable or disable RX interrupt.

```c
esp_err_t rmt_set_err_intr_en (rmt_channel_t channel, bool en)
```
Set RMT RX error interrupt enable.

**Return**
• ESP_ERR_INVALID_ARG Parameter error
• ESP_OK Success

**Parameters**
• channel: RMT channel
• en: enable or disable RX err interrupt.

```c
esp_err_t rmt_set_tx_intr_en (rmt_channel_t channel, bool en)
```
Set RMT TX interrupt enable.

**Return**
• ESP_ERR_INVALID_ARG Parameter error
• ESP_OK Success

**Parameters**
• channel: RMT channel
• en: enable or disable TX interrupt.

```c
esp_err_t rmt_set_tx_thr_intr_en (rmt_channel_t channel, bool en, uint16_t evt_thresh)
```
Set RMT TX threshold event interrupt enable. An interrupt will be triggered when the number of transmitted items reaches the threshold value.

**Return**
• ESP_ERR_INVALID_ARG Parameter error
• ESP_OK Success

**Parameters**
• channel: RMT channel
• en: enable or disable TX event interrupt.
• evt_thresh: RMT event interrupt threshold value

```c
esp_err_t rmt_set_gpio (rmt_channel_t channel, rmt_mode_t mode, gpio_num_t gpio_num, bool invert_signal)
```
Configure the GPIO used by RMT channel.

**Return**
• ESP_ERR_INVALID_ARG Configure RMT GPIO failed because of wrong parameter
• ESP_OK Configure RMT GPIO successfully
Parameters
- **channel**: RMT channel
- **mode**: RMT mode, either RMT_MODE_TX or RMT_MODE_RX
- **gpio_num**: GPIO number, which is connected with certain RMT signal
- **invert_signal**: Invert RMT signal physically by GPIO matrix

```c
esp_err_t rmt_config(const rmt_config_t *rmt_param)
```
Configure RMT parameters.

**Return**
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

**Parameters**
- **rmt_param**: RMT parameter struct

```c
esp_err_t rmt_isr_register(void (*fn)(void), void *arg, int intr_alloc_flags, rmt_isr_handle_t *handle)
```
Register RMT interrupt handler, the handler is an ISR.

The handler will be attached to the same CPU core that this function is running on.

**Note** If you already called rmt_driver_install to use system RMT driver, please do not register ISR handler again.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Function pointer error.
- ESP_FAIL System driver installed, cannot register ISR handler for RMT

**Parameters**
- **fn**: Interrupt handler function.
- **arg**: Parameter for the handler function
- **intr_alloc_flags**: Flags used to allocate the interrupt. One or multiple (ORred) ESP_INTR_FLAG_* values. See esp_intr_alloc.h for more info.
- **handle**: If non-zero, a handle to later clean up the ISR gets stored here.

```c
esp_err_t rmt_isr_deregister(rmt_isr_handle_t handle)
```
Deregister previously registered RMT interrupt handler.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Handle invalid

**Parameters**
- **handle**: Handle obtained from rmt_isr_register

```c
esp_err_t rmt_fill_tx_items(rmt_channel_t channel, const rmt_item32_t *item, uint16_t item_num, uint16_t mem_offset)
```
Fill memory data of channel with given RMT items.

**Return**
- ESP_ERRVALID_ARG Parameter error
- ESP_OK Success

**Parameters**
- **channel**: RMT channel
- **item**: Pointer of items.
- **item_num**: RMT sending items number.
- **mem_offset**: Index offset of memory.

```c
esp_err_t rmt_driver_install(rmt_channel_t channel, size_t rx_buf_size, int intr_alloc_flags)
```
Initialize RMT driver.

**Return**
- ESP_ERR_INVALID_STATE Driver is already installed, call rmt_driver_uninstall first.
- ESP_ERR_NO_MEM Memory allocation failure
- ESP_ERRINVALID_ARG Parameter error
- ESP_OK Success
Parameters
• channel: RMT channel
• rx_buf_size: Size of RMT RX ringbuffer. Can be 0 if the RX ringbuffer is not used.
• intr_alloc_flags: Flags for the RMT driver interrupt handler. Pass 0 for default flags. See esp_intr_alloc.h for details. If ESP_INTR_FLAG_I RAM is used, please do not use the memory allocated from psram when calling rmt_write_items.

```c
esp_err_t rmt_driver_uninstall (rmt_channel_t channel)
```
Uninstall RMT driver.

**Return**
• ESP_ERR_INVALID_ARG Parameter error
• ESP_OK Success

Parameters
• channel: RMT channel

```c
esp_err_t rmt_get_channel_status (rmt_channel_status_result_t *channel_status)
```
Get the current status of eight channels.

**Note** Do not call this function if it is possible that rmt_driver_uninstall will be called at the same time.

**Return**
• ESP_ERR_INVALID_ARG Parameter is NULL
• ESP_OK Success

Parameters
• [out] channel_status: store the current status of each channel

```c
esp_err_t rmt_get_counter_clock (rmt_channel_t channel, uint32_t *clock_hz)
```
Get speed of channel’s internal counter clock.

**Return**
• ESP_ERR_INVALID_ARG Parameter is NULL
• ESP_OK Success

Parameters
• channel: RMT channel
• [out] clock_hz: counter clock speed, in Hz

```c
esp_err_t rmt_write_items (rmt_channel_t channel, const rmt_item32_t *rmt_item, int item_num, bool wait_tx_done)
```
RMT send waveform from rmt_item array.

This API allows user to send waveform with any length.

**Note** This function will not copy data, instead, it will point to the original items, and send the waveform items. If wait_tx_done is set to true, this function will block and will not return until all items have been sent out. If wait_tx_done is set to false, this function will return immediately, and the driver interrupt will continue sending the items. We must make sure the item data will not be damaged when the driver is still sending items in driver interrupt.

**Return**
• ESP_ERR_INVALID_ARG Parameter error
• ESP_OK Success

Parameters
• channel: RMT channel
• rmt_item: head point of RMT items array. If ESP_INTR_FLAG_IRAM is used, please do not use the memory allocated from psram when calling rmt_write_items.
• item_num: RMT data item number.
• wait_tx_done:
  – If set 1, it will block the task and wait for sending done.
  – If set 0, it will not wait and return immediately.

```c
esp_err_t rmt_wait_tx_done (rmt_channel_t channel, TickType_t wait_time)
```
Wait RMT TX finished.

**Return**
• ESP_OK RMT Tx done successfully
• ESP_ERR_TIMEOUT Exceeded the ‘wait_time’ given
• ESP_ERR_INVALID_ARG Parameter error
• ESP_FAIL Driver not installed

Parameters
• channel: RMT channel
• wait_time: Maximum time in ticks to wait for transmission to be complete. If set 0, return immediately with ESP_ERR_TIMEOUT if TX is busy (polling).

```c
esp_err_t rmt_get_ringbuf_handle(rmt_channel_t channel, RingbufHandle_t *buf_handle)
```

Get ringbuffer from RMT.

Users can get the RMT RX ringbuffer handle, and process the RX data.

Return
• ESP_ERR_INVALID_ARG Parameter error
• ESP_OK Success

Parameters
• channel: RMT channel
• buf_handle: Pointer to buffer handle to accept RX ringbuffer handle.

```c
esp_err_t rmt_translator_init(rmt_channel_t channel, sample_to_rmt_t fn)
```

Init rmt translator and register user callback. The callback will convert the raw data that needs to be sent to rmt format. If a channel is initialized more than once, the user callback will be replaced by the later.

Return
• ESP_FAIL Init fail.
• ESP_OK Init success.

Parameters
• channel: RMT channel.
• fn: Pointer to the data conversion function.

```c
esp_err_t rmt_translator_set_context(rmt_channel_t channel, void* context)
```

Set user context for the translator of specific channel.

Return
• ESP_FAIL Set context fail
• ESP_OK Set context success

Parameters
• channel: RMT channel number
• context: User context

```c
esp_err_t rmt_translator_get_context(const size_t* item_num, void** context)
```

Get the user context set by ‘rmt_translator_set_context’.

Note This API must be invoked in the RMT translator callback function, and the first argument must be the actual parameter ‘item_num’ you got in that callback function.

Return
• ESP_FAIL Get context fail
• ESP_OK Get context success

Parameters
• item_num: Address of the memory which contains the number of translated items (It’s from driver’s internal memory)
• context: Returned User context

```c
esp_err_t rmt_write_sample(rmt_channel_t channel, const uint8_t *src, size_t src_size, bool wait_tx_done)
```

Translate uint8_t type of data into rmt format and send it out. Requires rmt_translator_init to init the translator first.

Return
• ESP_FAIL Send fail
• ESP_OK Send success

Parameters
• channel: RMT channel.
• src: Pointer to the raw data.
• src_size: The size of the raw data.
• wait_tx_done: Set true to wait all data send done.

`rmt_tx_end_callback_t rmt_register_tx_end_callback (rmt_tx_end_fn_t function, void *arg)`
Registers a callback that will be called when transmission ends.

Called by `rmt_driver_isr_default` in interrupt context.

**Note** Requires `rmt_driver_install` to install the default ISR handler.

**Return** the previous callback settings (members will be set to NULL if there was none)

**Parameters**
- `function`: Function to be called from the default interrupt handler or NULL.
- `arg`: Argument which will be provided to the callback when it is called.

`esp_err_t rmt_set_rx_thr_intr_en (rmt_channel_t channel, bool en, uint16_t evt_thresh)`
Set RMT RX threshold event interrupt enable.

An interrupt will be triggered when the number of received items reaches the threshold value

**Return**
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

**Parameters**
- `channel`: RMT channel
- `en`: enable or disable RX event interrupt.
- `evt_thresh`: RMT event interrupt threshold value

`esp_err_t rmt_add_channel_to_group (rmt_channel_t channel)`
Add channel into a synchronous group (channels in the same group can start transaction simultaneously)

**Return**
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

**Parameters**
- `channel`: RMT channel

`esp_err_t rmt_remove_channel_from_group (rmt_channel_t channel)`
Remove channel out of a group.

**Return**
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

**Parameters**
- `channel`: RMT channel

`esp_err_t rmt_set_tx_loop_count (rmt_channel_t channel, uint32_t count)`
Set loop count threshold value for RMT TX channel.

When `tx` loop count reaches this value, an ISR callback will notify user

**Return**
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

**Parameters**
- `channel`: RMT channel
- `count`: loop count, 1 ~ 1023

`esp_err_t rmt_enable_tx_loop_autostop (rmt_channel_t channel, bool en)`
Enable or disable the feature that when loop count reaches the threshold, RMT will stop transmitting.

- When the loop auto-stop feature is enabled will halt RMT transmission after the loop count reaches a certain threshold
- When disabled, the RMT transmission continue indefinitely until halted by the users
Note The auto-stop feature is implemented in hardware on particular targets (i.e. those with SOC_RMT_SUPPORT_TX_LOOP_AUTOSTOP defined). Otherwise, the auto-stop feature is implemented in software via the interrupt.

Return
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

Parameters
- channel: RMT channel
- en: enable bit

`esp_err_t rmt_memory_rw_rst(rmt_channel_t channel)`
Reset RMT TX/RX memory index.

Return
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

Parameters
- channel: RMT channel

`void rmt_set_intr_enable_mask(uint32_t mask)`
Set mask value to RMT interrupt enable register.

Parameters
- mask: Bit mask to set to the register

`void rmt_clr_intr_enable_mask(uint32_t mask)`
Clear mask value to RMT interrupt enable register.

Parameters
- mask: Bit mask to clear the register

`esp_err_t rmt_set_pin(rmt_channel_t channel, rmt_mode_t mode, gpio_num_t gpio_num)`
Set RMT pin.

Return
- ESP_ERR_INVALID_ARG Parameter error
- ESP_OK Success

Parameters
- channel: RMT channel
- mode: TX or RX mode for RMT
- gpio_num: GPIO number to transmit or receive the signal.

Structures

`struct rmt_tx_config_t`
Data struct of RMT TX configure parameters.

Public Members

`uint32_t carrier_freq_hz`
RMT carrier frequency

`rmt_carrier_level_t carrier_level`
Level of the RMT output, when the carrier is applied

`rmt_idle_level_t idle_level`
RMT idle level

`uint8_t carrier_duty_percent`
RMT carrier duty (%)

`uint32_t loop_count`
Maximum loop count
bool carrier_en
   RMT carrier enable

bool loop_en
   Enable sending RMT items in a loop

bool idle_output_en
   RMT idle level output enable

**struct rmt_rx_config_t**
   Data struct of RMT RX configure parameters.

**Public Members**

uint16_t idle_threshold
   RMT RX idle threshold

uint8_t filter_ticks_thresh
   RMT filter tick number

bool filter_en
   RMT receiver filter enable

bool rm_carrier
   RMT receiver remove carrier enable

uint32_t carrier_freq_hz
   RMT carrier frequency

uint8_t carrier_duty_percent
   RMT carrier duty (%)

*rmrmt_carrier_level_t carrier_level*
   The level to remove the carrier

**struct rmt_config_t**
   Data struct of RMT configure parameters.

**Public Members**

*rmt_mode_t rmt_mode*
   RMT mode: transmitter or receiver

*rmt_channel_t channel*
   RMT channel

*gpio_num_t gpio_num*
   RMT GPIO number

uint8_t clk_div
   RMT channel counter divider

uint8_t mem_block_num
   RMT memory block number

uint32_t flags
   RMT channel extra configurations, OR’d with RMT_CHANNEL_FLAGS_[*]

*rmt_tx_config_t tx_config*
   RMT TX parameter

*rmt_rx_config_t rx_config*
   RMT RX parameter

**struct rmt_tx_end_callback_t**
   Structure encapsulating a RMT TX end callback.
Public Members

\texttt{rmt\_tx\_end\_fn\_t} function
Function which is called on RMT TX end

void* \textit{arg}
Optional argument passed to function

Macros
\texttt{RMT\_CHANNEL\_FLAGS\_AWARE\_DFS}
Channel can work during APB clock scaling
\texttt{RMT\_CHANNEL\_FLAGS\_INVERT\_SIG}
Invert RMT signal
\texttt{RMT\_MEM\_ITEM\_NUM}
Define memory space of each RMT channel (in words = 4 bytes)
\texttt{RMT\_DEFAULT\_CONFIG\_TX}(gpio, channel_id)
Default configuration for Tx channel.
\texttt{RMT\_DEFAULT\_CONFIG\_RX}(gpio, channel_id)
Default configuration for RX channel.

Type Definitions
\texttt{typedef intr\_handle\_t rmt\_isr\_handle\_t}
RMT interrupt handle.
\texttt{typedef void(*rmt\_tx\_end\_fn\_t)(rmt\_channel\_t channel, void*arg)}
Type of RMT Tx End callback function.
\texttt{typedef void(*sample\_to\_rmt\_t)(const void *src, rmt\_item32\_t *dest, size\_t src\_size, size\_t \texttt{wanted\_num, size\_t *translated\_size, size\_t *item\_num)}}
User callback function to convert uint8\_t type data to rmt format(rmt\_item32\_t).
This function may be called from an ISR, so, the code should be short and efficient.

\textbf{Note} In fact, \textit{item\_num} should be a multiple of \textit{translated\_size}, e.g.: When we convert each byte of uint8\_t type data to rmt format data, the relation between \textit{item\_num} and \textit{translated\_size} should be \textit{item\_num} = \textit{translated\_size} \times 8.

Parameters
\begin{itemize}
\item \texttt{src} : Pointer to the buffer storing the raw data that needs to be converted to rmt format.
\item \texttt{[out] dest} : Pointer to the buffer storing the rmt format data.
\item \texttt{src\_size} : The raw data size.
\item \texttt{wanted\_num} : The number of rmt format data that wanted to get.
\item \texttt{[out] translated\_size} : The size of the raw data that has been converted to rmt format, it should return 0 if no data is converted in user callback.
\item \texttt{[out] item\_num} : The number of the rmt format data that actually converted to, it can be less than \texttt{wanted\_num} if there is not enough raw data, but cannot exceed \texttt{wanted\_num}. it should return 0 if no data was converted.
\end{itemize}

Header File
\begin{itemize}
\item components/hal/include/hal/rmt_types.h
\end{itemize}

Structures
\texttt{struct rmt\_channel\_status\_result\_t}
Data struct of RMT channel status.
Public Members

\texttt{rmt\_channel\_status\_t status[RMT\_CHANNEL\_MAX]}  
Store the current status of each channel

Enumerations

\texttt{enum rmt\_channel\_t}  
RMT channel ID.

\textit{Values:}

\begin{itemize}
  \item \texttt{RMT\_CHANNEL\_0}  
    RMT channel number 0
  \item \texttt{RMT\_CHANNEL\_1}  
    RMT channel number 1
  \item \texttt{RMT\_CHANNEL\_2}  
    RMT channel number 2
  \item \texttt{RMT\_CHANNEL\_3}  
    RMT channel number 3
  \item \texttt{RMT\_CHANNEL\_4}  
    RMT channel number 4
  \item \texttt{RMT\_CHANNEL\_5}  
    RMT channel number 5
  \item \texttt{RMT\_CHANNEL\_6}  
    RMT channel number 6
  \item \texttt{RMT\_CHANNEL\_7}  
    RMT channel number 7
  \item \texttt{RMT\_CHANNEL\_MAX}  
    Number of RMT channels
\end{itemize}

\texttt{enum rmt\_mem\_owner\_t}  
RMT Internal Memory Owner.

\textit{Values:}

\begin{itemize}
  \item \texttt{RMT\_MEM\_OWNER\_TX}  
    RMT RX mode, RMT transmitter owns the memory block
  \item \texttt{RMT\_MEM\_OWNER\_RX}  
    RMT RX mode, RMT receiver owns the memory block
  \item \texttt{RMT\_MEM\_OWNER\_MAX}
\end{itemize}

\texttt{enum rmt\_source\_clk\_t}  
Clock Source of RMT Channel.

\textit{Values:}

\begin{itemize}
  \item \texttt{RMT\_BASECLK\_APB = 1}  
    RMT source clock is APB CLK, 80Mhz by default
  \item \texttt{RMT\_BASECLK\_XTAL = 3}  
    RMT source clock is XTAL clock, 40Mhz by default
  \item \texttt{RMT\_BASECLK\_MAX}
\end{itemize}

\texttt{enum rmt\_data\_mode\_t}  
RMT Data Mode.

\textbf{Note}  We highly recommended to use MEM mode not FIFO mode since there will be some gotcha in FIFO mode.
Values:

- RMT_DATA_MODE_FIFO
- RMT_DATA_MODE_MEM
- RMT_DATA_MODE_MAX

**enum rmt_mode_t**

RMT Channel Working Mode (TX or RX)

Values:

- RMT_MODE_TX
  - RMT TX mode
- RMT_MODE_RX
  - RMT RX mode
- RMT_MODE_MAX

**enum rmt_idle_level_t**

RMT Idle Level.

Values:

- RMT_IDLE_LEVEL_LOW
  - RMT TX idle level: low Level
- RMT_IDLE_LEVEL_HIGH
  - RMT TX idle level: high Level
- RMT_IDLE_LEVEL_MAX

**enum rmt_carrier_level_t**

RMT Carrier Level.

Values:

- RMT_CARRIER_LEVEL_LOW
  - RMT carrier wave is modulated for low Level output
- RMT_CARRIER_LEVEL_HIGH
  - RMT carrier wave is modulated for high Level output
- RMT_CARRIER_LEVEL_MAX

**enum rmt_channel_status_t**

RMT Channel Status.

Values:

- RMT_CHANNEL_UNINIT
  - RMT channel uninitialized
- RMT_CHANNEL_IDLE
  - RMT channel status idle
- RMT_CHANNEL_BUSY
  - RMT channel status busy

### 2.3.14 SD Pull-up Requirements

Espressif hardware products are designed for multiple use cases which may require different pull states on pins. For this reason, the pull state of particular pins on certain products will need to be adjusted to provide the pull-ups required in the SD bus.

SD pull-up requirements apply to cases where ESP32-S3 uses the SPI controller to communicate with SD cards. When an SD card is operating in SPI mode or 1-bit SD mode, the CMD and DATA (DAT0 - DAT3) lines of the SD
bus must be pulled up by 10 kOhm resistors. Slaves should also have pull-ups on all above-mentioned lines (regardless of whether these lines are connected to the host) in order to prevent SD cards from entering a wrong state.

By default, the MTDI bootstrapping pin is incompatible with the DAT2 line pull-up if the flash voltage is 3.3 V. For more information, see *MTDI Strapping Pin* below.

This document has the following structure:

- **Overview of compatibility** between the default pull states on pins of Espressif’s products and the states required by the SD bus
- **Solutions** - ideas on how to resolve compatibility issues
- **Related information** - other relevant information

### Overview of Compatibility

This section provides an overview of compatibility issues that might occur when using SDIO (secure digital input output). Since the SD bus needs to be connected to pull-ups, these issues should be resolved regardless of whether they are related to master (host) or slave (device). Each issue has links to its respective solution. A solution for a host and device may differ.

#### Systems on a Chip (SoCs)

#### Systems in Packages (SIP)

#### Modules

#### Development Boards

**Non-Espressif Hosts** Please make sure that your SDIO host provides necessary pull-ups for all SD bus signals.

**Solutions**

#### No Pull-ups

If you use a development board without pull-ups, you can do the following:

- If your host and slave device are on separate boards, replace one of them with a board that has pull-ups. For the list of Espressif’s development boards with pull-ups, go to [Development Boards](#).
- Attach external pull-ups by connecting each pin which requires a pull-up to VDD via a 10 kOhm resistor.

#### Pull-up Conflicts on GPIO13

If DAT3 of your device is not properly pulled up, you have the following options:

- Use 1-bit SD mode and tie the device’s DAT3 to VDD
- Use SPI mode
- **Perform one of the following actions on the GPIO13 pin:**
  - Remove the pull-down resistors
  - Attach a pull-up resistor of less than 5 kOhm (2 kOhm suggested)
  - Pull it up or drive it high either by using the host or with 3.3 V on VDD in 1-bit SD mode

#### Conflicts Between Bootstrap and SDIO on DAT2

There is a conflict between the boot strapping requirements of the ESP32 and the SDIO protocol. For details, see *MTDI Strapping Pin*.

To resolve the conflict, you have the following options:

1. **(Recommended) Burn the flash voltage selection eFuses.** This will permanently configure the internal regulator’s output voltage to 3.3 V, and GPIO12 will not be used as a bootstrapping pin. After that, connect a pull-up resistor to GPIO12.
**Warning:** Burning eFuses is irreversible! The issue list above might be out of date, so please make sure that the module you are burning has a 3.3 V flash chip by checking the information on [http://www.espressif.com](http://www.espressif.com). If you burn the 3.3 V eFuses on a module with a 1.8 V flash chip, the module will stop functioning.

If you are sure that you need to irreversibly burn eFuses, go to your ESP-IDF directory and run the following command:

```bash
components/esptool_py/esptool/espefuse.py set_flash_voltage 3.3V
```

This command will burn the `XPD_SDIO_TIEH`, `XPD_SDIO_FORCE`, and `XPD_SDIO_REG` eFuses. After all the three eFuses are burned to value 1, the internal VDD_SDIO flash voltage regulator will be permanently set to 3.3 V. You will see the following log if the burning succeeds:

```
espefuse.py v2.6
Connecting....
Enable internal flash voltage regulator (VDD_SDIO) to 3.3 V.
The following eFuses are burned: XPD_SDIO_FORCE, XPD_SDIO_REG, XPD_SDIO_TIEH.
This is an irreversible operation.
Type 'BURN' (all capitals) to continue.
BURN
VDD_SDIO setting complete.
```

To check the status of the eFuses, run:

```
`\`components/esptool_py/esptool/espefuse.py summary``
```

If running from an automated flashing script, `espefuse.py` has an option `--do-not-confirm`. For more details, see [ESP32-S3 Technical Reference Manual](https://docs.espressif.com/en/latest/technical-reference-manual/)

2. **If using 1-bit SD mode or SPI mode,** disconnect the DAT2 pin and make sure it is pulled high. For this, do one of the following:
   - Leave the host’s DAT2 floating and directly connect the slave’s DAT2 to VDD.
   - For a slave device, build a firmware with the option `SDIO_SLAVE_FLAG_DAT2_DISABLED` and re-flash your device. This option will help avoid slave detecting on the DAT2 line. Note that 4-bit SD mode will no longer be supported by the standard Card Common Control Register (CCCR); however, the host will not be aware of that. The use of 4-bit SD mode will have to be disabled on the host’s side.

**No Pull-up on GPIO12** Your module is compatible with the SDIO protocol. Just connect GPIO12 to VDD via a 10 kOhm resistor.

**Download Mode Not Working (minor issue)** When the GPIO2 pin is pulled high in accordance with the SD pull-up requirements, you cannot enter Download mode because GPIO2 is a bootstrapping pin which in this case must be pulled low.

There are the following solutions:

   - For boards that require shorting the GPIO0 and GPIO2 pins with a jumper, put the jumper in place, and the auto-reset circuit will pull GPIO2 low along with GPIO0 before entering Download mode.
   - For boards with components attached to their GPIO2 pin (such as pull-down resistors and/or LEDs), check the schematic of your development board for anything connected to GPIO2.
     - **LEDs** would not affect operation in most cases.
     - **Pull-down resistors** can interfere with DAT0 signals and must be removed.

If the above solutions do not work for you, please determine if it is the host or slave device that has pull-ups affecting their GPIO2, then locate these pull-ups and remove them.

**Related Information**
**MTDI Strapping Pin**  MTDI (GPIO12) is used as a bootstrapping pin to select the output voltage of an internal regulator (VDD_SDIO) which powers the flash chip. This pin has an internal pull-down, so, if left unconnected, it will read low at startup, which will lead to selecting the default 3.3 V operation.

When adding a pull-up to this pin for SD card operation, consider the following:

- For boards that do not use the internal regulator (VDD_SDIO) to power flash, GPIO12 can be pulled high.
- For boards using 1.8 V flash chips, GPIO12 needs to be pulled high at reset. This is fully compatible with the SD card operation.
- On boards using the internal regulator and a 3.3 V flash chip, GPIO12 must be pulled low at reset. This is incompatible with the SD card operation. For reference information on compatibility of Espressif’s boards with the SD card operation, see *Overview of Compatibility*.

**Internal Pull-ups and Strapping Requirements**  Using external resistors is always preferable. However, Espressif’s products have internal weak pull-up and pull-down resistors which can be enabled and used instead of external ones. Please keep in mind that this solution cannot guarantee reliable SDIO communication.

With that said, the information about these internal pull-ups and strapping requirements can still be useful. Espressif hardware products have different weak internal pull-ups/pull-downs connected to CMD and DATA pins. The table below shows the default pull-up and pull-down states of the CMD and DATA pins.

The following abbreviations are used in the table:

- **WPU**: Weak pull-up inside the SoC
- **WPD**: Weak pull-down inside the SoC
- **PU**: Pull-up inside Espressif modules but outside the SoC

### 2.3.15 SDMMC Host Driver

**Overview**

ESP32’s SDMMC host peripheral has two slots:

- Slot 0 (*SDMMC_HOST_SLOT_0*) is an 8-bit slot. It uses HS1_* signals in the PIN MUX.
- Slot 1 (*SDMMC_HOST_SLOT_1*) is a 4-bit slot. It uses HS2_* signals in the PIN MUX.

Pin mappings of these slots are given in the table below.
The Card Detect and Write Protect signals can be routed to arbitrary pins using the GPIO matrix. To reserve the pins, set the `gpio_cd` and `gpio_wp` members of the `sdmmc_slot_config_t` structure before calling `sdmmc_host_init_slot()`. Please note that it is not advised to specify a Card Detect pin when working with SDIO cards, because the card detect signal in ESP32 can also trigger SDIO slave interrupt.

**Warning:** Pins used by Slot 0 (`HS1_*`) are also used to connect the SPI flash chip in ESP32-WROOM and ESP32-WROVER modules. These pins cannot be shared between an SD card and SPI flash. If you need to use Slot 0, connect SPI flash to different pins and set eFuses accordingly.

### Supported Speed Modes

SDMMC Host driver supports the following speed modes:

- Default Speed (20 MHz), 1/4-line (with SD cards), and 1/4/8-line (with 3.3 V eMMC)
- High Speed (40 MHz), 1/4-line (with SD cards), and 1/4/8-line (with 3.3 V eMMC)
- High Speed DDR (40 MHz), 4-line (with 3.3 V eMMC)

Speed modes not supported at present:

- High Speed DDR mode, 8-line eMMC
- UHS-I 1.8 V modes, 4-line SD cards

### Using the SDMMC Host Driver

Of all the functions listed below, only the following ones will be used directly by most applications:

- `sdmmc_host_init()`
- `sdmmc_host_init_slot()`
- `sdmmc_host_deinit()`

Other functions, such as the ones given below, will be called by the SD/MMC protocol layer via function pointers in the `sdmmc_host_t` structure:

- `sdmmc_host_set_bus_width()`
- `sdmmc_host_set_card_clk()`
- `sdmmc_host_do_transaction()`

### Configuring Bus Width and Frequency

With the default initializers for `sdmmc_host_t` and `sdmmc_slot_config_t` (`SDMMC_HOST_DEFAULT` and `SDMMC_SLOT_CONFIG_DEFAULT`), SDMMC Host driver will attempt to use the widest bus supported by the card (4 lines for SD, 8 lines for eMMC) and the frequency of 20 MHz.
In the designs where communication at 40 MHz frequency can be achieved, it is possible to increase the bus frequency by changing the `max_freq_khz` field of `sdmmc_host_t`:

```c
sdmmc_host_t host = SDMMC_HOST_DEFAULT();
host.max_freq_khz = SDMMC_FREQ_HIGHSPEED;
```

To configure the bus width, set the `width` field of `sdmmc_slot_config_t`. For example, to set 1-line mode:

```c
sdmmc_slot_config_t slot = SDMMC_SLOT_CONFIG_DEFAULT();
slot.width = 1;
```

See also

See **SD/SDIO/MMC Driver** for the higher level driver which implements the protocol layer.

See **SD SPI Host Driver** for a similar driver which uses the SPI controller and is limited to SD protocol’s SPI mode.

See **SD Pull-up Requirements** for pullup support and compatibilities of modules and development kits.

### API Reference

#### Header File

- components/driver/include/driver/sdmmc_host.h

#### Functions

**esp_err_t sdmmc_host_init**(void)

Initialize SDMMC host peripheral.

- **Note** This function is not thread safe

- **Return**
  - ESP_OK on success
  - ESP_ERR_INVALID_STATE if sdmmc_host_init was already called
  - ESP_ERR_NO_MEM if memory cannot be allocated

**esp_err_t sdmmc_host_init_slot**(int slot, const sdmmc_slot_config_t *slot_config)

Initialize given slot of SDMMC peripheral.

On the ESP32, SDMMC peripheral has two slots:

- Slot 0: 8-bit wide, maps to HS1_* signals in PIN MUX
- Slot 1: 4-bit wide, maps to HS2_* signals in PIN MUX

Card detect and write protect signals can be routed to arbitrary GPIOs using GPIO matrix.

- **Note** This function is not thread safe

- **Return**
  - ESP_OK on success
  - ESP_ERR_INVALID_STATE if host has not been initialized using sdmmc_host_init

**Parameters**

- slot: slot number (SDMMC_HOST_SLOT_0 or SDMMC_HOST_SLOT_1)
- slot_config: additional configuration for the slot

**esp_err_t sdmmc_host_set_bus_width**(int slot, size_t width)

Select bus width to be used for data transfer.

SD/MMC card must be initialized prior to this command, and a command to set bus width has to be sent to the card (e.g. SD_APP_SET_BUS_WIDTH)

- **Note** This function is not thread safe

- **Return**
  - ESP_OK on success
  - ESP_ERR_INVALID_ARG if slot number or width is not valid
Chapter 2. API Reference

Parameters

• slot: slot number (SDMMC_HOST_SLOT_0 or SDMMC_HOST_SLOT_1)
• width: bus width (1, 4, or 8 for slot 0; 1 or 4 for slot 1)

size_t sdmmc_host_get_slot_width (int slot)
Get bus width configured in sdmmc_host_init_slot to be used for data transfer.

Return configured bus width of the specified slot.

Parameters

• slot: slot number (SDMMC_HOST_SLOT_0 or SDMMC_HOST_SLOT_1)

esp_err_t sdmmc_host_set_card_clk (int slot, uint32_t freq_khz)
Set card clock frequency.
Currently only integer fractions of 40MHz clock can be used. For High Speed cards, 40MHz can be used. For Default Speed cards, 20MHz can be used.

Note This function is not thread safe

Return
• ESP_OK on success
• other error codes may be returned in the future

Parameters

• slot: slot number (SDMMC_HOST_SLOT_0 or SDMMC_HOST_SLOT_1)
• freq_khz: card clock frequency, in kHz

esp_err_t sdmmc_host_set_bus_ddr_mode (int slot, bool ddr_enabled)
Enable or disable DDR mode of SD interface.

Return
• ESP_OK on success
• ESP_ERR_NOT_SUPPORTED if DDR mode is not supported on this slot

Parameters

• slot: slot number (SDMMC_HOST_SLOT_0 or SDMMC_HOST_SLOT_1)
• ddr_enabled: enable or disable DDR mode

esp_err_t sdmmc_host_do_transaction (int slot, sdmmc_command_t *cmdinfo)
Send command to the card and get response.
This function returns when command is sent and response is received, or data is transferred, or timeout occurs.

Note This function is not thread safe w.r.t. init/deinit functions, and bus width/clock speed configuration functions. Multiple tasks can call sdmmc_host_do_transaction as long as other sdmmc_host_* functions are not called.

Attention Data buffer passed in cmdinfo->data must be in DMA capable memory

Return
• ESP_OK on success
• ESP_ERR_TIMEOUT if response or data transfer has timed out
• ESP_ERR_INVALID_CRC if response or data transfer CRC check has failed
• ESP_ERR_INVALID_RESPONSE if the card has sent an invalid response
• ESP_ERR_INVALID_SIZE if the size of data transfer is not valid in SD protocol
• ESP_ERR_INVALID_ARG if the data buffer is not in DMA capable memory

Parameters

• slot: slot number (SDMMC_HOST_SLOT_0 or SDMMC_HOST_SLOT_1)
• cmdinfo: pointer to structure describing command and data to transfer

esp_err_t sdmmc_host_io_int_enable (int slot)
Enable IO interrupts.
This function configures the host to accept SDIO interrupts.

Return returns ESP_OK, other errors possible in the future

Parameters

• slot: slot number (SDMMC_HOST_SLOT_0 or SDMMC_HOST_SLOT_1)
**Chapter 2. API Reference**

**esp_err_t sdmmc_host_io_int_wait** (int slot, TickType_t timeout_ticks)

Block until an SDIO interrupt is received, or timeout occurs.

**Return**
- ESP_OK on success (interrupt received)
- ESP_ERR_TIMEOUT if the interrupt did not occur within timeout_ticks

**Parameters**
- **slot**: slot number (SDMMC_HOST_SLOT_0 or SDMMC_HOST_SLOT_1)
- **timeout_ticks**: number of RTOS ticks to wait for the interrupt

**esp_err_t sdmmc_host_deinit** (void)

Disable SDMMC host and release allocated resources.

**Note** This function is not thread safe

**Return**
- ESP_OK on success
- ESP_ERR_INVALID_STATE if sdmmc_host_init function has not been called

**esp_err_t sdmmc_host_pullup_en** (int slot, int width)

Enable the pull-ups of sd pins.

This function is deprecated. Please set SDMMC_SLOT_FLAG_INTERNAL_PULLUP flag in **sdmmc_slot_config_t::flags** instead.

**Note** You should always place actual pullups on the lines instead of using this function. Internal pullup resistance are high and not sufficient, may cause instability in products. This is for debug or examples only.

**Return**
- ESP_OK: if success
- ESP_ERR_INVALID_ARG: if configured width larger than maximum the slot can support

**Parameters**
- **slot**: Slot to use, normally set it to 1.
- **width**: Bit width of your configuration, 1 or 4.

**Structures**

**struct sdmmc_slot_config_t**

Extra configuration for SDMMC peripheral slot

**Public Members**

**gpio_num_t clk**

GPIO number of CLK signal.

**gpio_num_t cmd**

GPIO number of CMD signal.

**gpio_num_t d0**

GPIO number of D0 signal.

**gpio_num_t d1**

GPIO number of D1 signal.

**gpio_num_t d2**

GPIO number of D2 signal.

**gpio_num_t d3**

GPIO number of D3 signal.

**gpio_num_t d4**

GPIO number of D4 signal. Ignored in 1- or 4-line mode.

**gpio_num_t d5**

GPIO number of D5 signal. Ignored in 1- or 4-line mode.
Chapter 2. API Reference

```c
gpio_num_t d6
GPIO number of D6 signal. Ignored in 1- or 4- line mode.
```

```c
gpio_num_t d7
GPIO number of D7 signal. Ignored in 1- or 4- line mode.
```

```c
gpio_num_t gpio_cd
GPIO number of card detect signal.
```

```c
gpio_num_t cd
GPIO number of card detect signal; shorter name.
```

```c
gpio_num_t gpio_wp
GPIO number of write protect signal.
```

```c
gpio_num_t wp
GPIO number of write protect signal; shorter name.
```

```c
uint8_t width
Bus width used by the slot (might be less than the max width supported)
```

```c
uint32_t flags
Features used by this slot.
```

Macros

```c
SDMMC_HOST_SLOT_0
SDMMC slot 0.
```

```c
SDMMC_HOST_SLOT_1
SDMMC slot 1.
```

```c
SDMMC_HOST_DEFAULT ()
Default `sdmmc_host_t` structure initializer for SDMMC peripheral.
```

```c
Uses SDMMC peripheral, with 4-bit mode enabled, and max frequency set to 20MHz
```

```c
SDMMC_SLOT_FLAG_INTERNAL_PULLUP
Enable internal pullups on enabled pins. The internal pullups are insufficient however, please make sure external pullups are connected on the bus. This is for debug / example purpose only.
```

```c
SDMMC_SLOT_NO_CD
indicates that card detect line is not used
```

```c
SDMMC_SLOT_NO_WP
indicates that write protect line is not used
```

```c
SDMMC_SLOT_WIDTH_DEFAULT
use the maximum possible width for the slot
```

```c
SDMMC_SLOT_CONFIG_DEFAULT ()
Macro defining default configuration of SDMMC host slot
```

2.3.16 SD SPI Host Driver

Overview

The SD SPI host driver allows communicating with one or more SD cards by the SPI Master driver which makes use of the SPI host. Each card is accessed through an SD SPI device represented by an `sdspi_dev_handle_t` `spi_handle` returned when attaching the device to an SPI bus by calling `sdspi_host_init_device`. The bus should be already initialized before (by `spi_bus_initialize`).

With the help of `SPI Master driver` based on, the SPI bus can be shared among SD cards and other SPI devices. The SPI Master driver will handle exclusive access from different tasks.

The SD SPI driver uses software-controlled CS signal.
Chapter 2. API Reference

How to Use

Firstly, use the macro `SDSPI_DEVICE_CONFIG_DEFAULT` to initialize a structure `sdmmc_slot_config_t`, which is used to initialize an SD SPI device. This macro will also fill in the default pin mappings, which is same as the pin mappings of SDMMC host driver. Modify the host and pins of the structure to desired value. Then call `sdspi_host_init_device` to initialize the SD SPI device and attach to its bus.

Then use `SDSPI_HOST_DEFAULT` macro to initialize a `sdmmc_host_t` structure, which is used to store the state and configurations of upper layer (SD/SDIO/MMC driver). Modify the `slot` parameter of the structure to the SD SPI device `spi_handle` just returned from `sdspi_host_init_device`. Call `sdmmc_card_init` with the `sdmmc_host_t` to probe and initialize the SD card.

Now you can use SD/SDIO/MMC driver functions to access your card!

Other Details

Only the following driver’s API functions are normally used by most applications:

- `sdspi_host_init()`
- `sdspi_host_init_device()`
- `sdspi_host_remove_device()`
- `sdspi_host_deinit()`

Other functions are mostly used by the protocol level SD/SDIO/MMC driver via function pointers in the `sdmmc_host_t` structure. For more details, see the SD/SDIO/MMC Driver.

Note: SD over SPI does not support speeds above `SDMMC_FREQ_DEFAULT` due to the limitations of the SPI driver.

Warning: If you want to share the SPI bus among SD card and other SPI devices, there are some restrictions, see Sharing the SPI bus among SD card and other SPI devices.

Related Docs

Sharing the SPI bus among SD card and other SPI devices The SD card has a SPI mode, which allows it to be communicated to as a SPI device. But there are some restrictions that we need to pay attention to.

Pin loading of other devices When adding more devices onto the same bus, the overall pin loading increases. The loading consists of AC loading (pin capacitor) and DC loading (pull-ups).

AC loading SD cards, which are designed for high-speed communications, have small pin capacitors (AC loading) to work until 50MHz. However, the other attached devices will increase the pin’s AC loading.

Heavy AC loading of a pin may prevent the pin from being toggled quickly. By using an oscilloscope, you will see the edges of the pin become smoother and not ideal any more (the gradient of the edge is smaller). The setup timing requirements of an SD card may be violated when the card is connected to such bus. Even worse, the clock from the host may not be recognized by the SD card and other SPI devices on the same bus.

This issue may be more obvious if other attached devices are not designed to work at the same frequency as the SD card, because they may have larger pin capacitors.

To see if your pin AC loading is too heavy, you can try the following tests:

(Terminology: launch edge: at which clock edge the data start to toggle; latch edge: at which clock edge the data is supposed to be sampled by the receiver, for SD cad, it’s the rising edge.)
1. Use an oscilloscope to see the clock and compare the data line to the clock. - If you see the clock is not fast enough (for example, the rising/falling edge is longer than 1/4 of the clock cycle), it means the clock is skewed too much. - If you see the data line unstable before the latch edge of the clock, it means the load of the data line is too large.

   You may also observed the corresponding phenomenon (data delayed largely from launching edge of clock) with logic analyzers. But it’s not as obvious as with an oscilloscope.

2. Try to use slower clock frequency.

   If the lower frequency can work while the higher frequency can’t, it’s an indication of the AC loading on the pins is too large.

   If the AC loading of the pins is too large, you can either use other faster devices (with lower pin load) or slow down the clock speed.

DC loading The pull-ups required by SD cards are usually around 10 kOhm to 50 kOhm, which may be too strong for some other SPI devices.

Check the specification of your device about its DC output current, it should be larger than 700μA, otherwise the device output may not be read correctly.

Initialization sequence

Note: If you see any problem in the following steps, please make sure the timing is correct first. You can try to slow down the clock speed (SDMMC_FREQ_PROBING = 400 KHz for SD card) to avoid the influence of pin AC loading (see above section).

When using an SD card with other SPI devices on the same SPI bus, due to the restrictions of the SD card startup flow, the following initialization sequence should be followed: (See also storage/sd_card)

1. Initialize the SPI bus properly by `spi_bus_initialize`.
2. Tie the CS lines of all other devices than the SD card to high. This is to avoid conflicts to the SD card in the following step.

   You can do this by either:
   1. Attach devices to the SPI bus by calling `spi_bus_add_device`. This function will initialize the GPIO that is used as CS to the idle level: high.
   2. Initialize GPIO on the CS pin that needs to be tied up before actually adding a new device.
   3. Rely on the internal/external pull-up (not recommended) to pull-up all the CS pins when the GPIOs of ESP are not initialized yet. You need to check carefully the pull-up is strong enough and there are no other pull-downs that will influence the pull-up (For example, internal pull-down should be enabled).

3. Mount the card to the filesystem by calling `esp_vfs_fat_sdspi_mount`.

   This step will put the SD card into the SPI mode, which SHOULD be done before all other SPI communications on the same bus. Otherwise the card will stay in the SD mode, in which mode it may randomly respond to any SPI communications on the bus, even when its CS line is not addressed.

   If you want to test this behavior, please also note that, once the card is put into SPI mode, it will not return to SD mode before next power cycle, i.e. powered down and powered up again.

4. Now you can talk to other SPI devices freely!

API Reference

Header File

- components/driver/include/driver/sdspi_host.h

Functions

```c
esp_err_t sdspi_host_init (void)
```

Initialize SD SPI driver.

Note: This function is not thread safe

Return
### Chapter 2. API Reference

**esp_err_t** `sdspi_host_init_device(const sdspi_device_config_t *dev_config, sdspi_dev_handle_t *out_handle)`

Attach and initialize an SD SPI device on the specific SPI bus.

**Note**
- This function is not thread safe
- Initialize the SPI bus by `spi_bus_initialize()` before calling this function.
- The SDIO over sdspi needs an extra interrupt line. Call `gpio_install_isr_service()` before this function.

**Return**
- ESP_OK on success
- ESP_ERR_INVALID_ARG if `sdspi_host_init_device` has invalid arguments
- ESP_ERR_NO_MEM if memory cannot be allocated
- other errors from the underlying spi_master and gpio drivers

**Parameters**
- `dev_config`: pointer to device configuration structure
- `out_handle`: Output of the handle to the sdspi device.

**esp_err_t** `sdspi_host_remove_device(sdspi_dev_handle_t handle)`

Remove an SD SPI device.

**Return**
- Always ESP_OK

**Parameters**
- `handle`: Handle of the SD SPI device

**esp_err_t** `sdspi_host_do_transaction(sdspi_dev_handle_t handle, sdmmc_command_t *cmdinfo)`

Send command to the card and get response.

This function returns when command is sent and response is received, or data is transferred, or timeout occurs.

**Note**
- This function is not thread safe w.r.t. init/deinit functions, and bus width/clock speed configuration functions. Multiple tasks can call `sdspi_host_do_transaction` as long as other `sdspi_host_*` functions are not called.

**Return**
- ESP_OK on success
- ESP_ERR_TIMEOUT if response or data transfer has timed out
- ESP_ERR_INVALID_CRC if response or data transfer CRC check has failed
- ESP_ERR_INVALID_RESPONSE if the card has sent an invalid response

**Parameters**
- `handle`: Handle of the sdspi device
- `cmdinfo`: pointer to structure describing command and data to transfer

**esp_err_t** `sdspi_host_set_card_clk(sdspi_dev_handle_t host, uint32_t freq_khz)`

Set card clock frequency.

Currently only integer fractions of 40MHz clock can be used. For High Speed cards, 40MHz can be used. For Default Speed cards, 20MHz can be used.

**Note**
- This function is not thread safe

**Return**
- ESP_OK on success
- other error codes may be returned in the future

**Parameters**
- `host`: Handle of the sdspi device
- `freq_khz`: card clock frequency, in kHz

**esp_err_t** `sdspi_host_deinit(void)`

Release resources allocated using `sdspi_host_init`.

**Note**
- This function is not thread safe

**Return**
- ESP_OK on success
- ESP_ERR_INVALID_STATE if `sdspi_host_init` function has not been called

---

679  Release v5.0-dev-952-g1538009

Submit Document Feedback
**esp_err_t esp_err_t sdspi_host_io_int_enable (sdspi_dev_handle_t handle)**

Enable SDIO interrupt.

**Return**
- ESP_OK on success

**Parameters**
- handle: Handle of the sdspi device

**esp_err_t esp_err_t sdspi_host_io_int_wait (sdspi_dev_handle_t handle, TickType_t timeout_ticks)**

Wait for SDIO interrupt until timeout.

**Return**
- ESP_OK on success

**Parameters**
- handle: Handle of the sdspi device
- timeout_ticks: Ticks to wait before timeout.

**esp_err_t esp_err_t sdspi_host_init_slot (int slot, const sdspi_slot_config_t *slot_config)**

Initialize SD SPI driver for the specific SPI controller.

**Note** This function is not thread safe

**Note** The SDIO over sdspi needs an extra interrupt line. Call gpio_install_isr_service() before this function.

**Parameters**
- slot: SPI controller to use (SPI2_HOST or SPI3_HOST)
- slot_config: pointer to slot configuration structure

**Return**
- ESP_OK on success
- ESP_ERR_INVALID_ARG if sdspi_init_slot has invalid arguments
- ESP_ERR_NO_MEM if memory cannot be allocated
- other errors from the underlying spi_master and gpio drivers

**Structures**

**struct sdspi_device_config_t**

Extra configuration for SD SPI device.

**Public Members**

**spi_host_device_t host_id**

SPI host to use, SPIx_HOST (see spi_types.h).

**gpio_num_t gpio_cs**

GPIO number of CS signal.

**gpio_num_t gpio_cd**

GPIO number of card detect signal.

**gpio_num_t gpio_wp**

GPIO number of write protect signal.

**gpio_num_t gpio_int**

GPIO number of interrupt line (input) for SDIO card.

**struct sdspi_slot_config_t**

Extra configuration for SPI host.

**Public Members**

**gpio_num_t gpio_cs**

GPIO number of CS signal.
Chapter 2. API Reference

```c
gpio_num_t gpio_cd
    // GPIO number of card detect signal.

gpio_num_t gpio_wp
    // GPIO number of write protect signal.

gpio_num_t gpio_int
    // GPIO number of interrupt line (input) for SDIO card.

gpio_num_t gpio_miso
    // GPIO number of MISO signal.

gpio_num_t gpio_mosi
    // GPIO number of MOSI signal.

gpio_num_t gpio_sck
    // GPIO number of SCK signal.

int dma_channel
    // DMA channel to be used by SPI driver (1 or 2).
```

Macros

```c
SDSPI_DEFAULT_HOST
SDSPI_HOST_DEFAULT() // Default `sdmmc_host_t` structure initializer for SD over SPI driver.
    // Uses SPI mode and max frequency set to 20MHz
    // 'slot' should be set to an sdspi device initialized by `sdspi_host_init_device()`.

SDSPI_SLOT_NO_CD
    // indicates that card detect line is not used

SDSPI_SLOT_NO_WP
    // indicates that write protect line is not used

SDSPI_SLOT_NO_INT
    // indicates that interrupt line is not used

SDSPI_DEVICE_CONFIG_DEFAULT() // Macro defining default configuration of SD SPI device.

SDSPI_SLOT_CONFIG_DEFAULT() // Macro defining default configuration of SPI host
```

Type Definitions

```c
typedef int sdspi_dev_handle_t
    // Handle representing an SD SPI device.
```

## 2.3.17 Sigma-delta Modulation

### Introduction

ESP32-S3 has a second-order sigma-delta modulation module. This driver configures the channels of the sigma-delta module.

### Functionality Overview

There are 8 independent sigma-delta modulation channels identified with `sigmadelta_channel_t`. Each channel is capable to output the binary, hardware generated signal with the sigma-delta modulation.
Selected channel should be set up by providing configuration parameters in `sigmadelta_config_t` and then applying this configuration with `sigmadelta_config()`.

Another option is to call individual functions, that will configure all required parameters one by one:

- **Prescaler** of the sigma-delta generator - `sigmadelta_set_prescale()`
- **Duty** of the output signal - `sigmadelta_set_duty()`
- **GPIO pin** to output modulated signal - `sigmadelta_set_pin()`

The range of the ‘duty’ input parameter of `sigmadelta_set_duty()` is from -128 to 127 (eight bit signed integer). If zero value is set, then the output signal’s duty will be about 50%, see description of `sigmadelta_set_duty()`.

### Convert to analog signal (Optional)

Typically, if the sigma-delta signal is connected to an LED, you don’t have to add any filter between them (because our eyes are a low pass filter naturally). However, if you want to check the real voltage or watch the analog waveform, you need to design an analog low pass filter. Also, it is recommended to use an active filter instead of a passive filter to gain better isolation and not lose too much voltage.

For example, you can take the following Sallen-Key topology Low Pass Filter as a reference.

![Sallen-Key Low Pass Filter](image)

**Fig. 15: Sallen-Key Low Pass Filter**

### Application Example

Sigma-delta Modulation example: `peripherals/sigmadelta`.

### API Reference

#### Header File

- `components/driver/include/driver/sigmadelta.h`
Functions

\texttt{esp_err_t sigmadelta_config(const sigmadelta_config_t *config)}
Configure Sigma-delta channel.

\textbf{Return}
- ESP_OK Success
- ESP_ERR_INVALID_STATE sigmadelta driver already initialized
- ESP_ERR_INVALID_ARG Parameter error

\textbf{Parameters}
- \texttt{config}: Pointer of Sigma-delta channel configuration struct

\texttt{esp_err_t sigmadelta_set_duty(sigmadelta_channel_t channel, int8_t duty)}
Set Sigma-delta channel duty.

This function is used to set Sigma-delta channel duty. If you add a capacitor between the output pin and ground, the average output voltage will be \( V_{dc} = \frac{VDDIO}{256} \times \text{duty} + \frac{VDDIO}{2} \), where VDDIO is the power supply voltage.

\textbf{Return}
- ESP_OK Success
- ESP_ERR_INVALID_STATE sigmadelta driver has not been initialized
- ESP_ERR_INVALID_ARG Parameter error

\textbf{Parameters}
- \texttt{channel}: Sigma-delta channel number
- \texttt{duty}: Sigma-delta duty of one channel, the value ranges from -128 to 127, recommended range is -90 ~ 90. The waveform is more like a random one in this range.

\texttt{esp_err_t sigmadelta_set_prescale(sigmadelta_channel_t channel, uint8_t prescale)}
Set Sigma-delta channel’s clock pre-scale value. The source clock is APP_CLK, 80MHz. The clock frequency of the sigma-delta channel is APP_CLK / pre_scale.

\textbf{Return}
- ESP_OK Success
- ESP_ERR_INVALID_STATE sigmadelta driver has not been initialized
- ESP_ERR_INVALID_ARG Parameter error

\textbf{Parameters}
- \texttt{channel}: Sigma-delta channel number
- \texttt{prescale}: The divider of source clock, ranges from 0 to 255

\texttt{esp_err_t sigmadelta_set_pin(sigmadelta_channel_t channel, gpio_num_t gpio_num)}
Set Sigma-delta signal output pin.

\textbf{Return}
- ESP_OK Success
- ESP_ERR_INVALID_STATE sigmadelta driver has not been initialized
- ESP_ERR_INVALID_ARG Parameter error

\textbf{Parameters}
- \texttt{channel}: Sigma-delta channel number
- \texttt{gpio_num}: GPIO number of output pin.

Header File
- \texttt{components/hal/include/hal/sigmadelta_types.h}

Structures

\texttt{struct sigmadelta_config_t}
Sigma-delta configure struct.
Public Members

`sigmadelta_channel_t channel`  
Sigma-delta channel number

`int8_t sigmadelta_duty`  
Sigma-delta duty, duty ranges from -128 to 127.

`uint8_t sigmadelta_prescale`  
Sigma-delta prescale, prescaler ranges from 0 to 255.

`uint8_t sigmadelta_gpio`  
Sigma-delta output io number, refer to gpio.h for more details.

Enumerations

`enum sigmadelta_port_t`  
SIGMADELTA port number, the max port number is (SIGMADELTA_NUM_MAX -1).

Values:

- `SIGMADELTA_PORT_0`  
  SIGMADELTA port 0

- `SIGMADELTA_PORT_MAX`  
  SIGMADELTA port max

`enum sigmadelta_channel_t`  
Sigma-delta channel list.

Values:

- `SIGMADELTA_CHANNEL_0`  
  Sigma-delta channel 0

- `SIGMADELTA_CHANNEL_1`  
  Sigma-delta channel 1

- `SIGMADELTA_CHANNEL_2`  
  Sigma-delta channel 2

- `SIGMADELTA_CHANNEL_3`  
  Sigma-delta channel 3

- `SIGMADELTA_CHANNEL_4`  
  Sigma-delta channel 4

- `SIGMADELTA_CHANNEL_5`  
  Sigma-delta channel 5

- `SIGMADELTA_CHANNEL_6`  
  Sigma-delta channel 6

- `SIGMADELTA_CHANNEL_7`  
  Sigma-delta channel 7

- `SIGMADELTA_CHANNEL_MAX`  
  Sigma-delta channel max

2.3.18 SPI Master Driver

SPI Master driver is a program that controls ESP32-S3’s SPI peripherals while they function as masters.
Overview of ESP32-S3’s SPI peripherals

ESP32-S3 integrates 4 SPI peripherals.

- SPI0 and SPI1 are used internally to access the ESP32-S3’s attached flash memory. Both controllers share the same SPI bus signals, and there is an arbiter to determine which can access the bus. Currently, SPI Master driver does not support SPI1 bus.

- SPI2 and SPI3 are general purpose SPI controllers. They are open to users. SPI2 and SPI3 have independent signal buses with the same respective names. SPI2 has 6 CS lines. SPI3 has 3 CS lines. Each CS line can be used to drive one SPI slave.

Terminology

The terms used in relation to the SPI master driver are given in the table below.

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Host</td>
<td>The SPI controller peripheral inside ESP32-S3 that initiates SPI transmissions over the bus, and acts as an SPI Master.</td>
</tr>
<tr>
<td>Device</td>
<td>SPI slave device. An SPI bus may be connected to one or more Devices. Each Device shares the MOSI, MISO and SCLK signals but is only active on the bus when the Host asserts the Device’s individual CS line.</td>
</tr>
<tr>
<td>Bus</td>
<td>A signal bus, common to all Devices connected to one Host. In general, a bus includes the following lines: MOSI, MISO, SCLK, one or more CS lines, and, optionally, QUADWP and QUADHD. So Devices are connected to the same lines, with the exception that each Device has its own CS line. Several Devices can also share one CS line if connected in the daisy-chain manner.</td>
</tr>
<tr>
<td>MOSI</td>
<td>Master Out, Slave In, a.k.a. D. Data transmission from a Host to Device. Also data0 signal in Octal/OPI mode.</td>
</tr>
<tr>
<td>MISO</td>
<td>Master In, Slave Out, a.k.a. Q. Data transmission from a Device to Host. Also data1 signal in Octal/OPI mode.</td>
</tr>
<tr>
<td>SCLK</td>
<td>Serial Clock. Oscillating signal generated by a Host that keeps the transmission of data bits in sync.</td>
</tr>
<tr>
<td>CS</td>
<td>Chip Select. Allows a Host to select individual Device(s) connected to the bus in order to send or receive data.</td>
</tr>
<tr>
<td>QUADWP</td>
<td>Protect signal. Used for 4-bit (qio/qout) transactions. Also for data2 signal in Octal/OPI mode.</td>
</tr>
<tr>
<td>QUADHD</td>
<td>Signal. Used for 4-bit (qio/qout) transactions. Also for data3 signal in Octal/OPI mode.</td>
</tr>
<tr>
<td>DATA4</td>
<td>Data4 signal in Octal/OPI mode.</td>
</tr>
<tr>
<td>DATA5</td>
<td>Data5 signal in Octal/OPI mode.</td>
</tr>
<tr>
<td>DATA6</td>
<td>Data6 signal in Octal/OPI mode.</td>
</tr>
<tr>
<td>DATA7</td>
<td>Data7 signal in Octal/OPI mode.</td>
</tr>
<tr>
<td>Assert</td>
<td>The action of activating a line.</td>
</tr>
<tr>
<td>De-assert</td>
<td>The action of returning the line back to inactive (back to idle) status.</td>
</tr>
<tr>
<td>Transaction</td>
<td>One instance of a Host asserting a CS line, transferring data to and from a Device, and de-asserting the CS line. Transactions are atomic, which means they can never be interrupted by another transaction.</td>
</tr>
<tr>
<td>Launch edge</td>
<td>Edge of the clock at which the source register launches the signal onto the line.</td>
</tr>
<tr>
<td>Latch edge</td>
<td>Edge of the clock at which the destination register latches in the signal.</td>
</tr>
</tbody>
</table>

Driver Features

The SPI master driver governs communications of Hosts with Devices. The driver supports the following features:

- Multi-threaded environments
• Transparent handling of DMA transfers while reading and writing data
• Automatic time-division multiplexing of data coming from different Devices on the same signal bus, see *SPI Bus Lock.*

**Warning:** The SPI master driver has the concept of multiple Devices connected to a single bus (sharing a single ESP32-S3 SPI peripheral). As long as each Device is accessed by only one task, the driver is thread safe. However, if multiple tasks try to access the same SPI Device, the driver is **not thread-safe.** In this case, it is recommended to either:

- Refactor your application so that each SPI peripheral is only accessed by a single task at a time.
- Add a mutex lock around the shared Device using `xSemaphoreCreateMutex`.

### SPI Features

#### SPI Master

**SPI Bus Lock** To realize the multiplexing of different devices from different drivers (SPI Master, SPI Flash, etc.), an SPI bus lock is applied on each SPI bus. Drivers can attach their devices onto the bus with the arbitration of the lock.

Each bus lock are initialized with a BG (background) service registered, all devices request to do transactions on the bus should wait until the BG to be successfully disabled.

- For SPI1 bus, the BG is the cache, the bus lock will help to disable the cache before device operations starts, and enable it again after device releasing the lock. No devices on SPI1 is allowed using ISR (it’s meaningless for the task to yield to other tasks when the cache is disabled).
- For other buses, the driver may register its ISR as the BG. The bus lock will block a device task when it requests for exclusive use of the bus, try to disable the ISR, and unblock the device task allowed to exclusively use the bus when the ISR is successfully disabled. When the task releases the lock, the lock will also try to resume the ISR if there are pending transactions to be done in the ISR.

#### SPI Transactions

An SPI bus transaction consists of five phases which can be found in the table below. Any of these phases can be skipped.

<table>
<thead>
<tr>
<th>Phase</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command</td>
<td>In this phase, a command (0-16 bit) is written to the bus by the Host.</td>
</tr>
<tr>
<td>Address</td>
<td>In this phase, an address (0-32 bit) is transmitted over the bus by the Host.</td>
</tr>
<tr>
<td>Write</td>
<td>Host sends data to a Device. This data follows the optional command and address phases and is indistinguishable from them at the electrical level.</td>
</tr>
<tr>
<td>Dummy</td>
<td>This phase is configurable and is used to meet the timing requirements.</td>
</tr>
<tr>
<td>Read</td>
<td>Device sends data to its Host.</td>
</tr>
</tbody>
</table>

The attributes of a transaction are determined by the bus configuration structure `spi_bus_config_t`, device configuration structure `spi_device_interface_config_t`, and transaction configuration structure `spi_transaction_t`.

An SPI Host can send full-duplex transactions, during which the read and write phases occur simultaneously. The total transaction length is determined by the sum of the following members:

- `spi_device_interface_config_t::command_bits`
- `spi_device_interface_config_t::address_bits`
- `spi_transaction_t::length`
While the member `spi_transaction_t::rxlength` only determines the length of data received into the buffer.

In half-duplex transactions, the read and write phases are not simultaneous (one direction at a time). The lengths of the write and read phases are determined by `length` and `rxlength` members of the struct `spi_transaction_t` respectively.

The command and address phases are optional, as not every SPI device requires a command and/or address. This is reflected in the Device’s configuration: if `command_bits` and/or `address_bits` are set to zero, no command or address phase will occur.

The read and write phases can also be optional, as not every transaction requires both writing and reading data. If `rx_buffer` is NULL and `SPI_TRANS_USE_RXDATA` is not set, the read phase is skipped. If `tx_buffer` is NULL and `SPI_TRANS_USE_TXDATA` is not set, the write phase is skipped.

The driver supports two types of transactions: the interrupt transactions and polling transactions. The programmer can choose to use a different transaction type per Device. If your Device requires both transaction types, see Notes on Sending Mixed Transactions to the Same Device.

**Interrupt Transactions**  Interrupt transactions will block the transaction routine until the transaction completes, thus allowing the CPU to run other tasks. An application task can queue multiple transactions, and the driver will automatically handle them one-by-one in the interrupt service routine (ISR). It allows the task to switch to other procedures until all the transactions complete.

**Polling Transactions**  Polling transactions do not use interrupts. The routine keeps polling the SPI Host’s status bit until the transaction is finished.

All the tasks that use interrupt transactions can be blocked by the queue. At this point, they will need to wait for the ISR to run twice before the transaction is finished. Polling transactions save time otherwise spent on queue handling and context switching, which results in smaller transaction duration. The disadvantage is that the CPU is busy while these transactions are in progress.

The `spi_device_polling_end()` routine needs an overhead of at least 1 us to unblock other tasks when the transaction is finished. It is strongly recommended to wrap a series of polling transactions using the functions `spi_device_acquire_bus()` and `spi_device_release_bus()` to avoid the overhead. For more information, see Bus Acquiring.

**Transaction Line Mode**  Supported line modes for ESP32-S3 are listed as follows, to make use of these modes, set the member `flags` in the struct `spi_transaction_t` as shown in the Transaction Flag column. If you want to check if corresponding IO pins are set or not, set the member `flags` in the `spi_bus_config_t` as shown in the Bus IO setting Flag column.
### Table: API Reference

### Command and Address Phases

During the command and address phases, the members `cmd` and `addr` in the struct `spi_transaction_t` are sent to the bus, nothing is read at this time. The default lengths of the command and address phases are set in `spi_device_interface_config_t` by calling `spi_bus_add_device()`. If the flags `SPI_TRANS_VARIABLE_CMD` and `SPI_TRANS_VARIABLE_ADDR` in the member `spi_transaction_t::flags` are not set, the driver automatically sets the length of these phases to default values during Device initialization.

If the lengths of the command and address phases need to be variable, declare the struct `spi_transaction_ext_t`, set the flags `SPI_TRANS_VARIABLE_CMD` and/or `SPI_TRANS_VARIABLE_ADDR` in the member `spi_transaction_ext_t::base` and configure the rest of base as usual. Then the length of each phase will be equal to `command_bits` and `address_bits` set in the struct `spi_transaction_ext_t`.

If the command and address phase need to be as the same number of lines as data phase, you need to set `SPI_TRANS_MULTILINE_CMD` and/or `SPI_TRANS_MULTILINE_ADDR` to the `flags` member in the struct `spi_transaction_t`. Also see *Transaction Line Mode*.

### Write and Read Phases

Normally, the data that needs to be transferred to or from a Device will be read from or written to a chunk of memory indicated by the members `rx_buffer` and `tx_buffer` of the structure `spi_transaction_t`. If DMA is enabled for transfers, the buffers are required to be:

1. Allocated in DMA-capable internal memory. If *external PSRAM is enabled*, this means using `pvPortMallocCaps(size, MALLOC_CAP_DMA)`.
2. 32-bit aligned (starting from a 32-bit boundary and having a length of multiples of 4 bytes).

If these requirements are not satisfied, the transaction efficiency will be affected due to the allocation and copying of temporary buffers.

If using more than one data lines to transmit, please set `SPI_DEVICE_HALFDUPLEX` flag for the member `flags` in the struct `spi_device_interface_config_t`. And the member `flags` in the struct `spi_transaction_t` should be set as described in *Transaction Line Mode*.

### Note:

Half-duplex transactions with both read and write phases are not supported. Please use full duplex mode.
Bus Acquiring Sometimes you might want to send SPI transactions exclusively and continuously so that it takes as little time as possible. For this, you can use bus acquiring, which helps to suspend transactions (both polling or interrupt) to other devices until the bus is released. To acquire and release a bus, use the functions `spi_device_acquire_bus()` and `spi_device_release_bus()`.

Driver Usage

- Initialize an SPI bus by calling the function `spi_bus_initialize()`. Make sure to set the correct I/O pins in the struct `spi_bus_config_t`. Set the signals that are not needed to -1.
- Register a Device connected to the bus with the driver by calling the function `spi_bus_add_device()`. Make sure to configure any timing requirements the device might need with the parameter `dev_config`. You should now have obtained the Device’s handle which will be used when sending a transaction to it.
- To interact with the Device, fill one or more `spi_transaction_t` structs with any transaction parameters required. Then send the structs either using a polling transaction or an interrupt transaction:
  - **Interrupt** Either queue all transactions by calling the function `spi_device_queue_trans()` and, at a later time, query the result using the function `spi_device_get_trans_result()`, or handle all requests synchronously by feeding them into `spi_device_transmit()`.
  - **Polling** Call the function `spi_device_polling_transmit()` to send polling transactions. Alternatively, if you want to insert something in between, send the transactions by using `spi_device_polling_start()` and `spi_device_polling_end()`.
- (Optional) To perform back-to-back transactions with a Device, call the function `spi_device_acquire_bus()` before sending transactions and `spi_device_release_bus()` after the transactions have been sent.
- (Optional) To unload the driver for a certain Device, call `spi_bus_remove_device()` with the Device handle as an argument.
- (Optional) To remove the driver for a bus, make sure no more drivers are attached and call `spi_bus_free()`.

The example code for the SPI master driver can be found in the `peripherals/spi_master` directory of ESP-IDF examples.

Transactions with Data Not Exceeding 32 Bits When the transaction data size is equal to or less than 32 bits, it will be sub-optimal to allocate a buffer for the data. The data can be directly stored in the transaction struct instead. For transmitted data, it can be achieved by using the `tx_data` member and setting the `SPI_TRANS_USE_TXDATA` flag on the transmission. For received data, use `rx_data` and set `SPI_TRANS_USE_RXDATA`. In both cases, do not touch the `tx_buffer` or `rx_buffer` members, because they use the same memory locations as `tx_data` and `rx_data`.

Transactions with Integers Other Than `uint8_t` An SPI Host reads and writes data into memory byte by byte. By default, data is sent with the most significant bit (MSB) first, as LSB first used in rare cases. If a value less than 8 bits needs to be sent, the bits should be written into memory in the MSB first manner.

For example, if `0b00010` needs to be sent, it should be written into a `uint8_t` variable, and the length for reading should be set to 5 bits. The Device will still receive 8 bits with 3 additional “random” bits, so the reading must be performed correctly.

On top of that, ESP32-S3 is a little-endian chip, which means that the least significant byte of `uint16_t` and `uint32_t` variables is stored at the smallest address. Hence, if `uint16_t` is stored in memory, bits `[7:0]` are sent first, followed by bits `[15:8]`.

For cases when the data to be transmitted has the size differing from `uint8_t` arrays, the following macros can be used to transform data to the format that can be sent by the SPI driver directly:

- `SPI_SWAP_DATA_TX` for data to be transmitted
- `SPI_SWAP_DATA_RX` for data received
Notes on Sending Mixed Transactions to the Same Device  To reduce coding complexity, send only one type of transactions (interrupt or polling) to one Device. However, you still can send both interrupt and polling transactions alternately. The notes below explain how to do this.

The polling transactions should be initiated only after all the polling and interrupt transactions are finished.

Since an unfinished polling transaction blocks other transactions, please do not forget to call the function `spi_device_polling_end()` after `spi_device_polling_start()` to allow other transactions or to allow other Devices to use the bus. Remember that if there is no need to switch to other tasks during your polling transaction, you can initiate a transaction with `spi_device_polling_transmit()` so that it will be ended automatically.

In-flight polling transactions are disturbed by the ISR operation to accommodate interrupt transactions. Always make sure that all the interrupt transactions sent to the ISR are finished before you call `spi_device_polling_start()`. To do that, you can keep calling `spi_device_get_trans_result()` until all the transactions are returned.

To have better control of the calling sequence of functions, send mixed transactions to the same Device only within a single task.

Transfer Speed Considerations

There are three factors limiting the transfer speed:

- Transaction interval
- SPI clock frequency
- Cache miss of SPI functions, including callbacks

The main parameter that determines the transfer speed for large transactions is clock frequency. For multiple small transactions, the transfer speed is mostly determined by the length of transaction intervals.

Transaction Duration  Transaction duration includes setting up SPI peripheral registers, copying data to FIFOs or setting up DMA links, and the time for SPI transaction.

Interrupt transactions allow appending extra overhead to accommodate the cost of FreeRTOS queues and the time needed for switching between tasks and the ISR.

For interrupt transactions, the CPU can switch to other tasks when a transaction is in progress. This saves the CPU time but increases the transaction duration. See Interrupt Transactions. For polling transactions, it does not block the task but allows to do polling when the transaction is in progress. For more information, see Polling Transactions.

If DMA is enabled, setting up the linked list requires about 2 us per transaction. When a master is transferring data, it automatically reads the data from the linked list. If DMA is not enabled, the CPU has to write and read each byte from the FIFO by itself. Usually, this is faster than 2 us, but the transaction length is limited to 64 bytes for both write and read.

Typical transaction duration for one byte of data are given below.

- Interrupt Transaction via DMA: 26 µs.
- Interrupt Transaction via CPU: 24 µs.
- Polling Transaction via DMA: 11 µs.
- Polling Transaction via CPU: 9 µs.

SPI Clock Frequency  Transferring each byte takes eight times the clock period $8/f_{spi}$.

Cache Miss  The default config puts only the ISR into the IRAM. Other SPI related functions, including the driver itself and the callback, might suffer from cache misses and will need to wait until the code is read from flash. Select `CONFIG_SPI_MASTER_IN_IRAM` to put the whole SPI driver into IRAM and put the entire callback(s) and its callee functions into IRAM to prevent cache misses.
For an interrupt transaction, the overall cost is $20 + 8n/F_{spi}[MHz]$ [us] for $n$ bytes transferred in one transaction. Hence, the transferring speed is: $n/(20 + 8n/F_{spi})$. An example of transferring speed at 8 MHz clock speed is given in the following table.

<table>
<thead>
<tr>
<th>Frequency (MHz)</th>
<th>Transaction Interval (us)</th>
<th>Transaction Length (bytes)</th>
<th>Total Time (us)</th>
<th>Total Speed (KBps)</th>
</tr>
</thead>
<tbody>
<tr>
<td>8</td>
<td>25</td>
<td>1</td>
<td>26</td>
<td>38.5</td>
</tr>
<tr>
<td>8</td>
<td>25</td>
<td>8</td>
<td>33</td>
<td>242.4</td>
</tr>
<tr>
<td>8</td>
<td>25</td>
<td>16</td>
<td>41</td>
<td>490.2</td>
</tr>
<tr>
<td>8</td>
<td>25</td>
<td>64</td>
<td>89</td>
<td>719.1</td>
</tr>
<tr>
<td>8</td>
<td>25</td>
<td>128</td>
<td>153</td>
<td>836.6</td>
</tr>
</tbody>
</table>

When a transaction length is short, the cost of transaction interval is high. If possible, try to squash several short transactions into one transaction to achieve a higher transfer speed.

Please note that the ISR is disabled during flash operation by default. To keep sending transactions during flash operations, enable `CONFIG_SPI_MASTER_ISR_IN_IRAM` and set `ESP_INTR_FLAG_IRAM` in the member `spi_bus_config_t::intr_flags`. In this case, all the transactions queued before starting flash operations will be handled by the ISR in parallel. Also note that the callback of each Device and their callee functions should be in IRAM, or your callback will crash due to cache miss. For more details, see `IRAM-Safe Interrupt Handlers`.

**Application Example**

The code example for using the SPI master half duplex mode to read/write a AT93C46D EEPROM (8-bit mode) can be found in the `peripherals/spi_master/hd_eeprom` directory of ESP-IDF examples.

**API Reference - SPI Common**

**Header File**

- components/hal/include/hal/spi_types.h

**Structures**

```c
struct spi_line_mode_t
    Line mode of SPI transaction phases: CMD, ADDR, DOUT/DIN.
```

**Public Members**

- `uint8_t cmd_lines`
  The line width of command phase, e.g. 2-line-cmd-phase.

- `uint8_t addr_lines`
  The line width of address phase, e.g. 1-line-addr-phase.

- `uint8_t data_lines`
  The line width of data phase, e.g. 4-line-data-phase.

**Enumerations**

- `enum spi_host_device_t`
  Enum with the three SPI peripherals that are software-accessible in it.

  ```c
  Values:
  SPI1_HOST = 0
  SPI1
  ```
SPI2_HOST = 1
SPI2.
SPI3_HOST = 2
SPI3.
SPI_HOST_MAX
invalid host value

enum spi_event_t
SPI Events.

Values:

SPI_EV_BUF_TX = BIT(0)
The buffer has sent data to master.

SPI_EV_BUF_RX = BIT(1)
The buffer has received data from master.

SPI_EV_SEND_DMA_READY = BIT(2)
Slave has loaded its TX data buffer to the hardware (DMA).

SPI_EV_SEND = BIT(3)
Master has received certain number of the data, the number is determined by Master.

SPI_EV_RECV_DMA_READY = BIT(4)
Slave has loaded its RX data buffer to the hardware (DMA).

SPI_EV_RECV = BIT(5)
Slave has received certain number of data from master, the number is determined by Master.

SPI_EV_CMD9 = BIT(6)
Received CMD9 from master.

SPI_EV_CMDA = BIT(7)
Received CMDA from master.

SPI_EV_TRANS = BIT(8)
A transaction has done.

Header File

- components/driver/include/driver/spi_common.h

Functions

esp_err_t spi_bus_initialize(spi_host_device_t host_id, const spi_bus_config_t *bus_config,
spi_dma_chan_t dma_chan)

Initialize a SPI bus.

Warning SPI0/1 is not supported
Warning If a DMA channel is selected, any transmit and receive buffer used should be allocated in DMA-capable memory.
Warning The ISR of SPI is always executed on the core which calls this function. Never starve the ISR on this core or the SPI transactions will not be handled.

Return

- ESP_ERR_INVALID_ARG if configuration is invalid
- ESP_ERR_INVALID_STATE if host already is in use
- ESP_ERR_NOT_FOUND if there is no available DMA channel
- ESP_ERR_NO_MEM if out of memory
- ESP_OK on success

Parameters

- host_id: SPI peripheral that controls this bus
- bus_config: Pointer to a spi_bus_config_t struct specifying how the host should be initialized
• **dma-chan**: Selecting a DMA channel for an SPI bus allows transactions on the bus with size only limited by the amount of internal memory.
  - Selecting SPI_DMA_DISABLED limits the size of transactions.
  - Set to SPI_DMA_DISABLED if only the SPI flash uses this bus.
  - Set to SPI_DMA_CH_AUTO to let the driver to allocate the DMA channel.

*esp_err_t* `spi_bus_free(spi_host_device_t host_id)`

Free a SPI bus.

**Warning**

In order for this to succeed, all devices have to be removed first.

**Return**

- ESP.ERR.INVALID_ARG if parameter is invalid
- ESP.ERR.INVALID_STATE if not all devices on the bus are freed
- ESP_OK on success

**Parameters**

- *host_id*: SPI peripheral to free

**Structures**

```c
struct spi_bus_config_t
```

This is a configuration structure for a SPI bus.

You can use this structure to specify the GPIO pins of the bus. Normally, the driver will use the GPIO matrix to route the signals. An exception is made when all signals either can be routed through the IO_MUX or are -1. In that case, the IO_MUX is used, allowing for >40MHz speeds.

**Note**

Be advised that the slave driver does not use the quadwp/quadhd lines and fields in `spi_bus_config_t` referring to these lines will be ignored and can thus safely be left uninitialized.

**Public Members**

```c
int mosi_io_num
```

GPIO pin for Master Out Slave In (spi_d) signal, or -1 if not used.

```c
int data0_io_num
```

GPIO pin for spi data0 signal in quad/octet mode, or -1 if not used.

```c
int miso_io_num
```

GPIO pin for Master In Slave Out (spi_q) signal, or -1 if not used.

```c
int data1_io_num
```

GPIO pin for spi data1 signal in quad/octet mode, or -1 if not used.

```c
int sclk_io_num
```

GPIO pin for SPI Clock signal, or -1 if not used.

```c
int quadwp_io_num
```

GPIO pin for WP (Write Protect) signal, or -1 if not used.

```c
int data2_io_num
```

GPIO pin for spi data2 signal in quad/octet mode, or -1 if not used.

```c
int quadhd_io_num
```

GPIO pin for HD (Hold) signal, or -1 if not used.

```c
int data3_io_num
```

GPIO pin for spi data3 signal in quad/octet mode, or -1 if not used.

```c
int data4_io_num
```

GPIO pin for spi data4 signal in octal mode, or -1 if not used.

```c
int data5_io_num
```

GPIO pin for spi data5 signal in octal mode, or -1 if not used.

```c
int data6_io_num
```

GPIO pin for spi data6 signal in octal mode, or -1 if not used.
**Chapter 2. API Reference**

```c
int data7_io_num
GPIO pin for spi data7 signal in octal mode, or -1 if not used.
```

```c
int max_transfer_sz
Maximum transfer size, in bytes.Defaults to 4092 if 0 when DMA enabled, or to
SOC_SPI_MAXIMUM_BUFFER_SIZE if DMA is disabled.
```

```c
uint32_t flags
Abilities of bus to be checked by the driver. Or-ed value of SPICOMMON_BUSFLAG_* flags.
```

```c
int intr_flags
Interrupt flag for the bus to set the priority, and IRAM attribute, see esp_intr_alloc.h. Note that
the EDGE, INTRDISABLED attribute are ignored by the driver. Note that if ESP_INTR_FLAG_IRAM
is set, ALL the callbacks of the driver, and their callee functions, should be put in the IRAM.
```

### Macros

**SPI_MAX_DMA_LEN**

**SPI_SWAP_DATA_TX** (DATA, LEN)

Transform unsigned integer of length <= 32 bits to the format which can be sent by the SPI driver directly.

E.g. to send 9 bits of data, you can:

```c
uint16_t data = SPI_SWAP_DATA_TX(0x145, 9);
```

Then points tx_buffer to `data`.

**Parameters**

- **DATA**: Data to be sent, can be uint8_t, uint16_t or uint32_t.
- **LEN**: Length of data to be sent, since the SPI peripheral sends from the MSB, this helps to shift the
data to the MSB.

**SPI_SWAP_DATA_RX** (DATA, LEN)

Transform received data of length <= 32 bits to the format of an unsigned integer.

E.g. to transform the data of 15 bits placed in a 4-byte array to integer:

```c
uint16_t data = SPI_SWAP_DATA_RX(*((uint32_t*)t)->rx_data, 15);
```

**Parameters**

- **DATA**: Data to be rearranged, can be uint8_t, uint16_t or uint32_t.
- **LEN**: Length of data received, since the SPI peripheral writes from the MSB, this helps to shift the
data to the LSB.

**SPICOMMON_BUSFLAG_SLAVE**

Initialize I/O in slave mode.

**SPICOMMON_BUSFLAG_MASTER**

Initialize I/O in master mode.

**SPICOMMON_BUSFLAG_IOMUX_PINS**

Check using iOMUX pins. Or indicates the pins are configured through the IO mux rather than GPIO matrix.

**SPICOMMON_BUSFLAG_GPIO_PINS**

Force the signals to be routed through GPIO matrix. Or indicates the pins are routed through the GPIO matrix.

**SPICOMMON_BUSFLAG_SCLK**

Check existing of SCLK pin. Or indicates CLK line initialized.

**SPICOMMON_BUSFLAG_MISO**

Check existing of MISO pin. Or indicates MISO line initialized.

**SPICOMMON_BUSFLAG_MOSI**

Check existing of MOSI pin. Or indicates MOSI line initialized.

**SPICOMMON_BUSFLAG_DUAL**

Check MOSI and MISO pins can output. Or indicates bus able to work under DIO mode.
**SPICOMMON_BUSFLAG_WPHD**
Check existing of WP and HD pins. Or indicates WP & HD pins initialized.

**SPICOMMON_BUSFLAG_QUAD**
Check existing of MOSI/MISO/WP/HD pins as output. Or indicates bus able to work under QIO mode.

**SPICOMMON_BUSFLAG_IO4_IO7**
Check existing of IO4~IO7 pins. Or indicates IO4~IO7 pins initialized.

**SPICOMMON_BUSFLAG_OCTAL**
Check existing of MOSI/MISO/WP/HD/SPIIO4/SPIIO5/SPIIO6/SPIIO7 pins as output. Or indicates bus able to work under octal mode.

**SPICOMMON_BUSFLAG_NATIVE_PINS**

---

**Type Definitions**

```c
typedef spi_common_dma_t spi_dma_chan_t
```

**Enumerations**

```c
enum spi_common_dma_t
SPI DMA channels.

Values:

SPI_DMA_DISABLED = 0
Do not enable DMA for SPI.

SPI_DMA_CH_AUTO = 3
Enable DMA, channel is automatically selected by driver.
```

---

**API Reference - SPI Master**

**Header File**

- components/driver/include/driver/spi_master.h

**Functions**

```c
esp_err_t spi_bus_add_device(spi_host_device_t host_id, const spi_device_interface_config_t *dev_config, spi_device_handle_t *handle)
```

Allocate a device on a SPI bus.

This initializes the internal structures for a device, plus allocates a CS pin on the indicated SPI master peripheral and routes it to the indicated GPIO. All SPI master devices have three CS pins and can thus control up to three devices.

**Note** While in general, speeds up to 80MHz on the dedicated SPI pins and 40MHz on GPIO-matrix-routed pins are supported, full-duplex transfers routed over the GPIO matrix only support speeds up to 26MHz.

**Return**

- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_NOT_FOUND if host doesn’t have any free CS slots
- ESP_ERR_NO_MEM if out of memory
- ESP_OK on success

**Parameters**

- host_id: SPI peripheral to allocate device on
- dev_config: SPI interface protocol config for the device
- handle: Pointer to variable to hold the device handle

```c
esp_err_t spi_bus_remove_device(spi_device_handle_t handle)
```

Remove a device from the SPI bus.

**Return**

- ESP_ERR_INVALID_ARG if parameter is invalid
• ESP_ERROR_INVALID_STATE if device already is freed
• ESP_OK on success

**Parameters**

• handle: Device handle to free

```c
esp_err_t spi_device_queue_trans(spi_device_handle_t handle, spi_transaction_t *trans_desc, TickType_t ticks_to_wait)
```

Queue a SPI transaction for interrupt transaction execution. Get the result by `spi_device_get_trans_result`.

**Note** Normally a device cannot start (queue) polling and interrupt transactions simultaneously.

**Return**

• ESP_ERROR_INVALID_ARG if parameter is invalid. This can happen if SPI_TRANS_CS_KEEP_ACTIVE flag is specified while the bus was not acquired (`spi_device_acquire_bus` should be called first)
• ESP_ERROR_TIMEOUT if there was no room in the queue before `ticks_to_wait` expired
• ESP_ERROR_NO_MEM if allocating DMA-capable temporary buffer failed
• ESP_ERROR_INVALID_STATE if previous transactions are not finished
• ESP_OK on success

**Parameters**

• handle: Device handle obtained using `spi_host_add_dev`
• trans_desc: Description of transaction to execute
• ticks_to_wait: Ticks to wait until there’s room in the queue; use portMAX_DELAY to never timeout.

```c
esp_err_t spi_device_get_trans_result(spi_device_handle_t handle, spi_transaction_t **trans_desc, TickType_t ticks_to_wait)
```

Get the result of a SPI transaction queued earlier by `spi_device_queue_trans`.

This routine will wait until a transaction to the given device successfully completed. It will then return the description of the completed transaction so software can inspect the result and e.g. free the memory or re-use the buffers.

**Return**

• ESP_ERROR_INVALID_ARG if parameter is invalid
• ESP_ERROR_TIMEOUT if there was no completed transaction before `ticks_to_wait` expired
• ESP_OK on success

**Parameters**

• handle: Device handle obtained using `spi_host_add_dev`
• trans_desc: Pointer to variable able to contain a pointer to the description of the transaction that is executed. The descriptor should not be modified until the descriptor is returned by `spi_device_get_trans_result`.
• ticks_to_wait: Ticks to wait until there’s a returned item; use portMAX_DELAY to never timeout.

```c
esp_err_t spi_device_transmit(spi_device_handle_t handle, spi_transaction_t *trans_desc)
```

Send a SPI transaction, wait for it to complete, and return the result.

This function is the equivalent of calling `spi_device_queue_trans()` followed by `spi_device_get_trans_result()`. Do not use this when there is still a transaction separately queued (started) from `spi_device_queue_trans()` or polling_start/transmit that hasn’t been finalized.

**Note** This function is not thread safe when multiple tasks access the same SPI device. Normally a device cannot start (queue) polling and interrupt transactions simultaneously.

**Return**

• ESP_ERROR_INVALID_ARG if parameter is invalid
• ESP_OK on success

**Parameters**

• handle: Device handle obtained using `spi_host_add_dev`
• trans_desc: Description of transaction to execute

```c
esp_err_t spi_device_polling_start(spi_device_handle_t handle, spi_transaction_t *trans_desc, TickType_t ticks_to_wait)
```
Immediately start a polling transaction.

**Note** Normally a device cannot start (queue) polling and interrupt transactions simultaneously. Moreover, a device cannot start a new polling transaction if another polling transaction is not finished.

**Return**
- ESP_ERR_INVALID_ARG if parameter is invalid. This can happen if SPI_TRANS_CS_KEEP_ACTIVE flag is specified while the bus was not acquired (spi_device_acquire_bus() should be called first)
- ESP_ERR_TIMEOUT if the device cannot get control of the bus before ticks_to_wait expired
- ESP_ERR_NO_MEM if allocating DMA-capable temporary buffer failed
- ESP_ERR_INVALID_STATE if previous transactions are not finished
- ESP_OK on success

**Parameters**
- **handle**: Device handle obtained using spi_host_add_dev
- **trans_desc**: Description of transaction to execute
- **ticks_to_wait**: Ticks to wait until there’s room in the queue; currently only portMAX_DELAY is supported.

```c
esp_err_t spi_device_polling_end(spi_device_handle_t handle, TickType_t ticks_to_wait)
```
Poll until the polling transaction ends.

This routine will not return until the transaction to the given device has successfully completed. The task is not blocked, but actively busy-spins for the transaction to be completed.

**Return**
- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_TIMEOUT if the transaction cannot finish before ticks_to_wait expired
- ESP_OK on success

**Parameters**
- **handle**: Device handle obtained using spi_host_add_dev
- **ticks_to_wait**: Ticks to wait until there’s a returned item; use portMAX_DELAY to never time out.

```c
esp_err_t spi_device_polling_transmit(spi_device_handle_t handle, spi_transaction_t *trans_desc)
```
Send a polling transaction, wait for it to complete, and return the result.

This function is the equivalent of calling spi_device_polling_start() followed by spi_device_polling_end(). Do not use this when there is still a transaction that hasn’t been finalized.

**Note** This function is not thread safe when multiple tasks access the same SPI device. Normally a device cannot start (queue) polling and interrupt transactions simultaneously.

**Return**
- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_OK on success

**Parameters**
- **handle**: Device handle obtained using spi_host_add_dev
- **trans_desc**: Description of transaction to execute

```c
esp_err_t spi_device_acquire_bus(spi_device_handle_t device, TickType_t wait)
```
Occupy the SPI bus for a device to do continuous transactions.

Transactions to all other devices will be put off until spi_device_release_bus is called.

**Note** The function will wait until all the existing transactions have been sent.

**Return**
- ESP_ERR_INVALID_ARG: wait is not set to portMAX_DELAY.
- ESP_OK : Success.

**Parameters**
- **device**: The device to occupy the bus.
- **wait**: Time to wait before the the bus is occupied by the device. Currently MUST set to portMAX_DELAY.
Chapter 2. API Reference

void spi_device_release_bus(spi_device_handle_t dev)

Release the SPI bus occupied by the device. All other devices can start sending transactions.

Parameters
- dev: The device to release the bus.

int spi_cal_clock(int fapb, int hz, int duty_cycle, uint32_t *reg_o)

Calculate the working frequency that is most close to desired frequency, and also the register value.

Parameters
- fapb: The frequency of apb clock, should be APB_CLK_FREQ.
- hz: Desired working frequency
- duty_cycle: Duty cycle of the spi clock
- reg_o: Output of value to be set in clock register, or NULL if not needed.

Return Actual working frequency that most fit.

int spi_get_actual_clock(int fapb, int hz, int duty_cycle)

Calculate the working frequency that is most close to desired frequency.

Return Actual working frequency that most fit.

Parameters
- fapb: The frequency of apb clock, should be APB_CLK_FREQ.
- hz: Desired working frequency
- duty_cycle: Duty cycle of the spi clock

void spi_get_timing(boolgpio_is_used, int input_delay_ns, int eff_clk, int *dummy_o, int *cycles_remain_o)

Calculate the timing settings of specified frequency and settings.

Note If **dummy_o** is not zero, it means dummy bits should be applied in half duplex mode, and full duplex mode may not work.

Parameters
- gpio_is_used: True if using GPIO matrix, or False if iomux pins are used.
- input_delay_ns: Input delay from SCLK launch edge to MISO data valid.
- eff_clk: Effective clock frequency (in Hz) from spi_cal_clock.
- dummy_o: Address of dummy bits used output. Set to NULL if not needed.
- cycles_remain_o: Address of cycles remaining (after dummy bits are used) output.
  - -1 If too many cycles remaining, suggest to compensate half a clock.
  - 0 If no remaining cycles or dummy bits are not used.
  - positive value: cycles suggest to compensate.

int spi_get_freq_limit(bool gpio_is_used, int input_delay_ns)

Get the frequency limit of current configurations. SPI master working at this limit is OK, while above the limit, full duplex mode and DMA will not work, and dummy bits will be applied in the half duplex mode.

Return Frequency limit of current configurations.

Parameters
- gpio_is_used: True if using GPIO matrix, or False if native pins are used.
- input_delay_ns: Input delay from SCLK launch edge to MISO data valid.

Structures

struct spi_device_interface_config_t

This is a configuration for a SPI slave device that is connected to one of the SPI buses.

Public Members

uint8_t command_bits

Default amount of bits in command phase (0-16), used when SPI_TRANS_VARIABLE_CMD is not used, otherwise ignored.
uint8_t address_bits
Default amount of bits in address phase (0-64), used when SPI_TRANS_VARIABLE_ADDR is not used, otherwise ignored.

uint8_t dummy_bits
Amount of dummy bits to insert between address and data phase.

uint8_t mode
SPI mode, representing a pair of (CPOL, CPHA) configuration:
• 0: (0, 0)
• 1: (0, 1)
• 2: (1, 0)
• 3: (1, 1)

uint16_t duty_cycle_pos
Duty cycle of positive clock, in 1/256th increments (128 = 50%/50% duty). Setting this to 0 (=not setting it) is equivalent to setting this to 128.

uint16_t cs_ena_pretrans
Amount of SPI bit-cycles the cs should be activated before the transmission (0-16). This only works on half-duplex transactions.

uint8_t cs_ena_posttrans
Amount of SPI bit-cycles the cs should stay active after the transmission (0-16)

int clock_speed_hz
Clock speed, divisors of 80MHz, in Hz. See SPI_MASTER_FREQ_*.

int input_delay_ns
Maximum data valid time of slave. The time required between SCLK and MISO valid, including the possible clock delay from slave to master. The driver uses this value to give an extra delay before the MISO is ready on the line. Leave at 0 unless you know you need a delay. For better timing performance at high frequency (over 8MHz), it’s suggest to have the right value.

int spics_io_num
CS GPIO pin for this device, or -1 if not used.

uint32_t flags
Bitwise OR of SPI DEVICE_* flags.

int queue_size
Transaction queue size. This sets how many transactions can be ‘in the air’ (queued using spi_device_queue_trans but not yet finished using spi_device_get_trans_result) at the same time.

transaction_cb_t pre_cb
Callback to be called before a transmission is started.

This callback is called within interrupt context should be in IRAM for best performance, see “Transferring Speed” section in the SPI Master documentation for full details. If not, the callback may crash during flash operation when the driver is initialized with ESP_INTR_FLAG_IRAM.

transaction_cb_t post_cb
Callback to be called after a transmission has completed.

This callback is called within interrupt context should be in IRAM for best performance, see “Transferring Speed” section in the SPI Master documentation for full details. If not, the callback may crash during flash operation when the driver is initialized with ESP_INTR_FLAG_IRAM.

struct spi_transaction_t
This structure describes one SPI transaction. The descriptor should not be modified until the transaction finishes.
Public Members

uint32_t flags
   Bitwise OR of SPI_TRANS_* flags.

uint16_t cmd
   Command data, of which the length is set in the cmd_bits of spi_device_interface_config_t.

   NOTE: this field, used to be "command" in ESP-IDF 2.1 and before, is re-written to be used in a new way in ESP-IDF 3.0.

   Example: write 0x0123 and command_bits=12 to send command 0x12, 0x3 (in previous version, you may have to write 0x3_12).

uint64_t addr
   Address data, of which the length is set in the address_bits of spi_device_interface_config_t.

   NOTE: this field, used to be "address" in ESP-IDF 2.1 and before, is re-written to be used in a new way in ESP-IDF 3.0.

   Example: write 0x123400 and address_bits=24 to send address of 0x12, 0x34, 0x00 (in previous version, you may have to write 0x12340000).

size_t length
   Total data length, in bits.

size_t rxlength
   Total data length received, should be not greater than length in full-duplex mode (0 defaults this to the value of length).

void *user
   User-defined variable. Can be used to store eg transaction ID.

const void *tx_buffer
   Pointer to transmit buffer, or NULL for no MOSI phase.

uint8_t tx_data[4]
   If SPI_TRANS_USE_TXDATA is set, data set here is sent directly from this variable.

void *rx_buffer
   Pointer to receive buffer, or NULL for no MISO phase. Written by 4 bytes-unit if DMA is used.

uint8_t rx_data[4]
   If SPI_TRANS_USE_RXDATA is set, data is received directly to this variable.

struct spi_transaction_ext_t
   This struct is for SPI transactions which may change their address and command length. Please do set the flags in base to SPI_TRANS_VARIABLE_CMD_ADR to use the bit length here.

Public Members

struct spi_transaction_t base
   Transaction data, so that pointer to spi_transaction_t can be converted into spi_transaction_ext_t.

uint8_t command_bits
   The command length in this transaction, in bits.

uint8_t address_bits
   The address length in this transaction, in bits.

uint8_t dummy_bits
   The dummy length in this transaction, in bits.
Chapter 2. API Reference

Macros

**SPI_MASTER_FREQ_8M**
SPI master clock is divided by 80MHz apb clock. Below defines are example frequencies, and are accurate. Be free to specify a random frequency, it will be rounded to closest frequency (to macros below if above 8MHz).

- 8MHz
- SPI_MASTER_FREQ_9M
  - 8.89MHz
- SPI_MASTER_FREQ_10M
  - 10MHz
- SPI_MASTER_FREQ_11M
  - 11.43MHz
- SPI_MASTER_FREQ_13M
  - 13.33MHz
- SPI_MASTER_FREQ_16M
  - 16MHz
- SPI_MASTER_FREQ_20M
  - 20MHz
- SPI_MASTER_FREQ_26M
  - 26.67MHz
- SPI_MASTER_FREQ_40M
  - 40MHz
- SPI_MASTER_FREQ_80M
  - 80MHz

**SPI_DEVICE_TXBIT_LSBFIRST**
Transmit command/address/data LSB first instead of the default MSB first.

**SPI_DEVICE_RXBIT_LSBFIRST**
Receive data LSB first instead of the default MSB first.

**SPI_DEVICE_BIT_LSBFIRST**
Transmit and receive LSB first.

**SPI_DEVICE_3WIRE**
Use MOSI (=spid) for both sending and receiving data.

**SPI_DEVICE_POSITIVE_CS**
Make CS positive during a transaction instead of negative.

**SPI_DEVICE_HALFDUPLEX**
Transmit data before receiving it, instead of simultaneously.

**SPI_DEVICE_CLK_AS_CS**
Output clock on CS line if CS is active.

**SPI_DEVICE_NO_DUMMY**
There are timing issue when reading at high frequency (the frequency is related to whether iomux pins are used, valid time after slave sees the clock).

- In half-duplex mode, the driver automatically inserts dummy bits before reading phase to fix the timing issue. Set this flag to disable this feature.
- In full-duplex mode, however, the hardware cannot use dummy bits, so there is no way to prevent data being read from getting corrupted. Set this flag to confirm that you’re going to work with output only, or read without dummy bits at your own risk.

**SPI_DEVICE_DDRCLK**

**SPI_TRANS_MODE_DIO**
Transmit/receive data in 2-bit mode.
Chapter 2. API Reference

SPI_TRANS_MODE_QIO
Transmit/receive data in 4-bit mode.

SPI_TRANS_USE_RXDATA
Receive into rx_data member of spi_transaction_t instead into memory at rx_buffer.

SPI_TRANS_USE_TXDATA
Transmit tx_data member of spi_transaction_t instead of data at tx_buffer. Do not set tx_buffer when using this.

SPI_TRANS_MODE_DIOQIO_ADDR
Also transmit address in mode selected by SPI_MODE_DIO/SPI_MODE_QIO.

SPI_TRANS_VARIABLE_CMD
Use the command_bits in spi_transaction_ext_t rather than default value in spi_device_interface_config_t.

SPI_TRANS_VARIABLE_ADDR
Use the address_bits in spi_transaction_ext_t rather than default value in spi_device_interface_config_t.

SPI_TRANS_VARIABLE_DUMMY
Use the dummy_bits in spi_transaction_ext_t rather than default value in spi_device_interface_config_t.

SPI_TRANS_CS_KEEP_ACTIVE
Keep CS active after data transfer.

SPI_TRANS_MULTILINE_CMD
The data lines used at command phase is the same as data phase (otherwise, only one data line is used at command phase)

SPI_TRANS_MODE_OCT
Transmit/receive data in 8-bit mode.

SPI_TRANS_MULTILINE_ADDR
The data lines used at address phase is the same as data phase (otherwise, only one data line is used at address phase)

Type Definitions
typedef struct spi_transaction_t spi_transaction_t
typedef void (*transaction_cb_t)(spi_transaction_t *trans)
typedef struct spi_device_t *spi_device_handle_t
Handle for a device on a SPI bus.

2.3.19 SPI Slave Driver

SPI Slave driver is a program that controls ESP32-S3’s SPI peripherals while they function as slaves.

Overview of ESP32-S3’s SPI peripherals

ESP32-S3 integrates two general purpose SPI controllers which can be used as slave nodes driven by an off-chip SPI master
SPI2 and SPI3 have independent signal buses with the same respective names.

Terminology

The terms used in relation to the SPI slave driver are given in the table below.
Chapter 2. API Reference

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Host</td>
<td>The SPI controller peripheral external to ESP32-S3 that initiates SPI transmissions over the bus, and acts as an SPI Master.</td>
</tr>
<tr>
<td>Device</td>
<td>SPI slave device (general purpose SPI controller). Each Device shares the MOSI, MISO and SCLK signals but is only active on the bus when the Host asserts the Device’s individual CS line.</td>
</tr>
<tr>
<td>Bus</td>
<td>A signal bus, common to all Devices connected to one Host. In general, a bus includes the following lines: MISO, MOSI, SCLK, one or more CS lines, and, optionally, QUADWP and QUADHD. So Devices are connected to the same lines, with the exception that each Device has its own CS line. Several Devices can also share one CS line if connected in the daisy-chain manner.</td>
</tr>
<tr>
<td>MISO</td>
<td>Master In, Slave Out, a.k.a. Q. Data transmission from a Device to Host.</td>
</tr>
<tr>
<td>MOSI</td>
<td>Master Out, Slave in, a.k.a. D. Data transmission from a Host to Device.</td>
</tr>
<tr>
<td>SCLK</td>
<td>Serial Clock. Oscillating signal generated by a Host that keeps the transmission of data bits in sync.</td>
</tr>
<tr>
<td>CS</td>
<td>Chip Select. Allows a Host to select individual Device(s) connected to the bus in order to send or receive data.</td>
</tr>
<tr>
<td>QUADWP</td>
<td>Write Protect signal. Only used for 4-bit (qio/qout) transactions.</td>
</tr>
<tr>
<td>QUADHD</td>
<td>Hold signal. Only used for 4-bit (qio/qout) transactions.</td>
</tr>
<tr>
<td>Assertion</td>
<td>The action of activating a line. The opposite action of returning the line back to inactive (back to idle) is called de-assertion.</td>
</tr>
<tr>
<td>Transaction</td>
<td>One instance of a Host asserting a CS line, transferring data to and from a Device, and de-asserting the CS line. Transactions are atomic, which means they can never be interrupted by another transaction.</td>
</tr>
<tr>
<td>Launch edge</td>
<td>Edge of the clock at which the source register launches the signal onto the line.</td>
</tr>
<tr>
<td>Latch edge</td>
<td>Edge of the clock at which the destination register latches in the signal.</td>
</tr>
</tbody>
</table>

**Driver Features**

The SPI slave driver allows using the SPI peripherals as full-duplex Devices. The driver can send/receive transactions up to 64 bytes in length, or utilize DMA to send/receive longer transactions. However, there are some known issues related to DMA.

**SPI Transactions**

A full-duplex SPI transaction begins when the Host asserts the CS line and starts sending out clock pulses on the SCLK line. Every clock pulse, a data bit is shifted from the Host to the Device on the MOSI line and back on the MISO line at the same time. At the end of the transaction, the Host de-asserts the CS line.
Chapter 2. API Reference

The attributes of a transaction are determined by the configuration structure for an SPI host acting as a slave device `spi_slave_interface_config_t`, and transaction configuration structure `spi_slave_transaction_t`.

As not every transaction requires both writing and reading data, you have a choice to configure the `spi_transaction_t` structure for TX only, RX only, or TX and RX transactions. If `spi_slave_transaction_t::rx_buffer` is set to NULL, the read phase will be skipped. If `spi_slave_transaction_t::tx_buffer` is set to NULL, the write phase will be skipped.

**Note:** A Host should not start a transaction before its Device is ready for receiving data. It is recommended to use another GPIO pin for a handshake signal to sync the Devices. For more details, see *Transaction Interval*.

**Driver Usage**

- Initialize an SPI peripheral as a Device by calling the function `spi_slave_initialize`. Make sure to set the correct I/O pins in the structure `bus_config`. Set the unused signals to -1.

- Before initiating transactions, fill one or more `spi_slave_transaction_t` structs with the transaction parameters required. Either queue all transactions by calling the function `spi_slave_queue_trans()` and, at a later time, query the result by using the function `spi_slave_get_trans_result()`, or handle all requests individually by feeding them into `spi_slave_transmit()`. The latter two functions will be blocked until the Host has initiated and finished a transaction, causing the queued data to be sent and received.

- (Optional) To unload the SPI slave driver, call `spi_slave_free()`.

**Transaction Data and Master/Slave Length Mismatches**

Normally, the data that needs to be transferred to or from a Device is read or written to a chunk of memory indicated by the `rx_buffer` and `tx_buffer` members of the `spi_transaction_t` structure. The SPI driver can be configured to use DMA for transfers, in which case these buffers must be allocated in DMA-capable memory using `pvPortMallocCaps(size, MALLOC_CAP_DMA)`.

The amount of data that the driver can read or write to the buffers is limited by the member `spi_transaction_t::length`. However, this member does not define the actual length of an SPI transaction. A transaction’s length is determined by a Host which drives the clock and CS lines. The actual length of the transmission can be read only after a transaction is finished from the member `spi_slave_transaction_t::trans_len`.

If the length of the transmission is greater than the buffer length, only the initial number of bits specified in the `length` member will be sent and received. In this case, `trans_len` is set to `length` instead of the actual transaction length. To meet the actual transaction length requirements, set `length` to a value greater than the maximum `trans_len` expected. If the transmission length is shorter than the buffer length, only the data equal to the length of the buffer will be transmitted.

**Speed and Timing Considerations**

**Transaction Interval** The ESP32-S3 SPI slave peripherals are designed as general purpose Devices controlled by a CPU. As opposed to dedicated slaves, CPU-based SPI Devices have a limited number of pre-defined registers. All transactions must be handled by the CPU, which means that the transfers and responses are not real-time, and there might be noticeable latency.

As a solution, a Device’s response rate can be doubled by using the functions `spi_slave_queue_trans()` and then `spi_slave_get_trans_result()` instead of using `spi_slave_transmit()`.

You can also configure a GPIO pin through which the Device will signal to the Host when it is ready for a new transaction. A code example of this can be found in `peripherals/spi_slave`.
**SCLK Frequency Requirements**  The SPI slaves are designed to operate at up to 40 MHz. The data cannot be recognized or received correctly if the clock is too fast or does not have a 50% duty cycle.

**Restrictions and Known Issues**

1. If DMA is enabled, the rx buffer should be word-aligned (starting from a 32-bit boundary and having a length of multiples of 4 bytes). Otherwise, DMA may write incorrectly or not in a boundary aligned manner. The driver reports an error if this condition is not satisfied.
   Also, a Host should write lengths that are multiples of 4 bytes. The data with inappropriate lengths will be discarded.

**Application Example**

The code example for Device/Host communication can be found in the peripherals/spi_slave directory of ESP-IDF examples.

**API Reference**

**Header File**

- components/driver/include/driver/spi_slave.h

**Functions**

```c
esp_err_t spi_slave_initialize(spi_host_device_t host, const spi_bus_config_t *bus_config,
                                const spi_slave_interface_config_t *slave_config,
                                spi_dma_chan_t dma_chan)
```

Initialize a SPI bus as a slave interface.

**Warning**

- SPI0/1 is not supported

**Warning**

If a DMA channel is selected, any transmit and receive buffer used should be allocated in DMA-capable memory.

**Warning**

The ISR of SPI is always executed on the core which calls this function. Never starve the ISR on this core or the SPI transactions will not be handled.

**Return**

- ESP_ERR_INVALID_ARG if configuration is invalid
- ESP_ERR_INVALID_STATE if host already in use
- ESP_ERR_NOT_FOUND if there is no available DMA channel
- ESP_ERR_NO_MEM if out of memory
- ESP_OK on success

**Parameters**

- **host:** SPI peripheral to use as a SPI slave interface
- **bus_config:** Pointer to a spi_bus_config_t struct specifying how the host should be initialized
- **slave_config:** Pointer to a spi_slave_interface_config_t struct specifying the details for the slave interface
- **dma_chan:** - Selecting a DMA channel for an SPI bus allows transactions on the bus with size only limited by the amount of internal memory.
  - Selecting SPI_DMA_DISABLED limits the size of transactions.
  - Set to SPI_DMA_DISABLED if only the SPI flash uses this bus.
  - Set to SPI_DMA_CH_AUTO to let the driver to allocate the DMA channel.

```c
esp_err_t spi_slave_free(spi_host_device_t host)
```

Free a SPI bus claimed as a SPI slave interface.

**Return**

- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_INVALID_STATE if not all devices on the bus are freed
- ESP_OK on success

**Parameters**
Chapter 2. API Reference

- **host**: SPI peripheral to free

```c
esp_err_t spi_slave_queue_trans(spi_host_device_t host, const spi_slave_transaction_t *trans_desc, TickType_t ticks_to_wait)
```
Queues a SPI transaction for execution.

Queues a SPI transaction to be executed by this slave device. (The transaction queue size was specified when the slave device was initialised via `spi_slave_initialize`. This function may block if the queue is full (depending on the ticks_to_wait parameter). No SPI operation is directly initiated by this function, the next queued transaction will happen when the master initiates a SPI transaction by pulling down CS and sending out clock signals.

This function hands over ownership of the buffers in `trans_desc` to the SPI slave driver; the application is not to access this memory until `spi_slave_queue_trans` is called to hand ownership back to the application.

**Return**
- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_OK on success

**Parameters**
- **host**: SPI peripheral that is acting as a slave
- **trans_desc**: Description of transaction to execute. Not const because we may want to write status back into the transaction description.
- **ticks_to_wait**: Ticks to wait until there’s room in the queue; use portMAX_DELAY to never time out.

```c
esp_err_t spi_slave_get_trans_result(spi_host_device_t host, spi_slave_transaction_t **trans_desc, TickType_t ticks_to_wait)
```
Get the result of a SPI transaction queued earlier.

This routine will wait until a transaction to the given device (queued earlier with `spi_slave_queue_trans`) has successfully completed. It will then return the description of the completed transaction so software can inspect the result and e.g. free the memory or re-use the buffers.

It is mandatory to eventually use this function for any transaction queued by `spi_slave_queue_trans`.

**Return**
- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_OK on success

**Parameters**
- **host**: SPI peripheral to that is acting as a slave
- **trans_desc**: Pointer to variable able to contain a pointer to the description of the transaction that is executed
- **ticks_to_wait**: Ticks to wait until there’s a returned item; use portMAX_DELAY to never time out.

```c
esp_err_t spi_slave_transmit(spi_host_device_t host, spi_slave_transaction_t *trans_desc, TickType_t ticks_to_wait)
```
Do a SPI transaction.

Essentially does the same as `spi_slave_queue_trans` followed by `spi_slave_get_trans_result`. Do not use this when there is still a transaction queued that hasn’t been finalized using `spi_slave_get_trans_result`.

**Return**
- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_OK on success

**Parameters**
- **host**: SPI peripheral to that is acting as a slave
- **trans_desc**: Pointer to variable able to contain a pointer to the description of the transaction that is executed. Not const because we may want to write status back into the transaction description.
- **ticks_to_wait**: Ticks to wait until there’s a returned item; use portMAX_DELAY to never time out.

**Structures**
```c
struct spi_slave_interface_config_t
This is a configuration for a SPI host acting as a slave device.

Public Members

int spics_io_num
CS GPIO pin for this device.

uint32_t flags
Bitwise OR of SPI_SLAVE_* flags.

int queue_size
Transaction queue size. This sets how many transactions can be ‘in the air’ (queued using
spi_slave_queue_trans but not yet finished using spi_slave_get_trans_result) at the same time.

uint8_t mode
SPI mode, representing a pair of (CPOL, CPHA) configuration:
• 0: (0, 0)
• 1: (0, 1)
• 2: (1, 0)
• 3: (1, 1)

slave_transaction_cb / post_setup_cb
Callback called after the SPI registers are loaded with new data.
This callback is called within interrupt context should be in IRAM for best performance, see “Trans-
ferring Speed” section in the SPI Master documentation for full details. If not, the callback may crash
during flash operation when the driver is initialized with ESP_INTR_FLAG_IRAM.

slave_transaction_cb / post_trans_cb
Callback called after a transaction is done.
This callback is called within interrupt context should be in IRAM for best performance, see “Trans-
ferring Speed” section in the SPI Master documentation for full details. If not, the callback may crash
during flash operation when the driver is initialized with ESP_INTR_FLAG_IRAM.

struct spi_slave_transaction_t
This structure describes one SPI transaction

Public Members

size_t length
Total data length, in bits.

size_t trans_len
Transaction data length, in bits.

const void *tx_buffer
Pointer to transmit buffer, or NULL for no MOSI phase.

void *rx_buffer
Pointer to receive buffer, or NULL for no MISO phase. When the DMA is enabled, must start at WORD
boundary (rx_buffer%4==0), and has length of a multiple of 4 bytes.

void *user
User-defined variable. Can be used to store eg transaction ID.

Macros

#define SPI_SLAVE_TXBIT_LSBFIRST
Transmit command/address/data LSB first instead of the default MSB first.
#define SPI_SLAVE_RXBIT_LSBFIRST
Receive data LSB first instead of the default MSB first.
```
SPI_SLAVE_BIT_LSBFIRST
    Transmit and receive LSB first.

Type Definitions
typedef struct spi_slave_transaction_t spi_slave_transaction_t
typedef void (*slave_transaction_cb_t)(spi_slave_transaction_t *trans)

2.3.20 Touch Sensor

Introduction
A touch sensor system is built on a substrate which carries electrodes and relevant connections under a protective flat surface. When a user touches the surface, the capacitance variation is used to evaluate if the touch was valid.

Touch sensor on ESP32-S3 can support up to 14 capacitive touch pads / GPIOs.
The sensing pads can be arranged in different combinations (e.g., matrix, slider), so that a larger area or more points can be detected. The touch pad sensing process is under the control of a hardware-implemented finite-state machine (FSM) which is initiated by software or a dedicated hardware timer.

For design, operation, and control registers of a touch sensor, see ESP32-S3 Technical Reference Manual > On-Chip Sensors and Analog Signal Processing [PDF].

In-depth design details of touch sensors and firmware development guidelines for ESP32-S3 are available in Touch Sensor Application Note.

Functionality Overview
Description of API is broken down into groups of functions to provide a quick overview of the following features:

- Initialization of touch pad driver
- Configuration of touch pad GPIO pins
- Taking measurements
- Adjusting parameters of measurements
- Filtering measurements
- Touch detection methods
- Setting up interrupts to report touch detection
- Waking up from Sleep mode on interrupt

For detailed description of a particular function, please go to Section API Reference. Practical implementation of this API is covered in Section Application Examples.

Initialization  Before using a touch pad, you need to initialize the touch pad driver by calling the function touch_pad_init(). This function sets several .._DEFAULT driver parameters listed in API Reference under Macros. It also removes the information about which pads have been touched before, if any, and disables interrupts.

If the driver is not required anymore, deinitialize it by calling touch_pad_deinit().

Configuration  Enabling the touch sensor functionality for a particular GPIO is done with touch_pad_config().

Use the function touch_pad_set_fsm_mode() to select if touch pad measurement (operated by FSM) should be started automatically by a hardware timer, or by software. If software mode is selected, use touch_pad_sw_start() to start the FSM.
Touch State Measurements  The following function come in handy to read raw measurements from the sensor:

- `touch_pad_read_raw_data()`

It can also be used, for example, to evaluate a particular touch pad design by checking the range of sensor readings when a pad is touched or released. This information can be then used to establish a touch threshold.

For the demonstration of how to read the touch pad data, check the application example `peripherals/touch_sensor/touch_sensor_v2/touch_pad_read`.

Optimization of Measurements  A touch sensor has several configurable parameters to match the characteristics of a particular touch pad design. For instance, to sense smaller capacity changes, it is possible to narrow down the reference voltage range within which the touch pads are charged / discharged. The high and low reference voltages are set using the function `touch_pad_set_voltage()`.

Besides the ability to discern smaller capacity changes, a positive side effect is reduction of power consumption for low power applications. A likely negative effect is an increase in measurement noise. If the dynamic range of obtained readings is still satisfactory, then further reduction of power consumption might be done by reducing the measurement time with `touch_pad_set_meas_time()`.

The following list summarizes available measurement parameters and corresponding ‘set’ functions:

- Touch pad charge / discharge parameters:
  - voltage range: `touch_pad_set_voltage()`
  - speed (slope): `touch_pad_set_cnt_mode()`
- Measurement time: `touch_pad_set_meas_time()`

Relationship between the voltage range (high / low reference voltages), speed (slope), and measurement time is shown in the figure below.

![Fig. 16: Touch pad - relationship between measurement parameters](image)

The last chart `Output` represents the touch sensor reading, i.e., the count of pulses collected within the measurement time.

All functions are provided in pairs to set a specific parameter and to get the current parameter’s value, e.g., `touch_pad_set_voltage()` and `touch_pad_get_voltage()`.

Filtering of Measurements  If measurements are noisy, you can filter them with provided API functions. The ESP32-S3’s touch functionality provide two sets of APIs for doing this.
There is an internal touch channel that is not connected to any external GPIO. The measurements from this denoise pad can be used to filters out interference introduced on all channels, such as noise introduced by the power supply and external EMI. The denoise parameters are set with the function `touch_pad_denoise_set_config()` and started by with `touch_pad_denoise_enable()`.

There is also a configurable hardware implemented IIR-filter (infinite impulse response). This IIR-filter is configured with the function `touch_pad_filter_set_config()` and enabled by calling `touch_pad_filter_enable()`.

**Touch Detection**  Touch detection is implemented in ESP32’s hardware based on the user-configured threshold and raw measurements executed by FSM. Use the functions `touch_pad_get_status()` to check which pads have been touched and `touch_pad_clear_status()` to clear the touch status information.

Hardware touch detection can also be wired to interrupts. This is described in the next section.

If measurements are noisy and capacity changes are small, hardware touch detection might be unreliable. To resolve this issue, instead of using hardware detection / provided interrupts, implement measurement filtering and perform touch detection in your own application. For sample implementation of both methods of touch detection, see `peripherals/touch_sensor/touch_sensor_v2/touch_pad_interrupt`.

**Touch Triggered Interrupts**  Before enabling an interrupt on a touch detection, you should establish a touch detection threshold. Use the functions described in Touch State Measurements to read and display sensor measurements when a pad is touched and released. Apply a filter if measurements are noisy and relative capacity changes are small. Depending on your application and environment conditions, test the influence of temperature and power supply voltage changes on measured values.

Once a detection threshold is established, it can be set during initialization with `touch_pad_config()` or at the runtime with `touch_pad_set_thresh()`.

Finally, configure and manage interrupt calls using the following functions:

- `touch_pad_isr_register()` / `touch_pad_isr_deregister()`
- `touch_pad_intr_enable()` / `touch_pad_intr_disable()`

When interrupts are operational, you can obtain the information from which particular pad an interrupt came by invoking `touch_pad_get_status()` and clear the pad status with `touch_pad_clear_status()`.

**Application Examples**

- Touch sensor read example: `peripherals/touch_sensor/touch_sensor_v2/touch_pad_read`.
- Touch sensor interrupt example: `peripherals/touch_sensor/touch_sensor_v2/touch_pad_interrupt`.

**API Reference**

**Header File**

```
• components/driver/esp32s3/include/driver/touch_sensor.h
```

**Functions**

```c
esp_err_t touch_pad_fsm_start (void)  
Set touch sensor FSM start.

Note  Start FSM after the touch sensor FSM mode is set.
Note  Call this function will reset benchmark of all touch channels.
Return  • ESP_OK on success
```

```c
esp_err_t touch_pad_fsm_stop (void)  
Stop touch sensor FSM.
```
Return
• ESP_OK on success

```c
esp_err_t touch_pad_sw_start (void)
```
Trigger a touch sensor measurement, only support in SW mode of FSM.

Return
• ESP_OK on success

```c
esp_err_t touch_pad_set_meas_time (uint16_t sleep_cycle, uint16_t meas_times)
```
Set touch sensor times of charge and discharge and sleep time. Excessive total time will slow down the touch response. Too small measurement time will not be sampled enough, resulting in inaccurate measurements.

Note The greater the duty cycle of the measurement time, the more system power is consumed.

Return
• ESP_OK on success

Parameters
• sleep_cycle: The touch sensor will sleep after each measurement. sleep_cycle decide the interval between each measurement. 
  \[ t\text{\_sleep} = \text{sleep\_cycle} / (\text{RTC\_SLOW\_CLK} \times \text{frequency}) \]
  The approximate frequency value of RTC\_SLOW\_CLK can be obtained using rtc_clk_slow_freq_get_hz function.
• meas_times: The times of charge and discharge in each measure process of touch channels. The timer frequency is 8Mhz. Range: 0 ~ 0xffff. Recommended typical value: Modify this value to make the measurement time around 1ms.

```c
esp_err_t touch_pad_get_meas_time (uint16_t *sleep_cycle, uint16_t *meas_times)
```
Get touch sensor times of charge and discharge and sleep time.

Return
• ESP_OK on success

Parameters
• sleep_cycle: Pointer to accept sleep cycle number
• meas_times: Pointer to accept measurement times count.

```c
esp_err_t touch_pad_set_idle_channel_connect (touch_pad_conn_type_t type)
```
Set connection type of touch channel in idle status. When a channel is in measurement mode, other initialized channels are in idle mode. The touch channel is generally adjacent to the trace, so the connection state of the idle channel affects the stability and sensitivity of the test channel. The CONN\_HIGHZ(high resistance) setting increases the sensitivity of touch channels. The CONN\_GND(grounding) setting increases the stability of touch channels.

Return
• ESP_OK on success

Parameters
• type: Select idle channel connect to high resistance state or ground.

```c
esp_err_t touch_pad_get_idle_channel_connect (touch_pad_conn_type_t *type)
```
Set connection type of touch channel in idle status. When a channel is in measurement mode, other initialized channels are in idle mode. The touch channel is generally adjacent to the trace, so the connection state of the idle channel affects the stability and sensitivity of the test channel. The CONN\_HIGHZ(high resistance) setting increases the sensitivity of touch channels. The CONN\_GND(grounding) setting increases the stability of touch channels.

Return
• ESP_OK on success

Parameters
• type: Pointer to connection type.

```c
touch_pad_set_thresh (touch_pad_t touch_num, uint32_t threshold)
```
Set the trigger threshold of touch sensor. The threshold determines the sensitivity of the touch sensor. The threshold is the original value of the trigger state minus the benchmark value.

Note If set “TOUCH\_PAD\_THRESHOLD\_MAX”, the touch is never be triggered.

Return
• ESP_OK on success

Parameters
• touch_num: touch pad index
• threshold: threshold of touch sensor. Should be less than the max change value of touch.

```c
esp_err_t touch_pad_get_thresh(touch_pad_t touch_num, uint32_t *threshold)
```
Get touch sensor trigger threshold.

Return
• ESP_OK on success
• ESP_ERR_INVALID_ARG if argument is wrong

Parameters
• touch_num: touch pad index
• threshold: pointer to accept threshold

```c
esp_err_t touch_pad_set_channel_mask(uint16_t enable_mask)
```
Register touch channel into touch sensor scan group. The working mode of the touch sensor is cyclically scanned. This function will set the scan bits according to the given bitmask.

Note
If set this mask, the FSM timer should be stop firstly.

Note
The touch sensor that in scan map, should be deinit GPIO function firstly by `touch_pad_io_init`.

Return
• ESP_OK on success

Parameters
• enable_mask: bitmask of touch sensor scan group. e.g. TOUCH_PAD_NUM14 -> BIT(14)

```c
esp_err_t touch_pad_get_channel_mask(uint16_t *enable_mask)
```
Get the touch sensor scan group bit mask.

Return
• ESP_OK on success

Parameters
• enable_mask: Pointer to bitmask of touch sensor scan group. e.g. TOUCH_PAD_NUM14 -> BIT(14)

```c
esp_err_t touch_pad_clear_channel_mask(uint16_t enable_mask)
```
Clear touch channel from touch sensor scan group. The working mode of the touch sensor is cyclically scanned. This function will clear the scan bits according to the given bitmask.

Note
If clear all mask, the FSM timer should be stop firstly.

Return
• ESP_OK on success

Parameters
• enable_mask: bitmask of touch sensor scan group. e.g. TOUCH_PAD_NUM14 -> BIT(14)

```c
esp_err_t touch_pad_config(touch_pad_t touch_num)
```
Configure parameter for each touch channel.

Note
Touch num 0 is denoise channel, please use `touch_pad_denoise_enable` to set denoise function

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG if argument wrong
• ESP_FAIL if touch pad not initialized

Parameters
• touch_num: touch pad index

```c
esp_err_t touch_pad_reset(void)
```
Reset the FSM of touch module.

Note
Call this function after `touch_pad_fsm_stop`.

Return
• ESP_OK Success

```c
touch_pad_t touch_pad_get_current_meas_channel(void)
```
Get the current measure channel.
Chapter 2. API Reference

Note Should be called when touch sensor measurement is in cyclic scan mode.

Return
• touch channel number

touch_pad_read_intr_status_mask (void)
Get the touch sensor interrupt status mask.

Return
• touch interrupt bit

esp_err_t touch_pad_intr_enable (touch_pad_intr_mask_t int_mask)
Enable touch sensor interrupt by bitmask.

Note This API can be called in ISR handler.

Return
• ESP_OK on success

Parameters
• int_mask: Pad mask to enable interrupts

esp_err_t touch_pad_intr_disable (touch_pad_intr_mask_t int_mask)
Disable touch sensor interrupt by bitmask.

Note This API can be called in ISR handler.

Return
• ESP_OK on success

Parameters
• int_mask: Pad mask to disable interrupts

esp_err_t touch_pad_intr_clear (touch_pad_intr_mask_t int_mask)
Clear touch sensor interrupt by bitmask.

Return
• ESP_OK on success

Parameters
• int_mask: Pad mask to clear interrupts

esp_err_t touch_pad_isr_register (intr_handler_t fn, void *arg, touch_pad_intr_mask_t intr_mask)
Register touch-pad ISR. The handler will be attached to the same CPU core that this function is running on.

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG Arguments error
• ESP_ERR_NO_MEM No memory

Parameters
• fn: Pointer to ISR handler
• arg: Parameter for ISR
• intr_mask: Enable touch sensor interrupt handler by bitmask.

esp_err_t touch_pad_timeout_set (bool enable, uint32_t threshold)
Enable/disable the timeout check and set timeout threshold for all touch sensor channels measurements. If enable: When the touch reading of a touch channel exceeds the measurement threshold, a timeout interrupt will be generated. If disable: the FSM does not check if the channel under measurement times out.

Note The threshold compared with touch readings.

Note In order to avoid abnormal short circuit of some touch channels. This function should be turned on. Ensure the normal operation of other touch channels.

Return
• ESP_OK Success

Parameters
• enable: true(default): Enable the timeout check; false: Disable the timeout check.
• threshold: For all channels, the maximum value that will not be exceeded during normal operation.

touch_pad_timeout_resume (void)
Call this interface after timeout to make the touch channel resume normal work. Point on the next channel to
measure. If this API is not called, the touch FSM will stop the measurement after timeout interrupt.

**Note** Call this API after finishes the exception handling by user.

**Return**
- ESP_OK Success

```c
esp_err_t touch_pad_read_raw_data(touch_pad_t touch_num, uint32_t* raw_data)
```
get raw data of touch sensor.

**Note** After the initialization is complete, the “raw_data” is max value. You need to wait for a measurement cycle before you can read the correct touch value.

**Return**
- ESP_OK Success
- ESP_FAIL Touch channel 0 haven’t this parameter.

**Parameters**
- `touch_num`: touch pad index
- `raw_data`: pointer to accept touch sensor value

```c
esp_err_t touch_pad_read_benchmark(touch_pad_t touch_num, uint32_t* benchmark)
```
get benchmark of touch sensor.

**Note** After initialization, the benchmark value is the maximum during the first measurement period.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Touch channel 0 haven’t this parameter.

**Parameters**
- `touch_num`: touch pad index
- `benchmark`: pointer to accept touch sensor benchmark value

```c
esp_err_t touch_pad_filter_read_smooth(touch_pad_t touch_num, uint32_t* smooth)
```
Get smoothed data that obtained by filtering the raw data.

**Parameters**
- `touch_num`: touch pad index
- `smooth`: pointer to smoothed data

```c
esp_err_t touch_pad_reset_benchmark(touch_pad_t touch_num)
```
Force reset benchmark to raw data of touch sensor.

**Return**
- ESP_OK Success

**Parameters**
- `touch_num`: touch pad index
  - TOUCH_PAD_MAX Reset baseline of all channels

```c
esp_err_t touch_pad_filter_set_config(const touch_filter_config_t *filter_info)
```
set parameter of touch sensor filter and detection algorithm. For more details on the detection algorithm, please refer to the application documentation.

**Return**
- ESP_OK Success

**Parameters**
- `filter_info`: select filter type and threshold of detection algorithm

```c
esp_err_t touch_pad_filter_get_config(touch_filter_config_t *filter_info)
```
get parameter of touch sensor filter and detection algorithm. For more details on the detection algorithm, please refer to the application documentation.

**Return**
- ESP_OK Success

**Parameters**
- `filter_info`: select filter type and threshold of detection algorithm

```c
esp_err_t touch_pad_filter_enable(void)
```
enable touch sensor filter for detection algorithm. For more details on the detection algorithm, please refer to
the application documentation.

Return
- ESP_OK Success

**esp_err_t touch_pad_filter_disable (void)**

disable touch sensor filter for detection algorithm. For more details on the detection algorithm, please refer to the application documentation.

Return
- ESP_OK Success

**esp_err_t touch_pad_denoise_set_config (const touch_pad_denoise_t *denoise)**

set parameter of denoise pad (TOUCH_PAD_NUM0). T0 is an internal channel that does not have a corresponding external GPIO. T0 will work simultaneously with the measured channel Tn. Finally, the actual measured value of Tn is the value after subtracting lower bits of T0. The noise reduction function filters out interference introduced simultaneously on all channels, such as noise introduced by power supplies and external EMI.

Return
- ESP_OK Success

Parameters
- denoise: parameter of denoise

**esp_err_t touch_pad_denoise_get_config (touch_pad_denoise_t *denoise)**

get parameter of denoise pad (TOUCH_PAD_NUM0).

Return
- ESP_OK Success

Parameters
- denoise: Pointer to parameter of denoise

**esp_err_t touch_pad_denoise_enable (void)**

enable denoise function. T0 is an internal channel that does not have a corresponding external GPIO. T0 will work simultaneously with the measured channel Tn. Finally, the actual measured value of Tn is the value after subtracting lower bits of T0. The noise reduction function filters out interference introduced simultaneously on all channels, such as noise introduced by power supplies and external EMI.

Return
- ESP_OK Success

**esp_err_t touch_pad_denoise_disable (void)**

disable denoise function.

Return
- ESP_OK Success

**esp_err_t touch_pad_denoise_read_data (uint32_t *data)**

Get denoise measure value (TOUCH_PAD_NUM0).

Return
- ESP_OK Success

Parameters
- data: Pointer to receive denoise value

**esp_err_t touch_pad_waterproof_set_config (const touch_pad_waterproof_t *waterproof)**

set parameter of waterproof function.

The waterproof function includes a shielded channel (TOUCH_PAD_NUM14) and a guard channel. Guard pad is used to detect the large area of water covering the touch panel. Shield pad is used to shield the influence of water droplets covering the touch panel. It is generally designed as a grid and is placed around the touch buttons.

Return
- ESP_OK Success

Parameters
• waterproof: parameter of waterproof

```c
esp_err_t touch_pad_waterproof_get_config(touch_pad_waterproof_t *waterproof)
```

get parameter of waterproof function.

**Return**
• ESP_OK Success

**Parameters**
• waterproof: parameter of waterproof

```c
esp_err_t touch_pad_waterproof_enable()
```

Enable parameter of waterproof function. Should be called after function `touch_pad_waterproof_set_config`.

**Return**
• ESP_OK Success

```c
esp_err_t touch_pad_waterproof_disable()
```

Disable parameter of waterproof function.

**Return**
• ESP_OK Success

```c
esp_err_t touch_pad_waterproof_enable(touch_pad_t touch_num, bool enabled)
```

Enable/disable proximity function of touch channels. The proximity sensor measurement is the accumulation of touch channel measurements.

**Note** Supports up to three touch channels configured as proximity sensors.

**Return**
• ESP_OK: Configured correctly.
• ESP_ERR_INVALID_ARG: Touch channel number error.
• ESP_ERR_NOT_SUPPORTED: Don’t support configured.

**Parameters**
• touch_num: touch pad index
• enabled: true: enable the proximity function; false: disable the proximity function

```c
esp_err_t touch_pad_proximity_enable(touch_pad_t touch_num, uint32_t count)
```

Set measure count of proximity channel. The proximity sensor measurement is the accumulation of touch channel measurements.

**Note** All proximity channels use the same `count` value. So please pass the parameter TOUCH_PAD_MAX.

**Return**
• ESP_OK: Configured correctly.
• ESP_ERR_INVALID_ARG: Touch channel number error.

**Parameters**
• touch_num: Touch pad index. In this version, pass the parameter TOUCH_PAD_MAX.
• count: The cumulative times of measurements for proximity pad. Range: 0 ~ 255.

```c
esp_err_t touch_pad_proximity_get_count(touch_pad_t touch_num, uint32_t *count)
```

Get measure count of proximity channel. The proximity sensor measurement is the accumulation of touch channel measurements.

**Note** All proximity channels use the same `count` value. So please pass the parameter TOUCH_PAD_MAX.

**Return**
• ESP_OK: Configured correctly.
• ESP_ERR_INVALID_ARG: Touch channel number error.

**Parameters**
• touch_num: Touch pad index. In this version, pass the parameter TOUCH_PAD_MAX.
• count: The cumulative times of measurements for proximity pad. Range: 0 ~ 255.

```c
esp_err_t touch_pad_proximity_get_data(touch_pad_t touch_num, uint32_t *measure_out)
```

Get the accumulated measurement of the proximity sensor. The proximity sensor measurement is the accumulation of touch channel measurements.

**Return**
• ESP_OK Success
• ESP_ERR_INVALID_ARG Touch num is not proximity

Parameters
• touch_num: touch pad index
• measure_out: If the accumulation process does not end, the measure_out is the process value.

```c
esp_err_t touch_pad_sleep_channel_get_info(touch_pad_sleep_channel_t *slp_config)
```
Get parameter of touch sensor sleep channel. The touch sensor can works in sleep mode to wake up sleep.

Note After the sleep channel is configured, Please use special functions for sleep channel. e.g. The user should use touch_pad_sleep_channel_read_data instead of touch_pad_read_raw_data to obtain the sleep channel reading.

Return
• ESP_OK Success

Parameters
• slp_config: touch sleep pad config.

```c
esp_err_t touch_pad_sleep_channel_enable(touch_pad_t pad_num, bool enable)
```
Enable/Disable sleep channel function for touch sensor. The touch sensor can works in sleep mode to wake up sleep.

Note ESP32S2 only support one sleep channel.

Note After the sleep channel is configured, Please use special functions for sleep channel. e.g. The user should use touch_pad_sleep_channel_read_data instead of touch_pad_read_raw_data to obtain the sleep channel reading.

Return
• ESP_OK Success

Parameters
• pad_num: Set touch channel number for sleep pad. Only one touch sensor channel is supported in deep sleep mode.
• enable: true: enable sleep pad for touch sensor; false: disable sleep pad for touch sensor;

```c
esp_err_t touch_pad_sleep_channel_enable_proximity(touch_pad_t pad_num, bool enable)
```
Enable/Disable proximity function for sleep channel. The touch sensor can works in sleep mode to wake up sleep.

Note ESP32S2 only support one sleep channel.

Return
• ESP_OK Success

Parameters
• pad_num: Set touch channel number for sleep pad. Only one touch sensor channel is supported in deep sleep mode.
• enable: true: enable proximity for sleep channel; false: disable proximity for sleep channel;

```c
esp_err_t touch_pad_sleep_set_threshold(touch_pad_t pad_num, uint32_t touch_thres)
```
Set the trigger threshold of touch sensor in deep sleep. The threshold determines the sensitivity of the touch sensor.

Note In general, the touch threshold during sleep can use the threshold parameter parameters before sleep.

Return
• ESP_OK Success

Parameters
• pad_num: Set touch channel number for sleep pad. Only one touch sensor channel is supported in deep sleep mode.
• touch_thres: touch sleep pad threshold

```c
esp_err_t touch_pad_sleep_get_threshold(touch_pad_t pad_num, uint32_t *touch_thres)
```
Get the trigger threshold of touch sensor in deep sleep. The threshold determines the sensitivity of the touch sensor.

Note In general, the touch threshold during sleep can use the threshold parameter parameters before sleep.

Return

• ESP_OK Success
Chapter 2. API Reference

- ESP_OK Success

Parameters

- pad_num: Set touch channel number for sleep pad. Only one touch sensor channel is supported in deep sleep mode.
- touch_thres: touch sleep pad threshold

$\text{esp_err_t touch_pad_sleep_channel_read_benchmark}$ ($\text{touch_pad_t \ pad_num, \ uint32_t *benchmark}$)

Read benchmark of touch sensor sleep channel.

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG parameter is NULL

Parameters

- pad_num: Set touch channel number for sleep pad. Only one touch sensor channel is supported in deep sleep mode.
- benchmark: pointer to accept touch sensor benchmark value

$\text{esp_err_t touch_pad_sleep_channel_read_smooth}$ ($\text{touch_pad_t \ pad_num, \ uint32_t \ *smooth_data}$)

Read smoothed data of touch sensor sleep channel. Smoothed data is filtered from the raw data.

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG parameter is NULL

Parameters

- pad_num: Set touch channel number for sleep pad. Only one touch sensor channel is supported in deep sleep mode.
- smooth_data: pointer to accept touch sensor smoothed data

$\text{esp_err_t touch_pad_sleep_channel_read_data}$ ($\text{touch_pad_t \ pad_num, \ uint32_t \ *raw_data}$)

Read raw data of touch sensor sleep channel.

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG parameter is NULL

Parameters

- pad_num: Set touch channel number for sleep pad. Only one touch sensor channel is supported in deep sleep mode.
- raw_data: pointer to accept touch sensor raw data

$\text{esp_err_t touch_pad_sleep_channel_reset_benchmark}$ (void)

Reset benchmark of touch sensor sleep channel.

Return

- ESP_OK Success

$\text{esp_err_t touch_pad_sleep_channel_read_proximity_cnt}$ ($\text{touch_pad_t \ pad_num, \ uint32_t \ *proximity_cnt}$)

Read proximity count of touch sensor sleep channel.

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG parameter is NULL

Parameters

- pad_num: Set touch channel number for sleep pad. Only one touch sensor channel is supported in deep sleep mode.
- proximity_cnt: pointer to accept touch sensor proximity count value

$\text{esp_err_t touch_pad_sleep_channel_set_work_time}$ ($\text{uint16_t \ sleep_cycle, \ uint16_t \ meas_times}$)

Change the operating frequency of touch pad in deep sleep state. Reducing the operating frequency can effectively reduce power consumption. If this function is not called, the working frequency of touch in the deep sleep state is the same as that in the wake-up state.
Chapter 2. API Reference

Return
• ESP_OK Success

Parameters
• sleep_cycle: The touch sensor will sleep after each measurement. sleep_cycle decide the interval between each measurement. t_sleep = sleep_cycle / (RTC_SLOW_CLK frequency). The approximate frequency value of RTC_SLOW_CLK can be obtained using rtc_clk_slow_freq_get_hz function.
• meas_times: The times of charge and discharge in each measure process of touch channels. The timer frequency is 8Mhz. Range: 0 ~ 0xffff. Recommended typical value: Modify this value to make the measurement time around 1ms.

Header File
• components/driver/include/driver/touch_sensor_common.h

Functions

esp_err_t touch_pad_init (void)
Initialize touch module.

Note If default parameter don’t match the usage scenario, it can be changed after this function.

Return
• ESP_OK Success
• ESP_ERR_NO_MEM Touch pad init error
• ESP_ERR_NOT_SUPPORTED Touch pad is providing current to external XTAL

esp_err_t touch_pad_deinit (void)
Un-install touch pad driver.

Note After this function is called, other touch functions are prohibited from being called.

Return
• ESP_OK Success
• ESP_FAIL Touch pad driver not initialized

esp_err_t touch_pad_io_init (touch_pad_t touch_num)
Initialize touch pad GPIO.

Return
• ESP_OK on success
• ESP_ERR_INVALID_ARG if argument is wrong

Parameters
• touch_num: touch pad index

esp_err_t touch_pad_set_voltage (touch_high_volt_t refh, touch_low_volt_t refl, touch_volt_atten_t atten)
Set touch sensor high voltage threshold of chanrge. The touch sensor measures the channel capacitance value by charging and discharging the channel. So the high threshold should be less than the supply voltage.

Return
• ESP_OK on success
• ESP_ERR_INVALID_ARG if argument is wrong

Parameters
• refh: the value of DREFH
• refl: the value of DREFL
• atten: the attenuation on DREFH

esp_err_t touch_pad_get_voltage (touch_high_volt_t *refh, touch_low_volt_t *refl, touch_volt_atten_t *atten)
Get touch sensor reference voltage.

Return
• ESP_OK on success

Parameters
• refh: pointer to accept DREFH value
• refl: pointer to accept DREFL value
• atten: pointer to accept the attenuation on DREFH

```
esp_err_t touch_pad_set_cnt_mode(touch_pad_t touch_num, touch_cnt_slope_t slope, touch_tie_opt_t opt)
```

Set touch sensor charge/discharge speed for each pad. If the slope is 0, the counter would always be zero. If the slope is 1, the charging and discharging would be slow, accordingly. If the slope is set 7, which is the maximum value, the charging and discharging would be fast.

**Note** The higher the charge and discharge current, the greater the immunity of the touch channel, but it will increase the system power consumption.

**Return**
• ESP_OK on success
• ESP_ERR_INVALID_ARG if argument is wrong

**Parameters**
• touch_num: touch pad index
• slope: touch pad charge/discharge speed
• opt: the initial voltage

```
esp_err_t touch_pad_get_cnt_mode(touch_pad_t touch_num, touch_cnt_slope_t *slope, touch_tie_opt_t *opt)
```

Get touch sensor charge/discharge speed for each pad.

**Return**
• ESP_OK on success
• ESP_ERR_INVALID_ARG if argument is wrong

**Parameters**
• touch_num: touch pad index
• slope: pointer to accept touch pad charge/discharge slope
• opt: pointer to accept the initial voltage

```
esp_err_t touch_pad_isr_deregister(void (*fn)) void *, void *arg)
```

Deregister the handler previously registered using `touch_pad_isr_handler_register`.

**Return**
• ESP_OK on success
• ESP_ERR_INVALID_STATE if a handler matching both fn and arg isn’t registered

**Parameters**
• fn: handler function to call (as passed to `touch_pad_isr_handler_register`)
• arg: argument of the handler (as passed to `touch_pad_isr_handler_register`)

```
esp_err_t touch_pad_get_wakeup_status(touch_pad_t *pad_num)
```

Get the touch pad which caused wakeup from deep sleep.

**Return**
• ESP_OK Success
• ESP_ERR_INVALID_ARG parameter is NULL

**Parameters**
• pad_num: pointer to touch pad which caused wakeup

```
esp_err_t touch_pad_set_fsm_mode(touch_fsm_mode_t mode)
```

Set touch sensor FSM mode, the test action can be triggered by the timer, as well as by the software.

**Return**
• ESP_OK on success
• ESP_ERR_INVALID_ARG if argument is wrong

**Parameters**
• mode: FSM mode

```
esp_err_t touch_pad_get_fsm_mode(touch_fsm_mode_t *mode)
```

Get touch sensor FSM mode.

**Return**
• ESP_OK on success
Parameters
• mode: pointer to accept FSM mode

```c
esp_err_t touch_pad_clear_status (void)
```
To clear the touch sensor channel active status.

**Note** The FSM automatically updates the touch sensor status. It is generally not necessary to call this API to clear the status.

**Return**
• ESP_OK on success

```c
uint32_t touch_pad_get_status (void)
```
Get the touch sensor channel active status mask. The bit position represents the channel number. The 0/1 status of the bit represents the trigger status.

**Return**
• The touch sensor status. e.g. Touch1 trigger status is status_mask & (BIT1).

```c
bool touch_pad_meas_is_done (void)
```
Check touch sensor measurement status.

**Return**
• True measurement is under way
• False measurement done

**GPIO Lookup Macros** Some useful macros can be used to specified the GPIO number of a touch pad channel, or vice versa. e.g.

1. TOUCH_PAD_NUM5_GPIO_NUM is the GPIO number of channel 5 (12);
2. TOUCH_PAD_GPIO4_CHANNEL is the channel number of GPIO 4 (channel 0).

Structures

**struct touch_pad_denoise**

Touch sensor denoise configuration

**Public Members**

```
touch_pad_denoise_grade_t grade
  Select denoise range of denoise channel. Determined by measuring the noise amplitude of the denoise channel.

touch_pad_denoise_cap_t cap_level
  Select internal reference capacitance of denoise channel. Ensure that the denoise readings are closest to the readings of the channel being measured. Use `touch_pad_denoise_read_data` to get the reading of denoise channel. The equivalent capacitance of the shielded channel can be calculated from the reading of denoise channel.
```

**struct touch_pad_waterproof**

Touch sensor waterproof configuration

**Public Members**

```
touch_pad_t guard_ring_pad
  Waterproof. Select touch channel use for guard pad. Guard pad is used to detect the large area of water covering the touch panel.

touch_pad_t shield_driver
  Waterproof. Shield channel drive capability configuration. Shield pad is used to shield the influence of water droplets covering the touch panel. When the waterproof function is enabled, Touch14 is set as shield channel by default. The larger the parasitic capacitance on the shielding channel, the higher the drive capability needs to be set. The equivalent capacitance of the shield channel can be estimated through the reading value of the denoise channel(Touch0).
```

**struct touch_filter_config**

Touch sensor filter configuration
Public Members

*touch_filter_mode_t mode*

Set filter mode. The input of the filter is the raw value of touch reading, and the output of the filter is involved in the judgment of the touch state.

*uint32_t debounce_cnt*

Set debounce count, such as \( n \). If the measured values continue to exceed the threshold for \( n+1 \) times, the touch sensor state changes. Range: 0 ~ 7

*uint32_t noise_thr*

Noise threshold coefficient. Higher = More noise resistance. The actual noise should be less than \((\text{noise coefficient} \times \text{touch threshold})\). Range: 0 ~ 3. The coefficient is 0: 4/8; 1: 3/8; 2: 2/8; 3: 1;

*uint32_t jitter_step*

Set jitter filter step size. Range: 0 ~ 15

*touch_smooth_mode_t smh_lvl*

Level of filter applied on the original data against large noise interference.

*struct touch_pad_sleep_channel_t*

Touch sensor channel sleep configuration

Public Members

*touch_pad_t touch_num*

Set touch channel number for sleep pad. Only one touch sensor channel is supported in deep sleep mode. If clear the sleep channel, point this pad to TOUCH_PAD_NUM0

*bool en_proximity*

enable proximity function for sleep pad

Macros

*TOUCH_PAD_BIT_MASK_ALL*

*TOUCH_PAD_SLOPE_DEFAULT*

*TOUCH_PAD_TIE_OPT_DEFAULT*

*TOUCH_PAD_BIT_MASK_MAX*

*TOUCH_PAD_HIGH_VOLTAGE_THRESHOLD*

*TOUCH_PAD_LOW_VOLTAGE_THRESHOLD*

*TOUCH_PAD_ATTEN_VOLTAGE_THRESHOLD*

*TOUCH_PAD_IDLE_CH_CONNECT_DEFAULT*

*TOUCH_PAD_THRESHOLD_MAX*

If set touch threshold max value, The touch sensor can’t be in touched status

*TOUCH_PAD_SLEEP_CYCLE_DEFAULT*

Excessive total time will slow down the touch response. Too small measurement time will not be sampled enough, resulting in inaccurate measurements.

**Note** The greater the duty cycle of the measurement time, the more system power is consumed. The number of sleep cycle in each measure process of touch channels. The timer frequency is RTC_SLOW_CLK (can be 150k or 32k depending on the options). Range: 0 ~ 0xffff

*TOUCH_PAD_MEASURE_CYCLE_DEFAULT*

The times of charge and discharge in each measure process of touch channels. The timer frequency is 8Mhz. Recommended typical value: Modify this value to make the measurement time around 1ms. Range: 0 ~ 0xffff

*TOUCH_PAD_INTR_MASK_ALL*

All touch interrupt type enable.
CHAPTER 2. API Reference

**TOUCH_PROXIMITY_MEAS_NUM_MAX**
Touch sensor proximity detection configuration

**TOUCH_DEBOUNCE_CNT_MAX**

**TOUCH_NOISE_THR_MAX**

**TOUCH_JITTER_STEP_MAX**

**Type Definitions**

```c
typedef struct touch_pad_denoise touch_pad_denoise_t
    Touch sensor denoise configuration

typedef struct touch_pad_waterproof touch_pad_waterproof_t
    Touch sensor waterproof configuration

typedef struct touch_filter_config touch_filter_config_t
    Touch sensor filter configuration
```

**Enumerations**

```c
enum touch_pad_t
    Touch pad channel

Values:

**TOUCH_PAD_NUM0** = 0
    Touch pad channel 0 is GPIO4(ESP32)

**TOUCH_PAD_NUM1**
    Touch pad channel 1 is GPIO0(ESP32) / GPIO1(ESP32-S2)

**TOUCH_PAD_NUM2**
    Touch pad channel 2 is GPIO2(ESP32) / GPIO2(ESP32-S2)

**TOUCH_PAD_NUM3**
    Touch pad channel 3 is GPIO15(ESP32) / GPIO3(ESP32-S2)

**TOUCH_PAD_NUM4**
    Touch pad channel 4 is GPIO13(ESP32) / GPIO4(ESP32-S2)

**TOUCH_PAD_NUM5**
    Touch pad channel 5 is GPIO12(ESP32) / GPIO5(ESP32-S2)

**TOUCH_PAD_NUM6**
    Touch pad channel 6 is GPIO14(ESP32) / GPIO6(ESP32-S2)

**TOUCH_PAD_NUM7**
    Touch pad channel 7 is GPIO27(ESP32) / GPIO7(ESP32-S2)

**TOUCH_PAD_NUM8**
    Touch pad channel 8 is GPIO33(ESP32) / GPIO8(ESP32-S2)

**TOUCH_PAD_NUM9**
    Touch pad channel 9 is GPIO32(ESP32) / GPIO9(ESP32-S2)

**TOUCH_PAD_NUM10**
    Touch channel 10 is GPIO10(ESP32-S2)

**TOUCH_PAD_NUM11**
    Touch channel 11 is GPIO11(ESP32-S2)

**TOUCH_PAD_NUM12**
    Touch channel 12 is GPIO12(ESP32-S2)

**TOUCH_PAD_NUM13**
    Touch channel 13 is GPIO13(ESP32-S2)
**TOUCH_PAD_NUM14**

Touch channel 14 is GPIO14(ESP32-S2)

**TOUCH_PAD_MAX**

*enum touch_high_volt_t*

Touch sensor high reference voltage

*Values:*

- **TOUCH_HVOLT_KEEP = -1**
  Touch sensor high reference voltage, no change

- **TOUCH_HVOLT_2V4 = 0**
  Touch sensor high reference voltage, 2.4V

- **TOUCH_HVOLT_2V5**
  Touch sensor high reference voltage, 2.5V

- **TOUCH_HVOLT_2V6**
  Touch sensor high reference voltage, 2.6V

- **TOUCH_HVOLT_2V7**
  Touch sensor high reference voltage, 2.7V

*enum touch_low_volt_t*

Touch sensor low reference voltage

*Values:*

- **TOUCH_LVOLT_KEEP = -1**
  Touch sensor low reference voltage, no change

- **TOUCH_LVOLT_0V5 = 0**
  Touch sensor low reference voltage, 0.5V

- **TOUCH_LVOLT_0V6**
  Touch sensor low reference voltage, 0.6V

- **TOUCH_LVOLT_0V7**
  Touch sensor low reference voltage, 0.7V

- **TOUCH_LVOLT_0V8**
  Touch sensor low reference voltage, 0.8V

*enum touch_volt_atten_t*

Touch sensor high reference voltage attenuation

*Values:*

- **TOUCH_HVOLT_ATTEN_KEEP = -1**
  Touch sensor high reference voltage attenuation, no change

- **TOUCH_HVOLT_ATTEN_1V5 = 0**
  Touch sensor high reference voltage attenuation, 1.5V attenuation

- **TOUCH_HVOLT_ATTEN_1V**
  Touch sensor high reference voltage attenuation, 1.0V attenuation

- **TOUCH_HVOLT_ATTEN_0V5**
  Touch sensor high reference voltage attenuation, 0.5V attenuation

- **TOUCH_HVOLT_ATTEN_0V**
  Touch sensor high reference voltage attenuation, 0V attenuation

- **TOUCH_HVOLT_ATTEN_MAX**
  Touch sensor high reference voltage attenuation, maximum attenuation
enum touch_cnt_slope_t  
Touch sensor charge/discharge speed
Values:

TOUCH_PAD_SLOPE_0 = 0  
Touch sensor charge / discharge speed, always zero

TOUCH_PAD_SLOPE_1 = 1  
Touch sensor charge / discharge speed, slowest

TOUCH_PAD_SLOPE_2 = 2  
Touch sensor charge / discharge speed

TOUCH_PAD_SLOPE_3 = 3  
Touch sensor charge / discharge speed

TOUCH_PAD_SLOPE_4 = 4  
Touch sensor charge / discharge speed

TOUCH_PAD_SLOPE_5 = 5  
Touch sensor charge / discharge speed

TOUCH_PAD_SLOPE_6 = 6  
Touch sensor charge / discharge speed

TOUCH_PAD_SLOPE_7 = 7  
Touch sensor charge / discharge speed, fast

TOUCH_PAD_SLOPE_MAX

enum touch_tie_opt_t  
Touch sensor initial charge level
Values:

TOUCH_PAD_TIE_OPT_LOW = 0  
Initial level of charging voltage, low level

TOUCH_PAD_TIE_OPT_HIGH = 1  
Initial level of charging voltage, high level

TOUCH_PAD_TIE_OPT_MAX

enum touch_fsm_mode_t  
Touch sensor FSM mode
Values:

TOUCH_FSM_MODE_TIMER = 0  
To start touch FSM by timer

TOUCH_FSM_MODE_SW  
To start touch FSM by software trigger

TOUCH_FSM_MODE_MAX

enum touch_trigger_mode_t  
Values:

TOUCH_TRIGGER_BELOW = 0  
Touch interrupt will happen if counter value is less than threshold.

TOUCH_TRIGGER_ABOVE = 1  
Touch interrupt will happen if counter value is larger than threshold.

TOUCH_TRIGGER_MAX

enum touch_trigger_src_t  
Values:
TOUCH_TRIGGER_SOURCE_BOTH = 0
wakeup interrupt is generated if both SET1 and SET2 are “touched”

TOUCH_TRIGGER_SOURCE_SET1 = 1
wakeup interrupt is generated if SET1 is “touched”

TOUCH_TRIGGER_SOURCE_MAX

enum touch_pad_intr_mask_t
Values:

TOUCH_PAD_INTR_MASK_DONE = BIT(0)
Measurement done for one of the enabled channels.

TOUCH_PAD_INTR_MASK_ACTIVE = BIT(1)
Active for one of the enabled channels.

TOUCH_PAD_INTR_MASK_INACTIVE = BIT(2)
Inactive for one of the enabled channels.

TOUCH_PAD_INTR_MASK_SCAN_DONE = BIT(3)
Measurement done for all the enabled channels.

TOUCH_PAD_INTR_MASK_TIMEOUT = BIT(4)
Timeout for one of the enabled channels.

TOUCH_PAD_INTR_MASK_PROXI_MEAS_DONE = BIT(5)
For proximity sensor, when the number of measurements reaches the set count of measurements, an interrupt will be generated.

enum touch_pad_denoise_grade_t
Values:

TOUCH_PAD_DENOISE_BIT12 = 0
Denoise range is 12bit

TOUCH_PAD_DENOISE_BIT10 = 1
Denoise range is 10bit

TOUCH_PAD_DENOISE_BIT8 = 2
Denoise range is 8bit

TOUCH_PAD_DENOISE_BIT4 = 3
Denoise range is 4bit

TOUCH_PAD_DENOISE_MAX

enum touch_pad_denoise_cap_t
Values:

TOUCH_PAD_DENOISE_CAP_L0 = 0
Denoise channel internal reference capacitance is 5pf

TOUCH_PAD_DENOISE_CAP_L1 = 1
Denoise channel internal reference capacitance is 6.4pf

TOUCH_PAD_DENOISE_CAP_L2 = 2
Denoise channel internal reference capacitance is 7.8pf

TOUCH_PAD_DENOISE_CAP_L3 = 3
Denoise channel internal reference capacitance is 9.2pf

TOUCH_PAD_DENOISE_CAP_L4 = 4
Denoise channel internal reference capacitance is 10.6pf

TOUCH_PAD_DENOISE_CAP_L5 = 5
Denoise channel internal reference capacitance is 12.0pf

TOUCH_PAD_DENOISE_CAP_L6 = 6
Denoise channel internal reference capacitance is 13.4pf
TOUCH_PAD_DENOISE_CAP_L7 = 7
Denoise channel internal reference capacitance is 14.8pf

TOUCH_PAD_DENOISE_CAP_MAX = 8

enum touch_pad_shield_driver_t
Touch sensor shield channel drive capability level

Values:

TOUCH_PAD_SHIELD_DRV_L0 = 0
The max equivalent capacitance in shield channel is 40pf

TOUCH_PAD_SHIELD_DRV_L1
The max equivalent capacitance in shield channel is 80pf

TOUCH_PAD_SHIELD_DRV_L2
The max equivalent capacitance in shield channel is 120pf

TOUCH_PAD_SHIELD_DRV_L3
The max equivalent capacitance in shield channel is 160pf

TOUCH_PAD_SHIELD_DRV_L4
The max equivalent capacitance in shield channel is 200pf

TOUCH_PAD_SHIELD_DRV_L5
The max equivalent capacitance in shield channel is 240pf

TOUCH_PAD_SHIELD_DRV_L6
The max equivalent capacitance in shield channel is 280pf

TOUCH_PAD_SHIELD_DRV_L7
The max equivalent capacitance in shield channel is 320pf

TOUCH_PAD_SHIELD_DRV_MAX

enum touch_pad_conn_type_t
Touch channel idle state configuration

Values:

TOUCH_PAD_CONN_HIGHZ = 0
Idle status of touch channel is high resistance state

TOUCH_PAD_CONN_GND = 1
Idle status of touch channel is ground connection

TOUCH_PAD_CONN_MAX

enum touch_filter_mode_t
Touch channel IIR filter coefficient configuration.

Note On ESP32S2. There is an error in the IIR calculation. The magnitude of the error is twice the filter coefficient. So please select a smaller filter coefficient on the basis of meeting the filtering requirements. Recommended filter coefficient selection IIR_16.

Values:

TOUCH_PAD_FILTER_IIR_4 = 0
The filter mode is first-order IIR filter. The coefficient is 4.

TOUCH_PAD_FILTER_IIR_8
The filter mode is first-order IIR filter. The coefficient is 8.

TOUCH_PAD_FILTER_IIR_16
The filter mode is first-order IIR filter. The coefficient is 16 (Typical value).

TOUCH_PAD_FILTER_IIR_32
The filter mode is first-order IIR filter. The coefficient is 32.
TOUCH_PAD_FILTER_IIR_64
The filter mode is first-order IIR filter. The coefficient is 64.

TOUCH_PAD_FILTER_IIR_128
The filter mode is first-order IIR filter. The coefficient is 128.

TOUCH_PAD_FILTER_IIR_256
The filter mode is first-order IIR filter. The coefficient is 256.

TOUCH_PAD_FILTER_JITTER
The filter mode is jitter filter

TOUCH_PAD_FILTER_MAX

enum touch_smooth_mode_t
Level of filter applied on the original data against large noise interference.

Note  On ESP32S2. There is an error in the IIR calculation. The magnitude of the error is twice the filter coefficient. So please select a smaller filter coefficient on the basis of meeting the filtering requirements.
Recommended filter coefficient selection IIR_2.

Values:

TOUCH_PAD_SMOOTH_OFF = 0
No filtering of raw data.

TOUCH_PAD_SMOOTH_IIR_2 = 1
Filter the raw data. The coefficient is 2 (Typical value).

TOUCH_PAD_SMOOTH_IIR_4 = 2
Filter the raw data. The coefficient is 4.

TOUCH_PAD_SMOOTH_IIR_8 = 3
Filter the raw data. The coefficient is 8.

TOUCH_PAD_SMOOTH_MAX

2.3.21 Two-Wire Automotive Interface (TWAI)

Overview

The Two-Wire Automotive Interface (TWAI) is a real-time serial communication protocol suited for automotive and industrial applications. It is compatible with ISO11898-1 Classical frames, thus can support Standard Frame Format (11-bit ID) and Extended Frame Format (29-bit ID). The ESP32-S3’s peripherals contains a TWAI controller that can be configured to communicate on a TWAI bus via an external transceiver.

Warning: The TWAI controller is not compatible with ISO11898-1 FD Format frames, and will interpret such frames as errors.

This programming guide is split into the following sections:

1. TWAI Protocol Summary
2. Signals Lines and Transceiver
3. Driver Configuration
4. Driver Operation
5. Examples

TWAI Protocol Summary

The TWAI is a multi-master, multi-cast, asynchronous, serial communication protocol. TWAI also supports error detection and signalling, and inbuilt message prioritization.
Multi-master: Any node on the bus can initiate the transfer of a message.

Multi-cast: When a node transmits a message, all nodes on the bus will receive the message (i.e., broadcast) thus ensuring data consistency across all nodes. However, some nodes can selectively choose which messages to accept via the use of acceptance filtering (multi-cast).

Asynchronous: The bus does not contain a clock signal. All nodes on the bus operate at the same bit rate and synchronize using the edges of the bits transmitted on the bus.

Error Detection and Signalling: Every node will constantly monitor the bus. When any node detects an error, it will signal the detection by transmitting an error frame. Other nodes will receive the error frame and transmit their own error frames in response. This will result in an error detection being propagated to all nodes on the bus.

Message Priorities: Messages contain an ID field. If two or more nodes attempt to transmit simultaneously, the node transmitting the message with the lower ID value will win arbitration of the bus. All other nodes will become receivers ensuring that there is at most one transmitter at any time.

TWAI Messages: TWAI Messages are split into Data Frames and Remote Frames. Data Frames are used to deliver a data payload to other nodes, whereas a Remote Frame is used to request a Data Frame from other nodes (other nodes can optionally respond with a Data Frame). Data and Remote Frames have two frame formats known as Extended Frame and Standard Frame which contain a 29-bit ID and an 11-bit ID respectively. A TWAI message consists of the following fields:

- 29-bit or 11-bit ID: Determines the priority of the message (lower value has higher priority).
- Data Length Code (DLC) between 0 to 8: Indicates the size (in bytes) of the data payload for a Data Frame, or the amount of data to request for a Remote Frame.
- Up to 8 bytes of data for a Data Frame (should match DLC).

Error States and Counters: The TWAI protocol implements a feature known as “fault confinement” where a persistently erroneous node will eventually eliminate itself from the bus. This is implemented by requiring every node to maintain two internal error counters known as the Transmit Error Counter (TEC) and the Receive Error Counter (REC). The two error counters are incremented and decremented according to a set of rules (where the counters increase on an error, and decrease on a successful message transmission/reception). The values of the counters are used to determine a node’s error state, namely Error Active, Error Passive, and Bus-Off.

Error Active: A node is Error Active when both TEC and REC are less than 128 and indicates that the node is operating normally. Error Active nodes are allowed to participate in bus communications, and will actively signal the detection of any errors by automatically transmitting an Active Error Flag over the bus.

Error Passive: A node is Error Passive when either the TEC or REC becomes greater than or equal to 128. Error Passive nodes are still able to take part in bus communications, but will instead transmit a Passive Error Flag upon detection of an error.

Bus-Off: A node becomes Bus-Off when the TEC becomes greater than or equal to 256. A Bus-Off node is unable to influence the bus in any manner (essentially disconnected from the bus) thus eliminating itself from the bus. A node will remain in the Bus-Off state until it undergoes bus-off recovery.

Signals Lines and Transceiver

The TWAI controller does not contain an integrated transceiver. Therefore, to connect the TWAI controller to a TWAI bus, an external transceiver is required. The type of external transceiver used should depend on the application’s physical layer specification (e.g. using SN65HVD23x transceivers for ISO 11898-2 compatibility).

The TWAI controller’s interface consists of 4 signal lines known as TX, RX, BUS-OFF, and CLKOUT. These four signal lines can be routed through the GPIO Matrix to the ESP32-S3’s GPIO pads.

TX and RX: The TX and RX signal lines are required to interface with an external transceiver. Both signal lines represent/interpret a dominant bit as a low logic level (0V), and a recessive bit as a high logic level (3.3V).

BUS-OFF: The BUS-OFF signal line is optional and is set to a low logic level (0V) whenever the TWAI controller reaches a bus-off state. The BUS-OFF signal line is set to a high logic level (3.3V) otherwise.
**CLKOUT:** The CLKOUT signal line is *optional* and outputs a prescaled version of the controller’s source clock (APB Clock).

**Note:** An external transceiver must internally loopback the TX to RX such that a change in logic level to the TX signal line can be observed on the RX line. Failing to do so will cause the TWAI controller to interpret differences in logic levels between the two signal lines as a loss in arbitration or a bit error.

---

**Driver Configuration**

This section covers how to configure the TWAI driver.

**Operating Modes** The TWAI driver supports the following modes of operations:

- **Normal Mode:** The normal operating mode allows the TWAI controller to take part in bus activities such as transmitting and receiving messages/error frames. Acknowledgement from another node is required when transmitting a message.

- **No Ack Mode:** The No Acknowledgement mode is similar to normal mode, however acknowledgements are not required for a message transmission to be considered successful. This mode is useful when self testing the TWAI controller (loopback of transmissions).

- **Listen Only Mode:** This mode will prevent the TWAI controller from influencing the bus. Therefore, transmission of messages/acknowledgement/error frames will be disabled. However the TWAI controller will still be able to receive messages but will not acknowledge the message. This mode is suited for bus monitor applications.

**Alerts** The TWAI driver contains an alert feature that is used to notify the application layer of certain TWAI controller or TWAI bus events. Alerts are selectively enabled when the TWAI driver is installed, but can be reconfigured during runtime by calling `twai_reconfigure_alerts()`. The application can then wait for any enabled alerts to occur by calling `twai_read_alerts()`. The TWAI driver supports the following alerts:
### Table 5: TWAI Driver Alerts

<table>
<thead>
<tr>
<th>Alert Flag</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TWAI_ALERT_TX_IDLE</td>
<td>No more messages queued for transmission</td>
</tr>
<tr>
<td>TWAI_ALERT_TX_SUCCESS</td>
<td>The previous transmission was successful</td>
</tr>
<tr>
<td>TWAI_ALERT_RX_DATA</td>
<td>A frame has been received and added to the RX queue</td>
</tr>
<tr>
<td>TWAI_ALERT_BELOW_ERR_WARN</td>
<td>Both error counters have dropped below error warning limit</td>
</tr>
<tr>
<td>TWAI_ALERT_ERR_ACTIVE</td>
<td>TWAI controller has become error active</td>
</tr>
<tr>
<td>TWAI_ALERT_RECOVERY_IN_PROGRESS</td>
<td>TWAI controller is undergoing bus recovery</td>
</tr>
<tr>
<td>TWAI_ALERT_BUS_RECOVERED</td>
<td>TWAI controller has successfully completed bus recovery</td>
</tr>
<tr>
<td>TWAI_ALERT_ARB_Lost</td>
<td>The previous transmission lost arbitration</td>
</tr>
<tr>
<td>TWAI_ALERT_ABOVE_ERR_WARN</td>
<td>One of the error counters have exceeded the error warning limit</td>
</tr>
<tr>
<td>TWAI_ALERT_BUS_ERROR</td>
<td>A (Bit, Stuff, CRC, Form, ACK) error has occurred on the bus</td>
</tr>
<tr>
<td>TWAI_ALERT_TX_FAILED</td>
<td>The previous transmission has failed</td>
</tr>
<tr>
<td>TWAI_ALERT_RX_QUEUE_FULL</td>
<td>The RX queue is full causing a received frame to be lost</td>
</tr>
<tr>
<td>TWAI_ALERT_ERR_PASS</td>
<td>TWAI controller has become error passive</td>
</tr>
<tr>
<td>TWAI_ALERT_BUS_OFF</td>
<td>Bus-off condition occurred. TWAI controller can no longer influence bus</td>
</tr>
</tbody>
</table>

**Note:** The TWAI controller’s error warning limit is used to preemptively warn the application of bus errors before the error passive state is reached. By default, the TWAI driver sets the error warning limit to 96. The TWAI_ALERT_ABOVE_ERR_WARN is raised when the TEC or REC becomes larger then or equal to the error warning limit. The TWAI_ALERT_BELOW_ERR_WARN is raised when both TEC and REC return back to values below 96.

**Note:** When enabling alerts, the TWAI_ALERT_AND_LOG flag can be used to cause the TWAI driver to log any raised alerts to UART. However, alert logging is disabled and TWAI_ALERT_AND_LOG if the CONFIG_TWAI_ISR_IN_IRAM option is enabled (see Placing ISR into IRAM).

**Note:** The TWAI_ALERT_ALL and TWAI_ALERT_NONE macros can also be used to enable/disable all alerts during configuration/reconfiguration.

### Bit Timing

The operating bit rate of the TWAI driver is configured using the `twai_timing_config_t` structure. The period of each bit is made up of multiple time quanta, and the period of a time quantum is determined by a prescaled version of the TWAI controller’s source clock. A single bit contains the following segments in the following order:

1. The **Synchronization Segment** consists of a single time quantum
2. **Timing Segment 1** consists of 1 to 16 time quanta before sample point
3. **Timing Segment 2** consists of 1 to 8 time quanta after sample point

The Baudrate Prescaler is used to determine the period of each time quantum by dividing the TWAI controller’s source clock (80 MHz APB clock). On the ESP32-S3, the `brp` can be any even number from 2 to 128.

![Fig. 18: Bit timing configuration for 500kbit/s given BRP = 8](image-url)
The sample point of a bit is located on the intersection of Timing Segment 1 and 2. Enabling **Triple Sampling** will cause 3 time quanta to be sampled per bit instead of 1 (extra samples are located at the tail end of Timing Segment 1).

The **Synchronization Jump Width** is used to determine the maximum number of time quanta a single bit time can be lengthened/shortened for synchronization purposes. sjw can range from 1 to 4.

**Note:** Multiple combinations of brp, tseg_1, tseg_2, and sjw can achieve the same bit rate. Users should tune these values to the physical characteristics of their bus by taking into account factors such as propagation delay, node information processing time, and phase errors.

Bit timing **macro initializers** are also available for commonly used bit rates. The following macro initializers are provided by the TWAI driver.

- TWAI_TIMING_CONFIG_1MBITS()
- TWAI_TIMING_CONFIG_800KBITS()
- TWAI_TIMING_CONFIG_500KBITS()
- TWAI_TIMING_CONFIG_250KBITS()
- TWAI_TIMING_CONFIG_125KBITS()
- TWAI_TIMING_CONFIG_100KBITS()
- TWAI_TIMING_CONFIG_50KBITS()
- TWAI_TIMING_CONFIG_25KBITS()

**Acceptance Filter**  The TWAI controller contains a hardware acceptance filter which can be used to filter messages of a particular ID. A node that filters out a message will not receive the message, but will still acknowledge it. Acceptance filters can make a node more efficient by filtering out messages sent over the bus that are irrelevant to the node. The acceptance filter is configured using two 32-bit values within twai_filter_config_t known as the **acceptance code** and the **acceptance mask**.

The **acceptance code** specifies the bit sequence which a message’s ID, RTR, and data bytes must match in order for the message to be received by the TWAI controller. The **acceptance mask** is a bit sequence specifying which bits of the acceptance code can be ignored. This allows for a messages of different IDs to be accepted by a single acceptance code.

The acceptance filter can be used under **Single or Dual Filter Mode**. Single Filter Mode will use the acceptance code and mask to define a single filter. This allows for the first two data bytes of a standard frame to be filtered, or the entirety of an extended frame’s 29-bit ID. The following diagram illustrates how the 32-bit acceptance code and mask will be interpreted under Single Filter Mode (Note: The yellow and blue fields represent standard and extended frame formats respectively).

![Fig. 19: Bit layout of single filter mode (Right side MSBit)](image)

**Dual Filter Mode** will use the acceptance code and mask to define two separate filters allowing for increased flexibility of ID’s to accept, but does not allow for all 29-bits of an extended ID to be filtered. The following diagram illustrates how the 32-bit acceptance code and mask will be interpreted under **Dual Filter Mode** (Note: The yellow and blue fields represent standard and extended frame formats respectively).

**Disabling TX Queue**  The TX queue can be disabled during configuration by setting the tx_queue_len member of twai_general_config_t to 0. This will allow applications that do not require message transmission to save a small amount of memory when using the TWAI driver.
Placing ISR into IRAM  The TWAI driver’s ISR (Interrupt Service Routine) can be placed into IRAM so that the ISR can still run whilst the cache is disabled. Placing the ISR into IRAM may be necessary to maintain the TWAI driver’s functionality during lengthy cache disabling operations (such as SPI Flash writes, OTA updates etc). Whilst the cache is disabled, the ISR will continue to:

- Read received messages from the RX buffer and place them into the driver’s RX queue.
- Load messages pending transmission from the driver’s TX queue and write them into the TX buffer.

To place the TWAI driver’s ISR, users must do the following:

- Enable the `CONFIG_TWAI_ISR_IN_IRAM` option using `idf.py menuconfig`.
- When calling `twai_driver_install()`, the `intr_flags` member of `twai_general_config_t` should set the `ESP_INTR_FLAG_IRAM` set.

**Note:** When the `CONFIG_TWAI_ISR_IN_IRAM` option is enabled, the TWAI driver will no longer log any alerts (i.e., the `TWAI_ALERT_AND_LOG` flag will not have any effect).

Driver Operation

The TWAI driver is designed with distinct states and strict rules regarding the functions or conditions that trigger a state transition. The following diagram illustrates the various states and their transitions.

![State transition diagram of the TWAI driver](image)

**Fig. 21:** State transition diagram of the TWAI driver (see table below)

Espressif Systems 734  Release v5.0-dev-952-g1538009
Driver States

**Uninstalled:** In the uninstalled state, no memory is allocated for the driver and the TWAI controller is powered OFF.

**Stopped:** In this state, the TWAI controller is powered ON and the TWAI driver has been installed. However the TWAI controller will be unable to take part in any bus activities such as transmitting, receiving, or acknowledging messages.

**Running:** In the running state, the TWAI controller is able to take part in bus activities. Therefore messages can be transmitted/received/acknowledged. Furthermore the TWAI controller will be able to transmit error frames upon detection of errors on the bus.

**Bus-Off:** The bus-off state is automatically entered when the TWAI controller’s Transmit Error Counter becomes greater than or equal to 256. The bus-off state indicates the occurrence of severe errors on the bus or in the TWAI controller. Whilst in the bus-off state, the TWAI controller will be unable to take part in any bus activities. To exit the bus-off state, the TWAI controller must undergo the bus recovery process.

**Recovering:** The recovering state is entered when the TWAI controller undergoes bus recovery. The TWAI controller/TWAI driver will remain in the recovering state until the 128 occurrences of 11 consecutive recessive bits is observed on the bus.

Message Fields and Flags

The TWAI driver distinguishes different types of messages by using the various bit field members of the `twai_message_t` structure. These bit field members determine whether a message is in standard or extended format, a remote frame, and the type of transmission to use when transmitting such a message.

These bit field members can also be toggled using the the `flags` member of `twai_message_t` and the following message flags:

<table>
<thead>
<tr>
<th>Message Flag</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TWAI_MSG_FLAG_EXTD</td>
<td>Message is in Extended Frame Format (29bit ID)</td>
</tr>
<tr>
<td>TWAI_MSG_FLAG_RTR</td>
<td>Message is a Remote Frame (Remote Transmission Request)</td>
</tr>
<tr>
<td>TWAI_MSG_FLAG_SSS</td>
<td>Transmit message using Single Shot Transmission (Message will not be retransmitted upon error or loss of arbitration). Unused for received message.</td>
</tr>
<tr>
<td>TWAI_MSG_FLAG_SELF</td>
<td>Transmit message using Self Reception Request (Transmitted message will also be received by the same node), Unused for received message.</td>
</tr>
<tr>
<td>TWAI_MSG_FLAG_DLC_NON_COMP</td>
<td>Message’s Data length code is larger than 8. This will break compliance with TWAI</td>
</tr>
<tr>
<td>TWAI_MSG_FLAG_NONE</td>
<td>Clears all bit fields. Equivalent to a Standard Frame Format (11bit ID) Data Frame.</td>
</tr>
</tbody>
</table>

Examples

**Configuration & Installation** The following code snippet demonstrates how to configure, install, and start the TWAI driver via the use of the various configuration structures, macro initializers, the `twai_driver_install()` function, and the `twai_start()` function.

```c
#include "driver/gpio.h"
#include "driver/twai.h"

void app_main()
{
    //Initialize configuration structures using macro initializers
    twai_general_config_t g_config = TWAI_GENERAL_CONFIG_DEFAULT(GPIO_NUM_21, GPIO_NUM_22, TWAI_MODE_NORMAL);
    twai_timing_config_t t_config = TWAI_TIMING_CONFIG_500KBITS();
    twai_filter_config_t f_config = TWAI_FILTER_CONFIG_ACCEPT_ALL();

    //Install TWAI driver
    if (twai_driver_install(&g_config, &t_config, &f_config) == ESP_OK) {
        printf("Driver installed\n");
    }
}
```

(continues on next page)
The usage of macro initializers is not mandatory and each of the configuration structures can be manually.

**Message Transmission** The following code snippet demonstrates how to transmit a message via the usage of the `twai_message_t` type and `twai_transmit()` function.

```
#include "driver/twai.h"
...

//Configure message to transmit
twai_message_t message;
message.identifier = 0xAAAA;
message.extd = 1;
message.data_length_code = 4;
for (int i = 0; i < 4; i++) {
    message.data[i] = 0;
}

//Queue message for transmission
if (twai_transmit(&message, pdMS_TO_TICKS(1000)) == ESP_OK) {
    printf("Message queued for transmission\n");
} else {
    printf("Failed to queue message for transmission\n");
}
```

**Message Reception** The following code snippet demonstrates how to receive a message via the usage of the `twai_message_t` type and `twai_receive()` function.

```
#include "driver/twai.h"
...

//Wait for message to be received
twai_message_t message;
if (twai_receive(&message, pdMS_TO_TICKS(10000)) == ESP_OK) {
    printf("Message received\n");
} else {
    printf("Failed to receive message\n");
    return;
}

//Process received message
```
Reconfiguring and Reading Alerts

The following code snippet demonstrates how to reconfigure and read TWAI driver alerts via the use of the `twai_reconfigure_alerts()` and `twai_read_alerts()` functions.

```c
#include "driver/twai.h"
...

//Reconfigure alerts to detect Error Passive and Bus-Off error states
uint32_t alerts_to_enable = TWAI_ALERT_ERR_PASS | TWAI_ALERT_BUS_OFF;
if (twai_reconfigure_alerts(alerts_to_enable, NULL) == ESP_OK) {
    printf("Alerts reconfigured\n");
} else {
    printf("Failed to reconfigure alerts\n");
}

//Block indefinitely until an alert occurs
uint32_t alerts_triggered;
twai_read_alerts(&alerts_triggered, portMAX_DELAY);
```

Stop and Uninstall

The following code demonstrates how to stop and uninstall the TWAI driver via the use of the `twai_stop()` and `twai_driver_uninstall()` functions.

```c
#include "driver/twai.h"
...

//Stop the TWAI driver
if (twai_stop() == ESP_OK) {
    printf("Driver stopped\n");
} else {
    printf("Failed to stop driver\n");
    return;
}

//Uninstall the TWAI driver
if (twai_driver_uninstall() == ESP_OK) {
    printf("Driver uninstalled\n");
} else {
    printf("Failed to uninstall driver\n");
    return;
}
```

Multiple ID Filter Configuration

The acceptance mask in `twai_filter_config_t` can be configured such that two or more IDs will be accepted for a single filter. For a particular filter to accept multiple IDs, the conflicting bit positions amongst the IDs must be set in the acceptance mask. The acceptance code can be set to any one of the IDs.
The following example shows how the calculate the acceptance mask given multiple IDs:

| ID1  | 11'b101 1010 0000 |
| ID2  | 11'b101 1010 0001 |
| ID3  | 11'b101 1010 0100 |
| ID4  | 11'b101 1010 1000 |
| MASK | 11'b000 0000 1101 |

**Application Examples**

**Network Example:** The TWAIN Network example demonstrates communication between two ESP32-S3s using the TWAI driver API. One TWAI node acts as a network master that initiates and ceases the transfer of a data from another node acting as a network slave. The example can be found via peripherals/twai/twai_network.

**Alert and Recovery Example:** This example demonstrates how to use the TWAI driver’s alert and bus-off recovery API. The example purposely introduces errors on the bus to put the TWAI controller into the Bus-Off state. An alert is used to detect the Bus-Off state and trigger the bus recovery process. The example can be found via peripherals/twai/twai_alert_and_recovery.

**Self Test Example:** This example uses the No Acknowledge Mode and Self Reception Request to cause the TWAI controller to send and simultaneously receive a series of messages. This example can be used to verify if the connections between the TWAI controller and the external transceiver are working correctly. The example can be found via peripherals/twai/twai_self_test.

**API Reference**

**Header File**

- components/hal/include/hal/twai_types.h

**Structures**

**struct twai_message_t**

Structure to store a TWAI message.

**Note** The flags member is deprecated

**Public Members**

- uint32_t extd : 1
  
  Extended Frame Format (29bit ID)

- uint32_t rtr : 1
  
  Message is a Remote Frame

- uint32_t ss : 1
  
  Transmit as a Single Shot Transmission. Unused for received.

- uint32_t self : 1
  
  Transmit as a Self Reception Request. Unused for received.

- uint32_t dlc_non_comp : 1
  
  Message’s Data length code is larger than 8. This will break compliance with ISO 11898-1

- uint32_t reserved : 27
  
  Reserved bits

- uint32_t flags
  
  Deprecated: Alternate way to set bits using message flags

- uint32_t identifier
  
  11 or 29 bit identifier
uint8_t data_length_code
    Data length code

uint8_t data[TWAI_FRAME_MAX_DLC]
    Data bytes (not relevant in RTR frame)

struct twai_timing_config_t
    Structure for bit timing configuration of the TWAI driver.

    Note Macro initializers are available for this structure

Public Members

uint32_t brp
    Baudrate prescaler (i.e., APB clock divider). Any even number from 2 to 128 for ESP32, 2 to 32768 for ESP32S2. For ESP32 Rev 2 or later, multiples of 4 from 132 to 256 are also supported

uint8_t tseg_1
    Timing segment 1 (Number of time quanta, between 1 to 16)

uint8_t tseg_2
    Timing segment 2 (Number of time quanta, 1 to 8)

uint8_t sjw
    Synchronization Jump Width (Max time quanta jump for synchronize from 1 to 4)

bool triple_sampling
    Enables triple sampling when the TWAI controller samples a bit

struct twai_filter_config_t
    Structure for acceptance filter configuration of the TWAI driver (see documentation)

    Note Macro initializers are available for this structure

Public Members

uint32_t acceptance_code
    32-bit acceptance code

uint32_t acceptance_mask
    32-bit acceptance mask

bool single_filter
    Use Single Filter Mode (see documentation)

Macros

TWAI_EXTD_ID_MASK
    TWAI Constants.
    Bit mask for 29 bit Extended Frame Format ID

TWAI_STD_ID_MASK
    Bit mask for 11 bit Standard Frame Format ID

TWAI_FRAME_MAX_DLC
    Max data bytes allowed in TWAI

TWAI_FRAME_EXTD_ID_LEN_BYTES
    EFF ID requires 4 bytes (29bit)

TWAI_FRAME_STD_ID_LEN_BYTES
    SFF ID requires 2 bytes (11bit)

TWAI_ERR_PASS_THRESH
    Error counter threshold for error passive
Enumerations

enum twai_mode_t
TWAI Controller operating modes.

Values:

TWAI_MODE_NORMAL
Normal operating mode where TWAI controller can send/receive/acknowledge messages

TWAI_MODE_NO_ACK
Transmission does not require acknowledgment. Use this mode for self testing

TWAI_MODE_LISTEN_ONLY
The TWAI controller will not influence the bus (No transmissions or acknowledgments) but can receive messages

Header File

- components/driver/include/driver/twai.h

Functions

esp_err_t twai_driver_install(const twai_general_config_t *g_config, const twai_timing_config_t *t_config, const twai_filter_config_t *f_config)

Install TWAI driver.

This function installs the TWAI driver using three configuration structures. The required memory is allocated and the TWAI driver is placed in the stopped state after running this function.

Note  Macro initializers are available for the configuration structures (see documentation)

Note  To reinstall the TWAI driver, call twai_driver_uninstall() first

Return

- ESP_OK: Successfully installed TWAI driver
- ESP_ERR_INVALID_ARG: Arguments are invalid
- ESP_ERR_NO_MEM: Insufficient memory
- ESP_ERR_INVALID_STATE: Driver is already installed

Parameters

- [in] g_config: General configuration structure
- [in] t_config: Timing configuration structure
- [in] f_config: Filter configuration structure

esp_err_t twai_driver_uninstall (void)

Uninstall the TWAI driver.

This function uninstalls the TWAI driver, freeing the memory utilized by the driver. This function can only be called when the driver is in the stopped state or the bus-off state.

Warning  The application must ensure that no tasks are blocked on TX/RX queues or alerts when this function is called.

Return

- ESP_OK: Successfully uninstalled TWAI driver
- ESP_ERR_INVALID_STATE: Driver is not in stopped/bus-off state, or is not installed

esp_err_t twai_start (void)

Start the TWAI driver.

This function starts the TWAI driver, putting the TWAI driver into the running state. This allows the TWAI driver to participate in TWAI bus activities such as transmitting/receiving messages. The TX and RX queue are reset in this function, clearing any messages that are unread or pending transmission. This function can only be called when the TWAI driver is in the stopped state.

Return

- ESP_OK: TWAI driver is now running
- ESP_ERR_INVALID_STATE: Driver is not in stopped state, or is not installed
Chapter 2. API Reference

```c
esp_err_t twai_stop(void)

Stop the TWAI driver.

This function stops the TWAI driver, preventing any further message from being transmitted or received until twai_start() is called. Any messages in the TX queue are cleared. Any messages in the RX queue should be read by the application after this function is called. This function can only be called when the TWAI driver is in the running state.

Warning A message currently being transmitted/received on the TWAI bus will be ceased immediately. This may lead to other TWAI nodes interpreting the unfinished message as an error.

Return
• ESP_OK: TWAI driver is now Stopped
• ESP_ERR_INVALID_STATE: Driver is not in running state, or is not installed
```

```c
esp_err_t twai_transmit(const twai_message_t *message, TickType_t ticks_to_wait)

Transmit a TWAI message.

This function queues a TWAI message for transmission. Transmission will start immediately if no other messages are queued for transmission. If the TX queue is full, this function will block until more space becomes available or until it times out. If the TX queue is disabled (TX queue length = 0 in configuration), this function will return immediately if another message is undergoing transmission. This function can only be called when the TWAI driver is in the running state and cannot be called under Listen Only Mode.

Note This function does not guarantee that the transmission is successful. The TX_SUCCESS/TX_FAILED alert can be enabled to alert the application upon the success/failure of a transmission.

Note The TX_IDLE alert can be used to alert the application when no other messages are awaiting transmission.

Return
• ESP_OK: Transmission successfully queued/initiated
• ESP_ERR_INVALID_ARG: Arguments are invalid
• ESP_ERR_TIMEOUT: Timed out waiting for space on TX queue
• ESP_FAIL: TX queue is disabled and another message is currently transmitting
• ESP_ERR_INVALID_STATE: TWAI driver is not in running state, or is not installed
• ESP_ERR_NOT_SUPPORTED: Listen Only Mode does not support transmissions

Parameters
• [in] message: Message to transmit
• [in] ticks_to_wait: Number of FreeRTOS ticks to block on the TX queue
```

```c
esp_err_t twai_receive(twai_message_t *message, TickType_t ticks_to_wait)

Receive a TWAI message.

This function receives a message from the RX queue. The flags field of the message structure will indicate the type of message received. This function will block if there are no messages in the RX queue

Warning The flags field of the received message should be checked to determine if the received message contains any data bytes.

Return
• ESP_OK: Message successfully received from RX queue
• ESP_ERR_TIMEOUT: Timed out waiting for message
• ESP_ERR_INVALID_ARG: Arguments are invalid
• ESP_ERR_INVALID_STATE: TWAI driver is not installed

Parameters
• [out] message: Received message
• [in] ticks_to_wait: Number of FreeRTOS ticks to block on RX queue
```

```c
esp_err_t twai_read_alerts(uint32_t *alerts, TickType_t ticks_to_wait)

Read TWAI driver alerts.

This function will read the alerts raised by the TWAI driver. If no alert has been issued when this function is called, this function will block until an alert occurs or until it timeouts.

Note Multiple alerts can be raised simultaneously. The application should check for all alerts that have been enabled.

Return
```
### Chapter 2. API Reference

- **ESP_OK**: Alerts read
- **ESP_ERR_TIMEOUT**: Timed out waiting for alerts
- **ESP_ERR_INVALID_ARG**: Arguments are invalid
- **ESP_ERR_INVALID_STATE**: TWAI driver is not installed

#### Parameters
- `[out] alerts`: Bitfield of raised alerts (see documentation for alert flags)
- `[in] ticks_to_wait`: Number of FreeRTOS ticks to block for alert

#### Function: esp_err_t twai_reconfigure_alerts(uint32_t alerts_enabled, uint32_t* current_alerts)

Reconfigure which alerts are enabled.

This function reconfigures which alerts are enabled. If there are alerts which have not been read whilst reconfiguring, this function can read those alerts.

#### Return
- **ESP_OK**: Alerts reconfigured
- **ESP_ERR_INVALID_STATE**: TWAI driver is not installed

#### Parameters
- `[in] alerts_enabled`: Bitfield of alerts to enable (see documentation for alert flags)
- `[out] current_alerts`: Bitfield of currently raised alerts. Set to NULL if unused

#### Function: esp_err_t twai_initiate_recovery(void)

Start the bus recovery process.

This function initiates the bus recovery process when the TWAI driver is in the bus-off state. Once initiated, the TWAI driver will enter the recovering state and wait for 128 occurrences of the bus-free signal on the TWAI bus before returning to the stopped state. This function will reset the TX queue, clearing any messages pending transmission.

#### Note
The BUS_RECOVERED alert can be enabled to alert the application when the bus recovery process completes.

#### Return
- **ESP_OK**: Bus recovery started
- **ESP_ERR_INVALID_STATE**: TWAI driver is not in the bus-off state, or is not installed

#### Function: esp_err_t twai_get_status_info(twai_status_info_t* status_info)

Get current status information of the TWAI driver.

#### Return
- **ESP_OK**: Status information retrieved
- **ESP_ERR_INVALID_ARG**: Arguments are invalid
- **ESP_ERR_INVALID_STATE**: TWAI driver is not installed

#### Parameters
- `[out] status_info`: Status information

#### Function: esp_err_t twai_clear_transmit_queue(void)

Clear the transmit queue.

This function will clear the transmit queue of all messages.

#### Note
The transmit queue is automatically cleared when twai_stop() or twai_initiate_recovery() is called.

#### Return
- **ESP_OK**: Transmit queue cleared
- **ESP_ERR_INVALID_STATE**: TWAI driver is not installed or TX queue is disabled

#### Function: esp_err_t twai_clear_receive_queue(void)

Clear the receive queue.

This function will clear the receive queue of all messages.

#### Note
The receive queue is automatically cleared when twai_start() is called.

#### Return
- **ESP_OK**: Transmit queue cleared
- **ESP_ERR_INVALID_STATE**: TWAI driver is not installed
Structures

**struct twai_general_config_t**

Structure for general configuration of the TWAI driver.

**Note** Macro initializers are available for this structure

**Public Members**

- `twai_mode_t mode`
  - Mode of TWAI controller

- `gpio_num_t tx_io`
  - Transmit GPIO number

- `gpio_num_t rx_io`
  - Receive GPIO number

- `gpio_num_t clkout_io`
  - CLKOUT GPIO number (optional, set to -1 if unused)

- `gpio_num_t bus_off_io`
  - Bus off indicator GPIO number (optional, set to -1 if unused)

- `uint32_t tx_queue_len`
  - Number of messages TX queue can hold (set to 0 to disable TX Queue)

- `uint32_t rx_queue_len`
  - Number of messages RX queue can hold

- `uint32_t alerts_enabled`
  - Bit field of alerts to enable (see documentation)

- `uint32_t clkout_divider`
  - CLKOUT divider. Can be 1 or any even number from 2 to 14 (optional, set to 0 if unused)

- `int intr_flags`
  - Interrupt flags to set the priority of the driver’s ISR. Note that to use the ESP_INTR_FLAG_IRAM, the CONFIG_TWAI_ISR_IN_IRAM option should be enabled first.

**struct twai_status_info_t**

Structure to store status information of TWAI driver.

**Public Members**

- `twai_state_t state`
  - Current state of TWAI controller (Stopped/Running/Bus-Off/Recovery)

- `uint32_t msg_to_tx`
  - Number of messages queued for transmission or awaiting transmission completion

- `uint32_t msg_to_rx`
  - Number of messages in RX queue waiting to be read

- `uint32_t tx_error_counter`
  - Current value of Transmit Error Counter

- `uint32_t rx_error_counter`
  - Current value of Receive Error Counter

- `uint32_t tx_failed_count`
  - Number of messages that failed transmissions

- `uint32_t rx_missed_count`
  - Number of messages that were lost due to a full RX queue (or errata workaround if enabled)
### Chapter 2. API Reference

#### Macros

**TWAI_IO_UNUSED**
Marks GPIO as unused in TWAI configuration

#### Enumerations

**enum twai_state_t**
TWAI driver states.

* Values:
  - **TWAI_STATE_STOPPED**: Stopped state. The TWAI controller will not participate in any TWAI bus activities
  - **TWAI_STATE_RUNNING**: Running state. The TWAI controller can transmit and receive messages
  - **TWAI_STATE_BUS_OFF**: Bus-off state. The TWAI controller cannot participate in bus activities until it has recovered
  - **TWAI_STATE_RECOVERING**: Recovering state. The TWAI controller is undergoing bus recovery

### 2.3.22 Universal Asynchronous Receiver/Transmitter (UART)

#### Overview

A Universal Asynchronous Receiver/Transmitter (UART) is a hardware feature that handles communication (i.e., timing requirements and data framing) using widely-adopted asynchronous serial communication interfaces, such as RS232, RS422, RS485. A UART provides a widely adopted and cheap method to realize full-duplex or half-duplex data exchange among different devices.

The ESP32-S3 chip has three UART controllers (UART0, UART1, and UART2), each featuring an identical set of registers to simplify programming and for more flexibility.

Each UART controller is independently configurable with parameters such as baud rate, data bit length, bit ordering, number of stop bits, parity bit etc. All the controllers are compatible with UART-enabled devices from various manufacturers and can also support Infrared Data Association protocols (IrDA).

#### Functional Overview

The following overview describes how to establish communication between an ESP32-S3 and other UART devices using the functions and data types of the UART driver. The overview reflects a typical programming workflow and is broken down into the sections provided below:

1. **Setting Communication Parameters** - Setting baud rate, data bits, stop bits, etc.
2. **Setting Communication Pins** - Assigning pins for connection to a device.
3. **Driver Installation** - Allocating ESP32-S3’s resources for the UART driver.
4. **Running UART Communication** - Sending / receiving data
5. **Using Interrupts** - Triggering interrupts on specific communication events
6. **Deleting a Driver** - Freeing allocated resources if a UART communication is no longer required
Steps 1 to 3 comprise the configuration stage. Step 4 is where the UART starts operating. Steps 5 and 6 are optional. The UART driver’s functions identify each of the UART controllers using \texttt{uart\_port\_t}. This identification is needed for all the following function calls.

**Setting Communication Parameters** UART communication parameters can be configured all in a single step or individually in multiple steps.

**Single Step** Call the function \texttt{uart\_param\_config()} and pass to it a \texttt{uart\_config\_t} structure. The \texttt{uart\_config\_t} structure should contain all the required parameters. See the example below.

```c
const uart\_port\_t uart\_num = UART\_NUM\_2;
uart\_config\_t uart\_config = {
    .baud\_rate = 115200,
    .data\_bits = UART\_DATA\_8\_BITS,
    .parity = UART\_PARITY\_DISABLE,
    .stop\_bits = UART\_STOP\_BITS\_1,
    .flow\_ctrl = UART\_HW\_FLOWCTRL\_CTS\_RTS,
    .rx\_flow\_ctrl\_thresh = 122,
};
// Configure UART parameters
ESP\_ERROR\_CHECK(uart\_param\_config(uart\_num, &uart\_config));
```

For more information on how to configure the hardware flow control options, please refer to \texttt{peripherals/uart/uart\_echo}.

**Multiple Steps** Configure specific parameters individually by calling a dedicated function from the table given below. These functions are also useful if re-configuring a single parameter.

<table>
<thead>
<tr>
<th>Parameter to Configure</th>

<tr>
<td>Communication mode</td>
<td>\texttt{uart_set_mode()} selected out of \texttt{uart_mode_t}</td>
</tr>
</tbody>
</table>

Each of the above functions has a \_get\_ counterpart to check the currently set value. For example, to check the current baud rate value, call \texttt{uart\_get\_baudrate()}.

**Setting Communication Pins** After setting communication parameters, configure the physical GPIO pins to which the other UART device will be connected. For this, call the function \texttt{uart\_set\_pin()} and specify the GPIO pin numbers to which the driver should route the Tx, Rx, RTS, and CTS signals. If you want to keep a currently allocated pin number for a specific signal, pass the macro \texttt{UART\_PIN\_NO\_CHANGE}.

The same macro should be specified for pins that will not be used.

```c
// Set UART pins(TX: IO4, RX: IO5, RTS: IO18, CTS: IO19)
ESP\_ERROR\_CHECK(uart\_set\_pin(UART\_NUM\_2, 4, 5, 18, 19));
```

**Driver Installation** Once the communication pins are set, install the driver by calling \texttt{uart\_driver\_install()} and specify the following parameters:

- Size of Tx ring buffer
Chapter 2. API Reference

- Size of Rx ring buffer
- Event queue handle and size
- Flags to allocate an interrupt

The function will allocate the required internal resources for the UART driver.

```c
// Setup UART buffered IO with event queue
const int uart_buffer_size = (1024 * 2);
QueueHandle_t uart_queue;
// Install UART driver using an event queue here
ESP_ERROR_CHECK(uart_driver_install(UART_NUM_2, uart_buffer_size, 
        uart_buffer_size, 10, &uart_queue, 0));
```

Once this step is complete, you can connect the external UART device and check the communication.

**Running UART Communication**  Serial communication is controlled by each UART controller’s finite state machine (FSM).

The process of sending data involves the following steps:

1. Write data into Tx FIFO buffer
2. FSM serializes the data
3. FSM sends the data out

The process of receiving data is similar, but the steps are reversed:

1. FSM processes an incoming serial stream and parallelizes it
2. FSM writes the data into Rx FIFO buffer
3. Read the data from Rx FIFO buffer

Therefore, an application will be limited to writing and reading data from a respective buffer using `uart_write_bytes()` and `uart_read_bytes()` respectively, and the FSM will do the rest.

**Transmitting**  After preparing the data for transmission, call the function `uart_write_bytes()` and pass the data buffer’s address and data length to it. The function will copy the data to the Tx ring buffer (either immediately or after enough space is available), and then exit. When there is free space in the Tx FIFO buffer, an interrupt service routine (ISR) moves the data from the Tx ring buffer to the Tx FIFO buffer in the background. The code below demonstrates the use of this function.

```c
// Write data to UART.
char* test_str = "This is a test string.\n";
uart_write_bytes(uart_num, (const char*)test_str, strlen(test_str));
```

The function `uart_write_bytes_with_break()` is similar to `uart_write_bytes()` but adds a serial break signal at the end of the transmission. A ‘serial break signal’ means holding the Tx line low for a period longer than one data frame.

```c
// Write data to UART, end with a break signal.
uart_write_bytes_with_break(uart_num, "test break\n", strlen("test break\n"), 100);
```

Another function for writing data to the Tx FIFO buffer is `uart_tx_chars()`. Unlike `uart_write_bytes()`, this function will not block until space is available. Instead, it will write all data which can immediately fit into the hardware Tx FIFO, and then return the number of bytes that were written.

There is a ‘companion’ function `uart_wait_tx_done()` that monitors the status of the Tx FIFO buffer and returns once it is empty.

```c
// Wait for packet to be sent
const uart_port_t uart_num = UART_NUM_2;
ESP_ERROR_CHECK(uart_wait_tx_done(uart_num, 100)); // wait timeout is 100 RTOS_ticks (TickType_t)
```
Chapter 2. API Reference

Receiving Once the data is received by the UART and saved in the Rx FIFO buffer, it needs to be retrieved using the function `uart_read_bytes()`. Before reading data, you can check the number of bytes available in the Rx FIFO buffer by calling `uart_get_buffered_data_len()`. An example of using these functions is given below.

```c
// Read data from UART.
const uart_port_t uart_num = UART_NUM_2;
uint8_t data[128];
int length = 0;
ESP_ERROR_CHECK(uart_get_buffered_data_len(uart_num, (size_t *)&length));
length = uart_read_bytes(uart_num, data, length, 100);
```

If the data in the Rx FIFO buffer is no longer needed, you can clear the buffer by calling `uart_flush()`.

Software Flow Control If the hardware flow control is disabled, you can manually set the RTS and DTR signal levels by using the functions `uart_set_rts()` and `uart_set_dtr()` respectively.

Communication Mode Selection The UART controller supports a number of communication modes. A mode can be selected using the function `uart_set_mode()`. Once a specific mode is selected, the UART driver will handle the behavior of a connected UART device accordingly. As an example, it can control the RS485 driver chip using the RTS line to allow half-duplex RS485 communication.

```c
// Setup UART in rs485 half duplex mode
ESP_ERROR_CHECK(uart_set_mode(uart_num, UART_MODE_RS485_HALF_DUPLEX));
```

Using Interrupts There are many interrupts that can be generated following specific UART states or detected errors. The full list of available interrupts is provided in ESP32-S3 Technical Reference Manual > UART Controller (UART) > UART Interrupts and UHCI Interrupts [PDF]. You can enable or disable specific interrupts by calling `uart_enable_intr_mask()` or `uart_disable_intr_mask()` respectively. The mask of all interrupts is available as `UART_INTR_MASK`.

By default, the `uart_driver_install()` function installs the driver’s internal interrupt handler to manage the Tx and Rx ring buffers and provides high-level API functions like events (see below). It is also possible to register a lower level interrupt handler instead using `uart_isr_register()`, and to free it again using `uart_isr_free()`. Some UART driver functions which use the Tx and Rx ring buffers, events, etc. will not automatically work in this case - it is necessary to handle the interrupts directly in the ISR. Inside the custom handler implementation, clear the interrupt status bits using `uart_clear_intr_status()`.

The API provides a convenient way to handle specific interrupts discussed in this document by wrapping them into dedicated functions:

- **Event detection**: There are several events defined in `uart_event_type_t` that may be reported to a user application using the FreeRTOS queue functionality. You can enable this functionality when calling `uart_driver_install()` described in Driver Installation. An example of using Event detection can be found in peripherals/uart/uart_events.

- **FIFO space threshold or transmission timeout reached**: The Tx and Rx FIFO buffers can trigger an interrupt when they are filled with a specific number of characters, or on a timeout of sending or receiving data. To use these interrupts, do the following:
  - Configure respective threshold values of the buffer length and timeout by entering them in the structure `uart_intr_config_t` and calling `uart_intr_config()`
  - Enable the interrupts using the functions `uart_enable_tx_intr()` and `uart_enable_rx_intr()`
  - Disable these interrupts using the corresponding functions `uart_disable_tx_intr()` or `uart_disable_rx_intr()`

- **Pattern detection**: An interrupt triggered on detecting a ‘pattern’ of the same character being received/sent repeatedly for a number of times. This functionality is demonstrated in the example peripherals/uart/uart_events. It can be used, e.g., to detect a command string followed by a specific number of identical characters (the ‘pattern’) added at the end of the command string. The following functions are available:
Configure and enable this interrupt using `uart_enable_pattern_det_intr()`.

Disable the interrupt using `uart_disable_pattern_det_intr()`.

**Macros**
The API also defines several macros. For example, `UART_FIFO_LEN` defines the length of hardware FIFO buffers; `UART_BITRATE_MAX` gives the maximum baud rate supported by the UART controllers, etc.

**Deleting a Driver**
If the communication established with `uart_driver_install()` is no longer required, the driver can be removed to free allocated resources by calling `uart_driver_delete()`.

**Overview of RS485 specific communication options**

**Note:** The following section will use `[UART_REGISTER_NAME].[UART_FIELD_BIT]` to refer to UART register fields/bits. For more information on a specific option bit, see *ESP32-S3 Technical Reference Manual > UART Controller (UART) > Register Summary* [PDF]. Use the register name to navigate to the register description and then find the field/bit.

- `UART_RS485_CONF_REG.UART_RS485_EN`: setting this bit enables RS485 communication mode support.
- `UART_RS485_CONF_REG.UART_RS485TX_RX_EN`: if this bit is set, the transmitter’s output signal loops back to the receiver’s input signal.
- `UART_RS485_CONF_REG.UART_RS485RXBY_TX_EN`: if this bit is set, the transmitter will still be sending data if the receiver is busy (remove collisions automatically by hardware).

The ESP32-S3’s RS485 UART hardware can detect signal collisions during transmission of a datagram and generate the interrupt `UART_RS485_CLASH_INT` if this interrupt is enabled. The term collision means that a transmitted datagram is not equal to the one received on the other end. Data collisions are usually associated with the presence of other active devices on the bus or might occur due to bus errors.

The collision detection feature allows handling collisions when their interrupts are activated and triggered. The interrupts `UART_RS485_FRM_ERR_INT` and `UART_RS485_PARITY_ERR_INT` can be used with the collision detection feature to control frame errors and parity bit errors accordingly in RS485 mode. This functionality is supported in the UART driver and can be used by selecting the `UART_MODE_RS485_APP_CTRL` mode (see the function `uart_set_mode()`).

The collision detection feature can work with circuit A and circuit C (see Section Interface Connection Options). In the case of using circuit A or B, the RTS pin connected to the DE pin of the bus driver should be controlled by the user application. Use the function `uart_get_collision_flag()` to check if the collision detection flag has been raised.

The ESP32-S3 UART controllers themselves do not support half-duplex communication as they cannot provide automatic control of the RTS pin connected to the ~RE/DE input of RS485 bus driver. However, half-duplex communication can be achieved via software control of the RTS pin by the UART driver. This can be enabled by selecting the `UART_MODE_RS485_HALF_DUPLEX` mode when calling `uart_set_mode()`.

Once the host starts writing data to the Tx FIFO buffer, the UART driver automatically asserts the RTS pin (logic 1); once the last bit of the data has been transmitted, the driver de-asserts the RTS pin (logic 0). To use this mode, the software would have to disable the hardware flow control function. This mode works with all the used circuits shown below.

**Interface Connection Options**
This section provides example schematics to demonstrate the basic aspects of ESP32-S3’s RS485 interface connection.

**Note:**
- The schematics below do not necessarily contain all required elements.
• The analog devices ADM483 & ADM2483 are examples of common RS485 transceivers and can be replaced with other similar transceivers.

**Circuit A: Collision Detection Circuit**

This circuit is preferable because it allows for collision detection and is quite simple at the same time. The receiver in the line driver is constantly enabled, which allows the UART to monitor the RS485 bus. Echo suppression is performed by the UART peripheral when the bit UART_RS485_CONF_REG.UART_RS485TX_RX_EN is enabled.

**Circuit B: Manual Switching Transmitter/Receiver Without Collision Detection**

This circuit does not allow for collision detection. It suppresses the null bytes that the hardware receives when the bit UART_RS485_CONF_REG.UART_RS485TX_RX_EN is set. The bit UART_RS485_CONF_REG.UART_RS485RXBY_TX_EN is not applicable in this case.

**Circuit C: Auto Switching Transmitter/Receiver**

(continues on next page)
This galvanically isolated circuit does not require RTS pin control by a software application or driver because it controls the transceiver direction automatically. However, it requires suppressing null bytes during transmission by setting UART_RS485_CONF_REG.UART_RS485RXBY_TX_EN to 1 and UART_RS485_CONF_REG.UART_RS485_TX_RX_EN to 0. This setup can work in any RS485 UART mode or even in UART_MODE_UART.

**Application Examples**

The table below describes the code examples available in the directory `peripherals/uart/`.

<table>
<thead>
<tr>
<th>Code Example</th>
<th>Description</th>

**API Reference**

**Header File**

- components/driver/include/driver/uart.h

**Functions**

```c
esp_err_t uart_driver_install(uart_port_t uart_num, int rx_buffer_size, int tx_buffer_size, int queue_size, QueueHandle_t *uart_queue, int intr_alloc_flags)
```

Install UART driver and set the UART to the default configuration.

UART ISR handler will be attached to the same CPU core that this function is running on.

**Note** Rx_buffer_size should be greater than UART_FIFO_LEN. Tx_buffer_size should be either zero or greater than UART_FIFO_LEN.

**Return**

- ESP_OK Success
- ESP_FAIL Parameter error

**Parameters**

- `uart_num`: UART port number, the max port number is (UART_NUM_MAX - 1).
- `rx_buffer_size`: UART RX ring buffer size.
- `tx_buffer_size`: UART TX ring buffer size. If set to zero, driver will not use TX buffer, TX function will block task until all data have been sent out.
- `queue_size`: UART event queue size/depth.
- `uart_queue`: UART event queue handle (out param). On success, a new queue handle is written here to provide access to UART events. If set to NULL, driver will not use an event queue.
• **intr_alloc_flags**: Flags used to allocate the interrupt. One or multiple (ORred) ESP_INTR_FLAG_* values. See esp_intr_alloc.h for more info. Do not set ESP_INTR_FLAG_IRAM here (the driver’s ISR handler is not located in IRAM)

```c
esp_err_t uart_driver_delete(uart_port_t uart_num)
```

Uninstall UART driver.

**Return**
- ESP_OK Success
- ESP_FAIL Parameter error

**Parameters**
- **uart_num**: UART port number, the max port number is (UART_NUM_MAX -1).

```c
bool uart_is_driver_installed(uart_port_t uart_num)
```

Checks whether the driver is installed or not.

**Return**
- true driver is installed
- false driver is not installed

**Parameters**
- **uart_num**: UART port number, the max port number is (UART_NUM_MAX -1).

```c
esp_err_t uart_set_word_length(uart_port_t uart_num, uart_word_length_t data_bit)
```

Set UART data bits.

**Return**
- ESP_OK Success
- ESP_FAIL Parameter error

**Parameters**
- **uart_num**: UART port number, the max port number is (UART_NUM_MAX -1).
- **data_bit**: UART data bits

```c
esp_err_t uart_get_word_length(uart_port_t uart_num, uart_word_length_t *data_bit)
```

Get the UART data bit configuration.

**Return**
- ESP_FAIL Parameter error
- ESP_OK Success, result will be put in (*data_bit)

**Parameters**
- **uart_num**: UART port number, the max port number is (UART_NUM_MAX -1).
- **data_bit**: UART data bits

```c
esp_err_t uart_set_stop_bits(uart_port_t uart_num, uart_stop_bits_t stop_bits)
```

Set UART stop bits.

**Return**
- ESP_OK Success
- ESP_FAIL Fail

**Parameters**
- **uart_num**: UART port number, the max port number is (UART_NUM_MAX -1).
- **stop_bits**: UART stop bits

```c
esp_err_t uart_get_stop_bits(uart_port_t uart_num, uart_stop_bits_t *stop_bits)
```

Get the UART stop bit configuration.

**Return**
- ESP_FAIL Parameter error
- ESP_OK Success, result will be put in (*stop_bit)

**Parameters**
- **uart_num**: UART port number, the max port number is (UART_NUM_MAX -1).
- **stop_bits**: UART stop bits

```c
esp_err_t uart_set_parity(uart_port_t uart_num, uart_parity_t parity_mode)
```

Set UART parity mode.

**Return**
Chapter 2. API Reference

- ESP_FAIL Parameter error
- ESP_OK Success

Parameters
- uart_num: UART port number, the max port number is (UART_NUM_MAX -1).
- parity_mode: the enum of uart parity configuration

esp_err_t uart_get_parity(uart_port_t uart_num, uart_parity_t *parity_mode)

Get the UART parity mode configuration.

Return
- ESP_FAIL Parameter error
- ESP_OK Success, result will be put in (*parity_mode)

Parameters
- uart_num: UART port number, the max port number is (UART_NUM_MAX -1).
- parity_mode: Pointer to accept value of UART parity mode.

esp_err_t uart_set_baudrate(uart_port_t uart_num, uint32_t baudrate)

Set UART baud rate.

Return
- ESP_FAIL Parameter error
- ESP_OK Success

Parameters
- uart_num: UART port number, the max port number is (UART_NUM_MAX -1).
- baudrate: UART baud rate.

esp_err_t uart_get_baudrate(uart_port_t uart_num, uint32_t *baudrate)

Get the UART baud rate configuration.

Return
- ESP_FAIL Parameter error
- ESP_OK Success, result will be put in (*baudrate)

Parameters
- uart_num: UART port number, the max port number is (UART_NUM_MAX -1).
- baudrate: Pointer to accept value of UART baud rate

esp_err_t uart_set_line_inverse(uart_port_t uart_num, uint32_t inverse_mask)

Set UART line inverse mode.

Return
- ESP_OK Success
- ESP_FAIL Parameter error

Parameters
- uart_num: UART port number, the max port number is (UART_NUM_MAX -1).
- inverse_mask: Choose the wires that need to be inverted. Using the ORred mask of
class uart_signal_inv_t

esp_err_t uart_set_hw_flow_ctrl(uart_port_t uart_num, uart_hw_flowcontrol_t flow_ctrl, uint8_t rx_thresh)

Set hardware flow control.

Return
- ESP_OK Success
- ESP_FAIL Parameter error

Parameters
- uart_num: UART port number, the max port number is (UART_NUM_MAX -1).
- flow_ctrl: Hardware flow control mode
- rx_thresh: Threshold of Hardware RX flow control (0 ~ UART_FIFO_LEN). Only when
  UART_HW_FLOWCTRL_RTS is set, will the rx_thresh value be set.

esp_err_t uart_set_sw_flow_ctrl(uart_port_t uart_num, bool enable, uint8_t rx_thresh_xon, uint8_t rx_thresh_xoff)

Set software flow control.
Return
• ESP_OK Success
• ESP_FAIL Parameter error

Parameters
• uart_num: UART_NUM_0, UART_NUM_1 or UART_NUM_2
• enable: switch on or off
• rx_thresh_xon: low water mark
• rx_thresh_xoff: high water mark

esp_err_t uart_get_hw_flow_ctrl (uart_port_t uart_num, uart_hw_flowcontrol_t *flow_ctrl)
Get the UART hardware flow control configuration.

Return
• ESP_FAIL Parameter error
• ESP_OK Success, result will be put in (*flow_ctrl)

Parameters
• uart_num: UART port number, the max port number is (UART_NUM_MAX -1).
• flow_ctrl: Option for different flow control mode.

esp_err_t uart_clear_intr_status (uart_port_t uart_num, uint32_t clr_mask)
Clear UART interrupt status.

Return
• ESP_OK Success
• ESP_FAIL Parameter error

Parameters
• uart_num: UART port number, the max port number is (UART_NUM_MAX -1).
• clr_mask: Bitmask of the interrupt status to be cleared.

esp_err_t uart_enable_intr_mask (uart_port_t uart_num, uint32_t enable_mask)
Set UART interrupt enable.

Return
• ESP_OK Success
• ESP_FAIL Parameter error

Parameters
• uart_num: UART port number, the max port number is (UART_NUM_MAX -1).
• enable_mask: Bitmask of the enable bits.

esp_err_t uart_disable_intr_mask (uart_port_t uart_num, uint32_t disable_mask)
Clear UART interrupt enable bits.

Return
• ESP_OK Success
• ESP_FAIL Parameter error

Parameters
• uart_num: UART port number, the max port number is (UART_NUM_MAX -1).
• disable_mask: Bitmask of the disable bits.

esp_err_t uart_enable_rx_intr (uart_port_t uart_num)
Enable UART RX interrupt (RX_FULL & RX_TIMEOUT INTERRUPT)

Return
• ESP_OK Success
• ESP_FAIL Parameter error

Parameters
• uart_num: UART port number, the max port number is (UART_NUM_MAX -1).

esp_err_t uart_disable_rx_intr (uart_port_t uart_num)
Disable UART RX interrupt (RX_FULL & RX_TIMEOUT INTERRUPT)

Return
• ESP_OK Success
• ESP_FAIL Parameter error
Parameters

- **uart_num**: UART port number, the max port number is (UART_NUM_MAX - 1).

```c
esp_err_t uart_disable_tx_intr(uart_port_t uart_num)
```

Disable UART TX interrupt (TX_FULL & TX_TIMEOUT INTERRUPT)

**Return**

- ESP_OK Success
- ESP_FAIL Parameter error

**Parameters**

- **uart_num**: UART port number

```c
esp_err_t uart_enable_tx_intr(uart_port_t uart_num, int enable, int thresh)
```

Enable UART TX interrupt (TX_FULL & TX_TIMEOUT INTERRUPT)

**Return**

- ESP_OK Success
- ESP_FAIL Parameter error

**Parameters**

- **uart_num**: UART port number, the max port number is (UART_NUM_MAX - 1).
- **enable**: 1: enable; 0: disable
- **thresh**: Threshold of TX interrupt, 0 ~ UART_FIFO_LEN

```c
esp_err_t uart_isr_register(uart_port_t uart_num, void (*fn)(void *) void *, void *arg, esp_intr_alloc_flags intr_alloc_flags, uart_isr_handle_t *handle)
```

Register UART interrupt handler (ISR).

**Note**

UART ISR handler will be attached to the same CPU core that this function is running on.

**Return**

- ESP_OK Success
- ESP_FAIL Parameter error

**Parameters**

- **uart_num**: UART port number, the max port number is (UART_NUM_MAX - 1).
- **fn**: Interrupt handler function.
- **arg**: parameter for handler function
- **intr_alloc_flags**: Flags used to allocate the interrupt. One or multiple (ORred) ESP_INTR_FLAG_* values. See esp_intr_alloc.h for more info.
- **handle**: Pointer to return handle. If non-NULL, a handle for the interrupt will be returned here.

```c
esp_err_t uart_isr_free(uart_port_t uart_num)
```

Free UART interrupt handler registered by uart_isr_register. Must be called on the same core as uart_isr_register was called.

**Return**

- ESP_OK Success
- ESP_FAIL Parameter error

**Parameters**

- **uart_num**: UART port number, the max port number is (UART_NUM_MAX - 1).

```c
esp_err_t uart_set_pin(uart_port_t uart_num, int tx_io_num, int rx_io_num, int rts_io_num, int cts_io_num)
```

Assign signals of a UART peripheral to GPIO pins.

**Note**

If the GPIO number configured for a UART signal matches one of the IOMUX signals for that GPIO, the signal will be connected directly via the IOMUX. Otherwise the GPIO and signal will be connected via the GPIO Matrix. For example, if on an ESP32 the call `uart_set_pin(0, 1, 3, -1, -1)` is performed, as GPIO1 is UART0’s default TX pin and GPIO3 is UART0’s default RX pin, both will be connected to respectively U0TXD and U0RXD through the IOMUX, totally bypassing the GPIO matrix. The check is performed on a per-pin basis. Thus, it is possible to have RX pin binded to a GPIO through the GPIO matrix, whereas TX is binded to its GPIO through the IOMUX.

**Note**

Internal signal can be output to multiple GPIO pads. Only one GPIO pad can connect with input signal.

**Return**

- ESP_OK Success
- ESP_FAIL Parameter error
Chapter 2. API Reference

Parameters
- uart_num: UART port number, the max port number is (UART_NUM_MAX - 1).
- tx_io_num: UART TX pin GPIO number.
- rx_io_num: UART RX pin GPIO number.
- rts_io_num: UART RTS pin GPIO number.
- cts_io_num: UART CTS pin GPIO number.

\[
\text{esp_err_t uart_set_rts}(\text{uart_port_t} \text{ uart_num}, \text{int} \text{ level})
\]
Manually set the UART RTS pin level.

Note UART must be configured with hardware flow control disabled.

Return
- ESP_OK Success
- ESP_FAIL Parameter error

Parameters
- uart_num: UART port number, the max port number is (UART_NUM_MAX - 1).
- level: 1: RTS output low (active); 0: RTS output high (block)

\[
\text{esp_err_t uart_set_dtr}(\text{uart_port_t} \text{ uart_num}, \text{int} \text{ level})
\]
Manually set the UART DTR pin level.

Return
- ESP_OK Success
- ESP_FAIL Parameter error

Parameters
- uart_num: UART port number, the max port number is (UART_NUM_MAX - 1).
- level: 1: DTR output low; 0: DTR output high

\[
\text{esp_err_t uart_set_tx_idle_num}(\text{uart_port_t} \text{ uart_num}, \text{uint16_t} \text{ idle_num})
\]
Set UART idle interval after tx FIFO is empty.

Return
- ESP_OK Success
- ESP_FAIL Parameter error

Parameters
- uart_num: UART port number, the max port number is (UART_NUM_MAX - 1).
- idle_num: idle interval after tx FIFO is empty (unit: the time it takes to send one bit under current baudrate)

\[
\text{esp_err_t uart_param_config}(\text{uart_port_t} \text{ uart_num}, \text{const} \text{ uart_config_t} *\text{uart_config})
\]
Set UART configuration parameters.

Return
- ESP_OK Success
- ESP_FAIL Parameter error

Parameters
- uart_num: UART port number, the max port number is (UART_NUM_MAX - 1).
- uart_config: UART parameter settings

\[
\text{esp_err_t uart_intr_config}(\text{uart_port_t} \text{ uart_num}, \text{const} \text{ uart_intr_config_t} *\text{intr_conf})
\]
Configure UART interrupts.

Return
- ESP_OK Success
- ESP_FAIL Parameter error

Parameters
- uart_num: UART port number, the max port number is (UART_NUM_MAX - 1).
- intr_conf: UART interrupt settings

\[
\text{esp_err_t uart_wait_tx_done}(\text{uart_port_t} \text{ uart_num}, \text{TickType_t} \text{ ticks_to_wait})
\]
Wait until UART TX FIFO is empty.

Return
- ESP_OK Success
- ESP_FAIL Parameter error
- ESP_ERR_TIMEOUT Timeout

**Parameters**
- uart_num: UART port number, the max port number is (UART_NUM_MAX - 1).
- ticks_to_wait: Timeout, count in RTOS ticks

int **uart_tx_chars** (uart_port_t uart_num, const char *buffer, uint32_t len)

Send data to the UART port from a given buffer and length.

This function will not wait for enough space in TX FIFO. It will just fill the available TX FIFO and return when the FIFO is full.

**Note** This function should only be used when UART TX buffer is not enabled.

**Return**
- (-1) Parameter error
- OTHERS (>=0) The number of bytes pushed to the TX FIFO

**Parameters**
- uart_num: UART port number, the max port number is (UART_NUM_MAX - 1).
- buffer: data buffer address
- len: data length to send

int **uart_write_bytes** (uart_port_t uart_num, const void *src, size_t size)

Send data to the UART port from a given buffer and length.

If the UART driver’s parameter ‘tx_buffer_size’ is set to zero: This function will not return until all the data have been sent out, or at least pushed into TX FIFO.

Otherwise, if the ‘tx_buffer_size’ > 0, this function will return after copying all the data to tx ring buffer, UART ISR will then move data from the ring buffer to TX FIFO gradually.

**Return**
- (-1) Parameter error
- OTHERS (>=0) The number of bytes pushed to the TX FIFO

**Parameters**
- uart_num: UART port number, the max port number is (UART_NUM_MAX - 1).
- src: data buffer address
- size: data length to send

int **uart_write_bytes_with_break** (uart_port_t uart_num, const void *src, size_t size, int brk_len)

Send data to the UART port from a given buffer and length.

If the UART driver’s parameter ‘tx_buffer_size’ is set to zero: This function will not return until all the data and the break signal have been sent out. After all data is sent out, send a break signal.

Otherwise, if the ‘tx_buffer_size’ > 0, this function will return after copying all the data to tx ring buffer, UART ISR will then move data from the ring buffer to TX FIFO gradually. After all data sent out, send a break signal.

**Return**
- (-1) Parameter error
- OTHERS (>=0) The number of bytes pushed to the TX FIFO

**Parameters**
- uart_num: UART port number, the max port number is (UART_NUM_MAX - 1).
- src: data buffer address
- size: data length to send
- brk_len: break signal duration(unit: the time it takes to send one bit at current baudrate)

int **uart_read_bytes** (uart_port_t uart_num, void *buf, uint32_t length, TickType_t ticks_to_wait)

UART read bytes from UART buffer.

**Return**
- (-1) Error
- OTHERS (>=0) The number of bytes read from UART FIFO

**Parameters**
Chapter 2. API Reference

- `uart_num`: UART port number, the max port number is UART_NUM_MAX - 1.
- `buf`: pointer to the buffer.
- `length`: data length
- `ticks_to_wait`: sTimeout, count in RTOS ticks

### esp_err_t uart_flush(uart_port_t uart_num)

Alias of `uart_flush_input`. UART ring buffer flush. This will discard all data in the UART RX buffer.

**Note** Instead of waiting the data sent out, this function will clear UART rx buffer. In order to send all the data in tx FIFO, we can use `uart_wait_tx_done` function.

**Return**
- ESP_OK Success
- ESP_FAIL Parameter error

**Parameters**
- `uart_num`: UART port number, the max port number is UART_NUM_MAX - 1.

### esp_err_t uart_flush_input(uart_port_t uart_num)

Clear input buffer, discard all the data in the ring-buffer.

**Note** In order to send all the data in tx FIFO, we can use `uart_wait_tx_done` function.

**Return**
- ESP_OK Success
- ESP_FAIL Parameter error

**Parameters**
- `uart_num`: UART port number, the max port number is UART_NUM_MAX - 1.

### esp_err_t uart_get_buffered_data_len(uart_port_t uart_num, size_t *size)

UART get RX ring buffer cached data length.

**Return**
- ESP_OK Success
- ESP_FAIL Parameter error

**Parameters**
- `uart_num`: UART port number, the max port number is UART_NUM_MAX - 1.
- `size`: Pointer of size_t to accept cached data length

### esp_err_t uart_disable_pattern_det_intr(uart_port_t uart_num)

UART disable pattern detect function. Designed for applications like ‘AT commands’. When the hardware detects a series of one same character, the interrupt will be triggered.

**Return**
- ESP_OK Success
- ESP_FAIL Parameter error

**Parameters**
- `uart_num`: UART port number, the max port number is UART_NUM_MAX - 1.

### esp_err_t uart_enable_pattern_det_baud_intr(uart_port_t uart_num, char pattern_chr, uint8_t chr_num, int chr_tout, int post_idle, int pre_idle)

UART enable pattern detect function. Designed for applications like ‘AT commands’. When the hardware detect a series of one same character, the interrupt will be triggered.

**Return**
- ESP_OK Success
- ESP_FAIL Parameter error

**Parameters**
- `uart_num`: UART port number.
- `pattern_chr`: character of the pattern.
- `chr_num`: number of the character, 8bit value.
- `chr_tout`: timeout of the interval between each pattern characters, 16bit value, unit is the baud-rate cycle you configured. When the duration is more than this value, it will not take this data as at_cmd char.
• **post_idle**: idle time after the last pattern character, 16bit value, unit is the baud-rate cycle you configured. When the duration is less than this value, it will not take the previous data as the last at_cmd char.

• **pre_idle**: idle time before the first pattern character, 16bit value, unit is the baud-rate cycle you configured. When the duration is less than this value, it will not take this data as the first at_cmd char.

```c
int uart_pattern_pop_pos(uart_port_t uart_num)
```

Return the nearest detected pattern position in buffer. The positions of the detected pattern are saved in a queue, this function will dequeue the first pattern position and move the pointer to next pattern position.

The following APIs will modify the pattern position info: uart_flush_input, uart_read_bytes, uart_driver_delete, uart_pop_pattern_pos. It is the application’s responsibility to ensure atomic access to the pattern queue and the rx data buffer when using pattern detect feature.

**Note** If the RX buffer is full and flow control is not enabled, the detected pattern may not be found in the rx buffer due to overflow.

**Return**
- (-1) No pattern found for current index or parameter error
- others the pattern position in rx buffer.

**Parameters**
- `uart_num`: UART port number, the max port number is (UART_NUM_MAX -1).

```c
int uart_pattern_get_pos(uart_port_t uart_num)
```

Return the nearest detected pattern position in buffer. The positions of the detected pattern are saved in a queue, this function do nothing to the queue.

The following APIs will modify the pattern position info: uart_flush_input, uart_read_bytes, uart_driver_delete, uart_pop_pattern_pos. It is the application’s responsibility to ensure atomic access to the pattern queue and the rx data buffer when using pattern detect feature.

**Note** If the RX buffer is full and flow control is not enabled, the detected pattern may not be found in the rx buffer due to overflow.

**Return**
- (-1) No pattern found for current index or parameter error
- others the pattern position in rx buffer.

**Parameters**
- `uart_num`: UART port number, the max port number is (UART_NUM_MAX -1).

```c
esp_err_t uart_pattern_queue_reset(uart_port_t uart_num, int queue_length)
```

Allocate a new memory with the given length to save record the detected pattern position in rx buffer.

**Return**
- ESP_ERR_NO_MEM No enough memory
- ESP_ERR_INVALID_STATE Driver not installed
- ESP_FAIL Parameter error
- ESP_OK Success

**Parameters**
- `uart_num`: UART port number, the max port number is (UART_NUM_MAX -1).
- `queue_length`: Max queue length for the detected pattern. If the queue length is not large enough, some pattern positions might be lost. Set this value to the maximum number of patterns that could be saved in data buffer at the same time.

```c
esp_err_t uart_set_mode(uart_port_t uart_num, uart_mode_t mode)
```

UART set communication mode.

**Note** This function must be executed after uart_driver_install(), when the driver object is initialized.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- `uart_num`: Uart number to configure, the max port number is (UART_NUM_MAX -1).
• mode: UART UART mode to set

```c
esp_err_t uart_set_rx_full_threshold(uart_port_t uart_num, int threshold)
```

Set uart threshold value for RX fifo full.

**Note** If application is using higher baudrate and it is observed that bytes in hardware RX fifo are overwritten then this threshold can be reduced

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_INVALID_STATE Driver is not installed

**Parameters**
- `uart_num`: UART_NUM_0, UART_NUM_1 or UART_NUM_2
- `threshold`: Threshold value above which RX fifo full interrupt is generated

```c
esp_err_t uart_set_tx_empty_threshold(uart_port_t uart_num, int threshold)
```

Set uart threshold values for TX fifo empty.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_INVALID_STATE Driver is not installed

**Parameters**
- `uart_num`: UART_NUM_0, UART_NUM_1 or UART_NUM_2
- `threshold`: Threshold value below which TX fifo empty interrupt is generated

```c
esp_err_t uart_set_rx_timeout(uart_port_t uart_num, const uint8_t tout_thresh)
```

UART set threshold timeout for TOUT feature.

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_INVALID_STATE Driver is not installed

**Parameters**
- `uart_num`: Uart number to configure, the max port number is (UART_NUM_MAX -1).
- `tout_thresh`: This parameter defines timeout threshold in uart symbol periods. The maximum value of threshold is 126. tout_thresh = 1, defines TOUT interrupt timeout equal to transmission time of one symbol (~11 bit) on current baudrate. If the time is expired the UART_RXFIFO_TOUT_INT interrupt is triggered. If tout_thresh == 0, the TOUT feature is disabled.

```c
esp_err_t uart_get_collision_flag(uart_port_t uart_num, bool *collision_flag)
```

Returns collision detection flag for RS485 mode Function returns the collision detection flag into variable pointed by collision_flag. *collision_flag = true, if collision detected else it is equal to false. This function should be executed when actual transmission is completed (after uart_write_bytes()).

**Return**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

**Parameters**
- `uart_num`: Uart number to configure the max port number is (UART_NUM_MAX -1).
- `collision_flag`: Pointer to variable of type bool to return collision flag.

```c
esp_err_t uart_set_wakeup_threshold(uart_port_t uart_num, int wakeup_threshold)
```

Set the number of RX pin signal edges for light sleep wakeup.

UART can be used to wake up the system from light sleep. This feature works by counting the number of positive edges on RX pin and comparing the count to the threshold. When the count exceeds the threshold, system is woken up from light sleep. This function allows setting the threshold value.

Stop bit and parity bits (if enabled) also contribute to the number of edges. For example, letter ‘a’ with ASCII code 97 is encoded as 0100001101 on the wire (with 8n1 configuration), start and stop bits included. This sequence has 3 positive edges (transitions from 0 to 1). Therefore, to wake up the system when ‘a’ is sent, set wakeup_threshold=3.
The character that triggers wakeup is not received by UART (i.e. it can not be obtained from UART FIFO). Depending on the baud rate, a few characters after that will also not be received. Note that when the chip enters and exits light sleep mode, APB frequency will be changing. To make sure that UART has correct baud rate all the time, select REF_TICK as UART clock source, by setting use_ref_tick field in `uart_config_t` to true.

**Note** in ESP32, the wakeup signal can only be input via IO_MUX (i.e. GPIO3 should be configured as function_1 to wake up UART0, GPIO9 should be configured as function_5 to wake up UART1), UART2 does not support light sleep wakeup feature.

**Return**

- ESP_OK on success
- ESP_ERR_INVALID_ARG if uart_num is incorrect or wakeup_threshold is outside of [3, 0x3ff] range.

**Parameters**

- `uart_num`: UART number, the max port number is (UART_NUM_MAX -1).
- `wakeup_threshold`: number of RX edges for light sleep wakeup, value is 3 .. 0x3ff.

`esp_err_t uart_get_wakeup_threshold(uart_port_t uart_num, int *out_wakeup_threshold)`

Get the number of RX pin signal edges for light sleep wakeup.

See description of `uart_set_wakeup_threshold` for the explanation of UART wakeup feature.

**Return**

- ESP_OK on success
- ESP_ERR_INVALID_ARG if `out_wakeup_threshold` is NULL

**Parameters**

- `uart_num`: UART number, the max port number is (UART_NUM_MAX -1).
- `out_wakeup_threshold`: output, set to the current value of wakeup threshold for the given UART.

`esp_err_t uart_wait_tx_idle_polling(uart_port_t uart_num)`

Wait until UART tx memory empty and the last char send ok (polling mode).

**Return**

- ESP_OK on success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_FAIL Driver not installed

**Parameters**

- `uart_num`: UART number

`esp_err_t uart_set_loop_back(uart_port_t uart_num, bool loop_back_en)`

Configure TX signal loop back to RX module, just for the test usage.

**Return**

- ESP_OK on success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_FAIL Driver not installed

**Parameters**

- `uart_num`: UART number
- `loop_back_en`: Set true to enable the loop back function, else set it false.

`void uart_set_always_rx_timeout(uart_port_t uart_num, bool always_rx_timeout_en)`

Configure behavior of UART RX timeout interrupt.

When `always_rx_timeout` is true, timeout interrupt is triggered even if FIFO is full. This function can cause extra timeout interrupts triggered only to send the timeout event. Call this function only if you want to ensure timeout interrupt will always happen after a byte stream.

**Parameters**

- `uart_num`: UART number
- `always_rx_timeout_en`: Set to false enable the default behavior of timeout interrupt, set it to true to always trigger timeout interrupt.
Structures

struct uart_intr_config_t

UART interrupt configuration parameters for uart_intr_config function.

Public Members

- uint32_t intr_enable_mask
  UART interrupt enable mask, choose from UART_XXXX_INT_ENA_M under
  UART_INT_ENA_REG(i), connect with bit-or operator

- uint8_t rx_timeout_thresh
  UART timeout interrupt threshold (unit: time of sending one byte)

- uint8_t txfifo_empty_intr_thresh
  UART TX empty interrupt threshold.

- uint8_t rxfifo_full_thresh
  UART RX full interrupt threshold.

struct uart_event_t

Event structure used in UART event queue.

Public Members

- uart_event_type_t type
  UART event type

- size_t size
  UART data size for UART_DATA event

- bool timeout_flag
  UART data read timeout flag for UART_DATA event (no new data received during configured RX
  TOUT) If the event is caused by FIFO-full interrupt, then there will be no event with the timeout flag
  before the next byte coming.

Macros

- UART_NUM_0
  UART port 0

- UART_NUM_1
  UART port 1

- UART_NUM_2
  UART port 2

- UART_NUM_MAX
  UART port max

- UART_PIN_NO_CHANGE

- UART_FIFO_LEN
  Length of the UART HW FIFO.

- UART_BITRATE_MAX
  Maximum configurable bitrate.

Type Definitions

typedef intr_handle_t uart_isr_handle_t
Enumerations

```c
enum uart_event_type_t
{
    UART_DATA,          // UART data event
    UART_BREAK,         // UART break event
    UART_BUFFER_FULL,   // UART RX buffer full event
    UART_FIFO_OVF,      // UART FIFO overflow event
    UART_FRAME_ERR,     // UART RX frame error event
    UART_PARITY_ERR,    // UART RX parity event
    UART_TX_BREAK,      // UART TX data and break event
    UART_PATTERN_DET,   // UART pattern detected
    UART_EVENT_MAX,     // UART event max index
};
```

Header File

- components/hal/include/hal/uart_types.h

Structures

```c
struct uart_at_cmd_t
{
    uint8_t cmd_char; // UART AT cmd char configuration parameters. Note that this function may differ on different chip. Please refer to the TRM at configuration.
    uint8_t char_num; // AT cmd char repeat number
    uint32_t gap_tout; // gap time (in baud-rate) between AT cmd char
    uint32_t pre_idle; // the idle time (in baud-rate) between the non AT char and first AT char
    uint32_t post_idle; // the idle time (in baud-rate) between the last AT char and the none AT char
};
```

```c
struct uart_sw_flowctrl_t
{
    uint32_t pre_idle; // the idle time (in baud-rate) between the non AT char and first AT char
    uint32_t post_idle; // the idle time (in baud-rate) between the last AT char and the none AT char
};
```
Public Members

uint8_t xon_char
Xon flow control char

uint8_t xoff_char
Xoff flow control char

uint8_t xon_thrd
If the software flow control is enabled and the data amount in rxfifo is less than xon_thrd, an xon_char will be sent

uint8_t xoff_thrd
If the software flow control is enabled and the data amount in rxfifo is more than xoff_thrd, an xoff_char will be sent

struct uart_config_t
UART configuration parameters for uart_param_config function.

Public Members

int baud_rate
UART baud rate

uint8_t data_bits
UART byte size

uint8_t parity
UART parity mode

uint8_t stop_bits
UART stop bits

uint8_t flow_ctrl
UART HW flow control mode (cts/rts)

uint8_t rx_flow_ctrl_thresh
UART HW RTS threshold

uint8_t source_clk
UART source clock selection

bool use_ref_tick
Deprecated method to select ref tick clock source, set source_clk field instead

Type Definitions
typedef int uart_port_t
UART port number, can be UART_NUM_0 ~ (UART_NUM_MAX -1).

Enumerations
enum uart_mode_t
UART mode selection.

Values:

UART_MODE_UART = 0x00
mode: regular UART mode

UART_MODE_RS485_HALF_DUPLEX = 0x01
mode: half duplex RS485 UART mode control by RTS pin

UART_MODE_IRDA = 0x02
mode: IRDA UART mode
UART_MODE_RS485_COLLISION_DETECT = 0x03
mode: RS485 collision detection UART mode (used for test purposes)

UART_MODE_RS485_APP_CTRL = 0x04
mode: application control RS485 UART mode (used for test purposes)

enum uart_word_length_t
UART word length constants.
Values:

UART_DATA_5_BITS = 0x0
word length: 5bits

UART_DATA_6_BITS = 0x1
word length: 6bits

UART_DATA_7_BITS = 0x2
word length: 7bits

UART_DATA_8_BITS = 0x3
word length: 8bits

UART_DATA_BITS_MAX = 0x4

enum uart_stop_bits_t
UART stop bits number.
Values:

UART_STOP_BITS_1 = 0x1
stop bit: 1bit

UART_STOP_BITS_1_5 = 0x2
stop bit: 1.5bits

UART_STOP_BITS_2 = 0x3
stop bit: 2bits

UART_STOP_BITS_MAX = 0x4

enum uart_parity_t
UART parity constants.
Values:

UART_PARITY_DISABLE = 0x0
Disable UART parity

UART_PARITY_EVEN = 0x2
Enable UART even parity

UART_PARITY_ODD = 0x3
Enable UART odd parity

enum uart_hw_flowcontrol_t
UART hardware flow control modes.
Values:

UART_HW_FLOWCTRL_DISABLE = 0x0
disable hardware flow control

UART_HW_FLOWCTRL_RTS = 0x1
enable RX hardware flow control (rts)

UART_HW_FLOWCTRL_CTS = 0x2
enable TX hardware flow control (cts)

UART_HW_FLOWCTRL_CTS_RTS = 0x3
enable hardware flow control
Chapter 2. API Reference

UART_HW_FLOWCTRL_MAX = 0x4

enum uart_signal_inv_t
    UART signal bit map.
    Values:

    UART_SIGNAL_INV_DISABLE = 0
        Disable UART signal inverse

    UART_SIGNAL_IRDA_TX_INV  = (0x1 << 0)
        Inverse the UART irda_tx signal

    UART_SIGNAL_IRDA_RX_INV  = (0x1 << 1)
        Inverse the UART irda_rx signal

    UART_SIGNAL_RXD_INV  = (0x1 << 2)
        Inverse the UART rxd signal

    UART_SIGNAL_CTS_INV  = (0x1 << 3)
        Inverse the UART cts signal

    UART_SIGNAL_DSR_INV  = (0x1 << 4)
        Inverse the UART dsr signal

    UART_SIGNAL_TXD_INV  = (0x1 << 5)
        Inverse the UART txd signal

    UART_SIGNAL_RTS_INV  = (0x1 << 6)
        Inverse the UART rts signal

    UART_SIGNAL_DTR_INV  = (0x1 << 7)
        Inverse the UART dtr signal

enum uart_sclk_t
    UART source clock.
    Values:

    UART_SCLK_APB  = 0x0
        UART source clock from APB

    UART_SCLK_RTC  = 0x1
        UART source clock from RTC

    UART_SCLK_XTAL  = 0x2
        UART source clock from XTAL

GPIO Lookup Macros  The UART peripherals have dedicated IO_MUX pins to which they are connected directly. However, signals can also be routed to other pins using the less direct GPIO matrix. To use direct routes, you need to know which pin is a dedicated IO_MUX pin for a UART channel. GPIO Lookup Macros simplify the process of finding and assigning IO_MUX pins. You choose a macro based on either the IO_MUX pin number, or a required UART channel name, and the macro will return the matching counterpart for you. See some examples below.

    Note:  These macros are useful if you need very high UART baud rates (over 40 MHz), which means you will have to use IO_MUX pins only. In other cases, these macros can be ignored, and you can use the GPIO Matrix as it allows you to configure any GPIO pin for any UART function.

    1. UART_NUM_2_TXD_DIRECT_GPIO_NUM  returns the IO_MUX pin number of UART channel 2 TXD pin (pin 17)
    2. UART_GPIO19_DIRECT_CHANNEL  returns the UART number of GPIO 19 when connected to the UART peripheral via IO_MUX (this is UART_NUM_0)
3. **UART_CTS_GPIO19_DIRECT_CHANNEL** returns the UART number of GPIO 19 when used as the UART CTS pin via IO_MUX (this is UART_NUM_0). Similar to the above macro but specifies the pin function which is also part of the IO_MUX assignment.

**Header File**
- components/soc/esp32s3/include/soc/uart_channel.h

**Macros**
- UART_GPIO1_DIRECT_CHANNEL
- UART_NUM_0_TXD_DIRECT_GPIO_NUM

- UART_TXD_GPIO17_DIRECT_CHANNEL
2.3.23 USB Device Driver

Overview

The driver allows users to use ESP32-S3 chips to develop USB devices on top the TinyUSB stack. TinyUSB is integrating with ESP-IDF to provide USB features of the framework. Using this driver the chip works as a composite device supporting to represent several USB devices simultaneously. Currently, only the communications device class (CDC) type of the device with the ACM (Abstract Control Model) subclass is supported.

Features

- Configuration of device and string USB descriptors
- USB Serial Device (CDC-ACM)
- Input and output through USB Serial Device

Hardware USB Connection

- Any board with the ESP32-S3 chip with USB connectors or with exposed USB’s D+ and D- (DATA+/DATA-) pins.

If the board has no USB connector but has the pins, connect pins directly to the host (e.g. with do-it-yourself cable from any USB connection cable).

On ESP32-S3, connect GPIO 20 and 19 to D+/D- respectively:

Driver Structure

As the basis is used the TinyUSB stack.

On top of it the driver implements:

- Customization of USB descriptors
- Serial device support
- Redirecting of standard streams through the Serial device
- Encapsulated driver’s task servicing the TinyUSB
Chapter 2. API Reference

Configuration

Via Menuconfig options you can specify:

- Several of descriptor’s parameters (see: Descriptors Configuration below)
- USB Serial low-level Configuration
- The verbosity of the TinyUSB’s log
- Disable the TinyUSB main task (for the custom implementation)

Descriptors Configuration  The driver’s descriptors are provided by the `tinyusb_config_t` structure’s descriptor and string_descriptor members. Therefore, users should initialize `tinyusb_config_t` to their desired descriptor before calling `tinyusb_driver_install()` to install driver.

However, the driver also provides a default descriptor. The driver can be installed with the default descriptor by setting the descriptor and string_descriptor members of `tinyusb_config_t` to `NULL` before calling `tinyusb_driver_install()`. The driver’s default descriptor is specified using Menuconfig, where the following fields should be configured:

- PID
- VID
- bcdDevice
- Manufacturer
- Product name
- Name of CDC device if it is On
- Serial number

If you want to use own descriptors with extended modification, you can define them during the driver installation process.

Install Driver

To initialize the driver, users should call `tinyusb_driver_install()`. The driver’s configuration is specified in a `tinyusb_config_t` structure that is passed as an argument to `tinyusb_driver_install()`.

Note that the `tinyusb_config_t` structure can be zero initialized (e.g. `tinyusb_config_t tusb_cfg = { 0 }`) or partially (as shown below). For any member that is initialized to 0 or `NULL`, the driver will use its default configuration values for that member (see example below)

```c
tinyusb_config_t partial_init = {
    .descriptor = NULL;  //Uses default descriptor specified in Menuconfig
    .string_descriptor = NULL;  //Uses default string specified in Menuconfig
    .external_phy = false;
}
```

USB Serial Device (CDC-ACM)

If the CDC option is enabled in Menuconfig, the USB Serial Device could be initialized with `tusb_cdc_acm_init()` according to the settings from `tinyusb_config_cdcacm_t` (see example below).

```c
tinyusb_config_cdcacm_t amc_cfg = {
    .usb_dev = TINYUSB_USBDEV_0,
    .cdc_port = TINYUSB_CDC_ACM_0,
    .rx_unread_buf_sz = 64,
    .callback_rx = NULL,
    .callback_rx_wanted_char = NULL,
    .callback_line_state_changed = NULL,
    .callback_line_coding_changed = NULL
}
```

(continues on next page)
To specify callbacks you can either set the pointer to your `tusb_cdcacm_callback_t` function in the configuration structure or call `tinyusb_cdcacm_register_callback()` after initialization.

**USB Serial Console** The driver allows to redirect all standard application strings (stdin/out/err) to the USB Serial Device and return them to UART using `esp_tusb_init_console()`/`esp_tusb_deinit_console()` functions.

**Application Examples**

The table below describes the code examples available in the directory `peripherals/usb`.

<table>
<thead>
<tr>
<th>Code Example</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>peripherals/usb/tusb_console</td>
<td>How to set up ESP32-S3 chip to get log output via Serial Device connection</td>
</tr>
<tr>
<td>peripherals/usb/tusb_sample_descriptor</td>
<td>How to set up ESP32-S3 chip to work as a Generic USB Device with a user-defined descriptor</td>
</tr>
<tr>
<td>peripherals/usb/tusb_serial_device</td>
<td>How to set up ESP32-S3 chip to work as a USB Serial Device</td>

</tbody>
</table>

**API Reference**

**Header File**

- components/tinyusb/additions/include/tinyusb.h

**Functions**

`esp_err_t tinyusb_driver_install(const tinyusb_config_t *config)`

This is an all-in-one helper function, including:

1. USB device driver initialization
2. Descriptors preparation
3. TinyUSB stack initialization
4. Creates and start a task to handle usb events

**Note** Don’t change Custom descriptor, but if it has to be done, Suggest to define as follows in order to match the Interface Association Descriptor (IAD): `bDeviceClass = TUSB_CLASS_MISC, bDeviceSubClass = MISC_SUBCLASS_COMMON`,

**Parameters**

- `config`: tinyusb stack specific configuration

**Return Value**

- `ESP_ERR_INVALID_ARG`: Install driver and tinyusb stack failed because of invalid argument
- `ESP_FAIL`: Install driver and tinyusb stack failed because of internal error
- `ESP_OK`: Install driver and tinyusb stack successfully

**Structures**

`struct tinyusb_config_t`

Configuration structure of the tinyUSB core.

**Public Members**

- `tusb_desc_device_t *descriptor`: Pointer to a device descriptor
const char **string_descriptor
   Pointer to an array of string descriptors

bool external_phy
   Should USB use an external PHY

Header File
   - components/tinyusb/additions/include/tinyusb_types.h

Macros
   USB_ESPRESSIF_VID
   USB_STRING_DESCRIPTOR_ARRAY_SIZE

Type Definitions
   typedef const char *tusb_desc_strarray_device_t[USB_STRING_DESCRIPTOR_ARRAY_SIZE]

Enumerations
   enum tinyusb_usbdev_t
      Values:
      TINYUSB_USBDEV_0

Header File
   - components/tinyusb/additions/include/tusb_cdc_acm.h

Functions
   esp_err_t tusb_cdc_acm_init (const tinyusb_config_cdcacm_t *cfg)
      Initialize CDC ACM. Initialization will be finished with the tud_cdc_line_state_cb callback.
      Return esp_err_t
      Parameters
      • cfg: - init configuration structure

   esp_err_t tusb_cdcacm_register_callback (tinyusb_cdcacm_itf_t itf, cdcacm_event_type_t event_type, tusb_cdcacm_callback_t callback)
      Register a callback invoking on CDC event. If the callback had been already registered, it will be overwritten.
      Return esp_err_t - ESP_OK or ESP_ERR_INVALID_ARG
      Parameters
      • itf: - number of a CDC object
      • event_type: - type of registered event for a callback
      • callback: - callback function

   esp_err_t tusb_cdcacm_unregister_callback (tinyusb_cdcacm_itf_t itf, cdcacm_event_type_t event_type)
      Unregister a callback invoking on CDC event.
      Return esp_err_t - ESP_OK or ESP_ERR_INVALID_ARG
      Parameters
      • itf: - number of a CDC object
      • event_type: - type of registered event for a callback

   size_t tusb_cdcacm_write_queue_char (tinyusb_cdcacm_itf_t itf, char ch)
      Sent one character to a write buffer.
      Return size_t - amount of queued bytes
      Parameters
      • itf: - number of a CDC object
Chapter 2. API Reference

• ch: - character to send

```c
size_t tinyusb_cdcacm_write_queue(tinyusb_cdcacm_itf_t itf, const uint8_t *in_buf, size_t in_size)
```
Write data to write buffer from a byte array.

**Return**  size_t - amount of queued bytes

**Parameters**

• itf: - number of a CDC object
• in_buf: - a source array
• in_size: - size to write from arr_src

```c
esp_err_t tinyusb_cdcacm_write_flush(tinyusb_cdcacm_itf_t itf, uint32_t timeout_ticks)
```
Send all data from a write buffer. Use `tinyusb_cdcacm_write_queue` to add data to the buffer.

**WARNING!** TinyUSB can block output Endpoint for several RX callbacks, after will do additional flush after the each transfer. That can lead to the situation when you requested a flush, but it will fail until out of the next callbacks ends. SO USING OF THE FLUSH WITH TIMEOUTS IN CALLBACKS IS NOT RECOMMENDED - YOU CAN GET A LOCK FOR THE TIMEOUT

**Return**  esp_err_t - ESP_OK if (timeout_ticks > 0) and and flush was successful, ESP_ERR_TIMEOUT if timeout occurred or flush was successful with (timeout_ticks == 0) ESP_FAIL if flush was unsuccessful

**Parameters**

• itf: - number of a CDC object
• timeout_ticks: - waiting until flush will be considered as failed

```c
esp_err_t tinyusb_cdcacm_read(tinyusb_cdcacm_itf_t itf, uint8_t *out_buf, size_t out_buf_sz, size_t *rx_data_size)
```
Read a content to the array, and defines it’s size to the sz_store.

**Return**  esp_err_t ESP_OK, ESP_FAIL or ESP_ERR_INVALID_STATE

**Parameters**

• itf: - number of a CDC object
• out_buf: - to this array will be stored the object from a CDC buffer
• out_buf_sz: - size of buffer for results
• rx_data_size: - to this address will be stored the object’s size

```c
bool tusb_cdc_acm_initialized(tinyusb_cdcacm_itf_t itf)
```
Check if the ACM initialized.

**Return**  true or false

**Parameters**

• itf: - number of a CDC object

**Structures**

```c
struct cdcacm_event_rx_wanted_char_data_t
```
Data provided to the input of the callback_rx_wanted_char callback.

**Public Members**

```c
char wanted_char
```
Wanted character

```c
struct cdcacm_event_line_state_changed_data_t
```
Data provided to the input of the callback_line_state_changed callback.

**Public Members**

```c
bool dtr
```
Data Terminal Ready (DTR) line state
bool rts
    Request To Send (RTS) line state

struct cdcacm_event_line_coding_changed_data_t
    Data provided to the input of the line_coding_changed callback.

Public Members

cdc_line_coding_t const *p_line_coding
    New line coding value

struct cdcacm_event_t
    Describes an event passing to the input of a callbacks.

Public Members

cdcacm_event_type_t type
    Event type

cdcacm_event_rx_wanted_char_data_t rx_wanted_char_data
    Data input of the callback_rx_wanted_char callback

cdcacm_event_line_state_changed_data_t line_state_changed_data
    Data input of the callback_line_state_changed callback

cdcacm_event_line_coding_changed_data_t line_coding_changed_data
    Data input of the line_coding_changed callback

struct tinyusb_config_cdcacm_t
    Configuration structure for CDC-ACM.

Public Members

tinyusb_usbdev_t usb_dev
    Usb device to set up

tinyusb_cdcacm_if_t cdc_port
    CDC port

size_t rx_unread_buf_sz
    Amount of data that can be passed to the AMC at once

tusb_cdcacm_callback_t callback_rx
    Pointer to the function with the tusb_cdcacm_callback_t type that will be handled as a callback

tusb_cdcacm_callback_t callback_rx_wanted_char
    Pointer to the function with the tusb_cdcacm_callback_t type that will be handled as a callback

tusb_cdcacm_callback_t callback_line_state_changed
    Pointer to the function with the tusb_cdcacm_callback_t type that will be handled as a callback

tusb_cdcacm_callback_t callback_line_coding_changed
    Pointer to the function with the tusb_cdcacm_callback_t type that will be handled as a callback

Type Definitions

typedef void (*tusb_cdcacm_callback_t) (int if, cdcacm_event_t *event)
    CDC-ACM callback type.
Enumerations

enum tinyusb_cdcacm_itf_t  
    CDC ports available to setup.
    
    Values:
    
    TINYUSB_CDC_ACM_0 = 0x0

denum cdcacm_event_type_t  
    Types of CDC ACM events.
    
    Values:
    
    CDC_EVENT_RX
    CDC_EVENT_RX_WANTED_CHAR
    CDC_EVENT_LINE_STATE_CHANGED
    CDC_EVENT_LINE_CODING_CHANGED

Header File

- components/tinyusb/additions/include/tusb_console.h

Functions

esp_err_t esp_tusb_init_console(int cdc_intf)  
    Redirect output to the USB serial.
    
    Return esp_err_t - ESP_OK, ESP_FAIL or an error code
    Parameters
    - cdc_intf: - interface number of TinyUSB’s CDC

def esp_err_t esp_tusb_deinit_console(int cdc_intf)  
    Switch log to the default output.
    
    Return esp_err_t
    Parameters
    - cdc_intf: - interface number of TinyUSB’s CDC

Header File

- components/tinyusb/additions/include/tusb_tasks.h

Functions

tusb_run_task (void)  
    This helper function creates and starts a task which wraps tud_task().
    
    The wrapper function basically wraps tud_task and some log. Default parameters: stack size and priority as configured, argument = NULL, not pinned to any core. If you have more requirements for this task, you can create your own task which calls tud_task as the last step.
    
    Return Value
    - ESP_OK: run tinyusb main task successfully
    - ESP_FAIL: run tinyusb main task failed of internal error
    - ESP_ERR_INVALID_STATE: tinyusb main task has been created before

tusb_stop_task (void)  
    This helper function stops and destroys the task created by tusb_run_task()
    
    Return Value
    - ESP_OK: stop and destory tinyusb main task successfully
    - ESP_ERR_INVALID_STATE: tinyusb main task hasn’t been created yet
Chapter 2. API Reference

Header File

- components/tinyusb/additions/include/vfs_tinyusb.h

Functions

`esp_err_t esp_vfs_tusb_cdc_register (int cdc_intf, char const *path)`

Register TinyUSB CDC at VFS with path.

Return: esp_err_t ESP_OK or ESP_FAIL

Parameters

- `cdc_intf`: interface number of TinyUSB’s CDC
- `path`: path where the CDC will be registered, /dev/tusb_cdc will be used if left NULL.

`esp_err_t esp_vfs_tusb_cdc_unregister (char const *path)`

Unregister TinyUSB CDC from VFS.

Return: esp_err_t ESP_OK or ESP_FAIL

Parameters

- `path`: path where the CDC will be unregistered if NULL will be used /dev/tusb_cdc

2.3.24 USB Host

Warning: The USB Host Library API is a beta version thus is subject to change.

The following document lists the API and types of the USB Host Library (that is currently under development).

API Reference

The API of the USB Host Library is separated into the following header files. However, it is sufficient for applications to only `#include "usb/usb_host.h"` and all of USB Host Library headers will also be included.

- `usb/include/usb/usb_host.h` contains the functions and types of the USB Host Library
- `usb/include/usb/usb_helpers.h` contains various helper functions that are related to the USB protocol such as descriptor parsing.
- `usb/include/usb/usb_types_stack.h` contains types that are are used across multiple layers of the USB Host stack.
- `usb/include/usb/usb_types_ch9.h` contains types and macros related to Chapter 9 of the USB2.0 specification (i.e., descriptors and standard requests).

Header File

- components/usb/include/usb/usb_host.h

Functions

`esp_err_t usb_host_install (const usb_host_config_t *config)`

Install the USB Host Library.

- This function should only once to install the USB Host Library
- This function should be called before any other USB Host Library functions are called

Return: esp_err_t

Parameters

- `config`: USB Host Library configuration

`esp_err_t usb_host_uninstall (void)`

Uninstall the USB Host Library.

- This function should be called to uninstall the USB Host Library, thereby freeing its resources
• All clients must have been deregistered before calling this function
• All devices must have been freed by calling usb_host_device_free_all() and receiving the USB_HOST_LIB_EVENT_FLAGS_ALL_FREE event flag

Return esp_err_t

esp_err_t usb_host_lib_handle_events(TickType_t timeout_ticks, uint32_t* event_flags_ret)
Handle USB Host Library events.
• This function handles all of the USB Host Library’s processing and should be called repeatedly in a loop
• Check event_flags_ret to see if an flags are set indicating particular USB Host Library events

Note This function can block
Return esp_err_t

Parameters
• [in] timeout_ticks: Timeout in ticks to wait for an event to occur
• [out] event_flags_ret: Event flags that indicate what USB Host Library event occurred

esp_err_t usb_host_lib_unblock(void)
Unblock the USB Host Library handler.
• This function simply unblocks the USB Host Library event handling function (usb_host_lib_handle_events())

Return esp_err_t

esp_err_t usb_host_client_register(const usb_host_client_config_t *client_config, usb_host_client_handle_t *client_hdl_ret)
Register a client of the USB Host Library.
• This function registers a client of the USB Host Library
• Once a client is registered, its processing function usb_host_client_handle_events() should be called repeatedly

Return esp_err_t

Parameters
• [in] client_config: Client configuration
• [out] client_hdl_ret: Client handle

esp_err_t usb_host_client_deregister(usb_host_client_handle_t client_hdl)
Deregister a USB Host Library client.
• This function deregisters a client of the USB Host Library
• The client must have closed all previously opened devices before attempting to deregister

Return esp_err_t

Parameters
• [in] client_hdl: Client handle

esp_err_t usb_host_client_handle_events(usb_host_client_handle_t client_hdl, TickType_t timeout_ticks)
USB Host Library client processing function.
• This function handles all of a client’s processing and should be called repeatedly in a loop

Note This function can block
Return esp_err_t

Parameters
• [in] client_hdl: Client handle
• [in] timeout_ticks: Timeout in ticks to wait for an event to occur

esp_err_t usb_host_client_unblock(usb_host_client_handle_t client_hdl)
Unblock a client.
• This function simply unblocks a client if it is blocked on the usb_host_client_handle_events() function.
• This function is useful when need to unblock a client in order to deregister it.

Return esp_err_t
Chapter 2. API Reference

Parameters
• [in] client_hdl: Client handle

```c
esp_err_t usb_host_device_open(usb_host_client_handle_t client_hdl,
                              uint8_t dev_addr,
                              usb_device_handle_t *dev_hdl_ret)
```

Open a device.

• This function allows a client to open a device
• A client must open a device first before attempting to use it (e.g., sending transfers, device requests etc.)

Return esp_err_t
Parameters
• [in] client_hdl: Client handle

```c
esp_err_t usb_host_device_close(usb_host_client_handle_t client_hdl,
                                usb_device_handle_t dev_hdl)
```

Close a device.

• This function allows a client to close a device
• A client must close a device after it has finished using the device (claimed interfaces must also be released)
• A client must close all devices it has opened before deregistering

Note This function can block

Return esp_err_t
Parameters
• [in] client_hdl: Client handle

```c
esp_err_t usb_host_device_free_all(void)
```

Indicate that all devices can be freed when possible.

• This function marks all devices as waiting to be freed
• If a device is not opened by any clients, it will be freed immediately
• If a device is opened by at least one client, the device will be free when the last client closes that device.
• Wait for the USB_HOST_LIB_EVENT_FLAGS_ALL_FREE flag to be set by
  usb_host_lib_handle_events() in order to know when all devices have been freed
• This function is useful when cleaning up devices before uninstalling the USB Host Library

Return
• ESP_ERR_NOT_FINISHED: There are one or more devices that still need to be freed. Wait for
  USB_HOST_LIB_EVENT_FLAGS_ALL_FREE event
• ESP_OK: All devices already freed (i.e., there were no devices)
• Other: Error

```c
esp_err_t usb_host_device_addr_list_fill(int list_len, uint8_t *dev_addr_list, int *num_dev_ret)
```

Fill a list of device address.

• This function fills an empty list with the address of connected devices
• The Device addresses can then used in usb_host_device_open()
• If there are more devices than the list_len, this function will only fill up to list_len number of devices.

Return esp_err_t
Parameters
• [in] list_len: Length of the empty list
• [inout] dev_addr_list: Empty list to be filled
• [out] num_dev_ret: Number of devices

```c
esp_err_t usb_host_device_info(usb_device_handle_t dev_hdl, usb_device_info_t *dev_info)
```

Get device’s information.

• This function gets some basic information of a device
• The device must be opened first before attempting to get its information
Note This function can block
Return esp_err_t
Parameters
• [in] dev_hdl: Device handle
• [out] dev_info: Device information

```c
esp_err_t usb_host_get_device_descriptor(usb_device_handle_t dev_hdl, const usb_device_desc_t **device_desc)
```
Get device’s device descriptor.

• A client must call `usb_host_device_open()` first
• No control transfer is sent. The device’s descriptor is cached on enumeration
• This function simple returns a pointer to the cached descriptor

Note No control transfer is sent. The device’s descriptor is cached on enumeration
Return esp_err_t
Parameters
• [in] dev_hdl: Device handle
• [out] device_desc: Device descriptor

```c
esp_err_t usb_host_get_active_config_descriptor(usb_device_handle_t dev_hdl, const usb_config_desc_t **config_desc)
```
Get device’s active configuration descriptor.

• A client must call `usb_host_device_open()` first
• No control transfer is sent. The device’s active configuration descriptor is cached on enumeration
• This function simple returns a pointer to the cached descriptor

Note This function can block
Note No control transfer is sent. A device’s active configuration descriptor is cached on enumeration
Return esp_err_t
Parameters
• [in] dev_hdl: Device handle
• [out] config_desc: Configuration descriptor

```c
esp_err_t usb_host_interface_claim(usb_host_client_handle_t client_hdl, usb_device_handle_t dev_hdl, uint8_t bInterfaceNumber, uint8_t bAlternateSetting)
```
Function for a client to claim a device’s interface.

• A client must claim a device’s interface before attempting to communicate with any of its endpoints
• Once an interface is claimed by a client, it cannot be claimed by any other client.

Note This function can block
Return esp_err_t
Parameters
• [in] client_hdl: Client handle
• [in] dev_hdl: Device handle
• [in] bInterfaceNumber: Interface number
• [in] bAlternateSetting: Interface alternate setting number

```c
esp_err_t usb_host_interface_release(usb_host_client_handle_t client_hdl, usb_device_handle_t dev_hdl, uint8_t bInterfaceNumber)
```
Function for a client to release a previously claimed interface.

• A client should release a device’s interface after it no longer needs to communicate with the interface
• A client must release all of its interfaces of a device it has claimed before being able to close the device

Note This function can block
Return esp_err_t
Parameters
• [in] client_hdl: Client handle
• [in] dev_hdl: Device handle
• [in] bInterfaceNumber: Interface number
**esp_err_t** `usb_host_endpoint_halt` *(usb_device_handle_t dev_hdl, uint8_t bEndpointAddress)*

Halt a particular endpoint.

- The device must have been opened by a client
- The endpoint must be part of an interface claimed by a client
- Once halted, the endpoint must be cleared using `usb_host_endpoint_clear()` before it can communicate again

**Note** This function can block

**Return** `esp_err_t`

**Parameters**

- `dev_hdl`: Device handle
- `bEndpointAddress`: Endpoint address

**esp_err_t** `usb_host_endpoint_flush` *(usb_device_handle_t dev_hdl, uint8_t bEndpointAddress)*

Flush a particular endpoint.

- The device must have been opened by a client
- The endpoint must be part of an interface claimed by a client
- The endpoint must have been halted (either through a transfer error, or `usb_host_endpoint_halt()`)  
- Flushing an endpoint will cause any queued up transfers to be canceled

**Note** This function can block

**Return** `esp_err_t`

**Parameters**

- `dev_hdl`: Device handle
- `bEndpointAddress`: Endpoint address

**esp_err_t** `usb_host_endpoint_clear` *(usb_device_handle_t dev_hdl, uint8_t bEndpointAddress)*

Clear a halt on a particular endpoint.

- The device must have been opened by a client
- The endpoint must be part of an interface claimed by a client
- The endpoint must have been halted (either through a transfer error, or `usb_host_endpoint_halt()`)  
- If the endpoint has any queued up transfers, clearing a halt will resume their execution

**Note** This function can block

**Return** `esp_err_t`

**Parameters**

- `dev_hdl`: Device handle
- `bEndpointAddress`: Endpoint address

**esp_err_t** `usb_host_transfer_alloc` *(size_t data_buffer_size, int num_isoc_packets, usb_transfer_t **transfer)*

Allocate a transfer object.

- This function allocates a transfer object
- Each transfer object has a fixed sized buffer specified on allocation
- A transfer object can be re-used indefinitely
- A transfer can be submitted using `usb_host_transfer_submit()` or `usb_host_transfer_submit_control()

**Return** `esp_err_t`

**Parameters**

- `[in]` `data_buffer_size`: Size of the transfer’s data buffer
- `[in]` `num_isoc_packets`: Number of isochronous packets in transfer (set to 0 for non-isochronous transfers)
- `[out]` `transfer`: Transfer object

**esp_err_t** `usb_host_transfer_free` *(usb_transfer_t *transfer)*

Free a transfer object.

- Free a transfer object previously allocated using `usb_host_transfer_alloc()`
- The transfer must not be in-flight when attempting to free it
- If a NULL pointer is passed, this function will simply return ESP_OK
Return esp_err_t
Parameters
  • [in] transfer: Transfer object

esp_err_t usb_host_transfer_submit (usb_transfer_t *transfer)
Submit a non-control transfer.
  • Submit a transfer to a particular endpoint. The device and endpoint number is specified inside the transfer
  • The transfer must be properly initialized before submitting
  • On completion, the transfer’s callback will be called from the client’s usb_host_client_handle_events() function.

Return esp_err_t
Parameters
  • [in] transfer: Initialized transfer object

esp_err_t usb_host_transfer_submit_control (usb_host_client_handle_t client_hdl, usb_transfer_t *transfer)
Submit a control transfer.
  • Submit a control transfer to a particular device. The client must have opened the device first
  • The transfer must be properly initialized before submitting. The first 8 bytes of the transfer’s data buffer should contain the control transfer setup packet
  • On completion, the transfer’s callback will be called from the client’s usb_host_client_handle_events() function.

Return esp_err_t
Parameters
  • [in] client_hdl: Client handle
  • [in] transfer: Initialized transfer object

Structures
struct usb_host_client_event_msg_t
Client event message.

Client event messages are sent to each client of the USB Host Library in order to notify them of various USB Host Library events such as:
  • Addition of new devices
  • Removal of existing devices

Note The event message structure has a union with members corresponding to each particular event. Based on the event type, only the relevant member field should be accessed.

Public Members

usb_host_client_event_t event
  Type of event

uint8_t address
  New device’s address

usb_device_handle_t dev_hdl
  The handle of the device that was gone

struct usb_host_config_t
USB Host Library configuration.

Configuration structure of the USB Host Library. Provided in the usb_host_install() function
Public Members

```c
int intr_flags
    Interrupt flags for the underlying ISR used by the USB Host stack
```

```c
struct usb_host_client_config_t
    USB Host Library Client configuration.
```

Configuration structure for a USB Host Library client. Provided in `usb_host_client_register()`

Public Members

```c
bool is_synchronous
    Whether the client is asynchronous or synchronous or not. Set to false for now.
```

```c
int max_num_event_msg
    Maximum number of event messages that can be stored (e.g., 3)
```

```c
usb_host_client_event_cb_t client_event_callback
    Client’s event callback function
```

```c
void *callback_arg
    Event callback function argument
```

Macros

```c
USB_HOST_LIB_EVENT_FLAGS_NO_CLIENTS
    All clients have been deregistered from the USB Host Library
```

```c
USB_HOST_LIB_EVENT_FLAGS_ALL_FREE
    The USB Host Library has freed all devices
```

Type Definitions

```c
typedef struct usb_host_client_handle_s *usb_host_client_handle_t
    Handle to a USB Host Library asynchronous client.
```

An asynchronous client can be registered using `usb_host_client_register()`

Note Asynchronous API

```c
typedef void (*usb_host_client_event_cb_t)(const usb_host_client_event_msg_t *event_msg, void *arg)
    Client event callback.
```

• Each client of the USB Host Library must register an event callback to receive event messages from the USB Host Library.

• The client event callback is run from the context of the clients `usb_host_client_handle_events()` function

Enumerations

```c
typedef enum usb_host_client_event_t
    The type event in a client event message.
```

Values:

```c
USB_HOST_CLIENT_EVENT_NEW_DEV
    A new device has been enumerated and added to the USB Host Library
```

```c
USB_HOST_CLIENT_EVENT_DEV_GONE
    A device opened by the client is now gone
```

Header File

```c
• components/usb/include/usb/usb_helpers.h
```
Chapter 2. API Reference

**Functions**

```c
const usb_standard_desc_t *usb_parse_next_descriptor(const usb_standard_desc_t *cur_desc, uint16_t wTotalLength, int *offset)
```

Get the next descriptor.

Given a particular descriptor within a full configuration descriptor, get the next descriptor within the configuration descriptor. This is a convenience function that can be used to walk each individual descriptor within a full configuration descriptor.

**Return** usb_standard_desc_t* Next descriptor, NULL if end of configuration descriptor reached

**Parameters**

- [in] cur_desc: Current descriptor
- [in] wTotalLength: Total length of the configuration descriptor
- [inout] offset: Byte offset relative to the start of the configuration descriptor. On input, it is the offset of the current descriptor. On output, it is the offset of the returned descriptor.

```c
const usb_standard_desc_t *usb_parse_next_descriptor_of_type(const usb_standard_desc_t *cur_desc, uint16_t wTotalLength, uint8_t bDescriptorType, int *offset)
```

Get the next descriptor of a particular type.

Given a particular descriptor within a full configuration descriptor, get the next descriptor of a particular type (i.e., using the bDescriptorType value) within the configuration descriptor.

**Return** usb_standard_desc_t* Next descriptor, NULL if end descriptor is not found or configuration descriptor reached

**Parameters**

- [in] cur_desc: Current descriptor
- [in] wTotalLength: Total length of the configuration descriptor
- [in] bDescriptorType: Type of the next descriptor to get
- [inout] offset: Byte offset relative to the start of the configuration descriptor. On input, it is the offset of the current descriptor. On output, it is the offset of the returned descriptor.

```c
int usb_parse_interface_number_of_alternate(const usb_config_desc_t *config_desc, uint8_t bInterfaceNumber)
```

Get the number of alternate settings for a bInterfaceNumber.

Given a particular configuration descriptor, for a particular bInterfaceNumber, get the number of alternate settings available for that interface (i.e., the max possible value of bAlternateSetting for that bInterfaceNumber).

**Return** int The number of alternate settings that the interface has, -1 if bInterfaceNumber not found

**Parameters**

- [in] config_desc: Pointer to the start of a full configuration descriptor
- [in] bInterfaceNumber: Interface number

```c
const usb_intf_desc_t *usb_parse_interface_descriptor(const usb_config_desc_t *config_desc, uint8_t bInterfaceNumber, uint8_t bAlternateSetting, int *offset)
```

Get a particular interface descriptor (using bInterfaceNumber and bAlternateSetting).

Given a full configuration descriptor, get a particular interface descriptor.

**Note** To get the number of alternate settings for a particular bInterfaceNumber, call `usb_parse_interface_number_of_alternate()`.

**Return** const usb_intf_desc_t* Pointer to interface descriptor, NULL if not found.

**Parameters**

- [in] config_desc: Pointer to the start of a full configuration descriptor
- [in] bInterfaceNumber: Interface number
- [in] bAlternateSetting: Alternate setting number
Chapter 2. API Reference

• [out] offset: Byte offset of the interface descriptor relative to the start of the configuration descriptor. Can be NULL.

```
const usb_ep_desc_t *usb_parse_endpoint_descriptor_by_index(const usb_intf_desc_t *intf_desc, int index, uint16_t wTotalLength, int *offset)
```

Get an endpoint descriptor within an interface descriptor.

Given an interface descriptor, get the Nth endpoint descriptor of the interface. The number of endpoints in an interface is indicated by the bNumEndpoints field of the interface descriptor.

**Note** If bNumEndpoints is 0, it means the interface uses the default endpoint only

**Return** const usb_ep_desc_t* Pointer to endpoint descriptor, NULL if not found.

**Parameters**

- [in] intf_desc: Pointer to the start of an interface descriptor
- [in] index: Endpoint index
- [in] wTotalLength: Total length of the containing configuration descriptor
- [inout] offset: Byte offset relative to the start of the configuration descriptor. On input, it is the offset of the interface descriptor. On output, it is the offset of the endpoint descriptor.

```
const usb_ep_desc_t *usb_parse_endpoint_descriptor_by_address(const usb_config_desc_t *config_desc, uint8_t bInterfaceNumber, uint8_t bAlternateSetting, uint8_t bEndpointAddress, int *offset)
```

Get an endpoint descriptor based on an endpoint’s address.

Given a configuration descriptor, get an endpoint descriptor based on its bEndpointAddress, bAlternateSetting, and bInterfaceNumber.

**Return** const usb_ep_desc_t* Pointer to endpoint descriptor, NULL if not found.

**Parameters**

- [in] config_desc: Pointer to the start of a full configuration descriptor
- [in] bInterfaceNumber: Interface number
- [in] bAlternateSetting: Alternate setting number
- [in] bEndpointAddress: Endpoint address
- [out] offset: Byte offset of the endpoint descriptor relative to the start of the configuration descriptor. Can be NULL

```
static int usb_round_up_to_mps(int num_bytes, int mps)
```

Round up to an integer multiple of endpoint’s MPS.

This is a convenience function to round up a size/length to an endpoint’s MPS (Maximum packet size). This is useful when calculating transfer or buffer lengths of IN endpoints.

**Return** int Round up integer multiple of MPS

**Parameters**

- [in] num_bytes: Number of bytes
- [in] mps: MPS

```
esp_err_t usb_print_descriptors(usb_device_handle_t device, print_class_descriptor_cb class_specific_cb)
```

Prints USB descriptors.

**Return** esp_err_t

**Parameters**

- [in] device: Handle to device
- [in] class_specific_cb: Optional callback to print class specific descriptors
Type Definitions

typedef void (*print_class_descriptor_cb)(const usb_standard_desc_t *)

Print class specific descriptor callback.

Optional callback to be provided to usb_print_descriptors() function. The callback is called when when a non-standard descriptor is encountered. The callback should decode the descriptor as print it.

Header File

- components/usb/include/usb/usb_types_stack.h

Structures

struct usb_device_info_t

Basic information of an enumerated device.

Public Members

usb_speed_t speed

Device’s speed

uint8_t dev_addr

Device’s address

uint8_t bMaxPacketSize0

The maximum packet size of the device’s default endpoint

uint8_t bConfigurationValue

Device’s current configuration number

struct usb_isoc_packet_desc_t

Isochronous packet descriptor.

If the number of bytes in an Isochronous transfer is larger than the MPS of the endpoint, the transfer is split into multiple packets transmitted at the endpoint’s specified interval. An array of Isochronous packet descriptors describes how an Isochronous transfer should be split into multiple packets.

Public Members

int num_bytes

Number of bytes to transmit/receive in the packet. IN packets should be integer multiple of MPS

int actual_num_bytes

Actual number of bytes transmitted/received in the packet

usb_transfer_status_t status

Status of the packet

struct usb_transfer_s

Public Members

uint8_t *const data_buffer

Pointer to data buffer

const size_t data_buffer_size

Size of the data buffer in bytes

int num_bytes

Number of bytes to transfer. Control transfers should include the size of the setup packet. Isochronous transfer should be the total transfer size of all packets. For non-control IN transfers, num_bytes should be an integer multiple of MPS.
int actual_num_bytes
    Actual number of bytes transferred

uint32_t flags
    Transfer flags

usb_device_handle_t device_handle
    Device handle

uint8_t bEndpointAddress
    Endpoint Address

usb_transfer_status_t status
    Status of the transfer

uint32_t timeout_ms
    Timeout (in milliseconds) of the packet (currently not supported yet)

usb_transfer_cb_t callback
    Transfer callback

void *context
    Context variable for transfer to associate transfer with something

const int num_isoc_packets
    Only relevant to Isochronous. Number of service periods (i.e., intervals) to transfer data buffer over.

usb_isoc_packet_desc_t isoc_packet_desc[0]
    Descriptors for each Isochronous packet

Macros

USB_TRANSFER_FLAG_ZERO_PACK
    (For bulk OUT only). Indicates that a bulk OUT transfers should always terminate with a short packet, even if it means adding an extra zero length packet

Type Definitions

typedef struct usb_device_handle_s *usb_device_handle_t
    Handle of a USB Device connected to a USB Host.

typedef struct usb_transfer_s usb_transfer_t
    USB transfer structure.

This structure is used to represent a transfer from a software client to an endpoint over the USB bus. Some of the fields are made const on purpose as they are fixed on allocation. Users should call the appropriate USB Host Library function to allocate a USB transfer structure instead of allocating this structure themselves.

The transfer type is inferred from the endpoint this transfer is sent to. Depending on the transfer type, users should note the following:

- Bulk: This structure represents a single bulk transfer. If the number of bytes exceeds the endpoint’s MPS, the transfer will be split into multiple MPS sized packets followed by a short packet.
- Control: This structure represents a single control transfer. This first 8 bytes of the data_buffer must be filled with the setup packet (see usb_setup_packet_t). The num_bytes field should be the total size of the transfer (i.e., size of setup packet + wLength).
- Interrupt: Represents an interrupt transfer. If num_bytes exceeds the MPS of the endpoint, the transfer will be split into multiple packets, and each packet is transferred at the endpoint’s specified interval.
- Isochronous: Represents a stream of bytes that should be transferred to an endpoint at a fixed rate. The transfer is split into packets according to the each isoc_packet_desc. A packet is transferred at each interval of the endpoint. If an entire ISOC URB was transferred without error (skipped packets do not count as errors), the URB’s overall status and the status of each packet descriptor will be updated, and the actual_num_bytes reflects the total bytes transferred over all packets. If the ISOC URB encounters an error, the entire URB is considered erroneous so only the overall status will be updated.
Note For Bulk/Control/Interrupt IN transfers, the num_bytes must be a integer multiple of the endpoint’s MPS

Note This structure should be allocated via usb_host_transfer_alloc()

Note Once the transfer has been submitted, users should not modify the structure until the transfer has completed

typedef void (*usb_transfer_cb_t)(usb_transfer_t *transfer)

USB transfer completion callback.

Enumerations

enum usb_speed_t
USB Standard Speeds.

Values:

USB_SPEED_LOW = 0
USB Low Speed (1.5 Mbit/s)

USB_SPEED_FULL
USB Full Speed (12 Mbit/s)

enum usb_transfer_type_t
The type of USB transfer.

Note The enum values need to match the bmAttributes field of an EP descriptor

Values:

USB_TRANSFER_TYPE_CTRL = 0
USB_TRANSFER_TYPE_ISOCHRONOUS
USB_TRANSFER_TYPE_BULK
USB_TRANSFER_TYPE_INTR

enum usb_transfer_status_t
The status of a particular transfer.

Values:

USB_TRANSFER_STATUS_COMPLETED
The transfer was successful (but may be short)

USB_TRANSFER_STATUS_ERROR
The transfer failed because due to excessive errors (e.g. no response or CRC error)

USB_TRANSFER_STATUS_TIMED_OUT
The transfer failed due to a time out

USB_TRANSFER_STATUS_CANCELED
The transfer was canceled

USB_TRANSFER_STATUS_STALL
The transfer was stalled

USB_TRANSFER_STATUS_OVERFLOW
The transfer as more data was sent than was requested

USB_TRANSFER_STATUS_SKIPPED
ISOC packets only. The packet was skipped due to system latency or bus overload

USB_TRANSFER_STATUS_NO_DEVICE
The transfer failed because the target device is gone

Header File

- components/usb/include/usb/usb_types_ch9.h
**Unions**

union usb_setup_packet_t

```
#include <usb_types_ch9.h>
```

Structure representing a USB control transfer setup packet.

See Table 9-2 of USB2.0 specification for more details

**Public Members**

uint8_t bmRequestType

Characteristics of request

uint8_t bRequest

Specific request

uint16_t wValue

Word-sized field that varies according to request

uint16_t wIndex

Word-sized field that varies according to request; typically used to pass an index or offset

uint16_t wLength

Number of bytes to transfer if there is a data stage

union usb_standard_desc_t

```
#include <usb_types_ch9.h>
```

USB standard descriptor.

All USB standard descriptors start with these two bytes. Use this type when traversing over configuration descriptors

**Public Members**

uint8_t bLength

Size of the descriptor in bytes

uint8_t bDescriptorType

Descriptor Type

struct usb_standard_desc_t::[anonymous] USB_DESC_ATTR

uint8_t val[USB_STANDARD_DESC_SIZE]

union usb_device_desc_t

```
#include <usb_types_ch9.h>
```

Structure representing a USB device descriptor.

See Table 9-8 of USB2.0 specification for more details

**Public Members**

uint8_t bLength

Size of the descriptor in bytes

uint8_t bDescriptorType

DEVICE Descriptor Type

uint16_t bcdUSB

USB Specification Release Number in Binary-Coded Decimal (i.e., 2.10 is 210H)

uint8_t bDeviceClass

Class code (assigned by the USB-IF)
Chapter 2. API Reference

uint8_t bDeviceSubClass
    Subclass code (assigned by the USB-IF)

uint8_t bDeviceProtocol
    Protocol code (assigned by the USB-IF)

uint8_t bMaxPacketSize0
    Maximum packet size for endpoint zero (only 8, 16, 32, or 64 are valid)

uint16_t idVendor
    Vendor ID (assigned by the USB-IF)

uint16_t idProduct
    Product ID (assigned by the manufacturer)

uint16_t bcdDevice
    Device release number in binary-coded decimal

uint8_t iManufacturer
    Index of string descriptor describing manufacturer

uint8_t iProduct
    Index of string descriptor describing product

uint8_t iSerialNumber
    Index of string descriptor describing the device’s serial number

uint8_t bNumConfigurations
    Number of possible configurations

struct usb_device_desc_t

union usb_config_desc_t
    #include <usb_types_ch9.h> Structure representing a short USB configuration descriptor.

See Table 9-10 of USB2.0 specification for more details.

Note The full USB configuration includes all the interface and endpoint descriptors of that configuration.

Public Members

uint8_t bLength
    Size of the descriptor in bytes

uint8_t bDescriptorType
    CONFIGURATION Descriptor Type

uint16_t wTotalLength
    Total length of data returned for this configuration

uint8_t bNumInterfaces
    Number of interfaces supported by this configuration

uint8_t bConfigurationValue
    Value to use as an argument to the SetConfiguration() request to select this configuration

uint8_t iConfiguration
    Index of string descriptor describing this configuration

uint8_t bmAttributes
    Configuration characteristics

uint8_t bMaxPower
    Maximum power consumption of the USB device from the bus in this specific configuration when the device is fully operational.
Chapter 2. API Reference

struct usb_config_desc_t:[anonymous] USB_DESC_ATTR
uint8_t val[USB_CONFIG_DESC_SIZE]

union usb_iad_desc_t
#include <usb_types_ch9.h> Structure representing a USB interface association descriptor.

Public Members

uint8_t bLength
Size of the descriptor in bytes

uint8_t bDescriptorType
INTERFACE ASSOCIATION Descriptor Type

uint8_t bFirstInterface
Interface number of the first interface that is associated with this function

uint8_t InterfaceCount
Number of contiguous interfaces that are associated with this function

uint8_t bFunctionClass
Class code (assigned by USB-IF)

uint8_t bFunctionSubClass
Subclass code (assigned by USB-IF)

uint8_t bFunctionProtocol
Protocol code (assigned by USB-IF)

uint8_t iFunction
Index of string descriptor describing this function

struct usb_iad_desc_t:[anonymous] USB_DESC_ATTR
uint8_t val[USB_IAD_DESC_SIZE]

union usb_intf_desc_t
#include <usb_types_ch9.h> Structure representing a USB interface descriptor.

See Table 9-12 of USB2.0 specification for more details

Public Members

uint8_t bLength
Size of the descriptor in bytes

uint8_t bDescriptorType
INTERFACE Descriptor Type

uint8_t bInterfaceNumber
Number of this interface.

uint8_t bAlternateSetting
Value used to select this alternate setting for the interface identified in the prior field

uint8_t bNumEndpoints
Number of endpoints used by this interface (excluding endpoint zero).

uint8_t bInterfaceClass
Class code (assigned by the USB-IF)

uint8_t bInterfaceSubClass
Subclass code (assigned by the USB-IF)

uint8_t bInterfaceProtocol
Protocol code (assigned by the USB)
uint8_t iInterface
  Index of string descriptor describing this interface

struct usb_intf_desc_t::{anonymous} USB_DESC_ATTR
uint8_t val[USB_INTF_DESC_SIZE]

union usb_ep_desc_t
#include <usb_types_ch9.h> Structure representing a USB endpoint descriptor.
See Table 9-13 of USB2.0 specification for more details

Public Members

uint8_t bLength
  Size of the descriptor in bytes

uint8_t bDescriptorType
  ENDPOINT Descriptor Type

uint8_t bEndpointAddress
  The address of the endpoint on the USB device described by this descriptor

uint8_t bmAttributes
  This field describes the endpoint’s attributes when it is configured using the bConfigurationValue.

uint16_t wMaxPacketSize
  Maximum packet size this endpoint is capable of sending or receiving when this configuration is selected.

uint8_t bInterval
  Interval for polling Isochronous and Interrupt endpoints. Expressed in frames or microframes depending on the device operating speed (1 ms for Low-Speed and Full-Speed or 125 us for USB High-Speed and above).

struct usb_ep_desc_t::{anonymous} USB_DESC_ATTR
uint8_t val[USB_EP_DESC_SIZE]

union usb_str_desc_t
#include <usb_types_ch9.h> Structure representing a USB string descriptor.

Public Members

uint8_t bLength
  Size of the descriptor in bytes

uint8_t bDescriptorType
  STRING Descriptor Type

uint16_t wData[1]
  UTF-16LE encoded

struct usb_str_desc_t::{anonymous} USB_DESC_ATTR
uint8_t val[USB_STR_DESC_SIZE]

Macros

USB_DESC_ATTR
USB_B_DESCRIPTOR_TYPE_DEVICE
  Descriptor types from USB2.0 specification table 9.5.

USB_B_DESCRIPTOR_TYPE_CONFIGURATION
USB_B_DESCRIPTOR_TYPE_STRING
USB_B_DESCRIPTOR_TYPE_INTERFACE
USB_B_DESCRIPTOR_TYPE_ENDPOINT
USB_B_DESCRIPTOR_TYPE_DEVICE_QUALIFIER
USB_B_DESCRIPTOR_TYPE_OTHER_SPEED_CONFIGURATION
USB_B_DESCRIPTOR_TYPE_INTERFACE_POWER
USB_B_DESCRIPTOR_TYPE_OTG
Descriptor types from USB 2.0 ECN.

USB_B_DESCRIPTOR_TYPE_DEBUG
USB_B_DESCRIPTOR_TYPE_INTERFACE_ASSOCIATION
USB_B_DESCRIPTOR_TYPE_SECURITY
Descriptor types from Wireless USB spec.

USB_B_DESCRIPTOR_TYPE_KEY
USB_B_DESCRIPTOR_TYPE_ENCRYPTION_TYPE
USB_B_DESCRIPTOR_TYPE_BOS
USB_B_DESCRIPTOR_TYPEDEVICE_CAPABILITY
USB_B_DESCRIPTOR_TYPE_WIRELESS_ENDPOINT_COMP
USB_B_DESCRIPTOR_TYPE_WIRE_ADAPTER
USB_B_DESCRIPTOR_TYPE_RPIPE
USB_B_DESCRIPTOR_TYPE_CS_RADIO_CONTROL
USB_B_DESCRIPTOR_TYPE_PIPE_USAGE
Descriptor types from UAS specification.

USB_SETUP_PACKET_SIZE
Size of a USB control transfer setup packet in bytes.

USB_B_REQUEST_TYPE_DIR_OUT
Bit masks belonging to the bmRequestType field of a setup packet.

USB_B_REQUEST_TYPE_DIR_IN
USB_B_REQUEST_TYPE_TYPE_STANDARD
USB_B_REQUEST_TYPE_TYPE_CLASS
USB_B_REQUEST_TYPE_TYPE_VENDOR
USB_B_REQUEST_TYPE_TYPE_RESERVED
USB_B_REQUEST_TYPE_TYPE_MASK
USB_B_REQUEST_TYPE_TYPE_RECIP_DEVICE
USB_B_REQUEST_TYPE_TYPE_RECIP_INTERFACE
USB_B_REQUEST_TYPE_TYPE_RECIP_ENDPOINT
USB_B_REQUEST_TYPE_TYPE_RECIP_OTHER
USB_B_REQUEST_TYPE_TYPE_RECIP_MASK
USB_B_REQUEST_GET_STATUS
Bit masks belonging to the bRequest field of a setup packet.

USB_B_REQUEST_CLEAR_FEATURE
USB_B_REQUEST_SET_FEATURE
USB_B_REQUEST_SET_ADDRESS
USB_B_REQUEST_GET_DESCRIPTOR
USB_B_REQUEST_SET_DESCRIPTOR
USB_B_REQUEST_GET_CONFIGURATION
USB_B_REQUEST_SET_CONFIGURATION
USB_B_REQUEST_GET_INTERFACE
USB_B_REQUEST_SET_INTERFACE
USB_B_REQUEST_SYNCH_FRAME

USB_W_VALUE_DT_DEVICE
Bit masks belonging to the wValue field of a setup packet.

USB_W_VALUE_DT_CONFIG
USB_W_VALUE_DT_STRING
USB_W_VALUE_DT_INTERFACE
USB_W_VALUE_DT_ENDPOINT
USB_W_VALUE_DT_DEVICE_QUALIFIER
USB_W_VALUE_DT_OTHER_SPEED_CONFIG
USB_W_VALUE_DT_INTERFACE_POWER

USB_SETUP_PACKET_INIT_SET_ADDR (setup_pkt_ptr, addr)
Initializer for a SET_ADDRESS request.
Sets the address of a connected device

USB_SETUP_PACKET_INIT_GET_DEVICE_DESC (setup_pkt_ptr)
Initializer for a request to get a device’s device descriptor.

USB_SETUP_PACKET_INIT_GET_CONFIG (setup_pkt_ptr)
Initializer for a request to get a device’s current configuration number.

USB_SETUP_PACKET_INIT_GET_CONFIG_DESC (setup_pkt_ptr, desc_index, desc_len)
Initializer for a request to get one of the device’s current configuration descriptor.
• desc_index indicates the configuration’s index number
• Number of bytes of the configuration descriptor to get

USB_SETUP_PACKET_INIT_SET_CONFIG (setup_pkt_ptr, config_num)
Initializer for a request to set a device’s current configuration number.

USB_SETUP_PACKET_INIT_SET_INTERFACE (setup_pkt_ptr, intf_num, alt_setting_num)
Initializer for a request to set an interface’s alternate setting.

USB_SETUP_PACKET_INIT_GET_STR_DESC (setup_pkt_ptr, string_index, desc_len)
Initializer for a request to get a string descriptor.

USB_STANDARD_DESC_SIZE
Size of dummy USB standard descriptor.

USB_DEVICE_DESC_SIZE
Size of a USB device descriptor in bytes.

USB_CLASS_PER_INTERFACE
Possible base class values of the bDeviceClass field of a USB device descriptor.

USB_CLASS_AUDIO
USB_CLASS_COMM
USB_CLASS_HID
USB_CLASS_PHYSICAL

USB_BM_ATTRIBUTES_USAGE_FEEDBACK 
USB_BM_ATTRIBUTES_USAGE_IMPLICIT_FB 

USB_EP_DESC_GET_XFERTYPE (desc_ptr)  
Macro helpers to get information about an endpoint from its descriptor. 

USB_EP_DESC_GET_EP_NUM (desc_ptr)  

USB_EP_DESC_GET_EP_DIR (desc_ptr) 

USB_EP_DESC_GET_MPS (desc_ptr) 

USB_STR_DESC_SIZE  
Size of a short USB string descriptor in bytes. 

Enumerations

enum usb_device_state_t  
USB2.0 device states. 

See Table 9-1 of USB2.0 specification for more details 

Note The USB_DEVICE_STATE_NOT_ATTACHED is not part of the USB2.0 specification, but is a catch 
al state for devices that need to be cleaned up after a sudden disconnection or port error. 

Values: 

USB_DEVICE_STATE_NOT_ATTACHED  
The device was previously configured or suspended, but is no longer attached (either suddenly discon-
ected or a port error) 

USB_DEVICE_STATE_ATTACHED  
Device is attached to the USB, but is not powered. 

USB_DEVICE_STATE_POWERED  
Device is attached to the USB and powered, but has not been reset. 

USB_DEVICE_STATE_DEFAULT  
Device is attached to the USB and powered and has been reset, but has not been assigned a unique address. 
Device responds at the default address. 

USB_DEVICE_STATE_ADDRESS  
Device is attached to the USB, powered, has been reset, and a unique device address has been assigned. 
Device is not configured. 

USB_DEVICE_STATE_CONFIGURED  
Device is attached to the USB, powered, has been reset, has a unique address, is configured, and is not 
suspended. The host may now use the function provided by the device. 

USB_DEVICE_STATE_SUSPENDED  
Device is, at minimum, attached to the USB and is powered and has not seen bus activity for 3 ms. It 
may also have a unique address and be configured for use. However, because the device is suspended, 
the host may not use the device’s function. 

Code examples for this API section are provided in the peripherals directory of ESP-IDF examples.
Chapter 2. API Reference

2.4 Application Protocols

2.4.1 ASIO port

Overview

Asio is a cross-platform C++ library, see https://think-async.com. It provides a consistent asynchronous model using a modern C++ approach.

ASIO documentation Please refer to the original asio documentation at https://think-async.com/Asio/Documentation. Asio also comes with a number of examples which could be found under Documentation/Examples on that website.

Supported features ESP platform port currently supports only network asynchronous socket operations; does not support serial port. SSL/TLS support is disabled by default and could be enabled in component configuration menu by choosing TLS library from

• mbedTLS with OpenSSL translation layer (default option)
• wolfSSL

SSL support is very basic at this stage and it does include following features:

• Verification callbacks
• DH property files
• Certificates/private keys file APIs

Internal asio settings for ESP include

• EXCEPTIONS are enabled in ASIO if enabled in menuconfig
• TYPEID is enabled in ASIO if enabled in menuconfig

Application Example

ESP examples are based on standard asio protocols/asio:

• protocols/asio/udp_echo_server
• protocols/asio/tcp_echo_server
• protocols/asio/asio_chat
• protocols/asio/ssl_client_server

Please refer to the specific example README.md for details

2.4.2 ESP-MQTT

Overview

ESP-MQTT is an implementation of MQTT protocol client (MQTT is a lightweight publish/subscribe messaging protocol).

Features

• Supports MQTT over TCP, SSL with mbedtls, MQTT over Websocket, MQTT over Websocket Secure.
• Easy to setup with URI
• Multiple instances (Multiple clients in one application)
• Support subscribing, publishing, authentication, last will messages, keep alive pings and all 3 QoS levels (it should be a fully functional client).
Application Example

- `protocols/mqtt/tcp`: MQTT over tcp, default port 1883
- `protocols/mqtt/ssl`: MQTT over tcp, default port 8883
- `protocols/mqtt/ssl_psk`: MQTT over tcp using pre-shared keys for authentication, default port 8883
- `protocols/mqtt/ws`: MQTT over Websocket, default port 80
- `protocols/mqtt/wss`: MQTT over Websocket Secure, default port 443

Configuration

URI

- Currently support `mqtt`, `mqtts`, `ws`, `wss` schemes
- MQTT over TCP samples:
  - `mqtt://mqtt.eclipseprojects.io`: MQTT over TCP, default port 1883
  - `mqtt://mqtt.eclipseprojects.io:1884`: MQTT over TCP, port 1884, with username and password
- MQTT over SSL samples:
  - `mqtts://mqtt.eclipseprojects.io`: MQTT over SSL, port 8883
  - `mqtts://mqtt.eclipseprojects.io:8884`: MQTT over SSL, port 8884
- MQTT over Websocket samples:
  - `ws://mqtt.eclipseprojects.io:80/mqtt`
- MQTT over Websocket Secure samples:
  - `wss://mqtt.eclipseprojects.io:443/mqtt`
- Minimal configurations:

```c
const esp_mqtt_client_config_t mqtt_cfg = {
    .uri = "mqtt://mqtt.eclipseprojects.io",
    // .user_context = (void *)your_context
};
esp_mqtt_client_handle_t client = esp_mqtt_client_init(&mqtt_cfg);
esp_mqtt_client_register_event(client, ESP_EVENT_ANY_ID, mqtt_event_handler, __client);
esp_mqtt_client_start(client);
```

- Note: By default mqtt client uses event loop library to post related mqtt events (connected, subscribed, published, etc.)

SSL

- Get certificate from server, example: `mqtt.eclipseprojects.io openssl s_client -showcerts -connect mqtt.eclipseprojects.io:8883 </dev/null 2>/dev/null|openssl x509 -outform PEM >mqtt_eclipse_org.pem`
- Check the sample application: `examples/mqtt_ssl`
- Configuration:

```c
const esp_mqtt_client_config_t mqtt_cfg = {
    .uri = "mqtts://mqtt.eclipseprojects.io:8883",
    .event_handle = mqtt_event_handler,
    .cert_pem = (const char *)mqtt_eclipse_org.pem_start,
};
```

If the certificate is not null-terminated then `cert_len` should also be set. Other SSL related configuration parameters are:

- `use_global_ca_store`: use the global certificate store to verify server certificate, see `esp-tls.h` for more information
- `client_cert_pem`: pointer to certificate data in PEM or DER format for SSL mutual authentication, default is NULL, not required if mutual authentication is not needed.
Chapter 2. API Reference

- **client_cert_len**: length of the buffer pointed to by client_cert_pem. May be 0 for null-terminated pem.
- **client_key_pem**: pointer to private key data in PEM or DER format for SSL mutual authentication, default is NULL, not required if mutual authentication is not needed.
- **client_key_len**: length of the buffer pointed to by client_key_pem. May be 0 for null-terminated pem.
- **psk_hint_key**: pointer to PSK struct defined in esp_tls.h to enable PSK authentication (as alternative to certificate verification). If not NULL and server/client certificates are NULL, PSK is enabled
- **alpn_protos**: NULL-terminated list of protocols to be used for ALPN.

**Last Will and Testament** MQTT allows for a last will and testament (LWT) message to notify other clients when a client ungracefully disconnects. This is configured by the following fields in the esp_mqtt_client_config_t struct.

- **lwt_topic**: pointer to the LWT message topic
- **lwt_msg**: pointer to the LWT message
- **lwt_msg_len**: length of the LWT message, required if lwt_msg is not null-terminated
- **lwt_qos**: quality of service for the LWT message
- **lwt_retain**: specifies the retain flag of the LWT message

**Other Configuration Parameters**

- **disable_clean_session**: determines the clean session flag for the connect message, defaults to a clean session
- **keepalive**: determines how many seconds the client will wait for a ping response before disconnecting, default is 120 seconds.
- **disable_auto_reconnect**: enable to stop the client from reconnecting to server after errors or disconnects
- **user_context**: custom context that will be passed to the event handler
- **task_prio**: MQTT task priority, defaults to 5
- **task_stack**: MQTT task stack size, defaults to 6144 bytes, setting this will override setting from menu-config
- **buffer_size**: size of MQTT send/receive buffer, default is 1024 bytes
- **username**: pointer to the username used for connecting to the broker
- **password**: pointer to the password used for connecting to the broker
- **client_id**: pointer to the client id, defaults to ESP32_%CHIPID% where %CHIPID% are the last 3 bytes of MAC address in hex format
- **host**: MQTT broker domain (ipv4 as string), setting the uri will override this
- **port**: MQTT broker port, specifying the port in the uri will override this
- **transport**: sets the transport protocol, setting the uri will override this
- **refresh_connection_after_ms**: refresh connection after this value (in milliseconds)
- **event_handle**: handle for MQTT events as a callback in legacy mode
- **event_loop_handle**: handle for MQTT event loop library

For more options on esp_mqtt_client_config_t, please refer to API reference below

**Change settings in Project Configuration Menu** The settings for MQTT can be found using idf.py menu-config, under Component config -> ESP-MQTT Configuration

The following settings are available:

- **CONFIG_MQTT_PROTOCOL_311**: Enables 3.1.1 version of MQTT protocol
- **CONFIG_MQTT_TRANSPORT_SSL, CONFIG_MQTT_TRANSPORT_WEBSOCKET**: Enables specific MQTT transport layer, such as SSL, WEBSOCKET, WEBSOCKET_SECURE
- **CONFIG_MQTT_CUSTOM_OUTBOX**: Disables default implementation of mqtt_outbox, so a specific implementation can be supplied

**Events**

The following events may be posted by the MQTT client:
Chapter 2. API Reference

- **MQTT_EVENT_BEFORE_CONNECT**: The client is initialized and about to start connecting to the broker.
- **MQTT_EVENT_CONNECTED**: The client has successfully established a connection to the broker. The client is now ready to send and receive data.
- **MQTT_EVENT_DISCONNECTED**: The client has aborted the connection due to being unable to read or write data, e.g. because the server is unavailable.
- **MQTT_EVENT_SUBSCRIBED**: The broker has acknowledged the client’s subscribe request. The event data will contain the message ID of the subscribe message.
- **MQTT_EVENT_UNSUBSCRIBED**: The broker has acknowledged the client’s unsubscribe request. The event data will contain the message ID of the unsubscribe message.
- **MQTT_EVENT_PUBLISHED**: The broker has acknowledged the client's publish message. This will only be posted for Quality of Service level 1 and 2, as level 0 does not use acknowledgements. The event data will contain the message ID of the publish message.
- **MQTT_EVENT_DATA**: The client has received a publish message. The event data contains: message ID, name of the topic it was published to, received data and its length. For data that exceeds the internal buffer multiple MQTT_EVENT_DATA will be posted and current_data_offset and total_data_len from event data updated to keep track of the fragmented message.
- **MQTT_EVENT_ERROR**: The client has encountered an error. esp_mqtt_error_type_t from error_handle in the event data can be used to further determine the type of the error. The type of error will determine which parts of the error_handle struct is filled.

API Reference

Header File

- components/mqtt/esp-mqtt/include/mqtt_client.h

Functions

**esp_mqtt_client_init**

`esp_mqtt_client_init(const esp_mqtt_client_config_t *config)`

Creates mqtt client handle based on the configuration.

**Return**

mqtt_client_handle if successfully created, NULL on error

**Parameters**

- `config`: mqtt configuration structure

**esp_mqtt_client_set_uri**

`esp_mqtt_client_set_uri(esp_mqtt_client_handle_t client, const char *uri)`

Sets mqtt connection URI. This API is usually used to overrides the URI configured in esp_mqtt_client_init.

**Return**

ESP_FAIL if URI parse error, ESP_OK on success

**Parameters**

- `client`: mqtt client handle
- `uri`:

**esp_mqtt_client_start**

`esp_mqtt_client_start(esp_mqtt_client_handle_t client)`

Starts mqtt client with already created client handle.

**Return**

ESP_OK on success ESP_ERR_INVALID_ARG on wrong initialization ESP_FAIL on other error

**Parameters**

- `client`: mqtt client handle

**esp_mqtt_client_reconnect**

`esp_mqtt_client_reconnect(esp_mqtt_client_handle_t client)`

This api is typically used to force reconnection upon a specific event.

**Return**

ESP_OK on success ESP_ERR_INVALID_ARG on wrong initialization ESP_FAIL if client is in invalid state

**Parameters**

- `client`: mqtt client handle

**esp_mqtt_client_disconnect**

`esp_mqtt_client_disconnect(esp_mqtt_client_handle_t client)`

This api is typically used to force disconnection from the broker.

**Return**

ESP_OK on success ESP_ERR_INVALID_ARG on wrong initialization

**Parameters**
Chapter 2. API Reference

- **client**: mqtt client handle

  ```c
  esp_err_t esp_mqtt_client_stop(esp_mqtt_client_handle_t client)
  ```

  Stops mqtt client tasks.

  **Notes**:
  - Cannot be called from the mqtt event handler

  **Return**
  ESP_OK on success
  ESP_ERR_INVALID_ARG on wrong initialization
  ESP_FAIL if client is in invalid state

  **Parameters**
  - **client**: mqtt client handle

- **int esp_mqtt_client_subscribe(esp_mqtt_client_handle_t client, const char* topic, int qos)**

  Subscribe the client to defined topic with defined qos.

  **Notes**:
  - Client must be connected to send subscribe message
  - This API is could be executed from a user task or from a mqtt event callback i.e. internal mqtt task (API is protected by internal mutex, so it might block if a longer data receive operation is in progress)

  **Return**
  message_id of the subscribe message on success
  -1 on failure

  **Parameters**
  - **client**: mqtt client handle
  - **topic**:
  - **qos**:

- **int esp_mqtt_client_unsubscribe(esp_mqtt_client_handle_t client, const char *topic)**

  Unsubscribe the client from defined topic.

  **Notes**:
  - Client must be connected to send unsubscribe message
  - It is thread safe, please refer to esp_mqtt_client_subscribe for details

  **Return**
  message_id of the subscribe message on success
  -1 on failure

  **Parameters**
  - **client**: mqtt client handle
  - **topic**:

- **int esp_mqtt_client_publish(esp_mqtt_client_handle_t client, const char *topic, const char *data, int len, int qos, int retain)**

  Client to send a publish message to the broker.

  **Notes**:
  - This API might block for several seconds, either due to network timeout (10s) or if publishing payloads longer than internal buffer (due to message fragmentation)
  - Client doesn’t have to be connected for this API to work, enqueueing the messages with qos>1 (returning -1 for all the qos=0 messages if disconnected). If MQTT_SKIP_PUBLISH_IF_DISCONNECTED is enabled, this API will not attempt to publish when the client is not connected and will always return -1.
  - It is thread safe, please refer to esp_mqtt_client_subscribe for details

  **Return**
  message_id of the publish message (for QoS 0 message_id will always be zero) on success
  -1 on failure.

  **Parameters**
  - **client**: mqtt client handle
  - **topic**: topic string
  - **data**: payload string (set to NULL, sending empty payload message)
  - **len**: data length, if set to 0, length is calculated from payload string
  - **qos**: qos of publish message
  - **retain**: retain flag
int esp_mqtt_client_enqueue(esp_mqtt_client_handle_t client, const char *topic, const char *data, int len, int qos, int retain, bool store)

Enqueue a message to the outbox, to be sent later. Typically used for messages with qos>0, but could be also used for qos=0 messages if store=true.

This API generates and stores the publish message into the internal outbox and the actual sending to the network is performed in the mqtt-task context (in contrast to the esp_mqtt_client_publish() which sends the publish message immediately in the user task’s context). Thus, it could be used as a non blocking version of esp_mqtt_client_publish().

Return message_id if queued successfully, -1 otherwise

Parameters

- client: mqtt client handle
- topic: topic string
- data: payload string (set to NULL, sending empty payload message)
- len: data length, if set to 0, length is calculated from payload string
- qos: qos of publish message
- retain: retain flag
- store: if true, all messages are enqueued; otherwise only qos1 and qos2 are enqueued

esp_err_t esp_mqtt_client_destroy(esp_mqtt_client_handle_t client)

Destroys the client handle.

Notes:

- Cannot be called from the mqtt event handler

Return ESP_OK ESP_ERR_INVALID_ARG on wrong initialization

Parameters

- client: mqtt client handle

esp_err_t esp_mqtt_set_config(esp_mqtt_client_handle_t client, const esp_mqtt_client_config_t *config)

Set configuration structure, typically used when updating the config (i.e. on “before_connect” event.

Return ESP_ERR_NO_MEM if failed to allocate ESP_ERR_INVALID_ARG if conflicts on transport configuration. ESP_OK on success

Parameters

- client: mqtt client handle
- config: mqtt configuration structure

esp_err_t esp_mqtt_client_register_event(esp_mqtt_client_handle_t client, esp_mqtt_event_id_t event, esp_event_handler_t event_handler, void *event_handler_arg)

Registers mqtt event.

Return ESP_ERR_NO_MEM if failed to allocate ESP_ERR_INVALID_ARG on wrong initialization ESP_OK on success

Parameters

- client: mqtt client handle
- event: event type
- event_handler: handler callback
- event_handler_arg: handlers context

int esp_mqtt_client_get_outbox_size(esp_mqtt_client_handle_t client)

Get outbox size.

Return outbox size 0 on wrong initialization

Parameters

- client: mqtt client handle

**Structures**

struct esp_mqtt_error_codes

MQTT error code structure to be passed as a contextual information into ERROR event.
Important: This structure extends `esp_tls_last_error` error structure and is backward compatible with it (so might be down-casted and treated as `esp_tls_last_error` error, but recommended to update applications if used this way previously)

Use this structure directly checking `error_type` first and then appropriate error code depending on the source of the error:

<table>
<thead>
<tr>
<th><code>error_type</code></th>
<th>related member variables</th>
<th>note</th>
</tr>
</thead>
<tbody>
<tr>
<td>MQTT_ERROR_TYPE_TCP_TRANSPORT</td>
<td>esp_tls_last_esp_err, esp_tls_stack_err, esp_tls_cert_verify_flags, sock_errno</td>
<td>Error reported from tcp_transport/esp-tls</td>
</tr>
<tr>
<td>MQTT_ERROR_TYPE_CONNECTION_REFUSED</td>
<td>connect_return_code</td>
<td>Internal error reported from MQTT broker on connection</td>
</tr>
</tbody>
</table>

**Public Members**

```c
esp_err_t esp_tls_last_esp_err
    last esp_err code reported from esp-tls component

int esp_tls_stack_err
    tls specific error code reported from underlying tls stack

int esp_tls_cert_verify_flags
    tls flags reported from underlying tls stack during certificate verification

esp_mqtt_error_type_t error_type
    error type referring to the source of the error

esp_mqtt_connect_return_code_t connect_return_code
    connection refused error code reported from MQTT broker on connection

int esp_transport_sock_errno
    errno from the underlying socket
```

```c
struct esp_mqtt_event_t
    MQTT event configuration structure
```

**Public Members**

```c
esp_mqtt_event_id_t event_id
    MQTT event type

esp_mqtt_client_handle_t client
    MQTT client handle for this event

void *user_context
    User context passed from MQTT client config

char *data
    Data associated with this event

int data_len
    Length of the data for this event

int total_data_len
    Total length of the data (longer data are supplied with multiple events)

int current_data_offset
    Actual offset for the data associated with this event

char *topic
    Topic associated with this event

int topic_len
    Length of the topic for this event associated with this event

int msg_id
    MQTT message id of message
int session_present
MQTT session_present flag for connection event

esp_mqtt_error_codes_t *error_handle
esp-mqtt error handle including esp-tls errors as well as internal mqtt errors

bool retain
Retained flag of the message associated with this event

int qos
qos of the messages associated with this event

bool dup
dup flag of the message associated with this event

struct esp_mqtt_client_config_t
MQTT client configuration structure

Public Members

mqtt_event_callback_t event_handle
handle for MQTT events as a callback in legacy mode

esp_event_loop_handle_t event_loop_handle
handle for MQTT event loop library

const char *host
MQTT server domain (ipv4 as string)

const char *uri
Complete MQTT broker URI

uint32_t port
MQTT server port

bool set_null_client_id
Selects a NULL client id

const char *client_id
Set client id. Ignored if set_null_client_id == true If NULL set the default client id. Default client id is ESP32_CHIPID% where CHIPID% are last 3 bytes of MAC address in hex format

const char *username
MQTT username

const char *password
MQTT password

const char *lwt_topic
LWT (Last Will and Testament) message topic (NULL by default)

const char *lwt_msg
LWT message (NULL by default)

int lwt_qos
LWT message qos

int lwt_retain
LWT retained message flag

int lwt_msg_len
LWT message length

int disable_clean_session
mqtt clean session, default clean_session is true
int keepalive
    mqtt keepalive, default is 120 seconds

bool disable_auto_reconnect
    this mqtt client will reconnect to server (when errors/disconnect). Set disable_auto_reconnect=true to
disable

void *user_context
    pass user context to this option, then can receive that context in event->user_context

int task_prio
    MQTT task priority, default is 5, can be changed in make menuconfig

int task_stack
    MQTT task stack size, default is 6144 bytes, can be changed in make menuconfig

int buffer_size
    size of MQTT send/receive buffer, default is 1024 (only receive buffer size if out_buffer_size
defined)

const char *cert_pem
    Pointer to certificate data in PEM or DER format for server verify (with SSL), default is NULL, not
required to verify the server. PEM-format must have a terminating NULL-character. DER-format requires
the length to be passed in cert_len.

size_t cert_len
    Length of the buffer pointed to by cert_pem. May be 0 for null-terminated pem

const char *client_cert_pem
    Pointer to certificate data in PEM or DER format for SSL mutual authentication, default is NULL, not
required if mutual authentication is not needed. If it is not NULL, also client_key_pem has to be
provided. PEM-format must have a terminating NULL-character. DER-format requires the length to be
passed in client_cert_len.

size_t client_cert_len
    Length of the buffer pointed to by client_cert_pem. May be 0 for null-terminated pem

const char *client_key_pem
    Pointer to private key data in PEM or DER format for SSL mutual authentication, default is NULL, not
required if mutual authentication is not needed. If it is not NULL, also client_cert_pem has to be
provided. PEM-format must have a terminating NULL-character. DER-format requires the length to be
passed in client_key_len

size_t client_key_len
    Length of the buffer pointed to by client_key_pem. May be 0 for null-terminated pem

esp_mqtt_transport_t transport
    overrides URI transport

int refresh_connection_after_ms
    Refresh connection after this value (in milliseconds)

const struct psk_key_hint *psk_hint_key
    Pointer to PSK struct defined in esp_tls.h to enable PSK authentication (as alternative to certificate veri-
fication). If not NULL and server/client certificates are NULL, PSK is enabled

bool use_global_ca_store
    Use a global ca_store for all the connections in which this bool is set.

esp_err_t (*crt_bundle_attach)(void *conf)
    Pointer to ESP x509 Certificate Bundle attach function for the usage of certification bundles in mqtt

int reconnect_timeout_ms
    Reconnect to the broker after this value in miliseconds if auto reconnect is not disabled (defaults to 10s)

const char **alpn_protos
    NULL-terminated list of supported application protocols to be used for ALPN
const char *clientkey_password
Client key decryption password string

int clientkey_password_len
String length of the password pointed to by clientkey_password

esp_mqtt_protocol_ver_t protocol_ver
MQTT protocol version used for connection, defaults to value from menuconfig

int out_buffer_size
size of MQTT output buffer. If not defined, both output and input buffers have the same size defined as buffer_size

bool skip_cert_common_name_check
Skip any validation of server certificate CN field, this reduces the security of TLS and makes the mqtt client susceptible to MITM attacks

bool use_secure_element
enable secure element for enabling SSL connection

void *ds_data
carrier of handle for digital signature parameters

int network_timeout_ms
Abort network operation if it is not completed after this value, in milliseconds (defaults to 10s)

bool disable_keepalive
Set disable_keepalive=true to turn off keep-alive mechanism, false by default (keepalive is active by default). Note: setting the config value keepalive to 0 doesn’t disable keepalive feature, but uses a default keepalive period

const char *path
Path in the URI

int message_retransmit_timeout
timeout for retransmit of failed packet

Macros
MQTT_ERROR_TYPE_ESP_TLS
MQTT_ERROR_TYPE_TCP_TRANSPORT error type hold all sorts of transport layer errors, including ESP-TLS error, but in the past only the errors from MQTT_ERROR_TYPE_ESP_TLS layer were reported, so the ESP-TLS error type is re-defined here for backward compatibility

Type Definitions
typedef struct esp_mqtt_client *esp_mqtt_client_handle_t
typedef struct esp_mqtt_error_codes esp_mqtt_error_codes_t
MQTT error code structure to be passed as a contextual information into ERROR event.

Important: This structure extends esp_tls_last_error error structure and is backward compatible with it (so might be down-casted and treated as esp_tls_last_error error, but recommended to update applications if used this way previously)

Use this structure directly checking error_type first and then appropriate error code depending on the source of the error:

| error_type | related member variables | note | | MQTT_ERROR_TYPE_TCP_TRANSPORT | esp_tls_last_error, esp_tls_stack_err, esp_tls_cert_verify_flags, sock_errno | Error reported from tcp_transport/esp-tls | MQTT_ERROR_TYPE_CONNECTION_REFUSED | connect_return_code | Internal error reported from MQTT broker on connection |

typedef esp_mqtt_event_t *esp_mqtt_event_handle_t
typedef esp_err_t (*esp_mqtt_event_callback_t)(esp_mqtt_event_handle_t event)
Enumerations

class esp_mqtt_event_id_t

MQTT event types.

User event handler receives context data in `esp_mqtt_event_t` structure with

• user_context - user data from `esp_mqtt_client_config_t`
• client - mqtt client handle
• various other data depending on event type

Values:

MQTT_EVENT_ANY = -1

MQTT_EVENT_ERROR = 0
  on error event, additional context: connection return code, error handle from `esp_tls` (if supported)

MQTT_EVENT_CONNECTED
  connected event, additional context: session_present flag

MQTT_EVENT_DISCONNECTED
  disconnected event

MQTT_EVENT_SUBSCRIBED
  subscribed event, additional context:
  • msg_id message id
  • data pointer to the received data
  • data_len length of the data for this event

MQTT_EVENT_UNSUBSCRIBED
  unsubscribed event

MQTT_EVENT_PUBLISHED
  published event, additional context: msg_id

MQTT_EVENT_DATA
  data event, additional context:
  • msg_id message id
  • topic pointer to the received topic
  • topic_len length of the topic
  • data pointer to the received data
  • data_len length of the data for this event
  • current_data_offset offset of the current data for this event
  • total_data_len total length of the data received
  • retain retain flag of the message
  • qos qos level of the message
  • dup dup flag of the message Note: Multiple MQTT_EVENT_DATA could be fired for one message, if it is longer than internal buffer. In that case only first event contains topic pointer and length, other contain data only with current data length and current data offset updating.

MQTT_EVENT_BEFORE_CONNECT
  The event occurs before connecting

MQTT_EVENT_DELETED
  Notification on delete of one message from the internal outbox, if the message couldn’t have been sent and acknowledged before expiring defined in OUTBOX_EXPIRED_TIMEOUT_MS. (events are not posted upon deletion of successfully acknowledged messages)
  • This event id is posted only if MQTT_REPORT_DELETED_MESSAGES==1
  • Additional context: msg_id (id of the deleted message).

class esp_mqtt_connect_return_code_t

MQTT connection error codes propagated via ERROR event

Values:
MQTT_CONNECTION_ACCEPTED = 0
Connection accepted

MQTT_CONNECTION_REFUSE_PROTOCOL
MQTT connection refused reason: Wrong protocol

MQTT_CONNECTION_REFUSE_ID_REJECTED
MQTT connection refused reason: ID rejected

MQTT_CONNECTION_REFUSE_SERVER_UNAVAILABLE
MQTT connection refused reason: Server unavailable

MQTT_CONNECTION_REFUSE_BAD_USERNAME
MQTT connection refused reason: Wrong user

MQTT_CONNECTION_REFUSE_NOT_AUTHORIZED
MQTT connection refused reason: Wrong username or password

enum esp_mqtt_error_type_t
MQTT connection error codes propagated via ERROR event

Values:

MQTT_ERROR_TYPE_NONE = 0
MQTT_ERROR_TYPE_TCP_TRANSPORT

MQTT_ERROR_TYPE_CONNECTION_REFUSED

enum esp_mqtt_transport_t
Values:

MQTT_TRANSPORT_UNKNOWN = 0x0
MQTT_TRANSPORT_OVER_TCP
MQTT over TCP, using scheme: mqtt

MQTT_TRANSPORT_OVER_SSL
MQTT over SSL, using scheme: mqtts

MQTT_TRANSPORT_OVER_WS
MQTT over Websocket, using scheme: ws

MQTT_TRANSPORT_OVER_WSS
MQTT over Websocket Secure, using scheme: wss

enum esp_mqtt_protocol_ver_t
MQTT protocol version used for connection

Values:

MQTT_PROTOCOL_UNDEFINED = 0
MQTT_PROTOCOL_V_3_1
MQTT_PROTOCOL_V_3_1_1

2.4.3 ESP-TLS

Overview

The ESP-TLS component provides a simplified API interface for accessing the commonly used TLS functionality. It supports common scenarios like CA certification validation, SNI, ALPN negotiation, non-blocking connection among others. All the configuration can be specified in the esp_tls_cfg_t data structure. Once done, TLS communication can be conducted using the following APIs:

- esp_tls_conn_new(): for opening a new TLS connection.
- esp_tls_conn_read(): for reading from the connection.
• `esp_tls_conn_write()`: for writing into the connection.
• `esp_tls_conn_delete()`: for freeing up the connection.

Any application layer protocol like HTTP1, HTTP2 etc can be executed on top of this layer.

Application Example

Simple HTTPS example that uses ESP-TLS to establish a secure socket connection: `protocols/https_request`.

Tree structure for ESP-TLS component

```
├── esp_tls.c
├── esp_tls.h
├── esp_tls_mbedtls.c
├── esp_tls_wolfssl.c
└── private_include
    ├── esp_tls_mbedtls.h
    └── esp_tls_wolfssl.h
```

The ESP-TLS component has a file `esp-tls/esp_tls.h` which contain the public API headers for the component. Internally ESP-TLS component uses one of the two SSL/TLS Libraries between mbedtls and wolfssl for its operation. API specific to mbedtls are present in `esp-tls/private_include/esp_tls_mbedtls.h` and API specific to wolfssl are present in `esp-tls/private_include/esp_tls_wolfssl.h`.

TLS Server verification

The ESP-TLS provides multiple options for TLS server verification on the client side. The ESP-TLS client can verify the server by validating the peer’s server certificate or with the help of pre-shared keys. The user should select only one of the following options in the `esp_tls_cfg_t` structure for TLS server verification. If no option is selected then client will return a fatal error by default at the time of the TLS connection setup.

• `cacert_buf` and `cacert_bytes`: The CA certificate can be provided in a buffer to the `esp_tls_cfg_t` structure. The ESP-TLS will use the CA certificate present in the buffer to verify the server. The following variables in `esp_tls_cfg_t` structure must be set.
  – `cacert_buf`: pointer to the buffer which contains the CA cert.
  – `cacert_bytes`: size of the CA certificate in bytes.

• `use_global_ca_store`: The global_ca_store can be initialized and set at once. Then it can be used to verify the server for all the ESP-TLS connections which have set `use_global_ca_store = true` in their respective `esp_tls_cfg_t` structure. See API Reference section below on information regarding different API used for initializing and setting up the `global_ca_store`.

• `crt_bundle_attach`: The ESP x509 Certificate Bundle API provides an easy way to include a bundle of custom x509 root certificates for TLS server verification. More details can be found at `ESP x509 Certificate Bundle`

• `psk_hint_key`: To use pre-shared keys for server verification, `CONFIG_ESP_TLS_PSK_VERIFICATION` should be enabled in the ESP-TLS menuconfig. Then the pointer to PSK hint and key should be provided to the `esp_tls_cfg_t` structure. The ESP-TLS will use the PSK for server verification only when no other option regarding the server verification is selected.

• `skip server verification`: This is an insecure option provided in the ESP-TLS for testing purpose. The option can be set by enabling `CONFIG_ESP_TLS_INSECURE` and `CONFIG_ESP_TLS_SKIP_SERVER_CERT_VERIFY` in the ESP-TLS menuconfig. When this option is enabled the ESP-TLS will skip server verification by default when no other options for server verification are selected in the `esp_tls_cfg_t` structure. **WARNING:**Enabling this option comes with a potential risk of establishing a TLS connection with a server which has a fake identity, provided that the server certificate is not provided either through API or other mechanism like ca_store etc.
Underlying SSL/TLS Library Options

The ESP-TLS component has an option to use mbedtls or wolfssl as their underlying SSL/TLS library. By default only mbedtls is available and is used, wolfssl SSL/TLS library is available publicly at https://github.com/espressif/esp-wolfssl. The repository provides wolfssl component in binary format, it also provides few examples which are useful for understanding the API. Please refer the repository README.md for information on licensing and other options. Please see below option for using wolfssl in your project.

**Note:** As the library options are internal to ESP-TLS, switching the libraries will not change ESP-TLS specific code for a project.

How to use wolfssl with ESP-IDF

There are two ways to use wolfssl in your project

1) Directly add wolfssl as a component in your project with following three commands.: 

```
(First change directory (cd) to your project directory) 
mkdir components
 cd components
 git clone https://github.com/espressif/esp-wolfssl.git
```

2) Add wolfssl as an extra component in your project.

   • Download wolfssl with:

```
git clone https://github.com/espressif/esp-wolfssl.git
```

   • Include esp-wolfssl in ESP-IDF with setting EXTRA_COMPONENT_DIRS in CMakeLists.txt of your project as done in wolfssl/examples. For reference see Optional Project variables in build-system.

After above steps, you will have option to choose wolfssl as underlying SSL/TLS library in configuration menu of your project as follows:

```
idf.py menuconfig -> ESP-TLS -> choose SSL/TLS Library -> mbedtls/wolfssl
```

Comparison between mbedtls and wolfssl

The following table shows a typical comparison between wolfssl and mbedtls when protocols/https_request example (which has server authentication) was run with both SSL/TLS libraries and with all respective configurations set to default. (mbedtls IN_CONTENT length and OUT_CONTENT length were set to 16384 bytes and 4096 bytes respectively)

<table>
<thead>
<tr>
<th>Property</th>
<th>Wolfssl</th>
<th>Mbedtls</th>
</tr>
</thead>
<tbody>
<tr>
<td>Total Heap Consumed</td>
<td>~19 Kb</td>
<td>~37 Kb</td>
</tr>
<tr>
<td>Task Stack Used</td>
<td>~2.2 Kb</td>
<td>~3.6 Kb</td>
</tr>
<tr>
<td>Bin size</td>
<td>~858 Kb</td>
<td>~736 Kb</td>
</tr>
</tbody>
</table>

**Note:** These values are subject to change with change in configuration options and version of respective libraries.

Digital Signature with ESP-TLS

ESP-TLS provides support for using the Digital Signature (DS) with ESP32-S3. Use of the DS for TLS is supported only when ESP-TLS is used with mbedtls (default stack) as its underlying SSL/TLS stack. For more details on Digital Signature, please refer to the Digital Signature Documentation. The technical details of Digital Signature such
as how to calculate private key parameters can be found in ESP32-S3 Technical Reference Manual > Digital Signature (DS) [PDF]. The DS peripheral must be configured before it can be used to perform Digital Signature, see Configure the DS Peripheral in Digital Signature.

The DS peripheral must be initialized with the required encrypted private key parameters (obtained when the DS peripheral is configured). ESP-TLS internally initializes the DS peripheral when provided with the required DS context (DS parameters). Please see the below code snippet for passing the DS context to esp-tls context. The DS context passed to the esp-tls context should not be freed till the TLS connection is deleted.

```c
#include "esp_tls.h"

esp_ds_data_ctx_t *ds_ctx;
/* initialize ds_ctx with encrypted private key parameters, which can be read from...or provided through the application code */

esp_tls_cfg_t cfg = {
    .clientcert_buf = /* the client cert */,
    .clientcert_bytes = /* length of the client cert */,
    /* other configuration options */
    .ds_data = (void *)ds_ctx,
};
```

**Note:** When using Digital Signature for the TLS connection, along with the other required params, only the client cert (`clientcert_buf`) and the DS params (`ds_data`) are required and the client key (`clientkey_buf`) can be set to NULL.

- An example of mutual authentication with the DS peripheral can be found at `ssl mutual auth` which internally uses (ESP-TLS) for the TLS connection.

## API Reference

### Header File

- `components/esp-tls/esp_tls.h`

### Functions

- `esp_tls_t *esp_tls_init (void)`
  - Create TLS connection.
  - This function allocates and initializes esp-tls structure handle.
  - **Return** tls Pointer to esp-tls as esp-tls handle if successfully initialized, NULL if allocation error

- `esp_tls_t *esp_tls_conn_new (const char *hostname, int hostlen, int port, const esp_tls_cfg_t *cfg)`
  - Create a new blocking TLS/SSL connection.
  - This function establishes a TLS/SSL connection with the specified host in blocking manner.
  - **Note:** This API is present for backward compatibility reasons. Alternative function with the same functionality is `esp_tls_conn_new_sync` (and its asynchronous version `esp_tls_conn_new_async`)
  - **Return** pointer to esp_tls_t, or NULL if connection couldn’t be opened.

- `int esp_tls_conn_new_sync (const char *hostname, int hostlen, int port, const esp_tls_cfg_t *cfg, esp_tls_t *tls)`
  - Create a new blocking TLS/SSL connection.
This function establishes a TLS/SSL connection with the specified host in blocking manner.

**Return**
- -1 If connection establishment fails.
- 1 If connection establishment is successful.
- 0 If connection state is in progress.

**Parameters**
- `[in] hostname`: Hostname of the host.
- `[in] port`: Port number of the host.
- `[in] cfg`: TLS configuration as esp_tls_cfg_t. If you wish to open non-TLS connection, keep this NULL. For TLS connection, a pass pointer to esp_tls_cfg_t. At a minimum, this structure should be zero-initialized.
- `[in] tls`: Pointer to esp-tls as esp-tls handle.

```c
esp_tls_t *esp_tls_conn_http_new(const char *url, const esp_tls_cfg_t *cfg)
```

Create a new blocking TLS/SSL connection with a given “HTTP” url.

The behaviour is same as esp_tls_conn_new() API. However this API accepts host’s url.

**Return**
- Pointer to esp_tls_t, or NULL if connection couldn’t be opened.

**Parameters**
- `[in] url`: url of host.
- `[in] cfg`: TLS configuration as esp_tls_cfg_t. If you wish to open non-TLS connection, keep this NULL. For TLS connection, a pass pointer to ‘esp_tls_cfg_t’. At a minimum, this structure should be zero-initialized.

```c
int esp_tls_conn_new_async(const char *hostname, int hostlen, int port, const esp_tls_cfg_t *cfg, esp_tls_t *tls)
```

Create a new non-blocking TLS/SSL connection.

This function initiates a non-blocking TLS/SSL connection with the specified host, but due to its non-blocking nature, it doesn’t wait for the connection to get established.

**Return**
- -1 If connection establishment fails.
- 0 If connection establishment is in progress.
- 1 If connection establishment is successful.

**Parameters**
- `[in] hostname`: Hostname of the host.
- `[in] port`: Port number of the host.
- `[in] cfg`: TLS configuration as esp_tls_cfg_t. non_block member of this structure should be set to be true.
- `[in] tls`: pointer to esp-tls as esp-tls handle.

```c
int esp_tls_conn_http_new_async(const char *url, const esp_tls_cfg_t *cfg, esp_tls_t *tls)
```

Create a new non-blocking TLS/SSL connection with a given “HTTP” url.

The behaviour is same as esp_tls_conn_new() API. However this API accepts host’s url.

**Return**
- -1 If connection establishment fails.
- 0 If connection establishment is in progress.
- 1 If connection establishment is successful.

**Parameters**
- `[in] url`: url of host.
- `[in] cfg`: TLS configuration as esp_tls_cfg_t.
- `[in] tls`: pointer to esp-tls as esp-tls handle.

```c
static ssize_t esp_tls_conn_write(esp_tls_t *tls, const void *data, size_t datalen)
```

Write from buffer ‘data’ into specified tls connection.

**Return**
• >=0 if write operation was successful, the return value is the number of bytes actually written to the TLS/SSL connection.
• <0 if write operation was not successful, because either an error occurred or an action must be taken by the calling process.
• ESP_TLS_ERR_SSL_WANT_READ/ ESP_TLS_ERR_SSL_WANT_WRITE. if the handshake is incomplete and waiting for data to be available for reading. In this case this functions needs to be called again when the underlying transport is ready for operation.

Parameters
• [in] tls: pointer to esp-tls as esp-tls handle.
• [in] data: Buffer from which data will be written.
• [in] datalen: Length of data buffer.

static ssize_t esp_tls_conn_read(esp_tls_t *tls, void *data, size_t datalen)
Read from specified tls connection into the buffer ‘data’.

Return
• >0 if read operation was successful, the return value is the number of bytes actually read from the TLS/SSL connection.
• 0 if read operation was not successful. The underlying connection was closed.
• <0 if read operation was not successful, because either an error occurred or an action must be taken by the calling process.

Parameters
• [in] tls: pointer to esp-tls as esp-tls handle.
• [in] data: Buffer to hold read data.
• [in] datalen: Length of data buffer.

void esp_tls_conn_delete(esp_tls_t *tls)
Compatible version of esp_tls_conn_destroy() to close the TLS/SSL connection.

Note This API will be removed in IDFv5.0

Parameters
• [in] tls: pointer to esp-tls as esp-tls handle.

int esp_tls_conn_destroy(esp_tls_t *tls)
Close the TLS/SSL connection and free any allocated resources.

This function should be called to close each tls connection opened with esp_tls_conn_new() or esp_tls_conn_http_new() APIs.

Return - 0 on success
• -1 if socket error or an invalid argument

Parameters
• [in] tls: pointer to esp-tls as esp-tls handle.

ssize_t esp_tls_get_bytes_avail(esp_tls_t *tls)
Return the number of application data bytes remaining to be read from the current record.

This API is a wrapper over mbedtls’s mbedtls_ssl_get_bytes_avail() API.

Return
• -1 in case of invalid arg
• bytes available in the application data record read buffer

Parameters
• [in] tls: pointer to esp-tls as esp-tls handle.

esp_err_t esp_tls_get_conn_sockfd(esp_tls_t *tls, int *sockfd)
Returns the connection socket file descriptor from esp_tls session.

Return - ESP_OK on success and value of sockfd will be updated with socket file descriptor for connection
• ESP_ERR_INVALID_ARG if (tls == NULL || sockfd == NULL)

Parameters
• [in] tls: handle to esp_tls context
• [out] sockfd: int pointer to sockfd value.
**esp_err_t esp_tls_init_global_ca_store** (void)

Create a global CA store, initially empty.

This function should be called if the application wants to use the same CA store for multiple connections. This function initialises the global CA store which can be then set by calling esp_tls_set_global_ca_store(). To be effective, this function must be called before any call to esp_tls_set_global_ca_store().

**Return**
- ESP_OK if creating global CA store was successful.
- ESP_ERR_NO_MEM if an error occurred when allocating the mbedTLS resources.

**esp_err_t esp_tls_set_global_ca_store** (const unsigned char *cacert_pem_buf, const unsigned int cacert_pem_bytes)

Set the global CA store with the buffer provided in pem format.

This function should be called if the application wants to set the global CA store for multiple connections i.e. to add the certificates in the provided buffer to the certificate chain. This function implicitly calls esp_tls_init_global_ca_store() if it has not already been called. The application must call this function before calling esp_tls_conn_new().

**Return**
- ESP_OK if adding certificates was successful.
- Other if an error occurred or an action must be taken by the calling process.

**Parameters**
- **[in]** cacert_pem_buf: Buffer which has certificates in pem format. This buffer is used for creating a global CA store, which can be used by other TLS connections.
- **[in]** cacert_pem_bytes: Length of the buffer.

**void esp_tls_free_global_ca_store** (void)

Free the global CA store currently being used.

The memory being used by the global CA store to store all the parsed certificates is freed up. The application can call this API if it no longer needs the global CA store.

**esp_err_t esp_tls_get_and_clear_last_error** (esp_tls_error_handle_t h, int *esp_tls_code, int *esp_tls_flags)

Returns last error in esp_tls with detailed mbedtls related error codes. The error information is cleared internally upon return.

**Return**
- ESP_ERR_INVALID_STATE if invalid parameters
- ESP_OK (0) if no error occurred
- specific error code (based on ESP_ERR_ESP_TLS_BASE) otherwise

**Parameters**
- **[in]** h: esp-tls error handle.
- **[out]** esp_tls_code: last error code returned from mbedtls api (set to zero if none) This pointer could be NULL if caller does not care about esp_tls_code
- **[out]** esp_tls_flags: last certification verification flags (set to zero if none) This pointer could be NULL if caller does not care about esp_tls_code

**esp_err_t esp_tls_get_and_clear_error_type** (esp_tls_error_handle_t h, esp_tls_error_type_t err_type, int *error_code)

Returns the last error captured in esp_tls of a specific type. The error information is cleared internally upon return.

**Return**
- ESP_ERR_INVALID_STATE if invalid parameters
- ESP_OK if a valid error returned and was cleared

**Parameters**
- **[in]** h: esp-tls error handle.
- **[in]** err_type: specific error type
- **[out]** error_code: last error code returned from mbedtls api (set to zero if none) This pointer could be NULL if caller does not care about esp_tls_code
mbedtls_x509_crt* esp_tls_get_global_ca_store (void)
Get the pointer to the global CA store currently being used.

The application must first call esp_tls_set_global_ca_store(). Then the same CA store could be used by the
application for APIs other than esp_tls.

Note Modifying the pointer might cause a failure in verifying the certificates.

Return
• Pointer to the global CA store currently being used if successful.
• NULL if there is no global CA store set.

esp_err_t esp_tls_plain_tcp_connect (const char* host, int hostlen, int port, const esp_tls_cfg_t*
 cfg, esp_tls_error_handle_t error_handle, int* sockfd)
Creates a plain TCP connection, returning a valid socket fd on success or an error handle.

Return ESP_OK on success ESP_ERR_INVALID_ARG if invalid output parameters ESP-TLS based error
codes on failure

Parameters
• [in] host: Hostname of the host.
• [in] hostlen: Length of hostname.
• [in] port: Port number of the host.
• [in] cfg: ESP-TLS configuration as esp_tls_cfg_t.
• [out] error_handle: ESP-TLS error handle holding potential errors occurred during con-
  nection
• [out] sockfd: Socket descriptor if successfully connected on TCP layer

Structures
struct psk_key_hint
ESP-TLS preshared key and hint structure.

Public Members

const uint8_t *key
key in PSK authentication mode in binary format

const size_t key_size
length of the key

const char *hint
hint in PSK authentication mode in string format

struct tls_keep_alive_cfg
esp-tls client session ticket ctx

Keep alive parameters structure

Public Members

bool keep_alive_enable
Enable keep-alive timeout

int keep_alive_idle
Keep-alive idle time (second)

int keep_alive_interval
Keep-alive interval time (second)

int keep_alive_count
Keep-alive packet retry send count

struct esp_tls_cfg
ESP-TLS configuration parameters.
Note  Note about format of certificates:

- This structure includes certificates of a Certificate Authority, of client or server as well as private keys, which may be of PEM or DER format. In case of PEM format, the buffer must be NULL terminated (with NULL character included in certificate size).
- Certificate Authority’s certificate may be a chain of certificates in case of PEM format, but could be only one certificate in case of DER format.
- Variables names of certificates and private key buffers and sizes are defined as unions providing backward compatibility for legacy *_pem_buf and *_pem_bytes names which suggested only PEM format was supported. It is encouraged to use generic names such as cacert_buf and cacert_bytes.

Public Members

const char **alpn_protos
Application protocols required for HTTP2. If HTTP2/ALPN support is required, a list of protocols that should be negotiated. The format is length followed by protocol name. For the most common cases the following is ok: const char **alpn_protos = { "h2", NULL };

const unsigned char *cacert_buf
Certificate Authority’s certificate in a buffer. Format may be PEM or DER, depending on mbedts-support This buffer should be NULL terminated in case of PEM.

const unsigned char *cacert_pem_buf
CA certificate buffer legacy name

unsigned int cacert_bytes
Size of Certificate Authority certificate pointed to by cacert_buf (including NULL-terminator in case of PEM format)

unsigned int cacert_pem_bytes
Size of Certificate Authority certificate legacy name

const unsigned char *clientcert_buf
Client certificate in a buffer Format may be PEM or DER, depending on mbedtls-support This buffer should be NULL terminated in case of PEM.

const unsigned char *clientcert_pem_buf
Client certificate legacy name

unsigned int clientcert_bytes
Size of client certificate pointed to by clientcert_pem_buf (including NULL-terminator in case of PEM format)

unsigned int clientcert_pem_bytes
Size of client certificate legacy name

const unsigned char *clientkey_buf
Client key in a buffer Format may be PEM or DER, depending on mbedtls-support This buffer should be NULL terminated in case of PEM.

const unsigned char *clientkey_pem_buf
Client key legacy name

unsigned int clientkey_bytes
Size of client key pointed to by clientkey_pem_buf (including NULL-terminator in case of PEM format)

unsigned int clientkey_pem_bytes
Size of client key legacy name

const unsigned char *clientkey_password
Client key decryption password string

unsigned int clientkey_password_len
String length of the password pointed to by clientkey_password
bool non_block
   Configure non-blocking mode. If set to true the underneath socket will be configured in non-block
   mode after TLS session is established.

bool use_secure_element
   Enable this option to use secure element or atcc608a chip (Integrated with ESP32-WROOM-32SE).

int timeout_ms
   Network timeout in milliseconds.

bool use_global_ca_store
   Use a global ca_store for all the connections in which this bool is set.

const char *common_name
   If non-NULL, server certificate CN must match this name. If NULL, server certificate CN must match
   hostname.

bool skip_common_name
   Skip any validation of server certificate CN field.

tls_keep_alive_cfg_t *keep_alive_cfg
   Enable TCP keep-alive timeout for SSL connection.

const psk_hint_key_t *psk_hint_key
   Pointer to PSK hint and key. If not NULL (and certificates are NULL) then PSK authentication is enabled
   with configured setup. Important note: the pointer must be valid for connection.

esp_err_t (*crt_bundle_attach)(void *conf)
   Function pointer to esp_crt_bundle_attach. Enables the use of certification bundle for server verification,
   must be enabled in menuconfig.

void *ds_data
   Pointer for digital signature peripheral context.

bool is_plain_tcp
   Use non-TLS connection: When set to true, the esp-tls uses plain TCP transport rather then
   TLS/SSL connection. Note, that it is possible to connect using a plain tcp transport directly with
   esp_tls_plain_tcp_connect() API.

struct ifreq *if_name
   The name of interface for data to go through. Use the default interface without setting.

struct esp_tls
   ESP-TLS Connection Handle.

Public Members

mbedtls_ssl_context ssl
   TLS/SSL context.

mbedtls_entropy_context entropy
   mbedTLS entropy context structure.

mbedtls_ctr_drbg_context ctr_drbg
   mbedTLS ctr drbg context structure. CTR_DRBG is deterministic random bit generation based on AES-256.

mbedtls_ssl_config conf
   TLS/SSL configuration to be shared between mbedtls_ssl_context structures.

mbedtls_net_context server_fd
   mbedTLS wrapper type for sockets.

mbedtls_x509_crt cacert
   Container for the X.509 CA certificate.
mbedtls_x509_crt *cacert_ptr
   Pointer to the cacert being used.

mbedtls_x509_crt clientcert
   Container for the X.509 client certificate

mbedtls_pk_context clientkey
   Container for the private key of the client certificate

int sockfd
   Underlying socket file descriptor.

ssize_t (*read)(struct esp_tls *tls, char *data, size_t datalen)
   Callback function for reading data from TLS/SSL connection.

ssize_t (*write)(struct esp_tls *tls, const char *data, size_t datalen)
   Callback function for writing data to TLS/SSL connection.

esp_tls_conn_state_t conn_state
   ESP-TLS Connection state

fd_set rset
   read file descriptors

fd_set wset
   write file descriptors

bool is_tls
   indicates connection type (TLS or NON-TLS)

esp_tls_role_t role
   esp-tls role
      • ESP_TLS_CLIENT
      • ESP_TLS_SERVER

esp_tls_error_handle_t error_handle
   handle to error descriptor

Type Definitions
typedef enum esp_tls_conn_state esp_tls_conn_state_t
   ESP-TLS Connection State.

typedef enum esp_tls_role esp_tls_role_t

typedef struct psk_key_hint psk_hint_key_t
   ESP-TLS preshared key and hint structure.

typedef struct tls_keep_alive_cfg tls_keep_alive_cfg_t
   esp-tls client session ticket ctx

   Keep alive parameters structure

typedef struct esp_tls_cfg esp_tls_cfg_t
   ESP-TLS configuration parameters.

Note
   Note about format of certificates:
      • This structure includes certificates of a Certificate Authority, of client or server as well as private keys, which may be of PEM or DER format. In case of PEM format, the buffer must be NULL terminated (with NULL character included in certificate size).
      • Certificate Authority’s certificate may be a chain of certificates in case of PEM format, but could be only one certificate in case of DER format
      • Variables names of certificates and private key buffers and sizes are defined as unions providing backward compatibility for legacy *.pem_buf and *.pem_bytes names which suggested only PEM format was supported. It is encouraged to use generic names such as cacert_buf and cacert_bytes.
typedef struct esp_tls esp_tls_t
    ESP-TLS Connection Handle.

Enumerations
enum esp_tls_conn_state
    ESP-TLS Connection State.
    Values:
    ESP_TLS_INIT = 0
    ESP_TLS_CONNECTING
    ESP_TLS_HANDSHAKE
    ESP_TLS_FAIL
    ESP_TLS_DONE
enum esp_tls_role
    Values:
    ESP_TLS_CLIENT = 0
    ESP_TLS_SERVER

2.4.4 OpenSSL-APIs

Note: The OpenSSL-API will be discontinued in ESP-IDF from v5.0. Please use ESP-TLS <esp_tls> instead.

The code of this API (located in openssl directory), does not contain OpenSSL itself but is intended as a wrapper for applications using the OpenSSL API. It uses mbedtls to do the actual work, so anyone compiling openssl code needs the mbedtls library and header file.

OpenSSL APIs not mentioned in this article are not open to public for the time, also do not have the corresponding function. If user calls it directly, it will always return an error or may show cannot link at compiling time.

Chapter Introduction

• Chapter 1. SSL Context Method Create
• Chapter 2. SSL Context Function
• Chapter 3. SSL Function
• Chapter 4. SSL X509 Certification and Private Key Function

Chapter 1. SSL Context Method Create

1.1 const SSL_METHOD* SSLv3_client_method (void)
    Arguments:
    none
    Return:
    SSLv3.0 version SSL context client method point
    Description:
    create the target SSL context method
Example:

```c
void example(void)
{
    const SSL_METHOD *method = SSLv3_client_method();
    ...
}
```

1.2 const SSL_METHOD* TLSv1_client_method (void)

Arguments:
none

Return:
TLSV1.0 version SSL context client method point

Description:
create the target SSL context method

Example:

```c
void example(void)
{
    const SSL_METHOD *method = TLSv1_client_method();
    ...
}
```

1.3 const SSL_METHOD* TLSv1_1_client_method (void)

Arguments:
none

Return:
TLSV1.1 version SSL context client method point

Description:
create the target SSL context method

Example:

```c
void example(void)
{
    const SSL_METHOD *method = TLSv1_1_client_method();
    ...
}
```

1.4 const SSL_METHOD* TLSv1_2_client_method (void)

Arguments:
none

Return:
Chapter 2. API Reference

### 1.5 const SSL_METHOD* TLS_client_method(void)

**Arguments:**
none

**Return:**
TLSV1.2 version SSL context client method point

**Description:**
create the default SSL context method, it's always to be TLSV1.2

**Example:**
```c
void example(void)
{
    const SSL_METHOD *method = TLSv1_2_client_method();
    ...
}
```

### 1.6 const SSL_METHOD* SSLv3_server_method(void)

**Arguments:**
none

**Return:**
SSLV3.0 version SSL context server method point

**Description:**
create the target SSL context method

**Example:**
```c
void example(void)
{
    const SSL_METHOD *method = SSLv3_server_method();
    ...
}
```

### 1.7 const SSL_METHOD* TLSv1_server_method(void)

**Arguments:**
none

**Return:**
TLSV1.2 version SSL context server method point

**Description:**
create the target SSL context method

**Example:**
```c
void example(void)
{
    const SSL_METHOD *method = TLSv1_server_method();
    ...
}
```
Chapter 2. API Reference

Arguments:
none

Return:
TLSV1.0 version SSL context server method point

Description:
create the target SSL context method

Example:

```c
void example(void)
{
    const SSL_METHOD *method = TLSv1_server_method();
    ...
}
```

1.8 `const SSL_METHOD* TLSv1_1_server_method (void)`

Arguments:
none

Return:
TLSV1.1 version SSL context server method point

Description:
create the target SSL context method

Example:

```c
void example(void)
{
    const SSL_METHOD *method = TLSv1_1_server_method();
    ...
}
```

1.9 `const SSL_METHOD* TLSv1_2_server_method (void)`

Arguments:
none

Return:
TLSV1.2 version SSL context server method point

Description:
create the target SSL context method

Example:

```c
void example(void)
{
    const SSL_METHOD *method = TLSv1_2_server_method();
    ...
}
```
1.10 const SSL_METHOD* TLS_server_method (void)

Arguments:
none

Return:
TLSV1.2 version SSL context server method point

Description:
create the default SSL context method, it's always to be TLSV1.2

Example:

```c
void example(void)
{
    const SSL_METHOD *method = TLSv1_2_server_method();
    ...
}
```

Chapter 2. SSL Context Function

2.1 SSL_CTX* SSL_CTX_new (const SSL_METHOD * method)

Arguments:
method - the SSL context method point

Return:
context point

Description:
create a SSL context

Example:

```c
void example(void)
{
    SSL_CTX *ctx = SSL_CTX_new(SSLv3_server_method());
    ...
}
```

2.2 void SSL_CTX_free (SSL_CTX * ctx)

Arguments:
ctx - the SSL context point

Return:
Chapter 2. API Reference

2.1 void free_ssl_context

Description:
free a SSL context

Example:

```c
void example(void)
{
    SSL_CTX *ctx;
    ...
    SSL_CTX_free(ctx);
}
```

2.3 int SSL_CTX_set_ssl_version (SSL_CTX *ctx, const SSL_METHOD *meth)

Arguments:

- ctx - SSL context point
- meth - SSL method point

Return:

- 1 : OK
- 0 : failed

Description:
set the SSL context version

Example:

```c
void example(void)
{
    SSL_CTX *ctx;
    const SSL_METHOD *meth;
    ...
    SSL_CTX_set_ssl_version(ctx, meth);
}
```

2.4 const SSL_METHOD * SSL_CTX_get_ssl_method (SSL_CTX * ctx)

Arguments:

- ctx - SSL context point

Return:

SSL context method

Description:
get the SSL context method

Example:
void example(void)
{
    const SSL_METHOD *method;
    SSL_CTX *ctx;
    ...
    method = SSL_CTX_get_ssl_method(ctx);
}

Chapter 3. SSL Function

3.1 SSL* SSL_new (SSL_CTX * ctx)

Arguments:

ctx - SSL context point

Return:

SSL method

Description:

create a SSL

Example:

void example(void)
{
    SSL *ssl;
    SSL_CTX *ctx;
    ...
    ssl = SSL_new(ctx);
}

3.2 void SSL_free (SSL * ssl)

Arguments:

ssl - SSL point

Return:

none

Description:

free SSL

Example:

void example(void)
{
    SSL *ssl;
    ...
    (continues on next page)
3.3 int SSL_do_handshake (SSL * ssl)

Arguments:

ssl - SSL point

Return:

1 : OK
0 : failed, connect is close by remote
-1 : a error catch

Description:

perform the SSL handshake

Example:

```c
void example(void)
{
    SSL *ssl;
    int ret;
    ...
    ret = SSL_do_handshake(ssl);
}
```

3.4 int SSL_connect (SSL * ssl)

Arguments:

ssl - SSL point

Return:

1 : OK
0 : failed, connect is close by remote
-1 : a error catch

Description:

connect to the remote SSL server

Example:

```c
void example(void)
{
    SSL *ssl;
    int ret;
    ...
    ret = SSL_connect(ssl);
}
```

3.5 int SSL_accept (SSL * ssl)

Arguments:
Chapter 2. API Reference

2.1 SSL_accept

Arguments:

ssl - SSL point

Return:

1 : OK
0 : failed, connect is close by remote
-1 : a error catch

Description:

accept the remote connection

Example:

```c
void example(void)
{
    SSL *ssl;
    int ret;
    ...
    ret = SSL_accept(ssl);
}
```

3.6 int SSL_shutdown (SSL * ssl)

Arguments:

ssl - SSL point

Return:

1 : OK
0 : failed, connect is close by remote
-1 : a error catch

Description:

shutdown the connection

Example:

```c
void example(void)
{
    SSL *ssl;
    int ret;
    ...
    ret = SSL_shutdown(ssl);
}
```

3.7 int SSL_clear (SSL * ssl)

Arguments:

ssl - SSL point

Return:

1 : OK
0 : failed
Chapter 2. API Reference

Description:

shutdown the connection

Example:

```c
void example(void)
{
    SSL *ssl;
    int ret;
    ...
    ret = SSL_clear(ssl);
}
```

3.8 int SSL_read (SSL * ssl, void * buffer, int len)

Arguments:

<table>
<thead>
<tr>
<th>ssl</th>
<th>point</th>
</tr>
</thead>
<tbody>
<tr>
<td>buffer</td>
<td>data buffer point</td>
</tr>
<tr>
<td>len</td>
<td>data length</td>
</tr>
</tbody>
</table>

Return:

> 0 : OK, and return received data bytes
= 0 : no data received or connection is closed
< 0 : an error catch

Description:

read data from remote

Example:

```c
void example(void)
{
    SSL *ssl;
    char *buf;
    int len;
    int ret;
    ...
    ret = SSL_read(ssl, buf, len);
}
```

3.9 int SSL_write (SSL * ssl, const void * buffer, int len)

Arguments:

<table>
<thead>
<tr>
<th>ssl</th>
<th>SSL point</th>
</tr>
</thead>
<tbody>
<tr>
<td>buffer</td>
<td>data buffer point</td>
</tr>
<tr>
<td>len</td>
<td>data length</td>
</tr>
</tbody>
</table>

Return:

> 0 : OK, and return received data bytes
= 0 : no data sent or connection is closed
< 0 : an error catch

Description:
Example:

```c
void example(void)
{
    SSL *ssl;
    char *buf;
    int len;
    int ret;
    ...
    ret = SSL_write(ssl, buf, len);
}
```

### 3.10 SSL_CTX *SSL_get_SSL_CTX (const SSL * ssl)

**Arguments:**

- `ssl` - SSL point

**Return:**

SSL context

**Description:**

get SSL context of the SSL

**Example:**

```c
void example(void)
{
    SSL *ssl;
    SSL_CTX *ctx;
    ...
    ctx = SSL_get_SSL_CTX(ssl);
}
```

### 3.11 int SSL_get_shutdown (const SSL * ssl)

**Arguments:**

- `ssl` - SSL point

**Return:**

shutdown mode

**Description:**

get SSL shutdown mode

**Example:**

```c
void example(void)
{
    SSL *ssl;
    int mode;
    ...
    ...
}
```
3.12 void SSL_set_shutdown (SSL * ssl, int mode)

Arguments:

ssl - SSL point

Return:

shutdown mode

Description:

set SSL shutdown mode

Example:

```c
void example(void)
{
    SSL *ssl;
    int mode = 0;
    ... ...
    SSL_set_shutdown(ssl, mode);
}
```

3.13 const SSL_METHOD* SSL_get_ssl_method (SSL * ssl)

Arguments:

ssl - SSL point

Return:

SSL method

Description:

set SSL shutdown mode

Example:

```c
void example(void)
{
    SSL *ssl;
    const SSL_METHOD *method;
    ... ...
    method = SSL_get_ssl_method(ssl);
}
```

3.14 int SSL_set_ssl_method (SSL * ssl, const SSL_METHOD * method)

Arguments:
Chapter 2. API Reference

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>SSL_set_ssl_method(ssl, method);</td>
<td>set the SSL method</td>
<td>void example(void)</td>
</tr>
<tr>
<td>void example(void)</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
| int SSL_pending(const SSL *ssl); | get received data bytes | \[
\begin{align*}
\text{void example(void)} & \\
\{ & \\
\text{int ret;} & \\
\text{SSL *ssl;} & \\
\text{const SSL_METHOD *method;} & \\
\ldots & \\
\text{ret = SSL_set_ssl_method(ssl, method);} & \\
\}
\end{align*}
| |
| int SSL_has_pending(const SSL *ssl); | | |
| void example(void) | | |
| int SSL_has_pending(const SSL *ssl); | | |

Arguments:

ssl - SSL point
meth - SSL method point

Return:

1 : OK
0 : failed

Description:

set the SSL method

Example:

```c
void example(void)
{
    int ret;
    SSL *ssl;
    const SSL_METHOD *method;
    ... ...
    ret = SSL_set_ssl_method(ssl, method);
}
```

3.15 int SSL_pending (const SSL * ssl)

Arguments:

ssl - SSL point

Return:

data bytes

Description:

get received data bytes

Example:

```c
void example(void)
{
    int ret;
    SSL *ssl;
    ... ...
    ret = SSL_pending(ssl);
}
```

3.16 int SSL_has_pending (const SSL * ssl)

Arguments:

ssl - SSL point

Return:

1 : Yes
0 : No

Description:
check if data is received

Example:

```c
void example(void)
{
    int ret;
    SSL *ssl;
    ...
    ret = SSL_has_pending(ssl);
}
```

3.17 int SSL_get_fd (const SSL * ssl)

Arguments:

ssl - SSL point

Return:

>= 0 : socket id
< 0 : a error catch

Description:

get the socket of the SSL

Example:

```c
void example(void)
{
    int ret;
    SSL *ssl;
    ...
    ret = SSL_get_fd(ssl);
}
```

3.18 int SSL_get_rfd (const SSL * ssl)

Arguments:

ssl - SSL point

Return:

>= 0 : socket id
< 0 : a error catch

Description:

get the read only socket of the SSL

Example:

```c
void example(void)
{
    int ret;
    SSL *ssl;
    ...
    ret = SSL_get_rfd(ssl);
}
```
... ...
ret = SSL_get_rfd(ssl);
}

3.19 int SSL_get_wfd (const SSL * ssl)

Arguments:
ssl - SSL point

Return:

>= 0 : socket id
< 0 : a error catch

Description:
get the write only socket of the SSL

Example:

void example(void)
{
    int ret;
    SSL *ssl;
    ...
    ret = SSL_get_wfd(ssl);
}

3.20 int SSL_set_fd (SSL * ssl, int fd)

Arguments:
ssl - SSL point
fd - socket id

Return:

1 : OK
0 : failed

Description:
set socket to SSL

Example:

void example(void)
{
    int ret;
    SSL *ssl;
    int socket;
    ...
    ret = SSL_set_fd(ssl, socket);
}
3.21 int SSL_set_rfd (SSL * ssl, int fd)

Arguments:

<table>
<thead>
<tr>
<th>ssl</th>
<th>SSL point</th>
</tr>
</thead>
<tbody>
<tr>
<td>fd</td>
<td>socket id</td>
</tr>
</tbody>
</table>

Return:

<table>
<thead>
<tr>
<th>1</th>
<th>OK</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>failed</td>
</tr>
</tbody>
</table>

Description:

set read only socket to SSL

Example:

```c
void example(void)
{
    int ret;
    SSL *ssl;
    int socket;
    ...
    ret = SSL_set_rfd(ssl, socket);
}
```

3.22 int SSL_set_wfd (SSL * ssl, int fd)

Arguments:

<table>
<thead>
<tr>
<th>ssl</th>
<th>SSL point</th>
</tr>
</thead>
<tbody>
<tr>
<td>fd</td>
<td>socket id</td>
</tr>
</tbody>
</table>

Return:

<table>
<thead>
<tr>
<th>1</th>
<th>OK</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>failed</td>
</tr>
</tbody>
</table>

Description:

set write only socket to SSL

Example:

```c
void example(void)
{
    int ret;
    SSL *ssl;
    int socket;
    ...
    ret = SSL_set_wfd(ssl, socket);
}
```

3.23 int SSL_version (const SSL * ssl)

Arguments:

<table>
<thead>
<tr>
<th>ssl</th>
<th>SSL point</th>
</tr>
</thead>
</table>
## API Reference

### SSL version

**Return:**
SSL version

**Description:**
get SSL version

**Example:**
```c
void example(void)
{
    int version;
    SSL *ssl;
    ...
    version = SSL_version(ssl);
}
```

### const char* SSL_get_version (const SSL * ssl)

**Arguments:**
- ssl - SSL point

**Return:**
SSL version string

**Description:**
get the SSL current version string

**Example:**
```c
void example(void)
{
    char *version;
    SSL *ssl;
    ...
    version = SSL_get_version(ssl);
}
```

### OSSL_HANDSHAKE_STATE SSL_get_state (const SSL * ssl)

**Arguments:**
- ssl - SSL point

**Return:**
SSL state

**Description:**
get the SSL state

**Example:**
void example(void)
{
    OSSL_HANDSHAKE_STATE state;
    SSL *ssl;
    ...
    state = SSL_get_state(ssl);
}

3.26 const char* SSL_alert_desc_string (int value)
Arguments:
value - SSL description

Return:
alert value string

Description:
get alert description string

Example:

void example(void)
{
    int val;
    char *str;
    ...
    str = SSL_alert_desc_string(val);
}

3.27 const char* SSL_alert_desc_string_long (int value)
Arguments:
value - SSL description

Return:
alert value long string

Description:
get alert description long string

Example:

void example(void)
{
    int val;
    char *str;
    ...
    str = SSL_alert_desc_string_long(val);
}

3.28 const char* SSL_alert_type_string (int value)
Arguments:

value - SSL type description

Return:

alert type string

Description:

get alert type string

Example:

```c
void example(void)
{
    int val;
    char *str;
    ...
    str = SSL_alert_type_string(val);
}
```

3.29 const char* SSL_alert_type_string_long (int value)

Arguments:

value - SSL type description

Return:

alert type long string

Description:

get alert type long string

Example:

```c
void example(void)
{
    int val;
    char *str;
    ...
    str = SSL_alert_type_string_long(val);
}
```

3.30 const char* SSL_rstate_string (SSL *ssl)

Arguments:

ssl - SSL point

Return:

state string

Description:
get the state string where SSL is reading

Example:

```c
void example(void)
{
    SSL *ssl;
    char *str;
    ... ...
    str = SSL_rstate_string(ssl);
}
```

3.31 const char* `SSL_rstate_string_long(SSL * ssl)`

Arguments:

```c
ssl  - SSL point
```

Return:

```c
state long string
```

Description:

get the state long string where SSL is reading

Example:

```c
void example(void)
{
    SSL *ssl;
    char *str;
    ... ...
    str = SSL_rstate_string_long(ssl);
}
```

3.32 const char* `SSL_state_string(const SSL * ssl)`

Arguments:

```c
ssl  - SSL point
```

Return:

```c
state string
```

Description:

get the state string

Example:

```c
void example(void)
{
    SSL *ssl;
    const char *str;
    ... ...
}
```
str = SSL_state_string(ssl);
}

3.33 char* SSL_state_string_long (const SSL * ssl)

Arguments:

ssl - SSL point

Return:

state long string

Description:

get the state long string

Example:

void example(void)
{
    SSL *ssl;
    char *str;
    ...
    str = SSL_state_string(ssl);
}

3.34 int SSL_get_error (const SSL * ssl, int ret_code)

Arguments:

ssl - SSL point
ret_code - SSL return code

Return:

SSL error number

Description:

get SSL error code

Example:

void example(void)
{
    SSL *ssl;
    int ret;
    int err;
    ...
    err = SSL_get_error(ssl, ret);
}

3.35 int SSL_want (const SSL * ssl)

Arguments:
ssl - SSL point

Return:

specifical statement

Description:

get the SSL specifical statement

Example:

```c
void example(void)
{
    SSL *ssl;
    int state;
    ...
    state = SSL_want(ssl);
}
```

3.36 int SSL_want_nothing (const SSL * ssl)

Arguments:

ssl - SSL point

Return:

0 : false
1 : true

Description:

check if SSL want nothing

Example:

```c
void example(void)
{
    SSL *ssl;
    int ret;
    ...
    ret = SSL_want(ssl);
}
```

3.37 int SSL_want_read (const SSL * ssl)

Arguments:

ssl - SSL point

Return:

0 : false
1 : true

Description:
check if SSL want to read

Example:

```c
void example(void)
{
    SSL *ssl;
    int ret;
    ...
    ret = SSL_want_read(ssl);
}
```

3.38 int SSL_want_write (const SSL * ssl)

Arguments:

ssl - SSL point

Return:

0 : false
1 : true

Description:

check if SSL want to write

Example:

```c
void example(void)
{
    SSL *ssl;
    int ret;
    ...
    ret = SSL_want_write(ssl);
}
```

Chapter 4. SSL X509 Certification and Private Key Function

4.1 X509 * d2i_X509 (X509 ** cert, const unsigned char * buffer, long len)

Arguments:

cert - a point pointed to X509 certification
buffer - a point pointed to the certification context memory point
length - certification bytes

Return:

X509 certification object point

Description:

load a character certification context into system context. If '*cert' is...
...pointed to the certification, then load certification into it. Or create a new X509...
...certification object
Example:

```c
void example(void)
{
    X509 *new;
    X509 *cert;
    unsigned char *buffer;
    long len;
    ... ...
    new = d2i_X509(&cert, buffer, len);
}
```

### 4.2 int SSL_add_client_CA (SSL * s, X509 * x)

**Arguments:**

- `ssl` - SSL point
- `x` - CA certification point

**Return:**

- 1 : OK
- 0 : failed

**Description:**

add CA client certification into the SSL

Example:

```c
void example(void)
{
    int ret;
    SSL *ssl;
    X509 *new;
    ... ...
    ret = SSL_add_client_CA(ssl, new);
}
```

### 4.3 int SSL_CTX_add_client_CA (SSL_CTX * c, X509 * x)

**Arguments:**

- `ctx` - SSL context point
- `x` - CA certification point

**Return:**

- 1 : OK
- 0 : failed

**Description:**

add CA client certification into the SSL context

Example:

```c
void example(void)
{
    int ret;
    ... ...
}
```

(continues on next page)
SSL_CTX *ctx;
X509 *new;

... ...

ret = SSL_add_client_CA(ctx, new);

4.4 X509* SSL_get_certificate (const SSL * ssl)

Arguments:

ssl - SSL point

Return:

SSL certification point

Description:

get the SSL certification point

Example:

void example(void)
{
    SSL *ssl;
    X509 *cert;
    ... ...
    cert = SSL_get_certificate(ssl);
}

4.5 long SSL_get_verify_result (const SSL * ssl)

Arguments:

ssl - SSL point

Return:

the result of verifying

Description:

get the verifying result of the SSL certification

Example:

void example(void)
{
    SSL *ssl;
    long ret;
    ... ...
    ret = SSL_get_verify_result(ssl);
}

4.6 int SSL_CTX_use_certificate (SSL_CTX * ctx, X509 * x)

Arguments:
ctx - the SSL context point  
pkey - certification object point

Return:

1 : OK  
0 : failed

Description:

load the certification into the SSL_CTX or SSL object

Example:

```c
void example(void)
{
    int ret;
    SSL_CTX *ctx
    X509 *new;
    ...
    ret = SSL_CTX_use_certificate(ctx, new);
}
```

4.7 int SSL_CTX_use_certificate_ASN1 (SSL_CTX *ctx, int len, const unsigned char *d)

Arguments:

ctx - SSL context point  
len - certification length  
d - data point

Return:

1 : OK  
0 : failed

Description:

load the ASN1 certification into SSL context

Example:

```c
void example(void)
{
    int ret;
    SSL_CTX *ctx;
    const unsigned char *buf;
    int len;
    ...
    ret = SSL_CTX_use_certificate_ASN1(ctx, len, buf);
}
```

4.8 int SSL_CTX_use_PrivateKey (SSL_CTX *ctx, EVP_PKEY *pkey)

Arguments:

ctx - SSL context point  
pkey - private key object point
Return:

1: OK
0: failed

Description:

load the private key into the context object

Example:

```c
void example(void)
{
  int ret;
  SSL_CTX *ctx;
  EVP_PKEY *pkey;
  ...
  ret = SSL_CTX_use_PrivateKey(ctx, pkey);
}
```

4.9 `int SSL_CTX_use_PrivateKey_ASN1 (int pk, SSL_CTX *ctx, const unsigned char *d, long len)`

Arguments:

- `ctx` - SSL context point
- `d` - data point
- `len` - private key length

Return:

1: OK
0: failed

Description:

load the ASN1 private key into SSL context

Example:

```c
void example(void)
{
  int ret;
  int pk;
  SSL_CTX *ctx;
  const unsigned char *buf;
  long len;
  ...
  ret = SSL_CTX_use_PrivateKey_ASN1(pk, ctx, buf, len);
}
```

4.10 `int SSL_CTX_use_RSAPrivateKey_ASN1 (SSL_CTX *ctx, const unsigned char *d, long len)`

Arguments:

- `ctx` - SSL context point
- `d` - data point
- `len` - private key length

Return:
1: OK  
0: failed  

Description:  
load the RSA ASN1 private key into SSL context  

Example:  

```c  
void example(void)  
{  
    int ret;  
    SSL_CTX *ctx;  
    const unsigned char *buf;  
    long len;  
    ... ...  
    ret = SSL_CTX_use_RSAPrivateKey_ASN1(ctx, buf, len);  
}  
```

4.11 int SSL_use_certificate_ASN1 (SSL * ssl, int len, const unsigned char * d)  

Arguments:  
ssl - SSL point  
len - data bytes  
d - data point  

Return:  
1: OK  
0: failed  

Description:  
load certification into the SSL  

Example:  

```c  
void example(void)  
{  
    int ret;  
    SSL *ssl;  
    const unsigned char *buf;  
    long len;  
    ... ...  
    ret = SSL_use_certificate_ASN1(ssl, len, buf);  
}  
```

4.12 X509* SSL_get_peer_certificate (const SSL * ssl)  

Arguments:  
ssl - SSL point  

Return:  
peer certification  

Description:
get peer certification

Example:

```c
void example(void)
{
    SSL *ssl;
    X509 *peer;
    ...
    peer = SSL_get_peer_certificate(ssl);
}
```

## 2.4.5 ESP HTTP Client

### Overview

*esp_http_client* provides an API for making HTTP/S requests from ESP-IDF applications. The steps to use this API are as follows:

- **esp_http_client_init():** Creates an *esp_http_client_config_t* instance i.e. a HTTP client handle based on the given *esp_http_client_config_t* configuration. This function must be the first to be called; default values will be assumed for the configuration values that are not explicitly defined by the user.
- **esp_http_client_perform():** Performs all operations of the esp_http_client - opening the connection, exchanging data and closing the connection (as required), while blocking the current task until its completion. All related events will be invoked through the event handler (as specified in *esp_http_client_config_t*).
- **esp_http_client_cleanup():** Closes the connection (if any) and frees up all the memory allocated to the HTTP client instance. This must be the last function to be called after the completion of operations.

### Application Example

Simple example that uses ESP HTTP Client to make HTTP/S requests at protocols/esp_http_client.

**Basic HTTP request**

Check out the example functions `http_rest_with_url` and `http_rest_with_hostname_path` in the application example for implementation details.

**Persistent Connections**

Persistent connection means that the HTTP client can re-use the same connection for several exchanges. If the server does not request to close the connection with the `Connection: close` header, the connection is not dropped but is instead kept open and used for further requests.

To allow ESP HTTP client to take full advantage of persistent connections, one should make as many requests as possible using the same handle instance.

Check out the example functions `http_rest_with_url` and `http_rest_with_hostname_path` in the application example. Here, once the connection is created, multiple requests (`GET`, `POST`, `PUT`, etc.) are made before the connection is closed.
HTTPS Request

ESP HTTP client supports SSL connections using mbedTLS, with the url configuration starting with https scheme or transport_type set to HTTP_TRANSPORT_OVER_SSL. HTTPS support can be configured via CONFIG_ESP_HTTP_CLIENT_ENABLE_HTTPS (enabled by default).

Note: While making HTTPS requests, if server verification is needed, additional root certificate (in PEM format) needs to be provided to the cert_pem member in esp_http_client_config_t configuration. Users can also use the ESP x509 Certificate Bundle for server verification using the crt_bundle_attach member of the esp_http_client_config_t configuration.

Check out the example functions https_with_url and https_with_hostname_path in the application example. (Implementation details of the above note are found here)

HTTP Stream

Some applications need to open the connection and control the exchange of data actively (data streaming). In such cases, the application flow is different from regular requests. Example flow is given below:

- esp_http_client_init(): Create a HTTP client handle
- esp_http_client_set_*, esp_http_client_delete_*: Modify the HTTP connection parameters (optional)
- esp_http_client_open(): Open the HTTP connection with write_len parameter (content length that needs to be written to server), set write_len=0 for read-only connection
- esp_http_client_write(): Write data to server with a maximum length equal to write_len of esp_http_client_open() function; no need to call this function for write_len=0
- esp_http_client_fetch_headers(): Read the HTTP Server response headers, after sending the request headers and server data (if any). Returns the content-length from the server and can be succeeded by esp_http_client_get_status_code() for getting the HTTP status of the connection.
- esp_http_client_read(): Read the HTTP stream
- esp_http_client_close(): Close the connection
- esp_http_client_cleanup(): Release allocated resources

Check out the example function http_perform_as_stream_reader in the application example for implementation details.

HTTP Authentication

ESP HTTP client supports both Basic and Digest Authentication.

- Users can provide the username and password in the url or the username and password members of the esp_http_client_config_t configuration. For auth_type = HTTP_AUTH_TYPE_BASIC, the HTTP client takes only 1 perform operation to pass the authentication process.
- If auth_type = HTTP_AUTH_TYPE_NONE, but the username and password fields are present in the configuration, the HTTP client takes 2 perform operations. The client will receive the 401 Unauthorized header in its first attempt to connect to the server. Based on this information, it decides which authentication method to choose and performs it in the second operation.
- Check out the example functions http_auth_basic, http_auth_digest (for Basic authentication) and http_auth_digest (for Digest authentication) in the application example for implementation details.

Examples of Authentication Configuration

- Authentication with URI
Authentication with username and password entry

```c
esp_http_client_config_t config = {
    .url = "http://httpbin.org/basic-auth/user/passwd",
    .username = "user",
    .password = "passwd",
    .auth_type = HTTP_AUTH_TYPE_BASIC,
};
```

API Reference

Header File

- components/esp_http_client/include/esp_http_client.h

Functions

```c
esp_http_client_handle_t esp_http_client_init(const esp_http_client_config_t *config)
```

Start a HTTP session This function must be the first function to call, and it returns a esp_http_client_handle_t that you must use as input to other functions in the interface. This call MUST have a corresponding call to esp_http_client_cleanup when the operation is complete.

Return

- esp_http_client_handle_t
- NULL if any errors

Parameters

- [in] config: The configurations, see http_client_config_t

```c
esp_err_t esp_http_client_perform(esp_http_client_handle_t client)
```

Invoke this function after esp_http_client_init and all the options calls are made, and will perform the transfer as described in the options. It must be called with the same esp_http_client_handle_t as input as the esp_http_client_init call returned. esp_http_client_perform performs the entire request in either blocking or non-blocking manner. By default, the API performs request in a blocking manner and returns when done, or if it failed, and in non-blocking manner, it returns if EAGAIN/EWOULDBLOCK or EINPROGRESS is encountered, or if it failed. And in case of non-blocking request, the user may call this API multiple times unless request & response is complete or there is a failure. To enable non-blocking esp_http_client_perform(), is_async member of esp_http_client_config_t must be set while making a call to esp_http_client_init() API. You can do any amount of calls to esp_http_client_perform while using the same esp_http_client_handle_t. The underlying connection may be kept open if the server allows it. If you intend to transfer more than one file, you are even encouraged to do so. esp_http_client will then attempt to re-use the same connection for the following transfers, thus making the operations faster, less CPU intense and using less network resources. Just note that you will have to use esp_http_client_set_** between the invoke to set options for the following esp_http_client_perform.

Note You must never call this function simultaneously from two places using the same client handle. Let the function return first before invoking it another time. If you want parallel transfers, you must use several esp_http_client_handle_t. This function include esp_http_client_open -> esp_http_client_write -> esp_http_client_fetch_headers -> esp_http_client_read (and option) esp_http_client_close.

Return

- ESP_OK on successful
- ESP_FAIL on error

Parameters

- client: The esp_http_client handle
### esp_err_t esp_http_client_set_url(esp_http_client_handle_t client, const char *url)
Set URL for client, when performing this behavior, the options in the URL will replace the old ones.

**Return**
- ESP_OK
- ESP_FAIL

**Parameters**
- [in] `client`: The esp_http_client handle
- [in] `url`: The url

### esp_err_t esp_http_client_set_post_field(esp_http_client_handle_t client, const char *data, int len)
Set post data, this function must be called before esp_http_client_perform. Note: The data parameter passed to this function is a pointer and this function will not copy the data.

**Return**
- ESP_OK
- ESP_FAIL

**Parameters**
- [in] `client`: The esp_http_client handle
- [in] `data`: post data pointer
- [in] `len`: post length

### int esp_http_client_get_post_field(esp_http_client_handle_t client, char **data)
Get current post field information.

**Return** Size of post data

**Parameters**
- [in] `client`: The client
- [out] `data`: Point to post data pointer

### esp_err_t esp_http_client_set_header(esp_http_client_handle_t client, const char *key, const char *value)
Set http request header, this function must be called after esp_http_client_init and before any perform function.

**Return**
- ESP_OK
- ESP_FAIL

**Parameters**
- [in] `client`: The esp_http_client handle
- [in] `key`: The header key
- [in] `value`: The header value

### esp_err_t esp_http_client_get_header(esp_http_client_handle_t client, const char *key, char **value)
Get http request header. The value parameter will be set to NULL if there is no header which is same as the key specified, otherwise the address of header value will be assigned to value parameter. This function must be called after esp_http_client_init.

**Return**
- ESP_OK
- ESP_FAIL

**Parameters**
- [in] `client`: The esp_http_client handle
- [in] `key`: The header key
- [out] `value`: The header value

### esp_err_t esp_http_client_get_username(esp_http_client_handle_t client, char **value)
Get http request username. The address of username buffer will be assigned to value parameter. This function must be called after esp_http_client_init.

**Return**
- ESP_OK
- ESP_ERR_INVALID_ARG
Parameters
- [in] client: The esp_http_client handle
- [out] value: The username value

`esp_err_t esp_http_client_set_username(esp_http_client_handle_t client, const char *username)`

Set http request username. The value of username parameter will be assigned to username buffer. If the username parameter is NULL then username buffer will be freed.

Return
- ESP_OK
- ESP_ERR_INVALID_ARG

Parameters
- [in] client: The esp_http_client handle
- [in] username: The username value

`esp_err_t esp_http_client_get_password(esp_http_client_handle_t client, char **value)`

Get http request password. The address of password buffer will be assigned to value parameter. This function must be called after `esp_http_client_init`.

Return
- ESP_OK
- ESP_ERR_INVALID_ARG

Parameters
- [in] client: The esp_http_client handle
- [out] value: The password value

`esp_err_t esp_http_client_set_password(esp_http_client_handle_t client, const char *password)`

Set http request password. The value of password parameter will be assigned to password buffer. If the password parameter is NULL then password buffer will be freed.

Return
- ESP_OK
- ESP_ERR_INVALID_ARG

Parameters
- [in] client: The esp_http_client handle
- [in] password: The password value

`esp_err_t esp_http_client_set_auth_type(esp_http_client_auth_type_t auth_type)`

Set http request auth_type.

Return
- ESP_OK
- ESP_ERR_INVALID_ARG

Parameters
- [in] client: The esp_http_client handle
- [in] auth_type: The esp_http_client auth type

`int esp_http_client_get_errno(esp_http_client_handle_t client)`

Get HTTP client session errno.

Return
- (-1) if invalid argument
- errno

Parameters
- [in] client: The esp_http_client handle

`esp_err_t esp_http_client_set_method(esp_http_client_method_t method)`

Set http request method.

Return
- ESP_OK
Chapter 2. API Reference

- ESP_ERR_INVALID_ARG

Parameters
- [in] client: The esp_http_client handle
- [in] method: The method

\textbf{esp_err_t esp_http_client_set_timeout_ms (esp_http_client_handle_t client, int timeout_ms)}
Set http request timeout.

Return
- ESP_OK
- ESP_ERR_INVALID_ARG

Parameters
- [in] client: The esp_http_client handle
- [in] timeout_ms: The timeout value

\textbf{esp_err_t esp_http_client_delete_header (esp_http_client_handle_t client, const char* key)}
Delete http request header.

Return
- ESP_OK
- ESP_FAIL

Parameters
- [in] client: The esp_http_client handle
- [in] key: The key

\textbf{esp_err_t esp_http_client_open (esp_http_client_handle_t client, int write_len)}
This function will be open the connection, write all header strings and return.

Return
- ESP_OK
- ESP_FAIL

Parameters
- [in] client: The esp_http_client handle
- [in] write_len: HTTP Content length need to write to the server

\textbf{int esp_http_client_write (esp_http_client_handle_t client, const char* buffer, int len)}
This function will write data to the HTTP connection previously opened by esp_http_client_open()

Return
- (-1) if any errors
  - Length of data written

Parameters
- [in] client: The esp_http_client handle
  - buffer: The buffer
  - [in] len: This value must not be larger than the write_len parameter provided to esp_http_client_open()

\textbf{int64_t esp_http_client_fetch_headers (esp_http_client_handle_t client)}
This function need to call after esp_http_client_open, it will read from http stream, process all receive headers.

Return
- (0) if stream doesn’t contain content-length header, or chunked encoding (checked by esp_http_client_is_chunked_response)
  - (-1: ESP_FAIL) if any errors
  - Download data length defined by content-length header

Parameters
- [in] client: The esp_http_client handle

\textbf{bool esp_http_client_is_chunked_response (esp_http_client_handle_t client)}
Check response data is chunked.

Return true or false

Parameters
- [in] client: The esp_http_client handle
int esp_http_client_read (esp_http_client_handle_t client, char *buffer, int len)
Read data from http stream.

Return
• (-1) if any errors
• Length of data was read

Parameters
• [in] client: The esp_http_client handle
• buffer: The buffer
• [in] len: The length

int esp_http_client_get_status_code (esp_http_client_handle_t client)
Get http response status code, the valid value if this function invoke after esp_http_client_perform

Return Status code

Parameters
• [in] client: The esp_http_client handle

int64_t esp_http_client_get_content_length (esp_http_client_handle_t client)
Get http response content length (from header Content-Length) the valid value if this function invoke after esp_http_client_perform

Return
• (-1) Chunked transfer
• Content-Length value as bytes

Parameters
• [in] client: The esp_http_client handle

esp_err_t esp_http_client_close (esp_http_client_handle_t client)
Close http connection, still kept all http request resources.

Return
• ESP_OK
• ESP_FAIL

Parameters
• [in] client: The esp_http_client handle

esp_err_t esp_http_client_cleanup (esp_http_client_handle_t client)
This function must be the last function to call for an session. It is the opposite of the esp_http_client_init function and must be called with the same handle as input that a esp_http_client_init call returned. This might close all connections this handle has used and possibly has kept open until now. Don’t call this function if you intend to transfer more files, re-using handles is a key to good performance with esp_http_client.

Return
• ESP_OK
• ESP_FAIL

Parameters
• [in] client: The esp_http_client handle

esp_http_client_transport_t esp_http_client_get_transport_type (esp_http_client_handle_t client)
Get transport type.

Return
• HTTP_TRANSPORT_UNKNOWN
• HTTP_TRANSPORT_OVER_TCP
• HTTP_TRANSPORT_OVER_SSL

Parameters
• [in] client: The esp_http_client handle

esp_err_t esp_http_client_set_redirection (esp_http_client_handle_t client)
Set redirection URL. When received the 30x code from the server, the client stores the redirect URL provided by the server. This function will set the current URL to redirect to enable client to execute the redirection request.
Return
- ESP_OK
- ESP_FAIL

Parameters
- [in] client: The esp_http_client handle

`void esp_http_client_add_auth(esp_http_client_handle_t client)`

On receiving HTTP Status code 401, this API can be invoked to add authorization information.

Note: There is a possibility of receiving body message with redirection status codes, thus make sure to flush
off body data after calling this API.

Parameters
- [in] client: The esp_http_client handle

`bool esp_http_client_is_complete_data_received(esp_http_client_handle_t client)`

Checks if entire data in the response has been read without any error.

Return
- true
- false

Parameters
- [in] client: The esp_http_client handle

`int esp_http_client_read_response(esp_http_client_handle_t client, char* buffer, int len)`

Helper API to read larger data chunks. This is a helper API which internally calls `esp_http_client_read`
multiple times till the end of data is reached or till the buffer gets full.

Return
- Length of data was read

Parameters
- [in] client: The esp_http_client handle
- buffer: The buffer
- [in] len: The buffer length

`esp_err_t esp_http_client_flush_response(esp_http_client_handle_t client, int* len)`

Process all remaining response data. This uses an internal buffer to repeatedly receive, parse, and discard
response data until complete data is processed. As no additional user-supplied buffer is required, this may be
preferable to `esp_http_client_read_response` in situations where the content of the response may
be ignored.

Return
- ESP_OK If successful, len will have discarded length
- ESP_FAIL If failed to read response
- ESP_ERR_INVALID_ARG If the client is NULL

Parameters
- [in] client: The esp_http_client handle
- len: Length of data discarded

`esp_err_t esp_http_client_get_url(esp_http_client_handle_t client, char *url, const int len)`

Get URL from client.

Return
- ESP_OK
- ESP_FAIL

Parameters
- [in] client: The esp_http_client handle
- [inout] url: The buffer to store URL
- [in] len: The buffer length

`esp_err_t esp_http_client_get_chunk_length(esp_http_client_handle_t client, int *len)`

Get Chunk-Length from client.

Return
- ESP_OK If successful, len will have length of current chunk
• ESP_FAIL If the server is not a chunked server
• ESP_ERR_INVALID_ARG If the client or len are NULL

**Parameters**
• **[in]** client: The esp_http_client handle
• **[out]** len: Variable to store length

**Structures**

```c
struct esp_http_client_event
HTTP Client events data.
```

**Public Members**

```c
def esp_http_client_event_id_t event_id:
    event_id, to know the cause of the event

def esp_http_client_handle_t client:
    esp_http_client_handle_t context

def *data:
    data of the event

def int data_len:
    data length of data

def *user_data:
    user_data context, from esp_http_client_config_t user_data

def char *header_key:
    For HTTP_EVENT_ON_HEADER event_id, it’s store current http header key

def char *header_value:
    For HTTP_EVENT_ON_HEADER event_id, it’s store current http header value
```

```c
struct esp_http_client_config_t
HTTP configuration.
```

**Public Members**

```c
def const char *url:
    HTTP URL, the information on the URL is most important, it overrides the other fields below, if any

def const char *host:
    Domain or IP as string

def int port:
    Port to connect, default depend on esp_http_client_transport_t (80 or 443)

def const char *username:
    Using for Http authentication

def const char *password:
    Using for Http authentication

def esp_http_client_auth_type_t auth_type:
    Http authentication type, see esp_http_client_auth_type_t

def const char *path:
    HTTP Path, if not set, default is /

def const char *query:
    HTTP query

def const char *cert_pem:
    SSL server certification, PEM format as string, if the client requires to verify server
size_t cert_len
Length of the buffer pointed to by cert_pem. May be 0 for null-terminated pem

const char *client_cert_pem
SSL client certification, PEM format as string, if the server requires to verify client

size_t client_cert_len
Length of the buffer pointed to by client_cert_pem. May be 0 for null-terminated pem

const char *client_key_pem
SSL client key, PEM format as string, if the server requires to verify client

size_t client_key_len
Length of the buffer pointed to by client_key_pem. May be 0 for null-terminated pem

const char *client_key_password
Client key decryption password string

size_t client_key_password_len
String length of the password pointed to by client_key_password

const char *user_agent
The User Agent string to send with HTTP requests

esp_http_client_method_t method
HTTP Method

int timeout_ms
Network timeout in milliseconds

bool disable_auto_redirect
Disable HTTP automatic redirects

int max_redirection_count
Max number of redirections on receiving HTTP redirect status code, using default value if zero

int max_authorization_retries
Max connection retries on receiving HTTP unauthorized status code, using default value if zero. Disables authorization retry if -1

http_event_handle_cb event_handler
HTTP Event Handle

esp_http_client_transport_t transport_type
HTTP transport type, see esp_http_client_transport_t

int buffer_size
HTTP receive buffer size

int buffer_size_tx
HTTP transmit buffer size

void *user_data
HTTP user_data context

bool is_async
Set asynchronous mode, only supported with HTTPS for now

bool use_global_ca_store
Use a global ca_store for all the connections in which this bool is set.

bool skip_cert_common_name_check
Skip any validation of server certificate CN field

esp_err_t (*crt_bundle_attach)(void *conf)
Function pointer to esp_crt_bundle_attach. Enables the use of certification bundle for server verification, must be enabled in menuconfig
bool keep_alive_enable
   Enable keep-alive timeout

int keep_alive_idle
   Keep-alive idle time. Default is 5 (second)

int keep_alive_interval
   Keep-alive interval time. Default is 5 (second)

int keep_alive_count
   Keep-alive packet retry send count. Default is 3 counts

struct ifreq *if_name
   The name of interface for data to go through. Use the default interface without setting

Macros
DEFAULT_HTTP_BUF_SIZE
ESP_ERR_HTTP_BASE
   Starting number of HTTP error codes

ESP_ERR_HTTP_MAX_REDIRECT
   The error exceeds the number of HTTP redirects

ESP_ERR_HTTP_CONNECT
   Error open the HTTP connection

ESP_ERR_HTTP_WRITE_DATA
   Error write HTTP data

ESP_ERR_HTTP_FETCH_HEADER
   Error read HTTP header from server

ESP_ERR_HTTP_INVALID_TRANSPORT
   There are no transport support for the input scheme

ESP_ERR_HTTP_CONNECTING
   HTTP connection hasn’t been established yet

ESP_ERR_HTTP_EAGAIN
   Mapping of errno EAGAIN to esp_err_t

ESP_ERR_HTTP_CONNECTION_CLOSED
   Read FIN from peer and the connection closed

Type Definitions
typedef struct esp_http_client *esp_http_client_handle_t
typedef struct esp_http_client_event *esp_http_client_event_handle_t
typedef struct esp_http_client_event esp_http_client_event_t
   HTTP Client events data.
typedef esp_err_t (*http_event_handle_cb)(esp_http_client_event_t *evt)

Enumerations
enum esp_http_client_event_id_t
   HTTP Client events id.

Values:

HTTP_EVENT_ERROR = 0
   This event occurs when there are any errors during execution

HTTP_EVENT_ON_CONNECTED
   Once the HTTP has been connected to the server, no data exchange has been performed
HTTP_EVENT_HEADERS_SENT
After sending all the headers to the server

HTTP_EVENT_HEADER_SENT = HTTP_EVENT_HEADERS_SENT
This header has been kept for backward compatibility and will be deprecated in future versions esp-idf

HTTP_EVENT_ON_HEADER
Occurs when receiving each header sent from the server

HTTP_EVENT_ON_DATA
Occurs when receiving data from the server, possibly multiple portions of the packet

HTTP_EVENT_ON_FINISH
Occurs when finish a HTTP session

HTTP_EVENT_DISCONNECTED
The connection has been disconnected

enum esp_http_client_transport_t
HTTP Client transport.
Values:

HTTP_TRANSPORT_UNKNOWN = 0x0
Unknown

HTTP_TRANSPORT_OVER_TCP
Transport over tcp

HTTP_TRANSPORT_OVER_SSL
Transport over ssl

enum esp_http_client_method_t
HTTP method.
Values:

HTTP_METHOD_GET = 0
HTTP GET Method

HTTP_METHOD_POST
HTTP POST Method

HTTP_METHOD_PUT
HTTP PUT Method

HTTP_METHOD_PATCH
HTTP PATCH Method

HTTP_METHOD_DELETE
HTTP DELETE Method

HTTP_METHOD_HEAD
HTTP HEAD Method

HTTP_METHOD_NOTIFY
HTTP NOTIFY Method

HTTP_METHOD_SUBSCRIBE
HTTP SUBSCRIBE Method

HTTP_METHOD_UNSUBSCRIBE
HTTP UNSUBSCRIBE Method

HTTP_METHOD_OPTIONS
HTTP OPTIONS Method

HTTP_METHOD_COPY
HTTP COPY Method
HTTP_METHOD_MOVE
   HTTP MOVE Method

HTTP_METHOD_LOCK
   HTTP LOCK Method

HTTP_METHOD_UNLOCK
   HTTP UNLOCK Method

HTTP_METHOD_PROPFIND
   HTTP PROPFIND Method

HTTP_METHOD_PROPPATCH
   HTTP PROPPATCH Method

HTTP_METHOD_MKCOL
   HTTP MKCOL Method

HTTP_METHOD_MAX

enum esp_http_client_auth_type_t
   HTTP Authentication type.

   Values:
   HTTP_AUTH_TYPE_NONE = 0
      No authention

   HTTP_AUTH_TYPE_BASIC
      HTTP Basic authentication

   HTTP_AUTH_TYPE_DIGEST
      HTTP Digest authentication

enum HttpStatus_Code
   Enum for the HTTP status codes.

   Values:
   HttpStatus_Ok = 200

   HttpStatus_MultipleChoices = 300

   HttpStatus_MovedPermanently = 301

   HttpStatus_Found = 302

   HttpStatus_TemporaryRedirect = 307

   HttpStatus_BadRequest = 400

   HttpStatus_Unauthorized = 401

   HttpStatus_Forbidden = 403

   HttpStatus_NotFound = 404

   HttpStatus_InternalError = 500

2.4.6 HTTP Server

Overview

The HTTP Server component provides an ability for running a lightweight web server on ESP32-S3. Following are
detailed steps to use the API exposed by HTTP Server:

   • httpd_start(): Creates an instance of HTTP server, allocate memory/resources for it depending upon
     the specified configuration and outputs a handle to the server instance. The server has both, a listening
     socket (TCP) for HTTP traffic, and a control socket (UDP) for control signals, which are selected in a round robin
Chapter 2. API Reference

fashion in the server task loop. The task priority and stack size are configurable during server instance creation by passing httpd_conf_t structure to httpd_start(). TCP traffic is parsed as HTTP requests and, depending on the requested URI, user registered handlers are invoked which are supposed to send back HTTP response packets.

- **httpd_stop()**: This stops the server with the provided handle and frees up any associated memory/resources. This is a blocking function that first signals a halt to the server task and then waits for the task to terminate. While stopping, the task will close all open connections, remove registered URI handlers and reset all session context data to empty.

- **httpd_register_uri_handler()**: A URI handler is registered by passing object of type httpd_uri_t structure which has members including uri name, method type (eg. HTTPD_GET/HTTPD_POST/HTTPD_PUT etc.), function pointer of type esp_err_t *handler (httpd_req_t *req) and user_ctx pointer to user context data.

**Application Example**

```c
/* Our URI handler function to be called during GET /uri request */
esp_err_t get_handler(httpd_req_t *req)
{
    /* Send a simple response */
    const char resp[] = "URI GET Response";
    httpd_resp_send(req, resp, HTTPD_RESP_USE_STRLEN);
    return ESP_OK;
}

/* Our URI handler function to be called during POST /uri request */
esp_err_t post_handler(httpd_req_t *req)
{
    /* Destination buffer for content of HTTP POST request. *
     * httpd_req_recv() accepts char* only, but content could *
     * as well be any binary data (needs type casting). *
     * In case of string data, null termination will be absent, and *
     * content length would give length of string */
    char content[100];

    /* Truncate if content length larger than the buffer */
    size_t recv_size = MIN(req->content_len, sizeof(content));

    int ret = httpd_req_recv(req, content, recv_size);
    if (ret <= 0) { /* 0 return value indicates connection closed */
        /* Check if timeout occurred */
        if (ret == HTTPD_SOCK_ERR_TIMEOUT) {
            /* In case of timeout one can choose to retry calling *
             * httpd_req_recv(), but to keep it simple, here we *
             * respond with an HTTP 408 (Request Timeout) error */
            httpd_resp_send_408(req);
        }
        /* In case of error, returning ESP_FAIL will *
         * ensure that the underlying socket is closed */
        return ESP_FAIL;
    }

    /* Send a simple response */
    const char resp[] = "URI POST Response";
    httpd_resp_send(req, resp, HTTPD_RESP_USE_STRLEN);
    return ESP_OK;
}

/* URI handler structure for GET /uri */
httpd_uri_t uri_get = {
    .uri = "/uri",
}
```

(continues on next page)
.method = HTTP_GET,
.handler = get_handler,
.user_ctx = NULL
};

/* URI handler structure for POST /uri */
httpd_uri_t uri_post = {
.uri = "/uri",
.method = HTTP_POST,
.handler = post_handler,
.user_ctx = NULL
};

/* Function for starting the webserver */
httpd_handle_t start_webserver(void)
{
    /* Generate default configuration */
    httpd_config_t config = HTTPD_DEFAULT_CONFIG();

    /* Empty handle to esp_http_server */
    httpd_handle_t server = NULL;

    /* Start the httpd server */
    if (httpd_start(&server, &config) == ESP_OK) {
        /* Register URI handlers */
        httpd_register_uri_handler(server, &uri_get);
        httpd_register_uri_handler(server, &uri_post);
    }

    /* If server failed to start, handle will be NULL */
    return server;
}

/* Function for stopping the webserver */
void stop_webserver(httpd_handle_t server)
{
    if (server) {
        /* Stop the httpd server */
        httpd_stop(server);
    }
}

Simple HTTP server example    Check HTTP server example under protocols/http_server/simple where handling of arbitrary content lengths, reading request headers and URL query parameters, and setting response headers is demonstrated.

Persistent Connections

HTTP server features persistent connections, allowing for the re-use of the same connection (session) for several transfers, all the while maintaining context specific data for the session. Context data may be allocated dynamically by the handler in which case a custom function may need to be specified for freeing this data when the connection/session is closed.

Persistent Connections Example

/* Custom function to free context */
void free_ctx_func(void *ctx)
{
    /* Could be something other than free */
```c
free(ctx);
}

esp_err_t adder_post_handler(httpd_req_t *req)
{
    /* Create session's context if not already available */
    if (!req->sess_ctx) {
        req->sess_ctx = malloc(sizeof(ANY_DATA_TYPE)); /* Pointer to context */
        req->free_ctx = free_ctx_func; /* Function to free context data */
    }
    /* Access context data */
    ANY_DATA_TYPE *ctx_data = (ANY_DATA_TYPE *)req->sess_ctx;
    /* Respond */
    ..........
    ..........
    ..........
    return ESP_OK;
}
```

Check the example under `protocols/http_server/persistent_sockets`.

**Websocket server**

HTTP server provides a simple websocket support if the feature is enabled in menuconfig, please see `CONFIG_HTTPD_WS_SUPPORT`. Please check the example under `protocols/http_server/ws_echo_server`.

**API Reference**

**Header File**

- `components/esp_http_server/include/esp_http_server.h`

**Functions**

`esp_err_t httpd_register_uri_handler(httpd_handle_t handle, const httpd_uri_t *uri_handler)`

Registers a URI handler.

Example usage:

```c
esp_err_t my_uri_handler(httpd_req_t *req)
{
    // Recv, Process and Send
    ....
    ....
    ....

    // Fail condition
    if (....) {
        // Return fail to close session
        return ESP_FAIL;
    }

    // On success
    return ESP_OK;
}
```

(continues on next page)
// URI handler structure
httpd_uri_t my_uri {
    .uri = "/my_uri/path/xyz",
    .method = HTTPD_GET,
    .handler = my_uri_handler,
    .user_ctx = NULL
};

// Register handler
if (httpd_register_uri_handler(server_handle, &my_uri) != ESP_OK) {
    // If failed to register handler
    ....
}

Note  URI handlers can be registered in real time as long as the server handle is valid.

Return
• ESP_OK : On successfully registering the handler
• ESP_ERR_INVALID_ARG : Null arguments
• ESP_ERR_HTTPD_HANDLERS_FULL : If no slots left for new handler
• ESP_ERR_HTTPD_HANDLER_EXISTS : If handler with same URI and method is already registered

Parameters
• [in] handle: handle to HTTPD server instance
• [in] uri_handler: pointer to handler that needs to be registered

esp_err_t httpd_unregister_uri_handler (httpd_handle_t handle, const char *uri, httpd_method_t method)

Unregister a URI handler.

Return
• ESP_OK : On successfully deregistering the handler
• ESP_ERR_INVALID_ARG : Null arguments
• ESP_ERR_NOT_FOUND : Handler with specified URI and method not found

Parameters
• [in] handle: handle to HTTPD server instance
• [in] uri: URI string
• [in] method: HTTP method

esp_err_t httpd_unregister_uri (httpd_handle_t handle, const char *uri)

Unregister all URI handlers with the specified uri string.

Return
• ESP_OK : On successfully deregistering all such handlers
• ESP_ERR_INVALID_ARG : Null arguments
• ESP_ERR_NOT_FOUND : No handler registered with specified uri string

Parameters
• [in] handle: handle to HTTPD server instance
• [in] uri: uri string specifying all handlers that need to be deregistered

esp_err_t httpd_sess_set_recv_override (httpd_handle_t hd, int sockfd, httpd_recv_func_t recv_func)

Override web server’s receive function (by session FD)

This function overrides the web server’s receive function. This same function is used to read HTTP request packets.

Note  This API is supposed to be called either from the context of
• an http session APIs where sockfd is a valid parameter
• a URI handler where sockfd is obtained using httpd_req_to_sockfd()
• ESP_OK: On successfully registering override
• ESP_ERR_INVALID_ARG : Null arguments

**Parameters**

• **hd**: HTTPD instance handle
• **sockfd**: Session socket FD
• **recv_func**: The receive function to be set for this session

```c
esp_err_t esp_httpd_sess_set_send_override(httpd_handle_t hd, int sockfd, httpd_send_func_t send_func)
```

Override web server’s send function (by session FD)

This function overrides the web server’s send function. This same function is used to send out any response to any HTTP request.

**Note** This API is supposed to be called either from the context of
• an http session APIs where sockfd is a valid parameter
• a URI handler where sockfd is obtained using httpd_req_to_sockfd()

**Return**

• ESP_OK : On successfully registering override
• ESP_ERR_INVALID_ARG : Null arguments

**Parameters**

• **hd**: HTTPD instance handle
• **sockfd**: Session socket FD
• **send_func**: The send function to be set for this session

```c
esp_err_t esp_httpd_sess_set_pending_override(httpd_handle_t hd, int sockfd, httpd_pending_func_t pending_func)
```

Override web server’s pending function (by session FD)

This function overrides the web server’s pending function. This function is used to test for pending bytes in a socket.

**Note** This API is supposed to be called either from the context of
• an http session APIs where sockfd is a valid parameter
• a URI handler where sockfd is obtained using httpd_req_to_sockfd()

**Return**

• ESP_OK : On successfully registering override
• ESP_ERR_INVALID_ARG : Null arguments

**Parameters**

• **hd**: HTTPD instance handle
• **sockfd**: Session socket FD
• **pending_func**: The receive function to be set for this session

```c
int esp_httpd_req_to_sockfd(httpd_req_t *r)
```

Get the Socket Descriptor from the HTTP request.

This API will return the socket descriptor of the session for which URI handler was executed on reception of HTTP request. This is useful when user wants to call functions that require session socket fd, from within a URI handler, ie. : httpd_sess_get_ctx(), httpd_sess_trigger_close(), httpd_sess_update_lru_counter().

**Note** This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.

**Return**

• Socket descriptor : The socket descriptor for this request
• -1 : Invalid/NULL request pointer

**Parameters**

• **r**: The request whose socket descriptor should be found

```c
int esp_httpd_req_recv(httpd_req_t *r, char *buf, size_t buf_len)
```

API to read content data from the HTTP request.

This API will read HTTP content data from the HTTP request into provided buffer. Use content_len provided in httpd_req_t structure to know the length of data to be fetched. If content_len is too large for the buffer then
user may have to make multiple calls to this function, each time fetching \texttt{buf_len} number of bytes, while the pointer to content data is incremented internally by the same number.

\textbf{Note}
\begin{itemize}
  \item This API is supposed to be called only from the context of a URI handler where \texttt{httpd_req_t* request pointer} is valid.
  \item If an error is returned, the URI handler must further return an error. This will ensure that the erroneous socket is closed and cleaned up by the web server.
  \item Presently Chunked Encoding is not supported
\end{itemize}

\textbf{Return}
\begin{itemize}
  \item Bytes : Number of bytes read into the buffer successfully
  \item 0 : Buffer length parameter is zero / connection closed by peer
  \item HTTPD\_SOCK\_ERR\_INVALID : Invalid arguments
  \item HTTPD\_SOCK\_ERR\_TIMEOUT : Timeout/interrupted while calling socket recv()
  \item HTTPD\_SOCK\_ERR\_FAIL : Unrecoverable error while calling socket recv()
\end{itemize}

\textbf{Parameters}
\begin{itemize}
  \item \texttt{[in]} \texttt{r}: The request being responded to
  \item \texttt{[in]} \texttt{buf}: Pointer to a buffer that the data will be read into
  \item \texttt{[in]} \texttt{buf\_len}: Length of the buffer
\end{itemize}

\begin{verbatim}
size_t httpd_req_get_hdr_value_len(httpd_req_t *r, const char *field)
\end{verbatim}

Search for a field in request headers and return the string length of it’s value.

\textbf{Note}
\begin{itemize}
  \item This API is supposed to be called only from the context of a URI handler where \texttt{httpd_req_t* request pointer} is valid.
  \item Once \texttt{httpd_resp_send()} API is called all request headers are purged, so request headers need be copied into separate buffers if they are required later.
\end{itemize}

\textbf{Return}
\begin{itemize}
  \item Length : If field is found in the request URL
  \item Zero : Field not found / Invalid request / Null arguments
\end{itemize}

\textbf{Parameters}
\begin{itemize}
  \item \texttt{[in]} \texttt{r}: The request being responded to
  \item \texttt{[in]} \texttt{field}: The header field to be searched in the request
\end{itemize}

\begin{verbatim}
esp_err_t httpd_req_get_hdr_value_str(httpd_req_t *r, const char *field, char *val, size_t val_size)
\end{verbatim}

Get the value string of a field from the request headers.

\textbf{Note}
\begin{itemize}
  \item This API is supposed to be called only from the context of a URI handler where \texttt{httpd_req_t* request pointer} is valid.
  \item Once \texttt{httpd_resp_send()} API is called all request headers are purged, so request headers need be copied into separate buffers if they are required later.
  \item If output size is greater than input, then the value is truncated, accompanied by truncation error as return value.
  \item Use \texttt{httpd_req_get_hdr_value_len()} to know the right buffer length
\end{itemize}

\textbf{Return}
\begin{itemize}
  \item ESP\_OK : Field found in the request header and value string copied
  \item ESP\_ERR\_NOT\_FOUND : Key not found
  \item ESP\_ERR\_INVALID\_ARG : Null arguments
  \item ESP\_ERR\_HTTPD\_INVALID\_REQ : Invalid HTTP request pointer
  \item ESP\_ERR\_HTTPD\_RESULT\_TRUNC : Value string truncated
\end{itemize}

\textbf{Parameters}
\begin{itemize}
  \item \texttt{[in]} \texttt{r}: The request being responded to
  \item \texttt{[in]} \texttt{field}: The field to be searched in the header
  \item \texttt{[out]} \texttt{val}: Pointer to the buffer into which the value will be copied if the field is found
  \item \texttt{[in]} \texttt{val\_size}: Size of the user buffer “val”
\end{itemize}

\begin{verbatim}
size_t httpd_req_get_url_query_len(httpd_req_t *r)
\end{verbatim}

Get Query string length from the request URL.
Note  This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid

Return

- Length: Query is found in the request URL
- Zero: Query not found / Null arguments / Invalid request

Parameters

- [in] r: The request being responded to

esp_err_t httpd_req_get_url_query_str(httpd_req_t* r, char* buf, size_t buf_len)

Get Query string from the request URL.

Note

- Presently, the user can fetch the full URL query string, but decoding will have to be performed by the user. Request headers can be read using httpd_req_get_hdr_value_str() to know the ‘Content-Type’ (eg. Content-Type: application/x-www-form-urlencoded) and then the appropriate decoding algorithm needs to be applied.
- This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid
- If output size is greater than input, then the value is truncated, accompanied by truncation error as return value
- Prior to calling this function, one can use httpd_req_get_url_query_len() to know the query string length beforehand and hence allocate the buffer of right size (usually query string length + 1 for null termination) for storing the query string

Return

- ESP_OK: Query is found in the request URL and copied to buffer
- ESP_ERR_NOT_FOUND: Query not found
- ESP_ERR_INVALID_ARG: Null arguments
- ESP_ERR_HTTPD_INVALID_REQ: Invalid HTTP request pointer
- ESP_ERR_HTTPD_RESULT_TRUNC: Query string truncated

Parameters

- [in] r: The request being responded to
- [out] buf: Pointer to the buffer into which the query string will be copied (if found)
- [in] buf_len: Length of output buffer

esp_err_t httpd_query_key_value(const char* qry, const char* key, char* val, size_t val_size)

Helper function to get a URL query tag from a query string of the type param1=val1&param2=val2.

Note

- The components of URL query string (keys and values) are not URL decoded. The user must check for ‘Content-Type’ field in the request headers and then depending upon the specified encoding (URL encoded or otherwise) apply the appropriate decoding algorithm.
- If actual value size is greater than val_size, then the value is truncated, accompanied by truncation error as return value.

Return

- ESP_OK: Key is found in the URL query string and copied to buffer
- ESP_ERR_NOT_FOUND: Key not found
- ESP_ERR_INVALID_ARG: Null arguments
- ESP_ERR_HTTPD_RESULT_TRUNC: Value string truncated

Parameters

- [in] r: Pointer to query string
- [in] key: The key to be searched in the query string
- [out] val: Pointer to the buffer into which the value will be copied if the key is found
- [in] val_size: Size of the user buffer “val”

esp_err_t httpd_req_get_cookie_val(httpd_req_t* req, const char* cookie_name, char* val, size_t val_size)

Get the value string of a cookie value from the “Cookie” request headers by cookie name.

Return

- ESP_OK: Key is found in the cookie string and copied to buffer
- ESP_ERR_NOT_FOUND: Key not found
Chapter 2. API Reference

- ESP_ERR_INVALID_ARG: Null arguments
- ESP_ERR_HTTPD_RESULT_TRUNC: Value string truncated
- ESP_ERR_NO_MEM: Memory allocation failure

Parameters
- [in] req: Pointer to the HTTP request
- [in] cookie_name: The cookie name to be searched in the request
- [out] val: Pointer to the buffer into which the value of cookie will be copied if the cookie is found
- [inout] val_size: Pointer to size of the user buffer. This variable will contain cookie length if ESP_OK is returned and required buffer length in case ESP_ERR_HTTPD_RESULT_TRUNC is returned.

bool httpd_uri_matchWildcard(const char *uri_template, const char *uri_to_match, size_t match_upto)

Test if a URI matches the given wildcard template.

Template may end with ‘?’ to make the previous character optional (typically a slash), ‘*’ for a wildcard match, and ‘??’ to make the previous character optional, and if present, allow anything to follow.

Example:
- * matches everything
- /foo/? matches /foo and /foo/ 
- /foo/* (sans the backslash) matches /foo/ and /foo/bar, but not /foo or /fo 
- /foo/?* or /foo/*? (sans the backslash) matches /foo/, /foo/bar, and also /foo, but not /foox or /fo 

The special characters ‘?’ and ‘*’ anywhere else in the template will be taken literally.

Return true if a match was found

Parameters
- [in] uri_template: URI template (pattern)
- [in] uri_to_match: URI to be matched
- [in] match_upto: how many characters of the URI buffer to test (there may be trailing query string etc.)

esp_err_t httpd_resp_send(httpd_req_t *r, const char *buf, size_t buf_len)

API to send a complete HTTP response.

This API will send the data as an HTTP response to the request. This assumes that you have the entire response ready in a single buffer. If you wish to send response in incremental chunks use httpd_resp_send_chunk() instead.

If no status code and content-type were set, by default this will send 200 OK status code and content type as text/html. You may call the following functions before this API to configure the response headers: httpd_resp_set_status() - for setting the HTTP status string, httpd_resp_set_type() - for setting the Content Type, httpd_resp_set_hdr() - for appending any additional field value entries in the response header

Note
- This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.
- Once this API is called, the request has been responded to.
- No additional data can then be sent for the request.
- Once this API is called, all request headers are purged, so request headers need be copied into separate buffers if they are required later.

Return
- ESP_OK : On successfully sending the response packet
- ESP_ERR_INVALID_ARG : Null request pointer
- ESP_ERR_HTTPD_RESP_HDR : Essential headers are too large for internal buffer
- ESP_ERR_HTTPD_RESP_SEND : Error in raw send
- ESP_ERR_HTTPD_INVALID_REQ : Invalid request

Parameters
- [in] r: The request being responded to
- [in] buf: Buffer from where the content is to be fetched
Chapter 2. API Reference

- [in] buf_len: Length of the buffer, HTTPD_RESP_USE_STRLEN to use strlen()

`esp_err_t httpd_resp_send_chunk(httpd_req_t *r, const char *buf, ssize_t buf_len)`

API to send one HTTP chunk.

This API will send the data as an HTTP response to the request. This API will use chunked-encoding and send the response in the form of chunks. If you have the entire response contained in a single buffer, please use `httpd_resp_send()` instead.

If no status code and content-type were set, by default this will send 200 OK status code and content type as text/html. You may call the following functions before this API to configure the response headers `httpd_resp_set_status()` - for setting the HTTP status string, `httpd_resp_set_type()` - for setting the Content Type, `httpd_resp_set_hdr()` - for appending any additional field value entries in the response header

Note
- This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.
- When you are finished sending all your chunks, you must call this function with buf_len as 0.
- Once this API is called, all request headers are purged, so request headers need be copied into separate buffers if they are required later.

Return
- ESP_OK: On successfully sending the response packet chunk
- ESP_ERR_INVALID_ARG: Null request pointer
- ESP_ERR_HTTPD_RESP_HDR: Essential headers are too large for internal buffer
- ESP_ERR_HTTPD_RESP_SEND: Error in raw send
- ESP_ERR_HTTPD_INVALID_REQ: Invalid request pointer

Parameters
- [in] r: The request being responded to
- [in] buf: Pointer to a buffer that stores the data
- [in] buf_len: Length of the buffer, HTTPD_RESP_USE_STRLEN to use strlen()

`static esp_err_t httpd_resp_sendstr(httpd_req_t *r, const char *str)`

API to send a complete string as HTTP response.

This API simply calls `http_resp_send` with buffer length set to string length assuming the buffer contains a null terminated string

Return
- ESP_OK: On successfully sending the response packet
- ESP_ERR_INVALID_ARG: Null request pointer
- ESP_ERR_HTTPD_RESP_HDR: Essential headers are too large for internal buffer
- ESP_ERR_HTTPD_RESP_SEND: Error in raw send
- ESP_ERR_HTTPD_INVALID_REQ: Invalid request

Parameters
- [in] r: The request being responded to
- [in] str: String to be sent as response body

`static esp_err_t httpd_resp_sendstr_chunk(httpd_req_t *r, const char *str)`

API to send a string as an HTTP response chunk.

This API simply calls `http_resp_send_chunk` with buffer length set to string length assuming the buffer contains a null terminated string

Return
- ESP_OK: On successfully sending the response packet
- ESP_ERR_INVALID_ARG: Null request pointer
- ESP_ERR_HTTPD_RESP_HDR: Essential headers are too large for internal buffer
- ESP_ERR_HTTPD_RESP_SEND: Error in raw send
- ESP_ERR_HTTPD_INVALID_REQ: Invalid request

Parameters
- [in] r: The request being responded to
- [in] str: String to be sent as response body (NULL to finish response packet)
esp_err_t httpd_resp_set_status (httpd_req_t *r, const char *status)

API to set the HTTP status code.
This API sets the status of the HTTP response to the value specified. By default, the ‘200 OK’ response is sent as the response.

Note
• This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.
• This API only sets the status to this value. The status isn’t sent out until any of the send APIs is executed.
• Make sure that the lifetime of the status string is valid till send function is called.

Return
• ESP_OK : On success
• ESP_ERR_INVALID_ARG : Null arguments
• ESP_ERR_HTTPD_INVALID_REQ : Invalid request pointer

Parameters
• [in] r: The request being responded to
• [in] status: The HTTP status code of this response

esp_err_t httpd_resp_set_type (httpd_req_t *r, const char *type)

API to set the HTTP content type.
This API sets the ‘Content Type’ field of the response. The default content type is ‘text/html’.

Note
• This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.
• This API only sets the content type to this value. The type isn’t sent out until any of the send APIs is executed.
• Make sure that the lifetime of the type string is valid till send function is called.

Return
• ESP_OK : On success
• ESP_ERR_INVALID_ARG : Null arguments
• ESP_ERR_HTTPD_INVALID_REQ : Invalid request pointer

Parameters
• [in] r: The request being responded to
• [in] type: The Content Type of the response

esp_err_t httpd_resp_set_hdr (httpd_req_t *r, const char *field, const char *value)

API to append any additional headers.
This API sets any additional header fields that need to be sent in the response.

Note
• This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.
• The header isn’t sent out until any of the send APIs is executed.
• The maximum allowed number of additional headers is limited to value of max_resp_headers in config structure.
• Make sure that the lifetime of the field value strings are valid till send function is called.

Return
• ESP_OK : On successfully appending new header
• ESP_ERR_INVALID_ARG : Null arguments
• ESP_ERR_HTTPD_RESP_HDR : Total additional headers exceed max allowed
• ESP_ERR_HTTPD_INVALID_REQ : Invalid request pointer

Parameters
• [in] r: The request being responded to
• [in] field: The field name of the HTTP header
• [in] value: The value of this HTTP header

esp_err_t httpd_resp_send_err (httpd_req_t *req, httpd_err_code_t error, const char *msg)

For sending out error code in response to HTTP request.
API Reference

Note
- This API is supposed to be called only from the context of a URI handler where httpd_req_t request pointer is valid.
- Once this API is called, all request headers are purged, so request headers need to be copied into separate buffers if they are required later.
- If you wish to send additional data in the body of the response, please use the lower-level functions directly.

Return
- ESP_OK: On successfully sending the response packet
- ESP_ERR_INVALID_ARG: Null arguments
- ESP_ERR_HTTPD_RESP_SEND: Error in raw send
- ESP_ERR_HTTPD_INVALID_REQ: Invalid request pointer

Parameters
- [in] req: Pointer to the HTTP request for which the response needs to be sent
- [in] error: Error type to send
- [in] msg: Error message string (pass NULL for default message)

static esp_err_t httpd_resp_send_404 (httpd_req_t *r)
Helper function for HTTP 404.

Send HTTP 404 message. If you wish to send additional data in the body of the response, please use the lower-level functions directly.

Note
- This API is supposed to be called only from the context of a URI handler where httpd_req_t request pointer is valid.
- Once this API is called, all request headers are purged, so request headers need to be copied into separate buffers if they are required later.

Return
- ESP_OK: On successfully sending the response packet
- ESP_ERR_INVALID_ARG: Null arguments
- ESP_ERR_HTTPD_RESP_SEND: Error in raw send
- ESP_ERR_HTTPD_INVALID_REQ: Invalid request pointer

Parameters
- [in] r: The request being responded to

static esp_err_t httpd_resp_send_408 (httpd_req_t *r)
Helper function for HTTP 408.

Send HTTP 408 message. If you wish to send additional data in the body of the response, please use the lower-level functions directly.

Note
- This API is supposed to be called only from the context of a URI handler where httpd_req_t request pointer is valid.
- Once this API is called, all request headers are purged, so request headers need to be copied into separate buffers if they are required later.

Return
- ESP_OK: On successfully sending the response packet
- ESP_ERR_INVALID_ARG: Null arguments
- ESP_ERR_HTTPD_RESP_SEND: Error in raw send
- ESP_ERR_HTTPD_INVALID_REQ: Invalid request pointer

Parameters
- [in] r: The request being responded to

static esp_err_t httpd_resp_send_500 (httpd_req_t *r)
Helper function for HTTP 500.

Send HTTP 500 message. If you wish to send additional data in the body of the response, please use the lower-level functions directly.

Note
• This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.
• Once this API is called, all request headers are purged, so request headers need be copied into separate buffers if they are required later.

Return
• ESP_OK : On successfully sending the response packet
• ESP_ERR_INVALID_ARG : Null arguments
• ESP_ERR_HTTPD_RESP_SEND : Error in raw send
• ESP_ERR_HTTPD_INVALID_REQ : Invalid request pointer

Parameters
• [in] r: The request being responded to

int httpd_send (httpd_req_t *r, const char *buf, size_t buf_len)
Raw HTTP send.

Call this API if you wish to construct your custom response packet. When using this, all essential header, eg. HTTP version, Status Code, Content Type and Length, Encoding, etc. will have to be constructed manually, and HTTP delimeters (CRLF) will need to be placed correctly for separating sub-sections of the HTTP response packet.

If the send override function is set, this API will end up calling that function eventually to send data out.

Note
• This API is supposed to be called only from the context of a URI handler where httpd_req_t* request pointer is valid.
• Unless the response has the correct HTTP structure (which the user must now ensure) it is not guaranteed that it will be recognized by the client. For most cases, you wouldn’t have to call this API, but you would rather use either of : httpd_resp_send(), httpd_resp_send_chunk()
Note: This API is not recommended to be used in any request handler. Use this only for advanced use cases, wherein some asynchronous communication is required.

Return
- Bytes: The number of bytes received successfully
- 0: Buffer length parameter is zero/connection closed by peer
- HTTPD_SOCK_ERR_INVALID: Invalid arguments
- HTTPD_SOCK_ERR_TIMEOUT: Timeout/interrupted while calling socket recv()
- HTTPD_SOCK_ERR_FAIL: Unrecoverable error while calling socket recv()

Parameters
- [in] hd: server instance
- [in] sockfd: session socket file descriptor
- [in] buf: buffer with bytes to send
- [in] buf_len: data size
- [in] flags: flags for the send() function

```c
esp_err_t httpd_register_err_handler(httpd_handle_t handle, httpd_err_code_t error, httpd_err_handler_func_t handler_fn)
```

Function for registering HTTP error handlers.

This function maps a handler function to any supported error code given by httpd_err_code_t. See prototype httpd_err_handler_func_t above for details.

Return
- ESP_OK: handler registered successfully
- ESP_ERR_INVALID_ARG: invalid error code or server handle

Parameters
- [in] handle: HTTP server handle
- [in] error: Error type
- [in] handler_fn: User implemented handler function (Pass NULL to unset any previously set handler)

```c
esp_err_t httpd_start(httpd_handle_t *handle, const httpd_config_t *config)
```

Starts the web server.

Create an instance of HTTP server and allocate memory/resources for it depending upon the specified configuration.

Example usage:

```c
//Function for starting the webserver
void start_webserver()
{
    // Generate default configuration
    httpd_config_t config = HTTPD_DEFAULT_CONFIG();

    // Empty handle to http_server
    httpd_handle_t server = NULL;

    // Start the httpd server
    if (httpd_start(&server, &config) == ESP_OK) {
        // Register URI handlers
        httpd_register_uri_handler(server, &uri_get);
        httpd_register_uri_handler(server, &uri_post);
    }
    // If server failed to start, handle will be NULL
    return server;
}
```

Return
- ESP_OK: Instance created successfully
- ESP_ERR_INVALID_ARG: Null argument(s)
- ESP_ERR_HTTPD_ALLOC_MEM: Failed to allocate memory for instance
• ESP_ERR_HTTPD_TASK : Failed to launch server task

Parameters
• [in] config: Configuration for new instance of the server
• [out] handle: Handle to newly created instance of the server. NULL on error

```c
esp_err_t httpd_stop(httpd_handle_t handle)
```

Stops the web server.

Deallocates memory/resources used by an HTTP server instance and deletes it. Once deleted the handle can no longer be used for accessing the instance.

Example usage:

```c
// Function for stopping the webserver
void stop_webserver(httpd_handle_t server)
{
    // Ensure handle is non NULL
    if (server != NULL) {
        // Stop the httpd server
        httpd_stop(server);
    }
}
```

Return
• ESP_OK: Server stopped successfully
• ESP_ERR_INVALID_ARG: Handle argument is NULL

```c
esp_err_t httpd_queue_work(httpd_handle_t handle, httpd_work_fn_t work, void *arg)
```

Queue execution of a function in HTTPD’s context.

This API queues a work function for asynchronous execution

Note Some protocols require that the web server generate some asynchronous data and send it to the persistently opened connection. This facility is for use by such protocols.

Return
• ESP_OK: On successfully queueing the work
• ESP_FAIL: Failure in ctrl socket
• ESP_ERR_INVALID_ARG: Null arguments

Parameters
• [in] handle: Handle to server returned by httpd_start
• [in] work: Pointer to the function to be executed in the HTTPD’s context
• [in] arg: Pointer to the arguments that should be passed to this function

```c
void *httpd_sess_get_ctx(httpd_handle_t handle, int sockfd)
```

Get session context from socket descriptor.

Typically if a session context is created, it is available to URI handlers through the httpd_req_t structure. But, there are cases where the web server’s send/receive functions may require the context (for example, for accessing keying information etc). Since the send/receive function only have the socket descriptor at their disposal, this API provides them with a way to retrieve the session context.

Return
• void*: Pointer to the context associated with this session
• NULL: Empty context / Invalid handle / Invalid socket fd

Parameters
• [in] handle: Handle to server returned by httpd_start
• [in] sockfd: The socket descriptor for which the context should be extracted.

```c
httpd_sess_set_ctx(httpd_handle_t handle, int sockfd, void *ctx, httpd_free_ctx_fn_t free_fn)
```

Set session context by socket descriptor.

Parameters
• [in] handle: Handle to server returned by httpd_start
Chapter 2. API Reference

- [in] sockfd: The socket descriptor for which the context should be extracted.
- [in] ctx: Context object to assign to the session
- [in] free_fn: Function that should be called to free the context

```c
void *httpd_sess_get_transport_ctx(httpd_handle_t handle, int sockfd)
```

Get session ‘transport’ context by socket descriptor.

This context is used by the send/receive functions, for example to manage SSL context.

See `httpd_sess_get_ctx()`

Return
- void*: Pointer to the transport context associated with this session
- NULL: Empty context / Invalid handle / Invalid socket fd

Parameters
- [in] handle: Handle to server returned by httpd_start
- [in] sockfd: The socket descriptor for which the context should be extracted.

```c
void httpd_sess_set_transport_ctx(httpd_handle_t handle, int sockfd, void *ctx, httpd_free_ctx_fn_t free_fn)
```

Set session ‘transport’ context by socket descriptor.

See `httpd_sess_set_ctx()`

Parameters
- [in] handle: Handle to server returned by httpd_start
- [in] sockfd: The socket descriptor for which the context should be extracted.
- [in] ctx: Transport context object to assign to the session
- [in] free_fn: Function that should be called to free the transport context

```c
void *httpd_get_global_user_ctx(httpd_handle_t handle)
```

Get HTTPD global user context (it was set in the server config struct)

Return global user context

Parameters
- [in] handle: Handle to server returned by httpd_start

```c
void *httpd_get_global_transport_ctx(httpd_handle_t handle)
```

Get HTTPD global transport context (it was set in the server config struct)

Return global transport context

Parameters
- [in] handle: Handle to server returned by httpd_start

```c
esp_err_t httpd_sess_trigger_close(httpd_handle_t handle, int sockfd)
```

Trigger an httpd session close externally.

Note Calling this API is only required in special circumstances wherein some application requires to close an
httpd client session asynchronously.

Return
- ESP_OK: On successfully initiating closure
- ESP_FAIL: Failure to queue work
- ESP_ERR_NOT_FOUND: Socket fd not found
- ESP_ERR_INVALID_ARG: Null arguments

Parameters
- [in] handle: Handle to server returned by httpd_start
- [in] sockfd: The socket descriptor of the session to be closed

```c
esp_err_t httpd_sess_update_lru_counter(httpd_handle_t handle, int sockfd)
```

Update LRU counter for a given socket.

LRU Counters are internally associated with each session to monitor how recently a session exchanged traffic.
When LRU purge is enabled, if a client is requesting for connection but maximum number of sockets/sessions is
reached, then the session having the earliest LRU counter is closed automatically.

Updating the LRU counter manually prevents the socket from being purged due to the Least Recently Used
(LRU) logic, even though it might not have received traffic for some time. This is useful when all open sock-
ets/session are frequently exchanging traffic but the user specifically wants one of the sessions to be kept open, irrespective of when it last exchanged a packet.

**Note** Calling this API is only necessary if the LRU Purge Enable option is enabled.

**Return**
- ESP_OK: Socket found and LRU counter updated
- ESP_ERR_NOT_FOUND: Socket not found
- ESP_ERR_INVALID_ARG: Null arguments

**Parameters**
- [in] handle: Handle to server returned by httpd_start
- [in] sockfd: The socket descriptor of the session for which LRU counter is to be updated

```c
esp_err_t httpd_get_client_list(httpd_handle_t handle, size_t* fds, int* client_fds)
```

Returns list of current socket descriptors of active sessions.

**Note** Size of provided array has to be equal or greater than maximum number of opened sockets, configured upon initialization with max_open_sockets field in httpd_config_t structure.

**Return**
- ESP_OK: Successfully retrieved session list
- ESP_ERR_INVALID_ARG: Wrong arguments or list is longer than provided array

**Parameters**
- [in] handle: Handle to server returned by httpd_start
- [inout] fds: In: Size of provided client_fds array Out: Number of valid client fds returned in client_fds,
- [out] client_fds: Array of client fds

**Structures**

```c
struct httpd_config
```

HTTP Server Configuration Structure.

**Note** Use HTTPD_DEFAULT_CONFIG() to initialize the configuration to a default value and then modify only those fields that are specifically determined by the use case.

**Public Members**

- unsigned **task_priority**: Priority of FreeRTOS task which runs the server
- size_t **stack_size**: The maximum stack size allowed for the server task
- BaseType_t **core_id**: The core the HTTP server task will run on
- uint16_t **server_port**: TCP Port number for receiving and transmitting HTTP traffic
- uint16_t **ctrl_port**: UDP Port number for asynchronously exchanging control signals between various components of the server
- uint16_t **max_open_sockets**: Max number of sockets/clients connected at any time
- uint16_t **max_uri_handlers**: Maximum allowed uri handlers
- uint16_t **max_resp_headers**: Maximum allowed additional headers in HTTP response
- uint16_t **backlog_conn**: Number of backlog connections
Chapter 2. API Reference

bool lru_purge_enable
    Purge “Least Recently Used” connection

uint16_t recv_wait_timeout
    Timeout for recv function (in seconds)

uint16_t send_wait_timeout
    Timeout for send function (in seconds)

void *global_user_ctx
    Global user context.
    This field can be used to store arbitrary user data within the server context. The value can be retrieved
    using the server handle, available e.g. in the httpd_req_t struct.
    When shutting down, the server frees up the user context by calling free() on the global_user_ctx field.
    If you wish to use a custom function for freeing the global user context, please specify that here.

httpd_free_ctx_fn_t global_user_ctx_free_fn
    Free function for global user context

void *global_transport_ctx
    Global transport context.
    Similar to global_user_ctx, but used for session encoding or encryption (e.g. to hold the SSL context). It
    will be freed using free(), unless global_transport_ctx_free_fn is specified.

httpd_free_ctx_fn_t global_transport_ctx_free_fn
    Free function for global transport context

httpd_open_func_t open_fn
    Custom session opening callback.
    Called on a new session socket just after accept(), but before reading any data.
    This is an opportunity to set up e.g. SSL encryption using global_transport_ctx and the send/recv/pending
    session overrides.
    If a context needs to be maintained between these functions, store it in the session using
    httpd_sess_set_transport_ctx() and retrieve it later with httpd_sess_get_transport_ctx()
    Returning a value other than ESP_OK will immediately close the new socket.

httpd_close_func_t close_fn
    Custom session closing callback.
    Called when a session is deleted, before freeing user and transport contexts and before closing the socket.
    This is a place for custom de-init code common to all sockets.
    The server will only close the socket if no custom session closing callback is set. If a custom callback is
    used, close(sockfd) should be called in here for most cases.
    Set the user or transport context to NULL if it was freed here, so the server does not try to free it again.
    This function is run for all terminated sessions, including sessions where the socket was closed by the
    network stack - that is, the file descriptor may not be valid anymore.

httpd_uri_match_func_t uri_match_fn
    URI matcher function.
    Called when searching for a matching URI: 1) whose request handler is to be executed right after an HTTP
    request is successfully parsed 2) in order to prevent duplication while registering a new URI handler using
    httpd_register_uri_handler()
    Available options are: 1) NULL : Internally do basic matching using strcmp() 2)
    httpd_uri_match_wildcard(): URI wildcard matcher
    Users can implement their own matching functions (See description of the
    httpd_uri_match_func_t function prototype)
**struct httpd_req**

HTTP Request Data Structure.

**Public Members**

- **httpd_handle_t handle**
  
  Handle to server instance

- **int method**
  
  The type of HTTP request, -1 if unsupported method

- **const char uri[HTTPD_MAX_URI_LEN + 1]**
  
  The URI of this request (1 byte extra for null termination)

- **size_t content_len**
  
  Length of the request body

- **void *aux**
  
  Internally used members

- **void *user_ctx**
  
  User context pointer passed during URI registration.

- **void *sess_ctx**
  
  Session Context Pointer

  A session context. Contexts are maintained across ‘sessions’ for a given open TCP connection. One session could have multiple request responses. The web server will ensure that the context persists across all these request and responses.

  By default, this is NULL. URI Handlers can set this to any meaningful value.

  If the underlying socket gets closed, and this pointer is non-NULL, the web server will free up the context by calling free(), unless free_ctx function is set.

- **httpd_free_ctx_fn_t free_ctx**
  
  Pointer to free context hook

  Function to free session context

  If the web server’s socket closes, it frees up the session context by calling free() on the sess_ctx member. If you wish to use a custom function for freeing the session context, please specify that here.

- **bool ignore_sess_ctx_changes**
  
  Flag indicating if Session Context changes should be ignored

  By default, if you change the sess_ctx in some URI handler, the http server will internally free the earlier context (if non NULL), after the URI handler returns. If you want to manage the allocation/reallocation/freeing of sess_ctx yourself, set this flag to true, so that the server will not perform any checks on it. The context will be cleared by the server (by calling free_ctx or free()) only if the socket gets closed.

**struct httpd_uri**

Structure for URI handler.

**Public Members**

- **const char *uri**
  
  The URI to handle

- **httpd_method_t method**
  
  Method supported by the URI
`esp_err_t (*handler) (httpd_req_t *r)`

Handler to call for supported request method. This must return ESP_OK, or else the underlying socket will be closed.

`void *user_ctx`

Pointer to user context data which will be available to handler

**Macros**

- `HTTPD_MAX_REQ_HDR_LEN`
- `HTTPD_MAX_URI_LEN`
- `HTTPD_SOCK_ERR_FAIL`
- `HTTPD_SOCK_ERR_INVALID`
- `HTTPD_SOCK_ERR_TIMEOUT`
- `HTTPD_200`
  - HTTP Response 200
- `HTTPD_204`
  - HTTP Response 204
- `HTTPD_207`
  - HTTP Response 207
- `HTTPD_400`
  - HTTP Response 400
- `HTTPD_404`
  - HTTP Response 404
- `HTTPD_408`
  - HTTP Response 408
- `HTTPD_500`
  - HTTP Response 500
- `HTTPD_TYPE_JSON`
  - HTTP Content type JSON
- `HTTPD_TYPE_TEXT`
  - HTTP Content type text/HTML
- `HTTPD_TYPE_OCTET`
  - HTTP Content type octext-stream
- `HTTPD_DEFAULT_CONFIG` ()

- `ESP_ERR_HTTPD_BASE`
  - Starting number of HTTPD error codes
- `ESP_ERR_HTTPD_HANDLERS_FULL`
  - All slots for registering URI handlers have been consumed
- `ESP_ERR_HTTPD_HANDLER_EXISTS`
  - URI handler with same method and target URI already registered
- `ESP_ERR_HTTPD_INVALID_REQ`
  - Invalid request pointer
- `ESP_ERR_HTTPD_RESULT_TRUNC`
  - Result string truncated
- `ESP_ERR_HTTPD_RESP_HDR`
  - Response header field larger than supported
**Chapter 2. API Reference**

**ESP_ERR_HTTPD_RESP_SEND**
Error occurred while sending response packet

**ESP_ERR_HTTPD_ALLOC_MEM**
Failed to dynamically allocate memory for resource

**ESP_ERR_HTTPD_TASK**
Failed to launch server task/thread

**HTTPD_RESP_USE_STRLEN**

### Type Definitions

**typedef struct httpd_req httpd_req_t**
HTTP Request Data Structure.

**typedef struct httpd_uri httpd_uri_t**
Structure for URI handler.

**typedef int (*httpd_send_func_t)(httpd_handle_t hd, int sockfd, const char *buf, size_t buf_len, int flags)**

Prototype for HTTPDs low-level send function.

**Note** User specified send function must handle errors internally, depending upon the set value of errno, and return specific HTTPD_SOCK_ERR_ codes, which will eventually be conveyed as return value of httpd_send() function

**Return**
- Bytes: The number of bytes sent successfully
- HTTPD_SOCK_ERR_INVALID: Invalid arguments
- HTTPD_SOCK_ERR_TIMEOUT: Timeout/interrupted while calling socket send()
- HTTPD_SOCK_ERR_FAIL: Unrecoverable error while calling socket send()

**Parameters**
- [in] hd: server instance
- [in] sockfd: session socket file descriptor
- [in] buf: buffer with bytes to send
- [in] buf_len: data size
- [in] flags: flags for the send() function

**typedef int (*httpd_recv_func_t)(httpd_handle_t hd, int sockfd, char *buf, size_t buf_len, int flags)**

Prototype for HTTPDs low-level recv function.

**Note** User specified recv function must handle errors internally, depending upon the set value of errno, and return specific HTTPD_SOCK_ERR_ codes, which will eventually be conveyed as return value of httpd_req_recv() function

**Return**
- Bytes: The number of bytes received successfully
- 0: Buffer length parameter is zero / connection closed by peer
- HTTPD_SOCK_ERR_INVALID: Invalid arguments
- HTTPD_SOCK_ERR_TIMEOUT: Timeout/interrupted while calling socket recv()
- HTTPD_SOCK_ERR_FAIL: Unrecoverable error while calling socket recv()

**Parameters**
- [in] hd: server instance
- [in] sockfd: session socket file descriptor
- [in] buf: buffer with bytes to send
- [in] buf_len: data size
- [in] flags: flags for the send() function

**typedef int (*httpd_pending_func_t)(httpd_handle_t hd, int sockfd)**

Prototype for HTTPDs low-level “get pending bytes” function.

**Note** User specified pending function must handle errors internally, depending upon the set value of errno, and return specific HTTPD_SOCK_ERR_ codes, which will be handled accordingly in the server task.

**Return**
Chapter 2. API Reference

- Bytes: The number of bytes waiting to be received
- HTTPD_SOCK_ERR_INVALID: Invalid arguments
- HTTPD_SOCK_ERR_TIMEOUT: Timeout/interrupted while calling socket pending()
- HTTPD_SOCK_ERR_FAIL: Unrecoverable error while calling socket pending()

**Parameters**
- [in] hd: server instance
- [in] sockfd: session socket file descriptor

```c
typedef esp_err_t (*httpd_err_handler_func_t)(httpd_req_t *req, httpd_err_code_t error)
```

Function prototype for HTTP error handling.

This function is executed upon HTTP errors generated during internal processing of an HTTP request. This is used to override the default behavior on error, which is to send HTTP error response and close the underlying socket.

**Note**
- If implemented, the server will not automatically send out HTTP error response codes, therefore, httpdRespSendErr() must be invoked inside this function if user wishes to generate HTTP error responses.
- When invoked, the validity of uri, method, content_len and user_ctx fields of the httpd_req_t parameter is not guaranteed as the HTTP request may be partially received/parsed.
- The function must return ESP_OK if underlying socket needs to be kept open. Any other value will ensure that the socket is closed. The return value is ignored when error is of type HTTPD_500_INTERNAL_SERVER_ERROR and the socket closed anyway.

**Return**
- ESP_OK: error handled successful
- ESP_FAIL: failure indicates that the underlying socket needs to be closed

**Parameters**
- [in] req: HTTP request for which the error needs to be handled
- [in] error: Error type

```c
typedef void (*httpd_handle_t)
```

HTTP Server Instance Handle.

Every instance of the server will have a unique handle.

```c
typedef enum http_method httpd_method_t
```

HTTP Method Type wrapper over "enum http_method" available in "http_parser" library.

```c
typedef void (*httpd_free_ctx_fn_t)(void*ctx)
```

Prototype for freeing context data (if any)

**Parameters**
- [in] ctx: object to free

```c
typedef esp_err_t (*httpd_open_func_t)(httpd_handle_t hd, int sockfd)
```

Function prototype for opening a session.

Called immediately after the socket was opened to set up the send/recv functions and other parameters of the socket.

**Return**
- ESP_OK: On success
- Any value other than ESP_OK will signal the server to close the socket immediately

**Parameters**
- [in] hd: server instance
- [in] sockfd: session socket file descriptor

```c
typedef void (*httpd_close_func_t)(httpd_handle_t hd, int sockfd)
```

Function prototype for closing a session.

**Note** It’s possible that the socket descriptor is invalid at this point, the function is called for all terminated sessions. Ensure proper handling of return codes.

**Parameters**
- [in] hd: server instance
Chapter 2. API Reference

```c
typedef bool (*httpd_uri_match_func_t)(const char *reference_uri, const char *uri_to_match, size_t match_upto)
```

Function prototype for URI matching.

- **Return**: true on match
- **Parameters**:
  - [in] `reference_uri`: URI/template with respect to which the other URI is matched
  - [in] `uri_to_match`: URI/template being matched to the reference URI/template
  - [in] `match_upto`: For specifying the actual length of `uri_to_match` up to which the matching algorithm is to be applied (The maximum value is `strlen(uri_to_match)`, independent of the length of `reference_uri`)

```c
typedef struct httpd_config httpd_config_t
```

HTTP Server Configuration Structure.

- **Note**: Use `HTTPD_DEFAULT_CONFIG()` to initialize the configuration to a default value and then modify only those fields that are specifically determined by the use case.

```c
typedef void (*httpd_work_fn_t)(void *arg)
```

Prototype of the HTTPD work function Please refer to `httpd_queue_work()` for more details.

- **Parameters**:
  - [in] `arg`: The arguments for this work function

**Enumerations**

```c
enum httpd_err_code_t
```

Error codes sent as HTTP response in case of errors encountered during processing of an HTTP request.

- **Values**:
  - `HTTPD_500_INTERNAL_SERVER_ERROR`
  - `HTTPD_501_METHOD_NOT_IMPLEMENTED`
  - `HTTPD_505_VERSION_NOT_SUPPORTED`
  - `HTTPD_400_BAD_REQUEST`
  - `HTTPD_401_UNAUTHORIZED`
  - `HTTPD_403_FORBIDDEN`
  - `HTTPD_404_NOT_FOUND`
  - `HTTPD_405_METHOD_NOT_ALLOWED`
  - `HTTPD_408_REQ_TIMEOUT`
  - `HTTPD_411_LENGTH_REQUIRED`
  - `HTTPD_414_URI_TOO_LONG`
  - `HTTPD_431_REQ_HDR_FIELDS_TOO_LARGE`
  - `HTTPD_ERR_CODE_MAX`

### 2.4.7 HTTPS server

**Overview**

This component is built on top of `esp_http_server`. The HTTPS server takes advantage of hooks and function overrides in the regular HTTP server to provide encryption using OpenSSL.

All documentation for `esp_http_server` applies also to a server you create this way.
Chapter 2. API Reference

Used APIs

The following API of `esp_http_server` should not be used with `esp_https_server`, as they are used internally to handle secure sessions and to maintain internal state:

- **“send”**, **“receive”** and **“pending”** function overrides - secure socket handling
  - `httpd_sess_set_send_override()`
  - `httpd_sess_set_recv_override()`
  - `httpd_sess_set_pending_override()`

- **“transport context”** - both global and session
  - `httpd_sess_get_transport_ctx()` - returns SSL used for the session
  - `httpd_sess_set_transport_ctx()`
  - `httpd_get_global_transport_ctx()` - returns the shared SSL context
  - `httpd_config_t.global_transport_ctx`
  - `httpd_config_t.global_transport_ctx_free_fn`
  - `httpd_config_t.open_fn` - used to set up secure sockets

Everything else can be used without limitations.

Usage

Please see the example `protocols/https_server` to learn how to set up a secure server.

Basically all you need is to generate a certificate, embed it in the firmware, and provide its pointers and lengths to the start function via the init struct.

The server can be started with or without SSL by changing a flag in the init struct - `httpd_ssl_config.transport_mode`. This could be used e.g. for testing or in trusted environments where you prefer speed over security.

Performance

The initial session setup can take about two seconds, or more with slower clock speeds or more verbose logging. Subsequent requests through the open secure socket are much faster (down to under 100 ms).

API Reference

Header File

```
• components/esp_https_server/include/esp_https_server.h
```

Functions

**esp_err_t httpd_ssl_start** *(httpd_handle_t *handle, httpd_ssl_config_t *config)*

Create a SSL capable HTTP server (secure mode may be disabled in config)

**Return** success

**Parameters**

- **[inout]** config: server config, must not be const. Does not have to stay valid after calling this function.
- **[out]** handle: storage for the server handle, must be a valid pointer

**void httpd_ssl_stop** *(httpd_handle_t handle)*

Stop the server. Blocks until the server is shut down.

**Parameters**

- **[in]** handle:
Structures

**struct esp_https_server_user_cb_arg**

Callback data struct, contains the ESP-TLS connection handle.

**struct httpd_ssl_config**

HTTPS server config struct

Please use HTTPD_SSL_CONFIG_DEFAULT() to initialize it.

Public Members

**httpd_config_t httpd**

Underlying HTTPD server config

Parameters like task stack size and priority can be adjusted here.

**const uint8_t* cacert_pem**

CA certificate (here it is treated as server cert) Todo: Fix this change in release/v5.0 as it would be a breaking change i.e. Rename the nomenclature of variables holding different certs in https_server component as well as example 1)The cacert variable should hold the CA which is used to authenticate clients (should inherit current role of client_verify_cert_pem var) 2)There should be another variable servercert which whould hold servers own certificate (should inherit current role of cacert var)

**size_t cacert_len**

CA certificate byte length

**const uint8_t* client_verify_cert_pem**

Client verify authority certificate (CA used to sign clients, or client cert itself

**size_t client_verify_cert_len**

Client verify authority cert len

**const uint8_t* prvtkey_pem**

Private key

**size_t prvtkey_len**

Private key byte length

**httpd_ssl_transport_mode_t transport_mode**

Transport Mode (default secure)

**uint16_t port_secure**

Port used when transport mode is secure (default 443)

**uint16_t port_insecure**

Port used when transport mode is insecure (default 80)

**bool session_tickets**

Enable TLS session tickets

**esp_https_server_user_cb *user_cb**

User callback for esp_https_server

Macros

**HTTPD_SSL_CONFIG_DEFAULT()**

Default config struct init

(http_server default config had to be copied for customization)

Notes:

- port is set when starting the server, according to ‘transport_mode’
- one socket uses ~ 40kB RAM with SSL, we reduce the default socket count to 4
- SSL sockets are usually long-lived, closing LRU prevents pool exhaustion DOS
- Stack size may need adjustments depending on the user application
### Type Definitions

```c
typedef struct esp_https_server_user_cb_arg esp_https_server_user_cb_arg_t
Callback data structure, contains the ESP-TLS connection handle.
typedef void esp_https_server_user_cb(esp_https_server_user_cb_arg_t *user_cb)
Callback function prototype. Can be used to get connection or client information (SSL context). E.g. Client certificate, Socket FD, Connection state, etc.
```

#### Parameters
- `user_cb`: Callback data structure

```c
typedef struct httpd_ssl_config httpd_ssl_config_t
```

### Enumerations

```c
enum httpd_ssl_transport_mode_t
```

#### Values:
- `HTTPD_SSL_TRANSPORT_SECURE`
- `HTTPD_SSL_TRANSPORT_INSECURE`

## 2.4.8 ICMP Echo

### Overview

ICMP (Internet Control Message Protocol) is used for diagnostic or control purposes or generated in response to errors in IP operations. The common network utility `ping` is implemented based on the ICMP packets with the type field value of 0, also called Echo Reply.

During a ping session, the source host firstly sends out an ICMP echo request packet and waits for an ICMP echo reply with specific times. In this way, it also measures the round-trip time for the messages. After receiving a valid ICMP echo reply, the source host will generate statistics about the IP link layer (e.g. packet loss, elapsed time, etc).

It is common that IoT device needs to check whether a remote server is alive or not. The device should show the warnings to users when it got offline. It can be achieved by creating a ping session and sending/parsing ICMP echo packets periodically.

To make this internal procedure much easier for users, ESP-IDF provides some out-of-box APIs.

### Create a new ping session

To create a ping session, you need to fill in the `esp_ping_config_t` configuration structure firstly, specifying target IP address, interval times, and etc. Optionally, you can also register some callback functions with the `esp_ping_callbacks_t` structure.

Example method to create a new ping session and register callbacks:

```c
static void test_on_ping_success(esp_ping_handle_t hdl, void *args)
{
    // optionally, get callback arguments
    // const char* str = (const char*) args;
    // printf("%s\r\n", str); // "foo"
    uint8_t ttl;
    uint16_t seqno;
    uint32_t elapsed_time, recv_len;
    ip_addr_t target_addr;
    esp_ping_get_profile(hdl, ESP_PING_PROF_SEQNO, &seqno, sizeof(seqno));
    esp_ping_get_profile(hdl, ESP_PING_PROF_TTL, &ttl, sizeof(ttl));
    esp_ping_get_profile(hdl, ESP_PING_PROF_IPADDR, &target_addr, sizeof(target_addr));
    esp_ping_get_profile(hdl, ESP_PING_PROF_SIZE, &recv_len, sizeof(recv_len));
    esp_ping_get_profile(hdl, ESP_PING_PROF_TIMEGAP, &elapsed_time, sizeof(elapsed_time));
}
```

(continues on next page)
printf("%d bytes from %s icmp_seq=%d ttl=%d time=%d ms\n", 
   recv_len, inet_ntoa(target_addr.u_addr.ip4), seqno, ttl, elapsed_time);
}

static void test_on_ping_timeout(esp_ping_handle_t hdl, void *args)
{
    uint16_t seqno;
    ip_addr_t target_addr;
    esp_ping_get_profile(hdl, ESP_PING_PROF_SEQNO, &seqno, sizeof(seqno));
    esp_ping_get_profile(hdl, ESP_PING_PROF_IPADDR, &target_addr, sizeof(target_addr));
    printf("From %s icmp_seq=%d timeout\n", inet_ntoa(target_addr.u_addr.ip4), seqno);
}

static void test_on_ping_end(esp_ping_handle_t hdl, void *args)
{
    uint32_t transmitted;
    uint32_t received;
    uint32_t total_time_ms;
    esp_ping_get_profile(hdl, ESP_PING_PROF_REQUEST, &transmitted, sizeof(transmitted));
    esp_ping_get_profile(hdl, ESP_PING_PROF_REPLY, &received, sizeof(received));
    esp_ping_get_profile(hdl, ESP_PING_PROF_DURATION, &total_time_ms, sizeof(total_time_ms));
    printf("%d packets transmitted, %d received, time %dms\n", transmitted, received, total_time_ms);
}

void initialize_ping()
{
    /* convert URL to IP address */
    ip_addr_t target_addr;
    struct addrinfo hint;
    struct addrinfo *res = NULL;
    memset(&hint, 0, sizeof(hint));
    memset(&target_addr, 0, sizeof(target_addr));
    getaddrinfo("www.espressif.com", NULL, &hint, &res);
    struct in_addr addr4 = ((struct sockaddr_in *) (res->ai_addr))->sin_addr;
    inet_addr_to_ip4addr(ip_2_ip4(&target_addr), &addr4);
    freeaddrinfo(res);
    esp_ping_config_t ping_config = ESP_PING_DEFAULT_CONFIG();
    ping_config.target_addr = target_addr; // target IP address
    ping_config.count = ESP_PING_COUNT_INFINITE; // ping in infinite mode, esp_ping_stop can stop it
    /* set callback functions */
    esp_ping_callbacks_t cbs;
    cbs.on_ping_success = test_on_ping_success;
    cbs.on_ping_timeout = test_on_ping_timeout;
    cbs.on_ping_end = test_on_ping_end;
    cbs.cb_args = "foo"; // arguments that will feed to all callback functions, can be NULL
    cbs.cb_args = eth_event_group;
    esp_ping_handle_t ping;
    esp_ping_new_session(&ping_config, &cbs, &ping);
Start and Stop ping session You can start and stop ping session with the handle returned by `esp_ping_new_session`. Note that, the ping session won’t start automatically after creation. If the ping session is stopped, and restart again, the sequence number in ICMP packets will recount from zero again.

Delete a ping session If a ping session won’t be used any more, you can delete it with `esp_ping_delete_session`. Please make sure the ping session is in stop state (i.e. you have called `esp_ping_stop` before or the ping session has finished all the procedures) when you call this function.

Get runtime statistics As the example code above, you can call `esp_ping_get_profile` to get different runtime statistics of ping session in the callback function.

Application Example

ICMP echo example: `protocols/icmp_echo`

API Reference

Header File

- `components/lwip/include/apps/ping/ping_sock.h`

Functions

- `esp_err_t esp_ping_new_session(const esp_ping_config_t *config, const esp_ping_callbacks_t *cbs, esp_ping_handle_t *hdl_out)`
  Create a ping session.
  **Return**
  - ESP_ERR_INVALID_ARG: invalid parameters (e.g. configuration is null, etc)
  - ESP_ERR_NO_MEM: out of memory
  - ESP_FAIL: other internal error (e.g. socket error)
  - ESP_OK: create ping session successfully, user can take the ping handle to do follow-on jobs

- `esp_err_t esp_ping_delete_session(esp_ping_handle_t hdl)`
  Delete a ping session.
  **Return**
  - ESP_ERR_INVALID_ARG: invalid parameters (e.g. ping handle is null, etc)
  - ESP_OK: delete ping session successfully

- `esp_err_t esp_ping_start(esp_ping_handle_t hdl)`
  Start the ping session.
  **Return**
  - ESP_ERR_INVALID_ARG: invalid parameters (e.g. ping handle is null, etc)
  - ESP_OK: start ping session successfully

- `esp_err_t esp_ping_stop(esp_ping_handle_t hdl)`
  Stop the ping session.
  **Return**
  - ESP_ERR_INVALID_ARG: invalid parameters (e.g. ping handle is null, etc)
Chapter 2. API Reference

- ESP_OK: stop ping session successfully

**Parameters**
- `hdl`: handle of ping session

```c
esp_err_t esp_ping_get_profile (esp_ping_handle_t hdl, esp_ping_profile_t profile, void *data, uint32_t size)
```

Get runtime profile of ping session.

**Return**
- ESP_ERR_INVALID_ARG: invalid parameters (e.g. ping handle is null, etc)
- ESP_ERR_INVALID_SIZE: the actual profile data size doesn’t match the “size” parameter
- ESP_OK: get profile successfully

**Parameters**
- `hdl`: handle of ping session
- `profile`: type of profile
- `data`: profile data
- `size`: profile data size

**Structures**

```c
struct esp_ping_callbacks_t
```

Type of “ping” callback functions.

**Public Members**

```c
void *cb_args
```

Arguments for callback functions

```c
void (*on_ping_success)(esp_ping_handle_t hdl, void *args)
```

Invoked by internal ping thread when received ICMP echo reply packet.

```c
void (*on_ping_timeout)(esp_ping_handle_t hdl, void *args)
```

Invoked by internal ping thread when receive ICMP echo reply packet timeout.

```c
void (*on_ping_end)(esp_ping_handle_t hdl, void *args)
```

Invoked by internal ping thread when a ping session is finished.

```c
struct esp_ping_config_t
```

Type of “ping” configuration.

**Public Members**

```c
uint32_t count
```

A “ping” session contains count procedures

```c
uint32_t interval_ms
```

Milliseconds between each ping procedure

```c
uint32_t timeout_ms
```

Timeout value (in milliseconds) of each ping procedure

```c
uint32_t data_size
```

Size of the data next to ICMP packet header

```c
uint8_t tos
```

Type of Service, a field specified in the IP header

```c
ip_addr_t target_addr
```

Target IP address, either IPv4 or IPv6

```c
uint32_t task_stack_size
```

Stack size of internal ping task
Chapter 2. API Reference

uint32_t task_prio
Priority of internal ping task

uint32_t interface
Netif index, interface=0 means NETIF_NO_INDEX

Macros
ESP_PING_DEFAULT_CONFIG()
Default ping configuration.
ESP_PING_COUNT_INFINITE
Set ping count to zero will ping target infinitely

Type Definitions
typedef void * esp_ping_handle_t
Type of “ping” session handle.

Enumerations
class esp_ping_profile_t
Profile of ping session.

Values:
ESP_PING_PROFILE_SEQNO
Sequence number of a ping procedure
ESP_PING_PROFILE_TTL
Time to live of a ping procedure
ESP_PING_PROFILE_REQUEST
Number of request packets sent out
ESP_PING_PROFILE_REPLY
Number of reply packets received
ESP_PING_PROFILE_IPADDR
IP address of replied target
ESP_PING_PROFILE_SIZE
Size of received packet
ESP_PING_PROFILE_TIMEGAP
Elapsed time between request and reply packet
ESP_PING_PROFILE_DURATION
Elapsed time of the whole ping session

2.4.9 ESP Local Control

Overview
ESP Local Control (esp_local_ctrl) component in ESP-IDF provides capability to control an ESP device over Wi-Fi + HTTPS or BLE. It provides access to application defined properties that are available for reading / writing via a set of configurable handlers.

Initialization of the esp_local_ctrl service over BLE transport is performed as follows:

```c
esp_local_ctrl_config_t config = {
    .transport = ESP_LOCAL_CTRL_TRANSPORT_BLE,
    .transport_config = {
        .ble = & (protocomm_ble_config_t) 
```
(continues on next page)
.device_name = SERVICE_NAME,
// * LSB <---------------------------------------
// * ---------------------------------------> MSB */
0x21, 0xd5, 0x3b, 0x8d, 0xbd, 0x75, 0x68, 0x5a,
0xb4, 0x42, 0xeb, 0x31, 0x4a, 0x1e, 0x98, 0x3d
} }

.proto_sec = {
.version = PROTOCOM_SEC0,
.custom_handle = NULL,
.pop = NULL,
},

.handlers = {
/* User defined handler functions */
.get_prop_values = get_property_values,
.set_prop_values = set_property_values,
.usr_ctx = NULL,
.usr_ctx_free_fn = NULL
},

/* Maximum number of properties that may be set */
.max_properties = 10
};

/* Start esp_local_ctrl service */
ESP_ERROR_CHECK(esp_local_ctrl_start(&config));

Similarly for HTTPS transport:

/* Set the configuration */
httpd_ssl_config_t https_conf = HTTPD_SSL_CONFIG_DEFAULT();

/* Load server certificate */
extern const unsigned char cacert_pem_start[] asm("_binary_cacert_pem_start");
extern const unsigned char cacert_pem_end[] asm("_binary_cacert_pem_end");
https_conf.cacert_pem = cacert_pem_start;
https_conf.cacert_len = cacert_pem_end - cacert_pem_start;

/* Load server private key */
extern const unsigned char prvtkey_pem_start[] asm("_binary_prvtkey_pem_start");
extern const unsigned char prvtkey_pem_end[] asm("_binary_prvtkey_pem_end");
https_conf.prvtkey_pem = prvtkey_pem_start;
https_conf.prvtkey_len = prvtkey_pem_end - prvtkey_pem_start;

esp_local_ctrl_config_t config = {
.transport = ESP_LOCAL_CTRL_TRANSPORT_HTTPD,
.transport_config = {
.httpd = &https_conf
},
.proto_sec = {
.version = PROTOCOM_SEC0,
.custom_handle = NULL,
.pop = NULL,
},
.handlers = {
/* User defined handler functions */
(continues on next page)
You may set security for transport in ESP local control using following options:

1. PROTOCOM_SEC1: specifies that end to end encryption is used.
2. PROTOCOM_SEC0: specifies that data will be exchanged as a plain text.
3. PROTOCOM_SEC_CUSTOM: you can define your own security requirement. Please note that you will also have to provide custom_handle of type protocomm_security_t * in this context.

Creating a property

Now that we know how to start the esp_local_ctrl service, let’s add a property to it. Each property must have a unique name (string), a type (e.g. enum), flags (bit fields) and size.

The size is to be kept 0, if we want our property value to be of variable length (e.g. if its a string or bytestream). For fixed length property value data-types, like int, float, etc., setting the size field to the right value, helps esp_local_ctrl to perform internal checks on arguments received with write requests.

The interpretation of type and flags fields is totally up to the application, hence they may be used as enumerations, bit-fields, or even simple integers. One way is to use type values to classify properties, while flags to specify characteristics of a property.

Here is an example property which is to function as a timestamp. It is assumed that the application defines TYPE_TIMESTAMP and READONLY, which are used for setting the type and flags fields here.

```c
/* Create a timestamp property */
esp_local_ctrl_prop_t timestamp = {
    .name = "timestamp",
    .type = TYPE_TIMESTAMP,
    .size = sizeof(int32_t),
    .flags = READONLY,
    .ctx = func_get_time,
    .ctx_free_fn = NULL
};

/* Now register the property */
esp_local_ctrl_add_property(&timestamp);
```

Also notice that there is a ctx field, which is set to point to some custom func_get_time(). This can be used inside the property get / set handlers to retrieve timestamp.

Here is an example of get_prop_values() handler, which is used for retrieving the timestamp.

```c
static esp_err_t get_property_values(size_t props_count, const esp_local_ctrl_prop_t *props, esp_local_ctrl_prop_val_t *prop_, esp_local_ctrl_prop_val_t *values, void *usr_ctx)
{
    for (uint32_t i = 0; i < props_count; i++) {
        ESP_LOGI(TAG, "Reading %s", props[i].name);
    }
```

(continues on next page)
if (props[i].type == TYPE_TIMESTAMP) {
    /* Obtain the timer function from ctx */
    int32_t (*func_get_time)(void) = props[i].ctx;

    /* Use static variable for saving the value.
      * This is essential because the value has to be
      * valid even after this function returns.
      * Alternative is to use dynamic allocation
      * and set the free_fn field */
    static int32_t ts = func_get_time();
    prop_values[i].data = &ts;
}

return ESP_OK;

Here is an example of set_prop_values() handler. Notice how we restrict from writing to read-only properties.

static esp_err_t set_property_values(size_t props_count,
                                      const esp_local_ctrl_prop_t *props,
                                      const esp_local_ctrl_prop_val_t *prop_values,
                                      void *usr_ctx)
{
    /* For keeping it simple, lets only log the incoming data */
    ESP_LOG_BUFFER_HEX_LEVEL(TAG, prop_values[i].data,
                              prop_values[i].size, ESP_LOG_INFO);

    return ESP_OK;
}

For complete example see protocols/esp_local_ctrl

Client Side Implementation

The client side implementation will have establish a protocomm session with the device first, over the supported mode of transport, and then send and receive protobuf messages understood by the esp_local_ctrl service. The service will translate these messages into requests and then call the appropriate handlers (set/get). Then, the generated response for each handler is again packed into a protobuf message and transmitted back to the client.

See below the various protobuf messages understood by the esp_local_ctrl service:

1. get_prop_count : This should simply return the total number of properties supported by the service
2. get_prop_values : This accepts an array of indices and should return the information (name, type, flags) and values of the properties corresponding to those indices
3. set_prop_values : This accepts an array of indices and an array of new values, which are used for setting the values of the properties corresponding to the indices

Note that indices may or may not be the same for a property, across multiple sessions. Therefore, the client must only use the names of the properties to uniquely identify them. So, every time a new session is established, the client should first call get_prop_count and then get_prop_values, hence form an index to name mapping for all properties. Now when calling set_prop_values for a set of properties, it must first convert the names to indexes, using the created
mapping. As emphasized earlier, the client must refresh the index to name mapping every time a new session is established with the same device.

The various protocomm endpoints provided by `esp_local_ctrl` are listed below:

<table>
<thead>
<tr>
<th>Endpoint Name (BLE + GATT Server)</th>
<th>URI (HTTPS Server + mDNS)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>esp_local_ctrl/version</td>
<td>https://&lt;mdns-hostname&gt;.local/esp_local_ctrl/version</td>
<td>Endpoint used for retrieving version string</td>
</tr>
<tr>
<td>esp_local_ctrl/control</td>
<td>https://&lt;mdns-hostname&gt;.local/esp_local_ctrl/control</td>
<td>Endpoint used for sending / receiving control messages</td>
</tr>
</tbody>
</table>

## API Reference

### Header File

- components/esp_local_ctrl/include/esp_local_ctrl.h

### Functions

- `const esp_local_ctrl_transport_t *esp_local_ctrl_get_transport_ble (void)`
  Function for obtaining BLE transport mode.

- `const esp_local_ctrl_transport_t *esp_local_ctrl_get_transport_httpd (void)`
  Function for obtaining HTTPD transport mode.

- `esp_err_t esp_local_ctrl_start (const esp_local_ctrl_config_t *config)`
  Start local control service.
  **Return**
  - ESP_OK : Success
  - ESP_FAIL : Failure
  **Parameters**
  - [in] config: Pointer to configuration structure

- `esp_err_t esp_local_ctrl_stop (void)`
  Stop local control service.

- `esp_err_t esp_local_ctrl_add_property (const esp_local_ctrl_prop_t *prop)`
  Add a new property.
  This adds a new property and allocates internal resources for it. The total number of properties that could be added is limited by configuration option `max_properties`
  **Return**
  - ESP_OK : Success
  - ESP_FAIL : Failure
  **Parameters**
  - [in] prop: Property description structure

- `esp_err_t esp_local_ctrl_remove_property (const char *name)`
  Remove a property.
  This finds a property by name, and releases the internal resources which are associated with it.
  **Return**
  - ESP_OK : Success
  - ESP_ERR_NOT_FOUND : Failure
  **Parameters**
Chapter 2. API Reference

- [in] name: Name of the property to remove

```c
const esp_local_ctrl_prop_t* esp_local_ctrl_get_property(const char *name)
```

Get property description structure by name.

This API may be used to get a property’s context structure `esp_local_ctrl_prop_t` when its name is known.

**Return**
- Pointer to property
- NULL if not found

**Parameters**
- [in] name: Name of the property to find

```c
esp_err_t esp_local_ctrl_set_handler(const char *ep_name, protocomm_req_handler_t handler, void *user_ctx)
```

Register protocomm handler for a custom endpoint.

This API can be called by the application to register a protocomm handler for an endpoint after the local control service has started.

**Note** In case of BLE transport the names and uuids of all custom endpoints must be provided beforehand as a part of the `protocomm_ble_config_t` structure set in `esp_local_ctrl_config_t`, and passed to `esp_local_ctrl_start()`.

**Return**
- ESP_OK: Success
- ESP_FAIL: Failure

**Parameters**
- [in] ep_name: Name of the endpoint
- [in] handler: Endpoint handler function
- [in] user_ctx: User data

**Unions**

```c
union esp_local_ctrl_transport_config_t
```

(include `<esp_local_ctrl.h>`) Transport mode (BLE/HTTPD) configuration.

**Public Members**

```c
esp_local_ctrl_transport_config_ble_t *ble
```

This is same as `protocomm_ble_config_t`. See `protocomm_ble.h` for available configuration parameters.

```c
esp_local_ctrl_transport_config_httpd_t *httpd
```

This is same as `httpd_ssl_config_t`. See `esp_https_server.h` for available configuration parameters.

**Structures**

```c
struct esp_local_ctrl_prop
```

Property description data structure, which is to be populated and passed to the `esp_local_ctrl_add_property()` function.

Once a property is added, its structure is available for read-only access inside `get_prop_values()` and `set_prop_values()` handlers.

**Public Members**

```c
char *name
```

Unique name of property
uint32_t **type**
Type of property. This may be set to application defined enums

size_t **size**
Size of the property value, which:

- if zero, the property can have values of variable size
- if non-zero, the property can have values of fixed size only, therefore, checks are performed internally by esp_local_ctrl when setting the value of such a property

uint32_t **flags**
Flags set for this property. This could be a bit field. A flag may indicate property behavior, e.g. read-only / constant

void **ctx**
Pointer to some context data relevant for this property. This will be available for use inside the get_prop_values and set_prop_values handlers as a part of this property structure. When set, this is valid throughout the lifetime of a property, till either the property is removed or the esp_local_ctrl service is stopped.

void (**ctx_free_fn**) (void **ctx**)
Function used by esp_local_ctrl to internally free the property context when esp_local_ctrl_remove_property() or esp_local_ctrl_stop() is called.

struct esp_local_ctrl_prop_val
Property value data structure. This gets passed to the get_prop_values() and set_prop_values() handlers for the purpose of retrieving or setting the present value of a property.

**Public Members**

void **data**
Pointer to memory holding property value

size_t **size**
Size of property value

void (**free_fn**) (void **data**)
This may be set by the application in get_prop_values() handler to tell esp_local_ctrl to call this function on the data pointer above, for freeing its resources after sending the get_prop_values response.

struct esp_local_ctrl_handlers
Handlers for receiving and responding to local control commands for getting and setting properties.

**Public Members**

esp_err_t (**get_prop_values**) (size_t props_count, const esp_local_ctrl_prop_t **props**, esp_local_ctrl_prop_val_t **prop_values**, void **usr_ctx**)
Handler function to be implemented for retrieving current values of properties.

**Note** If any of the properties have fixed sizes, the size field of corresponding element in prop_values need to be set

**Return** Returning different error codes will convey the corresponding protocol level errors to the client:

- ESP_OK: Success
- ESP_ERR_INVALID_ARG: InvalidArgument
- ESP_ERR_INVALID_STATE: InvalidProto
- All other error codes: InternalError

**Parameters**

- [in] props_count: Total elements in the props array
- [in] props: Array of properties, the current values for which have been requested by the client
• **[out]** prop_values: Array of empty property values, the elements of which need to be populated with the current values of those properties specified by props argument

• **[in]** usr_ctx: This provides value of the usr_ctx field of esp_local_ctrl_handlers_t structure

```c
esp_err_t (*set_prop_values)(size_t props_count, const esp_local_ctrl_prop_t *props[], const esp_local_ctrl_prop_val_t *prop_values[], void *usr_ctx)
```

Handler function to be implemented for changing values of properties.

**Note** If any of the properties have variable sizes, the size field of the corresponding element in prop_values must be checked explicitly before making any assumptions on the size.

**Return** Returning different error codes will convey the corresponding protocol level errors to the client:

- ESP_OK: Success
- ESP_ERR_INVALID_ARG: InvalidArgument
- ESP_ERR_INVALID_STATE: InvalidProto
- All other error codes: InternalError

**Parameters**

• **[in]** props_count: Total elements in the props array

• **[in]** props: Array of properties, the values for which the client requests to change

• **[in]** prop_values: Array of property values, the elements of which need to be used for updating those properties specified by props argument

• **[in]** usr_ctx: This provides value of the usr_ctx field of esp_local_ctrl_handlers_t structure

```c
void *usr_ctx
```

Context pointer to be passed to above handler functions upon invocation. This is different from the protocol level context, as this is valid throughout the lifetime of the esp_local_ctrl service, and freed only when the service is stopped.

```c
void (*usr_ctx_free_fn)(void *usr_ctx)
```

Pointer to function which will be internally invoked on usr_ctx for freeing the context resources when esp_local_ctrl_stop() is called.

**struct esp_local_ctrl_proto_sec_cfg**

Protocom security config

**Public Members**

```c
esp_local_ctrl_proto_sec_t version
```

This sets protocom security version, sec0/sec1 or custom. If custom, user must provide handle via proto_sec_custom_handle below

```c
void *custom_handle
```

Custom security handle if security is set custom via proto_sec above. This handle must follow protocomm_security_t signature

```c
void *pop
```

Proof of possession to be used for local control. Could be NULL.

**struct esp_local_ctrl_config**

Configuration structure to pass to esp_local_ctrl_start()
Chapter 2. API Reference

```c
esp_local_ctrl_proto_sec_cfg_t proto_sec
  Security version and POP

esp_local_ctrl_handlers_t handlers
  Register handlers for responding to get/set requests on properties

size_t max_properties
  This limits the number of properties that are available at a time
```

Macros

```
ESP_LOCAL_CTRL_TRANSPORT_BLE
ESP_LOCAL_CTRL_TRANSPORT_HTTPD
```

Type Definitions

```c
typedef struct esp_local_ctrl_prop esp_local_ctrl_prop_t
  Property description data structure, which is to be populated and passed to the
  esp_local_ctrl_add_property() function.

  Once a property is added, its structure is available for read-only access inside get_prop_values() and
  set_prop_values() handlers.

typedef struct esp_local_ctrl_prop_val esp_local_ctrl_prop_val_t
  Property value data structure. This gets passed to the get_prop_values() and set_prop_values()
  handlers for the purpose of retrieving or setting the present value of a property.

typedef struct esp_local_ctrl_handlers esp_local_ctrl_handlers_t
  Handlers for receiving and responding to local control commands for getting and setting properties.

typedef struct esp_local_ctrl_transport esp_local_ctrl_transport_t
  Transport mode (BLE/HTTPD) over which the service will be provided.

  This is forward declaration of a private structure, implemented internally by esp_local_ctrl.

typedef struct protocomm_ble_config esp_local_ctrl_transport_config_ble_t
  Configuration for transport mode BLE.

  This is a forward declaration for protocomm_ble_config_t. To use this, application must set CON-
  FIG_BT_BLUEDROID_ENABLED and include protocomm_ble.h.

typedef struct httpd_ssl_config esp_local_ctrl_transport_config_httpd_t
  Configuration for transport mode HTTPD.

  This is a forward declaration for httpd_ssl_config_t. To use this, application must set CON-
  FIG_ESP_HTTPS_SERVER_ENABLE and include esp_https_server.h.

typedef enum esp_local_ctrl_proto_sec esp_local_ctrl_proto_sec_t
  Security types for esp_local_control.

  Protocom security configs

typedef struct esp_local_ctrl_proto_sec_cfg esp_local_ctrl_proto_sec_cfg_t
  Configuration structure to pass to esp_local_ctrl_start() all
```

Enumerations

```
enum esp_local_ctrl_proto_sec
  Security types for esp_local_control.

  Values:
  PROTOCOM_SEC0 = 0
  PROTOCOM_SEC1
  PROTOCOM_SEC_CUSTOM
```
2.4.10 mDNS Service

Overview

mDNS is a multicast UDP service that is used to provide local network service and host discovery. mDNS is installed by default on most operating systems or is available as separate package. On Mac OS it is installed by default and is called Bonjour. Apple releases an installer for Windows that can be found on Apple’s support page. On Linux, mDNS is provided by avahi and is usually installed by default.

mDNS Properties

• hostname: the hostname that the device will respond to. If not set, the hostname will be read from the interface. Example: my-esp32s3 will resolve to my-esp32s3.local
• default_instance: friendly name for your device, like Jhon's ESP32-S3 Thing. If not set, hostname will be used.

Example method to start mDNS for the STA interface and set hostname and default_instance:

```c
void start_mdns_service()
{
    //initialize mDNS service
    esp_err_t err = mdns_init();
    if (err)
    {
        printf("MDNS Init failed: %d\n", err);
        return;
    }

    //set hostname
    mdns_hostname_set("my-esp32s3");
    //set default instance
    mdns_instance_name_set("Jhon's ESP32-S3 Thing");
}
```

mDNS Services mDNS can advertise information about network services that your device offers. Each service is defined by a few properties.

• instance_name: friendly name for your service, like Jhon's EESP32-S3 Web Server. If not defined, default_instance will be used.
• service_type: (required) service type, prepended with underscore. Some common types can be found here.
• proto: (required) protocol that the service runs on, prepended with underscore. Example: _tcp or _udp
• port: (required) network port that the service runs on
• txt: {var, val} array of strings, used to define properties for your service

Example method to add a few services and different properties:

```c
void add_mdns_services()
{
    //add our services
    mdns_service_add(NULL, "http", _tcp", 80, NULL, 0);
    mdns_service_add(NULL, "arduino", _tcp", 3232, NULL, 0);
    mdns_service_add(NULL, "_myservice", _udp", 1234, NULL, 0);

    //NOTE: services must be added before their properties can be set
    //use custom instance for the web server
    mdns_service_instance_name_set("http", _tcp", "Jhon's ESP32-S3 Web Server");

    mdns_txt_item_t serviceTxtData[3] = {
        {"board","{esp32s3}"},
        /* more items */
    };
}
```

(continues on next page)
mdns_service_txt_set("_http", "_tcp", serviceTxtData, 3);

// change service port
mdns_service_port_set("_myservice", "_udp", 4321);

mDNS Query  

mDNS provides methods for browsing for services and resolving host’s IP/IPv6 addresses. Results for services are returned as a linked list of mdns_result_t objects.

Example method to resolve host IPs:

```c
void resolve_mdns_host(const char * host_name)
{
    printf("Query A: %s.local\n", host_name);

    struct ip4_addr addr;
    addr.addr = 0;

    esp_err_t err = mdns_query_a(host_name, 2000, &addr);
    if(err){
        if(err == ESP_ERR_NOT_FOUND){
            printf("Host was not found!\n");
            return;
        }
        printf("Query Failed\n");
        return;
    }
    printf(IPSTR, IP2STR(&addr));
}
```

Example method to resolve local services:

```c
static const char * if_str[] = {"STA", "AP", "ETH", "MAX"};
static const char * ip_protocol_str[] = {"V4", "V6", "MAX"};

void mdns_print_results(mdns_result_t * results){
    mdns_result_t * r = results;
    mdns_ip_addr_t * a = NULL;
    int i = 1, t;
    while(r){
        printf("%d: Interface: %s, Type: %s\n", i++, if_str[r->tcpip_if], ip_protocol_str[r->ip_protocol]);
        if(r->instance_name){
            printf(" PTR : %s\n", r->instance_name);
        }
        if(r->hostname){
            printf(" SRV : %s.local:%u\n", r->hostname, r->port);
        }
        if(r->txt_count){
            printf(" TXT : [%u] \n", r->txt_count);
            for(t=0; t<r->txt_count; t++)
                printf("%s=%s\n", r->txt[t].key, r->txt[t].value);
        }
        printf("\n");
        r = r->next;
    }
}
```
void find_mdns_service(const char * service_name, const char * proto)
{
    ESP_LOGI(TAG, "Query PTR: %s.%s.local", service_name, proto);

    mdns_result_t * results = NULL;
    esp_err_t err = mdns_query_ptr(service_name, proto, 3000, 20, &results);
    if(err){
        ESP_LOGE(TAG, "Query Failed");
        return;
    }
    if(!results){
        ESP_LOGW(TAG, "No results found!");
        return;
    }

    mdns_print_results(results);
    mdns_query_results_free(results);
}

Example of using the methods above:

void my_app_some_method()
{
    //search for esp32s3-mdns.local
    resolve_mdns_host("esp32s3-mdns");

    //search for HTTP servers
    find_mdns_service("_http", "_tcp");
    //or file servers
    find_mdns_service("_smb", "_tcp"); //windows sharing
    find_mdns_service("_afpovertcp", "_tcp"); //apple sharing
    find_mdns_service("_nfs", "_tcp"); //NFS server
    find_mdns_service("_ftp", "_tcp"); //FTP server
    //or networked printer
    find_mdns_service("_printer", "_tcp");
    find_mdns_service("_ipp", "_tcp");
}

Application Example

mDNS server/scanner example: protocols/mdns.

API Reference

Header File
Functions

`esp_err_t mdns_init (void)`
Initialize mDNS on given interface.

Return
- ESP_OK on success
- ESP_ERR_INVALID_STATE when failed to register event handler
- ESP_ERR_NO_MEM on memory error
- ESP_FAIL when failed to start mDNS task

`void mdns_free (void)`
Stop and free mDNS server.

`esp_err_t mdns_hostname_set (const char *hostname)`
Set the hostname for mDNS server required if you want to advertise services.

Return
- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NO_MEM memory error

Parameters
- hostname: Hostname to set

`esp_err_t mdns_delegate_hostname_add (const char *hostname, const mdns_ip_addr_t *address_list)`
Adds a hostname and address to be delegated A/AAAA queries will be replied for the hostname and services can be added to this host.

Return
- ESP_OK success
- ESP_ERR_INVALID_STATE mDNS is not running
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NO_MEM memory error

Parameters
- hostname: Hostname to add
- address_list: The IP address list of the host

`esp_err_t mdns_delegate_hostname_remove (const char *hostname)`
Remove a delegated hostname All the services added to this host will also be removed.

Return
- ESP_OK success
- ESP_ERR_INVALID_STATE mDNS is not running
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NO_MEM memory error

Parameters
- hostname: Hostname to remove

`bool mdns_hostname_exists (const char *hostname)`
Query whether a hostname has been added.

Return
- true The hostname has been added.
- false The hostname has not been added.

Parameters
- hostname: Hostname to query

`esp_err_t mdns_instance_name_set (const char *instance_name)`
Set the default instance name for mDNS server.

Return
- ESP_OK success
Chapter 2. API Reference

- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NO_MEM memory error

Parameters
- instance_name: Instance name to set

```c
esp_err_t mdns_service_add(const char *instance_name, const char *service_type, const char *proto, uint16_t port, mdns_txt_item_t txt[], size_t num_items)
```

Add service to mDNS server.

**Note** The value length of txt items will be automatically decided by strlen

**Return**
- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NO_MEM memory error
- ESP_FAIL failed to add service

Parameters
- instance_name: instance name to set. If NULL, global instance name or hostname will be used.
  Note that MDNS_MULTIPLE_INSTANCE config option needs to be enabled for adding multiple instances with the same instance type.
- service_type: service type (_http, _ftp, etc)
- proto: service protocol (_tcp, _udp)
- port: service port
- txt: string array of TXT data (eg. {{ “var” ,” val” },{ “other”, ” 2” }})
- num_items: number of items in TXT data

```c
esp_err_t mdns_service_add_for_host(const char *instance_name, const char *service_type, const char *proto, const char *hostname, uint16_t port, mdns_txt_item_t txt[], size_t num_items)
```

Add service to mDNS server with a delegated hostname.

**Note** The value length of txt items will be automatically decided by strlen

**Return**
- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NO_MEM memory error
- ESP_FAIL failed to add service

Parameters
- instance_name: instance name to set. If NULL, global instance name or hostname will be used.
  Note that MDNS_MULTIPLE_INSTANCE config option needs to be enabled for adding multiple instances with the same instance type.
- service_type: service type (_http, _ftp, etc)
- proto: service protocol (_tcp, _udp)
- hostname: service hostname. If NULL, checks for the local hostname.
- port: service port
- txt: string array of TXT data (eg. {{ “var” ,” val” },{ “other”, ” 2” }})
- num_items: number of items in TXT data

```c
bool mdns_service_exists(const char *service_type, const char *proto, const char *hostname)
```

Check whether a service has been added.

**Return**
- true Corresponding service has been added.
- false Service not found.

Parameters
- service_type: service type (_http, _ftp, etc)
- proto: service protocol (_tcp, _udp)
- hostname: service hostname. If NULL, checks for the local hostname.

```c
bool mdns_service_exists_with_instance(const char *instance, const char *service_type, const char *proto, const char *hostname)
```

Check whether a service has been added.

**Return**
• true Corresponding service has been added.
• false Service not found.

**Parameters**

• instance: instance name
• service_type: service type (_http, _ftp, etc)
• proto: service protocol (_tcp, _udp)
• hostname: service hostname. If NULL, checks for the local hostname.

```c
esp_err_t mdns_service_remove(const char *service_type, const char *proto)
```
Remove service from mDNS server.

**Return**

• ESP_OK success
• ESP_ERR_INVALID_ARG Parameter error
• ESP_ERR_NOT_FOUND Service not found
• ESP_ERR_NO_MEM memory error

**Parameters**

• service_type: service type (_http, _ftp, etc)
• proto: service protocol (_tcp, _udp)

```c
esp_err_t mdns_service_remove_for_host(const char *instance, const char *service_type,
                                       const char *proto, const char *hostname)
```
Remove service from mDNS server with hostname.

**Return**

• ESP_OK success
• ESP_ERR_INVALID_ARG Parameter error
• ESP_ERR_NOT_FOUND Service not found
• ESP_ERR_NO_MEM memory error

**Parameters**

• instance: instance name
• service_type: service type (_http, _ftp, etc)
• proto: service protocol (_tcp, _udp)
• hostname: service hostname. If NULL, localhost name will be used.

```c
esp_err_t mdns_service_instance_name_set(const char *service_type, const char *proto,
                                         const char *instance_name)
```
Set instance name for service.

**Return**

• ESP_OK success
• ESP_ERR_INVALID_ARG Parameter error
• ESP_ERR_NOT_FOUND Service not found
• ESP_ERR_NO_MEM memory error

**Parameters**

• service_type: service type (_http, _ftp, etc)
• proto: service protocol (_tcp, _udp)
• instance_name: instance name to set

```c
esp_err_t mdns_service_instance_name_set_for_host(const char *instance_old, const char *service_type,
                                                   const char *proto, const char *hostname,
                                                   const char *instance_name)
```
Set instance name for service with hostname.

**Return**

• ESP_OK success
• ESP_ERR_INVALID_ARG Parameter error
• ESP_ERR_NOT_FOUND Service not found
• ESP_ERR_NO_MEM memory error

**Parameters**

• instance_old: original instance name
• service_type: service type (_http, _ftp, etc)
• **proto**: service protocol (_tcp, _udp)
• **hostname**: service hostname. If NULL, local hostname will be used.
• **instance name**: instance name to set

```c
esp_err_t mdns_service_port_set (const char *service_type, const char *proto, uint16_t port)
```

Sets service port.

**Return**
- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NOT_FOUND Service not found
- ESP_ERR_NO_MEM memory error

**Parameters**
- **service_type**: service type (_http, _ftp, etc)
- **proto**: service protocol (_tcp, _udp)
- **port**: service port

```c
esp_err_t mdns_service_port_set_for_host (const char *instance, const char *service_type, const char *proto, const char *hostname, uint16_t port)
```

Sets service port with hostname.

**Return**
- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NOT_FOUND Service not found
- ESP_ERR_NO_MEM memory error

**Parameters**
- **instance**: instance name
- **service_type**: service type (_http, _ftp, etc)
- **proto**: service protocol (_tcp, _udp)
- **hostname**: service hostname. If NULL, local hostname will be used.
- **port**: service port

```c
esp_err_t mdns_service_txt_set (const char *service_type, const char *proto, mdns_txt_item_t txt[], uint8_t num_items)
```

Replace all TXT items for service.

**Note** The value length of txt items will be automatically decided by strlen

**Return**
- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NOT_FOUND Service not found
- ESP_ERR_NO_MEM memory error

**Parameters**
- **service_type**: service type (_http, _ftp, etc)
- **proto**: service protocol (_tcp, _udp)
- **txt**: array of TXT data (eg. [{“var”,”val”},{“other”,”2”}])
- **num_items**: number of items in TXT data

```c
esp_err_t mdns_service_txt_set_for_host (const char *instance, const char *service_type, const char *proto, const char *hostname, mdns_txt_item_t txt[], uint8_t num_items)
```

Replace all TXT items for service with hostname.

**Note** The value length of txt items will be automatically decided by strlen

**Return**
- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NOT_FOUND Service not found
- ESP_ERR_NO_MEM memory error

**Parameters**
- **instance**: instance name
- **service_type**: service type (_http, _ftp, etc)
- **proto**: service protocol (_tcp, _udp)
- **hostname**: service hostname. If NULL, local hostname will be used.
- **txt**: array of TXT data (eg. `{{ "var", "val" }, { "other", "2" }}`)
- **num_items**: number of items in TXT data

```c
esp_err_t mdns_service_txt_item_set(const char *service_type, const char *proto, const char *key, const char *value)
```

Set/Add TXT item for service TXT record.

**Note**  The value length will be automatically decided by strlen

**Return**
- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NOT_FOUND Service not found
- ESP_ERR_NO_MEM memory error

**Parameters**
- **service_type**: service type (_http, _ftp, etc)
- **proto**: service protocol (_tcp, _udp)
- **key**: the key that you want to add/update
- **value**: the new value of the key

```c
esp_err_t mdns_service_txt_item_set_with_explicit_value_len(const char *service_type, const char *proto, const char *key, const char *value, uint8_t value_len)
```

Set/Add TXT item for service TXT record.

**Return**
- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NOT_FOUND Service not found
- ESP_ERR_NO_MEM memory error

**Parameters**
- **service_type**: service type (_http, _ftp, etc)
- **proto**: service protocol (_tcp, _udp)
- **key**: the key that you want to add/update
- **value**: the new value of the key
- **value_len**: the length of the value

```c
esp_err_t mdns_service_txt_item_set_for_host(const char *instance, const char *service_type, const char *proto, const char *hostname, const char *key, const char *value)
```

Set/Add TXT item for service TXT record with hostname.

**Note**  The value length will be automatically decided by strlen

**Return**
- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NOT_FOUND Service not found
- ESP_ERR_NO_MEM memory error

**Parameters**
- **instance**: instance name
- **service_type**: service type (_http, _ftp, etc)
- **proto**: service protocol (_tcp, _udp)
- **hostname**: service hostname. If NULL, local hostname will be used.
- **key**: the key that you want to add/update
- **value**: the new value of the key
**esp_err_t** `mdns_service_txt_item_set_for_host_with_explicit_value_len` (const char *`instance`, const char *`service_type`, const char *`proto`, const char *`hostname`, const char *`key`, const char *`value`, uint8_t *`value_len`)

Set/Add TXT item for service TXT record with hostname and txt value length.

**Return**
- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NOT_FOUND Service not found
- ESP_ERR_NO_MEM memory error

**Parameters**
- `instance`: instance name
- `service_type`: service type (_http, _ftp, etc)
- `proto`: service protocol (_tcp, _udp)
- `hostname`: service hostname. If NULL, local hostname will be used.
- `key`: the key that you want to add/update
- `value`: the new value of the key
- `value_len`: the length of the value

**esp_err_t** `mdns_service_txt_item_remove` (const char *`service_type`, const char *`proto`, const char *`key`)

Remove TXT item for service TXT record.

**Return**
- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NOT_FOUND Service not found
- ESP_ERR_NO_MEM memory error

**Parameters**
- `service_type`: service type (_http, _ftp, etc)
- `proto`: service protocol (_tcp, _udp)
- `key`: the key that you want to remove

**esp_err_t** `mdns_service_txt_item_remove_for_host` (const char *`instance`, const char *`service_type`, const char *`proto`, const char *`hostname`, const char *`key`)

Remove TXT item for service TXT record with hostname.

**Return**
- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NOT_FOUND Service not found
- ESP_ERR_NO_MEM memory error
Parameters

- `instance`: instance name
- `service_type`: service type (_http, _ftp, etc)
- `proto`: service protocol (_tcp, _udp)
- `hostname`: service hostname. If NULL, local hostname will be used.
- `key`: the key that you want to remove

```c
esp_err_t mdns_service_subtype_add_for_host(const char *instance_name, const char *service_type, const char *proto, const char *hostname, const char *subtype)
```

Add subtype for service.

Return

- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_NOT_FOUND Service not found
- ESP_ERR_NO_MEM memory error

Parameters

- `instance_name`: instance name. If NULL, will find the first service with the same service type and protocol.
- `service_type`: service type (_http, _ftp, etc)
- `proto`: service protocol (_tcp, _udp)
- `hostname`: service hostname. If NULL, local hostname will be used.
- `subtype`: The subtype to add.

```c
esp_err_t mdns_service_remove_all(void)
```

Remove and free all services from mDNS server.

Return

- ESP_OK success
- ESP_ERR_INVALID_ARG Parameter error

```c
esp_err_t mdns_query_async_delete(mdns_search_once_t *search)
```

Deletes the finished query. Call this only after the search has ended!

Return

- ESP_OK success
- ESP_ERR_INVALID_STATE search has not finished
- ESP_ERR_INVALID_ARG pointer to search object is NULL

Parameters

- `search`: pointer to search object

```c
bool mdns_query_async_get_results(mdns_search_once_t *search, uint32_t timeout, mdns_result_t **results, uint8_t *num_results)
```

Get results from search pointer. Results available as a pointer to the output parameter. Pointer to search object has to be deleted via `mdns_query_async_delete` once the query has finished. The results although have to be freed manually.

Return True if search has finished before or at timeout False if search timeout is over

Parameters

- `search`: pointer to search object
- `timeout`: time in milliseconds to wait for answers
- `results`: pointer to the results of the query
- `num_results`: pointer to the number of the actual result items (set to NULL to ignore this return value)

```c
mdns_search_once_t *mdns_query_async_new(const char *name, const char *service_type, const char *proto, uint16_t type, uint32_t timeout, size_t max_results, mdns_query_notify_t notifier)
```

Query mDNS for host or service asynchronously. Search has to be tested for progress and deleted manually!

Return `mdns_search_once_s` pointer to new search object if query initiated successfully. NULL otherwise.

Parameters

- `name`: service instance or host name (NULL for PTR queries)
• service_type: service type (_http, _arduino, _ftp etc.) (NULL for host queries)
• proto: service protocol (_tcp, _udp, etc.) (NULL for host queries)
• type: type of query (MDNS_TYPE_*)
• timeout: time in milliseconds during which mDNS query is active
• max_results: maximum results to be collected
• notifier: Notification function to be called when the result is ready, can be NULL

`esp_err_t mdns_query(const char *name, const char *service_type, const char *proto, uint16_t type, uint32_t timeout, size_t max_results, mdns_result_t **results)`

Query mDNS for host or service. All following query methods are derived from this one.

Return
• ESP_OK success
• ESP_ERR_INVALID_STATE mDNS is not running
• ESP_ERR_NO_MEM memory error
• ESP_ERR_INVALID_ARG timeout was not given

Parameters
• name: service instance or host name (NULL for PTR queries)
• service_type: service type (_http, _arduino, _ftp etc.) (NULL for host queries)
• proto: service protocol (_tcp, _udp, etc.) (NULL for host queries)
• type: type of query (MDNS_TYPE_*)
• timeout: time in milliseconds to wait for answers.
• max_results: maximum results to be collected
• results: pointer to the results of the query results must be freed using mdns_query_results_free below

`void mdns_query_results_free(mdns_result_t *results)`

Free query results.

Parameters
• results: linked list of results to be freed

`esp_err_t mdns_query_ptr(const char *service_type, const char *proto, uint32_t timeout, size_t max_results, mdns_result_t **results)`

Query mDNS for service.

Return
• ESP_OK success
• ESP_ERR_INVALID_STATE mDNS is not running
• ESP_ERR_NO_MEM memory error
• ESP_ERR_INVALID_ARG parameter error

Parameters
• service_type: service type (_http, _arduino, _ftp etc.)
• proto: service protocol (_tcp, _udp, etc.)
• timeout: time in milliseconds to wait for answer.
• max_results: maximum results to be collected
• results: pointer to the results of the query

`esp_err_t mdns_query_srv(const char *instance_name, const char *service_type, const char *proto, uint32_t timeout, mdns_result_t **result)`

Query mDNS for SRV record.

Return
• ESP_OK success
• ESP_ERR_INVALID_STATE mDNS is not running
• ESP_ERR_NO_MEM memory error
• ESP_ERR_INVALID_ARG parameter error

Parameters
• instance_name: service instance name
• service_type: service type (_http, _arduino, _ftp etc.)
• proto: service protocol (_tcp, _udp, etc.)
• timeout: time in milliseconds to wait for answer.
• result: pointer to the result of the query
### esp_err_t mdns_query_txt(const char *instance_name, const char *service_type, const char *proto, uint32_t timeout, mdns_result_t **result)

Query mDNS for TXT record.

**Return**
- ESP_OK success
- ESP_ERR_INVALID_STATE mDNS is not running
- ESP_ERR_NO_MEM memory error
- ESP_ERR_INVALID_ARG parameter error

**Parameters**
- instance_name: service instance name
- service_type: service type (_http, _arduino, _ftp etc.)
- proto: service protocol (_tcp, _udp, etc.)
- timeout: time in milliseconds to wait for answer.
- result: pointer to the result of the query

### esp_err_t mdns_query_a(const char *host_name, uint32_t timeout, esp_ip4_addr_t *addr)

Query mDNS for A record.

**Return**
- ESP_OK success
- ESP_ERR_INVALID_STATE mDNS is not running
- ESP_ERR_NO_MEM memory error
- ESP_ERR_INVALID_ARG parameter error

**Parameters**
- host_name: host name to look for
- timeout: time in milliseconds to wait for answer.
- addr: pointer to the resulting IP4 address

### esp_err_t mdns_query_aaaa(const char *host_name, uint32_t timeout, esp_ip6_addr_t *addr)

Query mDNS for A record.

Please note that hostname must not contain domain name, as mDNS uses `.local` domain.

**Return**
- ESP_OK success
- ESP_ERR_INVALID_STATE mDNS is not running
- ESP_ERR_NO_MEM memory error
- ESP_ERR_INVALID_ARG parameter error

**Parameters**
- host_name: host name to look for
- timeout: time in milliseconds to wait for answer. If 0, max_results needs to be defined
- addr: pointer to the resulting IP6 address

### esp_err_t mdns_handle_system_event(void *ctx, system_event_t *event)

System event handler This method controls the service state on all active interfaces and applications are required to call it from the system event handler for normal operation of mDNS service.

Please note that hostname must not contain domain name, as mDNS uses `.local` domain.

**Parameters**
- ctx: The system event context
- event: The system event

### Structures

**struct mdns_txt_item_t**

mDNS basic text item structure Used in mdns_service_add()
Public Members

```c
const char *key
    item key name
const char *value
    item value string
struct mdns_ip_addr_s
    mDNS query linked list IP item
```

Public Members

```c
esp_ip_addr_t addr
    IP address
struct mdns_ip_addr_s *next
    next IP, or NULL for the last IP in the list
struct mdns_result_s
    mDNS query result structure
```

Public Members

```c
struct mdns_result_s *next
    next result, or NULL for the last result in the list
mdns_if_t tcpip_if
    interface index
uint32_t ttl
    time to live
mdns_ip_protocol_t ip_protocol
    ip_protocol type of the interface (v4/v6)
char *instance_name
    instance name
char *service_type
    service type
char *proto
    service protocol
char *hostname
    hostname
uint16_t port
    service port
mdns_txt_item_t *txt
    txt record
uint8_t *txt_value_len
    array of txt value len of each record
size_t txt_count
    number of txt items
mdns_ip_addr_t *addr
    linked list of IP addresses found
```
Chapter 2. API Reference

Macros

- MDNS_TYPE_A
- MDNS_TYPE_PTR
- MDNS_TYPE_TXT
- MDNS_TYPE_AAAA
- MDNS_TYPE_SRV
- MDNS_TYPE_OPT
- MDNS_TYPE_NSEC
- MDNS_TYPE_ANY

Type Definitions

typedef struct mdns_search_once_s mdns_search_once_t
    Asynchronous query handle.

typedef struct mdns_ip_addr_s mdns_ip_addr_t
    mDNS query linked list IP item

typedef enum mdns_if_internal mdns_if_t

typedef struct mdns_result_s mdns_result_t
    mDNS query result structure

typedef void (*mdns_query_notify_t)(mdns_search_once_t *search)

Enumerations

enum mdns_ip_protocol_t
    mDNS enum to specify the ip_protocol type

Values:
- MDNS_IP_PROTOCOL_V4
- MDNS_IP_PROTOCOL_V6
- MDNS_IP_PROTOCOL_MAX

enum mdns_if_internal
    Values:
- MDNS_IF_STA = 0
- MDNS_IF_AP = 1
- MDNS_IF_ETH = 2
- MDNS_IF_MAX

2.4.11 ESP-Modbus

Overview

The Modbus serial communication protocol is de facto standard protocol widely used to connect industrial electronic devices. Modbus allows communication among many devices connected to the same network, for example, a system that measures temperature and humidity and communicates the results to a computer. The Modbus protocol uses several types of data: Holding Registers, Input Registers, Coils (single bit output), Discrete Inputs. Versions of the Modbus protocol exist for serial port and for Ethernet and other protocols that support the Internet protocol suite. There are many variants of Modbus protocols, some of them are:
Chapter 2. API Reference

- **Modbus RTU** — This is used in serial communication and makes use of a compact, binary representation of the data for protocol communication. The RTU format follows the commands/data with a cyclic redundancy check checksum as an error check mechanism to ensure the reliability of data. Modbus RTU is the most common implementation available for Modbus. A Modbus RTU message must be transmitted continuously without inter-character hesitations. Modbus messages are framed (separated) by idle (silent) periods. The RS-485 interface communication is usually used for this type.

- **Modbus ASCII** — This is used in serial communication and makes use of ASCII characters for protocol communication. The ASCII format uses a longitudinal redundancy check checksum. Modbus ASCII messages are framed by leading colon (":") and trailing newline (CR/LF).

- **Modbus TCP/IP or Modbus TCP** — This is a Modbus variant used for communications over TCP/IP networks, connecting over port 502. It does not require a checksum calculation, as lower layers already provide checksum protection.

The following document (and included code snippets) requires some familiarity with the Modbus protocol. Refer to the Modbus Organization’s with protocol specifications for specifics.

### Messaging Model And Data Mapping

Modbus is an application protocol that defines rules for messaging structure and data organization that are independent of the data transmission medium. Traditional serial Modbus is a register-based protocol that defines message transactions that occur between master(s) and slave devices (multiple masters are allowed on using Modbus TCP/IP). The slave devices listen for communication from the master and simply respond as instructed. The master(s) always controls communication and may communicate directly to one slave, or all connected slaves, but the slaves cannot communicate directly with each other.

**Note:** It is assumed that the number of slaves and their register maps are known by the Modbus master before the start of stack.

The register map of each slave device is usually part of its device manual. A Slave device usually permits configuration of its short slave address and communication options that are used within the device’s network segment.

The Modbus protocol allows devices to map data to four types of registers (Holding, Input, Discrete, Coil). The figure below illustrates an example mapping of a device’s data to the four types of registers.

The following sections give an overview of how to use the ESP_Modbus component found under components/freemodbus. The sections cover initialization of a Modbus port, and the setup a master or slave device accordingly:

- **Modbus Port Initialization**
- **Modbus Slave API Overview**
- **Modbus Master API Overview**

#### Modbus Port Initialization

The ESP_Modbus supports Modbus SERIAL and TCP ports and a port must be initialized before calling any other Modbus API. The functions below are used to create and then initialize Modbus controller interface (either master or slave) over a particular transmission medium (either Serial or TCP/IP):

- `mbc_slave_init()`
- `mbc_master_init()`
- `mbc_slave_init_tcp()`
- `mbc_master_init_tcp()`

The API call uses the first parameter to recognize the type of port being initialized. Supported enumeration for different ports: `MB_PORT_SERIAL_MASTER, MB_PORT_SERIAL_SLAVE` accordingly. The parameters `MB_PORT_TCP_MASTER, MB_PORT_TCP_SLAVE` are reserved for internal usage.

```c
void* master_handler = NULL; // Pointer to allocate interface structure

// Initialization of Modbus master for serial port
esp_err_t err = mbc_master_init(MB_PORT_SERIAL_MASTER, &master_handler);
```

(continues on next page)
Chapter 2. API Reference

Fig. 22: Modbus segment diagram

UID-1 (UNIT ID = slave address)  N - number of slaves in the network segment usually <= 32

Modbus Slave 1

Modbus master device initiates transactions to read/write slave registers

Modbus Slave 2

Modbus Master

... Network (RS485 for Modbus RTU and ASCII, Ethernet or WiFi connection for Modbus TCP)

UID-N

Modbus Slave N

Slave devices listen for communication from the master and simply respond as instructed

Fig. 23: Modbus data mapping
if (master_handler == NULL || err != ESP_OK) {
    ESP_LOGE(TAG, "mb controller initialization fail.");
}

This example code to initialize slave port:

```c
void* slave_handler = NULL; // Pointer to allocate interface structure
// Initialization of Modbus slave for TCP
esp_err_t err = mbc_slave_init_tcp(&slave_handler);
if (slave_handler == NULL || err != ESP_OK) {
    // Error handling is performed here
    ESP_LOGE(TAG, "mb controller initialization fail.");
}
```

Modbus Master API Overview

The following overview describes how to setup Modbus master communication. The overview reflects a typical programming workflow and is broken down into the sections provided below:

1. **Modbus Port Initialization** - Initialization of Modbus controller interface for the selected port.
2. **Configuring Master Data Access** - Configure data descriptors to access slave parameters.
3. **Master Communication Options** - Allows to setup communication options for selected port.
4. **Master Communication** - Start stack and sending / receiving data.
5. **Modbus Master Teardown** - Destroy Modbus controller and its resources.

**Configuring Master Data Access**  The architectural approach of ESP_Modbus includes one level above standard Modbus IO driver. The additional layer is called Modbus controller and its goal is to add an abstraction such as CID - characteristic identifier. The CID is linked to a corresponding Modbus registers through the table called Data Dictionary and represents device physical parameter (such as temperature, humidity, etc.) in specific Modbus slave device. This approach allows the upper layer (e.g., MESH or MQTT) to be isolated from Modbus specifics thus simplify Modbus integration with other protocols/networks.

The Data Dictionary is the list in the Modbus master which shall be defined by user to link each CID to its corresponding Modbus registers representation using Register Mapping table of the Modbus slave being used. Each element in this data dictionary is of type `mb_parameter_descriptor_t` and represents the description of one physical characteristic:
Table 8: Table 1 Modbus master Data Dictionary description

<table>
<thead>
<tr>

  CID_TEMP_DATA_2
};

// Example Data Dictionary for Modbus parameters in 2 slaves in the segment
mb_parameter_descriptor_t device_parameters[] = {
  // CID, Name, Units, Modbus addr, register type, Modbus Reg Start Addr, Modbus...
  // Instance offset (NA), Instance type, Instance length (bytes), Options (NA),...
  // Permissions
  { CID_SER_NUM1, STR("Serial_number_1"), STR("--"), MB_DEVICE_ADDR1, MB_PARAM_...
    INPUT, 0, 2, 0, PARAM_TYPE_U32, 4, OPTS( 0,0,0 ), PAR_PERMS_READ_WRITE_
    TRIGGER },
  { CID_SW_VER1, STR("Software_version_1"), STR("--"), MB_DEVICE_ADDR1, MB_PARAM_...
    INPUT, 2, 1, 0, PARAM_TYPE_U16, 2, OPTS( 0,0,0 ), PAR_PERMS_READ_WRITE_
    TRIGGER },
  { CID_TEMP_DATA_1, STR("Temperature_1"), STR("C"), MBDEVICE_ADDR1, MB_PARAM_...
    HOLDING, 0, 2, 0, PARAM_TYPE_FLOAT, 4, OPTS( 16,30,1 ), PAR_PERMS_READ_
    WRITE_TRIGGER },
  { CID_SER_NUM2, STR("Serial_number_2"), STR("--"), MB_DEVICE_ADDR2, MB_PARAM_...
    INPUT, 0, 2, 0, PARAM_TYPE_U32, 4, OPTS( 0,0,0 ), PAR_PERMS_READ_WRITE_
    TRIGGER },
  { CID_SW_VER2, STR("Software_version_2"), STR("--"), MB_DEVICE_ADDR2, MB_PARAM_...
    INPUT, 2, 1, 0, PARAM_TYPE_U16, 2, OPTS( 0,0,0 ), PAR_PERMS_READ_WRITE_
    TRIGGER },
  { CID_TEMP_DATA_2, STR("Temperature_2"), STR("C"), MB_DEVICE_ADDR2, MB_PARAM_...
    HOLDING, 0, 2, 0, PARAM_TYPE_FLOAT, 4, OPTS( 20,30,1 ), PAR_PERMS_READ_
    WRITE_TRIGGER },
};

// Calculate number of parameters in the table
uint16_t num_device_parameters = (sizeof(device_parameters) / sizeof(device_...
  parameters[0]));

During initialization of the Modbus stack, a pointer to the Data Dictionary (called descriptor) must be provided as
the parameter of the function below.

mbc_master_set_descriptor(): Initialization of master descriptor.

ESP_ERROR_CHECK(mbc_master_set_descriptor(&device_parameters[0], num_device_...
  parameters));

The Data Dictionary can be initialized from SD card, MQTT or other source before start of stack. Once the initial-
ization and setup is done, the Modbus controller allows the reading of complex parameters from any slave included
in descriptor table using its CID.

Master Communication Options  Calling the setup function allows for specific communication options to be de-

\[912\]
mbc_master_setup()

The communication structure provided as a parameter is different for serial and TCP communication mode.

Example setup for serial port:

```c
mb_communication_info_t comm_info = {
    .port = MB_PORT_NUM, // Serial port number
    .mode = MB_MODE_RTU, // Modbus mode of communication (MB_MODE_RTU or MB_MODE_ASCII)
    .baudrate = 9600, // Modbus communication baud rate
    .parity = MB_PARITY_NONE // parity option for serial port
};
ESP_ERROR_CHECK(mbc_master_setup((void*)&comm_info));
```

Modbus master TCP port requires additional definition of IP address table where number of addresses should be equal to number of unique slave addresses in master Modbus Data Dictionary:

The order of IP address string corresponds to short slave address in the Data Dictionary:

```c
#define MB_SLAVE_COUNT 2 // Number of slaves in the segment being accessed (as defined in Data Dictionary)
char* slave_ip_address_table[MB_SLAVE_COUNT] = {
    "192.168.1.2", // Address corresponds to UID1 and set to predefined value by user
    "192.168.1.3", // corresponds to UID2 in the segment
    NULL // end of table
};
mb_communication_info_t comm_info = {
    .ip_port = MB_TCP_PORT, // Modbus TCP port number (default = 502)
    .ip_addr_type = MB_IPV4, // version of IP protocol
    .ip_mode = MB_MODE_TCP, // Port communication mode
    .ip_addr = (void*)slave_ip_address_table, // assign table of IP addresses
    .ip_netif_ptr = esp_netif_ptr // esp_netif_ptr pointer to the corresponding network interface
};
ESP_ERROR_CHECK(mbc_master_setup((void*)&comm_info));
```

Note: Refer to esp_netif component for more information about network interface initialization.

The slave IP addresses in the table can be assigned automatically using mDNS service as described in the example. Refer to protocols/modbus/tcp/mb_tcp_master for more information.

Note: RS485 communication requires call to UART specific APIs to setup communication mode and pins. Refer to Running UART Communication section of UART documentation.

Master Communication   The starting of the Modbus controller is the final step in enabling communication. This is performed using function below:

```c
mbc_master_start()
```

```c
esp_err_t err = mbc_master_start();
if (err != ESP_OK) {
```
The list of functions below are used by the Modbus master stack from a user’s application:

**mbc_master_send_request()**: This function executes a blocking Modbus request. The master sends a data request (as defined in parameter request structure `mb_param_request_t`) and then blocks until a response from the corresponding slave and returns the status of command execution. This function provides a standard way for read/write access to Modbus devices in the network.

**mbc_master_get_cid_info()**: The function gets information about each characteristic supported in the data dictionary and returns the characteristic’s description in the form of the `mb_parameter_descriptor_t` structure. Each characteristic is accessed using its CID.

**mbc_master_get_parameter()**: The function reads the data of a characteristic defined in the parameters of a Modbus slave device. The additional data for the request is taken from the parameter description table.

Example:

```c
const mb_parameter_descriptor_t* param_descriptor = NULL;
uint8_t temp_data[4] = {0}; // temporary buffer to hold maximum CID size
uint8_t type = 0;
....

// Get the information for characteristic cid from data dictionary
esp_err_t err = mbc_master_get_cid_info(cid, &param_descriptor);
if ((err != ESP_ERR_NOT_FOUND) && (param_descriptor != NULL)) {
    err = mbc_master_get_parameter(param_descriptor->cid, (char*)param_descriptor->param_key, (uint8_t*)temp_data, &type);
    if (err == ESP_OK) {
        ESP_LOGI(TAG, "Characteristic %d %s (%s) value = (0x%08x) read successful.",
                 param_descriptor->cid,
                 (char*)param_descriptor->param_key,
                 (char*)param_descriptor->param_units,
                 (uint32_t)temp_data);
    } else {
        ESP_LOGE(TAG, "Characteristic %d %s (%s) read fail, err = 0x%x (%s).",
                 param_descriptor->cid,
                 (char*)param_descriptor->param_key,
                 (int)err,
                 (char*)esp_err_to_name(err));
    }
} else {
    ESP_LOGE(TAG, "Could not get information for characteristic %d.", cid);
}
```

**mbc_master_set_parameter()**

The function writes a characteristic’s value defined as a name and cid parameter in the corresponded slave device. The additional data for the parameter request is taken from the master parameter description table.

```c
uint8_t type = 0; // Type of parameter
uint8_t temp_data[4] = {0}; // temporary buffer

esp_err_t err = mbc_master_set_parameter(CID_TEMP_DATA_2, "Temperature_2", (uint8_t*)temp_data, &type);
if (err == ESP_OK) {
    ESP_LOGI(TAG, "Set parameter data successfully.");
} else {
    ESP_LOGE(TAG, "Set data fail, err = 0x%x (%s).", (int)err, (char*)esp_err_to_name(err));
}
```
Chapter 2. API Reference

Modbus Master Teardown  This function stops Modbus communication stack and destroys controller interface and free all used active objects.

```c
mbc_master_destroy()
```

```c
ESP_ERROR_CHECK(mbc_master_destroy());
```

Modbus Slave API Overview

The sections below represent typical programming workflow for the slave API which should be called in following order:

1. **Modbus Port Initialization** - Initialization of Modbus controller interface for the selected port.
2. **Configuring Slave Data Access** - Configure data descriptors to access slave parameters.
3. **Slave Communication Options** - Allows to setup communication options for selected port.
4. **Slave Communication** - Start stack and sending / receiving data. Filter events when master accesses the register areas.
5. **Modbus Slave Teardown** - Destroy Modbus controller and its resources.

Configuring Slave Data Access  The following functions must be called when the Modbus controller slave port is already initialized. Refer to **Modbus Port Initialization**.

The slave stack requires the user to define structures (memory storage areas) that store the Modbus parameters accessed by stack. These structures should be prepared by the user and be assigned to the Modbus controller interface using `mbc_slave_set_descriptor()` API call before the start of communication. The slave task can call the `mbc_slave_check_event()` function which will block until the Modbus master access the slave. The slave task can then get information about the data being accessed.

**Note:** One slave can define several area descriptors per each type of Modbus register area with different start_offset.

Register area is defined by using the `mb_register_area_descriptor_t` structure.

**Table 10: Table 3 Modbus register area descriptor**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>start</td>
<td>Zero-based register relative offset for defined register area. Example: register address = 40002 (4x register area - Function 3 - holding register), start_offset = 2</td>
</tr>
<tr>
<td>type</td>
<td>Type of the Modbus register area. Refer to <code>mb_param_type_t</code> for more information.</td>
</tr>
<tr>
<td>address</td>
<td>A pointer to the memory area which is used to store the register data for this area descriptor.</td>
</tr>
<tr>
<td>size</td>
<td>The size of the memory area in bytes which is used to store register data.</td>
</tr>
</tbody>
</table>

```c
mbc_slave_set_descriptor()
```

The function initializes Modbus communication descriptors for each type of Modbus register area (Holding Registers, Input Registers, Coils (single bit output), Discrete Inputs). Once areas are initialized and the `mbc_slave_start()` API is called the Modbus stack can access the data in user data structures by request from master.

```c
#define MB_REG_INPUT_START_AREA0 (0)
#define MB_REG_HOLDING_START_AREA0 (0)
#define MB_REG_HOLD_CNT (100)
#define MB_REG_INPUT_CNT (100)

mb_register_area_descriptor_t reg_area; // Modbus register area descriptor

unit16_t holding_reg_area[MB_REG_HOLD_CNT] = {0}; // storage area for holding

unit16_t input_reg_area[MB_REG_INPUT_CNT] = {0}; // storage area for input
```

(continues on next page)
reg_area.type = MB_PARAM_HOLDING;                  // Set type of register area
reg_area.start_offset = MB_REG_HOLDING_START_AREA0; // Offset of register area in Modbus protocol
reg_area.address = (void*)holding_reg_area[0];    // Set pointer to storage instance
reg_area.size = sizeof(holding_reg_area) << 1;     // Set the size of register storage area in bytes
ESP_ERROR_CHECK(mbc_slave_set_descriptor(reg_area));

reg_area.type = MB_PARAM_INPUT;
reg_area.start_offset = MB_REG_INPUT_START_AREA0;
reg_area.address = (void*)input_reg_area[0];
reg_area.size = sizeof(input_reg_area) << 1;
ESP_ERROR_CHECK(mbc_slave_set_descriptor(reg_area));

At least one area descriptor per each Modbus register type must be set in order to provide register access to its area. If the master tries to access an undefined area, the stack will generate a Modbus exception.

Direct access to register area from user application must be protected by critical section:

  portENTER_CRITICAL(&param_lock);
  holding_reg_area[2] += 10;
  portEXIT_CRITICAL(&param_lock);

### Slave Communication Options

The function initializes the Modbus controller interface and its active context (tasks, RTOS objects and other resources).

`mbc_slave_setup()`

The function is used to setup communication parameters of the Modbus stack.

Example initialization of Modbus TCP communication:

```c
esp_netif_init();
...

mb_communication_info_t comm_info = {
  .ip_port = MB_TCP_PORT, // Modbus TCP port number (default = 502)
  .ip_addr_type = MB_IPV4, // version of IP protocol
  .ip_mode = MB_MODE_TCP, // Port communication mode
  .ip_addr = NULL,        // This field keeps the client IP
  .address_to_bind, NULL - bind to any client
  .ip_netif_ptr = esp_netif_ptr // esp_netif_ptr = pointer to the corresponding network interface
};

// Setup communication parameters and start stack
ESP_ERROR_CHECK(mbc_slave_setup((void*)comm_info));
```

Example initialization of Modbus serial communication:

```c
#define MB_SLAVE_DEV_SPEED 9600
#define MB_SLAVE_ADDR 1
#define MB_SLAVE_PORT_NUM 2
...

// Setup communication parameters and start stack
mb_communication_info_t comm_info = {
```

(continues on next page)
### Slave Communication

The function below is used to start Modbus controller interface and allows communication.

```c
mbc_slave_start();
```

```c
mbc_slave_check_event();
```

The blocking call to function waits for an event specified (represented as an event mask parameter). Once the master accesses the parameter and the event mask matches the parameter type, the application task will be unblocked and function will return the corresponding event `mb_event_group_t` which describes the type of register access being done.

```c
mbc_slave_get_param_info();
```

The function gets information about accessed parameters from the Modbus controller event queue. The KConfig `CONFIG_FMB_CONTROLLER_NOTIFY_QUEUE_SIZE` key can be used to configure the notification queue size. The timeout parameter allows a timeout to be specified when waiting for a notification. The `mb_param_info_t` structure contains information about accessed parameter.

#### Table 11: Table 4 Description of the register info structure:

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>time_stamp</td>
<td>time stamp of the event when defined parameter is accessed</td>
</tr>
<tr>
<td>mb_offset</td>
<td>start Modbus register accessed by master</td>
</tr>
<tr>
<td>type</td>
<td>type of the Modbus register area being accessed (See the <code>mb_event_group_t</code> for more information)</td>
</tr>
<tr>
<td>address</td>
<td>memory address that corresponds to accessed register in defined area descriptor</td>
</tr>
<tr>
<td>size</td>
<td>number of registers being accessed by master</td>
</tr>
</tbody>
</table>

Example to get event when holding or input registers accessed in the slave:

```c
#define MB_READ_MASK (MB_EVENT_INPUT_REG_RD | MB_EVENT_HOLDING_REG_RD)
#define MB_WRITE_MASK (MB_EVENT_HOLDING_REG_WR)
#define MB_READ_WRITE_MASK (MB_READ_MASK | MB_WRITE_MASK)
#define MB_PAR_INFO_GET_TOUT (10 / portTICK_RATE_MS)
```

```c
....

// The function blocks while waiting for register access
mb_event_group_t event = mbc_slave_check_event(MB_READ_WRITE_MASK);

// Get information about data accessed from master
ESP_ERROR_CHECK(mbc_slave_get_param_info(&reg_info, MB_PAR_INFO_GET_TOUT));
const char* rw_str = (event & MB_READ_MASK) ? "READ" : "WRITE";

// Filter events and process them accordingly
if (event & (MB_EVENT_HOLDING_REG_WR | MB_EVENT_HOLDING_REG_RD)) {
  ESP_LOGI(TAG, "HOLDING %s (%u us), ADDR:%u, TYPE:%u, INST_ADDR:0x%.4x, SIZE:%u");
  rw_str,
}```
(continued from previous page)

```c
else_if (event & (MB_EVENT_INPUT_REG_RD)) {
    ESP_LOGI(TAG, "INPUT %s (%u us), ADDR:%u, TYPE:%u, INST_ADDR:0x%.4x, SIZE:%u",
             rw_str,
             (uint32_t)reg_info.time_stamp,
             (uint32_t)reg_info.mb_offset,
             (uint32_t)reg_info.type,
             (uint32_t)reg_info.address,
             (uint32_t)reg_info.size);
}
```

**Modbus Slave Teardown**  This function stops the Modbus communication stack, destroys the controller interface, and frees all used active objects allocated for the slave.

```c
mbc_slave_destroy()
```

ESP_ERROR_CHECK(mbc_slave_destroy());

**Possible Communication Issues And Solutions**

If the examples do not work as expected and slave and master boards are not able to communicate correctly, it is possible to find the reason for errors. The most important errors are described in master example output and formatted as below:

```
E (1692332) MB_CONTROLLER_MASTER: mbc_master_get_parameter(111): SERIAL master get--parameter failure error=(0x107) (ESP_ERR_TIMEOUT).
```
Table 12: Table 5 Modbus error codes and troubleshooting

<table>
<thead>
<tr>
<th>Error</th>
<th>Description</th>
<th>Possible solution</th>
</tr>
</thead>
<tbody>
<tr>
<td>0x10</td>
<td>ESP_ERR_NOT_SUPPORTED - Invalid register request - slave returned an exception because the requested register is not supported.</td>
<td>Refer to slave register map. Check the master data dictionary for correctness.</td>
</tr>
<tr>
<td>0x10</td>
<td>ESP_ERR_TIMEOUT - Slave response timeout - Modbus slave did not send response during configured slave response timeout.</td>
<td>Measure and increase the maximum slave response timeout idf.py menu-config, option CONFIG_FMB_MASTER_TIMEOUT_MS_RESPOND. Check physical connection or network configuration and make sure that the slave response can reach the master side. If the application has some high performance tasks with higher priority than CONFIG_FMB_PORT_TASK_Prio it is recommended to place Modbus tasks on the other core using an option CONFIG_FMB_PORT_TASK_AFFINITY. Configure the Modbus task’s priority CONFIG_FMB_PORT_TASK_Prio to ensure that the task gets sufficient processing time to handle Modbus stack events.</td>
</tr>
<tr>
<td>0x10</td>
<td>ESP_ERR_INVALID_RESPONSE - Received unsupported response from slave or frame check failure. Master can not execute command handler because the command is either not supported or is incorrect.</td>
<td>Check the physical connection then refer to register map of your slave to configure the master data dictionary properly.</td>
</tr>
<tr>
<td>0x10</td>
<td>ESP_ERR_INVALID_STATE - Critical failure or FSM sequence failure or master FSM is busy processing previous request.</td>
<td>Make sure your physical connection is working properly. Increase task stack size and check Modbus initialization sequence.</td>
</tr>
</tbody>
</table>

Application Example

The examples below use the FreeModbus library port for serial TCP slave and master implementations accordingly. The selection of stack is performed through KConfig menu option “Enable Modbus stack support …” for appropriate communication mode and related configuration keys.

- protocols/modbus/serial/mb_slave
- protocols/modbus/serial/mb_master
- protocols/modbus/tcp/mb_tcp_slave
- protocols/modbus/tcp/mb_tcp_master

Please refer to the specific example README.md for details.

interface method destroy

typedef esp_err_t (*iface_setup)(void *)
interface method setup

typedef esp_err_t (*iface_start)(void)
interface method start

Enumerations

enum mb_port_type_t
Types of actual Modbus implementation.

Values:

MB_PORT_SERIAL_MASTER = 0x00
Modbus port type serial master.

MB_PORT_SERIAL_SLAVE
Modbus port type serial slave.

MB_PORT_TCP_MASTER
Modbus port type TCP master.

MB_PORT_TCP_SLAVE
Modbus port type TCP slave.

MB_PORT_COUNT
Modbus port count.

MB_PORT_INACTIVE = 0xFF

enum mb_event_group_t
Event group for parameters notification.

Values:

MB_EVENT_NO_EVENTS = 0x00

MB_EVENT_HOLDING_REG_WR = BIT0
Modbus Event Write Holding registers.

MB_EVENT_HOLDING_REG_RD = BIT1
Modbus Event Read Holding registers.

MB_EVENT_INPUT_REG_RD = BIT3
Modbus Event Read Input registers.

MB_EVENT_COILS_WR = BIT4
Modbus Event Write Coils.

MB_EVENT_COILS_RD = BIT5
Modbus Event Read Coils.

MB_EVENT_DISCRETE_RD = BIT6
Modbus Event Read Discrete bits.

MB_EVENT_STACK_STARTED = BIT7
Modbus Event Stack started

enum mb_param_type_t
Type of Modbus parameter.

Values:
MB_PARAM_HOLDING = 0x00
    Modbus Holding register.

MB_PARAM_INPUT
    Modbus Input register.

MB_PARAM_COIL
    Modbus Coils.

MB_PARAM_DISCRETE
    Modbus Discrete bits.

MB_PARAM_COUNT
MB_PARAM_UNKNOWN = 0xFF

enum mb_mode_type_t
    Modbus serial transmission modes (RTU/ASCII).
    Values:

    MB_MODE_RTU
        RTU transmission mode.

    MB_MODE_ASCII
        ASCII transmission mode.

    MB_MODE_TCP
        TCP communication mode.

    MB_MODE_UDP
        UDP communication mode.

enum mb_tcp_addr_type_t
    Modbus TCP type of address.
    Values:

    MB_IPV4 = 0
        TCP IPV4 addressing

    MB_IPV6 = 1
        TCP IPV6 addressing

Header File
    • components/freemodbus/common/include/esp_modbus_master.h

Functions

esp_err_t mbc_master_init_tcp(void **handler)
    Initialize Modbus controller and stack for TCP port.

Return
    • ESP_OK Success
    • ESP_ERR_NO_MEM Parameter error
    • ESP_ERR_NOT_SUPPORTED Port type not supported
    • ESP_ERR_INVALID_STATE Initialization failure

Parameters
    • [out] handler: handler(pointer) to master data structure

esp_err_t mbc_master_init(mb_port_type_t port_type, void **handler)
    Initialize Modbus Master controller and stack for Serial port.

Return
    • ESP_OK Success
    • ESP_ERR_NO_MEM Parameter error
    • ESP_ERR_NOT_SUPPORTED Port type not supported
Chapter 2. API Reference

• ESP_ERR_INVALID_STATE Initialization failure

Parameters
• [out] handler: handler(pointer) to master data structure
• [in] port_type: type of stack

doctor mbc_master_init_iface (void *handler)
  
Initialize Modbus Master controller interface handle.

Parameters
• [in] handler: - pointer to master data structure

esp_err_t mbc_master_destroy (void)
  
Destroy Modbus controller and stack.

Return
• ESP_OK Success
• ESP_ERR_INVALID_STATE Parameter error

esp_err_t mbc_master_start (void)
  
Start Modbus communication stack.

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG Modbus stack start error

esp_err_t mbc_master_setup (void *comm_info)
  
Set Modbus communication parameters for the controller.

Return
• ESP_OK Success
• ESP_ERR_INVALID_ARG Incorrect parameter data

Parameters
• comm_info: Communication parameters structure.

esp_err_t mbc_master_set_descriptor (const mb_parameter_descriptor_t *descriptor, const uint16_t num_elements)
  
Assign parameter description table for Modbus controller interface.

Return
• esp_err_t ESP_OK - set descriptor successfully
• esp_err_t ESP_ERR_INVALID_ARG - invalid argument in function call

Parameters
• [in] descriptor: pointer to parameter description table
• num_elements: number of elements in the table

esp_err_t mbc_master_send_request (mb_param_request_t *request, void *data_ptr)
  
Send data request as defined in parameter request, waits response from slave and returns status of command execution. This function provides standard way for read/write access to Modbus devices in the network.

Return
• esp_err_t ESP_OK - request was successful
• esp_err_t ESP_ERR_INVALID_ARG - invalid argument of function
• esp_err_t ESP_ERR_INVALID_RESPONSE - an invalid response from slave
• esp_err_t ESP_ERR_TIMEOUT - operation timeout or no response from slave
• esp_err_t ESP_ERR_NOT_SUPPORTED - the request command is not supported by slave
• esp_err_t ESP_FAIL - slave returned an exception or other failure

Parameters
• [in] request: pointer to request structure of type mb_param_request_t
• [in] data_ptr: pointer to data buffer to send or received data (dependent of command field in request)

esp_err_t mbc_master_get_cid_info (uint16_t cid, const mb_parameter_descriptor_t **param_info)
  
Get information about supported characteristic defined as cid. Uses parameter description table to get this
information. The function will check if characteristic defined as a cid parameter is supported and returns its description in param_info. Returns ESP_ERR_NOT_FOUND if characteristic is not supported.

Return

- esp_err_t ESP_OK - request was successful and buffer contains the supported characteristic name
- esp_err_t ESP_ERR_INVALID_ARG - invalid argument of function
- esp_err_t ESP_ERR_NOT_FOUND - the characteristic (cid) not found
- esp_err_t ESP_FAIL - unknown error during lookup table processing

Parameters

- [in] cid: characteristic id
- [in] param_info: pointer to pointer of characteristic data.

esp_err_t mbc_master_get_parameter (uint16_t cid, char *name, uint8_t *value, uint8_t *type)

Read parameter from modbus slave device whose name is defined by name and has cid. The additional data for request is taken from parameter description (lookup) table.

Return

- esp_err_t ESP_OK - request was successful and value buffer contains representation of actual parameter data from slave
- esp_err_t ESP_ERR_INVALID_ARG - invalid argument of function or parameter descriptor
- esp_err_t ESP_ERR_INVALID_RESPONSE - an invalid response from slave
- esp_err_t ESP_ERR_INVALID_STATE - invalid state during data processing or allocation failure
- esp_err_t ESP_ERR_TIMEOUT - operation timed out and no response from slave
- esp_err_t ESP_ERR_NOT_SUPPORTED - the request command is not supported by slave
- esp_err_t ESP_ERR_NOT_FOUND - the parameter is not found in the parameter description table
- esp_err_t ESP_FAIL - slave returned an exception or other failure

Parameters

- [in] cid: id of the characteristic for parameter
- [in] name: pointer into string name (key) of parameter (null terminated)
- [out] value: pointer to data buffer of parameter
- [out] type: parameter type associated with the name returned from parameter description table.

esp_err_t mbc_master_set_parameter (uint16_t cid, char *name, uint8_t *value, uint8_t *type)

Set characteristic’s value defined as a name and cid parameter. The additional data for cid parameter request is taken from master parameter lookup table.

Return

- esp_err_t ESP_OK - request was successful and value was saved in the slave device registers
- esp_err_t ESP_ERR_INVALID_ARG - invalid argument of function or parameter descriptor
- esp_err_t ESP_ERR_INVALID_RESPONSE - an invalid response from slave during processing of parameter
- esp_err_t ESP_ERR_INVALID_STATE - invalid state during data processing or allocation failure
- esp_err_t ESP_ERR_TIMEOUT - operation timed out and no response from slave
- esp_err_t ESP_ERR_NOT_SUPPORTED - the request command is not supported by slave
- esp_err_t ESP_FAIL - slave returned an exception or other failure

Parameters

- [in] cid: id of the characteristic for parameter
- [in] name: pointer into string name (key) of parameter (null terminated)
- [out] value: pointer to data buffer of parameter (actual representation of json value field in binary form)
- [out] type: pointer to parameter type associated with the name returned from parameter lookup table.

Unions

union mb_parameter_opt_t

#include <esp_modbus_master.h> Modbus parameter options for description table.
Public Members

int opt1
   Parameter option1
int opt2
   Parameter option2
int opt3
   Parameter option3

struct mb_parameter_opt_t::[anonymous] [anonymous]
int min
   Parameter minimum value
int max
   Parameter maximum value
int step
   Step of parameter change tracking

struct mb_parameter_opt_t::[anonymous] [anonymous]

Structures

struct mb_parameter_descriptor_t
   Characteristics descriptor type is used to describe characteristic and link it with Modbus parameters that reflect its data.

Public Members

uint16_t cid
   Characteristic cid
const char *param_key
   The key (name) of the parameter
const char *param_units
   The physical units of the parameter
uint8_t mb_slave_addr
   Slave address of device in the Modbus segment
mb_param_type_t mb_param_type
   Type of modbus parameter
uint16_t mb_reg_start
   This is the Modbus register address. This is the 0 based value.
uint16_t mb_size
   Size of mb parameter in registers
uint16_t param_offset
   Parameter name (OFFSET in the parameter structure)
mb_descr_type_t param_type
   Float, U8, U16, U32, ASCII, etc.
mb_descr_size_t param_size
   Number of bytes in the parameter.
mb_parameter_opt_t param_opts
   Parameter options used to check limits and etc.
mb_param_perms_t access
   Access permissions based on mode
struct mb_param_request_t
Modbus register request type structure.

Public Members

 unint8_t slave_addr
  Modbus slave address
 unint8_t command
  Modbus command to send
 unint16_t reg_start
  Modbus start register
 unint16_t reg_size
  Modbus number of registers

Enumerations

 enum mb_descr_type_t
  Modbus descriptor table parameter type defines.

  Values:

  PARAM_TYPE_U8   = 0x00
      Unsigned 8
  PARAM_TYPE_U16  = 0x01
      Unsigned 16
  PARAM_TYPE_U32  = 0x02
      Unsigned 32
  PARAM_TYPE_FLOAT = 0x03
      Float type
  PARAM_TYPE_ASCII = 0x04
      ASCII type

 enum mb_descr_size_t
  Modbus descriptor table parameter size in bytes.

  Values:

  PARAM_SIZE_U8   = 0x01
      Unsigned 8
  PARAM_SIZE_U16  = 0x02
      Unsigned 16
  PARAM_SIZE_U32  = 0x04
      Unsigned 32
  PARAM_SIZE_FLOAT = 0x04
      Float size
  PARAM_SIZE_ASCII = 0x08
      ASCII size
  PARAM_SIZE_ASCII24 = 0x18
      ASCII24 size
  PARAM_MAX_SIZE

 enum mb_param_perms_t
  Permissions for the characteristics.

  Values:
Chapter 2. API Reference

PAR_PERMS_READ = 1 << BIT0
the characteristic of the device are readable

PAR_PERMS_WRITE = 1 << BIT1
the characteristic of the device are writable

PAR_PERMS_TRIGGER = 1 << BIT2
the characteristic of the device are triggerable

PAR_PERMS_READ_WRITE = PAR_PERMS_READ | PAR_PERMS_WRITE
the characteristic of the device are readable & writable

PAR_PERMS_READ_TRIGGER = PAR_PERMS_READ | PAR_PERMS_TRIGGER
the characteristic of the device are readable & triggerable

PAR_PERMS_WRITE_TRIGGER = PAR_PERMS_WRITE | PAR_PERMS_TRIGGER
the characteristic of the device are writable & triggerable

PAR_PERMS_READ_WRITE_TRIGGER = PAR_PERMS_READ_WRITE | PAR_PERMS_TRIGGER
the characteristic of the device are readable & writable & triggerable

Header File
• components/freemodbus/common/include/esp_modbus_slave.h

Functions

esp_err_t mbc_slave_init_tcp (void **handler)
Initialize Modbus Slave controller and stack for TCP port.

Return
• ESP_OK Success
• ESP_ERR_NO_MEM Parameter error
• ESP_ERR_NOT_SUPPORTED Port type not supported
• ESP_ERR_INVALID_STATE Initialization failure

Parameters
• [out] handler: handler(pointer) to master data structure

esp_err_t mbc_slave_init (mb_port_type_t port_type, void **handler)
Initialize Modbus Slave controller and stack for Serial port.

Return
• ESP_OK Success
• ESP_ERR_NO_MEM Parameter error
• ESP_ERR_NOT_SUPPORTED Port type not supported
• ESP_ERR_INVALID_STATE Initialization failure

Parameters
• [out] handler: handler(pointer) to master data structure
• [in] port_type: the type of port

global mbc_slave_init_iface (void *handler)
Initialize Modbus Slave controller interface handle.

Parameters
• [in] handler: - pointer to slave interface data structure

esp_err_t mbc_slave_destroy (void)
Destroy Modbus controller and stack.

Return
• ESP_OK Success
• ESP_ERR_INVALID_STATE Parameter error

esp_err_t mbc_slave_start (void)
Start Modbus communication stack.
Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG Modbus stack start error

```c
esp_err_t mbc_slave_setup(void *comm_info)
```
Set Modbus communication parameters for the controller.

Return

- ESP_OK Success
- ESP_ERR_INVALID_ARG Incorrect parameter data

Parameters

- `comm_info`: Communication parameters structure.

```c
mb_event_group_t mbc_slave_check_event(mb_event_group_t group)
```
Wait for specific event on parameter change.

Return

- `mb_event_group_t` event bits triggered

Parameters

- `group`: Group event bit mask to wait for change

```c
esp_err_t mbc_slave_get_param_info(mb_param_info_t *reg_info, uint32_t timeout)
```
Get parameter information.

Return

- ESP_OK Success
- ESP_ERR_TIMEOUT Cannot get data from parameter queue or queue overflow

Parameters

- `*reg_info`: Parameter info structure
- `timeout`: Timeout in milliseconds to read information from parameter queue

```c
esp_err_t mbc_slave_set_descriptor(mb_register_area_descriptor_t descr_data)
```
Set Modbus area descriptor.

Return

- ESP_OK: The appropriate descriptor is set
- ESP_ERR_INVALID_ARG: The argument is incorrect

Parameters

- `descr_data`: Modbus registers area descriptor structure

Structures

```c
struct mb_param_info_t
```
Parameter access event information type.

Public Members

- `uint32_t time_stamp`
  Timestamp of Modbus Event (uS)
- `uint16_t mb_offset`
  Modbus register offset
- `mb_event_group_t type`
  Modbus event type
- `uint8_t *address`
  Modbus data storage address
- `size_t size`
  Modbus event register size (number of registers)

```c
struct mb_register_area_descriptor_t
```
Parameter storage area descriptor.
Public Members

`uint16_t start_offset`
Modbus start address for area descriptor

`mb_param_type_t type`
Type of storage area descriptor

`void* address`
Instance address for storage area descriptor

`size_t size`
Instance size for area descriptor (bytes)

2.4.12 ESP WebSocket Client

Overview

The ESP WebSocket client is an implementation of WebSocket protocol client for ESP32-S3

Features

- Supports WebSocket over TCP, TLS with mbedtls
- Easy to setup with URI
- Multiple instances (Multiple clients in one application)

Configuration

URI

- Supports `ws`, `wss` schemes
- WebSocket samples:
  - `ws://echo.websocket.org`: WebSocket over TCP, default port 80
  - `wss://echo.websocket.org`: WebSocket over SSL, default port 443

Minimal configurations:

```c
const esp_websocket_client_config_t ws_cfg = {
    .uri = "ws://echo.websocket.org",
};
```

The WebSocket client supports the use of both path and query in the URI. Sample:

```c
const esp_websocket_client_config_t ws_cfg = {
    .uri = "ws://echo.websocket.org/connectionhandler?id=104",
};
```

If there are any options related to the URI in `esp_websocket_client_config_t`, the option defined by the URI will be overridden. Sample:

```c
const esp_websocket_client_config_t ws_cfg = {
    .uri = "ws://echo.websocket.org:123",
    .port = 4567,
};
//WebSocket client will connect to websocket.org using port 4567
```
Chapter 2. API Reference

TLS Configuration:

```c
const esp_websocket_client_config_t ws_cfg = {
    .uri = "wss://echo.websocket.org",
    .cert_pem = (const char *)websocket_org_pem_start,
};
```

**Note:** If you want to verify the server, then you need to provide a certificate in PEM format, and provide to `cert_pem` in `websocket_client_config_t`. If no certificate is provided then the TLS connection will default to not requiring verification.

PEM certificate for this example could be extracted from an openssl `s_client` command connecting to websocket.org. In case a host operating system has `openssl` and `sed` packages installed, one could execute the following command to download and save the root or intermediate root certificate to a file (Note for Windows users: Both Linux like environment or Windows native packages may be used):

```
`echo "" | openssl s_client -showcerts -connect websocket.org:443 | sed -n "1,/Root/d; /BEGIN/,/END/p" | openssl x509 -outform PEM >websocket_org.pem`
```

This command will extract the second certificate in the chain and save it as a pem-file.

**Subprotocol**  The subprotocol field in the config struct can be used to request a subprotocol

```c
const esp_websocket_client_config_t ws_cfg = {
    .uri = "ws://websocket.org",
    .subprotocol = "soap",
};
```

**Note:** The client is indifferent to the subprotocol field in the server response and will accept the connection no matter what the server replies.

For more options on `esp_websocket_client_config_t`, please refer to API reference below

**Events**

- **WEBSOCKET_EVENT_CONNECTED**: The client has successfully established a connection to the server. The client is now ready to send and receive data. Contains no event data.
- **WEBSOCKET_EVENT_DISCONNECTED**: The client has aborted the connection due to the transport layer failing to read data, e.g. because the server is unavailable. Contains no event data.
- **WEBSOCKET_EVENT_DATA**: The client has successfully received and parsed a WebSocket frame. The event data contains a pointer to the payload data, the length of the payload data as well as the opcode of the received frame. A message may be fragmented into multiple events if the length exceeds the buffer size. This event will also be posted for non-payload frames, e.g. pong or connection close frames.
- **WEBSOCKET_EVENT_ERROR**: Not used in the current implementation of the client.

If the client handle is needed in the event handler it can be accessed through the pointer passed to the event handler:

```
esp_websocket_client_handle_t client = (esp_websocket_client_handle_t)handler_args;
```

**Limitations and Known Issues**

- The client is able to request the use of a subprotocol from the server during the handshake, but does not do any subprotocol related checks on the response from the server.
Chapter 2. API Reference

Application Example

A simple WebSocket example that uses esp_websocket_client to establish a websocket connection and send/receive data with the websocket.org server can be found here: protocols/websocket.

Sending Text Data

The WebSocket client supports sending data as a text data frame, which informs the application layer that the payload data is text data encoded as UTF-8. Example:

```
esp_websocket_client_send_text(client, data, len, portMAX_DELAY);
```

API Reference

Header File

- components/esp_websocket_client/include/esp_websocket_client.h

Functions

```
esp_websocket_client_handle_t esp_websocket_client_init(const esp_websocket_client_config_t *config)
```

Start a Websocket session. This function must be the first function to call, and it returns a esp_websocket_client_handle_t that you must use as input to other functions in the interface. This call MUST have a corresponding call to esp_websocket_client_destroy when the operation is complete.

Return

- esp_websocket_client_handle_t
- NULL if any errors

Parameters

- [in] config: The configuration

```
esp_err_t esp_websocket_client_set_uri(esp_websocket_client_handle_t client, const char *uri)
```

Set URL for client, when performing this behavior, the options in the URL will replace the old ones. Must stop the WebSocket client before set URI if the client has been connected.

Return

esp_err_t

Parameters

- [in] client: The client
- [in] uri: The uri

```
esp_err_t esp_websocket_client_start(esp_websocket_client_handle_t client)
```

Open the WebSocket connection.

Return

esp_err_t

Parameters

- [in] client: The client

```
esp_err_t esp_websocket_client_stop(esp_websocket_client_handle_t client)
```

Stop the WebSocket connection without websocket closing handshake. This API stops ws client and closes TCP connection directly without sending close frames. It is a good practice to close the connection in a clean way using esp_websocket_client_close().

Notes:

- Cannot be called from the websocket event handler

Return

esp_err_t

Parameters

- [in] client: The client

```
esp_err_t esp_websocket_client_destroy(esp_websocket_client_handle_t client)
```

Destroy the WebSocket connection and free all resources. This function must be the last function to call for an
session. It is the opposite of the esp_websocket_client_init function and must be called with the same handle
as input that a esp_websocket_client_init call returned. This might close all connections this handle has used.

Notes:
• Cannot be called from the websocket event handler

Return esp_err_t
Parameters
• [in] client: The client

int esp_websocket_client_send_bin (esp_websocket_client_handle_t client, const char *data, int len, TickType_t timeout)
Write binary data to the WebSocket connection (data send with WS OPCODE=02, i.e. binary)

Return
• Number of data was sent
• (-1) if any errors
Parameters
• [in] client: The client
• [in] data: The data
• [in] len: The length
• [in] timeout: Write data timeout in RTOS ticks

int esp_websocket_client_send_text (esp_websocket_client_handle_t client, const char *data, int len, TickType_t timeout)
Write textual data to the WebSocket connection (data send with WS OPCODE=01, i.e. text)

Return
• Number of data was sent
• (-1) if any errors
Parameters
• [in] client: The client
• [in] data: The data
• [in] len: The length
• [in] timeout: Write data timeout in RTOS ticks

esp_err_t esp_websocket_client_close (esp_websocket_client_handle_t client, TickType_t timeout)
Close the WebSocket connection in a clean way.

Sequence of clean close initiated by client:
• Client sends CLOSE frame
• Client waits until server echos the CLOSE frame
• Client waits until server closes the connection
• Client is stopped the same way as by the esp_websocket_client_stop()
Notes:
– Cannot be called from the websocket event handler

Return esp_err_t
Parameters
• [in] client: The client
• [in] timeout: Timeout in RTOS ticks for waiting

esp_err_t esp_websocket_client_close_with_code (esp_websocket_client_handle_t client, int code, const char *data, int len, TickType_t timeout)
Close the WebSocket connection in a clean way with custom code/data Closing sequence is the same as for
esp_websocket_client_close()

Notes:
• Cannot be called from the websocket event handler

Return esp_err_t
Parameters
  • [in] client: The client
  • [in] code: Close status code as defined in RFC6455 section-7.4
  • [in] data: Additional data to closing message
  • [in] len: The length of the additional data
  • [in] timeout: Timeout in RTOS ticks for waiting

bool esp_websocket_client_is_connected(esp_websocket_client_handle_t client)
Check the WebSocket client connection state.

Return
  • true
  • false

Parameters
  • [in] client: The client handle

esp_err_t esp_websocket_register_events(esp_websocket_client_handle_t client,
                                         esp_websocket_event_id_t event,
                                         esp_event_handler_t event_handler,
                                         void *event_handler_arg)
Register the Websocket Events.

Return esp_err_t
Parameters
  • client: The client handle
  • event: The event id
  • event_handler: The callback function
  • event_handler_arg: User context

Structures
struct esp_websocket_event_data_t
Websocket event data.

Public Members

const char *data_ptr
  Data pointer

int data_len
  Data length

uint8_t op_code
  Received opcode

esp_websocket_client_handle_t client
  esp_websocket_client_handle_t context

void *user_context
  user_data context, from esp_websocket_client_config_t user_data

int payload_len
  Total payload length, payloads exceeding buffer will be posted through multiple events

int payload_offset
  Actual offset for the data associated with this event

struct esp_websocket_client_config_t
Websocket client setup configuration.

Public Members

const char *uri
  Websocket URI, the information on the URI can be overrides the other fields below, if any
const char *host
    Domain or IP as string

int port
    Port to connect, default depend on esp_websocket_transport_t (80 or 443)

const char *username
    Using for Http authentication - Not supported for now

const char *password
    Using for Http authentication - Not supported for now

const char *path
    HTTP Path, if not set, default is /

bool disable_auto_reconnect
    Disable the automatic reconnect function when disconnected

void *user_context
    HTTP user data context

int task_prio
    Websocket task priority

int task_stack
    Websocket task stack

int buffer_size
    Websocket buffer size

const char *cert_pem
    Pointer to certificate data in PEM or DER format for server verify (with SSL), default is NULL, not required to verify the server. PEM-format must have a terminating NULL-character. DER-format requires the length to be passed in cert_len.

size_t cert_len
    Length of the buffer pointed to by cert_pem. May be 0 for null-terminated pem

const char *client_cert
    Pointer to certificate data in PEM or DER format for SSL mutual authentication, default is NULL, not required if mutual authentication is not needed. If it is not NULL, also client_key has to be provided. PEM-format must have a terminating NULL-character. DER-format requires the length to be passed in client_cert_len.

size_t client_cert_len
    Length of the buffer pointed to by client_cert. May be 0 for null-terminated pem

const char *client_key
    Pointer to private key data in PEM or DER format for SSL mutual authentication, default is NULL, not required if mutual authentication is not needed. If it is not NULL, also client_cert has to be provided. PEM-format must have a terminating NULL-character. DER-format requires the length to be passed in client_key_len

size_t client_key_len
    Length of the buffer pointed to by client_key_pem. May be 0 for null-terminated pem

esp_websocket_transport_t *transport
    Websocket transport type, see `esp_websocket_transport_t

const char *subprotocol
    Websocket subprotocol

const char *user_agent
    Websocket user-agent

const char *headers
    Websocket additional headers
### Type Definitions

```c
typedef struct esp_websocket_client *esp_websocket_client_handle_t
```

### Enumerations

#### Websocket Event ID Types

```c
eenum esp_websocket_event_id_t
```

*Websocket Client events id.*

*Values:*

- `WEBSOCKET_EVENT_ANY` = -1
- `WEBSOCKET_EVENT_ERROR` = 0
  
  This event occurs when there are any errors during execution

- `WEBSOCKET_EVENT_CONNECTED`  
  
  Once the Websocket has been connected to the server, no data exchange has been performed

- `WEBSOCKET_EVENT_DISCONNECTED`  
  
  The connection has been disconnected

- `WEBSOCKET_EVENT_DATA`  
  
  When receiving data from the server, possibly multiple portions of the packet

- `WEBSOCKET_EVENT_CLOSED`  
  
  The connection has been closed cleanly

*Values:*

- `WEBSOCKET_TRANSPORT_UNKNOWN ` = 0x0  
  
  Transport unknown

- `WEBSOCKET_TRANSPORT_OVER_TCP`  
  
  Transport over tcp
Chapter 2. API Reference

WEBSOCKET_TRANSPORT_OVER_SSL
Transport over ssl

2.4.13 ESP Serial Slave Link

Overview

Espressif provides several chips that can work as slaves. These slave devices rely on some common buses, and have their own communication protocols over those buses. The \texttt{esp\_serial\_slave\_link} component is designed for the master to communicate with ESP slave devices through those protocols over the bus drivers.

After an \texttt{esp\_serial\_slave\_link} device is initialized properly, the application can use it to communicate with the ESP slave devices conveniently.

Espressif Device protocols

For more details about Espressif device protocols, see the following documents.

ESP SPI Slave HD (Half Duplex) Mode Protocol

Introduction In the half duplex mode, the master has to use the protocol defined by the slave to communicate with the slave. Each transaction may consist of the following phases (list by the order they should exist):

- **Command:** 8-bit, master to slave
  
  This phase determines the rest phases of the transactions. See \textit{Supported Commands}.

- **Address:** 8-bit, master to slave, optional
  
  For some commands (WRBUF, RDBUF), this phase specifies the address of the shared buffer to write to/read from. For other commands with this phase, they are meaningless but still have to exist in the transaction.

- **Dummy:** 8-bit, floating, optional
  
  This phase is the turnaround time between the master and the slave on the bus, and also provides enough time for the slave to prepare the data to send to the master.

- **Data:** variable length, the direction is also determined by the command.
  
  This may be a data OUT phase, in which the direction is slave to master, or a data IN phase, in which the direction is master to slave.

The \textit{direction} means which side (master or slave) controls the MOSI, MISO, WP, and HD pins.

Data IO Modes In some IO modes, more data wires can be used to send the data. As a result, the SPI clock cycles required for the same amount of data will be less than in the 1-bit mode. For example, in QIO mode, address and data (IN and OUT) should be sent on all 4 data wires (MOSI, MISO, WP, and HD). Here are the modes supported by the ESP32-S2 SPI slave and the wire number used in corresponding modes.
Chapter 2. API Reference

<table>
<thead>

<td>4</td>
<td>4</td>
<td>4</td>
</tr>
</tbody>
</table>

Normally, which mode is used is determined by the command sent by the master (See Supported Commands), except the QPI mode.

**QPI Mode** The QPI mode is a special state of the SPI Slave. The master can send the ENQPI command to put the slave into the QPI mode state. In the QPI mode, the command is also sent in 4-bit, thus it’s not compatible with the normal modes. The master should only send QPI commands when the slave is in QPI mode. To exit from the QPI mode, master can send the EXQPI command.

**Supported Commands**

*Note:* The command name is in a master-oriented direction. For example, WRBUF means master writes the buffer of slave.

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>

<td>•</td>
<td>•</td>
</tr>
<tr>
<td>EXQPI</td>
<td>Exit QPI mode</td>
<td>0xDD</td>
<td>•</td>
<td>•</td>
</tr>
</tbody>
</table>

Moreover, WRBUF, RDBUF, WRDMA, RDDMA commands have their 2-bit and 4-bit version. To do transactions in 2-bit or 4-bit mode, send the original command ORed by the corresponding command mask below. For example, command 0xA1 means WRBUF in QIO mode.
Segment Transaction Mode  Segment transaction mode is the only mode supported by the SPI Slave HD driver for now. In this mode, for a transaction the slave load onto the DMA, the master is allowed to read or write in segments. This way the master doesn’t have to prepare a large buffer as the size of data provided by the slave. After the master finishes reading/writing a buffer, it has to send the corresponding termination command to the slave as a synchronization signal. The slave driver will update new data (if exist) onto the DMA upon seeing the termination command.

The termination command is WR_DONE (0x07) for the WRDMA and CMD8 (0x08) for the RDDMA.

Here’s an example for the flow the master read data from the slave DMA:

1. The slave loads 4092 bytes of data onto the RDDMA
2. The master do seven RDDMA transactions, each of them is 512 bytes long, and reads the first 3584 bytes from the slave
3. The master do the last RDDMA transaction of 512 bytes (equal, longer, or shorter than the total length loaded by the slave are all allowed). The first 508 bytes are valid data from the slave, while the last 4 bytes are meaningless bytes.
4. The master sends CMD8 to the slave
5. The slave loads another 4092 bytes of data onto the RDDMA
6. The master can start new reading transactions after it sends the CMD8

Terminology

- ESSL: Abbreviation for ESP Serial Slave Link, the component described by this document.
- Master: The device running the esp_serial_slave_link component.
- ESSL device: a virtual device on the master associated with an ESP slave device. The device context has the knowledge of the slave protocol above the bus, relying on some bus drivers to communicates with the slave.
- ESSL device handle: a handle to ESSL device context containing the configuration, status and data required by the ESSL component. The context stores the driver configurations, communication state, data shared by master and slave, etc.
  The context should be initialized before it is used, and get deinitialized if not used any more. The master application operates on the ESSL device through this handle.
- ESP slave: the slave device connected to the bus, which ESSL component is designed to communicate with.
- Bus: The bus over which the master and the slave communicate with each other.
- Slave protocol: The special communication protocol specified by Espressif HW/SW over the bus.
- TX buffer num: a counter, which is on the slave and can be read by the master, indicates the accumulated buffer numbers that the slave has loaded to the hardware to receive data from the master.
- RX data size: a counter, which is on the slave and can be read by the master, indicates the accumulated data size that the slave has loaded to the hardware to send to the master.

Services provided by ESP slave

There are some common services provided by the Espressif slaves:

1. Tohost Interrupts: The slave can inform the master about certain events by the interrupt line. (optional)
2. From host Interrupts: The master can inform the slave about certain events.
3. Tx FIFO (master to slave): the slave can send data in stream to the master. The SDIO slave can also indicate it has new data to send to master by the interrupt line.
Chapter 2. API Reference

The slave updates the TX buffer num to inform the master how much data it can receive, and the master then read the TX buffer num, and take off the used buffer number to know how many buffers are remaining.

4. Rx FIFO (slave to master): the slave can receive data from the master in units of receiving buffers.

The slave updates the RX data size to inform the master how much data it has prepared to send, and then the master read the data size, and take off the data length it has already received to know how many data is remaining.

5. Shared registers: the master can read some part of the registers on the slave, and also write these registers to let the slave read.

The services provided by the slave depends on the slave’s model. See *SPI Slave Capabilities of Espressif chips* for more details.

Initialization of ESP Serial Slave Link

**ESP SDIO Slave**  The ESP SDIO slave link (ESL SDIO) devices relies on the sdmmc component. It includes the usage of communicating with ESP SDIO Slave device via SDSPI feature. The ESSL device should be initialized as below:

1. Initialize a sdmmc card (see ;doc:`Document of SDMMC driver </api-reference/storage/sdmmc>` ) structure.
2. Call *sdmmc_card_init()* to initialize the card.
3. Initialize the ESSL device with *essl_sdio_config_t*. The card member should be the *sdmmc_card_t* got in step 2, and the *recv_buffer_size* member should be filled correctly according to pre-negotiated value.
4. Call *essl_init()* to do initialization of the SDIO part.
5. Call *essl_wait_for_ready()* to wait for the slave to be ready.

**ESP SPI Slave**

*Note*: If you are communicating with the ESP SDIO Slave device through SPI interface, you should use the *SDIO interface* instead.

Hasn’t been supported yet.

**APIs**

After the initialization process above is performed, you can call the APIs below to make use of the services provided by the slave:

**Tohost Interrupts (optional)**

1. Call *essl_get_intr_ena()* to know which events will trigger the interrupts to the master.
2. Call *essl_set_intr_ena()* to set the events that will trigger interrupts to the master.
3. Call *essl_wait_int()* to wait until interrupt from the slave, or timeout.
4. When interrupt is triggered, call *essl_get_intr()* to know which events are active, and call *essl_clear_intr()* to clear them.

**Frhost Interrupts**

1. Call *essl_send_slave_intr()* to trigger general purpose interrupt of the slave.

**TX FIFO**

1. Call *essl_get_tx_buffer_num()* to know how many buffers the slave has prepared to receive data from the master. This is optional. The master will poll tx_buffer_num when it try to send packets to the slave, until the slave has enough buffer or timeout.
2. Call *essl_send_paket()* to send data to the slave.
RX FIFO

1. Call `essl_get_rx_data_size()` to know how many data the slave has prepared to send to the master. This is optional. When the master tries to receive data from the slave, it will update the `rx_data_size` for once, if the current `rx_data_size` is shorter than the buffer size the master prepared to receive. And it may poll the `rx_data_size` if the `rx_dat_size` keeps 0, until timeout.

2. Call `essl_get_packet()` to receive data from the slave.

**Reset counters (Optional)** Call `essl_reset_cnt()` to reset the internal counter if you find the slave has reset its counter.

**Application Example**

The example below shows how ESP32 SDIO host and slave communicate with each other. The host use the ESSL SDIO.

Please refer to the specific example README.md for details.

**API Reference**

**Header File**

- components/esp_serial_slave_link/include/esp_serial_slave_link/essl.h

**Functions**

- `esp_err_t essl_init(essl_handle_t handle, uint32_t wait_ms)`

  Initialize the slave.

  **Return**
  - ESP_OK: If success
  - ESP_ERR_NOT_SUPPORTED: Current device does not support this function.
  - Other value returned from lower layer `init`.

  **Parameters**
  - handle: Handle of an ESSL device.
  - wait_ms: Millisecond to wait before timeout, will not wait at all if set to 0-9.

- `esp_err_t essl_wait_for_ready(essl_handle_t handle, uint32_t wait_ms)`

  Wait for interrupt of an ESSL slave device.

  **Return**
  - ESP_OK: If success
  - ESP_ERR_NOT_SUPPORTED: Current device does not support this function.
  - One of the error codes from SDMMC host controller

  **Parameters**
  - handle: Handle of an ESSL device.
  - wait_ms: Millisecond to wait before timeout, will not wait at all if set to 0-9.

- `esp_err_t essl_get_tx_buffer_num(essl_handle_t handle, uint32_t *out_tx_num, uint32_t wait_ms)`

  Get buffer num for the host to send data to the slave. The buffers are size of `buffer_size`.

  **Return**
  - ESP_OK: Success
  - ESP_ERR_NOT_SUPPORTED: This API is not supported in this mode
  - One of the error codes from SDMMC/SPI host controller

  **Parameters**
  - handle: Handle of a ESSL device.
  - out_tx_num: Output of buffer num that host can send data to ESSL slave.
  - wait_ms: Millisecond to wait before timeout, will not wait at all if set to 0-9.
Chapter 2. API Reference

```c
esp_err_t essl_get_rx_data_size (essl_handle_t handle, uint32_t *out_rx_size, uint32_t wait_ms)
```

Get the size, in bytes, of the data that the ESSL slave is ready to send.

**Return**
- ESP_OK: Success
- ESP_ERR_NOT_SUPPORTED: This API is not supported in this mode
- One of the error codes from SDMMC/SPI host controller

**Parameters**
- `handle`: Handle of an ESSL device.
- `out_rx_size`: Output of data size to read from slave, in bytes.
- `wait_ms`: Millisecond to wait before timeout, will not wait at all if set to 0-9.

```c
esp_err_t essl_reset_cnt (essl_handle_t handle)
```

Reset the counters of this component. Usually you don’t need to do this unless you know the slave is reset.

**Return**
- ESP_OK: Success
- ESP_ERR_NOT_SUPPORTED: This API is not supported in this mode
- ESP_ERR_INVALID_ARG: Invalid argument, handle is not init.

**Parameters**
- `handle`: Handle of an ESSL device.

```c
esp_err_t essl_send_packet (essl_handle_t handle, const void *start, size_t length, uint32_t wait_ms)
```

Send a packet to the ESSL Slave. The Slave receives the packet into buffers whose size is `buffer_size` configured during initialization.

**Return**
- ESP_OK: Success
- ESP_ERR_INVALID_ARG: Invalid argument, handle is not init or other argument is not valid.
- ESP_ERR_TIMEOUT: No buffer to use, or error from SDMMC host controller.
- ESP_ERR_NOT_FOUND: Slave is not ready for receiving.
- ESP_ERR_NOT_SUPPORTED: This API is not supported in this mode
- One of the error codes from SDMMC/SPI host controller.

**Parameters**
- `handle`: Handle of an ESSL device.
- `start`: Start address of the packet to send.
- `length`: Length of data to send, if the packet is over-size, the it will be divided into blocks and hold into different buffers automatically.
- `wait_ms`: Millisecond to wait before timeout, will not wait at all if set to 0-9.

```c
esp_err_t essl_get_packet (essl_handle_t handle, void *out_data, size_t size, size_t *out_length, uint32_t wait_ms)
```

Get a packet from ESSL slave.

**Return**
- ESP_OK: Success: All the data has been read from the slave.
- ESP_ERR_INVALID_ARG: Invalid argument, The handle is not initialized or the other arguments are invalid.
- ESP_ERR_NOT_FINISHED: Read was successful, but there is still data remaining.
- ESP_ERR_NOT_FOUND: Slave is not ready to send data.
- ESP_ERR_NOT_SUPPORTED: This API is not supported in this mode
- One of the error codes from SDMMC/SPI host controller.

**Parameters**
- `handle`: Handle of an ESSL device.
- `out_data`: Data output address.
- `size`: The size of the output buffer, if the buffer is smaller than the size of data to receive from slave, the driver returns ESP_ERR_NOT_FINISHED.
- `out_length`: Output of length the data actually received from slave.
- `wait_ms`: Millisecond to wait before timeout, will not wait at all if set to 0-9.

```c
esp_err_t essl_write_reg (essl_handle_t handle, uint8_t addr, uint8_t value, uint8_t *value_o, uint32_t wait_ms)
```

Write general purpose R/W registers (8-bit) of ESSL slave.

Write general purpose R/W registers (8-bit) of ESSL slave.
Note  sdio 28-31 are reserved, the lower API helps to skip.

**Return**
- ESP_OK Success
- One of the error codes from SDMMC/SPI host controller

**Parameters**
- `handle`: Handle of an ESSL device.
- `addr`: Address of register to write. For SDIO, valid address: 0-59. For SPI, see `essl_spi.h`
- `value`: Value to write to the register.
- `value_o`: Output of the returned written value.
- `wait_ms`: Millisecond to wait before timeout, will not wait at all if set to 0-9.

```c
esp_err_t essl_read_reg (essl_handle_t handle, uint8_t addr, uint8_t *value_o, uint32_t wait_ms)
```

Read general purpose R/W registers (8-bit) of ESSL slave.

**Return**
- ESP_OK Success
- One of the error codes from SDMMC/SPI host controller

**Parameters**
- `handle`: Handle of a ESSL device.
- `addr`: Address of register to read. For SDIO, Valid address: 0-27, 32-63 (28-31 reserved, return interrupt bits on read). For SPI, see `essl_spi.h`
- `value_o`: Output value read from the register.
- `wait_ms`: Millisecond to wait before timeout, will not wait at all if set to 0-9.

```c
esp_err_t essl_wait_int (essl_handle_t handle, uint32_t wait_ms)
```

wait for an interrupt of the slave

**Return**
- ESP_OK: If interrupt is triggered.
- ESP_ERR_NOT_SUPPORTED: Current device does not support this function.
- ESP_ERR_TIMEOUT: No interrupts before timeout.

**Parameters**
- `handle`: Handle of an ESSL device.
- `wait_ms`: Millisecond to wait before timeout, will not wait at all if set to 0-9.

```c
esp_err_t essl_clear_intr (essl_handle_t handle, uint32_t intr_mask, uint32_t wait_ms)
```

Clear interrupt bits of ESSL slave. All the bits set in the mask will be cleared, while other bits will stay the same.

**Return**
- ESP_OK: Success
- ESP_ERR_NOT_SUPPORTED: Current device does not support this function.
- One of the error codes from SDMMC host controller

**Parameters**
- `handle`: Handle of an ESSL device.
- `intr_mask`: Mask of interrupt bits to clear.
- `wait_ms`: Millisecond to wait before timeout, will not wait at all if set to 0-9.

```c
esp_err_t essl_get_intr (essl_handle_t handle, uint32_t *intr_raw, uint32_t *intr_st, uint32_t wait_ms)
```

Get interrupt bits of ESSL slave.

**Return**
- ESP_OK: Success
- ESP_INVALID_ARG: If both `intr_raw` and `intr_st` are NULL.
- ESP_ERR_NOT_SUPPORTED: Current device does not support this function.
- One of the error codes from SDMMC host controller

**Parameters**
- `handle`: Handle of an ESSL device.
- `intr_raw`: Output of the raw interrupt bits. Set to NULL if only masked bits are read.
- `intr_st`: Output of the masked interrupt bits. set to NULL if only raw bits are read.
- `wait_ms`: Millisecond to wait before timeout, will not wait at all if set to 0-9.
Chapter 2. API Reference

```c
esp_err_t essl_set_intr_ena(essl_handle_t handle, uint32_t ena_mask, uint32_t wait_ms)
```

Set interrupt enable bits of ESSL slave. The slave only sends interrupt on the line when there is a bit both the raw status and the enable are set.

**Return**
- ESP_OK: Success
- ESP_ERR_NOT_SUPPORTED: Current device does not support this function.
- One of the error codes from SDMMC host controller

**Parameters**
- `handle`: Handle of an ESSL device.
- `ena_mask`: Mask of the interrupt bits to enable.
- `wait_ms`: Millisecond to wait before timeout, will not wait at all if set to 0-9.

```c
esp_err_t essl_get_intr_ena(essl_handle_t handle, uint32_t* ena_mask_o, uint32_t wait_ms)
```

Get interrupt enable bits of ESSL slave.

**Return**
- ESP_OK Success
- One of the error codes from SDMMC host controller

**Parameters**
- `handle`: Handle of an ESSL device.
- `ena_mask_o`: Output of interrupt bit enable mask.
- `wait_ms`: Millisecond to wait before timeout, will not wait at all if set to 0-9.

```c
esp_err_t essl_send_slave_intr(essl_handle_t handle, uint32_t intr_mask, uint32_t wait_ms)
```

Send interrupts to slave. Each bit of the interrupt will be triggered.

**Return**
- ESP_OK: Success
- ESP_ERR_NOT_SUPPORTED: Current device does not support this function.
- One of the error codes from SDMMC host controller

**Parameters**
- `handle`: Handle of an ESSL device.
- `intr_mask`: Mask of interrupt bits to send to slave.
- `wait_ms`: Millisecond to wait before timeout, will not wait at all if set to 0-9.

**Type Definitions**
```c
typedef struct essl_dev_t *essl_handle_t
```

Handle of an ESSL device.

**Header File**
- components/esp_serial_slave_link/include/esp_serial_slave_link/essl_sdio.h

**Functions**
```c
esp_err_t essl_sdio_init_dev(essl_handle_t *out_handle, const essl_sdio_config_t *config)
```

Initialize the ESSL SDIO device and get its handle.

**Return**
- ESP_OK: on success
- ESP_ERR_NO_MEM: memory exhausted.

**Parameters**
- `out_handle`: Output of the handle.
- `config`: Configuration for the ESSL SDIO device.

```c
esp_err_t essl_sdio_deinit_dev(essl_handle_t handle)
```

Deinitialize and free the space used by the ESSL SDIO device.

**Return**
- ESP_OK: on success
- ESP_ERR_INVALID_ARG: wrong handle passed
Chapter 2. API Reference

Parameters

• handle: Handle of the ESSL SDIO device to deinit.

Structures

struct essl_sdio_config_t
Configuration for the ESSL SDIO device.

Public Members

sdmmc_card_t *card
The initialized sdmmc card pointer of the slave.

recv_buffer_size
The pre-negotiated recv buffer size used by both the host and the slave.

Header File

• components/esp_serial_slave_link/include/esp_serial_slave_link/essl_spi.h

Functions

esp_err_t essl_spi_init_dev (essl_handle_t *out_handle, const essl_spi_config_t *init_config)
Initialize the ESSL SPI device function list and get its handle.

Return

• ESP_OK: On success
• ESP_ERR_NO_MEM: Memory exhausted
• ESP_ERR_INVALID_STATE: SPI driver is not initialized
• ESP_ERR_INVALID_ARG: Wrong register ID

Parameters

• [out] out_handle: Output of the handle
• init_config: Configuration for the ESSL SPI device

esp_err_t essl_spi_deinit_dev (essl_handle_t handle)
Deinitialize the ESSL SPI device and free the memory used by the device.

Return

• ESP_OK: On success
• ESP_ERR_INVALID_STATE: ESSL SPI is not in use

Parameters

• handle: Handle of the ESSL SPI device

esp_err_t essl_spi_read_reg (void *arg, uint8_t addr, uint8_t *out_value, uint32_t wait_ms)
Read from the shared registers.

Note The registers for Master/Slave synchronization are reserved. Do not use them. (see rx_sync_reg in essl_spi_config_t)

Return

• ESP_OK: success
• ESP_ERR_INVALID_STATE: ESSL SPI has not been initialized.
• ESP_ERR_INVALID_ARG: The address argument is not valid. See note 1.
• or other return value from :cpp:func:spi_device_transmit.

Parameters

• arg: Context of the component. (Member arg from essl_handle_t)
• addr: Address of the shared registers. (Valid: 0 ~ SOC_SPI_MAXIMUM_BUFFER_SIZE, registers for M/S sync are reserved, see note1).
• [out] out_value: Read buffer for the shared registers.
• wait_ms: Time to wait before timeout (reserved for future use, user should set this to 0).

esp_err_t essl_spi_get_packet (void *arg, void *out_data, size_t size, uint32_t wait_ms)
Get a packet from Slave.
Chapter 2. API Reference

Return
• ESP_OK: On Success
• ESP_ERR_INVALID_STATE: ESSL SPI has not been initialized.
• ESP_ERR_INVALID_ARG: The output data address is neither DMA capable nor 4 byte-aligned
• ESP_ERR_INVALID_SIZE: Master requires size bytes of data but Slave did not load enough bytes.

Parameters
• arg: Context of the component. (Member arg from essl_handle_t)
• [out] out_data: Output data address
• size: The size of the output data.
• wait_ms: Time to wait before timeout (reserved for future use, user should set this to 0).

`esp_err_t essl_spi_write_reg(void *arg, uint8_t addr, uint8_t value, uint8_t *out_value, uint32_t wait_ms)`
Write to the shared registers.

Note The registers for Master/Slave synchronization are reserved. Do not use them. (see tx_sync_reg in essl_spi_config_t)

Note Feature of checking the actual written value (out_value) is not supported.

Return
• ESP_OK: success
• ESP_ERR_INVALID_STATE: ESSL SPI has not been initialized.
• ESP_ERR_INVALID_ARG: The address argument is not valid. See note 1.
• ESP_ERR_NOT_SUPPORTED: Should set out_value to NULL. See note 2.
• or other return value from :cpp:func:spi_device_transmit.

Parameters
• arg: Context of the component. (Member arg from essl_handle_t)
• addr: Address of the shared registers. (Valid: 0 ~ SOC_SPI_MAXIMUM_BUFFER_SIZE, registers for M/S sync are reserved, see note 1)
• value: Buffer for data to send, should be align to 4.
• [out] out_value: Not supported, should be set to NULL.
• wait_ms: Time to wait before timeout (reserved for future use, user should set this to 0).

`esp_err_t essl_spi_send_packet (void *arg, const void *data, size_t size, uint32_t wait_ms)`
Send a packet to Slave.

Return
• ESP_OK: On success
• ESP_ERR_INVALID_STATE: ESSL SPI has not been initialized.
• ESP_ERR_INVALID_ARG: The data address is not DMA capable
• ESP_ERR_INVALID_SIZE: Master will send size bytes of data but Slave did not load enough RX buffer

Parameters
• arg: Context of the component. (Member arg from essl_handle_t)
• data: Address of the data to send
• size: Size of the data to send.
• wait_ms: Time to wait before timeout (reserved for future use, user should set this to 0).

void essl_spi_reset_cnt (void *arg)
Reset the counter in Master context.

Note Shall only be called if the slave has reset its counter. Else, Slave and Master would be desynchronized.

Parameters
• arg: Context of the component. (Member arg from essl_handle_t)

`esp_err_t essl_spi_rdbuf (spi_device_handle_t spi, uint8_t *out_data, int addr, int len, uint32_t flags)`
Read the shared buffer from the slave in ISR way.

Note The slave’s HW doesn’t guarantee the data in one SPI transaction is consistent. It sends data in unit of byte. In other words, if the slave SW attempts to update the shared register when a rdbuf SPI transaction is in-flight, the data got by the master will be the combination of bytes of different writes of slave SW.

Note out_data should be prepared in words and in the DRAM. The buffer may be written in words by the
DMA. When a byte is written, the remaining bytes in the same word will also be overwritten, even the len is shorter than a word.

**Return**
- ESP_OK: on success
- or other return value from `cpp:func:spi_device_transmit`.

**Parameters**
- `spi`: SPI device handle representing the slave
- `[out] out_data`: Buffer for read data, strongly suggested to be in the DRAM and aligned to 4
- `addr`: Address of the slave shared buffer
- `len`: Length to read
- `flags`: SPI_TRANS_* flags to control the transaction mode of the transaction to send.

`esp_err_t essl_spi_rdbuf_polling(spi_device_handle_t spi, uint8_t *out_data, int addr, int len, uint32_t flags)`

Read the shared buffer from the slave in polling way.

**Note** `out_data` should be prepared in words and in the DRAM. The buffer may be written in words by the DMA. When a byte is written, the remaining bytes in the same word will also be overwritten, even the len is shorter than a word.

**Return**
- ESP_OK: on success
- or other return value from `cpp:func:spi_device_transmit`.

**Parameters**
- `spi`: SPI device handle representing the slave
- `[out] out_data`: Buffer for read data, strongly suggested to be in the DRAM and aligned to 4
- `addr`: Address of the slave shared buffer
- `len`: Length to read
- `flags`: SPI_TRANS_* flags to control the transaction mode of the transaction to send.

`esp_err_t essl_spi_wrbuf(spi_device_handle_t spi, const uint8_t *data, int addr, int len, uint32_t flags)`

Write the shared buffer of the slave in ISR way.

**Note** `out_data` should be prepared in words and in the DRAM. The buffer may be written in words by the DMA. When a byte is written, the remaining bytes in the same word will also be overwritten, even the len is shorter than a word.

**Return**
- ESP_OK: success
- or other return value from `cpp:func:spi_device_transmit`.

**Parameters**
- `spi`: SPI device handle representing the slave
- `data`: Buffer for data to send, strongly suggested to be in the DRAM
- `addr`: Address of the slave shared buffer,
- `len`: Length to write
- `flags`: SPI_TRANS_* flags to control the transaction mode of the transaction to send.

`esp_err_t essl_spi_wrbuf_polling(spi_device_handle_t spi, const uint8_t *data, int addr, int len, uint32_t flags)`

Write the shared buffer of the slave in polling way.

**Note** `out_data` should be prepared in words and in the DRAM. The buffer may be written in words by the DMA. When a byte is written, the remaining bytes in the same word will also be overwritten, even the len is shorter than a word.

**Return**
- ESP_OK: success
- or other return value from `cpp:func:spi_device_polling_transmit`.

**Parameters**
- `spi`: SPI device handle representing the slave
- `data`: Buffer for data to send, strongly suggested to be in the DRAM
- `addr`: Address of the slave shared buffer,
- `len`: Length to write
- `flags`: SPI_TRANS_* flags to control the transaction mode of the transaction to send.
**esp_err_t essl_spi_rddma** (spi_device_handle_t spi, uint8_t *out_data, int len, int seg_len, uint32_t flags)

Receive long buffer in segments from the slave through its DMA.

**Note** This function combines several :cpp:func:`essl_spi_rddma_seg` and one :cpp:func:`essl_spi_rddma_done` at the end. Used when the slave is working in segment mode.

**Return**
- ESP_OK: success
- or other return value from :cpp:func:`spi_device_transmit`.

**Parameters**
- spi: SPI device handle representing the slave
- [out] out_data: Buffer to hold the received data, strongly suggested to be in the DRAM and aligned to 4
- len: Total length of data to receive.
- seg_len: Length of each segment, which is not larger than the maximum transaction length allowed for the spi device. Suggested to be multiples of 4. When set < 0, means send all data in one segment (the rddma_done will still be sent.)
- flags: SPI_TRANS_* flags to control the transaction mode of the transaction to send.

**esp_err_t essl_spi_rddma_seg** (spi_device_handle_t spi, uint8_t *out_data, int seg_len, uint32_t flags)

Read one data segment from the slave through its DMA.

**Note** To read long buffer, call :cpp:func:`essl_spi_rddma` instead.

**Return**
- ESP_OK: success
- or other return value from :cpp:func:`spi_device_transmit`.

**Parameters**
- spi: SPI device handle representing the slave
- [out] out_data: Buffer to hold the received data. strongly suggested to be in the DRAM and aligned to 4
- seg_len: Length of this segment
- flags: SPI_TRANS_* flags to control the transaction mode of the transaction to send.

**esp_err_t essl_spi_rddma_done** (spi_device_handle_t spi, uint32_t flags)

Send the rddma_done command to the slave. Upon receiving this command, the slave will stop sending the current buffer even if there are data unsent, and maybe prepare the next buffer to send.

**Note** This is required only when the slave is working in segment mode.

**Return**
- ESP_OK: success
- or other return value from :cpp:func:`spi_device_transmit`.

**Parameters**
- spi: SPI device handle representing the slave
- flags: SPI_TRANS_* flags to control the transaction mode of the transaction to send.

**esp_err_t essl_spi_wrdma** (spi_device_handle_t spi, const uint8_t *data, int len, int seg_len, uint32_t flags)

Send long buffer in segments to the slave through its DMA.

**Note** This function combines several :cpp:func:`essl_spi_wrdma_seg` and one :cpp:func:`essl_spi_wrdma_done` at the end. Used when the slave is working in segment mode.

**Return**
- ESP_OK: success
- or other return value from :cpp:func:`spi_device_transmit`.

**Parameters**
- spi: SPI device handle representing the slave
- data: Buffer for data to send, strongly suggested to be in the DRAM
- len: Total length of data to send.
- seg_len: Length of each segment, which is not larger than the maximum transaction length allowed for the spi device. Suggested to be multiples of 4. When set < 0, means send all data in one
Chapter 2. API Reference

segment (the wrdma_done will still be sent.)
• flags: SPI_TRANS_* flags to control the transaction mode of the transaction to send.

\[ \text{esp_err_t essl_spi_wrdma_seg(spi_device_handle_t spi, const uint8_t *data, int seg_len, uint32_t flags)} \]
Send one data segment to the slave through its DMA.

\textbf{Note} To send long buffer, call \texttt{cpp:func:essl_spi_wrdma} instead.

\textbf{Return}
• ESP_OK: success
• or other return value from \texttt{cpp:func:spi_device_transmit}.

\textbf{Parameters}
• \texttt{spi}: SPI device handle representing the slave
• \texttt{data}: Buffer for data to send, strongly suggested to be in the DRAM
• \texttt{seg_len}: Length of this segment
• \texttt{flags}: SPI_TRANS_* flags to control the transaction mode of the transaction to send.

\[ \text{esp_err_t essl_spi_wrdma_done(spi_device_handle_t spi, uint32_t flags)} \]
Send the wrdma_done command to the slave. Upon receiving this command, the slave will stop receiving, process the received data, and maybe prepare the next buffer to receive.

\textbf{Note} This is required only when the slave is working in segment mode.

\textbf{Return}
• ESP_OK: success
• or other return value from \texttt{cpp:func:spi_device_transmit}.

\textbf{Parameters}
• \texttt{spi}: SPI device handle representing the slave
• \texttt{flags}: SPI_TRANS_* flags to control the transaction mode of the transaction to send.

\textbf{Structures}
\texttt{struct essl_spi_config_t}
Configuration of ESSL SPI device.

\textbf{Public Members}

\texttt{spi_device_handle_t *spi}
Pointer to SPI device handle.

\texttt{uint32_t tx_buf_size}
The pre-negotiated Master TX buffer size used by both the host and the slave.

\texttt{uint8_t tx_sync_reg}
The pre-negotiated register ID for Master-TX-SLAVE-RX synchronization. 1 word (4 Bytes) will be reserved for the synchronization.

\texttt{uint8_t rx_sync_reg}
The pre-negotiated register ID for Master-RX-Slave-TX synchronization. 1 word (4 Bytes) will be reserved for the synchronization.

2.4.14 ESP x509 Certificate Bundle

\textbf{Overview}
The ESP x509 Certificate Bundle API provides an easy way to include a bundle of custom x509 root certificates for TLS server verification.

\textbf{Note}: The bundle is currently not available when using WolfSSL.
Chapter 2. API Reference

The bundle comes with the complete list of root certificates from Mozilla’s NSS root certificate store. Using the gen_crt_bundle.py python utility the certificates’ subject name and public key are stored in a file and embedded in the ESP32-S3 binary.

When generating the bundle you may choose between:

- The full root certificate bundle from Mozilla, containing more than 130 certificates. The current bundle was updated Tue Oct 5 09:35:35 2021 GMT.
- A pre-selected filter list of the name of the most commonly used root certificates, reducing the amount of certificates to around 35 while still having around 90% coverage according to market share statistics.

In addition it is possible to specify a path to a certificate file or a directory containing certificates which then will be added to the generated bundle.

**Note:** Trusting all root certificates means the list will have to be updated if any of the certificates are retracted. This includes removing them from cacrt_all.pem.

**Configuration**

Most configuration is done through menuconfig. CMakewill generate the bundle according to the configuration and embed it.

- `CONFIG_MBEDTLS_CERTIFICATE_BUNDLE`: automatically build and attach the bundle.
- `CONFIG_MBEDTLS_DEFAULT_CERTIFICATE_BUNDLE`: decide which certificates to include from the complete root list.
- `CONFIG_MBEDTLS_CUSTOM_CERTIFICATE_BUNDLE_PATH`: specify the path of any additional certificates to embed in the bundle.

To enable the bundle when using ESP-TLS simply pass the function pointer to the bundle attach function:

```c
esp_tls_cfg_t cfg = {
    .crt_bundle_attach = esp_crt_bundle_attach,
};
```

This is done to avoid embedding the certificate bundle unless activated by the user.

If using mbedTLS directly then the bundle may be activated by directly calling the attach function during the setup process:

```c
mbedtls_ssl_config conf;
mbedtls_ssl_config_init(&conf);
esp_crt_bundle_attach(&conf);
```

**Generating the List of Root Certificates**

The list of root certificates comes from Mozilla’s NSS root certificate store, which can be found here. The list can be downloaded and created by running the script `mk-ca-bundle.pl` that is distributed as a part of curl. Another alternative would be to download the finished list directly from the curl website: CA certificates extracted from Mozilla.

The common certificates bundle were made by selecting the authorities with a market share of more than 1% from w3tech’s SSL Survey. These authorities were then used to pick the names of the certificates for the filter list, cmn_crtAuthorities.csv, from this list provided by Mozilla.
Chapter 2. API Reference

Updating the Certificate Bundle

The bundle is embedded into the app and can be updated along with the app by an OTA update. If you want to include a more up-to-date bundle than the bundle currently included in IDF, then the certificate list can be downloaded from Mozilla as described in *Updating the Certificate Bundle*.

Application Example

Simple HTTPS example that uses ESP-TLS to establish a secure socket connection using the certificate bundle with two custom certificates added for verification: protocols/https_x509_bundle.
HTTPS example that uses ESP-TLS and the default bundle: protocols/https_request.
HTTPS example that uses mbedTLS and the default bundle: protocols/https_mbedtls.

API Reference

Header File

- components/mbedtls/esp_crt_bundle/include/esp_crt_bundle.h

Functions

`esp_err_t esp_crt_bundle_attach(void *conf)`

Attach and enable use of a bundle for certificate verification.

- Attach and enable use of a bundle for certificate verification through a verification callback. If no specific bundle has been set through `esp_crt_bundle_set()` it will default to the bundle defined in menuconfig and embedded in the binary.

  **Return**

  - ESP_OK if adding certificates was successful.
  - Other if an error occurred or an action must be taken by the calling process.

  **Parameters**

  - [in] conf: The config struct for the SSL connection.

`void esp_crt_bundle_detach(mbedtls_ssl_config *conf)`

Disable and deallocate the certification bundle.

- Removes the certificate verification callback and deallocates used resources.

  **Parameters**

  - [in] conf: The config struct for the SSL connection.

`void esp_crt_bundle_set(const uint8_t *x509_bundle)`

Set the default certificate bundle used for verification.

- Overrides the default certificate bundle. In most use cases the bundle should be set through menuconfig. The bundle needs to be sorted by subject name since binary search is used to find certificates.

  **Parameters**

  - [in] x509_bundle: A pointer to the certificate bundle.

Code examples for this API section are provided in the protocols directory of ESP-IDF examples.

2.4.15 IP Network Layer

Documentation for IP Network Layer protocols (below the Application Protocol layer) are provided in *Networking APIs*.
2.5 Provisioning API

2.5.1 Protocol Communication

Overview

Protocol Communication (protocomm) component manages secure sessions and provides framework for multiple transports. The application can also use protocomm layer directly to have application specific extensions for the provisioning (or non-provisioning) use cases.

Following features are available for provisioning:

- Communication security at application level -
  - protocomm_security0 (no security)
  - protocomm_security1 (curve25519 key exchange + AES-CTR encryption)
- Proof-of-possession (support with protocomm_security1 only)

Protocomm internally uses protobuf (protocol buffers) for secure session establishment. Though users can implement their own security (even without using protobuf). One can even use protocomm without any security layer.

Protocomm provides framework for various transports - WiFi (SoftAP+HTTPD), BLE, console - in which case the handler invocation is automatically taken care of on the device side (see Transport Examples below for code snippets).

Note that the client still needs to establish session (only for protocomm_security1) by performing the two way handshake. See Unified Provisioning for more details about the secure handshake logic.

Transport Example (SoftAP + HTTP) with Security 1

For complete example see provisioning/legacy/softap_prov

```c
/* Endpoint handler to be registered with protocomm. *
 * This simply echoes back the received data. */
esp_err_t echo_req_handler(uint32_t session_id,                  
                          const uint8_t *inbuf, ssize_t inlen,      
                          uint8_t *outbuf, ssize_t *outlen,        
                          void *priv_data)
{
    /* Session ID may be used for persistence */
    printf("Session ID : %d", session_id);

    /* Echo back the received data */
    *outlen = inlen; /* Output data length updated */
    *outbuf = malloc(inlen); /* This will be deallocated outside */
    memcpy(*outbuf, inbuf, inlen);

    /* Private data that was passed at the time of endpoint creation */
    uint32_t *priv = (uint32_t *) priv_data;
    if (priv) {
        printf("Private data : %d", *priv);
    }

    return ESP_OK;
}

/* Example function for launching a protocomm instance over HTTP */
protocomm_t *start_pc(const char *pop_string)
{
    protocomm_t *pc = protocomm_new();

    /* Config for protocomm_httpd_start() */
    protocomm_httpd_config_t pc_config = {
```
.data = {
    .config = PROTOCOL_HTTPD_DEFAULT_CONFIG()
};

/* Start protocomm server on top of HTTP */
protocomm_httpd_start(pc, &pc_config);

/* Create Proof of Possession object from pop_string. It must be valid
 * throughout the scope of protocomm endpoint. This need not be static,
 * ie. could be dynamically allocated and freed at the time of endpoint
 * removal */
const static protocomm_security_pop_t pop_obj = {
    .data = (const uint8_t *) strdup(pop_string),
    .len = strlen(pop_string)
};

/* Set security for communication at application level. Just like for
 * request handlers, setting security creates an endpoint and registers
 * the handler provided by protocomm_security1. One can similarly use
 * protocomm_security0. Only one type of security can be set for a
 * protocomm instance at a time. */
protocomm_set_security(pc, "security_endpoint", &protocomm_security1, &pop_obj);

/* Private data passed to the endpoint must be valid throughout the
 * scope of protocomm endpoint. This need not be static, ie. could be
dynamically allocated and freed at the time of endpoint removal */
static uint32_t priv_data = 1234;

/* Add a new endpoint for the protocomm instance, identified by a
 * unique name and register a handler function along with private data to be
 * passed at the time of handler execution. Multiple endpoints can be added as long
 * as they are identified by unique names */
protocomm_add_endpoint(pc, "echo_req_endpoint",
    echo_req_handler, (void *) &priv_data);

return pc;

/* Example function for stopping a protocomm instance */
void stop_pc(protocomm_t *pc)
{
    /* Remove endpoint identified by it's unique name */
    protocomm_remove_endpoint(pc, "echo_req_endpoint");

    /* Remove security endpoint identified by it's name */
    protocomm_unset_security(pc, "security_endpoint");

    /* Stop HTTP server */
    protocomm_httpd_stop(pc);

    /* Delete (deallocate) the protocomm instance */
    protocomm_delete(pc);
}
Transport Example (BLE) with Security 0

For complete example see provisioning/legacy/ble_prov

```c
/* Example function for launching a secure protocomm instance over BLE */
protocomm_t *start_pc()
{
    protocomm_t *pc = protocomm_new();

    /* Endpoint UUIDs */
    protocomm_ble_name_uuid_t nu_lookup_table[] = {
        {"security_endpoint", 0xFF51},
        {"echo_req_endpoint", 0xFF52}
    };

    /* Config for protocomm_ble_start() */
    protocomm_ble_config_t config = {
        .service_uuid = {
            /* LSB <---------------------------------------
             * ---------------------------------------> MSB */
            0xfb, 0x34, 0x9b, 0x5f, 0x80, 0x00, 0x00, 0x80,

    protocomm_ble_start(pc, &config);

    /* For protocomm_security0, Proof of Possession is not used, and can--
    be kept NULL */
    protocomm_set_security(pc, "security_endpoint", &protocomm_security0,--NULL);
    protocomm_add_endpoint(pc, "echo_req_endpoint", echo_req_handler,--NULL);
    return pc;
}

/* Example function for stopping a protocomm instance */
void stop_pc(protocomm_t *pc)
{
    protocomm_remove_endpoint(pc, "echo_req_endpoint");
    protocomm_unset_security(pc, "security_endpoint");

    /* Stop BLE protocomm service */
    protocomm_ble_stop(pc);

    protocomm_delete(pc);
}
```

API Reference

Header File

- components/protocomm/include/common/protocomm.h
Chapter 2. API Reference

**Functions**

*protocomm_t* protocomm_new(void)

Create a new protocomm instance.

This API will return a new dynamically allocated protocomm instance with all elements of the protocomm_t structure initialized to NULL.

**Return**

- protocomm_t*: On success
- NULL: No memory for allocating new instance

void protocomm_delete (protocomm_t *pc)

Delete a protocomm instance.

This API will deallocate a protocomm instance that was created using protocomm_new().

**Parameters**

- [in] pc: Pointer to the protocomm instance to be deleted

esp_err_t protocomm_add_endpoint (protocomm_t *pc, const char *ep_name, protocomm_req_handler_t h, void *priv_data)

Add endpoint request handler for a protocomm instance.

This API will bind an endpoint handler function to the specified endpoint name, along with any private data that needs to be pass to the handler at the time of call.

**Note**

- An endpoint must be bound to a valid protocomm instance, created using protocomm_new().
- This function internally calls the registered add_endpoint() function of the selected transport which is a member of the protocomm_t instance structure.

**Return**

- ESP_OK : Success
- ESP_FAIL : Error adding endpoint / Endpoint with this name already exists
- ESP_ERR_NO_MEM : Error allocating endpoint resource
- ESP_ERR_INVALID_ARG : Null instance/name/handler arguments

**Parameters**

- [in] pc: Pointer to the protocomm instance
- [in] ep_name: Endpoint identifier(name) string
- [in] h: Endpoint handler function
- [in] priv_data: Pointer to private data to be passed as a parameter to the handler function on call. Pass NULL if not needed.

esp_err_t protocomm_remove_endpoint (protocomm_t *pc, const char *ep_name)

Remove endpoint request handler for a protocomm instance.

This API will remove a registered endpoint handler identified by an endpoint name.

**Note**

- This function internally calls the registered remove_endpoint() function which is a member of the protocomm_t instance structure.

**Return**

- ESP_OK : Success
- ESP_ERR_NOT_FOUND : Endpoint with specified name doesn’t exist
- ESP_ERR_INVALID_ARG : Null instance/name arguments

**Parameters**

- [in] pc: Pointer to the protocomm instance
- [in] ep_name: Endpoint identifier(name) string

esp_err_t protocomm_open_session (protocomm_t *pc, uint32_t session_id)

Allocates internal resources for new transport session.

**Note**

- An endpoint must be bound to a valid protocomm instance, created using protocomm_new().

**Return**

- ESP_OK : Request handled successfully
### Chapter 2. API Reference

**ESP_ERR_NO_MEM**: Error allocating internal resource

**ESP_ERR_INVALID_ARG**: Null instance/name arguments

**Parameters**

- `[in] pc`: Pointer to the protocomm instance
- `[in] session_id`: Unique ID for a communication session

**esp_err_t protocomm_close_session (protocomm_t *pc, uint32_t session_id)**

Frees internal resources used by a transport session.

**Note**

An endpoint must be bound to a valid protocomm instance, created using `protocomm_new()`.

**Return**

- **ESP_OK**: Request handled successfully
- **ESP_ERR_INVALID_ARG**: Null instance/name arguments

**Parameters**

- `[in] pc`: Pointer to the protocomm instance
- `[in] session_id`: Unique ID for a communication session

**esp_err_t protocomm_req_handle (protocomm_t *pc, const char *ep_name, uint32_t session_id, const uint8_t *inbuf, ssize_t inlen, uint8_t **outbuf, ssize_t *outlen)**

Calls the registered handler of an endpoint session for processing incoming data and generating the response.

**Note**

An endpoint must be bound to a valid protocomm instance, created using `protocomm_new()`.

- Resulting output buffer must be deallocated by the caller.

**Return**

- **ESP_OK**: Request handled successfully
- **ESP_FAIL**: Internal error in execution of registered handler
- **ESP_ERR_NO_MEM**: Error allocating internal resource
- **ESP_ERR_NOT_FOUND**: Endpoint with specified name doesn’t exist
- **ESP_ERR_INVALID_ARG**: Null instance/name arguments

**Parameters**

- `[in] pc`: Pointer to the protocomm instance
- `[in] ep_name`: Endpoint identifier(name) string
- `[in] session_id`: Unique ID for a communication session
- `[in] inbuf`: Input buffer contains input request data which is to be processed by the registered handler
- `[in] inlen`: Length of the input buffer
- `[out] outbuf`: Pointer to internally allocated output buffer, where the resulting response data output from the registered handler is to be stored
- `[out] outlen`: Buffer length of the allocated output buffer

**esp_err_t protocomm_set_security (protocomm_t *pc, const char *ep_name, const protocomm_security_t *sec, const protocomm_security_pop_t *pop)**

Add endpoint security for a protocomm instance.

This API will bind a security session establisher to the specified endpoint name, along with any proof of possession that may be required for authenticating a session client.

**Note**

An endpoint must be bound to a valid protocomm instance, created using `protocomm_new()`.

- The choice of security can be any `protocomm_security_t` instance. Choices `protocomm_security0` and `protocomm_security1` are readily available.

**Return**

- **ESP_OK**: Success
- **ESP_FAIL**: Error adding endpoint / Endpoint with this name already exists
- **ESP_ERR_INVALID_STATE**: Security endpoint already set
- **ESP_ERR_NO_MEM**: Error allocating endpoint resource
- **ESP_ERR_INVALID_ARG**: Null instance/name/handler arguments

**Parameters**
Chapter 2. API Reference

- [in] pc: Pointer to the protocomm instance
- [in] ep_name: Endpoint identifier(name) string
- [in] sec: Pointer to endpoint security instance
- [in] pop: Pointer to proof of possession for authenticating a client

`esp_err_t protocomm_unset_security (protocomm_t *pc, char *ep_name)`

Remove endpoint security for a protocomm instance.

This API will remove a registered security endpoint identified by an endpoint name.

Return
- ESP_OK : Success
- ESP_ERR_NOT_FOUND : Endpoint with specified name doesn’t exist
- ESP_ERR_INVALID_ARG : Null instance/name arguments

Parameters
- [in] pc: Pointer to the protocomm instance
- [in] ep_name: Endpoint identifier(name) string

`esp_err_t protocomm_set_version (protocomm_t *pc, const char *ep_name, const char *version)`

Set endpoint for version verification.

This API can be used for setting an application specific protocol version which can be verified by clients through the endpoint.

Note
- An endpoint must be bound to a valid protocomm instance, created using `protocomm_new()`.

Return
- ESP_OK : Success
- ESP_FAIL : Error adding endpoint/ Endpoint with this name already exists
- ESP_ERR_INVALID_STATE : Version endpoint already set
- ESP_ERR_NO_MEM : Error allocating endpoint resource
- ESP_ERR_INVALID_ARG : Null instance/name/handler arguments

Parameters
- [in] pc: Pointer to the protocomm instance
- [in] ep_name: Endpoint identifier(name) string
- [in] version: Version identifier(name) string

`esp_err_t protocomm_unset_version (protocomm_t *pc, const char *ep_name)`

Remove version verification endpoint from a protocomm instance.

This API will remove a registered version endpoint identified by an endpoint name.

Return
- ESP_OK : Success
- ESP_ERR_NOT_FOUND : Endpoint with specified name doesn’t exist
- ESP_ERR_INVALID_ARG : Null instance/name arguments

Parameters
- [in] pc: Pointer to the protocomm instance
- [in] ep_name: Endpoint identifier(name) string

Type Definitions

`typedef esp_err_t (*protocomm_req_handler_t)(uint32_t session_id, const uint8_t *inbuf, ssize_t inlen, uint8_t **outbuf, ssize_t *outlen, void *priv_data)`

Function prototype for protocomm endpoint handler.

`typedef struct protocomm protocomm_t`  

This structure corresponds to a unique instance of protocomm returned when the API `protocomm_new()` is called. The remaining Protocomm APIs require this object as the first parameter.

Note Structure of the protocomm object is kept private.
Header File
- components/protocomm/include/security/protocomm_security.h

Structures
struct protocomm_security_pop
Proof Of Possession for authenticating a secure session.

Public Members
const uint8_t *data
Pointer to buffer containing the proof of possession data

Public Members
uint16_t len
Length (in bytes) of the proof of possession data

struct protocomm_security
Protocomm security object structure.
The member functions are used for implementing secure protocomm sessions.

Note This structure should not have any dynamic members to allow re-entrancy

Public Members
int ver
Unique version number of security implementation

esp_err_t (*init)(protocomm_security_handle_t *handle)
Function for initializing/allocationg security infrastructure

esp_err_t (*cleanup)(protocomm_security_handle_t handle)
Function for deallocating security infrastructure

esp_err_t (*new_transport_session)(protocomm_security_handle_t handle, uint32_t session_id)
Starts a new secure transport session with specified ID

esp_err_t (*close_transport_session)(protocomm_security_handle_t handle, uint32_t session_id)
Closes a secure transport session with specified ID

esp_err_t (*security_req_handler)(protocomm_security_handle_t handle, const protocomm_security_pop_t *pop, uint32_t session_id, const uint8_t *inbuf, ssize_t inlen, uint8_t **outbuf, ssize_t *outlen, void *priv_data)
Handler function for authenticating connection request and establishing secure session

esp_err_t (*encrypt)(protocomm_security_handle_t handle, uint32_t session_id, const uint8_t *inbuf, ssize_t inlen, uint8_t **outbuf, ssize_t *outlen)
Function which implements the encryption algorithm

esp_err_t (*decrypt)(protocomm_security_handle_t handle, uint32_t session_id, const uint8_t *inbuf, ssize_t inlen, uint8_t **outbuf, ssize_t *outlen)
Function which implements the decryption algorithm

Type Definitions
typedef struct protocomm_security_pop protocomm_security_pop_t
Proof Of Possession for authenticating a secure session.
typedef void *protocomm_security_handle_t

Espressif Systems 957 Release v5.0-dev-952-g1538009
Submit Document Feedback
**Chapter 2. API Reference**

**typedef struct** protocomm_security **protocomm_security_t**

Protocomm security object structure.

The member functions are used for implementing secure protocomm sessions.

**Note** This structure should not have any dynamic members to allow re-entry.

**Header File**

- components/protocomm/include/security/protocomm_security0.h

**Header File**

- components/protocomm/include/security/protocomm_security1.h

**Header File**

- components/protocomm/include/transports/protocomm_httpd.h

**Functions**

```c
esp_err_t protocomm_httpd_start (protocomm_t *pc, const protocomm_httpd_config_t *config)
```

Start HTTPD protocomm transport.

This API internally creates a framework to allow endpoint registration and security configuration for the protocomm.

**Note** This is a singleton. i.e. Protocomm can have multiple instances, but only one instance can be bound to an HTTP transport layer.

**Return**

- ESP_OK : Success
- ESP_ERR_INVALID_ARG : Null arguments
- ESP_ERR_NOT_SUPPORTED : Transport layer bound to another protocomm instance
- ESP_ERR_INVALID_STATE : Transport layer already bound to this protocomm instance
- ESP_ERR_NO_MEM : Memory allocation for server resource failed
- ESP_ERR_HTTPD_* : HTTP server error on start

**Parameters**

- [in] pc: Protocomm instance pointer obtained from protocomm_new()
- [in] config: Pointer to config structure for initializing HTTP server

```c
esp_err_t protocomm_httpd_stop (protocomm_t *pc)
```

Stop HTTPD protocomm transport.

This API cleans up the HTTPD transport protocomm and frees all the handlers registered with the protocomm.

**Return**

- ESP_OK : Success
- ESP_ERR_INVALID_ARG : Null / incorrect protocomm instance pointer

**Parameters**

- [in] pc: Same protocomm instance that was passed to protocomm_httpd_start()

**Unions**

```c
union protocomm_httpd_config_data_t
```

# include <protocomm_httpd.h>

Protocomm HTTPD Configuration Data

**Public Members**

```c
void *handle
```

HTTP Server Handle, if ext_handle_provided is set to true
protocomm_http_server_config_t config
    HTTP Server Configuration, if a server is not already active

Structures
struct protocomm_http_server_config_t
    Config parameters for protocomm HTTP server.

Public Members

    uint16_t port
        Port on which the HTTP server will listen

    size_t stack_size
        Stack size of server task, adjusted depending upon stack usage of endpoint handler

    unsigned task_priority
        Priority of server task

struct protocomm_httpd_config_t
    Config parameters for protocomm HTTP server.

Public Members

    bool ext_handle_provided
        Flag to indicate of an external HTTP Server Handle has been provided. In such as case, protocomm will
        use the same HTTP Server and not start a new one internally.

protocomm_httpd_config_data_t data
    Protocomm HTTPD Configuration Data

 Macros

PROTOCOL_HTTPD_DEFAULT_CONFIG()

Header File

- components/protocomm/include/transports/protocomm_ble.h

Functions

esp_err_t protocomm_ble_start (protocomm_t *pc, const protocomm_ble_config_t *config)
    Start Bluetooth Low Energy based transport layer for provisioning.
    Initialize and start required BLE service for provisioning. This includes the initialization for characteristics/service for BLE.
    Return
        • ESP_OK : Success
        • ESP_FAIL : Simple BLE start error
        • ESP_ERR_NO_MEM : Error allocating memory for internal resources
        • ESP_ERR_INVALID_STATE : Error in ble config
        • ESP_ERR_INVALID_ARG : Null arguments

Parameters

    • [in] pc: Protocomm instance pointer obtained from protocomm_new()
    • [in] config: Pointer to config structure for initializing BLE

esp_err_t protocomm_ble_stop (protocomm_t *pc)
    Stop Bluetooth Low Energy based transport layer for provisioning.
    Stops service/task responsible for BLE based interactions for provisioning
Note You might want to optionally reclaim memory from Bluetooth. Refer to the documentation of esp_bt_mem_release in that case.

Return

- ESP_OK : Success
- ESP_FAIL : Simple BLE stop error
- ESP_ERR_INVALID_ARG : Null / incorrect protocomm instance

Parameters

- [in] pc: Same protocomm instance that was passed to protocomm_ble_start()

Structures

struct name_uuid
This structure maps handler required by protocomm layer to UUIDs which are used to uniquely identify BLE characteristics from a smartphone or a similar client device.

Public Members

c

const char *name
Name of the handler, which is passed to protocomm layer

uint16_t uuid
UUID to be assigned to the BLE characteristic which is mapped to the handler

struct protocomm_ble_config
Config parameters for protocomm BLE service.

Public Members

c

char device_name[MAX_BLE_DEVNAME_LEN]
BLE device name being broadcast at the time of provisioning

uint8_t service_uuid[BLE_UUID128_VAL_LENGTH]
128 bit UUID of the provisioning service

uint8_t *manufacturer_data
BLE device manufacturer data pointer in advertisement

ssize_t manufacturer_data_len
BLE device manufacturer data length in advertisement

ssize_t nu_lookup_count
Number of entries in the Name-UUID lookup table

protocomm_ble_name_uuid_t *nu_lookup
Pointer to the Name-UUID lookup table

Macros

MAX_BLE_DEVNAME_LEN
BLE device name cannot be larger than this value 31 bytes (max scan response size) - 1 byte (length) - 1 byte (type) = 29 bytes

BLE_UUID128_VAL_LENGTH
Theoretically, the limit for max manufacturer length remains same as BLE device name i.e. 31 bytes (max scan response size) - 1 byte (length) - 1 byte (type) = 29 bytes However, manufacturer data goes along with BLE device name in scan response. So, it is important to understand the actual length should be smaller than (29 - (BLE device name length) - 2).
Type Definitions

```c
typedef struct name_uuid protocomm_ble_name_uuid_t
This structure maps handler required by protocomm layer to UUIDs which are used to uniquely identify BLE characteristics from a smartphone or a similar client device.
```

```c
typedef struct protocomm_ble_config protocomm_ble_config_t
Config parameters for protocomm BLE service.
```

2.5.2 Unified Provisioning

Overview

Unified provisioning support in the ESP-IDF provides an extensible mechanism to the developers to configure the device with the Wi-Fi credentials and/or other custom configuration using various transports and different security schemes. Depending on the use-case it provides a complete and ready solution for Wi-Fi network provisioning along with example iOS and Android applications. Or developers can extend the device-side and phone-app side implementations to accommodate their requirements for sending additional configuration data. Following are the important features of this implementation.

1. Extensible Protocol: The protocol is completely flexible and it offers the ability for the developers to send custom configuration in the provisioning process. The data representation too is left to the application to decide.
2. Transport Flexibility: The protocol can work on Wi-Fi (SoftAP + HTTP server) or on BLE as a transport protocol. The framework provides an ability to add support for any other transport easily as long as command-response behaviour can be supported on the transport.
3. Security Scheme Flexibility: It’s understood that each use-case may require different security scheme to secure the data that is exchanged in the provisioning process. Some applications may work with SoftAP that’s WPA2 protected or BLE with “just-works” security. Or the applications may consider the transport to be insecure and may want application level security. The unified provisioning framework allows application to choose the security as deemed suitable.
4. Compact Data Representation: The protocol uses Google Protobufs as a data representation for session setup and Wi-Fi provisioning. They provide a compact data representation and ability to parse the data in multiple programming languages in native format. Please note that this data representation is not forced on application specific data and the developers may choose the representation of their choice.

Typical Provisioning Process

Deciding on Transport

Unified provisioning subsystem supports Wi-Fi (SoftAP+HTTP server) and BLE (GATT based) transport schemes. Following points need to be considered while selecting the best possible transport for provisioning.

1. BLE based transport has an advantage that in the provisioning process, the BLE communication channel stays intact between the device and the client. That provides reliable provisioning feedback.
2. BLE based provisioning implementation makes the user-experience better from the phone apps as on Android and iOS both, the phone app can discover and connect to the device without requiring user to go out of the phone app
3. BLE transport however consumes ~110KB memory at runtime. If the product does not use the BLE or BT functionality after provisioning is done, almost all the memory can be reclaimed back and can be added into the heap.
4. SoftAP based transport is highly interoperable; however as the same radio is shared between SoftAP and Station interface, the transport is not reliable in the phase when the Wi-Fi connection to external AP is attempted. Also, the client may roam back to different network when the SoftAP changes the channel at the time of Station connection.
5. SoftAP transport does not require much additional memory for the Wi-Fi use-cases
6. SoftAP based provisioning requires the phone app user to go to “System Settings” to connect to Wi-Fi network hosted by the device in case of iOS. The discovery (scanning) as well as connection API is not available for the iOS applications.
Chapter 2. API Reference

Fig. 24: Typical Provisioning Process

1. Transport specific discovery and connection
   - Some form of beaoning
   - Client connects

2. Session Establishment
   - Get Version Request
   - Get Version Response
   - Session Setup Request
   - Session Setup Response
   - One or multiple steps as per protocol

3. Configuration
   - App specific Set Config (optional)
   - Set Config Response (optional)
   - Wi-Fi SetConfig(SSID, Pessphrase...)
     - Wi-Fi SetConfig response
     - Wi-Fi ApplyConfig cmd
       - Wi-Fi ApplyConfig resp
     - Wi-Fi GetStatus cmd (repeated)
       - Wi-Fi GetStatus resp (repeated)

4. Close connection
   - Close Connection
Deciding on Security

Depending on the transport and other constraints the security scheme needs to be selected by the application developers. Following considerations need to be given from the provisioning security perspective: 1. The configuration data sent from the client to the device and the response has to be secured. 2. The client should authenticate the device it is connected to. 3. The device manufacturer may choose proof-of-possession - a unique per device secret to be entered on the provisioning client as a security measure to make sure that the user can provisions the device in the possession.

There are two levels of security schemes. The developer may select one or combination depending on requirements.

1. Transport Security: SoftAP provisioning may choose WPA2 protected security with unique per-device passphrase. Per-device unique passphrase can also act as a proof-of-possession. For BLE, “just-works” security can be used as a transport level security after understanding the level of security it provides.

2. Application Security: The unified provisioning subsystem provides application level security (security1) that provides data protection and authentication (through proof-of-possession) if the application does not use the transport level security or if the transport level security is not sufficient for the use-case.

Device Discovery

The advertisement and device discovery is left to the application and depending on the protocol chosen, the phone apps and device firmware application can choose appropriate method to advertise and discovery.

For the SoftAP+HTTP transport, typically the SSID (network name) of the AP hosted by the device can be used for discovery.

For the BLE transport device name or primary service included in the advertisement or combination of both can be used for discovery.

Architecture

The below diagram shows architecture of unified provisioning.

It relies on the base layer called Protocol Communication (Protocol Communication) which provides a framework for security schemes and transport mechanisms. Wi-Fi Provisioning layer uses Protocomm to provide simple callbacks to the application for setting the configuration and getting the Wi-Fi status. The application has control over implementation of these callbacks. In addition application can directly use protocomm to register custom handlers.

Application creates a protocomm instance which is mapped to a specific transport and specific security scheme. Each transport in the protocomm has a concept of an “end-point” which corresponds to logical channel for communication for specific type of information. For example security handshake happens on a different endpoint than the Wi-Fi configuration endpoint. Each end-point is identified using a string and depending on the transport internal representation of the end-point changes. In case of SoftAP+HTTP transport the end-point corresponds to URI whereas in case of BLE the end-point corresponds to GATT characteristic with specific UUID. Developers can create custom end-points and implement handler for the data that is received or sent over the same end-point.

Security Schemes

At present unified provisioning supports two security schemes: 1. Security0 - No security (No encryption) 2. Security1 - Curve25519 based key exchange, shared key derivation and AES256-CTR mode encryption of the data. It supports two modes:

a. Authorized - Proof of Possession (PoP) string used to authorize session and derive shared key
b. No Auth (Null PoP) - Shared key derived through key exchange only

Security1 scheme details are shown in the below sequence diagram
Sample Code

Please refer to Protocol Communication and Wi-Fi Provisioning for API guides and code snippets on example usage. Application implementation can be found as an example under provisioning.

Provisioning Tools

Provisioning applications are available for various platforms, along with source code:

- **Android**:
  - BLE Provisioning app on Play Store.
  - SoftAP Provisioning app on Play Store.
  - Source code on GitHub: esp-idf-provisioning-android.

- **iOS**:
  - BLE Provisioning app on app store.
  - SoftAP Provisioning app on app Store.
  - Source code on GitHub: esp-idf-provisioning-ios.

- **Linux/MacOS/Windows**: tools/esp_prov (a python based command line tool for provisioning)

The phone applications offer simple UI and thus more user centric, while the command line application is useful as a debugging tool for developers.

### 2.5.3 Wi-Fi Provisioning

**Overview**

This component provides APIs that control Wi-Fi provisioning service for receiving and configuring Wi-Fi credentials over SoftAP or BLE transport via secure Protocol Communication (protocomm) sessions. The set of
Fig. 26: Security1
**Chapter 2. API Reference**

`wifi_prov_mgr_` APIs help in quickly implementing a provisioning service having necessary features with minimal amount of code and sufficient flexibility.

### Initialization

`wifi_prov_mgr_init()` is called to configure and initialize the provisioning manager and thus this must be called prior to invoking any other `wifi_prov_mgr_` APIs. Note that the manager relies on other components of IDF, namely NVS, TCP/IP, Event Loop and Wi-Fi (and optionally mDNS), hence these must be initialized beforehand. The manager can be de-initialized at any moment by making a call to `wifi_prov_mgr_deinit()`.

```c
wifi_prov_mgr_config_t config = {
    .scheme = wifi_prov_scheme_ble,
    .scheme_event_handler = WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BTDM
};
ESP_ERROR_CHECK( wifi_prov_mgr_init(config) );
```

The configuration structure `wifi_prov_mgr_config_t` has a few fields to specify the behavior desired of the manager:

- **scheme**: This is used to specify the provisioning scheme. Each scheme corresponds to one of the modes of transport supported by protocomm. Hence, we have three options:
  - `wifi_prov_scheme_ble`: BLE transport and GATT Server for handling provisioning commands
  - `wifi_prov_scheme_softap`: Wi-Fi SoftAP transport and HTTP Server for handling provisioning commands
  - `wifi_prov_scheme_console`: Serial transport and console for handling provisioning commands
- **scheme_event_handler**: An event handler defined along with scheme. Choosing appropriate scheme specific event handler allows the manager to take care of certain matters automatically. Presently this is not used for either SoftAP or Console based provisioning, but is very convenient for BLE. To understand how, we must recall that Bluetooth requires quite some amount of memory to function and once provisioning is finished, the main application may want to reclaim back this memory (or part of it, if it needs to use either BLE or classic BT). Also, upon every future re-boot of a provisioned device, this reclamation of memory needs to be performed again. To reduce this complication in using `wifi_prov_scheme_ble`, the scheme specific handlers have been defined, and depending upon the chosen handler, the BLE / classic BT / BTDM memory will be freed automatically when the provisioning manager is de-initialized. The available options are:
  - `WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BTDM` - Free both classic BT and BLE (BTDM) memory. Used when main application doesn’t require Bluetooth at all.
  - `WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BLE` - Free only BLE memory. Used when main application requires classic BT.
  - `WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BT` - Free only classic BT. Used when main application requires BLE. In this case freeing happens right when the manager is initialized.
  - `WIFI_PROV_EVENT_HANDLER_NONE` - Don’t use any scheme specific handler. Used when provisioning scheme is not BLE (i.e. SoftAP or Console), or when main application wants to handle the memory reclaiming on its own, or needs both BLE and classic BT to function.
- **app_event_handler** (Deprecated): It is now recommended to catch `WIFI_PROV_EVENT`’s that are emitted to the default event loop handler. See definition of ```wifi_prov_cb_event_t``` for the list of events that are generated by the provisioning service. Here is an excerpt showing some of the provisioning events:

```c
static void event_handler(void* arg, esp_event_base_t event_base, int event_id, void* event_data)
{
    if (event_base == WIFI_PROV_EVENT) {
        switch (event_id) {
            case WIFI_PROV_START:
                ESP_LOGI(TAG, "Provisioning started");
```

(continues on next page)
Chapter 2. API Reference

(continued from previous page)

```c
break;

case WIFI_PROV_CRED_RECV:
    wifi_sta_config_t *wifi_stacfg = (wifi_sta_config_t *)event_data;
    ESP_LOGI(TAG, "Received Wi-Fi credentials
           SSID : \%s
           Password : \%s",
           (const char *)wifi_stacfg->ssid,
           (const char *)wifi_stacfg->password);
    break;

    ...

    break;

    case WIFI_PROV_CRED_FAIL:
        wifi_prov_sta_fail_reason_t *reason = (wifi_prov_sta_fail_reason_t *)event_data;
        ESP_LOGE(TAG, "Provisioning failed!
                  Reason : \%s"
                  " \n                  Please reset to factory and retry
                  \n                  Provisioning",
                  (*reason == WIFI_PROV_STA_AUTH_ERROR) ? "Wi-Fi station authentication failed" : "Wi-Fi
                  access-point not found");
        break;

    case WIFI_PROV_CRED_SUCCESS:
        ESP_LOGI(TAG, "Provisioning successful");
        break;

    case WIFI_PROV_END:
        /* De-initialize manager once provisioning is finished */
        wifi_prov_mgr_deinit();
        break;

    default:
        break;
}
```

The manager can be de-initialized at any moment by making a call to `wifi_prov_mgr_deinit()`.

**Check Provisioning State** Whether device is provisioned or not can be checked at runtime by calling `wifi_prov_mgr_is_provisioned()`. This internally checks if the Wi-Fi credentials are stored in NVS.

Note that presently manager does not have its own NVS namespace for storage of Wi-Fi credentials, instead it relies on the esp_wifi APIs to set and get the credentials stored in NVS from the default location.

If provisioning state needs to be reset, any of the following approaches may be taken:

- the associated part of NVS partition has to be erased manually
- main application must implement some logic to call esp_wifi APIs for erasing the credentials at runtime
- main application must implement some logic to force start the provisioning irrespective of the provisioning state

```c
bool provisioned = false;
ESP_ERROR_CHECK( wifi_prov_mgr_is_provisioned(&provisioned) );
```

**Start Provisioning Service** At the time of starting provisioning we need to specify a service name and the corresponding key. These translate to:

- Wi-Fi SoftAP SSID and passphrase, respectively, when scheme is `wifi_prov_scheme_softap`
- BLE Device name (service key is ignored) when scheme is `wifi_prov_scheme_ble`

Also, since internally the manager uses `protocomm`, we have the option of choosing one of the security features provided by it:
Chapter 2. API Reference

- Security 1 is secure communication which consists of a prior handshake involving X25519 key exchange along with authentication using a proof of possession (pop), followed by AES-CTR for encryption/decryption of subsequent messages
- Security 0 is simply plain text communication. In this case the pop is simply ignored

See Provisioning for details about the security features.

```c
const char *service_name = "my_device";
const char *service_key = "password";

wifi_prov_security_t security = WIFI_PROV_SECURITY_1;
const char *pop = "abcd1234";

ESP_ERROR_CHECK( wifi_prov_mgr_start_provisioning(security, pop, service_name, service_key) );
```

The provisioning service will automatically finish only if it receives valid Wi-Fi AP credentials followed by successfully connection of device to the AP (IP obtained). Regardless of that, the provisioning service can be stopped at any moment by making a call to `wifi_prov_mgr_stop_provisioning()`.

**Note:** If the device fails to connect with the provided credentials, it won’t accept new credentials anymore, but the provisioning service will keep on running (only to convey failure to the client), until the device is restarted. Upon restart the provisioning state will turn out to be true this time (as credentials will be found in NVS), but device will again fail to connect with those same credentials (unless an AP with the matching credentials somehow does become available). This situation can be fixed by resetting the credentials in NVS or force starting the provisioning service. This has been explained above in Check Provisioning State.

**Waiting For Completion** Typically, the main application will wait for the provisioning to finish, then de-initialize the manager to free up resources and finally start executing its own logic.

There are two ways for making this possible. The simpler way is to use a blocking call to `wifi_prov_mgr_wait()`.

```c
// Start provisioning service
ESP_ERROR_CHECK( wifi_prov_mgr_start_provisioning(security, pop, service_name, service_key) );

// Wait for service to complete
wifi_prov_mgr_wait();

// Finally de-initialize the manager
wifi_prov_mgr_deinit();
```

The other way is to use the default event loop handler to catch `WIFI_PROV_EVENT`'s and call :cpp:func:`wifi_prov_mgr_deinit()` when event ID is `WIFI_PROV_END`:

```c
static void event_handler(void* arg, esp_event_base_t event_base, int event_id, void* event_data)
{
    if (event_base == WIFI_PROV_EVENT && event_id == WIFI_PROV_END) {
        /* De-initialize manager once provisioning is finished */
        wifi_prov_mgr_deinit();
    }
}
```

**User Side Implementation** When the service is started, the device to be provisioned is identified by the advertised service name which, depending upon the selected transport, is either the BLE device name or the SoftAP SSID.
When using SoftAP transport, for allowing service discovery, mDNS must be initialized before starting provisioning. In this case the hostname set by the main application is used, and the service type is internally set to \_esp_wifi_prov.

When using BLE transport, a custom 128 bit UUID should be set using \textit{wifi_prov_scheme_ble_set_service_uuid()}. This UUID will be included in the BLE advertisement and will correspond to the primary GATT service that provides provisioning endpoints as GATT characteristics. Each GATT characteristic will be formed using the primary service UUID as base, with different auto assigned 12th and 13th bytes (assume counting starts from 0th byte). Since, an endpoint characteristic UUID is auto assigned, it shouldn’t be used to identify the endpoint. Instead, client side applications should identify the endpoints by reading the User Characteristic Description (0x2901) descriptor for each characteristic, which contains the endpoint name of the characteristic. For example, if the service UUID is set to 55cc035e-fb27-4f80-be02-3c608288b7451, each endpoint characteristic will be assigned a UUID like 55cc____-fb27-4f80-be02-3c608288b7451, with unique values at the 12th and 13th bytes.

Once connected to the device, the provisioning related protocomm endpoints can be identified as follows:

<table>
<thead>
<tr>
<th>Endpoint Name (BLE + GATT Server)</th>
<th>URI (SoftAP + HTTP Server + mDNS)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>prov-session</td>
<td>http://&lt;mdns-hostname&gt;.local/prov-session</td>
<td>Security endpoint used for session establishment</td>
</tr>
<tr>
<td>prov-scan</td>
<td><a href="http://wifi-prov.local/prov-scan">http://wifi-prov.local/prov-scan</a></td>
<td>Endpoint used for starting Wi-Fi scan and receiving scan results</td>
</tr>
<tr>
<td>prov-config</td>
<td>http://&lt;mdns-hostname&gt;.local/prov-config</td>
<td>Endpoint used for configuring Wi-Fi credentials on device</td>
</tr>
<tr>
<td>proto-ver</td>
<td>http://&lt;mdns-hostname&gt;.local/proto-ver</td>
<td>Endpoint for retrieving version info</td>
</tr>
</tbody>
</table>

Immediately after connecting, the client application may fetch the version / capabilities information from the \textit{proto-ver} endpoint. All communications to this endpoint are un-encrypted, hence necessary information (that may be relevant for deciding compatibility) can be retrieved before establishing a secure session. The response is in JSON format and looks like: \texttt{prov: \{ ver: v1.1, cap: [no_pop] \}, my_app: \{ ver: 1.345, cap: [cloud, local_ctrl] \}, \ldots}. Here label \texttt{prov} provides provisioning service version (\texttt{ver}) and capabilities (\texttt{cap}). For now, only \texttt{no_pop} capability is supported, which indicates that the service doesn’t require proof of possession for authentication. Any application related version / capabilities will be given by other labels (like \texttt{my_app} in this example). These additional fields are set using \textit{wifi_prov_mgr_set_app_info()}. User side applications need to implement the signature handshaking required for establishing and authenticating secure protocomm sessions as per the security scheme configured for use (this is not needed when manager is configured to use protocomm security 0).

See Unified Provisioning for more details about the secure handshake and encryption used. Applications must use the \texttt{.proto} files found under \texttt{protocomm/proto}, which define the Protobuf message structures supported by \texttt{prov-session} endpoint.

Once a session is established, Wi-Fi credentials are configured using the following set of \textit{wifi_config} commands, serialized as Protobuf messages (the corresponding \texttt{.proto} files can be found under \texttt{wifi_provisioning/proto}):

- \texttt{get_status} - For querying the Wi-Fi connection status. The device will respond with a status which will be one of connecting / connected / disconnected. If status is disconnected, a disconnection reason will also be included in the status response.
- \texttt{set_config} - For setting the Wi-Fi connection credentials
- \texttt{apply_config} - For applying the credentials saved during \texttt{set_config} and start the Wi-Fi station

After session establishment, client can also request Wi-Fi scan results from the device. The results returned is a list of AP SSIDs, sorted in descending order of signal strength. This allows client applications to display APs nearby to the device at the time of provisioning, and users can select one of the SSIDs and provide the password which is
then sent using the `wifi_config` commands described above. The `wifi_scan` endpoint supports the following protobuf commands:

- **scan_start** - For starting Wi-Fi scan with various options:
  - `blocking` (input) - If true, the command returns only when the scanning is finished
  - `passive` (input) - If true scan is started in passive mode (this may be slower) instead of active mode
  - `group_channels` (input) - This specifies whether to scan all channels in one go (when zero) or perform scanning of channels in groups, with 120ms delay between scanning of consecutive groups, and the value of this parameter sets the number of channels in each group. This is useful when transport mode is SoftAP, where scanning all channels in one go may not give the Wi-Fi driver enough time to send out beacons, and hence may cause disconnection with any connected stations. When scanning in groups, the manager will wait for at least 120ms after completing scan on a group of channels, and thus allow the driver to send out the beacons. For example, given that the total number of Wi-Fi channels is 14, then setting `group_channels` to 4, will create 5 groups, with each group having 3 channels, except the last one which will have 14 % 3 = 2 channels. So, when scan is started, the first 3 channels will be scanned, followed by a 120ms delay, and then the next 3 channels, and so on, until all the 14 channels have been scanned. One may need to adjust this parameter as having only few channels in a group may slow down the overall scan time, while having too many may again cause disconnection. Usually a value of 4 should work for most cases. Note that for any other mode of transport, e.g. BLE, this can be safely set to 0, and hence achieve the fastest overall scanning time.
  - `period_ms` (input) - Scan parameter specifying how long to wait on each channel
- **scan_status** - Gives the status of scanning process:
  - `scan_finished` (output) - When scan has finished this returns true
  - `result_count` (output) - This gives the total number of results obtained till now. If scan is yet happening this number will keep on updating
- **scan_result** - For fetching scan results. This can be called even if scan is still on going:
  - `start_index` (input) - Starting index from where to fetch the entries from the results list
  - `count` (input) - Number of entries to fetch from the starting index
  - `entries` (output) - List of entries returned. Each entry consists of `ssid`, `channel` and `rssi` information

**Additional Endpoints** In case users want to have some additional protocomm endpoints customized to their requirements, this is done in two steps. First is creation of an endpoint with a specific name, and the second step is the registration of a handler for this endpoint. See `protocomm` for the function signature of an endpoint handler. A custom endpoint must be created after initialization and before starting the provisioning service. Whereas, the protocomm handler is registered for this endpoint only after starting the provisioning service.

```c
wifi_prov_mgr_init(config);
wifi_prov_mgr_endpoint_create("custom-endpoint");
wifi_prov_mgr_start_provisioning(security, pop, service_name, service_,
  key);
wifi_prov_mgr_endpoint_register("custom-endpoint", custom_ep_handler,
  custom_ep_data);
```

When the provisioning service stops, the endpoint is unregistered automatically.

One can also choose to call `wifi_prov_mgr_endpoint_unregister()` to manually deactivate an endpoint at runtime. This can also be used to deactivate the internal endpoints used by the provisioning service.

**When / How To Stop Provisioning Service?** The default behavior is that once the device successfully connects using the Wi-Fi credentials set by the `apply_config` command, the provisioning service will be stopped (and BLE / SoftAP turned off) automatically after responding to the next `get_status` command. If `get_status` command is not received by the device, the service will be stopped after a 30s timeout.

On the other hand, if device was not able to connect using the provided Wi-Fi credentials, due to incorrect SSID / passphrase, the service will keep running, and `get_status` will keep responding with disconnected status and reason for disconnection. Any further attempts to provide another set of Wi-Fi credentials, will be rejected. These credentials will be preserved, unless the provisioning service is force started, or NVS erased.

If this default behavior is not desired, it can be disabled by calling `wifi_prov_mgr_disable_auto_stop()`. Now the provisioning service will only be stopped after an explicit call to
wifi_prov_mgr_stop_provisioning(), which returns immediately after scheduling a task for stopping the service. The service stops after a certain delay and WIFI_PROV_END event gets emitted. This delay is specified by the argument to wifi_prov_mgr_disable_auto_stop().

The customized behavior is useful for applications which want the provisioning service to be stopped some time after the Wi-Fi connection is successfully established. For example, if the application requires the device to connect to some cloud service and obtain another set of credentials, and exchange this credentials over a custom protocomm endpoint, then after successfully doing so stop the provisioning service by calling wifi_prov_mgr_stop_provisioning() inside the protocomm handler itself. The right amount of delay ensures that the transport resources are freed only after the response from the protocomm handler reaches the client side application.

Application Examples

For complete example implementation see provisioning/wifi_prov_mgr

Provisioning Tools

Provisioning applications are available for various platforms, along with source code:

- **Android:**
  - BLE Provisioning app on Play Store.
  - SoftAP Provisioning app on Play Store.
  - Source code on GitHub: esp-idf-provisioning-android.
- **iOS:**
  - BLE Provisioning app on app store.
  - SoftAP Provisioning app on app Store.
  - Source code on GitHub: esp-idf-provisioning-ios.
- **Linux/MacOS/Windows:** tools/esp_prov (a python based command line tool for provisioning)

The phone applications offer simple UI and thus more user centric, while the command line application is useful as a debugging tool for developers.

API Reference

Header File

- components/wifi_provisioning/include/wifi_provisioning/manager.h

Functions

```
esp_err_t wifi_prov_mgr_init(wifi_prov_mgr_config_t config)
```

Initialize provisioning manager instance.

- Configures the manager and allocates internal resources
- Configuration specifies the provisioning scheme (transport) and event handlers
- Event WIFI_PROV_INIT is emitted right after initialization is complete

Return

- ESP_OK : Success
- ESP_FAIL : Fail

Parameters

- [in] config: Configuration structure

```
void wifi_prov_mgr_deinit(void)
```

Stop provisioning (if running) and release resource used by the manager.

- Event WIFI_PROV_DEINIT is emitted right after de-initialization is finished
Chapter 2. API Reference

If provisioning service is still active when this API is called, it first stops the service, hence emitting WIFI_PROV_END, and then performs the de-initialization.

```c
esp_err_t wifi_prov_mgr_is_provisioned (bool *provisioned)
```

Checks if device is provisioned.

This checks if Wi-Fi credentials are present on the NVS.

The Wi-Fi credentials are assumed to be kept in the same NVS namespace as used by esp_wifi component.

If one were to call esp_wifi_set_config() directly instead of going through the provisioning process, this function will still yield true (i.e. device will be found to be provisioned).

**Note** Calling wifi_prov_mgr_start_provisioning() automatically resets the provision state, irrespective of what the state was prior to making the call.

Return

- **ESP_OK**: Retrieved provision state successfully
- **ESP_FAIL**: Wi-Fi not initialized
- **ESP_ERR_INVALID_ARG**: Null arguments supplied
- **ESP_ERR_INVALID_STATE**: Manager not initialized

Parameters

- [out] **provisioned**: True if provisioned, else false

```c
esp_err_t wifi_prov_mgr_start_provisioning (wifi_prov_security_t security, const char *pop, const char *service_name, const char *service_key)
```

Start provisioning service.

This starts the provisioning service according to the scheme configured at the time of initialization. For scheme:

- **wifi_prov_scheme_ble**: This starts protocomm_ble, which internally initializes BLE transport and starts GATT server for handling provisioning requests.
- **wifi_prov_scheme_softap**: This activates SoftAP mode of Wi-Fi and starts protocomm_httpd, which internally starts an HTTP server for handling provisioning requests (If mDNS is active it also starts advertising service with type _esp_wifi_prov._tcp)

Event WIFI_PROV_START is emitted right after provisioning starts without failure.

**Note** This API will start provisioning service even if device is found to be already provisioned, i.e. wifi_prov_mgr_is_provisioned() yields true.

Return

- **ESP_OK**: Provisioning started successfully
- **ESP_FAIL**: Failed to start provisioning service
- **ESP_ERR_INVALID_STATE**: Provisioning manager not initialized or already started

Parameters

- [in] **security**: Specify which protocomm security scheme to use:
  - **WIFI_PROV_SECURITY_0**: For no security
  - **WIFI_PROV_SECURITY_1**: x25519 secure handshake for session establishment followed by AES-CTR encryption of provisioning messages
- [in] **pop**: Pointer to proof of possession string (NULL if not needed). This is relevant only for protocomm security 1, in which case it is used for authenticating secure session
- [in] **service_name**: Unique name of the service. This translates to:
  - Wi-Fi SSID when provisioning mode is softAP
  - Device name when provisioning mode is BLE
- [in] **service_key**: Key required by client to access the service (NULL if not needed). This translates to:
  - Wi-Fi password when provisioning mode is softAP
  - ignored when provisioning mode is BLE

```c
void wifi_prov_mgr_stop_provisioning (void)
```

Stop provisioning service.
If provisioning service is active, this API will initiate a process to stop the service and return. Once the service actually stops, the event WIFI_PROV_END will be emitted.

If wifi_prov_mgr_deinit() is called without calling this API first, it will automatically stop the provisioning service and emit the WIFI_PROV_END, followed by WIFI_PROV_DEINIT, before returning.

This API will generally be used along with wifi_prov_mgr_disable_auto_stop() in the scenario when the main application has registered its own endpoints, and wishes that the provisioning service is stopped only when some protocomm command from the client side application is received.

Calling this API inside an endpoint handler, with sufficient cleanup_delay, will allow the response / acknowledgment to be sent successfully before the underlying protocomm service is stopped.

Cleanup_delay is set when calling wifi_prov_mgr_disable_auto_stop(). If not specified, it defaults to 1000ms.

For straightforward cases, using this API is usually not necessary as provisioning is stopped automatically once WIFI_PROV_CRED_SUCCESS is emitted. Stopping is delayed (maximum 30 seconds) thus allowing the client side application to query for Wi-Fi state, i.e. after receiving the first query and sending Wi-Fi state connected response the service is stopped immediately.

```c
void wifi_prov_mgr_wait (void)
```

Wait for provisioning service to finish.

Calling this API will block until provisioning service is stopped i.e. till event WIFI_PROV_END is emitted.

This will not block if provisioning is not started or not initialized.

```c
esp_err_t wifi_prov_mgr_disable_auto_stop (uint32_t cleanup_delay)
```

Disable auto stopping of provisioning service upon completion.

By default, once provisioning is complete, the provisioning service is automatically stopped, and all endpoints (along with those registered by main application) are deactivated.

This API is useful in the case when main application wishes to close provisioning service only after it receives some protocomm command from the client side app. For example, after connecting to Wi-Fi, the device may want to connect to the cloud, and only once that is successfully, the device is said to be fully configured. But, then it is up to the main application to explicitly call wifi_prov_mgr_stop_provisioning() later when the device is fully configured and the provisioning service is no longer required.

**Note** This must be called before executing wifi_prov_mgr_start_provisioning()

**Return**
- ESP_OK : Success
- ESP_ERR_INVALID_STATE : Manager not initialized or provisioning service already started

**Parameters**
- [in] cleanup_delay: Sets the delay after which the actual cleanup of transport related resources is done after a call to wifi_prov_mgr_stop_provisioning() returns. Minimum allowed value is 100ms. If not specified, this will default to 1000ms.

```c
esp_err_t wifi_prov_mgr_set_app_info (const char *label, const char *version, const char **capabilities, size_t total_capabilities)
```

Set application version and capabilities in the JSON data returned by proto-ver endpoint.

This function can be called multiple times, to specify information about the various application specific services running on the device, identified by unique labels.

The provisioning service itself registers an entry in the JSON data, by the label “prov”, containing only provisioning service version and capabilities. Application services should use a label other than “prov” so as not to overwrite this.

**Note** This must be called before executing wifi_prov_mgr_start_provisioning()

**Return**
- ESP_OK : Success
- ESP_ERR_INVALID_STATE : Manager not initialized or provisioning service already started
- ESP_ERR_NO_MEM : Failed to allocate memory for version string
- ESP_ERR_INVALID_ARG : Null argument

**Parameters**
Chapter 2. API Reference

- [in] **label**: String indicating the application name.
- [in] **version**: String indicating the application version. There is no constraint on format.
- [in] **capabilities**: Array of strings with capabilities. These could be used by the client side app to know the application registered endpoint capabilities
- [in] **total_capabilities**: Size of capabilities array

```c
esp_err_t wifi_prov_mgr_endpoint_create(const char *ep_name)
```
Create an additional endpoint and allocate internal resources for it.

This API is to be called by the application if it wants to create an additional endpoint. All additional endpoints will be assigned UUIDs starting from 0xFF54 and so on in the order of execution.

protocomm handler for the created endpoint is to be registered later using `wifi_prov_mgr_endpoint_register()` after provisioning has started.

**Note** This API can only be called BEFORE provisioning is started

**Note** Additional endpoints can be used for configuring client provided parameters other than Wi-Fi credentials, that are necessary for the main application and hence must be set prior to starting the application

**Note** After session establishment, the additional endpoints must be targeted first by the client side application before sending Wi-Fi configuration, because once Wi-Fi configuration finishes the provisioning service is stopped and hence all endpoints are unregistered

**Return**
- ESP_OK : Success
- ESP_FAIL : Failure

**Parameters**
- [in] **ep_name**: unique name of the endpoint

```c
esp_err_t wifi_prov_mgr_endpoint_register(const char *ep_name, protocomm_req_handler_t handler, void *user_ctx)
```
Register a handler for the previously created endpoint.

This API can be called by the application to register a protocomm handler to any endpoint that was created using `wifi_prov_mgr_endpoint_create()`.

**Note** This API can only be called AFTER provisioning has started

**Note** Additional endpoints can be used for configuring client provided parameters other than Wi-Fi credentials, that are necessary for the main application and hence must be set prior to starting the application

**Note** After session establishment, the additional endpoints must be targeted first by the client side application before sending Wi-Fi configuration, because once Wi-Fi configuration finishes the provisioning service is stopped and hence all endpoints are unregistered

**Return**
- ESP_OK : Success
- ESP_FAIL : Failure

**Parameters**
- [in] **ep_name**: Name of the endpoint
- [in] **handler**: Endpoint handler function
- [in] **user_ctx**: User data

```c
void wifi_prov_mgr_endpoint_unregister(const char *ep_name)
```
Unregister the handler for an endpoint.

This API can be called if the application wants to selectively unregister the handler of an endpoint while the provisioning is still in progress.

All the endpoint handlers are unregistered automatically when the provisioning stops.

**Parameters**
- [in] **ep_name**: Name of the endpoint

```c
esp_err_t wifi_prov_mgr_event_handler(void *ctx, system_event_t *event)
```
Event handler for provisioning manager.

This is called from the main event handler and controls the provisioning manager’s internal state machine depending on incoming Wi-Fi events
Note: This function is DEPRECATED, because events are now handled internally using the event loop library, esp_event. Calling this will do nothing and simply return ESP_OK.

**Return**
- ESP_OK: Event handled successfully

**Parameters**
- [in] ctx: Event context data
- [in] event: Event info

```c
esp_err_t wifi_prov_mgr_get_wifi_state (wifi_prov_sta_state_t *state)
```

Get state of Wi-Fi Station during provisioning.

**Return**
- ESP_OK: Successfully retrieved Wi-Fi state
- ESP_FAIL: Provisioning app not running

**Parameters**
- [out] state: Pointer to wifi_prov_sta_state_t variable to be filled

```c
esp_err_t wifi_prov_mgr_get_wifi_disconnect_reason (wifi_prov_sta_fail_reason_t *reason)
```

Get reason code in case of Wi-Fi station disconnection during provisioning.

**Return**
- ESP_OK: Successfully retrieved Wi-Fi disconnect reason
- ESP_FAIL: Provisioning app not running

**Parameters**
- [out] reason: Pointer to wifi_prov_sta_fail_reason_t variable to be filled

```c
esp_err_t wifi_prov_mgr_configure_sta (wifi_config_t *wifi_cfg)
```

Runs Wi-Fi as Station with the supplied configuration.

Configures the Wi-Fi station mode to connect to the AP with SSID and password specified in config structure and sets Wi-Fi to run as station.

This is automatically called by provisioning service upon receiving new credentials.

If credentials are to be supplied to the manager via a different mode other than through protocomm, then this API needs to be called.

Event WIFI_PROV_CRED_RECV is emitted after credentials have been applied and Wi-Fi station started

**Return**
- ESP_OK: Wi-Fi configured and started successfully
- ESP_FAIL: Failed to set configuration

**Parameters**
- [in] wifi_cfg: Pointer to Wi-Fi configuration structure

```c
esp_err_t wifi_prov_mgr_reset_provisioning (void)
```

Reset Wi-Fi provisioning config.

Calling this API will restore WiFi stack persistent settings to default values.

**Return**
- ESP_OK: Reset provisioning config successfully
- ESP_FAIL: Failed to reset provisioning config

```c
esp_err_t wifi_prov_mgr_reset_sm_state_on_failure (void)
```

Reset internal state machine and clear provisioned credentials.

This API can be used to restart provisioning in case invalid credentials are entered.

**Return**
- ESP_OK: Reset provisioning state machine successfully
- ESP_FAIL: Failed to reset provisioning state machine
- ESP_ERR_INVALID_STATE: Manager not initialized
Chapter 2. API Reference

Structures

struct wifi_prov_event_handler_t
Event handler that is used by the manager while provisioning service is active.

Public Members

wifi_prov_cb_func_t event_cb
Callback function to be executed on provisioning events

void *user_data
User context data to pass as parameter to callback function

struct wifi_prov_scheme
Structure for specifying the provisioning scheme to be followed by the manager.

Note Ready to use schemes are available:

• wifi_prov_scheme_ble: for provisioning over BLE transport + GATT server
• wifi_prov_scheme_softap: for provisioning over SoftAP transport + HTTP server
• wifi_prov_scheme_console: for provisioning over Serial UART transport + Console (for debugging)

Public Members

esp_err_t (*prov_start) (protocomm_t *pc, void *config)
Function which is to be called by the manager when it is to start the provisioning service associated with a protocomm instance and a scheme specific configuration

esp_err_t (*prov_stop) (protocomm_t *pc)
Function which is to be called by the manager to stop the provisioning service previously associated with a protocomm instance

void *(new_config) (void)
Function which is to be called by the manager to generate a new configuration for the provisioning service, that is to be passed to prov_start()

void *(delete_config) (void *config)
Function which is to be called by the manager to delete a configuration generated using new_config()

esp_err_t (*set_config_service) (void *config, const char *service_name, const char *service_key)
Function which is to be called by the manager to set the service name and key values in the configuration structure

esp_err_t (*set_config_endpoint) (void *config, const char *endpoint_name, uint16_t uuid)
Function which is to be called by the manager to set a protocomm endpoint with an identifying name and UUID in the configuration structure

wifi_mode_t wifi_mode
Sets mode of operation of Wi-Fi during provisioning This is set to :

• WIFI_MODE_APSTA for SoftAP transport
• WIFI_MODE_STA for BLE transport

struct wifi_prov_mgr_config_t
Structure for specifying the manager configuration.

Public Members

wifi_prov_scheme_t scheme
Provisioning scheme to use. Following schemes are already available:

• wifi_prov_scheme_ble: for provisioning over BLE transport + GATT server
• wifi_prov_scheme_softap : for provisioning over SoftAP transport + HTTP server + mDNS (optional)
• wifi_prov_scheme_console : for provisioning over Serial UART transport + Console (for debugging)

**wifi_prov_event_handler_t scheme_event_handler**
Event handler required by the scheme for incorporating scheme specific behavior while provisioning manager is running. Various options may be provided by the scheme for setting this field. Use WIFI_PROV_EVENT_HANDLER_NONE when not used. When using scheme wifi_prov_scheme_ble, the following options are available:
• WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BTDM
• WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BLE
• WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BT

**wifi_prov_event_handler_t app_event_handler**
Event handler that can be set for the purpose of incorporating application specific behavior. Use WIFI_PROV_EVENT_HANDLER_NONE when not used.

**Macros**

**WIFI_PROV_EVENT_HANDLER_NONE**
Event handler can be set to none if not used.

**Type Definitions**

typedef void (*wifi_prov_cb_func_t)(void *user_data, wifi_prov_cb_event_t event, void *event_data)

typedef struct wifi_prov_scheme wifi_prov_scheme_t
Structure for specifying the provisioning scheme to be followed by the manager.

**Note** Ready to use schemes are available:
• wifi_prov_scheme_ble : for provisioning over BLE transport + GATT server
• wifi_prov_scheme_softap : for provisioning over SoftAP transport + HTTP server
• wifi_prov_scheme_console : for provisioning over Serial UART transport + Console (for debugging)

typedef enum wifi_prov_security wifi_prov_security_t
Security modes supported by the Provisioning Manager.
These are same as the security modes provided by protocomm

**Enumerations**

typedef enum wifi_prov_cb_event_t
Events generated by manager.

These events are generated in order of declaration and, for the stretch of time between initialization and de-initialization of the manager, each event is signaled only once.

**Values:**

**WIFI_PROV_INIT**
Emitted when the manager is initialized

**WIFI_PROV_START**
Indicates that provisioning has started

**WIFI_PROV_CRED_RECV**
Emitted when Wi-Fi AP credentials are received via protocomm endpoint wifi_config. The event data in this case is a pointer to the corresponding wifi_sta_config_t structure

**WIFI_PROV_CRED_FAIL**
Emitted when device fails to connect to the AP of which the credentials were received earlier on event WIFI_PROV_CRED_RECV. The event data in this case is a pointer to the disconnection reason code with type wifi_prov_sta_fail_reason_t

**WIFI_PROV_CRED_SUCCESS**
Emitted when device successfully connects to the AP of which the credentials were received earlier on event WIFI_PROV_CRED_RECV

**WIFI_PROV_END**
Signals that provisioning service has stopped

**WIFI_PROV_DEINIT**
Signals that manager has been de-initialized

---

**enum wifi_prov_security**
Security modes supported by the Provisioning Manager.
These are same as the security modes provided by protocomm

**Values:**

**WIFI_PROV_SECURITY_0**
No security (plain-text communication)

**WIFI_PROV_SECURITY_1**
This secure communication mode consists of X25519 key exchange
- proof of possession (pop) based authentication
- AES-CTR encryption

---

**Header File**
- components/wifi_provisioning/include/wifi_provisioning/scheme_ble.h

---

**Functions**

**void wifi_prov_scheme_ble_event_cb_free_btdm**(void *user_data, wifi_prov_cb_event_t event, void *event_data)

**void wifi_prov_scheme_ble_event_cb_free_ble**(void *user_data, wifi_prov_cb_event_t event, void *event_data)

**void wifi_prov_scheme_ble_event_cb_free_bt**(void *user_data, wifi_prov_cb_event_t event, void *event_data)

**esp_err_t wifi_prov_scheme_ble_set_service_uuid**(uint8_t *uuid128)
Set the 128 bit GATT service UUID used for provisioning.

This API is used to override the default 128 bit provisioning service UUID, which is 0000fff-0000-1000-8000-00805f9b34fb.

This must be called before starting provisioning, i.e. before making a call to wifi_prov_mgr_start_provisioning(), otherwise the default UUID will be used.

**Note** The data being pointed to by the argument must be valid at least till provisioning is started. Upon start, the manager will store an internal copy of this UUID, and this data can be freed or invalidated afterwards.

**Return**
- ESP_OK : Success
- ESP_ERR_INVALID_ARG : Null argument

**Parameters**
- [in] uuid128: A custom 128 bit UUID

**esp_err_t wifi_prov_scheme_ble_set_mfg_data**(uint8_t *mfg_data, ssize_t mfg_data_len)
Set manufacturer specific data in scan response.

This must be called before starting provisioning, i.e. before making a call to wifi_prov_mgr_start_provisioning().

**Note** It is important to understand that length of custom manufacturer data should be within limits. The manufacturer data goes into scan response along with BLE device name. By default, BLE device name length is of 11 Bytes, however it can vary as per application use case. So, one has to honour the scan
response data size limits i.e. \((\text{mfg\_data\_len} + 2) < 31 - (\text{device\_name\_length} + 2)\). If the \text{mfg\_data\_len} exceeds this limit, the length will be truncated.

**Return**
- ESP_OK: Success
- ESP_ERR_INVALID_ARG: Null argument

**Parameters**
- [in] \text{mfg\_data}: Custom manufacturer data
- [in] \text{mfg\_data\_len}: Manufacturer data length

**Macros**
- WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BTDM
- WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BLE
- WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BT

**Header File**
- components/wifi_provisioning/include/wifi_provisioning/scheme_softap.h

**Functions**
void \text{wifi\_prov\_scheme\_softap\_set\_httpd\_handle}(\text{void* handle})

Provide HTTPD Server handle externally.

Useful in cases wherein applications need the webserver for some different operations, and do not want the wifi provisioning component to start/stop a new instance.

**Note** This API should be called before \text{wifi\_prov\_mgr\_start\_provisioning}()

**Parameters**
- [in] handle: Handle to HTTPD server instance

**Header File**
- components/wifi_provisioning/include/wifi_provisioning/scheme_console.h

**Functions**

```c
esp_err_t \text{wifi\_prov\_config\_data\_handler}(\text{uint32_t session\_id, const uint8_t *inbuf, ssize_t inlen, uint8_t **outbuf, ssize_t *outlen, void *priv\_data})
```

Handler for receiving and responding to requests from master.

This is to be registered as the \text{wifi\_config endpoint handler} (\text{protocomm proto- comm\_req\_handler\_t}) using \text{protocomm\_add\_endpoint}()

**Structures**

```c
struct \text{wifi\_prov\_sta\_conn\_info\_t}
```

WiFi STA connected status information.

**Public Members**

```c
char \text{ip\_addr}[\text{IP4ADDR\_STRLEN\_MAX}]
```

IP Address received by station
Chapter 2. API Reference

char **bssid**[6]
   BSSID of the AP to which connection was established

char **ssid**[33]
   SSID of the AP to which connection was established

uint8_t **channel**
   Channel of the AP

uint8_t **auth_mode**
   Authorization mode of the AP

struct wifi_prov_config_get_data_t
   WiFi status data to be sent in response to get_status request from master.

Public Members

**wifi_prov_sta_state_t** wifi_state
   WiFi state of the station

**wifi_prov_sta_fail_reason_t** fail_reason
   Reason for disconnection (valid only when wifi_state is WIFI_STATION_DISCONNECTED)

**wifi_prov_sta_conn_info_t** conn_info
   Connection information (valid only when wifi_state is WIFI_STATION_CONNECTED)

struct wifi_prov_config_set_data_t
   WiFi config data received by slave during set_config request from master.

Public Members

char **ssid**[33]
   SSID of the AP to which the slave is to be connected

char **password**[64]
   Password of the AP

char **bssid**[6]
   BSSID of the AP

uint8_t **channel**
   Channel of the AP

struct wifi_prov_config_handlers
   Internal handlers for receiving and responding to protocomm requests from master.

This is to be passed as priv_data for protocomm request handler (refer to wifi_prov_config_data_handler()) when calling protocomm_add_endpoint().

Public Members

```c
esp_err_t (**get_status_handler**) (wifi_prov_config_get_data_t *resp_data, wifi_prov_ctx_t **ctx)
```

Handler function called when connection status of the slave (in WiFi station mode) is requested

```c
esp_err_t (**set_config_handler**) (const wifi_prov_config_set_data_t *req_data, wifi_prov_ctx_t **ctx)
```

Handler function called when WiFi connection configuration (eg. AP SSID, password, etc.) of the slave (in WiFi station mode) is to be set to user provided values

```c
esp_err_t (**apply_config_handler**) (wifi_prov_ctx_t **ctx)
```

Handler function for applying the configuration that was set in set_config_handler. After applying the station may get connected to the AP or may fail to connect. The slave must be ready to convey the updated connection status information when get_status_handler is invoked again by the master.
```c
wifi_prov_ctx_t *ctx
Context pointer to be passed to above handler functions upon invocation
```

### Type Definitions

```c
typedef struct wifi_prov_ctx wifi_prov_ctx_t
Type of context data passed to each get/set/apply handler function set in wifi_prov_config_handlers structure.
```

This is passed as an opaque pointer, thereby allowing it be defined later in application code as per requirements.

```c
typedef struct wifi_prov_config_handlers wifi_prov_config_handlers_t
Internal handlers for receiving and responding to protocomm requests from master.
```

This is to be passed as priv_data for protocomm request handler (refer to wifi_prov_config_data_handler() when calling protocomm_add_endpoint()).

### Enumerations

```c
define wifi_prov_sta_state_t
WiFi STA status for conveying back to the provisioning master.
```

Values:

- `WIFI_PROV_STA_CONNECTING`
- `WIFI_PROV_STA_CONNECTED`
- `WIFI_PROV_STA_DISCONNECTED`

```c
define wifi_prov_sta_fail_reason_t
WiFi STA connection fail reason.
```

Values:

- `WIFI_PROV_STA_AUTH_ERROR`
- `WIFI_PROV_STA_AP_NOT_FOUND`

Code examples for above API are provided in the provisioning directory of ESP-IDF examples. Code example for above API is provided in wifi/smart_config Code example for above API is provided in wifi/wifi_easy_connect/dpp-enrollee

## 2.6 Storage API

### 2.6.1 FAT Filesystem Support
