- `mcpwm_carrier_config_t::duty_cycle` indicates the duty cycle of the carrier. Note that, the supported choices of the duty cycle are discrete, the driver searches for the nearest one based on your configuration.
- `mcpwm_carrier_config_t::first_pulse_duration_us` indicates the duration of the first pulse in microseconds. The resolution of the first pulse duration is determined by the carrier frequency you set in the `mcpwm_carrier_config_t::frequency_hz`. The first pulse duration can not be zero, and it has to be at least one period of the carrier. A longer pulse width can help conduct the inductance quicker.
- `mcpwm_carrier_config_t::invert_before_modulate` and `mcpwm_carrier_config_t::invert_after_modulate` set whether to invert the carrier output before and after modulation.

Specifically, the carrier submodule can be disabled by calling `mcpwm_operator_apply_carrier()` with a NULL configuration.

**Faults and Brake Actions**  The MCPWM operator is able to sense external signals with information about the failure of the motor, the power driver or any other device connected. These failure signals are encapsulated into MCPWM fault objects.

You should determine possible failure modes of the motor and what action should be performed on detection of a
particular fault, e.g., drive all outputs low for a brushed motor, lock current state for a stepper motor, etc. Because of this action, the motor should be put into a safe state to reduce the likelihood of damage caused by the fault.

**Set Operator Brake Mode on Fault** The way that MCPWM operator reacts to the fault is called *Brake*. The MCPWM operator can be configured to perform different brake modes for each fault object by calling `mcpwm_operator_set_brake_on_fault()`. Specific brake configuration is passed as a structure `mcpwm_brake_config_t`:

- `mcpwm_brake_config_t::fault` sets which fault the operator should react to.
- `mcpwm_brake_config_t::brake_mode` sets the brake mode that should be used for the fault. The supported brake modes are listed in the `mcpwm_operator_brake_mode_t`. For `MCPWM_OPER_BRAKE_MODE_CBC` mode, the operator recovers itself automatically as long as the fault disappears. You can specify the recovery time in `mcpwm_brake_config_t::cbc_recover_on_tez` and `mcpwm_brake_config_t::cbc_recover_on_tep`. For `MCPWM_OPER_BRAKE_MODE_OST` mode, the operator can not recover even though the fault disappears. You have to call `mcpwm_operator_recover_from_fault()` to manually recover it.

**Set Generator Action on Brake Event** One generator can set multiple actions on different brake events, by calling `mcpwm_generator_set_actions_on_brake_event()` with a variable number of action configurations. The action configuration is defined in `mcpwm_gen_brake_event_action_t`:

- `mcpwm_gen_brake_event_action_t::direction` specifies the timer direction. The supported directions are listed in `mcpwm_timer_direction_t`.
- `mcpwm_gen_brake_event_action_t::brake_mode` specifies the brake mode. The supported brake modes are listed in the `mcpwm_operator_brake_mode_t`.
- `mcpwm_gen_brake_event_action_t::action` specifies the generator action to be taken. The supported actions are listed in `mcpwm_generator_action_t`.

There is a helper macro `MCPWM_GEN_BRAKE_EVENT_ACTION` to simplify the construction of a brake event action entry.

Please note, the argument list of `mcpwm_generator_set_actions_on_brake_event()` must be terminated by `MCPWM_GEN_BRAKE_EVENT_ACTION_END`.

You can also set the brake action one by one by calling `mcpwm_generator_set_action_on_brake_event()` without varargs.

**Register Fault Event Callbacks** The MCPWM fault detector can inform you when it detects a valid fault or a fault signal disappears. If you have some function that should be called when such an event happens, you should hook your function to the interrupt service routine by calling `mcpwm_fault_register_event_callbacks()`. The callback function prototype is declared in `mcpwm_fault_event_cb_t`. All supported event callbacks are listed in the `mcpwm_fault_event_callbacks_t`:

- `mcpwm_fault_event_callbacks_t::on_fault_enter` sets the callback function that will be called when a fault is detected.
- `mcpwm_fault_event_callbacks_t::on_fault_exit` sets the callback function that will be called when a fault is cleared.

The callback function is called within the ISR context, so it should not attempt to block. For example, you may make sure that only FreeRTOS APIs with the `ISR` suffix are called within the function.

The parameter `user_data` of `mcpwm_fault_register_event_callbacks()` function is used to save your own context. It is passed to the callback function directly.

This function will lazy the install interrupt service for the MCPWM fault, whereas the service can only be removed in `mcpwm_del_fault`.

**Register Brake Event Callbacks** The MCPWM operator can inform you when it is going to take a brake action. If you have some function that should be called when this event happens, you should hook your function to the interrupt service routine by calling `mcpwm_operator_register_event_callbacks()`. The callback
function prototype is declared in `mcpwm_brake_event_cb_t`. All supported event callbacks are listed in the `mcpwm_operator_event_callbacks_t`:

- `mcpwm_operator_event_callbacks_t::on_brake_cbc` sets the callback function that will be called when the operator is going to take a CBC action.
- `mcpwm_operator_event_callbacks_t::on_brake_ost` sets the callback function that will be called when the operator is going to take an OST action.

The callback function is called within the ISR context, so it should not attempt to block. For example, you may make sure that only FreeRTOS APIs with the `ISR` suffix are called within the function.

The parameter `user_data` of the `mcpwm_operator_register_event_callbacks()` function is used to save your own context. It will be passed to the callback function directly.

This function will lazy the install interrupt service for the MCPWM operator, whereas the service can only be removed in `mcpwm_del_operator`.

**Generator Force Actions** Software can override generator output level at runtime, by calling `mcpwm_generator_set_force_level()`. The software force level always has a higher priority than other event actions set in e.g., `mcpwm_generator_set_actions_on_timer_event()`.

- Set the `level` to -1 means to disable the force action, and the generator’s output level will be controlled by the event actions again.
- Set the `hold_on` to true, and the force output level will keep alive until it is removed by assigning `level` to -1.
- Set the `hole_on` to false, the force output level will only be active for a short time, and any upcoming event can override it.

**Synchronization** When a sync signal is taken by the MCPWM timer, the timer will be forced into a pre-defined phase, where the phase is determined by count value and count direction. You can set the sync phase by calling `mcpwm_timer_set_phase_on_sync()`. The sync phase configuration is defined in `mcpwm_timer_sync_phase_config_t` structure:

- `mcpwm_timer_sync_phase_config_t::sync_src` sets the sync signal source. See `MCPWM Sync Sources` for how to create a sync source object. Specifically, if this is set to `NULL`, the driver will disable the sync feature for the MCPWM timer.
- `mcpwm_timer_sync_phase_config_t::count_value` sets the count value to load when the sync signal is taken.
- `mcpwm_timer_sync_phase_config_t::direction` sets the count direction when the sync signal is taken.

Likewise, the `MCPWM Capture Timer` can be synced as well. You can set the sync phase for the capture timer by calling `mcpwm_capture_timer_set_phase_on_sync()`. The sync phase configuration is defined in `mcpwm_capture_timer_sync_phase_config_t` structure:

- `mcpwm_capture_timer_sync_phase_config_t::sync_src` sets the sync signal source. See `MCPWM Sync Sources` for how to create a sync source object. Specifically, if this is set to `NULL`, the driver will disable the sync feature for the MCPWM capture timer.
- `mcpwm_capture_timer_sync_phase_config_t::count_value` sets the count value to load when the sync signal is taken.
- `mcpwm_capture_timer_sync_phase_config_t::direction` sets the count direction when the sync signal is taken. Note that, different from MCPWM Timer, the capture timer can only support one count direction: `MCPWM_TIMER_DIRECTION_UP`.

**Sync Timers by GPIO**

```c
static void example_setup_sync_strategy(mcpwm_timer_handle_t timers[])
{
    mcpwm_sync_handle_t gpio_sync_source = NULL;
    mcpwm_gpio_sync_src_config_t gpio_sync_config = {
```

(continues on next page)
Capture  The basic functionality of MCPWM capture is to record the time when any pulse edge of the capture signal turns active. Then you can get the pulse width and convert it into other physical quantities like distance or speed in the capture callback function. For example, in the BLDC (Brushless DC, see figure below) scenario, you can use the capture submodule to sense the rotor position from the Hall sensor.

The capture timer is usually connected to several capture channels. Please refer to MCPWM Capture Timer and Channels for more information about resource allocation.

Register Capture Event Callbacks  The MCPWM capture channel can inform you when there is a valid edge detected on the signal. You have to register a callback function to get the timer count value of the captured mo-
Fig. 18: MCPWM BLDC with Hall Sensor

ment, by calling `mcpwm_capture_channel_register_event_callbacks()`. The callback function prototype is declared in `mcpwm_capture_event_cb_t`. All supported capture callbacks are listed in the `mcpwm_capture_event_callbacks_t`:

- `mcpwm_capture_event_callbacks_t::on_cap` sets the callback function for the capture channel when a valid edge is detected.

The callback function provides event-specific data of type `mcpwm_capture_event_data_t`, so that you can get the edge of the capture signal in `mcpwm_capture_event_data_t::cap_edge` and the count value of that moment in `mcpwm_capture_event_data_t::cap_value`. To convert the capture count into a timestamp, you need to know the resolution of the capture timer by calling `mcpwm_capture_timer_get_resolution()`.

The callback function is called within the ISR context, so it should not attempt to block. For example, you may make sure that only FreeRTOS APIs with the `ISR` suffix are called within the function.

The parameter `user_data` of `mcpwm_capture_channel_register_event_callbacks()` function is used to save your context. It is passed to the callback function directly.

This function will lazy install interrupt service for the MCPWM capture channel, whereas the service can only be removed in `mcpwm_del_capture_channel`.

**Enable and Disable Capture Channel** The capture channel is not enabled after allocation by `mcpwm_new_capture_channel()`. You should call `mcpwm_capture_channel_enable()` and `mcpwm_capture_channel_disable()` accordingly to enable or disable the channel. If the interrupt service is lazy installed during registering event callbacks for the channel in `mcpwm_capture_channel_register_event_callbacks()`, `mcpwm_capture_channel_enable()` will enable the interrupt service as well.

**Enable and Disable Capture Timer** Before doing IO control to the capture timer, you need to enable the timer first, by calling `mcpwm_capture_timer_enable()`. Internally, this function:

- switches the capture timer state from `init` to `enable`. 
• acquires a proper power management lock if a specific clock source (e.g., APB clock) is selected. See also
  *Power management* for more information.

On the contrary, calling `mcpwm_capture_timer_disable()` will put the timer driver back to *init* state, and
release the power management lock.

**Start and Stop Capture Timer**  The basic IO operation of a capture timer is to start and stop. Calling
`mcpwm_capture_timer_start()` can start the timer and calling `mcpwm_capture_timer_stop()` can
stop the timer immediately.

**Trigger a Software Capture Event**  Sometimes, the software also wants to trigger a “fake” capture event. The
`mcpwm_capture_channel_trigger_soft_catch()` is provided for that purpose. Please note that, even
though it is a “fake” capture event, it can still cause an interrupt, thus your capture event callback function gets
invoked as well.

**Power Management**  When power management is enabled (i.e., `CONFIG_PM_ENABLE` is on), the system will
adjust the PLL and APB frequency before going into Light-sleep, thus potentially changing the period of an MCPWM
timers’ counting step and leading to inaccurate time-keeping.

However, the driver can prevent the system from changing APB frequency by acquiring a power management lock
of type `ESP_PM_APB_FREQ_MAX`. Whenever the driver creates an MCPWM timer instance that has selected
`MCPWM_TIMER_CLK_SRC_PLL160M` as its clock source, the driver guarantees that the power management lock
is acquired when enabling the timer by `mcpwm_timer_enable()`. On the contrary, the driver releases the lock
when `mcpwm_timer_disable()` is called for that timer.

Likewise, whenever the driver creates an MCPWM capture timer instance that has selected
`MCPWM_CAPTURE_CLK_SRC_APB` as its clock source, the driver guarantees that the power management
lock is acquired when enabling the timer by `mcpwm_capture_timer_enable()`. And releases the lock in
`mcpwm_capture_timer_disable()`.

**IRAM Safe**  By default, the MCPWM interrupt will be deferred when the Cache is disabled for reasons like writing/erasing Flash. Thus the event callback functions will not get executed in time, which is not expected in a real-time application.

There is a Kconfig option `CONFIG_MCPWM_ISR_IRAM_SAFE` that:

• enables the interrupt to be serviced even when the cache is disabled
• places all functions used by the ISR into IRAM\(^2\)
• places the driver object into DRAM (in case it is mapped to PSRAM by accident)

This allows the interrupt to run while the cache is disabled but comes at the cost of increased IRAM consumption.

There is another Kconfig option `CONFIG_MCPWM_CTRL_FUNC_IN_IRAM` that can put commonly used IO control functions into IRAM as well. So, these functions can also be executable when the cache is disabled. The IO control function is as follows:

- `mcpwm_comparator_set_compare_value()`
- `mcpwm_timer_set_period()`

**Thread Safety**  The factory functions like `mcpwm_new_timer()` are guaranteed to be thread-safe by the driver,
which means, you can call it from different RTOS tasks without protection by extra locks.

The following function is allowed to run under the ISR context, as the driver uses a critical section to prevent them
from being called concurrently in the task and ISR.

- `mcpwm_comparator_set_compare_value()`
- `mcpwm_timer_set_period()`

\(^2\) The callback function and the sub-functions invoked by itself should also be placed in IRAM. You need to take care of this by yourself.
Other functions that are not related to Resource Allocation and Initialization, are not thread-safe. Thus, you should avoid calling them in different tasks without mutex protection.

Kconfig Options

- `CONFIG_MCPWM_ISR_IRAM_SAFE` controls whether the default ISR handler can work when the cache is disabled, see IRAM Safe for more information.
- `CONFIG_MCPWM_CTRL_FUNC_IN_IRAM` controls where to place the MCPWM control functions (IRAM or flash), see IRAM Safe for more information.
- `CONFIG_MCPWM_ENABLE_DEBUG_LOG` is used to enable the debug log output. Enabling this option will increase the firmware binary size.

Application Examples

- Brushed DC motor speed control by PID algorithm: `peripherals/mcpwm/mcpwm_bdc_speed_control`
- BLDC motor control with hall sensor feedback: `peripherals/mcpwm/mcpwm_bldc_hall_control`
- Ultrasonic sensor (HC-SR04) distance measurement: `peripherals/mcpwm/mcpwm_capture_hc_sr04`
- Servo motor angle control: `peripherals/mcpwm/mcpwm_servo_control`
- MCPWM synchronization between timers: `peripherals/mcpwm/mcpwm_sync`

API Reference

Header File

- `components/driver/mcpwm/include/driver/mcpwm_timer.h`
- This header file can be included with:
  ```
  #include "driver/mcpwm_timer.h"
  ```
- This header file is a part of the API provided by the driver component. To declare that your component depends on driver, add the following to your CMakeLists.txt:
  ```
  REQUIRES driver
  ```
  or
  ```
  PRIV_REQUIRES driver
  ```

Functions

```c
esp_err_t mcpwm_new_timer(const mcpwm_timer_config_t *config, mcpwm_timer_handle_t *ret_timer)
```
Create MCPWM timer.

**Parameters**

- `config` - [in] MCPWM timer configuration
- `ret_timer` - [out] Returned MCPWM timer handle

**Returns**

- ESP_OK: Create MCPWM timer successfully
- ESP_ERR_INVALID_ARG: Create MCPWM timer failed because of invalid argument
- ESP_ERR_NO_MEM: Create MCPWM timer failed because out of memory
- ESP_ERR_NOT_FOUND: Create MCPWM timer failed because all hardware timers are used up and no more free one
- ESP_FAIL: Create MCPWM timer failed because of other error

```c
esp_err_t mcpwm_del_timer(mcpwm_timer_handle_t timer)
```
Delete MCPWM timer.

**Parameters**

- `timer` - [in] MCPWM timer handle, allocated by `mcpwm_new_timer()`

**Returns**

- ESP_OK: Delete MCPWM timer successfully
• ESP_ERR_INVALID_ARG: Delete MCPWM timer failed because of invalid argument
• ESP_ERR_INVALID_STATE: Delete MCPWM timer failed because timer is not in init state
• ESP_FAIL: Delete MCPWM timer failed because of other error

`esp_err_t mcpwm_timer_set_period(mcpwm_timer_handle_t timer, uint32_t period_ticks)`

Set a new period for MCPWM timer.

**Note:** If `mcpwm_timer_config_t::update_period_on_empty` and `mcpwm_timer_config_t::update_period_on_sync` are not set, the new period will take effect immediately. Otherwise, the new period will take effect when timer counts to zero or on sync event.

**Note:** You may need to use `mcpwm_comparator_set_compare_value` to set a new compare value for MCPWM comparator in order to keep the same PWM duty cycle.

**Parameters**

- **timer** [in] MCPWM timer handle, allocated by `mcpwm_new_timer`
- **period_ticks** [in] New period in count ticks

**Returns**

- ESP_OK: Set new period for MCPWM timer successfully
- ESP_ERR_INVALID_ARG: Set new period for MCPWM timer failed because of invalid argument
- ESP_FAIL: Set new period for MCPWM timer failed because of other error

`esp_err_t mcpwm_timer_enable(mcpwm_timer_handle_t timer)`

Enable MCPWM timer.

**Parameters**

- **timer** [in] MCPWM timer handle, allocated by `mcpwm_new_timer()`

**Returns**

- ESP_OK: Enable MCPWM timer successfully
- ESP_ERR_INVALID_ARG: Enable MCPWM timer failed because of invalid argument
- ESP_ERR_INVALID_STATE: Enable MCPWM timer failed because timer is enabled already
- ESP_FAIL: Enable MCPWM timer failed because of other error

`esp_err_t mcpwm_timer_disable(mcpwm_timer_handle_t timer)`

Disable MCPWM timer.

**Parameters**

- **timer** [in] MCPWM timer handle, allocated by `mcpwm_new_timer()`

**Returns**

- ESP_OK: Disable MCPWM timer successfully
- ESP_ERR_INVALID_ARG: Disable MCPWM timer failed because of invalid argument
- ESP_ERR_INVALID_STATE: Disable MCPWM timer failed because timer is disabled already
- ESP_FAIL: Disable MCPWM timer failed because of other error

`esp_err_t mcpwm_timer_start_stop(mcpwm_timer_handle_t timer, mcpwm_timer_start_stop_cmd_t command)`

Send specific start/stop commands to MCPWM timer.

**Parameters**

- **timer** [in] MCPWM timer handle, allocated by `mcpwm_new_timer()`
- **command** [in] Supported command list for MCPWM timer

**Returns**

- ESP_OK: Start or stop MCPWM timer successfully
- ESP_ERR_INVALID_ARG: Start or stop MCPWM timer failed because of invalid argument
• ESP_ERR_INVALID_STATE: Start or stop MCPWM timer failed because timer is not enabled
• ESP_FAIL: Start or stop MCPWM timer failed because of other error

```c
esp_err_t mcpwm_timer_register_event_callbacks(mcpwm_timer_handle_t timer, const mcpwm_timer_event_callbacks_t *cbs, void *user_data)
```

Set event callbacks for MCPWM timer.

**Note:** The first call to this function needs to be before the call to `mcpwm_timer_enable`

**Note:** User can deregister a previously registered callback by calling this function and setting the callback member in the `cbs` structure to NULL.

**Parameters**
- `timer` - [in] MCPWM timer handle, allocated by `mcpwm_new_timer()`
- `cbs` - [in] Group of callback functions
- `user_data` - [in] User data, which will be passed to callback functions directly

**Returns**
- ESP_OK: Set event callbacks successfully
- ESP_ERR_INVALID_ARG: Set event callbacks failed because of invalid argument
- ESP_ERR_INVALID_STATE: Set event callbacks failed because timer is not in init state
- ESP_FAIL: Set event callbacks failed because of other error

```c
esp_err_t mcpwm_timer_set_phase_on_sync(mcpwm_timer_handle_t timer, const mcpwm_timer_sync_phase_config_t *config)
```

Set sync phase for MCPWM timer.

**Parameters**
- `timer` - [in] MCPWM timer handle, allocated by `mcpwm_new_timer()`
- `config` - [in] MCPWM timer sync phase configuration

**Returns**
- ESP_OK: Set sync phase for MCPWM timer successfully
- ESP_ERR_INVALID_ARG: Set sync phase for MCPWM timer failed because of invalid argument
- ESP_FAIL: Set sync phase for MCPWM timer failed because of other error

**Structures**

```c
struct mcpwm_timer_event_callbacks_t
```

Group of supported MCPWM timer event callbacks.

**Note:** The callbacks are all running under ISR environment

**Public Members**

```c
mcpwm_timer_event_cb_t on_full
```

callback function when MCPWM timer counts to peak value

```c
mcpwm_timer_event_cb_t on_empty
```

callback function when MCPWM timer counts to zero
mcpwm_timer_event_cb_t on_stop
    callback function when MCPWM timer Stops

struct mcpwm_timer_config_t
    MCPWM timer configuration.

Public Members

int group_id
    Specify from which group to allocate the MCPWM timer

mcpwm_timer_clock_source_t clk_src
    MCPWM timer clock source

uint32_t resolution_hz
    Counter resolution in Hz The step size of each count tick equals to (1 / resolution_hz) seconds

mcpwm_timer_count_mode_t count_mode
    Count mode

uint32_t period_ticks
    Number of count ticks within a period

int intr_priority
    MCPWM timer interrupt priority, if set to 0, the driver will try to allocate an interrupt with a relative low priority (1,2,3)

uint32_t update_period_on_empty
    Whether to update period when timer counts to zero

uint32_t update_period_on_sync
    Whether to update period on sync event

struct mcpwm_timer_config_t::[anonymous] flags
    Extra configuration flags for timer

struct mcpwm_timer_sync_phase_config_t
    MCPWM Timer sync phase configuration.

Public Members

mcpwm_sync_handle_t sync_src
    The sync event source. Set to NULL will disable the timer being synced by others

uint32_t count_value
    The count value that should lock to upon sync event

mcpwm_timer_direction_t direction
    The count direction that should lock to upon sync event
Header File

```

Functions

`esp_err_t mcpwm_new_operator` (const `mcpwm_operator_config_t *config`, `mcpwm_oper_handle_t *ret_oper`)

Create MCPWM operator.

**Parameters**

- `config` - [in] MCPWM operator configuration
- `ret_oper` - [out] Returned MCPWM operator handle

**Returns**

- ESP_OK: Create MCPWM operator successfully
- ESP_ERR_INVALID_ARG: Create MCPWM operator failed because of invalid argument
- ESP_ERR_NO_MEM: Create MCPWM operator failed because out of memory
- ESP_ERR_NOT_FOUND: Create MCPWM operator failed because can’t find free resource
- ESP_FAIL: Create MCPWM operator failed because of other error

`esp_err_t mcpwm_del_operator` (`mcpwm_oper_handle_t oper`)

Delete MCPWM operator.

**Parameters**

- `oper` - [in] MCPWM operator, allocated by `mcpwm_new_operator()`

**Returns**

- ESP_OK: Delete MCPWM operator successfully
- ESP_ERR_INVALID_ARG: Delete MCPWM operator failed because of invalid argument
- ESP_FAIL: Delete MCPWM operator failed because of other error

`esp_err_t mcpwm_operator_connect_timer` (`mcpwm_oper_handle_t oper`, `mcpwm_timer_handle_t timer`)

Connect MCPWM operator and timer, so that the operator can be driven by the timer.

**Parameters**

- `oper` - [in] MCPWM operator handle, allocated by `mcpwm_new_operator()`
- `timer` - [in] MCPWM timer handle, allocated by `mcpwm_new_timer()`

**Returns**

- ESP_OK: Connect MCPWM operator and timer successfully
- ESP_ERR_INVALID_ARG: Connect MCPWM operator and timer failed because of invalid argument
- ESP_FAIL: Connect MCPWM operator and timer failed because of other error

`esp_err_t mcpwm_operator_set_brake_on_fault` (`mcpwm_oper_handle_t oper`, `const mcpwm_brake_config_t *config`)

Set brake method for MCPWM operator.

**Parameters**

- `oper` - [in] MCPWM operator, allocated by `mcpwm_new_operator()`
- `config` - [in] MCPWM brake configuration

**Returns**

...
Chapter 2. API Reference

- ESP_OK: Set trip for operator successfully
- ESP_ERR_INVALID_ARG: Set trip for operator failed because of invalid argument
- ESP_FAIL: Set trip for operator failed because of other error

*esp_err_t* `mcpwm_operator_recover_from_fault (mcpwm_oper_handle_t oper, mcpwm_fault_handle_t fault)`

Try to make the operator recover from fault.

**Note:** To recover from fault or escape from trip, you make sure the fault signal has dissapeared already. Otherwise the recovery can’t succeed.

**Parameters**

- `oper` - [in] MCPWM operator, allocated by `mcpwm_new_operator()`
- `fault` - [in] MCPWM fault handle

**Returns**

- ESP_OK: Recover from fault successfully
- ESP_ERR_INVALID_ARG: Recover from fault failed because of invalid argument
- ESP_ERR_INVALID_STATE: Recover from fault failed because the fault source is still active
- ESP_FAIL: Recover from fault failed because of other error

*esp_err_t* `mcpwm_operator_register_event_callbacks (mcpwm_oper_handle_t oper, const mcpwm_operator_event_callbacks_t *cbs, void *user_data)`

Set event callbacks for MCPWM operator.

**Note:** User can deregister a previously registered callback by calling this function and setting the callback member in the `cbs` structure to NULL.

**Parameters**

- `oper` - [in] MCPWM operator handle, allocated by `mcpwm_new_operator()`
- `cbs` - [in] Group of callback functions
- `user_data` - [in] User data, which will be passed to callback functions directly

**Returns**

- ESP_OK: Set event callbacks successfully
- ESP_ERR_INVALID_ARG: Set event callbacks failed because of invalid argument
- ESP_FAIL: Set event callbacks failed because of other error

*esp_err_t* `mcpwm_operator_apply_carrier (mcpwm_oper_handle_t oper, const mcpwm_carrier_config_t *config)`

Apply carrier feature for MCPWM operator.

**Parameters**

- `oper` - [in] MCPWM operator, allocated by `mcpwm_new_operator()`
- `config` - [in] MCPWM carrier specific configuration

**Returns**

- ESP_OK: Set carrier for operator successfully
- ESP_ERR_INVALID_ARG: Set carrier for operator failed because of invalid argument
- ESP_FAIL: Set carrier for operator failed because of other error

**Structures**

struct `mcpwm_operator_config_t`

```c
mcpwm_fault_handle_t fault
    Which fault causes the operator to brake
```

```c
mcpwm_operator_brake_mode_t brake_mode
    Brake mode
```

```c
uint32_t cbc_recover_on_tez
    Recovery CBC brake state on tez event
```

```c
uint32_t cbc_recover_on_tep
    Recovery CBC brake state on tep event
```

```c
struct mcpwm_brake_config_t::[anonymous] flags
    Extra flags for brake configuration
```
struct `mcpwm_operator_event_callbacks_t`

Group of supported MCPWM operator event callbacks.

**Note:** The callbacks are all running under ISR environment

### Public Members

- `mcpwm_brake_event_cb_t on_brake_cbc`
  callback function when mcpwm operator brakes in CBC

- `mcpwm_brake_event_cb_t on_brake_ost`
  callback function when mcpwm operator brakes in OST

struct `mcpwm_carrier_config_t`

MCPWM carrier configuration structure.

### Public Members

- `mcpwm_carrier_clock_source_t clk_src`
  MCPWM carrier clock source

- `uint32_t frequency_hz`
  Carrier frequency in Hz

- `uint32_t first_pulse_duration_us`
  The duration of the first PWM pulse, in us

- `float duty_cycle`
  Carrier duty cycle

- `uint32_t invert_before_modulate`
  Invert the raw signal

- `uint32_t invert_after_modulate`
  Invert the modulated signal

- `struct mcpwm_carrier_config_t::[anonymous] flags`
  Extra flags for carrier configuration

### Header File

- `components/driver/mcpwm/include/driver/mcpwm_cmpr.h`
- This header file can be included with:

  ```
  #include "driver/mcpwm_cmpr.h"
  ```
- This header file is a part of the API provided by the `driver` component. To declare that your component depends on `driver`, add the following to your `CMakeLists.txt`:
REQUIRES driver

or

PRIV_REQUIRES driver

**Functions**

`esp_err_t mcpwm_new_comparator (mcpwm_oper_handle_t oper, const mcpwm_comparator_config_t *config, mcpwm_cmpr_handle_t *ret_cmpr)`

Create MCPWM comparator.

**Parameters**

- `oper` - [in] MCPWM operator, allocated by `mcpwm_new_operator()`, the new comparator will be allocated from this operator
- `config` - [in] MCPWM comparator configuration
- `ret_cmpr` - [out] Returned MCPWM comparator

**Returns**

- ESP_OK: Create MCPWM comparator successfully
- ESP_ERR_INVALID_ARG: Create MCPWM comparator failed because of invalid argument
- ESP_ERR_NO_MEM: Create MCPWM comparator failed because out of memory
- ESP_ERR_NOT_FOUND: Create MCPWM comparator failed because can’t find free resource
- ESP_FAIL: Create MCPWM comparator failed because of other error

`esp_err_t mcpwm_del_comparator (mcpwm_cmpr_handle_t cmpr)`

Delete MCPWM comparator.

**Parameters**

- `cmpr` - [in] MCPWM comparator handle, allocated by `mcpwm_new_comparator()`

**Returns**

- ESP_OK: Delete MCPWM comparator successfully
- ESP_ERR_INVALID_ARG: Delete MCPWM comparator failed because of invalid argument
- ESP_FAIL: Delete MCPWM comparator failed because of other error

`esp_err_t mcpwm_comparator_register_event_callbacks (mcpwm_cmpr_handle_t cmpr, const mcpwm_comparator_event_callbacks_t *cbs, void *user_data)`

Set event callbacks for MCPWM comparator.

**Note:** User can deregister a previously registered callback by calling this function and setting the callback member in the `cbs` structure to NULL.

**Parameters**

- `cmpr` - [in] MCPWM comparator handle, allocated by `mcpwm_new_comparator()`
- `cbs` - [in] Group of callback functions
- `user_data` - [in] User data, which will be passed to callback functions directly

**Returns**

- ESP_OK: Set event callbacks successfully
- ESP_ERR_INVALID_ARG: Set event callbacks failed because of invalid argument
- ESP_FAIL: Set event callbacks failed because of other error

`esp_err_t mcpwm_comparator_set_compare_value (mcpwm_cmpr_handle_t cmpr, uint32_t cmp_ticks)`

Set MCPWM comparator’s compare value.

**Parameters**

- `cmpr` - [in] MCPWM comparator handle, allocated by `mcpwm_new_comparator()`
• **cmp_ticks**  [in] The new compare value

**Returns**
• ESP_OK: Set MCPWM compare value successfully
• ESP_ERR_INVALID_ARG: Set MCPWM compare value failed because of invalid argument (e.g. the cmp_ticks is out of range)
• ESP_ERR_INVALID_STATE: Set MCPWM compare value failed because the operator doesn’t have a timer connected
• ESP_FAIL: Set MCPWM compare value failed because of other error

**Structures**

```c
struct mcpwm_comparator_config_t
    MCPWM comparator configuration.
```

**Public Members**

```c
int intr_priority
    MCPWM comparator interrupt priority, if set to 0, the driver will try to allocate an interrupt with a relative low priority (1,2,3)
```

```c
uint32_t update_cmp_on_tez
    Whether to update compare value when timer count equals to zero (tez)
```

```c
uint32_t update_cmp_on_tep
    Whether to update compare value when timer count equals to peak (tep)
```

```c
uint32_t update_cmp_on_sync
    Whether to update compare value on sync event
```

```c
struct mcpwm_comparator_config_t::[anonymous] flags
    Extra configuration flags for comparator
```

```c
struct mcpwm_comparator_event_callbacks_t
    Group of supported MCPWM compare event callbacks.
```

---

**Note:** The callbacks are all running under ISR environment

---

**Public Members**

```c
mcpwm_compare_event_cb_t on_reach
    ISR callback function which would be invoked when counter reaches compare value
```

**Header File**

- components/driver/mcpwm/include/driver/mcpwm_gen.h
- This header file can be included with:

  ```c
  #include "driver/mcpwm_gen.h"
  ```
- This header file is a part of the API provided by the driver component. To declare that your component depends on driver, add the following to your CMakeLists.txt:
### Functions

**esp_err_t mcpwm_new_generator** *(mcpwm_oper_handle_t oper, const mcpwm_generator_config_t *config, mcpwm_gen_handle_t *ret_gen)*

Allocate MCPWM generator from given operator.

**Parameters**

- **oper** - [in] MCPWM operator, allocated by `mcpwm_new_operator()`
- **config** - [in] MCPWM generator configuration
- **ret_gen** - [out] Returned MCPWM generator

**Returns**

- **ESP_OK**: Create MCPWM generator successfully
- **ESP_ERR_INVALID_ARG**: Create MCPWM generator failed because of invalid argument
- **ESP_ERR_NO_MEM**: Create MCPWM generator failed because out of memory
- **ESP_ERR_NOT_FOUND**: Create MCPWM generator failed because can’t find free resource
- **ESP_FAIL**: Create MCPWM generator failed because of other error

**esp_err_t mcpwm_del_generator** *(mcpwm_gen_handle_t gen)*

Delete MCPWM generator.

**Parameters**

- **gen** - [in] MCPWM generator handle, allocated by `mcpwm_new_generator()`

**Returns**

- **ESP_OK**: Delete MCPWM generator successfully
- **ESP_ERR_INVALID_ARG**: Delete MCPWM generator failed because of invalid argument
- **ESP_FAIL**: Delete MCPWM generator failed because of other error

**esp_err_t mcpwm_generator_set_force_level** *(mcpwm_gen_handle_t gen, int level, bool hold_on)*

Set force level for MCPWM generator.

**Note:** The force level will be applied to the generator immediately, regardless any other events that would change the generator’s behaviour.

**Note:** If the `hold_on` is true, the force level will retain forever, until user removes the force level by setting the force level to -1.

**Note:** If the `hold_on` is false, the force level can be overridden by the next event action.

**Note:** The force level set by this function can be inverted by GPIO matrix or dead-time module. So the level set here doesn’t equal to the final output level.

**Parameters**

- **gen** - [in] MCPWM generator handle, allocated by `mcpwm_new_generator()`
- **level** - [in] GPIO level to be applied to MCPWM generator, specially, -1 means to remove the force level
• **hold_on** —[in] Whether the forced PWM level should retain (i.e. will remain unchanged until manually remove the force level)

**Returns**
- ESP_OK: Set force level for MCPWM generator successfully
- ESP_ERR_INVALID_ARG: Set force level for MCPWM generator failed because of invalid argument
- ESP_FAIL: Set force level for MCPWM generator failed because of other error

`esp_err_t mcpwm_generator_set_action_on_timer_event (mcpwm_gen_handle_t gen, mcpwm_gen_timer_event_action_t ev_act)`

Set generator action on MCPWM timer event.

**Parameters**
- **gen** —[in] MCPWM generator handle, allocated by `mcpwm_new_generator()`
- **ev_act** —[in] MCPWM timer event action, can be constructed by `MCPWM_GEN_TIMER_EVENT_ACTION` helper macro

**Returns**
- ESP_OK: Set generator action successfully
- ESP_ERR_INVALID_ARG: Set generator action failed because of invalid argument
- ESP_ERR_INVALID_STATE: Set generator action failed because of timer is not connected to operator
- ESP_FAIL: Set generator action failed because of other error

`esp_err_t mcpwm_generator_set_actions_on_timer_event (mcpwm_gen_handle_t gen, mcpwm_gen_timer_event_action_t ev_act, ...)`

Set generator actions on multiple MCPWM timer events.

**Note:** This is an aggregation version of `mcpwm_generator_set_action_on_timer_event`, which allows user to set multiple actions in one call.

**Parameters**
- **gen** —[in] MCPWM generator handle, allocated by `mcpwm_new_generator()`
- **ev_act** —[in] MCPWM timer event action list, must be terminated by `MCPWM_GEN_TIMER_EVENT_ACTION_END()`

**Returns**
- ESP_OK: Set generator actions successfully
- ESP_ERR_INVALID_ARG: Set generator actions failed because of invalid argument
- ESP_ERR_INVALID_STATE: Set generator actions failed because of timer is not connected to operator
- ESP_FAIL: Set generator actions failed because of other error

`esp_err_t mcpwm_generator_set_action_on_compare_event (mcpwm_gen_handle_t generator, mcpwm_gen_compare_event_action_t ev_act)`

Set generator action on MCPWM compare event.

**Parameters**
- **generator** —[in] MCPWM generator handle, allocated by `mcpwm_new_generator()`
- **ev_act** —[in] MCPWM compare event action, can be constructed by `MCPWM_GEN_COMPARE_EVENT_ACTION` helper macro

**Returns**
- ESP_OK: Set generator action successfully
- ESP_ERR_INVALID_ARG: Set generator action failed because of invalid argument
- ESP_FAIL: Set generator action failed because of other error
## Chapter 2. API Reference

**esp_err_t** `mcpwm_generator_set_actions_on_compare_event` *(mcpwm_gen_handle_t generator, mcpwm_gen_compare_event_action_t ev_act,...)*

Set generator actions on multiple MCPWM compare events.

**Note:** This is an aggregation version of `mcpwm_generator_set_action_on_compare_event`, which allows user to set multiple actions in one call.

### Parameters
- **generator** - [in] MCPWM generator handle, allocated by `mcpwm_new_generator()`
- **ev_act** - [in] MCPWM compare event action list, must be terminated by `MCPWM_GEN_COMPARE_EVENT_ACTION_END()`

### Returns
- **ESP_OK:** Set generator actions successfully
- **ESP_ERR_INVALID_ARG:** Set generator actions failed because of invalid argument
- **ESP_FAIL:** Set generator actions failed because of other error

**esp_err_t** `mcpwm_generator_set_action_on_brake_event` *(mcpwm_gen_handle_t generator, mcpwm_gen_brake_event_action_t ev_act)*

Set generator action on MCPWM brake event.

### Parameters
- **generator** - [in] MCPWM generator handle, allocated by `mcpwm_new_generator()`
- **ev_act** - [in] MCPWM brake event action, can be constructed by `MCPWM_GEN_BRAKE_EVENT_ACTION` helper macro

### Returns
- **ESP_OK:** Set generator action successfully
- **ESP_ERR_INVALID_ARG:** Set generator action failed because of invalid argument
- **ESP_FAIL:** Set generator action failed because of other error

**esp_err_t** `mcpwm_generator_set_actions_on_brake_event` *(mcpwm_gen_handle_t generator, mcpwm_gen_brake_event_action_t ev_act,...)*

Set generator actions on multiple MCPWM brake events.

**Note:** This is an aggregation version of `mcpwm_generator_set_action_on_brake_event`, which allows user to set multiple actions in one call.

### Parameters
- **generator** - [in] MCPWM generator handle, allocated by `mcpwm_new_generator()`
- **ev_act** - [in] MCPWM brake event action list, must be terminated by `MCPWM_GEN_BRAKE_EVENT_ACTION_END()`

### Returns
- **ESP_OK:** Set generator actions successfully
- **ESP_ERR_INVALID_ARG:** Set generator actions failed because of invalid argument
- **ESP_FAIL:** Set generator actions failed because of other error

**esp_err_t** `mcpwm_generator_set_action_on_fault_event` *(mcpwm_gen_handle_t generator, mcpwm_gen_fault_event_action_t ev_act)*

Set generator action on MCPWM Fault event.
Parameters

- `generator` - [in] MCPWM generator handle, allocated by `mcpwm_new_generator()`
- `ev_act` - [in] MCPWM trigger event action, can be constructed by `MCPWM_GEN_FAULT_EVENT_ACTION` helper macro

Returns

- ESP_OK: Set generator action successfully
- ESP_ERR_INVALID_ARG: Set generator action failed because of invalid argument
- ESP_FAIL: Set generator action failed because of other error

```c
esp_err_t mcpwm_generator_set_action_on_sync_event (mcpwm_gen_handle_t generator, mcpwm_gen_sync_event_action_t ev_act)
```

Set generator action on MCPWM Sync event.

**Note:** The trigger only support one sync action, regardless of the kinds. Should not call this function more than once.

Parameters

- `generator` - [in] MCPWM generator handle, allocated by `mcpwm_new_generator()`
- `ev_act` - [in] MCPWM trigger event action, can be constructed by `MCPWM_GEN_SYNC_EVENT_ACTION` helper macro

Returns

- ESP_OK: Set generator action successfully
- ESP_ERR_INVALID_ARG: Set generator action failed because of invalid argument
- ESP_FAIL: Set generator action failed because of other error

```c
esp_err_t mcpwm_generator_set_dead_time (mcpwm_gen_handle_t in_generator, mcpwm_gen_handle_t out_generator, const mcpwm_dead_time_config_t *config)
```

Set dead time for MCPWM generator.

**Note:** Due to a hardware limitation, you cannot set rising edge delay for both MCPWM generator 0 and 1 at the same time, otherwise, there will be a conflict inside the dead time module. The same goes for the falling edge setting. But you can set both the rising edge and falling edge delay for the same MCPWM generator.

Parameters

- `in_generator` - [in] MCPWM generator, before adding the dead time
- `out_generator` - [in] MCPWM generator, after adding the dead time
- `config` - [in] MCPWM dead time configuration

Returns

- ESP_OK: Set dead time for MCPWM generator successfully
- ESP_ERR_INVALID_ARG: Set dead time for MCPWM generator failed because of invalid argument
- ESP_ERR_INVALID_STATE: Set dead time for MCPWM generator failed because of invalid state (e.g. delay module is already in use by other generator)
- ESP_FAIL: Set dead time for MCPWM generator failed because of other error

Structures

```c
struct mcpwm_generator_config_t
```

MCPWM generator configuration.

Public Members
int gen_gpio_num
    The GPIO number used to output the PWM signal

uint32_t invert_pwm
    Whether to invert the PWM signal (done by GPIO matrix)

uint32_t io_loop_back
    For debug/test, the signal output from the GPIO will be fed to the input path as well

uint32_t io_od_mode
    Configure the GPIO as open-drain mode

uint32_t pull_up
    Whether to pull up internally

uint32_t pull_down
    Whether to pull down internally

struct mcpwm_generator_config_t::[anonymous] flags
    Extra configuration flags for generator

struct mcpwm_gen_timer_event_action_t
    Generator action on specific timer event.

    Public Members

    mcpwm_timer_direction_t direction
        Timer direction

    mcpwm_timer_event_t event
        Timer event

    mcpwm_generator_action_t action
        Generator action should perform

struct mcpwm_gen_compare_event_action_t
    Generator action on specific comparator event.

    Public Members

    mcpwm_timer_direction_t direction
        Timer direction

    mcpwm_cmpr_handle_t comparator
        Comparator handle

    mcpwm_generator_action_t action
        Generator action should perform
struct `mcpwm_gen_brake_event_action_t`
Generator action on specific brake event.

**Public Members**

`mcpwm_timer_direction_t direction`
Timer direction

`mcpwm_operator_brake_mode_t brake_mode`
Brake mode

`mcpwm_generator_action_t action`
Generator action should perform

struct `mcpwm_gen_fault_event_action_t`
Generator action on specific fault event.

**Public Members**

`mcpwm_timer_direction_t direction`
Timer direction

`mcpwm_fault_handle_t fault`
Which fault as the trigger. Only support GPIO fault

`mcpwm_generator_action_t action`
Generator action should perform

struct `mcpwm_gen_sync_event_action_t`
Generator action on specific sync event.

**Public Members**

`mcpwm_timer_direction_t direction`
Timer direction

`mcpwm_sync_handle_t sync`
Which sync as the trigger

`mcpwm_generator_action_t action`
Generator action should perform

struct `mcpwm_dead_time_config_t`
MCPWM dead time configuration structure.
Public Members

```c
uint32_t posedge_delay_ticks
    delay time applied to rising edge, 0 means no rising delay time

uint32_t negedge_delay_ticks
    delay time applied to falling edge, 0 means no falling delay time

uint32_t invert_output
    Invert the signal after applied the dead time
```

```c
struct mcpwm_dead_time_config_t::[anonymous] flags
    Extra flags for dead time configuration
```

Macros

```c
MCPWM_GEN_TIMER_EVENT_ACTION (dir, ev, act)
    Help macro to construct a mcpwm_gen_timer_event_action_t entry.
MCPWM_GEN_TIMER_EVENT_ACTION_END ()
```

```c
MCPWM_GEN_COMPARE_EVENT_ACTION (dir, cmp, act)
    Help macro to construct a mcpwm_gen_compare_event_action_t entry.
MCPWM_GEN_COMPARE_EVENT_ACTION_END ()
```

```c
MCPWM_GEN_BRAKE_EVENT_ACTION (dir, mode, act)
    Help macro to construct a mcpwm_gen_brake_event_action_t entry.
MCPWM_GEN_BRAKE_EVENT_ACTION_END ()
```

```c
MCPWM_GEN_FAULT_EVENT_ACTION (dir, flt, act)
    Help macro to construct a mcpwm_gen_fault_event_action_t entry.
MCPWM_GEN_SYNC_EVENT_ACTION (dir, syn, act)
    Help macro to construct a mcpwm_gen_sync_event_action_t entry.
```

Header File

- components/driver/mcpwm/include/driver/mcpwm_fault.h
- This header file can be included with:

```c
#include "driver/mcpwm_fault.h"
```
- This header file is a part of the API provided by the driver component. To declare that your component depends on driver, add the following to your CMakeLists.txt:

```cmake
REQUIRES driver
```
or

```cmake
PRIV_REQUIRES driver
```

Functions

```c
esp_err_t mcpwm_new_gpio_fault (const mcpwm_gpio_fault_config_t *config, mcpwm_fault_handle_t *ret_fault)
```

Create MCPWM GPIO fault.

Parameters
Chapter 2. API Reference

- **config** - [in] MCPWM GPIO fault configuration
- **ret_fault** - [out] Returned GPIO fault handle

**Returns**
- ESP_OK: Create MCPWM GPIO fault successfully
- ESP_ERR_INVALID_ARG: Create MCPWM GPIO fault failed because of invalid argument
- ESP_ERR_NO_MEM: Create MCPWM GPIO fault failed because out of memory
- ESP_ERR_NOT_FOUND: Create MCPWM GPIO fault failed because cannot find free resource
- ESP_FAIL: Create MCPWM GPIO fault failed because of other error

`esp_err_t mcpwm_new_soft_fault (const mcpwm_soft_fault_config_t *config, mcpwm_fault_handle_t *ret_fault)`

Create MCPWM software fault.

**Parameters**
- **config** - [in] MCPWM software fault configuration
- **ret_fault** - [out] Returned software fault handle

**Returns**
- ESP_OK: Create MCPWM software fault successfully
- ESP_ERR_INVALID_ARG: Create MCPWM software fault failed because of invalid argument
- ESP_ERR_NO_MEM: Create MCPWM software fault failed because out of memory
- ESP_FAIL: Create MCPWM software fault failed because of other error

`esp_err_t mcpwm_del_fault (mcpwm_fault_handle_t fault)`

Delete MCPWM fault.

**Parameters**
- **fault** - [in] MCPWM fault handle allocated by mcpwm_new_gpio_fault() or mcpwm_new_soft_fault()

**Returns**
- ESP_OK: Delete MCPWM fault successfully
- ESP_ERR_INVALID_ARG: Delete MCPWM fault failed because of invalid argument
- ESP_FAIL: Delete MCPWM fault failed because of other error

`esp_err_t mcpwm_soft_fault_activate (mcpwm_fault_handle_t fault)`

Activate the software fault, trigger the fault event for once.

**Parameters**
- **fault** - [in] MCPWM soft fault, allocated by mcpwm_new_soft_fault()

**Returns**
- ESP_OK: Trigger MCPWM software fault event successfully
- ESP_ERR_INVALID_ARG: Trigger MCPWM software fault event failed because of invalid argument
- ESP_FAIL: Trigger MCPWM software fault event failed because of other error

`esp_err_t mcpwm_fault_register_event_callbacks (mcpwm_fault_handle_t fault, const mcpwm_fault_event_callbacks_t *cbs, void *user_data)`

Set event callbacks for MCPWM fault.

**Note:** User can deregister a previously registered callback by calling this function and setting the callback member in the cbs structure to NULL.

**Parameters**
- **fault** - [in] MCPWM GPIO fault handle, allocated by mcpwm_new_gpio_fault()
- **cbs** - [in] Group of callback functions
- **user_data** - [in] User data, which will be passed to callback functions directly

**Returns**
- ESP_OK: Set event callbacks successfully
• ESP_ERR_INVALID_ARG: Set event callbacks failed because of invalid argument
• ESP_FAIL: Set event callbacks failed because of other error

Structures

struct \texttt{mcpwm\_gpio\_fault\_config\_t}
MCPWM GPIO fault configuration structure.

Public Members

int \texttt{group\_id}
In which MCPWM group that the GPIO fault belongs to

int \texttt{intr\_priority}
MCPWM GPIO fault interrupt priority, if set to 0, the driver will try to allocate an interrupt with a relative low priority (1, 2, 3)

int \texttt{gpio\_num}
GPIO used by the fault signal

uint32\_t \texttt{active\_level}
On which level the fault signal is treated as active

uint32\_t \texttt{io\_loop\_back}
For debug/test, the signal output from the GPIO will be fed to the input path as well

uint32\_t \texttt{pull\_up}
Whether to pull up internally

uint32\_t \texttt{pull\_down}
Whether to pull down internally

struct \texttt{mcpwm\_gpio\_fault\_config\_t::[anonymous]} \texttt{flags}
Extra configuration flags for GPIO fault

struct \texttt{mcpwm\_soft\_fault\_config\_t}
MCPWM software fault configuration structure.

struct \texttt{mcpwm\_fault\_event\_callbacks\_t}
Group of supported MCPWM fault event callbacks.

Note: The callbacks are all running under ISR environment

Public Members

\texttt{mcpwm\_fault\_event\_cb\_t on\_fault\_enter}
ISR callback function that would be invoked when fault signal becomes active
**mcpwm_fault_event_cb_t on_fault_exit**

ISR callback function that would be invoked when fault signal becomes inactive.

### Header File

- `components/driver/mcpwm/include/driver/mcpwm_sync.h`
- This header file can be included with:
  ```c
  #include "driver/mcpwm_sync.h"
  ```
- This header file is a part of the API provided by the `driver` component. To declare that your component depends on `driver`, add the following to your CMakeLists.txt:
  ```cmake
  REQUIRE driver
  ```
  or
  ```cmake
  PRIV_REQUIRES driver
  ```

### Functions

1. **esp_err_t mcpwm_new_timer_sync_src**

   ```c
   esp_err_t mcpwm_new_timer_sync_src(
       mcpwm_timer_handle_t timer,
       const mcpwm_timer_sync_src_config_t *config,
       mcpwm_sync_handle_t *ret_sync)
   ```

   Create MCPWM timer sync source.

   **Parameters**
   - `timer` - [in] MCPWM timer handle, allocated by `mcpwm_new_timer()`
   - `config` - [in] MCPWM timer sync source configuration
   - `ret_sync` - [out] Returned MCPWM sync handle

   **Returns**
   - `ESP_OK`: Create MCPWM timer sync source successfully
   - `ESP_ERR_INVALID_ARG`: Create MCPWM timer sync source failed because of invalid argument
   - `ESP_ERR_NO_MEM`: Create MCPWM timer sync source failed because out of memory
   - `ESP_ERR_INVALID_STATE`: Create MCPWM timer sync source failed because the timer has created a sync source before
   - `ESP_FAIL`: Create MCPWM timer sync source failed because of other error

2. **esp_err_t mcpwm_new_gpio_sync_src**

   ```c
   esp_err_t mcpwm_new_gpio_sync_src(
       const mcpwm_gpio_sync_src_config_t *config,
       mcpwm_sync_handle_t *ret_sync)
   ```

   Create MCPWM GPIO sync source.

   **Parameters**
   - `config` - [in] MCPWM GPIO sync source configuration
   - `ret_sync` - [out] Returned MCPWM GPIO sync handle

   **Returns**
   - `ESP_OK`: Create MCPWM GPIO sync source successfully
   - `ESP_ERR_INVALID_ARG`: Create MCPWM GPIO sync source failed because of invalid argument
   - `ESP_ERR_NO_MEM`: Create MCPWM GPIO sync source failed because out of memory
   - `ESP_ERR_NOT_FOUND`: Create MCPWM GPIO sync source failed because can’t find free resource
   - `ESP_FAIL`: Create MCPWM GPIO sync source failed because of other error

3. **esp_err_t mcpwm_new_soft_sync_src**

   ```c
   esp_err_t mcpwm_new_soft_sync_src(
       const mcpwm_soft_sync_config_t *config,
       mcpwm_sync_handle_t *ret_sync)
   ```

   Create MCPWM software sync source.

   **Parameters**
   - `config` - [in] MCPWM software sync source configuration
Chapter 2. API Reference

• ret_sync - [out] Returned software sync handle

Returns
• ESP_OK: Create MCPWM software sync successfully
• ESP_ERR_INVALID_ARG: Create MCPWM software sync failed because of invalid argument
• ESP_ERR_NO_MEM: Create MCPWM software sync failed because out of memory
• ESP_FAIL: Create MCPWM software sync failed because of other error

**esp_err_t mcpwm_del_sync_src (mcpwm_sync_handle_t sync)**
Delete MCPWM sync source.

**Parameters**
- **sync** - [in] MCPWM sync handle, allocated by mcpwm_new_timer_sync_src() or mcpwm_new_gpio_sync_src() or mcpwm_new_soft_sync_src()

**Returns**
- ESP_OK: Delete MCPWM sync source successfully
- ESP_ERR_INVALID_ARG: Delete MCPWM sync source failed because of invalid argument
- ESP_FAIL: Delete MCPWM sync source failed because of other error

**esp_err_t mcpwm_soft_sync_activate (mcpwm_sync_handle_t sync)**
Activate the software sync, trigger the sync event for once.

**Parameters**
- **sync** - [in] MCPWM soft sync handle, allocated by mcpwm_new_soft_sync_src()

**Returns**
- ESP_OK: Trigger MCPWM software sync event successfully
- ESP_ERR_INVALID_ARG: Trigger MCPWM software sync event failed because of invalid argument
- ESP_FAIL: Trigger MCPWM software sync event failed because of other error

**Structures**

**struct mcpwm_timer_sync_src_config_t**
MCPWM timer sync source configuration.

**Public Members**

**mcpwm_timer_event_t timer_event**
Timer event, upon which MCPWM timer will generate the sync signal

**uint32_t propagate_input_sync**
The input sync signal would be routed to its sync output

**struct mcpwm_timer_sync_src_config_t::[anonymous] flags**
Extra configuration flags for timer sync source

**struct mcpwm_gpio_sync_src_config_t**
MCPWM GPIO sync source configuration.

**Public Members**

**int group_id**
MCPWM group ID
int gpio_num
    GPIO used by sync source

uint32_t active_neg
    Whether the sync signal is active on negedge, by default, the sync signal’s posedge is treated as active

uint32_t io_loop_back
    For debug/test, the signal output from the GPIO will be fed to the input path as well

uint32_t pull_up
    Whether to pull up internally

uint32_t pull_down
    Whether to pull down internally

struct mcpwm_gpio_sync_src_config_t::[anonymous] flags
    Extra configuration flags for GPIO sync source

struct mcpwm_soft_sync_config_t
    MCPWM software sync configuration structure.

Header File

- components/driver/mcpwm/include/driver/mcpwm_cap.h
- This header file can be included with:

```c
#include "driver/mcpwm_cap.h"
```

- This header file is a part of the API provided by the driver component. To declare that your component depends on driver, add the following to your CMakeLists.txt:

```cmake
REQUIRES driver
```

or

```cmake
PRIV_REQUIRES driver
```

Functions

```
esp_err_t mcpwm_new_capture_timer(const mcpwm_capture_timer_config_t *config,
                                   mcpwm_cap_timer_handle_t *ret_cap_timer)
```

Create MCPWM capture timer.

**Parameters**

- `config` [in] MCPWM capture timer configuration
- `ret_cap_timer` [out] Returned MCPWM capture timer handle

**Returns**

- ESP_OK: Create MCPWM capture timer successfully
- ESP_ERR_INVALID_ARG: Create MCPWM capture timer failed because of invalid argument
- ESP_ERR_NO_MEM: Create MCPWM capture timer failed because out of memory
- ESP_ERR_NOT_FOUND: Create MCPWM capture timer failed because can’t find free resource
- ESP_FAIL: Create MCPWM capture timer failed because of other error
**esp_err_t mcpwm_del_capture_timer** *(mcpwm_cap_timer_handle_t cap_timer)*  
Delete MCPWM capture timer.

**Parameters**  
cap_timer ⚶ [in] MCPWM capture timer, allocated by mcpwm_new_capture_timer()

**Returns**  
- ESP_OK: Delete MCPWM capture timer successfully  
- ESP_ERR_INVALID_ARG: Delete MCPWM capture timer failed because of invalid argument  
- ESP_FAIL: Delete MCPWM capture timer failed because of other error

**esp_err_t mcpwm_capture_timer_enable** *(mcpwm_cap_timer_handle_t cap_timer)*  
Enable MCPWM capture timer.

**Parameters**  
cap_timer ⚶ [in] MCPWM capture timer handle, allocated by mcpwm_new_capture_timer()

**Returns**  
- ESP_OK: Enable MCPWM capture timer successfully  
- ESP_ERR_INVALID_ARG: Enable MCPWM capture timer failed because of invalid argument  
- ESP_ERR_INVALID_STATE: Enable MCPWM capture timer failed because timer is enabled already  
- ESP_FAIL: Enable MCPWM capture timer failed because of other error

**esp_err_t mcpwm_capture_timer_disable** *(mcpwm_cap_timer_handle_t cap_timer)*  
Disable MCPWM capture timer.

**Parameters**  
cap_timer ⚶ [in] MCPWM capture timer handle, allocated by mcpwm_new_capture_timer()

**Returns**  
- ESP_OK: Disable MCPWM capture timer successfully  
- ESP_ERR_INVALID_ARG: Disable MCPWM capture timer failed because of invalid argument  
- ESP_ERR_INVALID_STATE: Disable MCPWM capture timer failed because timer is disabled already  
- ESP_FAIL: Disable MCPWM capture timer failed because of other error

**esp_err_t mcpwm_capture_timer_start** *(mcpwm_cap_timer_handle_t cap_timer)*  
Start MCPWM capture timer.

**Parameters**  
cap_timer ⚶ [in] MCPWM capture timer, allocated by mcpwm_new_capture_timer()

**Returns**  
- ESP_OK: Start MCPWM capture timer successfully  
- ESP_ERR_INVALID_ARG: Start MCPWM capture timer failed because of invalid argument  
- ESP_FAIL: Start MCPWM capture timer failed because of other error

**esp_err_t mcpwm_capture_timer_stop** *(mcpwm_cap_timer_handle_t cap_timer)*  
Start MCPWM capture timer.

**Parameters**  
cap_timer ⚶ [in] MCPWM capture timer, allocated by mcpwm_new_capture_timer()

**Returns**  
- ESP_OK: Stop MCPWM capture timer successfully  
- ESP_ERR_INVALID_ARG: Stop MCPWM capture timer failed because of invalid argument  
- ESP_FAIL: Stop MCPWM capture timer failed because of other error

**esp_err_t mcpwm_capture_timer_get_resolution** *(mcpwm_cap_timer_handle_t cap_timer, uint32_t *out_resolution)*  
Get MCPWM capture timer resolution, in Hz.
Chapter 2. API Reference

Parameters
- `cap_timer` - [in] MCPWM capture timer, allocated by `mcpwm_new_capture_timer()`
- `out_resolution` - [out] Returned capture timer resolution, in Hz

Returns
- ESP_OK: Get capture timer resolution successfully
- ESP_ERR_INVALID_ARG: Get capture timer resolution failed because of invalid argument
- ESP_FAIL: Get capture timer resolution failed because of other error

`esp_err_t mcpwm_capture_timer_set_phase_on_sync` (mcpwm_cap_timer_handle_t cap_timer, const mcpwm_capture_timer_sync_phase_config_t *config)

Set sync phase for MCPWM capture timer.

Parameters
- `cap_timer` - [in] MCPWM capture timer, allocated by `mcpwm_new_capture_timer()`
- `config` - [in] MCPWM capture timer sync phase configuration

Returns
- ESP_OK: Set sync phase for MCPWM capture timer successfully
- ESP_ERR_INVALID_ARG: Set sync phase for MCPWM capture timer failed because of invalid argument
- ESP_FAIL: Set sync phase for MCPWM capture timer failed because of other error

`esp_err_t mcpwm_new_capture_channel` (mcpwm_cap_timer_handle_t cap_timer, const mcpwm_capture_channel_config_t *config, mcpwm_cap_channel_handle_t *ret_cap_channel)

Create MCPWM capture channel.

Note: The created capture channel won’t be enabled until calling `mcpwm_capture_channel_enable`

Parameters
- `cap_timer` - [in] MCPWM capture timer, allocated by `mcpwm_new_capture_timer()`, will be connected to the new capture channel
- `config` - [in] MCPWM capture channel configuration
- `ret_cap_channel` - [out] Returned MCPWM capture channel

Returns
- ESP_OK: Create MCPWM capture channel successfully
- ESP_ERR_INVALID_ARG: Create MCPWM capture channel failed because of invalid argument
- ESP_ERR_NO_MEM: Create MCPWM capture channel failed because out of memory
- ESP_ERR_NOT_FOUND: Create MCPWM capture channel failed because can’t find free resource
- ESP_FAIL: Create MCPWM capture channel failed because of other error

`esp_err_t mcpwm_del_capture_channel` (mcpwm_cap_channel_handle_t cap_channel)

Delete MCPWM capture channel.

Parameters `cap_channel` - [in] MCPWM capture channel handle, allocated by `mcpwm_new_capture_channel()`

Returns
- ESP_OK: Delete MCPWM capture channel successfully
- ESP_ERR_INVALID_ARG: Delete MCPWM capture channel failed because of invalid argument
- ESP_FAIL: Delete MCPWM capture channel failed because of other error
**esp_err_t mcpwm_capture_channel_enable (mcpwm_cap_channel_handle_t cap_channel)**

Enable MCPWM capture channel.

**Note:** This function will transit the channel state from init to enable.

**Note:** This function will enable the interrupt service, if it’s lazy installed in `mcpwm_capture_channel_register_event_callbacks()`.

**Parameters**

`cap_channel`  -[in] MCPWM capture channel handle, allocated by `mcpwm_new_capture_channel()`

**Returns**

- ESP_OK: Enable MCPWM capture channel successfully
- ESP_ERR_INVALID_ARG: Enable MCPWM capture channel failed because of invalid argument
- ESP_ERR_INVALID_STATE: Enable MCPWM capture channel failed because the channel is already enabled
- ESP_FAIL: Enable MCPWM capture channel failed because of other error

**esp_err_t mcpwm_capture_channel_disable (mcpwm_cap_channel_handle_t cap_channel)**

Disable MCPWM capture channel.

**Parameters**

`cap_channel`  -[in] MCPWM capture channel handle, allocated by `mcpwm_new_capture_channel()`

**Returns**

- ESP_OK: Disable MCPWM capture channel successfully
- ESP_ERR_INVALID_ARG: Disable MCPWM capture channel failed because of invalid argument
- ESP_ERR_INVALID_STATE: Disable MCPWM capture channel failed because the channel is not enabled yet
- ESP_FAIL: Disable MCPWM capture channel failed because of other error

**esp_err_t mcpwm_capture_channel_register_event_callbacks (mcpwm_cap_channel_handle_t cap_channel, const mcpwm_capture_event_callbacks_t *cbs, void *user_data)**

Set event callbacks for MCPWM capture channel.

**Note:** The first call to this function needs to be before the call to `mcpwm_capture_channel_enable`

**Note:** User can deregister a previously registered callback by calling this function and setting the callback member in the `cbs` structure to NULL.

**Parameters**

- `cap_channel`  -[in] MCPWM capture channel handle, allocated by `mcpwm_new_capture_channel()`
- `cbs`  -[in] Group of callback functions
- `user_data`  -[in] User data, which will be passed to callback functions directly

**Returns**

- ESP_OK: Set event callbacks successfully
- ESP_ERR_INVALID_ARG: Set event callbacks failed because of invalid argument
- ESP_ERR_INVALID_STATE: Set event callbacks failed because the channel is not in init state
• ESP_FAIL: Set event callbacks failed because of other error

\[ \text{esp_err_t mcpwm_capture_channel_trigger_soft_catch(mcpwm_cap_channel_handle_t cap_channel)} \]

Trigger a catch by software.

**Parameters**

\[
\text{cap_channel} \quad \rightarrow \quad \text{[in]} \quad \text{MCPWM capture channel handle, allocated by mcpwm_new_capture_channel()}
\]

**Returns**

- ESP_OK: Trigger software catch successfully
- ESP_ERR_INVALID_ARG: Trigger software catch failed because of invalid argument
- ESP_ERR_INVALID_STATE: Trigger software catch failed because the channel is not enabled yet
- ESP_FAIL: Trigger software catch failed because of other error

```  
Get the ETM event for MCPWM comparator.

Note: The created ETM event object can be deleted later by calling `esp_etm_del_event`

Parameters

- cmpr [in] MCPWM comparator, allocated by `mcpwm_new_comparator()` or `mcpwm_new_event_comparator()`
- config [in] MCPWM ETM comparator event configuration
- out_event [out] Returned ETM event handle

Returns

- ESP_OK: Get ETM event successfully
- ESP_ERR_INVALID_ARG: Get ETM event failed because of invalid argument
- ESP_FAIL: Get ETM event failed because of other error

Structures

```
struct mcpwm_cmpr_etm_event_config_t

      Captured value

  mcpwm_capture_edge_t cap_edge
      Capture edge
Type Definitions

typedef struct mcpwm_timer_t *mcpwm_timer_handle_t
    Type of MCPWM timer handle.

typedef struct mcpwm_oper_t *mcpwm_oper_handle_t
    Type of MCPWM operator handle.

typedef struct mcpwm_cmpr_t *mcpwm_cmpr_handle_t
    Type of MCPWM comparator handle.

typedef struct mcpwm_gen_t *mcpwm_gen_handle_t
    Type of MCPWM generator handle.

typedef struct mcpwm_fault_t *mcpwm_fault_handle_t
    Type of MCPWM fault handle.

typedef struct mcpwmSync_t *mcpwmSync_handle_t
    Type of MCPWM sync handle.

typedef struct mcpwm_cap_timer_t *mcpwm_cap_timer_handle_t
    Type of MCPWM capture timer handle.

typedef struct mcpwm_cap_channel_t *mcpwm_cap_channel_handle_t
    Type of MCPWM capture channel handle.

typedef bool (*mcpwm_timer_event_cb_t)(mcpwm_timer_handle_t timer, const mcpwm_timer_event_data_t *edata, void *user_ctx)
    MCPWM timer event callback function.
        
        Param timer [in] MCPWM timer handle
        Param edata [in] MCPWM timer event data, fed by driver
        Param user_ctx [in] User data, set in mcpwm_timer_register_event_callbacks()
        Return Whether a high priority task has been waken up by this function

typedef bool (*mcpwm_brake_event_cb_t)(mcpwm_oper_handle_t oper, const mcpwm_brake_event_data_t *edata, void *user_ctx)
    MCPWM operator brake event callback function.
        
        Param oper [in] MCPWM operator handle
        Param edata [in] MCPWM brake event data, fed by driver
        Param user_ctx [in] User data, set in mcpwm_operator_register_event_callbacks()
        Return Whether a high priority task has been waken up by this function

typedef bool (*mcpwm_fault_event_cb_t)(mcpwm_fault_handle_t fault, const mcpwm_fault_event_data_t *edata, void *user_ctx)
    MCPWM fault event callback function.
        
        Param fault MCPWM fault handle
        Param edata MCPWM fault event data, fed by driver
        Param user_ctx User data, set in mcpwm_fault_register_event_callbacks()
        Return whether a task switch is needed after the callback returns

typedef bool (*mcpwm_compare_event_cb_t)(mcpwm_cmpr_handle_t comparator, const mcpwm_compare_event_data_t *edata, void *user_ctx)
MCPWM comparator event callback function.

```c
typedef bool (*mcpwm_comparator_event_cb_t)(MCPWMcomparatorhandle comparator,
                                          const MCPWMcomparatoreventdata edata,
                                          void *user_ctx)
```

**Return** Whether a high priority task has been waken up by this function.

MCPWM capture event callback function.

```c
typedef bool (*mcpwm_capture_event_cb_t)(MCPWMcapturechannelhandle cap_channel,
                                          const MCPWMcaptureeventdata edata,
                                          void *user_ctx)
```

**Return** Whether a high priority task has been waken up by this function.

**Header File**

- `components/hal/include/hal/mcpwm_types.h`
- This header file can be included with:

```c
#include "hal/mcpwm_types.h"
```

**Type Definitions**

- `soc_periph_mcpwm_timer_clk_src_t mcpwm_timer_clock_source_t` MCPWM timer clock source.
- `soc_periph_mcpwm_capture_clk_src_t mcpwm_capture_clock_source_t` MCPWM capture clock source.
- `soc_periph_mcpwm_carrier_clk_src_t mcpwm_carrier_clock_source_t` MCPWM carrier clock source.

**Enumerations**

- `enum mcpwm_timer_direction_t` MCPWM timer count direction.
  
  **Values:**
  
  - `MCPWM_TIMER_DIRECTION_UP` Counting direction: Increase
  - `MCPWM_TIMER_DIRECTION_DOWN` Counting direction: Decrease

- `enum mcpwm_timer_event_t` MCPWM timer events.
  
  **Values:**
  
  - `MCPWM_TIMER_EVENT_EMPTY` MCPWM timer counts to zero (i.e. counter is empty)
enumerator **MCPWM_TIMER_EVENT_FULL**
MCPWM timer counts to peak (i.e. counter is full)

enumerator **MCPWM_TIMER_EVENT_INVALID**
MCPWM timer invalid event

c enum **mcpwm_timer_count_mode_t**
MCPWM timer count modes.
Values:

enumerator **MCPWM_TIMER_COUNT_MODE_PAUSE**
MCPWM timer paused

enumerator **MCPWM_TIMER_COUNT_MODE_UP**
MCPWM timer counting up

enumerator **MCPWM_TIMER_COUNT_MODE_DOWN**
MCPWM timer counting down

enumerator **MCPWM_TIMER_COUNT_MODE_UP_DOWN**
MCPWM timer counting up and down

c enum **mcpwm_timer_start_stop_cmd_t**
MCPWM timer commands, specify the way to start or stop the timer.
Values:

enumerator **MCPWM_TIMER_STOP_EMPTY**
MCPWM timer stops when next count reaches zero

enumerator **MCPWM_TIMER_STOP_FULL**
MCPWM timer stops when next count reaches peak

enumerator **MCPWM_TIMER_START_NO_STOP**
MCPWM timer starts counting, and don’t stop until received stop command

enumerator **MCPWM_TIMER_START_STOP_EMPTY**
MCPWM timer starts counting and stops when next count reaches zero

enumerator **MCPWM_TIMER_START_STOP_FULL**
MCPWM timer starts counting and stops when next count reaches peak

c enum **mcpwm_generator_action_t**
MCPWM generator actions.
Values:

enumerator **MCPWM_GEN_ACTION_KEEP**
Generator action: Keep the same level
enumerator **MCPWM_GEN_ACTION_LOW**
Generator action: Force to low level

enumerator **MCPWM_GEN_ACTION_HIGH**
Generator action: Force to high level

enumerator **MCPWM_GEN_ACTION_TOGGLE**
Generator action: Toggle level

enum **mcpwm_operator_brake_mode_t**
MCPWM operator brake mode.

Values:

enumerator **MCPWM_OPER_BRAKE_MODE_CBC**
Brake mode: CBC (cycle by cycle)

enumerator **MCPWM_OPER_BRAKE_MODE_OST**
Brake mode: OST (one shot)

enumerator **MCPWM_OPER_BRAKE_MODE_INVALID**
MCPWM operator invalid brake mode

enum **mcpwm_capture_edge_t**
MCPWM capture edge.

Values:

enumerator **MCPWM_CAP_EDGE_POS**
Capture on the positive edge

enumerator **MCPWM_CAP_EDGE_NEG**
Capture on the negative edge

enum **mcpwm_comparator_etm_event_type_t**
MCPWM comparator specific events that supported by the ETM module.

Values:

enumerator **MCPWM_CMPR_ETM_EVENT_EQUAL**
The count value equals the value of comparator

enumerator **MCPWM_CMPR_ETM_EVENT_MAX**
Maximum number of comparator events

### 2.6.15 Pulse Counter (PCNT)
Introduction

The PCNT (Pulse Counter) module is designed to count the number of rising and/or falling edges of input signals. The ESP32-S3 contains multiple pulse counter units in the module. Each unit is in effect an independent counter with multiple channels, where each channel can increment/decrement the counter on a rising/falling edge. Furthermore, each channel can be configured separately.

PCNT channels can react to signals of edge type and level type, however for simple applications, detecting the edge signal is usually sufficient. PCNT channels can be configured react to both pulse edges (i.e., rising and falling edge), and can be configured to increase, decrease or do nothing to the unit’s counter on each edge. The level signal is the so-called control signal, which is used to control the counting mode of the edge signals that are attached to the same channel. By combining the usage of both edge and level signals, a PCNT unit can act as a quadrature decoder.

Besides that, PCNT unit is equipped with a separate glitch filter, which is helpful to remove noise from the signal.

Typically, a PCNT module can be used in scenarios like:

- Calculate periodic signal’s frequency by counting the pulse numbers within a time slice
- Decode quadrature signals into speed and direction

Functional Overview

Description of the PCNT functionality is divided into the following sections:

- **Resource Allocation** - covers how to allocate PCNT units and channels with properly set of configurations. It also covers how to recycle the resources when they finished working.
- **Set Up Channel Actions** - covers how to configure the PCNT channel to behave on different signal edges and levels.
- **Watch Points** - describes how to configure PCNT watch points (i.e., tell PCNT unit to trigger an event when the count reaches a certain value).
- **Register Event Callbacks** - describes how to hook your specific code to the watch point event callback function.
- **Set Glitch Filter** - describes how to enable and set the timing parameters for the internal glitch filter.
- **Enable and Disable Unit** - describes how to enable and disable the PCNT unit.
- **Unit IO Control** - describes IO control functions of PCNT unit, like enable glitch filter, start and stop unit, get and clear count value.
- **Power Management** - describes what functionality will prevent the chip from going into low power mode.
- **IRAM Safe** - describes tips on how to make the PCNT interrupt and IO control functions work better along with a disabled cache.
- **Thread Safety** - lists which APIs are guaranteed to be thread safe by the driver.
- **Kconfig Options** - lists the supported Kconfig options that can be used to make a different effect on driver behavior.

**Resource Allocation** The PCNT unit and channel are represented by `pcnt_unit_handle_t` and `pcnt_channel_handle_t` respectively. All available units and channels are maintained by the driver in a resource pool, so you do not need to know the exact underlying instance ID.

**Install PCNT Unit** To install a PCNT unit, there is a configuration structure that needs to be given in advance:

```c
pcnt_unit_config_t:
```

- `pcnt_unit_config_t::low_limit` and `pcnt_unit_config_t::high_limit` specify the range for the internal hardware counter. The counter will reset to zero automatically when it crosses either the high or low limit.

---

1 Different ESP chip series might have different number of PCNT units and channels. Please refer to the [TRM] for details. The driver does not forbid you from applying for more PCNT units and channels, but it returns error when all available hardware resources are used up. Please always check the return value when doing resource allocation (e.g., `pcnt_new_unit()`).
**pcnt_unit_config_t::accum_count** sets whether to create an internal accumulator for the counter. This is helpful when you want to extend the counter’s width, which by default is 16 bit at most, defined in the hardware. See also **Compensate Overflow Loss** for how to use this feature to compensate the overflow loss.

**pcnt_unit_config_t::intr_priority** sets the priority of the interrupt. If it is set to 0, the driver will allocate an interrupt with a default priority. Otherwise, the driver will use the given priority.

**Note:** Since all PCNT units share the same interrupt source, when installing multiple PCNT units make sure that the interrupt priority **pcnt_unit_config_t::intr_priority** is the same for each unit.

Unit allocation and initialization is done by calling a function **pcnt_new_unit()** with **pcnt_unit_config_t** as an input parameter. The function will return a PCNT unit handle only when it runs correctly. Specifically, when there are no more free PCNT units in the pool (i.e., unit resources have been used up), then this function will return **ESP_ERR_NOT_FOUND** error. The total number of available PCNT units is recorded by **SOC_PCNT_UNITS_PER_GROUP** for reference.

If a previously created PCNT unit is no longer needed, it is recommended to recycle the resource by calling **pcnt_del_unit()**. Which in return allows the underlying unit hardware to be used for other purposes. Before deleting a PCNT unit, one should ensure the following prerequisites:

- The unit is in the init state, in other words, the unit is either disabled by **pcnt_unit_disable()** or not enabled yet.
- The attached PCNT channels are all removed by **pcnt_del_channel()**.

```c
#define EXAMPLE_PCNT_HIGH_LIMIT 100
#define EXAMPLE_PCNT_LOW_LIMIT -100
pcnt_unit_config_t unit_config = {  .high_limit = EXAMPLE_PCNT_HIGH_LIMIT,  .low_limit = EXAMPLE_PCNT_LOW_LIMIT,}; pcnt_unit_handle_t pcnt_unit = NULL; ESP_ERROR_CHECK(pcnt_new_unit(&unit_config, &pcnt_unit));
```

**Install PCNT Channel** To install a PCNT channel, you must initialize a **pcnt_chan_config_t** structure in advance, and then call **pcnt_new_channel()**. The configuration fields of the **pcnt_chan_config_t** structure are described below:

- **pcnt_chan_config_t::edge_gpio_num** and **pcnt_chan_config_t::level_gpio_num** specify the GPIO numbers used by edge type signal and level type signal. Please note, either of them can be assigned to -1 if it is not actually used, and thus it will become a virtual IO. For some simple pulse counting applications where one of the level/edge signals is fixed (i.e., never changes), you can reclaim a GPIO by setting the signal as a virtual IO on channel allocation. Setting the level/edge signal as a virtual IO causes that signal to be internally routed to a fixed High/Low logic level, thus allowing you to save a GPIO for other purposes.

- **pcnt_chan_config_t::virt_edge_io_level** and **pcnt_chan_config_t::virt_level_io_level** specify the virtual IO level for edge and level input signal, to ensure a deterministic state for such control signal. Please note, they are only valid when either **pcnt_chan_config_t::edge_gpio_num** or **pcnt_chan_config_t::level_gpio_num** is assigned to -1.

- **pcnt_chan_config_t::invert_edge_input** and **pcnt_chan_config_t::invert_level_input** are used to decide whether to invert the input signals before they going into PCNT hardware. The invert is done by GPIO matrix instead of PCNT hardware.

- **pcnt_chan_config_t::io_loop_back** is for debug only, which enables both the GPIO’s input and output paths. This can help to simulate the pulse signals by function **gpio_set_level()** on the same GPIO.

Channel allocating and initialization is done by calling a function **pcnt_new_channel()** with the above **pcnt_chan_config_t** as an input parameter plus a PCNT unit handle returned from **pcnt_new_unit()**. This function will return a PCNT channel handle if it runs correctly. Specifically, when there are no more free PCNT channel within the unit (i.e., channel resources have been used up), then this function will return
ESP_ERR_NOT_FOUND error. The total number of available PCNT channels within the unit is recorded by
SOC_PCNT_CHANNELS_PER_UNIT for reference. Note that, when install a PCNT channel for a specific unit,
one should ensure the unit is in the init state, otherwise this function will return ESP_ERR_INVALID_STATE
error.

If a previously created PCNT channel is no longer needed, it is recommended to recycle the resources by calling
pcnt_del_channel(). Which in return allows the underlying channel hardware to be used for other purposes.

```c
#define EXAMPLE_CHAN_GPIO_A 0
#define EXAMPLE_CHAN_GPIO_B 2

cnt_chan_config_t chan_config = {
    .edge_gpio_num = EXAMPLE_CHAN_GPIO_A,
    .level_gpio_num = EXAMPLE_CHAN_GPIO_B,
};

cnt_channel_handle_t pcnt_chan = NULL;
ESP_ERROR_CHECK(pcnt_new_channel(pcnt_unit, &chan_config, &pcnt_chan));
```

### Set Up Channel Actions
The PCNT will increase/decrease/hold its internal count value when the input pulse signal
toggles. You can set different actions for edge signal and/or level signal.

- **pcnt_channel_set_edge_action()** function is to set specific actions for rising and falling edge of
  the signal attached to the pcnt_chan_config_t::edge_gpio_num. Supported actions are listed in
  pcnt_channel_edge_action_t.
- **pcnt_channel_set_level_action()** function is to set specific actions for high and low
  level of the signal attached to the pcnt_chan_config_t::level_gpio_num. Supported actions
  are listed in pcnt_channel_level_action_t. This function is not mandatory if the
  pcnt_chan_config_t::level_gpio_num is set to -1 when allocating PCNT channel by
  pcnt_new_channel().

```c
// decrease the counter on rising edge, increase the counter on falling edge
ESP_ERROR_CHECK(pcnt_channel_set_edge_action(pcnt_chan, PCNT_CHANNEL_EDGE_ACTION_-
->DECREASE, PCNT_CHANNEL_EDGE_ACTION_INCREASE));
// keep the counting mode when the control signal is high level, and reverse the_
->counting mode when the control signal is low level
ESP_ERROR_CHECK(pcnt_channel_set_level_action(pcnt_chan, PCNT_CHANNEL_LEVEL_ACTION_-
->KEEP, PCNT_CHANNEL_LEVEL_ACTION_INVERSE));
```

### Watch Points
Each PCNT unit can be configured to watch several different values that you are interested in. The value to be watched is also called **Watch Point**. The watch point itself cannot exceed the range set in pcnt_unit_config_t by pcnt_unit_config_t::low_limit and
pcnt_unit_config_t::high_limit. When the counter reaches either watch point, a watch
event will be triggered and notify you by interrupt if any watch event callback has ever registered in
pcnt_unit_register_event_callbacks(). See **Register Event Callbacks** for how to register event call-
backs.

The watch point can be added and removed by pcnt_unit_add_watch_point() and
pcnt_unit_remove_watch_point(). The commonly-used watch points are: **zero cross, maximum/minimum**
and other threshold values. The number of available watch point is limited, pcnt_unit_add_watch_point() will return error ESP_ERR_NOT_FOUND if it can not find any
free hardware resource to save the watch point. You can not add the same watch point for multiple times, otherwise
it will return error ESP_ERR_INVALID_STATE.

It is recommended to remove the unused watch point by pcnt_unit_remove_watch_point() to recycle the
watch point resources.

```c
// add zero across watch point
ESP_ERROR_CHECK(pcnt_unit_add_watch_point(pcnt_unit, 0));
// add high limit watch point
ESP_ERROR_CHECK(pcnt_unit_add_watch_point(pcnt_unit, EXAMPLE_PCNT_HIGH_LIMIT));
```
Note: Due to the hardware limitation, after adding a watch point, you should call `pcnt_unit_clear_count()` to make it take effect.

Register Event Callbacks  When PCNT unit reaches any enabled watch point, specific event will be generated and notify the CPU by interrupt. If you have some function that want to get executed when event happens, you should hook your function to the interrupt service routine by calling `pcnt_unit_register_event_callbacks()`. All supported event callbacks are listed in the `pcnt_event_callbacks_t`:

- `pcnt_event_callbacks_t::on_reach` sets a callback function for watch point event. As this function is called within the ISR context, you must ensure that the function does not attempt to block (e.g., by making sure that only FreeRTOS APIs with _ISR suffix are called from within the function). The function prototype is declared in `pcnt_watch_cb_t`.

You can save their own context to `pcnt_unit_register_event_callbacks()` as well, via the parameter `user_ctx`. This user data will be directly passed to the callback functions.

In the callback function, the driver will fill in the event data of specific event. For example, the watch point event data is declared as `pcnt_watch_event_data_t`:

- `pcnt_watch_event_data_t::watch_point_value` saves the watch point value that triggers the event.
- `pcnt_watch_event_data_t::zero_cross_mode` saves how the PCNT unit crosses the zero point in the latest time. The possible zero cross modes are listed in the `pcnt_unit_zero_cross_mode_t`. Usually different zero cross mode means different counting direction and counting step size.

Registering callback function results in lazy installation of interrupt service, thus this function should only be called before the unit is enabled by `pcnt_unit_enable()`. Otherwise, it can return `ESP_ERR_INVALID_STATE` error.

```c
static bool example_pcnt_on_reach(pcnt_unit_handle_t unit, const pcnt_watch_event_data_t *edata, void *user_ctx)
{
    BaseType_t high_task_wakeup;
    QueueHandle_t queue = (QueueHandle_t)user_ctx;
    // send watch point to queue, from this interrupt callback
    xQueueSendFromISR(queue, &edata->watch_point_value, &high_task_wakeup);
    // return whether a high priority task has been waken up by this function
    return (high_task_wakeup == pdTRUE);
}

cnt_event_callbacks_t cbs = {
    .on_reach = example_pcnt_on_reach,
};
QueueHandle_t queue = xQueueCreate(10, sizeof(int));
ESP_ERROR_CHECK(pcnt_unit_register_event_callbacks(pcnt_unit, &cbs, queue));
```

Set Glitch Filter  The PCNT unit features filters to ignore possible short glitches in the signals. The parameters that can be configured for the glitch filter are listed in `pcnt_glitch_filter_config_t`:

- `pcnt_glitch_filter_config_t::max_glitch_ns` sets the maximum glitch width, in nanoseconds. If a signal pulse’s width is smaller than this value, then it will be treated as noise and will not increase/decrease the internal counter.

You can enable the glitch filter for PCNT unit by calling `pcnt_unit_set_glitch_filter()` with the filter configuration provided above. Particularly, you can disable the glitch filter later by calling `pcnt_unit_set_glitch_filter()` with a NULL filter configuration.

This function should be called when the unit is in the init state. Otherwise, it will return `ESP_ERR_INVALID_STATE` error.
Chapter 2. API Reference

**Note:** The glitch filter is clocked from APB. For the counter not to miss any pulses, the maximum glitch width should be longer than one APB_CLK cycle (usually 12.5 ns if APB equals 80 MHz). As the APB frequency would be changed after DFS (Dynamic Frequency Scaling) enabled, which means the filter does not work as expect in that case. So the driver installs a PM lock for PCNT unit during the first time you enable the glitch filter. For more information related to power management strategy used in PCNT driver, please see *Power Management*.

```c
pcnt_glitch_filter_config_t filter_config = {
    .max_glitch_ns = 1000,
};
ESP_ERROR_CHECK(pcnt_unit_set_glitch_filter(pcnt_unit, &filter_config));
```

**Enable and Disable Unit** Before doing IO control to the PCNT unit, you need to enable it first, by calling `pcnt_unit_enable()`. Internally, this function:

- switches the PCNT driver state from *init* to *enable*.
- enables the interrupt service if it has been lazy installed in `pcnt_unit_register_event_callbacks()`.
- acquires a proper power management lock if it has been lazy installed in `pcnt_unit_set_glitch_filter()`. See also *Power Management* for more information.

On the contrary, calling `pcnt_unit_disable()` will do the opposite, that is, put the PCNT driver back to the *init* state, disable the interrupts service and release the power management lock.

**Unit IO Control**

**Start/Stop and Clear** Calling `pcnt_unit_start()` makes the PCNT unit start to work, increase or decrease counter according to pulse signals. On the contrary, calling `pcnt_unit_stop()` will stop the PCNT unit but retain current count value. Instead, clearing counter can only be done by calling `pcnt_unit_clear_count()`.

Note, `pcnt_unit_start()` and `pcnt_unit_stop()` should be called when the unit has been enabled by `pcnt_unit_enable()`. Otherwise, it will return `ESP_ERR_INVALID_STATE` error.

**Get Count Value** You can read current count value at any time by calling `pcnt_unit_get_count()`. The returned count value is a *signed* integer, where the sign can be used to reflect the direction.

```c
int pulse_count = 0;
ESP_ERROR_CHECK(pcnt_unit_get_count(pcnt_unit, &pulse_count));
```

**Compensate Overflow Loss** The internal hardware counter will be cleared to zero automatically when it reaches high or low limit. If you want to compensate for that count loss and extend the counter’s bit-width, you can:

1. Enable `pcnt_unit_config_t::accum_count` when installing the PCNT unit.
2. Add the high/low limit as the *Watch Points*.
3. Now, the returned count value from the `pcnt_unit_get_count()` function not only reflects the hardware’s count value, but also accumulates the high/low overflow loss to it.

**Note:** `pcnt_unit_clear_count()` resets the accumulated count value as well.

**Power Management** When power management is enabled (i.e., `CONFIG_PM_ENABLE` is on), the system will adjust the APB frequency before going into light sleep, thus potentially changing the behavior of PCNT glitch filter and leading to valid signal being treated as noise.

However, the driver can prevent the system from changing APB frequency by acquiring a power management lock of type `ESP_PM_APB_FREQ_MAX`. Whenever you enable the glitch filter by
`pcnt_unit_set_glitch_filter()`, the driver guarantees that the power management lock is acquired after the PCNT unit is enabled by `pcnt_unit_enable()`. Likewise, the driver releases the lock after `pcnt_unit_disable()` is called.

**IRAM Safe**  By default, the PCNT interrupt will be deferred when the Cache is disabled for reasons like writing/erasing Flash. Thus the alarm interrupt will not get executed in time, which is not expected in a real-time application.

There is a Kconfig option `CONFIG_PCNT_ISR_IRAM_SAFE` that:

1. Enables the interrupt being serviced even when cache is disabled
2. Places all functions that used by the ISR into IRAM
3. Places driver object into DRAM (in case it is mapped to PSRAM by accident)

This allows the interrupt to run while the cache is disabled but comes at the cost of increased IRAM consumption.

There is another Kconfig option `CONFIG_PCNT_CTRL_FUNC_IN_IRAM` that can put commonly used IO control functions into IRAM as well. So that these functions can also be executable when the cache is disabled. These IO control functions are as follows:

- `pcnt_unit_start()`
- `pcnt_unit_stop()`
- `pcnt_unit_clear_count()`
- `pcnt_unit_get_count()`

**Thread Safety**  The factory functions `pcnt_new_unit()` and `pcnt_new_channel()` are guaranteed to be thread safe by the driver, which means, you can call them from different RTOS tasks without protection by extra locks.

The following functions are allowed to run under ISR context, the driver uses a critical section to prevent them being called concurrently in both task and ISR.

- `pcnt_unit_start()`
- `pcnt_unit_stop()`
- `pcnt_unit_clear_count()`
- `pcnt_unit_get_count()`

Other functions that take the `pcnt_unit_handle_t` and `pcnt_channel_handle_t` as the first positional parameter, are not treated as thread safe. This means you should avoid calling them from multiple tasks.

**Kconfig Options**

- `CONFIG_PCNT_CTRL_FUNC_IN_IRAM` controls where to place the PCNT control functions (IRAM or Flash), see **IRAM Safe** for more information.
- `CONFIG_PCNT_ISR_IRAM_SAFE` controls whether the default ISR handler can work when cache is disabled, see **IRAM Safe** for more information.
- `CONFIG_PCNT_ENABLE_DEBUG_LOG` is used to enabled the debug log output. Enabling this option increases the firmware binary size.

**Application Examples**

- Decode the quadrature signals from rotary encoder: `peripherals/pcnt/rotary_encoder`.

---

2 `pcnt_event_callbacks_t::on_reach` callback and the functions invoked by itself should also be placed in IRAM, you need to take care of them by themselves.
API Reference

Header File

- components/esp_driver_pcnt/include/driver/pulse_cnt.h
- This header file can be included with:

  ```c
  #include "driver/pulse_cnt.h"
  ```
- This header file is a part of the API provided by the esp_driver_pcnt component. To declare that your component depends on esp_driver_pcnt, add the following to your CMakeLists.txt:

  ```
  REQUIRES esp_driver_pcnt
  or
  PRIV_REQUIRES esp_driver_pcnt
  ```

Functions

```c
esp_err_t pcnt_new_unit (const pcnt_unit_config_t *config, pcnt_unit_handle_t *ret_unit)
```

Create a new PCNT unit, and return the handle.

**Note:** The newly created PCNT unit is put in the init state.

**Parameters**

- `config` - [in] PCNT unit configuration
- `ret_unit` - [out] Returned PCNT unit handle

**Returns**

- ESP_OK: Create PCNT unit successfully
- ESP_ERR_INVALID_ARG: Create PCNT unit failed because of invalid argument (e.g. high/low limit value out of the range)
- ESP_ERR_NO_MEM: Create PCNT unit failed because out of memory
- ESP_ERR_NOT_FOUND: Create PCNT unit failed because all PCNT units are used up and no more free one
- ESP_FAIL: Create PCNT unit failed because of other error

```c
esp_err_t pcnt_del_unit (pcnt_unit_handle_t unit)
```

Delete the PCNT unit handle.

**Note:** A PCNT unit can’t be in the enable state when this function is invoked. See also `pcnt_unit_disable()` for how to disable a unit.

**Parameters**

- `unit` - [in] PCNT unit handle created by `pcnt_new_unit()`

**Returns**

- ESP_OK: Delete the PCNT unit successfully
- ESP_ERR_INVALID_ARG: Delete the PCNT unit failed because of invalid argument
- ESP_ERR_INVALID_STATE: Delete the PCNT unit failed because the unit is not in init state or some PCNT channel is still in working
- ESP_FAIL: Delete the PCNT unit failed because of other error

```c
esp_err_t pcnt_unit_set_glitch_filter (pcnt_unit_handle_t unit, const pcnt_glitch_filter_config_t *config)
```

Set glitch filter for PCNT unit.

**Note:** The glitch filter module is clocked from APB, and APB frequency can be changed during DFS, which in return make the filter out of action. So this function will lazy-install a PM lock internally when the power
management is enabled. With this lock, the APB frequency won’t be changed. The PM lock can be uninstalled in `pcnt_del_unit()`.

Note: This function should be called when the PCNT unit is in the init state (i.e. before calling `pcnt_unit_enable()`)

### Parameters
- `unit` - [in] PCNT unit handle created by `pcnt_new_unit()`
- `config` - [in] PCNT filter configuration, set config to NULL means disabling the filter function

### Returns
- ESP_OK: Set glitch filter successfully
- ESP_ERR_INVALID_ARG: Set glitch filter failed because of invalid argument (e.g. glitch width is too big)
- ESP_ERR_INVALID_STATE: Set glitch filter failed because the unit is not in the init state
- ESP_FAIL: Set glitch filter failed because of other error

```c
esp_err_t pcnt_unit_enable (pcnt_unit_handle_t unit)
```
Enable the PCNT unit.

Note: This function will transit the unit state from init to enable.

Note: This function will enable the interrupt service, if it’s lazy installed in `pcnt_unit_register_event_callbacks()`.

Note: This function will acquire the PM lock if it’s lazy installed in `pcnt_unit_set_glitch_filter()`.

Note: Enable a PCNT unit doesn’t mean to start it. See also `pcnt_unit_start()` for how to start the PCNT counter.

```c
esp_err_t pcnt_unit_disable (pcnt_unit_handle_t unit)
```
Disable the PCNT unit.

Note: This function will do the opposite work to the `pcnt_unit_enable()`

Note: Disable a PCNT unit doesn’t mean to stop it. See also `pcnt_unit_stop()` for how to stop the
PCNT counter.

**Parameters**  
unit –[in] PCNT unit handle created by `pcnt_new_unit()`  

**Returns**  
- ESP_OK: Disable PCNT unit successfully  
- ESP_ERR_INVALID_ARG: Disable PCNT unit failed because of invalid argument  
- ESP_ERR_INVALID_STATE: Disable PCNT unit failed because the unit is not enabled yet  
- ESP_FAIL: Disable PCNT unit failed because of other error

`esp_err_t pcnt_unit_start (pcnt_unit_handle_t unit)`

Start the PCNT unit, the counter will start to count according to the edge and/or level input signals.

**Note:**  
This function should be called when the unit is in the enable state (i.e. after calling `pcnt_unit_enable()`)

**Note:**  
This function is allowed to run within ISR context

**Note:**  
This function will be placed into IRAM if `CONFIG_PCNT_CTRL_FUNC_IN_IRAM` is on, so that it’s allowed to be executed when Cache is disabled

**Parameters**  
unit –[in] PCNT unit handle created by `pcnt_new_unit()`  

**Returns**  
- ESP_OK: Start PCNT unit successfully  
- ESP_ERR_INVALID_ARG: Start PCNT unit failed because of invalid argument  
- ESP_ERR_INVALID_STATE: Start PCNT unit failed because the unit is not enabled yet  
- ESP_FAIL: Start PCNT unit failed because of other error

`esp_err_t pcnt_unit_stop (pcnt_unit_handle_t unit)`

Stop PCNT from counting.

**Note:**  
This function should be called when the unit is in the enable state (i.e. after calling `pcnt_unit_enable()`)

**Note:**  
The stop operation won’t clear the counter. Also see `pcnt_unit_clear_count()` for how to clear pulse count value.

**Note:**  
This function is allowed to run within ISR context

**Note:**  
This function will be placed into IRAM if `CONFIG_PCNT_CTRL_FUNC_IN_IRAM`, so that it is allowed to be executed when Cache is disabled

**Parameters**  
unit –[in] PCNT unit handle created by `pcnt_new_unit()`  

**Returns**  
- ESP_OK: Stop PCNT unit successfully  
- ESP_ERR_INVALID_ARG: Stop PCNT unit failed because of invalid argument
• ESP_ERR_INVALID_STATE: Stop PCNT unit failed because the unit is not enabled yet
• ESP_FAIL: Stop PCNT unit failed because of other error

`esp_err_t pcnt_unit_clear_count (pcnt_unit_handle_t unit)`
Clear PCNT pulse count value to zero.

**Note:** It’s recommended to call this function after adding a watch point by `pcnt_unit_add_watch_point()`, so that the newly added watch point is effective immediately.

**Note:** This function is allowed to run within ISR context

**Note:** This function will be placed into IRAM if `CONFIG_PCNT_CTRL_FUNC_IN_IRAM`, so that it’s allowed to be executed when Cache is disabled

**Parameters**
- `unit` – [in] PCNT unit handle created by `pcnt_new_unit()`

**Returns**
- ESP_OK: Clear PCNT pulse count successfully
- ESP_ERR_INVALID_ARG: Clear PCNT pulse count failed because of invalid argument
- ESP_FAIL: Clear PCNT pulse count failed because of other error

`esp_err_t pcnt_unit_get_count (pcnt_unit_handle_t unit, int *value)`
Get PCNT count value.

**Note:** This function is allowed to run within ISR context

**Note:** This function will be placed into IRAM if `CONFIG_PCNT_CTRL_FUNC_IN_IRAM`, so that it’s allowed to be executed when Cache is disabled

**Parameters**
- `unit` – [in] PCNT unit handle created by `pcnt_new_unit()`
- `value` – [out] Returned count value

**Returns**
- ESP_OK: Get PCNT pulse count successfully
- ESP_ERR_INVALID_ARG: Get PCNT pulse count failed because of invalid argument
- ESP_FAIL: Get PCNT pulse count failed because of other error

`esp_err_t pcnt_unit_register_event_callbacks (pcnt_unit_handle_t unit, const pcnt_event_callbacks_t *cbs, void *user_data)`
Set event callbacks for PCNT unit.

**Note:** User registered callbacks are expected to be runnable within ISR context

**Note:** The first call to this function needs to be before the call to `pcnt_unit_enable`
**Note:** User can deregister a previously registered callback by calling this function and setting the callback member in the `cbs` structure to NULL.

### Parameters
- **unit** - [in] PCNT unit handle created by `pcnt_new_unit()`  
- **cbs** - [in] Group of callback functions  
- **user_data** - [in] User data, which will be passed to callback functions directly

### Returns
- **ESP_OK:** Set event callbacks successfully  
- **ESP_ERR_INVALID_ARG:** Set event callbacks failed because of invalid argument  
- **ESP_ERR_INVALID_STATE:** Set event callbacks failed because the unit is not in init state  
- **ESP_FAIL:** Set event callbacks failed because of other error

`esp_err_t pcnt_unit_add_watch_point (pcnt_unit_handle_t unit, int watch_point)`

Add a watch point for PCNT unit, PCNT will generate an event when the counter value reaches the watch point value.

### Parameters
- **unit** - [in] PCNT unit handle created by `pcnt_new_unit()`  
- **watch_point** - [in] Value to be watched

### Returns
- **ESP_OK:** Add watch point successfully  
- **ESP_ERR_INVALID_ARG:** Add watch point failed because of invalid argument (e.g. the value to be watched is out of the limitation set in `pcnt_unit_config_t`)  
- **ESP_ERR_INVALID_STATE:** Add watch point failed because the same watch point has already been added  
- **ESP_ERR_NOT_FOUND:** Add watch point failed because no more hardware watch point can be configured  
- **ESP_FAIL:** Add watch point failed because of other error

`esp_err_t pcnt_unit_remove_watch_point (pcnt_unit_handle_t unit, int watch_point)`

Remove a watch point for PCNT unit.

### Parameters
- **unit** - [in] PCNT unit handle created by `pcnt_new_unit()`  
- **watch_point** - [in] Watch point value

### Returns
- **ESP_OK:** Remove watch point successfully  
- **ESP_ERR_INVALID_ARG:** Remove watch point failed because of invalid argument  
- **ESP_ERR_INVALID_STATE:** Remove watch point failed because the watch point was not added by `pcnt_unit_add_watch_point()` yet  
- **ESP_FAIL:** Remove watch point failed because of other error

`esp_err_t pcnt_new_channel (pcnt_unit_handle_t unit, const pcnt_chan_config_t *config, pcnt_channel_handle_t *ret_chan)`

Create PCNT channel for specific unit, each PCNT has several channels associated with it.

### Parameters
- **unit** - [in] PCNT unit handle created by `pcnt_new_unit()`  
- **config** - [in] PCNT channel configuration  
- **ret_chan** - [out] Returned channel handle

### Returns
- **ESP_OK:** Channel created successfully  
- **ESP_ERR_INVALID_ARG:** Channel creation failed because of invalid argument  
- **ESP_ERR_INVALID_STATE:** Channel creation failed because the unit is not in init state  
- **ESP_FAIL:** Channel creation failed because of other error
Chapter 2. API Reference

- ESP_OK: Create PCNT channel successfully
- ESP_ERR_INVALID_ARG: Create PCNT channel failed because of invalid argument
- ESP_ERR_NO_MEM: Create PCNT channel failed because of insufficient memory
- ESP_ERR_NOT_FOUND: Create PCNT channel failed because all PCNT channels are used up and no more free one
- ESP_ERR_INVALID_STATE: Create PCNT channel failed because the unit is not in the init state
- ESP_FAIL: Create PCNT channel failed because of other error

`esp_err_t pcnt_del_channel (pcnt_channel_handle_t chan)`
Delete the PCNT channel.

**Parameters**
- `chan` – [in] PCNT channel handle created by `pcnt_new_channel()`

**Returns**
- ESP_OK: Delete the PCNT channel successfully
- ESP_ERR_INVALID_ARG: Delete the PCNT channel failed because of invalid argument
- ESP_FAIL: Delete the PCNT channel failed because of other error

`esp_err_t pcnt_channel_set_edge_action (pcnt_channel_handle_t chan, pcnt_channel_edge_action_t pos_act, pcnt_channel_edge_action_t neg_act)`
Set channel actions when edge signal changes (e.g. falling or rising edge occurred). The edge signal is input from the `edge_gpio_num` configured in `pcnt_chan_config_t`. We use these actions to control when and how to change the counter value.

**Parameters**
- `chan` – [in] PCNT channel handle created by `pcnt_new_channel()`
- `neg_act` – [in] Action on negedge signal

**Returns**
- ESP_OK: Set edge action for PCNT channel successfully
- ESP_ERR_INVALID_ARG: Set edge action for PCNT channel failed because of invalid argument
- ESP_FAIL: Set edge action for PCNT channel failed because of other error

`esp_err_t pcnt_channel_set_level_action (pcnt_channel_handle_t chan, pcnt_channel_level_action_t high_act, pcnt_channel_level_action_t low_act)`
Set channel actions when level signal changes (e.g. signal level goes from high to low). The level signal is input from the `level_gpio_num` configured in `pcnt_chan_config_t`. We use these actions to control when and how to change the counting mode.

**Parameters**
- `chan` – [in] PCNT channel handle created by `pcnt_new_channel()`
- `high_act` – [in] Action on high level signal
- `low_act` – [in] Action on low level signal

**Returns**
- ESP_OK: Set level action for PCNT channel successfully
- ESP_ERR_INVALID_ARG: Set level action for PCNT channel failed because of invalid argument
- ESP_FAIL: Set level action for PCNT channel failed because of other error

**Structures**

```c
struct pcnt_watch_event_data_t
PCNT watch event data.
```

**Public Members**
int watch_point_value
Watch point value that triggered the event

pcnt_unit_zero_cross_mode_t zero_cross_mode
Zero cross mode

struct pcnt_event_callbacks_t
Group of supported PCNT callbacks.

---

**Note:** The callbacks are all running under ISR environment

---

**Note:** When CONFIG_PCNT_ISR_IRAM_SAFE is enabled, the callback itself and functions called by it should be placed in IRAM.

---

**Public Members**

struct pcnt_watch_cb_t on_reach
Called when PCNT unit counter reaches any watch point

---

**Public Members**

struct pcnt_unit_config_t
PCNT unit configuration.

---

**Public Members**

int low_limit
Low limitation of the count unit, should be lower than 0

int high_limit
High limitation of the count unit, should be higher than 0

int intr_priority
PCNT interrupt priority, if set to 0, the driver will try to allocate an interrupt with a relative low priority (1,2,3)

uint32_t accum_count
Whether to accumulate the count value when overflows at the high/low limit

struct pcnt_unit_config_t::[anonymous] flags
Extra flags

---

**Public Members**

struct pcnt_chan_config_t
PCNT channel configuration.
int `edge_gpio_num`
   
   GPIO number used by the edge signal, input mode with pull up enabled. Set to -1 if unused

int `level_gpio_num`
   
   GPIO number used by the level signal, input mode with pull up enabled. Set to -1 if unused

uint32_t `invert_edge_input`
   
   Invert the input edge signal

uint32_t `invert_level_input`
   
   Invert the input level signal

uint32_t `virt_edge_io_level`
   
   Virtual edge IO level, 0: low, 1: high. Only valid when edge_gpio_num is set to -1

uint32_t `virt_level_io_level`
   
   Virtual level IO level, 0: low, 1: high. Only valid when level_gpio_num is set to -1

uint32_t `io_loop_back`
   
   For debug/test, the signal output from the GPIO will be fed to the input path as well

struct `pcnt_chan_config_t`::[anonymous] `flags`
   
   Channel config flags

struct `pcnt_glitch_filter_config_t`
   
   PCNT glitch filter configuration.

Public Members

uint32_t `max_glitch_ns`
   
   Pulse width smaller than this threshold will be treated as glitch and ignored, in the unit of ns

Type Definitions

typedef struct `pcnt_unit_t` *`pcnt_unit_handle_t`
   
   Type of PCNT unit handle.

typedef struct `pcnt_chan_t` *`pcnt_channel_handle_t`
   
   Type of PCNT channel handle.

typedef bool (*`pcnt_watch_cb_t`)(`pcnt_unit_handle_t` unit, const `pcnt_watch_event_data_t` *edata, void *user_ctx)
   
   PCNT watch event callback prototype.

Note: The callback function is invoked from an ISR context, so it should meet the restrictions of not calling any blocking APIs when implementing the callback. e.g. must use ISR version of FreeRTOS APIs.

Param unit [in] PCNT unit handle
### Chapter 2. API Reference

**Param edata [in]** PCNT event data, fed by the driver

**Param user_ctx [in]** User data, passed from `pcnt_unit_register_event_callbacks()`

**Return** Whether a high priority task has been woken up by this function

#### Header File

- components/hal/include/hal/pcnt_types.h
- This header file can be included with:

```
#include "hal/pcnt_types.h"
```

#### Enumerations

**enum pcnt_channel_level_action_t**

PCNT channel action on control level.

**Values:**

- enumerator **PCNT_CHANNEL_LEVEL_ACTION_KEEP**
  - Keep current count mode

- enumerator **PCNT_CHANNEL_LEVEL_ACTION_INVERSE**
  - Invert current count mode (increase -> decrease, decrease -> increase)

- enumerator **PCNT_CHANNEL_LEVEL_ACTION_HOLD**
  - Hold current count value

**enum pcnt_channel_edge_action_t**

PCNT channel action on signal edge.

**Values:**

- enumerator **PCNT_CHANNEL_EDGE_ACTION_HOLD**
  - Hold current count value

- enumerator **PCNT_CHANNEL_EDGE_ACTION_INCREASE**
  - Increase count value

- enumerator **PCNT_CHANNEL_EDGE_ACTION_DECREASE**
  - Decrease count value

**enum pcnt_unit_zero_cross_mode_t**

PCNT unit zero cross mode.

**Values:**

- enumerator **PCNT_UNIT_ZERO_CROSS_POS_ZERO**
  - start from positive value, end to zero, i.e. +N->0

- enumerator **PCNT_UNIT_ZERO_CROSS_NEG_ZERO**
  - start from negative value, end to zero, i.e. -N->0
2.6.16 Remote Control Transceiver (RMT)

Introduction

The RMT (Remote Control Transceiver) peripheral was designed to act as an infrared transceiver. However, due to the flexibility of its data format, RMT can be extended to a versatile and general-purpose transceiver, transmitting or receiving many other types of signals. From the perspective of network layering, the RMT hardware contains both physical and data link layers. The physical layer defines the communication media and bit signal representation. The data link layer defines the format of an RMT frame. The minimal data unit in the frame is called the RMT symbol, which is represented by `rmt_symbol_word_t` in the driver.

ESP32-S3 contains multiple channels in the RMT peripheral\(^1\). Each channel can be independently configured as either transmitter or receiver.

Typically, the RMT peripheral can be used in the following scenarios:

- Transmit or receive infrared signals, with any IR protocols, e.g., NEC
- General-purpose sequence generator
- Transmit signals in a hardware-controlled loop, with a finite or infinite number of times
- Multi-channel simultaneous transmission
- Modulate the carrier to the output signal or demodulate the carrier from the input signal

Layout of RMT Symbols

The RMT hardware defines data in its own pattern—the RMT symbol. The diagram below illustrates the bit fields of an RMT symbol. Each symbol consists of two pairs of two values. The first value in the pair is a 15-bit value representing the signal’s duration in units of RMT ticks. The second in the pair is a 1-bit value representing the signal’s logic level, i.e., high or low.

\(^1\) Different ESP chip series might have different numbers of RMT channels. Please refer to [TRM] for details. The driver does not forbid you from applying for more RMT channels, but it returns an error when there are no hardware resources available. Please always check the return value when doing Resource Allocation.
Chapter 2. API Reference

**RMT Transmitter Overview**  The data path and control path of an RMT TX channel is illustrated in the figure below:

![RMT Transmitter Overview Diagram](image)

The driver encodes the user’s data into RMT data format, then the RMT transmitter can generate the waveforms according to the encoding artifacts. It is also possible to modulate a high-frequency carrier signal before being routed to a GPIO pad.

**RMT Receiver Overview**  The data path and control path of an RMT RX channel is illustrated in the figure below:

![RMT Receiver Overview Diagram](image)

The RMT receiver can sample incoming signals into RMT data format, and store the data in memory. It is also possible to tell the receiver the basic characteristics of the incoming signal, so that the signal’s stop condition can be recognized, and signal glitches and noise can be filtered out. The RMT peripheral also supports demodulating the high-frequency carrier from the base signal.

**Functional Overview**

The description of the RMT functionality is divided into the following sections:

- **Resource Allocation** - covers how to allocate and properly configure RMT channels. It also covers how to recycle channels and other resources when they are no longer used.
- **Carrier Modulation and Demodulation** - describes how to modulate and demodulate the carrier signals for TX and RX channels respectively.
- **Register Event Callbacks** - covers how to register user-provided event callbacks to receive RMT channel events.
- **Enable and Disable Channel** - shows how to enable and disable the RMT channel.
- **Initiate TX Transaction** - describes the steps to initiate a transaction for a TX channel.
- **Initiate RX Transaction** - describes the steps to initiate a transaction for an RX channel.
• **Multiple Channels Simultaneous Transmission** - describes how to collect multiple channels into a sync group so that their transmissions can be started simultaneously.

• **RMT Encoder** - focuses on how to write a customized encoder by combining multiple primitive encoders that are provided by the driver.

• **Power Management** - describes how different clock sources affects power consumption.

• **IRAM Safe** - describes how disabling the cache affects the RMT driver, and tips to mitigate it.

• **Thread Safety** - lists which APIs are guaranteed to be thread-safe by the driver.

• **Kconfig Options** - describes the various Kconfig options supported by the RMT driver.

**Resource Allocation** Both RMT TX and RX channels are represented by `rmt_channel_handle_t` in the driver. The driver internally manages which channels are available and hands out a free channel on request.

**Install RMT TX Channel** To install an RMT TX channel, there is a configuration structure that needs to be given in advance `rmt_tx_channel_config_t`. The following list describes each member of the configuration structure.

- `rmt_tx_channel_config_t::gpio_num` sets the GPIO number used by the transmitter.
- `rmt_tx_channel_config_t::clk_src` selects the source clock for the RMT channel. The available clocks are listed in `rmt_clock_source_t`. Note that, the selected clock is also used by other channels, which means the user should ensure this configuration is the same when allocating other channels, regardless of TX or RX. For the effect on the power consumption of different clock sources, please refer to the **Power Management** section.
- `rmt_tx_channel_config_t::resolution_hz` sets the resolution of the internal tick counter. The timing parameter of the RMT signal is calculated based on this tick.
- `rmt_tx_channel_config_t::mem_block_symbols` has a slightly different meaning based on if the DMA backend is enabled or not.
  - If the DMA is enabled via `rmt_tx_channel_config_t::with_dma`, then this field controls the size of the internal DMA buffer. To achieve a better throughput and smaller CPU overhead, you can set a larger value, e.g., 1024.
  - If DMA is not used, this field controls the size of the dedicated memory block owned by the channel, which should be at least 48.
- `rmt_tx_channel_config_t::trans_queue_depth` sets the depth of the internal transaction queue, the deeper the queue, the more transactions can be prepared in the backlog.
- `rmt_tx_channel_config_t::invert_out` is used to decide whether to invert the RMT signal before sending it to the GPIO pad.
- `rmt_tx_channel_config_t::with_dma` enables the DMA backend for the channel. Using the DMA allows a significant amount of the channel’s workload to be offloaded from the CPU. However, the DMA backend is not available on all ESP chips, please refer to [TRM] before you enable this option. Or you might encounter a `ESP_ERR_NOT_SUPPORTED` error.
- `rmt_tx_channel_config_t::io_loop_back` enables both input and output capabilities on the channel’s assigned GPIO. Thus, by binding a TX and RX channel to the same GPIO, loopback can be achieved.
- `rmt_tx_channel_config_t::io_od_mode` configures the channel’s assigned GPIO as open-drain. When combined with `rmt_tx_channel_config_t::io_loop_back`, a bi-directional bus (e.g., 1-wire) can be achieved.
- `rmt_tx_channel_config_t::intr_priority` Set the priority of the interrupt. If set to 0, then the driver will use a interrupt with low or medium priority (priority level may be one of 1, 2 or 3), otherwise use the priority indicated by `rmt_tx_channel_config_t::intr_priority`. Please use the number form (1,2,3), not the bitmask form (1<<1),(1<<2),(1<<3)). Please pay attention that once the interrupt priority is set, it cannot be changed until `rmt_del_channel()` is called.

Once the `rmt_tx_channel_config_t` structure is populated with mandatory parameters, users can call `rmt_new_tx_channel()` to allocate and initialize a TX channel. This function returns an RMT channel handle if it runs correctly. Specifically, when there are no more free channels in the RMT resource pool, this function returns `ESP_ERR_NOT_FOUND` error. If some feature (e.g., DMA backend) is not supported by the hardware, it returns `ESP_ERR_NOT_SUPPORTED` error.
Install RMT RX Channel

To install an RMT RX channel, there is a configuration structure that needs to be given in advance `rmt_rx_channel_config_t`. The following list describes each member of the configuration structure.

- `rmt_rx_channel_config_t::gpio_num` sets the GPIO number used by the receiver.
- `rmt_rx_channel_config_t::clk_src` selects the source clock for the RMT channel. The available clocks are listed in `rmt_clock_source_t`. Note that, the selected clock is also used by other channels, which means the user should ensure this configuration is the same when allocating other channels, regardless of TX or RX. For the effect on the power consumption of different clock sources, please refer to the Power Management section.
- `rmt_rx_channel_config_t::resolution_hz` sets the resolution of the internal tick counter. The timing parameter of the RMT signal is calculated based on this tick.
- `rmt_rx_channel_config_t::mem_block_symbols` has a slightly different meaning based on whether the DMA backend is enabled.
  - If the DMA is enabled via `rmt_rx_channel_config_t::with_dma`, this field controls the maximum size of the DMA buffer.
  - If DMA is not used, this field controls the size of the dedicated memory block owned by the channel, which should be at least 48.
- `rmt_rx_channel_config_t::invert_in` is used to invert the input signals before it is passed to the RMT receiver. The inversion is done by the GPIO matrix instead of by the RMT peripheral.
- `rmt_rx_channel_config_t::with_dma` enables the DMA backend for the channel. Using the DMA allows a significant amount of the channel’s workload to be offloaded from the CPU. However, the DMA backend is not available on all ESP chips, please refer to [TRM] before you enable this option. Or you might encounter a `ESP_ERR_NOT_SUPPORTED` error.
- `rmt_rx_channel_config_t::io_loop_back` enables both input and output capabilities on the channel’s assigned GPIO. Thus, by binding a TX and RX channel to the same GPIO, loopback can be achieved.
- `rmt_rx_channel_config_t::intr_priority` Set the priority of the interrupt. If set to 0, then the driver will use a interrupt with low or medium priority (priority level may be one of 1,2 or 3), otherwise use the priority indicated by `rmt_rx_channel_config_t::intr_priority`. Please use the number form (1,2,3) , not the bitmask form ((1<<1),(1<<2),(1<<3)). Please pay attention that once the interrupt priority is set, it cannot be changed until `rmt_del_channel()` is called.

Once the `rmt_rx_channel_config_t` structure is populated with mandatory parameters, users can call `rmt_new_rx_channel()` to allocate and initialize an RX channel. This function returns an RMT channel handle if it runs correctly. Specifically, when there are no more free channels in the RMT resource pool, this function returns `ESP_ERR_NOT_FOUND` error. If some feature (e.g., DMA backend) is not supported by the hardware, it returns `ESP_ERR_NOT_SUPPORTED` error.

```c
rmt_channel_handle_t tx_chan = NULL;
rmt_tx_channel_config_t tx_chan_config = {
    .clk_src = RMT_CLK_SRC_DEFAULT,  // select source clock
    .gpio_num = 0,                   // GPIO number
    .mem_block_symbols = 64,         // memory block size, 64 * 4 = 256 Bytes
    .resolution_hz = 1 * 1000 * 1000, // 1 MHz tick resolution, i.e., 1 tick = 1 µs
    .trans_queue_depth = 4,          // set the number of transactions that can_→pend in the background
    .flags.invert_out = false,      // do not invert output signal
    .flags.with_dma = false,        // do not need DMA backend
};
ESP_ERROR_CHECK(rmt_new_tx_channel(&tx_chan_config, &tx_chan));
```

```c
rmt_channel_handle_t rx_chan = NULL;
rmt_rx_channel_config_t rx_chan_config = {
    .clk_src = RMT_CLK_SRC_DEFAULT,  // select source clock
    .resolution_hz = 1 * 1000 * 1000, // 1 MHz tick resolution, i.e., 1 tick = 1 µs
    .mem_block_symbols = 64,         // memory block size, 64 * 4 = 256 Bytes
    .gpio_num = 2,                   // GPIO number
    .clk_src = RMT_CLK_SRC_DEFAULT,  // select source clock
    .gpio_num = 0,                   // GPIO number
    .mem_block_symbols = 64,         // memory block size, 64 * 4 = 256 Bytes
    .resolution_hz = 1 * 1000 * 1000, // 1 MHz tick resolution, i.e., 1 tick = 1 µs
    .trans_queue_depth = 4,          // set the number of transactions that can_→pend in the background
    .flags.invert_out = false,      // do not invert output signal
    .flags.with_dma = false,        // do not need DMA backend
};
ESP_ERROR_CHECK(rmt_new_rx_channel(&rx_chan_config, &rx_chan));
```
Chapter 2. API Reference

(continued from previous page)

`.flags.invert_in = false; // do not invert input signal`  
`.flags.with_dma = false; // do not need DMA backend`  
};  
ESP_ERROR_CHECK(rmt_new_rx_channel(&rx_chan_config, &rx_chan));

Note: Due to a software limitation in the GPIO driver, when both TX and RX channels are bound to the same GPIO, ensure the RX Channel is initialized before the TX Channel. If the TX Channel was set up first, then during the RX Channel setup, the previous RMT TX Channel signal will be overridden by the GPIO control signal.

Uninstall RMT Channel If a previously installed RMT channel is no longer needed, it is recommended to recycle the resources by calling `rmt_del_channel()`, which in return allows the underlying software and hardware resources to be reused for other purposes.

Carrier Modulation and Demodulation The RMT transmitter can generate a carrier wave and modulate it onto the message signal. Compared to the message signal, the carrier signal’s frequency is significantly higher. In addition, the user can only set the frequency and duty cycle for the carrier signal. The RMT receiver can demodulate the carrier signal from the incoming signal. Note that, carrier modulation and demodulation are not supported on all ESP chips, please refer to [TRM] before configuring the carrier, or you might encounter a `ESP_ERR_NOT_SUPPORTED` error.

Carrier-related configurations lie in `rmt_carrier_config_t`:
  - `rmt_carrier_config_t::frequency_hz` sets the carrier frequency, in Hz.  
  - `rmt_carrier_config_t::duty_cycle` sets the carrier duty cycle.  
  - `rmt_carrier_config_t::polarity_active_low` sets the carrier polarity, i.e., on which level the carrier is applied.  
  - `rmt_carrier_config_t::always_on` sets whether to output the carrier even when the data transmission has finished. This configuration is only valid for the TX channel.

Note: For the RX channel, we should not set the carrier frequency exactly to the theoretical value. It is recommended to leave a tolerance for the carrier frequency. For example, in the snippet below, we set the frequency to 25 KHz, instead of the 38 KHz configured on the TX side. The reason is that reflection and refraction occur when a signal travels through the air, leading to distortion on the receiver side.

```
rmt_carrier_config_t tx_carrier_cfg = {  
  .duty_cycle = 0.33, // duty cycle 33%  
  .frequency_hz = 38000, // 38 KHz  
  .flags.polarity_active_low = false, // carrier should be modulated to high level
};  
// modulate carrier to TX channel  
ESP_ERROR_CHECK(rmt_apply_carrier(tx_chan, &tx_carrier_cfg));

rmt_carrier_config_t rx_carrier_cfg = {  
  .duty_cycle = 0.33, // duty cycle 33%  
  .frequency_hz = 25000, // 25 KHz carrier, should be smaller than the transmitter's carrier frequency  
  .flags.polarity_active_low = false, // the carrier is modulated to high level
};  
// demodulate carrier from RX channel  
ESP_ERROR_CHECK(rmt_apply_carrier(rx_chan, &rx_carrier_cfg));
```

Register Event Callbacks When an event occurs on an RMT channel (e.g., transmission or receiving is completed), the CPU is notified of this event via an interrupt. If you have some function that needs to be called when a particular events occur, you can register a callback for that event to the RMT driver’s ISR (Interrupt Service Routine)
by calling `rmt_tx_register_event_callbacks()` and `rmt_rx_register_event_callbacks()` for TX and RX channel respectively. Since the registered callback functions are called in the interrupt context, the user should ensure the callback function does not block, e.g., by making sure that only FreeRTOS APIs with the `FromISR` suffix are called from within the function. The callback function has a boolean return value used to indicate whether a higher priority task has been unblocked by the callback.

The TX channel-supported event callbacks are listed in the `rmt_tx_event_callbacks_t`:

- `rmt_tx_event_callbacks_t::on_trans_done` sets a callback function for the “trans-done” event. The function prototype is declared in `rmt_tx_done_callback_t`.

The RX channel-supported event callbacks are listed in the `rmt_rx_event_callbacks_t`:

- `rmt_rx_event_callbacks_t::on_recv_done` sets a callback function for “receive-done” event. The function prototype is declared in `rmt_rx_done_callback_t`.

Users can save their own context in `rmt_tx_register_event_callbacks()` and `rmt_rx_register_event_callbacks()` as well, via the parameter `user_data`. The user data is directly passed to each callback function.

In the callback function, users can fetch the event-specific data that is filled by the driver in the `edata`. Note that the `edata` pointer is only valid during the callback.

The TX-done event data is defined in `rmt_tx_done_event_data_t`:

- `rmt_tx_done_event_data_t::num_symbols` indicates the number of transmitted RMT symbols. This also reflects the size of the encoding artifacts. Please note, this value accounts for the `EOF` symbol as well, which is appended by the driver to mark the end of one transaction.

The RX-complete event data is defined in `rmt_rx_done_event_data_t`:

- `rmt_rx_done_event_data_t::received_symbols` points to the received RMT symbols. These symbols are saved in the `buffer` parameter of the `rmt_receive()` function. Users should not free this receive buffer before the callback returns.
- `rmt_rx_done_event_data_t::num_symbols` indicates the number of received RMT symbols. This value is not larger than the `buffer_size` parameter of `rmt_receive()` function. If the `buffer_size` is not sufficient to accommodate all the received RMT symbols, the driver only keeps the maximum number of symbols that the buffer can hold, and excess symbols are discarded or ignored.

Enable and Disable Channel  
`rmt_enable()` must be called in advance before transmitting or receiving RMT symbols. For TX channels, enabling a channel enables a specific interrupt and prepares the hardware to dispatch transactions. For RX channels, enabling a channel enables an interrupt, but the receiver is not started during this time, as the characteristics of the incoming signal have yet to be specified. The receiver is started in `rmt_receive()`. 
`rmt_disable()` does the opposite by disabling the interrupt and clearing any pending interrupts. The transmitter and receiver are disabled as well.

```c
ESP_ERROR_CHECK(rmt_enable(tx_chan));
ESP_ERROR_CHECK(rmt_enable(rx_chan));
```

Initiate TX Transaction  
RMT is a special communication peripheral, as it is unable to transmit raw byte streams like SPI and I2C. RMT can only send data in its own format `rmt_symbol_word_t`. However, the hardware does not help to convert the user data into RMT symbols, this can only be done in software by the so-called RMT Encoder. The encoder is responsible for encoding user data into RMT symbols and then writing to the RMT memory block or the DMA buffer. For how to create an RMT encoder, please refer to RMT Encoder.

Once you created an encoder, you can initiate a TX transaction by calling `rmt_transmit()`. This function takes several positional parameters like channel handle, encoder handle, and payload buffer. Besides, you also need to provide a transmission-specific configuration in `rmt_transmit_config_t`:

- `rmt_transmit_config_t::loop_count` sets the number of transmission loops. After the transmitter has finished one round of transmission, it can restart the same transmission again if this value is not set to zero.
As the loop is controlled by hardware, the RMT channel can be used to generate many periodic sequences with minimal CPU intervention.

- Setting `rmt_transmit_config_t::loop_count` to -1 means an infinite loop transmission. In this case, the channel does not stop until `rmt_disable()` is called. The “trans-done” event is not generated as well.
- Setting `rmt_transmit_config_t::loop_count` to a positive number means finite number of iterations. In this case, the “trans-done” event is when the specified number of iterations have completed.

**Note:** The loop transmit feature is not supported on all ESP chips, please refer to [TRM] before you configure this option, or you might encounter ESP_ERR_NOT_SUPPORTED error.

- `rmt_transmit_config_t::eot_level` sets the output level when the transmitter finishes working or stops working by calling `rmt_disable()`.
- `rmt_transmit_config_t::queue_nonblocking` sets whether to wait for a free slot in the transaction queue when it is full. If this value is set to true, then the function will return with an error code ESP_ERR_INVALID_STATE when the queue is full. Otherwise, the function will block until a free slot is available in the queue.

**Note:** There is a limitation in the transmission size if the `rmt_transmit_config_t::loop_count` is set to non-zero, i.e., to enable the loop feature. The encoded RMT symbols should not exceed the capacity of the RMT hardware memory block size, or you might see an error message like encoding artifacts can't exceed hw memory block for loop transmission. If you have to start a large transaction by loop, you can try either of the following methods.

- Increase the `rmt_tx_channel_config_t::mem_block_symbols`. This approach does not work if the DMA backend is also enabled.
- Customize an encoder and construct an infinite loop in the encoding function. See also RMT Encoder.

Internally, `rmt_transmit()` constructs a transaction descriptor and sends it to a job queue, which is dispatched in the ISR. So it is possible that the transaction is not started yet when `rmt_transmit()` returns. To ensure all pending transactions to complete, the user can use `rmt_tx_wait_all_done()`.

**Multiple Channels Simultaneous Transmission** In some real-time control applications (e.g., to make two robotic arms move simultaneously), you do not want any time drift between different channels. The RMT driver can help to manage this by creating a so-called Sync Manager. The sync manager is represented by `rmt_sync_manager_handle_t` in the driver. The procedure of RMT sync transmission is shown as follows:

![RMT TX Sync Diagram](image-url)
Install RMT Sync Manager  To create a sync manager, the user needs to tell which channels are going to be managed in the `rmt_sync_manager_config_t`:

- `rmt_sync_manager_config_t::tx_channel_array` points to the array of TX channels to be managed.
- `rmt_sync_manager_config_t::array_size` sets the number of channels to be managed.

`rmt_new_sync_manager()` can return a manager handle on success. This function could also fail due to various errors such as invalid arguments, etc. Especially, when the sync manager has been installed before, and there are no hardware resources to create another manager, this function reports `ESP_ERR_NOT_FOUND` error. In addition, if the sync manager is not supported by the hardware, it reports a `ESP_ERR_NOT_SUPPORTED` error. Please refer to [TRM] before using the sync manager feature.

Start Transmission Simultaneously  For any managed TX channel, it does not start the machine until `rmt_transmit()` has been called on all channels in `rmt_sync_manager_config_t::tx_channel_array`. Before that, the channel is just put in a waiting state. TX channels will usually complete their transactions at different times due to differing transactions, thus resulting in a loss of sync. So before restarting a simultaneous transmission, the user needs to call `rmt_sync_reset()` to synchronize all channels again.

Calling `rmt_del_sync_manager()` can recycle the sync manager and enable the channels to initiate transactions independently afterward.

```c
// declare two channels
rmt_channel_handle_t tx_channels[2] = {NULL};
// install channels one by one
for (int i = 0; i < 2; i++) {
    rmt_tx_channel_config_t tx_chan_config = {
        .clk_src = RMT_CLK_SRC_DEFAULT, // select source clock
        .gpio_num = tx_gpio_number[i], // GPIO number
        .mem_block_symbols = 64, // memory block size, 64 * 4 = 256 Bytes
        .resolution_hz = 1 * 1000 * 1000, // 1 MHz resolution
        .trans_queue_depth = 1, // set the number of transactions that can pend in the background
    };
    ESP_ERROR_CHECK(rmt_new_tx_channel(&tx_chan_config, &tx_channels[i]));
}
// install sync manager
rmt_sync_manager_handle_t synchro = NULL;
rmt_sync_manager_config_t synchro_config = {
    .tx_channel_array = tx_channels,
    .array_size = sizeof(tx_channels) / sizeof(tx_channels[0]),
};
ESP_ERROR_CHECK(rmt_new_sync_manager(&synchro_config, &synchro));
ESP_ERROR_CHECK(rmt_transmit(tx_channels[0], led_strip_encoders[0], led_data, led_num * 3, &transmit_config));
// tx_channels[0] does not start transmission until call of `rmt_transmit()` for tx_channels[1] returns
ESP_ERROR_CHECK(rmt_transmit(tx_channels[1], led_strip_encoders[1], led_data, led_num * 3, &transmit_config));
```

Initiate RX Transaction  As also discussed in the Enable and Disable Channel, calling `rmt_enable()` does not prepare an RX to receive RMT symbols. The user needs to specify the basic characteristics of the incoming signals in `rmt_receive_config_t`:

- `rmt_receive_config_t::signal_range_min_ns` specifies the minimal valid pulse duration in either high or low logic levels. A pulse width that is smaller than this value is treated as a glitch, and ignored by the hardware.
Chapter 2. API Reference

- **rmt_receive_config_t::signal_range_max_ns** specifies the maximum valid pulse duration in either high or low logic levels. A pulse width that is bigger than this value is treated as **Stop Signal**, and the receiver generates receive-complete event immediately.

The RMT receiver starts the RX machine after the user calls **rmt_receive()** with the provided configuration above. Note that, this configuration is transaction specific, which means, to start a new round of reception, the user needs to set the **rmt_receive_config_t** again. The receiver saves the incoming signals into its internal memory block or DMA buffer, in the format of **rmt_symbol_word_t**.

Due to the limited size of the memory block, the RMT receiver notifies the driver to copy away the accumulated symbols in a ping-pong way.

The copy destination should be provided in the **buffer** parameter of **rmt_receive()** function. If this buffer overflows due to an insufficient buffer size, the receiver can continue to work, but overflowed symbols are dropped and the following error message is reported: **user buffer too small, received symbols truncated**. Please take care of the lifecycle of the **buffer** parameter, ensuring that the buffer is not recycled before the receiver is finished or stopped.

The receiver is stopped by the driver when it finishes working, i.e., receive a signal whose duration is bigger than **rmt_receive_config_t::signal_range_max_ns**. The user needs to call **rmt_receive()** again to restart the receiver, if necessary. The user can get the received data in the **rmt_rx_event_callbacks_t::on_recv_done** callback. See also **Register Event Callbacks** for more information.

```
static bool example_rmt_rx_done_callback(rmt_channel_handle_t channel, const rmt_rx_done_event_data_t *edata, void *user_data)
{
  BaseType_t high_task_wakeup = pdFALSE;
  QueueHandle_t receive_queue = (QueueHandle_t)user_data;
  // send the received RMT symbols to the parser task
  xQueueSendFromISR(receive_queue, edata, &high_task_wakeup);
  // return whether any task is woken up
  return high_task_wakeup = pdTRUE;
}
```

```
QueueHandle_t receive_queue = xQueueCreate(1, sizeof(rmt_rx_done_event_data_t));
static rmt_rx_event_callbacks_t cbs = {
  .on_recv_done = example_rmt_rx_done_callback,
};
ESP_ERROR_CHECK(rmt_rx_register_event_callbacks(rx_channel, &cbs, receive_queue));
```

```
// the following timing requirement is based on NEC protocol
rmt_receive_config_t receive_config = {
  .signal_range_min_ns = 1250,  // the shortest duration for NEC signal is ~560 µs, 1250 ns < 560 µs, valid signal is not treated as noise
  .signal_range_max_ns = 12000000, // the longest duration for NEC signal is ~9000 µs, 12000000 ns > 9000 µs, the receive does not stop early
};
```

```
rmt_symbol_word_t raw_symbols[64]; // 64 symbols should be sufficient for a standard NEC frame
// ready to receive
ESP_ERROR_CHECK(rmt_receive(rx_channel, raw_symbols, sizeof(raw_symbols), &receive_config));
// wait for the RX-done signal
rmt_rx_done_event_data_t rx_data;
xQueueReceive(receive_queue, &rx_data, portMAX_DELAY);
// parse the received symbols
example_parse_nec_frame(rx_data.received_symbols, rx_data.num_symbols);
```

**RMT Encoder** An RMT encoder is part of the RMT TX transaction, whose responsibility is to generate and write the correct RMT symbols into hardware memory or DMA buffer at a specific time. There are some special restrictions
for an encoding function:

- During a single transaction, the encoding function may be called multiple times. This is necessary because the target RMT memory block cannot hold all the artifacts at once. To overcome this limitation, the driver utilizes a **ping-pong** approach, where the encoding session is divided into multiple parts. This means that the encoder needs to **keep track of its state** to continue encoding from where it left off in the previous part.
- The encoding function is running in the ISR context. To speed up the encoding session, it is highly recommended to put the encoding function into IRAM. This can also avoid the cache miss during encoding.

To help get started with the RMT driver faster, some commonly used encoders are provided out-of-the-box. They can either work alone or be chained together into a new encoder. See also Composite Pattern for the principle behind it. The driver has defined the encoder interface in `rmt_encoder_t`, it contains the following functions:

- **`rmt_encoder_t::encode`** is the fundamental function of an encoder. This is where the encoding session happens.
  - The function might be called multiple times within a single transaction. The encode function should return the state of the current encoding session.
  - The supported states are listed in the `rmt_encode_state_t`. If the result contains `RMT_ENCODING_COMPLETE`, it means the current encoder has finished work.
  - If the result contains `RMT_ENCODING_MEM_FULL`, the program needs to yield from the current session, as there is no space to save more encoding artifacts.
- **`rmt_encoder_t::reset`** should reset the encoder state back to the initial state (the RMT encoder is stateful).
  - If the RMT transmitter is manually stopped without resetting its corresponding encoder, subsequent encoding session can be erroneous.
  - This function is also called implicitly in `rmt_disable()`.
- **`rmt_encoder_t::del`** should free the resources allocated by the encoder.

**Copy Encoder** A copy encoder is created by calling `rmt_new_copy_encoder()`. A copy encoder’s main functionality is to copy the RMT symbols from user space into the driver layer. It is usually used to encode const data, i.e., data does not change at runtime after initialization such as the leading code in the IR protocol.

A configuration structure `rmt_copy_encoder_config_t` should be provided in advance before calling `rmt_new_copy_encoder()`. Currently, this configuration is reserved for future expansion, and has no specific use or setting items for now.

**Bytes Encoder** A bytes encoder is created by calling `rmt_new_bytes_encoder()`. The bytes encoder’s main functionality is to convert the user space byte stream into RMT symbols dynamically. It is usually used to encode dynamic data, e.g., the address and command fields in the IR protocol.

A configuration structure `rmt_bytes_encoder_config_t` should be provided in advance before calling `rmt_new_bytes_encoder()`:

- **`rmt_bytes_encoder_config_t::bit0`** and **`rmt_bytes_encoder_config_t::bit1`** are necessary to specify the encoder how to represent bit zero and bit one in the format of `rmt_symbol_word_t`.
- **`rmt_bytes_encoder_config_t::msb_first`** sets the bit endianness of each byte. If it is set to true, the encoder encodes the **Most Significant Bit** first. Otherwise, it encodes the **Least Significant Bit** first.

Besides the primitive encoders provided by the driver, the user can implement his own encoder by chaining the existing encoders together. A common encoder chain is shown as follows:

**Customize RMT Encoder for NEC Protocol** This section demonstrates how to write an NEC encoder. The NEC IR protocol uses pulse distance encoding of the message bits. Each pulse burst is 562.5 µs in length, logical bits are transmitted as follows. It is worth mentioning that the least significant bit of each byte is sent first.

- Logical 0: a 562.5 µs pulse burst followed by a 562.5 µs space, with a total transmit time of 1.125 ms
- Logical 1: a 562.5 µs pulse burst followed by a 1.6875 ms space, with a total transmit time of 2.25 ms
When a key is pressed on the remote controller, the transmitted message includes the following elements in the specified order:

- 9 ms leading pulse burst, also called the “AGC pulse”
- 4.5 ms space
- 8-bit address for the receiving device
- 8-bit logical inverse of the address
- 8-bit command
- 8-bit logical inverse of the command
- a final 562.5 µs pulse burst to signify the end of message transmission

Then you can construct the NEC `rmt_encoder_t::encode` function in the same order, for example:

```c
// IR NEC scan code representation
typedef struct {
    uint16_t address;
    uint16_t command;
} ir_nec_scan_code_t;

// construct an encoder by combining primitive encoders
typedef struct {
    rmt_encoder_t base; // the base "class" declares the standard
    rmt_encoder_t *copy_encoder; // use the copy_encoder to encode the leading pulse
    rmt_encoder_t *bytes_encoder; // use the bytes_encoder to encode the address
    rmt_symbol_word_t nec_leading_symbol; // NEC leading code with RMT representation
    rmt_symbol_word_t nec_ending_symbol; // NEC ending code with RMT representation
} rmt_nec_encoder_t;
```

(continues on next page)
int state; // record the current encoding state, i.e., we are in which
encoding phase
}

static size_t rmt_encode_ir_nec(rmt_encoder_t *encoder, rmt_channel_handle_t channel,
const void *primary_data, size_t data_size, rmt_encode_state_t *ret_
state)
{
    rmt_ir_nec_encoder_t *nec_encoder = __containerof(encoder, rmt_ir_nec_encoder_
t, base);
    rmt_encode_state_t session_state = RMT_ENCODING_RESET;
    rmt_encode_state_t state = RMT_ENCODING_RESET;
    size_t encoded_symbols = 0;
    ir_nec_scan_code_t *scan_code = (ir_nec_scan_code_t *)primary_data;
    rmt_encoder_handle_t copy_encoder = nec_encoder->copy_encoder;
    rmt_encoder_handle_t bytes_encoder = nec_encoder->bytes_encoder;
    switch (nec_encoder->state) {
    case 0: // send leading code
        encoded_symbols += copy_encoder->encode(copy_encoder, channel, 
&nec_
->encoder->nec_leading_symbol,
          sizeof(rmt_symbol_word_t)), &
->session_state);
        if (session_state & RMT_ENCODING_COMPLETE) {
            nec_encoder->state = 1; // we can only switch to the next state when
the current encoder finished
        }
        if (session_state & RMT_ENCODING_MEM_FULL) {
            state |= RMT_ENCODING_MEM_FULL;
            goto out; // yield if there is no free space to put other encoding
artifacts
        }
        // fall-through
    case 1: // send address
        encoded_symbols += bytes_encoder->encode(bytes_encoder, channel, &scan_
->address, sizeof(uint16_t), &session_state);
        if (session_state & RMT_ENCODING_COMPLETE) {
            nec_encoder->state = 2; // we can only switch to the next state when
the current encoder finished
        }
        if (session_state & RMT_ENCODING_MEM_FULL) {
            state |= RMT_ENCODING_MEM_FULL;
            goto out; // yield if there is no free space to put other encoding
artifacts
        }
        // fall-through
    case 2: // send command
        encoded_symbols += bytes_encoder->encode(bytes_encoder, channel, &scan_
->command, sizeof(uint16_t), &session_state);
        if (session_state & RMT_ENCODING_COMPLETE) {
            nec_encoder->state = 3; // we can only switch to the next state when
the current encoder finished
        }
        if (session_state & RMT_ENCODING_MEM_FULL) {
            state |= RMT_ENCODING_MEM_FULL;
            goto out; // yield if there is no free space to put other encoding
artifacts
        }
        // fall-through
    case 3: // send ending code
        encoded_symbols += copy_encoder->encode(copy_encoder, channel, &nec_
->encoder->nec_ending_symbol,
A full sample code can be found in peripherals/rmt/ir_nec_transceiver. In the above snippet, we use a switch-case and several goto statements to implement a Finite-state machine. With this pattern, users can construct much more complex IR protocols.

**Power Management** When power management is enabled, i.e., CONFIG_PM_ENABLE is on, the system adjusts the APB frequency before going into Light-sleep, thus potentially changing the resolution of the RMT internal counter.

However, the driver can prevent the system from changing APB frequency by acquiring a power management lock of type ESP_PM_APB_FREQ_MAX. Whenever the user creates an RMT channel that has selected RMT_CLK_SRC_APB as the clock source, the driver guarantees that the power management lock is acquired after the channel enabled by rmt_enable(). Likewise, the driver releases the lock after rmt_disable() is called for the same channel. This also reveals that the rmt_enable() and rmt_disable() should appear in pairs.

If the channel clock source is selected to others like RMT_CLK_SRC_XTAL, then the driver does not install a power management lock for it, which is more suitable for a low-power application as long as the source clock can still provide sufficient resolution.

**IRAM Safe** By default, the RMT interrupt is deferred when the Cache is disabled for reasons like writing or erasing the main Flash. Thus the transaction-done interrupt does not get handled in time, which is not acceptable in a real-time application. What is worse, when the RMT transaction relies on ping-pong interrupt to successively encode or copy RMT symbols, a delayed interrupt can lead to an unpredictable result.

There is a Kconfig option CONFIG_RMT_ISR_IRAM_SAFE that has the following features:

1. Enable the interrupt being serviced even when the cache is disabled
2. Place all functions used by the ISR into IRAM
3. Place the driver object into DRAM in case it is mapped to PSRAM by accident

This Kconfig option allows the interrupt handler to run while the cache is disabled but comes at the cost of increased IRAM consumption.

Another Kconfig option CONFIG_RMT_RECV_FUNC_IN_IRAM can place rmt_receive() into the IRAM as well. So that the receive function can be used even when the Flash cache is disabled.

**Thread Safety** The factory function rmt_new_tx_channel(), rmt_new_rx_channel() and rmt_new_sync_manager() are guaranteed to be thread-safe by the driver, which means, user can call them from different RTOS tasks without protection by extra locks. Other functions that take the

---

2 The callback function, e.g., rmt_tx_event_callbacks_t::on_trans_done, and the functions invoked by itself should also reside in IRAM, users need to take care of this by themselves.
Chapter 2. API Reference

rmt_channel_handle_t and rmt_sync_manager_handle_t as the first positional parameter, are not thread-safe. which means the user should avoid calling them from multiple tasks.

The following functions are allowed to use under ISR context as well.

- rmt_receive()

Kconfig Options

- CONFIG_RMT_ISR_IRAM_SAFE controls whether the default ISR handler can work when cache is disabled, see also IRAM Safe for more information.
- CONFIG_RMT_ENABLE_DEBUG_LOG is used to enable the debug log at the cost of increased firmware binary size.
- CONFIG_RMT_RECV_FUNC_IN_IRAM controls where to place the RMT receive function (IRAM or Flash), see IRAM Safe for more information.

Application Examples

- RMT-based RGB LED strip customized encoder: peripherals/rmt/led_strip
- RMT IR NEC protocol encoding and decoding: peripherals/rmt/ir_nec_transceiver
- RMT transactions in queue: peripherals/rmt/musical_buzzer
- RMT-based stepper motor with S-curve algorithm: peripherals/rmt/stepper_motor
- RMT infinite loop for driving Dshot ESC: peripherals/rmt/dshot_esc
- RMT simulate 1-wire protocol (take DS18B20 as example): peripherals/rmt/onewire

FAQ

- Why the RMT encoder results in more data than expected?

The RMT encoding takes place in the ISR context. If your RMT encoding session takes a long time (e.g., by logging debug information) or the encoding session is deferred somehow because of interrupt latency, then it is possible the transmitting becomes faster than the encoding. As a result, the encoder can not prepare the next data in time, leading to the transmitter sending the previous data again. There is no way to ask the transmitter to stop and wait. You can mitigate the issue by combining the following ways:

- Increase the rmt_tx_channel_config_t::mem_block_symbols, in steps of 48.
- Place the encoding function in the IRAM.
- Enables the rmt_tx_channel_config_t::with_dma if it is available for your chip.

This header file can be included with:

```c
#include "driver/rmt_tx.h"
```

This header file is a part of the API provided by the driver component. To declare that your component depends on driver, add the following to your CMakeLists.txt:

```cmake
REQUIRES driver
```

or

```cmake
PRIV_REQUIRES driver
```
Chapter 2. API Reference

Functions

esp_err_t rmt_new_tx_channel(const rmt_tx_channel_config_t *config, rmt_channel_handle_t *ret_chan)
Create a RMT TX channel.

Parameters
- config [in] TX channel configurations
- ret_chan [out] Returned generic RMT channel handle

Returns
- ESP_OK: Create RMT TX channel successfully
- ESP_ERR_INVALID_ARG: Create RMT TX channel failed because of invalid argument
- ESP_ERR_NO_MEM: Create RMT TX channel failed because out of memory
- ESP_ERR_NOT_FOUND: Create RMT TX channel failed because all RMT channels are used up and no more free one
- ESP_ERR_NOT_SUPPORTED: Create RMT TX channel failed because some feature is not supported by hardware, e.g. DMA feature is not supported by hardware
- ESP_FAIL: Create RMT TX channel failed because of other error

esp_err_t rmt_transmit(rmt_channel_handle_t tx_channel, rmt_encoder_handle_t encoder, const void *payload, size_t payload_bytes, const rmt_transmit_config_t *config)
Transmit data by RMT TX channel.

Note: This function constructs a transaction descriptor then pushes to a queue. The transaction will not start immediately if there’s another one under processing. Based on the setting of rmt_transmit_config_t::queue_nonblocking, if there’re too many transactions pending in the queue, this function can block until it has free slot, otherwise just return quickly.

Note: The data to be transmitted will be encoded into RMT symbols by the specific encoder.

Parameters
- tx_channel [in] RMT TX channel that created by rmt_new_tx_channel()
- encoder [in] RMT encoder that created by various factory APIs like rmt_new_bytes_encoder()
- payload [in] The raw data to be encoded into RMT symbols
- payload_bytes [in] Size of the payload in bytes
- config [in] Transmission specific configuration

Returns
- ESP_OK: Transmit data successfully
- ESP_ERR_INVALID_ARG: Transmit data failed because of invalid argument
- ESP_ERR_INVALID_STATE: Transmit data failed because channel is not enabled
- ESP_ERR_NOT_SUPPORTED: Transmit data failed because some feature is not supported by hardware, e.g. unsupported loop count
- ESP_FAIL: Transmit data failed because of other error

esp_err_t rmt_tx_wait_all_done(rmt_channel_handle_t tx_channel, int timeout_ms)
Wait for all pending TX transactions done.

Note: This function will block forever if the pending transaction can’t be finished within a limited time (e.g. an infinite loop transaction). See also rmt_disable() for how to terminate a working channel.

Parameters
- tx_channel [in] RMT TX channel that created by rmt_new_tx_channel()

Returns
- ESP_OK: Flush transactions successfully
• ESP_ERR_INVALID_ARG: Flush transactions failed because of invalid argument
• ESP_ERR_TIMEOUT: Flush transactions failed because of timeout
• ESP_FAIL: Flush transactions failed because of other error

```c
esp_err_t rmt_tx_register_event_callbacks(rmt_channel_handle_t tx_channel, const rmt_tx_event_callbacks_t *cbs, void *user_data)
```

Set event callbacks for RMT TX channel.

**Note:** User can deregister a previously registered callback by calling this function and setting the callback member in the `cbs` structure to NULL.

**Note:** When CONFIG_RMT_ISR_IRAM_SAFE is enabled, the callback itself and functions called by it should be placed in IRAM. The variables used in the function should be in the SRAM as well. The `user_data` should also reside in SRAM.

**Parameters**
- `tx_channel` – [in] RMT generic channel that created by `rmt_new_tx_channel()`
- `cbs` – [in] Group of callback functions
- `user_data` – [in] User data, which will be passed to callback functions directly

**Returns**
- ESP_OK: Set event callbacks successfully
- ESP_ERR_INVALID_ARG: Set event callbacks failed because of invalid argument
- ESP_FAIL: Set event callbacks failed because of other error

```c
esp_err_t rmt_new_sync_manager(const rmt_sync_manager_config_t *config, rmt_sync_manager_handle_t *ret_synchro)
```

Create a synchronization manager for multiple TX channels, so that the managed channel can start transmitting at the same time.

**Note:** All the channels to be managed should be enabled by `rmt_enable()` before put them into sync manager.

**Parameters**
- `config` – [in] Synchronization manager configuration
- `ret_synchro` – [out] Returned synchronization manager handle

**Returns**
- ESP_OK: Create sync manager successfully
- ESP_ERR_INVALID_ARG: Create sync manager failed because of invalid argument
- ESP_ERR_NOT_SUPPORTED: Create sync manager failed because it is not supported by hardware
- ESP_ERR_INVALID_STATE: Create sync manager failed because not all channels are enabled
- ESP_ERR_NO_MEM: Create sync manager failed because out of memory
- ESP_ERR_NOT_FOUND: Create sync manager failed because all sync controllers are used up and no more free one
- ESP_FAIL: Create sync manager failed because of other error

```c
esp_err_t rmt_del_sync_manager(rmt_sync_manager_handle_t synchro)
```

Delete synchronization manager.

**Parameters**
- `synchro` – [in] Synchronization manager handle returned from `rmt_new_sync_manager()`

**Returns**
• ESP_OK: Delete the synchronization manager successfully
• ESP_ERR_INVALID_ARG: Delete the synchronization manager failed because of invalid argument
• ESP_FAIL: Delete the synchronization manager failed because of other error

```
esp_err_t rmt_sync_reset(rmt_sync_manager_handle_t synchro)
```

Reset synchronization manager.

**Parameters**

`synchro` - [in] Synchronization manager handle returned from `rmt_new_sync_manager()`

**Returns**

• ESP_OK: Reset the synchronization manager successfully
• ESP_ERR_INVALID_ARG: Reset the synchronization manager failed because of invalid argument
• ESP_FAIL: Reset the synchronization manager failed because of other error

**Structures**

```c
struct rmt_tx_event_callbacks_t
```

Group of RMT TX callbacks.

**Note:** The callbacks are all running under ISR environment

**Note:** When CONFIG_RMT_ISR_IRAM_SAFE is enabled, the callback itself and functions called by it should be placed in IRAM. The variables used in the function should be in the SRAM as well.

**Public Members**

```c
rmt_tx_done_callback_t on_trans_done
```

Event callback, invoked when transmission is finished

```c
struct rmt_tx_channel_config_t
```

RMT TX channel specific configuration.

**Public Members**

```c
gpio_num_t gpio_num
```

GPIO number used by RMT TX channel. Set to -1 if unused

```c
rmt_clock_source_t clk_src
```

Clock source of RMT TX channel, channels in the same group must use the same clock source

```c
uint32_t resolution_hz
```

Channel clock resolution, in Hz

```c
size_t mem_block_symbols
```

Size of memory block, in number of `rmt_symbol_word_t`, must be an even. In the DMA mode, this field controls the DMA buffer size, it can be set to a large value; In the normal mode, this field controls the number of RMT memory block that will be used by the channel.
size_t **trans_queue_depth**
Depth of internal transfer queue, increase this value can support more transfers pending in the background

int **intr_priority**
RMT interrupt priority, if set to 0, the driver will try to allocate an interrupt with a relative low priority (1,2,3)

uint32_t **invert_out**
Whether to invert the RMT channel signal before output to GPIO pad

uint32_t **with_dma**
If set, the driver will allocate an RMT channel with DMA capability

uint32_t **io_loop_back**
The signal output from the GPIO will be fed to the input path as well

uint32_t **io_od_mode**
Configure the GPIO as open-drain mode

struct **rmt_tx_channel_config_t**: [anonymous] **flags**
TX channel config flags

struct **rmt_transmit_config_t**
RMT transmit specific configuration.

**Public Members**

int **loop_count**
Specify the times of transmission in a loop, -1 means transmitting in an infinite loop

uint32_t **eot_level**
Set the output level for the “End Of Transmission”

uint32_t **queue_nonblocking**
If set, when the transaction queue is full, driver will not block the thread but return directly

struct **rmt_transmit_config_t**: [anonymous] **flags**
Transmit specific config flags

struct **rmt_sync_manager_config_t**
Synchronous manager configuration.

**Public Members**

const **rmt_channel_handle_t** * **tx_channel_array**
Array of TX channels that are about to be managed by a synchronous controller
size_t array_size

Size of the tx_channel_array

**Header File**

- components/driver/rmt/include/driver/rmt_rx.h
- This header file can be included with:

  ```
  #include "driver/rmt_rx.h"
  ```

- This header file is a part of the API provided by the driver component. To declare that your component depends on driver, add the following to your CMakeLists.txt:

  ```
  REQUIRES driver
  ```
  or
  ```
  PRIV_REQUIRES driver
  ```

**Functions**

`esp_err_t rmt_new_rx_channel` (const `rmt_rx_channel_config_t *config`, `rmt_channel_handle_t *ret_chan`)

Create a RMT RX channel.

**Parameters**

- `config` - [in] RX channel configurations
- `ret_chan` - [out] Returned generic RMT channel handle

**Returns**

- ESP_OK: Create RMT RX channel successfully
- ESP_ERR_INVALID_ARG: Create RMT RX channel failed because of invalid argument
- ESP_ERR_NO_MEM: Create RMT RX channel failed because out of memory
- ESP_ERR_NOT_FOUND: Create RMT RX channel failed because all RMT channels are used up and no more free one
- ESP_ERR_NOT_SUPPORTED: Create RMT RX channel failed because some feature is not supported by hardware, e.g. DMA feature is not supported by hardware
- ESP_FAIL: Create RMT RX channel failed because of other error

`esp_err_t rmt_receive` ( `rmt_channel_handle_t rx_channel`, `void*buffer`, `size_t buffer_size`, `const rmt_receive_config_t *config`)

Initiate a receive job for RMT RX channel.

**Note:** This function is non-blocking, it initiates a new receive job and then returns. User should check the received data from the `on_recv_done` callback that registered by `rmt_rx_register_event_callbacks()`.

**Note:** This function can also be called in ISR context.

**Note:** If you want this function to work even when the flash cache is disabled, please enable the `CONFIG_RMT_RECV_FUNC_IN_IRAM` option.

**Parameters**

- `rx_channel` - [in] RMT RX channel that created by `rmt_new_rx_channel`
- `buffer` - [in] The buffer to store the received RMT symbols
- `buffer_size` - [in] size of the `buffer`, in bytes
- `config` - [in] Receive specific configurations
Returns

- ESP_OK: Initiate receive job successfully
- ESP_ERR_INVALID_ARG: Initiate receive job failed because of invalid argument
- ESP_ERR_INVALID_STATE: Initiate receive job failed because channel is not enabled
- ESP_FAIL: Initiate receive job failed because of other error

```c
esp_err_t rmt_rx_register_event_callbacks(rmt_channel_handle_t rx_channel, const
                                        rmt_rx_event_callbacks_t *cbs, void *user_data)
```

Set callbacks for RMT RX channel.

**Note:** User can deregister a previously registered callback by calling this function and setting the callback member in the `cbs` structure to NULL.

**Note:** When CONFIG_RMT_ISR_IRAM_SAFE is enabled, the callback itself and functions called by it should be placed in IRAM. The variables used in the function should be in the SRAM as well. The `user_data` should also reside in SRAM.

Parameters

- `rx_channel` - [in] RMT generic channel that created by `rmt_new_rx_channel()`
- `cbs` - [in] Group of callback functions
- `user_data` - [in] User data, which will be passed to callback functions directly

Returns

- ESP_OK: Set event callbacks successfully
- ESP_ERR_INVALID_ARG: Set event callbacks failed because of invalid argument
- ESP_FAIL: Set event callbacks failed because of other error

**Structures**

```c
struct rmt_rx_event_callbacks_t
```

Group of RMT RX callbacks.

**Note:** The callbacks are all running under ISR environment

**Note:** When CONFIG_RMT_ISR_IRAM_SAFE is enabled, the callback itself and functions called by it should be placed in IRAM. The variables used in the function should be in the SRAM as well.

**Public Members**

```c
rmt_rx_done_callback_t on_recv_done
```

Event callback, invoked when one RMT channel receiving transaction completes

```c
struct rmt_rx_channel_config_t
```

RMT RX channel specific configuration.

**Public Members**
Chapter 2. API Reference

gpio_num_t gpio_num

GPIO number used by RMT RX channel. Set to -1 if unused

rmt_clock_source_t clk_src

Clock source of RMT RX channel, channels in the same group must use the same clock source

uint32_t resolution_hz

Channel clock resolution, in Hz

size_t mem_block_symbols

Size of memory block, in number of rmt_symbol_word_t, must be an even. In the DMA mode, this field controls the DMA buffer size, it can be set to a large value (e.g. 1024); In the normal mode, this field controls the number of RMT memory block that will be used by the channel.

uint32_t invert_in

Whether to invert the incoming RMT channel signal

uint32_t with_dma

If set, the driver will allocate an RMT channel with DMA capability

uint32_t io_loop_back

For debug/test, the signal output from the GPIO will be fed to the input path as well

struct rmt_rx_channel_config_t::[anonymous] flags

RX channel config flags

int intr_priority

RMT interrupt priority, if set to 0, the driver will try to allocate an interrupt with a relative low priority (1,2,3)

struct rmt_receive_config_t

RMT receive specific configuration.

Public Members

uint32_t signal_range_min_ns

A pulse whose width is smaller than this threshold will be treated as glitch and ignored

uint32_t signal_range_max_ns

RMT will stop receiving if one symbol level has kept more than signal_range_max_ns

Header File

REQUIRES driver

or

PRIV REQUIRES driver

Functions

`esp_err_t rmt_del_channel(rmt_channel_handle_t channel)`
Delete an RMT channel.

Parameters
- channel - [in] RMT generic channel that created by `rmt_new_tx_channel()` or `rmt_new_rx_channel()`

Returns
- ESP_OK: Delete RMT channel successfully
- ESP_ERR_INVALID_ARG: Delete RMT channel failed because of invalid argument
- ESP_ERR_INVALID_STATE: Delete RMT channel failed because it is still in working
- ESP_FAIL: Delete RMT channel failed because of other error

`esp_err_t rmt_apply_carrier(rmt_channel_handle_t channel, const rmt_carrier_config_t *config)`
Apply modulation feature for TX channel or demodulation feature for RX channel.

Parameters
- channel - [in] RMT generic channel that created by `rmt_new_tx_channel()` or `rmt_new_rx_channel()`
- config - [in] Carrier configuration. Specially, a NULL config means to disable the carrier modulation or demodulation feature

Returns
- ESP_OK: Apply carrier configuration successfully
- ESP_ERR_INVALID_ARG: Apply carrier configuration failed because of invalid argument
- ESP_FAIL: Apply carrier configuration failed because of other error

`esp_err_t rmt_enable(rmt_channel_handle_t channel)`
Enable the RMT channel.

Note: This function will acquire a PM lock that might be installed during channel allocation

Parameters
- channel - [in] RMT generic channel that created by `rmt_new_tx_channel()` or `rmt_new_rx_channel()`

Returns
- ESP_OK: Enable RMT channel successfully
- ESP_ERR_INVALID_ARG: Enable RMT channel failed because of invalid argument
- ESP_ERR_INVALID_STATE: Enable RMT channel failed because it’s enabled already
- ESP_FAIL: Enable RMT channel failed because of other error

`esp_err_t rmt_disable(rmt_channel_handle_t channel)`
Disable the RMT channel.

Note: This function will release a PM lock that might be installed during channel allocation

Parameters
- channel - [in] RMT generic channel that created by `rmt_new_tx_channel()` or `rmt_new_rx_channel()`

Returns
- ESP_OK: Disable RMT channel successfully
- ESP_ERR_INVALID_ARG: Disable RMT channel failed because of invalid argument
- ESP_ERR_INVALID_STATE: Disable RMT channel failed because it’s not enabled yet
Structures

struct rmt_carrier_config_t

RMT carrier wave configuration (for either modulation or demodulation)

Public Members

uint32_t frequency_hz
Carrier wave frequency, in Hz, 0 means disabling the carrier

float duty_cycle
Carrier wave duty cycle (0-100%)

uint32_t polarity_active_low
Specify the polarity of carrier, by default it’s modulated to base signal’s high level

uint32_t always_on
If set, the carrier can always exist even there’s not transfer undergoing

struct rmt_carrier_config_t::[anonymous] flags
Carrier config flags

Header File

- components/driver/rmt/include/driver/rmt_encoder.h
- This header file can be included with:

```c
#include "driver/rmt_encoder.h"
```

- This header file is a part of the API provided by the driver component. To declare that your component depends on driver, add the following to your CMakeLists.txt:

REQUIRES driver
```
or

```c
PRIV_REQUIRES driver
```

Functions

`esp_err_t rmt_new_bytes_encoder (const rmt_bytes_encoder_config_t *config, rmt_encoder_handle_t *ret_encoder)`

Create RMT bytes encoder, which can encode byte stream into RMT symbols.

Parameters

- config - [in] Bytes encoder configuration
- ret_encoder - [out] Returned encoder handle

Returns

- ESP_OK: Create RMT bytes encoder successfully
- ESP_ERR_INVALID_ARG: Create RMT bytes encoder failed because of invalid argument
- ESP_ERR_NO_MEM: Create RMT bytes encoder failed because out of memory
- ESP_FAIL: Create RMT bytes encoder failed because of other error
esp_err_t rmt_new_copy_encoder (const rmt_copy_encoder_config_t *config, rmt_encoder_handle_t *ret_encoder)

Create RMT copy encoder, which copies the given RMT symbols into RMT memory.

Parameters
- config [in] Copy encoder configuration
- ret_encoder [out] Returned encoder handle

Returns
- ESP_OK: Create RMT copy encoder successfully
- ESP_ERR_INVALID_ARG: Create RMT copy encoder failed because of invalid argument
- ESP_ERR_NO_MEM: Create RMT copy encoder failed because out of memory
- ESP_FAIL: Create RMT copy encoder failed because of other error

del_encoder rmt_del_encoder (rmt_encoder_handle_t encoder)

Delete RMT encoder.

Parameters
- encoder [in] RMT encoder handle, created by e.g. rmt_new_bytes_encoder()

Returns
- ESP_OK: Delete RMT encoder successfully
- ESP_ERR_INVALID_ARG: Delete RMT encoder failed because of invalid argument
- ESP_FAIL: Delete RMT encoder failed because of other error

del_encoder rmt_encoder_reset (rmt_encoder_handle_t encoder)

Reset RMT encoder.

Parameters
- encoder [in] RMT encoder handle, created by e.g. rmt_new_bytes_encoder()

Returns
- ESP_OK: Reset RMT encoder successfully
- ESP_ERR_INVALID_ARG: Reset RMT encoder failed because of invalid argument
- ESP_FAIL: Reset RMT encoder failed because of other error

Structures

struct rmt_encoder_t

Interface of RMT encoder.

Public Members

size_t (*encode)(rmt_encoder_t *encoder, rmt_channel_handle_t tx_channel, const void *primary_data, size_t data_size, rmt_encode_state_t *ret_state)

Encode the user data into RMT symbols and write into RMT memory.

Note: The encoding function will also be called from an ISR context, thus the function must not call any blocking API.

Note: It’s recommended to put this function implementation in the IRAM, to achieve a high performance and less interrupt latency.
**Param primary_data** [in] App data to be encoded into RMT symbols

**Param data_size** [in] Size of primary_data, in bytes

**Param ret_state** [out] Returned current encoder’s state

**Return** Number of RMT symbols that the primary data has been encoded into

```c
esp_err_t (*reset)(rmt_encoder_t *encoder)
```

Reset encoding state.

**Param encoder** [in] Encoder handle

**Return**
- ESP_OK: reset encoder successfully
- ESP_FAIL: reset encoder failed

```c
esp_err_t (*del)(rmt_encoder_t *encoder)
```

Delete encoder object.

**Param encoder** [in] Encoder handle

**Return**
- ESP_OK: delete encoder successfully
- ESP_FAIL: delete encoder failed

**struct rmt_bytes_encoder_config_t**

Bytes encoder configuration.

**Public Members**

```c
rmt_symbol_word_t bit0
```

How to represent BIT0 in RMT symbol

```c
rmt_symbol_word_t bit1
```

How to represent BIT1 in RMT symbol

```c
uint32_t msb_first
```

Whether to encode MSB bit first

```c
struct rmt_bytes_encoder_config_t::[anonymous] flags
```

Encoder config flag

**struct rmt_copy_encoder_config_t**

Copy encoder configuration.

**Enumerations**

```c
enum rmt_encode_state_t
```

RMT encoding state.

**Values:**

- enumerator **RMT_ENCODING_RESET**
  - The encoding session is in reset state
enumerator RMT_ENCODING_COMPLETE
   The encoding session is finished, the caller can continue with subsequent encoding

enumerator RMT_ENCODING_MEM_FULL
   The encoding artifact memory is full, the caller should return from current encoding session

Header File

- components/driver/rmt/include/driver/rmt_types.h
- This header file can be included with:
  ```
  #include "driver/rmt_types.h"
  ```
- This header file is a part of the API provided by the driver component. To declare that your component depends on driver, add the following to your CMakeLists.txt:
  ```
  REQUIRES driver
  ```
  or
  ```
  PRIV_REQUIRES driver
  ```

Structures

struct rmt_tx_done_event_data_t
   Type of RMT TX done event data.

   **Public Members**

   size_t num_symbols
   The number of transmitted RMT symbols, including one EOF symbol, which is appended by the driver to mark the end of a transmission. For a loop transmission, this value only counts for one round.

struct rmt_rx_done_event_data_t
   Type of RMT RX done event data.

   **Public Members**

   rmt_symbol_word_t *received_symbols
   Point to the received RMT symbols

   size_t num_symbols
   The number of received RMT symbols

Type Definitions

typedef struct rmt_channel_t *rmt_channel_handle_t
   Type of RMT channel handle.

typedef struct rmt_sync_manager_t *rmt_sync_manager_handle_t
   Type of RMT synchronization manager handle.
typedef struct
    rmt_encoder_t *rmt_encoder_handle_t
Type of RMT encoder handle.

typedef bool (*rmt_tx_done_callback_t)(rmt_channel_handle_t tx_chan, const rmt_tx_done_event_data_t *edata, void *user_ctx)
Prototype of RMT event callback.
    
    Param tx_chan [in] RMT channel handle, created from rmt_new_tx_channel()
    Param edata [in] Point to RMT event data. The lifecycle of this pointer memory is inside this
    function, user should copy it into static memory if used outside this function.
    Param user_ctx [in] User registered context, passed from
    rmt_tx_register_event_callbacks()
    Return Whether a high priority task has been waken up by this callback function

typedef bool (*rmt_rx_done_callback_t)(rmt_channel_handle_t rx_chan, const rmt_rx_done_event_data_t *edata, void *user_ctx)
Prototype of RMT event callback.
    
    Param rx_chan [in] RMT channel handle, created from rmt_new_rx_channel()
    Param edata [in] Point to RMT event data. The lifecycle of this pointer memory is inside this
    function, user should copy it into static memory if used outside this function.
    Param user_ctx [in] User registered context, passed from
    rmt_rx_register_event_callbacks()
    Return Whether a high priority task has been waken up by this function

Header File
- components/hal/include/hal/rmt_types.h
- This header file can be included with:

```
#include "hal/rmt_types.h"
```

Unions

union rmt_symbol_word_t

```
#include <rmt_types.h>
```
The layout of RMT symbol stored in memory, which is decided by the hardware design.

Public Members

uint16_t duration0
    Duration of level0

uint16_t level0
    Level of the first part

uint16_t duration1
    Duration of level1

uint16_t level1
    Level of the second part

struct rmt_symbol_word_t::[anonymous] [anonymous]

```c
uint32_t val

Equivalent unsigned value for the RMT symbol
```

**Type Definitions**

typedef `soc_periph_rmt_clk_src_t rmt_clock_source_t`

RMT group clock source.

*Note:* User should select the clock source based on the power and resolution requirement

### 2.6.17 SD Pull-up Requirements

Espressif hardware products are designed for multiple use cases which may require different pull states on pins. For this reason, the pull state of particular pins on certain products needs to be adjusted to provide the pull-ups required in the SD bus.

SD pull-up requirements apply to cases where ESP32-S3 uses the SPI or SDMMC controller to communicate with SD cards. When an SD card is operating in SPI mode or 1-bit SD mode, the CMD and DATA (DAT0 - DAT3) lines of the SD bus must be pulled up by 10 kOhm resistors. SD cards and SDIO devices should also have pull-ups on all above-mentioned lines (regardless of whether these lines are connected to the host) in order to prevent them from entering a wrong state.

This document has the following structure:

- **Overview of compatibility** between the default pull states on pins of Espressif’s products and the states required by the SD bus
- **Solutions** - ideas on how to resolve compatibility issues
- **Related information** - other relevant information

**Overview of Compatibility**

This section provides an overview of compatibility issues that might occur when using SDIO (secure digital input output). Since the SD bus needs to be connected to pull-ups, these issues should be resolved regardless of whether they are related to master (host) or slave (device). Each issue has links to its respective solution. A solution for a host and device may differ.

**Systems on a Chip (SoCs)**

ESP32-S3 SDMMC host controller allows using any of GPIOs for any of SD interface signals. However, it is recommended to avoid using strapping GPIOs, GPIOs with internal weak pull-downs and GPIOs commonly used for other purposes to prevent conflicts:

- GPIO0 (strapping pin)
- GPIO45, GPIO46 (strapping pins, internal weak pullup)
- GPIO26 - GPIO32 (commonly used for SPI Flash and PSRAM)
- GPIO33 - GPIO37 (when using chips and modules with Octal SPI Flash or Octal PSRAM)
- GPIO43, GPIO44 (GPIOs used for UART0 by default)
- GPIO19, GPIO20 (GPIOs used for USB by default)

**Systems in Packages (SIP)**

**Modules**
Development Boards

- ESP32-S3-DevKitC-1
  - No Pull-ups
- ESP32-S3-USB-OTG
  - The board may be used in 1-line and 4-line SD mode or SPI mode.
  - Required pull-ups are provided on GPIOs 33-38.
- ESP32-S3-EYE
  - The board is limited to 1-line SD mode.
  - Required pull-ups are provided on GPIOs 38-40.

Solutions

No Pull-ups  If you use a development board without pull-ups, you can do the following:

- If your host and slave device are on separate boards, replace one of them with a board that has pull-ups. For the list of Espressif’s development boards with pull-ups, go to Development Boards.
- Attach external pull-ups by connecting each pin which requires a pull-up to VDD via a 10 kOhm resistor.

Related Information

2.6.18 SDMMC Host Driver

Overview

ESP32-S3’s SDMMC host peripheral has two slots. Each slot can be used independently to connect to an SD card, SDIO device, or eMMC chip.

Both slots SDMMC_HOST_SLOT_0 and SDMMC_HOST_SLOT_1 support 1-, 4- and 8-line SD interfaces. The slots are connected to ESP32-S3 GPIOs using the GPIO matrix. This means that any GPIO may be used for each of the SD card signals.

Supported Speed Modes

SDMMC Host driver supports the following speed modes:

- Default Speed (20 MHz): 1-line or 4-line with SD cards, and 1-line, 4-line, or 8-line with 3.3 V eMMC
- High Speed (40 MHz): 1-line or 4-line with SD cards, and 1-line, 4-line, or 8-line with 3.3 V eMMC
- High Speed DDR (40 MHz): 4-line with 3.3 V eMMC

Speed modes not supported at present:

- High Speed DDR mode: 8-line eMMC
- UHS-I 1.8 V modes: 4-line SD cards

Using the SDMMC Host Driver

Of all the functions listed below, only the following ones will be used directly by most applications:

- `sdmmc_host_init()`
- `sdmmc_host_init_slot()`
- `sdmmc_host_deinit()`

Other functions, such as the ones given below, will be called by the SD/MMC protocol layer via function pointers in the `sdmmc_host_t` structure:

- `sdmmc_host_set_bus_width()`
Chapter 2. API Reference

- `sdmmc_host_set_card_clk()`
- `sdmmc_host_do_transaction()`

### Configuring Bus Width and Frequency

With the default initializers for `sdmmc_host_t` and `sdmmc_slot_config_t`, i.e., `SDMMC_HOST_DEFAULT` and `SDMMC_SLOT_CONFIG_DEFAULT`, SDMMC Host driver will attempt to use the widest bus supported by the card (4 lines for SD, 8 lines for eMMC) and the frequency of 20 MHz.

In the designs where communication at 40 MHz frequency can be achieved, it is possible to increase the bus frequency by changing the `max_freq_khz` field of `sdmmc_host_t`:

```c
sdmmc_host_t host = SDMMC_HOST_DEFAULT();
host.max_freq_khz = SDMMC_FREQ_HIGHSPEED;
```

If you need a specific frequency other than standard speeds, you are free to use any value from within an appropriate range of the SD interface given (SDMMC or SDSPI). However, the real clock frequency shall be calculated by the underlying driver and the value can be different from the one required.

For the SDMMC, `max_freq_khz` works as the upper limit so the final frequency value shall be always lower or equal. For the SDSPI, the nearest fitting frequency is supplied and thus the value can be greater than/equal to/lower than `max_freq_khz`.

To configure the bus width, set the `width` field of `sdmmc_slot_config_t`. For example, to set 1-line mode:

```c
sdmmc_slot_config_t slot = SDMMC_SLOT_CONFIG_DEFAULT();
slot.width = 1;
```

### Configuring GPIOs

ESP32-S3 SDMMC Host can be configured to use arbitrary GPIOs for each of the signals. Configuration is performed by setting members of `sdmmc_slot_config_t` structure.

For example, to use GPIOs 1-6 for CLK, CMD, and D0-D3 signals respectively:

```c
sdmmc_slot_config_t slot = SDMMC_SLOT_CONFIG_DEFAULT();
slot.clk = GPIO_NUM_1;
slot.cmd = GPIO_NUM_2;
slot.d0 = GPIO_NUM_3;
slot.d1 = GPIO_NUM_4;
slot.d2 = GPIO_NUM_5;
slot.d3 = GPIO_NUM_6;
```

It is also possible to configure Card Detect and Write Protect pins. Similar to other signals, set `cd` and `wp` members of the same structure:

```c
slot.cd = GPIO_NUM_7;
slot.wp = GPIO_NUM_8;
```

`SDMMC_SLOT_CONFIG_DEFAULT` sets both to `GPIO_NUM_NC`, meaning that by default the signals are not used.

Once `sdmmc_slot_config_t` structure is initialized this way, you can use it when calling `sdmmc_host_init_slot()` or one of the higher level functions (such as `esp_vfs_fat_sdmmc_mount()`).

### DDR Mode for eMMC Chips

By default, DDR mode will be used if:

- SDMMC host frequency is set to `SDMMC_FREQ_HIGHSPEED` in `sdmmc_host_t` structure, and
- eMMC chip reports DDR mode support in its CSD register
DDR mode places higher requirements for signal integrity. To disable DDR mode while keeping the `SDMMC_FREQ_HIGHSPEED` frequency, clear the `SDMMC_HOST_FLAG_DDR` bit in `sdmmc_host_t::flags` field of the `sdmmc_host_t`:

```c
sdmmc_host_t host = SDMMC_HOST_DEFAULT();
host.max_freq_khz = SDMMC_FREQ_HIGHSPEED;
host.flags &= ~SDMMC_HOST_FLAG_DDR;
```

### See also

- **SD/SDIO/MMC Driver**: introduces the higher-level driver which implements the protocol layer.
- **SD SPI Host Driver**: introduces a similar driver that uses the SPI controller and is limited to SD protocol’s SPI mode.
- **SD Pull-up Requirements**: introduces pull-up support and compatibilities of modules and development kits.

### API Reference

#### Header File

- `components/driver/sdmmc/include/driver/sdmmc_host.h`
- This header file can be included with:
  ```c
  #include "driver/sdmmc_host.h"
  ```
- This header file is a part of the API provided by the `driver` component. To declare that your component depends on `driver`, add the following to your `CMakeLists.txt`:
  ```cmake
  REQUIRE(driver)
  ```
  or
  ```cmake
  PRIV_REQUIRE(driver)
  ```

#### Functions

**`esp_err_t sdmmc_host_init(void)`**

Initialize SDMMC host peripheral.

**Note:** This function is not thread safe

**Returns**

- `ESP_OK` on success
- `ESP_ERR_INVALID_STATE` if `sdmmc_host_init` was already called
- `ESP_ERR_NO_MEM` if memory can not be allocated

**`esp_err_t sdmmc_host_init_slot(int slot, const sdmmc_slot_config_t *slot_config)`**

Initialize given slot of SDMMC peripheral.

On the ESP32, SDMMC peripheral has two slots:

- Slot 0: 8-bit wide, maps to HS1_* signals in PIN MUX
- Slot 1: 4-bit wide, maps to HS2_* signals in PIN MUX

Card detect and write protect signals can be routed to arbitrary GPIOs using GPIO matrix.

**Note:** This function is not thread safe
### Parameters
- **slot** - slot number (SDMMC_HOST_SLOT_0 or SDMMC_HOST_SLOT_1)
- **slot_config** - additional configuration for the slot

### Returns
- ESP_OK on success
- ESP_ERR_INVALID_STATE if host has not been initialized using sdmmc_host_init

```c
esp_err_t sdmmc_host_set_bus_width(int slot, size_t width)
```
Select bus width to be used for data transfer.

SD/MMC card must be initialized prior to this command, and a command to set bus width has to be sent to the card (e.g. SD_APP_SET_BUS_WIDTH)

**Note:** This function is not thread safe

### Parameters
- **slot** - slot number (SDMMC_HOST_SLOT_0 or SDMMC_HOST_SLOT_1)
- **width** - bus width (1, 4, or 8 for slot 0; 1 or 4 for slot 1)

### Returns
- ESP_OK on success
- ESP_ERR_INVALID_ARG if slot number or width is not valid

```c
size_t sdmmc_host_get_slot_width(int slot)
```
Get bus width configured in sdmmc_host_init_slot to be used for data transfer.

**Parameters**
- **slot** - slot number (SDMMC_HOST_SLOT_0 or SDMMC_HOST_SLOT_1)

**Returns**
- configured bus width of the specified slot.

```c
esp_err_t sdmmc_host_set_card_clk(int slot, uint32_t freq_khz)
```
Set card clock frequency.

Currently only integer fractions of 40MHz clock can be used. For High Speed cards, 40MHz can be used. For Default Speed cards, 20MHz can be used.

**Note:** This function is not thread safe

### Parameters
- **slot** - slot number (SDMMC_HOST_SLOT_0 or SDMMC_HOST_SLOT_1)
- **freq_khz** - card clock frequency, in kHz

### Returns
- ESP_OK on success
- other error codes may be returned in the future

```c
esp_err_t sdmmc_host_set_bus_ddr_mode(int slot, bool ddr_enabled)
```
Enable or disable DDR mode of SD interface.

**Parameters**
- **slot** - slot number (SDMMC_HOST_SLOT_0 or SDMMC_HOST_SLOT_1)
- **ddr_enabled** - enable or disable DDR mode

**Returns**
- ESP_OK on success
- ESP_ERR_NOT_SUPPORTED if DDR mode is not supported on this slot

```c
esp_err_t sdmmc_host_set_cclk_always_on(int slot, bool cclk_always_on)
```
Enable or disable always-on card clock. When cclk_always_on is false, the host controller is allowed to shut down the card clock between the commands. When cclk_always_on is true, the clock is generated even if no command is in progress.
Parameters

- **slot** – slot number
- **cclk_always_on** – enable or disable always-on clock

Returns

- ESP_OK on success
- ESP_ERR_INVALID_ARG if the slot number is invalid

```c
esp_err_t sdmmc_host_do_transaction(int slot, sdmmc_command_t *cmdinfo)
```

Send command to the card and get response.

This function returns when command is sent and response is received, or data is transferred, or timeout occurs.

**Attention** Data buffer passed in cmdinfo->data must be in DMA capable memory

---

**Note:** This function is not thread safe w.r.t. init/deinit functions, and bus width/clock speed configuration functions. Multiple tasks can call sdmmc_host_do_transaction as long as other sdmmc_host_* functions are not called.

---

Parameters

- **slot** – slot number (SDMMC_HOST_SLOT_0 or SDMMC_HOST_SLOT_1)
- **cmdinfo** – pointer to structure describing command and data to transfer

Returns

- ESP_OK on success
- ESP_ERR_TIMEOUT if response or data transfer has timed out
- ESP_ERR_INVALID_CRC if response or data transfer CRC check has failed
- ESP_ERR_INVALID_RESPONSE if the card has sent an invalid response
- ESP_ERR_INVALID_SIZE if the size of data transfer is not valid in SD protocol
- ESP_ERR_INVALID_ARG if the data buffer is not in DMA capable memory

```c
esp_err_t sdmmc_host_io_int_enable(int slot)
```

Enable IO interrupts.

This function configures the host to accept SDIO interrupts.

**Parameters**

- **slot** – slot number (SDMMC_HOST_SLOT_0 or SDMMC_HOST_SLOT_1)

**Returns**

returns ESP_OK, other errors possible in the future

```c
esp_err_t sdmmc_host_io_int_wait(int slot, TickType_t timeout_ticks)
```

Block until an SDIO interrupt is received, or timeout occurs.

**Parameters**

- **slot** – slot number (SDMMC_HOST_SLOT_0 or SDMMC_HOST_SLOT_1)
- **timeout_ticks** – number of RTOS ticks to wait for the interrupt

**Returns**

- ESP_OK on success (interrupt received)
- ESP_ERR_TIMEOUT if the interrupt did not occur within timeout_ticks

```c
esp_err_t sdmmc_host_deinit(void)
```

Disable SDMMC host and release allocated resources.

**Note:** This function is not thread safe

---

Returns

- ESP_OK on success
- ESP_ERR_INVALID_STATE if sdmmc_host_init function has not been called
**esp_err_t sdmmc_host_get_real_freq**(int slot, int *real_freq_khz)

Provides a real frequency used for an SD card installed on specific slot of SD/MMC host controller.

This function calculates real working frequency given by current SD/MMC host controller setup for required slot: it reads associated host and card dividers from corresponding SDMMC registers, calculates respective frequency and stores the value into the ‘real_freq_khz’ parameter

**Parameters**
- **slot** - slot number (SDMMC_HOST_SLOT_0 or SDMMC_HOST_SLOT_1)
- **real_freq_khz** - [out] output parameter for the result frequency (in kHz)

**Returns**
- ESP_OK on success
- ESP_ERR_INVALID_ARG on real_freq_khz == NULL or invalid slot number used

**esp_err_t sdmmc_host_set_input_delay**(int slot, sdmmc_delay_phase_t delay_phase)

set input delay

- This API sets delay when the SDMMC Host samples the signal from the SD Slave.
- This API will check if the given delay_phase is valid or not.
- This API will print out the delay time, in picosecond (ps)

**Note:** ESP32 doesn’t support this feature, you will get an ESP_ERR_NOT_SUPPORTED

**Parameters**
- **slot** - slot number (SDMMC_HOST_SLOT_0 or SDMMC_HOST_SLOT_1)
- **delay_phase** - delay phase, this API will convert the phase into picoseconds and print it out

**Returns**
- ESP_OK: ON success.
- ESP_ERR_INVALID_ARG: Invalid argument.
- ESP_ERR_NOT_SUPPORTED: ESP32 doesn’t support this feature.

**Structures**

struct **sdmmc_slot_config_t**

Extra configuration for SDMMC peripheral slot

**Public Members**

- **gpio_num_t clk**
  - GPIO number of CLK signal.
- **gpio_num_t cmd**
  - GPIO number of CMD signal.
- **gpio_num_t d0**
  - GPIO number of D0 signal.
- **gpio_num_t d1**
  - GPIO number of D1 signal.
gpio_num_t d2
    GPIO number of D2 signal.

gpio_num_t d3
    GPIO number of D3 signal.

gpio_num_t d4
    GPIO number of D4 signal. Ignored in 1- or 4- line mode.

gpio_num_t d5
    GPIO number of D5 signal. Ignored in 1- or 4- line mode.

gpio_num_t d6
    GPIO number of D6 signal. Ignored in 1- or 4- line mode.

gpio_num_t d7
    GPIO number of D7 signal. Ignored in 1- or 4- line mode.

gpio_num_t gpio_cd
    GPIO number of card detect signal.

gpio_num_t cd
    GPIO number of card detect signal; shorter name.

gpio_num_t gpio_wp
    GPIO number of write protect signal.

gpio_num_t wp
    GPIO number of write protect signal; shorter name.

uint8_t width
    Bus width used by the slot (might be less than the max width supported)

uint32_t flags
    Features used by this slot.

**Macros**

**SDMMC_SLOT_FLAG_INTERNAL_PULLUP**

Enable internal pullups on enabled pins. The internal pullups are insufficient however, please make sure external pullups are connected on the bus. This is for debug / example purpose only.

**SDMMC_SLOT_FLAG_WP_ACTIVE_HIGH**

GPIO write protect polarity. 0 means “active low”, i.e. card is protected when the GPIO is low; 1 means “active high”, i.e. card is protected when GPIO is high.

### 2.6.19 SD SPI Host Driver
Overview

The SD SPI host driver allows communication with one or more SD cards using the SPI Master driver, which utilizes the SPI host. Each card is accessed through an SD SPI device, represented by an SD SPI handle `sdspi_dev_handle_t`, which returns when the device is attached to an SPI bus by calling `sdspi_host_init_device()`. It is important to note that the SPI bus should be initialized beforehand by `spi_bus_initialize()`.

With the help of **SPI Master Driver** the SD SPI host driver based on, the SPI bus can be shared among SD cards and other SPI devices. The SPI Master driver will handle exclusive access from different tasks.

The SD SPI driver uses software-controlled CS signal.

How to Use

Firstly, use the macro `SDSPI_DEVICE_CONFIG_DEFAULT` to initialize the structure `sdspi_device_config_t`, which is used to initialize an SD SPI device. This macro will also fill in the default pin mappings, which are the same as the pin mappings of the SDMMC host driver. Modify the host and pins of the structure to desired value. Then call `sdspi_host_init_device` to initialize the SD SPI device and attach to its bus.

Then use the `SDSPI_HOST_DEFAULT` macro to initialize the `sdmmc_host_t` structure, which is used to store the state and configurations of the upper layer (SD/SDIO/MMC driver). Modify the slot parameter of the structure to the SD SPI device SD SPI handle just returned from `sdspi_host_init_device`. Call `sdmmc_card_init` with the `sdmmc_host_t` to probe and initialize the SD card.

Now you can use SD/SDIO/MMC driver functions to access your card!

Other Details

Only the following driver’s API functions are normally used by most applications:

- `sdspi_host_init`
- `sdspi_host_init_device`
- `sdspi_host_remove_device`
- `sdspi_host_deinit`

Other functions are mostly used by the protocol level SD/SDIO/MMC driver via function pointers in the `sdmmc_host_t` structure. For more details, see [SD/SDIO/MMC Driver](#).

**Note:** SD over SPI does not support speeds above `SDMMC_FREQ_DEFAULT` due to the limitations of the SPI driver.

**Warning:** If you want to share the SPI bus among SD card and other SPI devices, there are some restrictions, see [Sharing the SPI Bus Among SD Cards and Other SPI Devices](#).

Related Docs

**Sharing the SPI Bus Among SD Cards and Other SPI Devices**

The SD card has an SPI mode, enabling it to function as an SPI device, but there are some restrictions that we need to pay attention to.

**Pin Loading of Other Devices** When adding more devices onto the same bus, the overall pin loading increases. The loading consists of AC loading (pin capacitor) and DC loading (pull-ups).
**AC Loading**  SD cards, designed for high-speed communications, have small pin capacitors (AC loading) to work until 50 MHz. However, the other attached devices will increase the pin’s AC loading.

Heavy AC loading of a pin may prevent the pin from being toggled quickly. By using an oscilloscope, you will see the edges of the pin become smoother, i.e., the gradient of the edge is smaller. The setup timing requirements of an SD card may be violated when the card is connected to a bus with a high AC load. Even worse, high AC loads may cause the SD card and other SPI devices to fail to properly resolve clock signals from the host, affecting communication stability.

This issue may be more obvious if other attached devices are not designed to work at the same frequency as the SD card, because they may have larger pin capacitors. The larger the pin capacity, the greater the pin response time, the smaller the max frequency the SD bus can work.

To see if your pin AC loading is too heavy, you can try the following tests:

**Terminology:**
- **launch edge**: at which clock edge the data starts to toggle;
- **latch edge**: at which clock edge the data is supposed to be sampled by the receiver. For SD card, it is the rising edge.

1. Use an oscilloscope to see the clock and compare the data line to the clock.
   - If you see the clock is not fast enough, e.g., the rising/falling edge is longer than 1/4 of the clock cycle, it means the clock is skewed too much.
   - If you see the data line unstable before the latch edge of the clock, it means the load of the data line is too large.
   
   You may also observe the corresponding phenomenon that data delayed largely from the launching edge of the clock with logic analyzers. But it is not as obvious as with an oscilloscope.

2. Try to use a slower clock frequency.
   - If the lower frequency can work while the higher frequency cannot, it is an indication that the AC loading on the pins is too large.

If the AC loading of the pins is too large, you can either use other faster devices with lower pin load or slow down the clock speed.

**DC Loading**  The pull-ups required by SD cards are usually around 10 kOhm to 50 kOhm, which may be too strong for some other SPI devices.

Check the specification of your device about its DC output current, it should be larger than 700 μA, otherwise, the device output may not be read correctly.

**Initialization Sequence**

**Note:** If you see any problem in the following steps, please make sure the timing is correct first. You can try to slow down the clock speed, such as setting `SDMMC_FREQ_PROBING` to 400 kHz for SD card, to avoid the influence of pin AC loading, as discussed in the previous section.

When using an SD card with other SPI devices on the same SPI bus, due to the restrictions of the SD card startup flow, the following initialization sequence should be followed. Refer to `storage/sd_card` for further details.

1. Initialize the SPI bus properly by `spi_bus_initialize()`.
2. Tie the CS lines of all other devices than the SD card to idle state (by default it’s high). This is to avoid conflicts with the SD card in the following step.
   
   You can do this by either:
   1. Attach devices to the SPI bus by calling `spi_bus_add_device()`. This function will by default initialize the GPIO that is used as CS to the idle level: high.
   2. Initialize GPIO on the CS pin that needs to be tied up before actually adding a new device.
   3. Rely on the internal/external pull-up (**not recommended**) to pull up all the CS pins when the GPIOs of ESP are not initialized yet. You need to check carefully the pull-up is strong enough and there are no other pull-downs that will influence the pull-up. For example, internal pull-down should be enabled.
3. Mount the card to the filesystem by calling `esp_vfs_fat_sdspi_mount()`. This step will put the SD card into the SPI mode, which should be done before all other SPI communications on the same bus. Otherwise, the card will stay in the SD mode, in which mode it may randomly respond to any SPI communications on the bus, even when its CS line is not addressed.

If you want to test this behavior, please also note that, once the card is put into SPI mode, it will not return to SD mode before the next power cycle, i.e., powered down and powered up again.

4. Now you can talk to other SPI devices freely!

API Reference

Header File

- `components/driver/spi/include/driver/sdspi_host.h`
- This header file can be included with:
  ```
  #include "driver/sdspi_host.h"
  ```
- This header file is a part of the API provided by the `driver` component. To declare that your component depends on `driver`, add the following to your CMakeLists.txt:
  ```
  REQUIRES driver
  ```
  or
  ```
  PRIV_REQUIRES driver
  ```

Functions

**esp_err_t** `sdspi_host_init` *(void)*

Initialize SD SPI driver.

**Note:** This function is not thread safe

**Returns**

- ESP_OK on success
- other error codes may be returned in future versions

**esp_err_t** `sdspi_host_init_device` *(const sdspi_device_config_t *dev_config, sdspi_dev_handle_t *out_handle)*

Attach and initialize an SD SPI device on the specific SPI bus.

**Note:** This function is not thread safe

**Note:** Initialize the SPI bus by `spi_bus_initialize()` before calling this function.

**Note:** The SDIO over sdspi needs an extra interrupt line. Call `gpio_install_isr_service()` before this function.

**Parameters**

- `dev_config` - pointer to device configuration structure
- `out_handle` - Output of the handle to the sdspi device.

**Returns**

- ESP_OK on success
• ESP_ERR_INVALID_ARG if sdspi_host_init_device has invalid arguments
• ESP_ERR_NO_MEM if memory can not be allocated
• other errors from the underlying spi_master and gpio drivers

\textbf{esp_err_t sdspi_host_remove_device (sdspi_dev_handle_t handle)}

Remove an SD SPI device.

\textbf{Parameters} \textbf{handle} – Handle of the SD SPI device

\textbf{Returns} Always ESP_OK

\textbf{esp_err_t sdspi_host_do_transaction (sdspi_dev_handle_t handle, sdmmc_command_t *cmdinfo)}

Send command to the card and get response.

This function returns when command is sent and response is received, or data is transferred, or timeout occurs.

\textbf{Note:} This function is not thread safe w.r.t. init/deinit functions, and bus width/clock speed configuration functions. Multiple tasks can call sdspi_host_do_transaction as long as other sdspi_host_* functions are not called.

\textbf{Parameters}
• handle – Handle of the sdspi device
• cmdinfo – pointer to structure describing command and data to transfer

\textbf{Returns}
• ESP_OK on success
• ESP_ERR_TIMEOUT if response or data transfer has timed out
• ESP_ERR_INVALID_CRC if response or data transfer CRC check has failed
• ESP_ERR_INVALID_RESPONSE if the card has sent an invalid response

\textbf{esp_err_t sdspi_host_set_card_clk (sdspi_dev_handle_t host, uint32_t freq_khz)}

Set card clock frequency.

Currently only integer fractions of 40MHz clock can be used. For High Speed cards, 40MHz can be used. For Default Speed cards, 20MHz can be used.

\textbf{Note:} This function is not thread safe

\textbf{Parameters}
• host – Handle of the sdspi device
• freq_khz – card clock frequency, in kHz

\textbf{Returns}
• ESP_OK on success
• other error codes may be returned in the future

\textbf{esp_err_t sdspi_host_get_real_freq (sdspi_dev_handle_t handle, int *real_freq_khz)}

Calculate working frequency for specific device.

\textbf{Parameters}
• handle – SDSPI device handle
• real_freq_khz – [out] output parameter to hold the calculated frequency (in kHz)

\textbf{Returns}
• ESP_ERR_INVALID_ARG : handle is NULL or invalid or real_freq_khz parameter is NULL
• ESP_OK : Success

\textbf{esp_err_t sdspi_host_deinit (void)}

Release resources allocated using sdspi_host_init.
Note: This function is not thread safe

Returns

- ESP_OK on success
- ESP_ERR_INVALID_STATE if sdspi_host_init function has not been called

```c
esp_err_t sdspi_host_io_int_enable (sdspi_dev_handle_t handle)
Enable SDIO interrupt.

Parameters
handle – Handle of the sdspi device

Returns
- ESP_OK on success
```

```c
esp_err_t sdspi_host_io_int_wait (sdspi_dev_handle_t handle, TickType_t timeout_ticks)
Wait for SDIO interrupt until timeout.

Parameters
- handle – Handle of the sdspi device
- timeout_ticks – Ticks to wait before timeout.

Returns
- ESP_OK on success
```

Structures

```c
struct sdspi_device_config_t
Extra configuration for SDSPI device.
```

Public Members

```c
spi_host_device_t host_id
SPI host to use, SPIx_HOST (see spi_types.h).
```

GPIO number of CS signal.
```

```c
gpio_num_t gpio_cd
GPIO number of card detect signal.
```

```c
gpio_num_t gpio_wp
GPIO number of write protect signal.
```

```c
gpio_num_t gpio_int
GPIO number of interrupt line (input) for SDIO card.
```

```c
bool gpio_wp_polarity
GPIO write protect polarity 0 means “active low”, i.e. card is protected when the GPIO is low; 1 means “active high”, i.e. card is protected when GPIO is high.
```

Macros

```c
SDSPI_DEFAULT_HOST
```
Chapter 2. API Reference

**SDSPI_DEFAULT_DMA**

**SDSPI_HOST_DEFAULT()**
Default `sdmmc_host_t` structure initializer for SD over SPI driver.
Uses SPI mode and max frequency set to 20MHz
‘slot’ should be set to an sdspi device initialized by `sdspi_host_init_device()`.

**SDSPI_SLOT_NO_CS**
indicates that card select line is not used

**SDSPI_SLOT_NO_CD**
indicates that card detect line is not used

**SDSPI_SLOT_NO_WP**
indicates that write protect line is not used

**SDSPI_SLOT_NO_INT**
indicates that interrupt line is not used

**SDSPI_IO_ACTIVE_LOW**

**SDSPI_DEVICE_CONFIG_DEFAULT()**
Macro defining default configuration of SD SPI device.

**Type Definitions**

typedef int `sdspi_dev_handle_t`
Handle representing an SD SPI device.

### 2.6.20 Sigma-Delta Modulation (SDM)

#### Introduction

ESP32-S3 has a second-order sigma-delta modulator, which can generate independent PDM pulses to multiple channels. Please refer to the TRM to check how many hardware channels are available.\(^1\)

Delta-sigma modulation converts an analog voltage signal into a pulse frequency, or pulse density, which can be understood as pulse-density modulation (PDM) (refer to Delta-sigma modulation on Wikipedia).

The main differences comparing to I2S PDM mode and DAC peripheral are:

1. SDM has no clock signal, it is just like the DAC mode of PDM;
2. SDM has no DMA, and it can not change its output density continuously. If you have to, you can update the density in a timer’s callback;
3. Based on the former two points, unlike the DAC peripheral, an external active or passive low-pass filter is required additionally to restore the analog wave (See Convert to an Analog Signal (Optional)).

Typically, a Sigma-Delta modulated channel can be used in scenarios like:

---
\(^1\) Different ESP chip series might have different numbers of SDM channels. Please refer to Chapter GPIO and IOMUX in ESP32-S3 Technical Reference Manual for more details. The driver does not forbid you from applying for more channels, but it will return an error when all available hardware resources are used up. Please always check the return value when doing resource allocation (e.g., `sdm_new_channel()`).
• LED dimming
• Simple DAC (8-bit), with the help of an active RC low-pass filter
• Class D amplifier, with the help of a half-bridge or full-bridge circuit plus an LC low-pass filter

Functional Overview

The following sections of this document cover the typical steps to install and operate an SDM channel:

• **Resource Allocation** - covers how to initialize and configure an SDM channel and how to recycle the resources when it finishes working.
• **Enable and Disable Channel** - covers how to enable and disable the channel.
• **Set Pulse Density** - describes how to set the equivalent duty cycle of the PDM pulses.
• **Power Management** - describes how different source clock selections can affect power consumption.
• **IRAM Safe** - lists which functions are supposed to work even when the cache is disabled.
• **Thread Safety** - lists which APIs are guaranteed to be thread-safe by the driver.
• **Kconfig Options** - lists the supported Kconfig options that can be used to make a different effect on driver behavior.

**Resource Allocation** In ESP-IDF, the information and attributes of SDM channels are managed and accessed through specific data structures, where the data structure is called `sdm_channel_handle_t`. Each channel is capable to output the binary, hardware-generated signal with the sigma-delta modulation. The driver manages all available channels in a pool so that there is no need to manually assign a fixed channel to a GPIO.

To install an SDM channel, you should call `sdm_new_channel()` to get a channel handle. Channel-specific configurations are passed in the `sdm_config_t` structure:

- `sdm_config_t::gpio_num` sets the GPIO that the PDM pulses output from.
- `sdm_config_t::clk_src` selects the source clock for the SDM module. Note that, all channels should select the same clock source.
- `sdm_config_t::sample_rate_hz` sets the sample rate of the SDM module.
- `sdm_config_t::invert_out` sets whether to invert the output signal.
- `sdm_config_t::io_loop_back` is for debugging purposes only. It enables both the GPIO’s input and output ability through the GPIO matrix peripheral.

The function `sdm_new_channel()` can fail due to various errors such as insufficient memory, invalid arguments, etc. Specifically, when there are no more free channels (i.e., all hardware SDM channels have been used up), `ESP_ERR_NOT_FOUND` will be returned.

If a previously created SDM channel is no longer required, you should recycle it by calling `sdm_del_channel()`. It allows the underlying HW channel to be used for other purposes. Before deleting an SDM channel handle, you should disable it by `sdm_channel_disable()` in advance or make sure it has not been enabled yet by `sdm_channel_enable()`.

**Creating an SDM Channel with a Sample Rate of 1 MHz**

```c
sdm_channel_handle_t chan = NULL;
sdm_config_t config = {
    .clk_src = SDM_CLK_SRC_DEFAULT,
    .sample_rate_hz = 1 * 1000 * 1000,
    .gpio_num = 0,
};
ESP_ERROR_CHECK(sdm_new_channel(&config, &chan));
```

**Enable and Disable Channel** Before doing further IO control to the SDM channel, you should enable it first, by calling `sdm_channel_enable()`. Internally, this function:

- switches the channel state from **init** to **enable**
- acquires a proper power management lock if a specific clock source (e.g., APB clock) is selected. See also **Power Management** for more information.
On the contrary, calling `sdm_channel_disable()` does the opposite, that is, put the channel back to the init state and releases the power management lock.

**Set Pulse Density** For the output PDM signals, the pulse density decides the output analog voltage that is restored by a low-pass filter. The restored analog voltage from the channel is calculated by $V_{out} = \frac{V_{DD_IO}}{256} \times \text{duty} + \frac{V_{DD_IO}}{2}$. The range of the quantized density input parameter of `sdm_channel_set_pulse_density()` is from -128 to 127 (8-bit signed integer). Depending on the value of the density parameter, the duty cycle of the output signal will be changed accordingly. For example, if a zero value is set, then the output signal’s duty will be around 50%.

**Power Management** When power management is enabled (i.e., `CONFIG_PM_ENABLE` is on), the system will adjust the APB frequency before going into Light-sleep, thus potentially changing the sample rate of the sigma-delta modulator.

However, the driver can prevent the system from changing APB frequency by acquiring a power management lock of type `ESP_PM_APB_FREQ_MAX`. Whenever the driver creates an SDM channel instance that has selected `SDM_CLK_SRC_APB` as its clock source, the driver guarantees that the power management lock is acquired when enabling the channel by `sdm_channel_enable()`. Likewise, the driver releases the lock when `sdm_channel_disable()` is called for that channel.

**IRAM Safe** There is a Kconfig option `CONFIG_SDM_CTRL_FUNC_IN_IRAM` that can put commonly-used IO control functions into IRAM as well. So that these functions can also be executable when the cache is disabled. These IO control functions are listed as follows:

- `sdm_channel_set_pulse_density()`

**Thread Safety** The factory function `sdm_new_channel()` is guaranteed to be thread-safe by the driver, which means, the user can call it from different RTOS tasks without protection by extra locks.

The following functions are allowed to run under ISR context, the driver uses a critical section to prevent them being called concurrently in both task and ISR.

- `sdm_channel_set_pulse_density()`

Other functions that take the `sdm_channel_handle_t` as the first positional parameter, are not treated as thread-safe. This means the user should avoid calling them from multiple tasks.

**Kconfig Options**

- `CONFIG_SDM_CTRL_FUNC_IN_IRAM` controls where to place the SDM channel control functions (IRAM or Flash), see `IRAM Safe` for more information.
- `CONFIG_SDM_ENABLE_DEBUG_LOG` is used to enable the debug log output. Enabling this option increases the firmware binary size.

**Convert to an Analog Signal (Optional)**

Typically, if a Sigma-Delta signal is connected to an LED to adjust the brightness, you do not have to add any filter between them, because our eyes have their own low-pass filters for changes in light intensity. However, if you want to check the real voltage or watch the analog waveform, you need to design an analog low-pass filter. Also, it is recommended to use an active filter instead of a passive filter to gain better isolation and not lose too much voltage.

For example, you can take the following Sallen-Key topology Low Pass Filter as a reference.

**Application Example**

- 100 Hz sine wave that is modulated with Sigma-Delta: `peripherals/sigma_delta/sdm_dac`
- LED driven by a GPIO that is modulated with Sigma-Delta: `peripherals/sigma_delta/sdm_led`
API Reference

Header File

- components/driver/sigma_delta/include/driver/sdm.h
- This header file can be included with:

```c
#include "driver/sdm.h"
```  
- This header file is a part of the API provided by the driver component. To declare that your component depends on driver, add the following to your CMakeLists.txt:

```cmake
REQUIRES driver
```
or
```
PRIV_REQUIRES driver
```

Functions

```c
esp_err_t sdm_new_channel(const sdm_config_t *config, sdm_channel_handle_t *ret_chan)
```
Create a new Sigma Delta channel.

Parameters

- `config` [in] SDM configuration
- `ret_chan` [out] Returned SDM channel handle

Returns

- ESP_OK: Create SDM channel successfully
- ESP_ERR_INVALID_ARG: Create SDM channel failed because of invalid argument
- ESP_ERR_NO_MEM: Create SDM channel failed because out of memory
- ESP_ERR_NOT_FOUND: Create SDM channel failed because all channels are used up and no more free one
- ESP_FAIL: Create SDM channel failed because of other error

```c
esp_err_t sdm_del_channel(sdm_channel_handle_t chan)
```
Delete the Sigma Delta channel.

Fig. 25: Sallen-Key Low Pass Filter
Parameters \texttt{chan} – [in] SDM channel created by \texttt{sdm\_new\_channel} \\

Returns \\
\begin{itemize} \\
\item ESP\_OK: Delete the SDM channel successfully \\
\item ESP\_ERR\_INVALID\_ARG: Delete the SDM channel failed because of invalid argument \\
\item ESP\_ERR\_INVALID\_STATE: Delete the SDM channel failed because the channel is not in init state \\
\item ESP\_FAIL: Delete the SDM channel failed because of other error \\
\end{itemize} 

\texttt{esp\_err\_t sdm\_channel\_enable (sdm\_channel\_handle\_t chan)} \\
Enable the Sigma Delta channel. 

\textbf{Note:} This function will transit the channel state from init to enable.

\textbf{Note:} This function will acquire a PM lock, if a specific source clock (e.g. APB) is selected in the \texttt{sdm\_config\_t}, while \texttt{CONFIG\_PM\_ENABLE} is enabled.

Parameters \texttt{chan} – [in] SDM channel created by \texttt{sdm\_new\_channel} \\

Returns \\
\begin{itemize} \\
\item ESP\_OK: Enable SDM channel successfully \\
\item ESP\_ERR\_INVALID\_ARG: Enable SDM channel failed because of invalid argument \\
\item ESP\_ERR\_INVALID\_STATE: Enable SDM channel failed because the channel is already enabled \\
\item ESP\_FAIL: Enable SDM channel failed because of other error \\
\end{itemize} 

\texttt{esp\_err\_t sdm\_channel\_disable (sdm\_channel\_handle\_t chan)} \\
Disable the Sigma Delta channel. 

\textbf{Note:} This function will do the opposite work to the \texttt{sdm\_channel\_enable()}

Parameters \texttt{chan} – [in] SDM channel created by \texttt{sdm\_new\_channel} \\

Returns \\
\begin{itemize} \\
\item ESP\_OK: Disable SDM channel successfully \\
\item ESP\_ERR\_INVALID\_ARG: Disable SDM channel failed because of invalid argument \\
\item ESP\_ERR\_INVALID\_STATE: Disable SDM channel failed because the channel is not enabled yet \\
\item ESP\_FAIL: Disable SDM channel failed because of other error \\
\end{itemize} 

\texttt{esp\_err\_t sdm\_channel\_set\_pulse\_density (sdm\_channel\_handle\_t chan, int8\_t density)} \\
Set the pulse density of the PDM output signal. 

\textbf{Note:} The raw output signal requires a low-pass filter to restore it into analog voltage, the restored analog output voltage could be \( V_{out} = V_{DD\_IO} / 256 \times \text{density} + V_{DD\_IO} / 2 \)

\textbf{Note:} This function is allowed to run within ISR context

\textbf{Note:} This function will be placed into IRAM if \texttt{CONFIG\_SDM\_CTRL\_FUNC\_IN\_IRAM} is on, so that it’s allowed to be executed when Cache is disabled

\textbf{Parameters}
• **chan** - [in] SDM channel created by `sdm_new_channel`

• **density** - [in] Quantized pulse density of the PDM output signal, ranges from -128 to 127. But the range of [-90, 90] can provide a better randomness.

**Returns**
- ESP_OK: Set pulse density successfully
- ESP_ERR_INVALID_ARG: Set pulse density failed because of invalid argument
- ESP_FAIL: Set pulse density failed because of other error

```c
esp_err_t sdm_channel_set_duty (sdm_channel_handle_t chan, int8_t duty)
```

The alias function of `sdm_channel_set_pulse_density`, it decides the pulse density of the output signal.

**Note:** `sdm_channel_set_pulse_density` has a more appropriate name compare this alias function, suggest to turn to `sdm_channel_set_pulse_density` instead.

**Parameters**
- **chan** - [in] SDM channel created by `sdm_new_channel`
- **duty** - [in] Actually it’s the quantized pulse density of the PDM output signal

**Returns**
- ESP_OK: Set duty cycle successfully
- ESP_ERR_INVALID_ARG: Set duty cycle failed because of invalid argument
- ESP_FAIL: Set duty cycle failed because of other error

**Structures**

```c
struct sdm_config_t
```

Sigma Delta channel configuration.

**Public Members**

```c
int gpio_num
```

GPIOnumber

```c
sdm_clock_source_t clk_src
```

Clock source

```c
uint32_t sample_rate_hz
```

Over sample rate in Hz, it determines the frequency of the carrier pulses

```c
uint32_t invert_out
```

Whether to invert the output signal

```c
uint32_t io_loop_back
```

For debug/test, the signal output from the GPIO will be fed to the input path as well

```c
struct sdm_config_t::[anonymous] flags
```

Extra flags
Type Definitions

typedef struct sdm_channel_t *sdm_channel_handle_t

Type of Sigma Delta channel handle.

Header File

- components/hal/include/hal/sdm_types.h
- This header file can be included with:

```
#include "hal/sdm_types.h"
```

Type Definitions

typedef soc_periph_sdm_clk_src_t sdm_clock_source_t

### 2.6.21 SPI Flash API

**Overview**

The spi_flash component contains API functions related to reading, writing, erasing, and memory mapping for data in the external flash.

For higher-level API functions which work with partitions defined in the partition table, see Partitions API

---

**Note:** esp_partition_* APIs are recommended to be used instead of the lower level esp_flash_* API functions when accessing the main SPI flash chip, since they conduct bounds checking and are guaranteed to calculate correct offsets in flash based on the information in the partition table. esp_flash_* functions can still be used directly when accessing an external (secondary) SPI flash chip.

Different from the API before ESP-IDF v4.0, the functionality of esp_flash_* APIs is not limited to the “main” SPI flash chip (the same SPI flash chip from which program runs). With different chip pointers, you can access external flash chips connected to not only SPI0/1 but also other SPI buses like SPI2.

**Note:** Instead of going through the cache connected to the SPI0 peripheral, most esp_flash_* APIs go through other SPI peripherals like SPI1, SPI2, etc. This makes them able to access not only the main flash, but also external (secondary) flash.

However, due to the limitations of the cache, operations through the cache are limited to the main flash. The address range limitation for these operations is also on the cache side. The cache is not able to access external flash chips or address range above its capabilities. These cache operations include: mmap, encrypted read/write, executing code or access to variables in the flash.

**Note:** Flash APIs after ESP-IDF v4.0 are no longer atomic. If a write operation occurs during another on-going read operation, and the flash addresses of both operations overlap, the data returned from the read operation may contain both old data and new data (that was updated written by the write operation).
Note: Encrypted flash operations are only supported with the main flash chip (and not with other flash chips, that is on SPI1 with different CS, or on other SPI buses). Reading through cache is only supported on the main flash, which is determined by the HW.

Support for Features of Flash Chips

Quad/Dual Mode Chips Features of different flashes are implemented in different ways and thus need special support. The fast/slow read and Dual mode (DOUT/DIO) of almost all flashes with 24-bit address are supported, because they do not need any vendor-specific commands.

Quad mode (QIO/QOUT) is supported on the following chip types:
1. ISSI
2. GD
3. MXIC
4. FM
5. Winbond
6. XMC
7. BOYA

Note: Only when one flash series listed above is supported by ESP32-S3, this flash series is supported by the chip driver by default. You can use `Component config > SPI Flash driver > Auto-detect flash chips` in menuconfig to enable/disable a flash series.

Optional Features

Optional Features for Flash Some features are not supported on all ESP chips and Flash chips. You can check the list below for more information.

- `Auto Suspend & Resume`
- `Flash unique ID`
- `High performance mode`
- `OPI flash support`
- `32-bit Address Flash Chips`

Note: When Flash optional features listed in this page are used, aside from the capability of ESP chips, and ESP-IDF verison you are using, you will also need to make sure these features are supported by flash chips used.

- If you are using an official Espressif modules/SiP. Some of the modules/SiPs always support the feature, in this case you can see these features listed in the datasheet. Otherwise please contact Espressif’s business team to know if we can supply such products for you.
- If you are making your own modules with your own bought flash chips, and you need features listed above. Please contact your vendor if they support the those features, and make sure that the chips can be supplied continuously.

Attention: This document only shows that ESP-IDF code has supported the features of those flash chips. It is not a list of stable flash chips certified by Espressif. If you build your own hardware from flash chips with your own brought flash chips (even with flash listed in this page), you need to validate the reliability of flash chips yourself.
Auto Suspend & Resume  This feature is only supported on ESP32-S3, ESP32-C2, ESP32-C3, ESP32-C6, ESP32-H2 for now.

The support for ESP32-P4 may be added in the future.

List of Flash chips that support this feature:

1. XM25QxxC series.
2. GD25QxxE series.
3. FM25Q32

**Attention:** There are multiple limitations about the auto-suspend feature, please do read Flash Auto Suspend Feature for more information before you enable this feature.

Flash Unique ID  This feature is supported on all Espressif chips.

Unique ID is not flash id, which means flash has 64-Bit unique ID for each device. The instruction to read the unique ID (4Bh) accesses a factory-set read-only 64-bit number that is unique to each flash device. This ID number helps you to recognize each single device. Not all flash vendors support this feature. If you try to read the unique ID on a chip which does not have this feature, the behavior is not determined. The support list is as follows.

List of Flash chips that support this feature:

1. ISSI
2. GD
3. TH
4. FM
5. Winbond
6. XMC
7. BOYA

High Performance Mode  This feature is only supported on ESP32-S3 for now.

The support for ESP32-S2, ESP32-C3, ESP32-C6, ESP32-H2, ESP32-P4 may be added in the future.

**Note:** This section is provided for Dual mode (DOUT/DIO) and Quad mode (QIO/QOUT) flash chips. Octal flash used on ESP-chips support High performance mode by default so far, you can refer to the octal flash support list below.

High performance mode (HPM) means that the SPI1 and flash chip works under high frequency. Usually, when the operating frequency of the flash is greater than 80 MHz, it is considered that the flash works under HPM.

As far as we acknowledged, there are more than three strategies for High Performance Mode (HPM) in typical SPI flash parts. For some flash chips, HPM is controlled by dummy cycle bit in the registers, while for other chips, it can be controlled by other bits (like HPM bit) in the register, or some special command. The difference in strategies requires the driver to explicitly add support for each chip.

**Attention:** It is hard to create several strategies to cover all situations, so all flash chips using HPM need to be supported explicitly. Therefore, if you try to use a flash not listed in Quad Flash HPM support list, it might cause some error. So, when you try to use the flash chip beyond supported list, please test properly.

Moreover, when the Dummy Cycle adjustment strategy is adopted by the flash chip, the flash remains in a state in which DC is different from the default value after a software reset. The sub mode of HPM that adjusts the dummy cycle to run at higher frequency in the application is called HPM-DC. HPM-DC feature needs a feature DC Aware to be enabled in the bootloader. Otherwise different DC value will forbid the 2nd bootloader from being boot up after reset.
To enable High Performance Mode:

1. De-select `CONFIG_ESPTOOLPY_OCT_FLASH` and `CONFIG_ESPTOOLPY_FLASH_MODE_AUTO_DETECT`. HPM is not used for Octal flash, enabling related options may bypass HPM functions.
2. Enable `CONFIG_SPI_FLASH_HPM_ENA` option.
3. Switch Flash frequency to HPM ones. For example, `CONFIG_ESPTOOLPY_FLASHFREQ_120M`.
4. Make sure the config option for `HPM-DC` feature (under `CONFIG_SPI_FLASH_HPM_DC` choices) is selected correctly according to whether the bootloader supports DC Aware.
   - If bootloader supports DC Aware, select `CONFIG_SPI_FLASH_HPM_DC_AUTO`. This allows the usage of flash chips that adopted Dummy Cycle adjustment strategy.
   - If bootloader doesn’t support DC Aware, select `CONFIG_SPI_FLASH_HPM_DC_DISABLE`. It avoid consequences caused by running HPM-DC with non-DC-aware bootloaders. But please avoid using flash chips that adopts Dummy Cycle adjustment strategy if `CONFIG_SPI_FLASH_HPM_DC_DISABLE` is selected. See list of flash models that adopt DC strategy below.

Check whether the bootloader supports DC Aware in the following way:

- If you are starting a new project, it’s suggested to enable DC Aware by selecting `CONFIG_BOOTLOADER_FLASH_DC_AWARE` option in the bootloader menu. Please note that, you won’t be able to modify this option via OTA, because the support is in the bootloader.
- If you are working on an existing project and want to update HPM-DC config option in the app via OTA, check the sdkconfig file used to build your bootloader: (Upgrading ESP-IDF version may make this file different from the one used by bootloader to build.)
  - For latest version (ESP-IDF v5.2 and above), if `CONFIG_BOOTLOADER_FLASH_DC_AWARE` is selected, the bootloader supports DC Aware.
  - For versions in this range: (v4.4.4+, v5.0+, and v5.1+), if `CONFIG_ESPTOOLPY_FLASHFREQ_120M` is selected, the bootloader supports DC Aware. In this case, enable `CONFIG_BOOTLOADER_FLASH_DC_AWARE` to confirm this (though it will not affect bootloader in devices in the field).
  - For versions below v4.4.4, the bootloader doesn’t support DC Aware.

**Quad Flash HPM support list** Flash chips that don’t need HPM-DC:

1. GD25Q64C (ID: 0xC84017)
2. GD25Q32C (ID: 0xC84016)
3. ZB25VQ32B (ID: 0x5E4016)
4. GD25LQ255E (ID: 0xC86019)

Following flash chips also have HPM feature, but requires the bootloader to support DC Aware:

1. GD25Q64E (ID: 0xC84017)
2. GD25Q128E (ID: 0xC84018)
3. XM25QH64C (ID: 0x204017)
4. XM25QH128C (ID: 0x204018)

**OPI flash Support** This feature is only supported on ESP32-S3 for now.

OPI flash means that the flash chip supports octal peripheral interface, which has octal I/O pins. Different octal flash has different configurations and different commands. Hence, it is necessary to carefully check the support list.

**Note:** To know how to configure menuconfig for a board with different Flash and PSRAM, please refer to the SPI Flash and External SPI RAM Configuration

List of Flash chips that support this feature:

1. MX25UM25645G
2. MX25UM12345G
### 32-bit Address Flash Chips

This feature is supported on all Espressif chips (with various restrictions to application).

Most NOR flash chips used by Espressif chips use 24-bits address, which can cover 16 MBytes memory. However, for larger memory (usually equal to or larger than 16 MBytes), flash uses a 32-bits address to address larger memory. Regretfully, 32-bits address chips have vendor-specific commands, so we need to support the chips one by one.

List of Flash chips that support this feature:

- W25Q256
- GD25Q256

**Important:** Over 16 MBytes space on flash mentioned above can be only used for data saving, like file system. If your data/instructions over 16 MBytes spaces need to be mapped to MMU (so as to be accessed by the CPU), please enable the config IDF_EXPERIMENTAL_FEATURES and BOOTLOADER_CACHE_32BIT_ADDR_FLASH and read the limitations following:

1. This feature is valid only for 4-line flash. Octal flash supports 32-bit-addr by default
2. This feature needs the MMU on ESP chip to be able to map to >= 16 MB physical address on the Flash. (Only ESP32S3 supports this up to now)
3. This option is experimental, which means it can not use on all flash chips stable, for more information, please contact Espressif Business support.

There are some features that are not supported by all flash chips, or not supported by all Espressif chips. These features include:

- OPI flash - means that flash supports octal mode.
- 32-bit address flash - usually means that the flash has higher capacity (equal to or larger than 16 MB) that needs longer addresses.
- High performance mode (HPM) - means that flash works under high frequency which is higher than 80 MHz.
- Flash unique ID - means that flash supports its unique 64-bit ID.
- Suspend & Resume - means that flash can accept suspend/resume command during its writing/erasing. The ESP32-S3 may keep the cache on when the flash is being written/erased and suspend it to read its contents randomly.

If you want to use these features, please ensure both ESP32-S3 and ALL flash chips in your product support these features. For more details, refer to Optional Features for Flash.

You may also customise your own flash chip driver. See Overriding Default Chip Drivers for more details.

---

**Warning:** Customizing SPI Flash Chip Drivers is considered an “expert” feature. Users should only do so at their own risk. (See the notes below)

**Overriding Default Chip Drivers**

During the SPI Flash driver’s initialization (i.e., `esp_flash_init()`) there is a chip detection step during which the driver iterates through a Default Chip Driver List and determine which chip driver can properly support the currently connected flash chip. The Default Chip Drivers are provided by the ESP-IDF, thus are updated in together with each ESP-IDF version. However ESP-IDF also allows users to customize their own flash drivers.

Users should note the following when customizing chip drivers:

1. You may need to rely on some non-public ESP-IDF functions, which have slight possibility to change between ESP-IDF versions. On the one hand, these changes may be useful bug fixes for your driver, on the other hand, they may also be breaking changes (i.e., breaks your code).
2. Some ESP-IDF bug fixes to other chip drivers are not automatically applied to your own custom chip drivers.
3. If the protection of flash is not handled properly, there may be some random reliability issues.
4. If you update to a newer ESP-IDF version that has support for more chips, you will have to manually add those new chip drivers into your custom chip driver list. Otherwise the driver will only search for the drivers in custom list you provided.

Steps For Creating Custom Chip Drivers and Overriding the ESP-IDF Default Driver List

1. Enable the `CONFIG_SPI_FLASH_OVERRIDE_CHIP_DRIVER_LIST` config option. This prevents compilation and linking of the Default Chip Driver List (default_registered_chips) provided by ESP-IDF. Instead, the linker searches for the structure of the same name (default_registered_chips) that must be provided by the user.

2. Add a new component in your project, e.g., `custom_chip_driver`.

3. Copy the necessary chip driver files from the `spi_flash` component in ESP-IDF. This may include:
   - `spi_flash_chip_drivers.c` (to provide the `default_registered_chips` structure)
   - Any of the `spi_flash_chip_*` files that matches your own flash model best
   - `CMakeLists.txt` and linker.lf files

Modify the files above properly. Including:
   - Change the `default_registered_chips` variable to non-static and remove the `#ifdef` logic around it.
   - Update linker.lf file to rename the fragment header and the library name to match the new component.
   - If reusing other drivers, some header names need prefixing with `spi_flash/` when included from outside `spi_flash` component.

Note:

- When writing your own flash chip driver, you can set your flash chip capabilities through `spi_flash_chip_***` *(vendor)* _get_caps and points the function pointer `get_chip_caps` for protection to the `spi_flash_chip_***` _get_caps function. The steps are as follows.
  1. Please check whether your flash chip have the capabilities listed in `spi_flash_caps_t` by checking the flash datasheet.
  2. Write a function named `spi_flash_chip_***` *(vendor)* _get_caps. Take the example below as a reference. (if the flash support suspend and read unique id).
  3. Points the pointer `get_chip_caps` (in `spi_flash_chip_t`) to the function mentioned above.

```c
spi_flash_caps_t spi_flash_chip_***`*(vendor)*`_get_caps(esp_flash_t *chip)
{
    spi_flash_caps_t caps_flags = 0;
    // 32-bit-address flash is not supported
    flash-suspend is supported
    caps_flags |= SPI_FLASH_CHIP_CAP_SUSPEND;
    // flash read unique id.
    caps_flags |= SPI_FLASH_CHIP_CAP_UNIQUE_ID;
    return caps_flags;
}
```

```c
const spi_flash_chip_t esp_flash_chip_eon = {
    // Other function pointers
    .get_chip_caps = spi_flash_chip_eon_get_caps,
};
```

- You also can see how to implement this in the example `storage/custom_flash_driver`.

4. Write a new `CMakeLists.txt` file for the `custom_chip_driver` component, including an additional line to add a linker dependency from `spi_flash` to `custom_chip_driver`:

```
idf_component_register(SRCS "spi_flash_chip_drivers.c"
    "spi_flash_chip_mychip.c" # modify as needed
    REQUIRES hal
```

(continues on next page)
PRIV_REQUIRES spi_flash
LDFRAGMENTS linker lf)
idf_component_add_link_dependency (FROM spi_flash)

- An example of this component CMakeLists.txt can be found in storage/custom_flash_driver/components/custom_chip_driver/CMakeLists.txt

5. The linker lf is used to put every chip driver that you are going to use whilst cache is disabled into internal RAM. See Linker Script Generation for more details. Make sure this file covers all the source files that you add.

6. Build your project, and you will see the new flash driver is used.

Example See also storage/custom_flash_driver.

Initializing a Flash Device

To use the esp_flash_* APIs, you need to initialise a flash chip on a certain SPI bus, as shown below:

1. Call spi_bus_initialize() to properly initialize an SPI bus. This function initializes the resources (I/O, DMA, interrupts) shared among devices attached to this bus.
2. Call spi_bus_add_flash_device() to attach the flash device to the bus. This function allocates memory and fills the members for the esp_flash_t structure. The CS I/O is also initialized here.
3. Call esp_flash_init() to actually communicate with the chip. This also detects the chip type, and influence the following operations.

Note: Multiple flash chips can be attached to the same bus now.

SPI Flash Access API

This is the set of API functions for working with data in flash:

- esp_flash_read() reads data from flash to RAM
- esp_flash_write() writes data from RAM to flash
- esp_flash_erase_region() erases specific region of flash
- esp_flash_erase_chip() erases the whole flash
- esp_flash_get_chip_size() returns flash chip size, in bytes, as configured in menuconfig

Generally, try to avoid using the raw SPI flash functions to the “main” SPI flash chip in favour of partition-specific functions.

SPI Flash Size

The SPI flash size is configured by writing a field in the software bootloader image header, flashed at offset 0x1000. By default, the SPI flash size is detected by esptool.py when this bootloader is written to flash, and the header is updated with the correct size. Alternatively, it is possible to generate a fixed flash size by setting CONFIG_ESPTOOLPY_FLASHSIZE in the project configuration.

If it is necessary to override the configured flash size at runtime, it is possible to set the chip_size member of the g_rom_flashchip structure. This size is used by esp_flash_* functions (in both software & ROM) to check the bounds.

Concurrency Constraints for Flash on SPI1

Concurrency Constraints for Flash on SPI1
The SPI0/1 bus is shared between the instruction & data cache (for firmware execution) and the SPI1 peripheral (controlled by the drivers including this SPI Flash driver). Hence, operations to SPI1 will cause significant influence to the whole system. This kind of operations include calling SPI Flash API or other drivers on SPI1 bus, any operations like read/write/erase or other user defined SPI operations, regardless to the main flash or other SPI slave devices.

On ESP32-S3, the config option `CONFIG_SPI_FLASH_AUTO_SUSPEND` (enabled by default) allows the cache to read flash concurrently with SPI1 operations. See Flash Auto Suspend Feature for more details.

If this option is disabled, the caches must be disabled while reading/writing/erasing operations. There are some constraints using driver on the SPI1 bus, see When the Caches Are Disabled. These constraints will cause more IRAM/DRAM usages.

On ESP32-S3, the config options `CONFIG_SPIRAM_FETCH_INSTRUCTIONS` (disabled by default) and `CONFIG_SPIRAM_RODATA` (disabled by default) allow the cache to read/write PSRAM concurrently with SPI1 operations. See XIP from PSRAM Feature for more details.

If these options are disabled, the caches must be disabled while reading/writing/erasing operations. There are some constraints using driver on the SPI1 bus, see When the Caches Are Disabled. These constraints will cause more IRAM/DRAM usages.

**When the Caches Are Disabled** Under this condition, all CPUs should always execute code and access data from internal RAM. The APIs documented in this file will disable the caches automatically and transparently.

**Note:** When `CONFIG_SPIRAM_FETCH_INSTRUCTIONS` and `CONFIG_SPIRAM_RODATA` are both enabled, these APIs will not disable the caches.

The way that these APIs disable the caches suspends all the other tasks. Besides, all non-IRAM-safe interrupts will be disabled. The other core will be polling in a busy loop. These will be restored until the Flash operation completes.

See also OS Functions and SPI Bus Lock.

There are no such constraints and impacts for flash chips on other SPI buses than SPI0/1.

For differences between internal RAM (e.g., IRAM, DRAM) and flash cache, please refer to the application memory layout documentation.

**IRAM-Safe Interrupt Handlers** For interrupt handlers which need to execute when the cache is disabled (e.g., for low latency operations), set the ESP_INTR_FLAG_IRAM flag when the interrupt handler is registered.

You must ensure that all data and functions accessed by these interrupt handlers, including the ones that handlers call, are located in IRAM or DRAM. See How to Place Code in IRAM.

If a function or symbol is not correctly put into IRAM/DRAM, and the interrupt handler reads from the flash cache during a flash operation, it will cause a crash due to Illegal Instruction exception (for code which should be in IRAM) or garbage data to be read (for constant data which should be in DRAM).

**Note:** When working with strings in ISRs, it is not advised to use printf and other output functions. For debugging purposes, use ESP_DRAM_LOGE() and similar macros when logging from ISRs. Make sure that both TAG and format string are placed into DRAM in that case.

**Non-IRAM-Safe Interrupt Handlers** If the ESP_INTR_FLAG_IRAM flag is not set when registering, the interrupt handler will not get executed when the caches are disabled. Once the caches are restored, the non-IRAM-safe interrupts will be re-enabled. After this moment, the interrupt handler will run normally again. This means that as long as caches are disabled, users will not see the corresponding hardware event happening.
Flash Auto Suspend Feature

Important:

1. The flash chip you are using should have a suspend/resume feature.
2. The SPI hardware should support the auto-suspend feature, i.e., hardware can send suspend command automatically.

If you use suspend feature on an unsupported chip, it may cause a severe crash. Therefore, we strongly suggest you reading the flash chip datasheets first. Ensure the flash chip satisfies the following conditions at minimum.

1. With the current software implementation, SUS bit in status registers should in SR2 bit7 or SR bit15.
2. With the current software implementation, suspend command should be 75H, with resume command being 7AH.
3. When the flash is successfully suspended, all address of the flash, except from the section/block being erased, can be read correctly. At this state, resume can be sent immediately as well.
4. When the flash is successfully resumed, another suspend can be sent immediately at this state.

When `CONFIG_SPI_FLASH_AUTO_SUSPEND` is enabled, the caches will be kept enabled. They would be disabled if `CONFIG_SPI_FLASH_AUTO_SUSPEND` is disabled. The hardware handles the arbitration between SPI0 and SPI1. If the SPI1 operation is short, such as a reading operation, the CPU and the cache will wait until the SPI1 operation is completed. However, during processes like erasing, page programming, or status register writing (e.g., SE, PP, and WRSR), an auto suspend will happen, interrupting the ongoing flash operation. This allows the CPU to access data from the cache and flash within limited time.

This approach allows certain code/variables to be stored in flash/PSRAM instead of IRAM/DRAM, while still being executable during flash erasing. This reduces the usage of IRAM/DRAM.

Please note that this feature comes with the overhead of flash suspend/resume. Frequent interruptions during flash erasing can significantly prolong the erasing process. To avoid this, you may use FreeRTOS task priorities to ensure that only real-time critical tasks are executed at a higher priority than flash erasing, allowing the flash erasing to complete in reasonable time.

There are three kinds of code:

1. Critical code: inside IRAM/DRAM. This kind of code usually has high performance requirements, related to cache/flash/PSRAM, or is called very often.
2. Cached code: inside flash/PSRAM. This kind of code has lower performance requirements or is called less often. They will execute during erasing, with some overhead.
3. Low-priority code: inside flash/PSRAM and disabled during erasing. This kind of code should be forbidden from being executed to avoid affecting the flash erasing, by setting a lower task priority than the erasing task.

Regarding the flash suspend feature usage and corresponding response time delay, please also see the `system/flash_suspend` example.

**Note:** The flash auto suspend feature relies heavily on strict timing. You can see it as a kind of optimization plan, which means that you cannot use it in every situation, like high requirement of real-time system or triggering interrupt very frequently (e.g., LCD flush, bluetooth, Wi-Fi, etc.). You should take following steps to evaluate what kind of ISR can be used together with flash suspend.

As you can see from the diagram, two key values should be noted:

1. ISR time: The ISR time cannot be very long, at least not larger than the value you set in `IWDT`. But it will significantly lengthen the erasing/writing completion time.
2. ISR interval: ISR cannot be triggered very often. The most important time is the **ISR interval minus ISR time** (from point b to point c in the diagram). During this time, SPI1 will send resume command to restart the operation. However, it needs a time `tsus` for preparation, and the typical value of `tsus` is about **40 us**. If
SPI1 cannot resume the operation but another suspend command comes, it will cause CPU starve and TWDT may be triggered.

The tsus time mentioned in point 2 can be found by looking through the flash datasheets, usually in the AC CHARACTERISTICS section. Users needs to make sure that the tsus value obtained from the datasheets is not greater than the CONFIG_SPI_FLASH_SUSPEND_TSUS_VAL_US value in Kconfig.

Furthermore, the flash suspend might be delayed. If both the CPU and the cache access the flash via SPI0 frequently and SPI1 sends the suspend command frequently as well, the efficiency of MSPI data transfer will be influenced. So, we have a lock inside to prevent this. When SPI1 sends the suspend command, SPI0 will take over memory SPI bus and take the lock. After SPI0 finishes sending data, it will retain control of the memory SPI bus until the lock delay period time finishes. During this lock delay period, if there is any other SPI0 transaction, then the SPI0 transaction will be proceeded and a new lock delay period will start. Otherwise, SPI0 will release the memory bus and start SPI0/1 arbitration.

XIP from PSRAM Feature   If CONFIG_SPIRAM_FETCH_INSTRUCTIONS is enabled, the flash .text sections (used for instructions) will be placed in PSRAM.

If CONFIG_SPIRAM_RODATA is enabled, the flash .rodata sections (used for read only data) will be placed in PSRAM.

The corresponding virtual memory range will be re-mapped to PSRAM.

If both of the above options are enabled, the Cache won’t be disabled during an SPI1 Flash operation. You don’t need to make sure ISRs, ISR callbacks and involved data are placed in internal RAM.

Attention: The SPI0/1 bus is shared between the instruction & data cache (for firmware execution) and the SPI1 peripheral (controlled by the drivers including this SPI flash driver). Hence, calling SPI Flash API on SPI1 bus (including the main flash) causes significant influence to the whole system. See Concurrency Constraints for Flash on SPI1 for more details.

SPI Flash Encryption

It is possible to encrypt the contents of SPI flash and have it transparently decrypted by hardware.

Refer to the Flash Encryption documentation for more details.

Memory Mapping API

ESP32-S3 features memory hardware which allows regions of flash memory to be mapped into instruction and data address spaces. This mapping works only for read operations. It is not possible to modify contents of flash memory by writing to a mapped memory region.

Mapping happens in 64 KB pages. Memory mapping hardware can map flash into the data address space and the instruction address space. See the technical reference manual for more details and limitations about memory mapping hardware.

Note that some pages are used to map the application itself into memory, so the actual number of available pages may be less than the capability of the hardware.

Reading data from flash using a memory mapped region is the only way to decrypt contents of flash when flash encryption is enabled. Decryption is performed at the hardware level.

Memory mapping API are declared in spi_flash_mmap.h and esp_partition.h:

- **spi_flash_mmap()** maps a region of physical flash addresses into instruction space or data space of the CPU.
- **spi_flash_munmap()** unmaps previously mapped region.
- **esp_partition_mmap()** maps part of a partition into the instruction space or data space of the CPU.
Differences between `spi_flash_mmap()` and `esp_partition_mmap()` are as follows:

- `spi_flash_mmap()` must be given a 64 KB aligned physical address.
- `esp_partition_mmap()` may be given any arbitrary offset within the partition. It adjusts the returned pointer to mapped memory as necessary.

Note that since memory mapping happens in pages, it may be possible to read data outside of the partition provided to `esp_partition_mmap`, regardless of the partition boundary.

**Note:** `mmap` is supported by cache, so it can only be used on main flash.

### SPI Flash Implementation

The `esp_flash_t` structure holds chip data as well as three important parts of this API:

1. The host driver, which provides the hardware support to access the chip;
2. The chip driver, which provides compatibility service to different chips;
3. The OS functions, provide support of some OS functions (e.g., lock, delay) in different stages (1st/2nd boot, or the app).

**Host Driver** The host driver relies on an interface (`spi_flash_host_driver_t`) defined in the `spi_flash_types.h` (in the `hal/include/hal` folder). This interface provides some common functions to communicate with the chip.

In other files of the SPI HAL, some of these functions are implemented with existing ESP32-S3 memory-spi functionalities. However, due to the speed limitations of ESP32-S3, the HAL layer cannot provide high-speed implementations to some reading commands (so the support for it was dropped). The files (`memspi_host_driver.h` and `.c`) implement the high-speed version of these commands with the `common_command` function provided in the HAL, and wrap these functions as `spi_flash_host_driver_t` for upper layer to use.

You can also implement your own host driver, even with the GPIO. As long as all the functions in the `spi_flash_host_driver_t` are implemented, the esp_flash API can access the flash regardless of the low-level hardware.

**Chip Driver** The chip driver, defined in `spi_flash_chip_driver.h`, wraps basic functions provided by the host driver for the API layer to use.

Some operations need some commands to be sent first, or read some status afterwards. Some chips need different commands or values, or need special communication ways.

There is a type of chip called generic chip which stands for common chips. Other special chip drivers can be developed on the base of the generic chip.

The chip driver relies on the host driver.

**OS Functions** Currently the OS function layer provides entries of a lock and delay.

The lock (see **SPI Bus Lock**) is used to resolve the conflicts among the access of devices on the same SPI bus, and the SPI Flash chip access. E.g.

1. On SPI1 bus, the cache (used to fetch the data (code) in the Flash and PSRAM) should be disabled when the flash chip on the SPI0/1 is being accessed.
2. On the other buses, the flash driver needs to disable the ISR registered by SPI Master driver, to avoid conflicts.
3. Some devices of SPI Master driver may require to use the bus monopolized during a period (especially when the device does not have a CS wire, or the wire is controlled by software like SDSPI driver).

The delay is used by some long operations which requires the master to wait or polling periodically.

The top API wraps these the chip driver and OS functions into an entire component, and also provides some argument checking.
OS functions can also help to avoid a watchdog timeout when erasing large flash areas. During this time, the CPU is occupied with the flash erasing task. This stops other tasks from being executed. Among these tasks is the idle task to feed the watchdog timer (WDT). If the configuration option `CONFIG_ESP_TASK_WDT_PANIC` is selected and the flash operation time is longer than the watchdog timeout period, the system will reboot.

It is pretty hard to totally eliminate this risk, because the erasing time varies with different flash chips, making it hard to be compatible in flash drivers. Therefore, users need to pay attention to it. Please use the following guidelines:

1. It is recommended to enable the `CONFIG_SPI_FLASH_YIELD_DURING_ERASE` option to allow the scheduler to re-schedule during erasing flash memory. Besides, following parameters can also be used.
   • Increase `CONFIG_SPI_FLASH_ERASE_YIELD_TICKS` or decrease `CONFIG_SPI_FLASH_ERASE_YIELD_DURATION_MS` in menuconfig.
   • You can also increase `CONFIG_ESP_TASK_WDT_TIMEOUT_S` in menuconfig for a larger watchdog timeout period. However, with larger watchdog timeout period, previously detected timeouts may no longer be detected.

2. Please be aware of the consequences of enabling the `CONFIG_ESP_TASK_WDT_PANIC` option when doing long-running SPI flash operations which triggers the panic handler when it times out. However, this option can also help dealing with unexpected exceptions in your application. Please decide whether this is needed to be enabled according to actual condition.

3. During your development, please carefully review the actual flash operation according to the specific requirements and time limits on erasing flash memory of your projects. Always allow reasonable redundancy based on your specific product requirements when configuring the flash erasing timeout threshold, thus improving the reliability of your product.

**Implementation Details**

In order to perform some flash operations, it is necessary to make sure that both CPUs are not running any code from flash for the duration of the flash operation:

• In a single-core setup, the SDK needs to disable interrupts or scheduler before performing the flash operation.
• In a dual-core setup, the SDK needs to make sure that both CPUs are not running any code from flash.

When SPI flash API is called on CPU A (can be PRO or APP), start the `spi_flash_op_block_func` function on CPU B using the `esp_ipc_call` API. This API wakes up a high priority task on CPU B and tells it to execute a given function, in this case, `spi_flash_op_block_func`. This function disables cache on CPU B and signals that the cache is disabled by setting the `s_flash_op_can_start` flag. Then the task on CPU A disables cache as well and proceeds to execute flash operation.

While a flash operation is running, interrupts can still run on CPUs A and B. It is assumed that all interrupt code is placed into RAM. Once the interrupt allocation API is added, a flag should be added to request the interrupt to be disabled for the duration of a flash operations.

Once the flash operation is complete, the function on CPU A sets another flag, `s_flash_op_complete`, to let the task on CPU B know that it can re-enable cache and release the CPU. Then the function on CPU A re-enables the cache on CPU A as well and returns control to the calling code.

Additionally, all API functions are protected with a mutex (`s_flash_op_mutex`).

In a single core environment (`CONFIG_FREERTOS_UNICORE` enabled), you need to disable both caches, so that no inter-CPU communication can take place.

**Related Documents**

- Optional Features for Flash
- Concurrency Constraints for Flash on SPI1
- SPI Flash API ESP-IDF Version vs Chip-ROM Version
There is a set of SPI Flash drivers in Chip-ROM which you can use by enabling CONFIG_SPI_FLASH_ROM_IMPL. Most of the ESP-IDF SPI Flash driver code are in internal RAM, therefore enabling this option frees some internal RAM usage. Note if you enable this option, this means some SPI Flash driver features and bugfixes that are done in ESP-IDF might not be included in the Chip-ROM version.

Feature Supported by ESP-IDF but Not in Chip-ROM

- Octal Flash chip support. See OPI flash Support for details.
- 32-bit-address support for GD25Q256. Note this feature is an optional feature, please do read 32-bit Address Flash Chips for details.
- TH Flash chip support.
- Kconfig option CONFIG_SPI_FLASH_CHECK_ERASE_TIMEOUT_DISABLED.
- CONFIG_SPI_FLASHVERIFY_WRITE, enabling this option helps you detect bad writing.
- CONFIG_SPI_FLASH_LOG_FAILED_WRITE, enabling this option prints the bad writing.
- CONFIG_SPI_FLASH_WARN_SETTING_ZERO_TO_ONE, enabling this option checks if you are writing zero to one.
- CONFIG_SPI_FLASH_DANGEROUS_WRITE, enabling this option checks for flash programming to certain protected regions like bootloader, partition table or application itself.
- CONFIG_SPI_FLASH_ENABLE_COUNTERS, enabling this option to collect performance data for ESP-IDF SPI Flash driver APIs.
- CONFIG_SPI_FLASH_AUTO_SUSPEND, enabling this option to automatically suspend/resume a long Flash operation when short Flash operation happens. Note this feature is an optional feature, please do read Auto Suspend & Resume for more limitations.

Bugfixes Introduced in ESP-IDF but Not in Chip-ROM

- Detected Flash physical size correctly, for larger than 256MBit Flash chips. (Commit ID: b4964279d44f73ccee7cfd5cf684567fd86ff69ed969)
- Fixed issue that 4-line Flash encryption cannot work normally when 8-line PSRAM enabled. (Commit ID: 683d92bc884e0f2a7ebee40a551cf0f0c28256)
- Fixed issue that only 128KB virtual address ranges can be mapped to instructions on Flash.
- Fixed issue that only 16MB virtual address ranges can be mapped to read-only data on Flash.

API Reference - SPI Flash

Header File

- components/spi_flash/include/esp_flash_spi_init.h
- This header file can be included with:

```
#include "esp_flash_spi_init.h"
```

- This header file is a part of the API provided by the spi_flash component. To declare that your component depends on spi_flash, add the following to your CMakeLists.txt:

```
REQUIRES spi_flash
```

or

```
PRIV_REQUIRES spi_flash
```

Functions

```
esp_err_t spi_bus_add_flash_device (esp_flash_t **out_chip, const esp_flash_spi_device_config_t *config)
```

Add a SPI Flash device onto the SPI bus.

The bus should be already initialized by spi_bus_initialization.
Chapter 2. API Reference

Parameters
  • **out_chip** - Pointer to hold the initialized chip.
  • **config** - Configuration of the chips to initialize.

Returns
  • ESP_ERR_INVALID_ARG: out_chip is NULL, or some field in the config is invalid.
  • ESP_ERR_NO_MEM: failed to allocate memory for the chip structures.
  • ESP_OK: success.

```c
esp_err_t spi_bus_remove_flash_device(esp_flash_t *chip)
```
Remove a SPI Flash device from the SPI bus.

Parameters **chip** - The flash device to remove.

Returns
  • ESP_ERR_INVALID_ARG: The chip is invalid.
  • ESP_OK: success.

Structures

```c
struct esp_flash_spi_device_config_t
```
Configurations for the SPI Flash to init.

Public Members

```c
spi_host_device_t host_id
```
Bus to use.

```c
int cs_io_num
```
GPIO pin to output the CS signal.

```c
esp_flash_io_mode_t io_mode
```
IO mode to read from the Flash.

```c
enum esp_flash_speed_s speed
```
Speed of the Flash clock. Replaced by freq_mhz.

```c
int input_delay_ns
```
Input delay of the data pins, in ns. Set to 0 if unknown.

```c
int cs_id
```
CS line ID, ignored when not host_id is not SPI1_HOST, or CONFIG_SPI_FLASH_SHARE_SPI1_BUS is enabled. In this case, the CS line used is automatically assigned by the SPI bus lock.

```c
int freq_mhz
```
The frequency of flash chip(MHZ)

Chapter 2. API Reference

REQUIRES spi_flash

or

PRIV_REQUIRES spi_flash

**Functions**

```c
esp_err_t esp_flash_init (esp_flash_t *chip)
```

Initialise SPI flash chip interface.

This function must be called before any other API functions are called for this chip.

**Note:** Only the host and read_mode fields of the chip structure must be initialised before this function is called. Other fields may be auto-detected if left set to zero or NULL.

**Note:** If the chip->drv pointer is NULL, chip chip_drv will be auto-detected based on its manufacturer & product IDs. See esp_flash_registered_flash_drivers pointer for details of this process.

**Parameters**

- **chip** – Pointer to SPI flash chip to use. If NULL, esp_flash_default_chip is substituted.

**Returns**

ESP_OK on success, or a flash error code if initialisation fails.

```c
bool esp_flash_chip_driver_initialized (const esp_flash_t *chip)
```

Check if appropriate chip driver is set.

**Parameters**

- **chip** – Pointer to SPI flash chip to use. If NULL, esp_flash_default_chip is substituted.

**Returns**

true if set, otherwise false.

```c
esp_err_t esp_flash_read_id (esp_flash_t *chip, uint32_t *out_id)
```

Read flash ID via the common “RDID” SPI flash command.

ID is a 24-bit value. Lower 16 bits of ‘id’ are the chip ID, upper 8 bits are the manufacturer ID.

**Parameters**

- **chip** – Pointer to identify flash chip. Must have been successfully initialised via esp_flash_init()
- **out_id** – [out] Pointer to receive ID value.

**Returns**

ESP_OK on success, or a flash error code if operation failed.

```c
esp_err_t esp_flash_get_size (esp_flash_t *chip, uint32_t *out_size)
```

Detect flash size based on flash ID.

**Note:** 1. Most flash chips use a common format for flash ID, where the lower 4 bits specify the size as a power of 2. If the manufacturer doesn’t follow this convention, the size may be incorrectly detected.

- a. The out_size returned only stands for The out_size stands for the size in the binary image header. If you want to get the real size of the chip, please call esp_flash_get_physical_size instead.

**Parameters**

- **chip** – Pointer to identify flash chip. Must have been successfully initialised via esp_flash_init()
- **out_size** – [out] Detected size in bytes, standing for the size in the binary image header.

**Returns**

ESP_OK on success, or a flash error code if operation failed.
esp_err_t esp_flash_get_physical_size(esp_flash_t *chip, uint32_t *flash_size)

Detect flash size based on flash ID.

**Note:** Most flash chips use a common format for flash ID, where the lower 4 bits specify the size as a power of 2. If the manufacturer doesn’t follow this convention, the size may be incorrectly detected.

**Parameters**
- **chip** – Pointer to identify flash chip. Must have been successfully initialised via esp_flash_init().
- **flash_size [out]** Detected size in bytes.

**Returns**
- ESP_OK on success, or a flash error code if operation failed.

esp_err_t esp_flash_read_unique_chip_id(esp_flash_t *chip, uint64_t *out_id)

Read flash unique ID via the common “RDUID” SPI flash command.

ID is a 64-bit value.

**Note:** This is an optional feature, which is not supported on all flash chips. READ PROGRAMMING GUIDE FIRST!

**Parameters**
- **chip** – Pointer to identify flash chip. Must have been successfully initialised via esp_flash_init().
- **out_id [out]** Pointer to receive unique ID value.

**Returns**
- ESP_OK on success, or a flash error code if operation failed.
- ESP_ERR_NOT_SUPPORTED if the chip doesn’t support read id.

esp_err_t esp_flash_erase_chip(esp_flash_t *chip)

Erase flash chip contents.

**Parameters**
- **chip** – Pointer to identify flash chip. Must have been successfully initialised via esp_flash_init().

**Returns**
- ESP_OK on success,
- ESP_ERR_NOT_SUPPORTED if the chip is not able to perform the operation. This is indicated by WREN = 1 after the command is sent.
- ESP_ERR_NOT_ALLOWED if a read-only partition is present.
- Other flash error code if operation failed.

esp_err_t esp_flash_erase_region(esp_flash_t *chip, uint32_t start, uint32_t len)

Erase a region of the flash chip.

**Parameters**
- **chip** – Pointer to identify flash chip. If NULL, esp_flash_default_chip is substituted. Must have been successfully initialised via esp_flash_init().
- **start** – Address to start erasing flash. Must be sector aligned.
• **len** – Length of region to erase. Must also be sector aligned.

**Returns**

• ESP_OK on success,
• ESP_ERR_NOT_SUPPORTED if the chip is not able to perform the operation. This is indicated by WREN = 1 after the command is sent.
• ESP_ERR_NOT_ALLOWED if the address range (start + start + len) overlaps with a read-only partition address space
• Other flash error code if operation failed.

```c
esp_err_t esp_flash_get_chip_write_protect(esp_flash_t *chip, bool *write_protected)
```

Read if the entire chip is write protected.

**Note:** A correct result for this flag depends on the SPI flash chip model and chip_drv in use (via the ‘chip->drv’ field).

**Parameters**

• **chip** – Pointer to identify flash chip. If NULL, esp_flash_default_chip is substituted. Must have been successfully initialised via esp_flash_init()
• **write_protected** – [out] Pointer to boolean, set to the value of the write protect flag.

**Returns** ESP_OK on success, or a flash error code if operation failed.

```c
esp_err_t esp_flash_set_chip_write_protect(esp_flash_t *chip, bool write_protect)
```

Set write protection for the SPI flash chip.

Some SPI flash chips may require a power cycle before write protect status can be cleared. Otherwise, write protection can be removed via a follow-up call to this function.

**Note:** Correct behaviour of this function depends on the SPI flash chip model and chip_drv in use (via the ‘chip->drv’ field).

**Parameters**

• **chip** – Pointer to identify flash chip. If NULL, esp_flash_default_chip is substituted. Must have been successfully initialised via esp_flash_init()
• **write_protect** – Boolean value for the write protect flag

**Returns** ESP_OK on success, or a flash error code if operation failed.

```c
esp_err_t esp_flash_get_protectable_regions(const esp_flash_t *chip, const esp_flash_region_t **out_regions, uint32_t *out_num_regions)
```

Read the list of individually protectable regions of this SPI flash chip.

**Note:** Correct behaviour of this function depends on the SPI flash chip model and chip_drv in use (via the ‘chip->drv’ field).

**Parameters**

• **chip** – Pointer to identify flash chip. Must have been successfully initialised via esp_flash_init()
• **out_regions** – [out] Pointer to receive a pointer to the array of protectable regions of the chip.
• **out_num_regions** – [out] Pointer to an integer receiving the count of protectable regions in the array returned in ‘regions’.

**Returns** ESP_OK on success, or a flash error code if operation failed.
**esp_err_t** esp_flash_get_protected_region(esp.flash_t *chip, const esp.flash_region_t *region, bool *out_protected)

Detect if a region of the SPI flash chip is protected.

**Note:** It is possible for this result to be false and write operations to still fail, if protection is enabled for the entire chip.

**Note:** Correct behaviour of this function depends on the SPI flash chip model and chip_drv in use (via the ‘chip->drv’ field).

Parameters

- **chip** – Pointer to identify flash chip. Must have been successfully initialised via esp.flash_init()
- **region** – Pointer to a struct describing a protected region. This must match one of the regions returned from esp.flash_get_protectable_regions(…).
- **out_protected** – [out] Pointer to a flag which is set based on the protected status for this region.

Returns ESP_OK on success, or a flash error code if operation failed.

**esp_err_t** esp_flash_set_protected_region(esp.flash_t *chip, const esp.flash_region_t *region, bool protect)

Update the protected status for a region of the SPI flash chip.

**Note:** It is possible for the region protection flag to be cleared and write operations to still fail, if protection is enabled for the entire chip.

**Note:** Correct behaviour of this function depends on the SPI flash chip model and chip_drv in use (via the ‘chip->drv’ field).

Parameters

- **chip** – Pointer to identify flash chip. Must have been successfully initialised via esp.flash_init()
- **region** – Pointer to a struct describing a protected region. This must match one of the regions returned from esp.flash_get_protectable_regions(…).
- **protect** – Write protection flag to set.

Returns ESP_OK on success, or a flash error code if operation failed.

**esp_err_t** esp_flash_read(esp.flash_t *chip, void *buffer, uint32_t address, uint32_t length)

Read data from the SPI flash chip.

There are no alignment constraints on buffer, address or length.

**Note:** If on-chip flash encryption is used, this function returns raw (ie encrypted) data. Use the flash cache to transparently decrypt data.

Parameters

- **chip** – Pointer to identify flash chip. If NULL, esp.flash_default_chip is substituted. Must have been successfully initialised via esp.flash_init()
• **buffer** - Pointer to a buffer where the data will be read. To get better performance, this should be in the DRAM and word aligned.
• **address** - Address on flash to read from. Must be less than chip->size field.
• **length** - Length (in bytes) of data to read.

**Returns**

• ESP_OK: success
• ESP_ERR_NO_MEM: Buffer is in external PSRAM which cannot be concurrently accessed, and a temporary internal buffer could not be allocated.
• or a flash error code if operation failed.

```c
esp_err_t esp_flash_write(esp_flash_t *chip, const void *buffer, uint32_t address, uint32_t length)
```

Write data to the SPI flash chip.

There are no alignment constraints on buffer, address or length.

**Parameters**

• **chip** - Pointer to identify flash chip. If NULL, esp_flash_default_chip is substituted. Must have been successfully initialised via esp_flash_init()
• **address** - Address on flash to write to. Must be previously erased (SPI NOR flash can only write bits 1->0).
• **buffer** - Pointer to a buffer with the data to write. To get better performance, this should be in the DRAM and word aligned.
• **length** - Length (in bytes) of data to write.

**Returns**

• ESP_OK on success
• ESP_FAIL, bad write, this will be detected only when CONFIG_SPI_FLASH_VERIFY_WRITE is enabled
• ESP_ERR_NOT_SUPPORTED if the chip is not able to perform the operation. This is indicated by WREN = 1 after the command is sent.
• ESP_ERR_NOT_ALLOWED if the address range (address - address + length) overlaps with a read-only partition address space
• Other flash error code if operation failed.

```c
esp_err_t esp_flash_write_encrypted(esp_flash_t *chip, uint32_t address, const void *buffer, uint32_t length)
```

Encrypted and write data to the SPI flash chip using on-chip hardware flash encryption.

**Note:** Both address & length must be 16 byte aligned, as this is the encryption block size

**Parameters**

• **chip** - Pointer to identify flash chip. Must be NULL (the main flash chip). For other chips, encrypted write is not supported.
• **address** - Address on flash to write to. 16 byte aligned. Must be previously erased (SPI NOR flash can only write bits 1->0).
• **buffer** - Pointer to a buffer with the data to write.
• **length** - Length (in bytes) of data to write. 16 byte aligned.

**Returns**

• ESP_OK: on success
• ESP_FAIL: bad write, this will be detected only when CONFIG_SPI_FLASH_VERIFY_WRITE is enabled
• ESP_ERR_NOT_SUPPORTED: encrypted write not supported for this chip.
• ESP_ERR_INVALID_ARG: Either the address, buffer or length is invalid.
• ESP_ERR_NOT_ALLOWED if the address range (address &~8212; address + length) overlaps with a read-only partition address space
**esp_err_t** `esp_flash_read_encrypted` *(esp_flash_t *chip, uint32_t address, void *out_buffer, uint32_t length)*

Read and decrypt data from the SPI flash chip using on-chip hardware flash encryption.

**Parameters**
- **chip** – Pointer to identify flash chip. Must be NULL (the main flash chip). For other chips, encrypted read is not supported.
- **address** – Address on flash to read from.
- **out_buffer** – Pointer to a buffer for the data to read to.
- **length** – Length (in bytes) of data to read.

**Returns**
- ESP_OK: on success
- ESP_ERR_NOT_SUPPORTED: encrypted read not supported for this chip.

static inline bool `esp_flash_is_quad_mode` *(const esp_flash_t *chip)*

Returns true if chip is configured for Quad I/O or Quad Fast Read.

**Parameters**
- **chip** – Pointer to SPI flash chip to use. If NULL, esp_flash_default_chip is substituted.

**Returns**
- true if flash works in quad mode, otherwise false

**Structures**

**struct esp_flash_region_t**

Structure for describing a region of flash.

**Public Members**

`uint32_t offset`

Start address of this region.

`uint32_t size`

Size of the region.

**struct esp_flash_os_functions_t**

OS-level integration hooks for accessing flash chips inside a running OS.

It’s in the public header because some instances should be allocated statically in the startup code. May be updated according to hardware version and new flash chip feature requirements, shouldn’t be treated as public API.

For advanced developers, you may replace some of them with your implementations at your own risk.

**Public Members**

`esp_err_t (*start)(void *arg)`

Called before commencing any flash operation. Does not need to be recursive (ie is called at most once for each call to ‘end’).

`esp_err_t (*end)(void *arg)`

Called after completing any flash operation.

`esp_err_t (*region_protected)(void *arg, size_t start_addr, size_t size)`

Called before any erase/write operations to check whether the region is limited by the OS.
**delay_us**

```c
esp_err_t (*delay_us)(void *arg, uint32_t us)
```

Delay for at least ‘us’ microseconds. Called in between ‘start’ and ‘end’.

**get_temp_buffer**

```c
void (*)(*get_temp_buffer)(void *arg, size_t request_size, size_t *out_size)
```

Called for get temp buffer when buffer from application cannot be directly read into/write from.

**release_temp_buffer**

```c
void (*)(*release_temp_buffer)(void *arg, void *temp_buf)
```

Called for release temp buffer.

**check_yield**

```c
esp_err_t (*check_yield)(void *arg, uint32_t chip_status, uint32_t *out_request)
```

Yield to other tasks. Called during erase operations.

- **Return**
  - ESP_OK means yield needs to be called (got an event to handle), while
  - ESP_ERR_TIMEOUT means skip yield.

**yield**

```c
esp_err_t (*yield)(void *arg, uint32_t *out_status)
```

Yield to other tasks. Called during erase operations.

**get_system_time**

```c
int64_t (*get_system_time)(void *arg)
```

Called for get system time.

**set_flash_op_status**

```c
void (*)(*set_flash_op_status)(uint32_t op_status)
```

Call to set flash operation status

---

**esp_flash_t**

Structure to describe a SPI flash chip connected to the system.

- Structure must be initialized before use (passed to esp_flash_init()). It’s in the public header because some instances should be allocated statically in the startup code. May be updated according to hardware version and new flash chip feature requirements, shouldn’t be treated as public API.
- For advanced developers, you may replace some of them with your implementations at your own risk.

### Public Members

**host**

```c
spi_flash_host_inst_t *host
```

Pointer to hardware-specific “host_driver” structure. Must be initialized before used.

**chip_drv**

```c
const spi_flash_chip_t *chip_drv
```

Pointer to chip-model-specific “adapter” structure. If NULL, will be detected during initialisation.

**os_func**

```c
const esp_flash_os_functions_t *os_func
```

Pointer to os-specific hook structure. Call esp_flash_init_os_functions() to setup this field, after the host is properly initialized.

**os_func_data**

```c
void *os_func_data
```

Pointer to argument for os-specific hooks. Left NULL and will be initialized with os_func.

**read_mode**

```c
esp_flash_io_mode_t read_mode
```

Configured SPI flash read mode. Set before esp_flash_init is called.
uint32_t size
Size of SPI flash in bytes. If 0, size will be detected during initialisation. Note: this stands
for the size in the binary image header. If you want to get the flash physical size, please call
esp_flash_get_physical_size.

uint32_t chip_id
Detected chip id.

uint32_t busy
This flag is used to verify chip’s status.

uint32_t hpm_dummy_ena
This flag is used to verify whether flash works under HPM status.

uint32_t reserved_flags
reserved.

Macros

SPI_FLASH_YIELD_REQ_YIELD

SPI_FLASH_YIELD_REQ_SUSPEND

SPI_FLASH_YIELD_STA_RESUME

SPI_FLASH_OS_IS_ERASING_STATUS_FLAG

Type Definitions
typedef struct spi_flash_chip_t spi_flash_chip_t

Header File

• components/spi_flash/include/spi_flash_mmap.h
• This header file can be included with:

```
#include "spi_flash_mmap.h"
```

• This header file is a part of the API provided by the spi_flash component. To declare that your component
depends on spi_flash, add the following to your CMakeLists.txt:

```
REQUIRES spi_flash
```

or

```
PRIV_REQUIRES spi_flash
```

Functions

esp_err_t spi_flash_mmap (size_t src_addr, size_t size, spi_flash_mmap_memory_t memory, const void **out_ptr, spi_flash_mmap_handle_t *out_handle)

Map region of flash memory into data or instruction address space.
This function allocates sufficient number of 64kB MMU pages and configures them to map the requested region of flash memory into the address space. It may reuse MMU pages which already provide the required mapping.

As with any allocator, if mmap/munmap are heavily used then the address space may become fragmented. To troubleshoot issues with page allocation, use `spi_flash_mmap_dump()` function.

**Parameters**
- **src_addr** - Physical address in flash where requested region starts. This address must be aligned to 64kB boundary (SPI_FLASH_MMU_PAGE_SIZE)
- **size** - Size of region to be mapped. This size will be rounded up to a 64kB boundary
- **memory** - Address space where the region should be mapped (data or instruction)
- **out_ptr** - [out] Output, pointer to the mapped memory region
- **out_handle** - [out] Output, handle which should be used for `spi_flash_munmap` call

**Returns**
- ESP_OK on success, ESP_ERR_NO_MEM if pages cannot be allocated

```c
esp_err_t spi_flash_mmap_pages(const int*pages, size_t page_count, spi_flash_mmap_memory_t memory, const void**out_ptr, spi_flash_mmap_handle_t*out_handle)
```

Map sequences of pages of flash memory into data or instruction address space.

This function allocates sufficient number of 64kB MMU pages and configures them to map the indicated pages of flash memory contiguously into address space. In this respect, it works in a similar way as `spi_flash_mmap()` but it allows mapping a (maybe non-contiguous) set of pages into a contiguous region of memory.

**Parameters**
- **pages** - An array of numbers indicating the 64kB pages in flash to be mapped contiguously into memory. These indicate the indexes of the 64kB pages, not the byte-size addresses as used in other functions. Array must be located in internal memory.
- **page_count** - Number of entries in the pages array
- **memory** - Address space where the region should be mapped (instruction or data)
- **out_ptr** - [out] Output, pointer to the mapped memory region
- **out_handle** - [out] Output, handle which should be used for `spi_flash_munmap` call

**Returns**
- ESP_OK on success
- ESP_ERR_NO_MEM if pages cannot be allocated
- ESP_ERR_INVALID_ARG if pagecount is zero or pages array is not in internal memory

```c
void spi_flash_munmap(spi_flash_mmap_handle_t handle)
```

Release region previously obtained using `spi_flash_mmap`.

**Note:** Calling this function will not necessarily unmap memory region. Region will only be unmapped when there are no other handles which reference this region. In case of partially overlapping regions it is possible that memory will be unmapped partially.

**Parameters**
- **handle** - Handle obtained from `spi_flash_mmap`

```c
void spi_flash_mmap_dump(void)
```

Display information about mapped regions.

This function lists handles obtained using `spi_flash_mmap`, along with range of pages allocated to each handle. It also lists all non-zero entries of MMU table and corresponding reference counts.

```c
uint32_t spi_flash_mmap_get_free_pages(spi_flash_mmap_memory_t memory)
```

get free pages number which can be mmap

This function will return number of free pages available in mmu table. This could be useful before calling actual `spi_flash_mmap` (maps flash range to DCache or ICache memory) to check if there is sufficient space available for mapping.

**Parameters**
- **memory** - memory type of MMU table free page

**Returns** number of free pages which can be mmaped
size_t \textbf{spi\_flash\_cache2phys} (const void *cached)

Given a memory address where flash is mapped, return the corresponding physical flash offset.

Cache address does not have been assigned via \textbf{spi\_flash\_mmap()}, any address in memory mapped flash space can be looked up.

\textbf{Parameters} cached – Pointer to flashed cached memory.

\textbf{Returns}

- SPI_FLASH_CACHE2PHYS_FAIL If cache address is outside flash cache region, or the address is not mapped.
- Otherwise, returns physical offset in flash

const void *\textbf{spi\_flash\_phys2cache} (size_t phys_offs, \textbf{spi\_flash\_mmap\_memory\_t} memory)

Given a physical offset in flash, return the address where it is mapped in the memory space.

Physical address does not have to have been assigned via \textbf{spi\_flash\_mmap()}, any address in flash can be looked up.

\textbf{Note:} Only the first matching cache address is returned. If MMU flash cache table is configured so multiple entries point to the same physical address, there may be more than one cache address corresponding to that physical address. It is also possible for a single physical address to be mapped to both the IROM and DROM regions.

\textbf{Note:} This function doesn’t impose any alignment constraints, but if memory argument is SPI_FLASH_MMAP_INST and phys_offs is not 4-byte aligned, then reading from the returned pointer will result in a crash.

\textbf{Parameters}

- phys_offs – Physical offset in flash memory to look up.
- memory – Address space type to look up a flash cache address mapping for (instruction or data)

\textbf{Returns}

- NULL if the physical address is invalid or not mapped to flash cache of the specified memory type.
- Cached memory address (in IROM or DROM space) corresponding to phys_offs.

\textbf{Macros}

ESP_ERR_FLASH_OP_FAIL

This file contains \textbf{spi\_flash\_mmap\_xx} APIs, mainly for doing memory mapping to an SPI0-connected external Flash, as well as some helper functions to convert between virtual and physical address

ESP_ERR_FLASH_OP_TIMEOUT

SPI_FLASH_SEC_SIZE

SPI Flash sector size

SPI_FLASH_MMU_PAGE_SIZE

Flash cache MMU mapping page size

SPI_FLASH_CACHE2PHYS_FAIL
Chapter 2. API Reference

Type Definitions
typedef uint32_t spi_flash_mmap_handle_t

Opaque handle for memory region obtained from spi_flash_mmap.

Enumerations
defined enum spi_flash_mmap_memory_t

Enumeration which specifies memory space requested in an mmap call.

Values:

- enumerator SPI_FLASH_MMAP_DATA
  - map to data memory, allows byte-aligned access

- enumerator SPI_FLASH_MMAP_INST
  - map to instruction memory, allows only 4-byte-aligned access

Header File

- components/hal/include/hal/spi_flash_types.h

- This header file can be included with:

  ```
  #include "hal/spi_flash_types.h"
  ```

Structures

defined struct spi_flash_trans_t

Definition of a common transaction. Also holds the return value.

Public Members

uint8_t reserved

Reserved, must be 0.

uint8_t mosi_len

Output data length, in bytes.

uint8_t miso_len

Input data length, in bytes.

uint8_t address_bitlen

Length of address in bits, set to 0 if command does not need an address.

uint32_t address

Address to perform operation on.

const uint8_t *mosi_data

Output data to salve.
Chapter 2. API Reference

```c
uint8_t* miso_data
[out] Input data from slave, little endian

uint32_t flags
Flags for this transaction. Set to 0 for now.

uint16_t command
Command to send.

uint8_t dummy_bitlen
Basic dummy bits to use.

uint32_t io_mode
Flash working mode when SPI_FLASH_IGNORE_BASEIO is specified.

struct spi_flash_sus_cmd_conf
Configuration structure for the flash chip suspend feature.

Public Members

uint32_t sus_mask
SUS/SUS1/SUS2 bit in flash register.

uint32_t cmd_rdsr
Read flash status register(2) command.

uint32_t sus_cmd
Flash suspend command.

uint32_t res_cmd
Flash resume command.

uint32_t reserved
Reserved, set to 0.

struct spi_flash_encryption_t
Structure for flash encryption operations.

Public Members

void (*flash_encryption_enable)(void)
Enable the flash encryption.

void (*flash_encryption_disable)(void)
Disable the flash encryption.
```
void (*flash_encryption_data_prepare)(uint32_t address, const uint32_t* buffer, uint32_t size)
Prepare flash encryption before operation.

Note: address and buffer must be 8-word aligned.

Param address  The destination address in flash for the write operation.
Param buffer Data for programming
Param size  Size to program.

void (*flash_encryption_done)(void)
flash data encryption operation is done.

void (*flash_encryption_destroy)(void)
Destroy encrypted result

bool (*flash_encryption_check)(uint32_t address, uint32_t length)
Check if is qualified to encrypt the buffer

Param address  the address of written flash partition.
Param length Buffer size.

struct spi_flash_host_inst_t
SPI Flash Host driver instance

Public Members

const struct spi_flash_host_driver_s *driver
Pointer to the implementation function table.

struct spi_flash_host_driver_s
Host driver configuration and context structure.

Public Members

esp_err_t (*dev_config)(spiflash_host_inst_t *host)
Configure the device-related register before transactions. This saves some time to re-configure those registers when we send continuously

esp_err_t (*common_command)(spiflash_host_inst_t *host, spiflash_trans_t *t)
Send an user-defined spi transaction to the device.

esp_err_t (*read_id)(spiflash_host_inst_t *host, uint32_t *id)
Read flash ID.

void (*erase_chip)(spiflash_host_inst_t *host)
Erase whole flash chip.
void (*erase_sector)(spi_flash_host_inst_t *host, uint32_t start_address)
Erase a specific sector by its start address.

void (*erase_block)(spi_flash_host_inst_t *host, uint32_t start_address)
Erase a specific block by its start address.

esp_err_t (*read_status)(spi_flash_host_inst_t *host, uint8_t *out_sr)
Read the status of the flash chip.

esp_err_t (*set_write_protect)(spi_flash_host_inst_t *host, bool wp)
Disable write protection.

void (*program_page)(spi_flash_host_inst_t *host, const void *buffer, uint32_t address, uint32_t length)
Program a page of the flash. Check max_write_bytes for the maximum allowed writing length.

bool (*supports_direct_write)(spi_flash_host_inst_t *host, const void *p)
Check whether the SPI host supports direct write.
When cache is disabled, SPI1 doesn’t support directly write when buffer isn’t internal.

int (*write_data_slicer)(spi_flash_host_inst_t *host, uint32_t address, uint32_t len, uint32_t *align_addr, uint32_t page_size)
Slicer for write data. The program_page should be called iteratively with the return value of this function.

    Param address  Beginning flash address to write
    Param len     Length request to write
    Param align_addr  Output of the aligned address to write to
    Param page_size  Physical page size of the flash chip
    Return    Length that can be actually written in one program_page call

esp_err_t (*read)(spi_flash_host_inst_t *host, void *buffer, uint32_t address, uint32_t read_len)
Read data from the flash. Check max_read_bytes for the maximum allowed reading length.

bool (*supports_direct_read)(spi_flash_host_inst_t *host, const void *p)
Check whether the SPI host supports direct read.
When cache is disabled, SPI1 doesn’t support directly read when the given buffer isn’t internal.

int (*read_data_slicer)(spi_flash_host_inst_t *host, uint32_t address, uint32_t len, uint32_t *align_addr, uint32_t page_size)
Slicer for read data. The read should be called iteratively with the return value of this function.

    Param address  Beginning flash address to read
    Param len     Length request to read
    Param align_addr  Output of the aligned address to read
    Param page_size  Physical page size of the flash chip
    Return    Length that can be actually read in one read call

uint32_t (*host_status)(spi_flash_host_inst_t *host)
Check the host status, 0:busy, 1:idle, 2:suspended.

esp_err_t (*configure_host_io_mode)(spi_flash_host_inst_t *host, uint32_t command, uint32_t addr_bitlen, int dummy_bitlen_base, esp_flash_io_mode_t io_mode)
Configure the host to work at different read mode. Responsible to compensate the timing and set IO mode.

```c
void (*poll_cmd_done)(spi_flash_host_inst_t *host)
```

Internal use, poll the HW until the last operation is done.

```c
esp_err_t (*flush_cache)(spi_flash_host_inst_t *host, uint32_t addr, uint32_t size)
```

For some host (SPI1), they are shared with a cache. When the data is modified, the cache needs to be flushed. Left NULL if not supported.

```c
void (*check_suspend)(spi_flash_host_inst_t *host)
```

Suspend check erase/program operation, reserved for ESP32-C3 and ESP32-S3 spi flash ROM IMPL.

```c
void (*resume)(spi_flash_host_inst_t *host)
```

Resume flash from suspend manually

```c
void (*suspend)(spi_flash_host_inst_t *host)
```

Set flash in suspend status manually

```c
esp_err_t (*sus_setup)(spi_flash_host_inst_t *host, const spi_flash_sus_cmd_conf *sus_conf)
```

Suspend feature setup for setting cmd and status register mask.

**Macros**

**SPI_FLASH_TRANS_FLAG_CMD16**

Send command of 16 bits.

**SPI_FLASH_TRANS_FLAG_IGNORE_BASEIO**

Not applying the basic io mode configuration for this transaction.

**SPI_FLASH_TRANS_FLAG_BYTE_SWAP**

Used for DTR mode, to swap the bytes of a pair of rising/falling edge.

**SPI_FLASH_TRANS_FLAG_PE_CMD**

Indicates that this transaction is to erase/program flash chip.

**SPI_FLASH_CONFIG_CONF_BITS**

OR the io_mode with this mask, to enable the dummy output feature or replace the first several dummy bits into address to meet the requirements of conf bits. (Used in DIO/QIO/OIO mode)

**SPI_FLASH_OPI_FLAG**

A flag for flash work in opi mode, the io mode below are opi, above are SPI/QSPI mode. DO NOT use this value in any API.

**SPI_FLASH_READ_MODE_MIN**

Slowest io mode supported by ESP32, currently SlowRd.

**Type Definitions**
typedef enum esp_flash_speed_s esp_flash_speed_t

SPI flash clock speed values, always refer to them by the enum rather than the actual value (more speed may be appended into the list).

A strategy to select the maximum allowed speed is to enumerate from the ESP_FLASH_SPEED_MAX-1 or highest frequency supported by your flash, and decrease the speed until the probing success.

typedef struct spi_flash_host_driver_s spi_flash_host_driver_t

Enumerations

enum esp_flash_speed_s

SPI flash clock speed values, always refer to them by the enum rather than the actual value (more speed may be appended into the list).

A strategy to select the maximum allowed speed is to enumerate from the ESP_FLASH_SPEED_MAX-1 or highest frequency supported by your flash, and decrease the speed until the probing success.

Values:

enumerator ESP_FLASH_5MHZ
   The flash runs under 5MHz.

enumerator ESP_FLASH_10MHZ
   The flash runs under 10MHz.

enumerator ESP_FLASH_20MHZ
   The flash runs under 20MHz.

enumerator ESP_FLASH_26MHZ
   The flash runs under 26MHz.

enumerator ESP_FLASH_40MHZ
   The flash runs under 40MHz.

enumerator ESP_FLASH_80MHZ
   The flash runs under 80MHz.

enumerator ESP_FLASH_120MHZ
   The flash runs under 120MHz. 120MHZ can only be used by main flash after timing tuning in system. Do not use this directly in any API.

enumerator ESP_FLASH_SPEED_MAX
   The maximum frequency supported by the host is ESP_FLASH_SPEED_MAX-1.

enum esp_flash_io_mode_t

Mode used for reading from SPI flash.

Values:

enumerator SPI_FLASH_SLOWRD
   Data read using single I/O, some limits on speed.
enumerator SPI_FLASH_FASTRD
    Data read using single I/O, no limit on speed.

counter SPI_FLASH_DOUT
    Data read using dual I/O.

counter SPI_FLASH_DIO
    Both address & data transferred using dual I/O.

counter SPI_FLASH_QOUT
    Data read using quad I/O.

counter SPI_FLASH_QIO
    Both address & data transferred using quad I/O.

counter SPI_FLASH_OPI_STR
    Only support on OPI flash, flash read and write under STR mode.

counter SPI_FLASH_OPI_DTR
    Only support on OPI flash, flash read and write under DTR mode.

counter SPI_FLASH_READ_MODE_MAX
    The fastest io mode supported by the host is ESP_FLASH_READ_MODE_MAX-1.

Header File

- components/hal/include/hal/esp_flash_err.h
- This header file can be included with:

```c
#include "hal/esp_flash_err.h"
```

Macros

**ESP_ERR_FLASH_NOT_INITIALISED**
    esp_flash_chip_t structure not correctly initialised by esp_flash_init().

**ESP_ERR_FLASH_UNSUPPORTED_HOST**
    Requested operation isn’t supported via this host SPI bus (chip->spi field).

**ESP_ERR_FLASH_UNSUPPORTED_CHIP**
    Requested operation isn’t supported by this model of SPI flash chip.

**ESP_ERR_FLASH_PROTECTED**
    Write operation failed due to chip’s write protection being enabled.

Enumerations

enum [anonymous]

Values:
enumerator **ESP_ERR_FLASH_SIZE_NOT_MATCH**

The chip doesn’t have enough space for the current partition table.

enumerator **ESP_ERR_FLASH_NO_RESPONSE**

Chip did not respond to the command, or timed out.

**Header File**

- components/spi_flash/include/esp_spi_flash_counters.h
- This header file can be included with:

```c
#include "esp_spi_flash_counters.h"
```

- This header file is a part of the API provided by the *spi_flash* component. To declare that your component depends on *spi_flash*, add the following to your `CMakeLists.txt`:

```cmake
REQUIRES spi_flash
```

or

```cmake
PRIV_REQUIRES spi_flash
```

**Functions**

```c
void esp_flash_reset_counters (void)
```
Reset SPI flash operation counters.

```c
void spi_flash_reset_counters (void)
```

```c
void esp_flash_dump_counters (FILE *stream)
```
Print SPI flash operation counters.

```c
void spi_flash_dump_counters (void)
```

```c
const esp_flash_counters_t *esp_flash_get_counters (void)
```
Return current SPI flash operation counters.

**Returns** pointer to the *esp_flash_counters_t* structure holding values of the operation counters

```c
const spi_flash_counters_t *spi_flash_get_counters (void)
```

**Structures**

```c
struct esp_flash_counter_t
```
Structure holding statistics for one type of operation

**Public Members**

```c
uint32_t count
```
number of times operation was executed

```c
uint32_t time
```
total time taken, in microseconds

```c
uint32_t bytes
```
total number of bytes
struct esp_flash_counters_t
    Structure for counters of flash actions

    **Public Members**

    *esp_flash_counter_t* read
        counters for read action, like `esp_flash_read`

    *esp_flash_counter_t* write
        counters for write action, like `esp_flash_write`

    *esp_flash_counter_t* erase
        counters for erase action, like `esp_flash_erase`

**Type Definitions**

typedef *esp_flash_counter_t* spi_flash_counter_t

typedef *esp_flash_counters_t* spi_flash_counters_t

**API Reference - Flash Encrypt**

**Header File**

- `components/bootloader_support/include/esp_flash_encrypt.h`
- This header file can be included with:

  ```c
  #include "esp_flash_encrypt.h"
  ```

- This header file is a part of the API provided by the `bootloader_support` component. To declare that your component depends on `bootloader_support`, add the following to your `CMakeLists.txt`:

  ```cmake
  REQUIRES bootloader_support
  ```

  or

  ```cmake
  PRIV_REQUIRES bootloader_support
  ```

**Functions**

bool *esp_flash_encryption_enabled* (void)
    Is flash encryption currently enabled in hardware?

    Flash encryption is enabled if the `FLASH_CRYPT_CNT` efuse has an odd number of bits set.

    **Returns** true if flash encryption is enabled.

    ```c
    esp_err_t *esp_flash_encrypt_check_and_update* (void)
    ```

bool *esp_flash_encrypt_state* (void)
    Returns the Flash Encryption state and prints it.

    **Returns** True - Flash Encryption is enabled False - Flash Encryption is not enabled
bool **esp_flash_encrypt_initialized_once**(void)

Checks if the first initialization was done.

If the first initialization was done then FLASH_CRYPT_CNT != 0

**Returns** true - the first initialization was done false - the first initialization was NOT done

**esp_err_t esp_flash_encrypt_init**(void)
The first initialization of Flash Encryption key and related eFuses.

**Returns** ESP_OK if all operations succeeded

**esp_err_t esp_flash_encrypt_contents**(void)
Encrypts flash content.

**Returns** ESP_OK if all operations succeeded

**esp_err_t esp_flash_encrypt_enable**(void)
Activates Flash encryption on the chip.

It burns FLASH_CRYPT_CNT eFuse based on the CONFIG_SECURE_FLASH_ENCRYPTION_MODE_RELEASE option.

**Returns** ESP_OK if all operations succeeded

bool **esp_flash_encrypt_is_write_protected**(bool print_error)

Returns True if the write protection of FLASH_CRYPT_CNT is set.

**Parameters** print_error - Print error if it is write protected

**Returns** true - if FLASH_CRYPT_CNT is write protected

**esp_err_t esp_flash_encrypt_region**(uint32_t src_addr, size_t data_length)
Encrypt-in-place a block of flash sectors.

**Note:** This function resets RTC_WDT between operations with sectors.

**Parameters**

- src_addr - Source offset in flash. Should be multiple of 4096 bytes.
- data_length - Length of data to encrypt in bytes. Will be rounded up to next multiple of 4096 bytes.

**Returns** ESP_OK if all operations succeeded, ESP_ERR_FLASH_OP_FAIL if SPI flash fails, ESP_ERR_FLASH_OP_TIMEOUT if flash times out.

void **esp_flash_write_protect_crypt_cnt**(void)
Write protect FLASH_CRYPT_CNT.

Intended to be called as a part of boot process if flash encryption is enabled but secure boot is not used. This should protect against serial re-flashing of an unauthorised code in absence of secure boot.

**Note:** On ESP32 V3 only, write protecting FLASH_CRYPT_CNT will also prevent disabling UART Download Mode. If both are wanted, call esp_efuse_disable_rom_download_mode() before calling this function.

**esp_flash_enc_mode_t esp_get_flash_encryption_mode**(void)
Return the flash encryption mode.

The API is called during boot process but can also be called by application to check the current flash encryption mode of ESP32

**Returns**
void esp_flash_encryption_init_checks (void)
Check the flash encryption mode during startup.

Verifies the flash encryption config during startup:

- Correct any insecure flash encryption settings if hardware Secure Boot is enabled.
- Log warnings if the efuse config doesn’t match the project config in any way

**Note:** This function is called automatically during app startup, it doesn’t need to be called from the app.

.esp_err_t esp_flash_encryption_enable_secure_features (void)
Set all secure eFuse features related to flash encryption.

**Returns**
- ESP_OK - Successfully

bool esp_flash_encryption_cfg_verify_release_mode (void)
Returns the verification status for all physical security features of flash encryption in release mode.

If the device has flash encryption feature configured in the release mode, then it is highly recommended to call this API in the application startup code. This API verifies the sanity of the eFuse configuration against the release (production) mode of the flash encryption feature.

**Returns**
- True - all Fuses are configured correctly
- False - not all Fuses are configured correctly.

void esp_flash_encryption_set_release_mode (void)
Switches Flash Encryption from “Development” to “Release”.

If already in “Release” mode, the function will do nothing. If flash encryption efuse is not enabled yet then abort. It burns:

- ” disable encrypt in dl mode”
- set FLASH_CRYPT_CNT efuse to max

**Enumerations**

enum esp_flash_enc_mode_t

**Values:**

enumerator ESP_FLASH_ENC_MODE_DISABLED
enumerator ESP_FLASH_ENC_MODE_DEVELOPMENT
enumerator ESP_FLASH_ENC_MODE_RELEASE

2.6.22 SPI Master Driver

SPI Master driver is a program that controls ESP32-S3’s General Purpose SPI (GP-SPI) peripheral(s) when it functions as a master.

For more hardware information about the GP-SPI peripheral(s), see ESP32-S3 Technical Reference Manual > SPI Controller [PDF].
Chapter 2. API Reference

Terminology

The terms used in relation to the SPI Master driver are given in the table below.

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Host</td>
<td>The SPI controller peripheral inside ESP32-S3 initiates SPI transmissions over the bus and acts as an SPI Master.</td>
</tr>
<tr>
<td>Device</td>
<td>SPI slave Device. An SPI bus may be connected to one or more Devices. Each Device shares the MOSI, MISO, and SCLK signals but is only active on the bus when the Host asserts the Device’s individual CS line.</td>
</tr>
<tr>
<td>Bus</td>
<td>A signal bus, common to all Devices connected to one Host. In general, a bus includes the following lines: MISO, MOSI, SCLK, one or more CS lines, and, optionally, QUADWP and QUADHD. So Devices are connected to the same lines, with the exception that each Device has its own CS line. Several Devices can also share one CS line if connected in a daisy-chain manner.</td>
</tr>
<tr>
<td>MOSI</td>
<td>Master Out, Slave In, a.k.a. D. Data transmission from a Host to Device. Also data0 signal in Octal/OPI mode.</td>
</tr>
<tr>
<td>MISO</td>
<td>Master In, Slave Out, a.k.a. Q. Data transmission from a Device to Host. Also data1 signal in Octal/OPI mode.</td>
</tr>
<tr>
<td>SCLK</td>
<td>Serial Clock. The oscillating signal generated by a Host keeps the transmission of data bits in sync.</td>
</tr>
<tr>
<td>CS</td>
<td>Chip Select. Allows a Host to select individual Device(s) connected to the bus in order to send or receive data.</td>
</tr>
<tr>
<td>QUADWP</td>
<td>Write Protect signal. Used for 4-bit (qio/qout) transactions. Also for the data2 signal in Octal/OPI mode.</td>
</tr>
<tr>
<td>QUADHD</td>
<td>Hold signal. Used for 4-bit (qio/qout) transactions. Also for the data3 signal in Octal/OPI mode.</td>
</tr>
<tr>
<td>DATA4</td>
<td>Data4 signal in Octal/OPI mode.</td>
</tr>
<tr>
<td>DATA5</td>
<td>Data5 signal in Octal/OPI mode.</td>
</tr>
<tr>
<td>DATA6</td>
<td>Data6 signal in Octal/OPI mode.</td>
</tr>
<tr>
<td>DATA7</td>
<td>Data7 signal in Octal/OPI mode.</td>
</tr>
<tr>
<td>Assertion</td>
<td>The action of activating a line.</td>
</tr>
<tr>
<td>De-assertion</td>
<td>The action of returning the line back to inactive (back to idle) status.</td>
</tr>
<tr>
<td>Transaction</td>
<td>One instance of a Host asserting a CS line, transferring data to and from a Device, and de-asserting the CS line. Transactions are atomic, which means they can never be interrupted by another transaction.</td>
</tr>
<tr>
<td>Launch Edge</td>
<td>Edge of the clock at which the source register launches the signal onto the line.</td>
</tr>
<tr>
<td>Latch Edge</td>
<td>Edge of the clock at which the destination register latches in the signal.</td>
</tr>
</tbody>
</table>

Driver Features

The SPI Master driver governs the communications between Hosts and Devices. The driver supports the following features:

- Multi-threaded environments
- Transparent handling of DMA transfers while reading and writing data
- Automatic time-division multiplexing of data coming from different Devices on the same signal bus, see SPI Bus Lock.

Warning: The SPI Master driver allows multiple Devices to be connected on a same SPI bus (sharing a single ESP32-S3 SPI peripheral). As long as each Device is accessed by only one task, the driver is thread-safe. However, if multiple tasks try to access the same SPI Device, the driver is not thread-safe. In this case, it is recommended to either:

- Refactor your application so that each SPI peripheral is only accessed by a single task at a time. You can
use `spi_bus_config_t::isr_cpu_id` to register the SPI ISR to the same core as SPI peripheral-related tasks to ensure thread safety.

- Add a mutex lock around the shared Device using `xSemaphoreCreateMutex`.

### SPI Features

#### SPI Master

#### SPI Bus Lock

To realize the multiplexing of different devices from different drivers, including SPI Master, SPI Flash, etc., an SPI bus lock is applied on each SPI bus. Drivers can attach their devices to the bus with the arbitration of the lock.

Each bus lock is initialized with a BG (background) service registered. All devices that request transactions on the bus should wait until the BG is successfully disabled.

- For the SPI1 bus, the BG is the cache. The bus lock disables the cache before device operations start, and enables it again after the device releases the lock. No devices on SPI1 are allowed to use ISR, since it is meaningless for the task to yield to other tasks when the cache is disabled. The SPI Master driver has not supported SPI1 bus. Only the SPI Flash driver can attach to the bus.
- For other buses, the driver can register the ISR as a BG. If a device task requests exclusive bus access, the bus lock will block the task, disable the ISR, and then unblock the task. After the task releases the lock, the lock will try to re-enable the ISR if there are still pending transactions in the ISR.

#### SPI Transactions

An SPI bus transaction consists of five phases which can be found in the table below. Any of these phases can be skipped.

<table>
<thead>
<tr>
<th>Phase</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Command</td>
<td>In this phase, a command (0-16 bit) is written to the bus by the Host.</td>
</tr>
<tr>
<td>Address</td>
<td>In this phase, an address (0-32 bit) is transmitted over the bus by the Host.</td>
</tr>
<tr>
<td>Dummy</td>
<td>This phase is configurable and is used to meet the timing requirements.</td>
</tr>
<tr>
<td>Write</td>
<td>Host sends data to a Device. This data follows the optional command and address phases and is indistinguishable from them at the electrical level.</td>
</tr>
<tr>
<td>Read</td>
<td>Device sends data to its Host.</td>
</tr>
</tbody>
</table>

The attributes of a transaction are determined by the bus configuration structure `spi_bus_config_t`, Device configuration structure `spi_device_interface_config_t`, and transaction configuration structure `spi_transaction_t`.

An SPI Host can send full-duplex transactions, during which the Read and Write phases occur simultaneously. The total transaction length is determined by the sum of the following members:

- `spi_device_interface_config_t::command_bits`
- `spi_device_interface_config_t::address_bits`
- `spi_transaction_t::length`

While the member `spi_transaction_t::rxlength` only determines the length of data received into the buffer.

In half-duplex transactions, the Read and Write phases are not simultaneous (one direction at a time). The lengths of the Write and Read phases are determined by `spi_transaction_t::length` and `spi_transaction_t::rxlength` respectively.

The Command and Address phases are optional, as not every SPI Device requires a command and/or address. This is reflected in the Device’s configuration: if `spi_device_interface_config_t::command_bits` and/or
spi_device_interface_config_t::address_bits are set to zero, no Command or Address phase will occur.

The Read and Write phases can also be optional, as not every transaction requires both writing and reading data. If spi_transaction_t::rx_buffer is NULL and SPI_TRANS_USE_RXDATA is not set, the Read phase is skipped. If spi_transaction_t::tx_buffer is NULL and SPI_TRANS_USE_TXDATA is not set, the Write phase is skipped.

The driver supports two types of transactions: interrupt transactions and polling transactions. The programmer can choose to use a different transaction type per Device. If your Device requires both transaction types, see Notes on Sending Mixed Transactions to the Same Device.

**Interrupt Transactions** Interrupt transactions blocks the transaction routine until the transaction completes, thus allowing the CPU to run other tasks.

An application task can queue multiple transactions, and the driver automatically handles them one by one in the interrupt service routine (ISR). It allows the task to switch to other procedures until all the transactions are complete.

**Polling Transactions** Polling transactions do not use interrupts. The routine keeps polling the SPI Host’s status bit until the transaction is finished.

All the tasks that use interrupt transactions can be blocked by the queue. At this point, they need to wait for the ISR to run twice before the transaction is finished. Polling transactions save time otherwise spent on queue handling and context switching, which results in smaller transaction duration. The disadvantage is that the CPU is busy while these transactions are in progress.

The spi_device_polling_end() routine needs an overhead of at least 1 µs to unblock other tasks when the transaction is finished. It is strongly recommended to wrap a series of polling transactions using the functions spi_device_acquire_bus() and spi_device_release_bus() to avoid the overhead. For more information, see Bus Acquiring.

**Transaction Line Mode** Supported line modes for ESP32-S3 are listed as follows, to make use of these modes, set the member flags in the struct spi_transaction_t as shown in the Transaction Flag column. If you want to check if corresponding IO pins are set or not, set the member flags in the spi_bus_config_t as shown in the Bus IO setting Flag column.

<table>

</tr>
</tbody>
</table>

**Command and Address Phases** During the Command and Address phases, the members spi_transaction_t::cmd and spi_transaction_t::addr are sent to the bus, nothing is read at this time. The default lengths of the Command and Address phases are set in spi_device_interface_config_t.
by calling `spi_bus_add_device()`. If the flags `SPI_TRANS_VARIABLE_CMD` and
`SPI_TRANS_VARIABLE_ADDR` in the member `spi_transaction_t::flags` are not set, the driver
automatically sets the length of these phases to default values during Device initialization.

If the lengths of the Command and Address phases need to be variable, declare the
struct `spi_transaction_ext_t`, set the flags `SPI_TRANS_VARIABLE_CMD` and/or
`SPI_TRANS_VARIABLE_ADDR` in the member `spi_transaction_ext_t::base` and configure the rest
of base as usual. Then the length of each phase will be equal to `spi_transaction_ext_t::command_bits`
and `spi_transaction_ext_t::address_bits` set in the struct `spi_transaction_ext_t`.

If the Command and Address phase need to have the same number of lines as the data phase, you need to set
`SPI_TRANS_MULTILINE_CMD` and/or `SPI_TRANS_MULTILINE_ADDR` to the
flags member in the struct `spi_transaction_t`. Also see `Transaction Line Mode`.

**Write and Read Phases** Normally, the data that needs to be transferred to or from a Device is read from
or written to a chunk of memory indicated by the members `spi_transaction_t::rx_buffer`
and `spi_transaction_t::tx_buffer`. If DMA is enabled for transfers, the buffers are required to be:

1. Allocated in DMA-capable internal memory (MALLOCap_DMA), see `DMA-Capable Memory`.
2. 32-bit aligned (starting from a 32-bit boundary and having a length of multiples of 4 bytes).

If these requirements are not satisfied, the transaction efficiency will be affected due to the allocation and copying of
temporary buffers.

If using more than one data line to transmit, please set `SPI_DEVICE_HALFDUPLEX` flag for the member
flags in the struct `spi_device_interface_config_t`. And the member flags in the struct
`spi_transaction_t` should be set as described in `Transaction Line Mode`.

**Note:** Half-duplex transactions with both Read and Write phases are not supported. Please use full duplex mode.

**Bus Acquiring** Sometimes you might want to send SPI transactions exclusively and continuously so that it
takes as little time as possible. For this, you can use bus acquiring, which helps to suspend transactions (both
polling or interrupt) to other Devices until the bus is released. To acquire and release a bus, use the functions
`spi_device_acquire_bus()` and `spi_device_release_bus()`.

**Driver Usage**

- Initialize an SPI bus by calling the function `spi_bus_initialize()`. Make sure to set the correct I/O
  pins in the struct `spi_bus_config_t`. Set the signals that are not needed to -1.
- Register a Device connected to the bus with the driver by calling the function `spi_bus_add_device()`. Make sure to configure any timing requirements the Device might need with the parameter `dev_config`. You should now have obtained the Device’s handle which will be used when sending a transaction to it.
- To interact with the Device, fill one or more `spi_transaction_t` structs with any transaction parameters
  required. Then send the structs either using a polling transaction or an interrupt transaction:
  - **Interrupt** Either queue all transactions by calling the function `spi_device_queue_trans()` and,
    at a later time, query the result using the function `spi_device_get_trans_result()`, or
    handle all requests synchronously by feeding them into `spi_device_transmit()`.
  - **Polling** Call the function `spi_device_polling_transmit()` to send polling transactions.
    Alternatively, if you want to insert something in between, send the transactions by using
    `spi_device_polling_start()` and `spi_device_polling_end()`.
- (Optional) To perform back-to-back transactions with a Device, call the function
  `spi_device_acquire_bus()` before sending transactions and `spi_device_release_bus()`
  after the transactions have been sent.
- (Optional) To remove a certain Device from the bus, call `spi_bus_remove_device()` with the Device
  handle as an argument.
- (Optional) To remove the driver from the bus, make sure no more devices are attached and call
  `spi_bus_free()`.
Transactions with Data Not Exceeding 32 Bits

When the transaction data size is equal to or less than 32 bits, it will be sub-optimal to allocate a buffer for the data. The data can be directly stored in the transaction struct instead. For transmitted data, it can be achieved by using the `spi_transaction_t::tx_data` member and setting the `SPI_TRANS_USE_TXDATA` flag on the transmission. For received data, use `spi_transaction_t::rx_data` and set `SPI_TRANS_USE_RXDATA`. In both cases, do not touch the `spi_transaction_t::tx_buffer` or `spi_transaction_t::rx_buffer` members, because they use the same memory locations as `spi_transaction_t::tx_data` and `spi_transaction_t::rx_data`.

Transactions with Integers Other than `uint8_t`

An SPI Host reads and writes data into memory byte by byte. By default, data is sent with the most significant bit (MSB) first, as LSB is first used in rare cases. If a value of fewer than 8 bits needs to be sent, the bits should be written into memory in the MSB first manner.

For example, if `0b00010` needs to be sent, it should be written into a `uint8_t` variable, and the length for reading should be set to 5 bits. The Device will still receive 8 bits with 3 additional “random” bits, so the reading must be performed correctly.

On top of that, ESP32-S3 is a little-endian chip, which means that the least significant byte of `uint16_t` and `uint32_t` variables is stored at the smallest address. Hence, if `uint16_t` is stored in memory, bits [7:0] are sent first, followed by bits [15:8].

For cases when the data to be transmitted has a size differing from `uint8_t` arrays, the following macros can be used to transform data to the format that can be sent by the SPI driver directly:

- `SPI_SWAP_DATA_TX` for data to be transmitted
- `SPI_SWAP_DATA_RX` for data received

Notes on Sending Mixed Transactions to the Same Device

To reduce coding complexity, send only one type of transaction (interrupt or polling) to one Device. However, you still can send both interrupt and polling transactions alternately. The notes below explain how to do this.

The polling transactions should be initiated only after all the polling and interrupt transactions are finished.

Since an unfinished polling transaction blocks other transactions, please do not forget to call the function `spi_device_polling_end()` after `spi_device_polling_start()` to allow other transactions or to allow other Devices to use the bus. Remember that if there is no need to switch to other tasks during your polling transaction, you can initiate a transaction with `spi_device_polling_transmit()` so that it will be ended automatically.

In-flight polling transactions are disturbed by the ISR operation to accommodate interrupt transactions. Always make sure that all the interrupt transactions sent to the ISR are finished before you call `spi_device_polling_start()`. To do that, you can keep calling `spi_device_get_trans_result()` until all the transactions are returned.

To have better control of the calling sequence of functions, send mixed transactions to the same Device only within a single task.

GPIO Matrix and IO_MUX

Most of the chip’s peripheral signals have a direct connection to their dedicated IO_MUX pins. However, the signals can also be routed to any other available pins using the less direct GPIO matrix. If at least one signal is routed through the GPIO matrix, then all signals will be routed through it.

When an SPI Host is set to 80 MHz or lower frequencies, routing SPI pins via the GPIO matrix will behave the same compared to routing them via IOMUX.

The IO_MUX pins for SPI buses are given below.
# Transfer Speed Considerations

There are three factors limiting the transfer speed:

- Transaction interval
- SPI clock frequency
- Cache miss of SPI functions, including callbacks

The main parameter that determines the transfer speed for large transactions is clock frequency. For multiple small transactions, the transfer speed is mostly determined by the length of transaction intervals.

### Transaction Duration

Transaction duration includes setting up SPI peripheral registers, copying data to FIFOs or setting up DMA links, and the time for SPI transactions.

Interrupt transactions allow appending extra overhead to accommodate the cost of FreeRTOS queues and the time needed for switching between tasks and the ISR.

For **interrupt transactions**, the CPU can switch to other tasks when a transaction is in progress. This saves CPU time but increases the transaction duration. See [Interrupt Transactions](#). For **polling transactions**, it does not block the task but allows to do polling when the transaction is in progress. For more information, see [Polling Transactions](#).

If DMA is enabled, setting up the linked list requires about 2 µs per transaction. When a master is transferring data, it automatically reads the data from the linked list. If DMA is not enabled, the CPU has to write and read each byte from the FIFO by itself. Usually, this is faster than 2 µs, but the transaction length is limited to 64 bytes for both write and read.

The typical transaction duration for one byte of data is given below.

- Interrupt Transaction via DMA: 26 µs.
- Interrupt Transaction via CPU: 24 µs.
- Polling Transaction via DMA: 11 µs.
- Polling Transaction via CPU: 9 µs.

Note that these data are tested with `CONFIG_SPI_MASTER_ISR_IN_IRAM` enabled. SPI transaction related code are placed in the internal memory. If this option is turned off (for example, for internal memory optimization), the transaction duration may be affected.

### SPI Clock Frequency

The clock source of the GPSPI peripherals can be selected by setting `spi_device_handle_t::cfg::clock_source`. You can refer to `spi_clock_source_t` to know the supported clock sources.

By default driver sets `spi_device_handle_t::cfg::clock_source` to `SPI_CLK_SRC_DEFAULT`. This usually stands for the highest frequency among GPSPI clock sources. Its value is different among chips.

The actual clock frequency of a Device may not be exactly equal to the number you set, it is re-calculated by the driver to the nearest hardware-compatible number, and not larger than the clock frequency of the clock source. You can call `spi_device_get_actual_freq()` to know the actual frequency computed by the driver.

The theoretical maximum transfer speed of the Write or Read phase can be calculated according to the table below:

<table>
<thead>
<tr>
<th>Pin Name</th>
<th>GPIO Number (SPI2)</th>
</tr>
</thead>
<tbody>
<tr>
<td>CS0</td>
<td>10</td>
</tr>
<tr>
<td>SCLK</td>
<td>12</td>
</tr>
<tr>
<td>MISO</td>
<td>13</td>
</tr>
<tr>
<td>MOSI</td>
<td>11</td>
</tr>
<tr>
<td>QUADWP</td>
<td>14</td>
</tr>
<tr>
<td>QUADHD</td>
<td>9</td>
</tr>
</tbody>
</table>

1 Only the first Device attached to the bus can use the CS0 pin.
### Line Width of Write/Read phase vs Speed (Bps)

<table>
<thead>
<tr>
<th>Line Width</th>
<th>Speed (Bps)</th>
</tr>
</thead>
<tbody>
<tr>
<td>1-Line</td>
<td>SPI Frequency / 8</td>
</tr>
<tr>
<td>2-Line</td>
<td>SPI Frequency / 4</td>
</tr>
<tr>
<td>4-Line</td>
<td>SPI Frequency / 2</td>
</tr>
<tr>
<td>8-Line</td>
<td>SPI Frequency</td>
</tr>
</tbody>
</table>

The transfer speed calculation of other phases (Command, Address, Dummy) is similar.

#### Cache Missing

The default config puts only the ISR into the IRAM. Other SPI-related functions, including the driver itself and the callback, might suffer from cache misses and need to wait until the code is read from flash. Select `CONFIG_SPI_MASTER_IN_IRAM` to put the whole SPI driver into IRAM and put the entire callback(s) and its callee functions into IRAM to prevent cache missing.

**Note:** SPI driver implementation is based on FreeRTOS APIs, to use `CONFIG_SPI_MASTER_IN_IRAM`, you should not enable `CONFIG_FREERTOS_PLACE_FUNCTIONS_INTO_FLASH`.

For an interrupt transaction, the overall cost is \( \frac{20 + 8n}{F_{spi}} \) [µs] for \( n \) bytes transferred in one transaction. Hence, the transferring speed is: \( \frac{n}{(20 + 8n) / F_{spi}} \). An example of transferring speed at 8 MHz clock speed is given in the following table.

<table>
<thead>
<tr>
<th>Frequency (MHz)</th>
<th>Transaction Interval (µs)</th>
<th>Transaction Length (bytes)</th>
<th>Total Time (µs)</th>
<th>Total Speed (KBps)</th>
</tr>
</thead>
<tbody>
<tr>
<td>8</td>
<td>25</td>
<td>1</td>
<td>26</td>
<td>38.5</td>
</tr>
<tr>
<td>8</td>
<td>25</td>
<td>8</td>
<td>33</td>
<td>242.4</td>
</tr>
<tr>
<td>8</td>
<td>25</td>
<td>16</td>
<td>41</td>
<td>490.2</td>
</tr>
<tr>
<td>8</td>
<td>25</td>
<td>64</td>
<td>89</td>
<td>719.1</td>
</tr>
<tr>
<td>8</td>
<td>25</td>
<td>128</td>
<td>153</td>
<td>836.6</td>
</tr>
</tbody>
</table>

When a transaction length is short, the cost of the transaction interval is high. If possible, try to squash several short transactions into one transaction to achieve a higher transfer speed.

Please note that the ISR is disabled during flash operation by default. To keep sending transactions during flash operations, enable `CONFIG_SPI_MASTER_ISR_IN_IRAM` and set `ESP_INTR_FLAG_IRAM` in the member `spi_bus_config_t::intr_flags`. In this case, all the transactions queued before starting flash operations are handled by the ISR in parallel. Also note that the callback of each Device and their callee functions should be in IRAM, or your callback will crash due to cache missing. For more details, see [IRAM-Safe Interrupt Handlers](#).  

#### Application Example

The code example for using the SPI master half duplex mode to read/write an AT93C46D EEPROM (8-bit mode) can be found in the `peripherals/spi_master/hd_eeprom` directory of ESP-IDF examples.

The code example for using the SPI master full duplex mode to drive a SPI_LCD (e.g. ST7789V or ILI9341) can be found in the `peripherals/spi_master/lcd` directory of ESP-IDF examples.

#### API Reference - SPI Common

```

**Functions**

`esp_err_t spi_bus_initialize` ( `spi_host_device_t host_id`, `const spi_bus_config_t *bus_config`, `spi_dma_chan_t dma_chan` )

Initialize a SPI bus.

**Warning:** SPI0/1 is not supported

**Warning:** If a DMA channel is selected, any transmit and receive buffer used should be allocated in DMA-capable memory.

**Warning:** The ISR of SPI is always executed on the core which calls this function. Never starve the ISR on this core or the SPI transactions will not be handled.

**Parameters**

- `host_id` - SPI peripheral that controls this bus
- `bus_config` - Pointer to a `spi_bus_config_t` struct specifying how the host should be initialized
- `dma_chan` - Selecting a DMA channel for an SPI bus allows transactions on the bus with size only limited by the amount of internal memory.
  - Selecting SPI_DMA_DISABLED limits the size of transactions.
  - Set to SPI_DMA_DISABLED if only the SPI flash uses this bus.
  - Set to SPI_DMA_CH_AUTO to let the driver to allocate the DMA channel.

**Returns**

- ESP_ERR_INVALID_ARG if configuration is invalid
- ESP_ERR_INVALID_STATE if host already is in use
- ESP_ERR_NOT_FOUND if there is no available DMA channel
- ESP_ERR_NO_MEM if out of memory
- ESP_OK on success

`esp_err_t spi_bus_free` ( `spi_host_device_t host_id` )

Free a SPI bus.

**Warning:** In order for this to succeed, all devices have to be removed first.

**Parameters** `host_id` - SPI peripheral to free
**Returns**

- ESP_ERR_INVALID_ARG if parameter is invalid
• ESP_ERR_INVALID_STATE if bus hasn’t been initialized before, or not all devices on the bus are freed
• ESP_OK on success

Structures

struct spi_bus_config_t

This is a configuration structure for a SPI bus.

You can use this structure to specify the GPIO pins of the bus. Normally, the driver will use the GPIO matrix to route the signals. An exception is made when all signals either can be routed through the IO_MUX or are -1. In that case, the IO_MUX is used, allowing for >40MHz speeds.

Note: Be advised that the slave driver does not use the quadwp/quadhd lines and fields in spi_bus_config_t refering to these lines will be ignored and can thus safely be left uninitialized.

Public Members

int mosi_io_num
    GPIO pin for Master Out Slave In (=spi_d) signal, or -1 if not used.

int data0_io_num
    GPIO pin for spi data0 signal in quad/octal mode, or -1 if not used.

int miso_io_num
    GPIO pin for Master In Slave Out (=spi_q) signal, or -1 if not used.

int data1_io_num
    GPIO pin for spi data1 signal in quad/octal mode, or -1 if not used.

int sclk_io_num
    GPIO pin for SPI Clock signal, or -1 if not used.

int quadwp_io_num
    GPIO pin for WP (Write Protect) signal, or -1 if not used.

int data2_io_num
    GPIO pin for spi data2 signal in quad/octal mode, or -1 if not used.

int quadhd_io_num
    GPIO pin for HD (Hold) signal, or -1 if not used.

int data3_io_num
    GPIO pin for spi data3 signal in quad/octal mode, or -1 if not used.

int data4_io_num
    GPIO pin for spi data4 signal in octal mode, or -1 if not used.
int data5_io_num
  GPIO pin for data5 signal in octal mode, or -1 if not used.

int data6_io_num
  GPIO pin for data6 signal in octal mode, or -1 if not used.

int data7_io_num
  GPIO pin for data7 signal in octal mode, or -1 if not used.

int max_transfer_sz
  Maximum transfer size, in bytes. Defaults to 4092 if DMA enabled, or to SOC_SPI_MAXIMUM_BUFFER_SIZE if DMA is disabled.

uint32_t flags
  Abilities of bus to be checked by the driver. Or-ed value of SPICOMMON_BUSFLAG_* flags.

esp_intr_cpu_affinity_t isr_cpu_id
  Select cpu core to register SPI ISR.

int intr_flags
  Interrupt flag for the bus to set the priority, and IRAM attribute, see esp_intr_alloc.h. Note that the EDGE, INTRDISABLED attribute are ignored by the driver. Note that if ESP_INTR_FLAG_IRAM is set, ALL the callbacks of the driver, and their callee functions, should be put in the IRAM.

Macros

SPI_MAX_DMA_LEN

SPI_SWAP_DATA_TX (DATA, LEN)
  Transform unsigned integer of length <= 32 bits to the format which can be sent by the SPI driver directly.

E.g. to send 9 bits of data, you can:

```c
uint16_t data = SPI_SWAP_DATA_TX(0x145, 9);
```

Then points tx_buffer to &data.

Parameters

- **DATA** - Data to be sent, can be uint8_t, uint16_t or uint32_t.
- **LEN** - Length of data to be sent, since the SPI peripheral sends from the MSB, this helps to shift the data to the MSB.

SPI_SWAP_DATA_RX (DATA, LEN)
  Transform received data of length <= 32 bits to the format of an unsigned integer.

E.g. to transform the data of 15 bits placed in a 4-byte array to integer:

```c
uint16_t data = SPI_SWAP_DATA_RX((uint32_t*)t->rx_data, 15);
```

Parameters

- **DATA** - Data to be rearranged, can be uint8_t, uint16_t or uint32_t.
- **LEN** - Length of data received, since the SPI peripheral writes from the MSB, this helps to shift the data to the LSB.
Chapter 2. API Reference

`SPICOMMON_BUSFLAG_SLAVE`
Initialize I/O in slave mode.

`SPICOMMON_BUSFLAG_MASTER`
Initialize I/O in master mode.

`SPICOMMON_BUSFLAG_IOMUX_PINS`
Check using iomux pins. Or indicates the pins are configured through the IO mux rather than GPIO matrix.

`SPICOMMON_BUSFLAG_GPIO_PINS`
Force the signals to be routed through GPIO matrix. Or indicates the pins are routed through the GPIO matrix.

`SPICOMMON_BUSFLAG_SCLK`
Check existing of SCLK pin. Or indicates CLK line initialized.

`SPICOMMON_BUSFLAG_MISO`
Check existing of MISO pin. Or indicates MISO line initialized.

`SPICOMMON_BUSFLAG_MOSI`
Check existing of MOSI pin. Or indicates MOSI line initialized.

`SPICOMMON_BUSFLAG_DUAL`
Check MOSI and MISO pins can output. Or indicates bus able to work under DIO mode.

`SPICOMMON_BUSFLAG_WPHD`
Check existing of WP and HD pins. Or indicates WP & HD pins initialized.

`SPICOMMON_BUSFLAG_QUAD`
Check existing of MOSI/MISO/ WP/ HD pins as output. Or indicates bus able to work under QIO mode.

`SPICOMMON_BUSFLAG_IO4_IO7`
Check existing of IO4- IO7 pins. Or indicates IO4-IO7 pins initialized.

`SPICOMMON_BUSFLAG_OCTAL`
Check existing of MOSI/MISO/WP/ HD/ SPIIO4/ SPIIO5/ SPIIO6/ SPIIO7 pins as output. Or indicates bus able to work under octal mode.

`SPICOMMON_BUSFLAG_NATIVE_PINS`

Type Definitions
typedef `spi_common_dma_t` spi_dma_chan_t

Enumerations
enum `spi_common_dma_t`
SPI DMA channels.

Values:
Chapter 2. API Reference

enumerator SPI_DMA_DISABLED
Do not enable DMA for SPI.

enumerator SPI_DMA_CH_AUTO
Enable DMA, channel is automatically selected by driver.

API Reference - SPI Master

Header File

• components/driver/spi/include/driver/spi_master.h
• This header file can be included with:

```c
#include "driver/spi_master.h"
```
• This header file is a part of the API provided by the driver component. To declare that your component depends on driver, add the following to your CMakeLists.txt:

```cmake
REQUIRES driver
```
or

```cmake
PRIV_REQUIRES driver
```

Functions

`esp_err_t spi_bus_add_device(spi_host_device_t host_id, const spi_device_interface_config_t *dev_config, spi_device_handle_t *handle)`

Allocate a device on a SPI bus.

This initializes the internal structures for a device, plus allocates a CS pin on the indicated SPI master peripheral and routes it to the indicated GPIO. All SPI master devices have three CS pins and can thus control up to three devices.

Note: While in general, speeds up to 80MHz on the dedicated SPI pins and 40MHz on GPIO-matrix-routed pins are supported, full-duplex transfers routed over the GPIO matrix only support speeds up to 26MHz.

Parameters

• **host_id** – SPI peripheral to allocate device on
• **dev_config** – SPI interface protocol config for the device
• **handle** – Pointer to variable to hold the device handle

Returns

• ESP_ERR_INVALID_ARG if parameter is invalid or configuration combination is not supported (e.g. dev_config->post_cb isn’t set while flag SPI_DEVICE_NO_RETURN_RESULT is enabled)
• ESP_ERR_INVALID_STATE if selected clock source is unavailable or spi bus not initialized
• ESP_ERR_NOT_FOUND if host doesn’t have any free CS slots
• ESP_ERR_NO_MEM if out of memory
• ESP_OK on success

`esp_err_t spi_bus_remove_device(spi_device_handle_t handle)`

Remove a device from the SPI bus.

Parameters **handle** – Device handle to free

Returns

• ESP_ERR_INVALID_ARG if parameter is invalid
• ESP_ERR_INVALID_STATE if device already is freed
• ESP_OK on success

`esp_err_t spi_device_queue_trans(spi_device_handle_t handle, spi_transaction_t *trans_desc,
                        TickType_t ticks_to_wait)`

Queue a SPI transaction for interrupt transaction execution. Get the result by `spi_device_get_trans_result`.

**Note:** Normally a device cannot start (queue) polling and interrupt transactions simultaneously.

**Parameters**
- **handle** - Device handle obtained using `spi_host_add_dev`
- **trans_desc** - Description of transaction to execute
- **ticks_to_wait** - Ticks to wait until there’s room in the queue; use `portMAX_DELAY` to never time out.

**Returns**
- ESP_ERR_INVALID_ARG if parameter is invalid. This can happen if `SPI_TRANS_CS_KEEP_ACTIVE` flag is specified while the bus was not acquired (`spi_device_acquire_bus()` should be called first) or set flag `SPI_TRANS_DMA_BUFFER_ALIGN_MANUAL` but tx or rx buffer not DMA-capable, or addr&len not align to cache line size
- ESP_ERR_TIMEOUT if there was no room in the queue before `ticks_to_wait` expired
- ESP_ERR_NO_MEM if allocating DMA-capable temporary buffer failed
- ESP_ERR_INVALID_STATE if previous transactions are not finished
- ESP_OK on success

`esp_err_t spi_device_get_trans_result(spi_device_handle_t handle, spi_transaction_t **trans_desc,
                        TickType_t ticks_to_wait)`

Get the result of a SPI transaction queued earlier by `spiDeviceQueue_trans`.

This routine will wait until a transaction to the given device successfully completed. It will then return the description of the completed transaction so software can inspect the result and e.g. free the memory or re-use the buffers.

**Parameters**
- **handle** - Device handle obtained using `spi_host_add_dev`
- **trans_desc** - Pointer to variable able to contain a pointer to the description of the transaction that is executed. The descriptor should not be modified until the descriptor is returned by `spi_device_get_trans_result`.
- **ticks_to_wait** - Ticks to wait until there’s a returned item; use `portMAX_DELAY` to never time out.

**Returns**
- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_NOT_SUPPORTED if flag `SPI_DEVICE_NO_RETURN_RESULT` is set
- ESP_ERR_TIMEOUT if there was no completed transaction before `ticks_to_wait` expired
- ESP_OK on success

`esp_err_t spi_device_transmit(spi_device_handle_t handle, spi_transaction_t *trans_desc)`

Send a SPI transaction, wait for it to complete, and return the result.

This function is the equivalent of calling `spiDeviceQueue_trans()` followed by `spiDeviceGet_trans_result()`. Do not use this when there is still a transaction separately queued (started) from `spiDeviceQueue_trans()` or polling_start/transmit that hasn’t been finalized.

**Note:** This function is not thread safe when multiple tasks access the same SPI device. Normally a device cannot start (queue) polling and interrupt transactions simultaneously.
Parameters
- **handle**: Device handle obtained using `spi_host_add_dev`
- **trans_desc**: Description of transaction to execute

Returns
- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_OK on success

```c
esp_err_t spi_device_polling_start (spi_device_handle_t handle, spi_transaction_t *trans_desc,
           TickType_t ticks_to_wait)
```

Immediately start a polling transaction.

**Note:** Normally a device cannot start (queue) polling and interrupt transactions simultaneously. Moreover, a device cannot start a new polling transaction if another polling transaction is not finished.

Parameters
- **handle**: Device handle obtained using `spi_host_add_dev`
- **trans_desc**: Description of transaction to execute
- **ticks_to_wait**: Tick to wait until there’s room in the queue; currently only `portMAX_DELAY` is supported.

Returns
- ESP_ERR_INVALID_ARG if parameter is invalid. This can happen if SPI_TRANS_CS_KEEP_ACTIVE flag is specified while the bus was not acquired (`spi_device_acquire_bus()` should be called first) or set flag SPI_TRANS_DMA_BUFFER_ALIGN_MANUAL but tx or rx buffer not DMA-capable, or addr&len not align to cache line size
- ESP_ERR_TIMEOUT if the device cannot get control of the bus before `ticks_to_wait` expired
- ESP_ERR_NO_MEM if allocating DMA-capable temporary buffer failed
- ESP_ERR_INVALID_STATE if previous transactions are not finished
- ESP_OK on success

```c
esp_err_t spi_device_polling_end (spi_device_handle_t handle, TickType_t ticks_to_wait)
```

Poll until the polling transaction ends.

This routine will not return until the transaction to the given device has successfully completed. The task is not blocked, but actively busy-spins for the transaction to be completed.

Parameters
- **handle**: Device handle obtained using `spi_host_add_dev`
- **ticks_to_wait**: Tick to wait until there’s a returned item; use `portMAX_DELAY` to never time out.

Returns
- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_TIMEOUT if the transaction cannot finish before `ticks_to_wait` expired
- ESP_OK on success

```c
esp_err_t spi_device_polling_transmit (spi_device_handle_t handle, spi_transaction_t *trans_desc)
```

Send a polling transaction, wait for it to complete, and return the result.

This function is the equivalent of calling `spi_device_polling_start()` followed by `spi_device_polling_end()`. Do not use this when there is still a transaction that hasn’t been finalized.

**Note:** This function is not thread safe when multiple tasks access the same SPI device. Normally a device cannot start (queue) polling and interrupt transactions simultaneously.
Chapter 2. API Reference

- **handle** - Device handle obtained using `spi_host_add_dev`
- **trans_desc** - Description of transaction to execute

**Returns**
- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_TIMEOUT if the device cannot get control of the bus
- ESP_ERR_NO_MEM if allocating DMA-capable temporary buffer failed
- ESP_ERR_INVALID_STATE if previous transactions of same device are not finished
- ESP_OK on success

```c
esp_err_t spi_device_acquire_bus(spi_device_handle_t device, TickType_t wait)
```

Occupy the SPI bus for a device to do continuous transactions.

Transactions to all other devices will be put off until `spi_device_release_bus` is called.

**Note:** The function will wait until all the existing transactions have been sent.

**Parameters**
- **device** - The device to occupy the bus.
- **wait** - Time to wait before the the bus is occupied by the device. Currently MUST set to portMAX_DELAY.

**Returns**
- ESP_ERR_INVALID_ARG: `wait` is not set to portMAX_DELAY.
- ESP_OK: Success.

```c
void spi_device_release_bus(spi_device_handle_t dev)
```

Release the SPI bus occupied by the device. All other devices can start sending transactions.

**Parameters**
- **dev** - The device to release the bus.

```c
esp_err_t spi_device_get_actual_freq(spi_device_handle_t handle, int* freq_khz)
```

Calculate working frequency for specific device.

**Parameters**
- **handle** - SPI device handle
- **freq_khz** - [out] output parameter to hold calculated frequency in kHz

**Returns**
- ESP_ERR_INVALID_ARG: `handle` or `freq_khz` parameter is NULL
- ESP_OK: Success

```c
int spi_get_actual_clock(int fapb, int hz, int duty_cycle)
```

Calculate the working frequency that is most close to desired frequency.

**Parameters**
- **fapb** - The frequency of apb clock, should be APB_CLK_FREQ.
- **hz** - Desired working frequency
- **duty_cycle** - Duty cycle of the spi clock

**Returns** Actual working frequency that most fit.

```c
void spi_get_timing(bool gpio_is_used, int input_delay_ns, int eff_clk, int *dummy_o, int *cycles_remain_o)
```

Calculate the timing settings of specified frequency and settings.

**Note:** If **dummy_o** is not zero, it means dummy bits should be applied in half duplex mode, and full duplex mode may not work.

**Parameters**
- **gpio_is_used** - True if using GPIO matrix, or False if iomux pins are used.
• **input delay ns** – Input delay from SCLK launch edge to MISO data valid.
• **eff_clk** – Effective clock frequency (in Hz) from `spi_get_actual_clock()`.
• **dummy o** – Address of dummy bits used output. Set to NULL if not needed.
• **cycles remain o** – Address of cycles remaining (after dummy bits are used) output.
  – -1 If too many cycles remaining, suggest to compensate half a clock.
  – 0 If no remaining cycles or dummy bits are not used.
  – positive value: cycles suggest to compensate.

```c
int spi_get_freq_limit (bool gpio_is_used, int input_delay_ns)
```

Get the frequency limit of current configurations. SPI master working at this limit is OK, while above the limit, full duplex mode and DMA will not work, and dummy bits will be applied in the half duplex mode.

**Parameters**
- **gpio_is_used** – True if using GPIO matrix, or False if native pins are used.
- **input_delay_ns** – Input delay from SCLK launch edge to MISO data valid.

**Returns** Frequency limit of current configurations.

```c
esp_err_t spi_bus_get_max_transaction_len (spi_host_device_t host_id, size_t *max_bytes)
```

Get max length (in bytes) of one transaction.

**Parameters**
- **host_id** – SPI peripheral
- **max_bytes** – [out] Max length of one transaction, in bytes

**Returns**
- ESP_OK: On success
- ESP_ERR_INVALID_ARG: Invalid argument

**Structures**

```c
struct spi_device_interface_config_t
```

This is a configuration for a SPI slave device that is connected to one of the SPI buses.

**Public Members**

```c
uint8_t command_bits
```

Default amount of bits in command phase (0-16), used when `SPI_TRANS_VARIABLE_CMD` is not used, otherwise ignored.

```c
uint8_t address_bits
```

Default amount of bits in address phase (0-64), used when `SPI_TRANS_VARIABLE_ADDR` is not used, otherwise ignored.

```c
uint8_t dummy_bits
```

Amount of dummy bits to insert between address and data phase.

```c
uint8_t mode
```

SPI mode, representing a pair of (CPOL, CPHA) configuration:
- 0: (0, 0)
- 1: (0, 1)
- 2: (1, 0)
- 3: (1, 1)

```c
spi_clock_source_t clock_source
```

Select SPI clock source, `SPI_CLK_SRC_DEFAULT` by default.
**Chapter 2. API Reference**

**uint16_t duty_cycle_pos**
Duty cycle of positive clock, in 1/256th increments (128 = 50%/50% duty). Setting this to 0 (=not setting it) is equivalent to setting this to 128.

**uint16_t cs_ena_pretrans**
Amount of SPI bit-cycles the cs should be activated before the transmission (0-16). This only works on half-duplex transactions.

**uint8_t cs_ena_posttrans**
Amount of SPI bit-cycles the cs should stay active after the transmission (0-16)

**int clock_speed_hz**
SPI clock speed in Hz. Derived from `clock_source`.

**int input_delay_ns**
Maximum data valid time of slave. The time required between SCLK and MISO valid, including the possible clock delay from slave to master. The driver uses this value to give an extra delay before the MISO is ready on the line. Leave at 0 unless you know you need a delay. For better timing performance at high frequency (over 8MHz), it’s suggest to have the right value.

**int spics_io_num**
CS GPIO pin for this device, or -1 if not used.

**uint32_t flags**
Bitwise OR of SPI_DEVICE_* flags.

**int queue_size**
Transaction queue size. This sets how many transactions can be ‘in the air’ (queued using spi_device_queue_trans but not yet finished using spi_device_get_trans_result) at the same time.

**transaction_cb_t pre_cb**
Callback to be called before a transmission is started.
This callback is called within interrupt context should be in IRAM for best performance, see “Transferring Speed” section in the SPI Master documentation for full details. If not, the callback may crash during flash operation when the driver is initialized with ESP_INTR_FLAG_IRAM.

**transaction_cb_t post_cb**
Callback to be called after a transmission has completed.
This callback is called within interrupt context should be in IRAM for best performance, see “Transferring Speed” section in the SPI Master documentation for full details. If not, the callback may crash during flash operation when the driver is initialized with ESP_INTR_FLAG_IRAM.

**struct spi_transaction_t**
This structure describes one SPI transaction. The descriptor should not be modified until the transaction finishes.

**Public Members**

**uint32_t flags**
Bitwise OR of SPI_TRANS_* flags.
uint16_t cmd
Command data, of which the length is set in the command_bits of spi_device_interface_config_t.

NOTE: this field, used to be “command” in ESP-IDF 2.1 and before, is re-written to be used in a new way in ESP-IDF 3.0.

Example: write 0x0123 and command_bits=12 to send command 0x12, 0x3 (in previous version, you may have to write 0x3_12).

uint64_t addr
Address data, of which the length is set in the address_bits of spi_device_interface_config_t.

NOTE: this field, used to be “address” in ESP-IDF 2.1 and before, is re-written to be used in a new way in ESP-IDF 3.0.

Example: write 0x123400 and address_bits=24 to send address of 0x12, 0x34, 0x00 (in previous version, you may have to write 0x12340000).

size_t length
Total data length, in bits.

size_t rxlength
Total data length received, should be not greater than length in full-duplex mode (0 defaults this to the value of length).

void *user
User-defined variable. Can be used to store eg transaction ID.

const void *tx_buffer
Pointer to transmit buffer, or NULL for no MOSI phase.

uint8_t tx_data[4]
If SPI_TRANS_USE_TXDATA is set, data set here is sent directly from this variable.

void *rx_buffer
Pointer to receive buffer, or NULL for no MISO phase. Written by 4 bytes-unit if DMA is used.

uint8_t rx_data[4]
If SPI_TRANS_USE_RXDATA is set, data is received directly to this variable.

struct spi_transaction_ext_t
This struct is for SPI transactions which may change their address and command length. Please do set the flags in base to SPI_TRANS_VARIABLE_CMD_ADR to use the bit length here.

Public Members

struct spi_transaction_t base
Transaction data, so that pointer to spi_transaction_t can be converted into spi_transaction_ext_t.

uint8_t command_bits
The command length in this transaction, in bits.
uint8_t address_bits
   The address length in this transaction, in bits.

uint8_t dummy_bits
   The dummy length in this transaction, in bits.

Macros

SPI_MASTER_FREQ_8M
   SPI common used frequency (in Hz)

Note: SPI peripheral only has an integer divider, and the default clock source can be different on other targets, so the actual frequency may be slightly different from the desired frequency. 8MHz

SPI_MASTER_FREQ_9M
   8.89MHz

SPI_MASTER_FREQ_10M
   10MHz

SPI_MASTER_FREQ_11M
   11.43MHz

SPI_MASTER_FREQ_13M
   13.33MHz

SPI_MASTER_FREQ_16M
   16MHz

SPI_MASTER_FREQ_20M
   20MHz

SPI_MASTER_FREQ_26M
   26.67MHz

SPI_MASTER_FREQ_40M
   40MHz

SPI_MASTER_FREQ_80M
   80MHz

SPI_DEVICE_TXBIT_LSBFIRST
   Transmit command/address/data LSB first instead of the default MSB first.

SPI_DEVICE_RXBIT_LSBFIRST
   Receive data LSB first instead of the default MSB first.

SPIDEVICE_BIT_LSBFIRST
   Transmit and receive LSB first.
SPI_DEVICE_3WIRE
Use MOSI (spid) for both sending and receiving data.

SPI_DEVICE_POSITIVE_CS
Make CS positive during a transaction instead of negative.

SPI_DEVICE_HALFDUPLEX
Transmit data before receiving it, instead of simultaneously.

SPI_DEVICE_CLK_AS_CS
Output clock on CS line if CS is active.

SPI_DEVICE_NO_DUMMY
There are timing issues when reading at high frequency (the frequency is related to whether iomux pins are used, valid time after slave sees the clock).

• In half-duplex mode, the driver automatically inserts dummy bits before reading phase to fix the timing issue. Set this flag to disable this feature.
• In full-duplex mode, however, the hardware cannot use dummy bits, so there is no way to prevent data being read from getting corrupted. Set this flag to confirm that you’re going to work with output only, or read without dummy bits at your own risk.

SPI_DEVICE_DDRCLK

SPI_DEVICE_NO_RETURN_RESULT
Don’t return the descriptor to the host on completion (use post_cb to notify instead)

SPI_TRANS_MODE_DIO
Transmit/receive data in 2-bit mode.

SPI_TRANS_MODE_QIO
Transmit/receive data in 4-bit mode.

SPI_TRANS_USE_RXDATA
Receive into rx_data member of spi_transaction_t instead into memory at rx_buffer.

SPI_TRANS_USE_TXDATA
Transmit tx_data member of spi_transaction_t instead of data at tx_buffer. Do not set tx_buffer when using this.

SPI_TRANS_MODE_DIOQIO_ADDR
Also transmit address in mode selected by SPI_MODE_DIO/SPI_MODE_QIO.

SPI_TRANS_VARIABLE_CMD
Use the command_bits in spi_transaction_ext_t rather than default value in spi_device_interface_config_t.

SPI_TRANS_VARIABLE_ADDR
Use the address_bits in spi_transaction_ext_t rather than default value in spi_device_interface_config_t.
**SPI_TRANS_VARIABLE_DUMMY**
Use the dummy_bits in `spi_transaction_ext_t` rather than default value in `spi_device_interface_config_t`.

**SPI_TRANS_CS_KEEP_ACTIVE**
Keep CS active after data transfer.

**SPI_TRANS_MULTILINE_CMD**
The data lines used at command phase is the same as data phase (otherwise, only one data line is used at command phase)

**SPI_TRANS_MODE_OCT**
Transmit/receive data in 8-bit mode.

**SPI_TRANS_MULTILINE_ADDR**
The data lines used at address phase is the same as data phase (otherwise, only one data line is used at address phase)

**SPI_TRANS_DMA_BUFFER_ALIGN_MANUAL**
By default driver will automatically re-alloc dma buffer if it doesn’t meet hardware alignment or dma_capable requirements, this flag is for you to disable this feature, you will need to take care of the alignment otherwise driver will return you error ESP_ERR_INVALID_ARG.

**Type Definitions**

```c
typedef void (*transaction_cb_t)(spi_transaction_t *trans)

typedef struct spi_device_t *spi_device_handle_t
Handle for a device on a SPI bus.
```

### 2.6.23 SPI Slave Driver

SPI Slave driver is a program that controls ESP32-S3’s General Purpose SPI (GP-SPI) peripheral(s) when it functions as a slave.

For more hardware information about the GP-SPI peripheral(s), see ESP32-S3 Technical Reference Manual > SPI Controller [PDF].

**Terminology**

The terms used in relation to the SPI slave driver are given in the table below.
<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Host</td>
<td>The SPI controller peripheral external to ESP32-S3 that initiates SPI transmissions over the bus, and acts as an SPI Master.</td>
</tr>
<tr>
<td>Device</td>
<td>SPI slave device (general purpose SPI controller). Each Device shares the MOSI, MISO and SCLK signals but is only active on the bus when the Host asserts the Device’s individual CS line.</td>
</tr>
<tr>
<td>Bus</td>
<td>A signal bus, common to all Devices connected to one Host. In general, a bus includes the following lines: MISO, MOSI, SCLK, one or more CS lines, and, optionally, QUADWP and QUADHD. So Devices are connected to the same lines, with the exception that each Device has its own CS line. Several Devices can also share one CS line if connected in the daisy-chain manner.</td>
</tr>
<tr>
<td>MISO</td>
<td>Master In, Slave Out, a.k.a. Q. Data transmission from a Device to Host.</td>
</tr>
<tr>
<td>MOSI</td>
<td>Master Out, Slave In, a.k.a. D. Data transmission from a Host to Device.</td>
</tr>
<tr>
<td>SCLK</td>
<td>Serial Clock. Oscillating signal generated by a Host that keeps the transmission of data bits in sync.</td>
</tr>
<tr>
<td>CS</td>
<td>Chip Select. Allows a Host to select individual Device(s) connected to the bus in order to send or receive data.</td>
</tr>
<tr>
<td>QUADWP</td>
<td>Write Protect signal. Only used for 4-bit (qio/qout) transactions.</td>
</tr>
<tr>
<td>QUADHD</td>
<td>Hold signal. Only used for 4-bit (qio/qout) transactions.</td>
</tr>
<tr>
<td>Assertion</td>
<td>The action of activating a line. The opposite action of returning the line back to inactive (back to idle) is called <strong>de-assertion</strong>.</td>
</tr>
<tr>
<td>Transaction</td>
<td>One instance of a Host asserting a CS line, transferring data to and from a Device, and de-asserting the CS line. Transactions are atomic, which means they can never be interrupted by another transaction.</td>
</tr>
<tr>
<td>Launch Edge</td>
<td>Edge of the clock at which the source register launches the signal onto the line.</td>
</tr>
<tr>
<td>Latch Edge</td>
<td>Edge of the clock at which the destination register latches in the signal.</td>
</tr>
</tbody>
</table>

**Driver Features**

The SPI slave driver allows using the SPI peripherals as full-duplex Devices. The driver can send/receive transactions up to 64 bytes in length, or utilize DMA to send/receive longer transactions. However, there are some known issues related to DMA.

The SPI slave driver supports registering the SPI ISR to a certain CPU core. If multiple tasks try to access the same SPI Device simultaneously, it is recommended that your application be refactored so that each SPI peripheral is only accessed by a single task at a time. Please also use `spi_bus_config_t::isr_cpu_id` to register the SPI ISR to the same core as SPI peripheral related tasks to ensure thread safety.

**SPI Transactions**

A full-duplex SPI transaction begins when the Host asserts the CS line and starts sending out clock pulses on the SCLK line. Every clock pulse, a data bit is shifted from the Host to the Device on the MOSI line and back on the MISO line at the same time. At the end of the transaction, the Host de-asserts the CS line.

The attributes of a transaction are determined by the configuration structure for an SPI peripheral acting as a slave device `spi_slave_interface_config_t`, and transaction configuration structure `spi_slave_transaction_t`.

As not every transaction requires both writing and reading data, you can choose to configure the `spi_transaction_t` structure for TX only, RX only, or TX and RX transactions. If `spi_slave_transaction_t::rx_buffer` is set to NULL, the read phase will be skipped. Similarly, if `spi_slave_transaction_t::tx_buffer` is set to NULL, the write phase will be skipped.

**Note:** A Host should not start a transaction before its Device is ready for receiving data. It is recommended to use another GPIO pin for a handshake signal to sync the Devices. For more details, see Transaction Interval.
Driver Usage

- Initialize an SPI peripheral as a Device by calling the function `spi_slave_initialize()`. Make sure to set the correct I/O pins in the struct `bus_config`. Set the unused signals to -1.
- Before initiating transactions, fill one or more `spi_slave_transaction_t` structs with the transaction parameters required. Either queue all transactions by calling the function `spi_slave_queue_trans()` and, at a later time, query the result by using the function `spi_slave_get_trans_result()`, or handle all requests individually by feeding them into `spi_slave_transmit()`. The latter two functions will be blocked until the Host has initiated and finished a transaction, causing the queued data to be sent and received.
- (Optional) To unload the SPI slave driver, call `spi_slave_free()`.

Transaction Data and Master/Slave Length Mismatches

Normally, the data that needs to be transferred to or from a Device is read or written to a chunk of memory indicated by the `spi_slave_transaction_t::rx_buffer` and `spi_slave_transaction_t::tx_buffer`. The SPI driver can be configured to use DMA for transfers, in which case these buffers must be allocated in DMA-capable memory using `pvPortMallocCaps(size, MALLOC_CAP_DMA)`.

The amount of data that the driver can read or write to the buffers is limited by `spi_slave_transaction_t::length`. However, this member does not define the actual length of an SPI transaction. A transaction’s length is determined by the clock and CS lines driven by the Host. The actual length of the transmission can be read only after a transaction is finished from the member `spi_slave_transaction_t::trans_len`.

If the length of the transmission is greater than the buffer length, only the initial number of bits specified in the `spi_slave_transaction_t::length` member will be sent and received. In this case, `spi_slave_transaction_t::trans_len` is set to `spi_slave_transaction_t::length` instead of the actual transaction length. To meet the actual transaction length requirements, set `spi_slave_transaction_t::trans_len` to a value greater than the maximum `spi_slave_transaction_t::trans_len` expected. If the transmission length is shorter than the buffer length, only the data equal to the length of the buffer will be transmitted.

GPIO Matrix and IO_MUX

Most of chip’s peripheral signals have direct connection to their dedicated IO_MUX pins. However, the signals can also be routed to any other available pins using the less direct GPIO matrix. If at least one signal is routed through the GPIO matrix, then all signals will be routed through it.

When an SPI Host is set to 80 MHz or lower frequencies, routing SPI pins via GPIO matrix will behave the same compared to routing them via IO_MUX.

The IO_MUX pins for SPI buses are given below.

<table>
<thead>
<tr>
<th>Pin Name</th>
<th>GPIO Number (SPI2)</th>
</tr>
</thead>
<tbody>
<tr>
<td>CS0</td>
<td>10</td>
</tr>

Speed and Timing Considerations

Transaction Interval

The ESP32-S3 SPI slave peripherals are designed as general purpose Devices controlled by a CPU. As opposed to dedicated slaves, CPU-based SPI Devices have a limited number of pre-defined registers. All transactions must be handled by the CPU, which means that the transfers and responses are not real-time, and there might be noticeable latency.
As a solution, a Device’s response rate can be doubled by using the functions `spi_slave_queue_trans()` and then `spi_slave_get_trans_result()` instead of using `spi_slave_transmit()`.

You can also configure a GPIO pin through which the Device will signal to the Host when it is ready for a new transaction. A code example of this can be found in `peripherals/spi_slave`.

**SCLK Frequency Requirements**  The SPI slaves are designed to operate at up to 60 MHz. The data cannot be recognized or received correctly if the clock is too fast or does not have a 50% duty cycle.

**Restrictions and Known Issues**

1. If DMA is enabled, the rx buffer should be word-aligned (starting from a 32-bit boundary and having a length of multiples of 4 bytes). Otherwise, DMA may write incorrectly or not in a boundary aligned manner. The driver reports an error if this condition is not satisfied.
   Also, a Host should write lengths that are multiples of 4 bytes. The data with inappropriate lengths will be discarded.

**Application Example**

The code example for Device/Host communication can be found in the `peripherals/spi_slave` directory of ESP-IDF examples.

**API Reference**

**Header File**

- `components/driver/spi/include/driver/spi_slave.h`
- This header file can be included with:

  ```
  #include "driver/spi_slave.h"
  ```

- This header file is a part of the API provided by the `driver` component. To declare that your component depends on `driver`, add the following to your `CMakeLists.txt`:

  ```
  REQUIRES driver
  ```
  or
  ```
  PRIV_REQUIRES driver
  ```

**Functions**

- `esp_err_t spi_slave_initialize(spi_host_device_t host, const spi_bus_config_t *bus_config, const spi_slave_interface_config_t *slave_config, spi_dma_chan_t dma_chan)`

  Initialize a SPI bus as a slave interface.

  **Warning:** SPI0/1 is not supported

  **Warning:** If a DMA channel is selected, any transmit and receive buffer used should be allocated in DMA-capable memory.

  **Warning:** The ISR of SPI is always executed on the core which calls this function. Never starve the ISR on this core or the SPI transactions will not be handled.
Parameters

- **host** - SPI peripheral to use as a SPI slave interface
- **bus_config** - Pointer to a `spi_bus_config_t` struct specifying how the host should be initialized
- **slave_config** - Pointer to a `spi_slave_interface_config_t` struct specifying the details for the slave interface
- **dma_chan** - Selecting a DMA channel for an SPI bus allows transactions on the bus with size only limited by the amount of internal memory.
  - Selecting `SPI_DMA_DISABLED` limits the size of transactions.
  - Set to `SPI_DMA_DISABLED` if only the SPI flash uses this bus.
  - Set to `SPI_DMA_CH_AUTO` to let the driver to allocate the DMA channel.

Returns

- ESP_ERR_INVALID_ARG if configuration is invalid
- ESP_ERR_INVALID_STATE if host already is in use
- ESP_ERR_NOT_FOUND if there is no available DMA channel
- ESP_ERR_NO_MEM if out of memory
- ESP_OK on success

```c
esp_err_t spi_slave_free(spi_host_device_t host)
```

Free a SPI bus claimed as a SPI slave interface.

Parameters **host** - SPI peripheral to free

Returns

- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_INVALID_STATE if not all devices on the bus are freed
- ESP_OK on success

```c
esp_err_t spi_slave_queue_trans(spi_host_device_t host, const spi_slave_transaction_t *trans_desc,
                                TickType_t ticks_to_wait)
```

Queue a SPI transaction for execution.

Queue a SPI transaction to be executed by this slave device. (The transaction queue size was specified when the slave device was initialised via `spi_slave_init()`. This function may block if the queue is full (depending on the `ticks_to_wait` parameter). No SPI operation is directly initiated by this function, the next queued transaction will happen when the master initiates a SPI transaction by pulling down CS and sending out clock signals.

This function hands over ownership of the buffers in `trans_desc` to the SPI slave driver; the application is not to access this memory until `spi_slave_queue_trans` is called to hand ownership back to the application.

Parameters

- **host** - SPI peripheral that is acting as a slave
- **trans_desc** - Description of transaction to execute. Not const because we may want to write status back into the transaction description.
- **ticks_to_wait** - Ticks to wait until there’s room in the queue; use `portMAX_DELAY` to never time out.

Returns

- ESP_ERR_INVALID_ARG if parameter is invalid
- ESP_ERR_NO_MEM if set flag `SPI_SLAVE_TRANS_DMA_BUFFER_ALIGN_AUTO` but there is no free memory
- ESP_ERR_INVALID_STATE if sync data between Cache and memory failed
- ESP_OK on success

```c
esp_err_t spi_slave_get_trans_result(spi_host_device_t host, spi_slave_transaction_t **trans_desc,
                                     TickType_t ticks_to_wait)
```

Get the result of a SPI transaction queued earlier.

This routine will wait until a transaction to the given device (queued earlier with `spi_slave_queue_trans`) has successfully completed. It will then return the description of the completed transaction so software can inspect the result and e.g. free the memory or re-use the buffers.

It is mandatory to eventually use this function for any transaction queued by `spi_slave_queue_trans`. 
Parameters

- `host` – SPI peripheral to that is acting as a slave
- `trans_desc` – Pointer to variable able to contain a pointer to the description of the transaction that is executed
- `ticks_to_wait` – Ticks to wait until there’s a returned item; use `portMAX_DELAY` to never time out.

Returns

- `ESP_ERR_INVALID_ARG` if parameter is invalid
- `ESP_OK` on success

```
esp_err_t spi_slave_transmit (spi_host_device_t host, spi_slave_transaction_t *trans_desc, TickType_t ticks_to_wait)
```

Do a SPI transaction.

Essentially does the same as `spi_slave_queue_trans` followed by `spi_slave_get_trans_result`. Do not use this when there is still a transaction queued that hasn’t been finalized using `spi_slave_get_trans_result`.

Parameters

- `host` – SPI peripheral to that is acting as a slave
- `trans_desc` – Pointer to variable able to contain a pointer to the description of the transaction that is executed. Not const because we may want to write status back into the transaction description.
- `ticks_to_wait` – Ticks to wait until there’s a returned item; use `portMAX_DELAY` to never time out.

Returns

- `ESP_ERR_INVALID_ARG` if parameter is invalid
- `ESP_OK` on success

Structures

```
struct spi_slave_interface_config_t
```

This is a configuration for a SPI host acting as a slave device.

Public Members

```
int spics_io_num
```

CS GPIO pin for this device.

```
uint32_t flags
```

Bitwise OR of `SPI_SLAVE_*` flags.

```
int queue_size
```

Transaction queue size. This sets how many transactions can be ‘in the air’ (queued using `spi_slave_queue_trans` but not yet finished using `spi_slave_get_trans_result`) at the same time.

```
uint8_t mode
```

SPI mode, representing a pair of (CPOL, CPHA) configuration:

- 0: (0, 0)
- 1: (0, 1)
- 2: (1, 0)
- 3: (1, 1)
slave_transaction_cb_t *post_setup_cb

Callback called after the SPI registers are loaded with new data.
This callback is called within interrupt context should be in IRAM for best performance, see “Transferring Speed” section in the SPI Master documentation for full details. If not, the callback may crash during flash operation when the driver is initialized with ESP_INTR_FLAG_IRAM.

slave_transaction_cb_t *post_trans_cb

Callback called after a transaction is done.
This callback is called within interrupt context should be in IRAM for best performance, see “Transferring Speed” section in the SPI Master documentation for full details. If not, the callback may crash during flash operation when the driver is initialized with ESP_INTR_FLAG_IRAM.

struct spi_slave_transaction_t

This structure describes one SPI transaction

Public Members

uint32_t flags

Bitwise OR of SPI_SLAVE_TRANS_* flags.

size_t length

Total data length, in bits.

size_t trans_len

Transaction data length, in bits.

const void *tx_buffer

Pointer to transmit buffer, or NULL for no MOSI phase.

void *rx_buffer

Pointer to receive buffer, or NULL for no MISO phase. When the DMA is enabled, must start at WORD boundary (rx_buffer%4==0), and has length of a multiple of 4 bytes.

void *user

User-defined variable. Can be used to store eg transaction ID.

Macros

SPI_SLAVE_TXBIT_LSBFIRST

Transmit command/address/data LSB first instead of the default MSB first.

SPI_SLAVE_RXBIT_LSBFIRST

Receive data LSB first instead of the default MSB first.

SPI_SLAVE_BIT_LSBFIRST

Transmit and receive LSB first.

SPI_SLAVE_NO_RETURN_RESULT

Don’t return the descriptor to the host on completion (use post_trans_cb to notify instead)
SPI_SLAVE_TRANS_DMA_BUFFER_ALIGN_AUTO

Automatically re-malloc dma buffer if user buffer doesn’t meet hardware alignment or dma_capable, this process may loss some memory and performance.

Type Definitions

typedef void (*slave_transaction_cb_t)(spi_slave_transaction_t *trans)

2.6.24 SPI Slave Half Duplex

Introduction

The Half Duplex (HD) Mode is a special mode provided by ESP SPI Slave peripheral. Under this mode, the hardware provides more services than the Full Duplex (FD) Mode (the mode for general-purpose SPI transactions, see SPI Slave Driver). These services reduce the CPU load and the response time of SPI Slave. However, it is important to note that the communication format is determined by the hardware and is always in a half-duplex configuration, allowing only one-way data transfer at any given time. Hence, the mode is named Half Duplex Mode due to this characteristic.

When conducting an SPI transaction, transactions can be classified into several types based on the command phase of the transaction. Each transaction may consist of the following phases: command, address, dummy, and data. The command phase is mandatory, while the other phases may be determined by the command field. During the command, address, and dummy phases, the bus is always controlled by the master (usually the host), while the direction of the data phase depends on the command. The data phase can be either an input phase, where the master writes data to the slave (e.g., the host sends data to the slave), or an output phase, where the master reads data from the slave (e.g., the host receives data from the slave).

Protocol

About the details of how master should communicate with the SPI Slave, see ESP SPI Slave HD (Half Duplex) Mode Protocol.

Through these different transactions, the slave provides these services to the master:

- A DMA channel for the master to write a great amount of data to the slave.
- A DMA channel for the master to read a great amount of data from the slave.
- Several general purpose registers, shared between the master and the slave.
- Several general purpose interrupts, for the master to interrupt the SW of the slave.

Terminology

- Transaction
- Channel
- Sending
- Receiving
- Data Descriptor

Driver Feature

- Transaction read/write by master in segments
- Queues for data to send and received
Chapter 2. API Reference

Driver Usage

Slave Initialization Call `spi_slave_hd_init()` to initialize the SPI bus as well as the peripheral and the driver. The SPI Slave exclusively uses the SPI peripheral, pins of the bus before it is deinitialized, which means other devices are unable to use the above resources during initialization. Thus, to ensure SPI resources are correctly occupied and the connections work properly, most configurations of the slave should be done as soon as the slave is initialized.

The `spi_bus_config_t` specifies how the bus should be initialized, while `spi_slave_hd_slot_config_t` specifies how the SPI Slave driver should work.

Deinitialization (Optional) Call `spi_slave_hd_deinit()` to uninstall the driver. The resources, including the pins, SPI peripheral, internal memory used by the driver, and interrupt sources, are released by the `deinit()` function.

Send/Receive Data by DMA Channels To send data to the master through the sending DMA channel, the application should properly wrap the data in an `spi_slave_hd_data_t` descriptor structure before calling `spi_slave_hd_queue_trans()` with the data descriptor and the channel argument of `SPI_SLAVE_CHAN_TX`. The pointers to descriptors are stored in the queue, and the data is sent to the master in the same order they are enqueued using `spi_slave_hd_queue_trans()`, upon receiving the master’s `Rd_DMA` command.

The application should check the result of data sending by calling `spi_slave_hd_get_trans_res()` with the channel set as `SPI_SLAVE_CHAN_TX`. This function blocks until the transaction with the command `Rd_DMA` from the master successfully completes (or timeout). The `out_trans` argument of the function outputs the pointer of the data descriptor which is just finished, providing information about the sending.

Receiving data from the master through the receiving DMA channel is quite similar. The application calls `spi_slave_hd_queue_trans()` with proper data descriptor and the channel argument of `SPI_SLAVE_CHAN_RX`. And the application calls the `spi_slave_hd_get_trans_res()` later to get the descriptor to the receiving buffer before it handles the data in the receiving buffer.

Note: This driver itself does not have an internal buffer for the data to send or just received. The application should provide data buffer for driver via data descriptors to send to the master, or to receive data from the master.

Please note that, when using this driver for data transfer, the buffer does not have to be fully sent or filled before it is terminated. For example, in the segment transaction mode, the master has to send `CMD7` to terminate a `Wr_DMA` transaction or send `CMD8` to terminate an `Rd_DMA` transaction (in segments), no matter whether the send (receive) buffer is used up (full) or not.

Using Data Descriptor with Customized User Arguments Sometimes you may have initiator (sending data descriptor) and closure (handling returned descriptors) functions in different places. When you get the returned data descriptor in the closure, you may need some extra information when handling the finished data descriptor. For example, you may want to know which round it is for the returned descriptor when you send the same piece of data several times.

Set the `arg` member in the data descriptor to a variable indicating the transaction by force casting, or point it to a structure that wraps all the information you may need when handling the sending/receiving data. Then you can get what you need in your closure.
Using Callbacks

**Note:** These callbacks are called in the ISR, so the required operations need to be processed quickly and returned as soon as possible to ensure that the system is functioning properly. You may need to be very careful to write the code in the ISR.

Since the interrupt handling is executed concurrently with the application, long delays or blocking may cause the system to respond slower or lead to unpredictable behavior. Therefore, when writing callback functions, avoid using operations that may cause delays or blocking, e.g., waiting, sleeping, resource locking, etc.

The `spi_slave_hd_callback_config_t` member in the `spi_slave_hd_slot_config_t` configuration structure passed when initializing the SPI Slave HD driver, allows you to have callbacks for each event you may concern.

The corresponding interrupt for each callback that is not `NULL` is enabled, so that the callbacks can be called immediately when the events happen. You do not need to provide callbacks for the unconcerned events.

The `arg` member in the configuration structure can help you pass some context to the callback or indicate the specific SPI Slave instance when using the same callbacks for multiple SPI Slave peripherals. You can set the `arg` member to a variable that indicates the SPI Slave instance by performing a forced type casting or point it to a context structure. All the callbacks are called with this `arg` argument you set when the callbacks are initialized.

There are two other arguments: the `event` and the `awoken`.

- The `event` passes the information of the current event to the callback. The `spi_slave_hd_event_t` type contains the information of the event, for example, event type, the data descriptor just finished (The `data argument` is very useful in this case!).
- The `awoken` argument serves as an output parameter. It informs the ISR that tasks have been awakened after the callback function, and the ISR should call `portYIELD_FROM_ISR()` to schedule these tasks. Simply pass the `awoken` argument to all FreeRTOS APIs that may unblock tasks, and the value of `awoken` will be returned to the ISR.

**Writing/Reading Shared Registers** Call `spi_slave_hd_write_buffer()` to write the shared buffer, and `spi_slave_hd_read_buffer()` to read the shared buffer.

**Note:** On ESP32-S3, the shared registers are read/written in words by the application but read/written in bytes by the master. There is no guarantee four continuous bytes read from the master are from the same word written by the slave’s application. It is also possible that if the slave reads a word while the master is writing bytes of the word, the slave may get one word with half of them just written by the master, and the other half has not been written into.

The master can confirm that the word is not in transition by reading the word twice and comparing the values.

For the slave, it is more difficult to ensure the word is not in transition because the process of master writing four bytes can be very long (32 SPI clocks). You can put some CRC in the last (largest address) byte of a word so that when the byte is written, the word is sure to be all written.

Due to the conflicts that may be among read/write from SW (worse if there are multi-cores) and master, it is suggested that a word is only used in one direction (only written by the master or only written by the slave).

**Receiving General Purpose Interrupts from the Master** When the master sends CMD8, CMD9 or CMDA, the slave corresponding is triggered. Currently the CMD8 is permanently used to indicate the termination of Rd_DMA segments. To receive general-purpose interrupts, register callbacks for CMD9 and CMDA when the slave is initialized, see Using Callbacks.

**Application Example**

The code example for Device/Host communication can be found in the `peripherals/spi_slave_hd` directory of ESP-IDF examples.
API Reference

Header File

- components/driver/spi/include/driver/spi_slave_hd.h
- This header file can be included with:
  ```
  #include "driver/spi_slave_hd.h"
  ```
- This header file is a part of the API provided by the driver component. To declare that your component depends on driver, add the following to your CMakeLists.txt:
  ```
  REQUIRE driver
  ```
  or
  ```
  PRIV_REQUIRES driver
  ```

Functions

**esp_err_t** **spi_slave_hd_init** (**spi_host_device_t** host_id, **const spi_bus_config_t** *bus_config, **const spi_slave_hd_slot_config_t** *config)

Initialize the SPI Slave HD driver.

**Parameters**

- host_id – The host to use
- bus_config – Bus configuration for the bus used
- config – Configuration for the SPI Slave HD driver

**Returns**

- ESP_OK: on success
- ESP_ERR_INVALID_ARG: invalid argument given
- ESP_ERR_INVALID_STATE: function called in invalid state, may be some resources are already in use
- ESP_ERR_NOT_FOUND if there is no available DMA channel
- ESP_ERR_NO_MEM: memory allocation failed
- or other return value from esp_intr_alloc

**esp_err_t** **spi_slave_hd_deinit** (**spi_host_device_t** host_id)

Deinitialize the SPI Slave HD driver.

**Parameters** host_id – The host to deinitialize the driver

**Returns**

- ESP_OK: on success
- ESP_ERR_INVALID_ARG: if the host_id is not correct

**esp_err_t** **spi_slave_hd_queue_trans** (**spi_host_device_t** host_id, **spi_slave_chan_t** chan, **spi_slave_hd_data_t** *trans, **TickType_t** timeout)

Queue transactions (segment mode)

**Parameters**

- host_id – Host to queue the transaction
- chan – SPI_SLAVE_CHAN_TX or SPI_SLAVE_CHAN_RX
- trans – Transaction descriptors
- timeout – Timeout before the data is queued

**Returns**

- ESP_OK: on success
- ESP_ERR_INVALID_ARG: The input argument is invalid. Can be the following reason:
  - The buffer given is not DMA capable
  - The length of data is invalid (not larger than 0, or exceed the max transfer length)
  - The transaction direction is invalid
- ESP_ERR_TIMEOUT: Cannot queue the data before timeout. Master is still processing previous transaction.
• ESP_ERR_INVALID_STATE: Function called in invalid state. This API should be called under segment mode.

```c
esp_err_t spi_slave_hd_get_trans_res(spi_host_device_t host_id, spi_slave_chan_t chan,
                                      spi_slave_hd_data_t **out_trans, TickType_t timeout)
```

Get the result of a data transaction (segment mode)

**Note:** This API should be called successfully the same times as the `spi_slave_hd_queue_trans`.

**Parameters**
- `host_id` – Host to queue the transaction
- `chan` – Channel to get the result, SPI_SLAVE_CHAN_TX or SPI_SLAVE_CHAN_RX
- `out_trans` – [out] Pointer to the transaction descriptor (spi_slave_hd_data_t) passed to the driver before. Hardware has finished this transaction. Member `trans_len` indicates the actual number of bytes of received data, it’s meaningless for TX.
- `timeout` – Timeout before the result is got

**Returns**
- ESP_OK: on success
- ESP_ERR_INVALID_ARG: Function is not valid
- ESP_ERR_TIMEOUT: There’s no transaction done before timeout
- ESP_ERR_INVALID_STATE: Function called in invalid state. This API should be called under segment mode.

```c
void spi_slave_hd_read_buffer(spi_host_device_t host_id, int addr, uint8_t*out_data, size_t len)
```

Read the shared registers.

**Parameters**
- `host_id` – Host to read the shared registers
- `addr` – Address of register to read, 0 to SOC_SPI_MAXIMUM_BUFFER_SIZE-1
- `out_data` – [out] Output buffer to store the read data
- `len` – Length to read, not larger than SOC_SPI_MAXIMUM_BUFFER_SIZE-addr

```c
void spi_slave_hd_write_buffer(spi_host_device_t host_id, int addr, uint8_t*data, size_t len)
```

Write the shared registers.

**Parameters**
- `host_id` – Host to write the shared registers
- `addr` – Address of register to write, 0 to SOC_SPI_MAXIMUM_BUFFER_SIZE-1
- `data` – Buffer holding the data to write
- `len` – Length to write, SOC_SPI_MAXIMUM_BUFFER_SIZE-addr

```c
esp_err_t spi_slave_hd_append_trans(spi_host_device_t host_id, spi_slave_chan_t chan,
                                    spi_slave_hd_data_t *trans, TickType_t timeout)
```

Load transactions (append mode)

**Note:** In this mode, user transaction descriptors will be appended to the DMA and the DMA will keep processing the data without stopping

**Parameters**
- `host_id` – Host to load transactions
- `chan` – SPI_SLAVE_CHAN_TX or SPI_SLAVE_CHAN_RX
- `trans` – Transaction descriptor
- `timeout` – Timeout before the transaction is loaded

**Returns**
- ESP_OK: on success
- ESP_ERR_INVALID_ARG: The input argument is invalid. Can be the following reason:
– The buffer given is not DMA capable
– The length of data is invalid (not larger than 0, or exceed the max transfer length)
– The transaction direction is invalid

• ESP_ERR_TIMEOUT: Master is still processing previous transaction. There is no available transaction for slave to load
• ESP_ERR_INVALID_STATE: Function called in invalid state. This API should be called under append mode.

```c
esp_err_t spi_slave_hd_get_append_trans_res(spi_host_device_t host_id, spi_slave_chan_t chan, spi_slave_hd_data_t **out_trans, TickType_t timeout)
```

Get the result of a data transaction (append mode)

**Note:** This API should be called the same times as the `spi_slave_hd_append_trans`

### Parameters

- **host_id** – Host to load the transaction
- **chan** – SPI_SLAVE_CHAN_TX or SPI_SLAVE_CHAN_RX
- **out_trans** – [out] Pointer to the transaction descriptor `spi_slave_hd_data_t` passed to the driver before. Hardware has finished this transaction. Member `trans_len` indicates the actual number of bytes of received data, it’s meaningless for TX.
- **timeout** – Timeout before the result is got

### Returns

- ESP_OK: on success
- ESP_ERR_INVALID_ARG: Function is not valid
- ESP_ERR_TIMEOUT: There’s no transaction done before timeout
- ESP_ERR_INVALID_STATE: Function called in invalid state. This API should be called under append mode.

### Structures

**struct spi_slave_hd_data_t**

Descriptor of data to send/receive.

**Public Members**

- `uint8_t* data`
  
  Buffer to send, must be DMA capable.

- `size_t len`

  Len of data to send/receive. For receiving the buffer length should be multiples of 4 bytes, otherwise the extra part will be truncated.

- `size_t trans_len`

  For RX direction, it indicates the data actually received. For TX direction, it is meaningless.

- `uint32_t flags`

  Bitwise OR of SPI_SLAVE_HD_TRANS_* flags.

- `void *arg`

  Extra argument indicating this data.
struct spi_slave_hd_event_t
Information of SPI Slave HD event.

Public Members

spi_event_t event
Event type.

spi_slave_hd_data_t *trans
Corresponding transaction for SPI_EV_SEND and SPI_EV_RECV events.

struct spi_slave_hd_callback_config_t
Callback configuration structure for SPI Slave HD.

Public Members

slave_cb_t cb_buffer_tx
Callback when master reads from shared buffer.

slave_cb_t cb_buffer_rx
Callback when master writes to shared buffer.

slave_cb_t cb_send_dma_ready
Callback when TX data buffer is loaded to the hardware (DMA)

slave_cb_t cb_sent
Callback when data are sent.

slave_cb_t cb_recv_dma_ready
Callback when RX data buffer is loaded to the hardware (DMA)

slave_cb_t cb_recv
Callback when data are received.

slave_cb_t cb_cmd9
Callback when CMD9 received.

slave_cb_t cb_cmdA
Callback when CMDA received.

void *arg
Argument indicating this SPI Slave HD peripheral instance.

struct spi_slave_hd_slot_config_t
Configuration structure for the SPI Slave HD driver.
Public Members

uint8_t mode
SPI mode, representing a pair of (CPOL, CPHA) configuration:
- 0: (0, 0)
- 1: (0, 1)
- 2: (1, 0)
- 3: (1, 1)

uint32_t spics_io_num
CS GPIO pin for this device.

uint32_t flags
Bitwise OR of SPI_SLAVE HD_* flags.

uint32_t command_bits
command field bits, multiples of 8 and at least 8.

uint32_t address_bits
address field bits, multiples of 8 and at least 8.

uint32_t dummy_bits
dummy field bits, multiples of 8 and at least 8.

uint32_t queue_size
Transaction queue size. This sets how many transactions can be ‘in the air’ (queued using spi_slave_hd_queue_trans but not yet finished using spi_slave_hd_get_trans_result) at the same time.

spi_dma_chan_t dma_chan
DMA channel to used.

spi_slave_hd_callback_config_t cb_config
Callback configuration.

Macros

SPI_SLAVE HD TRANS DMA BUFFER ALIGN AUTO
Automatically re-allocate dma buffer if user buffer doesn’t meet hardware alignment or dma_capable, this process may lose some memory and performance.

SPI_SLAVE HD TXBIT LSBFIRST
Transmit command/address/data LSB first instead of the default MSB first.

SPI_SLAVE HD RXBIT LSBFIRST
Receive data LSB first instead of the default MSB first.

SPI_SLAVE HD BIT LSBFIRST
Transmit and receive LSB first.
SPI_SLAVE_HD_APPEND_MODE

Adopt DMA append mode for transactions. In this mode, users can load(append) DMA descriptors without stopping the DMA.

Type Definitions
typedef bool (*slave_cb_t)(void *arg, spi_slave_hd_event_t *event, BaseType_t *awoken)

Callback for SPI Slave HD.

Enumerations
enum spi_slave_chan_t

Channel of SPI Slave HD to do data transaction.

Values:

counter SPI_SLAVE_CHAN_TX

The output channel (RDDMA)

counter SPI_SLAVE_CHAN_RX

The input channel (WRDMA)

2.6.25 Temperature Sensor

Introduction

The ESP32-S3 has a built-in sensor used to measure the chip’s internal temperature. The temperature sensor module contains an 8-bit Sigma-Delta analog-to-digital converter (ADC) and a digital-to-analog converter (DAC) to compensate for the temperature measurement.

Due to restrictions of hardware, the sensor has predefined measurement ranges with specific measurement errors. See the table below for details.

<table>
<thead>
<tr>
<th>Predefined Range (°C)</th>
<th>Error (°C)</th>
</tr>
</thead>
<tbody>
<tr>
<td>50 ~ 125</td>
<td>&lt; 3</td>

Note: The temperature sensor is designed primarily to measure the temperature changes inside the chip. The internal temperature of a chip is usually higher than the ambient temperature, and is affected by factors such as the microcontroller’s clock frequency or I/O load, and the external thermal environment.

Functional Overview

The description of the temperature sensor functionality is divided into the following sections:
Resource Allocation  The ESP32-S3 has just one built-in temperature sensor hardware. The temperature sensor instance is represented by `temperature_sensor_handle_t`, which is also the bond of the context. By using `temperature_sensor_handle_t`, the temperature sensor properties can be accessed and modified in different function calls to control and manage the temperature sensor. The variable would always be the parameter of the temperature APIs with the information of hardware and configurations, so you can just create a pointer of type `temperature_sensor_handle_t` and passing to APIs as needed.

In order to install a built-in temperature sensor instance, the first thing is to evaluate the temperature range in your detection environment. For example, if the testing environment is in a room, the range you evaluate might be 10°C ~ 30°C; if the testing in a lamp bulb, the range you evaluate might be 60°C ~ 110°C. Based on that, configuration structure `temperature_sensor_config_t` should be defined in advance:

- `range_min`: The minimum value of the testing range you have evaluated.
- `range_max`: The maximum value of the testing range you have evaluated.

After the ranges are set, the structure could be passed to `temperature_sensor_install()`, which will instantiate the temperature sensor instance and return a handle.

As mentioned above, different measure ranges have different measurement errors. You do not need to care about the measurement error because we have an internal mechanism to choose the minimum error according to the given range.

If the temperature sensor is no longer needed, you need to call `temperature_sensor_uninstall()` to free the temperature sensor resource.

Creating a Temperature Sensor Handle

- Step 1: Evaluate the testing range. In this example, the range is 20°C ~ 50°C.
- Step 2: Configure the range and obtain a handle.

```c
温度传感器句柄_t temp_handle = NULL;
温度传感器配置_t temp_sensor = {
    .range_min = 20,
    .range_max = 50,
};
ESP_ERROR_CHECK(temperature_sensor_install(&temp_sensor, &temp_handle));
```

Enable and Disable Temperature Sensor

1. Enable the temperature sensor by calling `temperature_sensor_enable()`. The internal temperature sensor circuit will start to work. The driver state will transit from init to enable.
2. To Disable the temperature sensor, please call `temperature_sensor_disable()`.

Get Temperature Value  After the temperature sensor is enabled by `temperature_sensor_enable()`, you can get the current temperature by calling `temperature_sensor_get_celsius()`.

```c
// Enable temperature sensor
ESP_ERROR_CHECK(temperature_sensor_enable(temp_handle));
// Get converted sensor data
float tsens_out;
ESP_ERROR_CHECK(temperature_sensor_get_celsius(temp_handle, &tsens_out));
```

(continues on next page)
printf("Temperature in %f °C\n", tsens_out);
// Disable the temperature sensor if it is not needed and save the power
ESP_ERROR_CHECK(temperature_sensor_disable(temp_handle));

**Power Management**  As the temperature sensor does not use the APB clock, it will keep working no matter if the power management is enabled with `CONFIG_PM_ENABLE`.

**Thread Safety**  In the temperature sensor driver, we do not add any protection to ensure the thread safety, because typically this driver is only supposed to be used in one task. If you have to use this driver in different tasks, please add extra locks to protect it.

**Unexpected Behaviors**

1. The value you get from the chip is usually different from the ambient temperature. It is because the temperature sensor is built inside the chip. To some extent, it measures the temperature of the chip.
2. When installing the temperature sensor, the driver may print the boundary you gave cannot meet the range of internal temperature sensor. It is because the built-in temperature sensor has a testing limit. The error comes from the incorrect configuration of `temperature_sensor_config_t` as follow:
   (1) Totally out of range, like 200 °C ~ 300 °C.
   (2) Cross the boundary of each predefined measurement. like 40 °C ~ 110 °C.

**Application Example**

- Temperature sensor reading example: `peripherals/temperature_sensor/temp_sensor`.

**API Reference**

**Header File**

- `components/driver/temperature_sensor/include/driver/temperature_sensor.h`

- This header file can be included with:

```c
#include "driver/temperature_sensor.h"
```

- This header file is a part of the API provided by the `driver` component. To declare that your component depends on `driver`, add the following to your CMakeLists.txt:

```cmake
REQUIRES driver
```

or

```cmake
PRIV_REQUIRES driver
```

**Functions**

```c
esp_err_t temperature_sensor_install (const temperature_sensor_config_t *tsens_config,
                  temperature_sensor_handle_t *ret_tsens)
```

Install temperature sensor driver.

**Parameters**

- `tsens_config` – Pointer to config structure.
- `ret_tsens` – Return the pointer of temperature sensor handle.

**Returns**

Espressif Systems 1337 Release v5.3-dev-277-gc8243465e4

Submit Document Feedback
• ESP_OK if succeed

```c
esp_err_t temperature_sensor_uninstall(temperature_sensor_handle_t tsens)
```

Uninstall the temperature sensor driver.

**Parameters**
- `tsens` - The handle created by `temperature_sensor_install()`.

**Returns**
- ESP_OK if succeed.

```c
esp_err_t temperature_sensor_enable(temperature_sensor_handle_t tsens)
```

Enable the temperature sensor.

**Parameters**
- `tsens` - The handle created by `temperature_sensor_install()`.

**Returns**
- ESP_OK Success
- ESP_ERR_INVALID_STATE if temperature sensor is enabled already.

```c
esp_err_t temperature_sensor_disable(temperature_sensor_handle_t tsens)
```

Disable temperature sensor.

**Parameters**
- `tsens` - The handle created by `temperature_sensor_install()`.

**Returns**
- ESP_OK Success
- ESP_ERR_INVALID_STATE if temperature sensor is not enabled yet.

```c
esp_err_t temperature_sensor_get_celsius(temperature_sensor_handle_t tsens, float *out_celsius)
```

Read temperature sensor data that is converted to degrees Celsius.

**Note:** Should not be called from interrupt.

**Parameters**
- `tsens` - The handle created by `temperature_sensor_install()`.
- `out_celsius` - The measure output value.

**Returns**
- ESP_OK Success
- ESP_ERR_INVALID_ARG invalid arguments
- ESP_ERR_INVALID_STATE if temperature sensor is not enabled yet.
- ESP_FAIL Parse the sensor data into ambient temperature failed (e.g. out of the range).

**Structures**

```c
struct temperature_sensor_config_t
```

Configuration of measurement range for the temperature sensor.

**Note:** If you see the log the boundary you gave cannot meet the range of internal temperature sensor. You may need to refer to predefined range listed doc api-reference/peripherals/Temperature sensor.

**Public Members**

```c
int range_min
```

the minimum value of the temperature you want to test

```c
int range_max
```

the maximum value of the temperature you want to test
temperature_sensor_clk_src_t clk_src
the clock source of the temperature sensor.

Macros

TEMPERATURE_SENSOR_CONFIG_DEFAULT (min, max)

 temperature_sensor_config_t default constructure

Type Definitions

typedef struct temperature_sensor_obj_t* temperature_sensor_handle_t
Type of temperature sensor driver handle.

2.6.26  Touch Sensor

Introduction

A touch sensor system is built on a substrate which carries electrodes and relevant connections under a protective flat surface. When the surface is touched, the capacitance variation is used to evaluate if the touch was valid.

The sensing pads can be arranged in different combinations (e.g., matrix, slider), so that a larger area or more points can be detected. The touch pad sensing process is under the control of a hardware-implemented finite-state machine (FSM) which is initiated by software or a dedicated hardware timer.

For design, operation, and control registers of a touch sensor, see ESP32-S3 Technical Reference Manual > On-Chip Sensors and Analog Signal Processing [PDF].

In-depth design details of touch sensors and firmware development guidelines for ESP32-S3 are available in Touch Sensor Application Note.

Functionality Overview

Description of API is broken down into groups of functions to provide a quick overview of the following features:

- Initialization of touch pad driver
- Configuration of touch pad GPIO pins
- Taking measurements
- Adjusting parameters of measurements
- Filtering measurements
- Touch detection methods
- Setting up interrupts to report touch detection
- Waking up from Sleep mode on interrupt

For detailed description of a particular function, please go to Section API Reference. Practical implementation of this API is covered in Section Application Examples.

Initialization  Before using a touch pad, you need to initialize the touch pad driver by calling the function touch_pad_init(). This function sets several . . . DEFAULT driver parameters listed in API Reference under Macros. It also removes the information about which pads have been touched before, if any, and disables interrupts.

If the driver is not required anymore, deinitialize it by calling touch_pad_deinit().
Configuration

Enabling the touch sensor functionality for a particular GPIO is done with `touch_pad_config()`. The following 14 capacitive touch pads are supported for ESP32-S3.

<table>

Use the function `touch_pad_set_fsm_mode()` to select if touch pad measurement (operated by FSM) should be started automatically by a hardware timer, or by software. If software mode is selected, use `touch_pad_sw_start()` to start the FSM.

Touch State Measurements

The following function come in handy to read raw measurements from the sensor:

- `touch_pad_read_raw_data()`

It can also be used, for example, to evaluate a particular touch pad design by checking the range of sensor readings when a pad is touched or released. This information can be then used to establish a touch threshold.

For the demonstration of how to read the touch pad data, check the application example `peripherals/touch_sensor/touch_sensor_v2/touch_pad_read`.

Method of Measurements

The touch sensor records the period of time (i.e., the number of clock cycles) over a fixed charge/discharge cycles (specified by `touch_pad_set_charge_discharge_times()`). The count result is the raw data that read from `touch_pad_read_raw_data()`. After finishing one measurement, the touch sensor sleeps until the next measurement start, this interval between two measurements can be set by `touch_pad_set_measurement_interval()`.

Note: If the specified charge and discharge cycles for measurement is too small, the result may be inaccurate, but increasing charge and discharge cycles will increase the power consumption as well. Additionally, the response of the touch sensor will slow down if the total time of the interval and measurement is too long.

Optimization of Measurements

A touch sensor has several configurable parameters to match the characteristics of a particular touch pad design. For instance, to sense smaller capacity changes, it is possible to narrow down the reference voltage range within which the touch pads are charged/discharged. The high and low reference voltages are set using the function `touch_pad_set_voltage()`.

Besides the ability to discern smaller capacity changes, a positive side effect is reduction of power consumption for low power applications. A likely negative effect is an increase in measurement noise. If the dynamic range of obtained readings is still satisfactory, then further reduction of power consumption might be done by reducing the measurement time with `touch_pad_set_charge_discharge_times()`.

The following list summarizes available measurement parameters and corresponding ‘set’ functions:

- Touch pad charge / discharge parameters:
- voltage range: `touch_pad_set_voltage()`
- speed (slope): `touch_pad_set_cnt_mode()`

• Charge and discharge times of one measurement: `touch_pad_set_charge_discharge_times()`

Relationship between the voltage range (high/low reference voltages), speed (slope), and measurement time is shown in the figure below.

![Diagram of Touchpad Relationship between Measurement Parameters](image)

The last chart **Output** represents the touch sensor reading, i.e., the time taken to accumulate the fixed number of cycles.

All functions are provided in pairs to set a specific parameter and to get the current parameter’s value, e.g., `touch_pad_set_voltage()` and `touch_pad_get_voltage()`.

**Filtering of Measurements** If measurements are noisy, you can filter them with provided API functions. The ESP32-S3’s touch functionality provide two sets of APIs for doing this.

There is an internal touch channel that is not connected to any external GPIO. The measurements from this denoise pad can be used to filter out interference introduced on all channels, such as noise introduced by the power supply and external EMI.

The denoise parameters are set with the function `touch_pad_denoise_set_config()` and started by with `touch_pad_denoise_enable()`.

There is also a configurable hardware implemented IIR-filter (infinite impulse response). This IIR-filter is configured with the function `touch_pad_filter_set_config()` and enabled by calling `touch_pad_filter_enable()`.

**Touch Detection** Touch detection is implemented in ESP32’s hardware based on the user-configured threshold and raw measurements executed by FSM. Use the functions `touch_pad_get_status()` to check which pads have been touched and `touch_pad_clear_status()` to clear the touch status information.
Hardware touch detection can also be wired to interrupts. This is described in the next section.

If measurements are noisy and capacity changes are small, hardware touch detection might be unreliable. To resolve this issue, instead of using hardware detection/provided interrupts, implement measurement filtering and perform touch detection in your own application. For sample implementation of both methods of touch detection, see peripherals/touch_sensor/touch_sensor_v2/touch_pad_interrupt.

**Touch Triggered Interrupts** Before enabling an interrupt on a touch detection, you should establish a touch detection threshold. Use the functions described in **Touch State Measurements** to read and display sensor measurements when a pad is touched and released. Apply a filter if measurements are noisy and relative capacity changes are small. Depending on your application and environment conditions, test the influence of temperature and power supply voltage changes on measured values.

Once a detection threshold is established, it can be set during initialization with `touch_pad_config()` or at the runtime with `touch_pad_set_thresh()`.

Finally, configure and manage interrupt calls using the following functions:

- `touch_pad_isr_register()` / `touch_pad_isr_deregister()`
- `touch_pad_intr_enable()` / `touch_pad_intr_disable()`

When interrupts are operational, you can obtain the information from which particular pad an interrupt came by invoking `touch_pad_get_status()` and clear the pad status with `touch_pad_clear_status()`.

**Application Examples**

- Touch sensor read example: peripherals/touch_sensor/touch_sensor_v2/touch_pad_read.
- Touch sensor interrupt example: peripherals/touch_sensor/touch_sensor_v2/touch_pad_interrupt.

**API Reference**

**Header File**

- components/driver/touch_sensor/esp32s3/include/driver/touch_sensor.h

This header file can be included with:

```c
#include "driver/touch_sensor.h"
```

- This header file is a part of the API provided by the driver component. To declare that your component depends on driver, add the following to your CMakeLists.txt:

```cmake
REQUIRES driver
```

or

```cmake
PRIV_REQUIRES driver
```

**Functions**

```c
esp_err_t touch_pad_fsm_start (void)
```

Set touch sensor FSM start.

**Note:** Start FSM after the touch sensor FSM mode is set.

**Note:** Call this function will reset benchmark of all touch channels.

**Returns**
Chapter 2. API Reference

- ESP_OK on success

**esp_err_t touch_pad_fsm_stop** (void)

Stop touch sensor FSM.

Returns
- ESP_OK on success

**esp_err_t touch_pad_sw_start** (void)

Trigger a touch sensor measurement, only support in SW mode of FSM.

Returns
- ESP_OK on success

**esp_err_t touch_pad_set_charge_discharge_times** (uint16_t charge_discharge_times)

Set charge and discharge times of each measurement.

Note: This function will specify the charge and discharge times in each measurement period. The clock is sourced from SOC_MOD_CLK_RTC_FAST, and its default frequency is SOC_CLK_RC_FAST_FREQ_APPROX. The touch sensor will record the total clock cycles of all the charge and discharge cycles as the final result (raw value).

Note: If the charge and discharge times is too small, it may lead to inaccurate results.

Parameters **charge_discharge_times** - Charge and discharge times, range: 0 ~ 0xffff. No exact typical value can be recommended because the capacity is influenced by the hardware design and how finger touches, but suggest adjusting this value to make the measurement time around 1 ms.

Returns
- ESP_OK Set charge and discharge times success

**esp_err_t touch_pad_get_charge_discharge_times** (uint16_t *charge_discharge_times)

Get charge and discharge times of each measurement.

Parameters **charge_discharge_times** - Charge and discharge times

Returns
- ESP_OK Get charge_discharge_times success
- ESP_ERR_INVALID_ARG The input parameter is NULL

**esp_err_t touch_pad_set_measurement_interval** (uint16_t interval_cycle)

Set the interval between two measurements.

Note: The touch sensor will sleep between two measurements. This function is to set the interval cycle. And the interval is clocked from SOC_MOD_CLK_RTC_SLOW, its default frequency is SOC_CLK_RC_SLOW_FREQ_APPROX.

Parameters **interval_cycle** - The interval between two measurements. sleep_time = interval_cycle / SOC_CLK_RC_SLOW_FREQ_APPROX. The approximate frequency value of RTC_SLOW_CLK can be obtained using rtc_clk_slow_freq_get_hz function.

Returns
- ESP_OK Set interval cycle success

**esp_err_t touch_pad_get_measurement_interval** (uint16_t *interval_cycle)

Get the interval between two measurements.

Parameters **interval_cycle** - The interval between two measurements
Chapter 2. API Reference

Returns

- ESP_OK Get interval cycle success
- ESP_ERR_INVALID_ARG The input parameter is NULL

`esp_err_t touch_pad_set_meas_time(uint16_t sleep_cycle, uint16_t meas_times)`

Set touch sensor times of charge and discharge and sleep time. Excessive total time will slow down the touch response. Too small measurement time will not be sampled enough, resulting in inaccurate measurements.

**Note:** The touch sensor will measure time of a fixed number of charge/discharge cycles (specified as the second parameter). That means the time (raw value) will increase as the capacity of the touch pad is increasing. The time (raw value) here is the number of clock cycles which is sourced from SOC_MOD_CLK_RTC_FAST and at (SOC_CLK_RC_FAST_FREQ_APPROX) Hz as default

**Note:** The greater the duty cycle of the measurement time, the more system power is consumed.

**Parameters**

- `sleep_cycle` – The touch sensor will sleep after each measurement. `sleep_cycle` decide the interval between each measurement. `t_sleep = sleep_cycle / SOC_CLK_RC_SLOW_FREQ_APPROX`. The approximate frequency value of RTC_SLOW_CLK can be obtained using `rtc_clk_slow_freq_get_hz` function.
- `meas_times` – The times of charge and discharge in each measurement of touch channels. Range: 0 ~ 0xffff. Recommended typical value: Modify this value to make the measurement time around 1 ms.

**Returns**

- ESP_OK on success

`esp_err_t touch_pad_get_meas_time(uint16_t *sleep_cycle, uint16_t *meas_times)`

Get touch sensor times of charge and discharge and sleep time.

**Parameters**

- `sleep_cycle` – Pointer to accept sleep cycle number
- `meas_times` – Pointer to accept measurement times count.

**Returns**

- ESP_OK on success

`esp_err_t touch_pad_set_idle_channel_connect(touch_pad_conn_type_t type)`

Set the connection type of touch channels in idle status. When a channel is in measurement mode, other initialized channels are in idle mode. The touch channel is generally adjacent to the trace, so the connection state of the idle channel affects the stability and sensitivity of the test channel. The `CONN_HIGHZ` (high resistance) setting increases the sensitivity of touch channels. The `CONN_GND` (grounding) setting increases the stability of touch channels.

**Parameters**

- `type` – Select idle channel connect to high resistance state or ground.

**Returns**

- ESP_OK on success

`esp_err_t touch_pad_get_idle_channel_connect(touch_pad_conn_type_t *type)`

Get the connection type of touch channels in idle status. When a channel is in measurement mode, other initialized channels are in idle mode. The touch channel is generally adjacent to the trace, so the connection state of the idle channel affects the stability and sensitivity of the test channel. The `CONN_HIGHZ` (high resistance) setting increases the sensitivity of touch channels. The `CONN_GND` (grounding) setting increases the stability of touch channels.

**Parameters**

- `type` – Pointer to connection type.

**Returns**

- ESP_OK on success
Chapter 2. API Reference

```c
esp_err_t touch_pad_set_thresh (touch_pad_t touch_num, uint32_t threshold)
```

Set the trigger threshold of touch sensor. The threshold determines the sensitivity of the touch sensor. The threshold is the original value of the trigger state minus the benchmark value.

**Note:** If set “TOUCH_PAD_THRESHOLD_MAX”, the touch is never be triggered.

**Parameters**
- touch_num – touch pad index
- threshold – threshold of touch sensor. Should be less than the max change value of touch.

**Returns**
- ESP_OK on success

```c
esp_err_t touch_pad_get_thresh (touch_pad_t touch_num, uint32_t *threshold)
```

Get touch sensor trigger threshold.

**Parameters**
- touch_num – touch pad index
- threshold – pointer to accept threshold

**Returns**
- ESP_OK on success
- ESP_ERR_INVALID_ARG if argument is wrong

```c
esp_err_t touch_pad_set_channel_mask (uint16_t enable_mask)
```

Register touch channel into touch sensor scan group. The working mode of the touch sensor is cyclically scanned. This function will set the scan bits according to the given bitmask.

**Note:** If set this mask, the FSM timer should be stop firstly.

**Parameters**
- enable_mask – bitmask of touch sensor scan group. e.g. TOUCH_PAD_NUM14 -> BIT(14)

**Returns**
- ESP_OK on success

```c
esp_err_t touch_pad_get_channel_mask (uint16_t *enable_mask)
```

Get the touch sensor scan group bit mask.

**Parameters**
- enable_mask – Pointer to bitmask of touch sensor scan group. e.g. TOUCH_PAD_NUM14 -> BIT(14)

**Returns**
- ESP_OK on success

```c
esp_err_t touch_pad_clear_channel_mask (uint16_t enable_mask)
```

Clear touch channel from touch sensor scan group. The working mode of the touch sensor is cyclically scanned. This function will clear the scan bits according to the given bitmask.

**Note:** If clear all mask, the FSM timer should be stop firstly.

**Parameters**
- enable_mask – bitmask of touch sensor scan group. e.g. TOUCH_PAD_NUM14 -> BIT(14)

**Returns**
- ESP_OK on success
Chapter 2. API Reference

- ESP_OK on success

```c
esp_err_t touch_pad_config(touch_pad_t touch_num)
```

Configure parameter for each touch channel.

**Note:** Touch num 0 is denoise channel, please use `touch_pad_denoise_enable` to set denoise function.

**Parameters**
- `touch_num`: touch pad index

**Returns**
- ESP_OK Success
- ESP_ERR_INVALID_ARG if argument wrong
- ESP_FAIL if touch pad not initialized

```c
esp_err_t touch_pad_reset(void)
```

Reset the FSM of touch module.

**Note:** Call this function after `touch_pad_fsm_stop`.

**Returns**
- ESP_OK Success

```c
uint32_t touch_pad_get_current_meas_channel(void)
```

Get the current measure channel.

**Note:** Should be called when touch sensor measurement is in cyclic scan mode.

**Returns**
- touch channel number

```c
uint32_t touch_pad_read_intr_status_mask(void)
```

Get the touch sensor interrupt status mask.

**Returns**
- touch interrupt bit

```c
esp_err_t touch_pad_intr_enable(touch_pad_intr_mask_t int_mask)
```

Enable touch sensor interrupt by bitmask.

**Note:** This API can be called in ISR handler.

**Parameters**
- `int_mask`: Pad mask to enable interrupts

**Returns**
- ESP_OK on success

```c
esp_err_t touch_pad_intr_disable(touch_pad_intr_mask_t int_mask)
```

Disable touch sensor interrupt by bitmask.

**Note:** This API can be called in ISR handler.

**Parameters**
- `int_mask`: Pad mask to disable interrupts
Returns
• ESP_OK on success

`esp_err_t touch_pad_intr_clear (touch_pad_intr_mask_t int_mask)`
Clear touch sensor interrupt by bitmask.

Parameters
int_mask – Pad mask to clear interrupts

Returns
• ESP_OK on success

`esp_err_t touch_pad_isr_register (intr_handler_t fn, void *arg, touch_pad_intr_mask_t intr_mask)`
Register touch-pad ISR. The handler will be attached to the same CPU core that this function is running on.

Parameters
• fn – Pointer to ISR handler
• arg – Parameter for ISR
• intr_mask – Enable touch sensor interrupt handler by bitmask.

Returns
• ESP_OK Success
• ESP_ERR_INVALID_ARG Arguments error
• ESP_ERR_NO_MEM No memory

`esp_err_t touch_pad_timeout_set (bool enable, uint32_t threshold)`
Enable/disable the timeout check and set timeout threshold for all touch sensor channels measurements. If enable: When the touch reading of a touch channel exceeds the measurement threshold, a timeout interrupt will be generated. If disable: the FSM does not check if the channel under measurement times out.

Note: The threshold compared with touch readings.

Note: In order to avoid abnormal short circuit of some touch channels. This function should be turned on. Ensure the normal operation of other touch channels.

Parameters
• enable – true(default): Enable the timeout check; false: Disable the timeout check.
• threshold – For all channels, the maximum value that will not be exceeded during normal operation.

Returns
• ESP_OK Success

`esp_err_t touch_pad_timeout_resume (void)`
Call this interface after timeout to make the touch channel resume normal work. Point on the next channel to measure. If this API is not called, the touch FSM will stop the measurement after timeout interrupt.

Note: Call this API after finishes the exception handling by user.

Returns
• ESP_OK Success

`esp_err_t touch_pad_read_raw_data (touch_pad_t touch_num, uint32_t *raw_data)`
get raw data of touch sensor.

Note: After the initialization is complete, the “raw_data” is max value. You need to wait for a measurement cycle before you can read the correct touch value.
Parameters
- `touch_num` - touch pad index
- `raw_data` - pointer to accept touch sensor value

Returns
- ESP_OK Success
- ESP_FAIL Touch channel 0 haven’t this parameter.

`esp_err_t touch_pad_read_benchmark(touch_pad_t touch_num, uint32_t *benchmark)`
get benchmark of touch sensor.

Note: After initialization, the benchmark value is the maximum during the first measurement period.

Parameters
- `touch_num` - touch pad index
- `benchmark` - pointer to accept touch sensor benchmark value

Returns
- ESP_OK Success
- ESP_ERR_INVALID_ARG Touch channel 0 haven’t this parameter.

`esp_err_t touch_pad_filter_read_smooth(touch_pad_t touch_num, uint32_t *smooth)`
Get smoothed data that obtained by filtering the raw data.

Parameters
- `touch_num` - touch pad index
- `smooth` - pointer to smoothed data

`esp_err_t touch_pad_reset_benchmark(touch_pad_t touch_num)`
Force reset benchmark to raw data of touch sensor.

Parameters `touch_num` - touch pad index
- TOUCH_PAD_MAX Reset baseline of all channels

Returns
- ESP_OK Success

`esp_err_t touch_pad_filter_set_config(const touch_filter_config_t *filter_info)`
set parameter of touch sensor filter and detection algorithm. For more details on the detection algorithm, please refer to the application documentation.

Parameters `filter_info` - select filter type and threshold of detection algorithm

Returns
- ESP_OK Success

`esp_err_t touch_pad_filter_get_config(touch_filter_config_t *filter_info)`
get parameter of touch sensor filter and detection algorithm. For more details on the detection algorithm, please refer to the application documentation.

Parameters `filter_info` - select filter type and threshold of detection algorithm

Returns
- ESP_OK Success

`esp_err_t touch_pad_filter_enable(void)`
enable touch sensor filter for detection algorithm. For more details on the detection algorithm, please refer to the application documentation.

Returns
- ESP_OK Success

`esp_err_t touch_pad_filter_disable(void)`
disable touch sensor filter for detection algorithm. For more details on the detection algorithm, please refer to the application documentation.
Returns

• ESP_OK Success

*esp_err_t* touch_pad_denoise_set_config (const *touch_pad_denoise_t* denoise)

set parameter of denoise pad (TOUCH_PAD_NUM0). T0 is an internal channel that does not have a corresponding external GPIO. T0 will work simultaneously with the measured channel Tn. Finally, the actual measured value of Tn is the value after subtracting lower bits of T0. The noise reduction function filters out interference introduced simultaneously on all channels, such as noise introduced by power supplies and external EMI.

Parameters denoise – parameter of denoise

Returns

• ESP_OK Success

*esp_err_t* touch_pad_denoise_get_config (*touch_pad_denoise_t* denoise)

get parameter of denoise pad (TOUCH_PAD_NUM0).

Parameters denoise – Pointer to parameter of denoise

Returns

• ESP_OK Success

*esp_err_t* touch_pad_denoise_enable (void)

enable denoise function. T0 is an internal channel that does not have a corresponding external GPIO. T0 will work simultaneously with the measured channel Tn. Finally, the actual measured value of Tn is the value after subtracting lower bits of T0. The noise reduction function filters out interference introduced simultaneously on all channels, such as noise introduced by power supplies and external EMI.

Returns

• ESP_OK Success

*esp_err_t* touch_pad_denoise_disable (void)

disable denoise function.

Returns

• ESP_OK Success

*esp_err_t* touch_pad_denoise_read_data (uint32_t* data)

Get denoise measure value (TOUCH_PAD_NUM0).

Parameters data – Pointer to receive denoise value

Returns

• ESP_OK Success

*esp_err_t* touch_pad_waterproof_set_config (const *touch_pad_waterproof_t* waterproof)

set parameter of waterproof function.

The waterproof function includes a shielded channel (TOUCH_PAD_NUM14) and a guard channel.

Guard pad is used to detect the large area of water covering the touch panel.

Shield pad is used to shield the influence of water droplets covering the touch panel.

It is generally designed as a grid and is placed around the touch buttons.

Parameters waterproof – parameter of waterproof

Returns

• ESP_OK Success

*esp_err_t* touch_pad_waterproof_get_config (*touch_pad_waterproof_t* waterproof)

get parameter of waterproof function.
Parameters `waterproof` – parameter of waterproof

Returns
- ESP_OK Success

`esp_err_t touch_pad_waterproof_enable (void)`
Enable parameter of waterproof function. Should be called after function `touch_pad_waterproof_set_config`.

Returns
- ESP_OK Success

`esp_err_t touch_pad_waterproof_disable (void)`
Disable parameter of waterproof function.

Returns
- ESP_OK Success

`esp_err_t touch_pad_proximity_enable (touch_pad_t touch_num, bool enabled)`
Enable/disable proximity function of touch channels. The proximity sensor measurement is the accumulation of touch channel measurements.

**Note:** Supports up to three touch channels configured as proximity sensors.

Parameters
- `touch_num` – touch pad index
- `enabled` – true: enable the proximity function; false: disable the proximity function

Returns
- ESP_OK: Configured correctly.
- ESP_ERR_INVALID_ARG: Touch channel number error.
- ESP_ERR_NOT_SUPPORTED: Don’t support configured.

`esp_err_t touch_pad_proximity_set_count (touch_pad_t touch_num, uint32_t count)`
Set measure count of proximity channel. The proximity sensor measurement is the accumulation of touch channel measurements.

**Note:** All proximity channels use the same `count` value. So please pass the parameter `TOUCH_PAD_MAX`.

Parameters
- `touch_num` – Touch pad index. In this version, pass the parameter `TOUCH_PAD_MAX`.
- `count` – The cumulative times of measurements for proximity pad. Range: 0 ~ 255.

Returns
- ESP_OK: Configured correctly.
- ESP_ERR_INVALID_ARG: Touch channel number error.

`esp_err_t touch_pad_proximity_get_count (touch_pad_t touch_num, uint32_t *count)`
Get measure count of proximity channel. The proximity sensor measurement is the accumulation of touch channel measurements.

**Note:** All proximity channels use the same `count` value. So please pass the parameter `TOUCH_PAD_MAX`.

Parameters
- `touch_num` – Touch pad index. In this version, pass the parameter `TOUCH_PAD_MAX`.
- `count` – The cumulative times of measurements for proximity pad. Range: 0 ~ 255.

Returns
- ESP_OK: Configured correctly.
• ESP_ERR_INVALID_ARG: Touch channel number error.

```c
esp_err_t touch_pad_proximity_get_data(touch_pad_t touch_num, uint32_t *measure_out)
```

Get the accumulated measurement of the proximity sensor. The proximity sensor measurement is the accumulation of touch channel measurements.

**Parameters**
- `touch_num` – touch pad index
- `measure_out` – If the accumulation process does not end, the measure_out is the process value.

**Returns**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Touch num is not proximity

```c
esp_err_t touch_pad_sleep_channel_get_info(touch_pad_sleep_channel_t *slp_config)
```

Get parameter of touch sensor sleep channel. The touch sensor can works in sleep mode to wake up sleep.

**Note:** After the sleep channel is configured, Please use special functions for sleep channel. e.g. The user should use `touch_pad_sleep_channel_read_data` instead of `touch_pad_read_raw_data` to obtain the sleep channel reading.

**Parameters**
- `slp_config` – touch sleep pad config.

**Returns**
- ESP_OK Success

```c
esp_err_t touch_pad_sleep_channel_enable(touch_pad_t pad_num, bool enable)
```

Enable/Disable sleep channel function for touch sensor. The touch sensor can works in sleep mode to wake up sleep.

**Note:** ESP32S2 only support one sleep channel.

**Note:** After the sleep channel is configured. Please use special functions for sleep channel. e.g. The user should use `touch_pad_sleep_channel_read_data` instead of `touch_pad_read_raw_data` to obtain the sleep channel reading.

**Parameters**
- `pad_num` – Set touch channel number for sleep pad. Only one touch sensor channel is supported in deep sleep mode.
- `enable` – true: enable sleep pad for touch sensor; false: disable sleep pad for touch sensor;

**Returns**
- ESP_OK Success

```c
esp_err_t touch_pad_sleep_channel_enable_proximity(touch_pad_t pad_num, bool enable)
```

Enable/Disable proximity function for sleep channel. The touch sensor can works in sleep mode to wake up sleep.

**Note:** ESP32S2 only support one sleep channel.

**Parameters**
- `pad_num` – Set touch channel number for sleep pad. Only one touch sensor channel is supported in deep sleep mode.
• **enable** - true: enable proximity for sleep channel; false: disable proximity for sleep channel;

**Returns**
• ESP_OK Success

```c
esp_err_t touch_pad_sleep_set_threshold(touch_pad_t pad_num, uint32_t touch_thres)
```

Set the trigger threshold of touch sensor in deep sleep. The threshold determines the sensitivity of the touch sensor.

**Note:** In general, the touch threshold during sleep can use the threshold parameter parameters before sleep.

**Parameters**
• **pad_num** - Set touch channel number for sleep pad. Only one touch sensor channel is supported in deep sleep mode.
• **touch_thres** - touch sleep pad threshold

**Returns**
• ESP_OK Success

```c
esp_err_t touch_pad_sleep_get_threshold(touch_pad_t pad_num, uint32_t *touch_thres)
```

Get the trigger threshold of touch sensor in deep sleep. The threshold determines the sensitivity of the touch sensor.

**Note:** In general, the touch threshold during sleep can use the threshold parameter parameters before sleep.

**Parameters**
• **pad_num** - Set touch channel number for sleep pad. Only one touch sensor channel is supported in deep sleep mode.
• **touch_thres** - touch sleep pad threshold

**Returns**
• ESP_OK Success

```c
esp_err_t touch_pad_sleep_channel_read_benchmark(touch_pad_t pad_num, uint32_t *benchmark)
```

Read benchmark of touch sensor sleep channel.

**Parameters**
• **pad_num** - Set touch channel number for sleep pad. Only one touch sensor channel is supported in deep sleep mode.
• **benchmark** - pointer to accept touch sensor benchmark value

**Returns**
• ESP_OK Success
• ESP_ERR_INVALID_ARG parameter is NULL

```c
esp_err_t touch_pad_sleep_channel_read_smooth(touch_pad_t pad_num, uint32_t *smooth_data)
```

Read smoothed data of touch sensor sleep channel. Smoothed data is filtered from the raw data.

**Parameters**
• **pad_num** - Set touch channel number for sleep pad. Only one touch sensor channel is supported in deep sleep mode.
• **smooth_data** - pointer to accept touch sensor smoothed data

**Returns**
• ESP_OK Success
• ESP_ERR_INVALID_ARG parameter is NULL
esp_err_t touch_pad_sleep_channel_read_data (touch_pad_t pad_num, uint32_t *raw_data)

Read raw data of touch sensor sleep channel.

Parameters
- **pad_num** – Set touch channel number for sleep pad. Only one touch sensor channel is supported in deep sleep mode.
- **raw_data** – pointer to accept touch sensor raw data

Returns
- ESP_OK Success
- ESP_ERR_INVALID_ARG parameter is NULL

esp_err_t touch_pad_sleep_channel_reset_benchmark (void)

Reset benchmark of touch sensor sleep channel.

Returns
- ESP_OK Success

esp_err_t touch_pad_sleep_channel_read_proximity_cnt (touch_pad_t pad_num, uint32_t *proximity_cnt)

Read proximity count of touch sensor sleep channel.

Parameters
- **pad_num** – Set touch channel number for sleep pad. Only one touch sensor channel is supported in deep sleep mode.
- **proximity_cnt** – pointer to accept touch sensor proximity count value

Returns
- ESP_OK Success
- ESP_ERR_INVALID_ARG parameter is NULL

esp_err_t touch_pad_sleep_channel_set_work_time (uint16_t sleep_cycle, uint16_t meas_times)

Change the operating frequency of touch pad in deep sleep state. Reducing the operating frequency can effectively reduce power consumption. If this function is not called, the working frequency of touch in the deep sleep state is the same as that in the wake-up state.

Parameters
- **sleep_cycle** – The touch sensor will sleep after each measurement. sleep_cycle decide the interval between each measurement. t_sleep = sleep_cycle / (RTC_SLOW_CLK frequency). The approximate frequency value of RTC_SLOW_CLK can be obtained using rtc_clk_slow_freq_get_hz function.
- **meas_times** – The times of charge and discharge in each measure process of touch channels. The timer frequency is 8Mhz. Range: 0 - 0xffff. Recommended typical value: Modify this value to make the measurement time around 1ms.

Returns
- ESP_OK Success

Header File
- components/driver/touch_sensor/include/driver/touch_sensor_common.h
- This header file can be included with:
  ```c
  #include "driver/touch_sensor_common.h"
  ```
- This header file is a part of the API provided by the driver component. To declare that your component depends on driver, add the following to your CMakeLists.txt:
  ```cmake
  REQUIRE(driver)
  ```
  or
  ```cmake
  PRIV_REQUIRES(driver)
  ```
Functions

`esp_err_t touch_pad_init (void)`

Initialize touch module.

**Note:** If default parameter don’t match the usage scenario, it can be changed after this function.

**Returns**

- ESP_OK Success
- ESP_ERR_NO_MEM Touch pad init error
- ESP_ERR_NOT_SUPPORTED Touch pad is providing current to external XTAL

`esp_err_t touch_pad_deinit (void)`

Un-install touch pad driver.

**Note:** After this function is called, other touch functions are prohibited from being called.

**Returns**

- ESP_OK Success
- ESP_FAIL Touch pad driver not initialized

`esp_err_t touch_pad_io_init (touch_pad_t touch_num)`

Initialize touch pad GPIO.

**Parameters**

- `touch_num` – touch pad index

**Returns**

- ESP_OK on success
- ESP_ERR_INVALID_ARG if argument is wrong

`esp_err_t touch_pad_set_voltage (touch_high_volt_t refh, touch_low_volt_t refl, touch_volt_atten_t atten)`

Set touch sensor high voltage threshold of change. The touch sensor measures the channel capacitance value by charging and discharging the channel. So the high threshold should be less than the supply voltage.

**Parameters**

- `refh` – the value of DREFH
- `refl` – the value of DREFL
- `atten` – the attenuation on DREFH

**Returns**

- ESP_OK on success
- ESP_ERR_INVALID_ARG if argument is wrong

`esp_err_t touch_pad_get_voltage (touch_high_volt_t *refh, touch_low_volt_t *refl, touch_volt_atten_t *atten)`

Get touch sensor reference voltage.

**Parameters**

- `refh` – pointer to accept DREFH value
- `refl` – pointer to accept DREFL value
- `atten` – pointer to accept the attenuation on DREFH

**Returns**

- ESP_OK on success

`esp_err_t touch_pad_set_cnt_mode (touch_pad_t touch_num, touch_cnt_slope_t slope, touch_tie_opt_t opt)`

Set touch sensor charge/discharge speed for each pad. If the slope is 0, the counter would always be zero. If the slope is 1, the charging and discharging would be slow, accordingly. If the slope is set 7, which is the maximum value, the charging and discharging would be fast.
Note: The higher the charge and discharge current, the greater the immunity of the touch channel, but it will increase the system power consumption.

**Parameters**
- `touch_num` - touch pad index
- `slope` - touch pad charge/discharge speed
- `opt` - the initial voltage

**Returns**
- ESP_OK on success
- ESP_ERR_INVALID_ARG if argument is wrong

```c
esp_err_t touch_pad_get_cnt_mode(touch_pad_t touch_num, touch_cnt_slope_t *slope, touch_tie_opt_t *opt)
```

Get touch sensor charge/discharge speed for each pad.

**Parameters**
- `touch_num` - touch pad index
- `slope` - pointer to accept touch pad charge/discharge slope
- `opt` - pointer to accept the initial voltage

**Returns**
- ESP_OK on success
- ESP_ERR_INVALID_ARG if argument is wrong

```c
esp_err_t touch_pad_isr_deregister(void (*fn)(void*), void *arg)
```

Deregister the handler previously registered using touch_pad_isr_handler_register.

**Parameters**
- `fn` - handler function to call (as passed to touch_pad_isr_handler_register)
- `arg` - argument of the handler (as passed to touch_pad_isr_handler_register)

**Returns**
- ESP_OK on success
- ESP_ERR_INVALID_STATE if a handler matching both fn and arg isn’t registered

```c
esp_err_t touch_pad_get_wakeup_status(touch_pad_t *pad_num)
```

Get the touch pad which caused wakeup from deep sleep.

**Parameters**
- `pad_num` - pointer to touch pad which caused wakeup

**Returns**
- ESP_OK Success
- ESP_ERR_INVALID_ARG parameter is NULL

```c
esp_err_t touch_pad_set_fsm_mode(touch_fsm_mode_t mode)
```

Set touch sensor FSM mode, the test action can be triggered by the timer, as well as by the software.

**Parameters**
- `mode` - FSM mode

**Returns**
- ESP_OK on success
- ESP_ERR_INVALID_ARG if argument is wrong

```c
esp_err_t touch_pad_get_fsm_mode(touch_fsm_mode_t *mode)
```

Get touch sensor FSM mode.

**Parameters**
- `mode` - pointer to accept FSM mode

**Returns**
- ESP_OK on success

```c
esp_err_t touch_pad_clear_status(void)
```

To clear the touch sensor channel active status.
Note: The FSM automatically updates the touch sensor status. It is generally not necessary to call this API to clear the status.

Returns

- ESP_OK on success

uint32_t touch_pad_get_status (void)
Get the touch sensor channel active status mask. The bit position represents the channel number. The 0/1 status of the bit represents the trigger status.

Returns

- The touch sensor status. e.g. Touch1 trigger status is status_mask & (BIT1).

bool touch_pad_meas_is_done (void)
Check touch sensor measurement status.

Returns

- True measurement is under way
- False measurement done

GPIO Lookup Macros

Some useful macros can be used to specified the GPIO number of a touch pad channel, or vice versa. e.g.,

1. TOUCH_PAD_NUM5_GPIO_NUM is the GPIO number of channel 5 (12);
2. TOUCH_PAD_GPIO4_CHANNEL is the channel number of GPIO 4 (channel 0).

**Structures**

struct `touch_pad_denoise`

Touch sensor denoise configuration

**Public Members**

- `touch_pad_denoise_grade_t grade`
  Select denoise range of denoise channel. Determined by measuring the noise amplitude of the denoise channel.

- `touch_pad_denoise_cap_t cap_level`
  Select internal reference capacitance of denoise channel. Ensure that the denoise readings are closest to the readings of the channel being measured. Use `touch_pad_denoise_read_data` to get the reading of denoise channel. The equivalent capacitance of the shielded channel can be calculated from the reading of denoise channel.

struct `touch_pad_waterproof`

Touch sensor waterproof configuration

**Public Members**

- `touch_pad_t guard_ring_pad`
  Waterproof. Select touch channel use for guard pad. Guard pad is used to detect the large area of water covering the touch panel.

- `touch_pad_shield_driver_t shield_driver`
  Waterproof. Shield channel drive capability configuration. Shield pad is used to shield the influence of water droplets covering the touch panel. When the waterproof function is enabled, Touch14 is set as shield channel by default. The larger the parasitic capacitance on the shielding channel, the higher the drive capability needs to be set. The equivalent capacitance of the shield channel can be estimated through the reading value of the denoise channel (Touch0).

struct `touch_filter_config`

Touch sensor filter configuration

**Public Members**

- `touch_filter_mode_t mode`
  Set filter mode. The input of the filter is the raw value of touch reading, and the output of the filter is involved in the judgment of the touch state.

- `uint32_t debounce_cnt`
  Set debounce count, such as n. If the measured values continue to exceed the threshold for n+1 times, the touch sensor state changes. Range: 0 ~ 7

- `uint32_t noise_thr`
  Noise threshold coefficient. Higher = More noise resistance. The actual noise should be less than (noise coefficient * touch threshold). Range: 0 ~ 3. The coefficient is 0: 4/8; 1: 3/8; 2: 2/8; 3: 1;
uint32_t jitter_step
    Set jitter filter step size. Range: 0 ~ 15

touch_smooth_mode_t smh_lvl
    Level of filter applied on the original data against large noise interference.

struct touch_pad_sleep_channel_t
    Touch sensor channel sleep configuration

Public Members

touch_pad_t touch_num
    Set touch channel number for sleep pad. Only one touch sensor channel is supported in deep sleep mode.
    If clear the sleep channel, point this pad to TOUCH_PAD_NUM0

bool en_proximity
    enable proximity function for sleep pad

Macros

TOUCH_PAD_BIT_MASK_ALL
TOUCH_PAD_SLOPE_DEFAULT
TOUCH_PAD_TIE_OPT_DEFAULT
TOUCH_PAD_BIT_MASK_MAX
TOUCH_PAD_HIGH_VOLTAGE_THRESHOLD
TOUCH_PAD_LOW_VOLTAGE_THRESHOLD
TOUCH_PAD_ATTEN_VOLTAGE_THRESHOLD
TOUCH_PAD_IDLE_CH_CONNECT_DEFAULT
TOUCH_PAD_THRESHOLD_MAX
    If set touch threshold max value, The touch sensor can’t be in touched status

TOUCH_PAD_SLEEP_CYCLE_DEFAULT
    Excessive total time will slow down the touch response. Too small measurement time will not be sampled
    enough, resulting in inaccurate measurements.

Note: The greater the duty cycle of the measurement time, the more system power is consumed. The number
of sleep cycle in each measure process of touch channels. The timer frequency is RTC_SLOW_CLK (can be
150k or 32k depending on the options). Range: 0 ~ 0xffff
**TOUCH_PAD_MEASURE_CYCLE_DEFAULT**

The times of charge and discharge in each measure process of touch channels. The timer frequency is 8Mhz. Recommended typical value: Modify this value to make the measurement time around 1ms. Range: 0 ~ 0xffff

**TOUCH_PAD_INTR_MASK_ALL**

All touch interrupt type enable.

**TOUCH_PROXIMITY_MEAS_NUM_MAX**

Touch sensor proximity detection configuration

**TOUCH_DEBOUNCE_CNT_MAX**

**TOUCH_NOISE_THR_MAX**

**TOUCH_JITTER_STEP_MAX**

### Type Definitions

```c
typedef struct touch_pad_denoise touch_pad_denoise_t
    Touch sensor denoise configuration
```

```c
typedef struct touch_pad_waterproof touch_pad_waterproof_t
    Touch sensor waterproof configuration
```

```c
typedef struct touch_filter_config touch_filter_config_t
    Touch sensor filter configuration
```

### Enumerations

```c
enum touch_pad_t
    Touch pad channel
    Values:
```

```c
enumerator TOUCH_PAD_NUM0
    Touch pad channel 0 is GPIO4(ESP32)
```

```c
enumerator TOUCH_PAD_NUM1
    Touch pad channel 1 is GPIO0(ESP32) / GPIO1(ESP32-S2)
```

```c
enumerator TOUCH_PAD_NUM2
    Touch pad channel 2 is GPIO2(ESP32) / GPIO2(ESP32-S2)
```

```c
enumerator TOUCH_PAD_NUM3
    Touch pad channel 3 is GPIO15(ESP32) / GPIO3(ESP32-S2)
```

```c
enumerator TOUCH_PAD_NUM4
    Touch pad channel 4 is GPIO13(ESP32) / GPIO4(ESP32-S2)
```
enumerator TOUCH_PAD_NUM5
    Touch pad channel 5 is GPIO12(ESP32) / GPIO5(ESP32-S2)

enumerator TOUCH_PAD_NUM6
    Touch pad channel 6 is GPIO14(ESP32) / GPIO6(ESP32-S2)

enumerator TOUCH_PAD_NUM7
    Touch pad channel 7 is GPIO27(ESP32) / GPIO7(ESP32-S2)

enumerator TOUCH_PAD_NUM8
    Touch pad channel 8 is GPIO33(ESP32) / GPIO8(ESP32-S2)

enumerator TOUCH_PAD_NUM9
    Touch pad channel 9 is GPIO32(ESP32) / GPIO9(ESP32-S2)

enumerator TOUCH_PAD_NUM10
    Touch channel 10 is GPIO10(ESP32-S2)

enumerator TOUCH_PAD_NUM11
    Touch channel 11 is GPIO11(ESP32-S2)

enumerator TOUCH_PAD_NUM12
    Touch channel 12 is GPIO12(ESP32-S2)

enumerator TOUCH_PAD_NUM13
    Touch channel 13 is GPIO13(ESP32-S2)

enumerator TOUCH_PAD_NUM14
    Touch channel 14 is GPIO14(ESP32-S2)

enumerator TOUCH_PAD_MAX

enum touch_high_volt_t
    Touch sensor high reference voltage

    Values:

enumerator TOUCH_HVOLT_KEEP
    Touch sensor high reference voltage, no change

enumerator TOUCH_HVOLT_2V4
    Touch sensor high reference voltage, 2.4V

enumerator TOUCH_HVOLT_2V5
    Touch sensor high reference voltage, 2.5V

enumerator TOUCH_HVOLT_2V6
    Touch sensor high reference voltage, 2.6V
enumerator TOUCH_HVOLT_2V7
  Touch sensor high reference voltage, 2.7V

enumerator TOUCH_HVOLT_MAX

def touch_low_volt_t
  Touch sensor low reference voltage

Values:

enumerator TOUCH_LVOLT_KEEP
  Touch sensor low reference voltage, no change

enumerator TOUCH_LVOLT_0V5
  Touch sensor low reference voltage, 0.5V

enumerator TOUCH_LVOLT_0V6
  Touch sensor low reference voltage, 0.6V

enumerator TOUCH_LVOLT_0V7
  Touch sensor low reference voltage, 0.7V

enumerator TOUCH_LVOLT_0V8
  Touch sensor low reference voltage, 0.8V

enumerator TOUCH_LVOLT_MAX

def touch_volt_atten_t
  Touch sensor high reference voltage attenuation

Values:

enumerator TOUCH_HVOLT_ATTEN_KEEP
  Touch sensor high reference voltage attenuation, no change

enumerator TOUCH_HVOLT_ATTEN_1V5
  Touch sensor high reference voltage attenuation, 1.5V attenuation

enumerator TOUCH_HVOLT_ATTEN_1V
  Touch sensor high reference voltage attenuation, 1.0V attenuation

enumerator TOUCH_HVOLT_ATTEN_0V5
  Touch sensor high reference voltage attenuation, 0.5V attenuation

enumerator TOUCH_HVOLT_ATTEN_0V
  Touch sensor high reference voltage attenuation, 0V attenuation

enumerator TOUCH_HVOLT_ATTEN_MAX
enum `touch_cnt_slope_t`

Touch sensor charge/discharge speed

Values:

enumerator `TOUCH_PAD_SLOPE_0`

Touch sensor charge / discharge speed, always zero

denumerator `TOUCH_PAD_SLOPE_1`

Touch sensor charge / discharge speed, slowest

enumerator `TOUCH_PAD_SLOPE_2`

Touch sensor charge / discharge speed

enumerator `TOUCH_PAD_SLOPE_3`

Touch sensor charge / discharge speed

enumerator `TOUCH_PAD_SLOPE_4`

Touch sensor charge / discharge speed

enumerator `TOUCH_PAD_SLOPE_5`

Touch sensor charge / discharge speed

enumerator `TOUCH_PAD_SLOPE_6`

Touch sensor charge / discharge speed

enumerator `TOUCH_PAD_SLOPE_7`

Touch sensor charge / discharge speed, fast

enumerator `TOUCH_PAD_SLOPE_MAX`

enum `touch_tie_opt_t`

Touch sensor initial charge level

Values:

enumerator `TOUCH_PAD_TIE_OPT_LOW`

Initial level of charging voltage, low level

denumerator `TOUCH_PAD_TIE_OPT_HIGH`

Initial level of charging voltage, high level

denumerator `TOUCH_PAD_TIE_OPT_MAX`

enum `touch_fsm_mode_t`

Touch sensor FSM mode

Values:

enumerator `TOUCH_FSM_MODE_TIMER`

To start touch FSM by timer
enumerator **TOUCH_FSM_MODE_SW**

To start touch FSM by software trigger

enumerator **TOUCH_FSM_MODE_MAX**

define **touch_trigger_mode_t**

**Values:**

enumerator **TOUCH_TRIGGER_BELOW**

Touch interrupt will happen if counter value is less than threshold.

enumerator **TOUCH_TRIGGER ABOVE**

Touch interrupt will happen if counter value is larger than threshold.

enumerator **TOUCH_TRIGGER_MAX**

define **touch_trigger_src_t**

**Values:**

enumerator **TOUCH_TRIGGER_SOURCE_BOTH**

wakeup interrupt is generated if both SET1 and SET2 are “touched”

enumerator **TOUCH_TRIGGER_SOURCE_SET1**

wakeup interrupt is generated if SET1 is “touched”

enumerator **TOUCH_TRIGGER_SOURCE_MAX**

define **touch_pad_intr_mask_t**

**Values:**

enumerator **TOUCH_PAD_INTR_MASK_DONE**

Measurement done for one of the enabled channels.

enumerator **TOUCH_PAD_INTR_MASK_ACTIVE**

Active for one of the enabled channels.

enumerator **TOUCH_PAD_INTR_MASK_INACTIVE**

Inactive for one of the enabled channels.

enumerator **TOUCH_PAD_INTR_MASK_SCAN_DONE**

Measurement done for all the enabled channels.

enumerator **TOUCH_PAD_INTR_MASK_TIMEOUT**

Timeout for one of the enabled channels.

enumerator **TOUCH_PAD_INTR_MASK_PROXI_MEAS_DONE**

For proximity sensor, when the number of measurements reaches the set count of measurements, an interrupt will be generated.
enum touch_pad_denoise_grade_t

Values:

enumerator TOUCH_PAD_DENOISE_BIT12
   Denoiserange is 12bit

enumerator TOUCH_PAD_DENOISE_BIT10
   Denoiserange is 10bit

enumerator TOUCH_PAD_DENOISE_BIT8
   Denoiserange is 8bit

enumerator TOUCH_PAD_DENOISE_BIT4
   Denoiserange is 4bit

enumerator TOUCH_PAD_DENOISE_MAX

enum touch_pad_denoise_cap_t

Values:

enumerator TOUCH_PAD_DENOISE_CAP_L0
   Denoise channel internal reference capacitance is 5pf

enumerator TOUCH_PAD_DENOISE_CAP_L1
   Denoise channel internal reference capacitance is 6.4pf

enumerator TOUCH_PAD_DENOISE_CAP_L2
   Denoise channel internal reference capacitance is 7.8pf

enumerator TOUCH_PAD_DENOISE_CAP_L3
   Denoise channel internal reference capacitance is 9.2pf

enumerator TOUCH_PAD_DENOISE_CAP_L4

    The max equivalent capacitance in shield channel is 200pf
enumerator TOUCH_PAD_SHIELD_DRV_L5
    The max equivalent capacitance in shield channel is 240pf
enumerator TOUCH_PAD_SHIELD_DRV_L6
    The max equivalent capacitance in shield channel is 280pf
enumerator TOUCH_PAD_SHIELD_DRV_L7
    The max equivalent capacitance in shield channel is 320pf
enumerator TOUCH_PAD_SHIELD_DRV_MAX

enum touch_pad_conn_type_t
    Touch channel idle state configuration
    Values:
enumerator TOUCH_PAD_CONN_HIGHZ
        Idle status of touch channel is high resistance state
enumerator TOUCH_PAD_CONN_GND
        Idle status of touch channel is ground connection
nenumerator TOUCH_PAD_CONN_MAX

enum touch_filter_mode_t
    Touch channel IIR filter coefficient configuration.

Note:  On ESP32S2. There is an error in the IIR calculation. The magnitude of the error is twice the filter coefficient. So please select a smaller filter coefficient on the basis of meeting the filtering requirements. Recommended filter coefficient selection IIR_16.

Values:
Chapter 2. API Reference

enumerator TOUCH_PAD_FILTER_IIR_4
    The filter mode is first-order IIR filter. The coefficient is 4.

enumerator TOUCH_PAD_FILTER_IIR_8
    The filter mode is first-order IIR filter. The coefficient is 8.

enumerator TOUCH_PAD_FILTER_IIR_16
    The filter mode is first-order IIR filter. The coefficient is 16 (Typical value).

enumerator TOUCH_PAD_FILTER_IIR_32
    The filter mode is first-order IIR filter. The coefficient is 32.

enumerator TOUCH_PAD_FILTER_IIR_64
    The filter mode is first-order IIR filter. The coefficient is 64.

enumerator TOUCH_PAD_FILTER_IIR_128
    The filter mode is first-order IIR filter. The coefficient is 128.

enumerator TOUCH_PAD_FILTER_IIR_256
    The filter mode is first-order IIR filter. The coefficient is 256.

eenumerator TOUCH_PAD_FILTER_JITTER
    The filter mode is jitter filter

enumerator TOUCH_PAD_FILTER_MAX

enum touch_smooth_mode_t
    Level of filter applied on the original data against large noise interference.

Note: On ESP32S2. There is an error in the IIR calculation. The magnitude of the error is twice the filter coefficient. So please select a smaller filter coefficient on the basis of meeting the filtering requirements. Recommended filter coefficient selection IIR_2.

Values:

enumerator TOUCH_PAD_SMOOTH_OFF
    No filtering of raw data.

enumerator TOUCH_PAD_SMOOTH_IIR_2
    Filter the raw data. The coefficient is 2 (Typical value).

enumerator TOUCH_PAD_SMOOTH_IIR_4
    Filter the raw data. The coefficient is 4.

enumerator TOUCH_PAD_SMOOTH_IIR_8
    Filter the raw data. The coefficient is 8.

eenumerator TOUCH_PAD_SMOOTH_MAX
2.6.27 Two-Wire Automotive Interface (TWAI)

Overview

The Two-Wire Automotive Interface (TWAI) is a real-time serial communication protocol suited for automotive and industrial applications. It is compatible with ISO11898-1 Classical frames, thus can support Standard Frame Format (11-bit ID) and Extended Frame Format (29-bit ID). The ESP32-S3 contains 1 TWAI controller(s) that can be configured to communicate on a TWAI bus via an external transceiver.

Warning: The TWAI controller is not compatible with ISO11898-1 FD Format frames, and will interpret such frames as errors.

This programming guide is split into the following sections:

Sections

- Two-Wire Automotive Interface (TWAI)
  - Overview
  - TWAI Protocol Summary
  - Signals Lines and Transceiver
  - API Naming Conventions
  - Driver Configuration
  - Driver Operation
  - Examples
  - API Reference

TWAI Protocol Summary

The TWAI is a multi-master, multi-cast, asynchronous, serial communication protocol. TWAI also supports error detection and signalling, and inbuilt message prioritization.

Multi-master: Any node on the bus can initiate the transfer of a message.

Multi-cast: When a node transmits a message, all nodes on the bus will receive the message (i.e., broadcast) thus ensuring data consistency across all nodes. However, some nodes can selectively choose which messages to accept via the use of acceptance filtering (multi-cast).

Asynchronous: The bus does not contain a clock signal. All nodes on the bus operate at the same bit rate and synchronize using the edges of the bits transmitted on the bus.

Error Detection and Signaling: Every node constantly monitors the bus. When any node detects an error, it signals the detection by transmitting an error frame. Other nodes will receive the error frame and transmit their own error frames in response. This results in an error detection being propagated to all nodes on the bus.

Message Priorities: Messages contain an ID field. If two or more nodes attempt to transmit simultaneously, the node transmitting the message with the lower ID value will win arbitration of the bus. All other nodes will become receivers ensuring that there is at most one transmitter at any time.

TWAI Messages TWAI Messages are split into Data Frames and Remote Frames. Data Frames are used to deliver a data payload to other nodes, whereas a Remote Frame is used to request a Data Frame from other nodes (other nodes can optionally respond with a Data Frame). Data and Remote Frames have two frame formats known as Extended Frame and Standard Frame which contain a 29-bit ID and an 11-bit ID respectively. A TWAI message consists of the following fields:

- 29-bit or 11-bit ID: Determines the priority of the message (lower value has higher priority).
- Data Length Code (DLC) between 0 to 8: Indicates the size (in bytes) of the data payload for a Data Frame, or the amount of data to request for a Remote Frame.
• Up to 8 bytes of data for a Data Frame (should match DLC).

**Error States and Counters**  The TWAI protocol implements a feature known as “fault confinement” where a persistently erroneous node will eventually eliminate itself from the bus. This is implemented by requiring every node to maintain two internal error counters known as the Transmit Error Counter (TEC) and the Receive Error Counter (REC). The two error counters are incremented and decremented according to a set of rules (where the counters increase on an error, and decrease on a successful message transmission/reception). The values of the counters are used to determine a node’s error state, namely Error Active, Error Passive, and Bus-Off.

**Error Active:** A node is Error Active when both TEC and REC are less than 128 and indicates that the node is operating normally. Error Active nodes are allowed to participate in bus communications, and will actively signal the detection of any errors by automatically transmitting an Active Error Flag over the bus.

**Error Passive:** A node is Error Passive when either the TEC or REC becomes greater than or equal to 128. Error Passive nodes are still able to take part in bus communications, but will instead transmit a Passive Error Flag upon detection of an error.

**Bus-Off:** A node becomes Bus-Off when the TEC becomes greater than or equal to 256. A Bus-Off node is unable to influence the bus in any manner (essentially disconnected from the bus) thus eliminating itself from the bus. A node will remain in the Bus-Off state until it undergoes bus-off recovery.

**Signals Lines and Transceiver**

The TWAI controller does not contain an integrated transceiver. Therefore, to connect the TWAI controller to a TWAI bus, an external transceiver is required. The type of external transceiver used should depend on the application’s physical layer specification (e.g., using SN65HVD23x transceivers for ISO 11898-2 compatibility).

The TWAI controller’s interface consists of 4 signal lines known as TX, RX, BUS-OFF, and CLKOUT. These four signal lines can be routed through the GPIO Matrix to the ESP32-S3’s GPIO pads.

![Signal lines of the TWAI controller](image)

**TX and RX:** The TX and RX signal lines are required to interface with an external transceiver. Both signal lines represent/interpret a dominant bit as a low logic level (0 V), and a recessive bit as a high logic level (3.3 V).

**BUS-OFF:** The BUS-OFF signal line is optional and is set to a low logic level (0 V) whenever the TWAI controller reaches a bus-off state. The BUS-OFF signal line is set to a high logic level (3.3 V) otherwise.

**CLKOUT:** The CLKOUT signal line is optional and outputs a prescaled version of the controller’s source clock.
Note: An external transceiver must internally loopback the TX to RX such that a change in logic level to the TX signal line can be observed on the RX line. Failing to do so will cause the TWAI controller to interpret differences in logic levels between the two signal lines as a loss in arbitration or a bit error.

API Naming Conventions

Note: The TWAI driver provides two sets of API. One is handle-free and is widely used in IDF versions earlier than v5.2, but it can only support one TWAI hardware controller. The other set is with handles, and the function name is usually suffixed with “v2”, which can support any number of TWAI controllers. These two sets of API can be used at the same time, but it is recommended to use the “v2” version in your new projects.

Driver Configuration

This section covers how to configure the TWAI driver.

Operating Modes The TWAI driver supports the following modes of operations:

Normal Mode: The normal operating mode allows the TWAI controller to take part in bus activities such as transmitting and receiving messages/error frames. Acknowledgement from another node is required when transmitting a message.

No Ack Mode: The No Acknowledgement mode is similar to normal mode, however acknowledgements are not required for a message transmission to be considered successful. This mode is useful when self testing the TWAI controller (loopback of transmissions).

Listen Only Mode: This mode prevents the TWAI controller from influencing the bus. Therefore, transmission of messages/acknowledgement/error frames will be disabled. However the TWAI controller is still able to receive messages but will not acknowledge the message. This mode is suited for bus monitor applications.

Alerts The TWAI driver contains an alert feature that is used to notify the application layer of certain TWAI controller or TWAI bus events. Alerts are selectively enabled when the TWAI driver is installed, but can be reconfigured during runtime by calling `twai_reconfigure_alerts()`. The application can then wait for any enabled alerts to occur by calling `twai_read_alerts()`. The TWAI driver supports the following alerts:

<table>
<thead>
<tr>
<th>Alert Flag</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TWAI_ALERT_TX_IDLE</td>
<td>No more messages queued for transmission</td>
</tr>
<tr>
<td>TWAI_ALERT_TX_SUCCESS</td>
<td>The previous transmission was successful</td>
</tr>
<tr>
<td>TWAI_ALERT_RX_DATA</td>
<td>A frame has been received and added to the RX queue</td>
</tr>
<tr>
<td>TWAI_ALERT BELOW_ERR_WARN</td>
<td>Both error counters have dropped below error warning limit</td>
</tr>
<tr>
<td>TWAI_ALERT_ERROR_ACTIVE</td>
<td>TWAI controller has become error active</td>
</tr>
<tr>
<td>TWAI_ALERT_RECOVERY_IN_PROGRESS</td>
<td>TWAI controller is undergoing bus recovery</td>
</tr>
<tr>
<td>TWAI_ALERT_BUS_RECOVERED</td>
<td>TWAI controller has successfully completed bus recovery</td>
</tr>
<tr>
<td>TWAI_ALERT_ARB_LOST</td>
<td>The previous transmission lost arbitration</td>
</tr>
<tr>
<td>TWAI_ALERT ABOVE_ERR_WARN</td>
<td>One of the error counters have exceeded the error warning limit</td>
</tr>
<tr>
<td>TWAI_ALERT_BUS_ERROR</td>
<td>A (Bit, Stuff, CRC, Form, ACK) error has occurred on the bus</td>
</tr>
<tr>
<td>TWAI_ALERT_TX FAILED</td>
<td>The previous transmission has failed</td>
</tr>
<tr>
<td>TWAI_ALERT_RX_QUEUE_FULL</td>
<td>The RX queue is full causing a received frame to be lost</td>
</tr>
<tr>
<td>TWAI_ALERT_ERR_PASS</td>
<td>TWAI controller has become error passive</td>
</tr>
<tr>
<td>TWAI_ALERT_BUS_OFF</td>
<td>Bus-off condition occurred. TWAI controller can no longer influence bus</td>
</tr>
</tbody>
</table>
Note: The TWAI controller’s error warning limit is used to preemptively warn the application of bus errors before the error passive state is reached. By default, the TWAI driver sets the error warning limit to 96. The TWAI_ALERT_ABOVE_ERR_WARN is raised when the TEC or REC becomes larger than or equal to the error warning limit. The TWAI_ALERT_BELOW_ERR_WARN is raised when both TEC and REC return back to values below 96.

Note: When enabling alerts, the TWAI_ALERT_AND_LOG flag can be used to cause the TWAI driver to log any raised alerts to UART. However, alert logging is disabled and TWAI_ALERT_AND_LOG if the CONFIG_TWAI_ISR_IN_IRAM option is enabled (see Placing ISR into IRAM).

Note: The TWAI_ALERT_ALL and TWAI_ALERT_NONE macros can also be used to enable/disable all alerts during configuration/reconfiguration.

Bit Timing The operating bit rate of the TWAI driver is configured using the twai_timing_config_t structure. The period of each bit is made up of multiple time quanta, and the period of a time quantum is determined by a pre-scaled version of the TWAI controller’s source clock. A single bit contains the following segments in the following order:

1. The Synchronization Segment consists of a single time quantum
2. Timing Segment 1 consists of 1 to 16 time quanta before sample point
3. Timing Segment 2 consists of 1 to 8 time quanta after sample point

The Baudrate Prescaler is used to determine the period of each time quantum by dividing the TWAI controller’s source clock. On the ESP32-S3, the brp can be any even number from 2 to 16384. Alternatively, you can decide the resolution of each quantum, by setting twai_timing_config_t::quanta_resolution_hz to a non-zero value. In this way, the driver can calculate the underlying brp value for you. It is useful when you set different clock sources but want the bit rate to keep the same.

Supported clock source for a TWAI controller is listed in the twai_clock_source_t and can be specified in twai_timing_config_t::clk_src.

![Fig. 28: Bit timing configuration for 500kbit/s given BRP = 8, clock source frequency is 80MHz](image)

The sample point of a bit is located on the intersection of Timing Segment 1 and 2. Enabling Triple Sampling causes 3 time quanta to be sampled per bit instead of 1 (extra samples are located at the tail end of Timing Segment 1).

The Synchronization Jump Width is used to determine the maximum number of time quanta a single bit time can be lengthened/shortened for synchronization purposes. sjw can range from 1 to 4.

Note: Multiple combinations of brp, tseg_1, tseg_2, and sjw can achieve the same bit rate. Users should tune these values to the physical characteristics of their bus by taking into account factors such as propagation delay, node information processing time, and phase errors.

Bit timing macro initializers are also available for commonly used bit rates. The following macro initializers are provided by the TWAI driver.
• TWAI\_TIMING\_CONFIG\_1MBITS
• TWAI\_TIMING\_CONFIG\_800KBITS
• TWAI\_TIMING\_CONFIG\_500KBITS
• TWAI\_TIMING\_CONFIG\_250KBITS
• TWAI\_TIMING\_CONFIG\_125KBITS
• TWAI\_TIMING\_CONFIG\_100KBITS
• TWAI\_TIMING\_CONFIG\_50KBITS
• TWAI\_TIMING\_CONFIG\_25KBITS
• TWAI\_TIMING\_CONFIG\_20KBITS
• TWAI\_TIMING\_CONFIG\_16KBITS
• TWAI\_TIMING\_CONFIG\_12.5KBITS
• TWAI\_TIMING\_CONFIG\_10KBITS
• TWAI\_TIMING\_CONFIG\_5KBITS
• TWAI\_TIMING\_CONFIG\_1KBITS

**Acceptance Filter** The TWAI controller contains a hardware acceptance filter which can be used to filter messages of a particular ID. A node that filters out a message **does not receive the message, but will still acknowledge it.** Acceptance filters can make a node more efficient by filtering out messages sent over the bus that are irrelevant to the node. The acceptance filter is configured using two 32-bit values within `twai\_filter\_config\_t` known as the **acceptance code** and the **acceptance mask.**

The **acceptance code** specifies the bit sequence which a message’s ID, RTR, and data bytes must match in order for the message to be received by the TWAI controller. The **acceptance mask** is a bit sequence specifying which bits of the acceptance code can be ignored. This allows for messages of different IDs to be accepted by a single acceptance code.

The acceptance filter can be used under **Single or Dual Filter Mode.** Single Filter Mode uses the acceptance code and mask to define a single filter. This allows for the first two data bytes of a standard frame to be filtered, or the entirety of an extended frame’s 29-bit ID. The following diagram illustrates how the 32-bit acceptance code and mask are interpreted under Single Filter Mode (Note: The yellow and blue fields represent standard and extended frame formats respectively).

![Fig. 29: Bit layout of single filter mode (Right side MSBit)](image)

**Dual Filter Mode** uses the acceptance code and mask to define two separate filters allowing for increased flexibility of ID’s to accept, but does not allow for all 29-bits of an extended ID to be filtered. The following diagram illustrates how the 32-bit acceptance code and mask are interpreted under **Dual Filter Mode** (Note: The yellow and blue fields represent standard and extended frame formats respectively).

![Fig. 30: Bit layout of dual filter mode (Right side MSBit)](image)
Disabling TX Queue  
The TX queue can be disabled during configuration by setting the `tx_queue_len` member of `twai_general_config_t` to 0. This allows applications that do not require message transmission to save a small amount of memory when using the TWAI driver.

Placing ISR into IRAM  
The TWAI driver’s ISR (Interrupt Service Routine) can be placed into IRAM so that the ISR can still run whilst the cache is disabled. Placing the ISR into IRAM may be necessary to maintain the TWAI driver’s functionality during lengthy cache disabling operations (such as SPI Flash writes, OTA updates etc). Whilst the cache is disabled, the ISR continues to:

- Read received messages from the RX buffer and place them into the driver’s RX queue.
- Load messages pending transmission from the driver’s TX queue and write them into the TX buffer.

To place the TWAI driver’s ISR, users must do the following:

- Enable the `CONFIG_TWAI_ISR_IN_IRAM` option using `idf.py menuconfig`.
- When calling `twai_driver_install()`, the `intr_flags` member of `twai_general_config_t` should set the `ESP_INTR_FLAG_IRAM` set.

Note: When the `CONFIG_TWAI_ISR_IN_IRAM` option is enabled, the TWAI driver will no longer log any alerts (i.e., the `TWAI_ALERT_AND_LOG` flag will not have any effect).

Driver Operation

The TWAI driver is designed with distinct states and strict rules regarding the functions or conditions that trigger a state transition. The following diagram illustrates the various states and their transitions.

![State transition diagram of the TWAI driver](image)

**Table: State transition diagram of the TWAI driver**

<table>
<thead>
<tr>
<th>Label</th>
<th>Transition</th>
<th>Action/Condition</th>
</tr>
</thead>
<tbody>
<tr>
<td>A</td>
<td>Uninstalled &gt; Stopped</td>
<td><code>twai_driver_install()</code></td>
</tr>
<tr>
<td>B</td>
<td>Stopped &gt; Uninstalled</td>
<td><code>twai_driver_uninstall()</code></td>
</tr>
<tr>
<td>C</td>
<td>Stopped &gt; Running</td>
<td><code>twai_start()</code></td>
</tr>
<tr>
<td>D</td>
<td>Running &gt; Stopped</td>
<td><code>twai_stop()</code></td>
</tr>
<tr>
<td>E</td>
<td>Running &gt; Bus-Off</td>
<td>Transmit Error Counter &gt;= 256</td>
</tr>
<tr>

<td>Bus-Off &gt; Uninstalled</td>
<td><code>twai_driver_uninstall()</code></td>
</tr>
<tr>
<td>G</td>
<td>Bus-Off &gt; Recovering</td>
<td><code>twai_initiate_recovery()</code></td>
</tr>
<tr>
<td>H</td>
<td>Recovering &gt; Stopped</td>
<td>128 occurrences of 11 consecutive recessive bits.</td>
</tr>
</tbody>
</table>

**Driver States**  
**Uninstalled**: In the uninstalled state, no memory is allocated for the driver and the TWAI controller is powered OFF.
**Stopped:** In this state, the TWAI controller is powered ON and the TWAI driver has been installed. However the TWAI controller is unable to take part in any bus activities such as transmitting, receiving, or acknowledging messages.

**Running:** In the running state, the TWAI controller is able to take part in bus activities. Therefore messages can be transmitted/received/acknowledged. Furthermore, the TWAI controller is able to transmit error frames upon detection of errors on the bus.

**Bus-Off:** The bus-off state is automatically entered when the TWAI controller’s Transmit Error Counter becomes greater than or equal to 256. The bus-off state indicates the occurrence of severe errors on the bus or in the TWAI controller. Whilst in the bus-off state, the TWAI controller is unable to take part in any bus activities. To exit the bus-off state, the TWAI controller must undergo the bus recovery process.

**Recovering:** The recovering state is entered when the TWAI controller undergoes bus recovery. The TWAI controller/TWAI driver remains in the recovering state until the 128 occurrences of 11 consecutive recessive bits is observed on the bus.

**Message Fields and Flags** The TWAI driver distinguishes different types of messages by using the various bit field members of the `twai_message_t` structure. These bit field members determine whether a message is in standard or extended format, a remote frame, and the type of transmission to use when transmitting such a message.

These bit field members can also be toggled using the `flags` member of `twai_message_t` and the following message flags:

<table>
<thead>
<tr>
<th>Message Flag</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TWAI_MSG_FLAG_EXTD</td>
<td>Message is in Extended Frame Format (29bit ID)</td>
</tr>
<tr>
<td>TWAI_MSG_FLAG_RTR</td>
<td>Message is a Remote Frame (Remote Transmission Request)</td>
</tr>
<tr>
<td>TWAI_MSG_FLAG_SS</td>
<td>Transmit message using Single Shot Transmission (Message will not be re-</td>
</tr>
<tr>
<td></td>
<td>transmitted upon error or loss of arbitration). Unused for received message.</td>
</tr>
<tr>
<td>TWAI_MSG_FLAG_SELF</td>
<td>Transmit message using Self Reception Request (Transmitted message will also</td>
</tr>
<tr>
<td></td>
<td>received by the same node). Unused for received message.</td>
</tr>
<tr>
<td>TWAI_MSG_FLAG_DLC_NON_COMP</td>
<td>Message’s Data length code is larger than 8. This will break compliance with</td>
</tr>
<tr>
<td></td>
<td>TWAI</td>
</tr>
<tr>
<td>TWAI_MSG_FLAG_NONE</td>
<td>Clears all bit fields. Equivalent to a Standard Frame Format (11bit ID)</td>
</tr>
<tr>
<td></td>
<td>Data Frame.</td>
</tr>
</tbody>
</table>

**Examples**

**Configuration & Installation** The following code snippet demonstrates how to configure, install, and start the TWAI driver via the use of the various configuration structures, macro initializers, the `twai_driver_install()` function, and the `twai_start()` function.

```c
#include "driver/gpio.h"
#include "driver/twai.h"

void app_main()
{
    //Initialize configuration structures using macro initializers
    twai_general_config_t g_config = TWAI_GENERAL_CONFIG_DEFAULT(GPIO_NUM_21, GPIO_NUM_22, TWAI_MODE_NORMAL);
    twai_timing_config_t t_config = TWAI_TIMING_CONFIG_500KBITS();
    twai_filter_config_t f_config = TWAI_FILTER_CONFIG_ACCEPT_ALL();

    //Install TWAI driver
    if (twai_driver_install(&g_config, &t_config, &f_config) == ESP_OK) {
        printf("Driver installed\n");
    } else {
        printf("Failed to install driver\n");
        return;
    }
}
```

(continues on next page)
The usage of macro initializers is not mandatory and each of the configuration structures can be manually.

Install Multiple TWAI Instances The following code snippet demonstrates how to install multiple TWAI instances via the use of the `twai_driver_install_v2()` function.

```c
#include "driver/gpio.h"
#include "driver/twai.h"

void app_main() {
    twai_handle_t twai_bus_0;
    twai_handle_t twai_bus_1;

    //Initialize configuration structures using macro initializers
    twai_general_config_t g_config = TWAI_GENERAL_CONFIG_DEFAULT(GPIO_NUM_0, GPIO_NUM_1, TWAI_MODE_NORMAL);
    twai_timing_config_t t_config = TWAI_TIMING_CONFIG_500KBITS();
    twai_filter_config_t f_config = TWAI_FILTER_CONFIG_ACCEPT_ALL();

    //Install driver for TWAI bus 0
    g_config.controller_id = 0;
    if (twai_driver_install_v2(&g_config, &t_config, &f_config, &twai_bus_0) == ESP_OK) {
        printf("Driver installed\n");
    } else {
        printf("Failed to install driver\n");
        return;
    }

    //Start TWAI driver
    if (twai_start_v2(twai_bus_0) == ESP_OK) {
        printf("Driver started\n");
    } else {
        printf("Failed to start driver\n");
        return;
    }

    //Install driver for TWAI bus 1
    g_config.controller_id = 1;
    g_config.tx_io = GPIO_NUM_2;
    g_config.rx_io = GPIO_NUM_3;
    if (twai_driver_install_v2(&g_config, &t_config, &f_config, &twai_bus_1) == ESP_OK) {
        printf("Driver installed\n");
    } else {
        printf("Failed to install driver\n");
        return;
    }

    //Start TWAI driver
```

(continues on next page)
if (twai_start_v2(twai_bus_1) == ESP_OK) {
    printf("Driver started\n");
} else {
    printf("Failed to start driver\n");
    return;
}

//Other Driver operations must use version 2 API as well
...

Message Transmission

The following code snippet demonstrates how to transmit a message via the usage of the `twai_message_t` type and `twai_transmit()` function.

```c
#include "driver/twai.h"
...

//Configure message to transmit
twai_message_t message;
message.identifier = 0xAAAA;
message.extd = 1;
message.data_length_code = 4;
for (int i = 0; i < 4; i++) {
    message.data[i] = 0;
}

//Queue message for transmission
if (twai_transmit(&message, pdMS_TO_TICKS(1000)) == ESP_OK) {
    printf("Message queued for transmission\n");
} else {
    printf("Failed to queue message for transmission\n");
}
```

Message Reception

The following code snippet demonstrates how to receive a message via the usage of the `twai_message_t` type and `twai_receive()` function.

```c
#include "driver/twai.h"
...

//Wait for message to be received
twai_message_t message;
if (twai_receive(&message, pdMS_TO_TICKS(10000)) == ESP_OK) {
    printf("Message received\n");
} else {
    printf("Failed to receive message\n");
    return;
}

//Process received message
if (message.extd) {
    printf("Message is in Extended Format\n");
} else {
    printf("Message is in Standard Format\n");
}
printf("ID is %d", message.identifier);
```
if (!message.rtr) {
    for (int i = 0; i < message.data_length_code; i++) {
        printf("Data byte %d = %d\n", i, message.data[i]);
    }
}

Reconfiguring and Reading Alerts  The following code snippet demonstrates how to reconfigure and read TWAI driver alerts via the use of the `twai_reconfigure_alerts()` and `twai_read_alerts()` functions.

```c
#include "driver/twai.h"
...
//Reconfigure alerts to detect Error Passive and Bus-Off error states
uint32_t alerts_to_enable = TWAI_ALERT_ERR_PASS | TWAI_ALERT_BUS_OFF;
if (twai_reconfigure_alerts(alerts_to_enable, NULL) == ESP_OK) {
    printf("Alerts reconfigured\n");
} else {
    printf("Failed to reconfigure alerts\n");
}
//Block indefinitely until an alert occurs
uint32_t alerts_triggered;
twai_read_alerts(&alerts_triggered, portMAX_DELAY);
```

Stop and Uninstall  The following code demonstrates how to stop and uninstall the TWAI driver via the use of the `twai_stop()` and `twai_driver_uninstall()` functions.

```c
#include "driver/twai.h"
...
//Stop the TWAI driver
if (twai_stop() == ESP_OK) {
    printf("Driver stopped\n");
} else {
    printf("Failed to stop driver\n");
    return;
}
//Uninstall the TWAI driver
if (twai_driver_uninstall() == ESP_OK) {
    printf("Driver uninstalled\n");
} else {
    printf("Failed to uninstall driver\n");
    return;
}
```

Multiple ID Filter Configuration  The acceptance mask in `twai_filter_config_t` can be configured such that two or more IDs are accepted for a single filter. For a particular filter to accept multiple IDs, the conflicting bit positions amongst the IDs must be set in the acceptance mask. The acceptance code can be set to any one of the IDs.

The following example shows how the calculate the acceptance mask given multiple IDs:

```
ID1 = 11'b101 1010 0000
ID2 = 11'b101 1010 0001
ID3 = 11'b101 1010 0100
```
Application Examples

Network Example: The TWAI Network example demonstrates communication between two ESP32-S3s using the TWAI driver API. One TWAI node acts as a network master that initiates and ceases the transfer of a data from another node acting as a network slave. The example can be found via peripherals/twai/twai_network.

Alert and Recovery Example: This example demonstrates how to use the TWAI driver’s alert and bus-off recovery API. The example purposely introduces errors on the bus to put the TWAI controller into the Bus-Off state. An alert is used to detect the Bus-Off state and trigger the bus recovery process. The example can be found via peripherals/twai/twai_alert_and_recovery.

Self Test Example: This example uses the No Acknowledge Mode and Self Reception Request to cause the TWAI controller to send and simultaneously receive a series of messages. This example can be used to verify if the connections between the TWAI controller and the external transceiver are working correctly. The example can be found via peripherals/twai/twai_self_test.

API Reference

Header File

- components/hal/include/hal/twai_types.h
- This header file can be included with:

```c
#include "hal/twai_types.h"
```

Structures

struct twai_message_t

Structure to store a TWAI message.

Note: The flags member is deprecated

Public Members

- uint32_t extd
  - Extended Frame Format (29bit ID)

- uint32_t rtr
  - Message is a Remote Frame

- uint32_t ss
  - Transmit as a Single Shot Transmission. Unused for received.

- uint32_t self
  - Transmit as a Self Reception Request. Unused for received.

```c
uint32_t dlc_non_comp
Message’s Data length code is larger than 8. This will break compliance with ISO 11898-1

uint32_t reserved
Reserved bits

uint32_t flags
Deprecated: Alternate way to set bits using message flags

uint32_t identifier
11 or 29 bit identifier

uint8_t data_length_code
Data length code

uint8_t data[TWAI_FRAME_MAX_DLC]
Data bytes (not relevant in RTR frame)
```

```
struct twai_timing_config_t
Structure for bit timing configuration of the TWAI driver.

Note: Macro initializers are available for this structure
```

**Public Members**

`twai_clock_source_t clk_src`
Clock source, set to 0 or TWAI_CLK_SRC_DEFAULT if you want a default clock source

`uint32_t quanta_resolution_hz`
The resolution of one timing quanta, in Hz. Note: the value of `brp` will reflected by this field if it’s non-zero, otherwise, `brp` needs to be set manually

`uint32_t brp`
Baudrate prescale (i.e., clock divider). Any even number from 2 to 128 for ESP32, 2 to 32768 for non-ESP32 chip. Note: For ESP32 ECO 2 or later, multiples of 4 from 132 to 256 are also supported

`uint8_t tseg_1`
Timing segment 1 (Number of time quanta, between 1 to 16)

`uint8_t tseg_2`
Timing segment 2 (Number of time quanta, 1 to 8)

`uint8_t sjw`
Synchronization Jump Width (Max time quanta jump for synchronize from 1 to 4)

`bool triple_sampling`
Enables triple sampling when the TWAI controller samples a bit
struct twai_filter_config_t
Structure for acceptance filter configuration of the TWAI driver (see documentation)

Note: Macro initializers are available for this structure

Public Members

uint32_t acceptance_code
32-bit acceptance code

uint32_t acceptance_mask
32-bit acceptance mask

bool single_filter
Use Single Filter Mode (see documentation)

Macros

TWAI_EXTD_ID_MASK
TWAI Constants.
Bit mask for 29 bit Extended Frame Format ID

TWAI_STD_ID_MASK
Bit mask for 11 bit Standard Frame Format ID

TWAI_FRAME_MAX_DLC
Max data bytes allowed in TWAI

TWAI_FRAME_EXTD_ID_LEN_BYTES
EFF ID requires 4 bytes (29bit)

TWAI_FRAME_STD_ID_LEN_BYTES
SFF ID requires 2 bytes (11bit)

TWAI_ERR_PASS_THRESH
Error counter threshold for error passive

Type Definitions

typedef soc_periph_twai_clk_src_t twai_clock_source_t
RMT group clock source.

Note: User should select the clock source based on the power and resolution requirement
Chapter 2. API Reference

Enumerations

enum twai_mode_t
    TWAIControlleroperatingmodes.

    Values:

enumerator TWAI_MODE_NORMAL
    NormaloperatingmodewhereTWAIcontrollercansend/receive/acknowledgemessages

enumerator TWAI_MODE_NO_ACK
    Transmissiondoesnotrequireacknowledgment.Usethismodeforselftesting

enumerator TWAI_MODE_LISTEN_ONLY
    TheTWAIcontrollerwillnotinfluencethebus(Notransmissionsoracknowledgments)butcanreceive
    messages

Functions

`esp_err_t twai_driver_install` (const `twai_general_config_t *g_config`, const `twai_timing_config_t` *`t_config`, const `twai_filter_config_t *f_config`)

InstallTWAIdriver.

ThisfunctioninstallstheTWAIdriverusingthreeconfigurationstructures.Therquiredmemoryisallocated
andtheTWAIdriverisplacedinthestoppedstateafterrunningthisfunction.

**Note:** Macroinitializersareavailablefortheconfigurationstructures(seedocumentation)

**Note:** ToreinstalltheTWAIdriver,call `twai_driver_uninstall()`first

Parameters

- `g_config` [in] Generalconfigurationstructure
- `t_config` [in] Timingconfigurationstructure
- `f_config` [in] Filterconfigurationstructure

Returns

- ESP_OK: SuccessfullyinstalledTWAIdriver
- ESP_ERR_INVALID_ARG: Argumentsareinvalid, e.g. invalidclocksource,invalid
  quantaresolution
- ESP_ERR_NO_MEM: Insufficientmemory
- ESP_ERR_INVALID_STATE: Driverisalreadyinstalled
**esp_err_t twai_driver_install_v2** (const `twai_general_config_t *g_config`, const `twai_timing_config_t *t_config`, const `twai_filter_config_t *f_config`, `twai_handle_t *ret_twai`)

Install TWAI driver and return a handle.

**Note:** This is an advanced version of `twai_driver_install` that can return a driver handle, so that it allows you to install multiple TWAI drivers. Don’t forget to set the proper controller_id in the `twai_general_config_t`. Please refer to the documentation of `twai_driver_install` for more details.

**Parameters**

- `g_config` - [in] General configuration structure
- `t_config` - [in] Timing configuration structure
- `f_config` - [in] Filter configuration structure
- `ret_twai` - [out] Pointer to a new created TWAI handle

**Returns**

- ESP_OK: Successfully installed TWAI driver
- ESP_ERR_INVALID_ARG: Arguments are invalid, e.g. invalid clock source, invalid quanta resolution, invalid controller ID
- ESP_ERR_NO_MEM: Insufficient memory
- ESP_ERR_INVALID_STATE: Driver is already installed

**esp_err_t twai_driver_uninstall** (void)

Uninstall the TWAI driver.

This function uninstalls the TWAI driver, freeing the memory utilized by the driver. This function can only be called when the driver is in the stopped state or the bus-off state.

**Warning:** The application must ensure that no tasks are blocked on TX/RX queues or alerts when this function is called.

**Returns**

- ESP_OK: Successfully uninstalled TWAI driver
- ESP_ERR_INVALID_STATE: Driver is not in stopped/bus-off state, or is not installed

**esp_err_t twai_driver_uninstall_v2** (twai_handle_t handle)

Uninstall the TWAI driver with a given handle.

**Note:** This is an advanced version of `twai_driver_uninstall` that can uninstall a TWAI driver with a given handle. Please refer to the documentation of `twai_driver_uninstall` for more details.

**Parameters**

- `handle` - [in] TWAI driver handle returned by `twai_driver_install_v2`

**Returns**

- ESP_OK: Successfully uninstalled TWAI driver
- ESP_ERR_INVALID_STATE: Driver is not in stopped/bus-off state, or is not installed

**esp_err_t twai_start** (void)

Start the TWAI driver.

This function starts the TWAI driver, putting the TWAI driver into the running state. This allows the TWAI driver to participate in TWAI bus activities such as transmitting/receiving messages. The TX and RX queue are reset in this function, clearing any messages that are unread or pending transmission. This function can only be called when the TWAI driver is in the stopped state.
Returns

• ESP_OK: TWAI driver is now running
• ESP_ERR_INVALID_STATE: Driver is not in stopped state, or is not installed

`esp_err_t twai_start_v2 (twai_handle_t handle)`
Start the TWAI driver with a given handle.

**Note:** This is an advanced version of `twai_start` that can start a TWAI driver with a given handle. Please refer to the documentation of `twai_start` for more details.

Parameters

- **handle** - [in] TWAI driver handle returned by `twai_driver_install_v2`

Returns

- ESP_OK: TWAI driver is now running
- ESP_ERR_INVALID_STATE: Driver is not in stopped state, or is not installed

`esp_err_t twai_stop (void)`
Stop the TWAI driver.

This function stops the TWAI driver, preventing any further message from being transmitted or received until `twai_start()` is called. Any messages in the TX queue are cleared. Any messages in the RX queue should be read by the application after this function is called. This function can only be called when the TWAI driver is in the running state.

**Warning:** A message currently being transmitted/received on the TWAI bus will be ceased immediately. This may lead to other TWAI nodes interpreting the unfinished message as an error.

Returns

- ESP_OK: TWAI driver is now Stopped
- ESP_ERR_INVALID_STATE: Driver is not in running state, or is not installed

`esp_err_t twai_stop_v2 (twai_handle_t handle)`
Stop the TWAI driver with a given handle.

**Note:** This is an advanced version of `twai_stop` that can stop a TWAI driver with a given handle. Please refer to the documentation of `twai_stop` for more details.

Parameters

- **handle** - [in] TWAI driver handle returned by `twai_driver_install_v2`

Returns

- ESP_OK: TWAI driver is now Stopped
- ESP_ERR_INVALID_STATE: Driver is not in running state, or is not installed

`esp_err_t twai_transmit (const twai_message_t *message, TickType_t ticks_to_wait)`
Transmit a TWAI message.

This function queues a TWAI message for transmission. Transmission will start immediately if no other messages are queued for transmission. If the TX queue is full, this function will block until more space becomes available or until it times out. If the TX queue is disabled (TX queue length = 0 in configuration), this function will return immediately if another message is undergoing transmission. This function can only be called when the TWAI driver is in the running state and cannot be called under Listen Only Mode.

**Note:** This function does not guarantee that the transmission is successful. The TX_SUCCESS/TX_FAILED alert can be enabled to alert the application upon the success/failure of a transmission.
Note: The TX_IDLE alert can be used to alert the application when no other messages are awaiting transmission.

Parameters
• message –[in] Message to transmit
• ticks_to_wait –[in] Number of FreeRTOS ticks to block on the TX queue

Returns
• ESP_OK: Transmission successfully queued/initiated
• ESP_ERR_INVALID_ARG: Arguments are invalid
• ESP_ERR_TIMEOUT: Timed out waiting for space on TX queue
• ESP_FAIL: TX queue is disabled and another message is currently transmitting
• ESP_ERR_INVALID_STATE: TWAI driver is not in running state, or is not installed
• ESP_ERR_NOT_SUPPORTED: Listen Only Mode does not support transmissions

`esp_err_t twai_transmit_v2 (twai_handle_t handle, const twai_message_t *message, TickType_t ticks_to_wait)`

Transmit a TWAI message via a given handle.

Note: This is an advanced version of `twai_transmit` that can transmit a TWAI message with a given handle. Please refer to the documentation of `twai_transmit` for more details.

Parameters
• handle –[in] TWAI driver handle returned by `twai_driver_install_v2`
• message –[in] Message to transmit
• ticks_to_wait –[in] Number of FreeRTOS ticks to block on the TX queue

Returns
• ESP_OK: Transmission successfully queued/initiated
• ESP_ERR_INVALID_ARG: Arguments are invalid
• ESP_ERR_TIMEOUT: Timed out waiting for space on TX queue
• ESP_FAIL: TX queue is disabled and another message is currently transmitting
• ESP_ERR_INVALID_STATE: TWAI driver is not in running state, or is not installed
• ESP_ERR_NOT_SUPPORTED: Listen Only Mode does not support transmissions

`esp_err_t twai_receive (twai_message_t *message, TickType_t ticks_to_wait)`

Receive a TWAI message.

This function receives a message from the RX queue. The flags field of the message structure will indicate the type of message received. This function will block if there are no messages in the RX queue

Warning: The flags field of the received message should be checked to determine if the received message contains any data bytes.

Parameters
• message –[out] Received message
• ticks_to_wait –[in] Number of FreeRTOS ticks to block on RX queue

Returns
• ESP_OK: Message successfully received from RX queue
• ESP_ERR_TIMEOUT: Timed out waiting for message
• ESP_ERR_INVALID_ARG: Arguments are invalid
• ESP_ERR_INVALID_STATE: TWAI driver is not installed
esp_err_t twai_receive_v2(twai_handle_t handle, twai_message_t *message, TickType_t ticks_to_wait)
Receive a TWAI message via a given handle.

**Note:** This is an advanced version of twai_receive that can receive a TWAI message with a given handle. Please refer to the documentation of twai_receive for more details.

**Parameters**
- **handle** - [in] TWAI driver handle returned by twai_driver_install_v2
- **message** - [out] Received message
- **ticks_to_wait** - [in] Number of FreeRTOS ticks to block on RX queue

**Returns**
- ESP_OK: Message successfully received from RX queue
- ESP_ERR_TIMEOUT: Timed out waiting for message
- ESP_ERR_INVALID_ARG: Arguments are invalid
- ESP_ERR_INVALID_STATE: TWAI driver is not installed

esp_err_t twai_read_alerts(uint32_t* alerts, TickType_t ticks_to_wait)
Read TWAI driver alerts.

This function will read the alerts raised by the TWAI driver. If no alert has been issued when this function is called, this function will block until an alert occurs or until it timeouts.

**Note:** Multiple alerts can be raised simultaneously. The application should check for all alerts that have been enabled.

**Parameters**
- **alerts** - [out] Bit field of raised alerts (see documentation for alert flags)
- **ticks_to_wait** - [in] Number of FreeRTOS ticks to block for alert

**Returns**
- ESP_OK: Alerts read
- ESP_ERR_TIMEOUT: Timed out waiting for alerts
- ESP_ERR_INVALID_ARG: Arguments are invalid
- ESP_ERR_INVALID_STATE: TWAI driver is not installed

esp_err_t twai_read_alerts_v2(twai_handle_t handle, uint32_t* alerts, TickType_t ticks_to_wait)
Read TWAI driver alerts with a given handle.

**Note:** This is an advanced version of twai_read_alerts that can read TWAI driver alerts with a given handle. Please refer to the documentation of twai_read_alerts for more details.

**Parameters**
- **handle** - [in] TWAI driver handle returned by twai_driver_install_v2
- **alerts** - [out] Bit field of raised alerts (see documentation for alert flags)
- **ticks_to_wait** - [in] Number of FreeRTOS ticks to block for alert

**Returns**
- ESP_OK: Alerts read
- ESP_ERR_TIMEOUT: Timed out waiting for alerts
- ESP_ERR_INVALID_ARG: Arguments are invalid
- ESP_ERR_INVALID_STATE: TWAI driver is not installed

esp_err_t twai_reconfigure_alerts(uint32_t alerts_enabled, uint32_t* current_alerts)
Reconfigure which alerts are enabled.
This function reconfigures which alerts are enabled. If there are alerts which have not been read whilst reconfiguring, this function can read those alerts.

**Parameters**
- `alerts_enabled` [in] Bit field of alerts to enable (see documentation for alert flags)
- `current_alerts` [out] Bit field of currently raised alerts. Set to NULL if unused

**Returns**
- ESP_OK: Alerts reconfigured
- ESP_ERR_INVALID_STATE: TWAI driver is not installed

```c
esp_err_t twai_reconfigure_alerts_v2(twai_handle_t handle, uint32_t alerts_enabled, uint32_t *current_alerts)
```

Reconfigure which alerts are enabled, with a given handle.

**Note:** This is an advanced version of `twai_reconfigure_alerts` that can reconfigure which alerts are enabled with a given handle. Please refer to the documentation of `twai_reconfigure_alerts` for more details.

**Parameters**
- `handle` [in] TWAI driver handle returned by `twai_driver_install_v2`
- `alerts_enabled` [in] Bit field of alerts to enable (see documentation for alert flags)
- `current_alerts` [out] Bit field of currently raised alerts. Set to NULL if unused

**Returns**
- ESP_OK: Alerts reconfigured
- ESP_ERR_INVALID_STATE: TWAI driver is not installed

```c
esp_err_t twai_initiate_recovery_v2(twai_handle_t handle)
```

Start the bus recovery process. This function initiates the bus recovery process when the TWAI driver is in the bus-off state. Once initiated, the TWAI driver will enter the recovering state and wait for 128 occurrences of the bus-free signal on the TWAI bus before returning to the stopped state. This function will reset the TX queue, clearing any messages pending transmission.

**Note:** The BUS_RECOVERED alert can be enabled to alert the application when the bus recovery process completes.

**Returns**
- ESP_OK: Bus recovery started
- ESP_ERR_INVALID_STATE: TWAI driver is not in the bus-off state, or is not installed

```c
esp_err_t twai_get_status_info(twai_status_info_t *status_info)
```

Get current status information of the TWAI driver.
### Parameters

- `status_info` - [out] Status information

### Returns

- ESP_OK: Status information retrieved
- ESP_ERR_INVALID_ARG: Arguments are invalid
- ESP_ERR_INVALID_STATE: TWAI driver is not installed

```c
esp_err_t twai_get_status_info_v2(twai_handle_t handle, twai_status_info_t *status_info)
```

Get current status information of a given TWAI driver handle.

**Note:** This is an advanced version of `twai_get_status_info` that can get current status information of a given TWAI driver handle. Please refer to the documentation of `twai_get_status_info` for more details.

### Parameters

- `handle` - [in] TWAI driver handle returned by `twai_driver_install_v2`
- `status_info` - [out] Status information

### Returns

- ESP_OK: Status information retrieved
- ESP_ERR_INVALID_ARG: Arguments are invalid
- ESP_ERR_INVALID_STATE: TWAI driver is not installed

```c
esp_err_t twai_clear_transmit_queue(void)
```

Clear the transmit queue.

This function will clear the transmit queue of all messages.

**Note:** The transmit queue is automatically cleared when `twai_stop()` or `twai_initiate_recovery()` is called.

### Returns

- ESP_OK: Transmit queue cleared
- ESP_ERR_INVALID_STATE: TWAI driver is not installed or TX queue is disabled

```c
esp_err_t twai_clear_transmit_queue_v2(twai_handle_t handle)
```

Clear the transmit queue of a given TWAI driver handle.

**Note:** This is an advanced version of `twai_clear_transmit_queue` that can clear the transmit queue of a given TWAI driver handle. Please refer to the documentation of `twai_clear_transmit_queue` for more details.

### Parameters

- `handle` - [in] TWAI driver handle returned by `twai_driver_install_v2`

### Returns

- ESP_OK: Transmit queue cleared
- ESP_ERR_INVALID_STATE: TWAI driver is not installed or TX queue is disabled

```c
esp_err_t twai_clear_receive_queue(void)
```

Clear the receive queue.

This function will clear the receive queue of all messages.

**Note:** The receive queue is automatically cleared when `twai_start()` is called.

### Returns

- ESP_OK: Transmit queue cleared
• ESP_ERR_INVALID_STATE: TWAI driver is not installed

```
esp_err_t twai_clear_receive_queue_v2(twai_handle_t handle)
```

Clear the receive queue of a given TWAI driver handle.

**Note:** This is an advanced version of `twai_clear_receive_queue` that can clear the receive queue of a given TWAI driver handle. Please refer to the documentation of `twai_clear_receive_queue` for more details.

**Parameters**

- **handle** — [in] TWAI driver handle returned by `twai_driver_install_v2`

**Returns**

- ESP_OK: Transmit queue cleared
- ESP_ERR_INVALID_STATE: TWAI driver is not installed

**Structures**

```
struct twai_general_config_t
```

Structure for general configuration of the TWAI driver.

**Note:** Macro initializers are available for this structure

**Public Members**

```
int controller_id
```

TWAI controller ID, index from 0. If you want to install TWAI driver with a non-zero controller_id, please use `twai_driver_install_v2`

```
twai_mode_t mode
```

Mode of TWAI controller

```
gpio_num_t tx_io
```

Transmit GPIO number

```
gpio_num_t rx_io
```

Receive GPIO number

```
gpio_num_t clkout_io
```

CLKOUT GPIO number (optional, set to -1 if unused)

```
gpio_num_t bus_off_io
```

Bus off indicator GPIO number (optional, set to -1 if unused)

```
uint32_t tx_queue_len
```

Number of messages TX queue can hold (set to 0 to disable TX Queue)

```
uint32_t rx_queue_len
```

Number of messages RX queue can hold
uint32_t alerts_enabled
    Bit field of alerts to enable (see documentation)

uint32_t clkout_divider
    CLKOUT divider. Can be 1 or any even number from 2 to 14 (optional, set to 0 if unused)

int intr_flags
    Interrupt flags to set the priority of the driver’s ISR. Note that to use the ESP_INTR_FLAG_IRAM, the CONFIG_TWAI_ISR_IN_IRAM option should be enabled first.

struct twai_status_info_t
    Structure to store status information of TWAI driver.

Public Members

twai_state_t* state
    Current state of TWAI controller (Stopped/Running/Bus-Off/Recovery)

uint32_t msgs_to_tx
    Number of messages queued for transmission or awaiting transmission completion

uint32_t msgs_to_rx
    Number of messages in RX queue waiting to be read

uint32_t tx_error_counter
    Current value of Transmit Error Counter

uint32_t rx_error_counter
    Current value of Receive Error Counter

uint32_t tx_failed_count
    Number of messages that failed transmissions

uint32_t rx_missed_count
    Number of messages that were lost due to a full RX queue (or errata workaround if enabled)

uint32_t rx_overrun_count
    Number of messages that were lost due to a RX FIFO overrun

uint32_t arb_lost_count
    Number of instances arbitration was lost

uint32_t bus_error_count
    Number of instances a bus error has occurred

Macros

TWAI_IO_UNUSED
    Marks GPIO as unused in TWAI configuration
Type Definitions

typedef struct twai_obj_t *twai_handle_t
TWAI controller handle.

Enumerations

eenum twai_state_t
TWAI driver states.

Values:

tenumerator TWAI_STATE_STOPPED
Stopped state. The TWAI controller will not participate in any TWAI bus activities

tenumerator TWAI_STATE_RUNNING
Running state. The TWAI controller can transmit and receive messages

tenumerator TWAI_STATE_BUS_OFF
Bus-off state. The TWAI controller cannot participate in bus activities until it has recovered

tenumerator TWAI_STATE_RECOVERING
Recovering state. The TWAI controller is undergoing bus recovery

2.6.28 Universal Asynchronous Receiver/Transmitter (UART)

Introduction

A Universal Asynchronous Receiver/Transmitter (UART) is a hardware feature that handles communication (i.e.,
timing requirements and data framing) using widely-adopted asynchronous serial communication interfaces, such
as RS232, RS422, and RS485. A UART provides a widely adopted and cheap method to realize full-duplex or
half-duplex data exchange among different devices.

The ESP32-S3 chip has 3 UART controllers (also referred to as port), each featuring an identical set of registers to
simplify programming and for more flexibility.

Each UART controller is independently configurable with parameters such as baud rate, data bit length, bit ordering,
number of stop bits, parity bit, etc. All the regular UART controllers are compatible with UART-enabled devices
from various manufacturers and can also support Infrared Data Association (IrDA) protocols.

Functional Overview

The overview describes how to establish communication between an ESP32-S3 and other UART devices using the
functions and data types of the UART driver. A typical programming workflow is broken down into the sections
provided below:

1. **Set Communication Parameters** - Setting baud rate, data bits, stop bits, etc.
2. **Set Communication Pins** - Assigning pins for connection to a device
3. **Install Drivers** - Allocating ESP32-S3’s resources for the UART driver
4. **Run UART Communication** - Sending/receiving data
5. **Use Interrupts** - Triggering interrupts on specific communication events
6. **Deleting a Driver** - Freeing allocated resources if a UART communication is no longer required

Steps 1 to 3 comprise the configuration stage. Step 4 is where the UART starts operating. Steps 5 and 6 are optional.
The UART driver’s functions identify each of the UART controllers using `uart_port_t`. This identification is
needed for all the following function calls.

Submit Document Feedback
Set Communication Parameters  UART communication parameters can be configured all in a single step or individually in multiple steps.

Single Step  Call the function `uart_param_config()` and pass to it a `uart_config_t` structure. The `uart_config_t` structure should contain all the required parameters. See the example below.

```c
const uart_port_t uart_num = UART_NUM_2;
uart_config_t uart_config = {
  .baud_rate = 115200,
  .data_bits = UART_DATA_8_BITS,
  .parity = UART_PARITY_DISABLE,
  .stop_bits = UART_STOP_BITS_1,
  .flow_ctrl = UART_HW_FLOWCTRL_CTS_RTS,
  .rx_flow_ctrl_thresh = 122,
};
// Configure UART parameters
ESP_ERROR_CHECK(uart_param_config(uart_num, &uart_config));
```

For more information on how to configure the hardware flow control options, please refer to `peripherals/uart/uart_echo`.

Multiple Steps  Configure specific parameters individually by calling a dedicated function from the table given below. These functions are also useful if re-configuring a single parameter.

<table>
<thead>
<tr>
<th>Parameter to Configure</th>
<th>Function</th>
</tr>
</thead>
<tbody>
<tr>
<td>Baud rate</td>
<td><code>uart_set_baudrate()</code></td>
</tr>
<tr>
<td>Number of transmitted bits</td>
<td><code>uart_set_word_length()</code> selected out of <code>uart_word_length_t</code></td>
</tr>
<tr>
<td>Parity control</td>
<td><code>uart_set_parity()</code> selected out of <code>uart_parity_t</code></td>
</tr>
<tr>
<td>Number of stop bits</td>
<td><code>uart_set_stop_bits()</code> selected out of <code>uart_stop_bits_t</code></td>
</tr>
<tr>
<td>Hardware flow control mode</td>
<td><code>uart_set_hw_flow_ctrl()</code> selected out of <code>uart_hw_flowcontrol_t</code></td>
</tr>
<tr>
<td>Communication mode</td>
<td><code>uart_set_mode()</code> selected out of <code>uart_mode_t</code></td>
</tr>
</tbody>
</table>

Each of the above functions has a `_get_` counterpart to check the currently set value. For example, to check the current baud rate value, call `uart_get_baudrate()`.

Set Communication Pins  After setting communication parameters, configure the physical GPIO pins to which the other UART device will be connected. For this, call the function `uart_set_pin()` and specify the GPIO pin numbers to which the driver should route the TX, RX, RTS, and CTS signals. If you want to keep a currently allocated pin number for a specific signal, pass the macro `UART_PIN_NO_CHANGE`.

The same macro `UART_PIN_NO_CHANGE` should be specified for pins that will not be used.

```c
// Set UART pins (TX: IO4, RX: IO5, RTS: IO18, CTS: IO19)
ESP_ERROR_CHECK(uart_set_pin(UART_NUM_2, 4, 5, 18, 19));
```

Install Drivers  Once the communication pins are set, install the driver by calling `uart_driver_install()` and specify the following parameters:

- Size of TX ring buffer
- Size of RX ring buffer
- Event queue handle and size
- Flags to allocate an interrupt

The function allocates the required internal resources for the UART driver.
// Setup UART buffered IO with event queue
const int uart_buffer_size = (1024 * 2);
QueueHandle_t uart_queue;
// Install UART driver using an event queue here
ESP_ERROR_CHECK(uart_driver_install(UART_NUM_2, uart_buffer_size,
                                        uart_buffer_size, 10, &uart_queue, 0));

Once this step is complete, you can connect the external UART device and check the communication.

**Run UART Communication**  Serial communication is controlled by each UART controller’s finite state machine (FSM).

The process of sending data involves the following steps:

1. Write data into TX FIFO buffer
2. FSM serializes the data
3. FSM sends the data out

The process of receiving data is similar, but the steps are reversed:

1. FSM processes an incoming serial stream and parallelizes it
2. FSM writes the data into RX FIFO buffer
3. Read the data from RX FIFO buffer

Therefore, an application only writes and reads data from a specific buffer using `uart_write_bytes()` and `uart_read_bytes()` respectively, and the FSM does the rest.

**Transmit Data**  After preparing the data for transmission, call the function `uart_write_bytes()` and pass the data buffer’s address and data length to it. The function copies the data to the TX ring buffer (either immediately or after enough space is available), and then exit. When there is free space in the TX FIFO buffer, an interrupt service routine (ISR) moves the data from the TX ring buffer to the TX FIFO buffer in the background. The code below demonstrates the use of this function.

```c
// Write data to UART.
char* test_str = "This is a test string.\n";
uart_write_bytes(uart_num, (const char*)test_str, strlen(test_str));
```

The function `uart_write_bytes_with_break()` is similar to `uart_write_bytes()` but adds a serial break signal at the end of the transmission. A ‘serial break signal’ means holding the TX line low for a period longer than one data frame.

```c
// Write data to UART, end with a break signal.
uart_write_bytes_with_break(uart_num, "test break\n", strlen("test break\n"), 100);
```

Another function for writing data to the TX FIFO buffer is `uart_tx_chars()`. Unlike `uart_write_bytes()`, this function does not block until space is available. Instead, it writes all data which can immediately fit into the hardware TX FIFO, and then return the number of bytes that were written.

There is a ‘companion’ function `uart_wait_tx_done()` that monitors the status of the TX FIFO buffer and returns once it is empty.

```c
// Wait for packet to be sent
const uart_port_t uart_num = UART_NUM_2;
ESP_ERROR_CHECK(uart_wait_tx_done(uart_num, 100)); // wait timeout is 100 RTOS_ticks (TickType_t)
```

**Receive Data**  Once the data is received by the UART and saved in the RX FIFO buffer, it needs to be retrieved using the function `uart_read_bytes()`. Before reading data, you can check the number of bytes available in the RX FIFO buffer by calling `uart_get_buffered_data_len()`. An example of using these functions is given below.
// Read data from UART.
const uart_port_t uart_num = UART_NUM_2;
uint8_t data[128];
int length = 0;
ESP_ERROR_CHECK(uart_get_buffered_data_len(uart_num, (size_t *)&length));
length = uart_read_bytes(uart_num, data, length, 100);

If the data in the RX FIFO buffer is no longer needed, you can clear the buffer by calling `uart_flush()`.

**Software Flow Control** If the hardware flow control is disabled, you can manually set the RTS and DTR signal levels by using the functions `uart_set_rts()` and `uart_set_dtr()` respectively.

**Communication Mode Selection** The UART controller supports a number of communication modes. A mode can be selected using the function `uart_set_mode()`. Once a specific mode is selected, the UART driver handles the behavior of a connected UART device accordingly. As an example, it can control the RS485 driver chip using the RTS line to allow half-duplex RS485 communication.

```c
// Setup UART in rs485 half duplex mode
ESP_ERROR_CHECK(uart_set_mode(uart_num, UART_MODE_RS485_HALF_DUPLEX));
```

**Use Interrupts** There are many interrupts that can be generated depending on specific UART states or detected errors. The full list of available interrupts is provided in ESP32-S3 Technical Reference Manual > UART Controller (UART) > UART Interrupts and UHCI Interrupts [PDF]. You can enable or disable specific interrupts by calling `uart_enable_intr_mask()` or `uart_disable_intr_mask()` respectively.

The `uart_driver_install()` function installs the driver’s internal interrupt handler to manage the TX and RX ring buffers and provides high-level API functions like events (see below).

The API provides a convenient way to handle specific interrupts discussed in this document by wrapping them into dedicated functions:

- **Event detection**: There are several events defined in `uart_event_type_t` that may be reported to a user application using the FreeRTOS queue functionality. You can enable this functionality when calling `uart_driver_install()` described in Install Drivers. An example of using Event detection can be found in peripherals/uart/uart_events.

- **FIFO space threshold or transmission timeout reached**: The TX and RX FIFO buffers can trigger an interrupt when they are filled with a specific number of characters, or on a timeout of sending or receiving data. To use these interrupts, do the following:
  - Configure respective threshold values of the buffer length and timeout by entering them in the structure `uart_intr_config_t` and calling `uart_intr_config()`
  - Enable the interrupts using the functions `uart_enable_tx_intr()` and `uart_enable_rx_intr()`
  - Disable these interrupts using the corresponding functions `uart_disable_tx_intr()` or `uart_disable_rx_intr()`

- **Pattern detection**: An interrupt triggered on detecting a ‘pattern’ of the same character being received/sent repeatedly. This functionality is demonstrated in the example peripherals/uart/uart_events. It can be used, e.g., to detect a command string with a specific number of identical characters (the ‘pattern’) at the end. The following functions are available:
  - Configure and enable this interrupt using `uart_enable_pattern_det_baud_intr()`
  - Disable the interrupt using `uart_disable_pattern_det_intr()`

**Macros** The API also defines several macros. For example, `UART_HW_FIFO_LEN` defines the length of hardware FIFO buffers; `UART_BITRATE_MAX` gives the maximum baud rate supported by the UART controllers, etc.

**Deleting a Driver** If the communication established with `uart_driver_install()` is no longer required, the driver can be removed to free allocated resources by calling `uart_driver_delete()`.
Overview of RS485 Specific Communication Options

Note: The following section uses [UART_REGISTER_NAME].[UART_FIELD_BIT] to refer to UART register fields/bits. For more information on a specific option bit, see ESP32-S3 Technical Reference Manual > UART Controller (UART) > Register Summary [PDF]. Use the register name to navigate to the register description and then find the field/bit.

- UART_RS485_CONF_REG.UART_RS485_EN: setting this bit enables RS485 communication mode support.
- UART_RS485_CONF_REG.UART_RS485TX_RX_EN: if this bit is set, the transmitter’s output signal loops back to the receiver’s input signal.
- UART_RS485_CONF_REG.UART_RS485RXBY_TX_EN: if this bit is set, the transmitter will still be sending data if the receiver is busy (remove collisions automatically by hardware).

The ESP32-S3’s RS485 UART hardware can detect signal collisions during transmission of a datagram and generate the interrupt UART_RS485_CLASH_INT if this interrupt is enabled. The term collision means that a transmitted datagram is not equal to the one received on the other end. Data collisions are usually associated with the presence of other active devices on the bus or might occur due to bus errors.

The collision detection feature allows handling collisions when their interrupts are activated and triggered. The interrupts UART_RS485_FRM_ERR_INT and UART_RS485_PARITY_ERR_INT can be used with the collision detection feature to control frame errors and parity bit errors accordingly in RS485 mode. This functionality is supported in the UART driver and can be used by selecting the UART_MODE_RS485_APP_CTRL mode (see the function uart_set_mode()).

The collision detection feature can work with circuit A and circuit C (see Section Interface Connection Options). In the case of using circuit A or B, the RTS pin connected to the DE pin of the bus driver should be controlled by the user application. Use the function uart_get_collision_flag() to check if the collision detection flag has been raised.

The ESP32-S3 UART controllers themselves do not support half-duplex communication as they cannot provide automatic control of the RTS pin connected to the RE/DE input of RS485 bus driver. However, half-duplex communication can be achieved via software control of the RTS pin by the UART driver. This can be enabled by selecting the UART_MODE_RS485_HALF_DUPLEX mode when calling uart_set_mode().

Once the host starts writing data to the TX FIFO buffer, the UART driver automatically asserts the RTS pin (logic 1); once the last bit of the data has been transmitted, the driver de-asserts the RTS pin (logic 0). To use this mode, the software would have to disable the hardware flow control function. This mode works with all the used circuits shown below.

Interface Connection Options This section provides example schematics to demonstrate the basic aspects of ESP32-S3’s RS485 interface connection.

Note:
- The schematics below do not necessarily contain all required elements.
- The analog devices ADM483 & ADM2483 are examples of common RS485 transceivers and can be replaced with other similar transceivers.

Circuit A: Collision Detection Circuit

VCC ---------------+  
|                |   
+--------x--------+   
RXD <--------| R |
|   |   |
|   |   |
TXD -------->| D | ADM483 |

(continues on next page)
This circuit is preferable because it allows for collision detection and is quite simple at the same time. The receiver in the line driver is constantly enabled, which allows the UART to monitor the RS485 bus. Echo suppression is performed by the UART peripheral when the bit UART_RS485_CONF_REG.UART_RS485TX_RX_EN is enabled.

**Circuit B: Manual Switching Transmitter/Receiver Without Collision Detection**

This circuit does not allow for collision detection. It suppresses the null bytes that the hardware receives when the bit UART_RS485_CONF_REG.UART_RS485TX_RX_EN is set. The bit UART_RS485_CONF_REG.UART_RS485RXBY_TX_EN is not applicable in this case.

**Circuit C: Auto Switching Transmitter/Receiver**

This galvanically isolated circuit does not require RTS pin control by a software application or driver because it controls the transceiver direction automatically. However, it requires suppressing null bytes during transmission by setting UART_RS485_CONF_REG.UART_RS485RXBY_TX_EN to 1 and UART_RS485_CONF_REG.UART_RS485TX_RX_EN to 0. This setup can work in any RS485 UART mode or even in UART_MODE_UART.
Application Examples

The table below describes the code examples available in the directory peripherals/uart/.

<table>
<thead>
<tr>
<th>Code Example</th>
<th>Description</th>

API Reference

Header File

- components/driver/uart/include/driver/uart.h
- This header file can be included with:

  ```c
  #include "driver/uart.h"
  ```

- This header file is a part of the API provided by the driver component. To declare that your component depends on driver, add the following to your CMakelists.txt:

  ```cmake
  REQUIRES driver
  ```

  or

  ```cmake
  PRIV_REQUIRES driver
  ```

Functions

```c
esp_err_t uart_driver_install(uart_port_t uart_num, int rx_buffer_size, int tx_buffer_size, int queue_size, QueueHandle_t *uart_queue, int intr_alloc_flags)
```

Install UART driver and set the UART to the default configuration.

UART ISR handler will be attached to the same CPU core that this function is running on.

**Note:** Rx_buffer_size should be greater than UART_HW_FIFO_LEN(uart_num). Tx_buffer_size should be either zero or greater than UART_HW_FIFO_LEN(uart_num).

Parameters

- `uart_num` - UART port number, the max port number is (UART_NUM_MAX -1).
- `rx_buffer_size` - UART RX ring buffer size.
- `tx_buffer_size` - UART TX ring buffer size. If set to zero, driver will not use TX buffer, TX function will block task until all data have been sent out.
- `queue_size` - UART event queue size/depth.
- `uart_queue` - UART event queue handle (out param). On success, a new queue handle is written here to provide access to UART events. If set to NULL, driver will not use an event queue.
• **intr_alloc_flags** – Flags used to allocate the interrupt. One or multiple (ORred) ESP_INTR_FLAG_* values. See esp_intr_alloc.h for more info. Do not set ESP_INTR_FLAG_IRAM here (the driver’s ISR handler is not located in IRAM)

**Returns**
- ESP_OK Success
- ESP_FAIL Parameter error

`esp_err_t uart_driver_delete(uart_port_t uart_num)`
Uninstall UART driver.

**Parameters**
- `uart_num` – UART port number, the max port number is (UART_NUM_MAX -1).

**Returns**
- ESP_OK Success
- ESP_FAIL Parameter error

`bool uart_is_driver_installed(uart_port_t uart_num)`
Checks whether the driver is installed or not.

**Parameters**
- `uart_num` – UART port number, the max port number is (UART_NUM_MAX -1).

**Returns**
- true driver is installed
- false driver is not installed

`esp_err_t uart_set_word_length(uart_port_t uart_num, uart_word_length_t data_bit)`
Set UART data bits.

**Parameters**
- `uart_num` – UART port number, the max port number is (UART_NUM_MAX -1).
- `data_bit` – UART data bits

**Returns**
- ESP_OK Success
- ESP_FAIL Parameter error

`esp_err_t uart_get_word_length(uart_port_t uart_num, uart_word_length_t *data_bit)`
Get the UART data bit configuration.

**Parameters**
- `uart_num` – UART port number, the max port number is (UART_NUM_MAX -1).
- `data_bit` – Pointer to accept value of UART data bits.

**Returns**
- ESP_FAIL Parameter error
- ESP_OK Success, result will be put in (*data_bit)

`esp_err_t uart_set_stop_bits(uart_port_t uart_num, uart_stop_bits_t stop_bits)`
Set UART stop bits.

**Parameters**
- `uart_num` – UART port number, the max port number is (UART_NUM_MAX -1).
- `stop_bits` – UART stop bits

**Returns**
- ESP_OK Success
- ESP_FAIL Fail

`esp_err_t uart_get_stop_bits(uart_port_t uart_num, uart_stop_bits_t *stop_bits)`
Get the UART stop bit configuration.

**Parameters**
- `uart_num` – UART port number, the max port number is (UART_NUM_MAX -1).
- `stop_bits` – Pointer to accept value of UART stop bits.

**Returns**
- ESP_FAIL Parameter error
- ESP_OK Success, result will be put in (*stop_bit)
esp_err_t uart_set_parity(uart_port_t uart_num, uart_parity_t parity_mode)
Set UART parity mode.

Parameters
• uart_num – UART port number, the max port number is (UART_NUM_MAX -1).
• parity_mode – the enum of uart parity configuration

Returns
• ESP_FAIL Parameter error
• ESP_OK Success

esp_err_t uart_get_parity(uart_port_t uart_num, uart_parity_t *parity_mode)
Get the UART parity mode configuration.

Parameters
• uart_num – UART port number, the max port number is (UART_NUM_MAX -1).
• parity_mode – Pointer to accept value of UART parity mode.

Returns
• ESP_FAIL Parameter error
• ESP_OK Success, result will be put in (*parity_mode)

esp_err_t uart_get_sclk_freq(uart_sclk_t sclk, uint32_t*out_freq_hz)
Get the frequency of a clock source for the HP UART port.

Parameters
• sclk – Clock source
• out_freq_hz – [out] Output of frequency, in Hz

Returns
• ESP_ERR_INVALID_ARG: if the clock source is not supported
• otherwise ESP_OK

esp_err_t uart_set_baudrate(uart_port_t uart_num, uint32_t baudrate)
Set UART baud rate.

Parameters
• uart_num – UART port number, the max port number is (UART_NUM_MAX -1).
• baudrate –UART baud rate.

Returns
• ESP_FAIL Parameter error
• ESP_OK Success

esp_err_t uart_get_baudrate(uart_port_t uart_num, uint32_t*baudrate)
Get the UART baud rate configuration.

Parameters
• uart_num – UART port number, the max port number is (UART_NUM_MAX -1).
• baudrate – Pointer to accept value of UART baud rate

Returns
• ESP_FAIL Parameter error
• ESP_OK Success, result will be put in (*baudrate)

esp_err_t uart_set_line_inverse(uart_port_t uart_num, uint32_t inverse_mask)
Set UART line inverse mode.

Parameters
• uart_num – UART port number, the max port number is (UART_NUM_MAX -1).
• inverse_mask – Choose the wires that need to be inverted. Using the ORred mask of uart_signal_inv_t

Returns
• ESP_OK Success
• ESP_FAIL Parameter error
esp_err_t uart_set_hw_flow_ctrl (uart_port_t uart_num, uart_hw_flowcontrol_t flow_ctrl, uint8_t rx_thresh)

Set hardware flow control.

Parameters
• uart_num - UART port number, the max port number is (UART_NUM_MAX - 1).
• flow_ctrl - Hardware flow control mode
• rx_thresh - Threshold of Hardware RX flow control (0 ~ UART_HW_FIFO_LEN(uart_num)). Only when UART_HW_FLOWCTRL_RTS is set, will the rx_thresh value be set.

Returns
• ESP_OK Success
• ESP_FAIL Parameter error

esp_err_t uart_set_sw_flow_ctrl (uart_port_t uart_num, bool enable, uint8_t rx_thresh_xon, uint8_t rx_thresh_xoff)

Set software flow control.

Parameters
• uart_num - UART port number, the max port number is (UART_NUM_MAX - 1)
• enable - switch on or off
• rx_thresh_xon - low water mark
• rx_thresh_xoff - high water mark

Returns
• ESP_OK Success
• ESP_FAIL Parameter error

esp_err_t uart_get_hw_flow_ctrl (uart_port_t uart_num, uart_hw_flowcontrol_t *flow_ctrl)

Get the UART hardware flow control configuration.

Parameters
• uart_num - UART port number, the max port number is (UART_NUM_MAX - 1).
• flow_ctrl - Option for different flow control mode.

Returns
• ESP_FAIL Parameter error
• ESP_OK Success, result will be put in (*flow_ctrl)

esp_err_t uart_clear_intr_status (uart_port_t uart_num, uint32_t clr_mask)

Clear UART interrupt status.

Parameters
• uart_num - UART port number, the max port number is (UART_NUM_MAX - 1).
• clr_mask - Bit mask of the interrupt status to be cleared.

Returns
• ESP_OK Success
• ESP_FAIL Parameter error

esp_err_t uart_enable_intr_mask (uart_port_t uart_num, uint32_t enable_mask)

Set UART interrupt enable.

Parameters
• uart_num - UART port number, the max port number is (UART_NUM_MAX - 1).
• enable_mask - Bit mask of the enable bits.

Returns
• ESP_OK Success
• ESP_FAIL Parameter error

esp_err_t uart_disable_intr_mask (uart_port_t uart_num, uint32_t disable_mask)

Clear UART interrupt enable bits.

Parameters
• uart_num - UART port number, the max port number is (UART_NUM_MAX - 1).
Chapter 2. API Reference

- **disable_mask** – Bit mask of the disable bits.

Returns

- ESP_OK Success
- ESP_FAIL Parameter error

```c
esp_err_t uart_enable_rx_intr(uart_port_t uart_num)
```

Enable UART RX interrupt (RX_FULL & RX_TIMEOUT INTERRUPT)

Parameters

- `uart_num` – UART port number, the max port number is (UART_NUM_MAX -1).

Returns

- ESP_OK Success
- ESP_FAIL Parameter error

```c
esp_err_t uart_disable_rx_intr(uart_port_t uart_num)
```

Disable UART RX interrupt (RX_FULL & RX_TIMEOUT INTERRUPT)

Parameters

- `uart_num` – UART port number, the max port number is (UART_NUM_MAX -1).

Returns

- ESP_OK Success
- ESP_FAIL Parameter error

```c
esp_err_t uart_disable_tx_intr(uart_port_t uart_num)
```

Disable UART TX interrupt (TX_FULL & TX_TIMEOUT INTERRUPT)

Parameters

- `uart_num` – UART port number

Returns

- ESP_OK Success
- ESP_FAIL Parameter error

```c
esp_err_t uart_enable_tx_intr(uart_port_t uart_num, int enable, int thresh)
```

Enable UART TX interrupt (TX_FULL & TX_TIMEOUT INTERRUPT)

Parameters

- `uart_num` – UART port number, the max port number is (UART_NUM_MAX -1).
- `enable` – 1: enable; 0: disable
- `thresh` – Threshold of TX interrupt, 0 ~ UART_HW_FIFO_LEN(uart_num)

Returns

- ESP_OK Success
- ESP_FAIL Parameter error

```c
esp_err_t uart_set_pin(uart_port_t uart_num, int tx_io_num, int rx_io_num, int rts_io_num, int cts_io_num)
```

Assign signals of a UART peripheral to GPIO pins.

**Note:** If the GPIO number configured for a UART signal matches one of the IOMUX signals for that GPIO, the signal will be connected directly via the IOMUX. Otherwise the GPIO and signal will be connected via the GPIO Matrix. For example, if on an ESP32 the call `uart_set_pin(0, 1, 3, -1, -1)` is performed, as GPIO1 is UAR0’s default TX pin and GPIO3 is UAR0’s default RX pin, both will be connected to respectively U0TXD and U0RXD through the IOMUX, totally bypassing the GPIO matrix. The check is performed on a per-pin basis. Thus, it is possible to have RX pin binded to a GPIO through the GPIO matrix, whereas TX is binded to its GPIO through the IOMUX.

**Note:** Internal signal can be output to multiple GPIO pads. Only one GPIO pad can connect with input signal.

Parameters

- `uart_num` – UART port number, the max port number is (UART_NUM_MAX -1).
- `tx_io_num` – UART TX pin GPIO number.
- `rx_io_num` – UART RX pin GPIO number.
• **rts_io_num** - UART RTS pin GPIO number.
• **cts_io_num** - UART CTS pin GPIO number.

**Returns**
- ESP_OK Success
- ESP_FAIL Parameter error

```c
esp_err_t uart_set_rts(uart_port_t uart_num, int level)
```
Manually set the UART RTS pin level.

**Note:** UART must be configured with hardware flow control disabled.

**Parameters**
- **uart_num** - UART port number, the max port number is (UART_NUM_MAX -1).
- **level** -1: RTS output low (active); 0: RTS output high (block)

**Returns**
- ESP_OK Success
- ESP_FAIL Parameter error

```c
esp_err_t uart_set_dtr(uart_port_t uart_num, int level)
```
Manually set the UART DTR pin level.

**Parameters**
- **uart_num** - UART port number, the max port number is (UART_NUM_MAX -1).
- **level** -1: DTR output low; 0: DTR output high

**Returns**
- ESP_OK Success
- ESP_FAIL Parameter error

```c
esp_err_t uart_set_tx_idle_num(uart_port_t uart_num, uint16_t idle_num)
```
Set UART idle interval after tx FIFO is empty.

**Parameters**
- **uart_num** - UART port number, the max port number is (UART_NUM_MAX -1).
- **idle_num** - idle interval after tx FIFO is empty (unit: the time it takes to send one bit under current baudrate)

**Returns**
- ESP_OK Success
- ESP_FAIL Parameter error

```c
esp_err_t uart_param_config(uart_port_t uart_num, const uart_config_t *uart_config)
```
Set UART configuration parameters.

**Parameters**
- **uart_num** - UART port number, the max port number is (UART_NUM_MAX -1).
- **uart_config** - UART parameter settings

**Returns**
- ESP_OK Success
- ESP_FAIL Parameter error

```c
esp_err_t uart_intr_config(uart_port_t uart_num, const uart_intr_config_t *intr_conf)
```
Configure UART interrupts.

**Parameters**
- **uart_num** - UART port number, the max port number is (UART_NUM_MAX -1).
- **intr_conf** - UART interrupt settings

**Returns**
- ESP_OK Success
- ESP_FAIL Parameter error
**esp_err_t uart_wait_tx_done(uart_port_t uart_num, TickType_t ticks_to_wait)**

Wait until UART TX FIFO is empty.

**Parameters**
- **uart_num** - UART port number, the max port number is (UART_NUM_MAX -1).
- **ticks_to_wait** - Timeout, count in RTOS ticks

**Returns**
- ESP_OK Success
- ESP_FAIL Parameter error
- ESP_ERR_TIMEOUT Timeout

**int uart_tx_chars(uart_port_t uart_num, const char* buffer, uint32_t len)**

Send data to the UART port from a given buffer and length.

This function will not wait for enough space in TX FIFO. It will just fill the available TX FIFO and return when the FIFO is full.

**Note:** This function should only be used when UART TX buffer is not enabled.

**Parameters**
- **uart_num** - UART port number, the max port number is (UART_NUM_MAX -1).
- **buffer** - data buffer address
- **len** - data length to send

**Returns**
- (-1) Parameter error
- OTHERS (>=0) The number of bytes pushed to the TX FIFO

**int uart_write_bytes(uart_port_t uart_num, const void* src, size_t size)**

Send data to the UART port from a given buffer and length.

If the UART driver’s parameter ‘tx_buffer_size’ is set to zero: This function will not return until all the data have been sent out, or at least pushed into TX FIFO.

Otherwise, if the ‘tx_buffer_size’ > 0, this function will return after copying all the data to tx ring buffer, UART ISR will then move data from the ring buffer to TX FIFO gradually.

**Parameters**
- **uart_num** - UART port number, the max port number is (UART_NUM_MAX -1).
- **src** - data buffer address
- **size** - data length to send

**Returns**
- (-1) Parameter error
- OTHERS (>=0) The number of bytes pushed to the TX FIFO

**int uart_write_bytes_with_break(uart_port_t uart_num, const void* src, size_t size, int brk_len)**

Send data to the UART port from a given buffer and length.

If the UART driver’s parameter ‘tx_buffer_size’ is set to zero: This function will not return until all the data and the break signal have been sent out. After all data is sent out, send a break signal.

Otherwise, if the ‘tx_buffer_size’ > 0, this function will return after copying all the data to tx ring buffer, UART ISR will then move data from the ring buffer to TX FIFO gradually. After all data sent out, send a break signal.

**Parameters**
- **uart_num** - UART port number, the max port number is (UART_NUM_MAX -1).
- **src** - data buffer address
- **size** - data length to send
- **brk_len** - break signal duration(unit: the time it takes to send one bit at current baudrate)

**Returns**
- (-1) Parameter error
Chapter 2. API Reference

- OTHERS (>=0) The number of bytes pushed to the TX FIFO

```c
int uart_read_bytes (uart_port_t uart_num, void *buf, uint32_t length, TickType_t ticks_to_wait)
```

UART read bytes from UART buffer.

**Parameters**
- `uart_num` – UART port number, the max port number is (UART_NUM_MAX -1).
- `buf` – pointer to the buffer.
- `length` – data length
- `ticks_to_wait` – s Timeout, count in RTOS ticks

**Returns**
- (-1) Error
- OTHERS (>=0) The number of bytes read from UART buffer

```c
esp_err_t uart_flush (uart_port_t uart_num)
```

Alias of uart_flush_input. UART ring buffer flush. This will discard all data in the UART RX buffer.

**Note:** Instead of waiting the data sent out, this function will clear UART rx buffer. In order to send all the data in tx FIFO, we can use uart_wait_tx_done function.

**Parameters**
- `uart_num` – UART port number, the max port number is (UART_NUM_MAX -1).

**Returns**
- ESP_OK Success
- ESP_FAIL Parameter error

```c
esp_err_t uart_flush_input (uart_port_t uart_num)
```

Clear input buffer, discard all the data in the ring-buffer.

**Note:** In order to send all the data in tx FIFO, we can use uart_wait_tx_done function.

**Parameters**
- `uart_num` – UART port number, the max port number is (UART_NUM_MAX -1).

**Returns**
- ESP_OK Success
- ESP_FAIL Parameter error

```c
esp_err_t uart_get_buffered_data_len (uart_port_t uart_num, size_t *size)
```

UART get RX ring buffer cached data length.

**Parameters**
- `uart_num` – UART port number, the max port number is (UART_NUM_MAX -1).
- `size` – Pointer of size_t to accept cached data length

**Returns**
- ESP_OK Success
- ESP_FAIL Parameter error

```c
esp_err_t uart_get_tx_buffer_free_size (uart_port_t uart_num, size_t *size)
```

UART get TX ring buffer free space size.

**Parameters**
- `uart_num` – UART port number, the max port number is (UART_NUM_MAX -1).
- `size` – Pointer of size_t to accept the free space size

**Returns**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
Esp_err_t uart_disable_pattern_det_intr(uart_port_t uart_num)

UART disable pattern detect function. Designed for applications like ‘AT commands’. When the hardware detects a series of one same character, the interrupt will be triggered.

Parameters
uart_num – UART port number, the max port number is (UART_NUM_MAX-1).

Returns
• ESP_OK Success
• ESP_FAIL Parameter error

Esp_err_t uart_enable_pattern_det_baud_intr(uart_port_t uart_num, char pattern_chr, uint8_t chr_num, int chr_tout, int post_idle, int pre_idle)

UART enable pattern detect function. Designed for applications like ‘AT commands’. When the hardware detect a series of one same character, the interrupt will be triggered.

Parameters
• uart_num – UART port number.
• pattern_chr – character of the pattern.
• chr_num – number of the character, 8bit value.
• chr_tout – timeout of the interval between each pattern characters, 16bit value, unit is the baud-rate cycle you configured. When the duration is more than this value, it will not take this data as at_cmd char.
• post_idle – idle time after the last pattern character, 16bit value, unit is the baud-rate cycle you configured. When the duration is less than this value, it will not take the previous data as the last at_cmd char
• pre_idle – idle time before the first pattern character, 16bit value, unit is the baud-rate cycle you configured. When the duration is less than this value, it will not take this data as the first at_cmd char.

Returns
• ESP_OK Success
• ESP_FAIL Parameter error

int uart_pattern_pop_pos(uart_port_t uart_num)

Return the nearest detected pattern position in buffer. The positions of the detected pattern are saved in a queue, this function will dequeue the first pattern position and move the pointer to next pattern position.

The following APIs will modify the pattern position info: uart_flush_input, uart_read_bytes, uart_driver_delete, uart_pop_pattern_pos It is the application’s responsibility to ensure atomic access to the pattern queue and the rx data buffer when using pattern detect feature.

Note: If the RX buffer is full and flow control is not enabled, the detected pattern may not be found in the rx buffer due to overflow.

Parameters
uart_num – UART port number, the max port number is (UART_NUM_MAX-1).

Returns
• (-1) No pattern found for current index or parameter error
• others the pattern position in rx buffer.

int uart_pattern_get_pos(uart_port_t uart_num)

Return the nearest detected pattern position in buffer. The positions of the detected pattern are saved in a queue. This function do nothing to the queue.

The following APIs will modify the pattern position info: uart_flush_input, uart_read_bytes, uart_driver_delete, uart_pop_pattern_pos It is the application’s responsibility to ensure atomic access to the pattern queue and the rx data buffer when using pattern detect feature.
Chapter 2. API Reference

**Note:** If the RX buffer is full and flow control is not enabled, the detected pattern may not be found in the rx buffer due to overflow.

**Parameters**
- `uart_num` – UART port number, the max port number is (UART_NUM_MAX -1).

**Returns**
- (-1) No pattern found for current index or parameter error
- others the pattern position in rx buffer.

```c
esp_err_t uart_pattern_queue_reset (uart_port_t uart_num, int queue_length)
```
Allocate a new memory with the given length to save record the detected pattern position in rx buffer.

**Parameters**
- `uart_num` – UART port number, the max port number is (UART_NUM_MAX -1).
- `queue_length` – Max queue length for the detected pattern. If the queue length is not large enough, some pattern positions might be lost. Set this value to the maximum number of patterns that could be saved in data buffer at the same time.

**Returns**
- ESP_ERR_NO_MEM No enough memory
- ESP_ERR_INVALID_STATE Driver not installed
- ESP_FAIL Parameter error
- ESP_OK Success

```c
esp_err_t uart_set_mode (uart_port_t uart_num, uart_mode_t mode)
```
UART set communication mode.

**Note:** This function must be executed after uart_driver_install(), when the driver object is initialized.

**Parameters**
- `uart_num` – Uart number to configure, the max port number is (UART_NUM_MAX -1).
- `mode` – UART UART mode to set

**Returns**
- ESP_OK Success
- ESP_INVALID_ARG Parameter error

```c
esp_err_t uart_set_rx_full_threshold (uart_port_t uart_num, int threshold)
```
Set uart threshold value for RX fifo full.

**Note:** If application is using higher baudrate and it is observed that bytes in hardware RX fifo are overwritten then this threshold can be reduced.

**Parameters**
- `uart_num` – UART port number, the max port number is (UART_NUM_MAX -1)
- `threshold` – Threshold value above which RX fifo full interrupt is generated

**Returns**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_INVALID_STATE Driver is not installed

```c
esp_err_t uart_set_tx_empty_threshold (uart_port_t uart_num, int threshold)
```
Set uart threshold values for TX fifo empty.

**Parameters**
- `uart_num` – UART port number, the max port number is (UART_NUM_MAX -1)
**Chapter 2. API Reference**

- **threshold** – Threshold value below which TX fifo empty interrupt is generated

**Returns**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_INVALID_STATE Driver is not installed

```c
esp_err_t uart_set_rx_timeout(uart_port_t uart_num, const uint8_t tout_thresh)
```

UART set threshold timeout for TOUT feature.

**Parameters**
- **uart_num** – UART number to configure, the maximum port number is (UART_NUM_MAX - 1).
- **tout_thresh** – This parameter defines timeout threshold in uart symbol periods. The maximum value of threshold is 126. tout_thresh = 1, defines TOUT interrupt timeout equal to transmission time of one symbol (~11 bit) on current baudrate. If the time is expired the UART_RXFIFO_TOUT_INT interrupt is triggered. If tout_thresh == 0, the TOUT feature is disabled.

**Returns**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_ERR_INVALID_STATE Driver is not installed

```c
esp_err_t uart_get_collision_flag(uart_port_t uart_num, bool *collision_flag)
```

Returns collision detection flag for RS485 mode. Function returns the collision detection flag into variable pointed by collision_flag. *collision_flag = true, if collision detected else it is equal to false. This function should be executed when actual transmission is completed (after uart_write_bytes()).

**Parameters**
- **uart_num** – UART number to configure, the maximum port number is (UART_NUM_MAX - 1).
- **collision_flag** – Pointer to variable of type bool to return collision flag.

**Returns**
- ESP_OK Success
- ESP_ERR_INVALID_ARG Parameter error

```c
esp_err_t uart_set_wakeup_threshold(uart_port_t uart_num, int wakeup_threshold)
```

Set the number of RX pin signal edges for light sleep wakeup.

UART can be used to wake up the system from light sleep. This feature works by counting the number of positive edges on RX pin and comparing the count to the threshold. When the count exceeds the threshold, the system is woken up from light sleep. This function allows setting the threshold value.

Stop bit and parity bits (if enabled) also contribute to the number of edges. For example, letter ‘a’ with ASCII code 97 is encoded as 0100001101 on the wire (with 8n1 configuration), start and stop bits included. This sequence has 3 positive edges (transitions from 0 to 1). Therefore, to wake up the system when ‘a’ is sent, set wakeup_threshold=3.

The character that triggers wakeup is not received by UART (i.e. it can not be obtained from UART FIFO). Depending on the baud rate, a few characters after that will also not be received. Note that when the chip enters and exits light sleep mode, APB frequency will be changing. To ensure that UART has correct Baud rate all the time, it is necessary to select a source clock which has a fixed frequency and remains active during sleep. For the supported clock sources of the chips, please refer to `uart_sclk_t` or `soc_periph_uart_clk_src_legacy_t`.

**Note:** in ESP32, the wakeup signal can only be input via IO_MUX (i.e. GPIO3 should be configured as function_1 to wake up UART0, GPIO9 should be configured as function_5 to wake up UART1), UART2 does not support light sleep wakeup feature.

**Parameters**
- **uart_num** – UART number, the maximum port number is (UART_NUM_MAX - 1).
- **wakeup_threshold** – number of RX edges for light sleep wakeup, value is 3 .. 0x3ff.
Returns

- ESP_OK on success
- ESP_ERR_INVALID_ARG if uart_num is incorrect or wakeup_threshold is outside of [3, 0x3ff] range.

```c
.esp_err_t uart_get_wakeup_threshold(uart_port_t uart_num, int*out_wakeup_threshold)
```

Get the number of RX pin signal edges for light sleep wakeup.

See description of uart_set_wakeup_threshold for the explanation of UART wakeup feature.

Parameters

- **uart_num** - UART number, the max port number is (UART_NUM_MAX - 1).
- **out_wakeup_threshold** - [out] output, set to the current value of wakeup threshold for the given UART.

Returns

- ESP_OK on success
- ESP_ERR_INVALID_ARG if out_wakeup_threshold is NULL

```c
.esp_err_t uart_wait_tx_idle_polling(uart_port_t uart_num)
```

Wait until UART tx memory empty and the last char send ok (polling mode).

Returns

- ESP_OK on success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_FAIL Driver not installed

Parameters **uart_num** - UART number

```c
.esp_err_t uart_set_loop_back(uart_port_t uart_num, bool loop_back_en)
```

Configure TX signal loop back to RX module, just for the test usage.

Returns

- ESP_OK on success
- ESP_ERR_INVALID_ARG Parameter error
- ESP_FAIL Driver not installed

Parameters **uart_num** - UART number
- **loop_back_en** - Set true to enable the loop back function, else set it false.

```c
void uart_set_always_rx_timeout(uart_port_t uart_num, bool always_rx_timeout_en)
```

Configure behavior of UART RX timeout interrupt.

When always_rx_timeout is true, timeout interrupt is triggered even if FIFO is full. This function can cause extra timeout interrupts triggered only to send the timeout event. Call this function only if you want to ensure timeout interrupt will always happen after a byte stream.

Parameters

- **uart_num** - UART number
- **always_rx_timeout_en** - Set to false enable the default behavior of timeout interrupt, set it to true to always trigger timeout interrupt.

**Structures**
struct `uart_config_t`

UART configuration parameters for `uart_param_config` function.

**Public Members**

`int baud_rate`

UART baud rate

`uart_word_length_t data_bits`

UART byte size

`uart_parity_t parity`

UART parity mode

`uart_stop_bits_t stop_bits`

UART stop bits

`uart_hw_flowcontrol_t flow_ctrl`

UART HW flow control mode (cts/rts)

`uint8_t rx_flow_ctrl_thresh`

UART HW RTS threshold

`uart_sclk_t source_clk`

UART source clock selection

struct `uart_intr_config_t`

UART interrupt configuration parameters for `uart_intr_config` function.

**Public Members**

`uint32_t intr_enable_mask`

UART interrupt enable mask, choose from `UART_XXXX_INT_ENA_M` under `UART_INT_ENA_REG(i)`, connect with bit-or operator

`uint8_t rx_timeout_thresh`

UART timeout interrupt threshold (unit: time of sending one byte)

`uint8_t txfifo_empty_intr_thresh`

UART TX empty interrupt threshold.

`uint8_t txfifo_full_thresh`

UART RX full interrupt threshold.

struct `uart_event_t`

Event structure used in UART event queue.
Public Members

`uart_event_type_t type`
UART event type

`size_t size`
UART data size for UART_DATA event

`bool timeout_flag`
UART data read timeout flag for UART_DATA event (no new data received during configured RX TOUT) If the event is caused by FIFO-full interrupt, then there will be no event with the timeout flag before the next byte coming.

Macros

`UART_PIN_NO_CHANGE`

`UART_FIFO_LEN`
Length of the HP UART HW FIFO.

`UART_HW_FIFO_LEN(uart_num)`
Length of the UART HW FIFO.

`UART_BITRATE_MAX`
Maximum configurable bitrate.

Type Definitions

typedef `intr_handle_t uart_isr_handle_t`

Enumerations

`enum uart_event_type_t`
UART event types used in the ring buffer.

`Values:`

- enumerator `UART_DATA`
  UART data event
- enumerator `UART_BREAK`
  UART break event
- enumerator `UART_BUFFER_FULL`
  UART RX buffer full event
- enumerator `UART_FIFO_OVF`
  UART FIFO overflow event
- enumerator `UART_FRAME_ERR`
  UART RX frame error event
Chapter 2. API Reference

enumerator **UART_PARITY_ERR**
UART RX parity event

enumerator **UART_DATA_BREAK**
UART TX data and break event

enumerator **UART_PATTERN_DET**
UART pattern detected

enumerator **UART_WAKEUP**
UART wakeup event

enumerator **UART_EVENT_MAX**
UART event max index

**Header File**
- components/hal/include/hal/uart_types.h
- This header file can be included with:

```c
#include "hal/uart_types.h"
```

**Structures**

struct **uart_at_cmd_t**
UART AT cmd char configuration parameters. Note that this function may different on different chip. Please refer to the TRM at configuration.

**Public Members**

`uint8_t cmd_char`
UART AT cmd char

`uint8_t char_num`
AT cmd char repeat number

`uint32_t gap_tout`
gap time(in baud-rate) between AT cmd char

`uint32_t pre_idle`
the idle time(in baud-rate) between the non AT char and first AT char

`uint32_t post_idle`
the idle time(in baud-rate) between the last AT char and the none AT char

struct **uart_sw_flowctrl_t**
UART software flow control configuration parameters.
Chapter 2. API Reference

Public Members

`uint8_t xon_char`
Xon flow control char

`uint8_t xoff_char`
Xoff flow control char

`uint8_t xon_thrd`
If the software flow control is enabled and the data amount in rxfifo is less than xon_thrd, an xon_char will be sent

`uint8_t xoff_thrd`
If the software flow control is enabled and the data amount in rxfifo is more than xoff_thrd, an xoff_char will be sent

Type Definitions

typedef `soc_periph_uart_clk_src_legacy_t` uart_sclk_t
UART source clock.

Enumerations

enum `uart_port_t`
UART port number, can be UART_NUM_0 ~ (UART_NUM_MAX -1).

Values:

enumerator `UART_NUM_0`
UART port 0

enumerator `UART_NUM_1`
UART port 1

enumerator `UART_NUM_2`
UART port 2

enumerator `UART_NUM_MAX`
UART port max

enum `uart_mode_t`
UART mode selection.

Values:

enumerator `UART_MODE_UART`
mode: regular UART mode

enumerator `UART_MODE_RS485_HALF_DUPLEX`
mode: half duplex RS485 UART mode control by RTS pin
enumerator **UART_MODE_IRDA**
   mode: IRDA UART mode

enumerator **UART_MODE_RS485_COLLISION_DETECT**
   mode: RS485 collision detection UART mode (used for test purposes)

enumerator **UART_MODE_RS485_APP_CTRL**
   mode: application control RS485 UART mode (used for test purposes)

**enum uart_word_length_t**
UART word length constants.

   **Values:**

   enumerator **UART_DATA_5_BITS**
      word length: 5bits

   enumerator **UART_DATA_6_BITS**
      word length: 6bits

   enumerator **UART_DATA_7_BITS**
      word length: 7bits

   enumerator **UART_DATA_8_BITS**
      word length: 8bits

   enumerator **UART_DATA_BITS_MAX**

**enum uart_stop_bits_t**
UART stop bits number.

   **Values:**

   enumerator **UART_STOP_BITS_1**
      stop bit: 1bit

   enumerator **UART_STOP_BITS_1_5**
      stop bit: 1.5bits

   enumerator **UART_STOP_BITS_2**
      stop bit: 2bits

   enumerator **UART_STOP_BITS_MAX**

**enum uart_parity_t**
UART parity constants.

   **Values:**

   enumerator **UART_PARITY_DISABLE**
      Disable UART parity
enumerator UART_PARITY_EVEN
   Enable UART even parity

denumerator UART_PARITY_ODD
   Enable UART odd parity

denum uart_hw_flowcontrol_t
   UART hardware flow control modes.
   Values:

denumerator UART_HW_FLOWCTRL_DISABLE
   disable hardware flow control

denumerator UART_HW_FLOWCTRL_RTS
   enable RX hardware flow control (rts)

denumerator UART_HW_FLOWCTRL_CTS
   enable TX hardware flow control (cts)

denumerator UART_HW_FLOWCTRL_CTS_RTS
   enable hardware flow control

denumerator UART_HW_FLOWCTRL_MAX

denum uart_signal_inv_t
   UART signal bit map.
   Values:

denumerator UART_SIGNAL_INV_DISABLE
   Disable UART signal inverse

denumerator UART_SIGNAL_IRDA_TX_INV
   inverse the UART irda_tx signal

denumerator UART_SIGNAL_IRDA_RX_INV
   inverse the UART irda_rx signal

denumerator UART_SIGNAL_RXD_INV
   inverse the UART rxd signal

denumerator UART_SIGNAL_CTS_INV
   inverse the UART cts signal

denumerator UART_SIGNAL_DSR_INV
   inverse the UART dsr signal

denumerator UART_SIGNAL_TXD_INV
   inverse the UART txd signal
Chapter 2. API Reference

enumerator UART_SIGNAL_RTS_INV
    inverse the UART rts signal

enumerator UART_SIGNAL_DTR_INV
    inverse the UART dtr signal

**GPIO Lookup Macros**  The UART peripherals have dedicated IO_MUX pins to which they are connected directly. However, signals can also be routed to other pins using the less direct GPIO matrix. To use direct routes, you need to know which pin is a dedicated IO_MUX pin for a UART channel. GPIO Lookup Macros simplify the process of finding and assigning IO_MUX pins. You choose a macro based on either the IO_MUX pin number, or a required UART channel name, and the macro returns the matching counterpart for you. See some examples below.

**Note:** These macros are useful if you need very high UART baud rates (over 40 MHz), which means you will have to use IO_MUX pins only. In other cases, these macros can be ignored, and you can use the GPIO Matrix as it allows you to configure any GPIO pin for any UART function.

1. UART_NUM_2_TXD_DIRECT_GPIO_NUM returns the IO_MUX pin number of UART channel 2 TXD pin (pin 17)
2. UART_GPIO19_DIRECT_CHANNEL returns the UART number of GPIO 19 when connected to the UART peripheral via IO_MUX (this is UART_NUM_0)
3. UART_CTS_GPIO19_DIRECT_CHANNEL returns the UART number of GPIO 19 when used as the UART CTS pin via IO_MUX (this is UART_NUM_0). It is similar to the above macro but specifies the pin function which is also part of the IO_MUX assignment.

**Header File**

- components/soc/esp32s3/include/soc/uart_channel.h
- This header file can be included with:

```
#include "soc/uart_channel.h"
```

**Macros**

- UART_GPIO43_DIRECT_CHANNEL
- UART_NUM_0_TXD_DIRECT_GPIO_NUM
- UART_GPIO44_DIRECT_CHANNEL
- UART_NUM_0_RXD_DIRECT_GPIO_NUM
- UART_GPIO16_DIRECT_CHANNEL
- UART_NUM_0_CTS_DIRECT_GPIO_NUM
- UART_GPIO15_DIRECT_CHANNEL
- UART_NUM_0_RTS_DIRECT_GPIO_NUM
- UART_TXD_GPIO43_DIRECT_CHANNEL
2.6.29 USB Device Driver

Overview

The driver allows you to use ESP32-S3 chips to develop USB devices on a top of TinyUSB stack. TinyUSB is integrated with ESP-IDF to provide USB features of the framework. Using this driver the chip works as simple or composite device supporting several USB devices simultaneously.

TinyUSB stack is distributed via IDF Component Registry.

Our USB-OTG implementation is limited to 6 USB endpoints (5 IN/OUT endpoints and 1 IN endpoint). Please note that enabling Secure Boot or flash encryption disables the USB-OTG USB stack in the ROM, disallowing updates via the serial emulation or Device Firmware Update (DFU) on that port. For more details, please refer to technical reference manual.
Chapter 2. API Reference

Features

- Configuration of device and string USB descriptors
- USB Serial Device (CDC-ACM)
- Input and output streams through USB Serial Device
- Other USB classes (MIDI, MSC, HID) support directly via TinyUSB
- USB Composite Device (MSC + CDC)
- VBUS monitoring for self-powered devices

Hardware USB Connection

- Any board with the ESP32-S3 chip with USB connectors or with exposed USB’s D+ and D- (DATA+/DATA-) pins.

If the board has no USB connector but has the pins, connect pins directly to the host (e.g., with do-it-yourself cable from any USB connection cable).

On ESP32-S3, connect GPIO 20 and 19 to D+/D- respectively:

![USB Connector Diagram]

Self-powered devices must also connect VBUS through voltage divider or comparator, more details in Self-Powered Device subchapter.

Driver Structure

As the basis is used the TinyUSB stack.

On top of it the driver implements:

- Customization of USB descriptors
- Serial device support
- Redirecting of standard streams through the Serial device
- Storage Media (SPI-Flash and SD-Card) for USB Device MSC Class.
- Encapsulated driver’s task servicing the TinyUSB

Configuration

To use the component, you need to add it as a dependency via the following command. For more details, please refer to IDF Component Registry.

```
idf.py add-dependency esp_tinyusb
```

Via Menuconfig options you can specify:

- Several descriptor’s parameters (see Descriptors Configuration below)
Chapter 2. API Reference

- USB Serial low-level configuration
- The verbosity of the TinyUSB’s log
- Disable the TinyUSB main task (for the custom implementation)

Descriptors Configuration  

The driver’s descriptors are provided by tinyusb_config_t structure’s device_descriptor, configuration_descriptor and string_descriptor members. Therefore, you should initialize tinyusb_config_t with your desired descriptors before calling tinyusb_driver_install() to install the driver.

However, the driver also provides default descriptors. You can install the driver with default device and string descriptors by setting the device_descriptor and string_descriptor members of tinyusb_config_t to NULL before calling tinyusb_driver_install(). To lower your development effort we also provide default configuration descriptor for CDC and MSC class, as these classes rarely require custom configuration. The driver’s default device descriptor is specified using Menuconfig, where the following fields should be configured:

- PID
- VID
- bcdDevice
- Manufacturer
- Product name
- Name of CDC or MSC device if it is On
- Serial number

If you want to use your own descriptors with extended modification, you can define them during the driver installation process.

Install Driver

To initialize the driver, users should call tinyusb_driver_install(). The driver’s configuration is specified in a tinyusb_config_t structure that is passed as an argument to tinyusb_driver_install().

Note that the tinyusb_config_t structure can be zero initialized (e.g., const tinyusb_config_t tusb_cfg = { 0 };) or partially (as shown below). For any member that is initialized to 0 or NULL, the driver will use its default configuration values for that member (see example below)

```c
const tinyusb_config_t partial_init = {
    .device_descriptor = NULL,  // Use default device descriptor specified in Menuconfig
    .string_descriptor = NULL,   // Use default string descriptors specified in Menuconfig
    .external_phy = false,       // Use internal USB PHY
    .configuration_descriptor = NULL,  // Use default configuration descriptor
                                      // according to settings in Menuconfig
};
```

Self-Powered Device

USB specification mandates self-powered devices to monitor voltage level on USB’s VBUS signal. As opposed to bus-powered devices, a self-powered device can be fully functional even without USB connection. The self-powered device detects connection and disconnection events by monitoring the VBUS voltage level. VBUS is considered valid if it rises above 4.75 V and invalid if it falls below 4.35 V.

No ESP32-S3 pin is 5 V tolerant, so you must connect the VBUS to ESP32-S3 via a comparator with voltage thresholds as described above, or use a simple resistor voltage divider that will output (0.75 x Vdd) if VBUS is 4.4 V (see figure below). In both cases, voltage on the sensing pin must be logic low within 3 ms after the device is unplugged from USB host.

To use this feature, in tinyusb_config_t you must set self_powered to true and vbus_monitor_io to GPIO number that will be used for VBUS monitoring.
USB Serial Device (CDC-ACM)

If the CDC option is enabled in Menuconfig, the USB Serial Device can be initialized with `tusb_cdc_acm_init()` according to the settings from `tinyusb_config_cdcacm_t` (see example below).

```c
const tinyusb_config_cdcacm_t acm_cfg = {
    .usb_dev = TINYUSB_USBDEV_0,
    .cdc_port = TINYUSB_CDC_ACM_0,
    .rx_unread_buf_sz = 64,
    .callback_rx = NULL,
    .callback_rx_wanted_char = NULL,
    .callback_line_state_changed = NULL,
    .callback_line_coding_changed = NULL
};
tusb_cdc_acm_init(&acm_cfg);
```

To specify callbacks you can either set the pointer to your `tusb_cdcacm_callback_t` function in the configuration structure or call `tinyusb_cdcacm_register_callback()` after initialization.

USB Serial Console

The driver allows to redirect all standard application streams (stdin, stdout, stderr) to the USB Serial Device and return them to UART using `esp_tusb_init_console()`/`esp_tusb_deinit_console()` functions.

USB Mass Storage Device (MSC)

If the MSC CONFIG_TINYUSB_MSC_ENABLED option is enabled in Menuconfig, the ESP Chip can be used as USB MSC Device. The storage media (spi-flash or sd-card) can be initialized as shown below (see example below).

- SPI-Flash
**Application Examples**

The table below describes the code examples available in the directory `peripherals/usb`.

```c
static esp_err_t storage_init_spiflash(wl_handle_t *wl_handle)
{
    esp_partition_t *data_partition = esp_partition_find_first(ESP_PARTITION_TYPE_DATA, ESP_PARTITION_SUBTYPE_DATA_FAT, NULL);
    wl_mount(data_partition, wl_handle);
}

storage_init_spiflash(&wl_handle);

const tinyusb_msc_spiflash_config_t config_spi = {
    .wl_handle = wl_handle
};
tinyusb_msc_storage_init_spiflash(&config_spi);

• SD-Card

static esp_err_t storage_init_sdmmc(sdmmc_card_t **card)
{
    sdmmc_host_t host = SDMMC_HOST_DEFAULT();
    sdmmc_slot_config_t slot_config = SDMMC_SLOT_CONFIG_DEFAULT();
    // For SD Card, set bus width to use
    slot_config.width = 4;
    slot_config.clk = CONFIG_EXAMPLE_PIN_CLK;
    slot_config.cmd = CONFIG_EXAMPLE_PIN_CMD;
    slot_config.d0 = CONFIG_EXAMPLE_PIN_D0;
    slot_config.d1 = CONFIG_EXAMPLE_PIN_D1;
    slot_config.d2 = CONFIG_EXAMPLE_PIN_D2;
    slot_config.d3 = CONFIG_EXAMPLE_PIN_D3;
    slot_config.flags |= SDMMC_SLOT_FLAG_INTERNAL_PULLUP;

    sd_card = (sdmmc_card_t *)malloc(sizeof(sdmmc_card_t));
    (*host.init)();
    sdmmc_host_init_slot(host.slot, (const sdmmc_slot_config_t *) &slot_config);
    sdmmc_card_init(&host, sd_card);
}

storage_init_sdmmc(&card);

const tinyusb_msc_sdmmc_config_t config_sdmmc = {
    .card = card
};
tinyusb_msc_storage_init_sdmmc(&config_sdmmc);
```
Chapter 2. API Reference

### 2.6.30 USB Host

The document provides information regarding the USB Host Library. This document is split into the following sections:

#### Sections

- **USB Host**
  - Overview
  - Architecture
  - Usage
  - Examples
  - Host Stack Configuration
  - API Reference
  - Maintainers Notes

#### Overview

The USB Host Library (hereinafter referred to as the Host Library) is the lowest layer of the USB Host stack that exposes a public facing API. In most cases, applications that require USB Host functionality do not need to interface with the Host Library directly. Instead, most applications use the API provided by a host class driver that is implemented on top of the Host Library.

However, you may want to use the Host Library directly for some of (but not limited to) the following reasons:

- Implementation of a custom host class driver
- Usage of lower level USB Host API

#### Features & Limitations

The Host Library has the following features:

- Supports Full Speed (FS) and Low Speed (LS) Devices.
- Supports all four transfer types, i.e., Control, Bulk, Interrupt, and Isochronous.
- Allows multiple class drivers to run concurrently, i.e., multiple clients of the Host Library.
- A single device can be used by multiple clients concurrently, e.g., composite devices.
- The Host Library itself and the underlying Host Stack does not internally instantiate any OS tasks. The number of tasks is entirely controlled by how the Host Library interface is used. However, a general rule of thumb regarding the number of tasks is \( (\text{the number of host class drivers running} + 1) \).

Currently, the Host Library and the underlying Host Stack has the following limitations:

- Only supports a single device, but the Host Library’s API is designed for multiple device support.
- Only supports Asynchronous transfers.
- Only supports using the first configuration found. Changing to other configurations is not supported yet.

Architecture

Fig. 33: Diagram of the key entities involved in USB Host functionality

The diagram above shows the key entities that are involved when implementing USB Host functionality. These entities are:

- The **Host Library**
- **Clients** of the Host Library
- **Devices**
- Host Library **Daemon Task**

**Host Library** The Host Library is the lowest public-facing API layer of the ESP-IDF USB Host Stack. Any other ESP-IDF component (such as a class driver or a user component) that needs to communicate with a connected USB device can only do so using the Host Library API either directly or indirectly.

The Host Library’s API is split into two sub-sets, namely the **Library API** and **Client API**.

- The Client API handles the communication between a client of the Host Library and one or more USB devices. The Client API should only be called by registered clients of the Host Library.
- The Library API handles all of the Host Library processing that is not specific to a single client, such as device enumeration. Usually, the library API is called by a Host Library Daemon Task.

**Clients** A client of the Host Library is a software component, such as a host class driver or user component, which utilizes the Host Library to establish communication with a USB device. Generally, each client has a one-to-one relation with a task. This implies that all Client API calls pertaining to a specific client must originate from the context of the same task.

By organizing the software components that use the Host Library’s into clients, the Host Library can delegate the handling of all events specific to that client to the client’s task. In other words, each task is responsible for all the required processing and event handling associated with the USB communication that the client initiates.
Daemon Task  Although the Host Library delegates the handling of client events to the clients themselves, there are still Library events—events that are not specific to any particular client—that need to be handled. Library event handling can include things such as:

- Handling USB device connection, enumeration, and disconnection
- Rerouting control transfers to/from clients
- Forwarding events to clients

Therefore, in addition to the client tasks, the Host Library also requires a task, which is usually the Host Library Daemon Task, to handle all of the library events.

Devices  The Host Library shields clients from the details of device handling, encompassing details such as connection, memory allocation, and enumeration. The clients are provided only with a list of already connected and enumerated devices to choose from. During enumeration, each device is automatically configured to use the first configuration found, namely, the first configuration descriptor returned on a Get Configuration Descriptor request. For most standard devices, the first configuration will have a bConfigurationValue of 1.

It is possible for two or more clients to simultaneously communicate with the same device as long as they are not communicating to the same interface. However, multiple clients can simultaneously communicate with the same device’s default endpoint (i.e., EP0), which will result in their control transfers being serialized.

For a client to communicate with a device, the client must:

1. Open the device using the device’s address. This lets the Host Library know that the client is using that device.
2. Claim the interface(s) that will be used for communication. This prevents other clients from claiming the same interface(s).
3. Send transfers to the endpoints of claimed interfaces. The client’s task is responsible for handling its own processing and events related to USB device communication.

Usage  The Host Library and the underlying Host Stack will not create any tasks. All tasks, namely the client tasks and the Daemon Task, need to be created by the class drivers or the user. Instead, the Host Library provides two event handler functions that handle all of the required Host Library processing, thus these functions should be called repeatedly from the client tasks and the Daemon Task. Therefore, the implementation of client tasks and the Daemon Task will be largely centered around the invocation of these event handler functions.

Host Library & Daemon Task

Basic Usage  The Host Library API provides `usb_host_lib_handle_events()` to handle library events. This function should be called repeatedly, typically from the Daemon Task. Some notable features regarding `usb_host_lib_handle_events()` are:

- The function can block until a library event needs handling.
- Event flags are returned on each invocation. These event flags are useful for knowing when the Host Library can be uninstalled.

A bare-bones Daemon Task would resemble something like the following code snippet:

```c
#include "usb/usb_host.h"

void daemon_task(void *arg)
{
    ...
    bool exit = false;
    while (!exit) {
        uint32_t event_flags;
        usb_host_lib_handle_events(portMAX_DELAY, &event_flags);
        if (event_flags & USB_HOST_LIB_EVENT_FLAGS_NO_CLIENTS) {
```

(continues on next page)
...}
if (event_flags & USB_HOST_LIB_EVENT_FLAGS_ALL_FREE) {
  ...}
}

Note: See the peripherals/usb/host/usb_host_lib example for full implementation of the Daemon Task.

Fig. 34: Graph of Typical USB Host Library Lifecycle

**Lifecycle** The graph above illustrates the typical lifecycle of the Host Library with multiple clients and devices. Specifically, the example involves:

- two registered clients (Client 1 and Client 2).
- two connected devices (Device 1 and Device 2), where Client 1 communicates with Device 1 and Client 2 communicates with Device 2.

With reference to the graph above, the typical lifecycle involves the following key stages.

1. **The Host Library is installed by calling** `usb_host_install()`.  
   - Installation must be done before any other Host Library API is called.
   - Where `usb_host_install()` is called (e.g., from the Daemon Task or another task) depends on the synchronization logic between the Daemon Task, client tasks, and the rest of the system.

2. **Once the Host Library is installed, the clients can be registered by calling** `usb_host_client_register()`.  
   - This is typically called from the client task, where the client task waits for a signal from the Daemon Task.
   - This can be called elsewhere if necessary as long it is called after `usb_host_install()`.

3. **Device 1 connects and is then enumerated.**  
   - Each registered client (in this case Client 1 and Client 2) is notified of the new device by way of the `USB_HOST_CLIENT_EVENT_NEW_DEV` event.
   - Client 1 opens Device 1 and begins communication with it.

4. **Similarly Device 2 connects and is enumerated.**  
   - Client 1 and 2 are notified of a new device via a `USB_HOST_CLIENT_EVENT_NEW_DEV` event.
   - Client 2 opens Device 2 and begins communication with it.

5. **Device 1 suddenly disconnects.**  
   - Client 1 is notified by way of `USB_HOST_CLIENT_EVENT_DEV_GONE` and begins its cleanup.
6. **Client 1 completes its cleanup and deregisters by calling** `usb_host_client_deregister()`.  
   - This is typically called from the client task before the task exits.  
   - This can be called elsewhere if necessary as long as Client 1 has already completed its cleanup.

7. **Client 2 completes its communication with Device 2. Client 2 then closes Device 2 and deregisters itself.**
   
   - The Daemon Task is notified of the deregistration of all clients by way the `USB_HOST_LIB_EVENT_FLAGS_NO_CLIENTS` event flag as Client 2 is the last client to deregister.
   - Device 2 is still allocated (i.e., not freed), as it is still connected albeit not currently opened by any client.

8. **The Daemon Task decides to clean up as there are no more clients.**
   
   - The Daemon Task must free Device 2 first by calling `usb_host_device_free_all()`.
   - If `usb_host_device_free_all()` was able to free all devices, the function will return `ESP_OK` indicating that all devices have been freed.
   - If `usb_host_device_free_all()` was unable to free all devices for reasons like the device is still opened by a client, the function will return `ESP_ERR_NOT_FINISHED`.
   - The Daemon Task must wait for `usb_host_lib_handle_events()` to return the `USB_HOST_LIB_EVENT_FLAGS_ALL_FREE` event flag in order to know when all devices have been freed.

9. Once the Daemon Task has verified that all clients have deregistered and all devices have been freed, it can now uninstall the Host Library by calling `usb_host_uninstall()`.

**Clients & Class Driver**

**Basic Usage** The Host Library API provides `usb_host_client_handle_events()` to handle a particular client’s events. This function should be called repeatedly, typically from the client’s task. Some notable features regarding `usb_host_client_handle_events()` are:

- The function can block until a client event needs handling.
- The function’s primary purpose is to call the various event handling callbacks when a client event occurs.

The following callbacks are called from within `usb_host_client_handle_events()` thus allowing the client task to be notified of events.

- The client event callback of type `usb_host_client_event_cb_t` delivers client event messages to the client. Client event messages indicate events such as the addition or removal of a device.
- The USB transfer completion callback of type `usb_transfer_cb_t` indicates that a particular USB transfer previously submitted by the client has been completed.

**Note:** Given that the callbacks are called from within `usb_host_client_handle_events()`, users should avoid blocking from within the callbacks as this will result in `usb_host_client_handle_events()` being blocked as well, thus preventing other pending client events from being handled.

The following code snippet demonstrates a bare-bones host class driver and its client task. The code snippet contains:

- A simple client task function `client_task` that calls `usb_host_client_handle_events()` in a loop.
- Implementations of a client event callback and transfer completion callbacks.
- Implementation of a simple state machine for the class driver. The class driver simply opens a device, sends an OUT transfer to EP1, then closes the device.

```c
#include <string.h>
#include "usb/usb_host.h"

#define CLASS_DRIVER_ACTION_OPEN_DEV 0x01
#define CLASS_DRIVER_ACTION_TRANSFER 0x02
#define CLASS_DRIVER_ACTION_CLOSE_DEV 0x03
```

(continues on next page)
struct class_driver_control {
    uint32_t actions;
    uint8_t dev_addr;
    usb_host_client_handle_t client_hdl;
    usb_device_handle_t dev_hdl;
};

static void client_event_cb(const usb_host_client_event_msg_t *event_msg, void *arg) {
    // This function is called from within usb_host_client_handle_events(). Do not...
    struct class_driver_control *class_driver_obj = (struct class_driver_control...)
    switch (event_msg->event) {
        case USB_HOST_CLIENT_EVENT_NEW_DEV:
            class_driver_obj->actions |= CLASS_DRIVER_ACTION_OPEN_DEV;
            class_driver_obj->dev_addr = event_msg->new_dev.address; //Store the...
            break;
        case USB_HOST_CLIENT_EVENT_DEV_GONE:
            class_driver_obj->actions |= CLASS_DRIVER_ACTION_CLOSE_DEV;
            break;
        default:
            break;
    }
}

static void transfer_cb(usb_transfer_t *transfer) {
    // This function is called from within usb_host_client_handle_events(). Do not...
    struct class_driver_control *class_driver_obj = (struct class_driver_control...)
    printf("Transfer status %d, actual number of bytes transferred %d\n", ...
    class_driver_obj->actions |= CLASS_DRIVER_ACTION_CLOSE_DEV;
}

void client_task(void *arg) {
    ... // Wait until Host Library is installed
    // Initialize class driver objects
    struct class_driver_control class_driver_obj = {0};
    // Register the client
    usb_host_client_config_t client_config = {
        .is_synchronous = false,
        .max_num_event_msg = 5,
        .async = {
            .client_event_callback = client_event_cb,
            .callback_arg = &class_driver_obj,
        }
    };
    usb_host_client_register(&client_config, &class_driver_obj.client_hdl);
    //Allocate a USB transfer
    usb_transfer_t *transfer;
    usb_host_transfer_alloc(1024, 0, &transfer);
    //Event handling loop
    bool exit = false;
(continues on next page)
while (true) {
    // Call the client event handler function
    usb_host_client_handle_events(class_driver_obj.clienthdl, portMAX_DELAY);
    // Execute pending class driver actions
    if (class_driver_obj.actions & CLASS_DRIVER_ACTION_OPEN_DEV) {
        // Open the device and claim interface 1
        usb_host_device_open(class_driver_obj.clienthdl, class_driver_obj.dev-
        ->addr, &class_driver_obj.dev_hdl);
        usb_host_interface_claim(class_driver_obj.clienthdl, class_driver_obj.
        ->dev_hdl, 1, 0);
    }
    if (class_driver_obj.actions & CLASS_DRIVER_ACTION_TRANSFER) {
        // Send an OUT transfer to EP1
        memset(transfer->data_buffer, 0xAA, 1024);
        transfer->num_bytes = 1024;
        transfer->device_handle = class_driver_obj.dev_hdl;
        transfer->bEndpointAddress = 0x01;
        transfer->callback = transfer_cb;
        transfer->context = (void *)&class_driver_obj;
        usb_host_transfer_submit(transfer);
    }
    if (class_driver_obj.actions & CLASS_DRIVER_ACTION_CLOSE_DEV) {
        // Release the interface and close the device
        usb_host_interface_release(class_driver_obj.clienthdl, class_driver_
        ->obj.dev_hdl, 1);
        usb_host_device_close(class_driver_obj.clienthdl, class_driver_obj.
        ->dev_hdl);
        exit = true;
    }
    ... // Handle any other actions required by the class driver
}

// Cleanup class driver
usb_host_transfer_free(transfer);
usb_host_client_deregister(class_driver_obj.clienthdl);
... // Delete the client task. Signal the Daemon Task if necessary.

Note: An actual host class driver is likely to support many more features, thus will have a much more complex state machine. A host class driver is also likely to need to:

- Be able to open multiple devices
- Parse an opened device’s descriptors to identify if the device is of the target class
- Communicate with multiple endpoints of an interface in a particular order
- Claim multiple interfaces of a device
- Handle various errors

Lifecycle The typical life cycle of a client task and class driver will go through the following stages:

1. Wait for some signal regarding the Host Library being installed.
2. Register the client via `usb_host_client_register()` and allocate any other class driver resources, such as allocating transfers using `usb_host_transfer_alloc()`.
3. For each new device that the class driver needs to communicate with:
   a. Check if the device is already connected via `usb_host_device_addr_list_fill()`.
   b. If the device is not already connected, wait for a `USB_HOST_CLIENT_EVENT_NEW_DEV` event from the client event callback.
   c. Open the device via `usb_host_device_open()`.
   d. Parse the device and configuration descriptors via `usb_host_get_device_descriptor()` and
4. Submit transfers to the device via `usb_host_transfer_submit()` or `usb_host_transfer_submit_control()`.
5. Once an opened device is no longer needed by the class driver, or has disconnected, as indicated by a `USB_HOST_CLIENT_EVENT_DEV_GONE` event:
   a. Stop any previously submitted transfers to the device’s endpoints by calling `usb_host_endpoint_halt()` and `usb_host_endpoint_flush()` on those endpoints.
   b. Release all previously claimed interfaces via `usb_host_interface_release()`.
   c. Close the device via `usb_host_device_close()`.
6. Deregister the client via `usb_host_client_deregister()` and free any other class driver resources.
7. Delete the client task. Signal the Daemon Task if necessary.

Examples

Host Library Examples The peripherals/usb/host/usb_host_lib demonstrates basic usage of the USB Host Library’s API to implement a pseudo-class driver.

Class Driver Examples The USB Host Stack provides a number of examples that implement host class drivers using the Host Library’s API.

CDC-ACM

- A host class driver for the Communication Device Class (Abstract Control Model) is distributed as a managed component via the ESP-IDF Component Registry.
- The peripherals/usb/host/cdc/cdc_acm_host example uses the CDC-ACM host driver component to communicate with CDC-ACM devices.
- The peripherals/usb/host/cdc/cdc_acm_vcp example shows how you can extend the CDC-ACM host driver to interface Virtual COM Port devices.
- The CDC-ACM driver is also used in esp_modem examples, where it is used for communication with cellular modems.

MSC

- A host class driver for the Mass Storage Class (Bulk-Only Transport) is deployed to ESP-IDF Component Registry.
- The peripherals/usb/host/msc example demonstrates the usage of the MSC host driver to read and write to a USB flash drive.

HID

- A host class driver for the HID (Human interface device) is distributed as a managed component via the ESP-IDF Component Registry.
- The peripherals/usb/host/hid example demonstrates the possibility to receive reports from a USB HID device with several interfaces.

UVC

- A host class driver for the USB Video Device Class is distributed as a managed component via the ESP-IDF Component Registry.
- The peripherals/usb/host/uvc example demonstrates the usage of the UVC host driver to receive a video stream from a USB camera and optionally forward that stream over Wi-Fi.
Host Stack Configuration

Non-Compliant Device Support To support USB devices that are non-compliant in various scenarios or exhibit specific behaviors it is possible to configure the USB Host stack.

As a USB device may be hot-plugged, it is essential to have the configurable delays between power switching and device attachment, and when the device’s internal power has stabilized.

Enumeration Configuration During the process of enumerating connected USB devices, several timeout values ensure the proper functioning of the device.

The figure above shows all the timeouts associated with both turning on port power with a device connected and hot-plugging a device.

- After a port is reset or resumed, the USB System Software is expected to provide a “recovery” interval of 10 ms before the device attached to the port is expected to respond to data transfers.
- After the reset/resume recovery interval, if a device receives a SetAddress() request, the device must be able to complete processing of the request and be able to successfully complete the Status stage of the request within 50 ms.
- After successful completion of the Status stage, the device is allowed a SetAddress() recovery interval of 2 ms.

Note: For more details regarding connection event timings, please refer to the Universal Serial Bus 2.0 specification, chapter 7.1.7.3 “Connect and Disconnect Signaling”.

Configurable parameters of the USB host stack can be configured with multiple options via Menuconfig.

- For Debounce delay refer to CONFIG_USB_HOST_DEBOUNCE_DELAY_MS
- For Reset hold interval refer to CONFIG_USB_HOST_RESET_HOLD_MS
- For Reset recovery interval refer to CONFIG_USB_HOST_RESET_RECOVERY_MS
- For SetAddress() recovery interval refer to: CONFIG_USB_HOST_SET_ADDR_RECOVERY_MS

API Reference

The API of the USB Host Library is separated into the following header files. However, it is sufficient for applications to only include "usb/usb_host.h" and all USB Host Library headers will also be included.
Chapter 2. API Reference

- `usb/include/usb/usb_host.h` contains the functions and types of the USB Host Library.
- `usb/include/usb/usb_helpers.h` contains various helper functions that are related to the USB protocol such as descriptor parsing.
- `usb/include/usb/usb_types_stack.h` contains types that are used across multiple layers of the USB Host stack.
- `usb/include/usb/usb_types_ch9.h` contains types and macros related to Chapter 9 of the USB2.0 specification, i.e., descriptors and standard requests.

Header File

- `components/usb/include/usb/usb_host.h`
- This header file can be included with:

```c
#include "usb/usb_host.h"
```
- This header file is a part of the API provided by the `usb` component. To declare that your component depends on `usb`, add the following to your CMakeLists.txt:

```cmake
REQUIRES usb
```

or

```cmake
PRIV_REQUIRES usb
```

Functions

`esp_err_t usb_host_install (const usb_host_config_t *config)`

Install the USB Host Library.

- This function should only once to install the USB Host Library
- This function should be called before any other USB Host Library functions are called

**Note:** If `skip_phy_setup` is set in the install configuration, the user is responsible for ensuring that the underlying Host Controller is enabled and the USB PHY (internal or external) is already setup before this function is called.

**Parameters**

- `config` – [in] USB Host Library configuration

**Returns** `esp_err_t`

`esp_err_t usb_host_uninstall (void)`

Uninstall the USB Host Library.

- This function should be called to uninstall the USB Host Library, thereby freeing its resources
- All clients must have been deregistered before calling this function
- All devices must have been freed by calling `usb_host_device_free_all()` and receiving the `USB_HOST_LIB_EVENT_FLAGS_ALL_FREE` event flag

**Note:** If `skip_phy_setup` was set when the Host Library was installed, the user is responsible for disabling the underlying Host Controller and USB PHY (internal or external).

**Returns** `esp_err_t`

`esp_err_t usb_host_lib_handle_events (TickType_t timeout_ticks, uint32_t *event_flags_ret)`

Handle USB Host Library events.
This function handles all of the USB Host Library’s processing and should be called repeatedly in a loop.

- Check event_flags_ret to see if any flags are set indicating particular USB Host Library events.
- This function should never be called by multiple threads simultaneously.

**Note:** This function can block.

### Parameters

- `timeout_ticks` - [in] Timeout in ticks to wait for an event to occur.
- `event_flags_ret` - [out] Event flags that indicate what USB Host Library event occurred.

### Returns

`esp_err_t` **usb_host_lib_unblock** (void)

Unblock the USB Host Library handler.

- This function simply unblocks the USB Host Library event handling function (usb_host_lib_handle_events())

### Returns

`esp_err_t` **usb_host_lib_unblock** (void)

Get current information about the USB Host Library.

### Parameters

- `info_ret` - [out] USB Host Library Information

### Returns

`esp_err_t` **usb_host_lib_info** (usb_host_lib_info_t *info_ret)

Register a client of the USB Host Library.

- This function registers a client of the USB Host Library.
- Once a client is registered, its processing function usb_host_client_handle_events() should be called repeatedly.

### Parameters

- `client_config` - [in] Client configuration
- `client_hdl_ret` - [out] Client handle

### Returns

`esp_err_t` **usb_host_client_register** (const usb_host_client_config_t *client_config, usb_host_client_handle_t *client_hdl_ret)

Deregister a USB Host Library client.

- This function deregisters a client of the USB Host Library.
- The client must have closed all previously opened devices before attempting to deregister.

### Parameters

- `client_hdl` - [in] Client handle

### Returns

`esp_err_t` **usb_host_client_deregister** (usb_host_client_handle_t client_hdl)

USB Host Library client processing function.
This function handles all of a client’s processing and should be called repeatedly in a loop.
- For a particular client, this function should never be called by multiple threads simultaneously.

Note: This function can block.

Parameters
- `client_hdl` [in] Client handle
- `timeout_ticks` [in] Timeout in ticks to wait for an event to occur

Returns `esp_err_t`

```
esp_err_t usb_host_client_unblock(usb_host_client_handle_t client_hdl)
```

Unblock a client.

- This function simply unblocks a client if it is blocked on the `usb_host_client_handle_events()` function.
- This function is useful when need to unblock a client in order to deregister it.

Parameters `client_hdl` [in] Client handle

Returns `esp_err_t`

```
esp_err_t usb_host_device_open(usb_host_client_handle_t client_hdl, uint8_t dev_addr, usb_device_handle_t *dev_hdl_ret)
```

Open a device.

- This function allows a client to open a device
- A client must open a device first before attempting to use it (e.g., sending transfers, device requests etc.)

Parameters
- `client_hdl` [in] Client handle
- `dev_addr` [in] Device’s address
- `dev_hdl_ret` [out] Device’s handle

Returns `esp_err_t`

```
esp_err_t usb_host_device_close(usb_host_client_handle_t client_hdl, usb_device_handle_t dev_hdl)
```

Close a device.

- This function allows a client to close a device
- A client must close a device after it has finished using the device (claimed interfaces must also be released)
- A client must close all devices it has opened before deregistering

Note: This function can block.

Parameters
- `client_hdl` [in] Client handle
- `dev_hdl` [in] Device handle

Returns `esp_err_t`

```
esp_err_t usb_host_device_free_all(void)
```

Indicate that all devices can be freed when possible.

- This function marks all devices as waiting to be freed
• If a device is not opened by any clients, it will be freed immediately
• If a device is opened by at least one client, the device will be free when the last client closes that device.
• Wait for the USB_HOST_LIB_EVENT_FLAGS_ALL_FREE flag to be set by usb_host_lib_handle_events() in order to know when all devices have been freed
• This function is useful when cleaning up devices before uninstalling the USB Host Library

Returns
• ESP_ERR_NOT_FINISHED: There are one or more devices that still need to be freed. Wait for USB_HOST_LIB_EVENT_FLAGS_ALL_FREE event
• ESP_OK: All devices already freed (i.e., there were no devices)
• Other: Error

esp_err_t usb_host_device_addr_list_fill (int list_len, uint8_t *dev_addr_list, int *num_dev_ret)

Fill a list of device address.

• This function fills an empty list with the address of connected devices
• The Device addresses can then used in usb_host_device_open()
• If there are more devices than the list_len, this function will only fill up to list_len number of devices.

Parameters
• list_len – [in] Length of the empty list
• dev_addr_list – [inout] Empty list to be filled
• num_dev_ret – [out] Number of devices

Returns esp_err_t

esp_err_t usb_host_device_info (usb_device_handle_t dev_hdl, usb_device_info_t *dev_info)

Get device’s information.

• This function gets some basic information of a device
• The device must be opened first before attempting to get its information

Note: This function can block

Parameters
• dev_hdl – [in] Device handle
• dev_info – [out] Device information

Returns esp_err_t

esp_err_t usb_host_get_device_descriptor (usb_device_handle_t dev_hdl, const usb_device_desc_t **device_desc)

Get device’s device descriptor.

• A client must call usb_host_device_open() first
• No control transfer is sent. The device’s descriptor is cached on enumeration
• This function simple returns a pointer to the cached descriptor

Note: No control transfer is sent. The device’s descriptor is cached on enumeration

Parameters
• dev_hdl – [in] Device handle
• device_desc – [out] Device descriptor
Returns esp_err_t

esp_err_t usb_host_get_active_config_descriptor (usb_device_handle_t dev_hdl, const usb_config_desc_t **config_desc)

Get device’s active configuration descriptor.

- A client must call `usb_host_device_open()` first
- No control transfer is sent. The device’s active configuration descriptor is cached on enumeration
- This function simply returns a pointer to the cached descriptor

**Note:** This function can block

**Note:** No control transfer is sent. A device’s active configuration descriptor is cached on enumeration

Parameters
- *dev_hdl* – [in] Device handle
- *config_desc* – [out] Configuration descriptor

Returns esp_err_t

esp_err_t usb_host_interface_claim (usb_host_client_handle_t client_hdl, usb_device_handle_t dev_hdl, uint8_t bInterfaceNumber, uint8_t bAlternateSetting)

Function for a client to claim a device’s interface.

- A client must claim a device’s interface before attempting to communicate with any of its endpoints
- Once an interface is claimed by a client, it cannot be claimed by any other client.

**Note:** This function can block

Parameters
- *client_hdl* – [in] Client handle
- *dev_hdl* – [in] Device handle
- *bInterfaceNumber* – [in] Interface number
- *bAlternateSetting* – [in] Interface alternate setting number

Returns esp_err_t

esp_err_t usb_host_interface_release (usb_host_client_handle_t client_hdl, usb_device_handle_t dev_hdl, uint8_t bInterfaceNumber)

Function for a client to release a previously claimed interface.

- A client should release a device’s interface after it no longer needs to communicate with the interface
- A client must release all of its interfaces of a device it has claimed before being able to close the device

**Note:** This function can block

Parameters
- *client_hdl* – [in] Client handle
- *dev_hdl* – [in] Device handle
- *bInterfaceNumber* – [in] Interface number
**Returns** esp_err_t

**esp_err_t usb_host_endpoint_halt** *(usb_device_handle_t dev_hdl, uint8_t bEndpointAddress)*

Halt a particular endpoint.

- The device must have been opened by a client
- The endpoint must be part of an interface claimed by a client
- Once halted, the endpoint must be cleared using usb_host_endpoint_clear() before it can communicate again

**Note:** This function can block

**Parameters**

- **dev_hdl** – Device handle
- **bEndpointAddress** – Endpoint address

**Returns** esp_err_t

**esp_err_t usb_host_endpoint_flush** *(usb_device_handle_t dev_hdl, uint8_t bEndpointAddress)*

Flush a particular endpoint.

- The device must have been opened by a client
- The endpoint must be part of an interface claimed by a client
- The endpoint must have been halted (either through a transfer error, or usb_host_endpoint_halt())
- Flushing an endpoint will caused an queued up transfers to be canceled

**Note:** This function can block

**Parameters**

- **dev_hdl** – Device handle
- **bEndpointAddress** – Endpoint address

**Returns** esp_err_t

**esp_err_t usb_host_endpoint_clear** *(usb_device_handle_t dev_hdl, uint8_t bEndpointAddress)*

Clear a halt on a particular endpoint.

- The device must have been opened by a client
- The endpoint must be part of an interface claimed by a client
- The endpoint must have been halted (either through a transfer error, or usb_host_endpoint_halt())
- If the endpoint has any queued up transfers, clearing a halt will resume their execution

**Note:** This function can block

**Parameters**

- **dev_hdl** – Device handle
- **bEndpointAddress** – Endpoint address

**Returns** esp_err_t
**esp_err_t** `usb_host_transfer_alloc` (**size_t** `data_buffer_size`, **int** `num_isoc_packets`, **usb_transfer_t** `**transfer`)

Allocate a transfer object.

- This function allocates a transfer object
- Each transfer object has a fixed sized buffer specified on allocation
- A transfer object can be re-used indefinitely
- A transfer can be submitted using `usb_host_transfer_submit()` or `usb_host_transfer_submit_control()`

**Parameters**

- `data_buffer_size` - [in] Size of the transfer’s data buffer
- `num_isoc_packets` - [in] Number of isochronous packets in transfer (set to 0 for non-isochronous transfers)
- `transfer` - [out] Transfer object

**Returns** `esp_err_t`

**esp_err_t** `usb_host_transfer_free` (**usb_transfer_t** `*transfer`)

Free a transfer object.

- Free a transfer object previously allocated using `usb_host_transfer_alloc()`
- The transfer must not be in-flight when attempting to free it
- If a NULL pointer is passed, this function will simply return ESP_OK

**Parameters**

- `transfer` - [in] Transfer object

**Returns** `esp_err_t`

**esp_err_t** `usb_host_transfer_submit` (**usb_transfer_t** `*transfer`)

Submit a non-control transfer.

- Submit a transfer to a particular endpoint. The device and endpoint number is specified inside the transfer
- The transfer must be properly initialized before submitting
- On completion, the transfer’s callback will be called from the client’s `usb_host_client_handle_events()` function.

**Parameters**

- `transfer` - [in] Initialized transfer object

**Returns** `esp_err_t`

**esp_err_t** `usb_host_transfer_submit_control` (**usb_host_client_handle_t** `client_hdl`, **usb_transfer_t** `*transfer`)

Submit a control transfer.

- Submit a control transfer to a particular device. The client must have opened the device first
- The transfer must be properly initialized before submitting. The first 8 bytes of the transfer’s data buffer should contain the control transfer setup packet
- On completion, the transfer’s callback will be called from the client’s `usb_host_client_handle_events()` function.

**Parameters**

- `client_hdl` - [in] Client handle
- `transfer` - [in] Initialized transfer object

**Returns** `esp_err_t`
Structures

struct `usb_host_client_event_msg_t`

Client event message.

Client event messages are sent to each client of the USB Host Library in order to notify them of various USB Host Library events such as:

- Addition of new devices
- Removal of existing devices

**Note:** The event message structure has a union with members corresponding to each particular event. Based on the event type, only the relevant member field should be accessed.

Public Members

`usb_host_client_event_t` event

Type of event

uint8_t address

New device’s address

struct `usb_host_client_event_msg_t`::[anonymous]::[anonymous] new_dev

New device info

`usb_device_handle_t` dev_hdl

The handle of the device that was gone

struct `usb_host_client_event_msg_t`::[anonymous]::[anonymous] dev_gone

Gone device info

struct `usb_host_lib_info_t`

Current information about the USB Host Library obtained via `usb_host_lib_info()`

Public Members

int num_devices

Current number of connected (and enumerated) devices

int num_clients

Current number of registered clients

struct `usb_host_config_t`

USB Host Library configuration.

Configuration structure of the USB Host Library. Provided in the `usb_host_install()` function

Public Members
bool \texttt{skip\_phy\_setup}

If set, the USB Host Library will not configure the USB PHY thus allowing the user to manually configure the USB PHY before calling \texttt{usb\_host\_install()}. Users should set this if they want to use an external USB PHY. Otherwise, the USB Host Library will automatically configure the internal USB PHY.

int \texttt{intr\_flags}

Interrupt flags for the underlying ISR used by the USB Host stack.

\textbf{struct} \texttt{usb\_host\_client\_config\_t}

USB Host Library Client configuration.

Configuration structure for a USB Host Library client. Provided in \texttt{usb\_host\_client\_register()}

\textbf{Public Members}

bool \texttt{is\_synchronous}

Whether the client is asynchronous or synchronous or not. Set to false for now.

int \texttt{max\_num\_event\_msg}

Maximum number of event messages that can be stored (e.g., 3)

\texttt{usb\_host\_client\_event\_cb\_t} \texttt{client\_event\_callback}

Client’s event callback function

void \*\texttt{callback\_arg}

Event callback function argument

\texttt{struct} \texttt{usb\_host\_client\_config\_t}\texttt{::[anonymous]}::[anonymous] \texttt{async}

Async callback config

\textbf{Macros}

\texttt{USB\_HOST\_LIB\_EVENT\_FLAGS\_NO\_CLIENTS}

All clients have been deregistered from the USB Host Library.

\texttt{USB\_HOST\_LIB\_EVENT\_FLAGS\_ALL\_FREE}

The USB Host Library has freed all devices

\textbf{Type Definitions}

typedef \texttt{struct} \texttt{usb\_host\_client\_handle\_s} \*\texttt{usb\_host\_client\_handle\_t}

Handle to a USB Host Library asynchronous client.

An asynchronous client can be registered using \texttt{usb\_host\_client\_register()}

\textbf{Note:} Asynchronous API

typedef void \((\star \texttt{usb\_host\_client\_event\_cb\_t})(\texttt{const} \texttt{usb\_host\_client\_event\_msg\_t} \*\texttt{event\_msg}, \texttt{void} \*\texttt{arg})\)

Client event callback.
• Each client of the USB Host Library must register an event callback to receive event messages from the USB Host Library.
• The client event callback is run from the context of the clients usb_host_client_handle_events() function.

Enumerations

eenum usb_host_client_event_t

The type event in a client event message.

Values:

enumerator USB_HOST_CLIENT_EVENT_NEW_DEV

A new device has been enumerated and added to the USB Host Library

enumerator USB_HOST_CLIENT_EVENT_DEV_GONE

A device opened by the client is now gone

Header File

• components/usb/include/usb/usb_helpers.h
• This header file can be included with:

```
#include "usb/usb_helpers.h"
```

• This header file is a part of the API provided by the usb component. To declare that your component depends on usb, add the following to your CMakeLists.txt:

```
REQUIRES usb
```
or

```
PRIV_REQUIRES usb
```

Functions

const usb_standard_desc_t *usb_parse_next_descriptor (const usb_standard_desc_t *cur_desc, uint16_t wTotalLength, int *offset)

Get the next descriptor.

Given a particular descriptor within a full configuration descriptor, get the next descriptor within the configuration descriptor. This is a convenience function that can be used to walk each individual descriptor within a full configuration descriptor.

Parameters

• cur_desc - [in] Current descriptor
• wTotalLength - [in] Total length of the configuration descriptor
• offset - [inout] Byte offset relative to the start of the configuration descriptor. On input, it is the offset of the current descriptor. On output, it is the offset of the returned descriptor.

Returns usb_standard_desc_t* Next descriptor, NULL if end of configuration descriptor reached

const usb_standard_desc_t *usb_parse_next_descriptor_of_type (const usb_standard_desc_t *cur_desc, uint16_t wTotalLength, uint8_t bDescriptorType, int *offset)

Get the next descriptor of a particular type.

Given a particular descriptor within a full configuration descriptor, get the next descriptor of a particular type (i.e., using the bDescriptorType value) within the configuration descriptor.

Parameters
Chapter 2. API Reference

- cur_desc - [in] Current descriptor
- wTotalLength - [in] Total length of the configuration descriptor
- bDescriptorType - [in] Type of the next descriptor to get
- offset - [inout] Byte offset relative to the start of the configuration descriptor. On input, it is the offset of the current descriptor. On output, it is the offset of the returned descriptor.

Returns usb_standard_desc_t* Next descriptor, NULL if end descriptor is not found or configuration descriptor reached

int usb_parse_interface_number_of_alternate (const usb_config_desc_t *config_desc, uint8_t bInterfaceNumber)

Get the number of alternate settings for a bInterfaceNumber.

Given a particular configuration descriptor, for a particular bInterfaceNumber, get the number of alternate settings available for that interface (i.e., the max possible value of bAlternateSetting for that bInterfaceNumber).

Parameters
- config_desc – [in] Pointer to the start of a full configuration descriptor
- bInterfaceNumber – [in] Interface number

Returns int The number of alternate settings that the interface has, -1 if bInterfaceNumber not found

const usb_intf_desc_t *usb_parse_interface_descriptor (const usb_config_desc_t *config_desc, uint8_t bInterfaceNumber, uint8_t bAlternateSetting, int *offset)

Get a particular interface descriptor (using bInterfaceNumber and bAlternateSetting)

Given a full configuration descriptor, get a particular interface descriptor.

Note: To get the number of alternate settings for a particular bInterfaceNumber, call usb_parse_interface_number_of_alternate()

Parameters
- config_desc – [in] Pointer to the start of a full configuration descriptor
- bInterfaceNumber – [in] Interface number
- bAlternateSetting – [in] Alternate setting number
- offset – [out] Byte offset of the interface descriptor relative to the start of the configuration descriptor. Can be NULL.

Returns const usb_intf_desc_t* Pointer to interface descriptor, NULL if not found.

const usb_ep_desc_t *usb_parse_endpoint_descriptor_by_index (const usb_intf_desc_t *intf_desc, int index, uint16_t wTotalLength, int *offset)

Get an endpoint descriptor within an interface descriptor.

Given an interface descriptor, get the Nth endpoint descriptor of the interface. The number of endpoints in an interface is indicated by the bNumEndpoints field of the interface descriptor.

Note: If bNumEndpoints is 0, it means the interface uses the default endpoint only

Parameters
- intf_desc – [in] Pointer to the start of an interface descriptor
- index – [in] Endpoint index
- wTotalLength – [in] Total length of the containing configuration descriptor
- offset – [inout] Byte offset relative to the start of the configuration descriptor. On input, it is the offset of the interface descriptor. On output, it is the offset of the endpoint descriptor.
Chapter 2.  API Reference

Returns  const usb_ep_desc_t* Pointer to endpoint descriptor, NULL if not found.

const usb_ep_desc_t *usb_parse_endpoint_descriptor_by_address (const usb_config_desc_t *config_desc, uint8_t bInterfaceNumber, uint8_t bAlternateSetting, uint8_t bEndpointAddress, int *offset)

Get an endpoint descriptor based on an endpoint’s address.

Given a configuration descriptor, get an endpoint descriptor based on it’s bEndpointAddress, bAlternateSetting, and bInterfaceNumber.

Parameters
•  config_desc [in] Pointer to the start of a full configuration descriptor
•  bInterfaceNumber [in] Interface number
•  bAlternateSetting [in] Alternate setting number
•  bEndpointAddress [in] Endpoint address
•  offset [out] Byte offset of the endpoint descriptor relative to the start of the configuration descriptor. Can be NULL

Returns  const usb_ep_desc_t* Pointer to endpoint descriptor, NULL if not found.

void usb_print_device_descriptor (const usb_device_desc_t *devc_desc)

Print device descriptor.

Parameters devc_desc - Device descriptor

void usb_print_config_descriptor (const usb_config_desc_t *cfg_desc, print_class_descriptor_cb class_specific_cb)

Print configuration descriptor.

•  This function prints the full contents of a configuration descriptor (including interface and endpoint descriptors)
•  When a non-standard descriptor is encountered, this function will call the class_specific_cb if it is provided

Parameters
•  cfg_desc - Configuration descriptor
•  class_specific_cb - Class specific descriptor callback. Can be NULL

void usb_print_string_descriptor (const usb_str_desc_t *str_desc)

Print a string descriptor.

This function will only print ASCII characters of the UTF-16 encoded string

Parameters str_desc - String descriptor

static inline int usb_round_up_to_mps (int num_bytes, int mps)

Round up to an integer multiple of endpoint’s MPS.

This is a convenience function to round up a size/length to an endpoint’s MPS (Maximum packet size). This is useful when calculating transfer or buffer lengths of IN endpoints.

•  If MPS <= 0, this function will return 0
•  If num_bytes <= 0, this function will return 0

Parameters
•  num_bytes [in] Number of bytes
•  mps [in] MPS

Returns  int Round up integer multiple of MPS
Chapter 2. API Reference

Type Definitions

typedef void (*print_class_descriptor_cb)(const usb_standard_desc_t*)

Print class specific descriptor callback.

Optional callback to be provided to usb_print_config_descriptor() function. The callback is called when when a non-standard descriptor is encountered. The callback should decode the descriptor as print it.

Header File

• components/usb/include/usb/usb_types_stack.h
• This header file can be included with:
   
```
#include "usb/usb_types_stack.h"
```

• This header file is a part of the API provided by the usb component. To declare that your component depends on usb, add the following to your CMakeLists.txt:

```
REQUIRES usb
```

or

```
PRIV_REQUIRES usb
```

Structures

struct usb_device_info_t

Basic information of an enumerated device.

Public Members

```
usb_speed_t speed
```

Device’s speed

```
uint8_t dev_addr
```

Device’s address

```
uint8_t bMaxPacketSize0
```

The maximum packet size of the device’s default endpoint

```
uint8_t bConfigurationValue
```

Device’s current configuration number

```
const usb_str_desc_t *str_desc_manufacturer
```

Pointer to Manufacturer string descriptor (can be NULL)

```
const usb_str_desc_t *str_desc_product
```

Pointer to Product string descriptor (can be NULL)

```
const usb_str_desc_t *str_desc_serial_num
```

Pointer to Serial Number string descriptor (can be NULL)
struct `usb_isoc_packet_desc_t`

Isochronous packet descriptor.
If the number of bytes in an Isochronous transfer is larger than the MPS of the endpoint, the transfer is split into multiple packets transmitted at the endpoint’s specified interval. An array of Isochronous packet descriptors describes how an Isochronous transfer should be split into multiple packets.

**Public Members**

```c
int num_bytes
   Number of bytes to transmit/receive in the packet. IN packets should be integer multiple of MPS
```

```c
int actual_num_bytes
   Actual number of bytes transmitted/received in the packet
```

```c
usb_transfer_status_t status
   Status of the packet
```

struct `usb_transfer_s`

USB transfer structure.

**Public Members**

```c
uint8_t *const data_buffer
   Pointer to data buffer
```

```c
const size_t data_buffer_size
   Size of the data buffer in bytes
```

```c
int num_bytes
   Number of bytes to transfer. Control transfers should include the size of the setup packet. Isochronous transfer should be the total transfer size of all packets. For non-control IN transfers, num_bytes should be an integer multiple of MPS.
```

```c
int actual_num_bytes
   Actual number of bytes transferred
```

```c
uint32_t flags
   Transfer flags
```

```c
usb_device_handle_t device_handle
   Device handle
```

```c
uint8_t bEndpointAddress
   Endpoint Address
```

```c
usb_transfer_status_t status
   Status of the transfer
```
Chapter 2. API Reference

```c
uint32_t timeout_ms
    Timeout (in milliseconds) of the packet (currently not supported yet)

usb_transfer_cb_t callback
    Transfer callback

void *context
    Context variable for transfer to associate transfer with something

const int num_isoc_packets
    Only relevant to Isochronous. Number of service periods (i.e., intervals) to transfer data buffer over.

usb_isoc_packet_desc_t isoc_packet_desc[]
    Descriptors for each Isochronous packet
```

### Macros

**USB_TRANSFER_FLAG_ZERO_PACK**

Terminates a Bulk/Interrupt OUT transfer with a zero length packet.

OUT transfers normally terminate when the Host has transferred the exact amount of data it needs to the device. However, for bulk and interrupt OUT transfers, if the transfer size just happened to be a multiple of MPS, it will be impossible to know the boundary between two consecutive transfers to the same endpoint.

Therefore, this flag will cause the transfer to automatically add a zero length packet (ZLP) at the end of the transfer if the following conditions are met:

- The target endpoint is a Bulk/Interrupt OUT endpoint (Host to device)
- The transfer’s length (i.e., transfer.num_bytes) is a multiple of the endpoint’s MPS

Otherwise, this flag has no effect.

Users should check whether their target device’s class requires a ZLP, as not all Bulk/Interrupt OUT endpoints require them. For example:

- For MSC Bulk Only Transport class, the Host MUST NEVER send a ZLP. Bulk transfer boundaries are determined by the CBW and CSW instead
- For CDC Ethernet, the Host MUST ALWAYS send a ZLP if a segment (i.e., a transfer) is a multiple of MPS (See 3.3.1 Segment Delineation)

---

**Note:** See USB2.0 specification 5.7.3 and 5.8.3 for more details

---

**Note:** IN transfers normally terminate when the Host          as receive the exact amount of data it needs (must be multiple of MPS) or the endpoint sends a short packet to the Host (For bulk OUT only). Indicates that a bulk OUT transfers should always terminate with a short packet, even if it means adding an extra zero length packet

### Type Definitions

```c
typedef struct usb_device_handle_s *usb_device_handle_t
    Handle of a USB Device connected to a USB Host.

typedef struct usb_transfer_s usb_transfer_t
```

Espressif Systems 1433 Release v5.3-dev-277-gc8243465e4

Submit Document Feedback
USB transfer structure.

This structure is used to represent a transfer from a software client to an endpoint over the USB bus. Some of the fields are made const on purpose as they are fixed on allocation. Users should call the appropriate USB Host Library function to allocate a USB transfer structure instead of allocating this structure themselves.

The transfer type is inferred from the endpoint this transfer is sent to. Depending on the transfer type, users should note the following:

- **Bulk**: This structure represents a single bulk transfer. If the number of bytes exceeds the endpoint’s MPS, the transfer will be split into multiple MPS sized packets followed by a short packet.
- **Control**: This structure represents a single control transfer. This first 8 bytes of the data_buffer must be filled with the setup packet (see `usb_setup_packet_t`). The num_bytes field should be the total size of the transfer (i.e., size of setup packet + wLength).
- **Interrupt**: Represents an interrupt transfer. If num_bytes exceeds the MPS of the endpoint, the transfer will be split into multiple packets, and each packet is transferred at the endpoint’s specified interval.
- **Isochronous**: Represents a stream of bytes that should be transferred to an endpoint at a fixed rate. The transfer is split into packets according to the each isoc_packet_desc. A packet is transferred at each interval of the endpoint. If an entire ISOC URB was transferred without error (skipped packets do not count as errors), the URB’s overall status and the status of each packet descriptor will be updated, and the actual_num_bytes reflects the total bytes transferred over all packets. If the ISOC URB encounters an error, the entire URB is considered erroneous so only the overall status will be updated.

**Note**: For Bulk/Control/Interrupt IN transfers, the num_bytes must be an integer multiple of the endpoint’s MPS

**Note**: This structure should be allocated via `usb_host_transfer_alloc()`

**Note**: Once the transfer has be submitted, users should not modify the structure until the transfer has completed

typedef void (*usb_transfer_cb_t)(usb_transfer_t *transfer)

USB transfer completion callback.

**Enumerations**

enum **usb_speed_t**

USB Standard Speeds.

*Values:*

- **USB_SPEED_LOW**: USB Low Speed (1.5 Mbit/s)
- **USB_SPEED_FULL**: USB Full Speed (12 Mbit/s)

enum **usb_transfer_type_t**

The type of USB transfer.
Note: The enum values need to match the bmAttributes field of an EP descriptor

Values:

enumerator USB_TRANSFER_TYPE_CTRL

enumerator USB_TRANSFER_TYPE_ISOCHRONOUS

enumerator USB_TRANSFER_TYPE_BULK

enumerator USB_TRANSFER_TYPE_INTR

enum usb_transfer_status_t
The status of a particular transfer.

Values:

enumerator USB_TRANSFER_STATUS_COMPLETED
The transfer was successful (but may be short)

enumerator USB_TRANSFER_STATUS_ERROR
The transfer failed because due to excessive errors (e.g. no response or CRC error)

enumerator USB_TRANSFER_STATUS_TIMED_OUT
The transfer failed due to a time out

enumerator USB_TRANSFER_STATUS_CANCELED
The transfer was canceled

enumerator USB_TRANSFER_STATUSSTALL
The transfer was stalled

enumerator USB_TRANSFER_STATUS_OVERFLOW
The transfer as more data was sent than was requested

enumerator USB_TRANSFER_STATUS_SKIPPED
ISOC packets only. The packet was skipped due to system latency or bus overload

enumerator USB_TRANSFER_STATUS_NO_DEVICE
The transfer failed because the target device is gone

Header File

- components/usb/include/usb/usb_types_ch9.h
- This header file can be included with:

```
#include "usb/usb_types_ch9.h"
```

- This header file is a part of the API provided by the usb component. To declare that your component depends on usb, add the following to your CMakeLists.txt:
Unions

union **usb_setup_packet_t**

#include <usb_types_ch9.h> Structure representing a USB control transfer setup packet.

See Table 9-2 of USB2.0 specification for more details

**Public Members**

- **uint8_t bmRequestType**
  Characteristics of request

- **uint8_t bRequest**
  Specific request

- **uint16_t wValue**
  Word-sized field that varies according to request

- **uint16_t wIndex**
  Word-sized field that varies according to request; typically used to pass an index or offset

- **uint16_t wLength**
  Number of bytes to transfer if there is a data stage

union **usb_standard_desc_t**

#include <usb_types_ch9.h> USB standard descriptor.

All USB standard descriptors start with these two bytes. Use this type when traversing over configuration descriptors

**Public Members**

- **uint8_t bLength**
  Size of the descriptor in bytes

- **uint8_t bDescriptorType**
  Descriptor Type
Chapter 2. API Reference

struct usb_standard_desc_t::[anonymous] USB_DESC_ATTR
    USB descriptor attributes

  uint8_t val[USB_STANDARD_DESC_SIZE]
    Descriptor value

union usb_device_desc_t
  #include <usb_types_ch9.h> Structure representing a USB device descriptor.
  See Table 9-8 of USB2.0 specification for more details

Public Members

  uint8_t bLength
    Size of the descriptor in bytes

  uint8_t bDescriptorType
    DEVICE Descriptor Type

  uint16_t bcdUSB
    USB Specification Release Number in Binary-Coded Decimal (i.e., 2.10 is 210H)

  uint8_t bDeviceClass
    Class code (assigned by the USB-IF)

  uint8_t bDeviceSubClass
    Subclass code (assigned by the USB-IF)

  uint8_t bDeviceProtocol
    Protocol code (assigned by the USB-IF)

  uint8_t bMaxPacketSize0
    Maximum packet size for endpoint zero (only 8, 16, 32, or 64 are valid)

  uint16_t idVendor
    Vendor ID (assigned by the USB-IF)

  uint16_t idProduct
    Product ID (assigned by the manufacturer)

  uint16_t bcdDevice
    Device release number in binary-coded decimal

  uint8_t iManufacturer
    Index of string descriptor describing manufacturer

  uint8_t iProduct
    Index of string descriptor describing product
uint8_t iSerialNumber
    Index of string descriptor describing the device’s serial number

uint8_t bNumConfigurations
    Number of possible configurations

struct usb_device_desc_t::[anonymous] USB_DESC_ATTR
    USB descriptor attributes

uint8_t val[USB_DEVICE_DESC_SIZE]
    Descriptor value

union usb_config_desc_t
#include <usb_types_ch9.h>
    Structure representing a short USB configuration descriptor.
    See Table 9-10 of USB2.0 specification for more details

Note: The full USB configuration includes all the interface and endpoint descriptors of that configuration.

Public Members

uint8_t bLength
    Size of the descriptor in bytes

uint8_t bDescriptorType
    CONFIGURATION Descriptor Type

uint16_t wTotalLength
    Total length of data returned for this configuration

uint8_t bNumInterfaces
    Number of interfaces supported by this configuration

uint8_t bConfigurationValue
    Value to use as an argument to the SetConfiguration() request to select this configuration

uint8_t iConfiguration
    Index of string descriptor describing this configuration

uint8_t bmAttributes
    Configuration characteristics

uint8_t bMaxPower
    Maximum power consumption of the USB device from the bus in this specific configuration when the
device is fully operational.

struct usb_config_desc_t::[anonymous] USB_DESC_ATTR
    USB descriptor attributes
Chapter 2. API Reference

```c
uint8_t val[USB_CONFIG_DESC_SIZE]
    Descriptor value

union usb_iad_desc_t
    #include <usb_types_ch9.h> Structure representing a USB interface association descriptor.

Public Members

uint8_t bLength
    Size of the descriptor in bytes

uint8_t bDescriptorType
    INTERFACE ASSOCIATION Descriptor Type

uint8_t bFirstInterface
    Interface number of the first interface that is associated with this function

uint8_t bInterfaceCount
    Number of contiguous interfaces that are associated with this function

uint8_t bFunctionClass
    Class code (assigned by USB-IF)

uint8_t bFunctionSubClass
    Subclass code (assigned by USB-IF)

uint8_t bFunctionProtocol
    Protocol code (assigned by USB-IF)

uint8_t iFunction
    Index of string descriptor describing this function

struct usb_iad_desc_t::[anonymous] USB_DESC_ATTR
    USB descriptor attributes

uint8_t val[USB_IAD_DESC_SIZE]
    Descriptor value

union usb_intf_desc_t
    #include <usb_types_ch9.h> Structure representing a USB interface descriptor.
    See Table 9-12 of USB2.0 specification for more details

Public Members

uint8_t bLength
    Size of the descriptor in bytes
```
**Chapter 2. API Reference**

```c
uint8_t bDescriptorType
    INTERFACE Descriptor Type

uint8_t bInterfaceNumber
    Number of this interface.

uint8_t bAlternateSetting
    Value used to select this alternate setting for the interface identified in the prior field

uint8_t bNumEndpoints
    Number of endpoints used by this interface (excluding endpoint zero).

uint8_t bInterfaceClass
    Class code (assigned by the USB-IF)

uint8_t bInterfaceSubClass
    Subclass code (assigned by the USB-IF)

uint8_t bInterfaceProtocol
    Protocol code (assigned by the USB)

uint8_t iInterface
    Index of string descriptor describing this interface

struct usb_intf_desc_t::[anonymous] USB_DESC_ATTR
    USB descriptor attributes

uint8_t val[USB_INTF_DESC_SIZE]
    Descriptor value
```

**union usb_ep_desc_t**

```
#include <usb_types_ch9.h> Structure representing a USB endpoint descriptor.
```

See Table 9-13 of USB2.0 specification for more details

**Public Members**

```c
uint8_t bLength
    Size of the descriptor in bytes

uint8_t bDescriptorType
    ENDPOINT Descriptor Type

uint8_t bEndpointAddress
    The address of the endpoint on the USB device described by this descriptor

uint8_t bmAttributes
    This field describes the endpoint’s attributes when it is configured using the bConfigurationValue.
```
uint16_t wMaxPacketSize
    Maximum packet size this endpoint is capable of sending or receiving when this configuration is selected.

uint8_t bInterval
    Interval for polling Isochronous and Interrupt endpoints. Expressed in frames or microframes depending on the device operating speed (1 ms for Low-Speed and Full-Speed or 125 us for USB High-Speed and above).

struct usb_ep_desc_t::[anonymous] USB_DESC_ATTR
    USB descriptor attributes

uint8_t val[USB_EP_DESC_SIZE]
    Descriptor value

union usb_str_desc_t
    #include <usb_types_ch9.h> Structure representing a USB string descriptor.

Public Members

uint8_t bLength
    Size of the descriptor in bytes

uint8_t bDescriptorType
    STRING Descriptor Type

uint16_t wData[]
    UTF-16LE encoded

struct usb_str_desc_t::[anonymous] USB_DESC_ATTR
    USB descriptor attributes

uint8_t val[USB_STR_DESC_SIZE]
    Descriptor value

Macros

USB_DESC_ATTR

USB_B_DESCRIPTOR_TYPE_DEVICE
    Descriptor types from USB2.0 specification table 9.5.

USB_B_DESCRIPTOR_TYPE_CONFIGURATION

USB_B_DESCRIPTOR_TYPE_STRING

USB_B_DESCRIPTOR_TYPE_INTERFACE

USB_B_DESCRIPTOR_TYPE_ENDPOINT
USB_B_DESCRIPTOR_TYPE_DEVICE_QUALIFIER

USB_B_DESCRIPTOR_TYPE_OTHER_SPEED_CONFIGURATION

USB_B_DESCRIPTOR_TYPE_INTERFACE_POWER

USB_B_DESCRIPTOR_TYPE_OTG
  Descriptor types from USB 2.0 ECN.

USB_B_DESCRIPTOR_TYPE_DEBUG

USB_B_DESCRIPTOR_TYPE_INTERFACE_ASSOCIATION

USB_B_DESCRIPTOR_TYPE_SECURITY
  Descriptor types from Wireless USB spec.

USB_B_DESCRIPTOR_TYPE_KEY

USB_B_DESCRIPTOR_TYPE_ENCRYPTION_TYPE

USB_B_DESCRIPTOR_TYPE_BOS

USB_B_DESCRIPTOR_TYPE_DEVICE_CAPABILITY

USB_B_DESCRIPTOR_TYPE_WIRELESS_ENDPOINT_COMP

USB_B_DESCRIPTOR_TYPE_WIRE_ADAPTER

USB_B_DESCRIPTOR_TYPE_RPIPE

USB_B_DESCRIPTOR_TYPE_CS_RADIO_CONTROL

USB_B_DESCRIPTOR_TYPE_PIPE_USAGE
  Descriptor types from UAS specification.

USB_SETUP_PACKET_SIZE
  Size of a USB control transfer setup packet in bytes.

USB_BM_REQUEST_TYPE_DIR_OUT
  Bit masks belonging to the bmRequestType field of a setup packet.

USB_BM_REQUEST_TYPE_DIR_IN

USB_BM_REQUEST_TYPE_TYPE_STANDARD

USB_BM_REQUEST_TYPE_TYPE_CLASS
USB_BM_REQUEST_TYPE_TYPE_VENDOR

USB_BM_REQUEST_TYPE_TYPE_RESERVED

USB_BM_REQUEST_TYPE_TYPE_MASK

USB_BM_REQUEST_TYPE_RECIP_DEVICE

USB_BM_REQUEST_TYPE_RECIP_INTERFACE

USB_BM_REQUEST_TYPE_RECIP_ENDPOINT

USB_BM_REQUEST_TYPE_RECIP_OTHER

USB_BM_REQUEST_TYPE_RECIP_MASK

USB_B_REQUEST_GET_STATUS

Bit masks belonging to the bRequest field of a setup packet.

USB_B_REQUEST_CLEAR_FEATURE

USB_B_REQUEST_SET_FEATURE

USB_B_REQUEST_SET_ADDRESS

USB_B_REQUEST_GET_DESCRIPTOR

USB_B_REQUEST_SET_DESCRIPTOR

USB_B_REQUEST_GET_CONFIGURATION

USB_B_REQUEST_SET_CONFIGURATION

USB_B_REQUEST_GET_INTERFACE

USB_B_REQUEST_SET_INTERFACE

USB_B_REQUEST_SYNCH_FRAME

USB_W_VALUE_DT_DEVICE

Bit masks belonging to the wValue field of a setup packet.

USB_W_VALUE_DT_CONFIG

USB_W_VALUE_DT_STRING
USB_W_VALUE_DT_INTERFACE

USB_W_VALUE_DT_ENDPOINT

USB_W_VALUE_DT_DEVICE_QUALIFIER

USB_W_VALUE_DT_OTHER_SPEED_CONFIG

USB_W_VALUE_DT_INTERFACE_POWER

USB_SETUP_PACKET_INIT_SET_ADDR(setup_pkt_ptr, addr)
  Initializes for a SET_ADDRESS request.
  Sets the address of a connected device

USB_SETUP_PACKET_INIT_GET_DEVICE_DESC(setup_pkt_ptr)
  Initializes for a request to get a device’s device descriptor.

USB_SETUP_PACKET_INIT_GET_CONFIG(setup_pkt_ptr)
  Initializes for a request to get a device’s current configuration number.

USB_SETUP_PACKET_INIT_GET_CONFIG_DESC(setup_pkt_ptr, desc_index, desc_len)
  Initializes for a request to get one of the device’s current configuration descriptor.

  * desc_index indicates the configuration’s index number
  * Number of bytes of the configuration descriptor to get

USB_SETUP_PACKET_INIT_SET_CONFIG(setup_pkt_ptr, config_num)
  Initializes for a request to set a device’s current configuration number.

USB_SETUP_PACKET_INIT_SET_INTERFACE(setup_pkt_ptr, intf_num, alt_setting_num)
  Initializes for a request to set an interface’s alternate setting.

USB_SETUP_PACKET_INIT_GET_STR_DESC(setup_pkt_ptr, string_index, lang_id, desc_len)
  Initializes for a request to get a string descriptor.

USB_STANDARD_DESC_SIZE
  Size of dummy USB standard descriptor.

USB_DEVICE_DESC_SIZE
  Size of a USB device descriptor in bytes.

USB_CLASS_PER_INTERFACE
  Possible base class values of the bDeviceClass field of a USB device descriptor.

USB_CLASS_AUDIO

USB_CLASS_COMM

USB_CLASS_HID

USB_CLASS_PHYSICAL
USB_CLASS_STILL_IMAGE
USB_CLASS_PRINTER
USB_CLASS_MASS_STORAGE
USB_CLASS_HUB
USB_CLASS_CDC_DATA
USB_CLASS_CSCID
USB_CLASS_CONTENT_SEC
USB_CLASS_VIDEO
USB_CLASS_WIRELESS_CONTROLLER
USB_CLASS_PERSONAL_HEALTHCARE
USB_CLASS_AUDIO_VIDEO
USB_CLASS_BILLBOARD
USB_CLASS_USB_TYPE_C_BRIDGE
USB_CLASS_MISC
USB_CLASS_APP_SPEC
USB_CLASS_VENDOR_SPEC
USB_SUBCLASS_VENDOR_SPEC
Vendor specific subclass code.

USB_CONFIG_DESC_SIZE
Size of a short USB configuration descriptor in bytes.

**Note:** The size of a full USB configuration includes all the interface and endpoint descriptors of that configuration.

USB_BM_ATTRIBUTES_ONE
Bit masks belonging to the bmAttributes field of a configuration descriptor.
Must be set
USB_BM_ATTRIBUTES_SELFPOWER
    Self powered

USB_BM_ATTRIBUTES_WAKEUP
    Can wake-up

USB_BM_ATTRIBUTES_BATTERY
    Battery powered

USB_IAD_DESC_SIZE
    Size of a USB interface association descriptor in bytes.

USB_INTF_DESC_SIZE
    Size of a USB interface descriptor in bytes.

USB_EP_DESC_SIZE
    Size of a USB endpoint descriptor in bytes.

USB_B_ENDPOINT_ADDRESS_EP_NUM_MASK
    Bit masks belonging to the bEndpointAddress field of an endpoint descriptor.

USB_B_ENDPOINT_ADDRESS_EP_DIR_MASK

USB_BM_ATTRIBUTES_XFERTYPE_MASK
    Bit masks belonging to the bmAttributes field of an endpoint descriptor.

USB_BM_ATTRIBUTES_XFER_CONTROL

USB_BM_ATTRIBUTES_XFER_ISOC

USB_BM_ATTRIBUTES_XFER_BULK

USB_BM_ATTRIBUTES_XFER_INT

USB_BM_ATTRIBUTES_SYNCTYPE_MASK

USB_BM_ATTRIBUTES_SYNC_NONE

USB_BM_ATTRIBUTES_SYNC_ASYNC

USB_BM_ATTRIBUTES_SYNC_ADAPTIVE

USB_BM_ATTRIBUTES_SYNC_SYNC

USB_BM_ATTRIBUTES_USAGETYPE_MASK

USB_BM_ATTRIBUTES_USAGE_DATA
USB_BM_ATTRIBUTES_USAGE_FEEDBACK

USB_BM_ATTRIBUTES_USAGE_IMPLICIT_FB

USB_EP_DESC_GET_XFERTYPE(desc_ptr)

Macro helpers to get information about an endpoint from its descriptor.

USB_EP_DESC_GET_EP_NUM(desc_ptr)

USB_EP_DESC_GET_EP_DIR(desc_ptr)

USB_EP_DESC_GET_MPS(desc_ptr)

USB_STR_DESC_SIZE

Size of a short USB string descriptor in bytes.

Enumerations

e num usb_device_state_t

USB2.0 device states.

See Table 9-1 of USB2.0 specification for more details

---

**Note:** The USB_DEVICE_STATE_NOT_ATTACHED is not part of the USB2.0 specification, but is a catch all state for devices that need to be cleaned up after a sudden disconnection or port error.

---

**Values:**

enumerator USB_DEVICE_STATE_NOT_ATTACHED

The device was previously configured or suspended, but is no longer attached (either suddenly disconnected or a port error)

enumerator USB_DEVICE_STATE_ATTACHED

Device is attached to the USB, but is not powered.

enumerator USB_DEVICE_STATE_POWERED

Device is attached to the USB and powered, but has not been reset.

enumerator USB_DEVICE_STATE_DEFAULT

Device is attached to the USB and powered and has been reset, but has not been assigned a unique address. Device responds at the default address.

enumerator USB_DEVICE_STATE_ADDRESS

Device is attached to the USB, powered, has been reset, and a unique device address has been assigned. Device is not configured.

enumerator USB_DEVICE_STATE_CONFIGURED

Device is attached to the USB, powered, has been reset, has a unique address, is configured, and is not suspended. The host may now use the function provided by the device.
enumerator **USB_DEVICE_STATE_SUSPENDED**

Device is, at minimum, attached to the USB and is powered and has not seen bus activity for 3 ms. It may also have a unique address and be configured for use. However, because the device is suspended, the host may not use the device’s function.

**Maintainers Notes**

**Note:** For more details regarding the internal implementation details of the USB Host stack, please refer to **USB Host Maintainers Notes (Introduction)**.

**USB Host Maintainers Notes (Introduction)** This document contains information regarding the implementation details of the USB Host stack. This document is intended for the maintainers and third-party contributors of the USB Host stack. Users of the USB Host stack should refer to **USB Host** instead.

**Warning:** The implementations details of the USB Host stack is categorized as private API. Thus, all layers (other than the USB Host Library) do not adhere to **ESP-IDF**’s versioning scheme (i.e., breaking changes are permitted).

This document is split into the following sections:

**USB Host Maintainers Notes (Design Guidelines)**
Chapter 2. API Reference

Design Considerations  The design of the Host Stack takes into account the following design considerations:

Limited Hardware Resources:
The embedded nature of Host Stack means limited hardware resources (such as memory and processing power) when compared to larger host systems.

USB2.0 Chapter 10:
Chapter 10 of the USB 2.0 specification specifies certain requirements of USB Host systems, in particular the required layers of the USB Host’s system software.

Diverse Use Case Complexities:
The embedded nature of the Host Stack also means a wide range of use cases with differing complexities. Some USB Host applications aim to only support a single vendor specific device, whereas other applications require support for a wide range of devices of different classes.

Requirements  Given the design considerations above, the Host Stack was designed with the following set of requirements:

DMA Support  Requirement: The Host Stack must support DMA.
The Host Stack must support DMA in order to reduce CPU’s workload. DMA support allows the automatic copying of USB transfer data to/from the Host Controller without CPU intervention. This is especially critical given the embedded nature of the CPU (i.e., lower CPU frequencies) and large maximum data payloads of USB transfers (e.g., 1023 bytes for isochronous transfers).

Minimize Memory Copies  Requirement: The Host Stack should minimize the amount of memory copies when passing data between layers.
Various data and objects (e.g., USB transfers) need to be passed between multiple layers of the Host Stack. The Host Stack should minimize the amount of memory copies that occur between layers by allocating the data’s/object’s memory once, and simply passing a pointer to that data/object between the layers. Therefore, the Host Stack requires some standardized data types shared across multiple layers (see USB2.0 Section 10.3.4).

Event Driven  Requirement: The Host Stack must allow for event driven operation (i.e., the Host Stack’s API must not be polling).
The Host Stack needs to support some CPU intensive use application scenarios such as video streaming (i.e., UVC class). Therefore, the Host Stack should minimize CPU usage by allowing for completely event driven operation, thus-reserving the majority of CPU time for the application itself (i.e., video encoding/decoding in this case).
The Host Stack needs to communicate events across the layers using interrupts, callbacks, and FreeRTOS synchronization primitives (e.g., queues and semaphores).

No Task Creation  Requirement: All layers of the Host Stack below (and including) the Host Library layer must not create any tasks.
Task stacks are generally one of the most memory intensive parts of an ESP-IDF applications. Given the wide range of applications scenarios, the number of tasks created (and their stack sizes) can vary greatly. For example:

• applications that require low latency or high throughput (such as isochronous transfers) may choose to create a dedicated task to handle those transfers in order to minimize latency;
• applications that do not have strict latency requirements (such as bulk transfers) may choose to handle those transfers from a shared task in order to save some memory.

Therefore, all layers of the Host Stack below (and including) the Host Library layer must not create any tasks. Instead, these layers should expose handlers functions to be called from tasks created by the upper layers. Task creation will be delegated to the class driver or application layer.
Operable at Different Layers  Given the wide range of use case complexities, the Host Stack must be operable at different layers, allowing users to use the Host Stack at a lower layer (e.g., the HCD or HAL) or at a higher layer (e.g., a class driver).

Being operable at different layers allows the users to decide on the appropriate trade-off between convenience, control, and optimization for their application when using the Host Stack. For example…

- Host Stack applications that support a dedicated custom device may want to use a lower level of abstraction for better optimization, control, and simpler API.
- Host Stack applications that need to support a wide range of device classes requires the full Host Stack so that device enumeration is automatically handled.

Coding Conventions  The Host Stack follows the following set of coding rules/guidelines for better code readability and maintainability:

Symbols Use Layer Name As Prefix  For each layer of the Host Stack, the symbols exposed by that layer (i.e., functions, types, macros) must be prefixed with that layer’s name. For example, the symbols exposed by the HCD layer will be prefixed `hcd_...`/`HCD_...`.

However, internal symbols (e.g., static functions) should not be prefixed with their layer’s name. This makes it easier to differentiate between internal and external symbols when modifying that layer’s source code.

Critical Section Functions Prefixed With _  In each layer of the Host Stack, there are various static functions that must be called inside a critical section. The names of these functions are prefixed with `_` (e.g., `_func_called_from_crit()`) to make it easier for maintainers to differentiate which functions should be called from critical sections. For example…

```c
some_func(); // Called outside critical section
taskENTER_CRITICAL(&some_lock);
_some_func_crit(); // Called inside critical section. _ prefix makes it easier to
differentiate
taskEXIT_CRITICAL(&some_lock);
```

Grouping Structure Members by Locking Mechanism  Some layers of the Host Stack utilize multiple locking schemes (e.g., critical sections and task mutexes) to ensure thread safety, where each locking scheme offers a different level of protection. However, member variables of the same object can be protected by different locking scheme. Therefore, to clearly demarcate the different locking schemes and their associated variables, structure members are grouped by locking scheme as nested structures.

<table>
<thead>
<tr>
<th>Locking Scheme</th>
<th>Nested Structure</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Critical Sections</td>
<td>dynamic</td>
<td>Shared data accessed from both a task context and ISR context are protected by a critical section.</td>
</tr>
<tr>
<td>Task Mutexes</td>
<td>mux_prot</td>
<td>Shared data accessed from only a task context are protected by a FreeRTOS Mutex</td>
</tr>
<tr>
<td>Single Thread</td>
<td>single_thread</td>
<td>Data that is only ever accessed by the same task do not require the use of any locks.</td>
</tr>
<tr>
<td>Constant</td>
<td>constant</td>
<td>Constant data is set once during the object’s instantiation and never changed again. Thus, any task or ISR can freely the constant data without the use of locks, so long as the variable is never written to.</td>
</tr>
</tbody>
</table>

Grouping structure members by locking scheme makes the code more maintainable as it makes clear which locking scheme is required when accessing a particular member variable, as demonstrated in the code snippet below:
typedef struct some_obj some_obj_t;

some_obj_t obj;

// Accessing dynamic members requires critical section
taskENTER_CRITICAL(&some_lock);
obj.dynamic.varA = 1;
taskEXIT_CRITICAL(&some_lock);

// Accessing mutex protected members requires taking the mutex
xSemaphoreTake(&some_mux, portMAX_DELAY);
obj.mux_protected.varB = 1;
xSemaphoreGive(&some_mux);

// Accessing single thread members does not require locking so long as this is the
// only task to access it
obj.single_thread.varC = 1;

// Accessing constant members requires no locking. But only read access is allowed
int local_var = obj.constant.varD;

**USB Host Maintainers Notes (Architecture)**  The Host Stack is roughly split into multiple layers of abstraction, with each layer representing different USB concepts and a different level of USB Host operation. For example, a higher layer may present an abstraction of devices and application data transfers, whereas a lower layer may present an abstraction of endpoints and USB transfers.

**Layer Descriptions**  The layers of the Host Stack are described in the following table. The layers are ordered from lowest layer (i.e., furthest away from the user) to highest layer (i.e., closest to the user).
## Table 7: Host Stack Layers

<table>
<thead>
<tr>
<th>Layer</th>
<th>Files</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Host Controller (DWC_OTG)</td>
<td>N/A</td>
<td>This layer represents the USB Controller Hardware of the ESP32-S3. The API presented by this layer is the register interface of the controller.</td>
</tr>
<tr>
<td>LL</td>
<td>usbh_ll.h</td>
<td>The LL (Low Level) layer abstracts the basic register access of the USB controller according to ESP-IDF’s Hardware Abstraction API Guidelines. In other words, this layer provides APIs to access the controller’s registers and format/parses the controller’s DMA descriptors.</td>
</tr>
<tr>
<td>HAL</td>
<td>usbh_hal.h,</td>
<td>The HAL (Hardware Abstraction Layer) abstracts the operating steps of the USB controller into functions according to ESP-IDF’s Hardware Abstraction API Guidelines. This layer also abstracts the controller’s host port and host channels, and provides APIs to operate them.</td>
</tr>
<tr>
<td></td>
<td>usbh_hal.c</td>
<td></td>
</tr>
<tr>
<td>HCD</td>
<td>hcd.h, hcd.c</td>
<td>The HCD (Host Controller Driver) acts as hardware agnostic API for all USB controllers (i.e., an API that can theoretically be used with any USB controller implementation). This layer also abstracts the root port (i.e., root hub) and USB pipes.</td>
</tr>
<tr>
<td>USBH and Hub Driver</td>
<td>usbh.h, usbh.c</td>
<td>The USBH (USB Host Driver) layer is equivalent to the USBD layer described in chapter 10 of the USB2.0 specification. The USBH presents an abstraction of USB devices, internally manages a list of connected devices (i.e., device pool), and also arbitrates device sharing between clients (i.e., tracks which endpoints are in use and also presents a shared endpoint 0).</td>
</tr>
<tr>
<td>Hub Driver</td>
<td>hub.h, hub.c</td>
<td>The Hub Driver layer acts as a special client of the USBH that is responsible for handling device attachment/detachment, and notifying the USBH of such events. For device attachment, the Hub Driver also handles the enumeration process as well.</td>
</tr>
<tr>
<td>USB Host Library</td>
<td>ush_host.h,</td>
<td>The USB Host Library layer is the lowest public API layer of the Host Stack and presents the concept of USB Host Clients. The abstraction of clients allows for multiple class drivers to coexist simultaneously (where each class roughly maps to a single client) and also acts as a mechanism for division of labor (where each client is responsible for its own processing and event handling).</td>
</tr>
<tr>
<td></td>
<td>ush_host.c</td>
<td></td>
</tr>
<tr>
<td>Host Class Drivers</td>
<td>See the ESP-IDF Extra Components repository or the USB Host examples in ESP-IDF (via peripherals/usb/host).</td>
<td>The Host Class Drivers implement the host side of a particular device class (e.g., CDC, MSC, HID). The exposed API is specific to each class driver.</td>
</tr>
</tbody>
</table>

### Layer Dependencies

The Host Stack roughly follows a top to bottom hierarchy with inter-layer dependencies. Given layers A (highest), B, and C (lowest), the Host Stack has the following inter-layer dependency rules:

- a particular layer can use the API of any layer directly below (Layer A using layer B is allowed)
- a particular layer can use the API of any layer indirectly below (Layer A using layer C is allowed) i.e., skipping layers.
- a particular layer must not use the API of any layer above (Layer C using layer A/B is forbidden)
**Note:** Layer skipping is permitted in order to circumvent the need to repeat the same abstraction across multiple layers. For example, the abstraction of pipes are presented at the HCD layer but are used by multiple layers above.

**USB Host Maintainers Notes (DWC_OTG Controller)** The ESP32-S3 uses a DesignWare USB 2.0 On-the-Go Controller (henceforth referred to as DWC_OTG in this document) as its underlying hardware controller, where the DWC_OTG operates in Host Mode with Scatter/Gather DMA enabled.

**Note:** This section only summarizes the operation of the DWC_OTG operation in Host Mode at a high level. For full details of the DWC_OTG, refer to the DWC_OTG Databook and Programming Guide.

**Host Mode Operating Model** A simplified version of the operating model of the DWC_OTG in Host Mode is illustrated in the diagram below. The diagram contains some of the key concepts and terms regarding DWC_OTG Host Mode.

**Host Port** The Host Port represents the single USB port provided by the DWC_OTG (in USB terms, this can be thought a single USB port of the root hub of the bus). The Host Port can only connect to a single device, though more devices can be connected via hub devices.

The Host Port is responsible for:

- detecting direct device connections/disconnections
- detecting the speed of the directly connected device
- issuing various bus signals (such as suspend, resume, reset)

**Host Channels** In Host Mode, the DWC_OTG uses channels to communicate with device endpoints, where one channel maps to a particular endpoint (in USB terms, channels are the hardware representation of pipes). For example, a channel will map to EP 1 OUT. Each channel has its own set of CSRs (Control and Status Registers) so that they can independently configured and controlled independently. A channel’s CSRs are used to:

- specify the details of the channel’s target endpoint (e.g., device address, EP number, transfer type, direction)
- start a transfer on the channel (e.g., by setting up DMA descriptors)

When using Scatter/Gather DMA, transfers on Host Channels are completely event driven. Users simply fill out the appropriate DMA descriptors, fill in the channel’s CSRs, then enable the channel. The channel will then generate an interrupt when the transfer completes.
**Data FIFOs**  In Host Mode, the DWC_OTG uses multiple FIFOs as a staging area for the data payloads of USB transfers. When using DMA, the DMA engine will copy data between the TX/RX FIFOs and ESP32-S3’s internal memory:

- For an OUT transfer, the transfer’s data payload is copied from main memory to one of the TX FIFOs by DMA. The MAC Layer will then transmit that data payload in accordance to USB packet formatting.
- For an IN transfer, the MAC Layer will parse the received USB packet and store the received data payload in the RX FIFO. The data is then copied to main memory by DMA.

The destination FIFO depends on the direction and transfer type of the channel:

- All IN channel data goes to the RX FIFO
- All non-periodic (i.e., Control and Bulk) OUT channel data goes to the Non-periodic TX (NPTX) FIFO
- All periodic (i.e., Interrupt and Isochronous) OUT channel data goes to the Periodic TX (PTX) FIFO

**Note:** The separation of non-periodic and periodic OUT channels to the NPTX and PTX FIFOs is due to the periodic nature of Interrupt and Isochronous endpoints (specified by the `bInterval` value of the endpoint). The DWC_OTG automatically schedules these periodic transfers, thus a separate PTX FIFO allows these periodic transfers to be staged separately.

**DMA Engine**  The DMA engine is responsible for copying data between the FIFOs and main memory. In Host Mode Scatter/Gather DMA, a particular channel can carry out multiple transfers automatically without software intervention. The following diagram illustrates the DWC_OTG Host Mode Scatter/Gather DMA Memory Structures.

- Each USB transfer is described by a Queue Transfer Descriptor (QTD). Each QTD consists of:
  - A 32-bit Buffer Status Quadlet specifying details of the transfer, and also reports the status of the transfer on completion. The Buffer Status Quadlet has bits to specify whether the QTD should generate an interrupt and/or halt the channel on completion.
  - A 32-bit pointer to the data buffer containing the data payload for OUT transfers, or an empty buffer used to store the data payload for IN transfers.
- The data payload of each QTD can be larger than the MPS (Maximum Packet Size) of its target endpoint. The DWC_OTG hardware automatically handles splitting of the transfer into multiple transactions.
- Multiple QTDs can be placed into a single QTD List. A channel will then execute each QTD in the list automatically, and optionally loop back around if configured to do so.
- Before a channel starts data transfer, it is configured with a QTD list (and QTD list length). Once the channel is enabled, USB transfers are executed automatically by the hardware.
- A channel can generate interrupts (configurable) on completion of a particular QTD, or an entire QTD list.
**Chapter 2. API Reference**

**Note:** Refer to Programming Guide section 6.2.1 (Descriptor Memory Structures) for more details

**Hardware Configuration** The DWC_OTG IP is configurable. The notable Host related configurations of the ESP32-S3’s DWC_OTG are listed below:

<table>
<thead>
<tr>
<th>Description</th>
<th>Configuration</th>
</tr>
</thead>
<tbody>
<tr>
<td>Host and Device Mode support with OTG</td>
<td>OTG_MODE = 0</td>
</tr>
<tr>
<td>Full Speed (FS) and Low Speed (LS) support</td>
<td>OTG_FSPHY_INTERFACE = 1, OTG_HSPHY_INTERFACE = 0</td>
</tr>
<tr>
<td>Internal DMA controller with Scatter/Gather DMA</td>
<td>OTG_ARCHITECTURE = 2, OTG_EN_DESC_DMA = 1</td>
</tr>
<tr>
<td>FS Hubs are supported but HS Hub are not (i.e., split transfers not supported)</td>
<td>OTG_SINGLE_POINT = 0</td>
</tr>
<tr>
<td>8 Host Mode channels</td>
<td>OTG_NUM_HOST_CHAN = 8, OTG_EN_PERIO_HOST = 1</td>
</tr>
<tr>
<td>Dynamically sized Data FIFO of 1024 bytes (256 lines)</td>
<td>OTG_DFIFO_DYNAMIC = 1, OTG_DFIFO_DEPTH = 256</td>
</tr>
</tbody>
</table>

**Scatter/Gather DMA Transfer** The basic operating procedure for Host channels transfers consists of the following steps:

1. Prepare data buffers, QTDs, and QTD list. In particular, which QTDs should halt the channel (and generate an interrupt) on completion.
2. Set channel/endpoint characteristics via CSRs (such as EP address, transfer type, EP MPS etc).
3. Set channel’s QTD list related CSRs (such as QTD list pointer and QTD list length) and channel interrupt CSRs
4. Enable the channel. Transfers are now handled automatically by hardware using DMA.
5. The Channel generates an interrupt on a channel event (e.g., QTD completion or channel error).
6. Parse the channel interrupt to determine what event occurred.
7. Parse the QTDs to determine the result of each individual transfer.

However, there are some minor differences in channel operation and QTD list usage depending on the transfer type.

**Bulk** Bulk transfers are a simplest. Each QTD represents a bulk transfer of a particular direction, where the DWC_OTG automatically splits a particular QTD into multiple MPS sized transactions. Thus it is possible to fill a QTD list with multiple bulk transfers, and have the entire list executed automatically (i.e., only interrupt on completion of the last QTD).

**Control** Control transfers are more complicated as they are bi-directional (i.e., each control transfer stage can have a different direction). Thus, a separate QTD is required for each stage, and each QTD must halt the channel on completion. Halting the channel after each QTD allows changing the channel’s direction to be changed by reconfiguring the channel’s CSRs. Thus a typical control transfer consists of 3 QTDs (one for each stage).

**Interrupt** In accordance with the USB2.0 specification, interrupt transfers executes transactions at the endpoints specified service period (i.e., bInterval). A particular interrupt endpoint may not execute more than one interrupt transaction within a service period. The service period is specified in number of microframes/frames, thus a particular interrupt endpoint will generally execute one transaction every Nth microframe/frame until the transfer is complete. For interrupt channels, the service period of a particular channel (i.e., bInterval) is specified via the Host Frame List (see section 6.5 of programming guide for more details).
Note: HS USB allows an interrupt endpoint to have 3 interrupt transactions in a single microframe. See USB2.0 specification section 5.7.3 (Interrupt Transfer Packet Size Constraints) for more details.

Thus, interrupt transfers in Host Mode Scatter/Gather DMA have the following peculiarities:

- If a QTD payload is larger than the endpoint’s MPS, the channel will automatically split the transfer into multiple MPS sized transactions (similar to bulk transfers). However, each transaction is executed at endpoint’s specified service period (i.e., one transaction per bInterval) until the transfer completes.
- For Interrupt IN transfers, if a short packet is received (i.e., transaction’s data payload is < MPS), this indicates that the endpoint has no more data to send. In this case:
  - the channel generates an extra channel interrupt even if the transfer’s QTD did not set the IOC (interrupt on complete) bit.
  - however, the channel is not halted even if this extra channel interrupt is generated.
  - software must then use this extra interrupt to manually halt the interrupt channel (thus canceling any remaining QTDs in the QTD list).

Note: Due to the interrupt transfer peculiarities, it may be easier for software allocate a QTD for each transaction instead of an entire transfer.

Isochronous In accordance with the USB2.0 specification, isochronous transfers executes transactions at the endpoints specified service period (i.e., bInterval) in order to achieve a constant rate of data transfer. A particular isochronous endpoint may not execute more than one isochronous transaction within a service period. The service period is specified in number of microframes/frames, thus a particular isochronous endpoint will generally execute one transaction every Nth microframe/frame until the transfer is complete. For isochronous channels, the service period of a particular channel (i.e., bInterval) is specified via the Host Frame List (see section 6.5 of programming guide for more details).

However, unlike interrupt transactions, isochronous transactions are not retried on failure (or NAK), due to the need to maintain the constant data rate.

Note: HS USB allows an isochronous endpoint to have 3 interrupt transactions in a single microframe. See USB2.0 specification section 5.6.3 (Isochronous Transfer Packet Size Constraints) for more details.

Thus, isochronous transfers in Host Mode Scatter/Gather DMA have the following peculiarities:

- A QTD must be allocated for each microframe/frame. However, non-service service period QTDs should be left blank (i.e., only ever Nth QTD should be filled if the channel’s service period is every Nth microframe/frame).
- Each filled QTD must represent a single transaction instead of a transfer.
- Because isochronous transactions are not retried on failure, the status each completed QTD must be checked.

Supplemental Notes Some of the DWC_OTG’s behaviors are not mentioned in the Databook or Programming Guide. This section describes some of those behaviors that are relevant to the Host stack’s implementation.

Port Errors Do Not Trigger a Channel Interrupt If a port error occurs (such as a sudden disconnection or port over-current) while there are one or more active channels—

- The active channels remains active (i.e., HCCHAR.ChEna remains set) and no channel interrupts are generated.
- Channels could in theory be disabled by setting HCCHAR.ChDis, but this does not work for Isochronous channels as the channel disabled interrupt is never generated.

Therefore, on port errors, a controller soft reset should be used to ensure all channels are disabled.
Port Reset Interrupts

- When the DWC_OTG issues a reset signal on its port, and during the reset signal the device disconnects, the disconnection interrupt (i.e., HPRT.PrtConnDet) is not generated until the reset is deasserted.
- When resetting an already enabled port (i.e., HPRT.PrtEna) such as a second reset during enumeration or a run-time reset, a Port Enable/Disable Change interrupt (i.e., HPRT.PrtEnChng) is generated both on the assertion and deassertion of the reset signal.

Introduction  The ESP-IDF USB Host Stack allows the ESP32-S3 to operate as a USB Host. Operating as a USB Host allows the ESP32-S3 to communicate with a wide range of USB devices. However, most USB Host Stack implementations do not run on embedded hardware (i.e., runs on PCs and smartphones), thus have comparatively more resources (i.e., memory and CPU speed).

The implementation of the ESP-IDF USB Host Stack (henceforth referred to as the Host Stack) takes into account the embedded nature of the ESP32-S3 which is reflected in various aspects of the Host Stack’s design.

Features & Limitations  The Host Stack currently supports the following notable features:

- Support FS (Full Speed) and LS (Low Speed) devices
- Support all transfer types (Control, Bulk, Isochronous, and Interrupt)
- Automatically enumerates connected devices
- Allows multiple class drivers (i.e., Clients of the USB Host Library) to run simultaneously and share the same device (i.e., composite devices).

The Host Stack currently has the following notable limitations:

- No HS (High Speed) support
- No Hub support (currently only supports a single device)

Code examples for this API section are provided in the peripherals directory of ESP-IDF examples.

2.7 Project Configuration

2.7.1 Introduction

The esp-idf-kconfig package that ESP-IDF uses is based on kconfiglib, which is a Python extension to the Kconfig system. Kconfig provides a compile-time project configuration mechanism and offers configuration options of several types (e.g., integers, strings, and booleans). Kconfig files specify dependencies between options, default values of options, the way options are grouped together, etc.

For the full list of available features, please see Kconfig and kconfiglib extensions.

2.7.2 Project Configuration Menu

Application developers can open a terminal-based project configuration menu with the idf.py menuconfig build target.
After being updated, this configuration is saved in the `sdkconfig` file under the project root directory. Based on `sdkconfig`, application build targets will generate the `sdkconfig.h` file under the build directory, and will make the `sdkconfig` options available to the project build system and source files.

### 2.7.3 Using `sdkconfig.defaults`

In some cases, for example, when the `sdkconfig` file is under revision control, it may be inconvenient for the build system to change the `sdkconfig` file. The build system offers a solution to prevent it from happening, which is to create the `sdkconfig.defaults` file. This file is never touched by the build system, and can be created manually or automatically. It contains all the options which matter to the given application and are different from the default ones. The format is the same as that of the `sdkconfig` file. `sdkconfig.defaults` can be created manually when one remembers all the changed configuration, or it can be generated automatically by running the `idf.py save-defconfig` command.

Once `sdkconfig.defaults` is created, `sdkconfig` can be deleted or added to the ignore list of the revision control system (e.g., the `.gitignore` file for `git`). Project build targets will automatically create the `sdkconfig` file, populate it with the settings from the `sdkconfig.defaults` file, and configure the rest of the settings to their default values. Note that during the build process, settings from `sdkconfig.defaults` will not override those already in `sdkconfig`. For more information, see *Custom Sdkconfig Defaults*.

### 2.7.4 Kconfig Format Rules

Format rules for Kconfig files are as follows:

- Option names in any menus should have consistent prefixes. The prefix currently should have at least 3 characters.
- The unit of indentation should be 4 spaces. All sub-items belonging to a parent item are indented by one level deeper. For example, `menu` is indented by 0 spaces, `config menu` by 4 spaces, `help in config` by 8 spaces, and the text under `help` by 12 spaces.
- No trailing spaces are allowed at the end of the lines.
- The maximum length of options is 40 characters.
- The maximum length of lines is 120 characters.

**Note:** The `help` section of each config in the menu is treated as reStructuredText to generate the reference documentation for each option.

### Format Checker

`kconfcheck` tool in `esp-idf-kconfig` package is provided for checking Kconfig files against the above format rules. The checker checks all Kconfig and Kconfig.projbuild files given as arguments, and generates a new file with suffix `.new` with some suggestions about how to fix issues (if there are any). Please note that the checker cannot correct all format issues and the responsibility of the developer is to final check and make corrections in order to pass the tests. For example, indentations will be corrected if there is not any misleading formatting, but it cannot come up with a common prefix for options inside a menu.

The `esp-idf-kconfig` package is available in ESP-IDF environments, where the checker tool can be invoked by running command `python -m kconfcheck <path_to_kconfig_file>`.

For more information, please refer to `esp-idf-kconfig` package documentation.

### 2.7.5 Backward Compatibility of Kconfig Options

The standard `Kconfig` tools ignore unknown options in `sdkconfig`. So if a developer has custom settings for options which are renamed in newer ESP-IDF releases, then the given setting for the option would be silently ignored. Therefore, several features have been adopted to avoid this:
1. `kconfgen` is used by the tool chain to pre-process `sdkconfig` files before anything else. For example, `menuconfig` would read them, so the settings for old options is kept and not ignored.

2. `kconfgen` recursively finds all `sdkconfig.rename` files in ESP-IDF directory which contain old and new Kconfig option names. Old options are replaced by new ones in the `sdkconfig` file. Renames that should only appear for a single target can be placed in a target-specific rename file `sdkconfig.rename.TARGET`, where TARGET is the target name, e.g., `sdkconfig.rename.esp32s2`.

3. `kconfgen` post-processes `sdkconfig` files and generates all build outputs (`sdkconfig.h`, `sdkconfig.cmake`, and `auto.conf`) by adding a list of compatibility statements, i.e., the values of old options are set for new options after modification. If users still use old options in their code, this will prevent it from breaking.

4. Depreciated options and their replacements are automatically generated by `kconfgen`.

### 2.7.6 Configuration Options Reference

Subsequent sections contain the list of available ESP-IDF options automatically generated from Kconfig files. Note that due to dependencies between options, some options listed here may not be visible by default in `menuconfig`.

By convention, all option names are upper-case letters with underscores. When Kconfig generates `sdkconfig` and `sdkconfig.h` files, option names are prefixed with `CONFIG_`. So if an option `ENABLE_FOO` is defined in a Kconfig file and selected in `menuconfig`, then the `sdkconfig` and `sdkconfig.h` files will have `CONFIG_ENABLE_FOO` defined. In the following sections, option names are also prefixed with `CONFIG_`, same as in the source code.

#### Build type

Contains:

- `CONFIG_APP_BUILD_TYPE`
- `CONFIG_APP_BUILD_TYPEPURE_RAM_APP`
- `CONFIG_APP_REPRODUCIBLE_BUILD`
- `CONFIG_APP_NO_BLOBS`

**CONFIG_APP_BUILD_TYPE**

Application build type

*Found in: Build type*

Select the way the application is built.

By default, the application is built as a binary file in a format compatible with the ESP-IDF bootloader. In addition to this application, 2nd stage bootloader is also built. Application and bootloader binaries can be written into flash and loaded/executed from there.

Another option, useful for only very small and limited applications, is to only link the .elf file of the application, such that it can be loaded directly into RAM over JTAG or UART. Note that since IRAM and DRAM sizes are very limited, it is not possible to build any complex application this way. However for some kinds of testing and debugging, this option may provide faster iterations, since the application does not need to be written into flash.

Note: when `APP_BUILD_TYPE_RAM` is selected and loaded with JTAG, ESP-IDF does not contain all the startup code required to initialize the CPUs and ROM memory (data/bss). Therefore it is necessary to execute a bit of ROM code prior to executing the application. A gdbinit file may look as follows (for ESP32):

```
# Connect to a running instance of OpenOCD target remote :3333 # Reset and halt the target
mon reset halt # Run to a specific point in ROM code, # where most of initialization is
thb *0x40007d54 c # Load the application into RAM load # Run till app_main tb
app_main c
```

Execute this gdbinit file as follows:
xtensa-esp32-elf-gdbbuild/app-name.elf -x gdbinit

Example gdbinit files for other targets can be found in tools/test_apps/system/gdb_loadable_elf/

When loading the BIN with UART, the ROM will jump to ram and run the app after finishing the
ROM startup code, so there’s no additional startup initialization required. You can use the load_ram
in esptool.py to load the generated .bin file into ram and execute.

Example: esptool.py -chip {chip} -p {port} -b {baud} -no-stub load_ram {app.bin}

Recommended sdkconfig.defaults for building loadable ELF files is as follows. CON-
FIG_APP_BUILD_TYPE_RAM is required, other options help reduce application memory footprint.

CONFIG_APP_BUILD_TYPE_RAM=y CONFIG_VFS_SUPPORT_TERMIOS=y CONFIG_NEWLIB_NANO_FORMAT=y CONFIG_ESP_SYSTEM_PANIC_PRINT_HALT=y
CONFIG_ESP_DEBUG_STUBS_ENABLE=CONFIG_ESP_ERR_TO_NAME_LOOKUP=

Available options:

• Default (binary application + 2nd stage bootloader) (CON-
FIG_APP_BUILD_TYPE_APP_2NDBOOT)
• Build app runs entirely in RAM (EXPERIMENTAL) (CON-
FIG_APP_BUILD_TYPE_RAM)

CONFIG_APP_BUILD_TYPEPURE_RAM_APP

Build app without SPI_FLASH/PSRAM support (saves ram)

Found in: Build type

If this option is enabled, external memory and related peripherals, such as Cache, MMU, Flash and
PSRAM, won’t be initialized. Corresponding drivers won’t be introduced either. Components that
depend on the spi_flash component will also be unavailable, such as app_update, etc. When this option
is enabled, about 26KB of RAM space can be saved.

CONFIG_APP_REPRODUCIBLE_BUILD

Enable reproducible build

Found in: Build type

If enabled, all date, time, and path information would be eliminated. A .gdbinit file would be create
automatically. (or will be append if you have one already)

Default value:
• No (disabled)

CONFIG_APP_NO_BLOBS

No Binary Blobs

Found in: Build type

If enabled, this disables the linking of binary libraries in the application build. Note that after enabling
this Wi-Fi/Bluetooth will not work.

Default value:
• No (disabled)
Chapter 2. API Reference

Bootloader config

Contains:

- CONFIG_BOOTLOADER_LOG_LEVEL
- Bootloader manager
- CONFIG_BOOTLOADER_COMPILER_OPTIMIZATION
- CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE
- CONFIG_BOOTLOADER_REGION_PROTECTION_ENABLE
- CONFIG_BOOTLOADER_APP_TEST
- CONFIG_BOOTLOADER_FACTORY_RESET
- CONFIG_BOOTLOADER_HOLD_TIME_GPIO
- CONFIG_BOOTLOADER_CUSTOM_RESERVE_RTC
- Serial Flash Configurations
- CONFIG_BOOTLOADER_SKIP_VALIDATE_ALWAYS
- CONFIG_BOOTLOADER_SKIP_VALIDATE_ON_POWER_ON
- CONFIG_BOOTLOADER_SKIP_VALIDATE_IN_DEEP_SLEEP
- CONFIG_BOOTLOADER_WDT_ENABLE
- CONFIG_BOOTLOADER_VDDSDIO_BOOST

Bootloader manager  Contains:

- CONFIG_BOOTLOADER_PROJECT_VER
- CONFIG_BOOTLOADER_COMPILE_TIME_DATE

CONFIG_BOOTLOADER_COMPILE_TIME_DATE

Use time/date stamp for bootloader

*Found in: Bootloader config > Bootloader manager*

If set, then the bootloader will be built with the current time/date stamp. It is stored in the bootloader description structure. If not set, time/date stamp will be excluded from bootloader image. This can be useful for getting the same binary image files made from the same source, but at different times.

CONFIG_BOOTLOADER_PROJECT_VER

Project version

*Found in: Bootloader config > Bootloader manager*

Project version. It is placed in “version” field of the esp_bootloader_desc structure. The type of this field is “uint32_t”.

*Range:*
- from 0 to 4294967295

*Default value:*
- 1

CONFIG_BOOTLOADER_COMPILER_OPTIMIZATION

Bootloader optimization Level

*Found in: Bootloader config*

This option sets compiler optimization level (gcc -O argument) for the bootloader.

- The default “Size” setting will add the -Os flag to CFLAGS.
- The “Debug” setting will add the -Og flag to CFLAGS.
- The “Performance” setting will add the -O2 flag to CFLAGS.
- The “None” setting will add the -O0 flag to CFLAGS.
Note that custom optimization levels may be unsupported.

Available options:

- Size (-Os) (CONFIG_BOOTLOADER_COMPILER_OPTIMIZATION_SIZE)
- Debug (-Og) (CONFIG_BOOTLOADER_COMPILER_OPTIMIZATION_DEBUG)
- Optimize for performance (-O2) (CONFIG_BOOTLOADER_COMPILER_OPTIMIZATION_PERF)
- Debug without optimization (-O0) (CONFIG_BOOTLOADER_COMPILER_OPTIMIZATION_NONE)

**CONFIG_BOOTLOADER_LOG_LEVEL**

Bootloader log verbosity

*Found in: Bootloader config*

Specify how much output to see in bootloader logs.

Available options:

- No output (CONFIG_BOOTLOADER_LOG_LEVEL_NONE)
- Error (CONFIG_BOOTLOADER_LOG_LEVEL_ERROR)
- Warning (CONFIG_BOOTLOADER_LOG_LEVEL_WARN)
- Info (CONFIG_BOOTLOADER_LOG_LEVEL_INFO)
- Debug (CONFIG_BOOTLOADER_LOG_LEVEL_DEBUG)
- Verbose (CONFIG_BOOTLOADER_LOG_LEVEL_VERBOSE)

**Serial Flash Configurations**

Contains:

- CONFIG_BOOTLOADER_FLASH_DC_AWARE
- CONFIG_BOOTLOADER_CACHE_32BIT_ADDR_QUAD_FLASH
- CONFIG_BOOTLOADER_FLASH_XMC_SUPPORT

**CONFIG_BOOTLOADER_FLASH_DC_AWARE**

Allow app adjust Dummy Cycle bits in SPI Flash for higher frequency (READ HELP FIRST)

*Found in: Bootloader config > Serial Flash Configurations*

This will force 2nd bootloader to be loaded by DOUT mode, and will restore Dummy Cycle setting by resetting the Flash

**CONFIG_BOOTLOADER_FLASH_XMC_SUPPORT**

Enable the support for flash chips of XMC (READ DOCS FIRST)

*Found in: Bootloader config > Serial Flash Configurations*

Perform the startup flow recommended by XMC. Please consult XMC for the details of this flow. XMC chips will be forbidden to be used, when this option is disabled.

**DON’T DISABLE THIS UNLESS YOU KNOW WHAT YOU ARE DOING.**

*comment*  “Features below require specific hardware (READ DOCS FIRST)”

**Default value:**

- Yes (enabled)
CONFIG_BOOTLOADER_CACHE_32BIT_ADDR_QUAD_FLASH
Enable cache access to 32-bit-address (over 16MB) range of SPI Flash (READ DOCS FIRST)

Found in: Bootloader config > Serial Flash Configurations

Enabling this option allows the CPU to access 32-bit-address flash beyond 16M range. 1. This option only valid for 4-line flash. Octal flash doesn’t need this. 2. This option is experimental, which means it can’t use on all flash chips stable, for more information, please contact Espressif Business support.

CONFIG_BOOTLOADER_VDDSDIO_BOOST
VDDSDIO LDO voltage

Found in: Bootloader config

If this option is enabled, and VDDSDIO LDO is set to 1.8V (using eFuse or MTDI bootstrapping pin), bootloader will change LDO settings to output 1.9V instead. This helps prevent flash chip from browning out during flash programming operations.

This option has no effect if VDDSDIO is set to 3.3V, or if the internal VDDSDIO regulator is disabled via eFuse.

Available options:

• 1.8V (CONFIG_BOOTLOADER_VDDSDIO_BOOST_1_8V)
• 1.9V (CONFIG_BOOTLOADER_VDDSDIO_BOOST_1_9V)

CONFIG_BOOTLOADER_FACTORY_RESET
GPIO triggers factory reset

Found in: Bootloader config

Allows to reset the device to factory settings: - clear one or more data partitions; - boot from “factory” partition. The factory reset will occur if there is a GPIO input held at the configured level while device starts up. See settings below.

Default value:
• No (disabled)

CONFIG_BOOTLOADER_NUM_PIN_FACTORY_RESET
Number of the GPIO input for factory reset

Found in: Bootloader config > CONFIG_BOOTLOADER_FACTORY_RESET

The selected GPIO will be configured as an input with internal pull-up enabled (note that on some SoCs, not all pins have an internal pull-up, consult the hardware datasheet for details.) To trigger a factory reset, this GPIO must be held high or low (as configured) on startup.

Default value:
• 4 if CONFIG_BOOTLOADER_FACTORY_RESET

CONFIG_BOOTLOADER_FACTORY_RESET_PIN_LEVEL
Factory reset GPIO level

Found in: Bootloader config > CONFIG_BOOTLOADER_FACTORY_RESET

Pin level for factory reset, can be triggered on low or high.

Available options:
• Reset on GPIO low (CONFIG_BOOTLOADER_FACTORY_RESET_PIN_LOW)
• Reset on GPIO high (CONFIG_BOOTLOADER_FACTORY_RESET_PIN_HIGH)

**CONFIG_BOOTLOADER OTA_DATA_ERASE**
Clear OTA data on factory reset (select factory partition)

*Found in: Bootloader config > CONFIG_BOOTLOADER_FACTORY_RESET*

The device will boot from “factory” partition (or OTA slot 0 if no factory partition is present) after a factory reset.

**CONFIG_BOOTLOADER_DATA_FACTORY_RESET**
Comma-separated names of partitions to clear on factory reset

*Found in: Bootloader config > CONFIG_BOOTLOADER_FACTORY_RESET*

Allows customers to select which data partitions will be erased while factory reset.

Specify the names of partitions as a comma-delimited with optional spaces for readability. (Like this: “nvs, phy_init, …”) Make sure that the name specified in the partition table and here are the same.

Partitions of type “app” cannot be specified here.

**Default value:**
• “nvs” if CONFIG_BOOTLOADER_FACTORY_RESET

**CONFIG_BOOTLOADER APP_TEST**
GPIO triggers boot from test app partition

*Found in: Bootloader config*

Allows to run the test app from “TEST” partition. A boot from “test” partition will occur if there is a GPIO input pulled low while device starts up. See settings below.

**CONFIG BOOTLOADER_NUM_PIN_APP_TEST**
Number of the GPIO input to boot TEST partition

*Found in: Bootloader config > CONFIG_BOOTLOADER_APP_TEST*

The selected GPIO will be configured as an input with internal pull-up enabled. To trigger a test app, this GPIO must be pulled low on reset. After the GPIO input is deactivated and the device reboots, the old application will boot. (factory or OTA[x]). Note that GPIO34-39 do not have an internal pullup and an external one must be provided.

**Range:**
• from 0 to 39 if CONFIG_BOOTLOADER_APP_TEST

**Default value:**
• 18 if CONFIG_BOOTLOADER_APP_TEST

**CONFIG_BOOTLOADER_APP_TEST_PIN_LEVEL**
App test GPIO level

*Found in: Bootloader config > CONFIG_BOOTLOADER_APP_TEST*

Pin level for app test, can be triggered on low or high.

Available options:

• Enter test app on GPIO low (CONFIG_BOOTLOADER_APP_TEST_PIN_LOW)
Chapter 2. API Reference

• Enter test app on GPIO high (CONFIG_BOOTLOADER_APP_TEST_PIN_HIGH)

**CONFIG_BOOTLOADER_HOLD_TIME_GPIO**

Hold time of GPIO for reset/test mode (seconds)

*Found in: Bootloader config*

The GPIO must be held low continuously for this period of time after reset before a factory reset or test partition boot (as applicable) is performed.

**Default value:**

- 5 if `CONFIG_BOOTLOADER_FACTORY_RESET || CONFIG_BOOTLOADER_APP_TEST`

**CONFIG_BOOTLOADER_REGION_PROTECTION_ENABLE**

Enable protection for unmapped memory regions

*Found in: Bootloader config*

Protects the unmapped memory regions of the entire address space from unintended accesses. This will ensure that an exception will be triggered whenever the CPU performs a memory operation on unmapped regions of the address space.

**Default value:**

- Yes (enabled)

**CONFIG_BOOTLOADER_WDT_ENABLE**

Use RTC watchdog in start code

*Found in: Bootloader config*

Tracks the execution time of startup code. If the execution time is exceeded, the RTC_WDT will restart system. It is also useful to prevent a lock up in start code caused by an unstable power source. NOTE: Tracks the execution time starts from the bootloader code - re-set timeout, while selecting the source for slow_clk - and ends calling app_main. Re-set timeout is needed due to WDT uses a SLOW_CLK clock source. After changing a frequency slow_clk a time of WDT needs to re-set for new frequency. slow_clk depends on RTC_CLK_SRC (INTERNAL_RC or EXTERNAL_CRYSTAL).

**Default value:**

- Yes (enabled)

**CONFIG_BOOTLOADER_WDT_DISABLE_IN_USER_CODE**

Allows RTC watchdog disable in user code

*Found in: Bootloader config > CONFIG_BOOTLOADER_WDT_ENABLE*

If this option is set, the ESP-IDF app must explicitly reset, feed, or disable the rtc_wdt in the app’s own code. If this option is not set (default), then rtc_wdt will be disabled by ESP-IDF before calling the app_main() function.

Use function rtc_wdt_feed() for resetting counter of rtc_wdt. Use function rtc_wdt_disable() for disabling rtc_wdt.

**Default value:**

- No (disabled)
CONFIG_BOOTLOADER_WDT_TIME_MS
Timeout for RTC watchdog (ms)

Found in: Bootloader config > CONFIG_BOOTLOADER_WDT_ENABLE

Verify that this parameter is correct and more then the execution time. Pay attention to options such as reset to factory, trigger test partition and encryption on boot - these options can increase the execution time. Note: RTC_WDT will reset while encryption operations will be performed.

Range:
  • from 0 to 120000

Default value:
  • 9000

CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE
Enable app rollback support

Found in: Bootloader config

After updating the app, the bootloader runs a new app with the “ESP_OTA_IMG_PENDING_VERIFY” state set. This state prevents the re-run of this app. After the first boot of the new app in the user code, the function should be called to confirm the operability of the app or vice versa about its non-operability. If the app is working, then it is marked as valid. Otherwise, it is marked as not valid and rolls back to the previous working app. A reboot is performed, and the app is booted before the software update. Note: If during the first boot a new app the power goes out or the WDT works, then roll back will happen. Rollback is possible only between the apps with the same security versions.

Default value:
  • No (disabled)

CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK
Enable app anti-rollback support

Found in: Bootloader config > CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE

This option prevents rollback to previous firmware/application image with lower security version.

Default value:
  • No (disabled) if CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE

CONFIG_BOOTLOADER_APP_SECURE_VERSION
eFuse secure version of app

Found in: Bootloader config > CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE > CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK

The secure version is the sequence number stored in the header of each firmware. The security version is set in the bootloader, version is recorded in the eFuse field as the number of set ones. The allocated number of bits in the efuse field for storing the security version is limited (see BOOTLOADER_APP_SEC_VER_SIZE_EFUSE_FIELD option).

Bootloader: When bootloader selects an app to boot, an app is selected that has a security version greater or equal that recorded in eFuse field. The app is booted with a higher (or equal) secure version.

The security version is worth increasing if in previous versions there is a significant vulnerability and their use is not acceptable.

Your partition table should has a scheme with ota_0 + ota_1 (without factory).

Default value:
  • 0 if CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK
**CONFIG_BOOTLOADER_APP_SEC_VER_SIZE_EFUSE_FIELD**

Size of the efuse secure version field

*Found in: Bootloader config > CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE > CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK*

The size of the efuse secure version field. Its length is limited to 32 bits for ESP32 and 16 bits for ESP32-S2. This determines how many times the security version can be increased.

**Range:**
- from 1 to 16 if `CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK`

**Default value:**
- 16 if `CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK`

**CONFIG_BOOTLOADER_EFUSE_SECURE_VERSION_EMULATE**

Emulate operations with efuse secure version (only test)

*Found in: Bootloader config > CONFIG_BOOTLOADER_APP_ROLLBACK_ENABLE > CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK*

This option allows to emulate read/write operations with all eFuses and efuse secure version. It allows to test anti-rollback implementation without permanent write eFuse bits. There should be an entry in partition table with following details: `emul_efuse, data, efuse, , 0x2000`.

This option enables: EFUSE_VIRTUAL and EFUSE_VIRTUAL_KEEP_IN_FLASH.

**Default value:**
- No (disabled) if `CONFIG_BOOTLOADER_APP_ANTI_ROLLBACK`

**CONFIG_BOOTLOADER_SKIP_VALIDATE_IN_DEEP_SLEEP**

Skip image validation when exiting deep sleep

*Found in: Bootloader config*

This option disables the normal validation of an image coming out of deep sleep (checksums, SHA256, and signature). This is a trade-off between wakeup performance from deep sleep, and image integrity checks.

Only enable this if you know what you are doing. It should not be used in conjunction with using `deep_sleep()` entry and changing the active OTA partition as this would skip the validation upon first load of the new OTA partition.

It is possible to enable this option with Secure Boot if “allow insecure options” is enabled, however it strongly recommended to NOT enable it as it may allow a Secure Boot bypass.

**Default value:**
- No (disabled) if `CONFIG_SECURE_BOOT` && `CONFIG_SECURE_BOOT_INSECURE`

**CONFIG_BOOTLOADER_SKIP_VALIDATE_ON_POWER_ON**

Skip image validation from power on reset (READ HELP FIRST)

*Found in: Bootloader config*

Some applications need to boot very quickly from power on. By default, the entire app binary is read from flash and verified which takes up a significant portion of the boot time.

Enabling this option will skip validation of the app when the SoC boots from power on. Note that in this case it’s not possible for the bootloader to detect if an app image is corrupted in the flash, therefore it’s not possible to safely fall back to a different app partition. Flash corruption of this kind is unlikely but can happen if there is a serious firmware bug or physical damage.
Following other reset types, the bootloader will still validate the app image. This increases the chances that flash corruption resulting in a crash can be detected following soft reset, and the bootloader will fall back to a valid app image. To increase the chances of successfully recovering from a flash corruption event, keep the option `BOOTLOADER_WDT_ENABLE` enabled and consider also enabling `BOOTLOADER_WDT_DISABLE_IN_USER_CODE` - then manually disable the RTC Watchdog once the app is running. In addition, enable both the Task and Interrupt watchdog timers with reset options set.

**Default value:**
- No (disabled)

**CONFIG_BOOTLOADER_SKIP_VALIDATE_ALWAYS**

Skip image validation always (READ HELP FIRST)

*Found in: Bootloader config*

Selecting this option prevents the bootloader from ever validating the app image before booting it. Any flash corruption of the selected app partition will make the entire SoC unbootable.

Although flash corruption is a very rare case, it is not recommended to select this option. Consider selecting “Skip image validation from power on reset” instead. However, if boot time is the only important factor then it can be enabled.

**Default value:**
- No (disabled)

**CONFIG_BOOTLOADER_CUSTOM_RESERVE_RTC**

Reserve RTC FAST memory for custom purposes

*Found in: Bootloader config*

This option allows the customer to place data in the RTC FAST memory, this area remains valid when rebooted, except for power loss. This memory is located at a fixed address and is available for both the bootloader and the application. (The application and bootloader must be compiled with the same option). The RTC FAST memory has access only through PRO_CPU.

**Default value:**
- No (disabled)

**CONFIG_BOOTLOADER_CUSTOM_RESERVE_RTC_SIZE**

Size in bytes for custom purposes

*Found in: Bootloader config > CONFIG_BOOTLOADER_CUSTOM_RESERVE_RTC*

This option reserves in RTC FAST memory the area for custom purposes. If you want to create your own bootloader and save more information in this area of memory, you can increase it. It must be a multiple of 4 bytes. This area (rtc_retain_mem_t) is reserved and has access from the bootloader and an application.

**Default value:**
- 0 if `CONFIG_BOOTLOADER_CUSTOM_RESERVE_RTC`

**Security features**

Contains:
- `CONFIG_SECURE_BOOT_INSECURE`
- `CONFIG_SECURE_SIGNED_APPS_SCHEME`
- `CONFIG_SECURE_SIGNED_ON_BOOT_NO_SECURE_BOOT`
- `CONFIG_SECURE_FLASH_CHECK_ENC_EN_IN_APP`
- `CONFIG_SECURE_BOOT_ECDSA_KEY_LEN_SIZE`
Chapter 2. API Reference

- CONFIG_SECURE_BOOT_ENABLE_AGGRESSIVE_KEY_REVOKE
- CONFIG_SECURE_FLASH_ENC_ENABLED
- CONFIG_SECURE_BOOT
- CONFIG_SECURE_BOOT_FLASH_BOOTLOADER_DEFAULT
- CONFIG_SECURE_BOOTLOADER_KEY_ENCODING
- Potentially insecure options
  - CONFIG_SECURE_SIGNED_APPS_NO_SECURE_BOOT
  - CONFIG_SECURE_BOOT_VERIFICATION_KEY
  - CONFIG_SECURE_BOOTLOADER_MODE
  - CONFIG_SECURE_BOOT_BUILD_SIGNED_BINARIES
  - CONFIG_SECURE_UART_ROM_DL_MODE
  - CONFIG_SECURE_SIGNED_ON_UPDATE_NO_SECURE_BOOT

CONFIG_SECURE_SIGNED_APPS_NO_SECURE_BOOT

Require signed app images

Found in: Security features

Require apps to be signed to verify their integrity.

This option uses the same app signature scheme as hardware secure boot, but unlike hardware secure boot it does not prevent the bootloader from being physically updated. This means that the device can be secured against remote network access, but not physical access. Compared to using hardware Secure Boot this option is much simpler to implement.

CONFIG_SECURE_SIGNED_APPS_SCHEME

App Signing Scheme

Found in: Security features

Select the Secure App signing scheme. Depends on the Chip Revision. There are two secure boot versions:

1. Secure boot V1
   - Legacy custom secure boot scheme. Supported in ESP32 SoC.
2. Secure boot V2
   - RSA based secure boot scheme. Supported in ESP32-ECO3 (ESP32 Chip Revision 3 onwards), ESP32-S2, ESP32-C3, ESP32-S3 SoCs.
   - ECDSA based secure boot scheme. Supported in ESP32-C2 SoC.

Available options:

- ECDSA (CONFIG_SECURE_SIGNED_APPS_ECDSA_SCHEME)
  Embeds the ECDSA public key in the bootloader and signs the application with an ECDSA key. Refer to the documentation before enabling.
- RSA (CONFIG_SECURE_SIGNED_APPS_RSA_SCHEME)
  Appends the RSA-3072 based Signature block to the application. Refer to <Secure Boot Version 2 documentation link> before enabling.
- ECDSA (V2) (CONFIG_SECURE_SIGNED_APPS_ECDSA_V2_SCHEME)
  For Secure boot V2 (e.g., ESP32-C2 SoC), appends ECDSA based signature block to the application. Refer to documentation before enabling.

CONFIG_SECURE_BOOT_ECDSA_KEY_LEN_SIZE

ECDSA key size

Found in: Security features

Select the ECDSA key size. Two key sizes are supported
• 192 bit key using NISTP192 curve
• 256 bit key using NISTP256 curve (Recommended)

The advantage of using 256 bit key is the extra randomness which makes it difficult to be bruteforced compared to 192 bit key. At present, both key sizes are practically implausible to bruteforce.

Available options:

• Using ECC curve NISTP192 (CONFIG_SECURE_BOOT_ECDSA_KEY_LEN_192_BITS)
• Using ECC curve NISTP256 (Recommended) (CONFIG_SECURE_BOOT_ECDSA_KEY_LEN_256_BITS)

**CONFIG_SECURE_SIGNED_ON_BOOT_NO_SECURE_BOOT**

Bootloader verifies app signatures

*Found in: Security features*

If this option is set, the bootloader will be compiled with code to verify that an app is signed before booting it.

If hardware secure boot is enabled, this option is always enabled and cannot be disabled. If hardware secure boot is not enabled, this option doesn’t add significant security by itself so most users will want to leave it disabled.

*Default value:*

• No (disabled) if CONFIG_SECURE_SIGNED_APPS_NO_SECURE_BOOT && CONFIG_SECURE_SIGNED_APPS_ECDSA_SCHEME

**CONFIG_SECURE_SIGNED_ON_UPDATE_NO_SECURE_BOOT**

Verify app signature on update

*Found in: Security features*

If this option is set, any OTA updated apps will have the signature verified before being considered valid.

When enabled, the signature is automatically checked whenever the esp_ota_ops.h APIs are used for OTA updates, or esp_image_format.h APIs are used to verify apps.

If hardware secure boot is enabled, this option is always enabled and cannot be disabled. If hardware secure boot is not enabled, this option still adds significant security against network-based attackers by preventing spoofing of OTA updates.

*Default value:*

• Yes (enabled) if CONFIG_SECURE_SIGNED_APPS_NO_SECURE_BOOT

**CONFIG_SECURE_BOOT**

Enable hardware Secure Boot in bootloader (READ DOCS FIRST)

*Found in: Security features*

Build a bootloader which enables Secure Boot on first boot.

Once enabled, Secure Boot will not boot a modified bootloader. The bootloader will only load a partition table or boot an app if the data has a verified digital signature. There are implications for reflashing updated apps once secure boot is enabled.

When enabling secure boot, JTAG and ROM BASIC Interpreter are permanently disabled by default.

*Default value:*

• No (disabled)
**CONFIG_SECURE_BOOT_VERSION**

Select secure boot version

*Found in: Security features>* CONFIG_SECURE_BOOT

Select the Secure Boot Version. Depends on the Chip Revision. Secure Boot V2 is the new RSA / ECDSA based secure boot scheme.

- RSA based scheme is supported in ESP32 (Revision 3 onwards), ESP32-S2, ESP32-C3 (ECO3), ESP32-S3.
- ECDSA based scheme is supported in ESP32-C2 SoC.

Please note that, RSA or ECDSA secure boot is property of specific SoC based on its HW design, supported crypto accelerators, die-size, cost and similar parameters. Please note that RSA scheme has requirement for bigger key sizes but at the same time it is comparatively faster than ECDSA verification.

Secure Boot V1 is the AES based (custom) secure boot scheme supported in ESP32 SoC.

Available options:

- Enable Secure Boot version 1 (CONFIG_SECURE_BOOT_V1_ENABLED)
  Build a bootloader which enables secure boot version 1 on first boot. Refer to the Secure Boot section of the ESP-IDF Programmer’s Guide for this version before enabling.
- Enable Secure Boot version 2 (CONFIG_SECURE_BOOT_V2_ENABLED)
  Build a bootloader which enables Secure Boot version 2 on first boot. Refer to Secure Boot V2 section of the ESP-IDF Programmer’s Guide for this version before enabling.

**CONFIG_SECURE_BOOTLOADER_MODE**

Secure bootloader mode

*Found in: Security features*

Available options:

- One-time flash (CONFIG_SECURE_BOOTLOADER_ONE_TIME_FLASH)
  On first boot, the bootloader will generate a key which is not readable externally or by software. A digest is generated from the bootloader image itself. This digest will be verified on each subsequent boot. Enabling this option means that the bootloader cannot be changed after the first time it is booted.
- Reflusable (CONFIG_SECURE_BOOTLOADER_REFLEASABLE)
  Generate a reusable secure bootloader key, derived (via SHA-256) from the secure boot signing key.
  This allows the secure bootloader to be re-flashed by anyone with access to the secure boot signing key.
  This option is less secure than one-time flash, because a leak of the digest key from one device allows reflashing of any device that uses it.

**CONFIG_SECURE_BOOT_BUILD_SIGNED_BINARIES**

Sign binaries during build

*Found in: Security features*

Once secure boot or signed app requirement is enabled, app images are required to be signed.

If enabled (default), these binary files are signed as part of the build process. The file named “Secure boot private signing key” will be used to sign the image.
If disabled, unsigned app/partition data will be built. They must be signed manually using espsecure.py. Version 1 to enable ECDSA Based Secure Boot and Version 2 to enable RSA based Secure Boot. (for example, on a remote signing server.)

**CONFIG_SECURE_BOOT_SIGNING_KEY**
Secure boot private signing key

*Found in: Security features > CONFIG_SECURE_BOOT_BUILD_SIGNED_BINARIES*

Path to the key file used to sign app images.

Key file is an ECDSA private key (NIST256p curve) in PEM format for Secure Boot V1. Key file is an RSA private key in PEM format for Secure Boot V2.

Path is evaluated relative to the project directory.

You can generate a new signing key by running the following command: espsecure.py generate_signing_key secure_boot_signing_key.pem

See the Secure Boot section of the ESP-IDF Programmer’s Guide for this version for details.

**Default value:**
- “secure_boot_signing_key.pem” if `CONFIG_SECURE_BOOT_BUILD_SIGNED_BINARIES`

**CONFIG_SECURE_BOOT_VERIFICATION_KEY**
Secure boot public signature verification key

*Found in: Security features*

Path to a public key file used to verify signed images. Secure Boot V1: This ECDSA public key is compiled into the bootloader and/or app, to verify app images.

Key file is in raw binary format, and can be extracted from a PEM formatted private key using the espsecure.py extract_public_key command.

Refer to the Secure Boot section of the ESP-IDF Programmer’s Guide for this version before enabling.

**CONFIG_SECURE_BOOT_ENABLE_AGGRESSIVE_KEY_REVOKE**
Enable Aggressive key revoke strategy

*Found in: Security features*

If this option is set, ROM bootloader will revoke the public key digest burned in efuse block if it fails to verify the signature of software bootloader with it. Revocation of keys does not happen when enabling secure boot. Once secure boot is enabled, key revocation checks will be done on subsequent boot-up, while verifying the software bootloader

This feature provides a strong resistance against physical attacks on the device.

**Default value:**
- No (disabled) if `CONFIG_SECURE_BOOT`

**CONFIG_SECURE_BOOT_FLASH_BOOTLOADER_DEFAULT**
Flash bootloader along with other artifacts when using the default flash command

*Found in: Security features*

When Secure Boot V2 is enabled, by default the bootloader is not flashed along with other artifacts like the application and the partition table images, i.e. bootloader has to be seperately flashed using the
command `idf.py bootloader flash`, whereas, the application and partition table can be flashed using the command `idf.py flash` itself. Enabling this option allows flashing the bootloader along with the other artifacts by invocation of the command `idf.py flash`.

If this option is enabled make sure that even the bootloader is signed using the correct secure boot key, otherwise the bootloader signature verification would fail, as hash of the public key which is present in the bootloader signature would not match with the digest stored into the efuses and thus the device will not be able to boot up.

**Default value:**
- **No** (disabled) if `CONFIG_SECURE_BOOT_V2_ENABLED` && `CONFIG_SECURE_BOOT_BUILD_SIGNED_BINARIES`

**CONFIG_SECURE_BOOTLOADER_KEY_ENCODING**

Hardware Key Encoding

*Found in: Security features*

In reflashable secure bootloader mode, a hardware key is derived from the signing key (with SHA-256) and can be written to eFuse with `esefuse.py`.

Normally this is a 256-bit key, but if 3/4 Coding Scheme is used on the device then the eFuse key is truncated to 192 bits.

This configuration item doesn’t change any firmware code, it only changes the size of key binary which is generated at build time.

**Available options:**

- **No encoding (256 bit key)** (CONFIG_SECURE_BOOTLOADER_KEY_ENCODING_256BIT)
- **3/4 encoding (192 bit key)** (CONFIG_SECURE_BOOTLOADER_KEY_ENCODING_192BIT)

**CONFIG_SECURE_BOOT_INSECURE**

Allow potentially insecure options

*Found in: Security features*

You can disable some of the default protections offered by secure boot, in order to enable testing or a custom combination of security features.

Only enable these options if you are very sure.

Refer to the Secure Boot section of the ESP-IDF Programmer’s Guide for this version before enabling.

**Default value:**
- **No** (disabled) if `CONFIG_SECURE_BOOT`

**CONFIG_SECURE_FLASH_ENC_ENABLED**

Enable flash encryption on boot (READ DOCS FIRST)

*Found in: Security features*

If this option is set, flash contents will be encrypted by the bootloader on first boot.

**Note:** After first boot, the system will be permanently encrypted. Re-flashing an encrypted system is complicated and not always possible.

Read *Flash Encryption* before enabling.

**Default value:**
- **No** (disabled)
CONFIG_SECURE_FLASH_ENCRYPTION_KEYSIZE

Size of generated XTS-AES key

*Found in:* Security features > CONFIG_SECURE_FLASH_ENC_ENABLED

Size of generated XTS-AES key.

- AES-128 uses a 256-bit key (32 bytes) derived from 128 bits (16 bytes) burned in half Efuse key block. Internally, it calculates SHA256(128 bits)
- AES-128 uses a 256-bit key (32 bytes) which occupies one Efuse key block.
- AES-256 uses a 512-bit key (64 bytes) which occupies two Efuse key blocks.

This setting is ignored if either type of key is already burned to Efuse before the first boot. In this case, the pre-burned key is used and no new key is generated.

Available options:

- AES-128 key derived from 128 bits (SHA256(128 bits)) (CONFIG_SECURE_FLASH_ENCRYPTION_AES128_DERIVED)
- AES-128 (256-bit key) (CONFIG_SECURE_FLASH_ENCRYPTION_AES128)
- AES-256 (512-bit key) (CONFIG_SECURE_FLASH_ENCRYPTION_AES256)

CONFIG_SECURE_FLASH_ENCRYPTION_MODE

Enable usage mode

*Found in:* Security features > CONFIG_SECURE_FLASH_ENC_ENABLED

By default Development mode is enabled which allows ROM download mode to perform flash encryption operations (plaintext is sent to the device, and it encrypts it internally and writes ciphertext to flash.) This mode is not secure, it’s possible for an attacker to write their own chosen plaintext to flash.

Release mode should always be selected for production or manufacturing. Once enabled it’s no longer possible for the device in ROM Download Mode to use the flash encryption hardware.

When EFUSE_VIRTUAL is enabled, SECURE_FLASH_ENCRYPTION_MODE_RELEASE is not available. For CI tests we use IDF_CI_BUILD to bypass it (“export IDF_CI_BUILD=1”). We do not recommend bypassing it for other purposes.

Refer to the Flash Encryption section of the ESP-IDF Programmer’s Guide for details.

Available options:

- Development (NOT SECURE) (CONFIG_SECURE_FLASH_ENCRYPTION_MODE_DEVELOPMENT)
- Release (CONFIG_SECURE_FLASH_ENCRYPTION_MODE_RELEASE)

**Potentially insecure options** Contains:

- CONFIG_SECURE_BOOT_V2_ALLOW_EFUSE_RD_DIS
- CONFIG_SECURE_BOOT_ALLOW_SHORT_APP_PARTITION
- CONFIG_SECURE_BOOT_ALLOW_JTAG
- CONFIG_SECURE_FLASH_UART_BOOTLOADER_ALLOW_ENC
- CONFIG_SECURE_FLASH_UART_BOOTLOADER_ALLOW_CACHE
- CONFIG_SECURE_BOOT_ALLOW_UNUSED_DIGEST_SLOTS
- CONFIG_SECURE_FLASH_REQUIRE_ALREADY_ENABLED
- CONFIG_SECURE_FLASH_SKIP_WRITE_PROTECTION_CACHE
CONFIG_SECURE_BOOT_ALLOW_JTAG

Allow JTAG Debugging

*Found in: Security features > Potentially insecure options*

If not set (default), the bootloader will permanently disable JTAG (across entire chip) on first boot when either secure boot or flash encryption is enabled.

Setting this option leaves JTAG on for debugging, which negates all protections of flash encryption and some of the protections of secure boot.

Only set this option in testing environments.

**Default value:**

- No (disabled) if `CONFIG_SECURE_BOOT_INSECURE || CONFIG_SECURE_FLASH_ENCRYPTION_MODE_DEVELOPMENT`

CONFIG_SECURE_BOOT_ALLOW_SHORT_APP_PARTITION

Allow app partition length not 64KB aligned

*Found in: Security features > Potentially insecure options*

If not set (default), app partition size must be a multiple of 64KB. App images are padded to 64KB length, and the bootloader checks any trailing bytes after the signature (before the next 64KB boundary) have not been written. This is because flash cache maps entire 64KB pages into the address space. This prevents an attacker from appending unverified data after the app image in the flash, causing it to be mapped into the address space.

Setting this option allows the app partition length to be unaligned, and disables padding of the app image to this length. It is generally not recommended to set this option, unless you have a legacy partitioning scheme which doesn’t support 64KB aligned partition lengths.

CONFIG_SECURE_BOOT_V2_ALLOW_EFUSE_RD_DIS

Allow additional read protecting of efuses

*Found in: Security features > Potentially insecure options*

If not set (default, recommended), on first boot the bootloader will burn the WR_DIS_RD_DIS efuse when Secure Boot is enabled. This prevents any more efuses from being read protected.

If this option is set, it will remain possible to write the EFUSE_RD_DIS efuse field after Secure Boot is enabled. This may allow an attacker to read-protect the BLK2 efuse (for ESP32) and BLOCK4-BLOCK10 (i.e. BLOCK_KEY0-BLOCK_KEY5) for other chips) holding the public key digest, causing an immediate denial of service and possibly allowing an additional fault injection attack to bypass the signature protection.

**NOTE:** Once a BLOCK is read-protected, the application will read all zeros from that block

**NOTE:** If “UART ROM download mode (Permanently disabled (recommended))” or “UART ROM download mode (Permanently switch to Secure mode (recommended))” is set, then it is **NOT** possible to read/write efuses using espfuse.py utility. However, efuse can be read/written from the application

CONFIG_SECURE_BOOT_ALLOW_UNUSED_DIGEST_SLOTS

Leave unused digest slots available (not revoke)

*Found in: Security features > Potentially insecure options*

If not set (default), during startup in the app all unused digest slots will be revoked. To revoke unused slot will be called `esp_efuse_set_digest_revoke(num_digest)` for each digest. Revoking unused digest slots makes ensures that no trusted keys can be added later by an attacker. If set, it means that you have a plan to use unused digests slots later.
Default value:
- No (disabled) if `CONFIG_SECURE_BOOT_INSECURE`

**CONFIG_SECURE_FLASH_UART_BOOTLOADER_ALLOW_ENC**

Leave UART bootloader encryption enabled

*Found in: Security features > Potentially insecure options*

If not set (default), the bootloader will permanently disable UART bootloader encryption access on first boot. If set, the UART bootloader will still be able to access hardware encryption.

It is recommended to only set this option in testing environments.

Default value:
- No (disabled) if `CONFIG_SECURE_FLASH_ENCRYPTION_MODE_DEVELOPMENT`

**CONFIG_SECURE_FLASH_UART_BOOTLOADER_ALLOW_CACHE**

Leave UART bootloader flash cache enabled

*Found in: Security features > Potentially insecure options*

If not set (default), the bootloader will permanently disable UART bootloader flash cache access on first boot. If set, the UART bootloader will still be able to access the flash cache.

Only set this option in testing environments.

Default value:
- No (disabled) if `CONFIG_SECURE_FLASH_ENCRYPTION_MODE_DEVELOPMENT`

**CONFIG_SECURE_FLASH_REQUIRE_ALREADY_ENABLED**

Require flash encryption to be already enabled

*Found in: Security features > Potentially insecure options*

If not set (default), and flash encryption is not yet enabled in eFuses, the 2nd stage bootloader will enable flash encryption: generate the flash encryption key and program eFuses. If this option is set, and flash encryption is not yet enabled, the bootloader will error out and reboot. If flash encryption is enabled in eFuses, this option does not change the bootloader behavior.

Only use this option in testing environments, to avoid accidentally enabling flash encryption on the wrong device. The device needs to have flash encryption already enabled using espfuse.py.

Default value:
- No (disabled) if `CONFIG_SECURE_FLASH_ENCRYPTION_MODE_DEVELOPMENT`

**CONFIG_SECURE_FLASH_SKIP_WRITE_PROTECTION_CACHE**

Skip write-protection of DIS_CACHE (DIS_ICACHE, DIS_DCACHE)

*Found in: Security features > Potentially insecure options*

If not set (default), on the first boot the bootloader will burn the write-protection of DIS_CACHE(for ESP32) or DIS_ICACHE/DIS_DCACHE(for other chips) eFuse when Flash Encryption is enabled. Write protection for cache disable efuse prevents the chip from being blocked if it is set by accident. App and bootloader use cache so disabling it makes the chip useless for IDF. Due to other eFuses are linked with the same write protection bit (see the list below) then write-protection will not be done if these SECURE_FLASH_UART_BOOTLOADER_ALLOW_ENC, SECURE_BOOT_ALLOW_JTAG or SECURE_FLASH_UART_BOOTLOADER_ALLOW_CACHE options are selected to give a chance to turn on the chip into the release mode later.

List of eFuses with the same write protection bit: ESP32: MAC, MAC_CRC, DISABLE_APP_CPU, DISABLE_BT, DIS_CACHE, VOL_LEVEL_HP_INV.
ESP32-C3: DIS_ICACHE, DIS_USB_JTAG, DIS_DOWNLOAD_ICACHE, DIS_USB_SERIAL_JTAG, DIS_FORCE_DOWNLOAD, DIS_TWAI, JTAG_SEL_ENABLE, DIS_PAD_JTAG, DIS_DOWNLOAD_MANUAL_ENCRYPT.

ESP32-C6: SWAP_UART_SDIO_EN, DIS_ICACHE, DIS_USB_JTAG, DIS_DOWNLOAD_ICACHE, DIS_USB_SERIAL_JTAG, DIS_FORCE_DOWNLOAD, DIS_TWAI, JTAG_SEL_ENABLE, DIS_PAD_JTAG, DIS_DOWNLOAD_MANUAL_ENCRYPT.

ESP32-H2: DIS_ICACHE, DIS_USB_JTAG, POWERGLITCH_EN, DIS_FORCE_DOWNLOAD, SPI_DOWNLOAD_MSPI_DIS, DIS_TWAI, JTAG_SEL_ENABLE, DIS_PAD_JTAG, DIS_DOWNLOAD_MANUAL_ENCRYPT.

ESP32-S2: DIS_ICACHE, DIS_DCACHE, DIS_DOWNLOAD_ICACHE, DIS_DOWNLOAD_DCACHE, DIS_FORCE_DOWNLOAD, DIS_USB, DIS_TWAI, DIS_BOOT_REMAP, SOFT_DIS_JTAG, HARD_DIS_JTAG, DIS_DOWNLOAD_MANUAL_ENCRYPT.

ESP32-S3: DIS_ICACHE, DIS_DCACHE, DIS_DOWNLOAD_ICACHE, DIS_DOWNLOAD_DCACHE, DIS_FORCE_DOWNLOAD, DIS_USB_OTG, DIS_TWAI, DIS_APP_CPU, DIS_PAD_JTAG, DIS_DOWNLOAD_MANUAL_ENCRYPT, DIS_USB_JTAG, DIS_USB_SERIAL_JTAG, STRAP_JTAG_SEL, USB_PHY_SEL.

CONFIG_SECURE_FLASH_CHECK_ENC_EN_IN_APP

Check Flash Encryption enabled on app startup

Found in: Security features

If set (default), in an app during startup code, there is a check of the flash encryption eFuse bit is on (as the bootloader should already have set it). The app requires this bit is on to continue work otherwise abort.

If not set, the app does not care if the flash encryption eFuse bit is set or not.

Default value:

- Yes (enabled) if CONFIG_SECURE_FLASH_ENC_ENABLED

CONFIG_SECURE_UART_ROM_DL_MODE

UART ROM download mode

Found in: Security features

Available options:

- UART ROM download mode (Permanently disabled (recommended)) (CONFIG_SECURE_DISABLE_ROM_DL_MODE)
  If set, during startup the app will burn an eFuse bit to permanently disable the UART ROM Download Mode. This prevents any future use of esptool.py, espefuse.py and similar tools.
  Once disabled, if the SoC is booted with strapping pins set for ROM Download Mode then an error is printed instead.
  It is recommended to enable this option in any production application where Flash Encryption and/or Secure Boot is enabled and access to Download Mode is not required. It is also possible to permanently disable Download Mode by calling esp_efuse_disable_rom_download_mode() at runtime.

- UART ROM download mode (Permanently switch to Secure mode (recommended)) (CONFIG_SECURE_ENABLE_SECURE_ROM_DL_MODE)
  If set, during startup the app will burn an eFuse bit to permanently switch the UART ROM Download Mode into a separate Secure Download mode. This option can only work if Download Mode is not already disabled by eFuse.
Secure Download mode limits the use of Download Mode functions to update SPI config, changing baud rate, basic flash write and a command to return a summary of currently enabled security features (get_security_info).
Secure Download mode is not compatible with the esptool.py flasher stub feature, esp-efuse.py, read/writing memory or registers, encrypted download, or any other features that interact with unsupported Download Mode commands.
Secure Download mode should be enabled in any application where Flash Encryption and/or Secure Boot is enabled. Disabling this option does not immediately cancel the benefits of the security features, but it increases the potential “attack surface” for an attacker to try and bypass them with a successful physical attack.
It is also possible to enable secure download mode at runtime by calling esp_efuse_enable_rom_secure_download_mode()

Note: Secure Download mode is not available for ESP32 (includes revisions till ECO3).

- UART ROM download mode (Enabled (not recommended)) (CONFIG_SECURE_INSECURE_ALLOW_DL_MODE)
  This is a potentially insecure option. Enabling this option will allow the full UART download mode to stay enabled. This option SHOULD NOT BE ENABLED for production use cases.

Application manager

Contains:

- CONFIG_APP_EXCLUDE_PROJECT_NAME_VAR
- CONFIG_APP_EXCLUDE_PROJECT_VER_VAR
- CONFIG_APP_PROJECT_VER_FROM_CONFIG
- CONFIG_APP_RETRIEVE_LEN_ELF_SHA
- CONFIG_APP_COMPILE_TIME_DATE

CONFIG_APP_COMPILE_TIME_DATE

Use time/date stamp for app

*Found in: Application manager*

If set, then the app will be built with the current time/date stamp. It is stored in the app description structure. If not set, time/date stamp will be excluded from app image. This can be useful for getting the same binary image files made from the same source, but at different times.

CONFIG_APP_EXCLUDE_PROJECT_VER_VAR

Exclude PROJECT_VER from firmware image

*Found in: Application manager*

The PROJECT_VER variable from the build system will not affect the firmware image. This value will not be contained in the esp_app_desc structure.

*Default value:*

- No (disabled)

CONFIG_APP_EXCLUDE_PROJECT_NAME_VAR

Exclude PROJECT_NAME from firmware image

*Found in: Application manager*

The PROJECT_NAME variable from the build system will not affect the firmware image. This value will not be contained in the esp_app_desc structure.

*Default value:*
Chapter 2. API Reference

• No (disabled)

**CONFIG_APP_PROJECT_VER_FROM_CONFIG**

Get the project version from Kconfig

*Found in: Application manager*

If this is enabled, then config item APP_PROJECT_VER will be used for the variable PROJECT_VER. Other ways to set PROJECT_VER will be ignored.

**Default value:**

• No (disabled)

**CONFIG_APP_PROJECT_VER**

Project version

*Found in: Application manager > CONFIG_APP_PROJECT_VER_FROM_CONFIG*

**Default value:**

• 1 if CONFIG_APP_PROJECT_VER_FROM_CONFIG

**CONFIG_APP_RETRIEVE_LEN_ELF_SHA**

The length of APP ELF SHA is stored in RAM(chars)

*Found in: Application manager*

At startup, the app will read the embedded APP ELF SHA-256 hash value from flash and convert it into a string and store it in a RAM buffer. This ensures the panic handler and core dump will be able to print this string even when cache is disabled. The size of the buffer is APP_RETRIEVE_LEN_ELF_SHA plus the null terminator. Changing this value will change the size of this buffer, in bytes.

**Range:**

• from 8 to 64

**Default value:**

• 9

Boot ROM Behavior

Contains:

• **CONFIG_BOOT_ROM_LOG_SCHEME**

**CONFIG_BOOT_ROM_LOG_SCHEME**

Permanently change Boot ROM output

*Found in: Boot ROM Behavior*

Controls the Boot ROM log behavior. The rom log behavior can only be changed for once, specific eFuse bit(s) will be burned at app boot stage.

Available options:

• Always Log (CONFIG_BOOT_ROM_LOG_ALWAYS_ON)  
  Always print ROM logs, this is the default behavior.

• Permanently disable logging (CONFIG_BOOT_ROM_LOG_ALWAYS_OFF)  
  Don’t print ROM logs.
• Log on GPIO High (CONFIG_BOOT_ROM_LOG_ON_GPIO_HIGH)
  Print ROM logs when GPIO level is high during start up. The GPIO number is chip
dependent, e.g. on ESP32-S2, the control GPIO is GPIO46.
• Log on GPIO Low (CONFIG_BOOT_ROM_LOG_ON_GPIO_LOW)
  Print ROM logs when GPIO level is low during start up. The GPIO number is chip
dependent, e.g. on ESP32-S2, the control GPIO is GPIO46.

Serial flasher config

Contains:

- CONFIG_ESPTOOLPY_AFTER
- CONFIG_ESPTOOLPY_BEFORE
- CONFIG_ESPTOOLPY_FLASH_MODE_AUTO_DETECT
- CONFIG_ESPTOOLPY_HEADER_FLASHSIZE_UPDATE
- CONFIG_ESPTOOLPY_NO_STUB
- CONFIG_ESPTOOLPY_OCT_FLASH
- CONFIG_ESPTOOLPY_FLASH_SAMPLE_MODE
- CONFIG_ESPTOOLPY_FLASHSIZE
- CONFIG_ESPTOOLPY_FLASHMODE
- CONFIG_ESPTOOLPY_FLASHFREQ

**CONFIG_ESPTOOLPY_NO_STUB**

Disable download stub

*Found in: Serial flasher config*

The flasher tool sends a precompiled download stub first by default. That stub allows things like com-
pressed downloads and more. Usually you should not need to disable that feature

**CONFIG_ESPTOOLPY_OCT_FLASH**

Enable Octal Flash

*Found in: Serial flasher config*

**CONFIG_ESPTOOLPY_FLASH_MODE_AUTO_DETECT**

Choose flash mode automatically (please read help)

*Found in: Serial flasher config*

This config option helps decide whether flash is Quad or Octal, but please note some limitations:

1. If the flash chip is an Octal one, even if one of “QIO”, “QOUT”, “DIO”, “DOUT” options
   is selected in ESPTOOLPY_FLASHMODE, our code will automatically change the mode to “OPI”
   and the sample mode will be STR.
2. If the flash chip is a Quad one, even if “OPI” is selected in ESPTOOLPY_FLASHMODE, our code
   will automatically change the mode to “DIO”.
3. This option is mainly to improve the out-of-box experience of developers. It doesn’t guar-
   antee the feature-complete. Some code still rely on ESPTOOLPY_OCT_FLASH. Please do not
   rely on this option when you are pretty sure that you are using Octal flash. In this case,
   please enable ESPTOOLPY_OCT_FLASH option, then you can choose DTR sample mode in ESP-
   TOOLPY_FLASH_SAMPLE_MODE. Otherwise, only STR mode is available.
4. Enabling this feature reduces available internal RAM size (around 900 bytes). If your IRAM space
   is insufficient and you’re aware of your flash type, disable this option and select corresponding
   flash type options.
**CONFIG_ESPTOOLPY_FLASHMODE**

Flash SPI mode

*Found in: Serial flasher config*

Mode the flash chip is flashed in, as well as the default mode for the binary to run in.

Available options:

- QIO (CONFIG_ESPTOOLPY_FLASHMODE_QIO)
- QOUT (CONFIG_ESPTOOLPY_FLASHMODE_QOUT)
- DIO (CONFIG_ESPTOOLPY_FLASHMODE_DIO)
- DOUT (CONFIG_ESPTOOLPY_FLASHMODE_DOUT)
- OPI (CONFIG_ESPTOOLPY_FLASHMODE_OPI)

**CONFIG_ESPTOOLPY_FLASH_SAMPLE_MODE**

Flash Sampling Mode

*Found in: Serial flasher config*

Available options:

- STR Mode (CONFIG_ESPTOOLPY_FLASH_SAMPLE_MODE_STR)
- DTR Mode (CONFIG_ESPTOOLPY_FLASH_SAMPLE_MODE_DTR)

**CONFIG_ESPTOOLPY_FLASHFREQ**

Flash SPI speed

*Found in: Serial flasher config*

Available options:

- 120 MHz (READ DOCS FIRST) (CONFIG_ESPTOOLPY_FLASHFREQ_120M)
  - Optional feature for QSPI Flash. Read docs and enable CONFIG_SPI_FLASH_HPM_ENA first!
  - Flash 120 MHz SDR mode is stable.
  - Flash 120 MHz DDR mode is an experimental feature, it works when the temperature is stable.
  - **Risks:** If your chip powers on at a certain temperature, then after the temperature increases or decreases by approximately 20 Celsius degrees (depending on the chip), the program will crash randomly.
- 80 MHz (CONFIG_ESPTOOLPY_FLASHFREQ_80M)
- 64 MHz (CONFIG_ESPTOOLPY_FLASHFREQ_64M)
- 60 MHz (CONFIG_ESPTOOLPY_FLASHFREQ_60M)
- 48 MHz (CONFIG_ESPTOOLPY_FLASHFREQ_48M)
- 40 MHz (CONFIG_ESPTOOLPY_FLASHFREQ_40M)
- 32 MHz (CONFIG_ESPTOOLPY_FLASHFREQ_32M)
- 30 MHz (CONFIG_ESPTOOLPY_FLASHFREQ_30M)
- 26 MHz (CONFIG_ESPTOOLPY_FLASHFREQ_26M)
- 24 MHz (CONFIG_ESPTOOLPY_FLASHFREQ_24M)
- 20 MHz (CONFIG_ESPTOOLPY_FLASHFREQ_20M)
- 16 MHz (CONFIG_ESPTOOLPY_FLASHFREQ_16M)
- 15 MHz (CONFIG_ESPTOOLPY_FLASHFREQ_15M)
CONFIG_ESPTOOLPY_FLASHSIZE

Flash size

*Found in: Serial flasher config*

SPI flash size, in megabytes

Available options:

- 1 MB (CONFIG_ESPTOOLPY_FLASHSIZE_1MB)
- 2 MB (CONFIG_ESPTOOLPY_FLASHSIZE_2MB)
- 4 MB (CONFIG_ESPTOOLPY_FLASHSIZE_4MB)
- 8 MB (CONFIG_ESPTOOLPY_FLASHSIZE_8MB)
- 16 MB (CONFIG_ESPTOOLPY_FLASHSIZE_16MB)
- 32 MB (CONFIG_ESPTOOLPY_FLASHSIZE_32MB)
- 64 MB (CONFIG_ESPTOOLPY_FLASHSIZE_64MB)
- 128 MB (CONFIG_ESPTOOLPY_FLASHSIZE_128MB)

CONFIG_ESPTOOLPY_HEADER_FLASHSIZE_UPDATE

Detect flash size when flashing bootloader

*Found in: Serial flasher config*

If this option is set, flashing the project will automatically detect the flash size of the target chip and update the bootloader image before it is flashed.

Enabling this option turns off the image protection against corruption by a SHA256 digest. Updating the bootloader image before flashing would invalidate the digest.

CONFIG_ESPTOOLPY_BEFORE

Before flashing

*Found in: Serial flasher config*

Configure whether esptool.py should reset the ESP32 before flashing.

Automatic resetting depends on the RTS & DTR signals being wired from the serial port to the ESP32. Most USB development boards do this internally.

Available options:

- Reset to bootloader (CONFIG_ESPTOOLPY_BEFORE_RESET)
- No reset (CONFIG_ESPTOOLPY_BEFORE_NORESET)

CONFIG_ESPTOOLPY_AFTER

After flashing

*Found in: Serial flasher config*

Configure whether esptool.py should reset the ESP32 after flashing.

Automatic resetting depends on the RTS & DTR signals being wired from the serial port to the ESP32. Most USB development boards do this internally.

Available options:

- Reset after flashing (CONFIG_ESPTOOLPY_AFTER_RESET)
- Stay in bootloader (CONFIG_ESPTOOLPY_AFTER_NORESET)
Partition Table

Contains:

- **CONFIG_PARTITION_TABLE_CUSTOM_FILENAME**
- **CONFIG_PARTITION_TABLE_MD5**
- **CONFIG_PARTITION_TABLE_OFFSET**
- **CONFIG_PARTITION_TABLE_TYPE**

**CONFIG_PARTITION_TABLE_TYPE**

Partition Table

*Found in: Partition Table*

The partition table to flash to the ESP32. The partition table determines where apps, data and other resources are expected to be found.

The predefined partition table CSV descriptions can be found in the components/partition_table directory. These are mostly intended for example and development use, it’s expect that for production use you will copy one of these CSV files and create a custom partition CSV for your application.

Available options:

- **Single factory app, no OTA (CONFIG_PARTITION_TABLE_SINGLE_APP)**
  This is the default partition table, designed to fit into a 2MB or larger flash with a single 1MB app partition.
  The corresponding CSV file in the IDF directory is components/partition_table/partitions_singleapp.csv
  This partition table is not suitable for an app that needs OTA (over the air update) capability.

- **Single factory app (large), no OTA (CONFIG_PARTITION_TABLE_SINGLE_APP_LARGE)**
  This is a variation of the default partition table, that expands the 1MB app partition size to 1.5MB to fit more code.
  The corresponding CSV file in the IDF directory is components/partition_table/partitions_singleapp_large.csv
  This partition table is not suitable for an app that needs OTA (over the air update) capability.

- **Factory app, two OTA definitions (CONFIG_PARTITION_TABLE_TWO_OTA)**
  This is a basic OTA-enabled partition table with a factory app partition plus two OTA app partitions. All are 1MB, so this partition table requires 4MB or larger flash size.
  The corresponding CSV file in the IDF directory is components/partition_table/partitions_two_ota.csv

- **Custom partition table CSV (CONFIG_PARTITION_TABLE_CUSTOM)**
  Specify the path to the partition table CSV to use for your project.
  Consult the Partition Table section in the ESP-IDF Programmers Guide for more information.

- **Single factory app, no OTA, encrypted NVS (CONFIG_PARTITION_TABLE_SINGLE_APP_ENCRYPTED_NVS)**
  This is a variation of the default “Single factory app, no OTA” partition table that supports encrypted NVS when using flash encryption. See the Flash Encryption section in the ESP-IDF Programmers Guide for more information.
  The corresponding CSV file in the IDF directory is components/partition_table/partitions_singleapp_encr_nvs.csv

- **Single factory app (large), no OTA, encrypted NVS (CONFIG_PARTITION_TABLE_SINGLE_APP_LARGE_ENC_NVS)**
  This is a variation of the “Single factory app (large), no OTA” partition table that supports encrypted NVS when using flash encryption. See the Flash Encryption section in the ESP-IDF Programmers Guide for more information.
Chapter 2. API Reference

The corresponding CSV file in the IDF directory is components/partition_table/partitions_singleapp_large_encr_nvs.csv

- Factory app, two OTA definitions, encrypted NVS (CONFIG_PARTITION_TABLE_TWO_OTA_ENCRYPTED_NVS)

This is a variation of the “Factory app, two OTA definitions” partition table that supports encrypted NVS when using flash encryption. See the Flash Encryption section in the ESP-IDF Programmers Guide for more information.

The corresponding CSV file in the IDF directory is components/partition_table/partitions_two_ota_encr_nvs.csv

CONFIG_PARTITION_TABLE_CUSTOM_FILENAME

Custom partition CSV file

*Found in: Partition Table*

Name of the custom partition CSV filename. This path is evaluated relative to the project root directory.

*Default value:*

- “partitions.csv”

CONFIG_PARTITION_TABLE_OFFSET

Offset of partition table

*Found in: Partition Table*

The address of partition table (by default 0x8000). Allows you to move the partition table, it gives more space for the bootloader. Note that the bootloader and app will both need to be compiled with the same PARTITION_TABLE_OFFSET value.

This number should be a multiple of 0x1000.

Note that partition offsets in the partition table CSV file may need to be changed if this value is set to a higher value. To have each partition offset adapt to the configured partition table offset, leave all partition offsets blank in the CSV file.

*Default value:*

- “0x8000”

CONFIG_PARTITION_TABLE_MD5

Generate an MD5 checksum for the partition table

*Found in: Partition Table*

Generate an MD5 checksum for the partition table for protecting the integrity of the table. The generation should be turned off for legacy bootloaders which cannot recognize the MD5 checksum in the partition table.

*Default value:*

- Yes (enabled)

**Compiler options**

Contains:

- `CONFIG_COMPILER_OPTIMIZATION_ASSERTION_LEVEL`
- `CONFIG_COMPILER_FLOAT_LIB_FROM`
- `CONFIG_COMPILER_RT_LIB`
- `CONFIG_COMPILER_OPTIMIZATION_CHECKS_SILENT`
- `CONFIG_COMPILER_DISABLE_GCC12_WARNINGS`
- `CONFIG_COMPILER_DISABLE_GCC13_WARNINGS`
Chapter 2. API Reference

- CONFIG_COMPILER_DUMPRTL_FILES
- CONFIG_COMPILER_WARN_WRITE_STRINGS
- CONFIG_COMPILER_CXX_EXCEPTIONS
- CONFIG_COMPILER_CXX_RTTI
- CONFIG_COMPILER_OPTIMIZATION
- CONFIG_COMPILER_HIDE_PATHS_MACROS
- CONFIG_COMPILER_STACK_CHECK_MODE

CONFIG_COMPILER_OPTIMIZATION

Optimization Level

Found in: Compiler options

This option sets compiler optimization level (gcc -O argument) for the app.

- The “Debug” setting will add the -0g flag to CFLAGS.
- The “Size” setting will add the -0s flag to CFLAGS.
- The “Performance” setting will add the -O2 flag to CFLAGS.
- The “None” setting will add the -00 flag to CFLAGS.

The “Size” setting causes the compiled code to be smaller and faster, but may lead to difficulties of correlating code addresses to source file lines when debugging.

The “Performance” setting causes the compiled code to be larger and faster, but will be easier to correlate code addresses to source file lines.

“None” with -00 produces compiled code without optimization.

Note that custom optimization levels may be unsupported.

Compiler optimization for the IDF bootloader is set separately, see the BOOT-LOADER_COMPILER_OPTIMIZATION setting.

Available options:

- Debug (-Og) (CONFIG_COMPILER_OPTIMIZATION_DEBUG)
- Optimize for size (-Os) (CONFIG_COMPILER_OPTIMIZATION_SIZE)
- Optimize for performance (-O2) (CONFIG_COMPILER_OPTIMIZATION_PERF)
- Debug without optimization (-00) (CONFIG_COMPILER_OPTIMIZATION_NONE)

CONFIG_COMPILER_OPTIMIZATION_ASSERTION_LEVEL

Assertion level

Found in: Compiler options

Assertions can be:

- Enabled. Failure will print verbose assertion details. This is the default.
- Set to “silent” to save code size (failed assertions will abort() but user needs to use the aborting address to find the line number with the failed assertion.)
- Disabled entirely (not recommended for most configurations.) -DNDEBUG is added to CPPFLAGS in this case.

Available options:

- Enabled (CONFIG_COMPILER_OPTIMIZATION_ASSERTIONS_ENABLE)
  Enable assertions. Assertion content and line number will be printed on failure.
- Silent (saves code size) (CONFIG_COMPILER_OPTIMIZATION_ASSERTIONS_SILENT)
  Enable silent assertions. Failed assertions will abort(), user needs to use the aborting address to find the line number with the failed assertion.
• Disabled (sets -DNDEBUG) (CONFIG_COMPILER_OPTIMIZATION_ASSERTIONS_DISABLE)
  If assertions are disabled, -DNDEBUG is added to CPPFLAGS.

**CONFIG_COMPILER_FLOAT_LIB_FROM**

Compiler float lib source

*Found in: Compiler options*

In the soft-fp part of libgcc, riscv version is written in C, and handles all edge cases in IEEE754, which makes it larger and performance is slow.

RVfplib is an optimized RISC-V library for FP arithmetic on 32-bit integer processors, for single and double-precision FP. RVfplib is “fast”, but it has a few exceptions from IEEE 754 compliance.

Available options:

- libgcc (CONFIG_COMPILER_FLOAT_LIB_FROM_GCCLIB)
- librvec (CONFIG_COMPILER_FLOAT_LIB_FROM_RVFPLIB)

**CONFIG_COMPILER_OPTIMIZATION_CHECKS_SILENT**

Disable messages in ESP_RETURN_ON_* and ESP_EXIT_ON_* macros

*Found in: Compiler options*

If enabled, the error messages will be discarded in following check macros: - ESP_RETURN_ON_ERROR - ESP_EXIT_ON_ERROR - ESP_RETURN_ON_FALSE - ESP_EXIT_ON_FALSE

*Default value:*
  - No (disabled)

**CONFIG_COMPILER_HIDE_PATHS_MACROS**

Replace ESP-IDF and project paths in binaries

*Found in: Compiler options*

When expanding the __FILE__ and __BASE_FILE__ macros, replace paths inside ESP-IDF with paths relative to the placeholder string “IDF”, and convert paths inside the project directory to relative paths.

This allows building the project with assertions or other code that embeds file paths, without the binary containing the exact path to the IDF or project directories.

This option passes -fmacro-prefix-map options to the GCC command line. To replace additional paths in your binaries, modify the project CMakeLists.txt file to pass custom -fmacro-prefix-map or -ffile-prefix-map arguments.

*Default value:*
  - Yes (enabled)

**CONFIG_COMPILER_CXX_EXCEPTIONS**

Enable C++ exceptions

*Found in: Compiler options*

Enabling this option compiles all IDF C++ files with exception support enabled.

Disabling this option disables C++ exception support in all compiled files, and any libstdc++ code which throws an exception will abort instead.
Enabling this option currently adds an additional ~500 bytes of heap overhead when an exception is thrown in user code for the first time.

**Default value:**
- No (disabled)

Contains:
- `CONFIG_COMPILER_CXX_EXCEPTIONS_EMG_POOL_SIZE`

**CONFIG_COMPILER_CXX_EXCEPTIONS_EMG_POOL_SIZE**

Emergency Pool Size

*Found in: Compiler options > CONFIG_COMPILER_CXX_EXCEPTIONS*

Size (in bytes) of the emergency memory pool for C++ exceptions. This pool will be used to allocate memory for thrown exceptions when there is not enough memory on the heap.

**Default value:**
- 0 if `CONFIG_COMPILER_CXX_EXCEPTIONS`

**CONFIG_COMPILER_CXX_RTTI**

Enable C++ run-time type info (RTTI)

*Found in: Compiler options*

Enabling this option compiles all C++ files with RTTI support enabled. This increases binary size (typically by tens of kB) but allows using `dynamic_cast` conversion and `typeid` operator.

**Default value:**
- No (disabled)

**CONFIG_COMPILER_STACK_CHECK_MODE**

Stack smashing protection mode

*Found in: Compiler options*

Stack smashing protection mode. Emit extra code to check for buffer overflows, such as stack smashing attacks. This is done by adding a guard variable to functions with vulnerable objects. The guards are initialized when a function is entered and then checked when the function exits. If a guard check fails, program is halted. Protection has the following modes:

- In NORMAL mode (GCC flag: `-fstack-protector`) only functions that call `alloca`, and functions with buffers larger than 8 bytes are protected.
- STRONG mode (GCC flag: `-fstack-protector-strong`) is like NORMAL, but includes additional functions to be protected – those that have local array definitions, or have references to local frame addresses.
- In OVERALL mode (GCC flag: `-fstack-protector-all`) all functions are protected.

Modes have the following impact on code performance and coverage:

- performance: NORMAL > STRONG > OVERALL
- coverage: NORMAL < STRONG < OVERALL

The performance impact includes increasing the amount of stack memory required for each task.

Available options:

- None (CONFIG_COMPILER_STACK_CHECK_MODE_NONE)
- Normal (CONFIG_COMPILER_STACK_CHECK_MODE_NORM)
- Strong (CONFIG_COMPILER_STACK_CHECK_MODE_STRONG)
• Overall (CONFIG_COMPILER_STACK_CHECK_MODE_ALL)

**CONFIG_COMPILER_WARN_WRITE_STRINGS**

Enable -Wwrite-strings warning flag

*Found in: Compiler options*

Adds -Wwrite-strings flag for the C/C++ compilers.

For C, this gives string constants the type `const char[]` so that copying the address of one into a non-const `char *` pointer produces a warning. This warning helps to find at compile time code that tries to write into a string constant.

For C++, this warns about the deprecated conversion from string literals to `char *`.

*Default value:*

• No (disabled)

**CONFIG_COMPILER_DISABLE_GCC12_WARNINGS**

Disable new warnings introduced in GCC 12

*Found in: Compiler options*

Enable this option if use GCC 12 or newer, and want to disable warnings which don’t appear with GCC 11.

*Default value:*

• No (disabled)

**CONFIG_COMPILER_DISABLE_GCC13_WARNINGS**

Disable new warnings introduced in GCC 13

*Found in: Compiler options*

Enable this option if use GCC 13 or newer, and want to disable warnings which don’t appear with GCC 12.

*Default value:*

• No (disabled)

**CONFIG_COMPILER_DUMP_RTL_FILES**

Dump RTL files during compilation

*Found in: Compiler options*

If enabled, RTL files will be produced during compilation. These files can be used by other tools, for example to calculate call graphs.

**CONFIG_COMPILER_RT_LIB**

Compiler runtime library

*Found in: Compiler options*

Select runtime library to be used by compiler. - GCC toolchain supports libgcc only. - Clang allows to choose between libgcc or libclang_rt. - For host builds ( “linux” target), uses the default library.

Available options:

• libgcc (CONFIG_COMPILER_RT_LIB_GCCLIB)
libclang_rt (CONFIG_COMPILER_RT_LIB_CLANGRT)
Host (CONFIG_COMPILER_RT_LIB_HOST)

Component config

Contains:

**Application Level Tracing** Contains:

- `CONFIG_APPTRACE_DESTINATION1`
- `CONFIG_APPTRACE_DESTINATION2`
- FreeRTOS System View Tracing
- `CONFIG_APPTRACE_GCOV_ENABLE`
- `CONFIG_APPTRACE_BUF_SIZE`
- `CONFIG_APPTRACE_PENDING_DATA_SIZE_MAX`
- `CONFIG_APPTRACE_POSTMORTEM_FLUSH_THRESH`
- `CONFIG_APPTRACE_ONPANIC_HOST_FLUSH_TMO`
- `CONFIG_APPTRACE_UART_BAUDRATE`
- `CONFIG_APPTRACE_UART_RX_GPIO`
- `CONFIG_APPTRACE_UART_RX_BUFF_SIZE`
- `CONFIG_APPTRACE_UART_TASK_PRIO`
- `CONFIG_APPTRACE_UART_TX_MSG_SIZE`
- `CONFIG_APPTRACE_UART_TX_GPIO`
- `CONFIG_APPTRACE_UART_TX_BUFF_SIZE`

**CONFIG_APPTRACE_DESTINATION1**

Data Destination 1

*Found in: Component config > Application Level Tracing*

Select destination for application trace: JTAG or none (to disable).

Available options:

- JTAG (CONFIG_APPTRACE_DEST_JTAG)
- None (CONFIG_APPTRACE_DEST_NONE)

**CONFIG_APPTRACE_DESTINATION2**

Data Destination 2

*Found in: Component config > Application Level Tracing*

Select destination for application trace: UART(XX) or none (to disable).

Available options:

- UART0 (CONFIG_APPTRACE_DEST_UART0)
- UART1 (CONFIG_APPTRACE_DEST_UART1)
- UART2 (CONFIG_APPTRACE_DEST_UART2)
- USB_CDC (CONFIG_APPTRACE_DEST_USB_CDC)
- None (CONFIG_APPTRACE_DEST_UART_NONE)
**CONFIG_APPTRACE_UART_TX_GPIO**

UART TX on GPIO#

*Found in: Component config > Application Level Tracing*

This GPIO is used for UART TX pin.

**CONFIG_APPTRACE_UART_RX_GPIO**

UART RX on GPIO#

*Found in: Component config > Application Level Tracing*

This GPIO is used for UART RX pin.

**CONFIG_APPTRACE_UART_BAUDRATE**

UART baud rate

*Found in: Component config > Application Level Tracing*

This baud rate is used for UART.

The application’s maximum baud rate depends on the UART clock source. If Power Management is disabled, the UART clock source is the APB clock and all baud rates in the available range will be sufficiently accurate. If Power Management is enabled, REF_TICK clock source is used so the baud rate is divided from 1MHz. Baud rates above 1Mbps are not possible and values between 500Kbps and 1Mbps may not be accurate.

**CONFIG_APPTRACE_UART_RX_BUFF_SIZE**

UART RX ring buffer size

*Found in: Component config > Application Level Tracing*

Size of the UART input ring buffer. This size related to the baudrate, system tick frequency and amount of data to transfer. The data placed to this buffer before sent out to the interface.

**CONFIG_APPTRACE_UART_TX_BUFF_SIZE**

UART TX ring buffer size

*Found in: Component config > Application Level Tracing*

Size of the UART output ring buffer. This size related to the baudrate, system tick frequency and amount of data to transfer.

**CONFIG_APPTRACE_UART_TX_MSG_SIZE**

UART TX message size

*Found in: Component config > Application Level Tracing*

Maximum size of the single message to transfer.

**CONFIG_APPTRACE_UART_TASK_PRIO**

UART Task Priority

*Found in: Component config > Application Level Tracing*

UART task priority. In case of high events rate, this parameter could be changed up to (config-MAX_PRIORITIES-1).
Range:
- from 1 to 32

Default value:
- 1

**CONFIG_APPTRACE_ONPANIC_HOST_FLUSH_TMO**
Timeout for flushing last trace data to host on panic

*Found in: Component config > Application Level Tracing*

Timeout for flushing last trace data to host in case of panic. In ms. Use -1 to disable timeout and wait forever.

**CONFIG_APPTRACE_POSTMORTEM_FLUSH_THRESH**
Threshold for flushing last trace data to host on panic

*Found in: Component config > Application Level Tracing*

Threshold for flushing last trace data to host on panic in post-mortem mode. This is minimal amount of data needed to perform flush. In bytes.

**CONFIG_APPTRACE_BUF_SIZE**
Size of the apptrace buffer

*Found in: Component config > Application Level Tracing*

Size of the memory buffer for trace data in bytes.

**CONFIG_APPTRACE_PENDING_DATA_SIZE_MAX**
Size of the pending data buffer

*Found in: Component config > Application Level Tracing*

Size of the buffer for events in bytes. It is useful for buffering events from the time critical code (scheduler, ISRs etc). If this parameter is 0 then events will be discarded when main HW buffer is full.

**FreeRTOS SystemView Tracing** Contains:

- **CONFIG_APPTRACE_SV_CPU**
- **CONFIG_APPTRACE_SV_EVT_ISR_ENTER_ENABLE**
- **CONFIG_APPTRACE_SV_EVT_ISR_EXIT_ENABLE**
- **CONFIG_APPTRACE_SV_EVT_ISR_TO_SCHED_ENABLE**
- **CONFIG_APPTRACE_SV_MAX_TASKS**
- **CONFIG_APPTRACE_SV_EVT_IDLE_ENABLE**
- **CONFIG_APPTRACE_SV_ENABLE**
- **CONFIG_APPTRACE_SV_EVT_TASK_CREATE_ENABLE**
- **CONFIG_APPTRACE_SV_EVT_TASK_START_EXEC_ENABLE**
- **CONFIG_APPTRACE_SV_EVT_TASK_START READY_ENABLE**
- **CONFIG_APPTRACE_SV_EVT_TASK_STOP_EXEC_ENABLE**
- **CONFIG_APPTRACE_SV_EVT_TASK_STOP READY_ENABLE**
- **CONFIG_APPTRACE_SV_EVT_TASK_TERMINATE_ENABLE**
- **CONFIG_APPTRACE_SV_EVT_TIMER ENTER_ENABLE**
- **CONFIG_APPTRACE_SV_EVT_TIMER_EXIT_ENABLE**
- **CONFIG_APPTRACE_SV_TS_SOURCE**
- **CONFIG_APPTRACE_SV_EVT_OVERFLOW_ENABLE**
- **CONFIG_APPTRACE_SV_BUF_WAIT_TMO**
Chapter 2. API Reference

CONFIG_APPTRACE_SV_ENABLE
SystemView Tracing Enable

*Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing*

Enables support for SEGGER SystemView tracing functionality.

CONFIG_APPTRACE_SV_DEST
SystemView destination

*Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing > CONFIG_APPTRACE_SV_ENABLE*

SystemView will transfer data through defined interface.

Available options:
- Data destination JTAG (CONFIG_APPTRACE_SV_DEST_JTAG)
  Send SEGGER SystemView events through JTAG interface.
- Data destination UART (CONFIG_APPTRACE_SV_DEST_UART)
  Send SEGGER SystemView events through UART interface.

CONFIG_APPTRACE_SV_CPU
CPU to trace

*Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing*

Define the CPU to trace by SystemView.

Available options:
- CPU0 (CONFIG_APPTRACE_SV_DEST_CPU_0)
  Send SEGGER SystemView events for Pro CPU.
- CPU1 (CONFIG_APPTRACE_SV_DEST_CPU_1)
  Send SEGGER SystemView events for App CPU.

CONFIG_APPTRACE_SV_TS_SOURCE
Timer to use as timestamp source

*Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing*

SystemView needs to use a hardware timer as the source of timestamps when tracing. This option selects the timer for it.

Available options:
- CPU cycle counter (CCOUNT) (CONFIG_APPTRACE_SV_TS_SOURCE_CCOUNT)
- General Purpose Timer (Timer Group) (CONFIG_APPTRACE_SV_TS_SOURCE_GPTIMER)
- esp_timer high resolution timer (CONFIG_APPTRACE_SV_TS_SOURCE_ESP_TIMER)
CONFIG_APPTRACE_SV_MAX_TASKS
Maximum supported tasks

*Found in:* Component config > Application Level Tracing > FreeRTOS SystemView Tracing

Configures maximum supported tasks in sysview debug

CONFIG_APPTRACE_SV_BUF_WAIT_TMO
Trace buffer wait timeout

*Found in:* Component config > Application Level Tracing > FreeRTOS SystemView Tracing

Configures timeout (in us) to wait for free space in trace buffer. Set to -1 to wait forever and avoid lost events.

CONFIG_APPTRACE_SV_EVT_OVERFLOW_ENABLE
Trace Buffer Overflow Event

*Found in:* Component config > Application Level Tracing > FreeRTOS SystemView Tracing

Enables “Trace Buffer Overflow” event.

CONFIG_APPTRACE_SV_EVT_ISR_ENTER_ENABLE
ISR Enter Event

*Found in:* Component config > Application Level Tracing > FreeRTOS SystemView Tracing

Enables “ISR Enter” event.

CONFIG_APPTRACE_SV_EVT_ISR_EXIT_ENABLE
ISR Exit Event

*Found in:* Component config > Application Level Tracing > FreeRTOS SystemView Tracing

Enables “ISR Exit” event.

CONFIG_APPTRACE_SV_EVT_ISR_TO_SCHED_ENABLE
ISR Exit to Scheduler Event

*Found in:* Component config > Application Level Tracing > FreeRTOS SystemView Tracing

Enables “ISR to Scheduler” event.

CONFIG_APPTRACE_SV_EVT_TASK_START_EXEC_ENABLE
Task Start Execution Event

*Found in:* Component config > Application Level Tracing > FreeRTOS SystemView Tracing

Enables “Task Start Execution” event.

CONFIG_APPTRACE_SV_EVT_TASK_STOP_EXEC_ENABLE
Task Stop Execution Event

*Found in:* Component config > Application Level Tracing > FreeRTOS SystemView Tracing

Enables “Task Stop Execution” event.
CONFIG_APPTRACE_SV_EVT_TASK_START_READY_ENABLE

Task Start Ready State Event

*Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing*

Enables “Task Start Ready State” event.

CONFIG_APPTRACE_SV_EVT_TASK_STOP_READY_ENABLE

Task Stop Ready State Event

*Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing*

Enables “Task Stop Ready State” event.

CONFIG_APPTRACE_SV_EVT_TASK_CREATE_ENABLE

Task Create Event

*Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing*

Enables “Task Create” event.

CONFIG_APPTRACE_SV_EVT_TASK_TERMINATE_ENABLE

Task Terminate Event

*Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing*

Enables “Task Terminate” event.

CONFIG_APPTRACE_SV_EVT_IDLE_ENABLE

System Idle Event

*Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing*

Enables “System Idle” event.

CONFIG_APPTRACE_SV_EVT_TIMER_ENTER_ENABLE

Timer Enter Event

*Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing*

Enables “Timer Enter” event.

CONFIG_APPTRACE_SV_EVT_TIMER_EXIT_ENABLE

Timer Exit Event

*Found in: Component config > Application Level Tracing > FreeRTOS SystemView Tracing*

Enables “Timer Exit” event.

CONFIG_APPTRACE_GCOV_ENABLE

GCOV to Host Enable

*Found in: Component config > Application Level Tracing*

Enables support for GCOV data transfer to host.
CONFIG_APPTRACE_GCOV_DUMP_TASK_STACK_SIZE
Gcov dump task stack size

*Found in: Component config > Application Level Tracing > CONFIG_APPTRACE_GCOV_ENABLE*

Configures stack size of Gcov dump task

*Default value:*
- 2048 if `CONFIG_APPTRACE_GCOV_ENABLE`

Bluetooth
Contains:
- **Bluedroid Options**
- **CONFIG_BT_ENABLED**
- **Controller Options**
- **NimBLE Options**
- **CONFIG_BT_RELEASE_IRAM**

CONFIG_BT_ENABLED
Bluetooth

*Found in: Component config > Bluetooth*

Select this option to enable Bluetooth and show the submenu with Bluetooth configuration choices.

CONFIG_BT_HOST
Host

*Found in: Component config > Bluetooth > CONFIG_BT_ENABLED*

This helps to choose Bluetooth host stack

Available options:

- Bluedroid - Dual-mode (CONFIG_BT_BLUEDROID_ENABLED)
  This option is recommended for classic Bluetooth or for dual-mode use cases
- NimBLE - BLE only (CONFIG_BT_NIMBLE_ENABLED)
  This option is recommended for BLE only use cases to save on memory
- Disabled (CONFIG_BT_CONTROLLER_ONLY)
  This option is recommended when you want to communicate directly with the controller (without any host) or when you are using any other host stack not supported by Espressif (not mentioned here).

CONFIG_BT_CONTROLLER
Controller

*Found in: Component config > Bluetooth > CONFIG_BT_ENABLED*

This helps to choose Bluetooth controller stack

Available options:

- Enabled (CONFIG_BT_CONTROLLER_ENABLED)
  This option is recommended for Bluetooth controller use cases
- Disabled (CONFIG_BT_CONTROLLER_DISABLED)
  This option is recommended for Bluetooth Host only use cases
Bluedroid Options

Contains:

- CONFIG_BT_BLE_HOST_QUEUE_CONG_CHECK
- CONFIG_BT_BLUEDROID_MEM_DEBUG
- CONFIG_BT_BTU_TASK_STACK_SIZE
- CONFIG_BT_BLE_TASK_STACK_SIZE
- CONFIG_BT_BLE_ENABLED
- BT DEBUG LOG LEVEL
- CONFIG_BT_ACL_CONNECTIONS
- CONFIG_BT_ALLOCATION_FROM_SPIRAM_FIRST
- CONFIG_BT_CLASSIC_ENABLED
- CONFIG_BT_HID_ENABLED
- CONFIG_BT_STACK_NO_LOG
- CONFIG_BT_BLE_42_FEATURES_SUPPORTED
- CONFIG_BT_BLE_50_FEATURES_SUPPORTED
- CONFIG_BT_BLE_HIGH_DUTY_ADV_INTERVAL
- CONFIG_BT_MULTI_CONNECTION_ENABLE
- CONFIG_BT_BLE_FEAT_PERIODIC_ADV_SYNC_TRANSFER
- CONFIG_BT_BLUEDROID_ESP_COEX_VSC
- CONFIG_BT_BLE_FEAT_PERIODIC_ADV_ENH
- CONFIG_BT_MAX_DEVICE_NAME_LEN
- CONFIG_BT_BLE_ESTAB_LINK_CONN_TOUT
- CONFIG_BT_BLE_RPA_TIMEOUT
- CONFIG_BT_BLE_RPA_SUPPORTED
- CONFIG_BT_BLE_DYNAMIC_ENV_MEMORY
- CONFIG_BT_HFP_WBS_ENABLE

CONFIG_BT_BTC_TASK_STACK_SIZE

Bluetooth event (callback to application) task stack size

*Found in: Component config > Bluetooth > Bluedroid Options*

This select btc task stack size

*Default value:*

- 3072 if CONFIG_BT_BLUEDROID_ENABLED && CONFIG_BT_BLUEDROID_ENABLED

CONFIG_BT_BLUEDROID_PINNED_TO_CORE_CHOICE

The cpu core which Bluedroid run

*Found in: Component config > Bluetooth > Bluedroid Options*

Which the cpu core to run Bluedroid. Can choose core0 and core1. Can not specify no-affinity.

Available options:

- Core 0 (PRO CPU) (CONFIG_BT_BLUEDROID_PINNED_TO_CORE_0)
- Core 1 (APP CPU) (CONFIG_BT_BLUEDROID_PINNED_TO_CORE_1)

CONFIG_BT_BTU_TASK_STACK_SIZE

Bluetooth Bluedroid Host Stack task stack size

*Found in: Component config > Bluetooth > Bluedroid Options*

This select btu task stack size
**Default value:**

- 4096 if `CONFIG_BT_BLUEDROID_ENABLED` & `CONFIG_BT_BLUEDROID_ENABLED`

**CONFIG_BT_BLUEDROID_MEM_DEBUG**

Bluedroid memory debug

*Found in: Component config > Bluetooth > Bluedroid Options*

Bluedroid memory debug

**Default value:**

- No (disabled) if `CONFIG_BT_BLUEDROID_ENABLED` & `CONFIG_BT_BLUEDROID_ENABLED`

**CONFIG_BT_BLUEDROID_ESP_COEX_VSC**

Enable Espressif Vendor-specific HCI commands for coexist status configuration

*Found in: Component config > Bluetooth > Bluedroid Options*

Enable Espressif Vendor-specific HCI commands for coexist status configuration

**Default value:**

- Yes (enabled) if `CONFIG_BT_BLUEDROID_ENABLED` & `CONFIG_BT_BLUEDROID_ENABLED`

**CONFIG_BT_CLASSIC_ENABLED**

Classic Bluetooth

*Found in: Component config > Bluetooth > Bluedroid Options*

For now this option needs “SMP_ENABLE” to be set to yes

**Default value:**

- No (disabled) if `CONFIG_BT_BLUEDROID_ENABLED` & `CONFIG_BT_CONTROLLER_ENABLED` & `SOC_BT_CLASSIC_SUPPORTED` & `CONFIG_BT_BLUEDROID_ENABLED`

**CONFIG_BT_CLASSIC_BQB_ENABLED**

Host Qualification support for Classic Bluetooth

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_CLASSIC_ENABLED*

This enables functionalities of Host qualification for Classic Bluetooth.

**Default value:**

- No (disabled) if `CONFIG_BT_CLASSIC_ENABLED` & `CONFIG_BT_BLUEDROID_ENABLED`

**CONFIG_BT_A2DP_ENABLE**

A2DP

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_CLASSIC_ENABLED*

Advanced Audio Distribution Profile

**Default value:**

- No (disabled) if `CONFIG_BT_CLASSIC_ENABLED` & `CONFIG_BT_BLUEDROID_ENABLED`
CONFIG_BT_SPP_ENABLED

SPP

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_CLASSIC_ENABLED*

This enables the Serial Port Profile

**Default value:**
- No (disabled) if `CONFIG_BT_CLASSIC_ENABLED` && `CONFIG_BT_BLUEDROID_ENABLED`

CONFIG_BT_L2CAP_ENABLED

BT L2CAP

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_CLASSIC_ENABLED*

This enables the Logical Link Control and Adaptation Layer Protocol. Only supported classic bluetooth.

**Default value:**
- No (disabled) if `CONFIG_BT_CLASSIC_ENABLED` && `CONFIG_BT_BLUEDROID_ENABLED`

CONFIG_BT_HFP_ENABLE

Hands Free/Handset Profile

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_CLASSIC_ENABLED*

Hands Free Unit and Audio Gateway can be included simultaneously but they cannot run simultaneously due to internal limitations.

**Default value:**
- No (disabled) if `CONFIG_BT_CLASSIC_ENABLED` && `CONFIG_BT_BLUEDROID_ENABLED`

Contains:
- `CONFIG_BT_HFP_AG_ENABLE`
- `CONFIG_BT_HFP_AUDIO_DATA_PATH`
- `CONFIG_BT_HFP_CLIENT_ENABLE`

CONFIG_BT_HFP_CLIENT_ENABLE

Hands Free Unit

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_CLASSIC_ENABLED > CONFIG_BT_HFP_ENABLE*

**Default value:**
- Yes (enabled) if `CONFIG_BT_HFP_ENABLE` && `CONFIG_BT_BLUEDROID_ENABLED`

CONFIG_BT_HFP_AG_ENABLE

Audio Gateway

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_CLASSIC_ENABLED > CONFIG_BT_HFP_ENABLE*

**Default value:**
- Yes (enabled) if `CONFIG_BT_HFP_ENABLE` && `CONFIG_BT_BLUEDROID_ENABLED`
CONFIG_BT_HFP_AUDIO_DATA_PATH

audio(SCO) data path

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_CLASSIC_ENABLED > CONFIG_BT_HFP_ENABLE*

SCO data path, i.e. HCI or PCM. This option is set using API “esp_bredr_sco_datapath_set” in Bluetooth host. Default SCO data path can also be set in Bluetooth Controller.

Available options:

- PCM (CONFIG_BT_HFP_AUDIO_DATA_PATH_PCM)
- HCI (CONFIG_BT_HFP_AUDIO_DATA_PATH_HCI)

CONFIG_BT_HFP_WBS_ENABLE

Wide Band Speech

*Found in: Component config > Bluetooth > Bluedroid Options*

This enables Wide Band Speech. Should disable it when SCO data path is PCM. Otherwise there will be no data transmitted via GPIOs.

**Default value:**

- Yes (enabled) if CONFIG_BT_HFP_AUDIO_DATA_PATH_HCI && CONFIG_BT_BLUEDROID_ENABLED

CONFIG_BT_HID_ENABLED

Classic BT HID

*Found in: Component config > Bluetooth > Bluedroid Options*

This enables the BT HID Host

**Default value:**

- No (disabled) if CONFIG_BT_CLASSIC_ENABLED && CONFIG_BT_BLUEDROID_ENABLED

Contains:

- CONFIG_BT_HID_DEVICE_ENABLED
- CONFIG_BT_HID_HOST_ENABLED

CONFIG_BT_HID_HOST_ENABLED

Classic BT HID Host

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_HID_ENABLED*

This enables the BT HID Host

**Default value:**

- No (disabled) if CONFIG_BT_HID_ENABLED && CONFIG_BT_BLUEDROID_ENABLED

CONFIG_BT_HID_DEVICE_ENABLED

Classic BT HID Device

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_HID_ENABLED*

This enables the BT HID Device
CONFIG_BT_BLE_ENABLED

Bluetooth Low Energy

Found in: Component config > Bluetooth > Bluedroid Options

This enables Bluetooth Low Energy

Default value:

- Yes (enabled) if CONFIG_BT_BLUEDROID_ENABLED && CONFIG_BT_BLE_ENABLED

CONFIG_BT_GATTS_ENABLE

Include GATT server module(GATTS)

Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_BLE_ENABLED

This option can be disabled when the app work only on gatt client mode

Default value:

- Yes (enabled) if CONFIG_BT_BLE_ENABLED && CONFIG_BT_BLUEDROID_ENABLED

CONFIG_BT_GATTS_PPCP_CHAR_GAP

Enable Peripheral Preferred Connection Parameters characteristic in GAP service

Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_BLE_ENABLED > CONFIG_BT_GATTS_ENABLE

This enables “Peripheral Preferred Connection Parameters” characteristic (UUID: 0x2A04) in GAP service that has connection parameters like min/max connection interval, slave latency and supervision timeout multiplier

Default value:

- No (disabled) if CONFIG_BT_GATTS_ENABLE && CONFIG_BT_BLUEDROID_ENABLED

CONFIG_BT_BLE_BLUFI_ENABLE

Include blufi function

Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_BLE_ENABLED > CONFIG_BT_GATTS_ENABLE

This option can be close when the app does not require blufi function.

Default value:

- No (disabled) if CONFIG_BT_GATTS_ENABLE && CONFIG_BT_BLUEDROID_ENABLED

CONFIG_BT_GATT_MAX_SR_PROFILES

Max GATT Server Profiles

Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_BLE_ENABLED > CONFIG_BT_GATTS_ENABLE

Maximum GATT Server Profiles Count

Range:

- from 1 to 32 if CONFIG_BT_GATT_MAX_SR_PROFILES && CONFIG_BT_BLE_ENABLED && CONFIG_BT_BLUEDROID_ENABLED

Default value:

- 8 if CONFIG_BT_GATT_MAX_SR_PROFILES && CONFIG_BT_BLE_ENABLED && CONFIG_BT_BLUEDROID_ENABLED
**CONFIG_BT_GATT_MAX_SR_ATTRIBUTES**

Max GATT Service Attributes

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_BLE_ENABLED > CONFIG_BT_GATTS_ENABLE*

Maximum GATT Service Attributes Count

**Range:**
- from 1 to 500 if `CONFIG_BT_GATTS_ENABLE` && `CONFIG_BT_BLE_ENABLED` && `CONFIG_BT_BLUEDROID_ENABLED`

**Default value:**
- 100 if `CONFIG_BT_GATTS_ENABLE` && `CONFIG_BT_BLE_ENABLED` && `CONFIG_BT_BLUEDROID_ENABLED`

**CONFIG_BT_GATTS_SEND_SERVICE_CHANGE_MODE**

GATTS Service Change Mode

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_BLE_ENABLED > CONFIG_BT_GATTS_ENABLE*

Service change indication mode for GATT Server.

Available options:

- GATTs manually send service change indication (CONFIG_BT_GATTS_SEND_SERVICE_CHANGE_MANUAL)
  Manually send service change indication through API `esp_ble_gatts_send_service_change_indication()`
- GATTs automatically send service change indication (CONFIG_BT_GATTS_SEND_SERVICE_CHANGE_AUTO)
  Let Bluedroid handle the service change indication internally

**CONFIG_BT_GATTS_ROBUST_CACHING_ENABLED**

Enable Robust Caching on Server Side

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_BLE_ENABLED > CONFIG_BT_GATTS_ENABLE*

This option enable gatt robust caching feature on server

**Default value:**
- No (disabled) if `CONFIG_BT_GATTS_ENABLE` && `CONFIG_BT_BLE_ENABLED` && `CONFIG_BT_BLUEDROID_ENABLED`

**CONFIG_BT_GATTS_DEVICE_NAME_WRITABLE**

Allow to write device name by GATT clients

*Found in: Component config > Bluetooth > Bluedroid Options > CONFIG_BT_BLE_ENABLED > CONFIG_BT_GATTS_ENABLE*

Enabling this option allows remote GATT clients to write device name

**Default value:**
- No (disabled) if `CONFIG_BT_GATTS_ENABLE` && `CONFIG_BT_BLE_ENABLED` && `CONFIG_BT_BLUEDROID_ENABLED`
CONFIG_BT_GATTS_APPEARANCE_WRITABLE

Allow to write appearance by GATT clients

*Found in:* Component config > Bluetooth > Bluedroid Options > CONFIG_BT_BLE_ENABLED > CONFIG_BT_GATTS_ENABLE

Enabling this option allows remote GATT clients to write appearance

**Default value:**
- No (disabled) if CONFIG_BT_GATTS_ENABLE && CONFIG_BT_BLUEDROID_ENABLED

CONFIG_BT_GATTC_ENABLE

Include GATT client module(GATTC)

*Found in:* Component config > Bluetooth > Bluedroid Options > CONFIG_BT_BLE_ENABLED

This option can be close when the app work only on gatt server mode

**Default value:**
- Yes (enabled) if CONFIG_BT_BLE_ENABLED && CONFIG_BT_BLUEDROID_ENABLED

CONFIG_BT_GATTC_MAX_CACHE_CHAR

Max gattc cache characteristic for discover

*Found in:* Component config > Bluetooth > Bluedroid Options > CONFIG_BT_BLE_ENABLED > CONFIG_BT_GATTC_ENABLE

Maximum GATTC cache characteristic count

**Range:**
- from 1 to 500 if CONFIG_BT_GATTC_ENABLE && CONFIG_BT_BLUEDROID_ENABLED

**Default value:**
- 40 if CONFIG_BT_GATTC_ENABLE && CONFIG_BT_BLUEDROID_ENABLED

CONFIG_BT_GATTC_NOTIF_REG_MAX

Max gattc notify(indication) register number

*Found in:* Component config > Bluetooth > Bluedroid Options > CONFIG_BT_BLE_ENABLED > CONFIG_BT_GATTC_ENABLE

Maximum GATTC notify(indication) register number

**Range:**
- from 1 to 64 if CONFIG_BT_GATTC_ENABLE && CONFIG_BT_BLUEDROID_ENABLED

**Default value:**
- 5 if CONFIG_BT_GATTC_ENABLE && CONFIG_BT_BLUEDROID_ENABLED

CONFIG_BT_GATTC_CACHE_NV_FiSH

Save gattc cache data to nvs flash

*Found in:* Component config > Bluetooth > Bluedroid Options > CONFIG_BT_BLE_ENABLED > CONFIG_BT_GATTC_ENABLE

This select can save gattc cache data to nvs flash

**Default value:**
- No (disabled) if CONFIG_BT_GATTC_ENABLE && CONFIG_BT_BLUEDROID_ENABLED
**CONFIG_BT_GATTC_CONNECT_RETRY_COUNT**

The number of attempts to reconnect if the connection establishment failed

*Found in:* Component config > Bluetooth > Bluedroid Options > CONFIG_BT_BLE_ENABLED > CONFIG_BT_GATTC_ENABLE

The number of attempts to reconnect if the connection establishment failed

**Range:**
- from 0 to 7 if CONFIG_BT_GATTC_ENABLE && CONFIG_BT_BLUEDROID_ENABLED

**Default value:**
- 3 if CONFIG_BT_GATTC_ENABLE && CONFIG_BT_BLUEDROID_ENABLED

**CONFIG_BT_BLE_SMP_ENABLE**

Include BLE security module(SMP)

*Found in:* Component config > Bluetooth > Bluedroid Options > CONFIG_BT_BLE_ENABLED

This option can be close when the app not used the ble security connect.

**Default value:**
- Yes (enabled) if CONFIG_BT_BLE_ENABLED && CONFIG_BT_BLUEDROID_ENABLED

**CONFIG_BT_SMP_SLAVE_CON_PARAMS_UPD_ENABLE**

Slave enable connection parameters update during pairing

*Found in:* Component config > Bluetooth > Bluedroid Options > CONFIG_BT_BLE_ENABLED > CONFIG_BT_BLE_SMP_ENABLE

In order to reduce the pairing time, slave actively initiates connection parameters update during pairing.

**Default value:**
- No (disabled) if CONFIG_BT_BLE_SMP_ENABLE && CONFIG_BT_BLUEDROID_ENABLED

**CONFIG_BT_STACK_NO_LOG**

Disable BT debug logs (minimize bin size)

*Found in:* Component config > Bluetooth > Bluedroid Options

This select can save the rodata code size

**Default value:**
- No (disabled) if CONFIG_BT_BLUEDROID_ENABLED && CONFIG_BT_BLUEDROID_ENABLED

**BT DEBUG LOG LEVEL**  Contains:

- CONFIG_BT_LOG_A2D_TRACE_LEVEL
- CONFIG_BT_LOG_APPL_TRACE_LEVEL
- CONFIG_BT_LOG_AVCT_TRACE_LEVEL
- CONFIG_BT_LOG_AVDT_TRACE_LEVEL
- CONFIG_BT_LOG_AVRC_TRACE_LEVEL
- CONFIG_BT_LOG_BLUFI_TRACE_LEVEL
- CONFIG_BT_LOG_BNEP_TRACE_LEVEL
- CONFIG_BT_LOG_BTC_TRACE_LEVEL
- CONFIG_BT_LOG_BTIF_TRACE_LEVEL
- CONFIG_BT_LOG_BTM_TRACE_LEVEL
- CONFIG_BT_LOG_GAP_TRACE_LEVEL
- CONFIG_BT_LOG_GATT_TRACE_LEVEL
Chapter 2. API Reference

- CONFIG_BT_LOG_HCI_TRACE_LEVEL
- CONFIG_BT_LOG_HID_TRACE_LEVEL
- CONFIG_BT_LOG_L2CAP_TRACE_LEVEL
- CONFIG_BT_LOG_MCA_TRACE_LEVEL
- CONFIG_BT_LOG_OSI_TRACE_LEVEL
- CONFIG_BT_LOG_PAN_TRACE_LEVEL
- CONFIG_BT_LOG_RFCOMM_TRACE_LEVEL
- CONFIG_BT_LOG_SDP_TRACE_LEVEL
- CONFIG_BT_LOG_SMP_TRACE_LEVEL

**CONFIG_BT_LOG_HCI_TRACE_LEVEL**

HCI layer

*Found in: Component config > Bluetooth > Bluez Options > BT DEBUG LOG LEVEL*

Define BT trace level for HCI layer

Available options:

- NONE (CONFIG_BT_LOG_HCI_TRACE_LEVEL_NONE)
- ERROR (CONFIG_BT_LOG_HCI_TRACE_LEVEL_ERROR)
- WARNING (CONFIG_BT_LOG_HCI_TRACE_LEVEL_WARNING)
- API (CONFIG_BT_LOG_HCI_TRACE_LEVEL_API)
- EVENT (CONFIG_BT_LOG_HCI_TRACE_LEVEL_EVENT)
- DEBUG (CONFIG_BT_LOG_HCI_TRACE_LEVEL_DEBUG)
- VERBOSE (CONFIG_BT_LOG_HCI_TRACE_LEVEL_VERBOSE)

**CONFIG_BT_LOG_BTM_TRACE_LEVEL**

BTM layer

*Found in: Component config > Bluetooth > Bluez Options > BT DEBUG LOG LEVEL*

Define BT trace level for BTM layer

Available options:

- NONE (CONFIG_BT_LOG_BTM_TRACE_LEVEL_NONE)
- ERROR (CONFIG_BT_LOG_BTM_TRACE_LEVEL_ERROR)
- WARNING (CONFIG_BT_LOG_BTM_TRACE_LEVEL_WARNING)
- API (CONFIG_BT_LOG_BTM_TRACE_LEVEL_API)
- EVENT (CONFIG_BT_LOG_BTM_TRACE_LEVEL_EVENT)
- DEBUG (CONFIG_BT_LOG_BTM_TRACE_LEVEL_DEBUG)
- VERBOSE (CONFIG_BT_LOG_BTM_TRACE_LEVEL_VERBOSE)

**CONFIG_BT_LOG_L2CAP_TRACE_LEVEL**

L2CAP layer

*Found in: Component config > Bluetooth > Bluez Options > BT DEBUG LOG LEVEL*

Define BT trace level for L2CAP layer

Available options:

- NONE (CONFIG_BT_LOG_L2CAP_TRACE_LEVEL_NONE)
- ERROR (CONFIG_BT_LOG_L2CAP TRACE_LEVEL_ERROR)
- WARNING (CONFIG_BT_LOG_L2CAP_TRACE_LEVEL_WARNING)
Chapter 2. API Reference

- **API** (CONFIG_BT_LOG_L2CAP_TRACE_LEVEL_API)
- **EVENT** (CONFIG_BT_LOG_L2CAP_TRACE_LEVEL_EVENT)
- **DEBUG** (CONFIG_BT_LOG_L2CAP_TRACE_LEVEL_DEBUG)
- **VERBOSE** (CONFIG_BT_LOG_L2CAP_TRACE_LEVEL_VERBOSE)

**CONFIG_BT_LOG_RFCOMM_TRACE_LEVEL**

RFCOMM layer

*Found in:* Component config > Bluetooth > Blueodr Options > BT DEBUG LOG LEVEL

Define BT trace level for RFCOMM layer

Available options:

- **NONE** (CONFIG_BT_LOG_RFCOMM_TRACE_LEVEL_NONE)
- **ERROR** (CONFIG_BT_LOG_RFCOMM_TRACE_LEVEL_ERROR)
- **WARNING** (CONFIG_BT_LOG_RFCOMM_TRACE_LEVEL_WARNING)
- **API** (CONFIG_BT_LOG_RFCOMM_TRACE_LEVEL_API)
- **EVENT** (CONFIG_BT_LOG_RFCOMM_TRACE_LEVEL_EVENT)
- **DEBUG** (CONFIG_BT_LOG_RFCOMM_TRACE_LEVEL_DEBUG)
- **VERBOSE** (CONFIG_BT_LOG_RFCOMM_TRACE_LEVEL_VERBOSE)

**CONFIG_BT_LOG_SDP_TRACE_LEVEL**

SDP layer

*Found in:* Component config > Bluetooth > Blueodr Options > BT DEBUG LOG LEVEL

Define BT trace level for SDP layer

Available options:

- **NONE** (CONFIG_BT_LOG_SDP_TRACE_LEVEL_NONE)
- **ERROR** (CONFIG_BT_LOG_SDP_TRACE_LEVEL_ERROR)
- **WARNING** (CONFIG_BT_LOG_SDP_TRACE_LEVEL_WARNING)
- **API** (CONFIG_BT_LOG_SDP_TRACE_LEVEL_API)
- **EVENT** (CONFIG_BT_LOG_SDP_TRACE_LEVEL_EVENT)
- **DEBUG** (CONFIG_BT_LOG_SDP_TRACE_LEVEL_DEBUG)
- **VERBOSE** (CONFIG_BT_LOG_SDP_TRACE_LEVEL_VERBOSE)

**CONFIG_BT_LOG_GAP_TRACE_LEVEL**

GAP layer

*Found in:* Component config > Bluetooth > Blueodr Options > BT DEBUG LOG LEVEL

Define BT trace level for GAP layer

Available options:

- **NONE** (CONFIG_BT_LOG_GAP_TRACE_LEVEL_NONE)
- **ERROR** (CONFIG_BT_LOG_GAP_TRACE_LEVEL_ERROR)
- **WARNING** (CONFIG_BT_LOG_GAP_TRACE_LEVEL_WARNING)
- **API** (CONFIG_BT_LOG_GAP_TRACE_LEVEL_API)
- **EVENT** (CONFIG_BT_LOG_GAP_TRACE_LEVEL_EVENT)
- **DEBUG** (CONFIG_BT_LOG_GAP_TRACE_LEVEL_DEBUG)
- **VERBOSE** (CONFIG_BT_LOG_GAP_TRACE_LEVEL_VERBOSE)
Chapter 2. API Reference

**CONFIG_BT_LOG_BNEP_TRACE_LEVEL**

BNEP layer

*Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL*

Define BT trace level for BNEP layer

Available options:

- NONE (CONFIG_BT_LOG_BNEP_TRACE_LEVEL_NONE)
- ERROR (CONFIG_BT_LOG_BNEP_TRACE_LEVEL_ERROR)
- WARNING (CONFIG_BT_LOG_BNEP_TRACE_LEVEL_WARNING)
- API (CONFIG_BT_LOG_BNEPTRACE_LEVEL_API)
- EVENT (CONFIG_BT_LOG_BNEP_TRACE_LEVEL_EVENT)
- DEBUG (CONFIG_BT_LOG_BNEP_TRACE_LEVEL_DEBUG)
- VERBOSE (CONFIG_BT_LOG_BNEP_TRACE_LEVEL_VERBOSE)

**CONFIG_BT_LOG_PAN_TRACE_LEVEL**

PAN layer

*Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL*

Define BT trace level for PAN layer

Available options:

- NONE (CONFIG_BT_LOG_PAN_TRACE_LEVEL_NONE)
- ERROR (CONFIG_BT_LOG_PAN_TRACE_LEVEL_ERROR)
- WARNING (CONFIG_BT_LOG_PAN_TRACE_LEVEL_WARNING)
- API (CONFIG_BT_LOG_PAN_TRACE_LEVEL_API)
- EVENT (CONFIG_BT_LOG_PAN_TRACE_LEVEL_EVENT)
- DEBUG (CONFIG_BT_LOG_PAN_TRACE_LEVEL_DEBUG)
- VERBOSE (CONFIG_BT_LOG_PAN_TRACE_LEVEL_VERBOSE)

**CONFIG_BT_LOG_A2D_TRACE_LEVEL**

A2D layer

*Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL*

Define BT trace level for A2D layer

Available options:

- NONE (CONFIG_BT_LOG_A2D_TRACE_LEVEL_NONE)
- ERROR (CONFIG_BT_LOG_A2D_TRACE_LEVEL_ERROR)
- WARNING (CONFIG_BT_LOG_A2D_TRACE_LEVEL_WARNING)
- API (CONFIG_BT_LOG_A2D_TRACE_LEVEL_API)
- EVENT (CONFIG_BT_LOG_A2D_TRACE_LEVEL_EVENT)
- DEBUG (CONFIG_BT_LOG_A2D_TRACE_LEVEL_DEBUG)
- VERBOSE (CONFIG_BT_LOG_A2D_TRACE_LEVEL_VERBOSE)

**CONFIG_BT_LOG_AVDT_TRACE_LEVEL**

AVDT layer

*Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL*
Define BT trace level for AVDT layer

Available options:

- NONE (CONFIG_BT_LOG_AVDT_TRACE_LEVEL_NONE)
- ERROR (CONFIG_BT_LOG_AVDT_TRACE_LEVEL_ERROR)
- WARNING (CONFIG_BT_LOG_AVDT_TRACE_LEVEL_WARNING)
- API (CONFIG_BT_LOG_AVDT_TRACE_LEVEL_API)
- EVENT (CONFIG_BT_LOG_AVDT_TRACE_LEVEL_EVENT)
- DEBUG (CONFIG_BT_LOG_AVDT_TRACE_LEVEL_DEBUG)
- VERBOSE (CONFIG_BT_LOG_AVDT_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_AVCT_TRACE_LEVEL

AVCT layer

*Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL*

Define BT trace level for AVCT layer

Available options:

- NONE (CONFIG_BT_LOG_AVCT_TRACE_LEVEL_NONE)
- ERROR (CONFIG_BT_LOG_AVCT_TRACE_LEVEL_ERROR)
- WARNING (CONFIG_BT_LOG_AVCT_TRACE_LEVEL_WARNING)
- API (CONFIG_BT_LOG_AVCT_TRACE_LEVEL_API)
- EVENT (CONFIG_BT_LOG_AVCT_TRACE_LEVEL_EVENT)
- DEBUG (CONFIG_BT_LOG_AVCT_TRACE_LEVEL_DEBUG)
- VERBOSE (CONFIG_BT_LOG_AVCT_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_AVRC_TRACE_LEVEL

AVRC layer

*Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL*

Define BT trace level for AVRC layer

Available options:

- NONE (CONFIG_BT_LOG_AVRC_TRACE_LEVEL_NONE)
- ERROR (CONFIG_BT_LOG_AVRC_TRACE_LEVEL_ERROR)
- WARNING (CONFIG_BT_LOG_AVRC_TRACE_LEVEL_WARNING)
- API (CONFIG_BT_LOG_AVRC_TRACE_LEVEL_API)
- EVENT (CONFIG_BT_LOG_AVRC_TRACE_LEVEL_EVENT)
- DEBUG (CONFIG_BT_LOG_AVRC_TRACE_LEVEL_DEBUG)
- VERBOSE (CONFIG_BT_LOG_AVRC_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_MCA_TRACE_LEVEL

MCA layer

*Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL*

Define BT trace level for MCA layer

Available options:
• NONE (CONFIG_BT_LOG_MCA_TRACE_LEVEL_NONE)
• ERROR (CONFIG_BT_LOG_MCA_TRACE_LEVEL_ERROR)
• WARNING (CONFIG_BT_LOG_MCA_TRACE_LEVEL_WARNING)
• API (CONFIG_BT_LOG_MCA_TRACE_LEVEL_API)
• EVENT (CONFIG_BT_LOG_MCA_TRACE_LEVEL_EVENT)
• DEBUG (CONFIG_BT_LOG_MCA_TRACE_LEVEL_DEBUG)
• VERBOSE (CONFIG_BT_LOG_MCA_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_HID_TRACE_LEVEL

HID layer

Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL

Define BT trace level for HID layer

Available options:

• NONE (CONFIG_BT_LOG_HID_TRACE_LEVEL_NONE)
• ERROR (CONFIG_BT_LOG_HID_TRACE_LEVEL_ERROR)
• WARNING (CONFIG_BT_LOG_HID_TRACE_LEVEL_WARNING)
• API (CONFIG_BT_LOG_HID_TRACE_LEVEL_API)
• EVENT (CONFIG_BT_LOG_HID_TRACE_LEVEL_EVENT)
• DEBUG (CONFIG_BT_LOG_HID_TRACE_LEVEL_DEBUG)
• VERBOSE (CONFIG_BT_LOG_HID_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_APPL_TRACE_LEVEL

APPL layer

Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL

Define BT trace level for APPL layer

Available options:

• NONE (CONFIG_BT_LOG_APPL_TRACE_LEVEL_NONE)
• ERROR (CONFIG_BT_LOG_APPL_TRACE_LEVEL_ERROR)
• WARNING (CONFIG_BT_LOG_APPL_TRACE_LEVEL_WARNING)
• API (CONFIG_BT_LOG_APPL_TRACE_LEVEL_API)
• EVENT (CONFIG_BT_LOG_APPL_TRACE_LEVEL_EVENT)
• DEBUG (CONFIG_BT_LOG_APPL_TRACE_LEVEL_DEBUG)
• VERBOSE (CONFIG_BT_LOG_APPL_TRACE_LEVEL_VERBOSE)

CONFIG_BT_LOG_GATT_TRACE_LEVEL

GATT layer

Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL

Define BT trace level for GATT layer

Available options:

• NONE (CONFIG_BT_LOG_GATT_TRACE_LEVEL_NONE)
• ERROR (CONFIG_BT_LOG_GATT_TRACE_LEVEL_ERROR)
• WARNING (CONFIG_BT_LOG_GATT_TRACE_LEVEL_WARNING)
• API (CONFIG_BT_LOG_GATT_TRACE_LEVEL_API)
• EVENT (CONFIG_BT_LOG_GATT_TRACE_LEVEL_EVENT)
Chapter 2. API Reference

- DEBUG (CONFIG_BT_LOG_GATT_TRACE_LEVEL_DEBUG)
- VERBOSE (CONFIG_BT_LOG_GATT_TRACE_LEVEL_VERBOSE)

**CONFIG_BT_LOG_SMP_TRACE_LEVEL**

SMP layer

*Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL*

Define BT trace level for SMP layer

Available options:

- NONE (CONFIG_BT_LOG_SMP_TRACE_LEVEL_NONE)
- ERROR (CONFIG_BT_LOG_SMP_TRACE_LEVEL_ERROR)
- WARNING (CONFIG_BT_LOG_SMP_TRACE_LEVEL_WARNING)
- API (CONFIG_BT_LOG_SMP_TRACE_LEVEL_API)
- EVENT (CONFIG_BT_LOG_SMP_TRACE_LEVEL_EVENT)
- DEBUG (CONFIG_BT_LOG_SMP_TRACE_LEVEL_DEBUG)
- VERBOSE (CONFIG_BT_LOG_SMP_TRACE_LEVEL_VERBOSE)

**CONFIG_BT_LOG_BTIF_TRACE_LEVEL**

BTIF layer

*Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL*

Define BT trace level for BTIF layer

Available options:

- NONE (CONFIG_BT_LOG_BTIF_TRACE_LEVEL_NONE)
- ERROR (CONFIG_BT_LOG_BTIF_TRACE_LEVEL_ERROR)
- WARNING (CONFIG_BT_LOG_BTIF_TRACE_LEVEL_WARNING)
- API (CONFIG_BT_LOG_BTIF_TRACE_LEVEL_API)
- EVENT (CONFIG_BT_LOG_BTIF_TRACE_LEVEL_EVENT)
- DEBUG (CONFIG_BT_LOG_BTIF_TRACE_LEVEL_DEBUG)
- VERBOSE (CONFIG_BT_LOG_BTIF_TRACE_LEVEL_VERBOSE)

**CONFIG_BT_LOG_BTC_TRACE_LEVEL**

BTC layer

*Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL*

Define BT trace level for BTC layer

Available options:

- NONE (CONFIG_BT_LOG_BTC_TRACE_LEVEL_NONE)
- ERROR (CONFIG_BT_LOG_BTC_TRACE_LEVEL_ERROR)
- WARNING (CONFIG_BT_LOG_BTC_TRACE_LEVEL_WARNING)
- API (CONFIG_BT_LOG_BTC_TRACE_LEVEL_API)
- EVENT (CONFIG_BT_LOG_BTC_TRACE_LEVEL_EVENT)
- DEBUG (CONFIG_BT_LOG_BTC_TRACE_LEVEL_DEBUG)
- VERBOSE (CONFIG_BT_LOG_BTC_TRACE_LEVEL_VERBOSE)
**CONFIG_BT_LOG_OSI_TRACE_LEVEL**

OSI layer

*Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL*

Define BT trace level for OSI layer

Available options:

- None (CONFIG_BT_LOG_OSI_TRACE_LEVEL_NONE)
- Error (CONFIG_BT_LOG_OSI_TRACE_LEVEL_ERROR)
- Warning (CONFIG_BT_LOG_OSI_TRACE_LEVEL_WARNING)
- Api (CONFIG_BT_LOG_OSI_TRACE_LEVEL_API)
- Event (CONFIG_BT_LOG_OSI_TRACE_LEVEL_EVENT)
- Debug (CONFIG_BT_LOG_OSI_TRACE_LEVEL_DEBUG)
- Verbose (CONFIG_BT_LOG_OSI_TRACE_LEVEL_VERBOSE)

**CONFIG_BT_LOG_BLUFI_TRACE_LEVEL**

BLUFI layer

*Found in: Component config > Bluetooth > Bluedroid Options > BT DEBUG LOG LEVEL*

Define BT trace level for BLUFI layer

Available options:

- None (CONFIG_BT_LOG_BLUFI_TRACE_LEVEL_NONE)
- Error (CONFIG_BT_LOG_BLUFI_TRACE_LEVEL_ERROR)
- Warning (CONFIG_BT_LOG_BLUFI_TRACE_LEVEL_WARNING)
- Api (CONFIG_BT_LOG_BLUFI_TRACE_LEVEL_API)
- Event (CONFIG_BT_LOG_BLUFI_TRACE_LEVEL_EVENT)
- Debug (CONFIG_BT_LOG_BLUFI_TRACE_LEVEL_DEBUG)
- Verbose (CONFIG_BT_LOG_BLUFI_TRACE_LEVEL_VERBOSE)

**CONFIG_BT_ACL_CONNECTIONS**

BT/BLE MAX ACL CONNECTIONS(1-9)

*Found in: Component config > Bluetooth > Bluedroid Options*

Maximum BT/BLE connection count. The ESP32-C3/S3 chip supports a maximum of 10 instances, including ADV, SCAN and connections. The ESP32-C3/S3 chip can connect up to 9 devices if ADV or SCAN uses only one. If ADV and SCAN are both used, The ESP32-C3/S3 chip is connected to a maximum of 8 devices. Because Bluetooth cannot reclaim used instances once ADV or SCAN is used.

Range:

- From 1 to 9 if CONFIG_BT_BLUEDROID_ENABLED && CONFIG_BT_BLUEDROID_ENABLED

Default value:

- 4 if CONFIG_BT_BLUEDROID_ENABLED && CONFIG_BT_BLUEDROID_ENABLED

**CONFIG_BT_MULTI_CONNECTION_ENBALE**

Enable BLE multi-conections

*Found in: Component config > Bluetooth > Bluedroid Options*

Enable this option if there are multiple connections

Default value:
• Yes (enabled) if CONFIG_BT_BLUEDROID_ENABLED && CONFIG_BT_BLUEDROID_ENABLED

**CONFIG_BT_ALLOCATION_FROM_SPIRAM_FIRST**

BT/BLE will first allocate the memory from the PSRAM

*Found in: Component config > Bluetooth > Bluedroid Options*

This select can save the internal RAM if there have the PSRAM

**Default value:**

• No (disabled) if CONFIG_BT_BLUEDROID_ENABLED && CONFIG_BT_BLUEDROID_ENABLED

**CONFIG_BT_BLE_DYNAMIC_ENV_MEMORY**

Use dynamic memory allocation in BT/BLE stack

*Found in: Component config > Bluetooth > Bluedroid Options*

This select can make the allocation of memory will become more flexible

**Default value:**

• No (disabled) if CONFIG_BT_BLUEDROID_ENABLED && CONFIG_BT_BLUEDROID_ENABLED

**CONFIG_BT_BLE_HOST_QUEUE_CONG_CHECK**

BLE queue congestion check

*Found in: Component config > Bluetooth > Bluedroid Options*

When scanning and scan duplicate is not enabled, if there are a lot of adv packets around or application layer handling adv packets is slow, it will cause the controller memory to run out. If enabled, adv packets will be lost when host queue is congested.

**Default value:**

• No (disabled) if CONFIG_BT_BLUEDROID_ENABLED && CONFIG_BT_BLUEDROID_ENABLED

**CONFIG_BT_BLE_ACT_SCAN_REP_ADV_SCAN**

Report adv data and scan response individually when BLE active scan

*Found in: Component config > Bluetooth > Bluedroid Options*

Originally, when doing BLE active scan, Bluedroid will not report adv to application layer until receive scan response. This option is used to disable the behavior. When enable this option, Bluedroid will report adv data or scan response to application layer immediately.

# Memory reserved at start of DRAM for Bluetooth stack

**Default value:**

• No (disabled) if CONFIG_BT_BLUEDROID_ENABLED && CONFIG_BT_BLE_ENABLED && CONFIG_BT_BLUEDROID_ENABLED

**CONFIG_BT_BLE_ESTAB_LINK_CONN_TOUT**

Timeout of BLE connection establishment

*Found in: Component config > Bluetooth > Bluedroid Options*

Bluetooth Connection establishment maximum time, if connection time exceeds this value, the connection establishment fails, ESP_GATTC_OPEN_EVT or ESP_GATTS_OPEN_EVT is triggered.
Range:
- from 1 to 60 if CONFIG_BT_BLUEDROID_ENABLED && CONFIG_BT_BLUEDROID_ENABLED

Default value:
- 30 if CONFIG_BT_BLUEDROID_ENABLED && CONFIG_BT_BLUEDROID_ENABLED

**CONFIG_BT_MAX_DEVICE_NAME_LEN**

Length of Bluetooth device name

*Found in: Component config > Bluetooth > Bluedroid Options*

Bluetooth device name length shall be no larger than 248 octets. If the broadcast data cannot contain the complete device name, only the short name will be displayed, the rest parts that can’t fit in will be truncated.

Range:
- from 32 to 248 if CONFIG_BT_BLUEDROID_ENABLED && CONFIG_BT_BLUEDROID_ENABLED

Default value:
- 32 if CONFIG_BT_BLUEDROID_ENABLED && CONFIG_BT_BLUEDROID_ENABLED

**CONFIG_BT_BLE_RPA_SUPPORTED**

Update RPA to Controller

*Found in: Component config > Bluetooth > Bluedroid Options*

This enables controller RPA list function. For ESP32, ESP32 only support network privacy mode. If this option is enabled, ESP32 will only accept advertising packets from peer devices that contain private address, HW will not receive the advertising packets contain identity address after IRK changed. If this option is disabled, address resolution will be performed in the host, so the functions that require controller to resolve address in the white list cannot be used. This option is disabled by default on ESP32, please enable or disable this option according to your own needs.

For other BLE chips, devices support network privacy mode and device privacy mode, users can switch the two modes according to their own needs. So this option is enabled by default.

Default value:
- Yes (enabled) if CONFIG_BT_CONTROLLER_DISABLED && CONFIG_BT_BLUEDROID_ENABLED && CONFIG_BT_CONTROLLER_DISABLED && CONFIG_BT_BLUEDROID_ENABLED

**CONFIG_BT_BLE_RPA_TIMEOUT**

Timeout of resolvable private address

*Found in: Component config > Bluetooth > Bluedroid Options*

This set RPA timeout of Controller and Host. Default is 900 s (15 minutes). Range is 1 s to 1 hour (3600 s).

Range:
- from 1 to 3600 if CONFIG_BT_BLUEDROID_ENABLED && CONFIG_BT_BLUEDROID_ENABLED

Default value:
- 900 if CONFIG_BT_BLUEDROID_ENABLED && CONFIG_BT_BLUEDROID_ENABLED

**CONFIG_BT_BLE_50_FEATURES_SUPPORTED**
Enable BLE 5.0 features

*Found in: Component config > Bluetooth > Bluedroid Options*

This enables BLE 5.0 features, this option only supports esp32c3/esp32s3 chip

**Default value:**
- Yes (enabled) if $\text{CONFIG\_BT\_BLUEDROID\_ENABLED} \land (\text{CONFIG\_BT\_CONTROLLER\_ENABLED} \lor \text{CONFIG\_BT\_CONTROLLER\_DISABLED}) \land \text{CONFIG\_BT\_BLUEDROID\_ENABLED}$

**CONFIG\_BT\_BLE\_42\_FEATURES\_SUPPORTED**

Enable BLE 4.2 features

*Found in: Component config > Bluetooth > Bluedroid Options*

This enables BLE 4.2 features.

**Default value:**
- No (disabled) if $\text{CONFIG\_BT\_BLUEDROID\_ENABLED} \land (\text{CONFIG\_BT\_CONTROLLER\_ENABLED} \lor \text{CONFIG\_BT\_CONTROLLER\_DISABLED}) \land \text{CONFIG\_BT\_BLUEDROID\_ENABLED}$

**CONFIG\_BT\_BLE\_FEAT\_PERIODIC\_ADV\_SYNC\_TRANSFER**

Enable BLE periodic advertising sync transfer feature

*Found in: Component config > Bluetooth > Bluedroid Options*

This enables BLE periodic advertising sync transfer feature

**Default value:**
- No (disabled) if $\text{CONFIG\_BT\_BLUEDROID\_ENABLED} \land \text{CONFIG\_BT\_BLUEDROID\_ENABLED} \land (\text{CONFIG\_BT\_CONTROLLER\_ENABLED} \land \text{SOC\_ESP\_NIMBLE\_CONTROLLER}) \lor \text{CONFIG\_BT\_CONTROLLER\_DISABLED}) \land \text{CONFIG\_BT\_BLUEDROID\_ENABLED}$

**CONFIG\_BT\_BLE\_FEAT\_PERIODIC\_ADV\_ENH**

Enable periodic adv enhancements(adi support)

*Found in: Component config > Bluetooth > Bluedroid Options*

Enable the periodic advertising enhancements

**Default value:**
- No (disabled) if $\text{CONFIG\_BT\_BLUEDROID\_ENABLED} \land \text{CONFIG\_BT\_BLUEDROID\_ENABLED} \land (\text{CONFIG\_BT\_CONTROLLER\_ENABLED} \land \text{SOC\_ESP\_NIMBLE\_CONTROLLER}) \lor \text{CONFIG\_BT\_CONTROLLER\_DISABLED}) \land \text{CONFIG\_BT\_BLUEDROID\_ENABLED}$

**CONFIG\_BT\_BLE\_HIGH\_DUTY\_ADV\_INTERVAL**

Enable BLE high duty advertising interval feature

*Found in: Component config > Bluetooth > Bluedroid Options*

This enables BLE high duty advertising interval feature

**Default value:**
- No (disabled) if $\text{CONFIG\_BT\_BLUEDROID\_ENABLED} \land \text{CONFIG\_BT\_BLUEDROID\_ENABLED}$
**NimBLE Options**  Contains:

- `CONFIG_BT_NIMBLE_SVC_GAP_DEVICE_NAME`
- `CONFIG_BT_NIMBLE_HS_STOP_TIMEOUT_MS`
- `CONFIG_BT_NIMBLE_HOST_QUEUE_CONG_CHECK`
- `CONFIG_BT_NIMBLE_WHITELIST_SIZE`
- `CONFIG_BT_NIMBLE_BLE_GATT_BLOB_TRANSFER`
- `CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT`
- `CONFIG_BT_NIMBLE_ROLE_BROADCASTER`
- `CONFIG_BT_NIMBLE_ROLE_CENTRAL`
- `CONFIG_BT_NIMBLE_HIGH_DUTY_ADV_ITVL`
- `CONFIG_BT_NIMBLE_MESH`
- `CONFIG_BT_NIMBLE_ROLE_OBSERVER`
- `CONFIG_BT_NIMBLE_ROLE_PERIPHERAL`
- `CONFIG_BT_NIMBLE_SECURITY_ENABLE`
- `CONFIG_BT_NIMBLE_BLUFI_ENABLE`
- `CONFIG_BT_NIMBLE_ENABLE_CONN_REATTEMPT`
- `CONFIG_BT_NIMBLE_DYNAMIC_SERVICE`
- `CONFIG_BT_NIMBLE_USE_ESP_TIMER`
- `CONFIG_BT_NIMBLE_DEBUG`
- `CONFIG_BT_NIMBLE_HS_FLOW_CTRL`
- `CONFIG_BT_NIMBLE_VS_SUPPORT`
- `CONFIG_BT_NIMBLE_OPTIMIZE_MULTI_CONN`
- `CONFIG_BT_NIMBLE_ENC_ADV_DATA`
- `CONFIG_BT_NIMBLE_SVC_GAP_APPEARANCE`
- `GAP Service`
- `CONFIG_BT_NIMBLE_GAP_DEVICE_NAME_MAX_LEN`
- `CONFIG_BT_NIMBLE_MAX_BONDS`
- `CONFIG_BT_NIMBLE_MAX_CCCDS`
- `CONFIG_BT_NIMBLE_MAX_CONNECTIONS`
- `CONFIG_BT_NIMBLE_L2CAP_COC_MAX_NUM`
- `CONFIG_BT_NIMBLE_GATT_MAX_PROCS`
- `CONFIG_BT_NIMBLE_MEM_ALLOC_MODE`
- `Memory Settings`
- `CONFIG_BT_NIMBLE_LOG_LEVEL`
- `CONFIG_BT_NIMBLE_HOST_TASK_STACK_SIZE`
- `CONFIG_BT_NIMBLE_CRYPTO_STACK_MBEDTLS`
- `CONFIG_BT_NIMBLE_NV_PERSIST`
- `CONFIG_BT_NIMBLE_ATT_PREFERRED_MTU`
- `CONFIG_BT_NIMBLE_RPA_TIMEOUT`
- `CONFIG_BT_NIMBLE_Pinned_to_Core_CHOICE`
- `CONFIG_BT_NIMBLE_TEST_THROUGHPUT_TEST`

**CONFIG_BT_NIMBLE_MEM_ALLOC_MODE**

Memory allocation strategy

*Found in: Component config > Bluetooth > NimBLE Options*

Allocation strategy for NimBLE host stack, essentially provides ability to allocate all required dynamic allocations from:

- Internal DRAM memory only
- External SPIRAM memory only
- Either internal or external memory based on default malloc() behavior in ESP-IDF
- Internal IRAM memory wherever applicable else internal DRAM

Available options:
• Internal memory (CONFIG_BT_NIMBLE_MEM_ALLOC_MODE_INTERNAL)
• External SPI RAM (CONFIG_BT_NIMBLE_MEM_ALLOC_MODE_EXTERNAL)
• Default alloc mode (CONFIG_BT_NIMBLE_MEM_ALLOC_MODE_DEFAULT)
• Internal IRAM (CONFIG_BT_NIMBLE_MEM_ALLOC_MODE_IRAM_8BIT)

Allows to use IRAM memory region as 8bit accessible region.
Every unaligned (8bit or 16bit) access will result in an exception and incur penalty of
certain clock cycles per unaligned read/write.

CONFIG_BT_NIMBLE_LOG_LEVEL

NimBLE Host log verbosity

Found in: Component config > Bluetooth > NimBLE Options

Select NimBLE log level. Please make a note that the selected NimBLE log verbosity can not exceed
the level set in “Component config -> Log output -> Default log verbosity”.

Available options:

• No logs (CONFIG_BT_NIMBLE_LOG_LEVEL_NONE)
• Error logs (CONFIG_BT_NIMBLE_LOG_LEVEL_ERROR)
• Warning logs (CONFIG_BT_NIMBLE_LOG_LEVEL_WARNING)
• Info logs (CONFIG_BT_NIMBLE_LOG_LEVEL_INFO)
• Debug logs (CONFIG_BT_NIMBLE_LOG_LEVEL_DEBUG)

CONFIG_BT_NIMBLE_MAX_CONNECTIONS

Maximum number of concurrent connections

Found in: Component config > Bluetooth > NimBLE Options

Defines maximum number of concurrent BLE connections. For ESP32, user is expected to configure
BTDM_CTRL_BLE_MAX_CONN from controller menu along with this option. Similarly for ESP32-
C3 or ESP32-S3, user is expected to configure BT_CTRL_BLE_MAX_ACT from controller menu.
For ESP32C2, ESP32C6 and ESP32H2, each connection will take about 1k DRAM.

Range:
• from 1 to 9 if CONFIG_BT_NIMBLE_ENABLED && CONFIG_BT_NIMBLE_ENABLED

Default value:
• 3 if CONFIG_BT_NIMBLE_ENABLED && CONFIG_BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_MAX_BONDS

Maximum number of bonds to save across reboots

Found in: Component config > Bluetooth > NimBLE Options

Defines maximum number of bonds to save for peer security and our security

Default value:
• 3 if CONFIG_BT_NIMBLE_ENABLED && CONFIG_BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_MAX_CCCDS

Maximum number of CCC descriptors to save across reboots

Found in: Component config > Bluetooth > NimBLE Options

Defines maximum number of CCC descriptors to save

Default value:
• 8 if CONFIG_BT_NIMBLE_ENABLED && CONFIG_BT_NIMBLE_ENABLED
**CONFIG_BT_NIMBLE_L2CAP_COC_MAX_NUM**

Maximum number of connection oriented channels

*Found in: Component config > Bluetooth > NimBLE Options*

Defines maximum number of BLE Connection Oriented Channels. When set to (0), BLE COC is not compiled in

**Range:**
- from 0 to 9 if `CONFIG_BT_NIMBLE_ENABLED` & `CONFIG_BT_NIMBLE_ENABLED`

**Default value:**
- 0 if `CONFIG_BT_NIMBLE_ENABLED` & `CONFIG_BT_NIMBLE_ENABLED`

**CONFIG_BT_NIMBLE_PINNED_TO_CORE_CHOICE**

The CPU core on which NimBLE host will run

*Found in: Component config > Bluetooth > NimBLE Options*

The CPU core on which NimBLE host will run. You can choose Core 0 or Core 1. Cannot specify no-affinity

**Available options:**
- Core 0 (PRO CPU) (CONFIG_BT_NIMBLE_PINNED_TO_CORE_0)
- Core 1 (APP CPU) (CONFIG_BT_NIMBLE_PINNED_TO_CORE_1)

**CONFIG_BT_NIMBLE_HOST_TASK_STACK_SIZE**

NimBLE Host task stack size

*Found in: Component config > Bluetooth > NimBLE Options*

This configures stack size of NimBLE host task

**Default value:**
- 5120 if `CONFIG_BLE_MESH` & `CONFIG_BT_NIMBLE_ENABLED` & `CONFIG_BT_NIMBLE_ENABLED`
- 4096 if `CONFIG_BT_NIMBLE_ENABLED` & `CONFIG_BT_NIMBLE_ENABLED`

**CONFIG_BT_NIMBLE_ROLE_CENTRAL**

Enable BLE Central role

*Found in: Component config > Bluetooth > NimBLE Options*

Enables central role

**Default value:**
- Yes (enabled) if `CONFIG_BT_NIMBLE_ENABLED` & `CONFIG_BT_NIMBLE_ENABLED`

**CONFIG_BT_NIMBLE_ROLE_PERIPHERAL**

Enable BLE Peripheral role

*Found in: Component config > Bluetooth > NimBLE Options*

Enable peripheral role

**Default value:**
- Yes (enabled) if `CONFIG_BT_NIMBLE_ENABLED` & `CONFIG_BT_NIMBLE_ENABLED`
CONFIG_BT_NIMBLE_ROLE_BROADCASTER
Enable BLE Broadcaster role

*Found in: Component config > Bluetooth > NimBLE Options*

Enables broadcaster role

**Default value:**
- Yes (enabled) if `CONFIG_BT_NIMBLE_ENABLED` & `CONFIG_BT_NIMBLE_ENABLED`

CONFIG_BT_NIMBLE_ROLE_OBSERVER
Enable BLE Observer role

*Found in: Component config > Bluetooth > NimBLE Options*

Enables observer role

**Default value:**
- Yes (enabled) if `CONFIG_BT_NIMBLE_ENABLED` & `CONFIG_BT_NIMBLE_ENABLED`

CONFIG_BT_NIMBLE_NVS_PERSIST
Persist the BLE Bonding keys in NVS

*Found in: Component config > Bluetooth > NimBLE Options*

Enable this flag to make bonding persistent across device reboots

**Default value:**
- No (disabled) if `CONFIG_BT_NIMBLE_ENABLED` & `CONFIG_BT_NIMBLE_ENABLED`

CONFIG_BT_NIMBLE_SECURITY_ENABLE
Enable BLE SM feature

*Found in: Component config > Bluetooth > NimBLE Options*

Enable BLE sm feature

**Default value:**
- Yes (enabled) if `CONFIG_BT_NIMBLE_ENABLED` & `CONFIG_BT_NIMBLE_ENABLED`

Contains:
- `CONFIG_BT_NIMBLE_LL_CFG_FEAT_LE_ENCRYPTION`
- `CONFIG_BT_NIMBLE_SM_LEGACY`
- `CONFIG_BT_NIMBLE_SM_SC`

CONFIG_BT_NIMBLE_SM_LEGACY
Security manager legacy pairing

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_SECURITY_ENABLE*

Enable security manager legacy pairing

**Default value:**
- Yes (enabled) if `CONFIG_BT_NIMBLE_SECURITY_ENABLE` & `CONFIG_BT_NIMBLE_ENABLED`
CONFIG_BT_NIMBLE_SM_SC

Security manager secure connections (4.2)

Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_SECURITY_ENABLE

Enable security manager secure connections

Default value:
- Yes (enabled) if CONFIG_BT_NIMBLE_SECURITY_ENABLE && CONFIG_BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_SM_SCDebugEnabled

Use predefined public-private key pair

Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_SECURITY_ENABLE > CONFIG_BT_NIMBLE_SM_SC

If this option is enabled, SM uses predefined DH key pair as described in Core Specification, Vol. 3, Part H, 2.3.5.6.1. This allows to decrypt air traffic easily and thus should only be used for debugging.

Default value:
- No (disabled) if CONFIG_BT_NIMBLE_SECURITY_ENABLE && CONFIG_BT_NIMBLE_SM_SC && CONFIG_BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_LL_CFG_FEAT_LE_ENCRYPTION

Enable LE encryption

Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_SECURITY_ENABLE

Enable encryption connection

Default value:
- Yes (enabled) if CONFIG_BT_NIMBLE_SECURITY_ENABLE && CONFIG_BT_NIMBLE_ENABLED && CONFIG_BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_DEBUG

Enable extra runtime asserts and host debugging

Found in: Component config > Bluetooth > NimBLE Options

This enables extra runtime asserts and host debugging

Default value:
- No (disabled) if CONFIG_BT_NIMBLE_ENABLED && CONFIG_BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_DYNAMIC_SERVICE

Enable dynamic services

Found in: Component config > Bluetooth > NimBLE Options

This enables user to add/remove Gatt services at runtime
**CONFIG_BT_NIMBLE_SVC_GAP_DEVICE_NAME**

BLE GAP default device name

*Found in: Component config > Bluetooth > NimBLE Options*

The Device Name characteristic shall contain the name of the device as an UTF-8 string. This name can be changed by using API `ble_svc_gap_device_name_set()`

**Default value:**

- “nimble” if `CONFIG_BT_NIMBLE_ENABLED` && `CONFIG_BT_NIMBLE_ENABLED`

**CONFIG_BT_NIMBLE_GAP_DEVICE_NAME_MAX_LEN**

Maximum length of BLE device name in octets

*Found in: Component config > Bluetooth > NimBLE Options*

Device Name characteristic value shall be 0 to 248 octets in length

**Default value:**

- 31 if `CONFIG_BT_NIMBLE_ENABLED` && `CONFIG_BT_NIMBLE_ENABLED`

**CONFIG_BT_NIMBLE_ATT_PREFERRED_MTU**

Preferred MTU size in octets

*Found in: Component config > Bluetooth > NimBLE Options*

This is the default value of ATT MTU indicated by the device during an ATT MTU exchange. This value can be changed using API `ble_att_set_preferred_mtu()`

**Default value:**

- 256 if `CONFIG_BT_NIMBLE_ENABLED` && `CONFIG_BT_NIMBLE_ENABLED`

**CONFIG_BT_NIMBLE_SVC_GAP_APPEARANCE**

External appearance of the device

*Found in: Component config > Bluetooth > NimBLE Options*

Standard BLE GAP Appearance value in HEX format e.g. 0x02C0

**Default value:**

- 0 if `CONFIG_BT_NIMBLE_ENABLED` && `CONFIG_BT_NIMBLE_ENABLED`

**Memory Settings**

Contains:

- `CONFIG_BT_NIMBLE_TRANSPORT_ACL_FROM_LL_COUNT`
- `CONFIG_BT_NIMBLE_TRANSPORT_EVT_DISCARD_COUNT`

CONFIG_BT_NIMBLE_MSYS_1_BLOCK_COUNT

MSYS_1 Block Count

*Found in: Component config > Bluetooth > NimBLE Options > Memory Settings*

MSYS is a system level mbuf registry. For prepare write & prepare responses MBUFs are allocated out of msys_1 pool. For NIMBLE_MESH enabled cases, this block count is increased by 8 than user defined count.

**Default value:**
- 24 if SOC_ESP_NIMBLE_CONTROLLER & CONFIG_BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_MSYS_1_BLOCK_SIZE

MSYS_1 Block Size

*Found in: Component config > Bluetooth > NimBLE Options > Memory Settings*

Dynamic memory size of block 1

**Default value:**
- 128 if SOC_ESP_NIMBLE_CONTROLLER & CONFIG_BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_MSYS_2_BLOCK_COUNT

MSYS_2 Block Count

*Found in: Component config > Bluetooth > NimBLE Options > Memory Settings*

Dynamic memory count

**Default value:**
- 24 if CONFIG_BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_MSYS_2_BLOCK_SIZE

MSYS_2 Block Size

*Found in: Component config > Bluetooth > NimBLE Options > Memory Settings*

Dynamic memory size of block 2

**Default value:**
- 320 if CONFIG_BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_MSYS_BUF_FROM_HEAP

Get Msys Mbuf from heap

*Found in: Component config > Bluetooth > NimBLE Options > Memory Settings*

This option sets the source of the shared msys mbuf memory between the Host and the Controller. Allocate the memory from the heap if this option is set, from the mempool otherwise.

**Default value:**
- Yes (enabled) if BT_LE_MSYS_INIT_IN_CONTROLLER & CONFIG_BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_TRANSPORT_ACL_FROM_LL_COUNT

ACL Buffer count

*Found in: Component config > Bluetooth > NimBLE Options > Memory Settings*

The number of ACL data buffers allocated for host.
**CONFIG_BT_NIMBLE_TRANSPORT_ACL_SIZE**

Transport ACL Buffer size

*Found in: Component config > Bluetooth > NimBLE Options > Memory Settings*

This is the maximum size of the data portion of HCI ACL data packets. It does not include the HCI data header (of 4 bytes)

**Default value:**
- 24 if `CONFIG_BT_NIMBLE_ENABLED && CONFIG_BT_NIMBLE_ENABLED`

**CONFIG_BT_NIMBLE_TRANSPORT_EVT_SIZE**

Transport Event Buffer size

*Found in: Component config > Bluetooth > NimBLE Options > Memory Settings*

This is the size of each HCI event buffer in bytes. In case of extended advertising, packets can be fragmented. 257 bytes is the maximum size of a packet.

**Default value:**
- 257 if `CONFIG_BT_NIMBLE_EXT_ADV && CONFIG_BT_NIMBLE_ENABLED && CONFIG_BT_NIMBLE_ENABLED`
- 70 if `CONFIG_BT_NIMBLE_ENABLED && CONFIG_BT_NIMBLE_ENABLED`

**CONFIG_BT_NIMBLE_TRANSPORT_EVT_COUNT**

Transport Event Buffer count

*Found in: Component config > Bluetooth > NimBLE Options > Memory Settings*

This is the high priority HCI events’ buffer size. High-priority event buffers are for everything except advertising reports. If there are no free high-priority event buffers then host will try to allocate a low-priority buffer instead

**Default value:**
- 30 if `CONFIG_BT_NIMBLE_ENABLED && CONFIG_BT_NIMBLE_ENABLED`

**CONFIG_BT_NIMBLE_TRANSPORT_EVT_DISCARD_COUNT**

Discardable Transport Event Buffer count

*Found in: Component config > Bluetooth > NimBLE Options > Memory Settings*

This is the low priority HCI events’ buffer size. Low-priority event buffers are only used for advertising reports. If there are no free low-priority event buffers, then an incoming advertising report will get dropped

**Default value:**
- 8 if `CONFIG_BT_NIMBLE_ENABLED && CONFIG_BT_NIMBLE_ENABLED`

**CONFIG_BT_NIMBLE_GATT_MAX_PROCS**

Maximum number of GATT client procedures

*Found in: Component config > Bluetooth > NimBLE Options*

Maximum number of GATT client procedures that can be executed.

**Default value:**
- 4 if `CONFIG_BT_NIMBLE_ENABLED && CONFIG_BT_NIMBLE_ENABLED`
CONFIG_BT_NIMBLE_HS_FLOW_CTRL
Enable Host Flow control

*Found in:* Component config > Bluetooth > NimBLE Options
Enable Host Flow control

**Default value:**
- No (disabled) if `CONFIG_BT_NIMBLE_ENABLED` && `CONFIG_BT_NIMBLE_ENABLED`

CONFIG_BT_NIMBLE_HS_FLOW_CTRL_ITVL
Host Flow control interval

*Found in:* Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_HS_FLOW_CTRL
Host flow control interval in msecs

**Default value:**
- 1000 if `CONFIG_BT_NIMBLE_HS_FLOW_CTRL` && `CONFIG_BT_NIMBLE_ENABLED`

CONFIG_BT_NIMBLE_HS_FLOW_CTRL_THRESH
Host Flow control threshold

*Found in:* Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_HS_FLOW_CTRL
Host flow control threshold, if the number of free buffers are at or below this threshold, send an immediate number-of-completed-packets event

**Default value:**
- 2 if `CONFIG_BT_NIMBLE_HS_FLOW_CTRL` && `CONFIG_BT_NIMBLE_ENABLED`

CONFIG_BT_NIMBLE_HS_FLOW_CTRL_TX_ON_DISCONNECT
Host Flow control on disconnect

*Found in:* Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_HS_FLOW_CTRL
Enable this option to send number-of-completed-packets event to controller after disconnection

**Default value:**
- Yes (enabled) if `CONFIG_BT_NIMBLE_HS_FLOW_CTRL` && `CONFIG_BT_NIMBLE_ENABLED`

CONFIG_BT_NIMBLE_RPA_TIMEOUT
RPA timeout in seconds

*Found in:* Component config > Bluetooth > NimBLE Options
Time interval between RPA address change. This is applicable in case of Host based RPA

**Range:**
- from 1 to 41400 if `CONFIG_BT_NIMBLE_ENABLED` && `CONFIG_BT_NIMBLE_ENABLED`

**Default value:**
- 900 if `CONFIG_BT_NIMBLE_ENABLED` && `CONFIG_BT_NIMBLE_ENABLED`
Chapter 2. API Reference

**CONFIG_BT_NIMBLE_MESH**

Enable BLE mesh functionality

*Found in: Component config > Bluetooth > NimBLE Options*

Enable BLE Mesh example present in upstream mynewt-nimble and not maintained by Espressif.

IDF maintains ESP-BLE-MESH as the official Mesh solution. Please refer to ESP-BLE-MESH guide at: `doc://esp32/api-guides/esp-ble-mesh/ble-mesh-index`

**Default value:**

- No (disabled) if `CONFIG_BT_NIMBLE_ENABLED` && `CONFIG_BT_NIMBLE_ENABLED`

**Contains:**

- `CONFIG_BT_NIMBLE_MESH_PROVISIONER`
- `CONFIG_BT_NIMBLE_MESH_PROXY`
- `CONFIG_BT_NIMBLE_MESH_GATT_PROXY`
- `CONFIG_BT_NIMBLE_MESH_FRIEND`
- `CONFIG_BT_NIMBLE_MESH_LOW_POWER`
- `CONFIG_BT_NIMBLE_MESH_PROXY`
- `CONFIG_BT_NIMBLE_MESH_RELAY`
- `CONFIG_BT_NIMBLE_MESH_DEVICE_NAME`
- `CONFIG_BT_NIMBLE_MESH_NODE_COUNT`

**CONFIG_BT_NIMBLE_MESH_PROXY**

Enable mesh proxy functionality

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_MESH*

Enable proxy. This is automatically set whenever NIMBLE_MESH_PB_GATT or NIMBLE_MESH_GATT_PROXY is set

**Default value:**

- No (disabled) if `CONFIG_BT_NIMBLE_MESH` && `CONFIG_BT_NIMBLE_ENABLED`

**CONFIG_BT_NIMBLE_MESH_PROV**

Enable BLE mesh provisioning

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_MESH*

Enable mesh provisioning

**Default value:**

- Yes (enabled) if `CONFIG_BT_NIMBLE_MESH` && `CONFIG_BT_NIMBLE_ENABLED`

**CONFIG_BT_NIMBLE_MESH_PB_ADV**

Enable mesh provisioning over advertising bearer

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_MESH > CONFIG_BT_NIMBLE_MESH_PROV*

Enable this option to allow the device to be provisioned over the advertising bearer

**Default value:**

- Yes (enabled) if `CONFIG_BT_NIMBLE_MESH_PROV` && `CONFIG_BT_NIMBLE_ENABLED`
CONFIG_BT_NIMBLE_MESH_PB_GATT
Enable mesh provisioning over GATT bearer

Default value:
• Yes (enabled) if CONFIG_BT_NIMBLE_MESH_PROV && CONFIG_BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_MESH_GATT_PROXY
Enable GATT Proxy functionality

Default value:
• Yes (enabled) if CONFIG_BT_NIMBLE_MESH && CONFIG_BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_MESH_RELAY
Enable mesh relay functionality

Default value:
• No (disabled) if CONFIG_BT_NIMBLE_MESH && CONFIG_BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_MESH_LOW_POWER
Enable mesh low power mode

Default value:
• No (disabled) if CONFIG_BT_NIMBLE_MESH && CONFIG_BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_MESH_FRIEND
Enable mesh friend functionality

Default value:
• No (disabled) if CONFIG_BT_NIMBLE_MESH && CONFIG_BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_MESH_DEVICE_NAME
Set mesh device name

Default value:
• “nimble-mesh-node” if CONFIG_BT_NIMBLE_MESH && CONFIG_BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_MESH_NODE_COUNT
Set mesh node count

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_MESH*

Defines mesh node count.

**Default value:**
• 1 if CONFIG_BT_NIMBLE_MESH && CONFIG_BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_MESH_PROVISIONER
Enable BLE mesh provisioner

*Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_MESH*

Enable mesh provisioner.

**Default value:**
• 0 if CONFIG_BT_NIMBLE_MESH && CONFIG_BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_CRYPTO_STACK_MBEDTLS
Override TinyCrypt with mbedTLS for crypto computations

*Found in: Component config > Bluetooth > NimBLE Options*

Enable this option to choose mbedTLS instead of TinyCrypt for crypto computations.

**Default value:**
• Yes (enabled) if CONFIG_BT_NIMBLE_ENABLED && CONFIG_BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_HS_STOP_TIMEOUT_MS
BLE host stop timeout in msec

*Found in: Component config > Bluetooth > NimBLE Options*

BLE Host stop procedure timeout in milliseconds.

**Default value:**
• 2000 if CONFIG_BT_NIMBLE_ENABLED && CONFIG_BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_ENABLE_CONN_REATTEMPT
Enable connection reattempts on connection establishment error

*Found in: Component config > Bluetooth > NimBLE Options*

Enable to make the NimBLE host to reattempt GAP connection on connection establishment failure.

**Default value:**
• Yes (enabled) if CONFIG_BT_NIMBLE_ENABLED
**CONFIG_BT_NIMBLE_MAX_CONN_REATTEMPT**

Maximum number connection reattempts

*Found in:* Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_ENABLE_CONN_REATTEMPT

Defines maximum number of connection reattempts.

**Range:**

- from 1 to 7 if CONFIG_BT_NIMBLE_ENABLED && CONFIG_BT_NIMBLE_ENABLE_CONN_REATTEMPT && CONFIG_BT_NIMBLE_ENABLED

**Default value:**

- 3 if CONFIG_BT_NIMBLE_ENABLED && CONFIG_BT_NIMBLE_ENABLE_CONN_REATTEMPT && CONFIG_BT_NIMBLE_ENABLED

**CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT**

Enable BLE 5 feature

*Found in:* Component config > Bluetooth > NimBLE Options

Enable BLE 5 feature

**Default value:**

- Yes (enabled) if CONFIG_BT_NIMBLE_ENABLED && CONFIG_BT_NIMBLE_ENABLED

Contains:

- CONFIG_BT_NIMBLE_LL_CFG_FEAT_LE_2M_PHY
- CONFIG_BT_NIMBLE_LL_CFG_FEAT_LE_CODED_PHY
- CONFIG_BT_NIMBLE_EXT_ADV
- CONFIG_BT_NIMBLE_BLE_POWER_CONTROL
- CONFIG_BT_NIMBLE_MAX_PERIODIC_ADVERTISER_LIST
- CONFIG_BT_NIMBLE_MAX_PERIODIC_SYNCS
- CONFIG_BT_NIMBLE_PERIODIC_ADV_ENH

**CONFIG_BT_NIMBLE_LL_CFG_FEAT_LE_2M_PHY**

Enable 2M Phy

*Found in:* Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT

Enable 2M-PHY

**Default value:**

- Yes (enabled) if CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT && CONFIG_BT_NIMBLE_ENABLED

**CONFIG_BT_NIMBLE_LL_CFG_FEAT_LE_CODED_PHY**

Enable coded Phy

*Found in:* Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT

Enable coded-PHY

**Default value:**

- Yes (enabled) if CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT && CONFIG_BT_NIMBLE_ENABLED
**CONFIG_BT_NIMBLE_EXT_ADV**

Enable extended advertising

*Found in:* Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT

Enable this option to do extended advertising. Extended advertising will be supported from BLE 5.0 onwards.

**Default value:**
- No (disabled) if CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT && CONFIG_BT_NIMBLE_ENABLED

**CONFIG_BT_NIMBLE_MAX_EXT_ADV_INSTANCES**

Maximum number of extended advertising instances.

*Found in:* Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT > CONFIG_BT_NIMBLE_EXT_ADV

Change this option to set maximum number of extended advertising instances. Minimum there is always one instance of advertising. Enter how many more advertising instances you want. For ESP32C2, ESP32C6 and ESP32H2, each extended advertising instance will take about 0.5k DRAM.

**Range:**
- from 0 to 4 if CONFIG_BT_NIMBLE_EXT_ADV && CONFIG_BT_NIMBLE_EXT_ADV && CONFIG_BT_NIMBLE_ENABLED

**Default value:**
- 1 if CONFIG_BT_NIMBLE_EXT_ADV && CONFIG_BT_NIMBLE_EXT_ADV && CONFIG_BT_NIMBLE_ENABLED
- 0 if CONFIG_BT_NIMBLE_EXT_ADV && CONFIG_BT_NIMBLE_EXT_ADV && CONFIG_BT_NIMBLE_ENABLED

**CONFIG_BT_NIMBLE_EXT_ADV_MAX_SIZE**

Maximum length of the advertising data.

*Found in:* Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT > CONFIG_BT_NIMBLE_EXT_ADV

Defines the length of the extended adv data. The value should not exceed 1650.

**Range:**
- from 0 to 1650 if CONFIG_BT_NIMBLE_EXT_ADV && CONFIG_BT_NIMBLE_EXT_ADV && CONFIG_BT_NIMBLE_ENABLED

**Default value:**
- 1650 if CONFIG_BT_NIMBLE_EXT_ADV && CONFIG_BT_NIMBLE_EXT_ADV && CONFIG_BT_NIMBLE_ENABLED
- 0 if CONFIG_BT_NIMBLE_EXT_ADV && CONFIG_BT_NIMBLE_EXT_ADV && CONFIG_BT_NIMBLE_ENABLED

**CONFIG_BT_NIMBLE_ENABLE_PERIODIC_ADV**

Enable periodic advertisement.

*Found in:* Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT > CONFIG_BT_NIMBLE_EXT_ADV

Enable this option to start periodic advertisement.

**Default value:**
- Yes (enabled) if CONFIG_BT_NIMBLE_EXT_ADV && CONFIG_BT_NIMBLE_EXT_ADV && CONFIG_BT_NIMBLE_ENABLED
CONFIG_BT_NIMBLE_PERIODIC_ADV_SYNC_TRANSFER

Enable Transer Sync Events

Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT > CONFIG_BT_NIMBLE_EXT_ADV > CONFIG_BT_NIMBLE_ENABLE_PERIODIC_ADV

This enables controller transfer periodic sync events to host

Default value:
- Yes (enabled) if CONFIG_BT_NIMBLE_ENABLE_PERIODIC_ADV && CONFIG_BT_NIMBLE_EXT_ADV && CONFIG_BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_MAX_PERIODIC_SYNCS

Maximum number of periodic advertising syncs

Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT

Set this option to set the upper limit for number of periodic sync connections. This should be less than maximum connections allowed by controller.

Range:
- from 0 to 8 if CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT && CONFIG_BT_NIMBLE_ENABLED

Default value:
- 1 if CONFIG_BT_NIMBLE_ENABLE_PERIODIC_ADV && CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT && CONFIG_BT_NIMBLE_ENABLED
- 0 if CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT && CONFIG_BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_MAX_PERIODIC_ADVERTISER_LIST

Maximum number of periodic advertiser list

Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT

Set this option to set the upper limit for number of periodic advertiser list.

Range:
- from 1 to 5 if CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT && SOC_ESP_NIMBLE_CONTROLLER && CONFIG_BT_NIMBLE_ENABLED

Default value:
- 5 if CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT && CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT && SOC_ESP_NIMBLE_CONTROLLER && CONFIG_BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_BLE_POWER_CONTROL

Enable support for BLE Power Control

Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT

Set this option to enable the Power Control feature

Default value:
- No (disabled) if CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT && SOC_BLE_POWER_CONTROL_SUPPORTED && CONFIG_BT_NIMBLE_ENABLED
CONFIG_BT_NIMBLE_PERIODIC_ADV_ENH
Periodic adv enhancements (adi support)

Found in: Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_50_FEATURE_SUPPORT

Enable the periodic advertising enhancements

CONFIG_BT_NIMBLE_WHITELIST_SIZE
BLE white list size

Found in: Component config > Bluetooth > NimBLE Options

BLE list size

Range:
- from 1 to 15 if CONFIG_BT_NIMBLE_ENABLED && CONFIG_BT_NIMBLE_ENABLED

Default value:
- 12 if CONFIG_BT_NIMBLE_ENABLED && CONFIG_BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_TEST_THROUGHPUT_TEST
Throughput Test Mode enable

Found in: Component config > Bluetooth > NimBLE Options

Enable the throughput test mode

Default value:
- No (disabled) if CONFIG_BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_BLUFI_ENABLE
Enable blufi functionality

Found in: Component config > Bluetooth > NimBLE Options

Set this option to enable blufi functionality.

Default value:
- No (disabled) if CONFIG_BT_NIMBLE_ENABLED && CONFIG_BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_USE_ESP_TIMER
Enable Esp Timer for Nimble

Found in: Component config > Bluetooth > NimBLE Options

Set this option to use Esp Timer which has higher priority timer instead of FreeRTOS timer

Default value:
- Yes (enabled) if CONFIG_BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_BLE_GATT_BLOB_TRANSFER
Blob transfer

Found in: Component config > Bluetooth > NimBLE Options

This option is used when data to be sent is more than 512 bytes. For peripheral role, BT_NIMBLE_MSBYS_1_BLOCK_COUNT needs to be increased according to the need.
GAP Service  Contains:

- GAP Appearance write permissions
- CONFIG_BT_NIMBLE_SVC_GAP_CENT_ADDR_RESOLUTION
- GAP device name write permissions
- CONFIG_BT_NIMBLE_SVC_GAP_PPCP_MAX_CONN_INTERVAL
- CONFIG_BT_NIMBLE_SVC_GAP_PPCP_MIN_CONN_INTERVAL
- CONFIG_BT_NIMBLE_SVC_GAP_PPCP_SLAVE_LATENCY
- CONFIG_BT_NIMBLE_SVC_GAP_PPCP_SUPERVISION_TMO

GAP Appearance write permissions  Contains:

- CONFIG_BT_NIMBLE_SVC_GAP_APPEAR_WRITE

CONFIG_BT_NIMBLE_SVC_GAP_APPEAR_WRITE

Write

Found in: Component config > Bluetooth > NimBLE Options > GAP Service > GAP Appearance write permissions

Enable write permission (BLE_GATT_CHR_F_WRITE)

Default value:

- No (disabled) if CONFIG_BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_SVC_GAP_APPEAR_WRITE_ENC

Write with encryption

Found in: Component config > Bluetooth > NimBLE Options > GAP Service > GAP Appearance write permissions > CONFIG_BT_NIMBLE_SVC_GAP_APPEAR_WRITE

Enable write with encryption permission (BLE_GATT_CHR_F_WRITE_ENC)

Default value:

- No (disabled) if CONFIG_BT_NIMBLE_SVC_GAP_APPEAR_WRITE &amp;&lt; CONFIG_BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_SVC_GAP_APPEAR_WRITE_AUTHEN

Write with authentication

Found in: Component config > Bluetooth > NimBLE Options > GAP Service > GAP Appearance write permissions > CONFIG_BT_NIMBLE_SVC_GAP_APPEAR_WRITE

Enable write with authentication permission (BLE_GATT_CHR_F_WRITE_AUTHEN)

Default value:

- No (disabled) if CONFIG_BT_NIMBLE_SVC_GAP_APPEAR_WRITE &amp;&lt; CONFIG_BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_SVC_GAP_APPEAR_WRITE_AUTHOR

Write with authorisation

Found in: Component config > Bluetooth > NimBLE Options > GAP Service > GAP Appearance write permissions > CONFIG_BT_NIMBLE_SVC_GAP_APPEAR_WRITE

Enable write with authorisation permission (BLE_GATT_CHR_F_WRITE_AUTHOR)

Default value:

- No (disabled) if CONFIG_BT_NIMBLE_SVC_GAP_APPEAR_WRITE &amp;&lt; CONFIG_BT_NIMBLE_ENABLED
CONFIG_BT_NIMBLE_SVC_GAP_CENT_ADDR_RESOLUTION

GAP Characteristic - Central Address Resolution

*Found in: Component config > Bluetooth > NimBLE Options > GAP Service*

Weather or not Central Address Resolution characteristic is supported on the device, and if supported, weather or not Central Address Resolution is supported.

- Central Address Resolution characteristic not supported
- Central Address Resolution not supported
- Central Address Resolution supported

Available options:

- Characteristic not supported (CONFIG_BT_NIMBLE_SVC_GAP_CAR_CHAR_NOT_SUPP)
- Central Address Resolution not supported (CONFIG_BT_NIMBLE_SVC_GAP_CAR_NOT_SUPP)
- Central Address Resolution supported (CONFIG_BT_NIMBLE_SVC_GAP_CAR_SUPP)

**GAP device name write permissions**  Contains:

- CONFIG_BT_NIMBLE_SVC_GAP_NAME_WRITE

**CONFIG_BT_NIMBLE_SVC_GAP_NAME_WRITE**

Write

*Found in: Component config > Bluetooth > NimBLE Options > GAP Service > GAP device name write permissions*

Enable write permission (BLE_GATT_CHR_F_WRITE)

**Default value:**

- No (disabled) if CONFIG_BT_NIMBLE_ENABLED

**CONFIG_BT_NIMBLE_SVC_GAP_NAME_WRITE_ENC**

Write with encryption

*Found in: Component config > Bluetooth > NimBLE Options > GAP Service > GAP device name write permissions > CONFIG_BT_NIMBLE_SVC_GAP_NAME_WRITE*

Enable write with encryption permission (BLE_GATT_CHR_F_WRITE_ENC)

**Default value:**

- No (disabled) if CONFIG_BT_NIMBLE_SVC_GAP_NAME_WRITE && CONFIG_BT_NIMBLE_ENABLED

**CONFIG_BT_NIMBLE_SVC_GAP_NAME_WRITE_AUTHEN**

Write with authentication

*Found in: Component config > Bluetooth > NimBLE Options > GAP Service > GAP device name write permissions > CONFIG_BT_NIMBLE_SVC_GAP_NAME_WRITE*

Enable write with authentication permission (BLE_GATT_CHR_F_WRITE_AUTHEN)

**Default value:**

- No (disabled) if CONFIG_BT_NIMBLE_SVC_GAP_NAME_WRITE && CONFIG_BT_NIMBLE_ENABLED
**CONFIG_BT_NIMBLE_SVC_GAP_NAME_WRITE_AUTHOR**

Write with authorisation

*Found in: Component config > Bluetooth > NimBLE Options > GAP Service > GAP device name write permissions > CONFIG_BT_NIMBLE_SVC_GAP_NAME_WRITE*

Enable write with authorisation permission (BLE_GATT_CHR_F_WRITE_AUTHOR)

**Default value:**
- No (disabled) if `CONFIG_BT_NIMBLE_SVC_GAP_NAME_WRITE` && `CONFIG_BT_NIMBLE_ENABLED`

**CONFIG_BT_NIMBLE_SVC_GAP_PPCP_MAX_CONN_INTERVAL**

PPCP Connection Interval Max (Unit: 1.25 ms)

*Found in: Component config > Bluetooth > NimBLE Options > GAP Service*

Peripheral Preferred Connection Parameter: Connection Interval maximum value Interval Max = value * 1.25 ms

**Default value:**
- 0 if `CONFIG_BT_NIMBLE_ROLE_PERIPHERAL` && `CONFIG_BT_NIMBLE_ENABLED`

**CONFIG_BT_NIMBLE_SVC_GAP_PPCP_MIN_CONN_INTERVAL**

PPCP Connection Interval Min (Unit: 1.25 ms)

*Found in: Component config > Bluetooth > NimBLE Options > GAP Service*

Peripheral Preferred Connection Parameter: Connection Interval minimum value Interval Min = value * 1.25 ms

**Default value:**
- 0 if `CONFIG_BT_NIMBLE_ROLE_PERIPHERAL` && `CONFIG_BT_NIMBLE_ENABLED`

**CONFIG_BT_NIMBLE_SVC_GAP_PPCP_SLAVE_LATENCY**

PPCP Slave Latency

*Found in: Component config > Bluetooth > NimBLE Options > GAP Service*

Peripheral Preferred Connection Parameter: Slave Latency

**Default value:**
- 0 if `CONFIG_BT_NIMBLE_ENABLED`

**CONFIG_BT_NIMBLE_SVC_GAP_PPCP_SUPERVISION_TMO**

PPCP Supervision Timeout (Unit: 10 ms)

*Found in: Component config > Bluetooth > NimBLE Options > GAP Service*

Peripheral Preferred Connection Parameter: Supervision Timeout Timeout = Value * 10 ms

**Default value:**
- 0 if `CONFIG_BT_NIMBLE_ENABLED`
CONFIG_BT_NIMBLE_VS_SUPPORT

Enable support for VSC and VSE

*Found in:* Component config > Bluetooth > NimBLE Options

This option is used to enable support for sending Vendor Specific HCI commands and handling Vendor Specific HCI Events.

CONFIG_BT_NIMBLE_OPTIMIZE_MULTI_CONN

Enable the optimization of multi-connection

*Found in:* Component config > Bluetooth > NimBLE Options

This option enables the use of vendor-specific APIs for multi-connections, which can greatly enhance the stability of coexistence between numerous central and peripheral devices. It will prohibit the usage of standard APIs.

*Default value:*
- No (disabled) if SOC_BLE_MULTI_CONN_OPTIMIZATION && CONFIG_BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_ENC_ADV_DATA

Encrypted Advertising Data

*Found in:* Component config > Bluetooth > NimBLE Options

This option is used to enable encrypted advertising data.

CONFIG_BT_NIMBLE_MAX_EADS

Maximum number of EAD devices to save across reboots

*Found in:* Component config > Bluetooth > NimBLE Options > CONFIG_BT_NIMBLE_ENC_ADV_DATA

Defines maximum number of encrypted advertising data key material to save

*Default value:*
- 10 if CONFIG_BT_NIMBLE_ENABLED && CONFIG_BT_NIMBLE_ENC_ADV_DATA && CONFIG_BT_NIMBLE_ENABLED

CONFIG_BT_NIMBLE_HIGH_DUTY_ADV_ITVL

Enable BLE high duty advertising interval feature

*Found in:* Component config > Bluetooth > NimBLE Options

This enable BLE high duty advertising interval feature

CONFIG_BT_NIMBLE_HOST_QUEUE_CONG_CHECK

BLE queue congestion check

*Found in:* Component config > Bluetooth > NimBLE Options

When scanning and scan duplicate is not enabled, if there are a lot of adv packets around or application layer handling adv packets is slow, it will cause the controller memory to run out. If enabled, adv packets will be lost when host queue is congested.

*Default value:*
- No (disabled) if CONFIG_BT_NIMBLE_ENABLED && CONFIG_BT_NIMBLE_ENABLED
Controller Options

Contains:

- `CONFIG_BT_CTRL_BLE_ADV_REPORT_FLOW_CTRL_SUPP`
- `CONFIG_BT_BLE_CCA_MODE`
- `CONFIG_BT_CTRL_DFT_TX_POWER_LEVEL`
- `CONFIG_BT_CTRL_BLE_MAX_ACT`
- `CONFIG_BT_CTRL_BLE_SCAN_DUPL`
- `CONFIG_BT_CTRL_BLE_STATIC_ACL_TX_BUF_NB`
- `CONFIG_BT_CTRL_HW_CCA_VAL`
- `CONFIG_BT_CTRL_COEX_PHY_CODED_TX_RX_TLIM`
- `CONFIG_BT_CTRL_CE_LENGTH_TYPE`
- `CONFIG_BT_CTRL_RX_ANTENNA_INDEX`
- `CONFIG_BT_CTRL_TX_ANTENNA_INDEX`
- `CONFIG_BT_CTRL_SCAN_BACKOFF_UPPERLIMITMAX`
- `CONFIG_BT_CTRL_HCI_MODE_CHOICE`
- `MODEM SLEEP Options`
- `CONFIG_BT_CTRL_PINNED_TO_CORE_CHOICE`
- `CONFIG_BT_CTRL_ADV_DUP_FILT_MAX`

**CONFIG_BT_CTRL_BLE_MAX_ACT**

BLE Max Instances

*Found in: Component config > Bluetooth > Controller Options*

BLE maximum activities of bluetooth controller. both of connections, scan, sync and adv(periodic adv, multi-adv). Each instance needs to consume 828 bytes, you can save RAM by modifying the instance value according to actual needs.

**Range:**
- from 1 to 10 if `CONFIG_BT_CONTROLLER_ENABLED`

**Default value:**
- 6 if `CONFIG_BT_CONTROLLER_ENABLED`

**CONFIG_BT_CTRL_BLE_STATIC_ACL_TX_BUF_NB**

BLE static ACL TX buffer numbers

*Found in: Component config > Bluetooth > Controller Options*

BLE ACL buffer have two methods to be allocated. One is persistent allocating (allocate when controller initialise, never free until controller de-initialise) another is dynamically allocating (allocate before TX and free after TX).

**Range:**
- from 0 to 12 if `CONFIG_BT_CONTROLLER_ENABLED`

**Default value:**
- 0 if `CONFIG_BT_CONTROLLER_ENABLED`

**CONFIG_BT_CTRL_PINNED_TO_CORE_CHOICE**

The cpu core which bluetooth controller run

*Found in: Component config > Bluetooth > Controller Options*

Specify the cpu core to run bluetooth controller. Can not specify no-affinity.

**Available options:**

- Core 0 (PRO CPU) (CONFIG_BT_CTRL_PINNED_TO_CORE_0)
• Core 1 (APP CPU) (CONFIG_BT_CTRL_PINNED_TO_CORE_1)

**CONFIG_BT_CTRL_HCI_MODE_CHOICE**

HCI mode

*Found in: Component config > Bluetooth > Controller Options*

Specify HCI mode as VHCI or UART(H4)

Available options:

• VHCI (CONFIG_BT_CTRL_HCI_MODE_VHCI)
  Normal option. Mostly, choose this VHCI when bluetooth host run on ESP32S3 or ESP32C3.

• UART(H4) (CONFIG_BT_CTRL_HCI_MODE_UART_H4)
  If use external bluetooth host which run on other hardware and use UART as the HCI interface, choose this option.

**CONFIG_BT_CTRL_ADV_DUP_FILT_MAX**

The maximum number of 5.0 extend duplicate scan filter

*Found in: Component config > Bluetooth > Controller Options*

The maximum number of duplicate scan filter

**Range:**

• from 1 to 500 if `CONFIG_BT_CONTROLLER_ENABLED`

**Default value:**

• 30 if `CONFIG_BT_CONTROLLER_ENABLED`

**CONFIG_BT_BLE_CCA_MODE**

BLE CCA mode

*Found in: Component config > Bluetooth > Controller Options*

Define BT BLE CCA mode

Available options:

• NONE (CONFIG_BT_BLE_CCA_MODE_NONE)

• Hardware (CONFIG_BT_BLE_CCA_MODE_HW)

• Software (CONFIG_BT_BLE_CCA_MODE_SW)

**CONFIG_BT_CTRL_HW_CCA_VAL**

CCA threshold value

*Found in: Component config > Bluetooth > Controller Options*

It is the threshold value of HW CCA, if the value is 30, it means CCA threshold is -30 dBm.

**Range:**

• from 20 to 100 if `CONFIG_BT_CONTROLLER_ENABLED`

**Default value:**

• 20 if `CONFIG_BT_CONTROLLER_ENABLED`
CONFIG_BT_CTRL_CE_LENGTH_TYPE
Connection event length determination method

*Found in: Component config > Bluetooth > Controller Options*

Specify connection event length determination

Available options:

- ORIGINAL (CONFIG_BT_CTRL_CE_LENGTH_TYPE_ORIG)
- Use CE parameter for HCI command (CONFIG_BT_CTRL_CE_LENGTH_TYPE_CE)
- Use Espressif self-defined method (CONFIG_BT_CTRL_CE_LENGTH_TYPE_SD)

CONFIG_BT_CTRL_TX_ANTENNA_INDEX

default Tx antenna used

*Found in: Component config > Bluetooth > Controller Options*

Specify default Tx antenna used for bluetooth

Available options:

- Antenna 0 (CONFIG_BT_CTRL_TX_ANTENNA_INDEX_0)
- Antenna 1 (CONFIG_BT_CTRL_TX_ANTENNA_INDEX_1)

CONFIG_BT_CTRL_RX_ANTENNA_INDEX

default Rx antenna used

*Found in: Component config > Bluetooth > Controller Options*

Specify default Rx antenna used for bluetooth

Available options:

- Antenna 0 (CONFIG_BT_CTRL_RX_ANTENNA_INDEX_0)
- Antenna 1 (CONFIG_BT_CTRL_RX_ANTENNA_INDEX_1)

CONFIG_BT_CTRL_DFT_TX_POWER_LEVEL

BLE default Tx power level

*Found in: Component config > Bluetooth > Controller Options*

Specify default Tx power level

Available options:

- -24dBm (CONFIG_BT_CTRL_DFT_TX_POWER_LEVEL_N24)
- -21dBm (CONFIG_BT_CTRL_DFT_TX_POWER_LEVEL_N21)
- -18dBm (CONFIG_BT_CTRL_DFT_TX_POWER_LEVEL_N18)
- -15dBm (CONFIG_BT_CTRL_DFT_TX_POWER_LEVEL_N15)
- -12dBm (CONFIG_BT_CTRL_DFT_TX_POWER_LEVEL_N12)
- -9dBm (CONFIG_BT_CTRL_DFT_TX_POWER_LEVEL_N9)
- -6dBm (CONFIG_BT_CTRL_DFT_TX_POWER_LEVEL_N6)
- -3dBm (CONFIG_BT_CTRL_DFT_TX_POWER_LEVEL_N3)
- 0dBm (CONFIG_BT_CTRL_DFT_TX_POWER_LEVEL_N0)
• +3dBm (CONFIG_BT_CTRL_DFT_TX_POWER_LEVEL_P3)
• +6dBm (CONFIG_BT_CTRL_DFT_TX_POWER_LEVEL_P6)
• +9dBm (CONFIG_BT_CTRL_DFT_TX_POWER_LEVEL_P9)
• +12dBm (CONFIG_BT_CTRL_DFT_TX_POWER_LEVEL_P12)
• +15dBm (CONFIG_BT_CTRL_DFT_TX_POWER_LEVEL_P15)
• +18dBm (CONFIG_BT_CTRL_DFT_TX_POWER_LEVEL_P18)
• +21dBm (CONFIG_BT_CTRL_DFT_TX_POWER_LEVEL_P21)

**CONFIG_BT_CTRL_BLE_ADV_REPORT_FLOW_CTRL_SUPP**

BLE adv report flow control supported

*Found in: Component config > Bluetooth > Controller Options*

The function is mainly used to enable flow control for advertising reports. When it is enabled, advertising reports will be discarded by the controller if the number of unprocessed advertising reports exceeds the size of BLE adv report flow control.

**Default value:**
- Yes (enabled) if CONFIG_BT_CONTROLLER_ENABLED

**CONFIG_BT_CTRL_BLE_ADV_REPORT_FLOW_CTRL_NUM**

BLE adv report flow control number

*Found in: Component config > Bluetooth > Controller Options > CONFIG_BT_CTRL_BLE_ADV_REPORT_FLOW_CTRL_SUPP*

The number of unprocessed advertising report that bluetooth host can save. If you set BT_CTRL_BLE_ADV_REPORT_FLOW_CTRL_NUM to a small value, this may cause adv packets lost. If you set BT_CTRL_BLE_ADV_REPORT_FLOW_CTRL_NUM to a large value, bluetooth host may cache a lot of adv packets and this may cause system memory run out. For example, if you set it to 50, the maximum memory consumed by host is 35 * 50 bytes. Please set BT_CTRL_BLE_ADV_REPORT_FLOW_CTRL_NUM according to your system free memory and handle adv packets as fast as possible, otherwise it will cause adv packets lost.

**Range:**
- from 50 to 1000 if CONFIG_BT_CTRL_BLE_ADV_REPORT_FLOW_CTRL_SUPP && CONFIG_BT_CONTROLLER_ENABLED

**Default value:**
- 100 if CONFIG_BT_CTRL_BLE_ADV_REPORT_FLOW_CTRL_SUPP && CONFIG_BT_CONTROLLER_ENABLED

**CONFIG_BT_CTRL_BLE_ADV_REPORT_DISCARD_THRESHOLD**

BLE adv lost event threshold value

*Found in: Component config > Bluetooth > Controller Options > CONFIG_BT_CTRL_BLE_ADV_REPORT_FLOW_CTRL_SUPP*

When adv report flow control is enabled, The ADV lost event will be generated when the number of ADV packets lost in the controller reaches this threshold. It is better to set a larger value. If you set BT_CTRL_BLE_ADV_REPORT_DISCARD_THRESHOLD to a small value or printf every adv lost event, it may cause adv packets lost more.

**Range:**
- from 1 to 1000 if CONFIG_BT_CTRL_BLE_ADV_REPORT_FLOW_CTRL_SUPP && CONFIG_BT_CONTROLLER_ENABLED

**Default value:**
- 20 if CONFIG_BT_CTRL_BLE_ADV_REPORT_FLOW_CTRL_SUPP && CONFIG_BT_CONTROLLER_ENABLED
CONFIG_BT_CTRL_BLE_SCAN_DUPL

BLE Scan Duplicate Options

*Found in: Component config > Bluetooth > Controller Options*

This select enables parameters setting of BLE scan duplicate.

**Default value:**
- Yes (enabled) if `CONFIG_BT_CONTROLLER_ENABLED`

CONFIG_BT_CTRL_SCAN_DUPL_TYPE

Scan Duplicate Type

*Found in: Component config > Bluetooth > Controller Options > CONFIG_BT_CTRL_BLE_SCAN_DUPL*

Scan duplicate have three ways. one is “Scan Duplicate By Device Address”. This way is to use advertiser address filtering. The adv packet of the same address is only allowed to be reported once. Another way is “Scan Duplicate By Device Address And Advertising Data”. This way is to use advertising data and device address filtering. All different adv packets with the same address are allowed to be reported. The last way is “Scan Duplicate By Advertising Data”. This way is to use advertising data filtering. All same advertising data only allow to be reported once even though they are from different devices.

Available options:

- Scan Duplicate By Device Address (CONFIG_BT_CTRL_SCAN_DUPL_TYPE_DEVICE) Advertising packets with the same address, address type, and advertising type are reported once.
- Scan Duplicate By Advertising Data (CONFIG_BT_CTRL_SCAN_DUPL_TYPE_DATA) Advertising packets with identical advertising data, address type, and advertising type are reported only once, even if they originate from different devices.
- Scan Duplicate By Device Address And Advertising Data (CONFIG_BT_CTRL_SCAN_DUPL_TYPE_DATA_DEVICE) Advertising packets with the same address, advertising data, address type, and advertising type are reported only once.

CONFIG_BT_CTRL_SCAN_DUPL_CACHE_SIZE

Maximum number of devices in scan duplicate filter

*Found in: Component config > Bluetooth > Controller Options > CONFIG_BT_CTRL_BLE_SCAN_DUPL*

Maximum number of devices which can be recorded in scan duplicate filter. When the maximum amount of device in the filter is reached, the cache will be refreshed.

**Range:**
- from 10 to 1000 if `CONFIG_BT_CTRL_BLE_SCAN_DUPL` & `CONFIG_BT_CONTROLLER_ENABLED`

**Default value:**
- 100 if `CONFIG_BT_CTRL_BLE_SCAN_DUPL` & `CONFIG_BT_CONTROLLER_ENABLED`

CONFIG_BT_CTRL_DUPL_SCAN_CACHE_REFRESH_PERIOD

Duplicate scan list refresh period (seconds)

*Found in: Component config > Bluetooth > Controller Options > CONFIG_BT_CTRL_BLE_SCAN_DUPL*

If the period value is non-zero, the controller will periodically clear the device information stored in the scan duplicate filter. If it is 0, the scan duplicate filter will not be cleared until the scanning is disabled. Duplicate advertisements for this period should not be sent to the Host in advertising report events. There
are two scenarios where the ADV packet will be repeatedly reported: 1. The duplicate scan cache is full, the controller will delete the oldest device information and add new device information. 2. When the refresh period is up, the controller will clear all device information and start filtering again.

**Range:**
- from 0 to 1000 if `CONFIG_BT_CTRL_BLE_SCAN_DUPL` && `CONFIG_BT_CONTROLLER_ENABLED`

**Default value:**
- 0 if `CONFIG_BT_CTRL_BLE_SCAN_DUPL` && `CONFIG_BT_CONTROLLER_ENABLED`

**CONFIG_BT_CTRL_BLE_MESH_SCAN_DUPL_EN**
Special duplicate scan mechanism for BLE Mesh scan

*Found in: Component config > Bluetooth > Controller Options > CONFIG_BT_CTRL_BLE_SCAN_DUPL*

This enables the BLE scan duplicate for special BLE Mesh scan.

**Default value:**
- No (disabled) if `CONFIG_BT_CTRL_BLE_SCAN_DUPL` && `CONFIG_BT_CONTROLLER_ENABLED`

**CONFIG_BT_CTRL_MESH_DUPL_SCAN_CACHE_SIZE**
Maximum number of Mesh adv packets in scan duplicate filter

*Found in: Component config > Bluetooth > Controller Options > CONFIG_BT_CTRL_BLE_SCAN_DUPL > CONFIG_BT_CTRL_BLE_MESH_SCAN_DUPL_EN*

Maximum number of adv packets which can be recorded in duplicate scan cache for BLE Mesh. When the maximum amount of device in the filter is reached, the cache will be refreshed.

**Range:**
- from 10 to 1000 if `CONFIG_BT_CTRL_BLE_MESH_SCAN_DUPL_EN` && `CONFIG_BT_CONTROLLER_ENABLED`

**Default value:**
- 100 if `CONFIG_BT_CTRL_BLE_MESH_SCAN_DUPL_EN` && `CONFIG_BT_CONTROLLER_ENABLED`

**CONFIG_BT_CTRL_COEX_PHY_CODED_TX_RX_TLIM**
Coexistence: limit on MAX Tx/Rx time for coded-PHY connection

*Found in: Component config > Bluetooth > Controller Options*

When using PHY-Coded in BLE connection, limitation on max tx/rx time can be applied to better avoid dramatic performance deterioration of Wi-Fi.

**Available options:**
- Force Enable (CONFIG_BT_CTRL_COEX_PHY_CODED_TX_RX_TLIM_EN)
  Always enable the limitation on max tx/rx time for Coded-PHY connection
- Force Disable (CONFIG_BT_CTRL_COEX_PHY_CODED_TX_RX_TLIM_DIS)
  Disable the limitation on max tx/rx time for Coded-PHY connection

**MODEM SLEEP Options**
Contains:
- `CONFIG_BT_CTRL_MODEM_SLEEP`
- `CONFIG_BT_CTRL_MAIN_XTAL_PU_DURING_LIGHT_SLEEP`
**CONFIG_BT_CTRL_MODEM_SLEEP**

Bluetooth modem sleep

*Found in: Component config > Bluetooth > Controller Options > MODEM SLEEP Options*

Enable/disable bluetooth controller low power mode. Modem sleep is not supported to be used with UART HCI.

**CONFIG_BT_CTRL_MODEM_SLEEP_MODE_1**

Bluetooth Modem sleep Mode 1

*Found in: Component config > Bluetooth > Controller Options > MODEM SLEEP Options > CONFIG_BT_CTRL_MODEM_SLEEP*

Mode 1 is the currently supported sleep mode. In this mode, bluetooth controller sleeps between and BLE events. A low power clock is used to maintain bluetooth reference clock.

**Default value:**
- Yes (enabled) if `CONFIG_BT_CTRL_MODEM_SLEEP` && `CONFIG_BT_CONTROLLER_ENABLED`

**CONFIG_BT_CTRL_LOW_POWER_CLOCK**

Bluetooth low power clock

*Found in: Component config > Bluetooth > Controller Options > MODEM SLEEP Options > CONFIG_BT_CTRL_MODEM_SLEEP > CONFIG_BT_CTRL_MODEM_SLEEP_MODE_1*

Select the low power clock source for bluetooth controller

**Available options:**

- **Main crystal (CONFIG_BT_CTRL_LPCLK_SEL_MAIN_XTAL)**
  Main crystal can be used as low power clock for bluetooth modem sleep. If this option is selected, bluetooth modem sleep can work under Dynamic Frequency Scaling (DFS) enabled, and bluetooth can work under light sleep enabled. Main crystal has a relatively better performance than other bluetooth low power clock sources.

- **External 32kHz crystal (CONFIG_BT_CTRL_LPCLK_SEL_EXT_32K_XTAL)**
  External 32kHz crystal has a nominal frequency of 32.768kHz and provides good frequency stability. If used as Bluetooth low power clock, External 32kHz can support Bluetooth modem sleep to be used with both DFS and light sleep.

- **Internal 150kHz RC oscillator (CONFIG_BT_CTRL_LPCLK_SEL_RTC_SLOW)**
  Internal 150kHz RC oscillator. The accuracy of this clock is a lot larger than 500ppm which is required in Bluetooth communication, so don’t select this option in scenarios such as BLE connection state.

**CONFIG_BT_CTRL_MAIN_XTAL_PU_DURING_LIGHT_SLEEP**

power up main XTAL during light sleep

*Found in: Component config > Bluetooth > Controller Options > MODEM SLEEP Options*

If this option is selected, the main crystal will power up during light sleep when the low power clock selects an external 32kHz crystal but the external 32kHz crystal does not exist or the low power clock selects the main crystal.

**Default value:**
- No (disabled) if `CONFIG_BT_CTRL_LPCLK_SEL_MAIN_XTAL` || `CONFIG_BT_CTRL_LPCLK_SEL_EXT_32K_XTAL` && `CONFIG_FREERTOS_USE_TICKLESS_IDLE` && `CONFIG_BT_CONTROLLER_ENABLED`
CONFIG_BT_CTRL_AG_C RECORRECT_EN
Enable HW AGC recorrect

Default value:
- No (disabled) if CONFIG_BT_CONTROLLER_ENABLED

CONFIG_BT_CTRL_CODED_AG C RECORRECT_EN
Enable coded phy AGC recorrect

Default value:
- No (disabled) if CONFIG_BT_CTRL_AG_C RECORRECT_EN && CONFIG_BT_CONTROLLER_ENABLED

CONFIG_BT_CTRL_SCAN_BACKOFF_UPPERLIMIT MAX
Disable active scan backoff

Default value:
- No (disabled) if CONFIG_BT_CONTROLLER_ENABLED

CONFIG_BT_RELEASE_IRAM
Release Bluetooth text (READ DOCS FIRST)

Default value:
- No (disabled) if CONFIG_BT_ENABLED && BT_LE_RELEASE_IRAM_SUPPORTED

CONFIG_BLE_MESH
ESP BLE Mesh Support

Contains:
- BLE Mesh and BLE coexistence support
- CONFIG_BLE_MESH_GATT_PROXY_CLIENT
• CONFIG_BLE_MESH_GATT_PROXY_SERVER
• BLE Mesh NET BUF DEBUG LOG LEVEL
• CONFIG_BLE_MESH_PROV
• CONFIG_BLE_MESH_PROXY
• BLE Mesh specific test option
• BLE Mesh STACK DEBUG LOG LEVEL
• CONFIG_BLE_MESH_NO_LOG
• CONFIG_BLE_MESH_IVU_DIVIDER
• CONFIG_BLE_MESH_FAST_PROV
• CONFIG_BLE_MESH_FREERTOS_STATIC_ALLOC
• CONFIG_BLE_MESH_CRPL
• CONFIG_BLE_MESH_RX_SDU_MAX
• CONFIG_BLE_MESH_MODEL_KEY_COUNT
• CONFIG_BLE_MESH_APP_KEY_COUNT
• CONFIG_BLE_MESH_MODEL_GROUP_COUNT
• CONFIG_BLE_MESH_LABEL_COUNT
• CONFIG_BLE_MESH_SUBNET_COUNT
• CONFIG_BLE_MESH_TX_SEG_MAX
• CONFIG_BLE_MESH_RX_SEG_MSG_COUNT
• CONFIG_BLE_MESH_TX_SEG_MSG_COUNT
• CONFIG_BLE_MESH_MEM_ALLOC_MODE
• CONFIG_BLE_MESH_MSG_CACHE_SIZE
• CONFIG_BLE_MESH_PB_GATT
• CONFIG_BLE_MESH_PB_ADV
• CONFIG_BLE_MESH_IVU_RECOVERY_IVI
• CONFIG_BLE_MESH_RELAY
• CONFIG_BLE_MESH_SAR_ENHANCEMENT
• CONFIG_BLE_MESH_SETTINGS
• CONFIG_BLE_MESH_ACTIVE_SCAN
• CONFIG_BLE_MESH_DEINIT
• CONFIG_BLE_MESH_USE_DUPLICATE_SCAN
• Support for BLE Mesh Client/Server models
• Support for BLE Mesh Foundation models
• CONFIG_BLE_MESH_NODE
• CONFIG_BLE_MESH_PROVISIONER
• CONFIG_BLE_MESH_FRIEND
• CONFIG_BLE_MESH_LOW_POWER
• CONFIG_BLE_MESH_HCI_5_0
• CONFIG_BLE_MESH_IV_UPDATE_TEST
• CONFIG_BLE_MESH_CLIENT_MSG_TIMEOUT

CONFIG_BLE_MESH_HCI_5_0
Support sending 20ms non-connectable adv packets

*Found in: Component config > CONFIG_BLE_MESH*

It is a temporary solution and needs further modifications.

**Default value:**
• Yes (enabled) if CONFIG_BLE_MESH

CONFIG_BLE_MESH_USE_DUPLICATE_SCAN
Support Duplicate Scan in BLE Mesh

*Found in: Component config > CONFIG_BLE_MESH*
Enable this option to allow using specific duplicate scan filter in BLE Mesh, and Scan Duplicate Type must be set by choosing the option in the Bluetooth Controller section in menuconfig, which is “Scan Duplicate By Device Address and Advertising Data”.

**Default value:**
- Yes (enabled) if `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_ACTIVE_SCAN**

Support Active Scan in BLE Mesh

*Found in: Component config > CONFIG_BLE_MESH*

Enable this option to allow using BLE Active Scan for BLE Mesh.

**CONFIG_BLE_MESH_MEM_ALLOC_MODE**

Memory allocation strategy

*Found in: Component config > CONFIG_BLE_MESH*

Allocation strategy for BLE Mesh stack, essentially provides ability to allocate all required dynamic allocations from,

- Internal DRAM memory only
- External SPIRAM memory only
- Either internal or external memory based on default malloc() behavior in ESP-IDF
- Internal IRAM memory wherever applicable else internal DRAM

Recommended mode here is always internal (*), since that is most preferred from security perspective. But if application requirement does not allow sufficient free internal memory then alternate mode can be selected.

(*) In case of ESP32-S2/ESP32-S3, hardware allows encryption of external SPIRAM contents provided hardware flash encryption feature is enabled. In that case, using external SPIRAM allocation strategy is also safe choice from security perspective.

Available options:

- Internal DRAM (CONFIG_BLE_MESH_MEM_ALLOC_MODE_INTERNAL)
- External SPIRAM (CONFIG_BLE_MESH_MEM_ALLOC_MODE_EXTERNAL)
- Default alloc mode (CONFIG_BLE_MESH_MEM_ALLOC_MODE_DEFAULT)
  
Enable this option to use the default memory allocation strategy when external SPIRAM is enabled. See the SPIRAM options for more details.

- Internal IRAM (CONFIG_BLE_MESH_MEM_ALLOC_MODE_IRAM_8BIT)
  
Allows to use IRAM memory region as 8bit accessible region. Every unaligned (8bit or 16bit) access will result in an exception and incur penalty of certain clock cycles per unaligned read/write.

**CONFIG_BLE_MESH_FREERTOS_STATIC_ALLOC**

Enable FreeRTOS static allocation

*Found in: Component config > CONFIG_BLE_MESH*

Enable this option to use FreeRTOS static allocation APIs for BLE Mesh, which provides the ability to use different dynamic memory (i.e. SPIRAM or IRAM) for FreeRTOS objects. If this option is disabled, the FreeRTOS static allocation APIs will not be used, and internal DRAM will be allocated for FreeRTOS objects.

**Default value:**
- No (disabled) if ESP32_IRAM_AS_8BIT_ACCESSIBLE_MEMORY && CONFIG_BLE_MESH
CONFIG_BLE_MESH_FREERTOS_STATICALLOC_MODE
Memory allocation for FreeRTOS objects

Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_FREERTOS_STATICALLOC

Choose the memory to be used for FreeRTOS objects.

Available options:

- External SPIRAM (CONFIG_BLE_MESH_FREERTOS_STATICALLOC_EXTERNAL)
  If enabled, BLE Mesh allocates dynamic memory from external SPIRAM for FreeRTOS objects, i.e. mutex, queue, and task stack. External SPIRAM can only be used for task stack when SPIRAM_ALLOW_STACK_EXTERNAL_MEMORY is enabled. See the SPIRAM options for more details.
- Internal IRAM (CONFIG_BLE_MESH_FREERTOS_STATICALLOC_IRAM_8BIT)
  If enabled, BLE Mesh allocates dynamic memory from internal IRAM for FreeRTOS objects, i.e. mutex, queue. Note: IRAM region cannot be used as task stack.

CONFIG_BLE_MESH_DEINIT
Support de-initialize BLE Mesh stack

Found in: Component config > CONFIG_BLE_MESH

If enabled, users can use the function esp_BLE_MESH_deinit() to de-initialize the whole BLE Mesh stack.

Default value:
- Yes (enabled) if CONFIG_BLE_MESH

BLE Mesh and BLE coexistence support
Contains:
- CONFIG_BLE_MESH_SUPPORT_BLE_SCAN
- CONFIG_BLE_MESH_SUPPORT_BLE_ADV

CONFIG_BLE_MESH_SUPPORT_BLE_ADV
Support sending normal BLE advertising packets

Found in: Component config > CONFIG_BLE_MESH > BLE Mesh and BLE coexistence support

When selected, users can send normal BLE advertising packets with specific API.

Default value:
- No (disabled) if CONFIG_BLE_MESH

CONFIG_BLE_MESH_BLE_ADV_BUF_COUNT
Number of advertising buffers for BLE advertising packets

Found in: Component config > CONFIG_BLE_MESH > BLE Mesh and BLE coexistence support > CONFIG_BLE_MESH_SUPPORT_BLE_ADV

Number of advertising buffers for BLE packets available.

Range:
- from 1 to 255 if CONFIG_BLE_MESH_SUPPORT_BLE_ADV && CONFIG_BLE_MESH

Default value:
- 3 if CONFIG_BLE_MESH_SUPPORT_BLE_ADV && CONFIG_BLE_MESH
**CONFIG_BLE_MESH_SUPPORT_BLE_SCAN**
Support scanning normal BLE advertising packets

*Found in: Component config > CONFIG_BLE_MESH > BLE Mesh and BLE coexistence support*

When selected, users can register a callback and receive normal BLE advertising packets in the application layer.

**Default value:**
- No (disabled) if `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_FAST_PROV**
Enable BLE Mesh Fast Provisioning

*Found in: Component config > CONFIG_BLE_MESH*

Enable this option to allow BLE Mesh fast provisioning solution to be used. When there are multiple unprovisioned devices around, fast provisioning can greatly reduce the time consumption of the whole provisioning process. When this option is enabled, and after an unprovisioned device is provisioned into a node successfully, it can be changed to a temporary Provisioner.

**Default value:**
- No (disabled) if `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_NODE**
Support for BLE Mesh Node

*Found in: Component config > CONFIG_BLE_MESH*

Enable the device to be provisioned into a node. This option should be enabled when an unprovisioned device is going to be provisioned into a node and communicate with other nodes in the BLE Mesh network.

**CONFIG_BLE_MESH_PROVISIONER**
Support for BLE Mesh Provisioner

*Found in: Component config > CONFIG_BLE_MESH*

Enable the device to be a Provisioner. The option should be enabled when a device is going to act as a Provisioner and provision unprovisioned devices into the BLE Mesh network.

**CONFIG_BLE_MESH_WAIT_FOR_PROV_MAX_DEV_NUM**
Maximum number of unprovisioned devices that can be added to device queue

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_PROVISIONER*

This option specifies how many unprovisioned devices can be added to device queue for provisioning. Users can use this option to define the size of the queue in the bottom layer which is used to store unprovisioned device information (e.g. Device UUID, address).

**Range:**
- from 1 to 100 if `CONFIG_BLE_MESH_PROVISIONER` && `CONFIG_BLE_MESH`

**Default value:**
- 10 if `CONFIG_BLE_MESH_PROVISIONER` && `CONFIG_BLE_MESH`
**CONFIG_BLE_MESH_MAX_PROV_NODES**

Maximum number of devices that can be provisioned by Provisioner

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_PROVISIONER*

This option specifies how many devices can be provisioned by a Provisioner. This value indicates the maximum number of unprovisioned devices which can be provisioned by a Provisioner. For instance, if the value is 6, it means the Provisioner can provision up to 6 unprovisioned devices. Theoretically a Provisioner without the limitation of its memory can provision up to 32766 unprovisioned devices, here we limit the maximum number to 100 just to limit the memory used by a Provisioner. The bigger the value is, the more memory it will cost by a Provisioner to store the information of nodes.

*Range:*
  - from 1 to 1000 if `CONFIG_BLE_MESH_PROVISIONER` && `CONFIG_BLE_MESH`

*Default value:*
  - 10 if `CONFIG_BLE_MESH_PROVISIONER` && `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_PBASAME_TIME**

Maximum number of PB-ADV running at the same time by Provisioner

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_PROVISIONER*

This option specifies how many devices can be provisioned at the same time using PB-ADV. For example, if the value is 2, it means a Provisioner can provision two unprovisioned devices with PB-ADV at the same time.

*Range:*
  - from 1 to 10 if `CONFIG_BLE_MESH_PB_ADV` && `CONFIG_BLE_MESH_PROVISIONER` && `CONFIG_BLE_MESH`

*Default value:*
  - 2 if `CONFIG_BLE_MESH_PB_ADV` && `CONFIG_BLE_MESH_PROVISIONER` && `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_PBGSAME_TIME**

Maximum number of PB-GATT running at the same time by Provisioner

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_PROVISIONER*

This option specifies how many devices can be provisioned at the same time using PB-GATT. For example, if the value is 2, it means a Provisioner can provision two unprovisioned devices with PB-GATT at the same time.

*Range:*
  - from 1 to 5 if `CONFIG_BLE_MESH_PB_GATT` && `CONFIG_BLE_MESH_PROVISIONER` && `CONFIG_BLE_MESH`

*Default value:*
  - 1 if `CONFIG_BLE_MESH_PB_GATT` && `CONFIG_BLE_MESH_PROVISIONER` && `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_PROVISIONER_SUBNET_COUNT**

Maximum number of mesh subnets that can be created by Provisioner

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_PROVISIONER*

This option specifies how many subnets per network a Provisioner can create. Indeed, this value decides the number of network keys which can be added by a Provisioner.

*Range:*
  - from 1 to 4096 if `CONFIG_BLE_MESH_PROVISIONER` && `CONFIG_BLE_MESH`

*Default value:*
  - None
Chapter 2. API Reference

- 3 if CONFIG_BLE_MESH_PROVISIONER && CONFIG_BLE_MESH

CONFIG_BLE_MESH_PROVISIONER_APP_KEY_COUNT

Maximum number of application keys that can be owned by Provisioner

Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_PROVISIONER

This option specifies how many application keys the Provisioner can have. Indeed, this value decides the number of the application keys which can be added by a Provisioner.

Range:
- from 1 to 4096 if CONFIG_BLE_MESH_PROVISIONER && CONFIG_BLE_MESH

Default value:
- 3 if CONFIG_BLE_MESH_PROVISIONER && CONFIG_BLE_MESH

CONFIG_BLE_MESH_PROVISIONER_RECV_HB

Support receiving Heartbeat messages

Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_PROVISIONER

When this option is enabled, Provisioner can call specific functions to enable or disable receiving Heartbeat messages and notify them to the application layer.

Default value:
- No (disabled) if CONFIG_BLE_MESH_PROVISIONER && CONFIG_BLE_MESH

CONFIG_BLE_MESH_PROVISIONER_RECV_HB_FILTER_SIZE

Maximum number of filter entries for receiving Heartbeat messages

Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_PROVISIONER > CONFIG_BLE_MESH_PROVISIONER_RECV_HB

This option specifies how many heartbeat filter entries Provisioner supports. The heartbeat filter (acceptlist or rejectlist) entries are used to store a list of SRC and DST which can be used to decide if a heartbeat message will be processed and notified to the application layer by Provisioner. Note: The filter is an empty rejectlist by default.

Range:
- from 1 to 1000 if CONFIG_BLE_MESH_PROVISIONER_RECV_HB && CONFIG_BLE_MESH_PROVISIONER && CONFIG_BLE_MESH

Default value:
- 3 if CONFIG_BLE_MESH_PROVISIONER_RECV_HB && CONFIG_BLE_MESH

CONFIG_BLE_MESH_PROV

BLE Mesh Provisioning support

Found in: Component config > CONFIG_BLE_MESH

Enable this option to support BLE Mesh Provisioning functionality. For BLE Mesh, this option should be always enabled.

Default value:
- Yes (enabled) if CONFIG_BLE_MESH
CONFIG_BLE_MESH_PROV_EPA

BLE Mesh enhanced provisioning authentication

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_PROV*

Enable this option to support BLE Mesh enhanced provisioning authentication functionality. This option can increase the security level of provisioning. It is recommended to enable this option.

**Default value:**

- Yes (enabled) if `CONFIG_BLE_MESH_PROV` && `CONFIG_BLE_MESH`

CONFIG_BLE_MESH_CERT_BASED_PROV

Support Certificate-based provisioning

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_PROV*

Enable this option to support BLE Mesh Certificate-Based Provisioning.

**Default value:**

- No (disabled) if `CONFIG_BLE_MESH_PROV` && `CONFIG_BLE_MESH`

CONFIG_BLE_MESH_RECORD_FRAG_MAX_SIZE

Maximum size of the provisioning record fragment that Provisioner can receive

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_PROV > CONFIG_BLE_MESH_CERT_BASED_PROV*

This option sets the maximum size of the provisioning record fragment that the Provisioner can receive. The range depends on provisioning bearer.

**Range:**

- from 1 to 57 if `CONFIG_BLE_MESH_CERT_BASED_PROV` && `CONFIG_BLE_MESH`

**Default value:**

- 56 if `CONFIG_BLE_MESH_CERT_BASED_PROV` && `CONFIG_BLE_MESH`

CONFIG_BLE_MESH_PB_ADV

Provisioning support using the advertising bearer (PB-ADV)

*Found in: Component config > CONFIG_BLE_MESH*

Enable this option to allow the device to be provisioned over the advertising bearer. This option should be enabled if PB-ADV is going to be used during provisioning procedure.

**Default value:**

- Yes (enabled) if `CONFIG_BLE_MESH`

CONFIG_BLE_MESH_UNPROVISIONED_BEACON_INTERVAL

Interval between two consecutive Unprovisioned Device Beacon

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_PB_ADV*

This option specifies the interval of sending two consecutive unprovisioned device beacon, users can use this option to change the frequency of sending unprovisioned device beacon. For example, if the value is 5, it means the unprovisioned device beacon will send every 5 seconds. When the option of BLE_MESH_FAST_PROV is selected, the value is better to be 3 seconds, or less.

**Range:**

- from 1 to 100 if `CONFIG_BLE_MESH_NODE` && `CONFIG_BLE_MESH_PB_ADV` && `CONFIG_BLE_MESH`

**Default value:**
Chapter 2. API Reference

- 5 if `CONFIG_BLE_MESH_NODE` && `CONFIG_BLE_MESH_PB_ADV` && `CONFIG_BLE_MESH`  
- 3 if `CONFIG_BLE_MESH_FAST_PROV` && `CONFIG_BLE_MESH_NODE` && `CONFIG_BLE_MESH_PB_ADV` && `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_PB_GATT**

Provisioning support using GATT (PB-GATT)

*Found in: Component config > CONFIG_BLE_MESH*

Enable this option to allow the device to be provisioned over GATT. This option should be enabled if PB-GATT is going to be used during provisioning procedure.

# Virtual option enabled whenever any Proxy protocol is needed

**CONFIG_BLE_MESH_PROXY**

BLE Mesh Proxy protocol support

*Found in: Component config > CONFIG_BLE_MESH*

Enable this option to support BLE Mesh Proxy protocol used by PB-GATT and other proxy pdu transmission.

*Default value:*

- Yes (enabled) if `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_GATT_PROXY_SERVER**

BLE Mesh GATT Proxy Server

*Found in: Component config > CONFIG_BLE_MESH*

This option enables support for Mesh GATT Proxy Service, i.e. the ability to act as a proxy between a Mesh GATT Client and a Mesh network. This option should be enabled if a node is going to be a Proxy Server.

*Default value:*

- Yes (enabled) if `CONFIG_BLE_MESH_NODE` && `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_NODE_ID_TIMEOUT**

Node Identity advertising timeout

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_GATT_PROXY_SERVER*

This option determines for how long the local node advertises using Node Identity. The given value is in seconds. The specification limits this to 60 seconds and lists it as the recommended value as well. So leaving the default value is the safest option. When an unprovisioned device is provisioned successfully and becomes a node, it will start to advertise using Node Identity during the time set by this option. And after that, Network ID will be advertised.

*Range:*

- from 1 to 60 if `CONFIG_BLE_MESH_GATT_PROXY_SERVER` && `CONFIG_BLE_MESH`

*Default value:*

- 60 if `CONFIG_BLE_MESH_GATT_PROXY_SERVER` && `CONFIG_BLE_MESH`
**CONFIG_BLE_MESH_PROXY_FILTER_SIZE**

Maximum number of filter entries per Proxy Client

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_GATT_PROXY_SERVER*

This option specifies how many Proxy Filter entries the local node supports. The entries of Proxy filter (whitelist or blacklist) are used to store a list of addresses which can be used to decide which messages will be forwarded to the Proxy Client by the Proxy Server.

*Range:*
  - from 1 to 32767 if CONFIG_BLE_MESH_GATT_PROXY_SERVER && CONFIG_BLE_MESH

*Default value:*
  - 4 if CONFIG_BLE_MESH_GATT_PROXY_SERVER && CONFIG_BLE_MESH

**CONFIG_BLE_MESH_PROXY_PRIVACY**

Support Proxy Privacy

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_GATT_PROXY_SERVER*

The Proxy Privacy parameter controls the privacy of the Proxy Server over the connection. The value of the Proxy Privacy parameter is controlled by the type of proxy connection, which is dependent on the bearer used by the proxy connection.

*Default value:*
  - Yes (enabled) if CONFIG_BLE_MESH_PRB_SRV && CONFIG_BLE_MESH_GATT_PROXY_SERVER && CONFIG_BLE_MESH

**CONFIG_BLE_MESH_PROXY_SOLIC_PDU_RX**

Support receiving Proxy Solicitation PDU

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_GATT_PROXY_SERVER*

Enable this option to support receiving Proxy Solicitation PDU.

**CONFIG_BLE_MESH_PROXY_SOLIC_RX_CRPL**

Maximum capacity of solicitation replay protection list

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_GATT_PROXY_SERVER > CONFIG_BLE_MESH_PROXY_SOLIC_PDU_RX*

This option specifies the maximum capacity of the solicitation replay protection list. The solicitation replay protection list is used to reject Solicitation PDUs that were already processed by a node, which will store the solicitation src and solicitation sequence number of the received Solicitation PDU message.

*Range:*
  - from 1 to 255 if CONFIG_BLE_MESH_PROXY_SOLIC_PDU_RX && CONFIG_BLE_MESH

*Default value:*
  - 2 if CONFIG_BLE_MESH_PROXY_SOLIC_PDU_RX && CONFIG_BLE_MESH

**CONFIG_BLE_MESH_GATT_PROXY_CLIENT**

BLE Mesh GATT Proxy Client

*Found in: Component config > CONFIG_BLE_MESH*

This option enables support for Mesh GATT Proxy Client. The Proxy Client can use the GATT bearer to send mesh messages to a node that supports the advertising bearer.

*Default value:*
  - No (disabled) if CONFIG_BLE_MESH
CONFIG_BLE_MESH_PROXY_SOLIC_PDU_TX
Support sending Proxy Solicitation PDU

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_GATT_PROXY_CLIENT*

Enable this option to support sending Proxy Solicitation PDU.

CONFIG_BLE_MESH_PROXY_SOLIC_TX_SRC_COUNT
Maximum number of SSRC that can be used by Proxy Client

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_GATT_PROXY_CLIENT > CONFIG_BLE_MESH_PROXY_SOLIC_PDU_TX*

This option specifies the maximum number of Solicitation Source (SSRC) that can be used by Proxy Client for sending a Solicitation PDU. A Proxy Client may use the primary address or any of the secondary addresses as the SSRC for a Solicitation PDU. So for a Proxy Client, it’s better to choose the value based on its own element count.

**Range:**
- from 1 to 16 if *CONFIG_BLE_MESH_PROXY_SOLIC_PDU_TX* && *CONFIG_BLE_MESH*

**Default value:**
- 2 if *CONFIG_BLE_MESH_PROXY_SOLIC_PDU_TX* && *CONFIG_BLE_MESH*

CONFIG_BLE_MESH_SETTINGS
Store BLE Mesh configuration persistently

*Found in: Component config > CONFIG_BLE_MESH*

When selected, the BLE Mesh stack will take care of storing/restoring the BLE Mesh configuration persistently in flash. If the device is a BLE Mesh node, when this option is enabled, the configuration of the device will be stored persistently, including unicast address, NetKey, AppKey, etc. And if the device is a BLE Mesh Provisioner, the information of the device will be stored persistently, including the information of provisioned nodes, NetKey, AppKey, etc.

**Default value:**
- No (disabled) if *CONFIG_BLE_MESH*

CONFIG_BLE_MESH_STORE_TIMEOUT
Delay (in seconds) before storing anything persistently

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_SETTINGS*

This value defines in seconds how soon any pending changes are actually written into persistent storage (flash) after a change occurs. The option allows nodes to delay a certain period of time to save proper information to flash. The default value is 0, which means information will be stored immediately once there are updates.

**Range:**
- from 0 to 1000000 if *CONFIG_BLE_MESH_SETTINGS* && *CONFIG_BLE_MESH*

**Default value:**
- 0 if *CONFIG_BLE_MESH_SETTINGS* && *CONFIG_BLE_MESH*

CONFIG_BLE_MESH_SEQ_STORE_RATE
How often the sequence number gets updated in storage

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_SETTINGS*

This value defines how often the local sequence number gets updated in persistent storage (i.e. flash). e.g. a value of 100 means that the sequence number will be stored to flash on every 100th increment.
If the node sends messages very frequently a higher value makes more sense, whereas if the node sends infrequently a value as low as 0 (update storage for every increment) can make sense. When the stack gets initialized it will add sequence number to the last stored one, so that it starts off with a value that's guaranteed to be larger than the last one used before power off.

**Range:**
- from 0 to 1000000 if `CONFIG_BLE_MESH_SETTINGS` & `CONFIG_BLE_MESH`

**Default value:**
- 0 if `CONFIG_BLE_MESH_SETTINGS` & `CONFIG_BLE_MESH`

### CONFIG_BLE_MESH_RPL_STORE_TIMEOUT

Minimum frequency that the RPL gets updated in storage

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_SETTINGS*

This value defines in seconds how soon the RPL (Replay Protection List) gets written to persistent storage after a change occurs. If the node receives messages frequently, then a large value is recommended. If the node receives messages rarely, then the value can be as low as 0 (which means the RPL is written into the storage immediately). Note that if the node operates in a security-sensitive case, and there is a risk of sudden power-off, then a value of 0 is strongly recommended. Otherwise, a power loss before RPL being written into the storage may introduce message replay attacks and system security will be in a vulnerable state.

**Range:**
- from 0 to 1000000 if `CONFIG_BLE_MESH_SETTINGS` & `CONFIG_BLE_MESH`

**Default value:**
- 0 if `CONFIG_BLE_MESH_SETTINGS` & `CONFIG_BLE_MESH`

### CONFIG_BLE_MESH_SETTINGS_BACKWARD_COMPATIBILITY

A specific option for settings backward compatibility

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_SETTINGS*

This option is created to solve the issue of failure in recovering node information after mesh stack updates. In the old version mesh stack, there is no key of “mesh/role” in nvs. In the new version mesh stack, key of “mesh/role” is added in nvs, recovering node information needs to check “mesh/role” key in nvs and implements selective recovery of mesh node information. Therefore, there may be failure in recovering node information during node restarting after OTA.

The new version mesh stack adds the option of “mesh/role” because we have added the support of storing Provisioner information, while the old version only supports storing node information.

If users are updating their nodes from old version to new version, we recommend enabling this option, so that system could set the flag in advance before recovering node information and make sure the node information recovering could work as expected.

**Default value:**
- No (disabled) if `CONFIG_BLE_MESH_NODE` & `CONFIG_BLE_MESH_SETTINGS` & `CONFIG_BLE_MESH`

### CONFIG_BLE_MESH_SPECIFIC_PARTITION

Use a specific NVS partition for BLE Mesh

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_SETTINGS*

When selected, the mesh stack will use a specified NVS partition instead of default NVS partition. Note that the specified partition must be registered with NVS using `nvs_flash_init_partition()` API, and the partition must exists in the csv file. When Provisioner needs to store a large amount of nodes’ information in the flash (e.g. more than 20), this option is recommended to be enabled.
Default value:
- No (disabled) if `CONFIG_BLE_MESH_SETTINGS` && `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_PARTITION_NAME**

Name of the NVS partition for BLE Mesh

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_SETTINGS > CONFIG_BLE_MESH_SPECIFIC_PARTITION*

This value defines the name of the specified NVS partition used by the mesh stack.

Default value:
- “ble_mesh” if `CONFIG_BLE_MESH_SPECIFIC_PARTITION` && `CONFIG_BLE_MESH_SETTINGS` && `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_USE_MULTIPLE_NAMESPACE**

Support using multiple NVS namespaces by Provisioner

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_SETTINGS*

When selected, Provisioner can use different NVS namespaces to store different instances of mesh information. For example, if in the first room, Provisioner uses NetKey A, AppKey A and provisions three devices, these information will be treated as mesh information instance A. When the Provisioner moves to the second room, it uses NetKey B, AppKey B and provisions two devices, then the information will be treated as mesh information instance B. Here instance A and instance B will be stored in different namespaces. With this option enabled, Provisioner needs to use specific functions to open the corresponding NVS namespace, restore the mesh information, release the mesh information or erase the mesh information.

Default value:
- No (disabled) if `CONFIG_BLE_MESH_PROVISIONER` && `CONFIG_BLE_MESH_SETTINGS` && `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_MAX_NVS_NAMESPACE**

Maximum number of NVS namespaces

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_SETTINGS > CONFIG_BLE_MESH_USE_MULTIPLE_NAMESPACE*

This option specifies the maximum NVS namespaces supported by Provisioner.

Range:
- from 1 to 255 if `CONFIG_BLE_MESH_USE_MULTIPLE_NAMESPACE` && `CONFIG_BLE_MESH_SETTINGS` && `CONFIG_BLE_MESH`

Default value:
- 2 if `CONFIG_BLE_MESH_USE_MULTIPLE_NAMESPACE` && `CONFIG_BLE_MESH_SETTINGS` && `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_SUBNET_COUNT**

Maximum number of mesh subnets per network

*Found in: Component config > CONFIG_BLE_MESH*

This option specifies how many subnets a Mesh network can have at the same time. Indeed, this value decides the number of the network keys which can be owned by a node.

Range:
- from 1 to 4096 if `CONFIG_BLE_MESH`

Default value:
Chapter 2. API Reference

- 3 if CONFIG_BLE_MESH

**CONFIG_BLE_MESH_APP_KEY_COUNT**
Maximum number of application keys per network

*Found in: Component config > CONFIG_BLE_MESH*

This option specifies how many application keys the device can store per network. Indeed, this value decides the number of the application keys which can be owned by a node.

*Range:*
- from 1 to 4096 if CONFIG_BLE_MESH

*Default value:*
- 3 if CONFIG_BLE_MESH

**CONFIG_BLE_MESH_MODEL_KEY_COUNT**
Maximum number of application keys per model

*Found in: Component config > CONFIG_BLE_MESH*

This option specifies the maximum number of application keys to which each model can be bound.

*Range:*
- from 1 to 4096 if CONFIG_BLE_MESH

*Default value:*
- 3 if CONFIG_BLE_MESH

**CONFIG_BLE_MESH_MODEL_GROUP_COUNT**
Maximum number of group address subscriptions per model

*Found in: Component config > CONFIG_BLE_MESH*

This option specifies the maximum number of addresses to which each model can be subscribed.

*Range:*
- from 1 to 4096 if CONFIG_BLE_MESH

*Default value:*
- 3 if CONFIG_BLE_MESH

**CONFIG_BLE_MESH_LABEL_COUNT**
Maximum number of Label UUIDs used for Virtual Addresses

*Found in: Component config > CONFIG_BLE_MESH*

This option specifies how many Label UUIDs can be stored. Indeed, this value decides the number of the Virtual Addresses can be supported by a node.

*Range:*
- from 0 to 4096 if CONFIG_BLE_MESH

*Default value:*
- 3 if CONFIG_BLE_MESH

**CONFIG_BLE_MESH_CRPL**
Maximum capacity of the replay protection list

*Found in: Component config > CONFIG_BLE_MESH*

This option specifies the maximum capacity of the replay protection list. It is similar to Network message cache size, but has a different purpose. The replay protection list is used to prevent a node from replay
attack, which will store the source address and sequence number of the received mesh messages. For Provisioner, the replay protection list size should not be smaller than the maximum number of nodes whose information can be stored. And the element number of each node should also be taken into consideration. For example, if Provisioner can provision up to 20 nodes and each node contains two elements, then the replay protection list size of Provisioner should be at least 40.

**Range:**
- from 2 to 65535 if `CONFIG_BLE_MESH`

**Default value:**
- 10 if `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_MSG_CACHE_SIZE**

Network message cache size

*Found in: Component config > CONFIG_BLE_MESH*

Number of messages that are cached for the network. This helps prevent unnecessary decryption operations and unnecessary relays. This option is similar to Replay protection list, but has a different purpose. A node is not required to cache the entire Network PDU and may cache only part of it for tracking, such as values for SRC/SEQ or others.

**Range:**
- from 2 to 65535 if `CONFIG_BLE_MESH`

**Default value:**
- 10 if `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_ADV_BUF_COUNT**

Number of advertising buffers

*Found in: Component config > CONFIG_BLE_MESH*

Number of advertising buffers available. The transport layer reserves ADV_BUF_COUNT - 3 buffers for outgoing segments. The maximum outgoing SDU size is 12 times this value (out of which 4 or 8 bytes are used for the Transport Layer MIC). For example, 5 segments means the maximum SDU size is 60 bytes, which leaves 56 bytes for application layer data using a 4-byte MIC, or 52 bytes using an 8-byte MIC.

**Range:**
- from 6 to 256 if `CONFIG_BLE_MESH`

**Default value:**
- 60 if `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_IVU-divider**

Divider for IV Update state refresh timer

*Found in: Component config > CONFIG_BLE_MESH*

When the IV Update state enters Normal operation or IV Update in Progress, we need to keep track of how many hours has passed in the state, since the specification requires us to remain in the state at least for 96 hours (Update in Progress has an additional upper limit of 144 hours).

In order to fulfill the above requirement, even if the node might be powered off once in a while, we need to store persistently how many hours the node has been in the state. This doesn’t necessarily need to happen every hour (thanks to the flexible duration range). The exact cadence will depend a lot on the ways that the node will be used and what kind of power source it has.

Since there is no single optimal answer, this configuration option allows specifying a divider, i.e. how many intervals the 96 hour minimum gets split into. After each interval the duration that the node has been in the current state gets stored to flash. E.g. the default value of 4 means that the state is saved every 24 hours (96 / 4).
Chapter 2. API Reference

Range:
• from 2 to 96 if CONFIG_BLE_MESH

Default value:
• 4 if CONFIG_BLE_MESH

CONFIG_BLE_MESH_IVU_RECOVERY_IVI

Recovery the IV index when the latest whole IV update procedure is missed

Found in: Component config > CONFIG_BLE_MESH

According to Section 3.10.5 of Mesh Specification v1.0.1. If a node in Normal Operation receives a Secure Network beacon with an IV index equal to the last known IV index+1 and the IV Update Flag set to 0, the node may update its IV without going to the IV Update in Progress state, or it may initiate an IV Index Recovery procedure (Section 3.10.6), or it may ignore the Secure Network beacon. The node makes the choice depending on the time since last IV update and the likelihood that the node has missed the Secure Network beacons with the IV update Flag. When the above situation is encountered, this option can be used to decide whether to perform the IV index recovery procedure.

Default value:
• No (disabled) if CONFIG_BLE_MESH

CONFIG_BLE_MESH_SAR_ENHANCEMENT

Segmentation and reassembly enhancement

Found in: Component config > CONFIG_BLE_MESH

Enable this option to use the enhanced segmentation and reassembly mechanism introduced in Bluetooth Mesh Protocol 1.1.

Default value:
• No (disabled) if CONFIG_BLE_MESH

CONFIG_BLE_MESH_TX_SEG_MSG_COUNT

Maximum number of simultaneous outgoing segmented messages

Found in: Component config > CONFIG_BLE_MESH

Maximum number of simultaneous outgoing multi-segment and/or reliable messages. The default value is 1, which means the device can only send one segmented message at a time. And if another segmented message is going to be sent, it should wait for the completion of the previous one. If users are going to send multiple segmented messages at the same time, this value should be configured properly.

Range:
• from 1 to if CONFIG_BLE_MESH

Default value:
• 1 if CONFIG_BLE_MESH

CONFIG_BLE_MESH_RX_SEG_MSG_COUNT

Maximum number of simultaneous incoming segmented messages

Found in: Component config > CONFIG_BLE_MESH

Maximum number of simultaneous incoming multi-segment and/or reliable messages. The default value is 1, which means the device can only receive one segmented message at a time. And if another segmented message is going to be received, it should wait for the completion of the previous one. If users are going to receive multiple segmented messages at the same time, this value should be configured properly.

Range:
CONFIG_BLE_MESH_RX_SDU_MAX

Maximum incoming Upper Transport Access PDU length

*Found in:* Component config > CONFIG_BLE_MESH

Maximum incoming Upper Transport Access PDU length. Leave this to the default value, unless you really need to optimize memory usage.

*Range:*
  - from 36 to 384 if CONFIG_BLE_MESH

*Default value:*
  - 384 if CONFIG_BLE_MESH

CONFIG_BLE_MESH_TX_SEG_MAX

Maximum number of segments in outgoing messages

*Found in:* Component config > CONFIG_BLE_MESH

Maximum number of segments supported for outgoing messages. This value should typically be fine-tuned based on what models the local node supports, i.e. what’s the largest message payload that the node needs to be able to send. This value affects memory and call stack consumption, which is why the default is lower than the maximum that the specification would allow (32 segments).

The maximum outgoing SDU size is 12 times this number (out of which 4 or 8 bytes is used for the Transport Layer MIC). For example, 5 segments means the maximum SDU size is 60 bytes, which leaves 56 bytes for application layer data using a 4-byte MIC and 52 bytes using an 8-byte MIC.

Be sure to specify a sufficient number of advertising buffers when setting this option to a higher value. There must be at least three more advertising buffers (BLE_MESH_ADV_BUF_COUNT) as there are outgoing segments.

*Range:*
  - from 2 to 32 if CONFIG_BLE_MESH

*Default value:*
  - 32 if CONFIG_BLE_MESH

CONFIG_BLE_MESH_RELAY

Relay support

*Found in:* Component config > CONFIG_BLE_MESH

Support for acting as a Mesh Relay Node. Enabling this option will allow a node to support the Relay feature, and the Relay feature can still be enabled or disabled by proper configuration messages. Disabling this option will let a node not support the Relay feature.

*Default value:*
  - Yes (enabled) if CONFIG_BLE_MESH_NODE & CONFIG_BLE_MESH

CONFIG_BLE_MESH_RELAY_ADV_BUF

Use separate advertising buffers for relay packets

*Found in:* Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_RELAY

When selected, self-send packets will be put in a high-priority queue and relay packets will be put in a low-priority queue.
Default value:
- No (disabled) if `CONFIG_BLE_MESH_RELAY` && `CONFIG_BLE_MESH`

`CONFIG_BLE_MESH_RELAY_ADV_BUF_COUNT`
Number of advertising buffers for relay packets

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_RELAY > CONFIG_BLE_MESH_RELAY_ADV_BUF*

Number of advertising buffers for relay packets available.

*Range:*
- from 6 to 256 if `CONFIG_BLE_MESH_RELAY_ADV_BUF` && `CONFIG_BLE_MESH_RELAY` && `CONFIG_BLE_MESH`

Default value:
- 60 if `CONFIG_BLE_MESH_RELAY_ADV_BUF` && `CONFIG_BLE_MESH_RELAY` && `CONFIG_BLE_MESH`

`CONFIG_BLE_MESH_LOW_POWER`
Support for Low Power features

*Found in: Component config > CONFIG_BLE_MESH*

Enable this option to operate as a Low Power Node. If low power consumption is required by a node, this option should be enabled. And once the node enters the mesh network, it will try to find a Friend node and establish a friendship.

`CONFIG_BLE_MESH_LPN_ESTABLISHMENT`
Perform Friendship establishment using low power

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_LOW_POWER*

Perform the Friendship establishment using low power with the help of a reduced scan duty cycle. The downside of this is that the node may miss out on messages intended for it until it has successfully set up Friendship with a Friend node. When this option is enabled, the node will stop scanning for a period of time after a Friend Request or Friend Poll is sent, so as to reduce more power consumption.

Default value:
- No (disabled) if `CONFIG_BLE_MESH_LOW_POWER` && `CONFIG_BLE_MESH`

`CONFIG_BLE_MESH_LPN_AUTO`
Automatically start looking for Friend nodes once provisioned

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_LOW_POWER*

Once provisioned, automatically enable LPN functionality and start looking for Friend nodes. If this option is disabled LPN mode needs to be manually enabled by calling `bt_mesh_lpn_set(true)`. When an unprovisioned device is provisioned successfully and becomes a node, enabling this option will trigger the node to send Friend Request at a certain period until it finds a proper Friend node.

Default value:
- No (disabled) if `CONFIG_BLE_MESH_LOW_POWER` && `CONFIG_BLE_MESH`

`CONFIG_BLE_MESH_LPN_AUTO_TIMEOUT`
Time from last received message before going to LPN mode

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_LOW_POWER > CONFIG_BLE_MESH_LPN_AUTO*
Time in seconds from the last received message, that the node waits out before starting to look for Friend nodes.

**Range:**
- from 0 to 3600 if `CONFIG_BLE_MESH_LPN_AUTO` && `CONFIG_BLE_MESH_LOW_POWER` && `CONFIG_BLE_MESH`

**Default value:**
- 15 if `CONFIG_BLE_MESH_LPN_AUTO` && `CONFIG_BLE_MESH_LOW_POWER` && `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_LPN_RETRY_TIMEOUT**

Retry timeout for Friend requests

*Found in:* Component config > `CONFIG_BLE_MESH` > `CONFIG_BLE_MESH_LOW_POWER`

Time in seconds between Friend Requests, if a previous Friend Request did not yield any acceptable Friend Offers.

**Range:**
- from 1 to 3600 if `CONFIG_BLE_MESH_LOW_POWER` && `CONFIG_BLE_MESH`

**Default value:**
- 6 if `CONFIG_BLE_MESH_LOW_POWER` && `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_LPN_RSSI_FACTOR**

RSSIFactor, used in Friend Offer Delay calculation

*Found in:* Component config > `CONFIG_BLE_MESH` > `CONFIG_BLE_MESH_LOW_POWER`

The contribution of the RSSI, measured by the Friend node, used in Friend Offer Delay calculations. 0 = 1, 1 = 1.5, 2 = 2, 3 = 2.5. RSSIFactor, one of the parameters carried by Friend Request sent by Low Power node, which is used to calculate the Friend Offer Delay.

**Range:**
- from 0 to 3 if `CONFIG_BLE_MESH_LOW_POWER` && `CONFIG_BLE_MESH`

**Default value:**
- 0 if `CONFIG_BLE_MESH_LOW_POWER` && `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_LPN_RECV_WIN_FACTOR**

ReceiveWindowFactor, used in Friend Offer Delay calculation

*Found in:* Component config > `CONFIG_BLE_MESH` > `CONFIG_BLE_MESH_LOW_POWER`

The contribution of the supported Receive Window used in Friend Offer Delay calculations. 0 = 1, 1 = 1.5, 2 = 2, 3 = 2.5. ReceiveWindowFactor, one of the parameters carried by Friend Request sent by Low Power node, which is used to calculate the Friend Offer Delay.

**Range:**
- from 0 to 3 if `CONFIG_BLE_MESH_LOW_POWER` && `CONFIG_BLE_MESH`

**Default value:**
- 0 if `CONFIG_BLE_MESH_LOW_POWER` && `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_LPN_MIN_QUEUE_SIZE**

Minimum size of the acceptable friend queue (MinQueueSizeLog)

*Found in:* Component config > `CONFIG_BLE_MESH` > `CONFIG_BLE_MESH_LOW_POWER`

The MinQueueSizeLog field is defined as log_2(N), where N is the minimum number of maximum size Lower Transport PDUs that the Friend node can store in its Friend Queue. As an example, MinQueueSizeLog value 1 gives N = 2, and value 7 gives N = 128.
Range:
    • from 1 to 7 if `CONFIG_BLE_MESH_LOW_POWER` && `CONFIG_BLE_MESH`

Default value:
    • 1 if `CONFIG_BLE_MESH_LOW_POWER` && `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_LPN_RECV_DELAY**

Receive delay requested by the local node

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_LOW_POWER*

The ReceiveDelay is the time between the Low Power node sending a request and listening for a response. This delay allows the Friend node time to prepare the response. The value is in units of milliseconds.

Range:
    • from 10 to 255 if `CONFIG_BLE_MESH_LOW_POWER` && `CONFIG_BLE_MESH`

Default value:
    • 100 if `CONFIG_BLE_MESH_LOW_POWER` && `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_LPN_POLL_TIMEOUT**

The value of the PollTimeout timer

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_LOW_POWER*

PollTimeout timer is used to measure time between two consecutive requests sent by a Low Power node. If no requests are received the Friend node before the PollTimeout timer expires, then the friendship is considered terminated. The value is in units of 100 milliseconds, so e.g. a value of 300 means 30 seconds. The smaller the value, the faster the Low Power node tries to get messages from corresponding Friend node and vice versa.

Range:
    • from 10 to 244735 if `CONFIG_BLE_MESH_LOW_POWER` && `CONFIG_BLE_MESH`

Default value:
    • 300 if `CONFIG_BLE_MESH_LOW_POWER` && `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_LPN_INIT_POLL_TIMEOUT**

The starting value of the PollTimeout timer

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_LOW_POWER*

The initial value of the PollTimeout timer when Friendship is to be established for the first time. After this, the timeout gradually grows toward the actual PollTimeout, doubling in value for each iteration. The value is in units of 100 milliseconds, so e.g. a value of 300 means 30 seconds.

Range:
    • from 10 to if `CONFIG_BLE_MESH_LOW_POWER` && `CONFIG_BLE_MESH`

Default value:
    • if `CONFIG_BLE_MESH_LOW_POWER` && `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_LPN_SCAN_LATENCY**

Latency for enabling scanning

*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_LOW_POWER*

Latency (in milliseconds) is the time it takes to enable scanning. In practice, it means how much time in advance of the Receive Window, the request to enable scanning is made.

Range:
    • from 0 to 50 if `CONFIG_BLE_MESH_LOW_POWER` && `CONFIG_BLE_MESH`

Default value:
• 10 if `CONFIG_BLE_MESH_LOW_POWER` && `CONFIG_BLE_MESH`  

**CONFIG_BLE_MESH_LPN_GROUPS**  
Number of groups the LPN can subscribe to  
*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_LOW_POWER*  
Maximum number of groups to which the LPN can subscribe.  
*Range:*  
• from 0 to 16384 if `CONFIG_BLE_MESH_LOW_POWER` && `CONFIG_BLE_MESH`  
*Default value:*  
• 8 if `CONFIG_BLE_MESH_LOW_POWER` && `CONFIG_BLE_MESH`  

**CONFIG_BLE_MESH_LPN_SUB_ALL_NODES_ADDR**  
Automatically subscribe all nodes address  
*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_LOW_POWER*  
Automatically subscribe all nodes address when friendship established.  
*Default value:*  
• No (disabled) if `CONFIG_BLE_MESH_LOW_POWER` && `CONFIG_BLE_MESH`  

**CONFIG_BLE_MESH_FRIEND**  
Support for Friend feature  
*Found in: Component config > CONFIG_BLE_MESH*  
Enable this option to be able to act as a Friend Node.  

**CONFIG_BLE_MESH_FRIEND_RECV_WIN**  
Friend Receive Window  
*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_FRIEND*  
Receive Window in milliseconds supported by the Friend node.  
*Range:*  
• from 1 to 255 if `CONFIG_BLE_MESH_FRIEND` && `CONFIG_BLE_MESH`  
*Default value:*  
• 255 if `CONFIG_BLE_MESH_FRIEND` && `CONFIG_BLE_MESH`  

**CONFIG_BLE_MESH_FRIEND_QUEUE_SIZE**  
Minimum number of buffers supported per Friend Queue  
*Found in: Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_FRIEND*  
Minimum number of buffers available to be stored for each local Friend Queue. This option decides the size of each buffer which can be used by a Friend node to store messages for each Low Power node.  
*Range:*  
• from 2 to 65536 if `CONFIG_BLE_MESH_FRIEND` && `CONFIG_BLE_MESH`  
*Default value:*  
• 16 if `CONFIG_BLE_MESH_FRIEND` && `CONFIG_BLE_MESH`
CONFIG_BLE_MESH_FRIEND_SUB_LIST_SIZE

Friend Subscription List Size

*Found in:* Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_FRIEND

Size of the Subscription List that can be supported by a Friend node for a Low Power node. And Low Power node can send Friend Subscription List Add or Friend Subscription List Remove messages to the Friend node to add or remove subscription addresses.

**Range:**
- from 0 to 1023 if CONFIG_BLE_MESH_FRIEND && CONFIG_BLE_MESH

**Default value:**
- 3 if CONFIG_BLE_MESH_FRIEND && CONFIG_BLE_MESH

CONFIG_BLE_MESH_FRIEND_LPN_COUNT

Number of supported LPN nodes

*Found in:* Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_FRIEND

Number of Low Power Nodes with which a Friend can have Friendship simultaneously. A Friend node can have friendship with multiple Low Power nodes at the same time, while a Low Power node can only establish friendship with only one Friend node at the same time.

**Range:**
- from 1 to 1000 if CONFIG_BLE_MESH_FRIEND && CONFIG_BLE_MESH

**Default value:**
- 2 if CONFIG_BLE_MESH_FRIEND && CONFIG_BLE_MESH

CONFIG_BLE_MESH_FRIEND_SEG_RX

Number of incomplete segment lists per LPN

*Found in:* Component config > CONFIG_BLE_MESH > CONFIG_BLE_MESH_FRIEND

Number of incomplete segment lists tracked for each Friend’s LPN. In other words, this determines from how many elements can segmented messages destined for the Friend queue be received simultaneously.

**Range:**
- from 1 to 1000 if CONFIG_BLE_MESH_FRIEND && CONFIG_BLE_MESH

**Default value:**
- 1 if CONFIG_BLE_MESH_FRIEND && CONFIG_BLE_MESH

CONFIG_BLE_MESH_NO_LOG

Disable BLE Mesh debug logs (minimize bin size)

*Found in:* Component config > CONFIG_BLE_MESH

Select this to save the BLE Mesh related rodata code size. Enabling this option will disable the output of BLE Mesh debug log.

**Default value:**
- No (disabled) if CONFIG_BLE_MESH && CONFIG_BLE_MESH

BLE Mesh STACK DEBUG LOG LEVEL

Contains:

- CONFIG_BLE_MESH_STACK_TRACE_LEVEL
CONFIG_BLE_MESH_STACK_TRACE_LEVEL

BLE_MESH_STACK

Found in: Component config > CONFIG_BLE_MESH > BLE Mesh STACK DEBUG LOG LEVEL

Define BLE Mesh trace level for BLE Mesh stack.

Available options:

- NONE (CONFIG_BLE_MESH_TRACE_LEVEL_NONE)
- ERROR (CONFIG_BLE_MESH_TRACE_LEVEL_ERROR)
- WARNING (CONFIG_BLE_MESH_TRACE_LEVEL_WARNING)
- INFO (CONFIG_BLE_MESH_TRACE_LEVEL_INFO)
- DEBUG (CONFIG_BLE_MESH_TRACE_LEVEL_DEBUG)
- VERBOSE (CONFIG_BLE_MESH_TRACE_LEVEL_VERBOSE)

BLE Mesh NET BUF DEBUG LOG LEVEL

Contains:

- CONFIG_BLE_MESH_NET_BUF_TRACE_LEVEL

CONFIG_BLE_MESH_NET_BUF_TRACE_LEVEL

BLE_MESH_NET_BUF

Found in: Component config > CONFIG_BLE_MESH > BLE Mesh NET BUF DEBUG LOG LEVEL

Define BLE Mesh trace level for BLE Mesh net buffer.

Available options:

- NONE (CONFIG_BLE_MESH_NET_BUF_TRACE_LEVEL_NONE)
- ERROR (CONFIG_BLE_MESH_NET_BUF_TRACE_LEVEL_ERROR)
- WARNING (CONFIG_BLE_MESH_NET_BUF_TRACE_LEVEL_WARNING)
- INFO (CONFIG_BLE_MESH_NET_BUF_TRACE_LEVEL_INFO)
- DEBUG (CONFIG_BLE_MESH_NET_BUF_TRACE_LEVEL_DEBUG)
- VERBOSE (CONFIG_BLE_MESH_NET_BUF_TRACE_LEVEL_VERBOSE)

CONFIG_BLE_MESH_CLIENT_MSG_TIMEOUT

Timeout(ms) for client message response

Found in: Component config > CONFIG_BLE_MESH

Timeout value used by the node to get response of the acknowledged message which is sent by the client model. This value indicates the maximum time that a client model waits for the response of the sent acknowledged messages. If a client model uses 0 as the timeout value when sending acknowledged messages, then the default value will be used which is four seconds.

Range:

- from 100 to 1200000 if CONFIG_BLE_MESH

Default value:

- 4000 if CONFIG_BLE_MESH

Support for BLE Mesh Foundation models

Contains:

- CONFIG_BLE_MESH_BRC_CLI
- CONFIG_BLE_MESH_BRC_SRV
- CONFIG_BLE_MESH_CFG_CLI
- CONFIG_BLE_MESH_DF_CLI
Chapter 2. API Reference

- CONFIG_BLE_MESH_DF_SRV
- CONFIG_BLE_MESH_HEALTH_CLI
- CONFIG_BLE_MESH_HEALTH_SRV
- CONFIG_BLE_MESH_LCD_CLI
- CONFIG_BLE_MESH_LCD_SRV
- CONFIG_BLE_MESH_PRB_CLI
- CONFIG_BLE_MESH_PRB_SRV
- CONFIG_BLE_MESH_ODP_CLI
- CONFIG_BLE_MESH_ODP_SRV
- CONFIG_BLE_MESH_AGG_CLI
- CONFIG_BLE_MESH_AGG_SRV
- CONFIG_BLE_MESH_RPR_CLI
- CONFIG_BLE_MESH_RPR_SRV
- CONFIG_BLE_MESH_SAR_CLI
- CONFIG_BLE_MESH_SAR_SRV
- CONFIG_BLE_MESH_SRPL_CLI
- CONFIG_BLE_MESH_SRPL_SRV
- CONFIG_BLE_MESH_COMP_DATA_1
- CONFIG_BLE_MESH_COMP_DATA_128
- CONFIG_BLE_MESH_MODELS_METADATA_0

CONFIG_BLE_MESH_CFG_CLI

Configuration Client model

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Foundation models*

Enable support for Configuration Client model.

CONFIG_BLE_MESH_HEALTH_CLI

Health Client model

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Foundation models*

Enable support for Health Client model.

CONFIG_BLE_MESH_HEALTH_SRV

Health Server model

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Foundation models*

Enable support for Health Server model.

**Default value:**
- Yes (enabled) if CONFIG_BLE_MESH

CONFIG_BLE_MESH_BRC_CLI

Bridge Configuration Client model

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Foundation models*

Enable support for Bridge Configuration Client model.

CONFIG_BLE_MESH_BRC_SRV

Bridge Configuration Server model

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Foundation models*

Enable support for Bridge Configuration Server model.
**Default value:**
- No (disabled) if `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_MAX_BRIDGING_TABLE_ENTRY_COUNT**

Maximum number of Bridging Table entries

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Foundation models > CONFIG_BLE_MESH_BRC_SRV*

Maximum number of Bridging Table entries that the Bridge Configuration Server can support.

**Range:**
- from 16 to 65535 if `CONFIG_BLE_MESH_BRC_SRV` && `CONFIG_BLE_MESH`

**Default value:**
- 16 if `CONFIG_BLE_MESH_BRC_SRV` && `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_BRIDGE_CRPL**

Maximum capacity of bridge replay protection list

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Foundation models > CONFIG_BLE_MESH_BRC_SRV*

This option specifies the maximum capacity of the bridge replay protection list. The bridge replay protection list is used to prevent a bridged subnet from replay attack, which will store the source address and sequence number of the received bridge messages.

**Range:**
- from 1 to 255 if `CONFIG_BLE_MESH_BRC_SRV` && `CONFIG_BLE_MESH`

**Default value:**
- 5 if `CONFIG_BLE_MESH_BRC_SRV` && `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_PRB_CLI**

Mesh Private Beacon Client model

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Foundation models*

Enable support for Mesh Private Beacon Client model.

**CONFIG_BLE_MESH_PRB_SRV**

Mesh Private Beacon Server model

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Foundation models*

Enable support for Mesh Private Beacon Server model.

**CONFIG_BLE_MESH_ODP_CLI**

On-Demand Private Proxy Client model

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Foundation models*

Enable support for On-Demand Private Proxy Client model.

**CONFIG_BLE_MESH_ODP_SRV**

On-Demand Private Proxy Server model

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Foundation models*

Enable support for On-Demand Private Proxy Server model.
Chapter 2. API Reference

**CONFIG_BLE_MESH_SRPL_CLI**
Solicitation PDU RPL Configuration Client model

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Foundation models*

Enable support for Solicitation PDU RPL Configuration Client model.

**CONFIG_BLE_MESH_SRPL_SRV**
Solicitation PDU RPL Configuration Server model

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Foundation models*

Enable support for Solicitation PDU RPL Configuration Server model. Note: This option depends on the functionality of receiving Solicitation PDU. If the device doesn’t support receiving Solicitation PDU, then there is no need to enable this server model.

**CONFIG_BLE_MESH_AGG_CLI**
Opcodes Aggregator Client model

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Foundation models*

Enable support for Opcodes Aggregator Client model.

**CONFIG_BLE_MESH_AGG_SRV**
Opcodes Aggregator Server model

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Foundation models*

Enable support for Opcodes Aggregator Server model.

**CONFIG_BLE_MESH_SAR_CLI**
SAR Configuration Client model

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Foundation models*

Enable support for SAR Configuration Client model.

**CONFIG_BLE_MESH_SAR_SRV**
SAR Configuration Server model

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Foundation models*

Enable support for SAR Configuration Server model.

**CONFIG_BLE_MESH_COMP_DATA_1**
Support Composition Data Page 1

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Foundation models*

Composition Data Page 1 contains information about the relationships among models. Each model either can be a root model or can extend other models.
CONFIG_BLE_MESH_COMP_DATA_128
Support Composition Data Page 128

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Foundation models*

Composition Data Page 128 is used to indicate the structure of elements, features, and models of a node after the successful execution of the Node Address Refresh procedure or the Node Composition Refresh procedure, or after the execution of the Node Removal procedure followed by the provisioning process. Composition Data Page 128 shall be present if the node supports the Remote Provisioning Server model; otherwise it is optional.

CONFIG_BLE_MESH_MODELS_METADATA_0
Support Models Metadata Page 0

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Foundation models*

The Models Metadata state contains metadata of a node’s models. The Models Metadata state is composed of a number of pages of information. Models Metadata Page 0 shall be present if the node supports the Large Composition Data Server model.

CONFIG_BLE_MESH_MODELS_METADATA_128
Support Models Metadata Page 128

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Foundation models > CONFIG_BLE_MESH_MODELS_METADATA_0*

The Models Metadata state contains metadata of a node’s models. The Models Metadata state is composed of a number of pages of information. Models Metadata Page 128 contains metadata for the node’s models after the successful execution of the Node Address Refresh procedure or the Node Composition Refresh procedure, or after the execution of the Node Removal procedure followed by the provisioning process. Models Metadata Page 128 shall be present if the node supports the Remote Provisioning Server model and the node supports the Large Composition Data Server model.

CONFIG_BLE_MESH_LCD_CLI
Large Composition Data Client model

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Foundation models*

Enable support for Large Composition Data Client model.

CONFIG_BLE_MESH_LCD_SRV
Large Composition Data Server model

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Foundation models*

Enable support for Large Composition Data Server model.

CONFIG_BLE_MESH_RPR_CLI
Remote Provisioning Client model

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Foundation models*

Enable support for Remote Provisioning Client model
**CONFIG_BLE_MESH_RPR_CLI_PROV_SAME_TIME**

Maximum number of PB-Remote running at the same time by Provisioner

*Found in:* Component config > CONFIG_BLE_MESH > Support for BLE Mesh Foundation models > CONFIG_BLE_MESH_RPR_CLI

This option specifies how many devices can be provisioned at the same time using PB-REMOTE. For example, if the value is 2, it means a Provisioner can provision two unprovisioned devices with PB-REMOTE at the same time.

**Range:**
- from 1 to 5 if CONFIG_BLE_MESH_RPR_CLI && CONFIG_BLE_MESH

**Default value:**
- 2 if CONFIG_BLE_MESH_RPR_CLI && CONFIG_BLE_MESH

**CONFIG_BLE_MESH_RPR_SRV**

Remote Provisioning Server model

*Found in:* Component config > CONFIG_BLE_MESH > Support for BLE Mesh Foundation models

Enable support for Remote Provisioning Server model

**CONFIG_BLE_MESH_RPR_SRV_MAX_SCANNED_ITEMS**

Maximum number of device information can be scanned

*Found in:* Component config > CONFIG_BLE_MESH > Support for BLE Mesh Foundation models > CONFIG_BLE_MESH_RPR_SRV

This option specifies how many device information can a Remote Provisioning Server store each time while scanning.

**Range:**
- from 4 to 255 if CONFIG_BLE_MESH_RPR_SRV && CONFIG_BLE_MESH

**Default value:**
- 10 if CONFIG_BLE_MESH_RPR_SRV && CONFIG_BLE_MESH

**CONFIG_BLE_MESH_RPR_SRV_ACTIVE_SCAN**

Support Active Scan for remote provisioning

*Found in:* Component config > CONFIG_BLE_MESH > Support for BLE Mesh Foundation models > CONFIG_BLE_MESH_RPR_SRV

Enable this option to support Active Scan for remote provisioning.

**CONFIG_BLE_MESH_RPR_SRV_MAX_EXT_SCAN**

Maximum number of extended scan procedures

*Found in:* Component config > CONFIG_BLE_MESH > Support for BLE Mesh Foundation models > CONFIG_BLE_MESH_RPR_SRV

This option specifies how many extended scan procedures can be started by the Remote Provisioning Server.

**Range:**
- from 1 to 10 if CONFIG_BLE_MESH_RPR_SRV && CONFIG_BLE_MESH

**Default value:**
- 1 if CONFIG_BLE_MESH_RPR_SRV && CONFIG_BLE_MESH
CONFIG_BLE_MESH_DF_CLI

Directed Forwarding Configuration Client model

Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Foundation models

Enable support for Directed Forwarding Configuration Client model.

CONFIG_BLE_MESH_DF_SRV

Directed Forwarding Configuration Server model

Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Foundation models

Enable support for Directed Forwarding Configuration Server model.

CONFIG_BLE_MESH_MAX_DISC_TABLE_ENTRY_COUNT

Maximum number of discovery table entries in a given subnet

Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Foundation models > CONFIG_BLE_MESH_DF_SRV

Maximum number of Discovery Table entries supported by the node in a given subnet.

Range:
- from 2 to 255 if CONFIG_BLE_MESH_DF_SRV && CONFIG_BLE_MESH

Default value:
- 2 if CONFIG_BLE_MESH_DF_SRV && CONFIG_BLE_MESH

CONFIG_BLE_MESH_MAX_FORWARD_TABLE_ENTRY_COUNT

Maximum number of forward table entries in a given subnet

Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Foundation models > CONFIG_BLE_MESH_DF_SRV

Maximum number of Forward Table entries supported by the node in a given subnet.

Range:
- from 2 to 64 if CONFIG_BLE_MESH_DF_SRV && CONFIG_BLE_MESH

Default value:
- 2 if CONFIG_BLE_MESH_DF_SRV && CONFIG_BLE_MESH

CONFIG_BLE_MESH_MAX_DEPS_NODES_PER_PATH

Maximum number of dependent nodes per path

Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Foundation models > CONFIG_BLE_MESH_DF_SRV

Maximum size of dependent nodes list supported by each forward table entry.

Range:
- from 2 to 64 if CONFIG_BLE_MESH_DF_SRV && CONFIG_BLE_MESH

Default value:
- 2 if CONFIG_BLE_MESH_DF_SRV && CONFIG_BLE_MESH

CONFIG_BLE_MESH_PATH_MONITOR_TEST

Enable Path Monitoring test mode

Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Foundation models > CONFIG_BLE_MESH_DF_SRV
The option only removes the Path Use timer; all other behavior of the device is not changed. If Path Monitoring test mode is going to be used, this option should be enabled.

**Default value:**
- No (disabled) if $CONFIG\_BLE\_MESH\_DF\_SRV$ && $CONFIG\_BLE\_MESH$

### $CONFIG\_BLE\_MESH\_SUPPORT\_DIRECTED\_PROXY$

Enable Directed Proxy functionality

*Found in:* Component config > $CONFIG\_BLE\_MESH$ > Support for BLE Mesh Foundation models > $CONFIG\_BLE\_MESH\_DF\_SRV$

Support Directed Proxy functionality.

**Default value:**
- Yes (enabled) if $CONFIG\_BLE\_MESH\_GATT\_PROXY\_SERVER$ && $CONFIG\_BLE\_MESH\_DF\_SRV$ && $CONFIG\_BLE\_MESH$

**Support for BLE Mesh Client/Server models**

Contains:
- $CONFIG\_BLE\_MESH\_MBT\_CLI$
- $CONFIG\_BLE\_MESH\_MBT\_SRV$
- $CONFIG\_BLE\_MESH\_GENERIC\_BATTERY\_CLI$
- $CONFIG\_BLE\_MESH\_GENERIC\_DEF\_TRANS\_TIME\_CLI$
- $CONFIG\_BLE\_MESH\_GENERIC\_LEVEL\_CLI$
- $CONFIG\_BLE\_MESH\_GENERIC\_LOCATION\_CLI$
- $CONFIG\_BLE\_MESH\_GENERIC\_ONOFF\_CLI$
- $CONFIG\_BLE\_MESH\_GENERIC\_POWER\_LEVEL\_CLI$
- $CONFIG\_BLE\_MESH\_GENERIC\_POWER\_ONOFF\_CLI$
- $CONFIG\_BLE\_MESH\_GENERIC\_PROPERTY\_CLI$
- $CONFIG\_BLE\_MESH\_GENERIC\_SERVER$
- $CONFIG\_BLE\_MESH\_LIGHT\_CTL\_CLI$
- $CONFIG\_BLE\_MESH\_LIGHT\_HSL\_CLI$
- $CONFIG\_BLE\_MESH\_LIGHT\_LC\_CLI$
- $CONFIG\_BLE\_MESH\_LIGHT\_LIGHTNESS\_CLI$
- $CONFIG\_BLE\_MESH\_LIGHT\_XYL\_CLI$
- $CONFIG\_BLE\_MESH\_LIGHTING\_SERVER$
- $CONFIG\_BLE\_MESH\_SCENE\_CLI$
- $CONFIG\_BLE\_MESH\_SCHEDULER\_CLI$
- $CONFIG\_BLE\_MESH\_SENSOR\_CLI$
- $CONFIG\_BLE\_MESH\_SENSOR\_SERVER$
- $CONFIG\_BLE\_MESH\_TIME\_SCENE\_SERVER$
- $CONFIG\_BLE\_MESH\_TIME\_CLI$

### $CONFIG\_BLE\_MESH\_GENERIC\_ONOFF\_CLI$

Generic OnOff Client model

*Found in:* Component config > $CONFIG\_BLE\_MESH$ > Support for BLE Mesh Client/Server models

Enable support for Generic OnOff Client model.

### $CONFIG\_BLE\_MESH\_GENERIC\_LEVEL\_CLI$

Generic Level Client model

*Found in:* Component config > $CONFIG\_BLE\_MESH$ > Support for BLE Mesh Client/Server models

Enable support for Generic Level Client model.
Chapter 2  API Reference

CONFIG_BLE_MESH_GENERIC_DEF_TRANS_TIME_CLI
Generic Default Transition Time Client model

Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models
Enable support for Generic Default Transition Time Client model.

CONFIG_BLE_MESH_GENERIC_POWER_ONOFF_CLI
Generic Power OnOff Client model

Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models
Enable support for Generic Power OnOff Client model.

CONFIG_BLE_MESH_GENERIC_POWER_LEVEL_CLI
Generic Power Level Client model

Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models
Enable support for Generic Power Level Client model.

CONFIG_BLE_MESH_GENERIC_BATTERY_CLI
Generic Battery Client model

Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models
Enable support for Generic Battery Client model.

CONFIG_BLE_MESH_GENERIC_LOCATION_CLI
Generic Location Client model

Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models
Enable support for Generic Location Client model.

CONFIG_BLE_MESH_GENERIC_PROPERTY_CLI
Generic Property Client model

Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models
Enable support for Generic Property Client model.

CONFIG_BLE_MESH_SENSOR_CLI
Sensor Client model

Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models
Enable support for Sensor Client model.

CONFIG_BLE_MESH_TIME_CLI
Time Client model

Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models
Enable support for Time Client model.
Chapter 2. API Reference

CONFIG_BLE_MESH_SCENE_CLI
Scene Client model

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models*
Enable support for Scene Client model.

CONFIG_BLE_MESH_SCHEDULER_CLI
Scheduler Client model

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models*
Enable support for Scheduler Client model.

CONFIG_BLE_MESH_LIGHT_LIGHTNESS_CLI
Light Lightness Client model

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models*
Enable support for Light Lightness Client model.

CONFIG_BLE_MESH_LIGHT_CTL_CLI
Light CTL Client model

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models*
Enable support for Light CTL Client model.

CONFIG_BLE_MESH_LIGHT_HSL_CLI
Light HSL Client model

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models*
Enable support for Light HSL Client model.

CONFIG_BLE_MESH_LIGHT_XYL_CLI
Light XYL Client model

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models*
Enable support for Light XYL Client model.

CONFIG_BLE_MESH_LIGHT_LC_CLI
Light LC Client model

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models*
Enable support for Light LC Client model.

CONFIG_BLE_MESH_GENERIC_SERVER
Generic server models

*Found in: Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models*
Enable support for Generic server models.

**Default value:**
- Yes (enabled) if `CONFIG_BLE_MESH`
CONFIG_BLE_MESH_SENSOR_SERVER

Sensor server models

*Found in:* Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models

Enable support for Sensor server models.

**Default value:**

- Yes (enabled) if CONFIG_BLE_MESH

CONFIG_BLE_MESH_TIME_SCENE_SERVER

Time and Scenes server models

*Found in:* Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models

Enable support for Time and Scenes server models.

**Default value:**

- Yes (enabled) if CONFIG_BLE_MESH

CONFIG_BLE_MESH_LIGHTING_SERVER

Lighting server models

*Found in:* Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models

Enable support for Lighting server models.

**Default value:**

- Yes (enabled) if CONFIG_BLE_MESH

CONFIG_BLE_MESH_MBT_CLI

BLOB Transfer Client model

*Found in:* Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models

Enable support for BLOB Transfer Client model.

**Default value:**

- Yes (enabled) if CONFIG_BLE_MESH

CONFIG_BLE_MESH_MAX_BLOB_RECEIVERS

Maximum number of simultaneous blob receivers

*Found in:* Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models > CONFIG_BLE_MESH_MBT_CLI

Maximum number of BLOB Transfer Server models that can participating in the BLOB transfer with a BLOB Transfer Client model.

**Range:**

- from 1 to 255 if CONFIG_BLE_MESH_MBT_CLI && CONFIG_BLE_MESH

**Default value:**

- 2 if CONFIG_BLE_MESH_MBT_CLI && CONFIG_BLE_MESH

CONFIG_BLE_MESH_MBT_SRV

BLOB Transfer Server model

*Found in:* Component config > CONFIG_BLE_MESH > Support for BLE Mesh Client/Server models

Enable support for BLOB Transfer Server model.
Default value:
  • Yes (enabled) if `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_IV_UPDATE_TEST**

Test the IV Update Procedure

*Found in: Component config > CONFIG_BLE_MESH*

This option removes the 96 hour limit of the IV Update Procedure and lets the state to be changed at any time. If IV Update test mode is going to be used, this option should be enabled.

Default value:
  • No (disabled) if `CONFIG_BLE_MESH`

**BLE Mesh specific test option** Contains:

  • `CONFIG_BLE_MESH_DEBUG`
  • `CONFIG_BLE_MESH_SHELL`
  • `CONFIG_BLE_MESH_BQB_TEST`
  • `CONFIG_BLE_MESH_SELF_TEST`
  • `CONFIG_BLE_MESH_TEST_AUTO_ENTER_NETWORK`
  • `CONFIG_BLE_MESH_TEST_USE_WHITE_LIST`

**CONFIG_BLE_MESH_SELF_TEST**

Perform BLE Mesh self-tests

*Found in: Component config > CONFIG_BLE_MESH > BLE Mesh specific test option*

This option adds extra self-tests which are run every time BLE Mesh networking is initialized.

Default value:
  • No (disabled) if `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_BQB_TEST**

Enable BLE Mesh specific internal test

*Found in: Component config > CONFIG_BLE_MESH > BLE Mesh specific test option*

This option is used to enable some internal functions for auto-pts test.

Default value:
  • No (disabled) if `CONFIG_BLE_MESH`

**CONFIG_BLE_MESH_TEST_AUTO_ENTER_NETWORK**

Unprovisioned device enters mesh network automatically

*Found in: Component config > CONFIG_BLE_MESH > BLE Mesh specific test option*

With this option enabled, an unprovisioned device can automatically enters mesh network using a specific test function without the pro- visioning procedure. And on the Provisioner side, a test function needs to be invoked to add the node information into the mesh stack.

Default value:
  • Yes (enabled) if `CONFIG_BLE_MESH_SELF_TEST` & `CONFIG_BLE_MESH`
CONFIG_BLE_MESH_TEST_USE_WHITE_LIST

Use white list to filter mesh advertising packets

*Found in: Component config > CONFIG_BLE_MESH > BLE Mesh specific test option*

With this option enabled, users can use white list to filter mesh advertising packets while scanning.

**Default value:**
- No (disabled) if `CONFIG_BLE_MESH_SELF_TEST` && `CONFIG_BLE_MESH`

CONFIG_BLE_MESH_SHELL

Enable BLE Mesh shell

*Found in: Component config > CONFIG_BLE_MESH > BLE Mesh specific test option*

Activate shell module that provides BLE Mesh commands to the console.

**Default value:**
- No (disabled) if `CONFIG_BLE_MESH`

CONFIG_BLE_MESH_DEBUG

Enable BLE Mesh debug logs

*Found in: Component config > CONFIG_BLE_MESH > BLE Mesh specific test option*

Enable debug logs for the BLE Mesh functionality.

**Default value:**
- No (disabled) if `CONFIG_BLE_MESH`

CONFIG_BLE_MESH_DEBUG_NET

Network layer debug

*Found in: Component config > CONFIG_BLE_MESH > BLE Mesh specific test option > CONFIG_BLE_MESH_DEBUG*

Enable Network layer debug logs for the BLE Mesh functionality.

CONFIG_BLE_MESH_DEBUG_TRANS

Transport layer debug

*Found in: Component config > CONFIG_BLE_MESH > BLE Mesh specific test option > CONFIG_BLE_MESH_DEBUG*

Enable Transport layer debug logs for the BLE Mesh functionality.

CONFIG_BLE_MESH_DEBUG_BEACON

Beacon debug

*Found in: Component config > CONFIG_BLE_MESH > BLE Mesh specific test option > CONFIG_BLE_MESH_DEBUG*

Enable Beacon-related debug logs for the BLE Mesh functionality.
CONFIG_BLE_MESH_DEBUG_CRYPTO

Crypto debug

*Found in:* Component config > CONFIG_BLE_MESH > BLE Mesh specific test option > CONFIG_BLE_MESH_DEBUG

Enable cryptographic debug logs for the BLE Mesh functionality.

CONFIG_BLE_MESH_DEBUG_PROV

Provisioning debug

*Found in:* Component config > CONFIG_BLE_MESH > BLE Mesh specific test option > CONFIG_BLE_MESH_DEBUG

Enable Provisioning debug logs for the BLE Mesh functionality.

CONFIG_BLE_MESH_DEBUG_ACCESS

Access layer debug

*Found in:* Component config > CONFIG_BLE_MESH > BLE Mesh specific test option > CONFIG_BLE_MESH_DEBUG

Enable Access layer debug logs for the BLE Mesh functionality.

CONFIG_BLE_MESH_DEBUG_MODEL

Foundation model debug

*Found in:* Component config > CONFIG_BLE_MESH > BLE Mesh specific test option > CONFIG_BLE_MESH_DEBUG

Enable Foundation Models debug logs for the BLE Mesh functionality.

CONFIG_BLE_MESH_DEBUG_ADV

Advertising debug

*Found in:* Component config > CONFIG_BLE_MESH > BLE Mesh specific test option > CONFIG_BLE_MESH_DEBUG

Enable advertising debug logs for the BLE Mesh functionality.

CONFIG_BLE_MESH_DEBUG_LOW_POWER

Low Power debug

*Found in:* Component config > CONFIG_BLE_MESH > BLE Mesh specific test option > CONFIG_BLE_MESH_DEBUG

Enable Low Power debug logs for the BLE Mesh functionality.

CONFIG_BLE_MESH_DEBUG_FRIEND

Friend debug

*Found in:* Component config > CONFIG_BLE_MESH > BLE Mesh specific test option > CONFIG_BLE_MESH_DEBUG

Enable Friend debug logs for the BLE Mesh functionality.
CONFIG_BLE_MESH_DEBUG_PROXY

Proxy debug

*Found in:* Component config > CONFIG_BLE_MESH > BLE Mesh specific test option > CONFIG_BLE_MESH_DEBUG

Enable Proxy protocol debug logs for the BLE Mesh functionality.

Driver Configurations  Contains:

- Analog Comparator Configuration
- DAC Configuration
- I2C Configuration
- I2S Configuration
- LEDC Configuration
- Legacy ADC Configuration
- MCPWM Configuration
- Parallel IO Configuration
- RMT Configuration
- Sigma Delta Modulator Configuration
- SPI Configuration
- Temperature sensor Configuration
- TWAI Configuration
- UART Configuration
- USB Serial/JTAG Configuration

Legacy ADC Configuration  Contains:

- CONFIG_ADC_DISABLE_DAC
- Legacy ADC Calibration Configuration
- CONFIG_ADC_SUPPRESS_DEPRECATE_WARN

CONFIG_ADC_DISABLE_DAC

Disable DAC when ADC2 is used on GPIO 25 and 26

*Found in:* Component config > Driver Configurations > Legacy ADC Configuration

If this is set, the ADC2 driver will disable the output of the DAC corresponding to the specified channel. This is the default value.

For testing, disable this option so that we can measure the output of DAC by internal ADC.

**Default value:**

- Yes (enabled) if SOC_DAC_SUPPORTED

CONFIG_ADC_SUPPRESS_DEPRECATE_WARN

Suppress legacy driver deprecated warning

*Found in:* Component config > Driver Configurations > Legacy ADC Configuration

Whether to suppress the deprecation warnings when using legacy adc driver (driver/adc.h). If you want to continue using the legacy driver, and don’t want to see related deprecation warnings, you can enable this option.

**Default value:**

- No (disabled)
Chapter 2. API Reference

Legacy ADC Calibration Configuration  Contains:
  - `CONFIG_ADC_CALI_SUPPRESS_DEPRECATE_WARN`

`CONFIG_ADC_CALI_SUPPRESS_DEPRECATE_WARN`
Suppress legacy driver deprecated warning

Found in: `Component config > Driver Configurations > Legacy ADC Configuration > Legacy ADC Calibration Configuration`

Whether to suppress the deprecation warnings when using legacy adc calibration driver (esp_adc_cal.h). If you want to continue using the legacy driver, and don’t want to see related deprecation warnings, you can enable this option.

Default value:
  - No (disabled)

SPI Configuration  Contains:
  - `CONFIG_SPI_MASTER_ISR_IN_IRAM`
  - `CONFIG_SPI_SLAVE_ISR_IN_IRAM`
  - `CONFIG_SPI_MASTER_IN_IRAM`
  - `CONFIG_SPI_SLAVE_IN_IRAM`

`CONFIG_SPI_MASTER_IN_IRAM`
Place transmitting functions of SPI master into IRAM

Found in: `Component config > Driver Configurations > SPI Configuration`

Normally only the ISR of SPI master is placed in the IRAM, so that it can work without the flash when interrupt is triggered. For other functions, there’s some possibility that the flash cache miss when running inside and out of SPI functions, which may increase the interval of SPI transactions. Enable this to put `queue\_trans, get\_trans\_result` and `transmit` functions into the IRAM to avoid possible cache miss.

This configuration won’t be available if `CONFIG_FREERTOS_PLACE_FUNCTIONS_INTO_FLASH` is enabled.

During unit test, this is enabled to measure the ideal case of api.

`CONFIG_SPI_MASTER_ISR_IN_IRAM`
Place SPI master ISR function into IRAM

Found in: `Component config > Driver Configurations > SPI Configuration`

Place the SPI master ISR in to IRAM to avoid possible cache miss.

Enabling this configuration is possible only when `HEAP_PLACE_FUNCTION_INTO_FLASH` is disabled since the spi master uses can allocate transactions buffers into DMA memory section using the heap component API that ipso facto has to be placed in IRAM.

Also you can forbid the ISR being disabled during flash writing access, by add `ESP_INTR_FLAG_IRAM` when initializing the driver.

`CONFIG_SPI_SLAVE_IN_IRAM`
Place transmitting functions of SPI slave into IRAM

Found in: `Component config > Driver Configurations > SPI Configuration`
Normally only the ISR of SPI slave is placed in the IRAM, so that it can work without the flash when interrupt is triggered. For other functions, there’s some possibility that the flash cache miss when running inside and out of SPI functions, which may increase the interval of SPI transactions. Enable this to put `queue_trans, get_trans_result` and `transmit` functions into the IRAM to avoid possible cache miss.

**Default value:**
- No (disabled)

**CONFIG_SPI_SLAVE_ISR_IN_IRAM**

Place SPI slave ISR function into IRAM

*Found in: Component config > Driver Configurations > SPI Configuration*

Place the SPI slave ISR in to IRAM to avoid possible cache miss.

Also you can forbid the ISR being disabled during flash writing access, by add `ESP_INTR_FLAG_IRAM` when initializing the driver.

**Default value:**
- Yes (enabled)

**TWAI Configuration**  
Contains:
- `CONFIG_TWAI_ERRATA_FIX_LISTEN_ONLY_DOM`
- `CONFIG_TWAI_ISR_IN_IRAM`

**CONFIG_TWAI_ISR_IN_IRAM**

Place TWAI ISR function into IRAM

*Found in: Component config > Driver Configurations > TWAI Configuration*

Place the TWAI ISR in to IRAM. This will allow the ISR to avoid cache misses, and also be able to run whilst the cache is disabled (such as when writing to SPI Flash). Note that if this option is enabled:
- Users should also set the `ESP_INTR_FLAG_IRAM` in the driver configuration structure when installing the driver (see docs for specifics). - Alert logging (i.e., setting of the `TWAI_ALERT_AND_LOG` flag) will have no effect.

**Default value:**
- No (disabled)

**CONFIG_TWAI_ERRATA_FIX_LISTEN_ONLY_DOM**

Add SW workaround for listen only transmits dominant bit errata

*Found in: Component config > Driver Configurations > TWAI Configuration*

When in the listen only mode, the TWAI controller must not influence the TWAI bus (i.e., must not send any dominant bits). However, while in listen only mode on the ESP32/ESP32-S2/ESP32-S3/ESP32-C3, the TWAI controller will still transmit dominant bits when it detects an error (i.e., as part of an active error frame). Enabling this option will add a workaround that forces the TWAI controller into an error passive state on initialization, thus preventing any dominant bits from being sent.

**Default value:**
- Yes (enabled)

**Temperature sensor Configuration**  
Contains:
- `CONFIG_TEMP_SENSOR_ENABLE_DEBUG_LOG`
- `CONFIG_TEMP_SENSOR_SUPPRESS_DEPRECATE_WARN`
- `CONFIG_TEMP_SENSOR_ISR_IRAM_SAFE`
CONFIG_TEMP_SENSOR_SUPPRESS_DEPRECATEN.Warn

Suppress legacy driver deprecated warning

Found in: Component config > Driver Configurations > Temperature sensor Configuration

Whether to suppress the deprecation warnings when using legacy temperature sensor driver (driver/temp_sensor.h). If you want to continue using the legacy driver, and don’t want to see related deprecation warnings, you can enable this option.

Default value:
- No (disabled)

CONFIG_TEMP_SENSOR_ENABLE_DEBUG_LOG

Enable debug log

Found in: Component config > Driver Configurations > Temperature sensor Configuration

Whether to enable the debug log message for temperature sensor driver. Note that, this option only controls the temperature sensor driver log, won’t affect other drivers.

Default value:
- No (disabled)

CONFIG_TEMP_SENSOR_ISR_IRAM_SAFE

Temperature sensor ISR IRAM-Safe

Found in: Component config > Driver Configurations > Temperature sensor Configuration

Ensure the Temperature Sensor interrupt is IRAM-Safe by allowing the interrupt handler to be executable when the cache is disabled (e.g. SPI Flash write).

Default value:
- No (disabled) if SOC_TEMPERATURE_SENSOR_INTR_SUPPORT

UART Configuration Contains:
- CONFIG_UART_ISR_IN_IRAM

CONFIG_UART_ISR_IN_IRAM

Place UART ISR function into IRAM

Found in: Component config > Driver Configurations > UART Configuration

If this option is not selected, UART interrupt will be disabled for a long time and may cause data lost when doing spi flash operation.

Sigma Delta Modulator Configuration Contains:
- CONFIG_SDM_ENABLE_DEBUG_LOG
- CONFIG_SDM_CTRL_FUNC_IN_IRAM
- CONFIG_SDM_SUPPRESS_DEPRECATEN.Warn

CONFIG_SDM_CTRL_FUNC_IN_IRAM

Place SDM control functions into IRAM

Found in: Component config > Driver Configurations > Sigma Delta Modulator Configuration
Place SDM control functions (like set_duty) into IRAM, so that these functions can be IRAM-safe and able to be called in the other IRAM interrupt context. Enabling this option can improve driver performance as well.

**Default value:**
- No (disabled)

**CONFIG_SDM_SUPPRESS_DEPRECATE_WARN**

Suppress legacy driver deprecated warning

*Found in: Component config > Driver Configurations > Sigma Delta Modulator Configuration*

Wether to suppress the deprecation warnings when using legacy sigma delta driver. If you want to continue using the legacy driver, and don’t want to see related deprecation warnings, you can enable this option.

**Default value:**
- No (disabled)

**CONFIG_SDM_ENABLE_DEBUG_LOG**

Enable debug log

*Found in: Component config > Driver Configurations > Sigma Delta Modulator Configuration*

Wether to enable the debug log message for SDM driver. Note that, this option only controls the SDM driver log, won’t affect other drivers.

**Default value:**
- No (disabled)

**Analog Comparator Configuration**

Contains:

- **CONFIG_ANA_CMPR_ISR_IRAM_SAFE**
- **CONFIG_ANA_CMPR_ENABLE_DEBUG_LOG**
- **CONFIG_ANA_CMPR_CTRL_FUNC_IN_IRAM**

**CONFIG_ANA_CMPR_ISR_IRAM_SAFE**

Analog comparator ISR IRAM-Safe

*Found in: Component config > Driver Configurations > Analog Comparator Configuration*

Ensure the Analog Comparator interrupt is IRAM-Safe by allowing the interrupt handler to be executable when the cache is disabled (e.g. SPI Flash write).

**Default value:**
- No (disabled) if SOC_ANA_CMPR_SUPPORTED

**CONFIG_ANA_CMPR_CTRL_FUNC_IN_IRAM**

Place Analog Comparator control functions into IRAM

*Found in: Component config > Driver Configurations > Analog Comparator Configuration*

Place Analog Comparator control functions (like ana_cmpr_set_internal_reference) into IRAM, so that these functions can be IRAM-safe and able to be called in an IRAM interrupt context. Enabling this option can improve driver performance as well.

**Default value:**
- No (disabled) if SOC_ANA_CMPR_SUPPORTED
CONFIG_ANA_CMPR_ENABLE_DEBUG_LOG

Enable debug log

*Found in: Component config > Driver Configurations > Analog Comparator Configuration*

Whether to enable the debug log message for Analog Comparator driver. Note that, this option only controls the Analog Comparator driver log, won’t affect other drivers.

**Default value:**
- No (disabled) if SOC_ANA_CMPR_SUPPORTED

RMT Configuration

Contains:
- `CONFIG_RMT_ENABLE_DEBUG_LOG`
- `CONFIG_RMT_RECV_FUNC_IN_IRAM`
- `CONFIG_RMT_ISR_IRAM_SAFE`
- `CONFIG_RMT_SUPPRESS_DEPRECATE_WARN`

CONFIG_RMT_ISR_IRAM_SAFE

RMT ISR IRAM-Safe

*Found in: Component config > Driver Configurations > RMT Configuration*

Ensure the RMT interrupt is IRAM-Safe by allowing the interrupt handler to be executable when the cache is disabled (e.g. SPI Flash write).

**Default value:**
- No (disabled)

CONFIG_RMT_RECV_FUNC_IN_IRAM

Place RMT receive function into IRAM

*Found in: Component config > Driver Configurations > RMT Configuration*

Place RMT receive function into IRAM, so that the receive function can be IRAM-safe and able to be called when the flash cache is disabled. Enabling this option can improve driver performance as well.

**Default value:**
- No (disabled)

CONFIG_RMT_SUPPRESS_DEPRECATE_WARN

Suppress legacy driver deprecated warning

*Found in: Component config > Driver Configurations > RMT Configuration*

Whether to suppress the deprecation warnings when using legacy rmt driver (driver/rmt.h). If you want to continue using the legacy driver, and don’t want to see related deprecation warnings, you can enable this option.

**Default value:**
- No (disabled)

CONFIG_RMT_ENABLE_DEBUG_LOG

Enable debug log

*Found in: Component config > Driver Configurations > RMT Configuration*

Whether to enable the debug log message for RMT driver. Note that, this option only controls the RMT driver log, won’t affect other drivers.
Default value:
• No (disabled)

**MCPWM Configuration** Contains:

• `CONFIG_MCPWM_ENABLE_DEBUG_LOG`
• `CONFIG_MCPWM_CTRL_FUNC_IN_IRAM`
• `CONFIG_MCPWM_ISR_IRAM_SAFE`
• `CONFIG_MCPWM_SUPPRESS_DEPRECATE_WARN`

**CONFIG_MCPWM_ISR_IRAM_SAFE**
Place MCPWM ISR function into IRAM

*Found in: Component config > Driver Configurations > MCPWM Configuration*

This will ensure the MCPWM interrupt handle is IRAM-Safe, allow to avoid flash cache misses, and also be able to run whilst the cache is disabled. (e.g. SPI Flash write)

Default value:
• No (disabled)

**CONFIG_MCPWM_CTRL_FUNC_IN_IRAM**
Place MCPWM control functions into IRAM

*Found in: Component config > Driver Configurations > MCPWM Configuration*

Place MCPWM control functions (like set_compare_value) into IRAM, so that these functions can be IRAM-safe and able to be called in the other IRAM interrupt context. Enabling this option can improve driver performance as well.

Default value:
• No (disabled)

**CONFIG_MCPWM_SUPPRESS_DEPRECATE_WARN**
Suppress legacy driver deprecated warning

*Found in: Component config > Driver Configurations > MCPWM Configuration*

Whether to suppress the deprecation warnings when using legacy MCPWM driver (driver/mcpwm.h). If you want to continue using the legacy driver, and don’t want to see related deprecation warnings, you can enable this option.

Default value:
• No (disabled)

**CONFIG_MCPWM_ENABLE_DEBUG_LOG**
Enable debug log

*Found in: Component config > Driver Configurations > MCPWM Configuration*

Whether to enable the debug log message for MCPWM driver. Note that, this option only controls the MCPWM driver log, won’t affect other drivers.

Default value:
• No (disabled)
**I2S Configuration**

Contains:

- `CONFIG_I2S_ENABLE_DEBUG_LOG`
- `CONFIG_I2S_ISR_IRAM_SAFE`
- `CONFIG_I2S_SUPPRESS_DEPRECATED_WARN`

**CONFIG_I2S_ISR_IRAM_SAFE**

I2S ISR IRAM-Safe

*Found in: Component config > Driver Configurations > I2S Configuration*

Ensure the I2S interrupt is IRAM-Safe by allowing the interrupt handler to be executable when the cache is disabled (e.g. SPI Flash write).

**Default value:**

- No (disabled)

**CONFIG_I2S_SUPPRESS_DEPRECATED_WARN**

Suppress legacy driver deprecated warning

*Found in: Component config > Driver Configurations > I2S Configuration*

Enable this option will suppress the deprecation warnings of using APIs in legacy I2S driver.

**Default value:**

- No (disabled)

**CONFIG_I2S_ENABLE_DEBUG_LOG**

Enable I2S debug log

*Found in: Component config > Driver Configurations > I2S Configuration*

Whether to enable the debug log message for I2S driver. Note that, this option only controls the I2S driver log, will not affect other drivers.

**Default value:**

- No (disabled)

**DAC Configuration**

Contains:

- `CONFIG_DAC_DMA_AUTO_16BIT_ALIGN`
- `CONFIG_DAC_ISR_IRAM_SAFE`
- `CONFIG_DAC_ENABLE_DEBUG_LOG`
- `CONFIG_DAC_CTRL_FUNC_IN_IRAM`
- `CONFIG_DAC_SUPPRESS_DEPRECATED_WARN`

**CONFIG_DAC_CTRL_FUNC_IN_IRAM**

Place DAC control functions into IRAM

*Found in: Component config > Driver Configurations > DAC Configuration*

Place DAC control functions (e.g. `dac_oneshot_output_voltage`) into IRAM, so that this function can be IRAM-safe and able to be called in the other IRAM interrupt context. Enabling this option can improve driver performance as well.

**Default value:**

- No (disabled) if SOC_DAC_SUPPORTED
CONFIG_DAC_ISR_IRAM_SAFE

DAC ISR IRAM-Safe

*Found in: Component config > Driver Configurations > DAC Configuration*

Ensure the DAC interrupt is IRAM-Safe by allowing the interrupt handler to be executable when the cache is disabled (e.g. SPI Flash write).

**Default value:**
- No (disabled) if SOC_DAC_SUPPORTED

CONFIG_DAC_SUPPRESS_DEPRECATE_WARN

Suppress legacy driver deprecated warning

*Found in: Component config > Driver Configurations > DAC Configuration*

Whether to suppress the deprecation warnings when using legacy DAC driver (driver/dac.h). If you want to continue using the legacy driver, and don’t want to see related deprecation warnings, you can enable this option.

**Default value:**
- No (disabled) if SOC_DAC_SUPPORTED

CONFIG_DAC_ENABLE_DEBUG_LOG

Enable debug log

*Found in: Component config > Driver Configurations > DAC Configuration*

Whether to enable the debug log message for DAC driver. Note that, this option only controls the DAC driver log, won’t affect other drivers.

**Default value:**
- No (disabled) if SOC_DAC_SUPPORTED

CONFIG_DAC_DMA_AUTO_16BIT_ALIGN

Align the continuous data to 16 bit automatically

*Found in: Component config > Driver Configurations > DAC Configuration*

Whether to left shift the continuous data to align every byte to 16 bits in the driver. On ESP32, although the DAC resolution is only 8 bits, the hardware requires 16 bits data in continuous mode. By enabling this option, the driver will left shift 8 bits for the input data automatically. Only disable this option when you decide to do this step by yourself. Note that the driver will allocate a new piece of memory to save the converted data.

**Default value:**
- Yes (enabled) if SOC_DAC_DMA_16BIT_ALIGN && SOC_DAC_SUPPORTED

USB Serial/JTAG Configuration

Contains:

- CONFIG_USJ_NO_AUTO_LS_ON_CONNECTION

CONFIG_USJ_NO_AUTO_LS_ON_CONNECTION

Don’t enter the automatic light sleep when USB Serial/JTAG port is connected

*Found in: Component config > Driver Configurations > USB Serial/JTAG Configuration*

If enabled, the chip will constantly monitor the connection status of the USB Serial/JTAG port. As long as the USB Serial/JTAG is connected, a ESP_PM_NO_LIGHT_SLEEP power management lock will be acquired to prevent the system from entering light sleep. This option can be useful if serial monitoring...
is needed via USB Serial/JTAG while power management is enabled, as the USB Serial/JTAG cannot work under light sleep and after waking up from light sleep. Note. This option can only control the automatic Light-Sleep behavior. If esp_light_sleep_start() is called manually from the program, enabling this option will not prevent light sleep entry even if the USB Serial/JTAG is in use.

**Parallel IO Configuration**
Contains:
- `CONFIG_PARLIO_ENABLE_DEBUG_LOG`
- `CONFIG_PARLIO_ISR_IRAM_SAFE`

**CONFIG_PARLIO_ENABLE_DEBUG_LOG**
Enable debug log

*Found in: Component config > Driver Configurations > Parallel IO Configuration*

Whether to enable the debug log message for parallel IO driver. Note that, this option only controls the parallel IO driver log, won’t affect other drivers.

**Default value:**
- No (disabled) if SOC_PARLIO_SUPPORTED

**CONFIG_PARLIO_ISR_IRAM_SAFE**
Parallel IO ISR IRAM-Safe

*Found in: Component config > Driver Configurations > Parallel IO Configuration*

Ensure the Parallel IO interrupt is IRAM-Safe by allowing the interrupt handler to be executable when the cache is disabled (e.g. SPI Flash write).

**Default value:**
- No (disabled) if SOC_PARLIO_SUPPORTED

**LEDC Configuration**
Contains:
- `CONFIG_LEDC_CTRL_FUNC_IN_IRAM`

**CONFIG_LEDC_CTRL_FUNC_IN_IRAM**
Place LEDC control functions into IRAM

*Found in: Component config > Driver Configurations > LEDC Configuration*

Place LEDC control functions (ledc_update_duty and ledc_stop) into IRAM, so that these functions can be IRAM-safe and able to be called in an IRAM context. Enabling this option can improve driver performance as well.

**Default value:**
- No (disabled)

**I2C Configuration**
Contains:
- `CONFIG_I2C_ENABLE_DEBUG_LOG`
- `CONFIG_I2C_ISR_IRAM_SAFE`
CONFIG_I2C_ISR_IRAM_SAFE

I2C ISR IRAM-Safe

*Found in: Component config > Driver Configurations > I2C Configuration*

Ensure the I2C interrupt is IRAM-Safe by allowing the interrupt handler to be executable when the cache is disabled (e.g. SPI Flash write). Note: This cannot be used in the I2C legacy driver.

**Default value:**
- No (disabled)

CONFIG_I2C_ENABLE_DEBUG_LOG

Enable I2C debug log

*Found in: Component config > Driver Configurations > I2C Configuration*

Whether to enable the debug log message for I2C driver. Note that this option only controls the I2C driver log, will not affect other drivers.

Note: This cannot be used in the I2C legacy driver.

**Default value:**
- No (disabled)

**eFuse Bit Manager**  Contains:

- CONFIG_EFUSE_VIRTUAL
- CONFIG_EFUSE_CUSTOM_TABLE

CONFIG_EFUSE_CUSTOM_TABLE

Use custom eFuse table

*Found in: Component config > eFuse Bit Manager*

Allows to generate a structure for eFuse from the CSV file.

**Default value:**
- No (disabled)

CONFIG_EFUSE_CUSTOM_TABLE_FILENAME

Custom eFuse CSV file

*Found in: Component config > eFuse Bit Manager > CONFIG_EFUSE_CUSTOM_TABLE*

Name of the custom eFuse CSV filename. This path is evaluated relative to the project root directory.

**Default value:**
- “main/esp_efuse_custom_table.csv” if CONFIG_EFUSE_CUSTOM_TABLE

CONFIG_EFUSE_VIRTUAL

Simulate eFuse operations in RAM

*Found in: Component config > eFuse Bit Manager*

If “n” - No virtual mode. All eFuse operations are real and use eFuse registers. If “y” - The virtual mode is enabled and all eFuse operations (read and write) are redirected to RAM instead of eFuse registers, all permanent changes (via eFuse) are disabled. Log output will state changes that would be applied, but they will not be.

If it is “y”, then SECURE_FLASH_ENCRYPTION_MODE_RELEASE cannot be used. Because the EFUSE VIRT mode is for testing only.
During startup, the eFuses are copied into RAM. This mode is useful for fast tests.

**Default value:**
- No (disabled)

**CONFIG_EFUSE_VIRTUAL_KEEP_IN_FLASH**

Keep eFuses in flash

*Found in: Component config > eFuse Bit Manager > CONFIG_EFUSE_VIRTUAL*

In addition to the “Simulate eFuse operations in RAM” option, this option just adds a feature to keep eFuses after reboots in flash memory. To use this mode the partition_table should have the `efuse` partition.

partition_table: `efuse_em, data, efuse, 0x2000,`

During startup, the eFuses are copied from flash or, in case if flash is empty, from real eFuse to RAM and then update flash. This mode is useful when need to keep changes after reboot (testing secure_boot and flash_encryption).

**CONFIG_EFUSE_VIRTUAL_LOG_ALL_WRITES**

Log all virtual writes

*Found in: Component config > eFuse Bit Manager > CONFIG_EFUSE_VIRTUAL*

If enabled, log efuse burns. This shows changes that would be made.

**ESP-TLS**

Contains:

- `CONFIG_ESP_TLS_INSECURE`
- `CONFIG_ESP_TLS_SERVER_CERT_SELECT_HOOK`
- `CONFIG_ESP_TLS_LIBRARY_CHOOSE`
- `CONFIG_ESP_TLS_CLIENT_SESSION_TICKETS`
- `CONFIG_ESP_DEBUG_WOLFSSL`
- `CONFIG_ESP_TLS_PSK_VERIFICATION`
- `CONFIG_ESP_TLS_SERVER_SESSION_TICKETS`
- `CONFIG_ESP_WOLFSSL_SMALL_CERT_VERIFY`
- `CONFIG_ESP_TLS_SERVER_MIN_AUTH_MODE_OPTIONAL`
- `CONFIG_ESP_TLS_USE_DS_PERIPHERAL`

**CONFIG_ESP_TLS_LIBRARY_CHOOSE**

Choose SSL/TLS library for ESP-TLS (See help for more Info)

*Found in: Component config > ESP-TLS*

The ESP-TLS APIs support multiple backend TLS libraries. Currently mbedTLS and WolfSSL are supported. Different TLS libraries may support different features and have different resource usage. Consult the ESP-TLS documentation in ESP-IDF Programming guide for more details.

Available options:

- mbedTLS (`CONFIG_ESP_TLS_USING_MBEDTLS`)
- wolfSSL (License info in wolfSSL directory README) (`CONFIG_ESP_TLS_USING_WOLFSSL`)
CONFIG_ESP_TLS_USE_DS_PERIPHERAL

Use Digital Signature (DS) Peripheral with ESP-TLS

*Found in: Component config > ESP-TLS*

Enable use of the Digital Signature Peripheral for ESP-TLS. The DS peripheral can only be used when it is appropriately configured for TLS. Consult the ESP-TLS documentation in ESP-IDF Programming Guide for more details.

**Default value:**
- Yes (enabled)

CONFIG_ESP_TLS_CLIENT_SESSION_TICKETS

Enable client session tickets

*Found in: Component config > ESP-TLS*

Enable session ticket support as specified in RFC5077.

CONFIG_ESP_TLS_SERVER_SESSION_TICKETS

Enable server session tickets

*Found in: Component config > ESP-TLS*

Enable session ticket support as specified in RFC5077.

CONFIG_ESP_TLS_SERVER_SESSION_TICKET_TIMEOUT

Server session ticket timeout in seconds

*Found in: Component config > ESP-TLS > CONFIG_ESP_TLS_SERVER_SESSION_TICKETS*

Sets the session ticket timeout used in the tls server.

**Default value:**
- 86400 if CONFIG_ESP_TLS_SERVER_SESSION_TICKETS

CONFIG_ESP_TLS_SERVER_CERT_SELECT_HOOK

Certificate selection hook

*Found in: Component config > ESP-TLS*

Ability to configure and use a certificate selection callback during server handshake, to select a certificate to present to the client based on the TLS extensions supplied in the client hello (alpn, sni, etc).

CONFIG_ESP_TLS_SERVER_MIN_AUTH_MODE_OPTIONAL

ESP-TLS Server: Set minimum Certificate Verification mode to Optional

*Found in: Component config > ESP-TLS*

When this option is enabled, the peer (here, the client) certificate is checked by the server, however the handshake continues even if verification failed. By default, the peer certificate is not checked and ignored by the server.

mbedtls_ssl_get_verify_result() can be called after the handshake is complete to retrieve status of verification.
**CONFIG_ESP_TLS_PSK_VERIFICATION**

Enable PSK verification

*Found in: Component config > ESP-TLS*

Enable support for pre shared key ciphers, supported for both mbedTLS as well as wolfSSL TLS library.

**CONFIG_ESP_TLS_INSECURE**

Allow potentially insecure options

*Found in: Component config > ESP-TLS*

You can enable some potentially insecure options. These options should only be used for testing purposes. Only enable these options if you are very sure.

**CONFIG_ESP_TLS_SKIP_SERVER_CERT_VERIFY**

Skip server certificate verification by default (WARNING: ONLY FOR TESTING PURPOSE, READ HELP)

*Found in: Component config > ESP-TLS > CONFIG_ESP_TLS_INSECURE*

After enabling this option the esp-tls client will skip the server certificate verification by default. Note that this option will only modify the default behaviour of esp-tls client regarding server cert verification. The default behaviour should only be applicable when no other option regarding the server cert verification is opted in the esp-tls config (e.g. crt_bundle_attach, use_global_ca_store etc.). WARNING: Enabling this option comes with a potential risk of establishing a TLS connection with a server which has a fake identity, provided that the server certificate is not provided either through API or other mechanism like ca_store etc.

**CONFIG_ESP_WOLFSSL_SMALL_CERT_VERIFY**

Enable SMALL_CERT_VERIFY

*Found in: Component config > ESP-TLS*

Enables server verification with Intermediate CA cert, does not authenticate full chain of trust upto the root CA cert (After Enabling this option client only needs to have Intermediate CA certificate of the server to authenticate server, root CA cert is not necessary).

**Default value:**

- Yes (enabled) if `CONFIG_ESP_TLS_USING_WOLFSSL`

**CONFIG_ESP_DEBUG_WOLFSSL**

Enable debug logs for wolfSSL

*Found in: Component config > ESP-TLS*

Enable detailed debug prints for wolfSSL SSL library.

**ADC and ADC Calibration**

Contains:

- *ADC Calibration Configurations*
- `CONFIG_ADC_CONTINUOUS_ISR_IRAM_SAFE`
- `CONFIG_ADC_DISABLE_DAC_OUTPUT`
- `CONFIG_ADC_ENABLE_DEBUG_LOG`
- `CONFIG_ADC_CONTINUOUS_FORCE_USE_ADC2_ON_C3_S3`
- `CONFIG_ADC_ONESHOT_CTRL_FUNC_IN_IRAM`
CONFIG_ADC_ONESHOT_CTRL_FUNC_IN_IRAM

Place ISR version ADC oneshot mode read function into IRAM.

Found in: Component config > ADC and ADC Calibration

Place ISR version ADC oneshot mode read function into IRAM.

Default value:
• No (disabled)

CONFIG_ADC_CONTINUOUS_ISR_IRAM_SAFE

ADC continuous mode driver ISR IRAM-Safe

Found in: Component config > ADC and ADC Calibration

Ensure the ADC continuous mode ISR is IRAM-Safe. When enabled, the ISR handler will be available when the cache is disabled.

Default value:
• No (disabled)

ADC Calibration Configurations

CONFIG_ADC_DISABLE_DAC_OUTPUT

Disable DAC when ADC2 is in use

Found in: Component config > ADC and ADC Calibration

By default, this is set. The ADC oneshot driver will disable the output of the corresponding DAC channels: ESP32: IO25 and IO26 ESP32S2: IO17 and IO18

Disable this option so as to measure the output of DAC by internal ADC, for test usage.

Default value:
• Yes (enabled) if SOC_DAC_SUPPORTED

CONFIG_ADC_CONTINUOUS_FORCE_USE_ADC2_ON_C3_S3

Force use ADC2 continuous mode on ESP32S3 or ESP32C3

Found in: Component config > ADC and ADC Calibration

On ESP32C3 and ESP32S3, ADC2 Digital Controller is not stable. Therefore, ADC2 continuous mode is not suggested on ESP32S3 and ESP32C3

If you stick to this, you can enable this option to force use ADC2 under above conditions. For more details, you can search for errata on espressif website.

Default value:
• No (disabled)

CONFIG_ADC_ENABLE_DEBUG_LOG

Enable ADC debug log

Found in: Component config > ADC and ADC Calibration

Whether to enable the debug log message for ADC driver. Note that this option only controls the ADC driver log, will not affect other drivers.

note: This cannot be used in the ADC legacy driver.

Default value:
• No (disabled)

**Wireless Coexistence**  Contains:

- `CONFIG_ESP_COEX_EXTERNAL_COEXIST_ENABLE`
- `CONFIG_ESP_COEX_SW_COEXIST_ENABLE`

**CONFIG_ESP_COEX_SW_COEXIST_ENABLE**

Software controls WiFi/Bluetooth coexistence

*Found in: Component config > Wireless Coexistence*

If enabled, WiFi & Bluetooth coexistence is controlled by software rather than hardware. Recommended for heavy traffic scenarios. Both coexistence configuration options are automatically managed, no user intervention is required. If only Bluetooth is used, it is recommended to disable this option to reduce binary file size.

**Default value:**

- Yes (enabled) if `CONFIG_BT_ENABLED`

**CONFIG_ESP_COEX_EXTERNAL_COEXIST_ENABLE**

External Coexistence

*Found in: Component config > Wireless Coexistence*

If enabled, HW External coexistence arbitration is managed by GPIO pins. It can support three types of wired combinations so far which are 1-wired/2-wired/3-wired. User can select GPIO pins in application code with configure interfaces.

This function depends on BT-off because currently we do not support external coex and internal coex simultaneously.

**Common ESP-related**  Contains:

- `CONFIG_ESP_ERR_TO_NAME_LOOKUP`

**CONFIG_ESP_ERR_TO_NAME_LOOKUP**

Enable lookup of error code strings

*Found in: Component config > Common ESP-related*

Functions esp_err_to_name() and esp_err_to_name_r() return string representations of error codes from a pre-generated lookup table. This option can be used to turn off the use of the look-up table in order to save memory but this comes at the price of sacrificing distinguishable (meaningful) output string representations.

**Default value:**

- Yes (enabled)

**ESP-Driver:GPIO Configurations**  Contains:

- `CONFIG_GPIO_CTRL_FUNC_IN_IRAM`
CONFIG_GPIO_CTRL_FUNC_IN_IRAM

Place GPIO control functions into IRAM

*Found in: Component config > ESP-Driver.GPIO Configurations*

Place GPIO control functions (like intr_disable/set_level) into IRAM, so that these functions can be IRAM-safe and able to be called in the other IRAM interrupt context.

**Default value:**
- No (disabled)

ESP-Driver:GPTimer Configurations Contains:

- CONFIG_GPTIMER_ENABLE_DEBUG_LOG
- CONFIG_GPTIMER_ISR_IRAM_SAFE
- CONFIG_GPTIMER_CTRL_FUNC_IN_IRAM
- CONFIG_GPTIMER_ISR_HANDLER_IN_IRAM
- CONFIG_GPTIMER_SUPPRESS_DEPRECATE_WARN

CONFIG_GPTIMER_ISR_HANDLER_IN_IRAM

Place GPTimer ISR handler into IRAM

*Found in: Component config > ESP-Driver:GPTimer Configurations*

Place GPTimer ISR handler into IRAM for better performance and fewer cache misses.

**Default value:**
- Yes (enabled)

CONFIG_GPTIMER_CTRL_FUNC_IN_IRAM

Place GPTimer control functions into IRAM

*Found in: Component config > ESP-Driver:GPTimer Configurations*

Place GPTimer control functions (like start/stop) into IRAM, so that these functions can be IRAM-safe and able to be called in the other IRAM interrupt context. Enabling this option can improve driver performance as well.

**Default value:**
- No (disabled)

CONFIG_GPTIMER_ISR_IRAM_SAFE

GPTimer ISR IRAM-Safe

*Found in: Component config > ESP-Driver:GPTimer Configurations*

Ensure the GPTimer interrupt is IRAM-Safe by allowing the interrupt handler to be executable when the cache is disabled (e.g. SPI Flash write).

**Default value:**
- No (disabled)

CONFIG_GPTIMER_SUPPRESS_DEPRECATE_WARN

Suppress legacy driver deprecated warning

*Found in: Component config > ESP-Driver:GPTimer Configurations*

Whether to suppress the deprecation warnings when using legacy timer group driver (driver/timer.h). If you want to continue using the legacy driver, and don’t want to see related deprecation warnings, you can enable this option.
Default value:
• No (disabled)

**CONFIG_GPTIMER_ENABLE_DEBUG_LOG**

Enable debug log

*Found in: Component config > ESP-Driver:GPTimer Configurations*

Whether to enable the debug log message for GPTimer driver. Note that, this option only controls the GPTimer driver log, won’t affect other drivers.

Default value:
• No (disabled)

**ESP-Driver:PCNT Configurations** Contains:

- **CONFIG_PCNT_ENABLE_DEBUG_LOG**
- **CONFIG_PCNT_ISR_IRAM_SAFE**
- **CONFIG_PCNT_CTRL_FUNC_IN_IRAM**
- **CONFIG_PCNT_SUPPRESS_DEPRECATE_WARN**

**CONFIG_PCNT_CTRL_FUNC_IN_IRAM**

Place PCNT control functions into IRAM

*Found in: Component config > ESP-Driver:PCNT Configurations*

Place PCNT control functions (like start/stop) into IRAM, so that these functions can be IRAM-safe and able to be called in the other IRAM interrupt context. Enabling this option can improve driver performance as well.

Default value:
• No (disabled)

**CONFIG_PCNT_ISR_IRAM_SAFE**

PCNT ISR IRAM-Safe

*Found in: Component config > ESP-Driver:PCNT Configurations*

Ensure the PCNT interrupt is IRAM-Safe by allowing the interrupt handler to be executable when the cache is disabled (e.g. SPI Flash write).

Default value:
• No (disabled)

**CONFIG_PCNT_SUPPRESS_DEPRECATE_WARN**

Suppress legacy driver deprecated warning

*Found in: Component config > ESP-Driver:PCNT Configurations*

Whether to suppress the deprecation warnings when using legacy PCNT driver (driver/pcnt.h). If you want to continue using the legacy driver, and don’t want to see related deprecation warnings, you can enable this option.

Default value:
• No (disabled)
**CONFIG_PCNT_ENABLE_DEBUG_LOG**

Enable debug log

*Found in: Component config > ESP-Driver:PCNT Configurations*

Whether to enable the debug log message for PCNT driver. Note that, this option only controls the PCNT driver log, won’t affect other drivers.

**Default value:**
- No (disabled)

**Ethernet**

Contains:
- CONFIG_ETH_TRANSMIT_MUTEX
- CONFIG_ETH_USE_OPENETH
- CONFIG_ETH_USE_SPI_etHERNET

**CONFIG_ETH_USE_SPI_etHERNET**

Support SPI to Ethernet Module

*Found in: Component config > Ethernet*

ESP-IDF can also support some SPI-Ethernet modules.

**Default value:**
- Yes (enabled)

Contains:
- CONFIG_ETH_SPI_etHERNET_DM9051
- CONFIG_ETH_SPI_etHERNET_KSZ8851SNL
- CONFIG_ETH_SPI_etHERNET_W5500

**CONFIG_ETH_SPI_etHERNET_DM9051**

Use DM9051

*Found in: Component config > Ethernet > CONFIG_ETH_USE_SPI_etHERNET*

DM9051 is a fast Ethernet controller with an SPI interface. It’s also integrated with a 10/100M PHY and MAC. Select this to enable DM9051 driver.

**CONFIG_ETH_SPI_etHERNET_W5500**

Use W5500 (MAC RAW)

*Found in: Component config > Ethernet > CONFIG_ETH_USE_SPI_etHERNET*

W5500 is a HW TCP/IP embedded Ethernet controller. TCP/IP stack, 10/100 Ethernet MAC and PHY are embedded in a single chip. However the driver in ESP-IDF only enables the RAW MAC mode, making it compatible with the software TCP/IP stack. Say yes to enable W5500 driver.

**CONFIG_ETH_SPI_etHERNET_KSZ8851SNL**

Use KSZ8851SNL

*Found in: Component config > Ethernet > CONFIG_ETH_USE_SPI_etHERNET*

The KSZ8851SNL is a single-chip Fast Ethernet controller consisting of a 10/100 physical layer transceiver (PHY), a MAC, and a Serial Peripheral Interface (SPI). Select this to enable KSZ8851SNL driver.
CONFIG_ETH_USE_OPENETH

Support OpenCores Ethernet MAC (for use with QEMU)

*Found in: Component config > Ethernet*

OpenCores Ethernet MAC driver can be used when an ESP-IDF application is executed in QEMU. This driver is not supported when running on a real chip.

**Default value:**
- No (disabled)

Contains:
- CONFIG_ETH_OPENETH_DMA_RX_BUFFER_NUM
- CONFIG_ETH_OPENETH_DMA_TX_BUFFER_NUM

CONFIG_ETH_OPENETH_DMA_RX_BUFFER_NUM

Number of Ethernet DMA Rx buffers

*Found in: Component config > Ethernet > CONFIG_ETH_USE_OPENETH*

Number of DMA receive buffers, each buffer is 1600 bytes.

**Range:**
- from 1 to 64 if CONFIG_ETH_USE_OPENETH

**Default value:**
- 4 if CONFIG_ETH_USE_OPENETH

CONFIG_ETH_OPENETH_DMA_TX_BUFFER_NUM

Number of Ethernet DMA Tx buffers

*Found in: Component config > Ethernet > CONFIG_ETH_USE_OPENETH*

Number of DMA transmit buffers, each buffer is 1600 bytes.

**Range:**
- from 1 to 64 if CONFIG_ETH_USE_OPENETH

**Default value:**
- 1 if CONFIG_ETH_USE_OPENETH

CONFIG_ETH_TRANSMIT_MUTEX

Enable Transmit Mutex

*Found in: Component config > Ethernet*

Prevents multiple accesses when Ethernet interface is used as shared resource and multiple functionalities might try to access it at a time.

**Default value:**
- No (disabled)

Event Loop Library

Contains:
- CONFIG_ESP_EVENT_LOOP_PROFILING
- CONFIG_ESP_EVENT_POST_FROM_ISR
CONFIG_ESP_EVENT_LOOP_PROFILING

Enable event loop profiling

*Found in: Component config > Event Loop Library*

Enables collections of statistics in the event loop library such as the number of events posted to/recieved by an event loop, number of callbacks involved, number of events dropped to a full event loop queue, run time of event handlers, and number of times/run time of each event handler.

**Default value:**
- No (disabled)

CONFIG_ESP_EVENT_POST_FROM_ISR

Support posting events from ISRs

*Found in: Component config > Event Loop Library*

Enable posting events from interrupt handlers.

**Default value:**
- Yes (enabled)

CONFIG_ESP_EVENT_POST_FROM_IRAM_ISR

Support posting events from ISRs placed in IRAM

*Found in: Component config > Event Loop Library > CONFIG_ESP_EVENT_POST_FROM_ISR*

Enable posting events from interrupt handlers placed in IRAM. Enabling this option places API functions esp_event_post and esp_event_post_to in IRAM.

**Default value:**
- Yes (enabled)

GDB Stub  
Contains:

* CONFIG_ESP_GDBSTUB_SUPPORT_TASKS
* CONFIG_ESP_SYSTEM_GDBSTUB_RUNTIME

CONFIG_ESP_SYSTEM_GDBSTUB_RUNTIME

GDBStub at runtime

*Found in: Component config > GDB Stub*

Enable builtin GDBStub. This allows to debug the target device using serial port: - Run `idf.py monitor` . - Wait for the device to initialize. - Press Ctrl+C to interrupt the execution and enter GDB attached to your device for debugging. NOTE: all UART input will be handled by GDBStub.

CONFIG_ESP_GDBSTUB_SUPPORT_TASKS

Enable listing FreeRTOS tasks through GDB Stub

*Found in: Component config > GDB Stub*

If enabled, GDBStub can supply the list of FreeRTOS tasks to GDB. Thread list can be queried from GDB using `info threads` command. Note that if GDB task lists were corrupted, this feature may not work. If GDBStub fails, try disabling this feature.
CONFIG_ESP_GDBSTUB_MAX_TASKS

Maximum number of tasks supported by GDB Stub

*Found in: Component config > GDB Stub > CONFIG_ESP_GDBSTUB_SUPPORT_TASKS*

Set the number of tasks which GDB Stub will support.

*Default value:*
  * 32 if `CONFIG_ESP_GDBSTUB_SUPPORT_TASKS`

---

ESP HTTP client

Contains:

- `CONFIG_ESP_HTTP_CLIENT_ENABLE_BASIC_AUTH`
- `CONFIG_ESP_HTTP_CLIENT_ENABLE_DIGEST_AUTH`
- `CONFIG_ESP_HTTP_CLIENT_ENABLE_HTTPS`

---

CONFIG_ESP_HTTP_CLIENT_ENABLE_HTTPS

Enable https

*Found in: Component config > ESP HTTP client*

This option will enable https protocol by linking esp-tls library and initializing SSL transport

*Default value:*
  * Yes (enabled)

---

CONFIG_ESP_HTTP_CLIENT_ENABLE_BASIC_AUTH

Enable HTTP Basic Authentication

*Found in: Component config > ESP HTTP client*

This option will enable HTTP Basic Authentication. It is disabled by default as Basic auth uses unencrypted encoding, so it introduces a vulnerability when not using TLS

*Default value:*
  * No (disabled)

---

CONFIG_ESP_HTTP_CLIENT_ENABLE_DIGEST_AUTH

Enable HTTP Digest Authentication

*Found in: Component config > ESP HTTP client*

This option will enable HTTP Digest Authentication. It is enabled by default, but use of this configuration is not recommended as the password can be derived from the exchange, so it introduces a vulnerability when not using TLS

*Default value:*
  * No (disabled)

---

HTTP Server

Contains:

- `CONFIG_HTTPD_QUEUE_WORK_BLOCKING`
- `CONFIG_HTTPD_PURGE_BUF_LEN`
- `CONFIG_HTTPD_LOG_PURGE_DATA`
- `CONFIG_HTTPD_MAX_REQ_HDR_LEN`
- `CONFIG_HTTPD_MAX_URI_LEN`
- `CONFIG_HTTPD_ERR_RESP_NO_DELAY`
- `CONFIG_HTTPD_WS_SUPPORT`
Chapter 2. API Reference

CONFIG_HTTPD_MAX_REQ_HDR_LEN
Max HTTP Request Header Length

*Found in: Component config > HTTP Server*

This sets the maximum supported size of headers section in HTTP request packet to be processed by the server

**Default value:**
- 512

CONFIG_HTTPD_MAX_URI_LEN
Max HTTP URI Length

*Found in: Component config > HTTP Server*

This sets the maximum supported size of HTTP request URI to be processed by the server

**Default value:**
- 512

CONFIG_HTTPD_ERR_RESP_NO_DELAY
Use TCP_NODELAY socket option when sending HTTP error responses

*Found in: Component config > HTTP Server*

Using TCP_NODEALY socket option ensures that HTTP error response reaches the client before the underlying socket is closed. Please note that turning this off may cause multiple test failures

**Default value:**
- Yes (enabled)

CONFIG_HTTPD_PURGE_BUF_LEN
Length of temporary buffer for purging data

*Found in: Component config > HTTP Server*

This sets the size of the temporary buffer used to receive and discard any remaining data that is received from the HTTP client in the request, but not processed as part of the server HTTP request handler.

If the remaining data is larger than the available buffer size, the buffer will be filled in multiple iterations. The buffer should be small enough to fit on the stack, but large enough to avoid excessive iterations.

**Default value:**
- 32

CONFIG_HTTPD_LOG_PURGE_DATA
Log purged content data at Debug level

*Found in: Component config > HTTP Server*

Enabling this will log discarded binary HTTP request data at Debug level. For large content data this may not be desirable as it will clutter the log.

**Default value:**
- No (disabled)
CONFIG_HTTPD_WS_SUPPORT

WebSocket server support

Found in: Component config > HTTP Server

This sets the WebSocket server support.

Default value:

- No (disabled)

CONFIG_HTTPD_QUEUE_WORK_BLOCKING

httpd_queue_work as blocking API

Found in: Component config > HTTP Server

This makes httpd_queue_work() API to wait until a message space is available on UDP control socket. It internally uses a counting semaphore with count set to LWIP_UDP_RECVMBOX_SIZE to achieve this. This config will slightly change API behavior to block until message gets delivered on control socket.

ESP HTTPS OTA  Contains:

- CONFIG_ESP_HTTPS_OTA_ALLOW_HTTP
- CONFIG_ESP_HTTPS_OTA_DECRYPT_CB

CONFIG_ESP_HTTPS_OTA_DECRYPT_CB

Provide decryption callback

Found in: Component config > ESP HTTPS OTA

Exposes an additional callback whereby firmware data could be decrypted before being processed by OTA update component. This can help to integrate external encryption related format and removal of such encapsulation layer from firmware image.

Default value:

- No (disabled)

CONFIG_ESP_HTTPS_OTA_ALLOW_HTTP

Allow HTTP for OTA (WARNING: ONLY FOR TESTING PURPOSE, READ HELP)

Found in: Component config > ESP HTTPS OTA

It is highly recommended to keep HTTPS (along with server certificate validation) enabled. Enabling this option comes with potential risk of: - Non-encrypted communication channel with server - Accepting firmware upgrade image from server with fake identity

Default value:

- No (disabled)

ESP HTTPS server  Contains:

- CONFIG_ESP_HTTPS_SERVER_ENABLE

CONFIG_ESP_HTTPS_SERVER_ENABLE

Enable ESP_HTTPS_SERVER component

Found in: Component config > ESP HTTPS server

Enable ESP HTTPS server component
Hardware Settings  Contains:

- Chip revision
- Crypto DPA Protection
- ESP_SLEEP_WORKAROUND
- ETM Configuration
- GDMA Configuration
- MAC Config
- Main XTAL Config
- Peripheral Control
- RTC Clock Config
- Sleep Config

Chip revision  Contains:

- CONFIG_ESP_REV_NEW_CHIP_TEST
- CONFIG_ESP32S3_REV_MIN

CONFIG_ESP32S3_REV_MIN
Minimum Supported ESP32-S3 Revision

Found in: Component config > Hardware Settings > Chip revision

Required minimum chip revision. ESP-IDF will check for it and reject to boot if the chip revision fails the check. This ensures the chip used will have some modifications (features, or bugfixes).

The compiled binary will only support chips above this revision, this will also help to reduce binary size.

Available options:

- Rev v0.0 (ECO0) (CONFIG_ESP32S3_REV_MIN_0)
- Rev v0.1 (ECO1) (CONFIG_ESP32S3_REV_MIN_1)
- Rev v0.2 (ECO2) (CONFIG_ESP32S3_REV_MIN_2)

CONFIG_ESP_REV_NEW_CHIP_TEST
Internal test mode

Found in: Component config > Hardware Settings > Chip revision

For internal chip testing, a small number of new versions chips didn’t update the version field in eFuse, you can enable this option to force the software recognize the chip version based on the rev selected in menuconfig.

Default value:
- No (disabled)

MAC Config  Contains:

- CONFIG_ESP32S3_UNIVERSAL_MAC_ADDRESSES

CONFIG_ESP32S3_UNIVERSAL_MAC_ADDRESSES
Number of universally administered (by IEEE) MAC address

Found in: Component config > Hardware Settings > MAC Config

Configure the number of universally administered (by IEEE) MAC addresses. During initialization, MAC addresses for each network interface are generated or derived from a single base MAC address.
If the number of universal MAC addresses is four, all four interfaces (WiFi station, WiFi softap, Bluetooth and Ethernet) receive a universally administered MAC address. These are generated sequentially by adding 0, 1, 2 and 3 (respectively) to the final octet of the base MAC address. If the number of universal MAC addresses is two, only two interfaces (WiFi station and Bluetooth) receive a universally administered MAC address. These are generated sequentially by adding 0 and 1 (respectively) to the base MAC address. The remaining two interfaces (WiFi softap and Ethernet) receive local MAC addresses. These are derived from the universal WiFi station and Bluetooth MAC addresses, respectively. When using the default (Espressif-assigned) base MAC address, either setting can be used. When using a custom universal MAC address range, the correct setting will depend on the allocation of MAC addresses in this range (either 2 or 4 per device.)

Available options:

- Two (CONFIG_ESP32S3_UNIVERSAL_MAC_ADDRESSES_TWO)
- Four (CONFIG_ESP32S3_UNIVERSAL_MAC_ADDRESSES_FOUR)

**Sleep Config**

Contains:

- CONFIG_ESP_SLEEP_GPIO_ENABLETERNAL_RESISTORS
- CONFIG_ESP_SLEEP_CACHE_SAFE_ASSERTION
- CONFIG_ESP_SLEEP_EVENT_CALLBACKS
- CONFIG_ESP_SLEEP_DEBUG
- CONFIG_ESP_SLEEP_DEEP_SLEEP_WAKEUP_DELAY
- CONFIG_ESP_SLEEP_GPIO_RESET_WORKAROUND
- CONFIG_ESP_SLEEP_POWER_DOWN_FLASH
- CONFIG_ESP_SLEEP_MSPI_NEED_ALL_IO_PU
- CONFIG_ESP_SLEEP_FLASH_LEAKAGE_WORKAROUND
- CONFIG_ESP_SLEEP_PSRAM_LEAKAGE_WORKAROUND

**CONFIG_ESP_SLEEP_POWER_DOWN_FLASH**

Power down flash in light sleep when there is no SPIRAM

*Found in: Component config > Hardware Settings > Sleep Config*

If enabled, chip will try to power down flash as part of esp_light_sleep_start(), which costs more time when chip wakes up. Can only be enabled if there is no SPIRAM configured.

This option will power down flash under a strict but relatively safe condition. Also, it is possible to power down flash under a relaxed condition by using esp_sleep_pd_config() to set ESP_PD_DOMAIN_VDDSDIO to ESP_PD_OPTION_OFF. It should be noted that there is a risk in powering down flash, you can refer ESP-IDF Programming Guide/API Reference/System API/Sleep Modes/Power-down of Flash for more details.

**CONFIG_ESP_SLEEP_FLASH_LEAKAGE_WORKAROUND**

Pull-up Flash CS pin in light sleep

*Found in: Component config > Hardware Settings > Sleep Config*

All IOs will be set to isolate(floating) state by default during sleep. Since the power supply of SPI Flash is not lost during light sleep, if its CS pin is recognized as low level(selected state) in the floating state, there will be a large current leakage, and the data in Flash may be corrupted by random signals on other SPI pins. Select this option will set the CS pin of Flash to PULL-UP state during sleep, but this will increase the sleep current about 10 uA. If you are developing with esp32xx modules, you must select this option, but if you are developing with chips, you can also pull up the CS pin of SPI Flash in the external circuit to save power consumption caused by internal pull-up during sleep. (!!! Don’t deselect this option if you don’t have external SPI Flash CS pin pullups.)
### CONFIG_ESP_SLEEP_PSRAM_LEAKAGE_WORKAROUND

Pull-up PSRAM CS pin in light sleep

*Found in: Component config > Hardware Settings > Sleep Config*

All IOs will be set to isolate(floating) state by default during sleep. Since the power supply of PSRAM is not lost during lightsleep, if its CS pin is recognized as low level(selected state) in the floating state, there will be a large current leakage, and the data in PSRAM may be corrupted by random signals on other SPI pins. Select this option will set the CS pin of PSRAM to PULL-UP state during sleep, but this will increase the sleep current about 10 uA. If you are developing with esp32xx modules, you must select this option, but if you are developing with chips, you can also pull up the CS pin of PSRAM in the external circuit to save power consumption caused by internal pull-up during sleep. (!!! Don’t deselect this option if you don’t have external PSRAM CS pin pullups.)

**Default value:**
- Yes (enabled) if `CONFIG_SPIRAM`

### CONFIG_ESP_SLEEP_MSPI_NEED_ALL_IO_PU

Pull-up all SPI pins in light sleep

*Found in: Component config > Hardware Settings > Sleep Config*

To reduce leakage current, some types of SPI Flash/RAM only need to pull up the CS pin during light sleep. But there are also some kinds of SPI Flash/RAM that need to pull up all pins. It depends on the SPI Flash/RAM chip used.

### CONFIG_ESP_SLEEP_GPIO_RESET_WORKAROUND

light sleep GPIO reset workaround

*Found in: Component config > Hardware Settings > Sleep Config*

esp32c2, esp32c3, esp32s3, esp32c6 and esp32h2 will reset at wake-up if GPIO is received a small electrostatic pulse during light sleep, with specific condition
- GPIO needs to be configured as input-mode only
- The pin receives a small electrostatic pulse, and reset occurs when the pulse voltage is higher than 6 V

For GPIO set to input mode only, it is not a good practice to leave it open-floating. The hardware design needs to controlled it with determined supply or ground voltage is necessary.

This option provides a software workaround for this issue. Configure to isolate all GPIO pins in sleep state.

**Default value:**
- Yes (enabled)

### CONFIG_ESP_SLEEP_DEEP_SLEEP_WAKEUP_DELAY

Extra delay in deep sleep wake stub (in us)

*Found in: Component config > Hardware Settings > Sleep Config*

When the chip exits deep sleep, the CPU and the flash chip are powered on at the same time. CPU will run deep sleep stub first, and then proceed to load code from flash. Some flash chips need sufficient time to pass between power on and first read operation. By default, without any extra delay, this time is approximately 900us, although some flash chip types need more than that.

By default extra delay is set to 2000us. When optimizing startup time for applications which require it, this value may be reduced.

If you are seeing “flash read err, 1000” message printed to the console after deep sleep reset, try increasing this value.
Range:
• from 0 to 5000
Default value:
• 2000

CONFIG_ESP_SLEEP_CACHE_SAFE_ASSERTION
Check the cache safety of the sleep wakeup code in sleep process

Found in: Component config > Hardware Settings > Sleep Config

Enabling it will check the cache safety of the code before the flash power is ready after light sleep wakeup, and check PM_SLP_IRAM_OPT related code cache safety. This option is only for code quality inspection. Enabling it will increase the time overhead of entering and exiting sleep. It is not recommended to enable it in the release version.

Default value:
• No (disabled)

CONFIG_ESP_SLEEP_DEBUG
esp sleep debug

Found in: Component config > Hardware Settings > Sleep Config

Enable esp sleep debug.

Default value:
• No (disabled)

CONFIG_ESP_SLEEP_GPIO_ENABLE_INTERNAL_RESISTORS
Allow to enable internal pull-up/downs for the Deep-Sleep wakeup IOs

Found in: Component config > Hardware Settings > Sleep Config

When using rtc gpio wakeup source during deepsleep without external pull-up/downs, you may want to make use of the internal ones.

Default value:
• Yes (enabled)

CONFIG_ESP_SLEEP_EVENT_CALLBACKS
Enable registration of sleep event callbacks

Found in: Component config > Hardware Settings > Sleep Config

If enabled, it allows user to register sleep event callbacks. It is primarily designed for internal developers and customers can use PM_LIGHT_SLEEP_CALLBACKS as an alternative.

NOTE: These callbacks are executed from the IDLE task context hence you cannot have any blocking calls in your callbacks.

NOTE: Enabling these callbacks may change sleep duration calculations based on time spent in callback and hence it is highly recommended to keep them as short as possible.

Default value:
• No (disabled) if CONFIG_FREERTOS_USE_TICKLESS_IDLE

ESP_SLEEP_WORKAROUND
RTC Clock Config  Contains:

- `CONFIG_RTC_CLK_CAL_CYCLES`
- `CONFIG_RTC_CLK_SRC`

**CONFIG_RTC_CLK_SRC**

RTC clock source

*Found in: Component config > Hardware Settings > RTC Clock Config*

Choose which clock is used as RTC clock source.

Available options:

- Internal 136kHz RC oscillator (`CONFIG_RTC_CLK_SRC_INT_RC`)
- External 32kHz crystal (`CONFIG_RTC_CLK_SRC_EXT_CRYS`)
- External 32kHz oscillator at 32K_XP pin (`CONFIG_RTC_CLK_SRC_EXT_OSC`)
- Internal 17.5MHz oscillator, divided by 256 (`CONFIG_RTC_CLK_SRC_INT_8MD256`)

**CONFIG_RTC_CLK_CAL_CYCLES**

Number of cycles for RTC_SLOW_CLK calibration

*Found in: Component config > Hardware Settings > RTC Clock Config*

When the startup code initializes RTC_SLOW_CLK, it can perform calibration by comparing the RTC_SLOW_CLK frequency with main XTAL frequency. This option sets the number of RTC_SLOW_CLK cycles measured by the calibration routine. Higher numbers increase calibration precision, which may be important for applications which spend a lot of time in deep sleep. Lower numbers reduce startup time.

When this option is set to 0, clock calibration will not be performed at startup, and approximate clock frequencies will be assumed:

- 150000 Hz if internal RC oscillator is used as clock source. For this use value 1024.
- **32768 Hz if the 32k crystal oscillator is used. For this use value 3000 or more.** In case more value will help improve the definition of the launch of the crystal. If the crystal could not start, it will be switched to internal RC.

**Range:**

- from 0 to 27000 if `CONFIG_RTC_CLK_SRC_EXT_CRYS` || `CONFIG_RTC_CLK_SRC_EXT_OSC` || `CONFIG_RTC_CLK_SRC_INT_8MD256`
- from 0 to 32766

**Default value:**

- 3000 if `CONFIG_RTC_CLK_SRC_EXT_CRYS` || `CONFIG_RTC_CLK_SRC_EXT_OSC` || `CONFIG_RTC_CLK_SRC_INT_8MD256`
- 1024

**Peripheral Control**  Contains:

- `CONFIGPeriph_CTRL_FUNC_IN_IRAM`

**CONFIGPeriph_CTRL_FUNC_IN_IRAM**

Place peripheral control functions into IRAM

*Found in: Component config > Hardware Settings > Peripheral Control*

Place peripheral control functions (e.g. `periph_module_reset`) into IRAM, so that these functions can be IRAM-safe and able to be called in the other IRAM interrupt context.
ETM Configuration  Contains:
  •  `CONFIG_ETM_ENABLE_DEBUG_LOG`

**CONFIG_ETM_ENABLE_DEBUG_LOG**
Enable debug log

*Found in: Component config > Hardware Settings > ETM Configuration*

Whether to enable the debug log message for ETM core driver. Note that, this option only controls the ETM related driver log, won’t affect other drivers.

**Default value:**
  •  No (disabled) if SOC_ETM_SUPPORTED

GDMA Configuration  Contains:
  •  `CONFIG_GDMA_ENABLE_DEBUG_LOG`
  •  `CONFIG_GDMA_ISR_IRAM_SAFE`
  •  `CONFIG_GDMA_CTRL_FUNC_IN_IRAM`

**CONFIG_GDMA_CTRL_FUNC_IN_IRAM**
Place GDMA control functions into IRAM

*Found in: Component config > Hardware Settings > GDMA Configuration*

Place GDMA control functions (like start/stop/append/reset) into IRAM, so that these functions can be IRAM-safe and able to be called in the other IRAM interrupt context. Enabling this option can improve driver performance as well.

**Default value:**
  •  No (disabled)

**CONFIG_GDMA_ISR_IRAM_SAFE**
GDMA ISR IRAM-Safe

*Found in: Component config > Hardware Settings > GDMA Configuration*

This will ensure the GDMA interrupt handler is IRAM-Safe, allow to avoid flash cache misses, and also be able to run whilst the cache is disabled. (e.g. SPI Flash write).

**Default value:**
  •  No (disabled)

**CONFIG_GDMA_ENABLE_DEBUG_LOG**
Enable debug log

*Found in: Component config > Hardware Settings > GDMA Configuration*

Whether to enable the debug log message for GDMA driver. Note that, this option only controls the GDMA driver log, won’t affect other drivers.

**Default value:**
  •  No (disabled)
Main XTAL Config  Contains:

- **CONFIG_XTAL_FREQ_SEL**

**CONFIG_XTAL_FREQ_SEL**

Main XTAL frequency

*Found in: Component config > Hardware Settings > Main XTAL Config*

This option selects the operating frequency of the XTAL (crystal) clock used to drive the ESP target. The selected value MUST reflect the frequency of the given hardware.

Note: The XTAL_FREQ_AUTO option allows the ESP target to automatically estimating XTAL clock’s operating frequency. However, this feature is only supported on the ESP32. The ESP32 uses the internal 8MHz as a reference when estimating. Due to the internal oscillator’s frequency being temperature dependent, usage of the XTAL_FREQ_AUTO is not recommended in applications that operate in high ambient temperatures or use high-temperature qualified chips and modules.

Available options:

- 24 MHz (CONFIG_XTAL_FREQ_24)
- 26 MHz (CONFIG_XTAL_FREQ_26)
- 32 MHz (CONFIG_XTAL_FREQ_32)
- 40 MHz (CONFIG_XTAL_FREQ_40)
- Autodetect (CONFIG_XTAL_FREQ_AUTO)

Crypto DPA Protection  Contains:

- **CONFIG_ESP_CRYPTO_DPA_PROTECTION_AT_STARTUP**

**CONFIG_ESP_CRYPTO_DPA_PROTECTION_AT_STARTUP**

Enable crypto DPA protection at startup

*Found in: Component config > Hardware Settings > Crypto DPA Protection*

This config controls the DPA (Differential Power Analysis) protection knob for the crypto peripherals. DPA protection dynamically adjusts the clock frequency of the crypto peripheral. DPA protection helps to make it difficult to perform SCA attacks on the crypto peripherals. However, there is also associated performance impact based on the security level set. Please refer to the TRM for more details.

Default value:

- Yes (enabled) if SOC_CRYPTO_DPA_PROTECTION_SUPPORTED

**CONFIG_ESP_CRYPTO_DPA_PROTECTION_LEVEL**

DPA protection level

*Found in: Component config > Hardware Settings > Crypto DPA Protection > CONFIG_ESP_CRYPTO_DPA_PROTECTION_AT_STARTUP*

Configure the DPA protection security level

Available options:

- Security level low (CONFIG_ESP_CRYPTO_DPA_PROTECTION_LEVEL_LOW)
- Security level medium (CONFIG_ESP_CRYPTO_DPA_PROTECTION_LEVEL_MEDIUM)
- Security level high (CONFIG_ESP_CRYPTO_DPA_PROTECTION_LEVEL_HIGH)
Chapter 2. API Reference

**LCD and Touch Panel**  Contains:

- *LCD Peripheral Configuration*

**LCD Peripheral Configuration**  Contains:

- `CONFIG_LCD_ENABLE_DEBUG_LOG`
- `CONFIG_LCD_PANEL_IO_FORMAT_BUF_SIZE`
- `CONFIG_LCD_RGB_RESTART_IN_VSYNC`
- `CONFIG_LCD_RGB_ISR_IRAM_SAFE`

**CONFIG_LCD_PANEL_IO_FORMAT_BUF_SIZE**

LCD panel io format buffer size

*Found in: Component config > LCD and Touch Panel > LCD Peripheral Configuration*

LCD driver allocates an internal buffer to transform the data into a proper format, because of the endian order mismatch. This option is to set the size of the buffer, in bytes.

**Default value:**

- 32

**CONFIG_LCD_ENABLE_DEBUG_LOG**

Enable debug log

*Found in: Component config > LCD and Touch Panel > LCD Peripheral Configuration*

 Whether to enable the debug log message for LCD driver. Note that, this option only controls the LCD driver log, won’t affect other drivers.

**Default value:**

- No (disabled)

**CONFIG_LCD_RGB_ISR_IRAM_SAFE**

RGB LCD ISR IRAM-Safe

*Found in: Component config > LCD and Touch Panel > LCD Peripheral Configuration*

Ensure the LCD interrupt is IRAM-Safe by allowing the interrupt handler to be executable when the cache is disabled (e.g. SPI Flash write). If you want the LCD driver to keep flushing the screen even when cache ops disabled, you can enable this option. Note, this will also increase the IRAM usage.

**Default value:**

- No (disabled)

**CONFIG_LCD_RGB_RESTART_IN_VSYNC**

Restart transmission in VSYNC

*Found in: Component config > LCD and Touch Panel > LCD Peripheral Configuration*

Reset the GDMA channel every VBlank to stop permanent desyncs from happening. Only need to enable it when in your application, the DMA can’t deliver data as fast as the LCD consumes it.

**Default value:**

- No (disabled)
ESP NETIF Adapter Contains:

- CONFIG_ESP_NETIF_BRIDGE_EN
- CONFIG_ESP_NETIF_L2_TAP
- CONFIG_ESP_NETIF_IP_LOST_TIMER_INTERVAL
- CONFIG_ESP_NETIF_USE_TCPIP_STACK_LIB
- CONFIG_ESP_NETIF_RECEIVE_REPORT_ERRORS

**CONFIG_ESP_NETIF_IP_LOST_TIMER_INTERVAL**

IP Address lost timer interval (seconds)

*Found in: Component config > ESP NETIF Adapter*

The value of 0 indicates the IP lost timer is disabled, otherwise the timer is enabled.

The IP address may be lost because of some reasons, e.g. when the station disconnects from soft-AP, or when DHCP IP renew fails etc. If the IP lost timer is enabled, it will be started everytime the IP is lost. Event SYSTEM_EVENT_STA_LOST_IP will be raised if the timer expires. The IP lost timer is stopped if the station get the IP again before the timer expires.

**Range:**

- from 0 to 65535

**Default value:**

- 120

**CONFIG_ESP_NETIF_USE_TCPIP_STACK_LIB**

TCP/IP Stack Library

*Found in: Component config > ESP NETIF Adapter*

Choose the TCP/IP Stack to work, for example, LwIP, uIP, etc.

**Available options:**

- LwIP (CONFIG_ESP_NETIF_TCPIP_LWIP)
  lwIP is a small independent implementation of the TCP/IP protocol suite.
- Loopback (CONFIG_ESP_NETIF_LOOPBACK)
  Dummy implementation of esp-netif functionality which connects driver transmit to receive function. This option is for testing purpose only

**CONFIG_ESP_NETIF_RECEIVE_REPORT_ERRORS**

Use esp_err_t to report errors from esp_netif_receive

*Found in: Component config > ESP NETIF Adapter*

Enable if esp_netif_receive() should return error code. This is useful to inform upper layers that packet input to TCP/IP stack failed, so the upper layers could implement flow control. This option is disabled by default due to backward compatibility and will be enabled in v6.0 (IDF-7194)

**Default value:**

- No (disabled)

**CONFIG_ESP_NETIF_L2_TAP**

Enable netif L2 TAP support

*Found in: Component config > ESP NETIF Adapter*

A user program can read/write link layer (L2) frames from/to ESP TAP device. The ESP TAP device can be currently associated only with Ethernet physical interfaces.
CONFIG_ESP_NETIF_L2_TAP_MAX_FDS

Maximum number of opened L2 TAP File descriptors

*Found in: Component config > ESP NETIF Adapter > CONFIG_ESP_NETIF_L2_TAP*

Maximum number of opened File descriptors (FD’s) associated with ESP TAP device. ESP TAP FD’s take up a certain amount of memory, and allowing fewer FD’s to be opened at the same time conserves memory.

*Range:*
  • from 1 to 10 if CONFIG_ESP_NETIF_L2_TAP

*Default value:*
  • 5 if CONFIG_ESP_NETIF_L2_TAP

CONFIG_ESP_NETIF_L2_TAP_RX_QUEUE_SIZE

Size of L2 TAP Rx queue

*Found in: Component config > ESP NETIF Adapter > CONFIG_ESP_NETIF_L2_TAP*

Maximum number of frames queued in opened File descriptor. Once the queue is full, the newly arriving frames are dropped until the queue has enough room to accept incoming traffic (Tail Drop queue management).

*Range:*
  • from 1 to 100 if CONFIG_ESP_NETIF_L2_TAP

*Default value:*
  • 20 if CONFIG_ESP_NETIF_L2_TAP

CONFIG_ESP_NETIF_BRIDGE_EN

Enable LwIP IEEE 802.1D bridge

*Found in: Component config > ESP NETIF Adapter*

Enable LwIP IEEE 802.1D bridge support in ESP-NETIF. Note that “Number of clients store data in netif” (LWIP_NUM_NETIF_CLIENT_DATA) option needs to be properly configured to be LwIP bridge avaialbe!

*Default value:*
  • No (disabled)

Partition API Configuration

PHY Contains:

• CONFIG_ESP_PHY_CALIBRATION_MODE
• CONFIG_ESP_PHY_ENABLE_CERT_TEST
• CONFIG_ESP_PHY_ENABLE_USB
• CONFIG_ESP_PHY_IMPROVE_RX_11B
• CONFIG_ESP_PHY_MAX_WIFI_TX_POWER
• CONFIG_ESP_PHY_MAC_BB_PD
• CONFIG_ESP_PHY_REDUCE_TX_POWER
• CONFIG_ESP_PHY_CALIBRATION_AND_DATA_STORAGE
• CONFIG_ESP_PHY_INIT_DATA_IN_PARTITION
CONFIG_ESP_PHY_CALIBRATION_AND_DATA_STORAGE

Store phy calibration data in NVS

*Found in: Component config > PHY*

If this option is enabled, NVS will be initialized and calibration data will be loaded from there. PHY calibration will be skipped on deep sleep wakeup. If calibration data is not found, full calibration will be performed and stored in NVS. Normally, only partial calibration will be performed. If this option is disabled, full calibration will be performed.

If it’s easy that your board calibrate bad data, choose ‘n’. Two cases for example, you should choose ‘n’: 1. If your board is easy to be booted up with antenna disconnected. 2. Because of your board design, each time when you do calibration, the result are too unstable. If unsure, choose ‘y’.

*Default value:*
  - Yes (enabled)

CONFIG_ESP_PHY_INIT_DATA_IN_PARTITION

Use a partition to store PHY init data

*Found in: Component config > PHY*

If enabled, PHY init data will be loaded from a partition. When using a custom partition table, make sure that PHY data partition is included (type: ‘data’, subtype: ‘phy’). With default partition tables, this is done automatically. If PHY init data is stored in a partition, it has to be flashed there, otherwise runtime error will occur.

If this option is not enabled, PHY init data will be embedded into the application binary.

If unsure, choose ‘n’.

*Default value:*
  - No (disabled)

Contains:
  - CONFIG_ESP_PHY_DEFAULT_INIT_IF_INVALID
  - CONFIG_ESP_PHY_MULTIPLE_INIT_DATA_BIN

CONFIG_ESP_PHY_DEFAULT_INIT_IF_INVALID

Reset default PHY init data if invalid

*Found in: Component config > PHY > CONFIG_ESP_PHY_INIT_DATA_IN_PARTITION*

If enabled, PHY init data will be restored to default if it cannot be verified successfully to avoid endless bootloops.

If unsure, choose ‘n’.

*Default value:*
  - No (disabled) if CONFIG_ESP_PHY_INIT_DATA_IN_PARTITION

CONFIG_ESP_PHY_MULTIPLE_INIT_DATA_BIN

Support multiple PHY init data bin

*Found in: Component config > PHY > CONFIG_ESP_PHY_INIT_DATA_IN_PARTITION*

If enabled, the corresponding PHY init data type can be automatically switched according to the country code. China’s PHY init data bin is used by default. Can be modified by country information in API esp_wifi_set_country(). The priority of switching the PHY init data type is: 1. Country configured by API esp_wifi_set_country() and the parameter policy is WIFI_COUNTRY_POLICY_MANUAL. 2. Country notified by the connected AP. 3. Country configured by API esp_wifi_set_country() and the parameter policy is WIFI_COUNTRY_POLICY_AUTO.
Default value:
• No (disabled) if \texttt{CONFIG\_ESP\_PHY\_INIT\_DATA\_IN\_PARTITION} && \texttt{CONFIG\_ESP\_PHY\_MULTIPLE\_INIT\_DATA\_BIN\_EMBED}

**CONFIG\_ESP\_PHY\_MULTIPLE\_INIT\_DATA\_BIN\_EMBED**

Support embedded multiple phy init data bin to app bin

*Found in:* Component config > PHY > CONFIG\_ESP\_PHY\_INIT\_DATA\_IN\_PARTITION > CONFIG\_ESP\_PHY\_MULTIPLE\_INIT\_DATA\_BIN

If enabled, multiple phy init data bin will be embedded into app bin. If not enabled, multiple phy init data bin will still leave alone, and need to be flashed by users.

Default value:
• No (disabled) if \texttt{CONFIG\_ESP\_PHY\_MULTIPLE\_INIT\_DATA\_BIN} && \texttt{CONFIG\_ESP\_PHY\_INIT\_DATA\_IN\_PARTITION}

**CONFIG\_ESP\_PHY\_INIT\_DATA\_ERROR**

Terminate operation when PHY init data error

*Found in:* Component config > PHY > CONFIG\_ESP\_PHY\_INIT\_DATA\_IN\_PARTITION > CONFIG\_ESP\_PHY\_MULTIPLE\_INIT\_DATA\_BIN

If enabled, when an error occurs while the PHY init data is updated, the program will terminate and restart. If not enabled, the PHY init data will not be updated when an error occurs.

Default value:
• No (disabled) if \texttt{CONFIG\_ESP\_PHY\_MULTIPLE\_INIT\_DATA\_BIN} && \texttt{CONFIG\_ESP\_PHY\_INIT\_DATA\_IN\_PARTITION}

**CONFIG\_ESP\_PHY\_MAX\_WIFI\_TX\_POWER**

Max WiFi TX power (dBm)

*Found in:* Component config > PHY

Set maximum transmit power for WiFi radio. Actual transmit power for high data rates may be lower than this setting.

**Range:**
• from 10 to 20

**Default value:**
• 20

**CONFIG\_ESP\_PHY\_MAC\_BB\_PD**

Power down MAC and baseband of Wi-Fi and Bluetooth when PHY is disabled

*Found in:* Component config > PHY

If enabled, the MAC and baseband of Wi-Fi and Bluetooth will be powered down when PHY is disabled. Enabling this setting reduces power consumption by a small amount but increases RAM use by approximately 4 KB (Wi-Fi only), 2 KB (Bluetooth only) or 5.3 KB (Wi-Fi + Bluetooth).

Default value:
• No (disabled) if \texttt{CONFIG\_FREERTOS\_USE\_TICKLESS\_IDLE}
CONFIG_ESP_PHY_REDUCE_TX_POWER

Reduce PHY TX power when brownout reset

*Found in: Component config > PHY*

When brownout reset occurs, reduce PHY TX power to keep the code running.

**Default value:**
- No (disabled)

CONFIG_ESP_PHY_ENABLE_USB

Enable USB when phy init

*Found in: Component config > PHY*

When using USB Serial/JTAG/OTG/CDC, PHY should enable USB, otherwise USB module can not work properly. Notice: Enabling this configuration option will slightly impact wifi performance.

**Default value:**
- Yes (enabled)
- No (disabled)

CONFIG_ESP_PHY_ENABLE_CERT_TEST

Enable RF certification test functions

*Found in: Component config > PHY*

If enabled, you can use RF certification test APIs.

**Default value:**
- No (disabled)

CONFIG_ESP_PHY_CALIBRATION_MODE

Calibration mode

*Found in: Component config > PHY*

Select PHY calibration mode. During RF initialization, the partial calibration method is used by default for RF calibration. Full calibration takes about 100ms more than partial calibration. If boot duration is not critical, it is suggested to use the full calibration method. No calibration method is only used when the device wakes up from deep sleep.

**Available options:**
- Calibration partial (CONFIG_ESP_PHY_RF_CAL_PARTIAL)
- Calibration none (CONFIG_ESP_PHY_RF_CAL_NONE)
- Calibration full (CONFIG_ESP_PHY_RF_CAL_FULL)

CONFIG_ESP_PHY_IMPROVE_RX_11B

Improve Wi-Fi receive 11b pkts

*Found in: Component config > PHY*

This is a workaround to improve Wi-Fi receive 11b pkts for some modules using AC-DC power supply with high interference, enable this option will sacrifice Wi-Fi OFDM receive performance. But to guarantee 11b receive performance serves as a bottom line in this case.

**Default value:**
- No (disabled) if SOC_PHY_IMPROVE_RX_11B
Power Management  Contains:

- `CONFIG_PM_LIGHTSLEEP_RTC_OSC_CAL_INTERVAL`
- `CONFIG_PM_SLP_DISABLE_GPIO`
- `CONFIG_PM_LIGHT_SLEEP_CALLBACKS`
- `CONFIG_PM_POWER_DOWN_CPU_IN_LIGHT_SLEEP`
- `CONFIG_PM_POWER_DOWN_PERIPHERAL_IN_LIGHT_SLEEP`
- `CONFIG_PM_SLP_IRAM_OPT`
- `CONFIG_PM_RTOS_IDLE_OPT`
- `CONFIG_PM_ENABLE`

**CONFIG_PM_ENABLE**

Support for power management

*Found in: Component config > Power Management*

If enabled, application is compiled with support for power management. This option has run-time overhead (increased interrupt latency, longer time to enter idle state), and it also reduces accuracy of RTOS ticks and timers used for timekeeping. Enable this option if application uses power management APIs.

**Default value:**
- No (disabled) if `__DOXYGEN__`

**CONFIG_PM_DFS_INIT_AUTO**

Enable dynamic frequency scaling (DFS) at startup

*Found in: Component config > Power Management > CONFIG_PM_ENABLE*

If enabled, startup code configures dynamic frequency scaling. Max CPU frequency is set to DEFAULT_CPU_FREQ_MHZ setting, min frequency is set to XTAL frequency. If disabled, DFS will not be active until the application configures it using esp_pm_configure function.

**Default value:**
- No (disabled) if `CONFIG_PM_ENABLE`

**CONFIG_PM_PROFILING**

Enable profiling counters for PM locks

*Found in: Component config > Power Management > CONFIG_PM_ENABLE*

If enabled, esp_pm_* functions will keep track of the amount of time each of the power management locks has been held, and esp_pm_dump_locks function will print this information. This feature can be used to analyze which locks are preventing the chip from going into a lower power state, and see what time the chip spends in each power saving mode. This feature does incur some run-time overhead, so should typically be disabled in production builds.

**Default value:**
- No (disabled) if `CONFIG_PM_ENABLE`

**CONFIG_PM_TRACE**

Enable debug tracing of PM using GPIOs

*Found in: Component config > Power Management > CONFIG_PM_ENABLE*

If enabled, some GPIOs will be used to signal events such as RTOS ticks, frequency switching, entry/exit from idle state. Refer to pm_trace.c file for the list of GPIOs. This feature is intended to be used when analyzing/debugging behavior of power management implementation, and should be kept disabled in applications.

**Default value:**
Chapter 2. API Reference

- No (disabled) if CONFIG_PM_ENABLE

CONFIG_PM_SLP_IRAM_OPT

Put lightsleep related codes in internal RAM

*Found in: Component config > Power Management*

If enabled, about 2.1KB of lightsleep related source code would be in IRAM and chip would sleep longer for 310us at 160MHz CPU frequency most each time. This feature is intended to be used when lower power consumption is needed while there is enough place in IRAM to place source code.

CONFIG_PM_RTOS_IDLE_OPT

Put RTOS IDLE related codes in internal RAM

*Found in: Component config > Power Management*

If enabled, about 180Bytes of RTOS_IDLE related source code would be in IRAM and chip would sleep longer for 20us at 160MHz CPU frequency most each time. This feature is intended to be used when lower power consumption is needed while there is enough place in IRAM to place source code.

CONFIG_PM_SLP_DISABLE_GPIO

Disable all GPIO when chip at sleep

*Found in: Component config > Power Management*

This feature is intended to disable all GPIO pins at automatic sleep to get a lower power mode. If enabled, chips will disable all GPIO pins at automatic sleep to reduce about 200–300 uA current. If you want to specifically use some pins normally as chip wakes when chip sleeps, you can call `gpio_sleep_sel_dis` to disable this feature on those pins. You can also keep this feature on and call `gpio_sleep_set_direction` and `gpio_sleep_set_pull_mode` to have a different GPIO configuration at sleep. Waring: If you want to enable this option on ESP32, you should enable GPIO_ESP32_SUPPORT_SWITCH_SLP_PULL at first, otherwise you will not be able to switch pullup/pulldown mode.

CONFIG_PM_LIGHTSLEEP_RTC_OSC_CAL_INTERVAL

Calibrate the RTC_FAST/SLOW clock every N times of light sleep

*Found in: Component config > Power Management*

The value of this option determines the calibration interval of the RTC_FAST/SLOW clock during sleep when power management is enabled. When it is configured as N, the RTC_FAST/SLOW clock will be calibrated every N times of lightsleep. Decreasing this value will increase the time the chip is in the active state, thereby increasing the average power consumption of the chip. Increasing this value can reduce the average power consumption, but when the external environment changes drastically and the chip RTC_FAST/SLOW oscillator frequency drifts, it may cause system instability.

*Range:*
- from 1 to 128 if CONFIG_PM_ENABLE

*Default value:*
- 1 if CONFIG_PM_ENABLE

CONFIG_PM_POWER_DOWN_CPU_IN_LIGHT_SLEEP

Power down CPU in light sleep

*Found in: Component config > Power Management*

If enabled, the CPU will be powered down in light sleep. On esp32c3 soc, enabling this option will consume 1.68 KB of internal RAM and will reduce sleep current consumption by about 100 uA. On
esp32s3 soc, enabling this option will consume 8.58 KB of internal RAM and will reduce sleep current consumption by about 650 uA.

**Default value:**
- Yes (enabled)

**CONFIG_PM_POWER_DOWN_TAGMEM_IN_LIGHT_SLEEP**

Power down I/D-cache tag memory in light sleep

*Found in: Component config > Power Management > CONFIG_PM_POWER_DOWN_CPU_IN_LIGHT_SLEEP*

If enabled, the I/D-cache tag memory will be retained in light sleep. Depending on the the cache configuration, if this option is enabled, it will consume up to 9 KB of internal RAM.

**Default value:**
- Yes (enabled)

**CONFIG_PM_POWER_DOWN_PERIPHERAL_IN_LIGHT_SLEEP**

Power down Digital Peripheral in light sleep (EXPERIMENTAL)

*Found in: Component config > Power Management*

If enabled, digital peripherals will be powered down in light sleep, it will reduce sleep current consumption by about 100 uA. Chip will save/restore register context at sleep/wake time to keep the system running. Enabling this option will increase static RAM and heap usage, the actual cost depends on the peripherals you have initialized. In order to save/restore the context of the necessary hardware for FreeRTOS to run, it will need at least 4.55 KB free heap at sleep time. Otherwise sleep will not power down the peripherals.

Note1: Please use this option with caution, the current IDF does not support the retention of all peripherals. When the digital peripherals are powered off and a sleep and wake-up is completed, the peripherals that have not saved the running context are equivalent to performing a reset. !!! Please confirm the peripherals used in your application and their sleep retention support status before enabling this option, peripherals sleep retention driver support status is tracked in power_management.rst

Note2: When this option is enabled simultaneously with FREERTOS_USE_TICKLESS_IDLE, since the UART will be powered down, the uart FIFO will be flushed before sleep to avoid data loss, however, this has the potential to block the sleep process and cause the wakeup time to be skipped, which will cause the tick of freertos to not be compensated correctly when returning from sleep and cause the system to crash. To avoid this, you can increase FREERTOS_IDLE_TIME_BEFORE_SLEEP threshold in menuconfig.

**Default value:**
- No (disabled) if SOC_PAU_SUPPORTED

**CONFIG_PM_LIGHT_SLEEP_CALLBACKS**

Enable registration of pm light sleep callbacks

*Found in: Component config > Power Management*

If enabled, it allows user to register entry and exit callbacks which are called before and after entering auto light sleep.

NOTE: These callbacks are executed from the IDLE task context hence you cannot have any blocking calls in your callbacks.

NOTE: Enabling these callbacks may change sleep duration calculations based on time spent in callback and hence it is highly recommended to keep them as short as possible

**Default value:**
ESP PSRAM  Contains:

• CONFIG_SPIRAM

CONFIG_SPIRAM

Support for external, SPI-connected RAM

*Found in: Component config > ESP PSRAM*

This enables support for an external SPI RAM chip, connected in parallel with the main SPI flash chip.

SPI RAM config  Contains:

• CONFIG_SPIRAM_ALLOW_BSS_SEG_EXTERNAL_MEMORY
• CONFIG_SPIRAM_ALLOW_STACK_EXTERNAL_MEMORY
• CONFIG_SPIRAM_ECC_ENABLE
• CONFIG_SPIRAM_BOOT_INIT
• CONFIG_SPIRAM_MALLOC_ALWAYSINTERNAL
• CONFIG_SPIRAM_MODE
• CONFIG_SPIRAM_FETCH_INSTRUCTIONS
• CONFIG_SPIRAM_RODATA
• CONFIG_SPIRAM_MALLOC_RESERVE_INTERNAL
• CONFIG_SPIRAM_MEMTEST
• CONFIG_SPIRAM_SPEED
• CONFIG_SPIRAM_USE
• CONFIG_SPIRAM_TRY_ALLOCATE_WIFI_LWIP
• CONFIG_SPIRAM_TYPE

CONFIG_SPIRAM_MODE

Mode (QUAD/OCT) of SPI RAM chip in use

*Found in: Component config > ESP PSRAM > CONFIG_SPIRAM > SPI RAM config*

Available options:

• Quad Mode PSRAM (CONFIG_SPIRAM_MODE_QUAD)
• Octal Mode PSRAM (CONFIG_SPIRAM_MODE_OCT)

CONFIG_SPIRAM_TYPE

Type of SPI RAM chip in use

*Found in: Component config > ESP PSRAM > CONFIG_SPIRAM > SPI RAM config*

Available options:

• Auto-detect (CONFIG_SPIRAM_TYPE_AUTO)
• ESP-PSRAM16 or APS1604 (CONFIG_SPIRAM_TYPE_ESPPSRAM16)
• ESP-PSRAM32 (CONFIG_SPIRAM_TYPE_ESPPSRAM32)
• ESP-PSRAM64, LY68L6400 or APS6408 (CONFIG_SPIRAM_TYPE_ESPPSRAM64)
• No (disabled) if CONFIG_FREERTOS_USE_TICKLESS_IDLE
CONFIG_SPIRAM_ALLOW_STACK_EXTERNAL_MEMORY
Allow external memory as an argument to xTaskCreateStatic

Found in: Component config > ESP PSRAM > CONFIG_SPIRAM > SPI RAM config

Accessing memory in SPIRAM has certain restrictions, so task stacks allocated by xTaskCreate are by default allocated from internal RAM.

This option allows for passing memory allocated from SPIRAM to be passed to xTaskCreateStatic. This should only be used for tasks where the stack is never accessed while the cache is disabled.

CONFIG_SPIRAM_FETCH_INSTRUCTIONS
Move Instructions in Flash to PSRAM

Found in: Component config > ESP PSRAM > CONFIG_SPIRAM > SPI RAM config

If enabled, instructions in flash will be moved into PSRAM on startup. If SPIRAM_RODATA is also enabled, code that requires execution during an SPI1 Flash operation can forgo being placed in IRAM, thus optimizing RAM usage (see External RAM documentation for more details).

CONFIG_SPIRAM_RODATA
Move Read-Only Data in Flash to PSRAM

Found in: Component config > ESP PSRAM > CONFIG_SPIRAM > SPI RAM config

If enabled, rodata in flash will be moved into PSRAM on startup. If SPIRAM_FETCH_INSTRUCTIONS is also enabled, code that requires execution during an SPI1 Flash operation can forgo being placed in IRAM, thus optimizing RAM usage (see External RAM documentation for more details).

CONFIG_SPIRAM_SPEED
Set RAM clock speed

Found in: Component config > ESP PSRAM > CONFIG_SPIRAM > SPI RAM config

Select the speed for the SPI RAM chip.

Available options:

- 120MHz clock speed (READ DOCS FIRST) (CONFIG_SPIRAM_SPEED_120M)
  - Quad PSRAM 120 MHz is stable.
  - Octal PSRAM 120 MHz is an experimental feature, it works when the temperature is stable.
  - **Risks:** If your chip powers on at a certain temperature, then after the temperature increases or decreases by approximately 20 Celsius degrees (depending on the chip), the accesses to / from PSRAM will crash randomly.
- 80MHz clock speed (CONFIG_SPIRAM_SPEED_80M)
- 40Mhz clock speed (CONFIG_SPIRAM_SPEED_40M)

CONFIG_SPIRAM_ECC_ENABLE
Enable SPI RAM ECC

Found in: Component config > ESP PSRAM > CONFIG_SPIRAM > SPI RAM config

Enable MSI Error-Correcting Code function when accessing SPIRAM.

If enabled, 1/16 of the SPI RAM total size will be reserved for error-correcting code.
CONFIG_SPIRAM_BOOT_INIT

Initialize SPI RAM during startup

*Found in: Component config > ESP PSRAM > CONFIG_SPIRAM > SPI RAM config*

If this is enabled, the SPI RAM will be enabled during initial boot. Unless you have specific requirements, you’ll want to leave this enabled so memory allocated during boot-up can also be placed in SPI RAM.

CONFIG_SPIRAM_IGNORE_NOTFOUND

Ignore PSRAM when not found

*Found in: Component config > ESP PSRAM > CONFIG_SPIRAM > SPI RAM config > CONFIG_SPIRAM_BOOT_INIT*

Normally, if psram initialization is enabled during compile time but not found at runtime, it is seen as an error making the CPU panic. If this is enabled, booting will complete but no PSRAM will be available.

CONFIG_SPIRAM_USE

SPI RAM access method

*Found in: Component config > ESP PSRAM > CONFIG_SPIRAM > SPI RAM config*

The SPI RAM can be accessed in multiple methods: by just having it available as an unmanaged memory region in the CPU’s memory map, by integrating it in the heap as ‘special’ memory needing heap_caps_malloc to allocate, or by fully integrating it making malloc() also able to return SPI RAM pointers.

Available options:

- Integrate RAM into memory map (CONFIG_SPIRAM_USE_MEMMAP)
- Make RAM allocatable using heap_caps_malloc(…, MALLOC_CAP_SPIRAM) (CONFIG_SPIRAM_USE_CAPACITY_ALLOCA)
- Make RAM allocatable using malloc() as well (CONFIG_SPIRAM_USE_MALLOC)

CONFIG_SPIRAM_MEMTEST

Run memory test on SPI RAM initialization

*Found in: Component config > ESP PSRAM > CONFIG_SPIRAM > SPI RAM config*

Runs a rudimentary memory test on initialization. Aborts when memory test fails. Disable this for slightly faster startup.

CONFIG_SPIRAM_MALLOC_ALWAYSINTERNAL

Maximum malloc() size, in bytes, to always put in internal memory

*Found in: Component config > ESP PSRAM > CONFIG_SPIRAM > SPI RAM config*

If malloc() is capable of also allocating SPI-connected ram, its allocation strategy will prefer to allocate chunks less than this size in internal memory, while allocations larger than this will be done from external RAM. If allocation from the preferred region fails, an attempt is made to allocate from the non-preferred region instead, so malloc() will not suddenly fail when either internal or external memory is full.
Chapter 2. API Reference

CONFIG_SPIRAM_TRY_ALLOCATE_WIFI_LWIP
Try to allocate memories of WiFi and LWIP in SPIRAM firstly. If failed, allocate internal memory

Found in: Component config > ESP PSRAM > CONFIG_SPIRAM > SPI RAM config

Try to allocate memories of WiFi and LWIP in SPIRAM firstly. If failed, try to allocate internal memory then.

CONFIG_SPIRAM_MALLOC_RESERVE_INTERNAL
Reserve this amount of bytes for data that specifically needs to be in DMA or internal memory

Found in: Component config > ESP PSRAM > CONFIG_SPIRAM > SPI RAM config

Because the external/internal RAM allocation strategy is not always perfect, it sometimes may happen that the internal memory is entirely filled up. This causes allocations that are specifically done in internal memory, for example the stack for new tasks or memory to service DMA or have memory that’s also available when SPI cache is down, to fail. This option reserves a pool specifically for requests like that; the memory in this pool is not given out when a normal malloc() is called.

Set this to 0 to disable this feature.

Note that because FreeRTOS stacks are forced to internal memory, they will also use this memory pool; be sure to keep this in mind when adjusting this value.

Note also that the DMA reserved pool may not be one single contiguous memory region, depending on the configured size and the static memory usage of the app.

CONFIG_SPIRAM_ALLOW_BSS_SEG_EXTERNAL_MEMORY
Allow .bss segment placed in external memory

Found in: Component config > ESP PSRAM > CONFIG_SPIRAM > SPI RAM config

If enabled, variables with EXT_RAM_BSS_ATTR attribute will be placed in SPIRAM instead of internal DRAM. BSS section of lwip, net80211, pp, bt libraries will be automatically placed in SPIRAM. BSS sections from other object files and libraries can also be placed in SPIRAM through linker fragment scheme extram_bss.

Note that the variables placed in SPIRAM using EXT_RAM_BSS_ATTR will be zero initialized.

ESP Ringbuf Contains:

• CONFIG_RINGBUF_PLACE_FUNCTIONS_INTO_FLASH

CONFIG_RINGBUF_PLACE_FUNCTIONS_INTO_FLASH
Place non-ISR ringbuf functions into flash

Found in: Component config > ESP Ringbuf

Place non-ISR ringbuf functions (like xRingbufferCreate/xRingbufferSend) into flash. This frees up IRAM, but the functions can no longer be called when the cache is disabled.

Default value:
• No (disabled)

CONFIG_RINGBUF_PLACE_ISR_FUNCTIONS_INTO_FLASH
Place ISR ringbuf functions into flash

Found in: Component config > ESP Ringbuf > CONFIG_RINGBUF_PLACE_FUNCTIONS_INTO_FLASH
Place ISR ringbuf functions (like `xRingbufferSendFromISR/xRingbufferReceiveFromISR`) into flash. This frees up IRAM, but the functions can no longer be called when the cache is disabled or from an IRAM interrupt context.

This option is not compatible with ESP-IDF drivers which are configured to run the ISR from an IRAM context, e.g. `CONFIG_UART_ISR_IN_IRAM`.

**Default value:**

- No (disabled) if `CONFIG_RINGBUF_PLACE_FUNCTIONS_INTO_FLASH`

**ESP System Settings** Contains:

- `CONFIG_ESP_SYSTEM_RTC_EXT_XTAL_BOOTSTRAP_CYCLES`
- `Brownout Detector`
- `Cache config`
- `CONFIG_ESP_CONSOLE_UART`
- `CONFIG_ESP_CONSOLE_SECONDARY`
- `CONFIG_ESP_DEFAULT_CPU_FREQ_MHZ`
- `CONFIG_ESP_CONSOLE_USB_CDC_SUPPORT_ETS_PRINTF`
- `CONFIG_ESP_SYSTEM.Allow_RTC_FAST_MEM_AS_HEAP`
- `CONFIG_ESP_TASK_WDT_EN`
- `CONFIG_ESP_SYSTEM_EVENT_TASK_STACK_SIZE`
- `CONFIG_ESP_SYSTEM_HW_STACK_GUARD`
- `CONFIG_ESP_XT_WDT`
- `CONFIG_ESP_SYSTEM_CHECK_INT_LEVEL`
- `CONFIG_ESP_INT_WDT`
- `CONFIG_ESP_MAIN_TASK_AFFINITY`
- `CONFIG_ESP_MAIN_TASK_STACK_SIZE`
- `CONFIG_ESP_DEBUG_OCDAWARE`
- `Memory`
- `Memory protection`
- `CONFIG_ESP_MINIMAL_SHARED_STACK_SIZE`
- `CONFIG_ESP_DEBUG_STUBS_ENABLE`
- `CONFIG_ESP_SYSTEM_PANIC`
- `CONFIG_ESP_SYSTEM_PANIC_REBOOT_DELAY_SECONDS`
- `CONFIG_ESP_PANIC_HANDLER_IRAM`
- `CONFIG_ESP_CONSOLE_USB_CDC_RX_BUF_SIZE`
- `CONFIG_ESP_SYSTEM_EVENT_QUEUE_SIZE`
- `Trace memory`
- `CONFIG_ESP_CONSOLE_UART_BAUDRATE`
- `CONFIG_ESP_CONSOLE_UART_NUM`
- `CONFIG_ESP_CONSOLE_UART_RX_GPIO`
- `CONFIG_ESP_CONSOLE_UART_TX_GPIO`

**CONFIG_ESP_DEFAULT_CPU_FREQ_MHZ**

CPU frequency

*Found in: Component config > ESP System Settings*

CPU frequency to be set on application startup.

Available options:

- 40 MHz (`CONFIG_ESP_DEFAULT_CPU_FREQ_MHZ_40`)
- 80 MHz (`CONFIG_ESP_DEFAULT_CPU_FREQ_MHZ_80`)
- 160 MHz (`CONFIG_ESP_DEFAULT_CPU_FREQ_MHZ_160`)
- 240 MHz (`CONFIG_ESP_DEFAULT_CPU_FREQ_MHZ_240`)

Submit Document Feedback
Cache config  Contains:

- `CONFIG_ESP32S3_DCACHE_ASSOCIATED_WAYS`
- `CONFIG_ESP32S3_DATA_CACHE_LINE_SIZE`
- `CONFIG_ESP32S3_DATA_CACHE_SIZE`
- `CONFIG_ESP32S3_ICACHE_ASSOCIATED_WAYS`
- `CONFIG_ESP32S3_INSTRUCTION_CACHE_LINE_SIZE`
- `CONFIG_ESP32S3_INSTRUCTION_CACHE_SIZE`

**CONFIG_ESP32S3_INSTRUCTION_CACHE_SIZE**

Instruction cache size

*Found in: Component config > ESP System Settings > Cache config*

Instruction cache size to be set on application startup. If you use 16KB instruction cache rather than 32KB instruction cache, then the other 16KB will be managed by heap allocator.

Available options:

- 16KB (CONFIG_ESP32S3_INSTRUCTION_CACHE_16KB)
- 32KB (CONFIG_ESP32S3_INSTRUCTION_CACHE_32KB)

**CONFIG_ESP32S3_ICACHE_ASSOCIATED_WAYS**

Instruction cache associated ways

*Found in: Component config > ESP System Settings > Cache config*

Instruction cache associated ways to be set on application startup.

Available options:

- 4 ways (CONFIG_ESP32S3_INSTRUCTION_CACHE_4WAYS)
- 8 ways (CONFIG_ESP32S3_INSTRUCTION_CACHE_8WAYS)

**CONFIG_ESP32S3_INSTRUCTION_CACHE_LINE_SIZE**

Instruction cache line size

*Found in: Component config > ESP System Settings > Cache config*

Instruction cache line size to be set on application startup.

Available options:

- 16 bytes (CONFIG_ESP32S3_INSTRUCTION_CACHE_LINE_16B)
- 32 bytes (CONFIG_ESP32S3_INSTRUCTION_CACHE_LINE_32B)

**CONFIG_ESP32S3_DATA_CACHE_SIZE**

Data cache size

*Found in: Component config > ESP System Settings > Cache config*

Data cache size to be set on application startup. If you use 32KB data cache rather than 64KB data cache, the other 32KB will be added to the heap.

Available options:
Chapter 2. API Reference

• 16KB (CONFIG_ESP32S3_DATA_CACHE_16KB)
• 32KB (CONFIG_ESP32S3_DATA_CACHE_32KB)
• 64KB (CONFIG_ESP32S3_DATA_CACHE_64KB)

**CONFIG_ESP32S3_DCACHE_ASSOCIATED_WAYS**

Data cache associated ways

*Found in: Component config > ESP System Settings > Cache config*

Data cache associated ways to be set on application startup.

Available options:

• 4 ways (CONFIG_ESP32S3_DATA_CACHE_4WAYS)
• 8 ways (CONFIG_ESP32S3_DATA_CACHE_8WAYS)

**CONFIG_ESP32S3_DATA_CACHE_LINE_SIZE**

Data cache line size

*Found in: Component config > ESP System Settings > Cache config*

Data cache line size to be set on application startup.

Available options:

• 16 Bytes (CONFIG_ESP32S3_DATA_CACHE_LINE_16B)
• 32 Bytes (CONFIG_ESP32S3_DATA_CACHE_LINE_32B)
• 64 Bytes (CONFIG_ESP32S3_DATA_CACHE_LINE_64B)

**Memory** Contains:

• CONFIG_ESP32S3_RTCDATA_IN_FAST_MEM
• CONFIG_ESP32S3_USE_FIXED_STATIC_RAM_SIZE

**CONFIG_ESP32S3_RTCDATA_IN_FAST_MEM**

Place RTC_DATA_ATTR and RTC_RODATA_ATTR variables into RTC fast memory segment

*Found in: Component config > ESP System Settings > Memory*

This option allows to place .rtc_data and .rtc_rodata sections into RTC fast memory segment to free the slow memory region for ULP programs.

**Default value:**

• No (disabled)

**CONFIG_ESP32S3_USE_FIXED_STATIC_RAM_SIZE**

Use fixed static RAM size

*Found in: Component config > ESP System Settings > Memory*

If this option is disabled, the DRAM part of the heap starts right after the .bss section, within the dram0_0 region. As a result, adding or removing some static variables will change the available heap size.

If this option is enabled, the DRAM part of the heap starts right after the dram0_0 region, where its length is set with ESP32S3_FIXED_STATIC_RAM_SIZE

**Default value:**
Chapter 2. API Reference

- No (disabled)

**CONFIG_ESP32S3_FIXED_STATIC_RAM_SIZE**

Fixed Static RAM size

*Found in:* Component config > ESP System Settings > Memory > CONFIG_ESP32S3_USE_FIXED_STATIC_RAM_SIZE

RAM size dedicated for static variables (.data & .bss sections). This value is less than the chip’s total memory, as not all of it can be used for this purpose. E.g. parts are used by the software bootloader, and will only be available as heap memory after app startup.

*Range:*
- from 0 to 0x54700 if `CONFIG_ESP32S3_USE_FIXED_STATIC_RAM_SIZE`

*Default value:*
- “0x10000” if `CONFIG_ESP32S3_USE_FIXED_STATIC_RAM_SIZE`

**Trace memory** Contains:
- `CONFIG_ESP32S3_TRAX`

**CONFIG_ESP32S3_TRAX**

Use TRAX tracing feature

*Found in:* Component config > ESP System Settings > Trace memory

The esp32-s3 contains a feature which allows you to trace the execution path the processor has taken through the program. This is stored in a chunk of 32K (16K for single-processor) of memory that can’t be used for general purposes anymore. Disable this if you do not know what this is.

*Default value:*
- No (disabled)

**CONFIG_ESP32S3_TRAX_TWOBANKS**

Reserve memory for tracing both pro as well as app cpu execution

*Found in:* Component config > ESP System Settings > Trace memory > CONFIG_ESP32S3_TRAX

The esp32-s3 contains a feature which allows you to trace the execution path the processor has taken through the program. This is stored in a chunk of 32K (16K for single-processor) of memory that can’t be used for general purposes anymore. Disable this if you do not know what this is.

**CONFIG_ESP_SYSTEM_PANIC**

Panic handler behaviour

*Found in:* Component config > ESP System Settings

If FreeRTOS detects unexpected behaviour or an unhandled exception, the panic handler is invoked. Configure the panic handler’s action here.

*Available options:*
- Print registers and halt (CONFIG_ESP_SYSTEM_PANIC_PRINT_HALT) Outputs the relevant registers over the serial port and halt the processor. Needs a manual reset to restart.
- Print registers and reboot (CONFIG_ESP_SYSTEM_PANIC_PRINT_REBOOT) Outputs the relevant registers over the serial port and immediately reset the processor.
- Silent reboot (CONFIG_ESP_SYSTEM_PANIC_SILENT_REBOOT)
  Just resets the processor without outputting anything
- GDBStub on panic (CONFIG_ESP_SYSTEM_PANIC_GDBSTUB)
  Invoke gdbstub on the serial port, allowing for gdb to attach to it to do a postmortem of the crash.

**CONFIG_ESP_SYSTEM_PANIC_REBOOT_DELAY_SECONDS**

Panic reboot delay (Seconds)

*Found in: Component config > ESP System Settings*

After the panic handler executes, you can specify a number of seconds to wait before the device reboots.

*Range:*
  - from 0 to 99
*Default value:*
  - 0

**CONFIG_ESP_SYSTEM_RTC_EXT_XTAL_BOOTSTRAP_CYCLES**

Bootstrap cycles for external 32kHz crystal

*Found in: Component config > ESP System Settings*

To reduce the startup time of an external RTC crystal, we bootstrap it with a 32kHz square wave for a fixed number of cycles. Setting 0 will disable bootstrapping (if disabled, the crystal may take longer to start up or fail to oscillate under some conditions).

If this value is too high, a faulty crystal may initially start and then fail. If this value is too low, an otherwise good crystal may not start.

To accurately determine if the crystal has started, set a larger “Number of cycles for RTC_SLOW_CLK calibration” (about 3000).

**CONFIG_ESP_SYSTEM_ALLOW_RTC_FAST_MEM_AS_HEAP**

Enable RTC fast memory for dynamic allocations

*Found in: Component config > ESP System Settings*

This config option allows to add RTC fast memory region to system heap with capability similar to that of DRAM region but without DMA. This memory will be consumed first per heap initialization order by early startup services and scheduler related code. Speed wise RTC fast memory operates on APB clock and hence does not have much performance impact.

*Default value:*
  - Yes (enabled)

**Memory protection**  Contains:

- CONFIG_ESP_SYSTEM_PMP_IDRAM_SPLIT
- CONFIG_ESP_SYSTEM_MEMPROT_FEATURE

**CONFIG_ESP_SYSTEM_PMP_IDRAM_SPLIT**

Enable IRAM/DRAM split protection

*Found in: Component config > ESP System Settings > Memory protection*

If enabled, the CPU watches all the memory access and raises an exception in case of any memory violation. This feature automatically splits the SRAM memory, using PMP, into data and instruction segments and sets Read/Execute permissions for the instruction part (below given splitting address) and
Read/Write permissions for the data part (above the splitting address). The memory protection is effective on all access through the IRAM0 and DRAM0 buses.

**Default value:**
- Yes (enabled) if SOC_CPU_IDRAM_SPLIT_USING_PMP

**CONFIG_ESP_SYSTEM_MEMPROT_FEATURE**
Enable memory protection

*Found in: Component config > ESP System Settings > Memory protection*

If enabled, the permission control module watches all the memory access and fires the panic handler if a permission violation is detected. This feature automatically splits the SRAM memory into data and instruction segments and sets Read/Execute permissions for the instruction part (below given splitting address) and Read/Write permissions for the data part (above the splitting address). The memory protection is effective on all access through the IRAM0 and DRAM0 buses.

**Default value:**
- Yes (enabled)

**CONFIG_ESP_SYSTEM_MEMPROT_FEATURE_LOCK**
Lock memory protection settings

*Found in: Component config > ESP System Settings > Memory protection > CONFIG_ESP_SYSTEM_MEMPROT_FEATURE*

Once locked, memory protection settings cannot be changed anymore. The lock is reset only on the chip startup.

**Default value:**
- Yes (enabled)

**CONFIG_ESP_SYSTEM_EVENT_QUEUE_SIZE**
System event queue size

*Found in: Component config > ESP System Settings*

Config system event queue size in different application.

**Default value:**
- 32

**CONFIG_ESP_SYSTEM_EVENT_TASK_STACK_SIZE**
Event loop task stack size

*Found in: Component config > ESP System Settings*

Config system event task stack size in different application.

**Default value:**
- 2304

**CONFIG_ESP_MAIN_TASK_STACK_SIZE**
Main task stack size

*Found in: Component config > ESP System Settings*

Configure the “main task” stack size. This is the stack of the task which calls app_main(). If app_main() returns then this task is deleted and its stack memory is freed.
Default value:
• 3584

**CONFIG_ESP_MAIN_TASK_AFFINITY**

Main task core affinity

*Found in: Component config > ESP System Settings*

Configure the “main task” core affinity. This is the used core of the task which calls app_main(). If app_main() returns then this task is deleted.

Available options:

• CPU0 (CONFIG_ESP_MAIN_TASK_AFFINITY_CPU0)
• CPU1 (CONFIG_ESP_MAIN_TASK_AFFINITY_CPU1)
• No affinity (CONFIG_ESP_MAIN_TASK_AFFINITY_NO_AFFINITY)

**CONFIG_ESP_MINIMAL_SHARED_STACK_SIZE**

Minimal allowed size for shared stack

*Found in: Component config > ESP System Settings*

Minimal value of size, in bytes, accepted to execute a expression with shared stack.

Default value:
• 2048

**CONFIG_ESP_CONSOLE_UART**

Channel for console output

*Found in: Component config > ESP System Settings*

Select where to send console output (through stdout and stderr).

• Default is to use UART0 on pre-defined GPIOs.
• If “Custom” is selected, UART0 or UART1 can be chosen, and any pins can be selected.
• If “None” is selected, there will be no console output on any UART, except for initial output from ROM bootloader. This ROM output can be suppressed by GPIO strapping or EFUSE, refer to chip datasheet for details.
• On chips with USB OTG peripheral, “USB CDC” option redirects output to the CDC port. This option uses the CDC driver in the chip ROM. This option is incompatible with TinyUSB stack.
• On chips with an USB serial/JTAG debug controller, selecting the option for that redirects output to the CDC/ACM (serial port emulation) component of that device.

Available options:

• Default: UART0 (CONFIG_ESP_CONSOLE_UART_DEFAULT)
• USB CDC (CONFIG_ESP_CONSOLE_USB_CDC)
• USB Serial/JTAG Controller (CONFIG_ESP_CONSOLE_USB_SERIAL_JTAG)
• Custom UART (CONFIG_ESP_CONSOLE_UART_CUSTOM)
• None (CONFIG_ESP_CONSOLE_NONE)

**CONFIG_ESP_CONSOLE_SECONDARY**

Channel for console secondary output

*Found in: Component config > ESP System Settings*
This secondary option supports output through other specific port like USB_SERIAL_JTAG when UART0 port as a primary is selected but not connected. This secondary output currently only supports non-blocking mode without using REPL. If you want to output in blocking mode with REPL or input through this secondary port, please change the primary config to this port in Channel for console output menu.

Available options:

- No secondary console (CONFIG_ESP_CONSOLE_SECONDARY_NONE)
- USB_SERIAL_JTAG PORT (CONFIG_ESP_CONSOLE_SECONDARY_USB_SERIAL_JTAG)
  This option supports output through USB_SERIAL_JTAG port when the UART0 port is not connected. The output currently only supports non-blocking mode without using the console. If you want to output in blocking mode with REPL or input through USB_SERIAL_JTAG port, please change the primary config to ESP_CONVERSE_USB_SERIAL_JTAG above.

**CONFIG_ESP_CONSOLE_UART_NUM**
UART peripheral to use for console output (0-1)

*Found in: Component config > ESP System Settings*
This UART peripheral is used for console output from the ESP-IDF Bootloader and the app.
If the configuration is different in the Bootloader binary compared to the app binary, UART is reconfigured after the bootloader exits and the app starts.
Due to an ESP32 ROM bug, UART2 is not supported for console output via esp_rom_printf.

Available options:

- UART0 (CONFIG_ESP_CONSOLE_UART_CUSTOM_NUM_0)
- UART1 (CONFIG_ESP_CONSOLE_UART_CUSTOM_NUM_1)

**CONFIG_ESP_CONSOLE_UART_TX_GPIO**
UART TX on GPIO#

*Found in: Component config > ESP System Settings*
This GPIO is used for console UART TX output in the ESP-IDF Bootloader and the app (including boot log output and default standard output and standard error of the app).
If the configuration is different in the Bootloader binary compared to the app binary, UART is reconfigured after the bootloader exits and the app starts.

**Range:**
- from 0 to 46 if CONFIG_ESP_CONSOLE_UART_CUSTOM

**Default value:**
- 43 if CONFIG_ESP_CONVERSE_UART_CUSTOM

**CONFIG_ESP_CONSOLE_UART_RX_GPIO**
UART RX on GPIO#

*Found in: Component config > ESP System Settings*
This GPIO is used for UART RX input in the ESP-IDF Bootloader and the app (including default default standard input of the app).

Note: The default ESP-IDF Bootloader configures this pin but doesn’t read anything from the UART.
If the configuration is different in the Bootloader binary compared to the app binary, UART is reconfigured after the bootloader exits and the app starts.

**Range:**
- from 0 to 46 if `CONFIG_ESP_CONSOLE_UART_CUSTOM`

**Default value:**
- 44 if `CONFIG_ESP_CONSOLE_UART_CUSTOM`

**CONFIG_ESP_CONSOLE_UART_BAUDRATE**

UART console baud rate

*Found in: Component config > ESP System Settings*

This baud rate is used by both the ESP-IDF Bootloader and the app (including boot log output and default standard input/output/error of the app).

The app’s maximum baud rate depends on the UART clock source. If Power Management is disabled, the UART clock source is the APB clock and all baud rates in the available range will be sufficiently accurate. If Power Management is enabled, REF_TICK clock source is used so the baud rate is divided from 1MHz. Baud rates above 1Mbps are not possible and values between 500Kbps and 1Mbps may not be accurate.

If the configuration is different in the Bootloader binary compared to the app binary, UART is reconfigured after the bootloader exits and the app starts.

**Range:**
- from 1200 to 1000000 if `CONFIG_PM_ENABLE`

**Default value:**
- 115200

**CONFIG_ESP_CONSOLE_USB_CDC_RX_BUF_SIZE**

Size of USB CDC RX buffer

*Found in: Component config > ESP System Settings*

Set the size of USB CDC RX buffer. Increase the buffer size if your application is often receiving data over USB CDC.

**Range:**
- from 4 to 16384 if `CONFIG_ESP_CONSOLE_USB_CDC`

**Default value:**
- 64 if `CONFIG_ESP_CONSOLE_USB_CDC`

**CONFIG_ESP_CONSOLE_USB_CDC_SUPPORT_ETS_PRINTF**

Enable esp_rom_printf / ESP_EARLY_LOG via USB CDC

*Found in: Component config > ESP System Settings*

If enabled, esp_rom_printf and ESP_EARLY_LOG output will also be sent over USB CDC. Disabling this option saves about 1kB or RAM.

**Default value:**
- No (disabled) if `CONFIG_ESP_CONSOLE_USB_CDC`

**CONFIG_ESP_INT_WDT**

Interrupt watchdog

*Found in: Component config > ESP System Settings*
This watchdog timer can detect if the FreeRTOS tick interrupt has not been called for a certain time, either because a task turned off interrupts and did not turn them on for a long time, or because an interrupt handler did not return. It will try to invoke the panic handler first and failing that reset the SoC.

**Default value:**
- Yes (enabled)

**CONFIG_ESP_INT_WDT_TIMEOUT_MS**

Interrupt watchdog timeout (ms)

*Found in: Component config > ESP System Settings > CONFIG_ESP_INT_WDT*

The timeout of the watchdog, in milliseconds. Make this higher than the FreeRTOS tick rate.

**Range:**
- from 10 to 10000

**Default value:**
- 300

**CONFIG_ESP_INT_WDT_CHECK_CPU1**

Also watch CPU1 tick interrupt

*Found in: Component config > ESP System Settings > CONFIG_ESP_INT_WDT*

Also detect if interrupts on CPU 1 are disabled for too long.

**CONFIG_ESP_TASK_WDT_EN**

Enable Task Watchdog Timer

*Found in: Component config > ESP System Settings*

The Task Watchdog Timer can be used to make sure individual tasks are still running. Enabling this option will enable the Task Watchdog Timer. It can be either initialized automatically at startup or initialized after startup (see Task Watchdog Timer API Reference)

**Default value:**
- Yes (enabled)

**CONFIG_ESP_TASK_WDT_INIT**

Initialize Task Watchdog Timer on startup

*Found in: Component config > ESP System Settings > CONFIG_ESP_TASK_WDT_EN*

Enabling this option will cause the Task Watchdog Timer to be initialized automatically at startup.

**Default value:**
- Yes (enabled)

**CONFIG_ESP_TASK_WDT_PANIC**

Invoke panic handler on Task Watchdog timeout

*Found in: Component config > ESP System Settings > CONFIG_ESP_TASK_WDT_EN > CONFIG_ESP_TASK_WDT_INIT*

If this option is enabled, the Task Watchdog Timer will be configured to trigger the panic handler when it times out. This can also be configured at run time (see Task Watchdog Timer API Reference)

**Default value:**
- No (disabled)
CONFIG_ESP_TASK_WDT_TIMEOUT_S

Task Watchdog timeout period (seconds)

Found in: Component config > ESP System Settings > CONFIG_ESP_TASK_WDT_EN > CONFIG_ESP_TASK_WDT_INIT

Timeout period configuration for the Task Watchdog Timer in seconds. This is also configurable at run time (see Task Watchdog Timer API Reference)

Range:
- from 1 to 60

Default value:
- 5

CONFIG_ESP_TASK_WDT_CHECK_IDLE_TASK_CPU0

Watch CPU0 Idle Task

Found in: Component config > ESP System Settings > CONFIG_ESP_TASK_WDT_EN > CONFIG_ESP_TASK_WDT_INIT

If this option is enabled, the Task Watchdog Timer will watch the CPU0 Idle Task. Having the Task Watchdog watch the Idle Task allows for detection of CPU starvation as the Idle Task not being called is usually a symptom of CPU starvation. Starvation of the Idle Task is detrimental as FreeRTOS household tasks depend on the Idle Task getting some runtime every now and then.

Default value:
- Yes (enabled)

CONFIG_ESP_TASK_WDT_CHECK_IDLE_TASK_CPU1

Watch CPU1 Idle Task

Found in: Component config > ESP System Settings > CONFIG_ESP_TASK_WDT_EN > CONFIG_ESP_TASK_WDT_INIT

If this option is enabled, the Task Watchdog Timer will watch the CPU1 Idle Task.

CONFIG_ESP_XT_WDT

Initialize XTAL32K watchdog timer on startup

Found in: Component config > ESP System Settings

This watchdog timer can detect oscillation failure of the XTAL32K_CLK. When such a failure is detected the hardware can be set up to automatically switch to BACKUP32K_CLK and generate an interrupt.

CONFIG_ESP_XT_WDT_TIMEOUT

XTAL32K watchdog timeout period

Found in: Component config > ESP System Settings > CONFIG_ESP_XT_WDT

Timeout period configuration for the XTAL32K watchdog timer based on RTC_CLK.

Range:
- from 1 to 255 if CONFIG_ESP_XT_WDT

Default value:
- 200 if CONFIG_ESP_XT_WDT
CONFIG_ESP_XT_WDT_BACKUP_CLK_ENABLE

Automatically switch to BACKUP32K_CLK when timer expires

*Found in: Component config > ESP System Settings > CONFIG_ESP_XT_WDT*

Enable this to automatically switch to BACKUP32K_CLK as the source of RTC_SLOW_CLK when the watchdog timer expires.

**Default value:**
- Yes (enabled) if `CONFIG_ESP_XT_WDT`

CONFIG_ESP_PANIC_HANDLER_IRAM

Place panic handler code in IRAM

*Found in: Component config > ESP System Settings*

If this option is disabled (default), the panic handler code is placed in flash not IRAM. This means that if ESP-IDF crashes while flash cache is disabled, the panic handler will automatically re-enable flash cache before running GDB Stub or Core Dump. This adds some minor risk, if the flash cache status is also corrupted during the crash.

If this option is enabled, the panic handler code (including required UART functions) is placed in IRAM. This may be necessary to debug some complex issues with crashes while flash cache is disabled (for example, when writing to SPI flash) or when flash cache is corrupted when an exception is triggered.

**Default value:**
- No (disabled)

CONFIG_ESP_DEBUG_STUBS_ENABLE

OpenOCD debug stubs

*Found in: Component config > ESP System Settings*

Debug stubs are used by OpenOCD to execute pre-compiled onboard code which does some useful debugging stuff, e.g. GCOV data dump.

CONFIG_ESP_DEBUG_OCDWARE

Make exception and panic handlers JTAG/OCD aware

*Found in: Component config > ESP System Settings*

The FreeRTOS panic and unhandled exception handlers can detect a JTAG OCD debugger and instead of panicking, have the debugger stop on the offending instruction.

**Default value:**
- Yes (enabled)

CONFIG_ESP_SYSTEM_CHECK_INT_LEVEL

Interrupt level to use for Interrupt Watchdog and other system checks

*Found in: Component config > ESP System Settings*

Interrupt level to use for Interrupt Watchdog, IPC_ISR and other system checks.

**Available options:**

- Level 5 interrupt (CONFIG_ESP_SYSTEM_CHECK_INT_LEVEL_5)

  Using level 5 interrupt for Interrupt Watchdog, IPC_ISR and other system checks.
• Level 4 interrupt (CONFIG_ESP_SYSTEM_CHECK_INT_LEVEL_4)
  Using level 4 interrupt for Interrupt Watchdog, IPC_ISR and other system checks.

**Brownout Detector**  Contains:
• CONFIG_ESP_BROWNOUT_DET

**CONFIG_ESP_BROWNOUT_DET**
Hardware brownout detect & reset

*Found in: Component config > ESP System Settings > Brownout Detector*

The ESP32-S3 has a built-in brownout detector which can detect if the voltage is lower than a specific value. If this happens, it will reset the chip in order to prevent unintended behaviour.

**Default value:**
• Yes (enabled)

**CONFIG_ESP_BROWNOUT_DET_LVL_SEL**
Brownout voltage level

*Found in: Component config > ESP System Settings > Brownout Detector > CONFIG_ESP_BROWNOUT_DET*

The brownout detector will reset the chip when the supply voltage is approximately below this level. Note that there may be some variation of brownout voltage level between each ESP32-S3 chip.

#The voltage levels here are estimates, more work needs to be done to figure out the exact voltages of the brownout threshold levels.

**Available options:**
• 2.44V (CONFIG_ESP_BROWNOUT_DET_LVL_SEL_7)
• 2.56V (CONFIG_ESP_BROWNOUT_DET_LVL_SEL_6)
• 2.67V (CONFIG_ESP_BROWNOUT_DET_LVL_SEL_5)
• 2.84V (CONFIG_ESP_BROWNOUT_DET_LVL_SEL_4)
• 2.98V (CONFIG_ESP_BROWNOUT_DET_LVL_SEL_3)
• 3.19V (CONFIG_ESP_BROWNOUT_DET_LVL_SEL_2)
• 3.30V (CONFIG_ESP_BROWNOUT_DET_LVL_SEL_1)

**CONFIG_ESP_SYSTEM_HW_STACK_GUARD**
Hardware stack guard

*Found in: Component config > ESP System Settings*

This config allows to trigger a panic interrupt when Stack Pointer register goes out of allocated stack memory bounds.

**Default value:**
• Yes (enabled) if SOC_ASSIST_DEBUG_SUPPORTED

**IPC (Inter-Processor Call)**  Contains:
• CONFIG_ESP_IPC_TASK_STACK_SIZE
• CONFIG_ESP_IPC_USES_CALLERS_PRIORITY

**CONFIG_ESP_IPC_TASK_STACK_SIZE**

Inter-Processor Call (IPC) task stack size

*Found in: Component config > IPC (Inter-Processor Call)*

Configure the IPC tasks stack size. An IPC task runs on each core (in dual core mode), and allows for cross-core function calls. See IPC documentation for more details. The default IPC stack size should be enough for most common simple use cases. However, users can increase/decrease the stack size to their needs.

**Range:**
- from 512 to 65536

**Default value:**
- 1280
- 1024

**CONFIG_ESP_IPC_USES_CALLERS_PRIORITY**

IPC runs at caller’s priority

*Found in: Component config > IPC (Inter-Processor Call)*

If this option is not enabled then the IPC task will keep behavior same as prior to that of ESP-IDF v4.0, hence IPC task will run at (configMAX_PRIORITIES - 1) priority.

**High resolution timer (esp_timer) Contains:**

- **CONFIG_ESP_TIMER_PROFILING**
- **CONFIG_ESP_TIMER_TASK_AFFINITY**
- **CONFIG_ESP_TIMER_TASK_STACK_SIZE**
- **CONFIG_ESP_TIMER_INTERRUPT_LEVEL**
- **CONFIG_ESP_TIMER_SHOW_EXPERIMENTAL**
- **CONFIG_ESP_TIMER_SUPPORTS_ISR_DISPATCH_METHOD**
- **CONFIG_ESP_TIMER_ISR_AFFINITY**

**CONFIG_ESP_TIMER_PROFILING**

Enable esp_timer profiling features

*Found in: Component config > High resolution timer (esp_timer)*

If enabled, esp_timer_dump will dump information such as number of times the timer was started, number of times the timer has triggered, and the total time it took for the callback to run. This option has some effect on timer performance and the amount of memory used for timer storage, and should only be used for debugging/testing purposes.

**Default value:**
- No (disabled)

**CONFIG_ESP_TIMER_TASK_STACK_SIZE**

High-resolution timer task stack size

*Found in: Component config > High resolution timer (esp_timer)*

Configure the stack size of “timer_task” task. This task is used to dispatch callbacks of timers created using ets_timer and esp_timer APIs. If you are seeing stack overflow errors in timer task, increase this value.

Note that this is not the same as FreeRTOS timer task. To configure FreeRTOS timer task size, see “FreeRTOS timer task stack size” option in “FreeRTOS”.

**Range:**
• from 2048 to 65536
**Default value:**
• 3584

**CONFIG_ESP_TIMER_INTERRUPT_LEVEL**

Interrupt level

*Found in: Component config > High resolution timer (esp_timer)*

It sets the interrupt level for esp_timer ISR in range 1..3. A higher level (3) helps to decrease the ISR esp_timer latency.

**Range:**
• from 1 to 1

**Default value:**
• 1

**CONFIG_ESP_TIMER_SHOW_EXPERIMENTAL**

show esp_timer’s experimental features

*Found in: Component config > High resolution timer (esp_timer)*

This shows some hidden features of esp_timer. Note that they may break other features, use them with care.

**CONFIG_ESP_TIMER_TASK_AFFINITY**

esp_timer task core affinity

*Found in: Component config > High resolution timer (esp_timer)*

The default settings: timer TASK on CPU0 and timer ISR on CPU0. Other settings may help in certain cases, but note that they may break other features, use them with care. - “CPU0” : (default) esp_timer task is processed by CPU0. - “CPU1” : esp_timer task is processed by CPU1. - “No affinity” : esp_timer task can be processed by any CPU.

Available options:

• CPU0 (CONFIG_ESP_TIMER_TASK_AFFINITY_CPU0)
• CPU1 (CONFIG_ESP_TIMER_TASK_AFFINITY_CPU1)
• No affinity (CONFIG_ESP_TIMER_TASK_AFFINITY_NO_AFFINITY)

**CONFIG_ESP_TIMER_ISR_AFFINITY**

timer interrupt core affinity

*Found in: Component config > High resolution timer (esp_timer)*

The default settings: timer TASK on CPU0 and timer ISR on CPU0. Other settings may help in certain cases, but note that they may break other features, use them with care. - “CPU0” : (default) timer interrupt is processed by CPU0. - “CPU1” : timer interrupt is processed by CPU1. - “No affinity” : timer interrupt can be processed by any CPU. It helps to reduce latency but there is a disadvantage it leads to the timer ISR running on every core. It increases the CPU time usage for timer ISRs by N on an N-core system.

Available options:

• CPU0 (CONFIG_ESP_TIMER_ISR_AFFINITY_CPU0)
• CPU1 (CONFIG_ESP_TIMER_ISR_AFFINITY_CPU1)
Chapter 2. API Reference

- No affinity (CONFIG_ESP_TIMER_ISR_AFFINITY_NO_AFFINITY)

**CONFIG_ESP_TIMER_SUPPORTS_ISR_DISPATCH_METHOD**

Support ISR dispatch method

*Found in: Component config > High resolution timer (esp_timer)*

Allows using ESP_TIMER_ISR dispatch method (ESP_TIMER_TASK dispatch method is also available). - **ESP_TIMER_TASK** - Timer callbacks are dispatched from a high-priority esp_timer task. - **ESP_TIMER_ISR** - Timer callbacks are dispatched directly from the timer interrupt handler. The ISR dispatch can be used, in some cases, when a callback is very simple or need a lower-latency.

**Default value:**
- No (disabled)

**Wi-Fi** Contains:

- `CONFIG_ESP_WIFI_TESTING_OPTIONS`
- `CONFIG_ESP_WIFI_WPS_SOFTAP_REGISTRAR`
- `CONFIG_ESP_WIFI_11KV_SUPPORT`
- `CONFIG_ESP_WIFI_11R_SUPPORT`
- `CONFIG_ESP_WIFI_DPP_SUPPORT`
- `CONFIG_ESP_WIFI_ENTERPRISE_SUPPORT`
- `CONFIG_ESP_WIFI_MBO_SUPPORT`
- `CONFIG_ESP_WIFI_SUITE_B_192`
- `CONFIG_ESP_WIFI_ENABLE_WPA3_OWE_STA`
- `CONFIG_ESP_WIFI_WAPI_PSK`
- `CONFIG_ESP_WIFI_DISABLE_WIFI_RX_STATS`
- `CONFIG_ESP_WIFI_DISABLE_WIFI_TX_STATS`
- `CONFIG_ESP_WIFI_ENABLE_WPA3_SAE`
- `CONFIG_ESP_WIFI_SOFTAP_BEACON_MAX_LEN`
- `CONFIG_ESP_WIFI_CACHE_TX_BUFFER_NUM`
- `CONFIG_ESP_WIFI_DYNAMIC_RX_BUFFER_NUM`
- `CONFIG_ESP_WIFI_DYNAMIC_TX_BUFFER_NUM`
- `CONFIG_ESP_WIFI_RX_MGMT_BUF_NUM_DEF`
- `CONFIG_ESP_WIFI_STATIC_RX_BUFFER_NUM`
- `CONFIG_ESP_WIFI_STATIC_TX_BUFFER_NUM`
- `CONFIG_ESP_WIFI_ESPNOW_MAX_ENCRYPT_NUM`
- `CONFIG_ESP_WIFI_STA_DISCONNECTED_PM_ENABLE`
- `CONFIG_ESP_WIFI_DEBUG_PRINT`
- `CONFIG_ESP_WIFI_MGMT_RX_BUFFER_NUM`
- `CONFIG_ESP_WIFI_TX_BUFFER_NUM`
- `CONFIG_ESP_WIFI_MBEDTLS_CRYPTO`
- `CONFIG_ESP_WIFI_AMPDU_RX_ENABLED`
- `CONFIG_ESP_WIFI_AMPDU_TX_ENABLED`
- `CONFIG_ESP_WIFI_AMSdü_TX_ENABLED`
- `CONFIG_ESP_WIFI_NAN_ENABLE`
- `CONFIG_ESP_WIFI_CSI_ENABLED`
- `CONFIG_ESP_WIFI_EXTRA_IRAM_OPT`
- `CONFIG_ESP_WIFI_FTM_ENABLE`
- `CONFIG_ESP_WIFI_GCMP_SUPPORT`
- `CONFIG_ESP_WIFI_GMAC_SUPPORT`
- `CONFIG_ESP_WIFI_HRAM_OPT`
- `CONFIG_ESP_WIFI_MGMT_SBUF_NUM`
- `CONFIG_ESP_WIFI_ENHANCED_LIGHT_SLEEP`
- `CONFIG_ESP_WIFI_NVFS_ENABLED`
- `CONFIG_ESP_WIFI_RX_IRAM_OPT`
- `CONFIG_ESP_WIFI_SLP_BEACON_LOST_OPT`
**CONFIG_ESP_WIFI_STATIC_RX_BUFFER_NUM**

Max number of WiFi static RX buffers

*Found in: Component config > Wi-Fi*

Set the number of WiFi static RX buffers. Each buffer takes approximately 1.6KB of RAM. The static rx buffers are allocated when esp_wifi_init is called, they are not freed until esp_wifi_deinit is called.

WiFi hardware use these buffers to receive all 802.11 frames. A higher number may allow higher throughput but increases memory use. If ESP_WIFI_AMPDU_RX_ENABLED is enabled, this value is recommended to set equal or bigger than ESP_WIFI_RX_BA_WIN in order to achieve better throughput and compatibility with both stations and APs.

*Range:*  
- from 2 to 128 if SOC_WIFI_HE_SUPPORT  

*Default value:*  
- 16 if CONFIG_SPIRAM_TRY_ALLOCATE_WIFI_LWIP

**CONFIG_ESP_WIFI_DYNAMIC_RX_BUFFER_NUM**

Max number of WiFi dynamic RX buffers

*Found in: Component config > Wi-Fi*

Set the number of WiFi dynamic RX buffers, 0 means unlimited RX buffers will be allocated (provided sufficient free RAM). The size of each dynamic RX buffer depends on the size of the received data frame.

For each received data frame, the WiFi driver makes a copy to an RX buffer and then delivers it to the high layer TCP/IP stack. The dynamic RX buffer is freed after the higher layer has successfully received the data frame.

For some applications, WiFi data frames may be received faster than the application can process them. In these cases we may run out of memory if RX buffer number is unlimited (0).

If a dynamic RX buffer limit is set, it should be at least the number of static RX buffers.

*Range:*  
- from 0 to 1024 if CONFIG_LWIPWND_SCALE  

*Default value:*  
- 32

**CONFIG_ESP_WIFI_TX_BUFFER**

Type of WiFi TX buffers

*Found in: Component config > Wi-Fi*

Select type of WiFi TX buffers:

If “Static” is selected, WiFi TX buffers are allocated when WiFi is initialized and released when WiFi is de-initialized. The size of each static TX buffer is fixed to about 1.6KB.

If “Dynamic” is selected, each WiFi TX buffer is allocated as needed when a data frame is delivered to the WiFi driver from the TCP/IP stack. The buffer is freed after the data frame has been sent by the WiFi driver. The size of each dynamic TX buffer depends on the length of each data frame sent by the TCP/IP layer.
If PSRAM is enabled, “Static” should be selected to guarantee enough WiFi TX buffers. If PSRAM is disabled, “Dynamic” should be selected to improve the utilization of RAM.

Available options:

- Static (CONFIG_ESP_WIFI_STATIC_TX_BUFFER)
- Dynamic (CONFIG_ESP_WIFI_DYNAMIC_TX_BUFFER)

**CONFIG_ESP_WIFI_STATIC_TX_BUFFER_NUM**

Max number of WiFi static TX buffers

*Found in: Component config > Wi-Fi*

Set the number of WiFi static TX buffers. Each buffer takes approximately 1.6KB of RAM. The static RX buffers are allocated when esp_wifi_init() is called, they are not released until esp_wifi_deinit() is called.

For each transmitted data frame from the higher layer TCP/IP stack, the WiFi driver makes a copy of it in a TX buffer. For some applications especially UDP applications, the upper layer can deliver frames faster than WiFi layer can transmit. In these cases, we may run out of TX buffers.

**Range:**
- from 1 to 64 if CONFIG_ESP_WIFI_STATIC_TX_BUFFER

**Default value:**
- 16 if CONFIG_ESP_WIFI_STATIC_TX_BUFFER

**CONFIG_ESP_WIFI_CACHE_TX_BUFFER_NUM**

Max number of WiFi cache TX buffers

*Found in: Component config > Wi-Fi*

Set the number of WiFi cache TX buffer number.

For each TX packet from uplayer, such as LWIP etc, WiFi driver needs to allocate a static TX buffer and makes a copy of uplayer packet. If WiFi driver fails to allocate the static TX buffer, it caches the uplayer packets to a dedicated buffer queue, this option is used to configure the size of the cached TX queue.

**Range:**
- from 16 to 128 if CONFIG_SPIRAM

**Default value:**
- 32 if CONFIG_SPIRAM

**CONFIG_ESP_WIFI_DYNAMIC_TX_BUFFER_NUM**

Max number of WiFi dynamic TX buffers

*Found in: Component config > Wi-Fi*

Set the number of WiFi dynamic TX buffers. The size of each dynamic TX buffer is not fixed, it depends on the size of each transmitted data frame.

For each transmitted frame from the higher layer TCP/IP stack, the WiFi driver makes a copy of it in a TX buffer. For some applications, especially UDP applications, the upper layer can deliver frames faster than WiFi layer can transmit. In these cases, we may run out of TX buffers.

**Range:**
- from 1 to 128

**Default value:**
- 32
CONFIG_ESP_WIFI_MGMT_RX_BUFFER
Type of WiFi RX MGMT buffers

*Found in: Component config > Wi-Fi*

Select type of WiFi RX MGMT buffers:
If “Static” is selected, WiFi RX MGMT buffers are allocated when WiFi is initialized and released when WiFi is de-initialized. The size of each static RX MGMT buffer is fixed to about 500 Bytes.
If “Dynamic” is selected, each WiFi RX MGMT buffer is allocated as needed when a MGMT data frame is received. The MGMT buffer is freed after the MGMT data frame has been processed by the WiFi driver.

Available options:

- Static (CONFIG_ESP_WIFI_STATIC_RX_MGMT_BUFFER)
- Dynamic (CONFIG_ESP_WIFI_DYNAMIC_RX_MGMT_BUFFER)

CONFIG_ESP_WIFI_RX_MGMT_BUF_NUM_DEF
Max number of WiFi RX MGMT buffers

*Found in: Component config > Wi-Fi*

Set the number of WiFi RX_MGMT buffers.
For Management buffers, the number of dynamic and static management buffers is the same. In order to prevent memory fragmentation, the management buffer type should be set to static first.

**Range:**
- from 1 to 10

**Default value:**
- 5

CONFIG_ESP_WIFI_CSI_ENABLED
WiFi CSI (Channel State Information)

*Found in: Component config > Wi-Fi*

Select this option to enable CSI (Channel State Information) feature. CSI takes about CONFIG_ESP_WIFI_STATIC_RX_BUFFER_NUM KB of RAM. If CSI is not used, it is better to disable this feature in order to save memory.

**Default value:**
- No (disabled)

CONFIG_ESP_WIFI_AMPDU_TX_ENABLED
WiFi AMPDU TX

*Found in: Component config > Wi-Fi*

Select this option to enable AMPDU TX feature

**Default value:**
- Yes (enabled)
CONFIG_ESP_WIFI_TX_BA_WIN

WiFi AMPDU TX BA window size

*Found in: Component config > Wi-Fi > CONFIG_ESP_WIFI_AMPDU_TX_ENABLED*

Set the size of WiFi Block Ack TX window. Generally a bigger value means higher throughput but more memory. Most of the time we should NOT change the default value unless special reason, e.g. test the maximum UDP TX throughput with iperf etc. For iperf test in shieldbox, the recommended value is 9~12.

*Range:*
- from 2 to 64 if SOC_WIFI_HE_SUPPORT && CONFIG_ESP_WIFI_AMPDU_TX_ENABLED

*Default value:*
- 6

CONFIG_ESP_WIFI_AMPDU_RX_ENABLED

WiFi AMPDU RX

*Found in: Component config > Wi-Fi*

Select this option to enable AMPDU RX feature

*Default value:*
- Yes (enabled)

CONFIG_ESP_WIFI_RX_BA_WIN

WiFi AMPDU RX BA window size

*Found in: Component config > Wi-Fi > CONFIG_ESP_WIFI_AMPDU_RX_ENABLED*

Set the size of WiFi Block Ack RX window. Generally a bigger value means higher throughput and better compatibility but more memory. Most of the time we should NOT change the default value unless special reason, e.g. test the maximum UDP RX throughput with iperf etc. For iperf test in shieldbox, the recommended value is 9~12. If PSRAM is used and WiFi memory is prefered to allocat in PSRAM first, the default and minimum value should be 16 to achieve better throughput and compatibility with both stations and APs.

*Range:*
- from 2 to 64 if SOC_WIFI_HE_SUPPORT && CONFIG_ESP_WIFI_AMPDU_RX_ENABLED

*Default value:*
- 16 if CONFIG_SPIRAM_TRY_ALLOCATE_WIFI_LWIP && CONFIG_ESP_WIFI_AMPDU_RX_ENABLED

CONFIG_ESP_WIFI_AMSDU_TX_ENABLED

WiFi AMSDU TX

*Found in: Component config > Wi-Fi*

Select this option to enable AMSDU TX feature

*Default value:*
- No (disabled) if CONFIG_SPIRAM

CONFIG_ESP_WIFI_NVS_ENABLED
WiFi NVS flash

*Found in: Component config > Wi-Fi*

Select this option to enable WiFi NVS flash

**Default value:**
- Yes (enabled)

**CONFIG_ESP_WIFI_TASK_CORE_ID**

WiFi Task Core ID

*Found in: Component config > Wi-Fi*

Pinned WiFi task to core 0 or core 1.

**Available options:**
- Core 0 (CONFIG_ESP_WIFI_TASK_PINNED_TO_CORE_0)
- Core 1 (CONFIG_ESP_WIFI_TASK_PINNED_TO_CORE_1)

**CONFIG_ESP_WIFI_SOFTAP_BEACON_MAX_LEN**

Max length of WiFi SoftAP Beacon

*Found in: Component config > Wi-Fi*

ESP-MESH utilizes beacon frames to detect and resolve root node conflicts (see documentation). However the default length of a beacon frame can simultaneously hold only five root node identifier structures, meaning that a root node conflict of up to five nodes can be detected at one time. In the occurrence of more root nodes conflict involving more than five root nodes, the conflict resolution process will detect five of the root nodes, resolve the conflict, and re-detect more root nodes. This process will repeat until all root node conflicts are resolved. However this process can generally take a very long time.

To counter this situation, the beacon frame length can be increased such that more root nodes can be detected simultaneously. Each additional root node will require 36 bytes and should be added on top of the default beacon frame length of 752 bytes. For example, if you want to detect 10 root nodes simultaneously, you need to set the beacon frame length as 932 (752+36*5).

Setting a longer beacon length also assists with debugging as the conflicting root nodes can be identified more quickly.

**Range:**
- from 752 to 1256

**Default value:**
- 752

**CONFIG_ESP_WIFI_MGMT_SBUF_NUM**

WiFi mgmt short buffer number

*Found in: Component config > Wi-Fi*

Set the number of WiFi management short buffer.

**Range:**
- from 6 to 32

**Default value:**
- 32
CONFIG_ESP_WIFI_IRAM_OPT

WiFi IRAM speed optimization

Found in: Component config > Wi-Fi

Select this option to place frequently called Wi-Fi library functions in IRAM. When this option is disabled, more than 10Kbytes of IRAM memory will be saved but Wi-Fi throughput will be reduced.

Default value:
- Yes (enabled)

CONFIG_ESP_WIFI_EXTRA_IRAM_OPT

WiFi EXTRA IRAM speed optimization

Found in: Component config > Wi-Fi

Select this option to place additional frequently called Wi-Fi library functions in IRAM. When this option is disabled, more than 5Kbytes of IRAM memory will be saved but Wi-Fi throughput will be reduced.

Default value:
- No (disabled)

CONFIG_ESP_WIFI_RX_IRAM_OPT

WiFi RX IRAM speed optimization

Found in: Component config > Wi-Fi

Select this option to place frequently called Wi-Fi library RX functions in IRAM. When this option is disabled, more than 17Kbytes of IRAM memory will be saved but Wi-Fi performance will be reduced.

Default value:
- Yes (enabled)

CONFIG_ESP_WIFI_ENABLE_WPA3_SAE

Enable WPA3-Personal

Found in: Component config > Wi-Fi

Select this option to allow the device to establish a WPA3-Personal connection with eligible AP’s. PMF (Protected Management Frames) is a prerequisite feature for a WPA3 connection, it needs to be explicitly configured before attempting connection. Please refer to the Wi-Fi Driver API Guide for details.

Default value:
- Yes (enabled)

CONFIG_ESP_WIFI_ENABLE_SAE_PK

Enable SAE-PK

Found in: Component config > Wi-Fi > CONFIG_ESP_WIFI_ENABLE_WPA3_SAE

Select this option to enable SAE-PK

Default value:
- Yes (enabled)
Chapter 2. API Reference

**CONFIG_ESP_WIFI_SOFTAP_SAE_SUPPORT**
Enable WPA3 Personal(SAE) SoftAP

*Found in: Component config > Wi-Fi > CONFIG_ESP_WIFI_ENABLE_WPA3_SAE*

Select this option to enable SAE support in softAP mode.

**Default value:**
- Yes (enabled)

**CONFIG_ESP_WIFI_ENABLE_WPA3_OWE_STA**
Enable OWE STA

*Found in: Component config > Wi-Fi*

Select this option to allow the device to establish OWE connection with eligible AP’s. PMF (Protected Management Frames) is a prerequisite feature for a WPA3 connection, it needs to be explicitly configured before attempting connection. Please refer to the Wi-Fi Driver API Guide for details.

**Default value:**
- Yes (enabled)

**CONFIG_ESP_WIFI_SLP_IRAM_OPT**
WiFi SLP IRAM speed optimization

*Found in: Component config > Wi-Fi*

Select this option to place called Wi-Fi library TBTT process and receive beacon functions in IRAM. Some functions can be put in IRAM either by ESP_WIFI_IRAM_OPT and ESP_WIFI_RX_IRAM_OPT, or this one. If already enabled ESP_WIFI_IRAM_OPT, the other 7.3KB IRAM memory would be taken by this option. If already enabled ESP_WIFI_RX_IRAM_OPT, the other 1.3KB IRAM memory would be taken by this option. If neither of them are enabled, the other 7.4KB IRAM memory would be taken by this option. Wi-Fi power-save mode average current would be reduced if this option is enabled.

**CONFIG_ESP_WIFI_SLP_DEFAULT_MIN_ACTIVE_TIME**
Minimum active time

*Found in: Component config > Wi-Fi > CONFIG_ESP_WIFI_SLP_IRAM_OPT*

The minimum timeout for waiting to receive data, unit: milliseconds.

**Range:**
- from 8 to 60 if CONFIG_ESP_WIFI_SLP_IRAM_OPT

**Default value:**
- 50 if CONFIG_ESP_WIFI_SLP_IRAM_OPT

**CONFIG_ESP_WIFI_SLP_DEFAULT_MAX_ACTIVE_TIME**
Maximum keep alive time

*Found in: Component config > Wi-Fi > CONFIG_ESP_WIFI_SLP_IRAM_OPT*

The maximum time that wifi keep alive, unit: seconds.

**Range:**
- from 10 to 60 if CONFIG_ESP_WIFI_SLP_IRAM_OPT

**Default value:**
- 10 if CONFIG_ESP_WIFI_SLP_IRAM_OPT
**CONFIG_ESP_WIFI_FTM_ENABLE**

WiFi FTMP

*Found in: Component config > Wi-Fi*

Enable feature Fine Timing Measurement for calculating WiFi Round-Trip-Time (RTT).

**Default value:**
- No (disabled)

**CONFIG_ESP_WIFI_FTM_INITIATOR_SUPPORT**

FTM Initiator support

*Found in: Component config > Wi-Fi > CONFIG_ESP_WIFI_FTM_ENABLE*

**Default value:**
- Yes (enabled) if CONFIG_ESP_WIFI_FTM_ENABLE

**CONFIG_ESP_WIFI_FTM_RESPONDER_SUPPORT**

FTM Responder support

*Found in: Component config > Wi-Fi > CONFIG_ESP_WIFI_FTM_ENABLE*

**Default value:**
- Yes (enabled) if CONFIG_ESP_WIFI_FTM_ENABLE

**CONFIG_ESP_WIFI_STA_DISCONNECTED_PM_ENABLE**

Power Management for station at disconnected

*Found in: Component config > Wi-Fi*

Select this option to enable power_management for station when disconnected. Chip will do modem-sleep when rf module is not in use any more.

**Default value:**
- Yes (enabled)

**CONFIG_ESP_WIFI_GCMP_SUPPORT**

WiFi GCMP Support(GCMP128 and GCMP256)

*Found in: Component config > Wi-Fi*

Select this option to enable GCMP support. GCMP support is compulsory for WiFi Suite-B support.

**Default value:**
- No (disabled)

**CONFIG_ESP_WIFI_GMAC_SUPPORT**

WiFi GMAC Support(GMAC128 and GMAC256)

*Found in: Component config > Wi-Fi*

Select this option to enable GMAC support. GMAC support is compulsory for WiFi 192 bit certification.

**Default value:**
- No (disabled)
CONFIG_ESP_WIFI_SOFTAP_SUPPORT

WiFi SoftAP Support

*Found in: Component config > Wi-Fi*

WiFi module can be compiled without SoftAP to save code size.

**Default value:**
- Yes (enabled)

CONFIG_ESP_WIFI_ENHANCED_LIGHT_SLEEP

WiFi modem automatically receives the beacon

*Found in: Component config > Wi-Fi*

The wifi modem automatically receives the beacon frame during light sleep.

**Default value:**
- No (disabled) if `CONFIG_ESP_PHY_MAC_BB_PD` && `SOC_PM_SUPPORT_BEACON_WAKEUP`

CONFIG_ESP_WIFI_SLP_BEACON_LOST_OPT

Wifi sleep optimize when beacon lost

*Found in: Component config > Wi-Fi*

Enable wifi sleep optimization when beacon loss occurs and immediately enter sleep mode when the WiFi module detects beacon loss.

CONFIG_ESP_WIFI_SLP_BEACON_LOST_TIMEOUT

Beacon loss timeout

*Found in: Component config > Wi-Fi > CONFIG_ESP_WIFI_SLP_BEACON_LOST_OPT*

Timeout time for close rf phy when beacon loss occurs, Unit: 1024 microsecond.

**Range:**
- from 5 to 100 if `CONFIG_ESP_WIFI_SLP_BEACON_LOST_OPT`

**Default value:**
- 10 if `CONFIG_ESP_WIFI_SLP_BEACON_LOST_OPT`

CONFIG_ESP_WIFI_SLP_BEACON_LOST_THRESHOLD

Maximum number of consecutive lost beacons allowed

*Found in: Component config > Wi-Fi > CONFIG_ESP_WIFI_SLP_BEACON_LOST_OPT*

Maximum number of consecutive lost beacons allowed, WiFi keeps Rx state when the number of consecutive beacons lost is greater than the given threshold.

**Range:**
- from 0 to 8 if `CONFIG_ESP_WIFI_SLP_BEACON_LOST_OPT`

**Default value:**
- 3 if `CONFIG_ESP_WIFI_SLP_BEACON_LOST_OPT`
**CONFIG_ESP_WIFI_SLP_PHY_ON_DELTA_EARLY_TIME**

Delta early time for RF PHY on

*Found in: Component config > Wi-Fi > CONFIG_ESP_WIFI_SLP_BEACON_LOST_OPT*

Delta early time for rf phy on. When the beacon is lost, the next rf phy on will be earlier the time specified by the configuration item. Unit: 32 microsecond.

**Range:**
- from 0 to 100 if `CONFIG_ESP_WIFI_SLP_BEACON_LOST_OPT`

**Default value:**
- 2 if `CONFIG_ESP_WIFI_SLP_BEACON_LOST_OPT`

**CONFIG_ESP_WIFI_SLP_PHY_OFF_DELTA_TIMEOUT_TIME**

Delta timeout time for RF PHY off

*Found in: Component config > Wi-Fi > CONFIG_ESP_WIFI_SLP_BEACON_LOST_OPT*

Delta timeout time for rf phy off, When the beacon is lost, the next rf phy off will be delayed for the time specified by the configuration item. Unit: 1024 microsecond.

**Range:**
- from 0 to 8 if `CONFIG_ESP_WIFI_SLP_BEACON_LOST_OPT`

**Default value:**
- 2 if `CONFIG_ESP_WIFI_SLP_BEACON_LOST_OPT`

**CONFIG_ESP_WIFI_ESPNOW_MAX_ENCRYPT_NUM**

Maximum espnow encrypt peers number

*Found in: Component config > Wi-Fi*

Maximum number of encrypted peers supported by espnow. The number of hardware keys for encryption is fixed. And the espnow and SoftAP share the same hardware keys. So this configuration will affect the maximum connection number of SoftAP. Maximum espnow encrypted peers number + maximum number of connections of SoftAP = Max hardware keys number. When using ESP mesh, this value should be set to a maximum of 6.

**Range:**
- from 0 to 17

**Default value:**
- 7

**CONFIG_ESP_WIFI_NAN_ENABLE**

WiFi Aware

*Found in: Component config > Wi-Fi*

Enable WiFi Aware (NAN) feature.

**Default value:**
- No (disabled) if SOC_WIFI_NAN_SUPPORT

**CONFIG_ESP_WIFI_ENABLE_WIFI_TX_STATS**

Enable Wi-Fi transmission statistics

*Found in: Component config > Wi-Fi*

Enable Wi-Fi transmission statistics. Total support 4 access category. Each access category will use 346 bytes memory.
Chapter 2. API Reference

**Default value:**
- Yes (enabled) if SOC_WIFI_HE_SUPPORT

**CONFIG_ESP_WIFIMBEDTLS_CRYPTO**

Use MbedTLS crypto APIs

*Found in: Component config > Wi-Fi*

Select this option to enable the use of MbedTLS crypto APIs. The internal crypto support within the supplicant is limited and may not suffice for all new security features, including WPA3.

It is recommended to always keep this option enabled. Additionally, note that MbedTLS can leverage hardware acceleration if available, resulting in significantly faster cryptographic operations.

**Default value:**
- Yes (enabled)

**CONFIG_ESP_WIFIMBEDTLS_TLS_CLIENT**

Use MbedTLS TLS client for WiFi Enterprise connection

*Found in: Component config > Wi-Fi > CONFIG_ESP_WIFIMBEDTLS_CRYPTO*

Select this option to use MbedTLS TLS client for WPA2 enterprise connection. Please note that from MbedTLS-3.0 onwards, MbedTLS does not support SSL-3.0 TLS-v1.0, TLS-v1.1 versions. Incase your server is using one of these version, it is advisable to update your server. Please disable this option for compatibility with older TLS versions.

**Default value:**
- Yes (enabled)

**CONFIG_ESP_WIFIWAPI_PSK**

Enable WAPI PSK support

*Found in: Component config > Wi-Fi*

Select this option to enable WAPI-PSK which is a Chinese National Standard Encryption for Wireless LANs (GB 15629.11-2003).

**Default value:**
- No (disabled)

**CONFIG_ESP_WIFI_SUITE_B_192**

Enable NSA suite B support with 192 bit key

*Found in: Component config > Wi-Fi*

Select this option to enable 192 bit NSA suite-B. This is necessary to support WPA3 192 bit security.

**Default value:**
- No (disabled)

**CONFIG_ESP_WIFI_11KV_SUPPORT**

Enable 802.11k, 802.11v APIs Support

*Found in: Component config > Wi-Fi*

Select this option to enable 802.11k 802.11v APIs (RRM and BTM support). Only APIs which are helpful for network assisted roaming are supported for now. Enable this option with BTM and RRM enabled in sta config to make device ready for network assisted roaming. BTM: BSS transition management enables an AP to request a station to transition to a specific AP, or to indicate to a station a
set of preferred APs. RRM: Radio measurements enable STAs to understand the radio environment, it enables STAs to observe and gather data on radio link performance and on the radio environment. Current implementation adds beacon report, link measurement, neighbor report.

**Default value:**
- No (disabled)

**CONFIG_ESP_WIFI_SCAN_CACHE**

Keep scan results in cache

*Found in: Component config > Wi-Fi > CONFIG_ESP_WIFI_11KV_SUPPORT*

Keep scan results in cache, if not enabled, those will be flushed immediately.

**Default value:**
- No (disabled) if CONFIG_ESP_WIFI_11KV_SUPPORT

**CONFIG_ESP_WIFI_MBO_SUPPORT**

Enable Multi Band Operation Certification Support

*Found in: Component config > Wi-Fi*

Select this option to enable WiFi Multiband operation certification support.

**Default value:**
- No (disabled)

**CONFIG_ESP_WIFI_DPP_SUPPORT**

Enable DPP support

*Found in: Component config > Wi-Fi*

Select this option to enable WiFi Easy Connect Support.

**Default value:**
- No (disabled)

**CONFIG_ESP_WIFI_11R_SUPPORT**

Enable 802.11R (Fast Transition) Support

*Found in: Component config > Wi-Fi*

Select this option to enable WiFi Fast Transition Support.

**Default value:**
- No (disabled)

**CONFIG_ESP_WIFI_WPS_SOFTAP_REGISTRAR**

Add WPS Registrar support in SoftAP mode

*Found in: Component config > Wi-Fi*

Select this option to enable WPS registrar support in softAP mode.

**Default value:**
- No (disabled)
**CONFIG_ESP_WIFI_ENABLE_WIFI_RX_STATS**

Enable Wi-Fi reception statistics

*Found in: Component config > Wi-Fi*

Enable Wi-Fi reception statistics. Total support 2 access category. Each access category will use 190 bytes memory.

*Default value:*
- Yes (enabled) if SOC_WIFI_HE_SUPPORT

**CONFIG_ESP_WIFI_ENABLE_WIFI_RX_MU_STATS**

Enable Wi-Fi DL MU-MIMO and DL OFDMA reception statistics

*Found in: Component config > Wi-Fi > CONFIG_ESP_WIFI_ENABLE_WIFI_RX_STATS*

Enable Wi-Fi DL MU-MIMO and DL OFDMA reception statistics. Will use 10932 bytes memory.

*Default value:*
- Yes (enabled) if CONFIG_ESP_WIFI_ENABLE_WIFI_RX_STATS

**WPS Configuration Options**

Contains:

- **CONFIG_ESP_WIFI_WPS_PASSPHRASE**
- **CONFIG_ESP_WIFI_WPS_STRICT**

**CONFIG_ESP_WIFI_WPS_STRICT**

Strictly validate all WPS attributes

*Found in: Component config > Wi-Fi > WPS Configuration Options*

Select this option to enable validate each WPS attribute rigorously. Disabling this add the workarounds with various APs. Enabling this may cause inter operability issues with some APs.

*Default value:*
- No (disabled)

**CONFIG_ESP_WIFI_WPS_PASSPHRASE**

Get WPA2 passphrase in WPS config

*Found in: Component config > Wi-Fi > WPS Configuration Options*

Select this option to get passphrase during WPS configuration. This option fakes the virtual display capabilities to get the configuration in passphrase mode. Not recommended to be used since WPS credentials should not be shared to other devices, making it in readable format increases that risk, also passphrase requires pbkdf2 to convert in psk.

*Default value:*
- No (disabled)

**CONFIG_ESP_WIFI_DEBUG_PRINT**

Print debug messages from WPA Supplicant

*Found in: Component config > Wi-Fi*

Select this option to print logging information from WPA supplicant, this includes handshake information and key hex dumps depending on the project logging level.

Enabling this could increase the build size ~60kb depending on the project logging level.

*Default value:*
Chapter 2. API Reference

**CONFIG_ESP_WIFI_TESTING_OPTIONS**

Add DPP testing code

*Found in: Component config > Wi-Fi*

Select this to enable unity test for DPP.

**Default value:**

- No (disabled)

**CONFIG_ESP_WIFI_ENTERPRISE_SUPPORT**

Enable enterprise option

*Found in: Component config > Wi-Fi*

Select this to enable/disable enterprise connection support.

Disabling this will reduce binary size. Disabling this will disable the use of any esp_wifi_sta_wpa2_ent_* (as APIs will be meaningless)

**Default value:**

- Yes (enabled)

**Core dump**  
Contains:

- `CONFIG_ESP_COREDUMP_CHECK_BOOT`
- `CONFIG_ESP_COREDUMP_DATA_FORMAT`
- `CONFIG_ESP_COREDUMP_CHECKSUM`
- `CONFIG_ESP_COREDUMP_TO_FLASH_OR_UART`
- `CONFIG_ESP_COREDUMP_UART_DELAY`
- `CONFIG_ESP_COREDUMP_FLASH_NO_OVERWRITE`
- `CONFIG_ESP_COREDUMP_LOGS`
- `CONFIG_ESP_COREDUMP_CODEC`
- `CONFIG_ESP_COREDUMP_MAX_TASKS_NUM`
- `CONFIG_ESP_COREDUMP_STACK_SIZE`

**CONFIG_ESP_COREDUMP_TO_FLASH_OR_UART**

Data destination

*Found in: Component config > Core dump*

Select place to store core dump: flash, uart or none (to disable core dumps generation).

Core dumps to Flash are not available if PSRAM is used for task stacks.

If core dump is configured to be stored in flash and custom partition table is used add corresponding entry to your CSV. For examples, please see predefined partition table CSV descriptions in the components/partition_table directory.

**Available options:**

- Flash (CONFIG_ESP_COREDUMP_ENABLE_TO_FLASH)
- UART (CONFIG_ESP_COREDUMP_ENABLE_TO_UART)
- None (CONFIG_ESP_COREDUMP_ENABLE_TO_NONE)
CONFIG_ESP_COREDUMP_DATA_FORMAT

Core dump data format

*Found in: Component config > Core dump*

Select the data format for core dump.

Available options:

- Binary format (CONFIG_ESP_COREDUMP_DATA_FORMAT_BIN)
- ELF format (CONFIG_ESP_COREDUMP_DATA_FORMAT_ELF)

CONFIG_ESP_COREDUMP_CHECKSUM

Core dump data integrity check

*Found in: Component config > Core dump*

Select the integrity check for the core dump.

Available options:

- Use CRC32 for integrity verification (CONFIG_ESP_COREDUMP_CHECKSUM_CRC32)
- Use SHA256 for integrity verification (CONFIG_ESP_COREDUMP_CHECKSUM_SHA256)

CONFIG_ESP_COREDUMP_CHECK_BOOT

Check core dump data integrity on boot

*Found in: Component config > Core dump*

When enabled, if any data are found on the flash core dump partition, they will be checked by calculating their checksum.

**Default value:**

- Yes (enabled) if CONFIG_ESP_COREDUMP_ENABLE_TO_FLASH

CONFIG_ESP_COREDUMP_LOGS

Enable coredump logs for debugging

*Found in: Component config > Core dump*

Enable/disable coredump logs. Logs strings from espcoredump component are placed in DRAM. Disabling these helps to save ~5KB of internal memory.

CONFIG_ESP_COREDUMP_MAX_TASKS_NUM

Maximum number of tasks

*Found in: Component config > Core dump*

Maximum number of tasks snapshots in core dump.

CONFIG_ESP_COREDUMP_UART_DELAY

Delay before print to UART

*Found in: Component config > Core dump*

Config delay (in ms) before printing core dump to UART. Delay can be interrupted by pressing Enter key.
Default value:

- 0 if `CONFIG_ESP_COREDUMP_ENABLE_TO_UART`

**CONFIG_ESP_COREDUMP_FLASH_NO_OVERWRITE**

Don’t overwrite existing core dump

*Found in: Component config > Core dump*

Don’t overwrite an existing core dump already present in flash. Enable this option to only keep the first of multiple core dumps.

If enabled, the core dump partition must be erased before the first core dump can be written.

Default value:

- No (disabled) if `CONFIG_ESP_COREDUMP_ENABLE_TO_FLASH`

**CONFIG_ESP_COREDUMP_STACK_SIZE**

Reserved stack size

*Found in: Component config > Core dump*

Size of the memory to be reserved for core dump stack. If 0 core dump process will run on the stack of crashed task/ISR, otherwise special stack will be allocated. To ensure that core dump itself will not overflow task/ISR stack set this to the value above 800. NOTE: It eats DRAM.

**CONFIG_ESP_COREDUMP_DECODE**

Handling of UART core dumps in IDF Monitor

*Found in: Component config > Core dump*

Available options:

- Decode and show summary (info_corefile) (CONFIG_ESP_COREDUMP_DECODE_INFO)
- Don’t decode (CONFIG_ESP_COREDUMP_DECODE_DISABLE)

**FAT Filesystem support**

Contains:

- `CONFIG_FATFS_API_ENCODING`
- `CONFIG_FATFS_VFS_FSTAT_BLKSIZE`
- `CONFIG_FATFS_IMMEDIATE_FSYNC`
- `CONFIG_FATFS_USE_FASTSEEK`
- `CONFIG_FATFS_LONG_FILENAMES`
- `CONFIG_FATFS_MAX_LFN`
- `CONFIG_FATFS_FS_LOCK`
- `CONFIG_FATFS_VOLUME_COUNT`
- `CONFIG_FATFS_CHOOSE_CODEPAGE`
- `CONFIG_FATFS_ALLOC_PREFER_EXTRAM`
- `CONFIG_FATFS_SECTOR_SIZE`
- `CONFIG_FATFS_TIMEOUT_MS`
- `CONFIG_FATFS_PER_FILE_CACHE`

**CONFIG_FATFS_VOLUME_COUNT**
Chapter 2. API Reference

Number of volumes

*Found in: Component config > FAT Filesystem support*

Number of volumes (logical drives) to use.

**Range:**
- from 1 to 10

**Default value:**
- 2

**CONFIG_FATFS_LONG_FILENAMES**

Long filename support

*Found in: Component config > FAT Filesystem support*

Support long filenames in FAT. Long filename data increases memory usage. FATFS can be configured to store the buffer for long filename data in stack or heap.

Available options:

- No long filenames (CONFIG_FATFS_LFN_NONE)
- Long filename buffer in heap (CONFIG_FATFS_LFN_HEAP)
- Long filename buffer on stack (CONFIG_FATFS_LFN_STACK)

**CONFIG_FATFS_SECTOR_SIZE**

Sector size

*Found in: Component config > FAT Filesystem support*

Specify the size of the sector in bytes for FATFS partition generator.

Available options:

- 512 (CONFIG_FATFS_SECTOR_512)
- 4096 (CONFIG_FATFS_SECTOR_4096)

**CONFIG_FATFS_CHOOSE_CODEPAGE**

OEM Code Page

*Found in: Component config > FAT Filesystem support*

OEM code page used for file name encodings.

If “Dynamic” is selected, code page can be chosen at runtime using f_setcp function. Note that choosing this option will increase application size by ~480kB.

Available options:

- Dynamic (all code pages supported) (CONFIG_FATFS_CODEPAGE_DYNAMIC)
- US (CP437) (CONFIG_FATFS_CODEPAGE_437)
- Arabic (CP720) (CONFIG_FATFS_CODEPAGE_720)
- Greek (CP737) (CONFIG_FATFS_CODEPAGE_737)
- KBL (CP771) (CONFIG_FATFS_CODEPAGE_771)
- Baltic (CP775) (CONFIG_FATFS_CODEPAGE_775)
- Latin 1 (CP850) (CONFIG_FATFS_CODEPAGE_850)
- Latin 2 (CP852) (CONFIG_FATFS_CODEPAGE_852)
- Cyrillic (CP855) (CONFIG_FATFS_CODEPAGE_855)
• Turkish (CP857) (CONFIG_FATFS_CODEPAGE_857)
• Portuguese (CP860) (CONFIG_FATFS_CODEPAGE_860)
• Icelandic (CP861) (CONFIG_FATFS_CODEPAGE_861)
• Hebrew (CP862) (CONFIG_FATFS_CODEPAGE_862)
• Canadian French (CP863) (CONFIG_FATFS_CODEPAGE_863)
• Arabic (CP864) (CONFIG_FATFS_CODEPAGE_864)
• Nordic (CP865) (CONFIG_FATFS_CODEPAGE_865)
• Russian (CP866) (CONFIG_FATFS_CODEPAGE_866)
• Greek 2 (CP869) (CONFIG_FATFS_CODEPAGE_869)
• Japanese (DBCS) (CP932) (CONFIG_FATFS_CODEPAGE_932)
• Simplified Chinese (DBCS) (CP936) (CONFIG_FATFS_CODEPAGE_936)
• Korean (DBCS) (CP949) (CONFIG_FATFS_CODEPAGE_949)
• Traditional Chinese (DBCS) (CP950) (CONFIG_FATFS_CODEPAGE_950)

**CONFIG_FATFS_MAX_LFN**
Max long filename length

*Found in: Component config > FAT Filesystem support*

Maximum long filename length. Can be reduced to save RAM.

**CONFIG_FATFS_API_ENCODING**
API character encoding

*Found in: Component config > FAT Filesystem support*

Choose encoding for character and string arguments/returns when using FATFS APIs. The encoding of arguments will usually depend on text editor settings.

Available options:

- API uses ANSI/OEM encoding (CONFIG_FATFS_API_ENCODING_ANSI_OEM)
- API uses UTF-8 encoding (CONFIG_FATFS_API_ENCODING_UTF_8)

**CONFIG_FATFS_FS_LOCK**
Number of simultaneously open files protected by lock function

*Found in: Component config > FAT Filesystem support*

This option sets the FATFS configuration value _FS_LOCK. The option _FS_LOCK switches file lock function to control duplicated file open and illegal operation to open objects.

* 0: Disable file lock function. To avoid volume corruption, application should avoid illegal open, remove and rename to the open objects.

* >0: Enable file lock function. The value defines how many files/sub-directories can be opened simultaneously under file lock control.

Note that file lock control is independent of re-entrancy.

**Range:**
- from 0 to 65535

**Default value:**
- 0
**CONFIG_FATFS_TIMEOUT_MS**

Timeout for acquiring a file lock, ms

*Found in: Component config > FAT Filesystem support*

This option sets FATFS configuration value _FS_TIMEOUT, scaled to milliseconds. Sets the number of milliseconds FATFS will wait to acquire a mutex when operating on an open file. For example, if one task is performing a lengthy operation, another task will wait for the first task to release the lock, and timeout after amount of time set by this option.

*Default value:*
- 10000

**CONFIG_FATFS_PER_FILE_CACHE**

Use separate cache for each file

*Found in: Component config > FAT Filesystem support*

This option affects FATFS configuration value _FS_TINY.

If this option is set, _FS_TINY is 0, and each open file has its own cache, size of the cache is equal to the _MAX_SS variable (512 or 4096 bytes). This option uses more RAM if more than 1 file is open, but needs less reads and writes to the storage for some operations.

If this option is not set, _FS_TINY is 1, and single cache is used for all open files, size is also equal to _MAX_SS variable. This reduces the amount of heap used when multiple files are open, but increases the number of read and write operations which FATFS needs to make.

*Default value:*
- Yes (enabled)

**CONFIG_FATFS_ALLOC_PREFER_EXTRAM**

Perfer external RAM when allocating FATFS buffers

*Found in: Component config > FAT Filesystem support*

When the option is enabled, internal buffers used by FATFS will be allocated from external RAM. If the allocation from external RAM fails, the buffer will be allocated from the internal RAM. Disable this option if optimizing for performance. Enable this option if optimizing for internal memory size.

*Default value:*
- Yes (enabled) if CONFIG_SPIRAM_USE_CAPS_ALLOC || CONFIG_SPIRAM_USE_MALLOC

**CONFIG_FATFS_USE_FASTSEEK**

Enable fast seek algorithm when using lseek function through VFS FAT

*Found in: Component config > FAT Filesystem support*

The fast seek feature enables fast backward/long seek operations without FAT access by using an in-memory CLMT (cluster link map table). Please note, fast-seek is only allowed for read-mode files, if a file is opened in write-mode, the seek mechanism will automatically fallback to the default implementation.

*Default value:*
- No (disabled)
**CONFIG_FATFS_FAST_SEEK_BUFFER_SIZE**

Fast seek CLMT buffer size

*Found in: Component config > FAT Filesystem support > CONFIG_FATFS_USE_FASTSEEK*

If fast seek algorithm is enabled, this defines the size of CLMT buffer used by this algorithm in 32-bit word units. This value should be chosen based on prior knowledge of maximum elements of each file entry would store.

**Default value:**
- 64 if `CONFIG_FATFS_USE_FASTSEEK`

**CONFIG_FATFS_VFS_FSTAT_BLKSIZE**

Default block size

*Found in: Component config > FAT Filesystem support*

If set to 0, the ‘newlib’ library’s default size (BLKSIZ) is used (128 B). If set to a non-zero value, the value is used as the block size. Default file buffer size is set to this value and the buffer is allocated when first attempt of reading/writing to a file is made. Increasing this value improves fread() speed, however the heap usage is increased as well.

**Default value:**
- 0

**CONFIG_FATFS_IMMEDIATE_FSYNC**

Enable automatic f_sync

*Found in: Component config > FAT Filesystem support*

Enables automatic calling of f_sync() to flush recent file changes after each call of vfs_fat_write(), vfs_fat_pwrite(), vfs_fat_link(), vfs_fat_truncate() and vfs_fat_ftruncate() functions. This feature improves file-consistency and size reporting accuracy for the FatFS, at a price on decreased performance due to frequent disk operations

**Default value:**
- No (disabled)

**FreeRTOS** Contains:

- **Kernel**
- **Port**

**Kernel** Contains:

- `CONFIG_FREERTOS_CHECK_STACKOVERFLOW`
- `CONFIG_FREERTOS_ENABLE_BACKWARD_COMPATIBILITY`
- `CONFIG_FREERTOS_GENERATE_RUN_TIME_STATS`
- `CONFIG_FREERTOS_MAX_TASK_NAME_LEN`
- `CONFIG_FREERTOS_IDLE_TASK_STACKSIZE`
- `CONFIG_FREERTOS_THREAD_LOCAL_STORAGE_POINTERS`
- `CONFIG_FREERTOS_QUEUE_REGISTRY_SIZE`
- `CONFIG_FREERTOS_TASK_NOTIFICATION_ARRAY_ENTRIES`
- `CONFIG_FREERTOS_HZ`
- `CONFIG_FREERTOS_TIMER_QUEUE_LENGTH`
- `CONFIG_FREERTOS_TIMER_SERVICE_TASK_NAME`
Chapter 2. API Reference

- CONFIG_FREERTOS_TIMER_TASK_PRIORITY
- CONFIG_FREERTOS_TIMER_TASK_STACK_DEPTH
- CONFIG_FREERTOS_USE_IDLE_HOOK
- CONFIG_FREERTOS_OPTIMIZED_SCHEDULER
- CONFIG_FREERTOS_USE_TICK_HOOK
- CONFIG_FREERTOS_USE_TICKLESS_IDLE
- CONFIG_FREERTOS_USE_TRACE_FACILITY
- CONFIG_FREERTOS_UNICORE
- CONFIG_FREERTOS_SMP
- CONFIG_FREERTOS_USE_MINIMAL_IDLE_HOOK

**CONFIG_FREERTOS_SMP**

Run the Amazon SMP FreeRTOS kernel instead (FEATURE UNDER DEVELOPMENT)

*Found in: Component config > FreeRTOS > Kernel*

Amazon has released an SMP version of the FreeRTOS Kernel which can be found via the following link: [https://github.com/FreeRTOS/FreeRTOS-Kernel/tree/smp](https://github.com/FreeRTOS/FreeRTOS-Kernel/tree/smp)

IDF has added an experimental port of this SMP kernel located in components/freertos/FreeRTOS-Kernel-SMP. Enabling this option will cause IDF to use the Amazon SMP kernel. Note that THIS FEATURE IS UNDER ACTIVE DEVELOPMENT, users use this at their own risk.

Leaving this option disabled will mean the IDF FreeRTOS kernel is used instead, which is located in: components/freertos/FreeRTOS-Kernel. Both kernel versions are SMP capable, but differ in their implementation and features.

*Default value:*

- No (disabled)

**CONFIG_FREERTOS_UNICORE**

Run FreeRTOS only on first core

*Found in: Component config > FreeRTOS > Kernel*

This version of FreeRTOS normally takes control of all cores of the CPU. Select this if you only want to start it on the first core. This is needed when e.g. another process needs complete control over the second core.

**CONFIG_FREERTOS_HZ**

configTICK_RATE_HZ

*Found in: Component config > FreeRTOS > Kernel*

Sets the FreeRTOS tick interrupt frequency in Hz (see configTICK_RATE_HZ documentation for more details).

*Range:*

- from 1 to 1000

*Default value:*

- 100

**CONFIG_FREERTOS_OPTIMIZED_SCHEDULER**

configUSE_PORT_OPTIMISED_TASK_SELECTION

*Found in: Component config > FreeRTOS > Kernel*
Chapter 2.  API Reference

Enables port specific task selection method. This option can speed up the search of ready tasks when scheduling (see configUSE_PORT_OPTIMISED_TASK_SELECTION documentation for more details).

**CONFIG_FREERTOS_CHECK_STACKOVERFLOW**

cfgCHECK_FOR_STACK_OVERFLOW

*Found in: Component config > FreeRTOS > Kernel*

Enables FreeRTOS to check for stack overflows (see configCHECK_FOR_STACK_OVERFLOW documentation for more details).

Note: If users do not provide their own vApplicationStackOverflowHook() function, a default function will be provided by ESP-IDF.

Available options:

- No checking (CONFIG_FREERTOS_CHECK_STACKOVERFLOW_NONE)
  Do not check for stack overflows (configCHECK_FOR_STACK_OVERFLOW = 0)
- Check by stack pointer value (Method 1) (CONFIG_FREERTOS_CHECK_STACKOVERFLOW_PTRVAL)
  Check for stack overflows on each context switch by checking if the stack pointer is in a valid range. Quick but does not detect stack overflows that happened between context switches (configCHECK_FOR_STACK_OVERFLOW = 1)
- Check using canary bytes (Method 2) (CONFIG_FREERTOS_CHECK_STACKOVERFLOW_CANARY)
  Places some magic bytes at the end of the stack area and on each context switch, check if these bytes are still intact. More thorough than just checking the pointer, but also slightly slower. (configCHECK_FOR_STACK_OVERFLOW = 2)

**CONFIG_FREERTOS_THREAD_LOCAL_STORAGE_POINTERS**

cfgNUM_THREAD_LOCAL_STORAGE_POINTERS

*Found in: Component config > FreeRTOS > Kernel*

Set the number of thread local storage pointers in each task (see configNUM_THREAD_LOCAL_STORAGE_POINTERS documentation for more details).

Note: In ESP-IDF, this value must be at least 1. Index 0 is reserved for use by the pthreads API thread-local-storage. Other indexes can be used for any desired purpose.

*Range:*
  - from 1 to 256

*Default value:*
  - 1

**CONFIG_FREERTOS_IDLE_TASK_STACKSIZE**

cfgMINIMAL_STACK_SIZE (Idle task stack size)

*Found in: Component config > FreeRTOS > Kernel*

Sets the idle task stack size in bytes (see configMINIMAL_STACK_SIZE documentation for more details).

Note:
  - ESP-IDF specifies stack sizes in bytes instead of words.
  - The default size is enough for most use cases.
Chapter 2. API Reference

- The stack size may need to be increased above the default if the app installs idle or thread local storage cleanup hooks that use a lot of stack memory.
- Conversely, the stack size can be reduced to the minimum if none of the idle features are used.

**Range:**
- from 768 to 32768

**Default value:**
- 1536

**CONFIG_FREERTOS_USE_IDLE_HOOK**

```
cfgUSE_IDLE_HOOK
```

*Found in: Component config > FreeRTOS > Kernel*

Enables the idle task application hook (see `configUSE_IDLE_HOOK` documentation for more details).

**Note:**
- The application must provide the hook function `void vApplicationIdleHook( void );`
- `vApplicationIdleHook()` is called from FreeRTOS idle task(s)
- The FreeRTOS idle hook is NOT the same as the ESP-IDF Idle Hook, but both can be enabled simultaneously.

**Default value:**
- No (disabled)

**CONFIG_FREERTOS_USE_MINIMAL_IDLE_HOOK**

```
UseFreeRTOSminimalidlehook
```

*Found in: Component config > FreeRTOS > Kernel*

Enables the minimal idle task application hook (see `configUSE_IDLE_HOOK` documentation for more details).

**Note:**
- The application must provide the hook function `void vApplicationMinimalIdleHook( void );`
- `vApplicationMinimalIdleHook()` is called from FreeRTOS minimal idle task(s)

**Default value:**
- No (disabled) if `CONFIG_FREERTOS_SMP`

**CONFIG_FREERTOS_USE_TICK_HOOK**

```
configUSE_TICK_HOOK
```

*Found in: Component config > FreeRTOS > Kernel*

Enables the tick hook (see `configUSE_TICK_HOOK` documentation for more details).

**Note:**
- The application must provide the hook function `void vApplicationTickHook( void );`
- `vApplicationTickHook()` is called from FreeRTOS’s tick handling function `xTaskIncrementTickCount()`
- The FreeRTOS tick hook is NOT the same as the ESP-IDF Tick Interrupt Hook, but both can be enabled simultaneously.

**Default value:**
- No (disabled)
**CONFIG_FREERTOS_MAX_TASK_NAME_LEN**

configMAX_TASK_NAME_LEN

*Found in: Component config > FreeRTOS > Kernel*

Sets the maximum number of characters for task names (see configMAX_TASK_NAME_LEN documentation for more details).

*Note:* For most uses, the default of 16 characters is sufficient.

*Range:*
  * from 1 to 256

*Default value:*
  * 16

**CONFIG_FREERTOS_ENABLE_BACKWARD_COMPATIBILITY**

configENABLE_BACKWARD_COMPATIBILITY

*Found in: Component config > FreeRTOS > Kernel*

Enable backward compatibility with APIs prior to FreeRTOS v8.0.0. (see configENABLE_BACKWARD_COMPATIBILITY documentation for more details).

*Default value:*
  * No (disabled)

**CONFIG_FREERTOS_TIMER_SERVICE_TASK_NAME**

configTIMER_SERVICE_TASK_NAME

*Found in: Component config > FreeRTOS > Kernel*

Sets the timer task’s name (see configTIMER_SERVICE_TASK_NAME documentation for more details).

*Default value:*
  * “Tmr Svc”

**CONFIG_FREERTOS_TIMER_TASK_PRIORITY**

configTIMER_TASK_PRIORITY

*Found in: Component config > FreeRTOS > Kernel*

Sets the timer task’s priority (see configTIMER_TASK_PRIORITY documentation for more details).

*Range:*
  * from 1 to 25

*Default value:*
  * 1

**CONFIG_FREERTOS_TIMER_TASK_STACK_DEPTH**

configTIMER_TASK_STACK_DEPTH

*Found in: Component config > FreeRTOS > Kernel*

Set the timer task’s stack size (see configTIMER_TASK_STACK_DEPTH documentation for more details).

*Range:*
  * from 1536 to 32768

*Default value:*
  * 2048
**CONFIG_FREERTOS_TIMER_QUEUE_LENGTH**

```c
configTIMER_QUEUE_LENGTH
```

*Found in: Component config > FreeRTOS > Kernel*

Set the timer task’s command queue length (see `configTIMER_QUEUE_LENGTH` documentation for more details).

**Range:**
- from 5 to 20

**Default value:**
- 10

**CONFIG_FREERTOS_QUEUE_REGISTRY_SIZE**

```c
configQUEUE_REGISTRY_SIZE
```

*Found in: Component config > FreeRTOS > Kernel*

Set the size of the queue registry (see `configQUEUE_REGISTRY_SIZE` documentation for more details).

**Note:** A value of 0 will disable queue registry functionality

**Range:**
- from 0 to 20

**Default value:**
- 0

**CONFIG_FREERTOS_TASK_NOTIFICATION_ARRAY_ENTRIES**

```c
configTASK_NOTIFICATION_ARRAY_ENTRIES
```

*Found in: Component config > FreeRTOS > Kernel*

Set the size of the task notification array of each task. When increasing this value, keep in mind that this means additional memory for each and every task on the system. However, task notifications in general are more lightweight compared to alternatives such as semaphores.

**Range:**
- from 1 to 32

**Default value:**
- 1

**CONFIG_FREERTOS_USE_TRACE_FACILITY**

```c
configUSE_TRACE_FACILITY
```

*Found in: Component config > FreeRTOS > Kernel*

Enables additional structure members and functions to assist with execution visualization and tracing (see `configUSE_TRACE_FACILITY` documentation for more details).

**Default value:**
- No (disabled)

**CONFIG_FREERTOS_USE_STATS_FORMATTING_FUNCTIONS**

```c
configUSE_STATS_FORMATTING_FUNCTIONS
```

*Found in: Component config > FreeRTOS > Kernel > CONFIG_FREERTOS_USE_TRACE_FACILITY*
Set configUSE_TRACE_FACILITY and configUSE_STATS_FORMATTING_FUNCTIONS to 1 to include the \texttt{vTaskList()} and \texttt{vTaskGetRunTimeStats()} functions in the build (see configUSE_STATS_FORMATTING_FUNCTIONS documentation for more details).

**Default value:**
- No (disabled) if \texttt{CONFIG_FREERTOS_USE_TRACE_FACILITY}

\textbf{CONFIG_FREERTOS_VTASKLIST_INCLUDE_COREID}

Enable display of xCoreID in vTaskList

*Found in: Component config > FreeRTOS > Kernel > CONFIG_FREERTOS_USE_TRACE_FACILITY > CONFIG_FREERTOS_USE_STATS_FORMATTING_FUNCTIONS*

If enabled, this will include an extra column when vTaskList is called to display the CoreID the task is pinned to (0,1) or -1 if not pinned.

\textbf{CONFIG_FREERTOS_GENERATE_RUN_TIME_STATS}

\texttt{config\_GENERATE\_RUN\_TIME\_STATS}

*Found in: Component config > FreeRTOS > Kernel*

Enables collection of run time statistics for each task (see config\_GENERATE\_RUN\_TIME\_STATS documentation for more details).

Note: The clock used for run time statistics can be configured in \texttt{FREERTOS\_RUN\_TIME\_STATS\_CLK}.

**Default value:**
- No (disabled)

\textbf{CONFIG_FREERTOS_RUN_TIME_COUNTER_TYPE}

\texttt{config\_RUN\_TIME\_COUNTER\_TYPE}

*Found in: Component config > FreeRTOS > Kernel > CONFIG_FREERTOS_GENERATE_RUN_TIME_STATS*

Sets the data type used for the FreeRTOS run time stats. A larger data type can be used to reduce the frequency of the counter overflowing.

Available options:

- \texttt{uint32\_t} (\texttt{CONFIG\_FREERTOS\_RUN\_TIME\_COUNTER\_TYPE\_U32})
- \texttt{uint64\_t} (\texttt{CONFIG\_FREERTOS\_RUN\_TIME\_COUNTER\_TYPE\_U64})

\textbf{CONFIG_FREERTOS_USE_TICKLESS_IDLE}

\texttt{config\_USE\_TICKLESS\_IDLE}

*Found in: Component config > FreeRTOS > Kernel*

If power management support is enabled, FreeRTOS will be able to put the system into light sleep mode when no tasks need to run for a number of ticks. This number can be set using \texttt{FREERTOS\_IDLE\_TIME\_BEFORE\_SLEEP} option. This feature is also known as “automatic light sleep”.

Note that timers created using esp\_timer APIs may prevent the system from entering sleep mode, even when no tasks need to run. To skip unnecessary wake-up initialize a timer with the “skip_unhandled_events” option as true.
If disabled, automatic light sleep support will be disabled.

**Default value:**
- No (disabled) if `CONFIG_PM_ENABLE`

### CONFIG_FREERTOS_IDLE_TIME_BEFORE_SLEEP

`configEXPECTED_IDLE_TIME_BEFORE_SLEEP`

*Found in: Component config > FreeRTOS > Kernel > CONFIG_FREERTOS_USE_TICKLESS_IDLE*

FreeRTOS will enter light sleep mode if no tasks need to run for this number of ticks. You can enable PM_PROFILING feature in esp_pm components and dump the sleep status with esp_pm_dump_locks, if the proportion of rejected sleeps is too high, please increase this value to improve scheduling efficiency

**Range:**
- from 2 to 4294967295 if `CONFIG_FREERTOS_USE_TICKLESS_IDLE`

**Default value:**
- 3 if `CONFIG_FREERTOS_USE_TICKLESS_IDLE`

#### Port

**Contains:**
- `CONFIG_FREERTOS_CHECK_MUTEX_GIVEN_BY_OWNER`
- `CONFIG_FREERTOS_RUN_TIME_STATS_CLK`
- `CONFIG_FREERTOS_INTERRUPT_BACKTRACE`
- `CONFIG_FREERTOS_WATCHPOINT_END_OF_STACK`
- `CONFIG_FREERTOS_ENABLE_STATIC_TASK_CLEAN_UP`
- `CONFIG_FREERTOS_TASK_PRE_DELETION_HOOK`
- `CONFIG_FREERTOS_TLSP_DELETION_CALLBACKS`
- `CONFIG_FREERTOS_ISR_STACKSIZE`
- `CONFIG_FREERTOS_PLACE_FUNCTIONS_INTO_FLASH`
- `CONFIG_FREERTOS_CHECK_PORT_CRITICAL_COMPLIANCE`
- `CONFIG_FREERTOS_CORETIMER`
- `CONFIG_FREERTOS_TASK_FUNCTION_WRAPPER`

### CONFIG_FREERTOS_TASK_FUNCTION_WRAPPER

Wrap task functions

*Found in: Component config > FreeRTOS > Port*

If enabled, all FreeRTOS task functions will be enclosed in a wrapper function. If a task function mistakenly returns (i.e. does not delete), the call flow will return to the wrapper function. The wrapper function will then log an error and abort the application. This option is also required for GDB backtraces and C++ exceptions to work correctly inside top-level task functions.

**Default value:**
- Yes (enabled)

### CONFIG_FREERTOS_WATCHPOINT_END_OF_STACK

Enable stack overflow debug watchpoint

*Found in: Component config > FreeRTOS > Port*

FreeRTOS can check if a stack has overflown its bounds by checking either the value of the stack pointer or by checking the integrity of canary bytes. (See `FREERTOS_CHECK_STACKOVERFLOW` for more information.) These checks only happen on a context switch, and the situation that caused the stack overflow may already be long gone by then. This option will use the last debug memory watchpoint to allow breaking into the debugger (or panic’ing) as soon as any of the last 32 bytes on the stack of a task are overwritten. The side effect is that using gdb, you effectively have one hardware watchpoint less because the last one is overwritten as soon as a task switch happens.
Another consequence is that due to alignment requirements of the watchpoint, the usable stack size decreases by up to 60 bytes. This is because the watchpoint region has to be aligned to its size and the size for the stack watchpoint in IDF is 32 bytes.

This check only triggers if the stack overflow writes within 32 bytes near the end of the stack, rather than overshooting further, so it is worth combining this approach with one of the other stack overflow check methods.

When this watchpoint is hit, gdb will stop with a SIGTRAP message. When no JTAG OCD is attached, esp-idf will panic on an unhandled debug exception.

**Default value:**
- No (disabled)

**CONFIG_FREERTOS_TLSP_DELETION_CALLBACKS**

Enable thread local storage pointers deletion callbacks

*Found in: Component config > FreeRTOS > Port*

ESP-IDF provides users with the ability to free TLSP memory by registering TLSP deletion callbacks. These callbacks are automatically called by FreeRTOS when a task is deleted. When this option is turned on, the memory reserved for TLSPs in the TCB is doubled to make space for storing the deletion callbacks. If the user does not wish to use TLSP deletion callbacks then this option could be turned off to save space in the TCB memory.

**Default value:**
- Yes (enabled)

**CONFIG_FREERTOS_TASK_PRE_DELETION_HOOK**

Enable task pre-deletion hook

*Found in: Component config > FreeRTOS > Port*

Enable this option to make FreeRTOS call a user provided hook function right before it deletes a task (i.e., frees/releases a dynamically/statically allocated task’s memory). This is useful if users want to know when a task is actually deleted (in case the task’s deletion is delegated to the IDLE task).

If this config option is enabled, users must define a `void vTaskPreDeletionHook( void *pxTCB )` hook function in their application.

**CONFIG_FREERTOS_ENABLE_STATIC_TASK_CLEAN_UP**

Enable static task cleanup hook (DEPRECATED)

*Found in: Component config > FreeRTOS > Port*

**THIS OPTION IS DEPRECATED. Use FREERTOS_TASK_PRE_DELETION_HOOK instead.**

Enable this option to make FreeRTOS call the static task cleanup hook when a task is deleted.

Note: Users will need to provide a `void vPortCleanUpTCB ( void *pxTCB )` callback

**Default value:**
- No (disabled)

**CONFIG_FREERTOS_CHECK_MUTEX_GIVEN_BY_OWNER**

Check that mutex semaphore is given by owner task

*Found in: Component config > FreeRTOS > Port*

If enabled, assert that when a mutex semaphore is given, the task giving the semaphore is the task which is currently holding the mutex.
**CONFIG_FREERTOS_ISR_STACKSIZE**

ISR stack size

*Found in: Component config > FreeRTOS > Port*

The interrupt handlers have their own stack. The size of the stack can be defined here. Each processor has its own stack, so the total size occupied will be twice this.

**Range:**
- from 2096 to 32768 if `CONFIG_ESP_COREDUMP_DATA_FORMAT_ELF`
- from 1536 to 32768

**Default value:**
- 2096 if `CONFIG_ESP_COREDUMP_DATA_FORMAT_ELF`
- 1536

**CONFIG_FREERTOS_INTERRUPT_BACKTRACE**

Enable backtrace from interrupt to task context

*Found in: Component config > FreeRTOS > Port*

If this option is enabled, interrupt stack frame will be modified to point to the code of the interrupted task as its return address. This helps the debugger (or the panic handler) show a backtrace from the interrupt to the task which was interrupted. This also works for nested interrupts: higher level interrupt stack can be traced back to the lower level interrupt. This option adds 4 instructions to the interrupt dispatching code.

**Default value:**
- Yes (enabled)

**CONFIG_FREERTOS_CORETIMER**

Tick timer source (Xtensa Only)

*Found in: Component config > FreeRTOS > Port*

FreeRTOS needs a timer with an associated interrupt to use as the main tick source to increase counters, run timers and do pre-emptive multitasking with. There are multiple timers available to do this, with different interrupt priorities.

**Available options:**
- Timer 0 (int 6, level 1) (CONFIG_FREERTOS_CORETIMER_0)
  Select this to use timer 0
- Timer 1 (int 15, level 3) (CONFIG_FREERTOS_CORETIMER_1)
  Select this to use timer 1
- SYSTIMER 0 (level 1) (CONFIG_FREERTOS_CORETIMER_SYSTIMER_LVL1)
  Select this to use systimer with the 1 interrupt priority.
- SYSTIMER 0 (level 3) (CONFIG_FREERTOS_CORETIMER_SYSTIMER_LVL3)
  Select this to use systimer with the 3 interrupt priority.

**CONFIG_FREERTOS_RUN_TIME_STATS_CLK**

Choose the clock source for run time stats

*Found in: Component config > FreeRTOS > Port*

Choose the clock source for FreeRTOS run time stats. Options are CPU0’s CPU Clock or the ESP Timer. Both clock sources are 32 bits. The CPU Clock can run at a higher frequency hence provide a finer resolution but will overflow much quicker. Note that run time stats are only valid until the clock source overflows.
Available options:

- Use ESP TIMER for run time stats (CONFIG_FREERTOS_RUN_TIME_STATS_USING_ESP_TIMER)
  ESP Timer will be used as the clock source for FreeRTOS run time stats. The ESP Timer runs at a frequency of 1MHz regardless of Dynamic Frequency Scaling. Therefore the ESP Timer will overflow in approximately 4290 seconds.

- Use CPU Clock for run time stats (CONFIG_FREERTOS_RUN_TIME_STATS_USING_CPU_CLK)
  CPU Clock will be used as the clock source for the generation of run time stats. The CPU Clock has a frequency dependent on ESP_DEFAULT_CPU_FREQ_MHZ and Dynamic Frequency Scaling (DFS). Therefore the CPU Clock frequency can fluctuate between 80 to 240MHz. Run time stats generated using the CPU Clock represents the number of CPU cycles each task is allocated and DOES NOT reflect the amount of time each task runs for (as CPU clock frequency can change). If the CPU clock consistently runs at the maximum frequency of 240MHz, it will overflow in approximately 17 seconds.

---

**CONFIG_FREERTOS_PLACE_FUNCTIONS_INTO_FLASH**

Place FreeRTOS functions into Flash

*Found in: Component config > FreeRTOS > Port*

When enabled the selected Non-ISR FreeRTOS functions will be placed into Flash memory instead of IRAM. This saves up to 8KB of IRAM depending on which functions are used.

*Default value:*
  - No (disabled)

---

**CONFIG_FREERTOS_CHECK_PORT_CRITICAL_COMPLIANCE**

Tests compliance with Vanilla FreeRTOS port*_CRITICAL calls

*Found in: Component config > FreeRTOS > Port*

If enabled, context of port*_CRITICAL calls (ISR or Non-ISR) would be checked to be in compliance with Vanilla FreeRTOS. e.g Calling port*_CRITICAL from ISR context would cause assert failure

*Default value:*
  - No (disabled)

---

**Hardware Abstraction Layer (HAL) and Low Level (LL)**  Contains:

- **CONFIG_HAL_DEFAULT_ASSERTION_LEVEL**
- **CONFIG_HAL_LOG_LEVEL**
- **CONFIG_HAL_SYSTIMER_USE_ROM_IMPL**
- **CONFIG_HAL_WDT_USE_ROM_IMPL**

---

**CONFIG_HAL_DEFAULT_ASSERTION_LEVEL**

Default HAL assertion level

*Found in: Component config > Hardware Abstraction Layer (HAL) and Low Level (LL)*

Set the assert behavior / level for HAL component. HAL component assert level can be set separately, but the level can’t exceed the system assertion level. e.g. If the system assertion is disabled, then the HAL assertion can’t be enabled either. If the system assertion is enable, then the HAL assertion can still be disabled by this Kconfig option.

*Available options:*
• Same as system assertion level (CONFIG_HAL_ASSERTION_EQUALS_SYSTEM)
• Disabled (CONFIG_HAL_ASSERTION_DISABLE)
• Silent (CONFIG_HAL_ASSERTION_SILENT)
• Enabled (CONFIG_HAL_ASSERTION_ENABLE)

**CONFIG_HAL_LOG_LEVEL**

HAL layer log verbosity

*Found in: Component config > Hardware Abstraction Layer (HAL) and Low Level (LL)*

Specify how much output to see in HAL logs.

Available options:

- No output (CONFIG_HAL_LOG_LEVEL_NONE)
- Error (CONFIG_HAL_LOG_LEVEL_ERROR)
- Warning (CONFIG_HAL_LOG_LEVEL_WARN)
- Info (CONFIG_HAL_LOG_LEVEL_INFO)
- Debug (CONFIG_HAL_LOG_LEVEL_DEBUG)
- Verbose (CONFIG_HAL_LOG_LEVEL_VERBOSE)

**CONFIG_HAL_SYSTIMER_USE_ROM_IMPL**

Use ROM implementation of SysTimer HAL driver

*Found in: Component config > Hardware Abstraction Layer (HAL) and Low Level (LL)*

Enable this flag to use HAL functions from ROM instead of ESP-IDF.

If keeping this as “n” in your project, you will have less free IRAM. If making this as “y” in your project, you will increase free IRAM, but you will lose the possibility to debug this module, and some new features will be added and bugs will be fixed in the IDF source but cannot be synced to ROM.

**Default value:**
- Yes (enabled) if ESP_ROM_HAS_HAL_SYSTIMER

**CONFIG_HAL_WDT_USE_ROM_IMPL**

Use ROM implementation of WDT HAL driver

*Found in: Component config > Hardware Abstraction Layer (HAL) and Low Level (LL)*

Enable this flag to use HAL functions from ROM instead of ESP-IDF.

If keeping this as “n” in your project, you will have less free IRAM. If making this as “y” in your project, you will increase free IRAM, but you will lose the possibility to debug this module, and some new features will be added and bugs will be fixed in the IDF source but cannot be synced to ROM.

**Default value:**
- Yes (enabled)

**Heap memory debugging**

Contains:

- CONFIG_HEAP_ABORT_WHEN_ALLOCATION_FAILS
- CONFIG_HEAP_TASK_TRACKING
- CONFIG_HEAP_PLACE_FUNCTION_INTO_FLASH
- CONFIG_HEAP_CORRUPTION_DETECTION
- CONFIG_HEAP_TRACING_DEST
- CONFIG_HEAP_TRACING_STACK_DEPTH
- CONFIG_HEAP_USE_HOOKS
- CONFIG_HEAP_TRACE_HASH_MAP
• **CONFIG_HEAP_TLSF_USE_ROM_IMPL**

**CONFIG_HEAP_CORRUPTION_DETECTION**

Heap corruption detection

*Found in: Component config > Heap memory debugging*

Enable heap poisoning features to detect heap corruption caused by out-of-bounds access to heap memory.

See the “Heap Memory Debugging” page of the IDF documentation for a description of each level of heap corruption detection.

Available options:

- Basic (no poisoning) (CONFIG_HEAP_POISONING_DISABLED)
- Light impact (CONFIG_HEAP_POISONING_LIGHT)
- Comprehensive (CONFIG_HEAP_POISONING_COMPREHENSIVE)

**CONFIG_HEAP_TRACING_DEST**

Heap tracing

*Found in: Component config > Heap memory debugging*

Enables the heap tracing API defined in esp_heap_trace.h.

This function causes a moderate increase in IRAM code side and a minor increase in heap function (malloc/free/realloc) CPU overhead, even when the tracing feature is not used. So it’s best to keep it disabled unless tracing is being used.

Available options:

- Disabled (CONFIG_HEAP_TRACING_OFF)
- Standalone (CONFIG_HEAP_TRACING_STANDALONE)
- Host-based (CONFIG_HEAP_TRACING_TOHOST)

**CONFIG_HEAP_TRACING_STACK_DEPTH**

Heap tracing stack depth

*Found in: Component config > Heap memory debugging*

Number of stack frames to save when tracing heap operation callers.

More stack frames uses more memory in the heap trace buffer (and slows down allocation), but can provide useful information.

**CONFIG_HEAP_USE_HOOKS**

Use allocation and free hooks

*Found in: Component config > Heap memory debugging*

Enable the user to implement function hooks triggered for each successful allocation and free.
**CONFIG_HEAP_TASK_TRACKING**

Enable heap task tracking

*Found in: Component config > Heap memory debugging*

Enables tracking the task responsible for each heap allocation.

This function depends on heap poisoning being enabled and adds four more bytes of overhead for each block allocated.

**CONFIG_HEAP_TRACE_HASH_MAP**

Use hash map mechanism to access heap trace records

*Found in: Component config > Heap memory debugging*

Enable this flag to use a hash map to increase performance in handling heap trace records.

Heap trace standalone supports storing records as a list, or a list + hash map.

Using only a list takes less memory, but calls to ‘free’ will get slower as the list grows. This is particularly affected when using HEAP_TRACE_ALL mode.

By using a list + hash map, calls to ‘free’ remain fast, at the cost of additional memory to store the hash map.

**Default value:**
- No (disabled) if `CONFIG_HEAP_TRACING_STANDALONE`

**CONFIG_HEAP_TRACE_HASH_MAP_IN_EXT_RAM**

Place hash map in external RAM

*Found in: Component config > Heap memory debugging > CONFIG_HEAP_TRACE_HASH_MAP*

When enabled this configuration forces the hash map to be placed in external RAM.

**Default value:**
- No (disabled) if `CONFIG_HEAP_TRACE_HASH_MAP`

**CONFIG_HEAP_TRACE_HASH_MAP_SIZE**

The number of entries in the hash map

*Found in: Component config > Heap memory debugging > CONFIG_HEAP_TRACE_HASH_MAP*

Defines the number of entries in the heap trace hashmap. Each entry takes 8 bytes. The bigger this number is, the better the performance. Recommended range: 200 - 2000.

**Default value:**
- 512 if `CONFIG_HEAP_TRACE_HASH_MAP`

**CONFIG_HEAP_ABORT_WHEN_ALLOCATION_FAILS**

Abort if memory allocation fails

*Found in: Component config > Heap memory debugging*

When enabled, if a memory allocation operation fails it will cause a system abort.

**Default value:**
- No (disabled)
CONFIG_HEAP_TLSF_USE_ROM_IMPL

Use ROM implementation of heap tlsf library

*Found in: Component config > Heap memory debugging*

Enable this flag to use heap functions from ROM instead of ESP-IDF.

If keeping this as “n” in your project, you will have less free IRAM. If making this as “y” in your project, you will increase free IRAM, but you will lose the possibility to debug this module, and some new features will be added and bugs will be fixed in the IDF source but cannot be synced to ROM.

**Default value:**

- Yes (enabled) if ESP_ROM_HAS_HEAP_TLSF

CONFIG_HEAP_PLACE_FUNCTION_INTO_FLASH

Force the entire heap component to be placed in flash memory

*Found in: Component config > Heap memory debugging*

Enable this flag to save up RAM space by placing the heap component in the flash memory.

Note that it is only safe to enable this configuration if no functions from esp_heap_caps.h or esp_heap_trace.h are called from ISR.

IEEE 802.15.4 Contains:

- CONFIG_IEEE802154_CCA_THRESHOLD
- CONFIG_IEEE802154_CCA_MODE
- CONFIG_IEEE802154_DEBUG
- CONFIG_IEEE802154_SLEEP_ENABLE
- CONFIG_IEEE802154_MULTI_PAN_ENABLE
- CONFIG_IEEE802154_TIMING_OPTIMIZATION
- CONFIG_IEEE802154_PENDING_TABLE_SIZE
- CONFIG_IEEE802154_RX_BUFFER_SIZE

CONFIG_IEEE802154_RX_BUFFER_SIZE

The number of 802.15.4 receive buffers

*Found in: Component config > IEEE 802.15.4*

The number of 802.15.4 receive buffers

CONFIG_IEEE802154_CCA_MODE

Clear Channel Assessment (CCA) mode

*Found in: Component config > IEEE 802.15.4*

configure the CCA mode

Available options:

- Carrier sense only (CONFIG_IEEE802154_CCA_CARRIER)
  configure the CCA mode to Energy above threshold
- Energy above threshold (CONFIG_IEEE802154_CCA_ED)
  configure the CCA mode to Energy above threshold
- Carrier sense OR energy above threshold (CONFIG_IEEE802154_CCA_CARRIER_OR_ED)
  configure the CCA mode to Carrier sense OR energy above threshold
- Carrier sense AND energy above threshold (CONFIG_IEEE802154_CCA_CARRIER_AND_ED)
  configure the CCA mode to Carrier sense AND energy above threshold

**CONFIG_IEEE802154_CCA_THRESHOLD**

CCA detection threshold

*Found in: Component config > IEEE 802.15.4*

set the CCA threshold, in dB

**Range:**
- from -120 to 0

**Default value:**
- “-60”

**CONFIG_IEEE802154_PENDING_TABLE_SIZE**

Pending table size

*Found in: Component config > IEEE 802.15.4*

set the pending table size

**Range:**
- from 1 to 100

**Default value:**
- 20

**CONFIG_IEEE802154_MULTI_PAN_ENABLE**

Enable multi-pan feature for frame filter

*Found in: Component config > IEEE 802.15.4*

Enable IEEE802154 multi-pan

**Default value:**
- No (disabled)

**CONFIG_IEEE802154_TIMING_OPTIMIZATION**

Enable throughput optimization

*Found in: Component config > IEEE 802.15.4*

Enabling this option increases throughput by ~5% at the expense of ~2.1k IRAM code size increase.

**Default value:**
- No (disabled)

**CONFIG_IEEE802154_SLEEP_ENABLE**

Enable IEEE802154 light sleep

*Found in: Component config > IEEE 802.15.4*

Enabling this option allows the IEEE802.15.4 module to be powered down during automatic light sleep, which reduces current consumption.

**Default value:**
- No (disabled) if CONFIG_PM_ENABLE &\& CONFIG_PM_POWER_DOWN_PERIPHERAL_IN_LIGHT_SLEEP
CONFIG_IEEE802154_DEBUG

Enable IEEE802154 Debug

*Found in: Component config > IEEE 802.15.4*

Enabling this option allows different kinds of IEEE802154 debug output. All IEEE802154 debug features increase the size of the final binary.

**Default value:**
- No (disabled)

**Contains:**
- CONFIG_IEEE802154_RECORD_ABORT
- CONFIG_IEEE802154_RECORD_CMD
- CONFIG_IEEE802154_RECORD_EVENT
- CONFIG_IEEE802154_RECORD_STATE
- CONFIG_IEEE802154_ASSERT

CONFIG_IEEE802154_ASSERT

Enrich the assert information with IEEE802154 state and event

*Found in: Component config > IEEE 802.15.4 > CONFIG_IEEE802154_DEBUG*

Enabling this option to add some probe codes in the driver, and these informations will be printed when assert.

**Default value:**
- No (disabled) if CONFIG_IEEE802154_DEBUG

CONFIG_IEEE802154_RECORD_EVENT

Enable record event information for debugging

*Found in: Component config > IEEE 802.15.4 > CONFIG_IEEE802154_DEBUG*

Enabling this option to record event, when assert, the recorded event will be printed.

**Default value:**
- No (disabled) if CONFIG_IEEE802154_DEBUG

CONFIG_IEEE802154_RECORD_EVENT_SIZE

Record event table size

*Found in: Component config > IEEE 802.15.4 > CONFIG_IEEE802154_DEBUG > CONFIG_IEEE802154_RECORD_EVENT*

set the record event table size

**Range:**
- from 1 to 50 if CONFIG_IEEE802154_RECORD_EVENT

**Default value:**
- 30 if CONFIG_IEEE802154_RECORD_EVENT

CONFIG_IEEE802154_RECORD_STATE

Enable record state information for debugging

*Found in: Component config > IEEE 802.15.4 > CONFIG_IEEE802154_DEBUG*

Enabling this option to record state, when assert, the recorded state will be printed.

**Default value:**
• No (disabled) if CONFIG_IEEE802154_DEBUG

CONFIG_IEEE802154_RECORD_STATE_SIZE

Record state table size

*Found in: Component config > IEEE 802.15.4 > CONFIG_IEEE802154_DEBUG > CONFIG_IEEE802154_RECORD_STATE*

set the record state table size

**Range:**

• from 1 to 50 if CONFIG_IEEE802154_RECORD_STATE

**Default value:**

• 10 if CONFIG_IEEE802154_RECORD_STATE

CONFIG_IEEE802154_RECORD_CMD

Enable record command information for debugging

*Found in: Component config > IEEE 802.15.4 > CONFIG_IEEE802154_DEBUG*

Enabling this option to record the command, when assert, the recorded command will be printed.

**Default value:**

• No (disabled) if CONFIG_IEEE802154_DEBUG

CONFIG_IEEE802154_RECORD_CMD_SIZE

Record command table size

*Found in: Component config > IEEE 802.15.4 > CONFIG_IEEE802154_DEBUG > CONFIG_IEEE802154_RECORD_CMD*

set the record command table size

**Range:**

• from 1 to 50 if CONFIG_IEEE802154_RECORD_CMD

**Default value:**

• 10 if CONFIG_IEEE802154_RECORD_CMD

CONFIG_IEEE802154_RECORD_ABORT

Enable record abort information for debugging

*Found in: Component config > IEEE 802.15.4 > CONFIG_IEEE802154_DEBUG*

Enabling this option to record the abort, when assert, the recorded abort will be printed.

**Default value:**

• No (disabled) if CONFIG_IEEE802154_DEBUG

CONFIG_IEEE802154_RECORD_ABORT_SIZE

Record abort table size

*Found in: Component config > IEEE 802.15.4 > CONFIG_IEEE802154_DEBUG > CONFIG_IEEE802154_RECORD_ABORT*

set the record abort table size

**Range:**

• from 1 to 50 if CONFIG_IEEE802154_RECORD_ABORT

**Default value:**

• 10 if CONFIG_IEEE802154_RECORD_ABORT
Chapter 2. API Reference

Log output Contains:

- CONFIG_LOG_DEFAULT_LEVEL
- CONFIG_LOG_MASTER_LEVEL
- CONFIG_LOG_TIMESTAMP_SOURCE
- CONFIG_LOG_MAXIMUM_LEVEL
- CONFIG_LOG_COLORS

CONFIG_LOG_DEFAULT_LEVEL

Default log verbosity

*Found in: Component config > Log output*

Specify how much output to see in logs by default. You can set lower verbosity level at runtime using esp_log_level_set function.

By default, this setting limits which log statements are compiled into the program. For example, selecting “Warning” would mean that changing log level to “Debug” at runtime will not be possible. To allow increasing log level above the default at runtime, see the next option.

Available options:

- No output (CONFIG_LOG_DEFAULT_LEVEL_NONE)
- Error (CONFIG_LOG_DEFAULT_LEVEL_ERROR)
- Warning (CONFIG_LOG_DEFAULT_LEVEL_WARN)
- Info (CONFIG_LOG_DEFAULT_LEVEL_INFO)
- Debug (CONFIG_LOG_DEFAULT_LEVEL_DEBUG)
- Verbose (CONFIG_LOG_DEFAULT_LEVEL_VERBOSE)

CONFIG_LOG_MAXIMUM_LEVEL

Maximum log verbosity

*Found in: Component config > Log output*

This config option sets the highest log verbosity that it’s possible to select at runtime by calling esp_log_level_set(). This level may be higher than the default verbosity level which is set when the app starts up.

This can be used enable debugging output only at a critical point, for a particular tag, or to minimize startup time but then enable more logs once the firmware has loaded.

Note that increasing the maximum available log level will increase the firmware binary size.

This option only applies to logging from the app, the bootloader log level is fixed at compile time to the separate “Bootloader log verbosity” setting.

Available options:

- Same as default (CONFIG_LOG_MAXIMUM_EQUALS_DEFAULT)
- Error (CONFIG_LOG_MAXIMUM_LEVEL_ERROR)
- Warning (CONFIG_LOG_MAXIMUM_LEVEL_WARN)
- Info (CONFIG_LOG_MAXIMUM_LEVEL_INFO)
- Debug (CONFIG_LOG_MAXIMUM_LEVEL_DEBUG)
- Verbose (CONFIG_LOG_MAXIMUM_LEVEL_VERBOSE)
**CONFIG_LOG_MASTER_LEVEL**

Enable global master log level

*Found in: Component config > Log output*

Enables an additional global “master” log level check that occurs before a log tag cache lookup. This is useful if you want to compile in a lot of logs that are selectable at runtime, but avoid the performance hit during periods where you don’t want log output. Examples include remote log forwarding, or disabling logs during a time-critical or CPU-intensive section and re-enabling them later. Results in larger program size depending on number of logs compiled in.

If enabled, defaults to LOG_DEFAULT_LEVEL and can be set using esp_log_set_level_master(). This check takes precedence over ESP_LOG_LEVEL_LOCAL.

**Default value:**

- No (disabled)

**CONFIG_LOG_COLORS**

Use ANSI terminal colors in log output

*Found in: Component config > Log output*

Enable ANSI terminal color codes in bootloader output.

In order to view these, your terminal program must support ANSI color codes.

**Default value:**

- Yes (enabled)

**CONFIG_LOG_TIMESTAMP_SOURCE**

Log Timestamps

*Found in: Component config > Log output*

Choose what sort of timestamp is displayed in the log output:

- Milliseconds since boot is calculated from the RTOS tick count multiplied by the tick period. This time will reset after a software reboot. e.g. (90000)
- System time is taken from POSIX time functions which use the chip’s RTC and high resolution timers to maintain an accurate time. The system time is initialized to 0 on startup, it can be set with an SNTF sync, or with POSIX time functions. This time will not reset after a software reboot. e.g. (00:01:30.000)
- NOTE: Currently this will not get used in logging from binary blobs (i.e WiFi & Bluetooth libraries), these will always print milliseconds since boot.

**Available options:**

- Milliseconds Since Boot (CONFIG_LOG_TIMESTAMP_SOURCE_RTOS)
- System Time (CONFIG_LOG_TIMESTAMP_SOURCE_SYSTEM)

**LWIP** Contains:

- **CONFIG_LWIP_CHECK_THREAD_SAFETY**
- **Checksums**
- **CONFIG_LWIP_DHCP_COARSE_TIMER_SECS**
- **DHCP server**
- **CONFIG_LWIP_DHCP_OPTIONS_LEN**
- **CONFIG_LWIP_DHCP_DISABLE_CLIENT_ID**
- **CONFIG_LWIP_DHCP_DISABLE_VENDOR_CLASS_ID**
- **CONFIG_LWIP_DHCP_DOES_ARP_CHECK**

Chapter 2. API Reference

CONFIG_LWIP_ENABLE
Enable LwIP stack

*Found in: Component config > LWIP*

Builds normally if selected. Excludes LwIP from build if unselected, even if it is a dependency of a component or application. Some applications can switch their IP stacks, e.g., when switching between chip and Linux targets (LwIP stack vs. Linux IP stack). Since the LwIP dependency cannot easily be excluded based on a Kconfig option, it has to be a dependency in all cases. This switch allows the LwIP stack to be built selectively, even if it is a dependency.

**Default value:**
- Yes (enabled)

CONFIG_LWIP_LOCAL_HOSTNAME
Local netif hostname

*Found in: Component config > LWIP*

The default name this device will report to other devices on the network. Could be updated at runtime with esp_netif_set_hostname().

**Default value:**
- “espressif”

CONFIG_LWIP_NETIF_API
Enable usage of standard POSIX APIs in LWIP

*Found in: Component config > LWIP*

If this feature is enabled, standard POSIX APIs: if_indextoname(), if_nametoindex() could be used to convert network interface index to name instead of IDF specific esp-netif APIs (such as esp_netif_get_netif_impl_name()).

**Default value:**
- No (disabled)

CONFIG_LWIP_TCPIP_TASK_PRIO
LWIP TCP/IP Task Priority

*Found in: Component config > LWIP*

LWIP tcpip task priority. In case of high throughput, this parameter could be changed up to (config-MAX_PRIORITIES-1).

**Range:**
- from 1 to 24

**Default value:**
- 18

CONFIG_LWIP_TCPIP_CORE_LOCKING
Enable tcpip core locking

*Found in: Component config > LWIP*

If Enable tcpip core locking, creates a global mutex that is held during TCPIP thread operations. Can be locked by client code to perform lwIP operations without changing into TCPIP thread using callbacks. See LOCK_TCPIP_CORE() and UNLOCK_TCPIP_CORE().

If disable tcpip core locking, TCP IP will perform tasks through context switching.
Default value:
• No (disabled)

**CONFIG_LWIP_TCPIP_CORE_LOCKING_INPUT**

Enable tcpip core locking input

*Found in: Component config > LWIP > CONFIG_LWIP_TCPIP_CORE_LOCKING*

When LWIP_TCPIP_CORE_LOCKING is enabled, this lets tcpip_input() grab the mutex for input packets as well, instead of allocating a message and passing it to tcpip_thread.

Default value:
• No (disabled) if CONFIG_LWIP_TCPIP_CORE_LOCKING

**CONFIG_LWIP_CHECK_THREAD_SAFETY**

Checks that lwip API runs in expected context

*Found in: Component config > LWIP*

Enable to check that the project does not violate lwip thread safety. If enabled, all lwip functions that require thread awareness run an assertion to verify that the TCP/IP core functionality is either locked or accessed from the correct thread.

Default value:
• No (disabled)

**CONFIG_LWIP_DNS_SUPPORT_MDNS_QUERIES**

Enable mDNS queries in resolving host name

*Found in: Component config > LWIP*

If this feature is enabled, standard API such as gethostbyname support .local addresses by sending one shot multicast mDNS query

Default value:
• Yes (enabled)

**CONFIG_LWIP_L2_TO_L3_COPY**

Enable copy between Layer2 and Layer3 packets

*Found in: Component config > LWIP*

If this feature is enabled, all traffic from layer2(WIFI Driver) will be copied to a new buffer before sending it to layer3(LWIP stack), freeing the layer2 buffer. Please be notified that the total layer2 receiving buffer is fixed and ESP32 currently supports 25 layer2 receiving buffer, when layer2 buffer runs out of memory, then the incoming packets will be dropped in hardware. The layer3 buffer is allocated from the heap, so the total layer3 receiving buffer depends on the available heap size, when heap runs out of memory, no copy will be sent to layer3 and packet will be dropped in layer2. Please make sure you fully understand the impact of this feature before enabling it.

Default value:
• No (disabled)

**CONFIG_LWIP_IRAM_OPTIMIZATION**

Enable LWIP IRAM optimization

*Found in: Component config > LWIP*
If this feature is enabled, some functions relating to RX/TX in LWIP will be put into IRAM, it can improve UDP/TCP throughput by >10% for single core mode, it doesn’t help too much for dual core mode. On the other hand, it needs about 10KB IRAM for these optimizations.

If this feature is disabled, all lwip functions will be put into FLASH.

Default value:
- No (disabled)

**CONFIG_LWIP_EXTRA_IRAM_OPTIMIZATION**
Enable LWIP IRAM optimization for TCP part

*Found in: Component config > LWIP*

If this feature is enabled, some tcp part functions relating to RX/TX in LWIP will be put into IRAM, it can improve TCP throughput. On the other hand, it needs about 17KB IRAM for these optimizations.

Default value:
- No (disabled)

**CONFIG_LWIP_TIMERS_ONDEMAND**
Enable LWIP Timers on demand

*Found in: Component config > LWIP*

If this feature is enabled, IGMP and MLD6 timers will be activated only when joining groups or receiving QUERY packets.

This feature will reduce the power consumption for applications which do not use IGMP and MLD6.

Default value:
- Yes (enabled)

**CONFIG_LWIP_ND6**
LWIP NDP6 Enable/Disable

*Found in: Component config > LWIP*

This option is used to disable the Network Discovery Protocol (NDP) if it is not required. Please use this option with caution, as the NDP is essential for IPv6 functionality within a local network.

Default value:
- Yes (enabled)

**CONFIG_LWIP_MAX_SOCKETS**
Max number of open sockets

*Found in: Component config > LWIP*

Sockets take up a certain amount of memory, and allowing fewer sockets to be open at the same time conserves memory. Specify the maximum amount of sockets here. The valid value is from 1 to 16.

Range:
- from 1 to 16

Default value:
- 10
CONFIG_LWIP_USE_ONLY_LWIP_SELECT

Support LWIP socket select() only (DEPRECATED)

*Found in: Component config > LWIP*

This option is deprecated. Do not use this option, use VFS_SUPPORT_SELECT instead.

**Default value:**
- No (disabled)

CONFIG_LWIP_SO_LINGER

Enable SO_LINGER processing

*Found in: Component config > LWIP*

Enabling this option allows SO_LINGER processing. l_onoff = 1, l_linger can set the timeout.

If llinger=0, When a connection is closed, TCP will terminate the connection. This means that TCP will discard any data packets stored in the socket send buffer and send an RST to the peer.

If llinger!=0, Then closesocket() calls to block the process until the remaining data packets has been sent or timed out.

**Default value:**
- No (disabled)

CONFIG_LWIP_SO_REUSE

Enable SO_REUSEADDR option

*Found in: Component config > LWIP*

Enabling this option allows binding to a port which remains in TIME_WAIT.

**Default value:**
- Yes (enabled)

CONFIG_LWIP_SO_REUSE_RXTOALL

SO_REUSEADDR copies broadcast/multicast to all matches

*Found in: Component config > LWIP > CONFIG_LWIP_SO_REUSE*

Enabling this option means that any incoming broadcast or multicast packet will be copied to all of the local sockets that it matches (may be more than one if SO_REUSEADDR is set on the socket.)

This increases memory overhead as the packets need to be copied, however they are only copied per matching socket. You can safely disable it if you don’t plan to receive broadcast or multicast traffic on more than one socket at a time.

**Default value:**
- Yes (enabled)

CONFIG_LWIP_SO_RCVBUF

Enable SO_RCVBUF option

*Found in: Component config > LWIP*

Enabling this option allows checking for available data on a netconn.

**Default value:**
- No (disabled)
CONFIG_LWIP_NETBUF_RECVINFO

Enable IP_PKTINFO option

Found in: Component config > LWIP

Enabling this option allows checking for the destination address of a received IPv4 Packet.

Default value:
- No (disabled)

CONFIG_LWIP_IP4_FRAG

Enable fragment outgoing IP4 packets

Found in: Component config > LWIP

Enabling this option allows fragmenting outgoing IP4 packets if their size exceeds MTU.

Default value:
- Yes (enabled)

CONFIG_LWIP_IP6_FRAG

Enable fragment outgoing IP6 packets

Found in: Component config > LWIP

Enabling this option allows fragmenting outgoing IP6 packets if their size exceeds MTU.

Default value:
- Yes (enabled)

CONFIG_LWIP_IP4_REASSEMBLY

Enable reassembly incoming fragmented IP4 packets

Found in: Component config > LWIP

Enabling this option allows reassembling incoming fragmented IP4 packets.

Default value:
- No (disabled)

CONFIG_LWIP_IP6_REASSEMBLY

Enable reassembly incoming fragmented IP6 packets

Found in: Component config > LWIP

Enabling this option allows reassembling incoming fragmented IP6 packets.

Default value:
- No (disabled)

CONFIG_LWIP_IP_REASS_MAX_PBUFS

The maximum amount of pbufs waiting to be reassembled

Found in: Component config > LWIP

Set the maximum amount of pbufs waiting to be reassembled.

Range:
- from 10 to 100

Default value:
- 10
CONFIG_LWIP_IP_FORWARD
Enable IP forwarding

*Found in: Component config > LWIP*

Enabling this option allows packets forwarding across multiple interfaces.

**Default value:**
- No (disabled)

CONFIG_LWIP_IPV4_NAPT
Enable NAT (new/experimental)

*Found in: Component config > LWIP > CONFIG_LWIP_IP_FORWARD*

Enabling this option allows Network Address and Port Translation.

**Default value:**
- No (disabled) if CONFIG_LWIP_IP_FORWARD

CONFIG_LWIP_IPV4_NAPT_PORTMAP
Enable NAT Port Mapping (new/experimental)

*Found in: Component config > LWIP > CONFIG_LWIP_IP_FORWARD > CONFIG_LWIP_IPV4_NAPT*

Enabling this option allows Port Forwarding or Port mapping.

**Default value:**
- Yes (enabled) if CONFIG_LWIP_IPV4_NAPT

CONFIG_LWIP_STATS
Enable LWIP statistics

*Found in: Component config > LWIP*

Enabling this option allows LWIP statistics

**Default value:**
- No (disabled)

CONFIG_LWIP_ESP_GRATUITOUS_ARP
Send gratuitous ARP periodically

*Found in: Component config > LWIP*

Enable this option allows to send gratuitous ARP periodically.

This option solve the compatibility issues. If the ARP table of the AP is old, and the AP doesn’t send ARP request to update it’s ARP table, this will lead to the STA sending IP packet fail. Thus we send gratuitous ARP periodically to let AP update it’s ARP table.

**Default value:**
- Yes (enabled)

CONFIG_LWIP_GARP_TMR_INTERVAL
GARP timer interval(seconds)

*Found in: Component config > LWIP > CONFIG_LWIP_ESP_GRATUITOUS_ARP*

Set the timer interval for gratuitous ARP. The default value is 60s
Default value:
- 60

**CONFIG_LWIP_ESP_MLDV6_REPORT**

Send mldv6 report periodically

*Found in: Component config > LWIP*

Enable this option allows to send mldv6 report periodically.

This option solve the issue that failed to receive multicast data. Some routers fail to forward multicast packets. To solve this problem, send multicast mldv6 report to routers regularly.

**Default value:**
- Yes (enabled)

**CONFIG_LWIP_MLDV6_TMR_INTERVAL**

mldv6 report timer interval(seconds)

*Found in: Component config > LWIP > CONFIG_LWIP_ESP_MLDV6_REPORT*

Set the timer interval for mldv6 report. The default value is 30s

**Default value:**
- 40

**CONFIG_LWIP_TCPIP_RECVMBOX_SIZE**

TCPIP task receive mail box size

*Found in: Component config > LWIP*

Set TCPIP task receive mail box size. Generally bigger value means higher throughput but more memory. The value should be bigger than UDP/TCP mail box size.

**Range:**
- from 6 to 1024 if **CONFIG_LWIP_WND_SCALE**

**Default value:**
- 32

**CONFIG_LWIP_DHCP_DOES_ARP_CHECK**

DHCP: Perform ARP check on any offered address

*Found in: Component config > LWIP*

Enabling this option performs a check (via ARP request) if the offered IP address is not already in use by another host on the network.

**Default value:**
- Yes (enabled)

**CONFIG_LWIP_DHCP_DISABLE_CLIENT_ID**

DHCP: Disable Use of HW address as client identification

*Found in: Component config > LWIP*

This option could be used to disable DHCP client identification with its MAC address. (Client id is used by DHCP servers to uniquely identify clients and are included in the DHCP packets as an option 61) Set this option to “y” in order to exclude option 61 from DHCP packets.

**Default value:**

Chapter 2. API Reference

- No (disabled)

**CONFIG_LWIP_DHCP_DISABLE_VENDOR_CLASS_ID**

DHCP: Disable Use of vendor class identification

*Found in: Component config > LWIP*

This option could be used to disable DHCP client vendor class identification. Set this option to “y” in order to exclude option 60 from DHCP packets.

*Default value:*
  - Yes (enabled)

**CONFIG_LWIP_DHCP_RESTORE_LAST_IP**

DHCP: Restore last IP obtained from DHCP server

*Found in: Component config > LWIP*

When this option is enabled, DHCP client tries to re-obtain last valid IP address obtained from DHCP server. Last valid DHCP configuration is stored in nvs and restored after reset/power-up. If IP is still available, there is no need for sending discovery message to DHCP server and save some time.

*Default value:*
  - No (disabled)

**CONFIG_LWIP_DHCP_OPTIONS_LEN**

DHCP total option length

*Found in: Component config > LWIP*

Set total length of outgoing DHCP option msg. Generally bigger value means it can carry more options and values. If your code meets LWIP_ASSERT due to option value is too long. Please increase the LWIP_DHCP_OPTIONS_LEN value.

*Range:*
  - from 68 to 255

*Default value:*
  - 68

**CONFIG_LWIP_NUM_NETIF_CLIENT_DATA**

Number of clients store data in netif

*Found in: Component config > LWIP*

Number of clients that may store data in client_data member array of struct netif.

*Range:*
  - from 0 to 256

*Default value:*
  - 0

**CONFIG_LWIP_DHCP_COARSE_TIMER_SECS**

DHCP coarse timer interval(s)

*Found in: Component config > LWIP*

Set DHCP coarse interval in seconds. A higher value will be less precise but cost less power consumption.

*Range:*
  - from 1 to 10
DHCP server Contains:

- **CONFIG_LWIP_DHCPS**

**CONFIG_LWIP_DHCPS**

DHCP: Enable IPv4 Dynamic Host Configuration Protocol Server (DHCP)

*Found in: Component config > LWIP > DHCP server*

Enabling this option allows the device to run the DHCP server (to dynamically assign IPv4 addresses to clients).

**Default value:**

- Yes (enabled)

**CONFIG_LWIP_DHCPSLEASE_UNIT**

Multiplier for lease time, in seconds

*Found in: Component config > LWIP > DHCP server > CONFIG_LWIP_DHCPS*

The DHCP server is calculating lease time multiplying the sent and received times by this number of seconds per unit. The default is 60, that equals one minute.

**Range:**

- from 1 to 3600

**Default value:**

- 60

**CONFIG_LWIP_DHCPS_MAX_STATION_NUM**

Maximum number of stations

*Found in: Component config > LWIP > DHCP server > CONFIG_LWIP_DHCPS*

The maximum number of DHCP clients that are connected to the server. After this number is exceeded, DHCP server removes of the oldest device from it’s address pool, without notification.

**Range:**

- from 1 to 64

**Default value:**

- 8

**CONFIG_LWIP_DHCPS_STATIC_ENTRIES**

Enable ARP static entries

*Found in: Component config > LWIP > DHCP server > CONFIG_LWIP_DHCPS*

Enabling this option allows DHCP server to support temporary static ARP entries for DHCP Client. This will help the DHCP server to send the DHCP OFFER and DHCP ACK using IP unicast.

**Default value:**

- Yes (enabled)
CONFIG_LWIP_AUTOIP

Enable IPV4 Link-Local Addressing (AUTOIP)

*Found in: Component config > LWIP*

Enabling this option allows the device to self-assign an address in the 169.256/16 range if none is assigned statically or via DHCP.

See RFC 3927.

**Default value:**
- No (disabled)

**Contains:**
- CONFIG_LWIP_AUTOIP_TRIES
- CONFIG_LWIP_AUTOIP_MAX_CONFLICTS
- CONFIG_LWIP_AUTOIP_RATE_LIMIT_INTERVAL

CONFIG_LWIP_AUTOIP_TRIES

DHCP Probes before self-assigning IPv4 LL address

*Found in: Component config > LWIP > CONFIG_LWIP_AUTOIP*

DHCP client will send these many probes before self-assigning a link local address.

From LWIP help: “This can be set as low as 1 to get an AutoIP address very quickly, but you should be prepared to handle a changing IP address when DHCP overrides AutoIP.” (In the case of ESP-IDF, this means multiple SYSTEM_EVENT_STA_GOT_IP events.)

**Range:**
- from 1 to 100 if CONFIG_LWIP_AUTOIP

**Default value:**
- 2 if CONFIG_LWIP_AUTOIP

CONFIG_LWIP_AUTOIP_MAX_CONFLICTS

Max IP conflicts before rate limiting

*Found in: Component config > LWIP > CONFIG_LWIP_AUTOIP*

If the AUTOIP functionality detects this many IP conflicts while self-assigning an address, it will go into a rate limited mode.

**Range:**
- from 1 to 100 if CONFIG_LWIP_AUTOIP

**Default value:**
- 9 if CONFIG_LWIP_AUTOIP

CONFIG_LWIP_AUTOIP_RATE_LIMIT_INTERVAL

Rate limited interval (seconds)

*Found in: Component config > LWIP > CONFIG_LWIP_AUTOIP*

If rate limiting self-assignment requests, wait this long between each request.

**Range:**
- from 5 to 120 if CONFIG_LWIP_AUTOIP

**Default value:**
- 20 if CONFIG_LWIP_AUTOIP
**CONFIG_LWIP_IPV4**

Enable IPv4

*Found in: Component config > LWIP*

Enable IPv4 stack. If you want to use IPv6 only TCP/IP stack, disable this.

**Default value:**
- Yes (enabled)

**CONFIG_LWIP_IPV6**

Enable IPv6

*Found in: Component config > LWIP*

Enable IPv6 function. If not use IPv6 function, set this option to n. If disabling LWIP_IPV6 then some other components (coap and asio) will no longer be available.

**Default value:**
- Yes (enabled)

**CONFIG_LWIP_IPV6_AUTOCONFIG**

Enable IPv6 stateless address autoconfiguration (SLAAC)

*Found in: Component config > LWIP > CONFIG_LWIP_IPV6*

Enabling this option allows the devices to IPV6 stateless address autoconfiguration (SLAAC).

See RFC 4862.

**Default value:**
- No (disabled)

**CONFIG_LWIP_IPV6_NUM_ADDRESSES**

Number of IPv6 addresses on each network interface

*Found in: Component config > LWIP > CONFIG_LWIP_IPV6*

The maximum number of IPv6 addresses on each interface. Any additional addresses will be discarded.

**Default value:**
- 3

**CONFIG_LWIP_IPV6_FORWARD**

Enable IPv6 forwarding between interfaces

*Found in: Component config > LWIP > CONFIG_LWIP_IPV6*

Forwarding IPv6 packets between interfaces is only required when acting as a router.

**Default value:**
- No (disabled)

**CONFIG_LWIP_IPV6_RDNSS_MAX_DNS_SERVERS**

Use IPv6 Router Advertisement Recursive DNS Server Option

*Found in: Component config > LWIP*

Use IPv6 Router Advertisement Recursive DNS Server Option (as per RFC 6106) to copy a defined maximum number of DNS servers to the DNS module. Set this option to a number of desired DNS servers advertised in the RA protocol. This feature is disabled when set to 0.
**Default value:**
- 0 if `CONFIG_LWIP_IPV6_AUTOCONFIG`

**CONFIG_LWIP_IPV6_DHCP6**
Enable DHCPv6 stateless address autoconfiguration

*Found in: Component config > LWIP*

Enable DHCPv6 for IPv6 stateless address autoconfiguration. Note that the dhcpv6 client has to be started using dhcp6_enable_stateless(netif); Note that the stateful address autoconfiguration is not supported.

*Default value:*
- No (disabled) if `CONFIG_LWIP_IPV6_AUTOCONFIG`

**CONFIG_LWIP_NETIF_STATUS_CALLBACK**
Enable status callback for network interfaces

*Found in: Component config > LWIP*

Enable callbacks when the network interface is up/down and addresses are changed.

*Default value:*
- No (disabled)

**CONFIG_LWIP_NETIF_LOOPBACK**
Support per-interface loopback

*Found in: Component config > LWIP*

Enabling this option means that if a packet is sent with a destination address equal to the interface’s own IP address, it will “loop back” and be received by this interface. Disabling this option disables support of loopback interface in lwIP

*Default value:*
- Yes (enabled)

Contains:
- `CONFIG_LWIP_LOOPBACK_MAX_PBUFS`

**CONFIG_LWIP_LOOPBACK_MAX_PBUFS**
Max queued loopback packets per interface

*Found in: Component config > LWIP > CONFIG_LWIP_NETIF_LOOPBACK*

Configure the maximum number of packets which can be queued for loopback on a given interface. Reducing this number may cause packets to be dropped, but will avoid filling memory with queued packet data.

*Range:*
- from 0 to 16

*Default value:*
- 8
TCP Contains:

- `CONFIG_LWIP_TCP_WND_DEFAULT`
- `CONFIG_LWIP_TCP_SND_BUF_DEFAULT`
- `CONFIG_LWIP_TCP_RECVMBX_SIZE`
- `CONFIG_LWIP_TCP_RTO_TIMEOUT`
- `CONFIG_LWIP_MAX_ACTIVE_TCP`
- `CONFIG_LWIP_TCP_FIN_WAIT_TIMEOUT`
- `CONFIG_LWIP_MAX_LISTENING_TCP`
- `CONFIG_LWIP_TCP_MAXRTX`
- `CONFIG_LWIP_TCP_SYNMAXRTX`
- `CONFIG_LWIP_TCP_MSL`
- `CONFIG_LWIP_TCP_MSS`
- `CONFIG_LWIP_TCP_OVERSIZE`
- `CONFIG_LWIP_TCP_QUEUE_OOSEQ`
- `CONFIG_LWIP_WND_SCALE`
- `CONFIG_LWIP_TCP_HIGH_SPEED RETRANSMISSION`
- `CONFIG_LWIP_TCP_TMR_INTERVAL`

**CONFIG_LWIP_MAX_ACTIVE_TCP**

Maximum active TCP Connections

*Found in: Component config > LWIP > TCP*

The maximum number of simultaneously active TCP connections. The practical maximum limit is determined by available heap memory at runtime.

Changing this value by itself does not substantially change the memory usage of LWIP, except for preventing new TCP connections after the limit is reached.

**Range:**
- from 1 to 1024

**Default value:**
- 16

**CONFIG_LWIP_MAX_LISTENING_TCP**

Maximum listening TCP Connections

*Found in: Component config > LWIP > TCP*

The maximum number of simultaneously listening TCP connections. The practical maximum limit is determined by available heap memory at runtime.

Changing this value by itself does not substantially change the memory usage of LWIP, except for preventing new listening TCP connections after the limit is reached.

**Range:**
- from 1 to 1024

**Default value:**
- 16

**CONFIG_LWIP_TCP_HIGH_SPEED RETRANSMISSION**

TCP high speed retransmissions

*Found in: Component config > LWIP > TCP*

Speed up the TCP retransmission interval. If disabled, it is recommended to change the number of SYN retransmissions to 6, and TCP initial rto time to 3000.

**Default value:**
Chapter 2. API Reference

- Yes (enabled)

**CONFIG_LWIP_TCP_MAXRTX**

Maximum number of retransmissions of data segments

*Found in: Component config > LWIP > TCP*

Set maximum number of retransmissions of data segments.

**Range:**
- from 3 to 12

**Default value:**
- 12

**CONFIG_LWIP_TCP_SYNMAXRTX**

Maximum number of retransmissions of SYN segments

*Found in: Component config > LWIP > TCP*

Set maximum number of retransmissions of SYN segments.

**Range:**
- from 3 to 12

**Default value:**
- 12

**CONFIG_LWIP_TCP_MSS**

Maximum Segment Size (MSS)

*Found in: Component config > LWIP > TCP*

Set maximum segment size for TCP transmission.

Can be set lower to save RAM, the default value 1460(ipv4)/1440(ipv6) will give best throughput. IPv4 TCP_MSS Range: 576 <= TCP_MSS <= 1460 IPv6 TCP_MSS Range: 1220 <= TCP_MSS <= 1440

**Range:**
- from 536 to 1460

**Default value:**
- 1440

**CONFIG_LWIP_TCP_TMR_INTERVAL**

TCP timer interval(ms)

*Found in: Component config > LWIP > TCP*

Set TCP timer interval in milliseconds.

Can be used to speed connections on bad networks. A lower value will redeliver unacked packets faster.

**Default value:**
- 250

**CONFIG_LWIP_TCP_MSL**

Maximum segment lifetime (MSL)

*Found in: Component config > LWIP > TCP*

Set maximum segment lifetime in milliseconds.

**Default value:**
• 60000

**CONFIG_LWIP_TCP_FIN_WAIT_TIMEOUT**

Maximum FIN segment lifetime

*Found in: Component config > LWIP > TCP*

Set maximum segment lifetime in milliseconds.

**Default value:**

• 20000

**CONFIG_LWIP_TCP_SND_BUF_DEFAULT**

Default send buffer size

*Found in: Component config > LWIP > TCP*

Set default send buffer size for new TCP sockets.

Per-socket send buffer size can be changed at runtime with lwip_setsockopt(s, TCP_SNDBUF, ...).

This value must be at least 2x the MSS size, and the default is 4x the default MSS size.

Setting a smaller default SNDBUF size can save some RAM, but will decrease performance.

**Range:**

• from 2440 to 1024000 if **CONFIG_LWIP_WND_SCALE**

**Default value:**

• 5760

**CONFIG_LWIP_TCP_WND_DEFAULT**

Default receive window size

*Found in: Component config > LWIP > TCP*

Set default TCP receive window size for new TCP sockets.

Per-socket receive window size can be changed at runtime with lwip_setsockopt(s, TCP_WINDOW, ...).

Setting a smaller default receive window size can save some RAM, but will decrease performance.

**Range:**

• from 2440 to 1024000 if **CONFIG_LWIP_WND_SCALE**

**Default value:**

• 5760

**CONFIG_LWIP_TCP_RECVMBOX_SIZE**

Default TCP receive mail box size

*Found in: Component config > LWIP > TCP*

Set TCP receive mail box size. Generally bigger value means higher throughput but more memory. The recommended value is: \(\text{LWIP_TCP_WND_DEFAULT}/\text{TCP_MSS} + 2\), e.g. if \(\text{LWIP_TCP_WND_DEFAULT}=14360\), \(\text{TCP_MSS}=1436\), then the recommended receive mail box size is \((14360/1436 + 2) = 12\).

TCP receive mail box is a per socket mail box, when the application receives packets from TCP socket, LWIP core firstly posts the packets to TCP receive mail box and the application then fetches the packets from mail box. It means LWIP can caches maximum \(\text{LWIP_TCP_RECVMBOX_SIZE}\) packets for each TCP socket, so the maximum possible cached TCP packets for all TCP sockets is...
LWIP_TCP_RECCVMBOX_SIZE multiples the maximum TCP socket number. In other words, the bigger LWIP_TCP_RECCVMBOX_SIZE means more memory. On the other hand, if the receive mailbox is too small, the mail box may be full. If the mail box is full, the LWIP drops the packets. So generally we need to make sure the TCP receive mail box is big enough to avoid packet drop between LWIP core and application.

Range:
- from 6 to 1024 if CONFIG_LWIP_WND_SCALE

Default value:
- 6

CONFIG_LWIP_TCP_QUEUE_OOSEQ

Queue incoming out-of-order segments

Found in: Component config > LWIP > TCP

Queue incoming out-of-order segments for later use.

Disable this option to save some RAM during TCP sessions, at the expense of increased retransmissions if segments arrive out of order.

Default value:
- Yes (enabled)

CONFIG_LWIP_TCP_OOSEQ_TIMEOUT

Timeout for each pbuf queued in TCP OOSEQ, in RTOs.

Found in: Component config > LWIP > TCP > CONFIG_LWIP_TCP_QUEUE_OOSEQ

The timeout value is TCP_OOSEQ_TIMEOUT * RTO.

Range:
- from 1 to 30

Default value:
- 6

CONFIG_LWIP_TCP_OOSEQ_MAX_PBUFS

The maximum number of pbufs queued on OOSEQ per pcb

Found in: Component config > LWIP > TCP > CONFIG_LWIP_TCP_QUEUE_OOSEQ

If LWIP_TCP_OOSEQ_MAX_PBUFS = 0, TCP will not control the number of OOSEQ pbufs.

In a poor network environment, many out-of-order tcp pbufs will be received. These out-of-order pbufs will be cached in the TCP out-of-order queue which will cause Wi-Fi/Ethernet fail to release RX buffer in time. It is possible that all RX buffers for MAC layer are used by OOSEQ.

Control the number of out-of-order pbufs to ensure that the MAC layer has enough RX buffer to receive packets.

In the Wi-Fi scenario, recommended OOSEQ PBUFS Range: 0 <= TCP_OOSEQ_MAX_PBUFS <= CONFIG_ESP_WIFI_DYNAMIC_RX_BUFFER_NUM/(MAX_TCPNUMBER + 1)

In the Ethernet scenario, recommended Ethernet OOSEQ PBUFS Range: 0 <= TCP_OOSEQ_MAX_PBUFS <= CONFIG_ETH_DMA_RX_BUFFER_NUM/(MAX_TCPNUMBER + 1)

Within the recommended value range, the larger the value, the better the performance.

MAX_TCPNUMBER represent Maximum number of TCP connections in Wi-Fi(STA+SoftAP) and Ethernet scenario.

Range:
• from 0 to 12

**Default value:**
• 4

**CONFIG_LWIP_TCP_SACK_OUT**

Support sending selective acknowledgements

*Found in: Component config > LWIP > TCP > CONFIG_LWIP_TCP_QUEUE_OOSEQ*

TCP will support sending selective acknowledgements (SACKs).

**Default value:**
• No (disabled)

**CONFIG_LWIP_TCP_OVERSIZE**

Pre-allocate transmit PBUF size

*Found in: Component config > LWIP > TCP*

Allows enabling “oversize” allocation of TCP transmission pbufs ahead of time, which can reduce the length of pbuf chains used for transmission.

This will not make a difference to sockets where Nagle’s algorithm is disabled.

Default value of MSS is fine for most applications, 25% MSS may save some RAM when only transmitting small amounts of data. Disabled will have worst performance and fragmentation characteristics, but uses least RAM overall.

Available options:

• MSS (CONFIG_LWIP_TCP_OVERSIZE_MSS)
• 25% MSS (CONFIG_LWIP_TCP_OVERSIZE_QUARTER_MSS)
• Disabled (CONFIG_LWIP_TCP_OVERSIZE_DISABLE)

**CONFIG_LWIP_WND_SCALE**

Support TCP window scale

*Found in: Component config > LWIP > TCP*

Enable this feature to support TCP window scaling.

**Default value:**
• No (disabled) if `CONFIG_SPIRAM_TRY_ALLOCATE_WIFI_LWIP`

**CONFIG_LWIP_TCP_RCV_SCALE**

Set TCP receiving window scaling factor

*Found in: Component config > LWIP > TCP > CONFIG_LWIP_WND_SCALE*

Enable this feature to support TCP window scaling.

**Range:**
• from 0 to 14 if `CONFIG_LWIP_WND_SCALE`

**Default value:**
• 0 if `CONFIG_LWIP_WND_SCALE`
CONFIG_LWIP_TCP_RTO_TIME

Default TCP rto time

*Found in: Component config > LWIP > TCP*

Set default TCP rto time for a reasonable initial rto. In bad network environment, recommend set value of rto time to 1500.

**Default value:**
- 1500

**UDP** Contains:

- CONFIG_LWIP_UDP_RECVMBOX_SIZE
- CONFIG_LWIP_MAX_UDP_PCBS

CONFIG_LWIP_MAX_UDP_PCBS

Maximum active UDP control blocks

*Found in: Component config > LWIP > UDP*

The maximum number of active UDP connections (ie UDP sockets sending/receiving data). The practical maximum limit is determined by available heap memory at runtime.

**Range:**
- from 1 to 1024

**Default value:**
- 16

CONFIG_LWIP_UDP_RECVMBOX_SIZE

Default UDP receive mail box size

*Found in: Component config > LWIP > UDP*

Set UDP receive mail box size. The recommended value is 6.

UDP receive mail box is a per socket mail box, when the application receives packets from UDP socket, LWIP core firstly posts the packets to UDP receive mail box and the application then fetches the packets from mail box. It means LWIP can caches maximum UDP_RECVMBOX_SIZE packets for each UDP socket, so the maximum possible cached UDP packets for all UDP sockets is UDP_RECVMBOX_SIZE multiples the maximum UDP socket number. In other words, the bigger UDP_RECVMBOX_SIZE means more memory. On the other hand, if the receive mail box is too small, the mail box may be full. If the mail box is full, the LWIP drops the packets. So generally we need to make sure the UDP receive mail box is big enough to avoid packet drop between LWIP core and application.

**Range:**
- from 6 to 64

**Default value:**
- 6

Checksums Contains:

- CONFIG_LWIP_CHECKSUM_CHECK_ICMP
- CONFIG_LWIP_CHECKSUM_CHECK_IP
- CONFIG_LWIP_CHECKSUM_CHECK_UDP
CONFIG_LWIP_CHECKSUM_CHECK_IP
Enable LWIP IP checksums

*Found in: Component config > LWIP > Checksums*
Enable checksum checking for received IP messages

**Default value:**
- No (disabled)

CONFIG_LWIP_CHECKSUM_CHECK_UDP
Enable LWIP UDP checksums

*Found in: Component config > LWIP > Checksums*
Enable checksum checking for received UDP messages

**Default value:**
- No (disabled)

CONFIG_LWIP_CHECKSUM_CHECK_ICMP
Enable LWIP ICMP checksums

*Found in: Component config > LWIP > Checksums*
Enable checksum checking for received ICMP messages

**Default value:**
- Yes (enabled)

CONFIG_LWIP_TCPIP_TASK_STACK_SIZE
TCP/IP Task Stack Size

*Found in: Component config > LWIP*
Configure TCP/IP task stack size, used by LWIP to process multi-threaded TCP/IP operations. Setting this stack too small will result in stack overflow crashes.

**Range:**
- from 2048 to 65536

**Default value:**
- 3072

CONFIG_LWIP_TCPIP_TASK_AFFINITY
TCP/IP task affinity

*Found in: Component config > LWIP*
Allows setting LwIP tasks affinity, i.e. whether the task is pinned to CPU0, pinned to CPU1, or allowed to run on any CPU. Currently this applies to “TCP/IP” task and “Ping” task.

**Available options:**
- No affinity (CONFIG_LWIP_TCPIP_TASK_AFFINITY_NO_AFFINITY)
- CPU0 (CONFIG_LWIP_TCPIP_TASK_AFFINITY_CPU0)
- CPU1 (CONFIG_LWIP_TCPIP_TASK_AFFINITY_CPU1)
CONFIG_LWIP_PPP_SUPPORT
Enable PPP support

*Found in: Component config > LWIP*

Enable PPP stack. Now only PPP over serial is possible.

**Default value:**
- No (disabled)

Contains:
- CONFIG_LWIP_PPP_ENABLE_IPV6

CONFIG_LWIP_PPP_ENABLE_IPV6
Enable IPv6 support for PPP connections (IPV6CP)

*Found in: Component config > LWIP > CONFIG_LWIP_PPP_SUPPORT*

Enable IPv6 support in PPP for the local link between the DTE (processor) and DCE (modem). There are some modems which do not support the IPv6 addressing in the local link. If they are requested for IPv6CP negotiation, they may time out. This would in turn fail the configuration for the whole link. If your modem is not responding correctly to PPP Phase Network, try to disable IPv6 support.

**Default value:**
- Yes (enabled) if CONFIG_LWIP_PPP_SUPPORT && CONFIG_LWIP_IPV6

CONFIG_LWIP_IPV6_MEMP_NUM_ND6_QUEUE
Max number of IPv6 packets to queue during MAC resolution

*Found in: Component config > LWIP*

Config max number of IPv6 packets to queue during MAC resolution.

**Range:**
- from 3 to 20

**Default value:**
- 3

CONFIG_LWIP_IPV6_ND6_NUM_NEIGHBORS
Max number of entries in IPv6 neighbor cache

*Found in: Component config > LWIP*

Config max number of entries in IPv6 neighbor cache

**Range:**
- from 3 to 10

**Default value:**
- 5

CONFIG_LWIP_PPP_NOTIFY_PHASE_SUPPORT
Enable Notify Phase Callback

*Found in: Component config > LWIP*

Enable to set a callback which is called on change of the internal PPP state machine.

**Default value:**
- No (disabled) if CONFIG_LWIP_PPP_SUPPORT
CONFIG_LWIP_PPP_PAP_SUPPORT
Enable PAP support
Found in: Component config > LWIP
Enable Password Authentication Protocol (PAP) support
Default value:
• No (disabled) if CONFIG_LWIP_PPP_SUPPORT

CONFIG_LWIP_PPP_CHAP_SUPPORT
Enable CHAP support
Found in: Component config > LWIP
Enable Challenge Handshake Authentication Protocol (CHAP) support
Default value:
• No (disabled) if CONFIG_LWIP_PPP_SUPPORT

CONFIG_LWIP_PPP_MSCHAP_SUPPORT
Enable MSCHAP support
Found in: Component config > LWIP
Enable Microsoft version of the Challenge-Handshake Authentication Protocol (MSCHAP) support
Default value:
• No (disabled) if CONFIG_LWIP_PPP_SUPPORT

CONFIG_LWIP_PPP_MPPE_SUPPORT
Enable MPPE support
Found in: Component config > LWIP
Enable Microsoft Point-to-Point Encryption (MPPE) support
Default value:
• No (disabled) if CONFIG_LWIP_PPP_SUPPORT

CONFIG_LWIP_ENABLE_LCP_ECHO
Enable LCP ECHO
Found in: Component config > LWIP
Enable LCP echo keepalive requests
Default value:
• No (disabled) if CONFIG_LWIP_PPP_SUPPORT

CONFIG_LWIP_LCP_ECHOINTERVAL
Echo interval (s)
Found in: Component config > LWIP > CONFIG_LWIP_ENABLE_LCP_ECHO
Interval in seconds between keepalive LCP echo requests, 0 to disable.
Range:
• from 0 to 1000000 if CONFIG_LWIP_ENABLE_LCP_ECHO
Default value:
• 3 if CONFIG_LWIP_ENABLE_LCP_ECHO
CONFIG_LWIP_LCP_MAXECHOFAILS

Maximum echo failures

*Found in: Component config > LWIP > CONFIG_LWIP_ENABLE_LCP_ECHO*

Number of consecutive unanswered echo requests before failure is indicated.

**Range:**
- from 0 to 100000 if `CONFIG_LWIP_ENABLE_LCP_ECHO`

**Default value:**
- 3 if `CONFIG_LWIP_ENABLE_LCP_ECHO`

CONFIG_LWIP_PPP_DEBUG_ON

Enable PPP debug log output

*Found in: Component config > LWIP*

Enable PPP debug log output

**Default value:**
- No (disabled) if `CONFIG_LWIP_PPP_SUPPORT`

CONFIG_LWIP_SLIP_SUPPORT

Enable SLIP support (new/experimental)

*Found in: Component config > LWIP*

Enable SLIP stack. Now only SLIP over serial is possible.

SLIP over serial support is experimental and unsupported.

**Default value:**
- No (disabled)

Contains:
- `CONFIG_LWIP_SLIP_DEBUG_ON`

CONFIG_LWIP_SLIP_DEBUG_ON

Enable SLIP debug log output

*Found in: Component config > LWIP > CONFIG_LWIP_SLIP_SUPPORT*

Enable SLIP debug log output

**Default value:**
- No (disabled) if `CONFIG_LWIP_SLIP_SUPPORT`

ICMP

Contains:
- `CONFIG_LWIP_ICMP`
- `CONFIG_LWIP_BROADCAST_PING`
- `CONFIG_LWIP_MULTICAST_PING`

CONFIG_LWIP_ICMP

ICMP: Enable ICMP

*Found in: Component config > LWIP > ICMP*

Enable ICMP module for check network stability

**Default value:**
Chapter 2. API Reference

- Yes (enabled)

**CONFIG_LWIP_MULTICAST_PING**

Respond to multicast pings

*Found in: Component config > LWIP > ICMP*

**Default value:**
- No (disabled)

**CONFIG_LWIP_BROADCAST_PING**

Respond to broadcast pings

*Found in: Component config > LWIP > ICMP*

**Default value:**
- No (disabled)

**LWIP RAW API** Contains:

- **CONFIG_LWIP_MAX_RAW_PCBS**

**CONFIG_LWIP_MAX_RAW_PCBS**

Maximum LWIP RAW PCBs

*Found in: Component config > LWIP > LWIP RAW API*

The maximum number of simultaneously active LWIP RAW protocol control blocks. The practical maximum limit is determined by available heap memory at runtime.

**Range:**
- from 1 to 1024

**Default value:**
- 16

**SNTP** Contains:

- **CONFIG_LWIP_SNTP_MAX_SERVERS**
- **CONFIG_LWIP_SNTP_UPDATE_DELAY**
- **CONFIG_LWIP_DHCP_GET_NTP_SRV**

**CONFIG_LWIP_SNTP_MAX_SERVERS**

Maximum number of NTP servers

*Found in: Component config > LWIP > SNTP*

Set maximum number of NTP servers used by LwIP SNTP module. First argument of sntp_setserver/snntp_setservername functions is limited to this value.

**Range:**
- from 1 to 16

**Default value:**
- 1
CONFIG_LWIP_DHCP_GET_NTP_SRV
Request NTP servers from DHCP

*Found in: Component config > LWIP > SNTP*

If enabled, LWIP will add ‘NTP’ to Parameter-Request Option sent via DHCP-request. DHCP server might reply with an NTP server address in option 42. SNTP callback for such replies should be set accordingly (see sntp_servermode_dhcp() func.)

*Default value:*
- No (disabled)

CONFIG_LWIP_DHCP_MAX_NTP_SERVERS
Maximum number of NTP servers acquired via DHCP

*Found in: Component config > LWIP > SNTP > CONFIG_LWIP_DHCP_GET_NTP_SRV*

Set maximum number of NTP servers acquired via DHCP-offer. Should be less or equal to “Maximum number of NTP servers”, any extra servers would be just ignored.

*Range:*
- from 1 to 16 if CONFIG_LWIP_DHCP_GET_NTP_SRV

*Default value:*
- 1 if CONFIG_LWIP_DHCP_GET_NTP_SRV

CONFIG_LWIP_SNTP_UPDATE_DELAY
Request interval to update time (ms)

*Found in: Component config > LWIP > SNTP*

This option allows you to set the time update period via SNTP. Default is 1 hour. Must not be below 15 seconds by specification. (SNTPv4 RFC 4330 enforces a minimum update time of 15 seconds).

*Range:*
- from 15000 to 4294967295

*Default value:*
- 3600000

CONFIG_LWIP_BRIDGEIF_MAX_PORTS
Maximum number of bridge ports

*Found in: Component config > LWIP*

Set maximum number of ports a bridge can consists of.

*Range:*
- from 1 to 63

*Default value:*
- 7

CONFIG_LWIP_ESP_LWIP_ASSERT
Enable LWIP ASSERT checks

*Found in: Component config > LWIP*

Enable this option keeps LWIP assertion checks enabled. It is recommended to keep this option enabled. If asserts are disabled for the entire project, they are also disabled for LWIP and this option is ignored.
Hooks

Contains:

- `CONFIG_LWIP_HOOK_ND6_GET_GW`
- `CONFIG_LWIP_HOOK_IP6_INPUT`
- `CONFIG_LWIP_HOOK_IP6_ROUTE`
- `CONFIG_LWIP_HOOK_IP6_SELECT_SRC_ADDR`
- `CONFIG_LWIP_HOOK_NETCONN_EXTERNAL_RESOLVE`
- `CONFIG_LWIP_HOOK_TCP_ISN`

**CONFIG_LWIP_HOOK_TCP_ISN**

TCP ISN Hook

*Found in: Component config > LWIP > Hooks*

Enables to define a TCP ISN hook to randomize initial sequence number in TCP connection. The default TCP ISN algorithm used in IDF (standardized in RFC 6528) produces ISN by combining an MD5 of the new TCP id and a stable secret with the current time. This is because the lwIP implementation (`tcp_next_iss`) is not very strong, as it does not take into consideration any platform specific entropy source.

Set to `LWIP_HOOK_TCP_ISN_CUSTOM` to provide custom implementation. Set to `LWIP_HOOK_TCP_ISN_NONE` to use lwIP implementation.

Available options:

- No hook declared (`CONFIG_LWIP_HOOK_TCP_ISN_NONE`)
- Default implementation (`CONFIG_LWIP_HOOK_TCP_ISN_DEFAULT`)
- Custom implementation (`CONFIG_LWIP_HOOK_TCP_ISN_CUSTOM`)

**CONFIG_LWIP_HOOK_IP6_ROUTE**

IPv6 route Hook

*Found in: Component config > LWIP > Hooks*

Enables custom IPv6 route hook. Setting this to “default” provides weak implementation stub that could be overwritten in application code. Setting this to “custom” provides hook’s declaration only and expects the application to implement it.

Available options:

- No hook declared (`CONFIG_LWIP_HOOK_IP6_ROUTE_NONE`)
- Default (weak) implementation (`CONFIG_LWIP_HOOK_IP6_ROUTE_DEFAULT`)
- Custom implementation (`CONFIG_LWIP_HOOK_IP6_ROUTE_CUSTOM`)

**CONFIG_LWIP_HOOK_ND6_GET_GW**

IPv6 get gateway Hook

*Found in: Component config > LWIP > Hooks*

Enables custom IPv6 route hook. Setting this to “default” provides weak implementation stub that could be overwritten in application code. Setting this to “custom” provides hook’s declaration only and expects the application to implement it.

Available options:

- No hook declared (`CONFIG_LWIP_HOOK_ND6_GET_GW_NONE`)
- Default (weak) implementation (`CONFIG_LWIP_HOOK_ND6_GET_GW_DEFAULT`)
- Custom implementation (CONFIG_LWIP_HOOK_ND6_GET_GW_CUSTOM)

**CONFIG_LWIP_HOOK_IP6_SELECT_SRC_ADDR**

IPv6 source address selection Hook

*Found in: Component config > LWIP > Hooks*

Enables custom IPv6 source address selection. Setting this to “default” provides weak implementation stub that could be overwritten in application code. Setting this to “custom” provides hook’s declaration only and expects the application to implement it.

Available options:

- No hook declared (CONFIG_LWIP_HOOK_IP6_SELECT_SRC_ADDR_NONE)
- Default (weak) implementation (CONFIG_LWIP_HOOK_IP6_SELECT_SRC_ADDR_DEFAULT)
- Custom implementation (CONFIG_LWIP_HOOK_IP6_SELECT_SRC_ADDR_CUSTOM)

**CONFIG_LWIP_HOOK_NETCONN_EXTERNAL_RESOLVE**

Netconn external resolve Hook

*Found in: Component config > LWIP > Hooks*

Enables custom DNS resolve hook. Setting this to “default” provides weak implementation stub that could be overwritten in application code. Setting this to “custom” provides hook’s declaration only and expects the application to implement it.

Available options:

- No hook declared (CONFIG_LWIP_HOOK_NETCONN_EXT_RESOLVE_NONE)
- Default (weak) implementation (CONFIG_LWIP_HOOK_NETCONN_EXT_RESOLVE_DEFAULT)
- Custom implementation (CONFIG_LWIP_HOOK_NETCONN_EXT_RESOLVE_CUSTOM)

**CONFIG_LWIP_HOOK_IP6_INPUT**

IPv6 packet input

*Found in: Component config > LWIP > Hooks*

Enables custom IPv6 packet input. Setting this to “default” provides weak implementation stub that could be overwritten in application code. Setting this to “custom” provides hook’s declaration only and expects the application to implement it.

Available options:

- No hook declared (CONFIG_LWIP_HOOK_IP6_INPUT_NONE)
- Default (weak) implementation (CONFIG_LWIP_HOOK_IP6_INPUT_DEFAULT)
- Custom implementation (CONFIG_LWIP_HOOK_IP6_INPUT_CUSTOM)

**CONFIG_LWIP_DEBUG**

Enable LWIP Debug

*Found in: Component config > LWIP*

Enabling this option allows different kinds of lwIP debug output.

All lwIP debug features increase the size of the final binary.

**Default value:**
Contains:

- `CONFIG_LWIP_API_LIB_DEBUG`
- `CONFIG_LWIP_BRIDGEIF_FDB_DEBUG`
- `CONFIG_LWIP_BRIDGEIF_FW_DEBUG`
- `CONFIG_LWIP_BRIDGEIF_DEBUG`
- `CONFIG_LWIP_DHCP_DEBUG`
- `CONFIG_LWIP_DHCP_STATE_DEBUG`
- `CONFIG_LWIP_DNS_DEBUG`
- `CONFIG_LWIP_ETHARP_DEBUG`
- `CONFIG_LWIP_ICMP_DEBUG`
- `CONFIG_LWIP_ICMP6_DEBUG`
- `CONFIG_LWIP_IP_DEBUG`
- `CONFIG_LWIP_IP6_DEBUG`
- `CONFIG_LWIP_NETIF_DEBUG`
- `CONFIG_LWIP_PBUF_DEBUG`
- `CONFIG_LWIP_SNTP_DEBUG`
- `CONFIG_LWIP_SOCKETS_DEBUG`
- `CONFIG_LWIP_TCP_DEBUG`
- `CONFIG_LWIP_UDP_DEBUG`
- `CONFIG_LWIP_DEBUG_ESP_LOG`

**CONFIG_LWIP_DEBUG_ESP_LOG**

Route LWIP debugs through ESP_LOG interface

*Found in: Component config > LWIP > CONFIG_LWIP_DEBUG*

Enabling this option routes all enabled LWIP debugs through ESP_LOGD.

**Default value:**

- No (disabled) if `CONFIG_LWIP_DEBUG`

**CONFIG_LWIP_NETIF_DEBUG**

Enable netif debug messages

*Found in: Component config > LWIP > CONFIG_LWIP_DEBUG*

**Default value:**

- No (disabled) if `CONFIG_LWIP_DEBUG`

**CONFIG_LWIP_PBUF_DEBUG**

Enable pbuf debug messages

*Found in: Component config > LWIP > CONFIG_LWIP_DEBUG*

**Default value:**

- No (disabled) if `CONFIG_LWIP_DEBUG`

**CONFIG_LWIP_ETHARP_DEBUG**

Enable etharp debug messages

*Found in: Component config > LWIP > CONFIG_LWIP_DEBUG*

**Default value:**

- No (disabled) if `CONFIG_LWIP_DEBUG`
CONFIG_LWIP_API_LIB_DEBUG

Enable api lib debug messages

*Found in:* Component config > LWIP > CONFIG_LWIP_DEBUG

**Default value:**
- No (disabled) if CONFIG_LWIP_DEBUG

CONFIG_LWIP_SOCKETS_DEBUG

Enable socket debug messages

*Found in:* Component config > LWIP > CONFIG_LWIP_DEBUG

**Default value:**
- No (disabled) if CONFIG_LWIP_DEBUG

CONFIG_LWIP_IP_DEBUG

Enable IP debug messages

*Found in:* Component config > LWIP > CONFIG_LWIP_DEBUG

**Default value:**
- No (disabled) if CONFIG_LWIP_DEBUG

CONFIG_LWIP_ICMP_DEBUG

Enable ICMP debug messages

*Found in:* Component config > LWIP > CONFIG_LWIP_DEBUG

**Default value:**
- No (disabled) if CONFIG_LWIP_DEBUG & & CONFIG_LWIP_ICMP

CONFIG_LWIP_DHCP_STATE_DEBUG

Enable DHCP state tracking

*Found in:* Component config > LWIP > CONFIG_LWIP_DEBUG

**Default value:**
- No (disabled) if CONFIG_LWIP_DEBUG

CONFIG_LWIP_DHCP_DEBUG

Enable DHCP debug messages

*Found in:* Component config > LWIP > CONFIG_LWIP_DEBUG

**Default value:**
- No (disabled) if CONFIG_LWIP_DEBUG

CONFIG_LWIP_IP6_DEBUG

Enable IP6 debug messages

*Found in:* Component config > LWIP > CONFIG_LWIP_DEBUG

**Default value:**
- No (disabled) if CONFIG_LWIP_DEBUG
CONFIG_LWIP_ICMP6_DEBUG
Enable ICMP6 debug messages

*Found in: Component config > LWIP > CONFIG_LWIP_DEBUG*

**Default value:**
- No (disabled) if `CONFIG_LWIP_DEBUG`

CONFIG_LWIP_TCP_DEBUG
Enable TCP debug messages

*Found in: Component config > LWIP > CONFIG_LWIP_DEBUG*

**Default value:**
- No (disabled) if `CONFIG_LWIP_DEBUG`

CONFIG_LWIP_UDP_DEBUG
Enable UDP debug messages

*Found in: Component config > LWIP > CONFIG_LWIP_DEBUG*

**Default value:**
- No (disabled) if `CONFIG_LWIP_DEBUG`

CONFIG_LWIP_SNTP_DEBUG
Enable SNTP debug messages

*Found in: Component config > LWIP > CONFIG_LWIP_DEBUG*

**Default value:**
- No (disabled) if `CONFIG_LWIP_DEBUG`

CONFIG_LWIP_DNS_DEBUG
Enable DNS debug messages

*Found in: Component config > LWIP > CONFIG_LWIP_DEBUG*

**Default value:**
- No (disabled) if `CONFIG_LWIP_DEBUG`

CONFIG_LWIP_NAPT_DEBUG
Enable NAPT debug messages

*Found in: Component config > LWIP > CONFIG_LWIP_DEBUG*

**Default value:**
- No (disabled) if `CONFIG_LWIP_DEBUG` & & `CONFIG_LWIP_IPV4_NAPT`

CONFIG_LWIP_BRIDGEIF_DEBUG
Enable bridge generic debug messages

*Found in: Component config > LWIP > CONFIG_LWIP_DEBUG*

**Default value:**
- No (disabled) if `CONFIG_LWIP_DEBUG`
**CONFIG_LWIP_BRIDGEIF_FDB_DEBUG**

Enable bridge FDB debug messages

*Found in: Component config > LWIP > CONFIG_LWIP_DEBUG*

*Default value:*

- No (disabled) if `CONFIG_LWIP_DEBUG`

**CONFIG_LWIP_BRIDGEIF_FW_DEBUG**

Enable bridge forwarding debug messages

*Found in: Component config > LWIP > CONFIG_LWIP_DEBUG*

*Default value:*

- No (disabled) if `CONFIG_LWIP_DEBUG`

**mbedTLS** Contains:

- `CONFIG_MBEDTLS_DYNAMIC_BUFFER`

### `CONFIG_MBEDTLS_MEM_ALLOC_MODE`

Memory allocation strategy

*Found in: Component config > mbedTLS*

Allocation strategy for mbedTLS, essentially provides ability to allocate all required dynamic allocations from,

- Internal DRAM memory only
- External SPIRAM memory only
- Either internal or external memory based on default malloc() behavior in ESP-IDF
- Custom allocation mode, by overwriting calloc()/free() using mbedtls_platform_set calloc_free() function
- Internal IRAM memory wherever applicable else internal DRAM

Recommended mode here is always internal (*), since that is most preferred from security perspective. But if application requirement does not allow sufficient free internal memory then alternate mode can be selected.

(*) In case of ESP32-S2/ESP32-S3, hardware allows encryption of external SPIRAM contents provided hardware flash encryption feature is enabled. In that case, using external SPIRAM allocation strategy is also safe choice from security perspective.

Available options:

- Internal memory (CONFIG_MBEDTLS_INTERNAL_MEM_ALLOC)
- External SPIRAM (CONFIG_MBEDTLS_EXTERNAL_MEM_ALLOC)
- Default alloc mode (CONFIG_MBEDTLS_DEFAULT_MEM_ALLOC)
- Custom alloc mode (CONFIG_MBEDTLS_CUSTOM_MEM_ALLOC)
- Internal IRAM (CONFIG_MBEDTLS_IRAM_8BIT_MEM_ALLOC)

  Allows to use IRAM memory region as 8bit accessible region.
  TLS input and output buffers will be allocated in IRAM section which is 32bit aligned memory. Every unaligned (8bit or 16bit) access will result in an exception and incur penalty of certain clock cycles per unaligned read/write.

### `CONFIG_MBEDTLS_SSL_MAX_CONTENT_LEN`

TLS maximum message content length

*Found in: Component config > mbedTLS*

Maximum TLS message length (in bytes) supported by mbedTLS.
16384 is the default and this value is required to comply fully with TLS standards.

However you can set a lower value in order to save RAM. This is safe if the other end of the connection supports Maximum Fragment Length Negotiation Extension (max_fragment_length, see RFC6066) or you know for certain that it will never send a message longer than a certain number of bytes.

If the value is set too low, symptoms are a failed TLS handshake or a return value of MBEDTLS_ERR_SSL_INVALID_RECORD (-0x7200).

**CONFIG_MBEDTLSASYMMETRIC_CONTENT_LEN**

Asymmetric in/out fragment length

*Found in: Component config > mbedTLS*

If enabled, this option allows customizing TLS in/out fragment length in asymmetric way. Please note that enabling this with default values saves 12KB of dynamic memory per TLS connection.

**Default value:**
- Yes (enabled)

**CONFIG_MBEDTLS_SSL_IN_CONTENT_LEN**

TLS maximum incoming fragment length

*Found in: Component config > mbedTLS > CONFIG_MBEDTLSASYMMETRIC_CONTENT_LEN*

This defines maximum incoming fragment length, overriding default maximum content length (MBEDTLS_SSL_MAX_CONTENT_LEN).

**Range:**
- from 512 to 16384

**Default value:**
- 16384

**CONFIG_MBEDTLS_SSL_OUT_CONTENT_LEN**

TLS maximum outgoing fragment length

*Found in: Component config > mbedTLS > CONFIG_MBEDTLSASYMMETRIC_CONTENT_LEN*

This defines maximum outgoing fragment length, overriding default maximum content length (MBEDTLS_SSL_MAX_CONTENT_LEN).

**Range:**
- from 512 to 16384

**Default value:**
- 4096

**CONFIG_MBEDTLS_DYNAMIC_BUFFER**

Using dynamic TX/RX buffer

*Found in: Component config > mbedTLS*

Using dynamic TX/RX buffer. After enabling this option, mbedTLS will allocate TX buffer when need to send data and then free it if all data is sent, allocate RX buffer when need to receive data and then free it when all data is used or read by upper layer.

By default, when SSL is initialized, mbedTLS also allocate TX and RX buffer with the default value of “MBEDTLS_SSL_OUT_CONTENT_LEN” or “MBEDTLS_SSL_IN_CONTENT_LEN”, so to save more heap, users can set the options to be an appropriate value.
**CONFIG_MBEDTLS_DYNAMIC_FREE_CONFIG_DATA**

Free private key and DHM data after its usage

*Found in: Component config > mbedTLS > CONFIG_MBEDTLS_DYNAMIC_BUFFER*

Free private key and DHM data after its usage in handshake process.
The option will decrease heap cost when handshake, but also lead to problem:
Because all certificate, private key and DHM data are freed so users should register certificate and private key to ssl config object again.

**Default value:**
- No (disabled) if CONFIG_MBEDTLS_DYNAMIC_BUFFER

**CONFIG_MBEDTLS_DYNAMIC_FREE_CA_CERT**

Free SSL CA certificate after its usage

*Found in: Component config > mbedTLS > CONFIG_MBEDTLS_DYNAMIC_BUFFER > CONFIG_MBEDTLS_DYNAMIC_FREE_CONFIG_DATA*

Free CA certificate after its usage in the handshake process. This option will decrease the heap footprint for the TLS handshake, but may lead to a problem: If the respective ssl object needs to perform the TLS handshake again, the CA certificate should once again be registered to the ssl object.

**Default value:**
- Yes (enabled) if CONFIG_MBEDTLS_DYNAMIC_FREE_CONFIG_DATA

**CONFIG_MBEDTLS_DEBUG**

Enable mbedTLS debugging

*Found in: Component config > mbedTLS*

Enable mbedTLS debugging functions at compile time.

If this option is enabled, you can include “mbedtls/esp_debug.h” and call mbedtls_esp_enable_debug_log() at runtime in order to enable mbedTLS debug output via the ESP log mechanism.

**Default value:**
- No (disabled)

**CONFIG_MBEDTLS_DEBUG_LEVEL**

Set mbedTLS debugging level

*Found in: Component config > mbedTLS > CONFIG_MBEDTLS_DEBUG*

Set mbedTLS debugging level

Available options:

- Warning (CONFIG_MBEDTLS_DEBUG_LEVEL_WARN)
- Info (CONFIG_MBEDTLS_DEBUG_LEVEL_INFO)
- Debug (CONFIG_MBEDTLS_DEBUG_LEVEL_DEBUG)
- Verbose (CONFIG_MBEDTLS_DEBUG_LEVEL_VERBOSE)
**mbedTLS v3.x related**  Contains:

- DTLS-based configurations
- `CONFIG_MBEDTLS_PKCS7_C`
- `CONFIG_MBEDTLS_SSL_CONTEXT.Serialization`
- `CONFIG_MBEDTLS_X509_TRUSTED_CERT_CALLBACK`
- `CONFIG_MBEDTLS_SSL_KEEP_PEER_CERTIFICATE`
- `CONFIG_MBEDTLS_SSL_CID_PADDING_GRANULARITY`
- `CONFIG_MBEDTLS_SSL_PROTO_TLS1_3`
- `CONFIG_MBEDTLS_ECDH_LEGACY_CONTEXT`
- `CONFIG_MBEDTLS_SSL_VARIABLE_BUFFER_LENGTH`

**CONFIG_MBEDTLS_SSL_PROTO_TLS1_3**

Support TLS 1.3 protocol

*Found in: Component config > mbedTLS > mbedTLS v3.x related*

**TLS 1.3 related configurations**  Contains:

- `CONFIG_MBEDTLS_SSL_TLS1_3_KEXM_EPHEMERAL`
- `CONFIG_MBEDTLS_SSL_TLS1_3_COMPATIBILITY_MODE`
- `CONFIG_MBEDTLS_SSL_TLS1_3_KEXM_PSK_EPHEMERAL`
- `CONFIG_MBEDTLS_SSL_TLS1_3_KEXM_PSK`

**CONFIG_MBEDTLS_SSL_TLS1_3_COMPATIBILITY_MODE**

TLS 1.3 middlebox compatibility mode

*Found in: Component config > mbedTLS > mbedTLS v3.x related > CONFIG_MBEDTLS_SSL_PROTO_TLS1_3 > TLS 1.3 related configurations*

**Default value:**

*Yes (enabled) if CONFIG_MBEDTLS_SSL_PROTO_TLS1_3*

**CONFIG_MBEDTLS_SSL_TLS1_3_KEXM_PSK**

TLS 1.3 PSK key exchange mode

*Found in: Component config > mbedTLS > mbedTLS v3.x related > CONFIG_MBEDTLS_SSL_PROTO_TLS1_3 > TLS 1.3 related configurations*

**Default value:**

*Yes (enabled) if CONFIG_MBEDTLS_SSL_PROTO_TLS1_3*

**CONFIG_MBEDTLS_SSL_TLS1_3_KEXM_EPHEMERAL**

TLS 1.3 ephemeral key exchange mode

*Found in: Component config > mbedTLS > mbedTLS v3.x related > CONFIG_MBEDTLS_SSL_PROTO_TLS1_3 > TLS 1.3 related configurations*

**Default value:**

*Yes (enabled) if CONFIG_MBEDTLS_SSL_PROTO_TLS1_3*

**CONFIG_MBEDTLS_SSL_TLS1_3_KEXM_PSK_EPHEMERAL**

TLS 1.3 PSK ephemeral key exchange mode

*Found in: Component config > mbedTLS > mbedTLS v3.x related > CONFIG_MBEDTLS_SSL_PROTO_TLS1_3 > TLS 1.3 related configurations*
Default value:
- Yes (enabled) if `CONFIG_MBEDTLS_SSL_PROTO_TLS1_3`

**CONFIG_MBEDTLS_SSL_VARIABLE_BUFFER_LENGTH**

Variable SSL buffer length

*Found in: Component config > mbedtls > mbedtls v3.x related*

This enables the SSL buffer to be resized automatically based on the negotiated maximum fragment length in each direction.

**Default value:**
- No (disabled)

**CONFIG_MBEDTLS_ECDH_LEGACY_CONTEXT**

Use a backward compatible ECDH context (Experimental)

*Found in: Component config > mbedtls > mbedtls v3.x related*

Use the legacy ECDH context format. Define this option only if you enable `MBEDTLS_ECP_RESTARTABLE` or if you want to access ECDH context fields directly.

**Default value:**
- No (disabled) if `CONFIG_MBEDTLS_ECDH_C` && `CONFIG_MBEDTLS_ECP_RESTARTABLE`

**CONFIG_MBEDTLS_X509_TRUSTED_CERT_CALLBACK**

Enable trusted certificate callbacks

*Found in: Component config > mbedtls > mbedtls v3.x related*

Enables users to configure the set of trusted certificates through a callback instead of a linked list.

See mbedtls documentation for required API and more details.

**Default value:**
- No (disabled)

**CONFIG_MBEDTLS_SSL_CONTEXT_SERIALIZATION**

Enable serialization of the TLS context structures

*Found in: Component config > mbedtls > mbedtls v3.x related*

Enable serialization of the TLS context structures. This is a local optimization in handling a single, potentially long-lived connection.

See mbedtls documentation for required API and more details. Disabling this option will save some code size.

**Default value:**
- No (disabled)

**CONFIG_MBEDTLS_SSL_KEEP_PEER_CERTIFICATE**

Keep peer certificate after handshake completion

*Found in: Component config > mbedtls > mbedtls v3.x related*

Keep the peer’s certificate after completion of the handshake. Disabling this option will save about 4kB of heap and some code size.

See mbedtls documentation for required API and more details.
**CONFIG_MBEDTLS_PKCS7_C**

Enable PKCS #7

*Found in: Component config > mbedTLS > mbedTLS v3.x related*

Enable PKCS #7 core for using PKCS #7-formatted signatures.

**Default value:**
- Yes (enabled)

**CONFIG_MBEDTLS_SSL_CID_PADDING_GRANULARITY**

Record plaintext padding

*Found in: Component config > mbedTLS > mbedTLS v3.x related*

Controls the use of record plaintext padding in TLS 1.3 and when using the Connection ID extension in DTLS 1.2.

The padding will always be chosen so that the length of the padded plaintext is a multiple of the value of this option.

**Notes:** A value of 1 means that no padding will be used for outgoing records. On systems lacking division instructions, a power of two should be preferred.

**Range:**
- from 0 to 32 if `CONFIG_MBEDTLS_SSL_PROTO_TLS1_3` || `CONFIG_MBEDTLS_SSL_DTLS_CONNECTION_ID`

**Default value:**
- 16 if `CONFIG_MBEDTLS_SSL_PROTO_TLS1_3` || `CONFIG_MBEDTLS_SSL_DTLS_CONNECTION_ID`

**DTLS-based configurations**

Contains:
- `CONFIG_MBEDTLS_SSL_DTLS_SRTP`
- `CONFIG_MBEDTLS_SSL_DTLS_CONNECTION_ID`

**CONFIG_MBEDTLS_SSL_DTLS_CONNECTION_ID**

Support for the DTLS Connection ID extension

*Found in: Component config > mbedTLS > mbedTLS v3.x related > DTLS-based configurations*

Enable support for the DTLS Connection ID extension which allows to identify DTLS connections across changes in the underlying transport.

**Default value:**
- No (disabled) if `CONFIG_MBEDTLS_SSL_PROTO_DTLS`

**CONFIG_MBEDTLS_SSL_CID_IN_LEN_MAX**

Maximum length of CIDs used for incoming DTLS messages

*Found in: Component config > mbedTLS > mbedTLS v3.x related > DTLS-based configurations > CONFIG_MBEDTLS_SSL_DTLS_CONNECTION_ID*

Maximum length of CIDs used for incoming DTLS messages

**Range:**
- from 0 to 32 if `CONFIG_MBEDTLS_SSL_DTLS_CONNECTION_ID` && `CONFIG_MBEDTLS_SSL_PROTO_DTLS`

**Default value:**
- 32 if `CONFIG_MBEDTLS_SSL_DTLS_CONNECTION_ID` && `CONFIG_MBEDTLS_SSL_PROTO_DTLS`
CONFIG_MBEDTLS_SSL_CID_OUT_LEN_MAX

Maximum length of CIDs used for outgoing DTLS messages

Found in: Component config > mbedTLS > mbedTLS v3.x related > DTLS-based configurations > CONFIG_MBEDTLS_SSL_DTLS_CONNECTION_ID

Maximum length of CIDs used for outgoing DTLS messages

Range:
- from 0 to 32 if CONFIG_MBEDTLS_SSL_DTLS_CONNECTION_ID && CONFIG_MBEDTLS_SSL_PROTO_DTLS

Default value:
- 32 if CONFIG_MBEDTLS_SSL_DTLS_CONNECTION_ID && CONFIG_MBEDTLS_SSL_PROTO_DTLS

CONFIG_MBEDTLS_SSL_DTLS_SRTP

Enable support for negotiation of DTLS-SRTP (RFC 5764)

Found in: Component config > mbedTLS > mbedTLS v3.x related > DTLS-based configurations

Enable support for negotiation of DTLS-SRTP (RFC 5764) through the use_srtp extension.

See mbedTLS documentation for required API and more details. Disabling this option will save some code size.

Default value:
- No (disabled) if CONFIG_MBEDTLS_SSL_PROTO_DTLS

Certificate Bundle Contains:
- CONFIG_MBEDTLS_CERTIFICATE_BUNDLE

CONFIG_MBEDTLS_CERTIFICATE_BUNDLE

Enable trusted root certificate bundle

Found in: Component config > mbedTLS > Certificate Bundle

Enable support for large number of default root certificates

When enabled this option allows user to store default as well as customer specific root certificates in compressed format rather than storing full certificate. For the root certificates the public key and the subject name will be stored.

Default value:
- Yes (enabled)

CONFIG_MBEDTLS_DEFAULT_CERTIFICATE_BUNDLE

Default certificate bundle options

Found in: Component config > mbedTLS > Certificate Bundle > CONFIG_MBEDTLS_CERTIFICATE_BUNDLE

Available options:
- Use the full default certificate bundle (CONFIG_MBEDTLS_CERTIFICATE_BUNDLE_DEFAULT_FULL)
- Use only the most common certificates from the default bundles (CONFIG_MBEDTLS_CERTIFICATE_BUNDLE_DEFAULT_CMN)
  Use only the most common certificates from the default bundles, reducing the size with 50%, while still having around 99% coverage.
• Do not use the default certificate bundle (CONFIG_MBEDTLS_CERTIFICATE_BUNDLE_DEFAULT_NONE)

**CONFIG_MBEDTLS_CUSTOM_CERTIFICATE_BUNDLE**
Add custom certificates to the default bundle

*Found in: Component config > mbedTLS > Certificate Bundle > CONFIG_MBEDTLS_CERTIFICATE_BUNDLE*

*Default value:*
• No (disabled)

**CONFIG_MBEDTLS_CUSTOM_CERTIFICATE_BUNDLE_PATH**
Custom certificate bundle path

*Found in: Component config > mbedTLS > Certificate Bundle > CONFIG_MBEDTLS_CERTIFICATE_BUNDLE > CONFIG_MBEDTLS_CUSTOM_CERTIFICATE_BUNDLE*

Name of the custom certificate directory or file. This path is evaluated relative to the project root directory.

**CONFIG_MBEDTLS_CERTIFICATE_BUNDLE_DEPRECATED_LIST**
Add deprecated root certificates

*Found in: Component config > mbedTLS > Certificate Bundle > CONFIG_MBEDTLS_CERTIFICATE_BUNDLE*

Include the deprecated list of root certificates in the bundle. This list gets updated when a certificate is removed from the Mozilla’s NSS root certificate store. This config can be enabled if you would like to ensure that none of the certificates that were deployed in the product are affected because of the update to bundle. In turn, enabling this config keeps expired, retracted certificates in the bundle and it may pose a security risk.

• Deprecated cert list may grow based based on sync with upstream bundle
• Deprecated certs would be be removed in ESP-IDF (next) major release

**CONFIG_MBEDTLS_CERTIFICATE_BUNDLE_MAX_CERTS**
Maximum no of certificates allowed in certificate bundle

*Found in: Component config > mbedTLS > Certificate Bundle > CONFIG_MBEDTLS_CERTIFICATE_BUNDLE*

*Default value:*
• 200

**CONFIG_MBEDTLS_ECP_RESTARTABLE**
Enable mbedTLS ecp restartable

*Found in: Component config > mbedTLS*

Enable “non-blocking” ECC operations that can return early and be resumed.

*Default value:*
• No (disabled)
CONFIG_MBEDTLS_CMAC_C
Enable CMAC mode for block ciphers

*Found in: Component config > mbedTLS*

Enable the CMAC (Cipher-based Message Authentication Code) mode for block ciphers.

**Default value:**
- No (disabled)

CONFIG_MBEDTLS_HARDWARE_AES
Enable hardware AES acceleration

*Found in: Component config > mbedTLS*

Enable hardware accelerated AES encryption & decryption.

Note that if the ESP32 CPU is running at 240MHz, hardware AES does not offer any speed boost over software AES.

CONFIG_MBEDTLS_AES_USE_INTERRUPT
Use interrupt for long AES operations

*Found in: Component config > mbedTLS > CONFIG_MBEDTLS_HARDWARE_AES*

Use an interrupt to coordinate long AES operations.

This allows other code to run on the CPU while an AES operation is pending. Otherwise the CPU busy-waits.

**Default value:**
- Yes (enabled)

CONFIG_MBEDTLS_AES_INTERRUPT_LEVEL
AES hardware interrupt level

*Found in: Component config > mbedTLS > CONFIG_MBEDTLS_HARDWARE_AES > CONFIG_MBEDTLS_AES_USE_INTERRUPT*

This config helps to set the interrupt priority level for the AES peripheral. Value 0 (default) means that there is no preference regarding the interrupt priority level and any level from 1 to 3 can be selected (based on the availability). Note: Higher value indicates high interrupt priority.

**Range:**
- from 0 to 3

**Default value:**
- 0

CONFIG_MBEDTLS_HARDWARE_GCM
Enable partially hardware accelerated GCM

*Found in: Component config > mbedTLS > CONFIG_MBEDTLS_HARDWARE_AES*

Enable partially hardware accelerated GCM. GHASH calculation is still done in software.

If MBEDTLS_HARDWARE_GCM is disabled and MBEDTLS_HARDWARE_AES is enabled then mbedTLS will still use the hardware accelerated AES block operation, but on a single block at a time.

**Default value:**
- Yes (enabled) if SOC_AES_SUPPORT_GCM & & CONFIG_MBEDTLS_HARDWARE_AES
**CONFIG_MBEDTLS_HARDWARE_MPI**
Enable hardware MPI (bignum) acceleration

*Found in: Component config > mbedTLS*

Enable hardware accelerated multiple precision integer operations.

Hardware accelerated multiplication, modulo multiplication, and modular exponentiation for up to SOC_RSA_MAX_BIT_LEN bit results.

These operations are used by RSA.

**CONFIG_MBEDTLS_MPI_USE_INTERRUPT**
Use interrupt for MPI exp-mod operations

*Found in: Component config > mbedTLS > CONFIG_MBEDTLS_HARDWARE_MPI*

Use an interrupt to coordinate long MPI operations.

This allows other code to run on the CPU while an MPI operation is pending. Otherwise the CPU busy-waits.

**Default value:**
- Yes (enabled)

**CONFIG_MBEDTLS_MPI_INTERRUPT_LEVEL**
MPI hardware interrupt level

*Found in: Component config > mbedTLS > CONFIG_MBEDTLS_HARDWARE_MPI > CONFIG_MBEDTLS_MPI_USE_INTERRUPT*

This config helps to set the interrupt priority level for the MPI peripheral. Value 0 (default) means that there is no preference regarding the interrupt priority level and any level from 1 to 3 can be selected (based on the availability). Note: Higher value indicates high interrupt priority.

**Range:**
- from 0 to 3

**Default value:**
- 0

**CONFIG_MBEDTLS_HARDWARE_SHA**
Enable hardware SHA acceleration

*Found in: Component config > mbedTLS*

Enable hardware accelerated SHA1, SHA256, SHA384 & SHA512 in mbedTLS.

Due to a hardware limitation, on the ESP32 hardware acceleration is only guaranteed if SHA digests are calculated one at a time. If more than one SHA digest is calculated at the same time, one will be calculated fully in hardware and the rest will be calculated (at least partially calculated) in software. This happens automatically.

SHA hardware acceleration is faster than software in some situations but slower in others. You should benchmark to find the best setting for you.

**CONFIG_MBEDTLS_HARDWARE_ECC**
Enable hardware ECC acceleration

*Found in: Component config > mbedTLS*
Enable hardware accelerated ECC point multiplication and point verification for points on curve SECP192R1 and SECP256R1 in mbedTLS

**Default value:**
- Yes (enabled) if SOC_ECC_SUPPORTED

**CONFIG_MBEDTLS_ECC_OTHER_CURVES_SOFT_FALLBACK**
Fallback to software implementation for curves not supported in hardware

*Found in: Component config > mbedTLS > CONFIG_MBEDTLS_HARDWARE_ECC*

Fallback to software implementation of ECC point multiplication and point verification for curves not supported in hardware.

**Default value:**
- Yes (enabled) if CONFIG_MBEDTLS_HARDWARE_ECC

**CONFIG_MBEDTLS_ROM_MD5**
Use MD5 implementation in ROM

*Found in: Component config > mbedTLS*

Use ROM MD5 in mbedTLS.

**Default value:**
- Yes (enabled)

**CONFIG_MBEDTLS_HARDWARE_ECDSA_SIGN**
Enable ECDSA signing using on-chip ECDSA peripheral

*Found in: Component config > mbedTLS*

Enable hardware accelerated ECDSA peripheral to sign data on curve SECP192R1 and SECP256R1 in mbedTLS.

Note that for signing, the private key has to be burnt in an efuse key block with key purpose set to ECDSA_KEY. If no key is burnt, it will report an error.

The key should be burnt in little endian format. espfuse.py utility handles it internally but care needs to be taken while burning using esp_efuse APIs

**Default value:**
- No (disabled) if SOC_ECDSA_SUPPORTED

**CONFIG_MBEDTLS_HARDWARE_ECDSA_VERIFY**
Enable ECDSA signature verification using on-chip ECDSA peripheral

*Found in: Component config > mbedTLS*

Enable hardware accelerated ECDSA peripheral to verify signature on curve SECP192R1 and SECP256R1 in mbedTLS.

**Default value:**
- Yes (enabled) if SOC_ECDSA_SUPPORTED
**CONFIG_MBEDTLS_ATCA_HW_ECDSA_SIGN**

Enable hardware ECDSA sign acceleration when using ATECC608A

*Found in: Component config > mbedTLS*

This option enables hardware acceleration for ECDSA sign function, only when using ATECC608A cryptoauth chip (integrated with ESP32-WROOM-32SE)

*Default value:*
- No (disabled)

**CONFIG_MBEDTLS_ATCA_HW_ECDSA_VERIFY**

Enable hardware ECDSA verify acceleration when using ATECC608A

*Found in: Component config > mbedTLS*

This option enables hardware acceleration for ECDSA sign function, only when using ATECC608A cryptoauth chip (integrated with ESP32-WROOM-32SE)

*Default value:*
- No (disabled)

**CONFIG_MBEDTLS_HAVE_TIME**

Enable mbedtls time support

*Found in: Component config > mbedTLS*

Enable use of time.h functions (time()) and gmtime() by mbedTLS.

This option doesn’t require the system time to be correct, but enables functionality that requires relative timekeeping - for example periodic expiry of TLS session tickets or session cache entries.

Disabling this option will save some firmware size, particularly if the rest of the firmware doesn’t call any standard timekeeping functions.

*Default value:*
- Yes (enabled)

**CONFIG_MBEDTLS_PLATFORM_TIME_ALT**

Enable mbedtls time support: platform-specific

*Found in: Component config > mbedTLS > CONFIG_MBEDTLS_HAVE_TIME*

Enabling this config will provide users with a function “mbedtls_platform_set_time()” that allows to set an alternative time function pointer.

*Default value:*
- No (disabled)

**CONFIG_MBEDTLS_HAVE_TIME_DATE**

Enable mbedtls certificate expiry check

*Found in: Component config > mbedTLS > CONFIG_MBEDTLS_HAVE_TIME*

Enables X.509 certificate expiry checks in mbedTLS.

If this option is disabled (default) then X.509 certificate “valid from” and “valid to” timestamp fields are ignored.

If this option is enabled, these fields are compared with the current system date and time. The time is retrieved using the standard time() and gmtime() functions. If the certificate is not valid for the
current system time then verification will fail with code MBEDTLS_X509_BADCERT_FUTURE or MBEDTLS_X509_BADCERT_EXPIRED.

Enabling this option requires adding functionality in the firmware to set the system clock to a valid timestamp before using TLS. The recommended way to do this is via ESP-IDF’s SNTP functionality, but any method can be used.

In the case where only a small number of certificates are trusted by the device, please carefully consider the tradeoffs of enabling this option. There may be undesired consequences, for example if all trusted certificates expire while the device is offline and a TLS connection is required to update. Or if an issue with the SNTP server means that the system time is invalid for an extended period after a reset.

Default value:
- No (disabled)

**CONFIG_MBEDTLS_ECDSA_DETERMINISTIC**

Enable deterministic ECDSA

*Found in: Component config > mbedTLS*

Standard ECDSA is “fragile” in the sense that lack of entropy when signing may result in a compromise of the long-term signing key.

Default value:
- Yes (enabled)

**CONFIG_MBEDTLS_SHA512_C**

Enable the SHA-384 and SHA-512 cryptographic hash algorithms

*Found in: Component config > mbedTLS*

Enable MBEDTLS_SHA512_C adds support for SHA-384 and SHA-512.

Default value:
- Yes (enabled)

**CONFIG_MBEDTLS_TLS_MODE**

TLS Protocol Role

*Found in: Component config > mbedTLS*

mbedTLS can be compiled with protocol support for the TLS server, TLS client, or both server and client.

Reducing the number of TLS roles supported saves code size.

Available options:

- Server & Client (CONFIG_MBEDTLS_TLS_SERVER_AND_CLIENT)
- Server (CONFIG_MBEDTLS_TLS_SERVER_ONLY)
- Client (CONFIG_MBEDTLS_TLS_CLIENT_ONLY)
- None (CONFIG_MBEDTLS_TLS_DISABLED)

**TLS Key Exchange Methods**

Contains:

- CONFIG_MBEDTLS_KEY_EXCHANGE_DHE_RSA
- CONFIG_MBEDTLS_KEY_EXCHANGE_ECJPAKE
- CONFIG_MBEDTLS_PSK_MODES
- CONFIG_MBEDTLS_KEY_EXCHANGE_RSA
- CONFIG_MBEDTLS_KEY_EXCHANGE_ELLIPTIC_CURVE
Chapter 2. API Reference

CONFIG_MBEDTLS_PSK_MODES
Enable pre-shared-key ciphersuites

*Found in: Component config > mbedTLS > TLS Key Exchange Methods*

Enable to show configuration for different types of pre-shared-key TLS authentication methods.
Leaving this options disabled will save code size if they are not used.

**Default value:**
- No (disabled)

CONFIG_MBEDTLS_KEY_EXCHANGE_PSK
Enable PSK based ciphersuite modes

*Found in: Component config > mbedTLS > TLS Key Exchange Methods > CONFIG_MBEDTLS_PSK_MODES*

Enable to support symmetric key PSK (pre-shared-key) TLS key exchange modes.

**Default value:**
- No (disabled) if CONFIG_MBEDTLS_PSK_MODES

CONFIG_MBEDTLS_KEY_EXCHANGE_DHE_PSK
Enable DHE-PSK based ciphersuite modes

*Found in: Component config > mbedTLS > TLS Key Exchange Methods > CONFIG_MBEDTLS_PSK_MODES*

Enable to support Diffie-Hellman PSK (pre-shared-key) TLS authentication modes.

**Default value:**
- Yes (enabled) if CONFIG_MBEDTLS_PSK_MODES && CONFIG_MBEDTLS_DHM_C

CONFIG_MBEDTLS_KEY_EXCHANGE_ECDHE_PSK
Enable ECDHE-PSK based ciphersuite modes

*Found in: Component config > mbedTLS > TLS Key Exchange Methods > CONFIG_MBEDTLS_PSK_MODES*

Enable to support Elliptic-Curve-Diffie-Hellman PSK (pre-shared-key) TLS authentication modes.

**Default value:**
- Yes (enabled) if CONFIG_MBEDTLS_PSK_MODES && CONFIG_MBEDTLS_ECDH_C

CONFIG_MBEDTLS_KEY_EXCHANGE_RSA_PSK
Enable RSA-PSK based ciphersuite modes

*Found in: Component config > mbedTLS > TLS Key Exchange Methods > CONFIG_MBEDTLS_PSK_MODES*

Enable to support RSA PSK (pre-shared-key) TLS authentication modes.

**Default value:**
- Yes (enabled) if CONFIG_MBEDTLS_PSK_MODES
### CONFIG_MBEDTLS_KEY_EXCHANGE_RSA

Enable RSA-only based ciphersuite modes

**Found in:** Component config > mbedTLS > TLS Key Exchange Methods

Enable to support ciphersuites with prefix TLS-RSA-WITH-

**Default value:**
- Yes (enabled)

### CONFIG_MBEDTLS_KEY_EXCHANGE_DHE_RSA

Enable DHE-RSA based ciphersuite modes

**Found in:** Component config > mbedTLS > TLS Key Exchange Methods

Enable to support ciphersuites with prefix TLS-DHE-RSA-WITH-

**Default value:**
- Yes (enabled) if CONFIG_MBEDTLS_DHm_C

### CONFIG_MBEDTLS_KEY_EXCHANGE_ELLIPTIC_CURVE

Support Elliptic Curve based ciphersuites

**Found in:** Component config > mbedTLS > TLS Key Exchange Methods

Enable to show Elliptic Curve based ciphersuite mode options.

Disabling all Elliptic Curve ciphersuites saves code size and can give slightly faster TLS handshakes, provided the server supports RSA-only ciphersuite modes.

**Default value:**
- Yes (enabled)

### CONFIG_MBEDTLS_KEY_EXCHANGE_ECDHE_RSA

Enable ECDHE-RSA based ciphersuite modes

**Found in:** Component config > mbedTLS > TLS Key Exchange Methods > CONFIG_MBEDTLS_KEY_EXCHANGE_ELLIPTIC_CURVE

Enable to support ciphersuites with prefix TLS-ECDHE-RSA-WITH-

**Default value:**
- Yes (enabled)

### CONFIG_MBEDTLS_KEY_EXCHANGE_ECDHE_ECDSA

Enable ECDHE-ECDSA based ciphersuite modes

**Found in:** Component config > mbedTLS > TLS Key Exchange Methods > CONFIG_MBEDTLS_KEY_EXCHANGE_ELLIPTIC_CURVE

Enable to support ciphersuites with prefix TLS-ECDHE-RSA-WITH-

**Default value:**
- Yes (enabled)
**CONFIG_MBEDTLS_KEY_EXCHANGE_ECDH_ECDSA**

Enable ECDH-ECDSA based ciphersuite modes

*Found in: Component config > mbedTLS > TLS Key Exchange Methods > CONFIG_MBEDTLS_KEY_EXCHANGE_ELLIPTIC_CURVE*

Enable to support ciphersuites with prefix TLS-ECDHE-RSA-WITH-

**Default value:**

- Yes (enabled)

**CONFIG_MBEDTLS_KEY_EXCHANGE_ECDH_RSA**

Enable ECDH-RSA based ciphersuite modes

*Found in: Component config > mbedTLS > TLS Key Exchange Methods > CONFIG_MBEDTLS_KEY_EXCHANGE_ELLIPTIC_CURVE*

Enable to support ciphersuites with prefix TLS-ECDHE-RSA-WITH-

**Default value:**

- Yes (enabled)

**CONFIG_MBEDTLS_KEY_EXCHANGE_ECJPAKE**

Enable ECJPAKE based ciphersuite modes

*Found in: Component config > mbedTLS > TLS Key Exchange Methods*

Enable to support ciphersuites with prefix TLS-ECJPAKE-WITH-

**Default value:**

- No (disabled) if CONFIG_MBEDTLS_ECJPAKE_C && CONFIG_MBEDTLS_ECP_DP_SECP256R1_ENABLED

**CONFIG_MBEDTLS_SSL_RENEGOTIATION**

Support TLS renegotiation

*Found in: Component config > mbedTLS*

The two main uses of renegotiation are (1) refresh keys on long-lived connections and (2) client authentication after the initial handshake. If you don’t need renegotiation, disabling it will save code size and reduce the possibility of abuse/vulnerability.

**Default value:**

- Yes (enabled)

**CONFIG_MBEDTLS_SSL_PROTO_TLS1_2**

Support TLS 1.2 protocol

*Found in: Component config > mbedTLS*

**Default value:**

- Yes (enabled)

**CONFIG_MBEDTLS_SSL_PROTO_GMTSSL1_1**

Support GM/T SSL 1.1 protocol

*Found in: Component config > mbedTLS*

Provisions for GM/T SSL 1.1 support
Default value:
  • No (disabled)

CONFIG_MBEDTLS_SSL_PROTO_DTLS
Support DTLS protocol (all versions)

*Found in: Component config > mbedTLS*
Requires TLS 1.2 to be enabled for DTLS 1.2

Default value:
  • No (disabled)

CONFIG_MBEDTLS_SSL_ALPN
Support ALPN (Application Layer Protocol Negotiation)

*Found in: Component config > mbedTLS*
Disabling this option will save some code size if it is not needed.

Default value:
  • Yes (enabled)

CONFIG_MBEDTLS_CLIENT_SSL_SESSION_TICKETS
TLS: Client Support for RFC 5077 SSL session tickets

*Found in: Component config > mbedTLS*
Client support for RFC 5077 session tickets. See mbedTLS documentation for more details. Disabling this option will save some code size.

Default value:
  • Yes (enabled)

CONFIG_MBEDTLS_SERVER_SSL_SESSION_TICKETS
TLS: Server Support for RFC 5077 SSL session tickets

*Found in: Component config > mbedTLS*
Server support for RFC 5077 session tickets. See mbedTLS documentation for more details. Disabling this option will save some code size.

Default value:
  • Yes (enabled)

**Symmetric Ciphers**
Contains:
  • CONFIG_MBEDTLS_AES_C
  • CONFIG_MBEDTLS_BLOWFISH_C
  • CONFIG_MBEDTLS_CAMELLIA_C
  • CONFIG_MBEDTLS_CCM_C
  • CONFIG_MBEDTLS_DES_C
  • CONFIG_MBEDTLS_GCM_C
  • CONFIG_MBEDTLS_NIST_KW_C
  • CONFIG_MBEDTLS_XTEA_C
**CONFIG_MBEDTLS_AES_C**

AES block cipher

*Found in: Component config \(\triangleright\) mbedTLS \(\triangleright\) Symmetric Ciphers*

**Default value:**
- Yes (enabled)

**CONFIG_MBEDTLS_CAMELLIA_C**

Camellia block cipher

*Found in: Component config \(\triangleright\) mbedTLS \(\triangleright\) Symmetric Ciphers*

**Default value:**
- No (disabled)

**CONFIG_MBEDTLS DES_C**

DES block cipher (legacy, insecure)

*Found in: Component config \(\triangleright\) mbedTLS \(\triangleright\) Symmetric Ciphers*

Enables the DES block cipher to support 3DES-based TLS ciphersuites.

3DES is vulnerable to the Sweet32 attack and should only be enabled if absolutely necessary.

**Default value:**
- No (disabled)

**CONFIG_MBEDTLS_BLOWFISH_C**

Blowfish block cipher (read help)

*Found in: Component config \(\triangleright\) mbedTLS \(\triangleright\) Symmetric Ciphers*

Enables the Blowfish block cipher (not used for TLS sessions.)

The Blowfish cipher is not used for mbedTLS TLS sessions but can be used for other purposes. Read up on the limitations of Blowfish (including Sweet32) before enabling.

**Default value:**
- No (disabled)

**CONFIG_MBEDTLS_XTEA_C**

XTEA block cipher

*Found in: Component config \(\triangleright\) mbedTLS \(\triangleright\) Symmetric Ciphers*

Enables the XTEA block cipher.

**Default value:**
- No (disabled)

**CONFIG_MBEDTLS_CCM_C**

CCM (Counter with CBC-MAC) block cipher modes

*Found in: Component config \(\triangleright\) mbedTLS \(\triangleright\) Symmetric Ciphers*

Enable Counter with CBC-MAC (CCM) modes for AES and/or Camellia ciphers.

Disabling this option saves some code size.

**Default value:**
Chapter 2. API Reference

- Yes (enabled)

**CONFIG_MBEDTLS_GCM_C**
GCM (Galois/Counter) block cipher modes

*Found in: Component config > mbedTLS > Symmetric Ciphers*

Enable Galois/Counter Mode for AES and/or Camellia ciphers.
This option is generally faster than CCM.

**Default value:**
- Yes (enabled)

**CONFIG_MBEDTLS_NIST_KW_C**
NIST key wrapping (KW) and KW padding (KWP)

*Found in: Component config > mbedTLS > Symmetric Ciphers*

Enable NIST key wrapping and key wrapping padding.

**Default value:**
- No (disabled)

**CONFIG_MBEDTLS_RIPEMD160_C**
Enable RIPEMD-160 hash algorithm

*Found in: Component config > mbedTLS*

Enable the RIPEMD-160 hash algorithm.

**Default value:**
- No (disabled)

**Certificates** Contains:

- **CONFIG_MBEDTLS_PEM_PARSE_C**
- **CONFIG_MBEDTLS_PEM_WRITE_C**
- **CONFIG_MBEDTLS_X509_CRL_PARSE_C**
- **CONFIG_MBEDTLS_X509_CSR_PARSE_C**

**CONFIG_MBEDTLS_PEM_PARSE_C**
Read & Parse PEM formatted certificates

*Found in: Component config > mbedTLS > Certificates*

Enable decoding/parsing of PEM formatted certificates.
If your certificates are all in the simpler DER format, disabling this option will save some code size.

**Default value:**
- Yes (enabled)

**CONFIG_MBEDTLS_PEM_WRITE_C**
Write PEM formatted certificates

*Found in: Component config > mbedTLS > Certificates*

Enable writing of PEM formatted certificates.
If writing certificate data only in DER format, disabling this option will save some code size.
Default value:
  • Yes (enabled)

CONFIG_MBEDTLS_X509_CRL_PARSE_C

X.509 CRL parsing

Found in: Component config > mbedTLS > Certificates

Default value:
  • Yes (enabled)

CONFIG_MBEDTLS_X509_CSR_PARSE_C

X.509 CSR parsing

Found in: Component config > mbedTLS > Certificates

Support for parsing X.509 Certificate Signing Requests

Default value:
  • Yes (enabled)

CONFIG_MBEDTLS_ECP_C

Elliptic Curve Ciphers

Found in: Component config > mbedTLS

Default value:
  • Yes (enabled)

CONFIG_MBEDTLS_DHM_C

Diffie-Hellman-Merkle key exchange (DHM)

Found in: Component config > mbedTLS

Enable DHM. Needed to use DHE-xxx TLS ciphersuites.

Note that the security of Diffie-Hellman key exchanges depends on a suitable prime being used for the exchange. Please see detailed warning text about this in file mbedtls/dhm.h file.

Default value:
  • No (disabled)

CONFIG_MBEDTLS_ECDH_C

Elliptic Curve Diffie-Hellman (ECDH)

Found in: Component config > mbedTLS

Enable ECDH. Needed to use ECDHE-xxx TLS ciphersuites.

Default value:
  • Yes (enabled)
CONFIG_MBEDTLS_ECDSA_C

Elliptic Curve DSA

*Found in: Component config > mbedTLS > CONFIG_MBEDTLS_ECDH_C*

Enable ECDSA. Needed to use ECDSA-xxx TLS ciphersuites.

**Default value:**
- Yes (enabled)

CONFIG_MBEDTLS_ECJPAKE_C

Elliptic curve J-PAKE

*Found in: Component config > mbedTLS*

Enable ECJPAKE. Needed to use ECJPAKE-xxx TLS ciphersuites.

**Default value:**
- No (disabled)

CONFIG_MBEDTLS_ECP_DP_SECP192R1_ENABLED

Enable SECP192R1 curve

*Found in: Component config > mbedTLS*

Enable support for SECP192R1 Elliptic Curve.

CONFIG_MBEDTLS_ECP_DP_SECP224R1_ENABLED

Enable SECP224R1 curve

*Found in: Component config > mbedTLS*

Enable support for SECP224R1 Elliptic Curve.

CONFIG_MBEDTLS_ECP_DP_SECP256R1_ENABLED

Enable SECP256R1 curve

*Found in: Component config > mbedTLS*

Enable support for SECP256R1 Elliptic Curve.

**Default value:**
- Yes (enabled)

CONFIG_MBEDTLS_ECP_DP_SECP384R1_ENABLED

Enable SECP384R1 curve

*Found in: Component config > mbedTLS*

Enable support for SECP384R1 Elliptic Curve.

CONFIG_MBEDTLS_ECP_DP_SECP521R1_ENABLED

Enable SECP521R1 curve

*Found in: Component config > mbedTLS*

Enable support for SECP521R1 Elliptic Curve.
CONFIG_MBEDTLS_ECP_DP_SECP192K1_ENABLED
Enable SECP192K1 curve
*Found in: Component config > mbedTLS*
Enable support for SECP192K1 Elliptic Curve.

CONFIG_MBEDTLS_ECP_DP_SECP224K1_ENABLED
Enable SECP224K1 curve
*Found in: Component config > mbedTLS*
Enable support for SECP224K1 Elliptic Curve.

CONFIG_MBEDTLS_ECP_DP_SECP256K1_ENABLED
Enable SECP256K1 curve
*Found in: Component config > mbedTLS*
Enable support for SECP256K1 Elliptic Curve.

CONFIG_MBEDTLS_ECP_DP_BP256R1_ENABLED
Enable BP256R1 curve
*Found in: Component config > mbedTLS*
support for DP Elliptic Curve.

CONFIG_MBEDTLS_ECP_DP_BP384R1_ENABLED
Enable BP384R1 curve
*Found in: Component config > mbedTLS*
support for DP Elliptic Curve.

CONFIG_MBEDTLS_ECP_DP_BP512R1_ENABLED
Enable BP512R1 curve
*Found in: Component config > mbedTLS*
support for DP Elliptic Curve.

CONFIG_MBEDTLS_ECP_DP_CURVE25519_ENABLED
Enable CURVE25519 curve
*Found in: Component config > mbedTLS*
Enable support for CURVE25519 Elliptic Curve.

CONFIG_MBEDTLS_ECP_NIST_OPTIM
NIST ‘modulo p’ optimisations
*Found in: Component config > mbedTLS*
NIST ‘modulo p’ optimisations increase Elliptic Curve operation performance.
Disabling this option saves some code size.
**Default value:**
- Yes (enabled)

**CONFIG_MBEDTLS_ECP_FIXED_POINT_OPTIM**

Enable fixed-point multiplication optimisations

*Found in: Component config > mbedTLS*

This configuration option enables optimizations to speedup (about 3 ~ 4 times) the ECP fixed point multiplication using pre-computed tables in the flash memory. Disabling this configuration option saves flash footprint (about 29KB if all Elliptic Curves selected) in the application binary.

# end of Elliptic Curve options

**Default value:**
- Yes (enabled)

**CONFIG_MBEDTLS_POLY1305_C**

Poly1305 MAC algorithm

*Found in: Component config > mbedTLS*

Enable support for Poly1305 MAC algorithm.

**Default value:**
- No (disabled)

**CONFIG_MBEDTLS_CHACHA20_C**

Chacha20 stream cipher

*Found in: Component config > mbedTLS*

Enable support for Chacha20 stream cipher.

**Default value:**
- No (disabled)

**CONFIG_MBEDTLS_CHACHAPOLY_C**

ChaCha20-Poly1305 AEAD algorithm

*Found in: Component config > mbedTLS > CONFIG_MBEDTLS_CHACHA20_C*

Enable support for ChaCha20-Poly1305 AEAD algorithm.

**Default value:**
- No (disabled) if CONFIG_MBEDTLS_CHACHA20_C && CONFIG_MBEDTLS_POLY1305_C

**CONFIG_MBEDTLS_HKDF_C**

HKDF algorithm (RFC 5869)

*Found in: Component config > mbedTLS*

Enable support for the Hashed Message Authentication Code (HMAC)-based key derivation function (HKDF).

**Default value:**
- No (disabled)
CONFIG_MBEDTLS_THREADING_C
Enable the threading abstraction layer

*Found in: Component config > mbedTLS*

If you do intend to use contexts between threads, you will need to enable this layer to prevent race conditions.

**Default value:**
- No (disabled)

CONFIG_MBEDTLS_THREADING_ALT
Enable threading alternate implementation

*Found in: Component config > mbedTLS > CONFIG_MBEDTLS_THREADING_C*

Enable threading alt to allow your own alternate threading implementation.

**Default value:**
- Yes (enabled) if CONFIG_MBEDTLS_THREADING_C

CONFIG_MBEDTLS_THREADING_PTHREAD
Enable threading pthread implementation

*Found in: Component config > mbedTLS > CONFIG_MBEDTLS_THREADING_C*

Enable the pthread wrapper layer for the threading layer.

**Default value:**
- No (disabled) if CONFIG_MBEDTLS_THREADING_C

CONFIG_MBEDTLS_LARGE_KEY_SOFTWARE_MPI
Fallback to software implementation for larger MPI values

*Found in: Component config > mbedTLS*

Fallback to software implementation for RSA key lengths larger than SOC_RSA_MAX_BIT_LEN. If this is not active then the ESP will be unable to process keys greater than SOC_RSA_MAX_BIT_LEN.

**Default value:**
- No (disabled)

CONFIG_MBEDTLS_USE_CRYPTO_ROM_IMPL
Use ROM implementation of the crypto algorithm

*Found in: Component config > mbedTLS*

Enable this flag to use mbedtls crypto algorithm from ROM instead of ESP-IDF.

This configuration option saves flash footprint in the application binary. Note that the version of mbedtls crypto algorithm library in ROM is v2.16.12. We have done the security analysis of the mbedtls revision in ROM (v2.16.12) and ensured that affected symbols have been patched (removed). If in the future mbedtls revisions there are security issues that also affects the version in ROM (v2.16.12) then we shall patch the relevant symbols. This would increase the flash footprint and hence care must be taken to keep some reserved space for the application binary in flash layout.

**Default value:**
- No (disabled) if ESP_ROM_HAS_MBEDTLS_CRYPTO_LIB && CONFIG_IDF_EXPERIMENTAL_FEATURES
**ESP-MQTT Configurations** Contains:

- CONFIG_MQTT_CUSTOM_OUTBOX
- CONFIG_MQTT_TRANSPORT_SSL
- CONFIG_MQTT_TRANSPORT_WEBSOCKET
- CONFIG_MQTT_PROTOCOL_311
- CONFIG_MQTT_PROTOCOL_5
- CONFIG_MQTT_TASK_CORE_SELECTION_ENABLED
- CONFIG_MQTT_USE_CUSTOM_CONFIG
- CONFIG_MQTT_OUTBOX_EXPIRED_TIMEOUT_MS
- CONFIG_MQTT_REPORT_DELETED_MESSAGES
- CONFIG_MQTT_SKIP_PUBLISH_IF_DISCONNECTED
- CONFIG_MQTT_OUTBOX_DATA_ON_EXTERNAL_MEMORY
- CONFIG_MQTT_MSG_ID_INCREMENTAL

**CONFIG_MQTT_PROTOCOL_311**
Enable MQTT protocol 3.1.1

*Found in: Component config > ESP-MQTT Configurations*

If not, this library will use MQTT protocol 3.1

**Default value:**
- Yes (enabled)

**CONFIG_MQTT_PROTOCOL_5**
Enable MQTT protocol 5.0

*Found in: Component config > ESP-MQTT Configurations*

If not, this library will not support MQTT 5.0

**Default value:**
- No (disabled)

**CONFIG_MQTT_TRANSPORT_SSL**
Enable MQTT over SSL

*Found in: Component config > ESP-MQTT Configurations*

Enable MQTT transport over SSL with mbedtls

**Default value:**
- Yes (enabled)

**CONFIG_MQTT_TRANSPORT_WEBSOCKET**
Enable MQTT over Websocket

*Found in: Component config > ESP-MQTT Configurations*

Enable MQTT transport over Websocket.

**Default value:**
- Yes (enabled)
CONFIG_MQTT_TRANSPORT_WEBSOCKET_SECURE
Enable MQTT over Websocket Secure

*Found in:* Component config > ESP-MQTT Configurations > CONFIG_MQTT_TRANSPORT_WEBSOCKET
Enable MQTT transport over Websocket Secure.

**Default value:**
- Yes (enabled)

CONFIG_MQTT_MSG_ID_INCREMENTAL
Use Incremental Message ID

*Found in:* Component config > ESP-MQTT Configurations
Set this to true for the message id (2.3.1 Packet Identifier) to be generated as an incremental number rather than a random value (used by default).

**Default value:**
- No (disabled)

CONFIG_MQTT_SKIP_PUBLISH_IF_DISCONNECTED
Skip publish if disconnected

*Found in:* Component config > ESP-MQTT Configurations
Set this to true to avoid publishing (enqueueing messages) if the client is disconnected. The MQTT client tries to publish all messages by default, even in the disconnected state (where the qos1 and qos2 packets are stored in the internal outbox to be published later) The MQTT_SKIP_PUBLISH_IF_DISCONNECTED option allows applications to override this behaviour and not enqueue publish packets in the disconnected state.

**Default value:**
- No (disabled)

CONFIG_MQTT_REPORT_DELETED_MESSAGES
Report deleted messages

*Found in:* Component config > ESP-MQTT Configurations
Set this to true to post events for all messages which were deleted from the outbox before being correctly sent and confirmed.

**Default value:**
- No (disabled)

CONFIG_MQTT_USE_CUSTOM_CONFIG
MQTT Using custom configurations

*Found in:* Component config > ESP-MQTT Configurations
Custom MQTT configurations.

**Default value:**
- No (disabled)
CONFIG_MQTT_TCP_DEFAULT_PORT
Default MQTT over TCP port

*Found in: Component config > ESP-MQTT Configurations > CONFIG_MQTT_USE_CUSTOM_CONFIG*

Default value:
- 1883 if `CONFIG_MQTT_USE_CUSTOM_CONFIG`

CONFIG_MQTT_SSL_DEFAULT_PORT
Default MQTT over SSL port

*Found in: Component config > ESP-MQTT Configurations > CONFIG_MQTT_USE_CUSTOM_CONFIG*

Default value:
- 8883 if `CONFIG_MQTT_USE_CUSTOM_CONFIG` & `CONFIG_MQTT_TRANSPORT_SSL`

CONFIG_MQTT_WS_DEFAULT_PORT
Default MQTT over Websocket port

*Found in: Component config > ESP-MQTT Configurations > CONFIG_MQTT_USE_CUSTOM_CONFIG*

Default value:
- 80 if `CONFIG_MQTT_USE_CUSTOM_CONFIG` & `CONFIG_MQTT_TRANSPORT_WEBSOCKET`

CONFIG_MQTT_WSS_DEFAULT_PORT
Default MQTT over Websocket Secure port

*Found in: Component config > ESP-MQTT Configurations > CONFIG_MQTT_USE_CUSTOM_CONFIG*

Default value:
- 443 if `CONFIG_MQTT_USE_CUSTOM_CONFIG` & `CONFIG_MQTT_TRANSPORT_WEBSOCKET` & `CONFIG_MQTT_TRANSPORT_WEBSOCKET_SECURE`

CONFIG_MQTT_BUFFER_SIZE
Default MQTT Buffer Size

*Found in: Component config > ESP-MQTT Configurations > CONFIG_MQTT_USE_CUSTOM_CONFIG*

This buffer size using for both transmit and receive

Default value:
- 1024 if `CONFIG_MQTT_USE_CUSTOM_CONFIG`

CONFIG_MQTT_TASK_STACK_SIZE
MQTT task stack size

*Found in: Component config > ESP-MQTT Configurations > CONFIG_MQTT_USE_CUSTOM_CONFIG*

Default value:
- 6144 if `CONFIG_MQTT_USE_CUSTOM_CONFIG`
CONFIG_MQTT_DISABLE_API_LOCKS

Disable API locks

*Found in:* Component config > ESP-MQTT Configurations > CONFIG_MQTT_USE_CUSTOM_CONFIG

Default config employs API locks to protect internal structures. It is possible to disable these locks if the user code doesn’t access MQTT API from multiple concurrent tasks

**Default value:**
- No (disabled) if CONFIG_MQTT_USE_CUSTOM_CONFIG

CONFIG_MQTT_TASK_PRIORITY

MQTT task priority

*Found in:* Component config > ESP-MQTT Configurations > CONFIG_MQTT_USE_CUSTOM_CONFIG

MQTT task priority. Higher number denotes higher priority.

**Default value:**
- 5 if CONFIG_MQTT_USE_CUSTOM_CONFIG

CONFIG_MQTT_POLL_READ_TIMEOUT_MS

MQTT transport poll read timeout

*Found in:* Component config > ESP-MQTT Configurations > CONFIG_MQTT_USE_CUSTOM_CONFIG

Timeout when polling underlying transport for read.

**Default value:**
- 1000 if CONFIG_MQTT_USE_CUSTOM_CONFIG

CONFIG_MQTT_EVENT_QUEUE_SIZE

Number of queued events.

*Found in:* Component config > ESP-MQTT Configurations > CONFIG_MQTT_USE_CUSTOM_CONFIG

A value higher than 1 enables multiple queued events.

**Default value:**
- 1 if CONFIG_MQTT_USE_CUSTOM_CONFIG

CONFIG_MQTT_TASK_CORE_SELECTION_ENABLED

Enable MQTT task core selection

*Found in:* Component config > ESP-MQTT Configurations

This will enable core selection

CONFIG_MQTT_TASK_CORE_SELECTION

Core to use?

*Found in:* Component config > ESP-MQTT Configurations > CONFIG_MQTT_TASK_CORE_SELECTION_ENABLED

Available options:

- Core 0 (CONFIG_MQTT_USE_CORE_0)
- Core 1 (CONFIG_MQTT_USE_CORE_1)
**CONFIG_MQTT_OUTBOX_DATA_ON_EXTERNAL_MEMORY**

Use external memory for outbox data

*Found in: Component config > ESP-MQTT Configurations*

Set to true to use external memory for outbox data.

**Default value:**
- No (disabled) if `CONFIG_MQTT_USE_CUSTOM_CONFIG`

**CONFIG_MQTT_CUSTOM_OUTBOX**

Enable custom outbox implementation

*Found in: Component config > ESP-MQTT Configurations*

Set to true if a specific implementation of message outbox is needed (e.g. persistent outbox in NVM or similar). Note: Implementation of the custom outbox must be added to the mqtt component. These CMake commands could be used to append the custom implementation to lib-mqtt sources:

```
idf_component_get_property(mqtt mqttCOMPONENT_LIB)set_property(TARGET ${mqtt} PROPERTY SOURCES ${PROJECT_DIR}/custom_outbox.c APPEND)
```

**Default value:**
- No (disabled)

**CONFIG_MQTT_OUTBOX_EXPIRED_TIMEOUT_MS**

Outbox message expired timeout [ms]

*Found in: Component config > ESP-MQTT Configurations*

Messages which stays in the outbox longer than this value before being published will be discarded.

**Default value:**
- 30000 if `CONFIG_MQTT_USE_CUSTOM_CONFIG`

**Newlib**

Contains:

- `CONFIG_NEWLIB_NANO_FORMAT`
- `CONFIG_NEWLIB_STDIN_LINE_ENDING`
- `CONFIG_NEWLIB_STDOUT_LINE_ENDING`
- `CONFIG_NEWLIB_TIME_SYSCALL`

**CONFIG_NEWLIB_STDOUT_LINE_ENDING**

Line ending for UART output

*Found in: Component config > Newlib*

This option allows configuring the desired line endings sent to UART when a newline (`n`, LF) appears on stdout. Three options are possible:

- CRLF: whenever LF is encountered, prepend it with CR
- LF: no modification is applied, stdout is sent as is
- CR: each occurrence of LF is replaced with CR

This option doesn’t affect behavior of the UART driver (drivers/uart.h).

Available options:

- CRLF (`CONFIG_NEWLIB_STDOUT_LINE_ENDING_CRLF`)
- LF (`CONFIG_NEWLIB_STDOUT_LINE_ENDING_LF`)
**CONFIG_NEWLIB_STDIN_LINE_ENDING**

Line ending for UART input

*Found in: Component config > Newlib*

This option allows configuring which input sequence on UART produces a newline (`’n’, LF) on stdin. Three options are possible:

- **CRLF**: CRLF is converted to LF
- **LF**: no modification is applied, input is sent to stdin as is
- **CR**: each occurrence of CR is replaced with LF

This option doesn’t affect behavior of the UART driver (drivers/uart.h).

Available options:

- **CRLF** (CONFIG_NEWLIB_STDIN_LINE_ENDING_CRLF)
- **LF** (CONFIG_NEWLIB_STDIN_LINE_ENDING_LF)
- **CR** (CONFIG_NEWLIB_STDIN_LINE_ENDING_CR)

**CONFIG_NEWLIB_NANO_FORMAT**

Enable ‘nano’ formatting options for printf/scanf family

*Found in: Component config > Newlib*

In most chips the ROM contains parts of newlib C library, including printf/scanf family of functions. These functions have been compiled with so-called “nano” formatting option. This option doesn’t support 64-bit integer formats and C99 features, such as positional arguments.

For more details about “nano” formatting option, please see newlib readme file, search for ‘–enable-newlib-nano-formatted-io’: https://sourceware.org/newlib/README

If this option is enabled and the ROM contains functions from newlib-nano, the build system will use functions available in ROM, reducing the application binary size. Functions available in ROM run faster than functions which run from flash. Functions available in ROM can also run when flash instruction cache is disabled.

Some chips (e.g. ESP32-C6) has the full formatting versions of printf/scanf in ROM instead of the nano versions and in this building with newlib nano might actually increase the size of the binary. Which functions are present in ROM can be seen from ROM caps: ESP_ROM_HAS_NEWLIB_NANO_FORMAT and ESP_ROM_HAS_NEWLIB_NORMAL_FORMAT.

If you need 64-bit integer formatting support or C99 features, keep this option disabled.

**CONFIG_NEWLIB_TIME_SYSCALL**

Timers used for gettimeofday function

*Found in: Component config > Newlib*

This setting defines which hardware timers are used to implement ‘gettimeofday’ and ‘time’ functions in C library.

- **If both high-resolution (systimer for all targets except ESP32) and RTC timers are used, timekeeping will continue in deep sleep. Time will be reported at 1 microsecond resolution. This is the default, and the recommended option.**
Chapter 2. API Reference

- If only high-resolution timer (systimer) is used, `gettimeofday` will provide time at microsecond resolution. Time will not be preserved when going into deep sleep mode.
- If only RTC timer is used, `timekeeping will continue` in deep sleep, but time will be measured at 6.6 microsecond resolution. Also, the `gettimeofday` function itself may take longer to run.
- If no timers are used, `gettimeofday and time functions` return -1 and set errno to ENOSYS.
- When RTC is used for timekeeping, two RTC_STORE registers are used to keep time in deep sleep mode.

Available options:

- RTC and high-resolution timer (CONFIG_NEWLIB_TIME_SYSCALL_USE_RTC_HRT)
- RTC (CONFIG_NEWLIB_TIME_SYSCALL_USE_RTC)
- High-resolution timer (CONFIG_NEWLIB_TIME_SYSCALL_USE_HRT)
- None (CONFIG_NEWLIB_TIME_SYSCALL_USE_NONE)

NVS Contains:

- CONFIG_NVS_LEGACY_DUP_KEYS_COMPATIBILITY
- CONFIG_NVS_ENCRYPTION
- CONFIG_NVS_COMPATIBLE_PRE_V4_3_ENCRYPTION_FLAG
- CONFIG_NVS_ASSERT_ERROR_CHECK

CONFIG_NVS_ENCRYPTION

Enable NVS encryption

*Found in: Component config > NVS*

This option enables encryption for NVS. When enabled, XTS-AES is used to encrypt the complete NVS data, except the page headers. It requires XTS encryption keys to be stored in an encrypted partition (enabling flash encryption is mandatory here) or to be derived from an HMAC key burnt in eFuse.

*Default value:*

- Yes (enabled) if CONFIG_SECURE_FLASH_ENC_ENABLED

CONFIG_NVS_COMPATIBLE_PRE_V4_3_ENCRYPTION_FLAG

NVS partition encrypted flag compatible with ESP-IDF before v4.3

*Found in: Component config > NVS*

Enabling this will ignore “encrypted” flag for NVS partitions. NVS encryption scheme is different than hardware flash encryption and hence it is not recommended to have “encrypted” flag for NVS partitions. This was not being checked in pre v4.3 IDF. Hence, if you have any devices where this flag is kept enabled in partition table then enabling this config will allow to have same behavior as pre v4.3 IDF.

CONFIG_NVS_ASSERT_ERROR_CHECK

Use assertions for error checking

*Found in: Component config > NVS*

This option switches error checking type between assertions (y) or return codes (n).

*Default value:*

- No (disabled)
**CONFIG_NVS_LEGACY_DUP_KEYS_COMPATIBILITY**

Enable legacy nvs_set function behavior when same key is reused with different data types

*Found in: Component config > NVS*

Enabling this option will switch the nvs_set() family of functions to the legacy mode: when called repeatedly with the same key but different data type, the existing value in the NVS remains active and the new value is just stored, actually not accessible through corresponding nvs_get() call for the key given. Use this option only when your application relies on such NVS API behaviour.

**Default value:**
- No (disabled)

**NVS Security Provider** Contains:
- `CONFIG_NVS_SEC_HMAC_EFUSE_KEY_ID`
- `CONFIG_NVS_SEC_KEY_PROTECTION_SCHEME`

**CONFIG_NVS_SEC_KEY_PROTECTION_SCHEME**

NVS Encryption: Key Protection Scheme

*Found in: Component config > NVS Security Provider*

This choice defines the default NVS encryption keys protection scheme; which will be used for the default NVS partition. Users can use the corresponding scheme registration APIs to register other schemes for the default as well as other NVS partitions.

**Available options:**

- Using Flash Encryption (`CONFIG_NVS_SEC_KEY_PROTECT_USING_FLASH_ENC`) Protect the NVS Encryption Keys using Flash Encryption Requires a separate ‘nvs_keys’ partition (which will be encrypted by flash encryption) for storing the NVS encryption keys
- Using HMAC peripheral (`CONFIG_NVS_SEC_KEY_PROTECT_USING_HMAC`) Derive and protect the NVS Encryption Keys using the HMAC peripheral Requires the specified eFuse block (NVS_SEC_HMAC_EFUSE_KEY_ID or the v2 API argument) to be empty or pre-written with a key with the purpose ESP_EFUSE_KEY_PURPOSE_HMAC_UP

**CONFIG_NVS_SEC_HMAC_EFUSE_KEY_ID**

eFuse key ID storing the HMAC key

*Found in: Component config > NVS Security Provider*

eFuse block key ID storing the HMAC key for deriving the NVS encryption keys

**Note:** The eFuse block key ID required by the HMAC scheme (`CONFIG_NVS_SEC_KEY_PROTECT_USING_HMAC`) is set using this config when the default NVS partition is initialized with nvs_flash_init(). The eFuse block key ID can also be set at runtime by passing the appropriate value to the NVS security scheme registration APIs.

**Range:**
- from 0 to 6 if `CONFIG_NVS_SEC_KEY_PROTECT_USING_HMAC`

**Default value:**
- 6 if `CONFIG_NVS_SEC_KEY_PROTECT_USING_HMAC`
OpenThread Contains:

- CONFIG_OPENTHREAD_PLATFORM_MSGPOOL_MANAGEMENT
- CONFIG_OPENTHREAD_DEVICE_TYPE
- CONFIG_OPENTHREAD_RADIO_TYPE
- CONFIG_OPENTHREAD_BORDER_ROUTER
- CONFIG_OPENTHREAD_COMMISSIONER
- CONFIG_OPENTHREAD_CSL_DEBUG_ENABLE
- CONFIG_OPENTHREAD_CSL_ENABLE
- CONFIG_OPENTHREAD_DIAG
- CONFIG_OPENTHREAD_DNS_CLIENT
- CONFIG_OPENTHREAD_DUA_ENABLE
- CONFIG_OPENTHREAD_JOINE
- CONFIG_OPENTHREAD_LINK_METRICS
- CONFIG_OPENTHREAD_MACFILTER_ENABLE
- CONFIG_OPENTHREAD_CLI
- CONFIG_OPENTHREAD_RADIO_STATS_ENABLE
- CONFIG_OPENTHREAD_SRTP_CLIENT
- CONFIG_OPENTHREAD_TIME_SYNC
- CONFIG_OPENTHREAD_ENABLED
- CONFIG_OPENTHREAD_XTAL_ACCURACY
- CONFIG_OPENTHREAD_CSL_UNCERTAIN
- CONFIG_OPENTHREAD_CSL_ACCURACY
- CONFIG_OPENTHREAD_NUM_MESSAGE_BUFFERS
- CONFIG_OPENTHREAD_RCP_TRANSPORT
- CONFIG_OPENTHREAD_MLE_MAX_CHILDREN
- CONFIG_OPENTHREAD_TMF_ADDR_CACHE_ENTRIES
- CONFIG_OPENTHREAD_SPINEL_RX_FRAME_BUFFER_SIZE
- CONFIG_OPENTHREAD_UART_BUFFER_SIZE
- Thread Operational Dataset
- CONFIG_OPENTHREAD_DNS64_CLIENT

CONFIG_OPENTHREAD_ENABLED

OpenThread

*Found in:* Component config > OpenThread

Select this option to enable OpenThread and show the submenu with OpenThread configuration choices.

**Default value:**

- No (disabled)

CONFIG_OPENTHREAD_LOG_LEVEL_DYNAMIC

Enable dynamic log level control

*Found in:* Component config > OpenThread > CONFIG_OPENTHREAD_ENABLED

Select this option to enable dynamic log level control for OpenThread

**Default value:**

- Yes (enabled) if CONFIG_OPENTHREAD_ENABLED

CONFIG_OPENTHREAD_CONSOLE_TYPE

OpenThread console type

*Found in:* Component config > OpenThread > CONFIG_OPENTHREAD_ENABLED

Select OpenThread console type

Available options:
• OpenThread console type UART (CONFIG_OPENTHREAD_CONSOLE_TYPE_UART)
• OpenThread console type USB Serial/JTAG Controller (CONFIG_OPENTHREAD_CONSOLE_TYPE_USB_SERIAL_JTAG)

CONFIG_OPENTHREAD_LOG_LEVEL
OpenThread log verbosity

Found in: Component config > OpenThread > CONFIG_OPENTHREAD_ENABLED

Select OpenThread log level.

Available options:

• No logs (CONFIG_OPENTHREAD_LOG_LEVEL_NONE)
• Error logs (CONFIG_OPENTHREAD_LOG_LEVEL_CRIT)
• Warning logs (CONFIG_OPENTHREAD_LOG_LEVEL_WARN)
• Notice logs (CONFIG_OPENTHREAD_LOG_LEVEL_NOTE)
• Info logs (CONFIG_OPENTHREAD_LOG_LEVEL_INFO)
• Debug logs (CONFIG_OPENTHREAD_LOG_LEVEL_DEBG)

Thread Operational Dataset Contains:

• CONFIG_OPENTHREAD_NETWORK_EXTPANID
• CONFIG_OPENTHREAD_MESH_LOCAL_PREFIX
• CONFIG_OPENTHREAD_NETWORK_CHANNEL
• CONFIG_OPENTHREAD_NETWORK_MASTERKEY
• CONFIG_OPENTHREAD_NETWORK_NAME
• CONFIG_OPENTHREAD_NETWORK_PANID
• CONFIG_OPENTHREAD_NETWORK_PSKC

CONFIG_OPENTHREAD_NETWORK_NAME
OpenThread network name

Found in: Component config > OpenThread > Thread Operational Dataset

Default value:

• “OpenThread-ESP”

CONFIG_OPENTHREAD_MESH_LOCAL_PREFIX
OpenThread mesh local prefix, format <address>/<plen>

Found in: Component config > OpenThread > Thread Operational Dataset

A string in the format “<address>/<plen>”, where <address> is an IPv6 address and <plen> is a prefix length. For example “fd00:db8:a0:0::/64”

Default value:

• “fd00:db8:a0:0:0:/64”

CONFIG_OPENTHREAD_NETWORK_CHANNEL
OpenThread network channel

Found in: Component config > OpenThread > Thread Operational Dataset

Range:

• from 11 to 26
**Default value:**

• 15

**CONFIG_OPENTHREAD_NETWORK_PANID**

OpenThread network pan id

*Found in: Component config > OpenThread > Thread Operational Dataset*

*Range:*

• from 0 to 0xFFFE

*Default value:*

• “0x1234”

**CONFIG_OPENTHREAD_NETWORK_EXTPANID**

OpenThread extended pan id

*Found in: Component config > OpenThread > Thread Operational Dataset*

The OpenThread network extended pan id in hex string format

*Default value:*

• dead00beef00cafe

**CONFIG_OPENTHREAD_NETWORK_MASTERKEY**

OpenThread network key

*Found in: Component config > OpenThread > Thread Operational Dataset*

The OpenThread network network key in hex string format

*Default value:*

• 00112233445566778899aabbccddeeff

**CONFIG_OPENTHREAD_NETWORK_PSKC**

OpenThread pre-shared commissioner key

*Found in: Component config > OpenThread > Thread Operational Dataset*

The OpenThread pre-shared commissioner key in hex string format

*Default value:*

• 104810e2315100af6be9215a6bfac53

**CONFIG_OPENTHREAD_RADIO_TYPE**

Config the Thread radio type

*Found in: Component config > OpenThread*

Configure how OpenThread connects to the 15.4 radio

*Available options:*

• Native 15.4 radio (CONFIG_OPENTHREAD_RADIO_NATIVE)
  Select this to use the native 15.4 radio.
• Connect via UART (CONFIG_OPENTHREAD_RADIO_SPINEL_UART)
  Select this to connect to a Radio Co-Processor via UART.
• Connect via SPI (CONFIG_OPENTHREAD_RADIO_SPINEL_SPI)
  Select this to connect to a Radio Co-Processor via SPI.
CONFIG_OPENTHREAD_DEVICE_TYPE

Config the Thread device type

*Found in: Component config > OpenThread*

OpenThread can be configured to different device types (FTD, MTD, Radio)

Available options:

- Full Thread Device (CONFIG_OPENTHREAD_FTD)
  Select this to enable Full Thread Device which can act as router and leader in a Thread network.

- Minimal Thread Device (CONFIG_OPENTHREAD_MTD)
  Select this to enable Minimal Thread Device which can only act as an end device in a Thread network. This will reduce the code size of the OpenThread stack.

- Radio Only Device (CONFIG_OPENTHREAD_RADIO)
  Select this to enable Radio Only Device which can only forward 15.4 packets to the host. The OpenThread stack will be run on the host and OpenThread will have minimal footprint on the radio only device.

CONFIG_OPENTHREAD_RCP_TRANSPORT

The RCP transport type

*Found in: Component config > OpenThread*

Available options:

- UART RCP (CONFIG_OPENTHREAD_RCP_UART)
  Select this to enable UART connection to host.

- SPI RCP (CONFIG_OPENTHREAD_RCP_SPI)
  Select this to enable SPI connection to host.

CONFIG_OPENTHREAD_CLI

Enable Openthread Command-Line Interface

*Found in: Component config > OpenThread*

Select this option to enable Command-Line Interface in OpenThread.

**Default value:**

- Yes (enabled) if CONFIG_OPENTHREAD_ENABLED

CONFIG_OPENTHREAD_DIAG

Enable diag

*Found in: Component config > OpenThread*

Select this option to enable Diag in OpenThread. This will enable diag mode and a series of diag commands in the OpenThread command line. These commands allow users to manipulate low-level features of the storage and 15.4 radio.

**Default value:**

- Yes (enabled) if CONFIG_OPENTHREAD_ENABLED
CONFIG_OPENTHREAD_COMMISSIONER
Enable Commissioner

*Found in: Component config > OpenThread*

Select this option to enable commissioner in OpenThread. This will enable the device to act as a commissioner in the Thread network. A commissioner checks the pre-shared key from a joining device with the Thread commissioning protocol and shares the network parameter with the joining device upon success.

**Default value:**
- No (disabled) if `CONFIG_OPENTHREAD_ENABLED`

CONFIG_OPENTHREAD_COMM_MAX_JOINER_ENTRIES
The size of max commissioning joiner entries

*Found in: Component config > OpenThread > CONFIG_OPENTHREAD_COMMISSIONER*

**Range:**
- from 2 to 50 if `CONFIG_OPENTHREAD_COMMISSIONER`

**Default value:**
- 2 if `CONFIG_OPENTHREAD_COMMISSIONER`

CONFIG_OPENTHREAD_JOINER
Enable Joiner

*Found in: Component config > OpenThread*

Select this option to enable Joiner in OpenThread. This allows a device to join the Thread network with a pre-shared key using the Thread commissioning protocol.

**Default value:**
- No (disabled) if `CONFIG_OPENTHREAD_ENABLED`

CONFIG_OPENTHREAD_SRP_CLIENT
Enable SRP Client

*Found in: Component config > OpenThread*

Select this option to enable SRP Client in OpenThread. This allows a device to register SRP services to SRP Server.

**Default value:**
- Yes (enabled) if `CONFIG_OPENTHREAD_ENABLED`

CONFIG_OPENTHREAD_SRP_CLIENT_MAX_SERVICES
Specifies number of service entries in the SRP client service pool

*Found in: Component config > OpenThread > CONFIG_OPENTHREAD_SRP_CLIENT*

Set the max buffer size of service entries in the SRP client service pool.

**Range:**
- from 2 to 20 if `CONFIG_OPENTHREAD_SRP_CLIENT`

**Default value:**
- 5 if `CONFIG_OPENTHREAD_SRP_CLIENT`
CONFIG_OPENTHREAD_DNS_CLIENT

Enable DNS Client

*Found in: Component config > OpenThread*

Select this option to enable DNS Client in OpenThread.

**Default value:**
- Yes (enabled) if `CONFIG_OPENTHREAD_ENABLED`

CONFIG_OPENTHREAD_BORDER_ROUTER

Enable Border Router

*Found in: Component config > OpenThread*

Select this option to enable border router features in OpenThread.

**Default value:**
- No (disabled) if `CONFIG_OPENTHREAD_ENABLED`

CONFIG_OPENTHREAD_PLATFORM_MSGPOOL_MANAGEMENT

Allocate message pool buffer from PSRAM

*Found in: Component config > OpenThread*

If enabled, the message pool is managed by platform defined logic.

**Default value:**
- No (disabled) if `CONFIG_OPENTHREAD_ENABLED` && (CONFIG_SPIRAM_USE_CAPS_ALLOC || CONFIG_SPIRAM_USE_MALLOC)

CONFIG_OPENTHREAD_NUM_MESSAGE_BUFFERS

The number of openthread message buffers

*Found in: Component config > OpenThread*

**Range:**
- from 10 to 8191 if `CONFIG_OPENTHREAD_PLATFORM_MSGPOOL_MANAGEMENT` && `CONFIG_OPENTHREAD_ENABLED`

**Default value:**
- 65 if `CONFIG_OPENTHREAD_ENABLED`

CONFIG_OPENTHREAD_SPINEL_RX_FRAME_BUFFER_SIZE

The size of openthread spinel rx frame buffer

*Found in: Component config > OpenThread*

**Range:**
- from 512 to 8192 if `CONFIG_OPENTHREAD_ENABLED`

**Default value:**
- 1024 if `CONFIG_OPENTHREAD_ENABLED`

CONFIG_OPENTHREAD_MLE_MAX_CHILDREN

The size of max MLE children entries

*Found in: Component config > OpenThread*

**Range:**
- from 5 to 50 if `CONFIG_OPENTHREAD_ENABLED`
Chapter 2. API Reference

**CONFIG_OPENTHREAD_TMALLOC_MAX退　CACHE_ENTRIES**

The size of max TMF address cache entries

*Found in: Component config > OpenThread*

**Range:**

- from 5 to 50 if `CONFIG_OPENTHREAD_ENABLED`

**Default value:**

- 20 if `CONFIG_OPENTHREAD_ENABLED`

**CONFIG_OPENTHREAD_DNS64_CLIENT**

Use dns64 client

*Found in: Component config > OpenThread*

Select this option to acquire NAT64 address from dns servers.

**Default value:**

- No (disabled) if `CONFIG_OPENTHREAD_ENABLED` && `CONFIG_LWIP_IPV4`

**CONFIG_OPENTHREAD_DNS_SERVER_ADDR**

DNS server address (IPv4)

*Found in: Component config > OpenThread > CONFIG_OPENTHREAD_DNS64_CLIENT*

Set the DNS server IPv4 address.

**Default value:**

- “8.8.8.8” if `CONFIG_OPENTHREAD_DNS64_CLIENT`

**CONFIG_OPENTHREAD_UART_BUFFER_SIZE**

The uart received buffer size of openthread

*Found in: Component config > OpenThread*

Set the OpenThread UART buffer size.

**Range:**

- from 128 to 1024 if `CONFIG_OPENTHREAD_ENABLED`

**Default value:**

- 256 if `CONFIG_OPENTHREAD_ENABLED`

**CONFIG_OPENTHREAD_LINK_METRICS**

Enable link metrics feature

*Found in: Component config > OpenThread*

Select this option to enable link metrics feature

**Default value:**

- No (disabled) if `CONFIG_OPENTHREAD_ENABLED`
CONFIG_OPENTHREAD_MACFILTER_ENABLE

Enable mac filter feature

*Found in: Component config > OpenThread*

Select this option to enable mac filter feature

**Default value:**

- No (disabled) if `CONFIG_OPENTHREAD_ENABLED`

CONFIG_OPENTHREAD_CSL_ENABLE

Enable CSL feature

*Found in: Component config > OpenThread*

Select this option to enable CSL feature

**Default value:**

- No (disabled) if `CONFIG_OPENTHREAD_ENABLED`

CONFIG_OPENTHREAD_XTAL_ACCURACY

The accuracy of the XTAL

*Found in: Component config > OpenThread*

The device’s XTAL accuracy, in ppm.

**Default value:**

- 130

CONFIG_OPENTHREAD_CSL_ACCURACY

The current CSL rx/tx scheduling drift, in units of ± ppm

*Found in: Component config > OpenThread*

The current accuracy of the clock used for scheduling CSL operations

**Default value:**

- 1 if `CONFIG_OPENTHREAD_CSL_ENABLE`

CONFIG_OPENTHREAD_CSL_UNCERTAIN

The CSL Uncertainty in units of 10 us.

*Found in: Component config > OpenThread*

The fixed uncertainty of the Device for scheduling CSL Transmissions in units of 10 microseconds.

**Default value:**

- 1 if `CONFIG_OPENTHREAD_CSL_ENABLE`

CONFIG_OPENTHREAD_CSL_DEBUG_ENABLE

Enable CSL debug

*Found in: Component config > OpenThread*

Select this option to set rx on when sleep in CSL feature, only for debug

**Default value:**

- No (disabled) if `CONFIG_OPENTHREAD_CSL_ENABLE`
**CONFIG_OPENTHREAD_DUA_ENABLE**

Enable Domain Unicast Address feature

*Found in: Component config > OpenThread*

Only used for Thread1.2 certification

**Default value:**

- No (disabled) if `CONFIG_OPENTHREAD_ENABLED`

---

**CONFIG_OPENTHREAD_TIME_SYNC**

Enable the time synchronization service feature

*Found in: Component config > OpenThread*

Select this option to enable time synchronization feature, the devices in the same Thread network could sync to the same network time.

**Default value:**

- No (disabled) if `CONFIG_OPENTHREAD_ENABLED`

---

**CONFIG_OPENTHREAD_RADIO_STATS_ENABLE**

Enable Radio Statistics feature

*Found in: Component config > OpenThread*

Select this option to enable the radio statistics feature, you can use radio command to print some radio Statistics informations.

**Default value:**

- No (disabled) if `CONFIG_OPENTHREAD_FTD || CONFIG_OPENTHREAD_MTD`

---

**Protocomm**  Contains:

- `CONFIG_ESP_PROTOCOMM_SUPPORT_SECURITY_VERSION_0`
- `CONFIG_ESP_PROTOCOMM_SUPPORT_SECURITY_VERSION_1`
- `CONFIG_ESP_PROTOCOMM_SUPPORT_SECURITY_VERSION_2`

---

**CONFIG_ESP_PROTOCOMM_SUPPORT_SECURITY_VERSION_0**

Support protocomm security version 0 (no security)

*Found in: Component config > Protocomm*

Enable support of security version 0. Disabling this option saves some code size. Consult the Enabling protocomm security version section of the Protocomm documentation in ESP-IDF Programming guide for more details.

**Default value:**

- Yes (enabled)

---

**CONFIG_ESP_PROTOCOMM_SUPPORT_SECURITY_VERSION_1**

Support protocomm security version 1 (Curve25519 key exchange + AES-CTR encryption/decryption)

*Found in: Component config > Protocomm*

Enable support of security version 1. Disabling this option saves some code size. Consult the Enabling protocomm security version section of the Protocomm documentation in ESP-IDF Programming guide for more details.

**Default value:**
• Yes (enabled)

**CONFIG_ESP_PROTOCOMM_SUPPORT_SECURITY_VERSION_2**

Support protocomm security version 2 (SRP6a-based key exchange + AES-GCM encryption/decryption)

*Found in: **Component config > Protocomm***

Enable support of security version 2. Disabling this option saves some code size. Consult the Enabling protocomm security version section of the Protocomm documentation in ESP-IDF Programming guide for more details.

**Default value:**

• Yes (enabled)

**PThreads**  Contains:

• **CONFIG_PTHREAD_TASK_NAME_DEFAULT**
• **CONFIG_PTHREAD_TASK_CORE_DEFAULT**
• **CONFIG_PTHREAD_TASK_PRIO_DEFAULT**
• **CONFIG_PTHREAD_TASK_STACK_SIZE_DEFAULT**
• **CONFIG_PTHREAD_STACK_MIN**

**CONFIG_PTHREAD_TASK_PRIO_DEFAULT**

Default task priority

*Found in: **Component config > PThreads***

Priority used to create new tasks with default pthread parameters.

**Range:**

• from 0 to 255

**Default value:**

• 5

**CONFIG_PTHREAD_TASK_STACK_SIZE_DEFAULT**

Default task stack size

*Found in: **Component config > PThreads***

Stack size used to create new tasks with default pthread parameters.

**Default value:**

• 3072

**CONFIG_PTHREAD_STACK_MIN**

Minimum allowed pthread stack size

*Found in: **Component config > PThreads***

Minimum allowed pthread stack size set in attributes passed to pthread_create

**Default value:**

• 768
CONFIG_PTHREAD_TASK_CORE_DEFAULT

Default pthread core affinity

*Found in: Component config > PThreads*

The default core to which pthreads are pinned.

Available options:

- No affinity (CONFIG_PTHREAD_DEFAULT_CORE_NO_AFFINITY)
- Core 0 (CONFIG_PTHREAD_DEFAULT_CORE_0)
- Core 1 (CONFIG_PTHREAD_DEFAULT_CORE_1)

CONFIG_PTHREAD_TASK_NAME_DEFAULT

Default name of pthreads

*Found in: Component config > PThreads*

The default name of pthreads.

*Default value:*

- “pthread”

SoC Settings  Contains:

- **MMU Config**

MMU Config

Main Flash configuration  Contains:

- **Optional and Experimental Features (READ DOCS FIRST)**
- **SPI Flash behavior when brownout**

SPI Flash behavior when brownout  Contains:

- **CONFIG_SPI_FLASH_BROWNOUT_RESET_XMC**

CONFIG_SPI_FLASH_BROWNOUT_RESET_XMC

Enable sending reset when brownout for XMC flash chips

*Found in: Component config > Main Flash configuration > SPI Flash behavior when brownout*

When this option is selected, the patch will be enabled for XMC. Follow the recommended flow by XMC for better stability.

DO NOT DISABLE UNLESS YOU KNOW WHAT YOU ARE DOING.

Optional and Experimental Features (READ DOCS FIRST)  Contains:

- **CONFIG_SPI_FLASH_AUTO_SUSPEND**
- **CONFIG_SPI_FLASH_HPM**
- **CONFIG_SPI_FLASH_SUSPEND_TSUS_VAL_US**
- **CONFIG_SPI_FLASH_HPM_DC**
**CONFIG_SPI_FLASH_HPM**

High Performance Mode (READ DOCS FIRST, > 80MHz)

*Found in: Component config > Main Flash configuration > Optional and Experimental Features (READ DOCS FIRST)*

Whether the High Performance Mode of Flash is enabled. As an optional feature, user needs to manually enable this option as a confirmation. To be back-compatible with earlier IDF versionn, this option is automatically enabled with warning when Flash running > 80Mhz.

Available options:

- Enable (CONFIG_SPI_FLASH_HPM_ENA)
- Auto (Not recommended) (CONFIG_SPI_FLASH_HPM_AUTO)
- Disabled (CONFIG_SPI_FLASH_HPM_DIS)

**CONFIG_SPI_FLASH_HPM_DC**

Support HPM using DC (READ DOCS FIRST)

*Found in: Component config > Main Flash configuration > Optional and Experimental Features (READ DOCS FIRST)*

This feature needs your bootloader to be compiled DC-aware (BOOT-LOADER_FLASH_DC_AWARE=y). Otherwise the chip will not be able to boot after a reset.

Available options:

- Auto (Enable when bootloader support enabled (BOOT-LOADER_FLASH_DC_AWARE)) (CONFIG_SPI_FLASH_HPM_DC_AUTO)
- Disable (READ DOCS FIRST) (CONFIG_SPI_FLASH_HPM_DC_DISABLE)

**CONFIG_SPI_FLASH_AUTO_SUSPEND**

Auto suspend long erase/write operations (READ DOCS FIRST)

*Found in: Component config > Main Flash configuration > Optional and Experimental Features (READ DOCS FIRST)*

This option is disabled by default because it is supported only for specific flash chips and for specific Espressif chips. To evaluate if you can use this feature refer to Optional Features for Flash > Auto Suspend & Resume of the ESP-IDF Programming Guide.

CAUTION: If you want to OTA to an app with this feature turned on, please make sure the bootloader has the support for it. (later than IDF v4.3)

If you are using an official Espressif module, please contact Espressif Business support to check if the module has the flash that support this feature installed. Also refer to Concurrency Constraints for Flash on SPI1 > Flash Auto Suspend Feature before enabling this option.

**CONFIG_SPI_FLASH_SUSPEND_TSUS_VAL_US**

SPI flash TSUS value (refer to chapter AC CHARACTERISTICS)

*Found in: Component config > Main Flash configuration > Optional and Experimental Features (READ DOCS FIRST)*

This config is used for setting Tsus parameter. Tsus means CS# high to next command after suspend. You can refer to the chapter of AC CHARACTERISTICS of flash datasheet.
SPI Flash driver  Contains:

• Auto-detect flash chips
• CONFIG_SPI_FLASH_BYPASS_BLOCK_ERASE
• CONFIG_SPI_FLASH_ENABLE_ENCRYPTED_READ_WRITE
• CONFIG_SPI_FLASH_ENABLE COUNTERS
• CONFIG_SPI_FLASH_ROM_DRIVER_PATCH
• CONFIG_SPI_FLASH_YIELD DURING_ERASE
• CONFIG_SPI_FLASH_CHECK_ERASE_TIMEOUT_DISABLED
• CONFIG_SPI_FLASH_WRITE_CHUNK_SIZE
• CONFIG_SPI_FLASH_OVERRIDE_CHIP_DRIVER_LIST
• CONFIG_SPI_FLASH_SIZE OVERRIDE
• CONFIG_SPI_FLASH_ROM_IMPL
• CONFIG_SPI_FLASH_VERIFY_WRITE
• CONFIG_SPI_FLASH_DANGEROUS_WRITE

CONFIG_SPI_FLASH_VERIFY_WRITE

Verify SPI flash writes

*Found in: Component config > SPI Flash driver*

If this option is enabled, any time SPI flash is written then the data will be read back and verified. This can catch hardware problems with SPI flash, or flash which was not erased before verification.

CONFIG_SPI_FLASH_LOG_FAILED_WRITE

Log errors if verification fails

*Found in: Component config > SPI Flash driver > CONFIG_SPI_FLASH_VERIFY_WRITE*

If this option is enabled, if SPI flash write verification fails then a log error line will be written with the address, expected & actual values. This can be useful when debugging hardware SPI flash problems.

CONFIG_SPI_FLASH_WARN_SETTING_ZERO_TO_ONE

Log warning if writing zero bits to ones

*Found in: Component config > SPI Flash driver > CONFIG_SPI_FLASH_VERIFY_WRITE*

If this option is enabled, any SPI flash write which tries to set zero bits in the flash to ones will log a warning. Such writes will not result in the requested data appearing identically in flash once written, as SPI NOR flash can only set bits to one when an entire sector is erased. After erasing, individual bits can only be written from one to zero.

Note that some software (such as SPIFFS) which is aware of SPI NOR flash may write one bits as an optimisation, relying on the data in flash becoming a bitwise AND of the new data and any existing data. Such software will log spurious warnings if this option is enabled.

CONFIG_SPI_FLASH_ENABLE_COUNTERS

Enable operation counters

*Found in: Component config > SPI Flash driver*

This option enables the following APIs:

• esp_flash_reset_counters
• esp_flash_dump_counters
• esp_flash_get_counters

These APIs may be used to collect performance data for spi_flash APIs and to help understand behaviour of libraries which use SPI flash.
CONFIG_SPI_FLASH_ROM_DRIVER_PATCH

Enable SPI flash ROM driver patched functions

*Found in: Component config > SPI Flash driver*

Enable this flag to use patched versions of SPI flash ROM driver functions. This option should be enabled, if any one of the following is true: (1) need to write to flash on ESP32-D2WD; (2) main SPI flash is connected to non-default pins; (3) main SPI flash chip is manufactured by ISSI.

CONFIG_SPI_FLASH_ROM_IMPL

Use esp_flash implementation in ROM

*Found in: Component config > SPI Flash driver*

Enable this flag to use new SPI flash driver functions from ROM instead of ESP-IDF.

If keeping this as “n” in your project, you will have less free IRAM. But you can use all of our flash features.

If making this as “y” in your project, you will increase free IRAM. But you may miss out on some flash features and support for new flash chips.

Currently the ROM cannot support the following features:

• SPI_FLASH_AUTO_SUSPEND (C3, S3)

CONFIG_SPI_FLASH_DANGEROUS_WRITE

Writing to dangerous flash regions

*Found in: Component config > SPI Flash driver*

SPI flash APIs can optionally abort or return a failure code if erasing or writing addresses that fall at the beginning of flash (covering the bootloader and partition table) or that overlap the app partition that contains the running app.

It is not recommended to ever write to these regions from an IDF app, and this check prevents logic errors or corrupted firmware memory from damaging these regions.

Note that this feature *does not* check calls to the esp_rom_xxx SPI flash ROM functions. These functions should not be called directly from IDF applications.

Available options:

• Aborts (CONFIG_SPI_FLASH_DANGEROUS_WRITE_ABORTS)
• Fails (CONFIG_SPI_FLASH_DANGEROUS_WRITE_FAILS)
• Allowed (CONFIG_SPI_FLASH_DANGEROUS_WRITE_ALLOWED)

CONFIG_SPI_FLASH_BYPASS_BLOCK_ERASE

Bypass a block erase and always do sector erase

*Found in: Component config > SPI Flash driver*

Some flash chips can have very high “max” erase times, especially for block erase (32KB or 64KB). This option allows to bypass “block erase” and always do sector erase commands. This will be much slower overall in most cases, but improves latency for other code to run.
CONFIG_SPI_FLASH_YIELD_DURING_ERASE

Enables yield operation during flash erase

*Found in: Component config > SPI Flash driver*

This allows to yield the CPUs between erase commands. Prevents starvation of other tasks. Please use this configuration together with `SPI\_FLASH\_ERASE\_YIELD\_DURATION\_MS` and `SPI\_FLASH\_ERASE\_YIELD\_TICKS` after carefully checking flash datasheet to avoid a watchdog timeout. For more information, please check SPI Flash API reference documentation under section *OS Function*.

CONFIG_SPI_FLASH_ERASE_YIELD_DURATION_MS

Duration of erasing to yield CPUs (ms)

*Found in: Component config > SPI Flash driver > CONFIG_SPI_FLASH_YIELD_DURING_ERASE*

If a duration of one erase command is large then it will yield CPUs after finishing a current command.

CONFIG_SPI_FLASH_ERASE_YIELD_TICKS

CPU release time (tick) for an erase operation

*Found in: Component config > SPI Flash driver > CONFIG_SPI_FLASH_YIELD_DURING_ERASE*

Defines how many ticks will be before returning to continue a erasing.

CONFIG_SPI_FLASH_WRITE_CHUNK_SIZE

Flash write chunk size

*Found in: Component config > SPI Flash driver*

Flash write is broken down in terms of multiple (smaller) write operations. This configuration options helps to set individual write chunk size, smaller value here ensures that cache (and non-IRAM resident interrupts) remains disabled for shorter duration.

CONFIG_SPI_FLASH_SIZE_OVERRIDE

Override flash size in bootloader header by ESPTOOLPY_FLASHSIZE

*Found in: Component config > SPI Flash driver*

SPI Flash driver uses the flash size configured in bootloader header by default. Enable this option to override flash size with latest ESPTOOLPY_FLASHSIZE value from the app header if the size in the bootloader header is incorrect.

CONFIG_SPI_FLASH_CHECK_ERASE_TIMEOUT_DISABLED

Flash timeout checkout disabled

*Found in: Component config > SPI Flash driver*

This option is helpful if you are using a flash chip whose timeout is quite large or unpredictable.

CONFIG_SPI_FLASH_OVERRIDE_CHIP_DRIVER_LIST

Override default chip driver list

*Found in: Component config > SPI Flash driver*

This option allows the chip driver list to be customized, instead of using the default list provided by ESP-IDF.
When this option is enabled, the default list is no longer compiled or linked. Instead, the `default_registered_chips` structure must be provided by the user.

See example: `custom_chip_driver` under examples/storage for more details.

**Auto-detect flash chips**  Contains:

- `CONFIG_SPI_FLASH_SUPPORT_BOYA_CHIP`
- `CONFIG_SPI_FLASH_SUPPORT_GD_CHIP`
- `CONFIG_SPI_FLASH_SUPPORT_ISSI_CHIP`
- `CONFIG_SPI_FLASH_SUPPORT_MXIC_CHIP`
- `CONFIG_SPI_FLASH_SUPPORT_MXIC_OPI_CHIP`
- `CONFIG_SPI_FLASH_SUPPORT_TH_CHIP`
- `CONFIG_SPI_FLASH_SUPPORT_WINBOND_CHIP`

**CONFIG_SPI_FLASH_SUPPORT_ISSI_CHIP**

ISSI  

*Found in: Component config > SPI Flash driver > Auto-detect flash chips*

Enable this to support auto detection of ISSI chips if chip vendor not directly given by `chip_drv` member of the chip struct. This adds support for variant chips, however will extend detecting time.

**CONFIG_SPI_FLASH_SUPPORT_MXIC_CHIP**

MXIC  

*Found in: Component config > SPI Flash driver > Auto-detect flash chips*

Enable this to support auto detection of MXIC chips if chip vendor not directly given by `chip_drv` member of the chip struct. This adds support for variant chips, however will extend detecting time.

**CONFIG_SPI_FLASH_SUPPORT_GD_CHIP**

GigaDevice  

*Found in: Component config > SPI Flash driver > Auto-detect flash chips*

Enable this to support auto detection of GD (GigaDevice) chips if chip vendor not directly given by `chip_drv` member of the chip struct. If you are using Wrover modules, please don’t disable this, otherwise your flash may not work in 4-bit mode.

This adds support for variant chips, however will extend detecting time and image size. Note that the default chip driver supports the GD chips with product ID 60H.

**CONFIG_SPI_FLASH_SUPPORT_WINBOND_CHIP**

Winbond  

*Found in: Component config > SPI Flash driver > Auto-detect flash chips*

Enable this to support auto detection of Winbond chips if chip vendor not directly given by `chip_drv` member of the chip struct. This adds support for variant chips, however will extend detecting time.

**CONFIG_SPI_FLASH_SUPPORT_BOYA_CHIP**

BOYA  

*Found in: Component config > SPI Flash driver > Auto-detect flash chips*

Enable this to support auto detection of BOYA chips if chip vendor not directly given by `chip_drv` member of the chip struct. This adds support for variant chips, however will extend detecting time.
**CONFIG_SPI_FLASH_SUPPORT_TH_CHIP**

TH

*Found in: Component config > SPI Flash driver > Auto-detect flash chips*

Enable this to support auto detection of TH chips if chip vendor not directly given by chip\_drv member of the chip struct. This adds support for variant chips, however will extend detecting time.

**CONFIG_SPI_FLASH_SUPPORT_MXIC_OPI_CHIP**

mxic ( opi)

*Found in: Component config > SPI Flash driver > Auto-detect flash chips*

Enable this to support auto detection of Octal MXIC chips if chip vendor not directly given by chip\_drv member of the chip struct. This adds support for variant chips, however will extend detecting time.

**CONFIG_SPI_FLASH_ENABLE_ENCRYPTED_READ_WRITE**

Enable encrypted partition read/write operations

*Found in: Component config > SPI Flash driver*

This option enables flash read/write operations to encrypted partition/s. This option is kept enabled irrespective of state of flash encryption feature. However, in case application is not using flash encryption feature and is in need of some additional memory from IRAM region (~1KB) then this config can be disabled.

**SPIFFS Configuration** Contains:

- Debug Configuration
- CONFIG_SPIFFS_USE_MAGIC
- CONFIG_SPIFFS_GC_STATS
- CONFIG_SPIFFS_PAGE_CHECK
- CONFIG_SPIFFS_FOLLOW_SYMLINKS
- CONFIG_SPIFFS_MAX_PARTITIONS
- CONFIG_SPIFFS_USE_MTIME
- CONFIG_SPIFFS_GC_MAX_RUNS
- CONFIG_SPIFFS_OBJS_NAME_LEN
- CONFIG_SPIFFS_META_LENGTH
- SPIFFS Cache Configuration
- CONFIG_SPIFFS_PAGE_SIZE
- CONFIG_SPIFFS_MTIME_WIDTH_64_BITS

**CONFIG_SPIFFS_MAX_PARTITIONS**

Maximum Number of Partitions

*Found in: Component config > SPIFFS Configuration*

Define maximum number of partitions that can be mounted.

**Range:**

- from 1 to 10

**Default value:**

- 3

**SPIFFS Cache Configuration** Contains:

- CONFIG_SPIFFS_CACHE
**CONFIG_SPIFFS_CACHE**

Enable SPIFFS Cache

*Found in: Component config > SPIFFS Configuration > SPIFFS Cache Configuration*

Enables/disables memory read caching of nucleus file system operations.

**Default value:**
- Yes (enabled)

**CONFIG_SPIFFS_CACHE_WR**

Enable SPIFFS Write Caching

*Found in: Component config > SPIFFS Configuration > SPIFFS Cache Configuration > CONFIG_SPIFFS_CACHE*

Enables memory write caching for file descriptors in hydrogen.

**Default value:**
- Yes (enabled)

**CONFIG_SPIFFS_CACHE_STATS**

Enable SPIFFS Cache Statistics

*Found in: Component config > SPIFFS Configuration > SPIFFS Cache Configuration > CONFIG_SPIFFS_CACHE*

Enable/disables statistics on caching. Debug/test purpose only.

**Default value:**
- No (disabled)

**CONFIG_SPIFFS_PAGE_CHECK**

Enable SPIFFS Page Check

*Found in: Component config > SPIFFS Configuration*

Always check header of each accessed page to ensure consistent state. If enabled it will increase number of reads from flash, especially if cache is disabled.

**Default value:**
- Yes (enabled)

**CONFIG_SPIFFS_GC_MAX_RUNS**

Set Maximum GC Runs

*Found in: Component config > SPIFFS Configuration*

Define maximum number of GC runs to perform to reach desired free pages.

**Range:**
- from 1 to 10000

**Default value:**
- 10
CONFIG_SPIFFS_GC_STATS
Enable SPIFFS GC Statistics

*Found in: Component config > SPIFFS Configuration*
Enable/disable statistics on gc. Debug/test purpose only.

**Default value:**
- No (disabled)

CONFIG_SPIFFS_PAGE_SIZE
SPIFFS logical page size

*Found in: Component config > SPIFFS Configuration*
Logical page size of SPIFFS partition, in bytes. Must be multiple of flash page size (which is usually 256 bytes). Larger page sizes reduce overhead when storing large files, and improve filesystem performance when reading large files. Smaller page sizes reduce overhead when storing small (< page size) files.

**Range:**
- from 256 to 1024

**Default value:**
- 256

CONFIG_SPIFFS_OBJ_NAME_LEN
Set SPIFFS Maximum Name Length

*Found in: Component config > SPIFFS Configuration*
Object name maximum length. Note that this length include the zero-termination character, meaning maximum string of characters can at most be SPIFFS_OBJ_NAME_LEN - 1.

SPIFFS_OBJ_NAME_LEN + SPIFFS_META_LENGTH should not exceed SPIFFS_PAGE_SIZE - 64.

**Range:**
- from 1 to 256

**Default value:**
- 32

CONFIG_SPIFFS_FOLLOW_SYMLINKS
Enable symbolic links for image creation

*Found in: Component config > SPIFFS Configuration*
If this option is enabled, symbolic links are taken into account during partition image creation.

**Default value:**
- No (disabled)

CONFIG_SPIFFS_USE_MAGIC
Enable SPIFFS Filesystem Magic

*Found in: Component config > SPIFFS Configuration*
Enable this to have an identifiable spiffs filesystem. This will look for a magic in all sectors to determine if this is a valid spiffs system or not at mount time.

**Default value:**
- Yes (enabled)
CONFIG_SPIFFS_USE_MAGIC_LENGTH

Enable SPIFFS Filesystem Length Magic

*Found in: Component config > SPIFFS Configuration > CONFIG_SPIFFS_USE_MAGIC*

If this option is enabled, the magic will also be dependent on the length of the filesystem. For example, a filesystem configured and formatted for 4 megabytes will not be accepted for mounting with a configuration defining the filesystem as 2 megabytes.

**Default value:**
- Yes (enabled)

CONFIG_SPIFFS_META_LENGTH

Size of per-file metadata field

*Found in: Component config > SPIFFS Configuration*

This option sets the number of extra bytes stored in the file header. These bytes can be used in an application-specific manner. Set this to at least 4 bytes to enable support for saving file modification time.

SPIFFS_OBJ_NAME_LEN + SPIFFS_META_LENGTH should not exceed SPIFFS_PAGE_SIZE - 64.

**Default value:**
- 4

CONFIG_SPIFFS_USE_MTIME

Save file modification time

*Found in: Component config > SPIFFS Configuration*

If enabled, then the first 4 bytes of per-file metadata will be used to store file modification time (mtime), accessible through stat/fstat functions. Modification time is updated when the file is opened.

**Default value:**
- Yes (enabled)

CONFIG_SPIFFS_MTIME_WIDE_64_BITS

The time field occupies 64 bits in the image instead of 32 bits

*Found in: Component config > SPIFFS Configuration*

If this option is not set, the time field is 32 bits (up to 2106 year), otherwise it is 64 bits and make sure it matches SPIFFS_META_LENGTH. If the chip already has the spiff's image with the time field = 32 bits then this option cannot be applied in this case. Erase it first before using this option. To resolve the Y2K38 problem for the spiffs, use a toolchain with 64-bit time_t support.

**Default value:**
- No (disabled) if CONFIG_SPIFFS_META_LENGTH >= 8

Debug Configuration  Contains:
- CONFIG_SPIFFS_DBG
- CONFIG_SPIFFS_API_DBG
- CONFIG_SPIFFS_CACHE_DBG
- CONFIG_SPIFFS_CHECK_DBG
- CONFIG_SPIFFS_TEST_VISUALISATION
- CONFIG_SPIFFS_GC_DBG
**CONFIG_SPIFFS_DBG**
Enable general SPIFFS debug

*Found in: Component config > SPIFFS Configuration > Debug Configuration*

Enabling this option will print general debug messages to the console.

**Default value:**
- No (disabled)

**CONFIG_SPIFFS_API_DBG**
Enable SPIFFS API debug

*Found in: Component config > SPIFFS Configuration > Debug Configuration*

Enabling this option will print API debug messages to the console.

**Default value:**
- No (disabled)

**CONFIG_SPIFFS_GC_DBG**
Enable SPIFFS Garbage Cleaner debug

*Found in: Component config > SPIFFS Configuration > Debug Configuration*

Enabling this option will print GC debug messages to the console.

**Default value:**
- No (disabled)

**CONFIG_SPIFFS_CACHE_DBG**
Enable SPIFFS Cache debug

*Found in: Component config > SPIFFS Configuration > Debug Configuration*

Enabling this option will print cache debug messages to the console.

**Default value:**
- No (disabled)

**CONFIG_SPIFFS_CHECK_DBG**
Enable SPIFFS Filesystem Check debug

*Found in: Component config > SPIFFS Configuration > Debug Configuration*

Enabling this option will print Filesystem Check debug messages to the console.

**Default value:**
- No (disabled)

**CONFIG_SPIFFS_TEST_VISUALISATION**
Enable SPIFFS Filesystem Visualization

*Found in: Component config > SPIFFS Configuration > Debug Configuration*

Enable this option to enable SPIFFS_vis function in the API.

**Default value:**
- No (disabled)
TCP Transport  Contains:
  •  Websocket

Websocket  Contains:
  •  CONFIG_WS_TRANSPORT

CONFIG_WS_TRANSPORT
  Enable Websocket Transport
  Found in: Component config > TCP Transport > Websocket
  Enable support for creating websocket transport.
  Default value:
  •  Yes (enabled)

CONFIG_WS_BUFFER_SIZE
  Websocket transport buffer size
  Found in: Component config > TCP Transport > Websocket > CONFIG_WS_TRANSPORT
  Size of the buffer used for constructing the HTTP Upgrade request during connect
  Default value:
  •  1024

CONFIG_WS_DYNAMIC_BUFFER
  Using dynamic websocket transport buffer
  Found in: Component config > TCP Transport > Websocket > CONFIG_WS_TRANSPORT
  If enable this option, websocket transport buffer will be freed after connection succeed to save more heap.
  Default value:
  •  No (disabled)

Ultra Low Power (ULP) Co-processor  Contains:
  •  CONFIG_ULP_COPROC_ENABLED
  •  ULP RISC-V Settings

CONFIG_ULP_COPROC_ENABLED
  Enable Ultra Low Power (ULP) Co-processor
  Found in: Component config > Ultra Low Power (ULP) Co-processor
  Enable this feature if you plan to use the ULP Co-processor. Once this option is enabled, further ULP co-processor configuration will appear in the menu.
  Default value:
  •  No (disabled)
**CONFIG_ULP_COPROC_TYPE**

ULP Co-processor type

*Found in: Component config > Ultra Low Power (ULP) Co-processor > CONFIG_ULP_COPROC_ENABLED*

Choose the ULP Coprocessor type: ULP FSM (Finite State Machine) or ULP RISC-V.

Available options:

- ULP FSM (Finite State Machine) (CONFIG_ULP_COPROC_TYPE_FSM)
- ULP RISC-V (CONFIG_ULP_COPROC_TYPE_RISCV)
- LP core RISC-V (CONFIG_ULP_COPROC_TYPE_LP_CORE)

**CONFIG_ULP_COPROC_RESERVE_MEM**

RTC slow memory reserved for coprocessor

*Found in: Component config > Ultra Low Power (ULP) Co-processor > CONFIG_ULP_COPROC_ENABLED*

Bytes of memory to reserve for ULP Co-processor firmware & data. Data is reserved at the beginning of RTC slow memory.

**Range:**
- from 32 to 8176 if `CONFIG_ULP_COPROC_ENABLED`

**Default value:**
- 4096 if `CONFIG_ULP_COPROC_ENABLED`

**ULP RISC-V Settings**

Contains:

- `CONFIG_ULP_RISCV_UART_BAUDRATE`
- `CONFIG_ULP_RISCV_I2C_RW_TIMEOUT`

**CONFIG_ULP_RISCV_UART_BAUDRATE**

Baudrate used by the bitbanged ULP RISC-V UART driver

*Found in: Component config > Ultra Low Power (ULP) Co-processor > ULP RISC-V Settings*

The accuracy of the bitbanged UART driver is limited, it is not recommend to increase the value above 19200.

**Default value:**
- 9600 if `CONFIG_ULP_COPROC_TYPE_RISCV`

**CONFIG_ULP_RISCV_I2C_RW_TIMEOUT**

Set timeout for ULP RISC-V I2C transaction timeout in ticks.

*Found in: Component config > Ultra Low Power (ULP) Co-processor > ULP RISC-V Settings*

Set the ULP RISC-V I2C read/write timeout. Set this value to -1 if the ULP RISC-V I2C read and write APIs should wait forever. Please note that the tick rate of the ULP co-processor would be different than the OS tick rate of the main core and therefore can have different timeout value depending on which core the API is invoked on.

**Range:**
- from -1 to 4294967295 if `CONFIG_ULP_COPROC_TYPE_RISCV`

**Default value:**
- 500 if `CONFIG_ULP_COPROC_TYPE_RISCV`
Unity unit testing library  Contains:

- `CONFIGUNITY_ENABLECOLOR`
- `CONFIGUNITY_ENABLEIDF_TESTRUNNER`
- `CONFIGUNITY_ENABLEFIXTURE`
- `CONFIGUNITY_ENABLE_BACKTRACE_ON_FAIL`
- `CONFIGUNITY_ENABLE_64BIT`
- `CONFIGUNITY_ENABLE_DOUBLE`
- `CONFIGUNITY_ENABLE_FLOAT`

`CONFIGUNITY_ENABLE_FLOAT`

Support for float type

*Found in: Component config > Unity unit testing library*

If not set, assertions on float arguments will not be available.

*Default value:*

- Yes (enabled)

`CONFIGUNITY_ENABLE_DOUBLE`

Support for double type

*Found in: Component config > Unity unit testing library*

If not set, assertions on double arguments will not be available.

*Default value:*

- Yes (enabled)

`CONFIGUNITY_ENABLE_64BIT`

Support for 64-bit integer types

*Found in: Component config > Unity unit testing library*

If not set, assertions on 64-bit integer types will always fail. If this feature is enabled, take care not to pass pointers (which are 32 bit) to `UNITYASSERT_EQUAL`, as that will cause pointer-to-int-cast warnings.

*Default value:*

- No (disabled)

`CONFIGUNITY_ENABLECOLOR`

Colorize test output

*Found in: Component config > Unity unit testing library*

If set, Unity will colorize test results using console escape sequences.

*Default value:*

- No (disabled)

`CONFIGUNITY_ENABLE_IDF_TESTRUNNER`

Include ESP-IDF test registration/running helpers

*Found in: Component config > Unity unit testing library*

If set, then the following features will be available:

- TESTCASE macro which performs automatic registration of test functions
Chapter 2. API Reference

- Functions to run registered test functions: unity_run_all_tests, unity_run_tests_with_filter, unity_run_single_test_by_name.
- Interactive menu which lists test cases and allows choosing the tests to be run, available via unity_run_menu function.

Disable if a different test registration mechanism is used.

**Default value:**
- Yes (enabled)

**CONFIGUNITY_ENABLE_FIXTURE**

Include Unity test fixture

*Found in: Component config > Unity unit testing library*

If set, unity_fixture.h header file and associated source files are part of the build. These provide an optional set of macros and functions to implement test groups.

**Default value:**
- No (disabled)

**CONFIGUNITY_ENABLE_BACKTRACE_ON_FAIL**

Print a backtrace when a unit test fails

*Found in: Component config > Unity unit testing library*

If set, the unity framework will print the backtrace information before jumping back to the test menu. The jumping is usually occurs in assert functions such as TEST_ASSERT, TEST_FAIL etc.

**Default value:**
- No (disabled)

**USB-OTG** Contains:

- **CONFIG_USB_HOST_HW_BUFFER_BIAS**
- **CONFIG_USB_HOST_CONTROL_TRANSFER_MAX_SIZE**
- *Root Hub configuration*

**CONFIG_USB_HOST_CONTROL_TRANSFER_MAX_SIZE**

Largest size (in bytes) of transfers to/from default endpoints

*Found in: Component config > USB-OTG*

Each USB device attached is allocated a dedicated buffer for its OUT/IN transfers to/from the device’s control endpoint. The maximum size of that buffer is determined by this option. The limited size of the transfer buffer have the following implications: - The maximum length of control transfers is limited - Device’s with configuration descriptors larger than this limit cannot be supported

**Default value:**
- 256

**CONFIG_USB_HOST_HW_BUFFER_BIAS**

Hardware FIFO size biasing

*Found in: Component config > USB-OTG*

The underlying hardware has size adjustable FIFOs to cache USB packets on reception (IN) or for transmission (OUT). The size of these FIFOs will affect the largest MPS (maximum packet size) and the maximum number of packets that can be cached at any one time. The hardware contains the following FIFOs: RX (for all IN packets), Non-periodic TX (for Bulk and Control OUT packets), and
Periodic TX (for Interrupt and Isochronous OUT packets). This configuration option allows biasing the FIFO sizes towards a particular use case, which may be necessary for devices that have endpoints with large MPS. The MPS limits for each biasing are listed below:

Balanced: - IN (all transfer types), 408 bytes - OUT non-periodic (Bulk/Control), 192 bytes (i.e., 3 x 64 byte packets) - OUT periodic (Interrupt/Isochronous), 192 bytes

Bias IN: - IN (all transfer types), 600 bytes - OUT non-periodic (Bulk/Control), 64 bytes (i.e., 1 x 64 byte packets) - OUT periodic (Interrupt/Isochronous), 128 bytes

Bias Periodic OUT: - IN (all transfer types), 128 bytes - OUT non-periodic (Bulk/Control), 64 bytes (i.e., 1 x 64 byte packets) - OUT periodic (Interrupt/Isochronous), 600 bytes

Available options:

- Balanced (CONFIG_USB_HOST_HW_BUFFER_BIAS_BALANCED)
- Bias IN (CONFIG_USB_HOST_HW_BUFFER_BIAS_IN)
- Periodic OUT (CONFIG_USB_HOST_HW_BUFFER_BIAS_PERIODIC_OUT)

Root Hub configuration

Contains:

- CONFIG_USB_HOST_DEBOUNCE_DELAY_MS
- CONFIG_USB_HOST_RESET_HOLD_MS
- CONFIG_USB_HOST_RESET_RECOVERY_MS
- CONFIG_USB_HOST_SET_ADDR_RECOVERY_MS

CONFIG_USB_HOST_DEBOUNCE_DELAY_MS

Debounce delay in ms

Found in: Component config > USB-OTG > Root Hub configuration

On connection of a USB device, the USB 2.0 specification requires a “debounce interval with a minimum duration of 100ms” to allow the connection to stabilize (see USB 2.0 chapter 7.1.7.3 for more details). During the debounce interval, no new connection/disconnection events are registered.

The default value is set to 250 ms to be safe.

Default value:

- 250

CONFIG_USB_HOST_RESET_HOLD_MS

Reset hold in ms

Found in: Component config > USB-OTG > Root Hub configuration

The reset signaling can be generated on any Hub or Host Controller port by request from the USB System Software. The USB 2.0 specification requires that “the reset signaling must be driven for a minimum of 10ms” (see USB 2.0 chapter 7.1.7.5 for more details). After the reset, the hub port will transition to the Enabled state (refer to Section 11.5).

The default value is set to 30 ms to be safe.

Default value:

- 30

CONFIG_USB_HOST_RESET_RECOVERY_MS

Reset recovery delay in ms

Found in: Component config > USB-OTG > Root Hub configuration
After a port stops driving the reset signal, the USB 2.0 specification requires that the USB System Software guarantees a minimum of 10 ms for reset recovery before the attached device is expected to respond to data transfers (see USB 2.0 chapter 7.1.7.3 for more details). The device may ignore any data transfers during the recovery interval.

The default value is set to 30 ms to be safe.

**Default value:**
- 30

### CONFIG_USB_HOST_SET_ADDR_RECOVERY_MS

SetAddress() recovery time in ms

*Found in: Component config > USB-OTG > Root Hub configuration*

“A successful completion of the Status stage, the device is allowed a SetAddress() recovery interval of 2 ms. At the end of this interval, the device must be able to accept Setup packets addressed to the new address. Also, at the end of the recovery interval, the device must not respond to tokens sent to the old address (unless, of course, the old and new address is the same).” See USB 2.0 chapter 9.2.6.3 for more details.

The default value is set to 10 ms to be safe.

**Default value:**
- 10

### Virtual file system

Contains:
- **CONFIG_VFS_SUPPORT_IO**

### CONFIG_VFS_SUPPORT_IO

Provide basic I/O functions

*Found in: Component config > Virtual file system*

If enabled, the following functions are provided by the VFS component:
- open, close, read, write, pread, pwrite, lseek, fstat, fsync, ioctl, fcntl

Filesystem drivers can then be registered to handle these functions for specific paths.

Disabling this option can save memory when the support for these functions is not required.

Note that the following functions can still be used with socket file descriptors when this option is disabled:
- close, read, write, ioctl, fcntl.

**Default value:**
- Yes (enabled)

### CONFIG_VFS_SUPPORT_DIR

Provide directory related functions

*Found in: Component config > Virtual file system > CONFIG_VFS_SUPPORT_IO*

If enabled, the following functions are provided by the VFS component:
- stat, link, unlink, rename, utime, access, truncate, rmdir, mkdir, opendir, closedir, readdir, readdir_r, seekdir, telldir, rewinddir

Filesystem drivers can then be registered to handle these functions for specific paths.

Disabling this option can save memory when the support for these functions is not required.
**Default value:**
- Yes (enabled)

**CONFIG_VFS_SUPPORT_SELECT**
Provide select function

*Found in: Component config > Virtual file system > CONFIG_VFS_SUPPORT_IO*

If enabled, select function is provided by the VFS component, and can be used on peripheral file descriptors (such as UART) and sockets at the same time.

If disabled, the default select implementation will be provided by LWIP for sockets only.

Disabling this option can reduce code size if support for “select” on UART file descriptors is not required.

**CONFIG_VFS_SUPPRESS_SELECT_DEBUG_OUTPUT**
Suppress select() related debug outputs

*Found in: Component config > Virtual file system > CONFIG_VFS_SUPPORT_IO > CONFIG_VFS_SUPPORT_SELECT*

Select() related functions might produce an unconveniently lot of debug outputs when one sets the default log level to DEBUG or higher. It is possible to suppress these debug outputs by enabling this option.

**Default value:**
- Yes (enabled)

**CONFIG_VFS_SELECT_IN_RAM**
Make VFS driver select() callbacks IRAM-safe

*Found in: Component config > Virtual file system > CONFIG_VFS_SUPPORT_IO > CONFIG_VFS_SUPPORT_SELECT*

If enabled, VFS driver select() callback function will be placed in IRAM.

**Default value:**
- No (disabled)

**CONFIG_VFS_SUPPORT_TERMIOS**
Provide termios.h functions

*Found in: Component config > Virtual file system > CONFIG_VFS_SUPPORT_IO*

Disabling this option can save memory when the support for termios.h is not required.

**Default value:**
- Yes (enabled)

**CONFIG_VFS_MAX_COUNT**
Maximum Number of Virtual Filesystems

*Found in: Component config > Virtual file system > CONFIG_VFS_SUPPORT_IO*

Define maximum number of virtual filesystems that can be registered.

**Range:**
- from 1 to 20

**Default value:**
- 8
Chapter 2. API Reference

Host File System I/O (Semihosting) Contains:

- CONFIG_VFS_SEMIHOSTFS_MAX_MOUNT_POINTS

**CONFIG_VFS_SEMIHOSTFS_MAX_MOUNT_POINTS**

Host FS: Maximum number of the host filesystem mount points

*Found in: Component config > Virtual file system > CONFIG_VFS_SUPPORT_IO > Host File System I/O (Semihosting)*

Define maximum number of host filesystem mount points.

**Default value:**

- 1

**Wear Levelling** Contains:

- CONFIG_WL_SECTOR_MODE
- CONFIG_WL_SECTOR_SIZE

**CONFIG_WL_SECTOR_SIZE**

Wear Levelling library sector size

*Found in: Component config > Wear Levelling*

Sector size used by wear levelling library. You can set default sector size or size that will fit to the flash device sector size.

With sector size set to 4096 bytes, wear levelling library is more efficient. However if FAT filesystem is used on top of wear levelling library, it will need more temporary storage: 4096 bytes for each mounted filesystem and 4096 bytes for each opened file.

With sector size set to 512 bytes, wear levelling library will perform more operations with flash memory, but less RAM will be used by FAT filesystem library (512 bytes for the filesystem and 512 bytes for each file opened).

**Available options:**

- 512 (CONFIG_WL_SECTOR_SIZE_512)
- 4096 (CONFIG_WL_SECTOR_SIZE_4096)

**CONFIG_WL_SECTOR_MODE**

Sector store mode

*Found in: Component config > Wear Levelling*

Specify the mode to store data into flash:

- In Performance mode a data will be stored to the RAM and then stored back to the flash. Compared to the Safety mode, this operation is faster, but if power will be lost when erase sector operation is in progress, then the data from complete flash device sector will be lost.
- In Safety mode data from complete flash device sector will be read from flash, modified, and then stored back to flash. Compared to the Performance mode, this operation is slower, but if power is lost during erase sector operation, then the data from full flash device sector will not be lost.

**Available options:**

- Performance (CONFIG_WL_SECTOR_MODE_PERF)
- Safety (CONFIG_WL_SECTOR_MODE_SAFE)
Wi-Fi Provisioning Manager Contains:
- CONFIG_WIFI_PROV_BLE_BONDING
- CONFIG_WIFI_PROV_BLE_SEC_CONN
- CONFIG_WIFI_PROV_BLE_FORCE_ENCRYPTION
- CONFIG_WIFI_PROV_KEEP_BLE_ON_AFTER_PROV
- CONFIG_WIFI_PROV_SCAN_MAX_ENTRIES
- CONFIG_WIFI_PROV_AUTOSTOP_TIMEOUT
- CONFIG_WIFI_PROV_STA_SCAN_METHOD

CONFIG_WIFI_PROV_SCAN_MAX_ENTRIES
Max Wi-Fi Scan Result Entries

Found in: Component config > Wi-Fi Provisioning Manager

This sets the maximum number of entries of Wi-Fi scan results that will be kept by the provisioning manager.

Range:  
- from 1 to 255

Default value:  
- 16

CONFIG_WIFI_PROV_AUTOSTOP_TIMEOUT
Provisioning auto-stop timeout

Found in: Component config > Wi-Fi Provisioning Manager

Time (in seconds) after which the Wi-Fi provisioning manager will auto-stop after connecting to a Wi-Fi network successfully.

Range:  
- from 5 to 600

Default value:  
- 30

CONFIG_WIFI_PROV_BLE_BONDING
Enable BLE bonding

Found in: Component config > Wi-Fi Provisioning Manager

This option is applicable only when provisioning transport is BLE.

CONFIG_WIFI_PROV_BLE_SEC_CONN
Enable BLE Secure connection flag

Found in: Component config > Wi-Fi Provisioning Manager

Used to enable Secure connection support when provisioning transport is BLE.

Default value:  
- Yes (enabled) if CONFIG_BT_NIMBLE_ENABLED

CONFIG_WIFI_PROV_BLE_FORCE_ENCRYPTION
Force Link Encryption during characteristic Read / Write

Found in: Component config > Wi-Fi Provisioning Manager

Used to enforce link encryption when attempting to read / write characteristic
CONFIG_WIFI_PROV_KEEP_BLE_ON_AFTER_PROV

Keep BT on after provisioning is done

Found in: Component config > Wi-Fi Provisioning Manager

Default value:
• Yes (enabled) if CONFIG_WIFI_PROV_KEEP_BLE_ON_AFTER_PROV

CONFIG_WIFI_PROV_DISCONNECT_AFTER_PROV

Terminate connection after provisioning is done

Found in: Component config > Wi-Fi Provisioning Manager > CONFIG_WIFI_PROV_KEEP_BLE_ON_AFTER_PROV

Default value:
• Yes (enabled) if CONFIG_WIFI_PROV_KEEP_BLE_ON_AFTER_PROV

CONFIG_WIFI_PROV_STA_SCAN_METHOD

Wifi Provisioning Scan Method

Found in: Component config > Wi-Fi Provisioning Manager

Available options:

• All Channel Scan (CONFIG_WIFI_PROV_STA_ALL_CHANNEL_SCAN)
  Scan will end after scanning the entire channel. This option is useful in Mesh WiFi Systems.
• Fast Scan (CONFIG_WIFI_PROV_STA_FAST_SCAN)
  Scan will end after an AP matching with the SSID has been detected.

CONFIG_IDF_EXPERIMENTALFEATURES

Make experimental features visible

Found in:

By enabling this option, ESP-IDF experimental feature options will be visible.

Note you should still enable a certain experimental feature option to use it, and you should read the corresponding risk warning and known issue list carefully.

Current experimental feature list:

• CONFIG_ESPTOOLPY_FLASHFREQ_120M && CONFIG_ESPTOOLPY_FLASH_SAMPLE_MODE_DTR
• CONFIG_SPIRAM_SPEED_120M && CONFIG_SPIRAM_MODE_OCT
• CONFIG_BOOTLOADER_CACHE_32BIT_ADDR_QUAD_FLASH
• CONFIG_MBEDTLS_USE_CRYPTO_ROM_IMPL

Default value:
• No (disabled)

Deprecated options and their replacements

• CONFIG_A2DP_ENABLE (CONFIG_BT_A2DP_ENABLE)
• CONFIG_A2D_INITIAL_TRACE_LEVEL (CONFIG_BT_LOG_A2D_TRACE_LEVEL)
  – CONFIG_A2D_TRACE_LEVEL_NONE
  – CONFIG_A2D_TRACE_LEVEL_ERROR
  – CONFIG_A2D_TRACE_LEVEL_WARNING
  – CONFIG_A2D_TRACE_LEVEL_API
  – CONFIG_A2D_TRACE_LEVEL_EVENT
  – CONFIG_A2D_TRACE_LEVEL_DEBUG
- CONFIG_A2D_TRACE_LEVEL_VERBOSE
  • CONFIG_ADC2_DISABLE_DAC (CONFIG_ADC_DISABLE_DAC)
- CONFIG_APPLICATION_INITIAL_TRACE_LEVEL (CONFIG_BT_LOG_APPL_TRACE_LEVEL)
  - CONFIG_APPL_TRACE_LEVEL_NONE
  - CONFIG_APPL_TRACE_LEVEL_ERROR

2.8 Provisioning API

2.8.1 Protocol Communication
Overview

The Protocol Communication (protocomm) component manages secure sessions and provides the framework for multiple transports. The application can also use the protocomm layer directly to have application-specific extensions for the provisioning or non-provisioning use cases.

Following features are available for provisioning:

- Communication security at the application level
  - protocomm_security0 (no security)
  - protocomm_security1 (Curve25519 key exchange + AES-CTR encryption/decryption)
  - protocomm_security2 (SRP6a-based key exchange + AES-GCM encryption/decryption)
- Proof-of-possession (support with protocomm_security1 only)
- Salt and Verifier (support with protocomm_security2 only)

Protocomm internally uses protobuf (protocol buffers) for secure session establishment. Users can choose to implement their own security (even without using protobuf). Protocomm can also be used without any security layer.

Protocomm provides the framework for various transports:

- Bluetooth LE
- Wi-Fi (SoftAP + HTTPD)
- Console, in which case the handler invocation is automatically taken care of on the device side. See Transport Examples below for code snippets.

Note that for protocomm_security1 and protocomm_security2, the client still needs to establish sessions by performing the two-way handshake. See Unified Provisioning for more details about the secure handshake logic.

Enabling Protocomm Security Version

The protocomm component provides a project configuration menu to enable/disable support of respective security versions. The respective configuration options are as follows:

- Support protocomm_security0, with no security: `CONFIG_ESP_PROTOCOMM_SUPPORT_SECURITY_VERSION_0`, this option is enabled by default.
- Support protocomm_security1 with Curve25519 key exchange + AES-CTR encryption/decryption: `CONFIG_ESP_PROTOCOMM_SUPPORT_SECURITY_VERSION_1`, this option is enabled by default.
- Support protocomm_security2 with SRP6a-based key exchange + AES-GCM encryption/decryption: `CONFIG_ESP_PROTOCOMM_SUPPORT_SECURITY_VERSION_2`.

Note: Enabling multiple security versions at once offers the ability to control them dynamically but also increases the firmware size.

SoftAP + HTTP Transport Example with Security 2

For sample usage, see `wifi_provisioning/src/scheme_softap.c`.

```c
/* The endpoint handler to be registered with protocomm. This simply echoes back the received data. */
esp_err_t echo_req_handler (uint32_t session_id,
                             const uint8_t *inbuf, ssize_t inlen,
                             uint8_t *outbuf, ssize_t *outlen,
                             void *priv_data)
{
    /* Session ID may be used for persistence. */
    printf("Session ID : %d", session_id);
}
```

(continues on next page)
Chapter 2. API Reference

(continued from previous page)

/* Echo back the received data. */
outlen = inlen;    /* Output the data length updated. */
*outbuf = malloc(inlen); /* This is to be deallocated outside */
memcpy(*outbuf, inbuf, inlen);

/* Private data that was passed at the time of endpoint creation. */
uint32_t *priv = (uint32_t *) priv_data;
if (priv) {
    printf("Private data : %d", *priv);
}
return ESP_OK;
}

protocomm_set_security(pc, "security_endpoint", &protocomm_security0, NULL);
protocomm_add_endpoint(pc, "echo_req_endpoint", echo_req_handler, NULL);
return pc;
```

```c
/* The example function for stopping a protocomm instance. */
void stop_pc(protocomm_t *pc)
{
    protocomm_remove_endpoint(pc, "echo_req_endpoint");
    protocomm_unset_security(pc, "security_endpoint");

    /* Stop the Bluetooth LE protocomm service. */
    protocomm_ble_stop(pc);

    protocomm_delete(pc);
}
```

API Reference

Header File

- components/protocomm/include/common/protocomm.h
- This header file can be included with:
  ```
  #include "protocomm.h"
  ```
- This header file is a part of the API provided by the protocomm component. To declare that your component depends on protocomm, add the following to your CMakeLists.txt:
  ```
  REQUIRES protocomm
  ```
  or
  ```
  PRIV_REQUIRES protocomm
  ```

Functions

- `protocomm_t *protocomm_new(void)`
  Create a new protocomm instance.
  This API will return a new dynamically allocated protocomm instance with all elements of the protocomm_t structure initialized to NULL.

  **Returns**
  - `protocomm_t *`: On success
  - `NULL`: No memory for allocating new instance

- `void protocomm_delete(protocomm_t *pc)`
  Delete a protocomm instance.
  This API will deallocate a protocomm instance that was created using `protocomm_new()`.

  **Parameters**
  - `pc` - [in] Pointer to the protocomm instance to be deleted

- `esp_err_t protocomm_add_endpoint(protocomm_t *pc, const char *ep_name, protocomm_req_handler_t h, void *priv_data)`
  Add endpoint request handler for a protocomm instance.
  This API will bind an endpoint handler function to the specified endpoint name, along with any private data that needs to be pass to the handler at the time of call.

  **Parameters**
  - `pc` - [in] Pointer to the protocomm instance
  - `ep_name` - Endpoint name
  - `h` - Pointer to the endpoint handler function
  - `priv_data` - Pointer to the private data

**Note:**
• An endpoint must be bound to a valid protocomm instance, created using `protocomm_new()`.
• This function internally calls the registered `add_endpoint()` function of the selected transport which is a member of the `protocomm_t` instance structure.

Parameters
• `pc` - [in] Pointer to the protocomm instance
• `ep_name` - [in] Endpoint identifier (name) string
• `h` - [in] Endpoint handler function
• `priv_data` - [in] Pointer to private data to be passed as a parameter to the handler function on call. Pass NULL if not needed.

Returns
• ESP_OK: Success
• ESP_FAIL: Error adding endpoint / Endpoint with this name already exists
• ESP_ERR_NO_MEM: Error allocating endpoint resource
• ESP_ERR_INVALID_ARG: Null instance/name/handler arguments

`esp_err_t protocomm_remove_endpoint (protocomm_t *pc, const char *ep_name)`
Remove endpoint request handler for a protocomm instance.
This API will remove a registered endpoint handler identified by an endpoint name.

Note:
• This function internally calls the registered `remove_endpoint()` function which is a member of the `protocomm_t` instance structure.

Parameters
• `pc` - [in] Pointer to the protocomm instance
• `ep_name` - [in] Endpoint identifier (name) string

Returns
• ESP_OK: Success
• ESP_ERR_NOT_FOUND: Endpoint with specified name doesn’t exist
• ESP_ERR_INVALID_ARG: Null instance/name arguments

`esp_err_t protocomm_open_session (protocomm_t *pc, uint32_t session_id)`
Allocates internal resources for new transport session.

Note:
• An endpoint must be bound to a valid protocomm instance, created using `protocomm_new()`.

Parameters
• `pc` - [in] Pointer to the protocomm instance
• `session_id` - [in] Unique ID for a communication session

Returns
• ESP_OK: Request handled successfully
• ESP_ERR_NO_MEM: Error allocating internal resource
• ESP_ERR_INVALID_ARG: Null instance/name arguments

`esp_err_t protocomm_close_session (protocomm_t *pc, uint32_t session_id)`
Frees internal resources used by a transport session.

Note:
• An endpoint must be bound to a valid protocomm instance, created using `protocomm_new()`.
### Parameters
- **pc** - [in] Pointer to the protocomm instance
- **session_id** - [in] Unique ID for a communication session

### Returns
- **ESP_OK** : Request handled successfully
- **ESP_ERR_INVALID_ARG** : Null instance/name arguments

```c
esp_err_t protocomm_req_handle(protocomm_t *pc, const char *ep_name, uint32_t session_id, const uint8_t *inbuf, ssize_t inlen, uint8_t **outbuf, ssize_t *outlen)
```

Calls the registered handler of an endpoint session for processing incoming data and generating the response.

#### Note:
- An endpoint must be bound to a valid protocomm instance, created using `protocomm_new()`.
- Resulting output buffer must be deallocated by the caller.

---

### Parameters
- **pc** - [in] Pointer to the protocomm instance
- **ep_name** - [in] Endpoint identifier (name) string
- **session_id** - [in] Unique ID for a communication session
- **inbuf** - [in] Input buffer contains input request data which is to be processed by the registered handler
- **inlen** - [in] Length of the input buffer
- **outbuf** - [out] Pointer to internally allocated output buffer, where the resulting response data output from the registered handler is to be stored
- **outlen** - [out] Buffer length of the allocated output buffer

### Returns
- **ESP_OK** : Request handled successfully
- **ESP_FAIL** : Internal error in execution of registered handler
- **ESP_ERR_NO_MEM** : Error allocating internal resource
- **ESP_ERR_NOT_FOUND** : Endpoint with specified name doesn’t exist
- **ESP_ERR_INVALID_ARG** : Null instance/name arguments

```c
esp_err_t protocomm_set_security(protocomm_t *pc, const char *ep_name, const protocomm_security_t *sec, const void *sec_params)
```

Add endpoint security for a protocomm instance.

This API will bind a security session establisher to the specified endpoint name, along with any proof of possession that may be required for authenticating a session client.

#### Note:
- An endpoint must be bound to a valid protocomm instance, created using `protocomm_new()`.
- The choice of security can be any `protocomm_security_t` instance. Choices `protocomm_security0` and `protocomm_security1` and `protocomm_security2` are readily available.

---

### Parameters
- **pc** - [in] Pointer to the protocomm instance
- **ep_name** - [in] Endpoint identifier (name) string
- **sec** - [in] Pointer to endpoint security instance
- **sec_params** - [in] Pointer to security params (NULL if not needed) The pointer should contain the security params struct of appropriate security version. For protocomm security version 1 and 2 sec_params should contain pointer to struct of type pro-
tocomm_security1_params_t and toocomm_security2_params_t respectively. The contents of this pointer must be valid till the security session has been running and is not closed.

**Returns**
- ESP_OK: Success
- ESP_FAIL: Error adding endpoint / Endpoint with this name already exists
- ESP_ERR_INVALID_STATE: Security endpoint already set
- ESP_ERR_NO_MEM: Error allocating endpoint resource
- ESP_ERR_INVALID_ARG: Null instance/name/handler arguments

```c
esp_err_t protocomm_unset_security (protocomm_t *pc, const char *ep_name)
```

Remove endpoint security for a protocomm instance.

This API will remove a registered security endpoint identified by an endpoint name.

**Parameters**
- `pc` [in] Pointer to the protocomm instance
- `ep_name` [in] Endpoint identifier(name) string

**Returns**
- ESP_OK: Success
- ESP_ERR_NOT_FOUND: Endpoint with specified name doesn’t exist
- ESP_ERR_INVALID_ARG: Null instance/name/arguments

```c
esp_err_t protocomm_set_version (protocomm_t *pc, const char *ep_name, const char *version)
```

Set endpoint for version verification.

This API can be used for setting an application specific protocol version which can be verified by clients through the endpoint.

**Note:**
- An endpoint must be bound to a valid protocomm instance, created using `protocomm_new()`.

```c
Parameters
- `pc` [in] Pointer to the protocomm instance
- `ep_name` [in] Endpoint identifier(name) string
- `version` [in] Version identifier(name) string

**Returns**
- ESP_OK: Success
- ESP_FAIL: Error adding endpoint / Endpoint with this name already exists
- ESP_ERR_INVALID_STATE: Version endpoint already set
- ESP_ERR_NO_MEM: Error allocating endpoint resource
- ESP_ERR_INVALID_ARG: Null instance/name/handler arguments
```

```c
esp_err_t protocomm_unset_version (protocomm_t *pc, const char *ep_name)
```

Remove version verification endpoint from a protocomm instance.

This API will remove a registered version endpoint identified by an endpoint name.

**Parameters**
- `pc` [in] Pointer to the protocomm instance
- `ep_name` [in] Endpoint identifier(name) string

**Returns**
- ESP_OK: Success
- ESP_FAIL: Error adding endpoint / Endpoint with this name already exists
- ESP_ERR_NOT_FOUND: Endpoint with specified name doesn’t exist
- ESP_ERR_INVALID_ARG: Null instance/name/arguments

**Type Definitions**
typedef _esp_err_t (*protocomm_req_handler_t)(uint32_t session_id, const uint8_t *inbuf, ssize_t inlen, uint8_t **outbuf, ssize_t *outlen, void *priv_data)

Function prototype for protocomm endpoint handler.

typedef struct protocomm protocomm_t

This structure corresponds to a unique instance of protocomm returned when the API protocomm_new() is called. The remaining Protocomm APIs require this object as the first parameter.

Note: Structure of the protocomm object is kept private

Header File

- components/protocomm/include/security/protocomm_security.h
- This header file can be included with:

```c
#include "protocomm_security.h"
```

- This header file is a part of the API provided by the protocomm component. To declare that your component depends on protocomm, add the following to your CMakeLists.txt:

```
REQUIRES protocomm
```
or

```
PRIV_REQUIRES protocomm
```

Structures

struct protocomm_security1_params

Protocomm Security 1 parameters: Proof Of Possession.

**Public Members**

const uint8_t *data

Pointer to buffer containing the proof of possession data

uint16_t len

Length (in bytes) of the proof of possession data

struct protocomm_security2_params

Protocomm Security 2 parameters: Salt and Verifier.

**Public Members**

const char *salt

Pointer to the buffer containing the salt

uint16_t salt_len

Length (in bytes) of the salt
const char *verifier
    Pointer to the buffer containing the verifier

uint16_t verifier_len
    Length (in bytes) of the verifier

struct protocomm_security
    Protocomm security object structure.
    The member functions are used for implementing secure protocomm sessions.

Note: This structure should not have any dynamic members to allow re-entrancy

Public Members

int ver
    Unique version number of security implementation

esp_err_t (*init)(protocomm_security_handle_t *handle)
    Function for initializing/allocating security infrastructure

esp_err_t (*cleanup)(protocomm_security_handle_t handle)
    Function for deallocating security infrastructure

esp_err_t (*new_transport_session)(protocomm_security_handle_t handle, uint32_t session_id)
    Starts new secure transport session with specified ID

esp_err_t (*close_transport_session)(protocomm_security_handle_t handle, uint32_t session_id)
    Closes a secure transport session with specified ID

esp_err_t (*security_req_handler)(protocomm_security_handle_t handle, const void *sec_params,
    uint32_t session_id, const uint8_t *inbuf, ssize_t inlen, uint8_t **outbuf, ssize_t *outlen, void *priv_data)
    Handler function for authenticating connection request and establishing secure session

esp_err_t (*encrypt)(protocomm_security_handle_t handle, uint32_t session_id, const uint8_t *inbuf,
    ssize_t inlen, uint8_t **outbuf, ssize_t *outlen)
    Function which implements the encryption algorithm

esp_err_t (*decrypt)(protocomm_security_handle_t handle, uint32_t session_id, const uint8_t *inbuf,
    ssize_t inlen, uint8_t **outbuf, ssize_t *outlen)
    Function which implements the decryption algorithm

Type Definitions

typedef struct protocomm_security1_params protocomm_security1_params_t
    Protocomm Security 1 parameters: Proof Of Possession.

typedef protocomm_security1_params_t protocomm_security_pop_t
typedef struct protocomm_security2_params protocomm_security2_params_t

   Protocomm Security 2 parameters: Salt and Verifier.

typedef void *protocomm_security_handle_t

typedef struct protocomm_security protocomm_security_t

   Protocomm security object structure.

   The member functions are used for implementing secure protocomm sessions.

---

**Note:** This structure should not have any dynamic members to allow re-entrancy

### Enumerations

enum protocomm_security_session_event_t

   Events generated by the protocomm security layer.

   These events are generated while establishing secured session.

   **Values:**

   - enumerator PROTOCOMM_SECURITY_SESSION_SETUP_OK
     
     Secured session established successfully

   - enumerator PROTOCOMM_SECURITY_SESSION_INVALID_SECURITY_PARAMS
     
     Received invalid (NULL) security parameters (username / client public-key)

   - enumerator PROTOCOMM_SECURITY_SESSION_CREDENTIALS_MISMATCH
     
     Received incorrect credentials (username / PoP)

### Header File

- components/protocomm/include/security/protocomm_security0.h
- components/protocomm/include/security/protocomm_security1.h

This header file can be included with:

```c
#include "protocomm_security0.h"
```

This header file is a part of the API provided by the protocomm component. To declare that your component depends on protocomm, add the following to your CMakeLists.txt:

```cmake
REQUIRES protocomm
```

or

```cmake
PRIV_REQUIRES protocomm
```

### Header File

- components/protocomm/include/security/protocomm_security1.h

This header file can be included with:

```c
#include "protocomm_security1.h"
```

This header file is a part of the API provided by the protocomm component. To declare that your component depends on protocomm, add the following to your CMakeLists.txt:
Chapter 2. API Reference

REQUIRES protocomm

or

PRIV_REQUIRES protocomm

Header File

- components/protocomm/include/transports/protocomm_httpd.h
- This header file can be included with:
  
  ```
  #include "protocomm_httpd.h"
  ```
- This header file is a part of the API provided by the protocomm component. To declare that your component depends on protocomm, add the following to your CMakeLists.txt:
  
  ```
  REQUIRES protocomm
  or
  ```

Functions

**esp_err_t protocomm_httpd_start (protocomm_t *pc, const protocomm_httpd_config_t *config)**

Start HTTPD protocomm transport.

This API internally creates a framework to allow endpoint registration and security configuration for the protocomm.

**Note:** This is a singleton. ie. Protocomm can have multiple instances, but only one instance can be bound to an HTTP transport layer.

**Parameters**

- **pc** - [in] Protocomm instance pointer obtained from protocomm_new()
- **config** - [in] Pointer to config structure for initializing HTTP server

**Returns**

- ESP_OK : Success
- ESP_ERR_INVALID_ARG : Null arguments
- ESP_ERR_NOT_SUPPORTED : Transport layer bound to another protocomm instance
- ESP_ERR_INVALID_STATE : Transport layer already bound to this protocomm instance
- ESP_ERR_NO_MEM : Memory allocation for server resource failed
- ESP_ERR_HTTPD_* : HTTP server error on start

**esp_err_t protocomm_httpd_stop (protocomm_t *pc)**

Stop HTTPD protocomm transport.

This API cleans up the HTTPD transport protocomm and frees all the handlers registered with the protocomm.

**Parameters**

- **pc** - [in] Same protocomm instance that was passed to protocomm_httpd_start()

**Returns**

- ESP_OK : Success
- ESP_ERR_INVALID_ARG : Null / incorrect protocomm instance pointer

**Unions**

union **protocomm_httpd_config_data_t**
  
  ```
  #include <protocomm_httpd.h> Protocomm HTTPD Configuration Data
  ```
Chapter 2. API Reference

Public Members

void *handle
HTTP Server Handle, if ext_handle_provided is set to true

protocomm_http_server_config_t config
HTTP Server Configuration, if a server is not already active

Structures

struct protocomm_http_server_config_t
Config parameters for protocomm HTTP server.

Public Members

uint16_t port
Port on which the HTTP server will listen

size_t stack_size
Stack size of server task, adjusted depending upon stack usage of endpoint handler

unsigned task_priority
Priority of server task

struct protocomm_httpd_config_t
Config parameters for protocomm HTTP server.

Public Members

bool ext_handle_provided
Flag to indicate of an external HTTP Server Handle has been provided. In such as case, protocomm will use the same HTTP Server and not start a new one internally.

protocomm_httpd_config_data_t data
Protocomm HTTPD Configuration Data

Macros

PROTOCOMM_HTTPD_DEFAULT_CONFIG()

Header File

- components/protocomm/include/transports/protocomm_ble.h
- This header file can be included with:

```
#include "protocomm_ble.h"
```

- This header file is a part of the API provided by the protocomm component. To declare that your component depends on protocomm, add the following to your CMakeLists.txt:
REQUIRES protocomm

or

PRIV_REQUIRES protocomm

Functions

esp_err_t protocomm_ble_start(protocomm_t *pc, const protocomm_ble_config_t *config)

Start Bluetooth Low Energy based transport layer for provisioning.

Initialize and start required BLE service for provisioning. This includes the initialization for characteristics/service for BLE.

Parameters

• pc - [in] Protocomm instance pointer obtained from protocomm_new()
• config - [in] Pointer to config structure for initializing BLE

Returns

• ESP_OK : Success
• ESP_FAIL : Simple BLE start error
• ESP_ERR_NO_MEM : Error allocating memory for internal resources
• ESP_ERR_INVALID_STATE : Error in ble config
• ESP_ERR_INVALID_ARG : Null arguments

esp_err_t protocomm_ble_stop(protocomm_t *pc)

Stop Bluetooth Low Energy based transport layer for provisioning.

Stops service/task responsible for BLE based interactions for provisioning

Note: You might want to optionally reclaim memory from Bluetooth. Refer to the documentation of esp_bt_mem_release in that case.

Parameters pc - [in] Same protocomm instance that was passed to protocomm_ble_start()

Returns

• ESP_OK : Success
• ESP_FAIL : Simple BLE stop error
• ESP_ERR_INVALID_ARG : Null / incorrect protocomm instance

Structures

struct name_uuid

This structure maps handler required by protocomm layer to UUIDs which are used to uniquely identify BLE characteristics from a smartphone or a similar client device.

Public Members

const char *name

Name of the handler, which is passed to protocomm layer

uint16_t uuid

UUID to be assigned to the BLE characteristic which is mapped to the handler

struct protocomm_ble_event_t

Structure for BLE events in Protocomm.
Chapter 2. API Reference

Public Members

```c
uint16_t evt_type
This field indicates the type of BLE event that occurred.
```

```c
uint16_t conn_handle
The handle of the relevant connection.
```

```c
uint16_t conn_status
The status of the connection attempt; 0: the connection was successfully established. 0 BLE host error code: the connection attempt failed for the specified reason.
```

```c
uint16_t disconnect_reason
Return code indicating the reason for the disconnect.
```

```c
struct protocomm_ble_config
Config parameters for protocomm BLE service.
```

Public Members

```c
char device_name[MAX_BLE_DEVNAME_LEN + 1]
BLE device name being broadcast at the time of provisioning
```

```c
uint8_t service_uuid[BLE_UUID128_VAL_LENGTH]
128 bit UUID of the provisioning service
```

```c
uint8_t *manufacturer_data
BLE device manufacturer data pointer in advertisement
```

```c
ssize_t manufacturer_data_len
BLE device manufacturer data length in advertisement
```

```c
ssize_t nu_lookup_count
Number of entries in the Name-UUID lookup table
```

```c
protocomm_ble_name_uuid_t *nu_lookup
Pointer to the Name-UUID lookup table
```

```c
unsigned ble_bonding
BLE bonding
```

```c
unsigned ble_sm_sc
BLE security flag
```

```c
unsigned ble_link_encryption
BLE security flag
```
## Macros

**MAX_BLE_DEVNAME_LEN**

BLE device name cannot be larger than this value 31 bytes (max scan response size) - 1 byte (length) - 1 byte (type) = 29 bytes

**BLE_UUID128_VAL_LENGTH**

Theoretically, the limit for max manufacturer length remains same as BLE device name i.e. 31 bytes (max scan response size) - 1 byte (length) - 1 byte (type) = 29 bytes However, manufacturer data goes along with BLE device name in scan response. So, it is important to understand the actual length should be smaller than (29 - (BLE device name length) - 2).

### Type Definitions

```c
typedef struct name_uuid protocomm_ble_name_uuid_t
This structure maps handler required by protocomm layer to UUIDs which are used to uniquely identify BLE characteristics from a smartphone or a similar client device.
```

```c
typedef struct protocomm_ble_config protocomm_ble_config_t
Config parameters for protocomm BLE service.
```

### Enumerations

```c
enum protocomm_transport_ble_event_t
Events generated by BLE transport.

These events are generated when the BLE transport is paired and disconnected.

Values:

enumerator PROTOCOL_TRANSPORT_BLE_CONNECTED
enumerator PROTOCOL_TRANSPORT_BLE_DISCONNECTED
```

## 2.8.2 Unified Provisioning

### Overview

The unified provisioning support in the ESP-IDF provides an extensible mechanism to the developers to configure the device with the Wi-Fi credentials and/or other custom configuration using various transports and different security schemes. Depending on the use case, it provides a complete and ready solution for Wi-Fi network provisioning along with example iOS and Android applications. The developers can choose to extend the device-side and phone-app side implementations to accommodate their requirements for sending additional configuration data. The followings are the important features of this implementation:

1. **Extensible Protocol**

   The protocol is completely flexible and it offers the ability for the developers to send custom configuration in the provisioning process. The data representation is also left to the application to decide.

2. **Transport Flexibility**
The protocol can work on Wi-Fi (SoftAP + HTTP server) or on Bluetooth LE as a transport protocol. The framework provides an ability to add support for any other transport easily as long as command-response behavior can be supported on the transport.

3. **Security Scheme Flexibility**

It is understood that each use case may require different security scheme to secure the data that is exchanged in the provisioning process. Some applications may work with SoftAP that is WPA2 protected or Bluetooth LE with the “just-works” security. Or the applications may consider the transport to be insecure and may want application-level security. The unified provisioning framework allows the application to choose the security as deemed suitable.

4. **Compact Data Representation**

The protocol uses Google Protobufs as a data representation for session setup and Wi-Fi provisioning. They provide a compact data representation and ability to parse the data in multiple programming languages in native format. Please note that this data representation is not forced on application-specific data and the developers may choose the representation of their choice.

**Typical Provisioning Process**

**Deciding on Transport**

The unified provisioning subsystem supports Wi-Fi (SoftAP+HTTP server) and Bluetooth LE (GATT based) transport schemes. The following points need to be considered while selecting the best possible transport for provisioning:

1. The Bluetooth LE-based transport has the advantage of maintaining an intact communication channel between the device and the client during the provisioning, which ensures reliable provisioning feedback.
2. The Bluetooth LE-based provisioning implementation makes the user experience better from the phone apps as on Android and iOS both, the phone app can discover and connect to the device without requiring the user to go out of the phone app.
3. However, the Bluetooth LE transport consumes about 110 KB memory at runtime. If the product does not use the Bluetooth LE or Bluetooth functionality after provisioning is done, almost all the memory can be reclaimed and added into the heap.
4. The SoftAP-based transport is highly interoperable. However, there are a few considerations:
   - The device uses the same radio to host the SoftAP and also to connect to the configured AP. Since these could potentially be on different channels, it may cause connection status updates not to be reliably received by the phone
   - The phone (client) has to disconnect from its current AP in order to connect to the SoftAP. The original network will get restored only when the provisioning process is complete, and the softAP is taken down.
5. The SoftAP transport does not require much additional memory for the Wi-Fi use cases.
6. The SoftAP-based provisioning requires the phone-app user to go to **System Settings** to connect to the Wi-Fi network hosted by the device in the iOS system. The discovery (scanning) as well as connection APIs are not available for the iOS applications.

**Deciding on Security**

Depending on the transport and other constraints, the security scheme needs to be selected by the application developers. The following considerations need to be given from the provisioning-security perspective:

1. The configuration data sent from the client to the device and the response have to be secured.
2. The client should authenticate the device that it is connected to.
3. The device manufacturer may choose proof-of-possession (PoP), a unique per-device secret to be entered on the provisioning client as a security measure to make sure that only the user can provision the device in their possession.

There are two levels of security schemes, of which the developer may select one or a combination, depending on requirements.

1. **Transport Security**
Chapter 2. API Reference

Fig. 36: Typical Provisioning Process

1. Transport-specific discovery and connection

- Some form of beaconing
- Client connects

2. Session Establishment

- Get Version Request
  - Get Version Response
- Session Setup Request
  - Session Setup Response

- One or multiple steps as per protocol

3. Configuration

- App-specific Set Config (optional)
  - Set Config Response (optional)
- Wi-Fi SetConfig(SSID, Passphrase...)
  - Wi-Fi SetConfig response
- Wi-Fi ApplyConfig cmd
  - Wi-Fi ApplyConfig resp
- Wi-Fi GetStatus cmd (repeated)
  - Wi-Fi GetStatus resp (repeated)

4. Close connection

- Close Connection
For SoftAP provisioning, developers may choose WPA2-protected security with unique per-device passphrase. Unique per-device passphrase can also act as a proof-of-possession. For Bluetooth LE, the “just-works” security can be used as a transport-level security after assessing its provided level of security.

2. Application Security

The unified provisioning subsystem provides the application-level security (Security 1 Scheme) that provides data protection and authentication through PoP, if the application does not use the transport-level security, or if the transport-level security is not sufficient for the use case.

Device Discovery

The advertisement and device discovery is left to the application and depending on the protocol chosen, the phone apps and device-firmware application can choose appropriate method for advertisement and discovery.

For the SoftAP+HTTP transport, typically the SSID (network name) of the AP hosted by the device can be used for discovery.

For the Bluetooth LE transport, device name or primary service included in the advertisement or a combination of both can be used for discovery.

Architecture

The below diagram shows the architecture of unified provisioning:

![Unified Provisioning Architecture](image)

It relies on the base layer called Protocol Communication (protocomm) which provides a framework for security schemes and transport mechanisms. The Wi-Fi Provisioning layer uses protocomm to provide simple callbacks to the application for setting the configuration and getting the Wi-Fi status. The application has control over implementation of these callbacks. In addition, the application can directly use protocomm to register custom handlers.

The application creates a protocomm instance which is mapped to a specific transport and specific security scheme. Each transport in the protocomm has a concept of an “end-point” which corresponds to the logical channel for
communication for specific type of information. For example, security handshake happens on a different endpoint from the Wi-Fi configuration endpoint. Each end-point is identified using a string and depending on the transport internal representation of the end-point changes. In case of the SoftAP+HTTP transport, the end-point corresponds to URI, whereas in case of Bluetooth LE, the end-point corresponds to the GATT characteristic with specific UUID. Developers can create custom end-points and implement handler for the data that is received or sent over the same end-point.

**Security Schemes**

At present, the unified provisioning supports the following security schemes:

1. Security 0
   - No security (No encryption).
2. Security 1
   - Curve25519-based key exchange, shared key derivation and AES256-CTR mode encryption of the data. It supports two modes:
     a. Authorized - Proof of Possession (PoP) string used to authorize session and derive shared key.
     b. No Auth (Null PoP) - Shared key derived through key exchange only.
3. Security 2
   - SRP6a-based shared key derivation and AES256-GCM mode encryption of the data.

**Note:** The respective security schemes need to be enabled through the project configuration menu. Please refer to *Enabling Protocomm Security Version* for more details.

**Security 1 Scheme**

The Security 1 scheme details are shown in the below sequence diagram:

**Security 2 Scheme**

The Security 2 scheme is based on the Secure Remote Password (SRP6a) protocol, see RFC 5054. The protocol requires the Salt and Verifier to be generated beforehand with the help of the identifying username $I$ and the plaintext password $p$. The Salt and Verifier are then stored on ESP32-S3.

- The password $p$ and the username $I$ are to be provided to the Phone App (Provisioning entity) by suitable means, e.g., QR code sticker.

Details about the Security 2 scheme are shown in the below sequence diagram:

**Sample Code**

Please refer to *Protocol Communication* and *Wi-Fi Provisioning* for API guides and code snippets on example usage. Application implementation can be found as an example under *provisioning*.

**Provisioning Tools**

Provisioning applications are available for various platforms, along with source code:

- **Android:**
  - Bluetooth LE Provisioning app on Play Store.
  - SoftAP Provisioning app on Play Store.

check (cli\_pubkey == aes\_ctr\_dec(dev\_verify...))
Fig. 39: Security 2

Client (PhoneApp) → Device (ESP)

Generate Key Pair

a (cli_privkey) = 256 bit random value, 
A (cli_pubkey) = g^a
q - generator; N - large safe prime,
All arithmetic operations are performed in ring of integers modulo N,
thus all occurrences like y^z should be read as y^z modulo N.

SessionCmd0(cli_pubkey A, username I)

Obtain Salt and Verifier stored on esp
Salt s = 256 bit random value,
Verifier v = q^x where x = H(s) || p

Obtain Salt and Verifier

Generate Key Pair

b (dev_privkey) = 256 bit random value
B(dev_pubkey) = k*v + g^b where k = H(N, q)

Generate Key Pair

Shared Key K = H(S) where,
S = (A - v^u)^b
u = H(A, B)

Shared Key

SessionResp0(dev_pubkey B, dev_ranc)

Signed Key(K) = H(S) where,
S = (B - k*v)^b (a + ux),
u = H(A, B),
k = H(N, q),
v = q^x,
x = H(s) || p,

Verification Token

client_proof M = [H(H(N) XOR H(q) || H(I) || s || A || B || K]

SessionCmd1(client_proof M1)

device generates M1 = [H(H(N) XOR H(q) || H(I) || s || A || B || K]
device verifies this M1 with the M1 obtained from Client

Device generate device_proof M2 = H(A, M, K)

dev_ranc = gen_16byte_random()
This random number is to be used for AES-GCM operation
for encryption and decryption of the data using the shared secret

SessionResp1(device_proof M2, dev_ranc)

Verify Device

Client calculates device proof M2 as M2 = H(A, M, K)
client verifies this M2 with M2 obtained from device

Verify Device

Source code on GitHub: esp-idf-provisioning-android.

iOS:
- Bluetooth LE Provisioning app on App Store.
- SoftAP Provisioning app on App Store.
- Source code on GitHub: esp-idf-provisioning-ios.

Linux/macOS/Windows: tools/esp_prov, a Python-based command line tool for provisioning.

The phone applications offer simple UI and are thus more user centric, while the command-line application is useful as a debugging tool for developers.

2.8.3 Wi-Fi Provisioning

Overview

This component provides APIs that control the Wi-Fi provisioning service for receiving and configuring Wi-Fi credentials over SoftAP or Bluetooth LE transport via secure Protocol Communication sessions. The set of wifi_prov_mgr_ APIs help quickly implement a provisioning service that has necessary features with minimal amount of code and sufficient flexibility.

Initialization

**wifi_prov_mgr_init()** is called to configure and initialize the provisioning manager, and thus must be called prior to invoking any other wifi_prov_mgr_ APIs. Note that the manager relies on other components of ESP-IDF, namely NVS, TCP/IP, Event Loop and Wi-Fi, and optionally mDNS, hence these components must be initialized beforehand. The manager can be de-initialized at any moment by making a call to wifi_prov_mgr_deinit().

```c
wifi_prov_mgr_config_t config = {
    .scheme = wifi_prov_scheme_ble,
    .scheme_event_handler = WIFI_prov_SCHEME_BLE_EVENT_HANDLER_FREE_BTDM
};
ESP_ERROR_CHECK( wifi_prov_mgr_init(config) );
```

The configuration structure wifi_prov_mgr_config_t has a few fields to specify the desired behavior of the manager:

- **wifi_prov_mgr_config_t::scheme**: This is used to specify the provisioning scheme. Each scheme corresponds to one of the modes of transport supported by protocomm. Hence, support the following options:
  - wifi_prov_scheme_ble - Bluetooth LE transport and GATT Server for handling the provisioning commands.
  - wifi_prov_scheme_softap - Wi-Fi SoftAP transport and HTTP Server for handling the provisioning commands.
  - wifi_prov_scheme_console - Serial transport and console for handling the provisioning commands.

- **wifi_prov_mgr_config_t::scheme_event_handler**: An event handler defined along with the scheme. Choosing the appropriate scheme-specific event handler allows the manager to take care of certain matters automatically. Presently, this option is not used for either the SoftAP or Console-based provisioning, but is very convenient for Bluetooth LE. To understand how, we must recall that Bluetooth requires a substantial amount of memory to function, and once the provisioning is finished, the main application may want to reclaim back this memory (or part of it) if it needs to use either Bluetooth LE or classic Bluetooth. Also, upon every future reboot of a provisioned device, this reclamation of memory needs to be performed again. To reduce this complication in using wifi_prov_scheme_ble, the scheme-specific handlers have been defined, and depending upon the chosen handler, the Bluetooth LE/classic Bluetooth/BTDM memory is freed automatically when the provisioning manager is de-initialized. The available options are:
- WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BTDM - Free both classic Bluetooth and Bluetooth LE/ BTDM memory. Used when the main application does not require Bluetooth at all.
- WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BLE - Free only Bluetooth LE memory. Used when main application requires classic Bluetooth.
- WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BT - Free only classic Bluetooth. Used when main application requires Bluetooth LE. In this case freeing happens right when the manager is initialized.
- WIFI_PROV_EVENT_HANDLER_NONE - Do not use any scheme specific handler. Used when the provisioning scheme is not Bluetooth LE, i.e., using SoftAP or Console, or when main application wants to handle the memory reclaiming on its own, or needs both Bluetooth LE and classic Bluetooth to function.

- wifi_prov_mgr_config_t::app_event_handler (Deprecated) - It is now recommended to catch WIFI_PROV_EVENT that is emitted to the default event loop handler. See definition of wifi_prov_cb_event_t for the list of events that are generated by the provisioning service. Here is an excerpt showing some of the provisioning events:

```
static void event_handler(void* arg, esp_event_base_t event_base, int event_id, void* event_data)
{
    if (event_base == WIFI_PROV_EVENT) {
        switch (event_id) {
            case WIFI_PROV_START:
                ESP_LOGI(TAG, "Provisioning started");
                break;
            case WIFI_PROV_CRED_RECV:
                wifi_sta_config_t *wifi_sta_cfg = (wifi_sta_config_t *)event_data;
                ESP_LOGI(TAG, "Received Wi-Fi credentials"
                    "SSID : %s
                    Password : %s",
                    (const char *)wifi_sta_cfg->ssid,
                    (const char *)wifi_sta_cfg->password);
                break;
            case WIFI_PROV_CRED_FAIL:
                wifi_prov_sta_fail_reason_t *reason = (wifi_prov_sta_fail_reason_t *)event_data;
                ESP_LOGE(TAG, "Provisioning failed!
                    Reason : %s"
                    "\n                    Please reset to factory and retry provisioning",
                    (*reason == WIFI_PROV_STA_AUTH_ERROR) ? "Wi-Fi station authentication failed" : "Wi-Fi access-point not found");
                break;
            case WIFI_PROV_CRED_SUCCESS:
                ESP_LOGI(TAG, "Provisioning successful");
                break;
            case WIFI_PROV_END:
                /* De-initialize manager once provisioning is finished */
                wifi_prov_mgr_deinit();
                break;
            default:
                break;
        }
    }
}
```

The manager can be de-initialized at any moment by making a call to wifi_prov_mgr_deinit().
Check the Provisioning State  Whether the device is provisioned or not can be checked at runtime by calling `wifi_prov_mgr_is_provisioned()`. This internally checks if the Wi-Fi credentials are stored in NVS.

Note that presently the manager does not have its own NVS namespace for storage of Wi-Fi credentials, instead it relies on the `esp_wifi_` APIs to set and get the credentials stored in NVS from the default location.

If the provisioning state needs to be reset, any of the following approaches may be taken:

- The associated part of NVS partition has to be erased manually
- The main application must implement some logic to call `esp_wifi_` APIs for erasing the credentials at runtime
- The main application must implement some logic to force start the provisioning irrespective of the provisioning state

```c
bool provisioned = false;
ESP_ERROR_CHECK( wifi_prov_mgr_is_provisioned(&provisioned) );
```

Start the Provisioning Service  At the time of starting provisioning we need to specify a service name and the corresponding key, that is to say:

- A Wi-Fi SoftAP SSID and a passphrase, respectively, when the scheme is `wifi_prov_scheme_softap`.
- Bluetooth LE device name with the service key ignored when the scheme is `wifi_prov_scheme_ble`.

Also, since internally the manager uses `protocomm`, we have the option of choosing one of the security features provided by it:

- Security 1 is secure communication which consists of a prior handshake involving X25519 key exchange along with authentication using a proof of possession `pop`, followed by AES-CTR for encryption or decryption of subsequent messages.
- Security 0 is simply plain text communication. In this case the `pop` is simply ignored.

See Unified Provisioning for details about the security features.

```c
const char *service_name = "my_device";
const char *service_key = "password";

wifi_prov_security_t security = WIFI_PROV_SECURITY_1;
const char *pop = "abcd1234";
ESP_ERROR_CHECK( wifi_prov_mgr_start_provisioning(security, pop, service_name, service_key) );
```

The provisioning service automatically finishes only if it receives valid Wi-Fi AP credentials followed by successful connection of device to the AP with IP obtained. Regardless of that, the provisioning service can be stopped at any moment by making a call to `wifi_prov_mgr_stop_provisioning()`.

Note: If the device fails to connect with the provided credentials, it does not accept new credentials anymore, but the provisioning service keeps on running, only to convey failure to the client, until the device is restarted. Upon restart, the provisioning state turns out to be true this time, as credentials are found in NVS, but the device does fail again to connect with those same credentials, unless an AP with the matching credentials somehow does become available. This situation can be fixed by resetting the credentials in NVS or force starting the provisioning service. This has been explained above in Check the Provisioning State.

Waiting for Completion  Typically, the main application waits for the provisioning to finish, then de-initializes the manager to free up resources, and finally starts executing its own logic.

There are two ways for making this possible. The simpler way is to use a blocking call to `wifi_prov_mgr_wait()`.

---

Espressif Systems 1814 Release v5.3-dev-277-gc8243465e4  Submit Document Feedback
Chapter 2. API Reference

```c
// Start provisioning service
ESP_ERROR_CHECK( wifi_prov_mgr_start_provisioning(security, pop, service_name, service_key) );

// Wait for service to complete
wifi_prov_mgr_wait();

// Finally de-initialize the manager
wifi_prov_mgr_deinit();
```

The other way is to use the default event loop handler to catch WIFI_PROV_EVENT and call `wifi_prov_mgr_deinit()` when event ID is WIFI_PROV_END:

```c
static void event_handler(void* arg, esp_event_base_t event_base, int event_id, void* event_data){
  if (event_base == WIFI_PROV_EVENT && event_id == WIFI_PROV_END) {
    /* De-initialize the manager once the provisioning is finished */
    wifi_prov_mgr_deinit();
  }
}
```

**User Side Implementation**  When the service is started, the device to be provisioned is identified by the advertised service name, which, depending upon the selected transport, is either the Bluetooth LE device name or the SoftAP SSID.

When using SoftAP transport, for allowing service discovery, mDNS must be initialized before starting provisioning. In this case, the host name set by the main application is used, and the service type is internally set to `_esp_wifi_prov`.

When using Bluetooth LE transport, a custom 128-bit UUID should be set using `wifi_prov_scheme_ble_set_service_uuid()`. This UUID is to be included in the Bluetooth LE advertisement and corresponds to the primary GATT service that provides provisioning endpoints as GATT characteristics. Each GATT characteristic is formed using the primary service UUID as the base, with different auto-assigned 12th and 13th bytes, presumably counting from the 0th byte. Since an endpoint characteristic UUID is auto-assigned, it should not be used to identify the endpoint. Instead, client-side applications should identify the endpoints by reading the User Characteristic Description (0x2901) descriptor for each characteristic, which contains the endpoint name of the characteristic. For example, if the service UUID is set to 55cc035e-fb27-4f80-be02-3c60828b7451, each endpoint characteristic is assigned a UUID like 55cc____-fb27-4f80-be02-3c60828b7451, with unique values at the 12th and 13th bytes.

Once connected to the device, the provisioning-related protocomm endpoints can be identified as follows:

**Table 9: Endpoints Provided by the Provisioning Service**

<table>
<thead>
<tr>
<th>Endpoint Name i.e., Bluetooth LE + GATT Server</th>
<th>URI, i.e., SoftAP + HTTP Server + mDNS</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>prov-session</td>
<td>http://&lt;mdns-hostname&gt;.local/prov-session</td>
<td>Security endpoint used for session establishment</td>
</tr>
<tr>
<td>prov-scan</td>
<td><a href="http://wifi-prov.local/prov-scan">http://wifi-prov.local/prov-scan</a></td>
<td>the endpoint used for starting Wi-Fi scan and receiving scan results</td>
</tr>
<tr>
<td>prov-ctrl</td>
<td><a href="http://wifi-prov.local/prov-ctrl">http://wifi-prov.local/prov-ctrl</a></td>
<td>the endpoint used for controlling Wi-Fi provisioning state</td>
</tr>
<tr>
<td>prov-config</td>
<td>http://&lt;mdns-hostname&gt;.local/prov-config</td>
<td>the endpoint used for configuring Wi-Fi credentials on device</td>
</tr>
<tr>
<td>proto-ver</td>
<td>http://&lt;mdns-hostname&gt;.local/proto-ver</td>
<td>the endpoint for retrieving version info</td>
</tr>
</tbody>
</table>

Immediately after connecting, the client application may fetch the version/capabilities information from the
proto-ver endpoint. All communications to this endpoint are unencrypted, hence necessary information, which may be relevant for deciding compatibility, can be retrieved before establishing a secure session. The response is in JSON format and looks like: 

```json
```

Here label `prov` provides provisioning service version `ver` and capabilities `cap`. For now, only the `no_pop` capability is supported, which indicates that the service does not require proof of possession for authentication. Any application-related version or capabilities are given by other labels, e.g., `my_app` in this example. These additional fields are set using `wifi_prov_mgr_set_app_info()`.

User side applications need to implement the signature handshaking required for establishing and authenticating secure protocomm sessions as per the security scheme configured for use, which is not needed when the manager is configured to use protocomm security 0.

See [Unified Provisioning](#) for more details about the secure handshake and encryption used. Applications must use the .proto files found under `protocomm/proto`, which define the Protobuf message structures supported by `prov-session endpoint`.

Once a session is established, Wi-Fi credentials are configured using the following set of `wifi_config` commands, serialized as Protobuf messages with the corresponding .proto files that can be found under `wifi_provisioning/proto`:

- **get_status** - For querying the Wi-Fi connection status. The device responds with a status which is one of connecting, connected or disconnected. If the status is disconnected, a disconnection reason is also to be included in the status response.
- **set_config** - For setting the Wi-Fi connection credentials.
- **apply_config** - For applying the credentials saved during `set_config` and starting the Wi-Fi station.

After session establishment, the client can also request Wi-Fi scan results from the device. The results returned is a list of AP SSIDs, sorted in descending order of signal strength. This allows client applications to display APs nearby at the device time of provisioning, and users can select one of the SSIDs and provide the password which is then sent using the `wifi_config` commands described above. The `wifi_scan` endpoint supports the following protobuf commands:

- **scan_start** - For starting Wi-Fi scan with various options:
  - `blocking` (input) - If true, the command returns only when the scanning is finished.
  - `passive` (input) - If true, the scan is started in passive mode, which may be slower, instead of active mode.
  - `group_channels` (input) - This specifies whether to scan all channels in one go when zero, or perform scanning of channels in groups, with 120 ms delay between scanning of consecutive groups, and the value of this parameter sets the number of channels in each group. This is useful when transport mode is SoftAP, where scanning all channels in one go may not give the Wi-Fi driver enough time to send out beacons, and hence may cause disconnection with any connected stations. When scanning in groups, the manager waits for at least 120 ms after completing the scan on a group of channels, and thus allows the driver to send out the beacons. For example, given that the total number of Wi-Fi channels is 14, then setting `group_channels` to 3 creates 5 groups, with each group having 3 channels, except the last one which has 14 % 3 = 2 channels. So, when the scan is started, the first 3 channels will be scanned, followed by a 120 ms delay, and then the next 3 channels, and so on, until all the 14 channels have been scanned. One may need to adjust this parameter as having only a few channels in a group may increase the overall scan time, while having too many may again cause disconnection. Usually, a value of 4 should work for most cases. Note that for any other mode of transport, e.g., Bluetooth LE, this can be safely set to 0, and hence achieve the shortest overall scanning time.
  - `period_ms` (input) - The scan parameter specifying how long to wait on each channel.
- **scan_status** - It gives the status of scanning process:
  - `scan_finished` (output) - When the scan has finished, this returns true.
  - `result_count` (output) - This gives the total number of results obtained till now. If the scan is yet happening, this number keeps on updating.
- **scan_result** - For fetching the scan results. This can be called even if the scan is still on going.
  - `start_index` (input) - Where the index starts from to fetch the entries from the results list.
  - `count` (input) - The number of entries to fetch from the starting index.
  - `entries` (output) - The list of entries returned. Each entry consists of `ssid`, `channel` and `rssi` information.

The client can also control the provisioning state of the device using `wifi_ctrl endpoint`. The `wifi_ctrl`
endpoint supports the following protobuf commands:

- **ctrl_reset** - Resets internal state machine of the device and clears provisioned credentials only in case of provisioning failures.
- **ctrl_reprov** - Resets internal state machine of the device and clears provisioned credentials only in case the device is to be provisioned again for new credentials after a previous successful provisioning.

Additional Endpoints In case users want to have some additional protocomm endpoints customized to their requirements, this is done in two steps. First is creation of an endpoint with a specific name, and the second step is the registration of a handler for this endpoint. See Protocol Communication for the function signature of an endpoint handler. A custom endpoint must be created after initialization and before starting the provisioning service. Whereas, the protocomm handler is registered for this endpoint only after starting the provisioning service.

```c
wifi_prov_mgr_init(config);
wifi_prov_mgr_endpoint_create("custom-endpoint");
wifi_prov_mgr_start_provisioning(security, pop, service_name, service_key);
wifi_prov_mgr_endpoint_register("custom-endpoint", custom_ep_handler, custom_ep_data);
```

When the provisioning service stops, the endpoint is unregistered automatically.

One can also choose to call `wifi_prov_mgr_endpoint_unregister()` to manually deactivate an endpoint at runtime. This can also be used to deactivate the internal endpoints used by the provisioning service.

**When/How to Stop the Provisioning Service?** The default behavior is that once the device successfully connects using the Wi-Fi credentials set by the `apply_config` command, the provisioning service stops, and Bluetooth LE or SoftAP turns off, automatically after responding to the next `get_status` command. If `get_status` command is not received by the device, the service stops after a 30 s timeout.

On the other hand, if device is not able to connect using the provided Wi-Fi credentials, due to incorrect SSID or passphrase, the service keeps running, and `get_status` keeps responding with disconnected status and reason for disconnection. Any further attempts to provide another set of Wi-Fi credentials, are to be rejected. These credentials are preserved, unless the provisioning service is force started, or NVS erased.

If this default behavior is not desired, it can be disabled by calling `wifi_prov_mgr_disable_auto_stop()`.

Now the provisioning service stops only after an explicit call to `wifi_prov_mgr_stop_provisioning()`, which returns immediately after scheduling a task for stopping the service. The service stops after a certain delay and `WIFI_PROV_END` event gets emitted. This delay is specified by the argument to `wifi_prov_mgr_disable_auto_stop()`.

The customized behavior is useful for applications which want the provisioning service to be stopped some time after the Wi-Fi connection is successfully established. For example, if the application requires the device to connect to some cloud service and obtain another set of credentials, and exchange these credentials over a custom protocomm endpoint, then after successfully doing so, stop the provisioning service by calling `wifi_prov_mgr_stop_provisioning()` inside the protocomm handler itself. The right amount of delay ensures that the transport resources are freed only after the response from the protocomm handler reaches the client side application.

**Application Examples**

For complete example implementation see `provisioning/wifi_prov_mgr`.

**Provisioning Tools**

Provisioning applications are available for various platforms, along with source code:

- **Android:**
  - Bluetooth LE Provisioning app on Play Store.
– SoftAP Provisioning app on Play Store.
– Source code on GitHub: esp-idf-provisioning-android.

• iOS:
– Bluetooth LE Provisioning app on App Store.
– SoftAP Provisioning app on App Store.
– Source code on GitHub: esp-idf-provisioning-ios.

• Linux/MacOS/Windows: tools/esp_prov, a Python-based command-line tool for provisioning.

The phone applications offer simple UI and are thus more user centric, while the command-line application is useful as a debugging tool for developers.

API Reference

Header File

• components/wifi_provisioning/include/wifi_provisioning/manager.h

This header file can be included with:

```
#include "wifi_provisioning/manager.h"
```

This header file is a part of the API provided by the wifi_provisioning component. To declare that your component depends on wifi_provisioning, add the following to your CMakeLists.txt:

```
REQUIRES wifi_provisioning
```

or

```
PRIV_REQUIRES wifi_provisioning
```

Functions

```c
esp_err_t wifi_prov_mgr_init (wifi_prov_mgr_config_t config)
```

Initialize provisioning manager instance.

Configures the manager and allocates internal resources

Configuration specifies the provisioning scheme (transport) and event handlers

Event WIFI_PROV_INIT is emitted right after initialization is complete

**Parameters** config — [in] Configuration structure

**Returns**

• ESP_OK : Success
• ESP_FAIL : Fail

```c
void wifi_prov_mgr_deinit (void)
```

Stop provisioning (if running) and release resource used by the manager.

Event WIFI_PROV_DEINIT is emitted right after de-initialization is finished

If provisioning service is still active when this API is called, it first stops the service, hence emitting WIFI_PROV_END, and then performs the de-initialization

```c
esp_err_t wifi_prov_mgr_is_provisioned (bool *provisioned)
```

Checks if device is provisioned.

This checks if Wi-Fi credentials are present on the NVS

The Wi-Fi credentials are assumed to be kept in the same NVS namespace as used by esp_wifi component

If one were to call esp_wifi_set_config() directly instead of going through the provisioning process, this function will still yield true (i.e. device will be found to be provisioned)
Note: Calling wifi_prov_mgr_start_provisioning() automatically resets the provision state, irrespective of what the state was prior to making the call.

Parameters
- provisioned  ⚶ [out] True if provisioned, else false

Returns
- ESP_OK : Retrieved provision state successfully
- ESP_FAIL : Wi-Fi not initialized
- ESP_ERR_INVALID_ARG : Null argument supplied

esp_err_t wifi_prov_mgr_start_provisioning (wifi_prov_security_t security, const void *wifi_prov_sec_params, const char *service_name, const char *service_key)

Start provisioning service.
This starts the provisioning service according to the scheme configured at the time of initialization. For scheme :
- wifi_prov_scheme_ble : This starts protocomm_ble, which internally initializes BLE transport and starts GATT server for handling provisioning requests
- wifi_prov_scheme_softap : This activates SoftAP mode of Wi-Fi and starts protocomm_httpd, which internally starts an HTTP server for handling provisioning requests (If mDNS is active it also starts advertising service with type _esp_wifi_prov._tcp)
Event WIFI_PROV_START is emitted right after provisioning starts without failure

Note: This API will start provisioning service even if device is found to be already provisioned, i.e. wifi_prov_mgr_is_provisioned() yields true

Parameters
- security  ⚶ [in] Specify which protocomm security scheme to use :
  - WIFI_PROV_SECURITY_0 : For no security
  - WIFI_PROV_SECURITY_1 : x25519 secure handshake for session establishment followed by AES-CTR encryption of provisioning messages
  - WIFI_PROV_SECURITY_2 : SRP6a based authentication and key exchange followed by AES-GCM encryption/decryption of provisioning messages
- wifi_prov_sec_params  ⚶ [in] Pointer to security params (NULL if not needed). This is not needed for protocomm security 0 This pointer should hold the struct of type wifi_prov_security1_params_t for protocomm security 1 and wifi_prov_security2_params_t for protocomm security 2 respectively. This pointer and its contents should be valid till the provisioning service is running and has not been stopped or de-initied.
- service_name  ⚶ [in] Unique name of the service. This translates to:
  - Wi-Fi SSID when provisioning mode is softAP
  - Device name when provisioning mode is BLE
- service_key  ⚶ [in] Key required by client to access the service (NULL if not needed).
  This translates to:
  - Wi-Fi password when provisioning mode is softAP
  - ignored when provisioning mode is BLE

Returns
- ESP_OK : Provisioning started successfully
- ESP_FAIL : Failed to start provisioning service
- ESP_ERR_INVALID_STATE : Provisioning manager not initialized or already started

void wifi_prov_mgr_stop_provisioning (void)
Stop provisioning service.
Chapter 2. API Reference

If provisioning service is active, this API will initiate a process to stop the service and return. Once the service actually stops, the event WIFI_PROV_END will be emitted.

If wifi_prov_mgr_deinit() is called without calling this API first, it will automatically stop the provisioning service and emit the WIFI_PROV_END, followed by WIFI_PROV_DEINIT, before returning.

This API will generally be used along with wifi_prov_mgr_disable_auto_stop() in the scenario when the main application has registered its own endpoints, and wishes that the provisioning service is stopped only when some protocomm command from the client side application is received.

Calling this API inside an endpoint handler, with sufficient cleanup_delay, will allow the response / acknowledgment to be sent successfully before the underlying protocomm service is stopped.

Cleanup_delay is set when calling wifi_prov_mgr_disable_auto_stop(). If not specified, it defaults to 1000ms.

For straightforward cases, using this API is usually not necessary as provisioning is stopped automatically once WIFI_PROV_CRED_SUCCESS is emitted. Stopping is delayed (maximum 30 seconds) thus allowing the client side application to query for Wi-Fi state, i.e. after receiving the first query and sending Wi-Fi state connected response the service is stopped immediately.

void wifi_prov_mgr_wait (void)

Wait for provisioning service to finish.

Calling this API will block until provisioning service is stopped i.e. till event WIFI_PROV_END is emitted.

This will not block if provisioning is not started or not initialized.

esp_err_t wifi_prov_mgr_disable_auto_stop (uint32_t cleanup_delay)

Disable auto stopping of provisioning service upon completion.

By default, once provisioning is complete, the provisioning service is automatically stopped, and all endpoints (along with those registered by main application) are deactivated.

This API is useful in the case when main application wishes to close provisioning service only after it receives some protocomm command from the client side app. For example, after connecting to Wi-Fi, the device may want to connect to the cloud, and only once that is successfully, the device is said to be fully configured. But, then it is upto the main application to explicitly call wifi_prov_mgr_stop_provisioning() later when the device is fully configured and the provisioning service is no longer required.

Note: This must be called before executing wifi_prov_mgr_start_provisioning()

Parameters cleanup_delay [in] Sets the delay after which the actual cleanup of transport related resources is done after a call to wifi_prov_mgr_stop_provisioning() returns. Minimum allowed value is 100ms. If not specified, this will default to 1000ms.

Returns
- ESP_OK : Success
- ESP_ERR_INVALID_STATE : Manager not initialized or provisioning service already started

esp_err_t wifi_prov_mgr_set_app_info (const char* label, const char* version, const char** capabilities, size_t total_capabilities)

Set application version and capabilities in the JSON data returned by proto-ver endpoint.

This function can be called multiple times, to specify information about the various application specific services running on the device, identified by unique labels.

The provisioning service itself registers an entry in the JSON data, by the label “prov”, containing only provisioning service version and capabilities. Application services should use a label other than “prov” so as not to overwrite this.

Note: This must be called before executing wifi_prov_mgr_start_provisioning()
Parameters

- **label** - [in] String indicating the application name.
- **version** - [in] String indicating the application version. There is no constraint on format.
- **capabilities** - [in] Array of strings with capabilities. These could be used by the client side app to know the application registered endpoint capabilities
- **total_capabilities** - [in] Size of capabilities array

Returns

- ESP_OK: Success
- ESP_ERR_INVALID_STATE: Manager not initialized or provisioning service already started
- ESP_ERR_NO_MEM: Failed to allocate memory for version string
- ESP_ERR_INVALID_ARG: Null argument

`esp_err_t wifi_prov_mgr_endpoint_create(const char* ep_name)`

Create an additional endpoint and allocate internal resources for it.

This API is to be called by the application if it wants to create an additional endpoint. All additional endpoints will be assigned UUIDs starting from 0xFF54 and so on in the order of execution.

The protocomm handler for the created endpoint is to be registered later using `wifi_prov_mgr_endpoint_register()` after provisioning has started.

**Note:** This API can only be called BEFORE provisioning is started

**Note:** Additional endpoints can be used for configuring client provided parameters other than Wi-Fi credentials, that are necessary for the main application and hence must be set prior to starting the application

**Note:** After session establishment, the additional endpoints must be targeted first by the client side application before sending Wi-Fi configuration, because once Wi-Fi configuration finishes the provisioning service is stopped and hence all endpoints are unregistered

Parameters **ep_name** - [in] unique name of the endpoint

Returns

- ESP_OK: Success
- ESP_FAIL: Failure

`esp_err_t wifi_prov_mgr_endpoint_register(const char* ep_name, protocomm_req_handler_t handler, void *user_ctx)`

Register a handler for the previously created endpoint.

This API can be called by the application to register a protocomm handler to any endpoint that was created using `wifi_prov_mgr_endpoint_create()`.

**Note:** This API can only be called AFTER provisioning has started

**Note:** Additional endpoints can be used for configuring client provided parameters other than Wi-Fi credentials, that are necessary for the main application and hence must be set prior to starting the application

**Note:** After session establishment, the additional endpoints must be targeted first by the client side application before sending Wi-Fi configuration, because once Wi-Fi configuration finishes the provisioning service is stopped and hence all endpoints are unregistered.
stopped and hence all endpoints are unregistered

Parameters
  • ep_name [in] Name of the endpoint
  • handler [in] Endpoint handler function
  • user_ctx [in] User data

Returns
  • ESP_OK : Success
  • ESP_FAIL : Failure

void wifi_prov_mgr_endpoint_unregister (const char *ep_name)
  Unregister the handler for an endpoint.
  This API can be called if the application wants to selectively unregister the handler of an endpoint while the provisioning is still in progress.
  All the endpoint handlers are unregistered automatically when the provisioning stops.

Parameters ep_name [in] Name of the endpoint

esp_err_t wifi_prov_mgr_get_wifi_state (wifi_prov_sta_state_t *state)
  Get state of Wi-Fi Station during provisioning.

Parameters state [out] Pointer to wifi_prov_sta_state_t variable to be filled

Returns
  • ESP_OK : Successfully retrieved Wi-Fi state
  • ESP_FAIL : Provisioning app not running

esp_err_t wifi_prov_mgr_get_wifi_disconnect_reason (wifi_prov_sta_fail_reason_t *reason)
  Get reason code in case of Wi-Fi station disconnection during provisioning.

Parameters reason [out] Pointer to wifi_prov_sta_fail_reason_t variable to be filled

Returns
  • ESP_OK : Successfully retrieved Wi-Fi disconnect reason
  • ESP_FAIL : Provisioning app not running

esp_err_t wifi_prov_mgr_configure_sta (wifi_config_t *wifi_cfg)
  Runs Wi-Fi as Station with the supplied configuration.

  Configures the Wi-Fi station mode to connect to the AP with SSID and password specified in config structure and sets Wi-Fi to run as station.

  This is automatically called by provisioning service upon receiving new credentials.

  If credentials are to be supplied to the manager via a different mode other than through protocomm, then this API needs to be called.

Event WIFI_PROV_CRED_RECV is emitted after credentials have been applied and Wi-Fi station started.

Parameters wifi_cfg [in] Pointer to Wi-Fi configuration structure

Returns
  • ESP_OK : Wi-Fi configured and started successfully
  • ESP_FAIL : Failed to set configuration

esp_err_t wifi_prov_mgr_reset_provisioning (void)
  Reset Wi-Fi provisioning config.

  Calling this API will restore WiFi stack persistent settings to default values.

Returns
  • ESP_OK : Reset provisioning config successfully
  • ESP_FAIL : Failed to reset provisioning config
**esp_err_t wifi_prov_mgr_reset_sm_state_on_failure (void)**
Reset internal state machine and clear provisioned credentials.

This API should be used to restart provisioning ONLY in the case of provisioning failures without rebooting the device.

**Returns**
- ESP_OK: Reset provisioning state machine successfully
- ESP_FAIL: Failed to reset provisioning state machine
- ESP_ERR_INVALID_STATE: Manager not initialized

**esp_err_t wifi_prov_mgr_reset_sm_state_for_reprovision (void)**
Reset internal state machine and clear provisioned credentials.

This API can be used to restart provisioning ONLY in case the device is to be provisioned again for new credentials after a previous successful provisioning without rebooting the device.

**Note:** This API can be used only if provisioning auto-stop has been disabled using wifi_prov_mgr_disable_auto_stop()

**Returns**
- ESP_OK: Reset provisioning state machine successfully
- ESP_FAIL: Failed to reset provisioning state machine
- ESP_ERR_INVALID_STATE: Manager not initialized

**Structures**

**struct wifi_prov_event_handler_t**
Event handler that is used by the manager while provisioning service is active.

**Public Members**

**wifi_prov_cb_func_t event_cb**
Callback function to be executed on provisioning events

void *user_data
User context data to pass as parameter to callback function

**struct wifi_prov_scheme**
Structure for specifying the provisioning scheme to be followed by the manager.

**Note:** Ready to use schemes are available:
- wifi_prov_scheme_ble: for provisioning over BLE transport + GATT server
- wifi_prov_scheme_softap: for provisioning over SoftAP transport + HTTP server
- wifi_prov_scheme_console: for provisioning over Serial UART transport + Console (for debugging)

**Public Members**

**esp_err_t (*prov_start)(protocomm_t *pc, void *config)**
Function which is to be called by the manager when it is to start the provisioning service associated with a protocomm instance and a scheme specific configuration
Chapter 2. API Reference

\texttt{esp_err_t (*prov_stop)(protocomm_t *pc)}

Function which is to be called by the manager to stop the provisioning service previously associated with a protocomm instance

\texttt{void (*new_config)(void)}

Function which is to be called by the manager to generate a new configuration for the provisioning service, that is to be passed to \texttt{prov_start()}

\texttt{void (*delete_config)(void *config)}

Function which is to be called by the manager to delete a configuration generated using \texttt{new_config()}

\texttt{esp_err_t (*set_config_service)(void *config, const char *service_name, const char *service_key)}

Function which is to be called by the manager to set the service name and key values in the configuration structure

\texttt{esp_err_t (*set_config_endpoint)(void *config, const char *endpoint_name, uint16_t uuid)}

Function which is to be called by the manager to set a protocomm endpoint with an identifying name and UUID in the configuration structure

\texttt{wifi_mode_t wifi_mode}

Sets mode of operation of Wi-Fi during provisioning. This is set to:

- WiFi\_MODE\_APSTA for SoftAP transport
- WiFi\_MODE\_STA for BLE transport

\texttt{struct wifi_prov_mgr_config_t}

Structure for specifying the manager configuration.

\textbf{Public Members}

\texttt{wifi_prov_scheme_t scheme}

Provisioning scheme to use. Following schemes are already available:

- \texttt{wifi_prov_scheme_ble} : for provisioning over BLE transport + GATT server
- \texttt{wifi_prov_scheme_softap} : for provisioning over SoftAP transport + HTTP server + mDNS (optional)
- \texttt{wifi_prov_scheme_console} : for provisioning over Serial UART transport + Console (for debugging)

\texttt{wifi_prov_event_handler_t scheme_event_handler}

Event handler required by the scheme for incorporating scheme specific behavior while provisioning manager is running. Various options may be provided by the scheme for setting this field. Use WIFI\_PROV\_EVENT\_HANDLER\_NONE when not used. When using scheme \texttt{wifi_prov_scheme_ble}, the following options are available:

- WIFI\_PROV\_SCHEME\_BLE\_EVENT\_HANDLER\_FREE\_BTDM
- WIFI\_PROV\_SCHEME\_BLE\_EVENT\_HANDLER\_FREE\_BLE
- WIFI\_PROV\_SCHEME\_BLE\_EVENT\_HANDLER\_FREE\_BT

\texttt{wifi_prov_event_handler_t app_event_handler}

Event handler that can be set for the purpose of incorporating application specific behavior. Use WIFI\_PROV\_EVENT\_HANDLER\_NONE when not used.
Chapter 2: API Reference

Macros

`WIFI_PROV_EVENT_HANDLER_NONE`

Event handler can be set to none if not used.

Type Definitions

typedef void (*`wifi_prov_cb_func_t`) (void *user_data, `wifi_prov_cb_event_t` event, void *event_data)

typedef struct `wifi_prov_scheme` `wifi_prov_scheme_t`

Structure for specifying the provisioning scheme to be followed by the manager.

Note: Ready to use schemes are available:

- `wifi_prov_scheme_ble`: for provisioning over BLE transport + GATT server
- `wifi_prov_scheme_softap`: for provisioning over SoftAP transport + HTTP server
- `wifi_prov_scheme_console`: for provisioning over Serial UART transport + Console (for debugging)

```c
typedef enum `wifi_prov_security` `wifi_prov_security_t`

Security modes supported by the Provisioning Manager.

These are same as the security modes provided by protocomm
```

typedef `protocomm_security2_params_t` `wifi_prov_security2_params_t`

Security 2 params structure This needs to be passed when using WIFI_PROV_SECURITY_2.

Enumerations

typedef enum `wifi_prov_cb_event_t`

Events generated by manager.

These events are generated in order of declaration and, for the stretch of time between initialization and de-initialization of the manager, each event is signaled only once

Values:

enumerator `WIFI_PROV_INIT`  
Emitted when the manager is initialized

enumerator `WIFI_PROV_START`  
Indicates that provisioning has started

enumerator `WIFI_PROV_CRED_RECV`  
Emitted when Wi-Fi AP credentials are received via protocomm endpoint wifi_config. The event data in this case is a pointer to the corresponding `wifi_sta_config_t` structure

enumerator `WIFI_PROV_CRED_FAIL`  
Emitted when device fails to connect to the AP of which the credentials were received earlier on event `WIFI_PROV_CRED_RECV`. The event data in this case is a pointer to the disconnection reason code with type `wifi_prov_sta_fail_reason_t`

enumerator `WIFI_PROV_CRED_SUCCESS`  
Emitted when device successfully connects to the AP of which the credentials were received earlier on event `WIFI_PROV_CRED_RECV`
Chapter 2. API Reference

enumerator WIFI_PROV_END
Signals that provisioning service has stopped

enumerator WIFI_PROV_DEINIT
Signals that manager has been de-initialized

enum wifi_prov_security
Security modes supported by the Provisioning Manager.
These are same as the security modes provided by protocomm
Values:

enumerator WIFI_PROV_SECURITY_0
No security (plain-text communication)

enumerator WIFI_PROV_SECURITY_1
This secure communication mode consists of X25519 key exchange
  • proof of possession (pop) based authentication
  • AES-CTR encryption

enumerator WIFI_PROV_SECURITY_2
This secure communication mode consists of SRP6a based authentication and key exchange
  • AES-GCM encryption/decryption

Header File

• components/wifi_provisioning/include/wifi_provisioning/scheme_ble.h
  • This header file can be included with:

```c
#include "wifi_provisioning/scheme_ble.h"
```

• This header file is a part of the API provided by the wifi_provisioning component. To declare that your component depends on wifi_provisioning, add the following to your CMakeLists.txt:

```cmake
REQUIRES wifi_provisioning
```

or

```cmake
PRIV_REQUIRES wifi_provisioning
```

Functions

```c
void wifi_prov_scheme_ble_event_cb_free_btdm (void *user_data, wifi_prov_cb_event_t event, void *event_data)
```

```c
void wifi_prov_scheme_ble_event_cb_free_ble (void *user_data, wifi_prov_cb_event_t event, void *event_data)
```

```c
void wifi_prov_scheme_ble_event_cb_free_bt (void *user_data, wifi_prov_cb_event_t event, void *event_data)
```

```c
esp_err_t wifi_prov_scheme_ble_set_service_uuid (uint8_t *uuid128)
```

Set the 128 bit GATT service UUID used for provisioning.

This API is used to override the default 128 bit provisioning service UUID, which is 0000fff0-0000-1000-8000-00805f9b34fb.
This must be called before starting provisioning, i.e., before making a call to wifi_prov_mgr_start_provisioning(), otherwise the default UUID will be used.

**Note:** The data being pointed to by the argument must be valid at least until provisioning is started. Upon start, the manager will store an internal copy of this UUID, and this data can be freed or invalidated afterwords.

### Parameters **uuid128** - [in] A custom 128 bit UUID

### Returns
- ESP_OK : Success
- ESP_ERR_INVALID_ARG : Null argument

```c
esp_err_t wifi_prov_scheme_ble_set_mfg_data(uint8_t *mfg_data, ssize_t mfg_data_len)
```

Set manufacturer specific data in scan response.

This must be called before starting provisioning, i.e., before making a call to wifi_prov_mgr_start_provisioning().

**Note:** It is important to understand that length of custom manufacturer data should be within limits. The manufacturer data goes into scan response along with BLE device name. By default, BLE device name length is of 11 Bytes, however it can vary as per application use case. So, one has to honour the scan response data size limits i.e. \((\text{mfg\_data\_len} + 2) < 31 - (\text{device\_name\_length} + 2)\). If the mfg_data length exceeds this limit, the length will be truncated.

### Parameters
- **mfg_data** - [in] Custom manufacturer data
- **mfg_data_len** - [in] Manufacturer data length

### Returns
- ESP_OK : Success
- ESP_ERR_INVALID_ARG : Null argument

### Macros
- **WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BTDM**
- **WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BLE**
- **WIFI_PROV_SCHEME_BLE_EVENT_HANDLER_FREE_BT**

### Header File
- components/wifi_provisioning/include/wifi_provisioning/scheme_softap.h
- This header file can be included with:

```c
#include "wifi_provisioning/scheme_softap.h"
```

- This header file is a part of the API provided by the wifi_provisioning component. To declare that your component depends on wifi_provisioning, add the following to your CMakeLists.txt:

```cmake
REQUIRES wifi_provisioning
```

or

```cmake
PRIV_REQUIRES wifi_provisioning
```
Functions

void wifi_prov_scheme_softap_set_httpd_handle (void *handle)

Provide HTTPD server handle externally.

Useful in cases wherein applications need the webserver for some different operations, and do not want the wifi provisioning component to start/stop a new instance.

**Note:** This API should be called before wifi_prov_mgr_start_provisioning()

**Parameters**

handle – [in] Handle to HTTPD server instance

Header File

- components/wifi_provisioning/include/wifi_provisioning/scheme_console.h
- This header file can be included with:

```c
#include "wifi_provisioning/scheme_console.h"
```

- This header file is a part of the API provided by the wifi_provisioning component. To declare that your component depends on wifi_provisioning, add the following to your CMakeLists.txt:

```cmake
REQUIRES wifi_provisioning
```

or

```cmake
PRIV_REQUIRES wifi_provisioning
```

**Functions**

`esp_err_t wifi_prov_config_data_handler (uint32_t session_id, const uint8_t* inbuf, ssize_t inlen, uint8_t** outbuf, ssize_t* outlen, void* priv_data)`

Handler for receiving and responding to requests from master.

This is to be registered as the wifi_config endpoint handler (protocomm proto-comm_req_handler_t) using protocomm_add_endpoint()

**Structures**

```c
struct wifi_prov_sta_conn_info_t
```

WiFi STA connected status information.
Chapter 2. API Reference

**Public Members**

```c
char ip_addr[IP4ADDR_STRLEN_MAX]
    IP Address received by station

char bssid[6]
    BSSID of the AP to which connection was established

char ssid[33]
    SSID of the to which connection was established

uint8_t channel
    Channel of the AP

uint8_t auth_mode
    Authorization mode of the AP
```

**struct wifi_prov_config_get_data_t**

WiFi status data to be sent in response to `get_status` request from master.

**Public Members**

```c
wifi_prov_sta_state_t wifi_state
    WiFi state of the station

wifi_prov_sta_fail_reason_t fail_reason
    Reason for disconnection (valid only when `wifi_state` is WIFI_STATION_DISCONNECTED)

wifi_prov_sta_conn_info_t conn_info
    Connection information (valid only when `wifi_state` is WIFI_STATION_CONNECTED)
```

**struct wifi_prov_config_set_data_t**

WiFi config data received by slave during `set_config` request from master.

**Public Members**

```c
char ssid[33]
    SSID of the AP to which the slave is to be connected

char password[64]
    Password of the AP

char bssid[6]
    BSSID of the AP

uint8_t channel
    Channel of the AP
```
struct wifi_prov_config_handlers

Internal handlers for receiving and responding to protocomm requests from master.

This is to be passed as priv_data for protocomm request handler (refer to wifi_prov_config_data_handler()) when calling protocomm_add_endpoint().

Public Members

esp_err_t (*get_status_handler)(wifi_prov_config_get_data_t *resp_data, wifi_prov_ctx_t **ctx)

Handler function called when connection status of the slave (in WiFi station mode) is requested

esp_err_t (*set_config_handler)(const wifi_prov_config_set_data_t *req_data, wifi_prov_ctx_t **ctx)

Handler function called when WiFi connection configuration (eg. AP SSID, password, etc.) of the slave (in WiFi station mode) is to be set to user provided values

esp_err_t (*apply_config_handler)(wifi_prov_ctx_t **ctx)

Handler function for applying the configuration that was set in set_config_handler. After applying the station may get connected to the AP or may fail to connect. The slave must be ready to convey the updated connection status information when get_status_handler is invoked again by the master.

wifi_prov_ctx_t *ctx

Context pointer to be passed to above handler functions upon invocation

Type Definitions

typedef struct wifi_prov_ctx wifi_prov_ctx_t

Type of context data passed to each get/set/apply handler function set in wifi_prov_config_handlers structure.

This is passed as an opaque pointer, thereby allowing it to be defined later in application code as per requirements.

typedef struct wifi_prov_config_handlers wifi_prov_config_handlers_t

Internal handlers for receiving and responding to protocomm requests from master.

This is to be passed as priv.data for protocomm request handler (refer to wifi_prov_config_data_handler()) when calling protocomm_add_endpoint().

Enumerations

enum wifi_prov_sta_state_t

WiFi STA status for conveying back to the provisioning master.

Values:

enumerator WIFI_PROV_STA_CONNECTING

enumerator WIFI_PROV_STA_CONNECTED

enumerator WIFI_PROV_STA_DISCONNECTED
num wifi_prov_sta_fail_reason_t
  WiFi STA connection fail reason.
  Values:

  enumerator WIFI_PROV_STA_AUTH_ERROR

  enumerator WIFI_PROV_STA_AP_NOT_FOUND

Code examples for above API are provided in the provisioning directory of ESP-IDF examples.
Code example for above API is provided in wifi/smart_config.
Code example for above API is provided in wifi/wifi_easy_connect/dpp-enrollee.

2.9 Storage API

This section contains reference of the high-level storage APIs. They are based on low-level drivers such as SPI flash, SD/MMC.

- Partitions API allow block based access to SPI flash according to the Partition Tables.
- Non-Volatile Storage library (NVS) implements a fault-tolerant wear-levelled key-value storage in SPI NOR flash.
- Virtual File System (VFS) library provides an interface for registration of file system drivers. SPIFFS, FAT and various other file system libraries are based on the VFS.
- SPIFFS is a wear-levelled file system optimized for SPI NOR flash, well suited for small partition sizes and low throughput
- FAT is a standard file system which can be used in SPI flash or on SD/MMC cards
- Wear Levelling library implements a flash translation layer (FTL) suitable for SPI NOR flash. It is used as a container for FAT partitions in flash.

Note: It is suggested to use high-level APIs (esp_partition or file system) instead of low-level driver APIs to access the SPI NOR flash.

Due to the restriction of NOR flash and ESP hardware, accessing the main flash will affect the performance of the whole system. See SPI Flash API to learn more about the limitations.

2.9.1 FAT Filesystem Support

ESP-IDF uses the FatFs library to work with FAT filesystems. FatFs resides in the fatfs component. Although the library can be used directly, many of its features can be accessed via VFS using the C standard library and POSIX API functions.

Additionally, FatFs has been modified to support the runtime pluggable disk I/O layer. This allows mapping of FatFs drives to physical disks at runtime.

Using FatFs with VFS

The header file fatfs/vfs/esp_vfs_fat.h defines the functions for connecting FatFs and VFS.

The function esp_vfs_fat_register() allocates a FATFS structure and registers a given path prefix in VFS. Subsequent operations on files starting with this prefix are forwarded to FatFs APIs.
The function `esp_vfs_fat_unregister_path()` deletes the registration with VFS, and frees the FATFS structure.

Most applications use the following workflow when working with `esp_vfs_fat_` functions:

1. **Call `esp_vfs_fat_register()` to specify:**
   - Path prefix where to mount the filesystem (e.g., "/sdcard", "/spiflash")
   - FatFs drive number
   - A variable which receives the pointer to the FATFS structure
2. Call `ff_diskio_register()` to register the disk I/O driver for the drive number used in Step 1.
3. Call the FatFs function `f_mount()`, and optionally `f_fdisk()`, `f_mkfs()`, to mount the filesystem using the same drive number which was passed to `esp_vfs_fat_register()`. For more information, see FatFs documentation.
4. Call the C standard library and POSIX API functions to perform such actions on files as open, read, write, erase, copy, etc. Use paths starting with the path prefix passed to `esp_vfs_fat_register()` (for example, "/sdcard/hello.txt"). The filesystem uses 8.3 filenames format (SFN) by default. If you need to use long filenames (LFN), enable the `CONFIG_FATFS_LONG_FILENAMES` option. More details on the FatFs filenames are available [here](#).
5. Optionally, by enabling the option `CONFIG_FATFS_USE_FASTSEEK`, you can use the POSIX lseek function to perform it faster. The fast seek does not work for files in write mode, so to take advantage of fast seek, you should open (or close and then reopen) the file in read-only mode.
6. Optionally, by enabling the option `CONFIG_FATFS_IMMEDIATE_FSYNC`, you can enable automatic calling of `f_sync()` to flush recent file changes after each call of `vfs_fat_write()`, `vfs_fat_link()`, `vfs_fat_truncate()` and `vfs_fat_ftruncate()` functions. This feature improves file-consistency and size reporting accuracy for the FatFs, at a price on decreased performance due to frequent disk operations.
7. Optionally, call the FatFs library functions directly. In this case, use paths without a VFS prefix, for example, "/hello.txt".
8. Close all open files.
9. Call the FatFs function `f_mount()` for the same drive number with NULL FATFS* argument to unmount the filesystem.
10. Call the FatFs function `ff_diskio_register()` with NULL `ff_diskio_impl_t*` argument and the same drive number to unregister the disk I/O driver.
11. Call `esp_vfs_fat_unregister_path()` with the path where the file system is mounted to remove FatFs from VFS, and free the FATFS structure allocated in Step 1.

The convenience functions `esp_vfs_fat_sdmmc_mount()`, `esp_vfs_fat_sdspi_mount()`, and `esp_vfs_fat_sdcardUnmount()` wrap the steps described above and also handle SD card initialization. These functions are described in the next section.

### Using FatFs with VFS and SD Cards

The header file `fatfs/vfs/esp_vfs_fat.h` defines convenience functions `esp_vfs_fat_sdmmc_mount()`, `esp_vfs_fat_sdspi_mount()`, and `esp_vfs_fat_sdcardUnmount()`. These functions perform Steps 1–3 and 7–9 respectively and handle SD card initialization, but provide only limited error handling. Developers are encouraged to check its source code and incorporate more advanced features into production applications.

The convenience function `esp_vfs_fat_sdmmcUnmount()` unmounts the filesystem and releases the resources acquired by `esp_vfs_fat_sdmmc_mount()`.

### Using FatFs with VFS in Read-Only Mode

The header file `fatfs/vfs/esp_vfs_fat.h` also defines the convenience functions `esp_vfs_fat_spiflash_mount_ro()` and `esp_vfs_fat_spiflashUnmount_ro()`. These functions perform Steps 1-3 and 7-9 respectively for read-only FAT partitions. These are particularly helpful for data partitions written only once during factory provisioning, which will not be changed by production application throughout the lifetime of the hardware.
FatFS Disk IO Layer

FatFs has been extended with API functions that register the disk I/O driver at runtime.

These APIs provide implementation of disk I/O functions for SD/MMC cards and can be registered for the given FatFs drive number using the function `ff_diskio_register_sdmmc()`.

```c
void ff_diskio_register_SD/MMC (BYTE pdrv, const ff_diskio_impl_t *discio_impl)
```

Register or unregister disk io driver for given drive number.
When FATFS library calls one of disk_xxx functions for driver number pdrv, corresponding function in discio_impl for given pdrv will be called.

**Parameters**
- `pdrv` - drive number
- `discio_impl` - pointer to `ff_diskio_impl_t` structure with diskio functions or NULL to unregister and free previously registered drive

```c
struct ff_diskio_impl_t
```

Structure of pointers to disk IO driver functions.
See FatFs documentation for details about these functions

**Public Members**

```c
DSTATUS (*init)(unsigned char pdrv)
```

Disk initialization function

```c
DSTATUS (*status)(unsigned char pdrv)
```

Disk status check function

```c
DRESULT (*read)(unsigned char pdrv, unsigned char *buff, uint32_t sector, unsigned count)
```

Sector read function

```c
DRESULT (*write)(unsigned char pdrv, const unsigned char *buff, uint32_t sector, unsigned count)
```

Sector write function

```c
DRESULT (*ioctl)(unsigned char pdrv, unsigned char cmd, void *buff)
```

Function to get info about disk and do some misc operations

```c
void ff_diskio_register_sdmmc (unsigned char pdrv, sdmmc_card_t *card)
```

Register SD/MMC diskio driver

**Parameters**
- `pdrv` - drive number
- `card` - pointer to `sdmmc_card_t` structure describing a card; card should be initialized before calling f_mount.

```c
esp_err_t ff_diskio_register wl_partition (unsigned char pdrv, wl_handle_t flash_handle)
```

Register spi flash partition

**Parameters**
- `pdrv` - drive number
- `flash_handle` - handle of the wear levelling partition.
Chapter 2. API Reference

`esp_err_t ff_diskio_register_raw_partition(unsigned char pdrv, const esp_partition_t *part_handle)`

Register spi flash partition

**Parameters**
- `pdrv` - drive number
- `part_handle` - pointer to raw flash partition.

**FatFs Partition Generator**

We provide a partition generator for FatFs (`wl_fatfsgen.py`) which is integrated into the build system and could be easily used in the user project.

The tool is used to create filesystem images on a host and populate it with content of the specified host folder.

The script is based on the partition generator (`fatfsgen.py`). Apart from generating partition, it can also initialize wear levelling.

The latest version supports both short and long file names, FAT12 and FAT16. The long file names are limited to 255 characters and can contain multiple periods (.) characters within the filename and additional characters +, , ; , =, [ and ].

An in-depth description of the FatFs partition generator and analyzer can be found at Generating and parsing FAT partition on host.

**Build System Integration with FatFs Partition Generator**

It is possible to invoke FatFs generator directly from the CMake build system by calling `fatfs_create_spiflash_image`:

```
fatfs_create_spiflash_image(<partition> <base_dir> [FLASH_IN_PROJECT])
```

If you prefer generating partition without wear levelling support, you can use `fatfs_create_rawflash_image`:

```
fatfs_create_rawflash_image(<partition> <base_dir> [FLASH_IN_PROJECT])
```

`fatfs_create_spiflash_image` respectively `fatfs_create_rawflash_image` must be called from project’s CMakeLists.txt.

If you decide for any reason to use `fatfs_create_rawflash_image` (without wear levelling support), beware that it supports mounting only in read-only mode in the device.

The arguments of the function are as follows:

1. `partition` - the name of the partition as defined in the partition table (e.g., `storage/fatfsgen/partitions_example.csv`).
2. `base_dir` - the directory that will be encoded to FatFs partition and optionally flashed into the device. Beware that you have to specify the suitable size of the partition in the partition table.
3. `flag FLASH_IN_PROJECT` - optionally, users can have the image automatically flashed together with the app binaries, partition tables, etc. on `idf.py flash -p <PORT>` by specifying `FLASH_IN_PROJECT`.
4. `flag PRESERVE_TIME` - optionally, users can force preserving the timestamps from the source folder to the target image. Without preserving the time, every timestamp will be set to the FATFS default initial time (1st January 1980).

For example:

```
fatfs_create_spiflash_image(my_fatfs_partition my_folder FLASH_IN_PROJECT)
```

If `FLASH_IN_PROJECT` is not specified, the image will still be generated, but you will have to flash it manually using `esptool.py` or a custom build system target.

For an example, see `storage/fatfsgen`.
Chapter 2. API Reference

FatFs Partition Analyzer

(fatfsparse.py) is a partition analyzing tool for FatFs.

It is a reverse tool of (fatfsgen.py), i.e., it can generate the folder structure on the host based on the FatFs image.

Usage:

```
./fatfsparse.py [-h] [-wl-layer {detect,enabled,disabled}] fatfs_image.img
```

High-level API Reference

Header File

- components/fatfs/vfs/esp_vfs_fat.h
- This header file can be included with:

  ```
  #include "esp_vfs_fat.h"
  ```

- This header file is a part of the API provided by the fatfs component. To declare that your component depends on fatfs, add the following to your CMakeLists.txt:

  ```
  REQUIREES fatfs
  ```

  or

  ```
  PRIV_REQUIRES fatfs
  ```

Functions

**esp_err_t esp_vfs_fat_register** (const char*base_path, const char*fat_drive, size_t max_files, FATFS **out_fs)

Register FATFS with VFS component.

This function registers given FAT drive in VFS, at the specified base path. If only one drive is used, fat_drive argument can be an empty string. Refer to FATFS library documentation on how to specify FAT drive. This function also allocates FATFS structure which should be used for f_mount call.

**Note:** This function doesn’t mount the drive into FATFS, it just connects POSIX and C standard library IO function with FATFS. You need to mount desired drive into FATFS separately.

Parameters

- **base_path** – path prefix where FATFS should be registered
- **fat_drive** – FATFS drive specification; if only one drive is used, can be an empty string
- **max_files** – maximum number of files which can be open at the same time
- **out_fs** – [out] pointer to FATFS structure which can be used for FATFS f_mount call is returned via this argument.

Returns

- ESP_OK on success
- ESP_ERR_INVALID_STATE if esp_vfs_fat_register was already called
- ESP_ERR_NO_MEM if not enough memory or too many VFSes already registered

**esp_err_t esp_vfs_fat_unregister_path** (const char *base_path)

Un-register FATFS from VFS.

**Note:** FATFS structure returned by esp_vfs_fat_register is destroyed after this call. Make sure to call f_mount function to unmount it before calling esp_vfs_fat_unregister_ctx. Difference between this function and the one above is that this one will release the correct drive, while the one above will release the last registered one.
**Parameters** **base_path**—path prefix where FATFS is registered. This is the same used when esp_vfs_fat_register was called

**Returns**
- ESP_OK on success
- ESP_ERR_INVALID_STATE if FATFS is not registered in VFS

```c
esp_err_t esp_vfs_fat_sdmmc_mount(const char* base_path, const sdmmc_host_t* host_config, const void* slot_config, const esp_vfs_fat_mount_config_t* mount_config, sdmmc_card_t** out_card)
```

Convenience function to get FAT filesystem on SD card registered in VFS.

This is an all-in-one function which does the following:
- initializes SDMMC driver or SPI driver with configuration in host_config
- initializes SD card with configuration in slot_config
- mounts FAT partition on SD card using FATFS library, with configuration in mount_config
- registers FATFS library with VFS, with prefix given by base_prefix variable

This function is intended to make example code more compact. For real world applications, developers should implement the logic of probing SD card, locating and mounting partition, and registering FATFS in VFS, with proper error checking and handling of exceptional conditions.

**Note:** Use this API to mount a card through SDSPI is deprecated. Please call esp_vfs_fat_sdspi_mount() instead for that case.

**Parameters**
- **base_path**—path where partition should be registered (e.g. “/sdcard”)
- **host_config**—Pointer to structure describing SDMMC host. When using SD-MMC peripheral, this structure can be initialized using SDMMC_HOST_DEFAULT() macro. When using SPI peripheral, this structure can be initialized using SD-SPI_HOST_DEFAULT() macro.
- **slot_config**—Pointer to structure with slot configuration. For SDMMC peripheral, pass a pointer to sdmmc_slot_config_t structure initialized using SDMMC_SLOT_CONFIG_DEFAULT.
- **mount_config**—pointer to structure with extra parameters for mounting FATFS
- **out_card**—[out] if not NULL, pointer to the card information structure will be returned via this argument

**Returns**
- ESP_OK on success
- ESP_ERR_INVALID_STATE if esp_vfs_fat_sdmmc_mount was already called
- ESP_ERR_NO_MEM if memory cannot be allocated
- ESP_FAIL if partition can be not mounted
- other error codes from SDMMC or SPI drivers, SDMMC protocol, or FATFS drivers

```c
esp_err_t esp_vfs_fat_sdspi_mount(const char* base_path, const sdmmc_host_t* host_config_input, const sdspi_device_config_t* slot_config, const esp_vfs_fat_mount_config_t* mount_config, sdmmc_card_t** out_card)
```

Convenience function to get FAT filesystem on SD card registered in VFS.

This is an all-in-one function which does the following:
- initializes an SPI Master device based on the SPI Master driver with configuration in slot_config, and attach it to an initialized SPI bus.
- initializes SD card with configuration in host_config_input
- mounts FAT partition on SD card using FATFS library, with configuration in mount_config
- registers FATFS library with VFS, with prefix given by base_prefix variable
This function is intended to make example code more compact. For real world applications, developers should implement the logic of probing SD card, locating and mounting partition, and registering FATFS in VFS, with proper error checking and handling of exceptional conditions.

**Note:** This function try to attach the new SD SPI device to the bus specified in host_config. Make sure the SPI bus specified in host_config->slot have been initialized by `spi_bus_initialize()` before.

### Parameters
- `base_path` — path where partition should be registered (e.g. “/sdcard”)
- `host_config_input` — Pointer to structure describing SDMMC host. This structure can be initialized using `SDSPI_HOST_DEFAULT()` macro.
- `slot_config` — Pointer to structure with slot configuration. For SPI peripheral, pass a pointer to `sdspi_device_config_t` structure initialized using `SDSPI_DEVICE_CONFIG_DEFAULT()`.
- `mount_config` — pointer to structure with extra parameters for mounting FATFS
- `out_card` — [out] If not NULL, pointer to the card information structure will be returned via this argument. It is suggested to hold this handle and use it to unmount the card later if needed. Otherwise it’s not suggested to use more than one card at the same time and unmount one of them in your application.

### Returns
- ESP_OK on success
- ESP_ERR_INVALID_STATE if `esp_vfs_fat_sdmmc_mount` was already called
- ESP_ERR_NO_MEM if memory cannot be allocated
- ESP_FAIL if partition cannot be mounted
- other error codes from SDMMC or SPI drivers, SDMMC protocol, or FATFS drivers

```c
esp_err_t esp_vfs_fat_sdmmc_unmount (void)
```

Unmount FAT filesystem and release resources acquired using `esp_vfs_fat_sdmmc_mount`.

**Deprecated:** Use `esp_vfs_fat_sdcard_unmount()` instead.

### Returns
- ESP_OK on success
- ESP_ERR_INVALID_STATE if `esp_vfs_fat_sdmmc_mount` hasn’t been called

```c
esp_err_t esp_vfs_fat_sdcard_unmount (const char *base_path, sdmmc_card_t *card)
```

Unmount an SD card from the FAT filesystem and release resources acquired using `esp_vfs_fat_sdmmc_mount()` or `esp_vfs_fat_sdspi_mount()`.

### Returns
- ESP_OK on success
- ESP_ERR_INVALID_ARG if the card argument is unregistered
- ESP_ERR_INVALID_STATE if `esp_vfs_fat_sdmmc_mount` hasn’t been called

```c
esp_err_t esp_vfs_fat_sdcard_format (const char *base_path, sdmmc_card_t *card)
```

Format FAT filesystem.

**Note:** This API should be only called when the FAT is already mounted.

### Parameters
- `base_path` — Path where partition should be registered (e.g. “/sdcard”)
- `card` — Pointer to the card handle, which should be initialised by calling `esp_vfs_fat_sdspi_mount` first
Returns

- ESP_OK
- ESP_ERR_INVALID_STATE: FAT partition isn’t mounted, call esp_vfsFatSdmmcMount or esp_vfsFatSdSpiMount first
- ESP_ERR_NO_MEM: if memory can not be allocated
- ESP_FAIL: fail to format it, or fail to mount back

```
esp_err_t esp_vfsFatSpiFlashMount_RW_WL(const char* base_path, const char* partition_label, const esp_vfsFatMountConfig_t *mount_config, wl_handle_t *wl_handle)
```

Convenience function to initialize FAT filesystem in SPI flash and register it in VFS.

This is an all-in-one function which does the following:

- finds the partition with defined partition_label. Partition label should be configured in the partition table.
- initializes flash wear levelling library on top of the given partition
- mounts FAT partition using FATFS library on top of flash wear levelling library
- registers FATFS library with VFS, with prefix given by base_prefix variable

This function is intended to make example code more compact.

**Parameters**

- **base_path** – path where FATFS partition should be mounted (e.g. “/spiflash”)
- **partition_label** – label of the partition which should be used
- **mount_config** – pointer to structure with extra parameters for mounting FATFS
- **wl_handle** – [out] wear levelling driver handle

**Returns**

- ESP_OK on success
- ESP_ERR_NOT_FOUND if the partition table does not contain FATFS partition with given label
- ESP_ERR_INVALID_STATE if esp_vfsFatSpiFlashMount_RW_WL was already called
- ESP_ERR_NO_MEM if memory can not be allocated
- ESP_FAIL if partition can not be mounted
- other error codes from wear levelling library, SPI flash driver, or FATFS drivers

```
esp_err_t esp_vfsFatSpiFlashUnmount_RW_WL(const char* base_path, wl_handle_t wl_handle)
```

Unmount FAT filesystem and release resources acquired using esp_vfsFatSpiFlashMount_RW_WL.

**Parameters**

- **base_path** – path where partition should be registered (e.g. “/spiflash”)
- **wl_handle** – wear levelling driver handle returned by esp_vfsFatSpiFlashMount_RW_WL

**Returns**

- ESP_OK on success
- ESP_ERR_INVALID_STATE if esp_vfsFatSpiFlashMount_RW_WL hasn’t been called

```
esp_err_t esp_vfsFatSpiFlashFormat_RW_WL(const char* base_path, const char* partition_label)
```

Format FAT filesystem.

**Note:** This API can be called when the FAT is mounted / not mounted. If this API is called when the FAT isn’t mounted (by calling esp_vfsFatSpiFlashMount_RW_WL), this API will first mount the FAT then format it, then restore back to the original state.

**Parameters**

- **base_path** – Path where partition should be registered (e.g. “/spiflash”)
- **partition_label** – Label of the partition which should be used

**Returns**

- ESP_OK
• ESP_ERR_NO_MEM: if memory can not be allocated
• Other errors from esp_vfsFat_spiflash_mount_rw_wl

`esp_err_t esp_vfsFat_spiflash_mount_ro(const char *base_path, const char *partition_label, const esp_vfsFat_mount_config_t *mount_config)`

Convenience function to initialize read-only FAT filesystem and register it in VFS.

This is an all-in-one function which does the following:

• finds the partition with defined partition_label. Partition label should be configured in the partition table.
• mounts FAT partition using FATFS library
• registers FATFS library with VFS, with prefix given by base_prefix variable

**Note:** Wear levelling is not used when FAT is mounted in read-only mode using this function.

### Parameters

- **base_path** — path where FATFS partition should be mounted (e.g. “/spiflash”)
- **partition_label** — label of the partition which should be used
- **mount_config** — pointer to structure with extra parameters for mounting FATFS

### Returns

- ESP_OK on success
- ESP_ERR_NOT_FOUND if the partition table does not contain FATFS partition with given label
- ESP_ERR_INVALID_STATE if esp_vfsFat_spiflash_mount_ro was already called for the same partition
- ESP_ERR_NO_MEM if memory can not be allocated
- ESP_FAIL if partition can not be mounted
- other error codes from SPI flash driver, or FATFS drivers

`esp_err_t esp_vfsFat_spiflash_unmount_ro(const char *base_path, const char *partition_label)`

Unmount FAT filesystem and release resources acquired using esp_vfsFat_spiflash_mount_ro.

### Parameters

- **base_path** — path where partition should be registered (e.g. “/spiflash”)
- **partition_label** — label of partition to be unmounted

### Returns

- ESP_OK on success
- ESP_ERR_INVALID_STATE if esp_vfsFat_spiflash_mount_ro hasn’t been called

`esp_err_t esp_vfsFat_info(const char *base_path, uint64_t *out_total_bytes, uint64_t *out_free_bytes)`

Get information for FATFS partition.

### Parameters

- **base_path** — Base path of the partition examined (e.g. “/spiflash”)
- **out_total_bytes** — [out] Size of the file system
- **out_free_bytes** — [out] Free bytes available in the file system

### Returns

- ESP_OK on success
- ESP_ERR_INVALID_STATE if partition not found
- ESP_FAIL if another FRESULT error (saved in errno)

### Structures

**struct esp_vfsFat_mount_config_t**

Configuration arguments for esp_vfsFat_sdmmc_mount and esp_vfsFat_spiflash_mount_rw_wl functions.
Chapter 2. API Reference

Public Members

**bool format_if_mount_failed**

If FAT partition can not be mounted, and this parameter is true, create partition table and format the
filesystem.

**int max_files**

Max number of open files.

**size_t allocation_unit_size**

If format_if_mount_failed is set, and mount fails, format the card with given allocation unit size. Must
be a power of 2, between sector size and 128 * sector size. For SD cards, sector size is always 512 bytes.
For wear levelling, sector size is determined by CONFIG_WL_SECTOR_SIZE option.

Using larger allocation unit size will result in higher read/write performance and higher overhead when
storing small files.

Setting this field to 0 will result in allocation unit set to the sector size.

**bool disk_status_check_enable**

Enables real ff_disk_status function implementation for SD cards (ff_sdmmc_status). Possibly slows
down IO performance.

Try to enable if you need to handle situations when SD cards are not unmounted properly before physical
removal or you are experiencing issues with SD cards.

Doesn’t do anything for other memory storage media.

Type Definitions

typedef esp_vfs_fat_mount_config_t esp_vfs_fat_sdmmc_mount_config_t

2.9.2 Manufacturing Utility

Introduction

This utility is designed to create instances of factory NVS partition images on a per-device basis for mass manufac-
turing purposes. The NVS partition images are created from CSV files containing user-provided configurations and
values.

Please note that this utility only creates manufacturing binary images which then need to be flashed onto your devices using:

- esptool.py
- Flash Download tool (available on Windows only)
  - Download and unzip it, and follow the instructions inside the doc folder.
- Direct flash programming using custom production tools.

Prerequisites

This utility is dependent on ESP-IDF’s NVS Partition Generator Utility.

- Operating System requirements:
  - Linux / MacOS / Windows (standard distributions)
• The following packages are needed to use this utility:
  – Python

Note:

Before using this utility, please make sure that:

• The path to Python is added to the PATH environment variable.
• You have installed the packages from `requirement.txt`, the file in the root of the ESP-IDF directory.

Workflow

CSV Configuration File

This file contains the configuration of the device to be flashed.

The data in the configuration file has the following format (the `REPEAT` tag is optional):

```
name1,namespace, << First entry should be of type "namespace"
key1,type1,encoding1
key2,type2,encoding2,REPEAT
name2,namespace,
key3,type3,encoding3
key4,type4,encoding4
```

Note: The first line in this file should always be the `namespace` entry.

Each line should have three parameters: `key`, `type`, `encoding`, separated by a comma. If the `REPEAT` tag is present, the value corresponding to this key in the master value CSV file will be the same for all devices.

Please refer to README of the NVS Partition Generator Utility for detailed description of each parameter.

Below is a sample example of such a configuration file:

```
app,namespace,
firmware_key,data,hex2bin
serial_no,data,string,REPEAT
device_no,data,i32
```

Note:

Make sure there are no spaces:

• before and after ‘,’
• at the end of each line in a CSV file
Master Value CSV File

This file contains details of the devices to be flashed. Each line in this file corresponds to a device instance.

The data in the master value CSV file has the following format:

```
key1,key2,key3,.....
value1,value2,value3,.....
```

**Note:** The first line in the file should always contain the key names. All the keys from the configuration file should be present here in the same order. This file can have additional columns (keys). The additional keys will be treated as metadata and would not be part of the final binary files.

Each line should contain the value of the corresponding keys, separated by a comma. If the key has the REPEAT tag, its corresponding value must be entered in the second line only. Keep the entry empty for this value in the following lines.

The description of this parameter is as follows:

**value** Data value

Data value is the value of data corresponding to the key.

Below is a sample example of a master value CSV file:

```
id,firmware_key,serial_no,device_no
1,1a2b3c4d5e6faabb,A1,101
2,1a2b3c4d5e6fcddd,,102
3,1a2b3c4d5e6feeff,,103
```

**Note:** If the ‘REPEAT’ tag is present, a new master value CSV file will be created in the same folder as the input Master CSV File with the values inserted at each line for the key with the ‘REPEAT’ tag.

This utility creates intermediate CSV files which are used as input for the NVS partition utility to generate the binary files.

The format of this intermediate CSV file is as follows:

```
key,type,encoding,value
key,namespace, ,
key1,type1,encoding1,value1
key2,type2,encoding2,value2
```

An instance of an intermediate CSV file will be created for each device on an individual basis.

**Running the utility**

**Usage:**

```
python mfg_gen.py [-h] {generate,generate-key} ...
```

**Optional Arguments:**

<table>
<thead>
<tr>
<th>No.</th>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>-h/--help</td>
<td>Show the help message and exit</td>
</tr>
</tbody>
</table>

**Commands:**
Run `mfg_gen.py {command} -h` for additional help

<table>
<thead>
<tr>
<th>No.</th>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td><code>generate</code></td>
<td>Generate NVS partition</td>
</tr>
<tr>
<td>2</td>
<td><code>generate-key</code></td>
<td>Generate keys for encryption</td>
</tr>
</tbody>
</table>

To generate factory images for each device (Default):

**Usage:**

```
python mfg_gen.py generate [-h] [--fileid FILEID] [--version {1,2}] [--keygen]
|--inputkey INPUTKEY] [--outdir OUTDIR]
|--key_protect_hmac] [--kp_hmac_keygen]
|--kp_hmac_keyfile KP_HMAC_KEYFILE] [--kp_hmac_key

```

**Positional Arguments:**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>conf</td>
<td>Path to configuration csv file to parse</td>
</tr>
<tr>
<td>values</td>
<td>Path to values csv file to parse</td>
</tr>
<tr>
<td>prefix</td>
<td>Unique name for each output filename prefix</td>
</tr>
<tr>
<td>size</td>
<td>Size of NVS partition in bytes (must be multiple of 4096)</td>
</tr>
</tbody>
</table>

**Optional Arguments:**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>-h/--help</code></td>
<td>Show the help message and exit</td>
</tr>
<tr>
<td><code>--fileid FILEID</code></td>
<td>Unique file identifier (any key in values file) for each filename suffix (Default: numeric value(1,2,3…))</td>
</tr>
<tr>
<td><code>--version {1,2}</code></td>
<td>Set multipage blob version. (Default: Version 2)</td>
</tr>
<tr>
<td><code>--keygen</code></td>
<td>Generates key for encrypting NVS partition</td>
</tr>
<tr>
<td><code>--inputkey INPUTKEY</code></td>
<td>File having key for encrypting NVS partition</td>
</tr>
<tr>
<td><code>--outdir OUTDIR</code></td>
<td>Output directory to store files created (Default: current directory)</td>
</tr>
<tr>
<td><code>--key_protect_hmac</code></td>
<td>If set, the NVS encryption key protection scheme based on HMAC peripheral is used; else the default scheme based on Flash Encryption is used</td>
</tr>
<tr>
<td><code>--kp_hmac_keygen</code></td>
<td>Generate the HMAC key for HMAC-based encryption scheme</td>
</tr>
<tr>
<td><code>--kp_hmac_keyfile KP_HMAC_KEYFILE</code></td>
<td>Path to output HMAC key file</td>
</tr>
<tr>
<td><code>--kp_hmac_keyfile KP_HMAC_INPUTKEY</code></td>
<td>File having the HMAC key for generating the NVS encryption keys</td>
</tr>
</tbody>
</table>

You can run the utility to generate factory images for each device using the command below. A sample CSV file is provided with the utility:

```
python mfg_gen.py generate samples/sample_config.csv samples/sample_values_singlepage_blob.csv Sample 0x3000
```

The master value CSV file should have the path in the file type relative to the directory from which you are running the utility.

To generate encrypted factory images for each device:
You can run the utility to encrypt factory images for each device using the command below. A sample CSV file is provided with the utility:

- Encrypt by allowing the utility to generate encryption keys:

```python
python mfg_gen.py generate samples/sample_config.csv samples/sample_values_ -->singlepage_blob.csv Sample 0x3000 -->keygen
```

**Note:** Encryption key of the following format `<outdir>/keys/keys--<prefix>--<fileid>.bin` is created. This newly created file having encryption keys in `keys/` directory is compatible with NVS key-partition structure. Refer to **NVS Key Partition** for more details.

- To generate an encrypted image using the HMAC-based scheme, the above command can be used along with some additional parameters.
  - Encrypt by allowing the utility to generate encryption keys and the HMAC-key:

```python
python mfg_gen.py generate samples/sample_config.csv samples/ -->sample_values_singlepage_blob.csv Sample 0x3000 -->keygen --key_ -->protect_hmac --kp_hmac_keygen
```

**Note:** Encryption key of the format `<outdir>/keys/keys--<timestamp>.bin` and HMAC key of the format `<outdir>/keys/hmac-keys--<timestamp>.bin` are created.

- Encrypt by allowing the utility to generate encryption keys with user-provided HMAC-key:

```python
python mfg_gen.py generate samples/sample_config.csv samples/ -->singlepage_blob.csv Sample 0x3000 -->keygen --key_protect_hmac --kp_hmac_ -->inputkey testdata/sample_hmac_key.bin
```

**Note:** You can provide the custom filename for the HMAC key as well as the encryption key as a parameter.

- Encrypt by providing the encryption keys as input binary file:

```python
python mfg_gen.py generate samples/sample_config.csv samples/sample_values_ -->singlepage_blob.csv Sample 0x3000 -->inputkey keys/sample_keys.bin
```

**To generate only encryption keys:**

**Usage:** `python mfg_gen.py generate-key [-h] [-keyfile KEYFILE] [-outdir OUTDIR]`

**Optional Arguments:**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>-h/--help</code></td>
<td>Show the help message and exit</td>
</tr>
<tr>
<td><code>--keyfile KEYFILE</code></td>
<td>Path to output encryption keys file</td>
</tr>
<tr>
<td><code>--outdir OUTDIR</code></td>
<td>Output directory to store files created. (Default: current directory)</td>
</tr>
<tr>
<td><code>--key_protect_hmac</code></td>
<td>If set, the NVS encryption key protection scheme based on HMAC peripheral is used; else the default scheme based on Flash Encryption is used</td>
</tr>
<tr>
<td><code>--kp_hmac_keygen</code></td>
<td>Generate the HMAC key for HMAC-based encryption scheme</td>
</tr>
<tr>
<td><code>--kp_hmac_keyfile</code></td>
<td>Path to output HMAC key file</td>
</tr>
<tr>
<td><code>--kp_hmac_inputkey</code></td>
<td>File having the HMAC key for generating the NVS encryption keys</td>
</tr>
<tr>
<td><code>KP_HMAC_INPUTKEY</code></td>
<td></td>
</tr>
</tbody>
</table>

You can run the utility to generate only encryption keys using the command below:

```python
python mfg_gen.py generate-key
```
Chapter 2. API Reference

Note: Encryption key of the following format `<outdir>/keys/keys-<timestamp>.bin` is created. Timestamp format is: `%m-%d_%H-%M`. To provide custom target filename use the `--keyfile` argument.

For generating encryption key for the HMAC-based scheme, the following commands can be used:

- Generate the HMAC key and the NVS encryption keys:
  ```bash
  python mfg_gen.py generate-key --key_protect_hmac --kp_hmac_keygen
  ```

Note: Encryption key of the format `<outdir>/keys/keys-<timestamp>.bin` and HMAC key of the format `<outdir>/keys/hmac-keys-<timestamp>.bin` are created.

- Generate the NVS encryption keys, given the HMAC-key:
  ```bash
  python mfg_gen.py generate-key --key_protect_hmac --kp_hmac_inputkey testdata/sample_hmac_key.bin
  ```

Note: You can provide the custom filename for the HMAC key as well as the encryption key as a parameter.

Generated encryption key binary file can further be used to encrypt factory images created on the per device basis. The default numeric value: 1,2,3... of the `fileid` argument corresponds to each line bearing device instance values in the master value CSV file.

While running the manufacturing utility, the following folders will be created in the specified `outdir` directory:

- `bin/` for storing the generated binary files
- `csv/` for storing the generated intermediate CSV files
- `keys/` for storing encryption keys (when generating encrypted factory images)

2.9.3 Non-Volatile Storage Library

Introduction

Non-volatile storage (NVS) library is designed to store key-value pairs in flash. This section introduces some concepts used by NVS.

Underlying Storage  Currently, NVS uses a portion of main flash memory through the `esp_partition` API. The library uses all the partitions with `data` type and `nvs` subtype. The application can choose to use the partition with the label `nvs` through the `nvs_open()` API function or any other partition by specifying its name using the `nvs_open_from_partition()` API function.

Future versions of this library may have other storage backends to keep data in another flash chip (SPI or I2C), RTC, FRAM, etc.

Note: if an NVS partition is truncated (for example, when the partition table layout is changed), its contents should be erased. ESP-IDF build system provides a `idf.py erase-flash` target to erase all contents of the flash chip.
Chapter 2. API Reference

Note: NVS works best for storing many small values, rather than a few large values of the type ‘string’ and ‘blob’. If you need to store large blobs or strings, consider using the facilities provided by the FAT filesystem on top of the wear levelling library.

Keys and Values  NVS operates on key-value pairs. Keys are ASCII strings; the maximum key length is currently 15 characters. Values can have one of the following types:

- integer types: uint8_t, int8_t, uint16_t, int16_t, uint32_t, int32_t, uint64_t, int64_t
- zero-terminated string
- variable length binary data (blob)

Note: String values are currently limited to 4000 bytes. This includes the null terminator. Blob values are limited to 508,000 bytes or 97.6% of the partition size - 4000 bytes, whichever is lower.

Additional types, such as float and double might be added later.

Keys are required to be unique. Assigning a new value to an existing key replaces the old value and data type specified by a write operation.

A data type check is performed when reading a value. An error is returned if the data type expected by read operation does not match the data type of entry found for the key provided.

Namespaces  To mitigate potential conflicts in key names between different components, NVS assigns each key-value pair to one of namespaces. Namespace names follow the same rules as key names, i.e., the maximum length is 15 characters. Furthermore, there can be no more than 254 different namespaces in one NVS partition. Namespace name is specified in the `nvs_open()` or `nvs_open_from_partition` call. This call returns an opaque handle, which is used in subsequent calls to the `nvs_get_*`, `nvs_set_*`, and `nvs_commit()` functions. This way, a handle is associated with a namespace, and key names will not collide with same names in other namespaces. Please note that the namespaces with the same name in different NVS partitions are considered as separate namespaces.

NVS Iterators  Iterators allow to list key-value pairs stored in NVS, based on specified partition name, namespace, and data type.

There are the following functions available:

- `nvs_entry_find()` creates an opaque handle, which is used in subsequent calls to the `nvs_entry_next()` and `nvs_entry_info()` functions.
- `nvs_entry_next()` advances an iterator to the next key-value pair.
- `nvs_entry_info()` returns information about each key-value pair

In general, all iterators obtained via `nvs_entry_find()` have to be released using `nvs_release_iterator()`, which also tolerates NULL iterators.

`nvs_entry_find()` and `nvs_entry_next()` set the given iterator to NULL or a valid iterator in all cases except a parameter error occured (i.e., return ESP_ERR_NVS_NOT_FOUND). In case of a parameter error, the given iterator will not be modified. Hence, it is best practice to initialize the iterator to NULL before calling `nvs_entry_find()` to avoid complicated error checking before releasing the iterator.

Security, Tampering, and Robustness  NVS is not directly compatible with the ESP32-S3 flash encryption system. However, data can still be stored in encrypted form if NVS encryption is used together with ESP32-S3 flash encryption or with the help of the HMAC peripheral. Please refer to `NVS Encryption` for more details.

If NVS encryption is not used, it is possible for anyone with physical access to the flash chip to alter, erase, or add key-value pairs. With NVS encryption enabled, it is not possible to alter or add a key-value pair and get recognized.
as a valid pair without knowing corresponding NVS encryption keys. However, there is no tamper-resistance against
the erase operation.

The library does try to recover from conditions when flash memory is in an inconsistent state. In particular, one
should be able to power off the device at any point and time and then power it back on. This should not result in loss
of data, except for the new key-value pair if it was being written at the moment of powering off. The library should
also be able to initialize properly with any random data present in flash memory.

**NVS Encryption**

Please refer to the *NVS Encryption* guide for more details.

**NVS Partition Generator Utility**

This utility helps generate NVS partition binary files which can be flashed separately on a dedicated partition via a
flashing utility. Key-value pairs to be flashed onto the partition can be provided via a CSV file. For more details,
please refer to *NVS Partition Generator Utility*.

Instead of calling the `nvs_partition_gen.py` tool manually, the creation of the partition binary files can also
be done directly from CMake using the function `nvs_create_partition_image`:

```python
nvs_create_partition_image(<partition> <csv> [FLASH_IN_PROJECT] [DEPENDS dep dep...
←dep ...])
```

**Positional Arguments:**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>partition</td>
<td>Name of the NVS partition</td>
</tr>
<tr>
<td>csv</td>
<td>Path to CSV file to parse</td>
</tr>
</tbody>
</table>

**Optional Arguments:**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>FLASH_IN_PROJECT</td>
<td>Name of the NVS partition</td>
</tr>
<tr>
<td>DEPENDS</td>
<td>Specify files on which the command depends</td>
</tr>
</tbody>
</table>

If `FLASH_IN_PROJECT` is not specified, the image will still be generated, but you will have to flash it manually
using `idf.py <partition>-flash` (e.g., if your partition name is `nvs`, then use `idf.py nvs-flash`).

`nvs_create_partition_image` must be called from one of the component CMakeLists.txt files. Currently, only non-encrypted partitions are supported.

**Application Example**

You can find code examples in the *storage* directory of ESP-IDF examples:

`storage/nvs_rw_value`

Demonstrates how to read a single integer value from, and write it to NVS.

The value checked in this example holds the number of the ESP32-S3 module restarts. The value’s
function as a counter is only possible due to its storing in NVS.

The example also shows how to check if a read/write operation was successful, or if a certain value has
not been initialized in NVS. The diagnostic procedure is provided in plain text to help you track the
program flow and capture any issues on the way.

`storage/nvs_rw_blob`
Demonstrates how to read a single integer value and a blob (binary large object), and write them to NVS to preserve this value between ESP32-S3 module restarts.

- value - tracks the number of the ESP32-S3 module soft and hard restarts.
- blob - contains a table with module run times. The table is read from NVS to dynamically allocated RAM. A new run time is added to the table on each manually triggered soft restart, and then the added run time is written to NVS. Triggering is done by pulling down GPIO0.

The example also shows how to implement the diagnostic procedure to check if the read/write operation was successful.

storage/nvs_rw_value_cxx

This example does exactly the same as storage/nvs_rw_value, except that it uses the C++ NVS handle class.

Internals

Log of Key-Value Pairs  NVS stores key-value pairs sequentially, with new key-value pairs being added at the end. When a value of any given key has to be updated, a new key-value pair is added at the end of the log and the old key-value pair is marked as erased.

Pages and Entries  NVS library uses two main entities in its operation: pages and entries. Page is a logical structure which stores a portion of the overall log. Logical page corresponds to one physical sector of flash memory. Pages which are in use have a sequence number associated with them. Sequence numbers impose an ordering on pages. Higher sequence numbers correspond to pages which were created later. Each page can be in one of the following states:

Empty/uninitialized  Flash storage for the page is empty (all bytes are 0xff). Page is not used to store any data at this point and does not have a sequence number.

Active  Flash storage is initialized, page header has been written to flash, page has a valid sequence number. Page has some empty entries and data can be written there. No more than one page can be in this state at any given moment.

Full  Flash storage is in a consistent state and is filled with key-value pairs. Writing new key-value pairs into this page is not possible. It is still possible to mark some key-value pairs as erased.

Erasing  Non-erased key-value pairs are being moved into another page so that the current page can be erased. This is a transient state, i.e., page should never stay in this state at the time when any API call returns. In case of a sudden power off, the move-and-erase process will be completed upon the next power-on.

Corrupted  Page header contains invalid data, and further parsing of page data was canceled. Any items previously written into this page will not be accessible. The corresponding flash sector will not be erased immediately and will be kept along with sectors in uninitialized state for later use. This may be useful for debugging.

Mapping from flash sectors to logical pages does not have any particular order. The library will inspect sequence numbers of pages found in each flash sector and organize pages in a list based on these numbers.

```

Structure of a Page  For now, we assume that flash sector size is 4096 bytes and that ESP32-S3 flash encryption hardware operates on 32-byte blocks. It is possible to introduce some settings configurable at compile-time (e.g., via
menuconfig) to accommodate flash chips with different sector sizes (although it is not clear if other components in
the system, e.g., SPI flash driver and SPI flash cache can support these other sizes).

Page consists of three parts: header, entry state bitmap, and entries themselves. To be compatible with ESP32-S3
flash encryption, the entry size is 32 bytes. For integer types, an entry holds one key-value pair. For strings and blobs,
an entry holds part of key-value pair (more on that in the entry structure description).

The following diagram illustrates the page structure. Numbers in parentheses indicate the size of each part in bytes.

```
| State (4) | Seq. no. (4) | version (1) | Unused (19) | CRC32 (4) | Header (32) |
+-----------+-------------+------------+------------+-----------+-------------|
|           |             |            |            |           |             |
| Entry state bitmap (32) |            |            |            |           |             |
+-----------+-------------+------------+------------+-----------+-------------|
| Entry 0 (32) |            |            |            |           |             |
+-----------+-------------+------------+------------+-----------+-------------|
| Entry 1 (32) |            |            |            |           |             |
+-----------+-------------+------------+------------+-----------+-------------|
|            |             |            |            |           |             |
| Entry 125 (32) |            |            |            |           |             |
```

Page header and entry state bitmap are always written to flash unencrypted. Entries are encrypted if flash encryption
feature of ESP32-S3 is used.

Page state values are defined in such a way that changing state is possible by writing 0 into some of the bits. Therefore
it is not necessary to erase the page to change its state unless that is a change to the erased state.

The version field in the header reflects the NVS format version used. For backward compatibility reasons, it is
decremented for every version upgrade starting at 0xff (i.e., 0xff for version-1, 0xfe for version-2 and so on).

CRC32 value in the header is calculated over the part which does not include a state value (bytes 4 to 28). The unused
part is currently filled with 0xff bytes.

The following sections describe the structure of entry state bitmap and entry itself.

**Entry and Entry State Bitmap** Each entry can be in one of the following three states represented with two bits in
the entry state bitmap. The final four bits in the bitmap (256 - 2 * 126) are not used.

**Empty (2’ b11)** Nothing is written into the specific entry yet. It is in an uninitialized state (all bytes are 0xff).

**Written (2’ b10)** A key-value pair (or part of key-value pair which spans multiple entries) has been written into
the entry.

**Erased (2’ b00)** A key-value pair in this entry has been discarded. Contents of this entry will not be parsed any-
more.

**Structure of Entry** For values of primitive types (currently integers from 1 to 8 bytes long), entry holds one key-
value pair. For string and blob types, entry holds part of the whole key-value pair. For strings, in case when a
key-value pair spans multiple entries, all entries are stored in the same page. Blobs are allowed to span over multiple
pages by dividing them into smaller chunks. For tracking these chunks, an additional fixed length metadata entry is
stored called “blob index”. Earlier formats of blobs are still supported (can be read and modified). However, once
the blobs are modified, they are stored using the new format.
Individual fields in entry structure have the following meanings:

**NS** Namespace index for this entry. For more information on this value, see the section on namespaces implementation.

**Type** One byte indicating the value data type. See the `ItemType` enumeration in `nvs_flash/include/nvs_handle.hpp` for possible values.

**Span** Number of entries used by this key-value pair. For integer types, this is equal to 1. For strings and blobs, this depends on value length.

**ChunkIndex** Used to store the index of a blob-data chunk for blob types. For other types, this should be 0xff.

**CRC32** Checksum calculated over all the bytes in this entry, except for the CRC32 field itself.

**Key** Zero-terminated ASCII string containing a key name. Maximum string length is 15 bytes, excluding a zero terminator.

**Data** For integer types, this field contains the value itself. If the value itself is shorter than 8 bytes, it is padded to the right, with unused bytes filled with 0xff.

- For "blob index" entry, these 8 bytes hold the following information about data-chunks:
  - **Size** (Only for blob index.) Size, in bytes, of complete blob data.
  - **ChunkCount** (Only for blob index.) Total number of blob-data chunks into which the blob was divided during storage.
  - **ChunkStart** (Only for blob index.) ChunkIndex of the first blob-data chunk of this blob. Subsequent chunks have ChunkIndex incrementally allocated (step of 1).

  For string and blob data chunks, these 8 bytes hold additional data about the value, which are described below:
  - **Size** (Only for strings and blobs.) Size, in bytes, of actual data. For strings, this includes zero terminators.
  - **CRC32** (Only for strings and blobs.) Checksum calculated over all bytes of data.

Variable length values (strings and blobs) are written into subsequent entries, 32 bytes per entry. The **Span** field of the first entry indicates how many entries are used.

**Namespaces** As mentioned above, each key-value pair belongs to one of the namespaces. Namespace identifiers (strings) are stored as keys of key-value pairs in namespace with index 0. Values corresponding to these keys are indexes of these namespaces.
To reduce the number of reads from flash memory, each member of the Page class maintains a list of pairs: item index; item hash. This list makes searches much quicker. Instead of iterating over all entries, reading them from flash one at a time, Page::findItem first performs a search for the item hash in the hash list. This gives the item index within the page if such an item exists. Due to a hash collision, it is possible that a different item is found. This is handled by falling back to iteration over items in flash.

Each node in the hash list contains a 24-bit hash and 8-bit item index. Hash is calculated based on item namespace, key name, and ChunkIndex. CRC32 is used for calculation; the result is truncated to 24 bits. To reduce the overhead for storing 32-bit entries in a linked list, the list is implemented as a double-linked list of arrays. Each array holds 29 entries, for the total size of 128 bytes, together with linked list pointers and a 32-bit count field. The minimum amount of extra RAM usage per page is therefore 128 bytes; maximum is 640 bytes.

### API Reference

#### Header File

- components/nvs_flash/include/nvs_flash.h
- This header file can be included with:

```c
#include "nvs_flash.h"
```
- This header file is a part of the API provided by the nvs_flash component. To declare that your component depends on nvs_flash, add the following to your CMakeLists.txt:

```cmake
REQUIRES nvs_flash
```
- or

```cmake
PRIV_REQUIRES nvs_flash
```

#### Functions

**esp_err_t nvs_flash_init (void)**

Initialize the default NVS partition.

This API initialises the default NVS partition. The default NVS partition is the one that is labeled "nvs" in the partition table.

When “NVS_ENCRYPTION” is enabled in the menuconfig, this API enables the NVS encryption for the default NVS partition as follows:

a. Read security configurations from the first NVS key partition listed in the partition table. (NVS key partition is any “data” type partition which has the subtype value set to “nvs_keys”)

b. If the NVS key partition obtained in the previous step is empty, generate and store new keys in that NVS key partition.

c. Internally call “nvs_flash_secure_init()” with the security configurations obtained/generated in the previous steps.

Post initialization NVS read/write APIs remain the same irrespective of NVS encryption.

**Returns**

- ESP_OK if storage was successfully initialized.
- ESP_ERR_NVS_NO_FREE_PAGES if the NVS storage contains no empty pages (which may happen if NVS partition was truncated)
- ESP_ERR_NOT_FOUND if no partition with label “nvs” is found in the partition table
- ESP_ERR_NO_MEM in case memory could not be allocated for the internal structures
- one of the error codes from the underlying flash storage driver
- error codes from nvs_flash_read_security_cfg API (when “NVS_ENCRYPTION” is enabled).
- error codes from nvs_flash_generate_keys API (when “NVS_ENCRYPTION” is enabled).
• error codes from nvs_flash_secure_init_partition API (when “NVS_ENCRYPTION” is enabled).

```c
esp_err_t nvs_flash_init_partition (const char *partition_label)
```

Initialize NVS flash storage for the specified partition.

**Parameters** `partition_label` – [in] Label of the partition. Must be no longer than 16 characters.

**Returns**
- ESP_OK if storage was successfully initialized.
- ESP_ERR_NVS_NO_FREE_PAGES if the NVS storage contains no empty pages (which may happen if NVS partition was truncated)
- ESP_ERR_NOT_FOUND if specified partition is not found in the partition table
- ESP_ERR_NO_MEM in case memory could not be allocated for the internal structures
- one of the error codes from the underlying flash storage driver

```c
esp_err_t nvs_flash_init_partition_ptr (const esp_partition_t *partition)
```

Initialize NVS flash storage for the partition specified by partition pointer.

**Parameters** `partition` – [in] pointer to a partition obtained by the ESP partition API.

**Returns**
- ESP_OK if storage was successfully initialized
- ESP_ERR_NVS_NO_FREE_PAGES if the NVS storage contains no empty pages (which may happen if NVS partition was truncated)
- ESP_ERR_INVALID_ARG in case partition is NULL
- ESP_ERR_NO_MEM in case memory could not be allocated for the internal structures
- one of the error codes from the underlying flash storage driver

```c
esp_err_t nvs_flash_deinit (void)
```

Deinitialize NVS storage for the default NVS partition.

Default NVS partition is the partition with “nvs” label in the partition table.

**Returns**
- ESP_OK on success (storage was deinitialized)
- ESP_ERR_NVS_NOT_INITIALIZED if the storage was not initialized prior to this call

```c
esp_err_t nvs_flash_deinit_partition (const char *partition_label)
```

Deinitialize NVS storage for the given NVS partition.

**Parameters** `partition_label` – [in] Label of the partition

**Returns**
- ESP_OK on success
- ESP_ERR_NVS_NOT_INITIALIZED if the storage for given partition was not initialized prior to this call

```c
esp_err_t nvs_flash_erase (void)
```

Erase the default NVS partition.

Erases all contents of the default NVS partition (one with label “nvs”).

**Note:** If the partition is initialized, this function first de-initializes it. Afterwards, the partition has to be initialized again to be used.

**Returns**
- ESP_OK on success
- ESP_ERR_NOT_FOUND if there is no NVS partition labeled “nvs” in the partition table
- different error in case de-initialization fails (shouldn’t happen)
**esp_err_t** nvs_flash_erase_partition(const char *part_name)

Erases specified NVS partition.

Erase all content of a specified NVS partition

**Note:** If the partition is initialized, this function first de-initializes it. Afterwards, the partition has to be initialized again to be used.

**Parameters** part_name - [in] Name (label) of the partition which should be erased

**Returns**
- ESP_OK on success
- ESP_ERR_NOT_FOUND if there is no NVS partition with the specified name in the partition table
- different error in case de-initialization fails (shouldn’t happen)

**esp_err_t** nvs_flash_erase_partition_ptr(const esp_partition_t *partition)

Erase custom partition.

Erase all content of specified custom partition.

**Note:** If the partition is initialized, this function first de-initializes it. Afterwards, the partition has to be initialized again to be used.

**Parameters** partition - [in] pointer to a partition obtained by the ESP partition API.

**Returns**
- ESP_OK on success
- ESP_ERR_NOT_FOUND if there is no partition with the specified parameters in the partition table
- ESP_ERR_INVALID_ARG in case partition is NULL
- one of the error codes from the underlying flash storage driver

**esp_err_t** nvs_flash_secure_init(nvs_sec_cfg_t *cfg)

Initialize the default NVS partition.

This API initialises the default NVS partition. The default NVS partition is the one that is labeled “nvs” in the partition table.

**Parameters** cfg - [in] Security configuration (keys) to be used for NVS encryption/decryption.
- If cfg is NULL, no encryption is used.

**Returns**
- ESP_OK if storage has been initialized successfully.
- ESP_ERR_NVSD_NO_FREE_PAGES if the NVS storage contains no empty pages (which may happen if NVS partition was truncated)
- ESP_ERR_NOT_FOUND if no partition with label “nvs” is found in the partition table
- ESP_ERR_NO_MEM in case memory could not be allocated for the internal structures
- one of the error codes from the underlying flash storage driver

**esp_err_t** nvs_flash_secure_init_partition(const char *partition_label, nvs_sec_cfg_t *cfg)

Initialize NVS flash storage for the specified partition.

**Parameters**
- partition_label - [in] Label of the partition. Note that internally, a reference to passed value is kept and it should be accessible for future operations
- cfg - [in] Security configuration (keys) to be used for NVS encryption/decryption. If cfg is null, no encryption/decryption is used.

**Returns**
- ESP_OK if storage has been initialized successfully.
Chapter 2. API Reference

- ESP_ERR_NVS_NO_FREE_PAGES if the NVS storage contains no empty pages (which may happen if NVS partition was truncated)
- ESP_ERR_NOT_FOUND if specified partition is not found in the partition table
- ESP_ERR_NVS_NO_MEM in case memory could not be allocated for the internal structures
- one of the error codes from the underlying flash storage driver

```c
esp_err_t nvs_flash_generate_keys (const esp_partition_t *partition, nvs_sec_cfg_t *cfg)
```

Generate and store NVS keys in the provided esp partition.

**Parameters**

- **partition** – [in] Pointer to partition structure obtained using esp_partition_find_first or esp_partition_get. Must be non-NULL.
- **cfg** – [out] Pointer to nvs security configuration structure. Pointer must be non-NULL. Generated keys will be populated in this structure.

**Returns**

- ESP_OK, if cfg was read successfully;
- ESP_ERR_INVALID_ARG, if partition or cfg is NULL;
- or error codes from esp_partition_write/erase APIs.

```c
esp_err_t nvs_flash_read_security_cfg (const esp_partition_t *partition, nvs_sec_cfg_t *cfg)
```

Read NVS security configuration from a partition.

**Note:** Provided partition is assumed to be marked ‘encrypted’.

**Parameters**

- **partition** – [in] Pointer to partition structure obtained using esp_partition_find_first or esp_partition_get. Must be non-NULL.
- **cfg** – [out] Pointer to nvs security configuration structure. Pointer must be non-NULL.

**Returns**

- ESP_OK, if cfg was read successfully;
- ESP_ERR_INVALID_ARG, if partition or cfg is NULL
- ESP_ERR_NVS_KEYS_NOT_INITIALIZED, if the partition is not yet written with keys.
- ESP_ERR_NVS_CORRUPT_KEY_PART, if the partition containing keys is found to be corrupt.
- or error codes from esp_partition_read API.

```c
esp_err_t nvs_flash_register_security_scheme (nvs_sec_scheme_t *scheme_cfg)
```

Registers the given security scheme for NVS encryption. The scheme registered with sec_scheme_id by this API be used as the default security scheme for the “nvs” partition. Users will have to call this API explicitly in their application.

**Parameters**

- **scheme_cfg** – [in] Pointer to the security scheme configuration structure that the user (or the nvs_key_provider) wants to register.

**Returns**

- ESP_OK, if security scheme registration succeeds;
- ESP_ERR_INVALID_ARG, if scheme_cfg is NULL;
- ESP_FAIL, if security scheme registration fails

```c
nvs_sec_scheme_t *nvs_flash_get_default_security_scheme (void)
```

Fetch the configuration structure for the default active security scheme for NVS encryption.

**Returns**

Pointer to the default active security scheme configuration (NULL if no scheme is registered yet i.e. active)

```c
esp_err_t nvs_flash_generate_keys_v2 (nvs_sec_scheme_t *scheme_cfg, nvs_sec_cfg_t *cfg)
```

Generate (and store) the NVS keys using the specified key-protection scheme.

**Parameters**
• `scheme_cfg` [in] Security scheme specific configuration
• `cfg` [out] Security configuration (encryption keys)

**Returns**
• ESP_OK, if `cfg` was populated successfully with generated encryption keys;
• ESP_ERR_INVALID_ARG, if `scheme_cfg` or `cfg` is NULL;
• ESP_FAIL, if the key generation process fails

```c
esp_err_t nvs_flash_read_security_cfg_v2 (nvs_sec_scheme_t *scheme_cfg, nvs_sec_cfg_t *cfg)
```

Read NVS security configuration set by the specified security scheme.

**Parameters**
• `scheme_cfg` [in] Security scheme specific configuration
• `cfg` [out] Security configuration (encryption keys)

**Returns**
• ESP_OK, if `cfg` was read successfully;
• ESP_ERR_INVALID_ARG, if `scheme_cfg` or `cfg` is NULL;
• ESP_FAIL, if the key reading process fails

### Structures

**struct nvs_sec_cfg_t**

Key for encryption and decryption.

#### Public Members

```c
uint8_t eky[NVS_KEY_SIZE]
```

XTS encryption and decryption key

```c
uint8_t tky[NVS_KEY_SIZE]
```

XTS tweak key

**struct nvs_sec_scheme_t**

NVS encryption: Security scheme configuration structure.

#### Public Members

```c
int scheme_id
```

Security Scheme ID (E.g. HMAC)

```c
void *scheme_data
```

Scheme-specific data (E.g. eFuse block for HMAC-based key generation)

```c
nvs_flash_generate_keys_t nvs_flash_key_gen
```

Callback for the `nvs_flash_key_gen` implementation

```c
nvs_flash_read_cfg_t nvs_flash_read_cfg
```

Callback for the `nvs_flash_read_keys` implementation

### Macros

```c
NVS_KEY_SIZE
```
Type Definitions

typedef esp_err_t (*nvs_flash_generate_keys_t)(const void *scheme_data, nvs_sec_cfg_t *cfg)

Callback function prototype for generating the NVS encryption keys.

typedef esp_err_t (*nvs_flash_read_cfg_t)(const void *scheme_data, nvs_sec_cfg_t *cfg)

Callback function prototype for reading the NVS encryption keys.

Header File

- components/nvs_flash/include/nvs.h

This header file can be included with:

```c
#include "nvs.h"
```

- This header file is a part of the API provided by the nvs_flash component. To declare that your component depends on nvs_flash, add the following to your CMakeLists.txt:

```cmake
REQUIRES nvs_flash
```
or

```cmake
PRIV_REQUIRES nvs_flash
```

Functions

```c
esp_err_t nvs_set_i8 (nvs_handle_t handle, const char *key, int8_t value)
```

set int8_t value for given key

Set value for the key, given its name. Note that the actual storage will not be updated until nvs_commit is called. Regardless whether key-value pair is created or updated, function always requires at least one nvs available entry. See nvs_get_stats. After create type of operation, the number of available entries is decreased by one. After update type of operation, the number of available entries remains the same.

Parameters

- handle - [in] Handle obtained from nvs_open function. Handles that were opened read only cannot be used.
- key - [in] Key name. Maximum length is (NVS_KEY_NAME_MAX_SIZE-1) characters. Shouldn’t be empty.
- value - [in] The value to set.

Returns

- ESP_OK if value was set successfully
- ESP_FAIL if there is an internal error; most likely due to corrupted NVS partition (only if NVS assertion checks are disabled)
- ESP_ERR_NVSS_INVALID_HANDLE if handle has been closed or is NULL
- ESP_ERR_NVSS_READ_ONLY if storage handle was opened as read only
- ESP_ERR_NVSS_INVALID_NAME if key name doesn’t satisfy constraints
- ESP_ERR_NVSS_NOT_ENOUGH_SPACE if there is not enough space in the underlying storage to save the value
- ESP_ERR_NVSS_REMOVE_FAILED if the value wasn’t updated because flash write operation has failed. The value was written however, and update will be finished after re-initialization of nvs, provided that flash operation doesn’t fail again.

```c
esp_err_t nvs_set_u8 (nvs_handle_t handle, const char *key, uint8_t value)
```

set uint8_t value for given key

This function is the same as nvs_set_i8 except for the data type.

```c
esp_err_t nvs_set_i16 (nvs_handle_t handle, const char *key, int16_t value)
```

set int16_t value for given key

This function is the same as nvs_set_i8 except for the data type.
Chapter 2. API Reference

```c
esp_err_t nvs_set_u16(nvs_handle_t handle, const char* key, uint16_t value)
```
set uint16_t value for given key

This function is the same as `nvs_set_i8` except for the data type.

```c
esp_err_t nvs_set_i32(nvs_handle_t handle, const char* key, int32_t value)
```
set int32_t value for given key

This function is the same as `nvs_set_i8` except for the data type.

```c
esp_err_t nvs_set_u32(nvs_handle_t handle, const char* key, uint32_t value)
```
set uint32_t value for given key

This function is the same as `nvs_set_i8` except for the data type.

```c
esp_err_t nvs_set_i64(nvs_handle_t handle, const char* key, int64_t value)
```
set int64_t value for given key

This function is the same as `nvs_set_i8` except for the data type.

```c
esp_err_t nvs_set_u64(nvs_handle_t handle, const char* key, uint64_t value)
```
set uint64_t value for given key

This function is the same as `nvs_set_i8` except for the data type.

```c
esp_err_t nvs_set_str(nvs_handle_t handle, const char* key, const char* value)
```
set string for given key

Sets string value for the key. Function requires whole space for new data to be available as contiguous entries in same nvs page. Operation consumes 1 overhead entry and 1 entry per each 32 characters of new string including zero character to be set. In case of value update for existing key, entries occupied by the previous value and overhead entry are returned to the pool of available entries. Note that storage of long string values can fail due to fragmentation of nvs pages even if `available_entries` returned by `nvs_get_stats` suggests enough overall space available. Note that the underlying storage will not be updated until `nvs_commit` is called.

**Parameters**

- `handle` - [in] Handle obtained from `nvs_open` function. Handles that were opened read only cannot be used.
- `key` - [in] Key name. Maximum length is (NVS_KEY_NAME_MAX_SIZE-1) characters. Shouldn’t be empty.
- `value` - [in] The value to set. For strings, the maximum length (including null character) is 4000 bytes, if there is one complete page free for writing. This decreases, however, if the free space is fragmented.

**Returns**

- ESP_OK if value was set successfully
- ESP_ERR_NVS_INVALID_HANDLE if handle has been closed or is NULL
- ESP_ERR_NVS_READ_ONLY if storage handle was opened as read only
- ESP_ERR_NVS_INVALID_NAME if key name doesn’t satisfy constraints
- ESP_ERR_NVS_NOT_ENOUGH_SPACE if there is not enough space in the underlying storage to save the value
- ESP_ERR_NVS_REMOVE_FAILED if the value wasn’t updated because flash write operation has failed. The value was written however, and update will be finished after re-initialization of nvs, provided that flash operation doesn’t fail again.
- ESP_ERR_NVS_VALUE_TOO_LONG if the string value is too long

```c
esp_err_t nvs_get_i8(nvs_handle_t handle, const char *key, int8_t *out_value)
```
get int8_t value for given key

These functions retrieve value for the key, given its name. If `key` does not exist, or the requested variable type doesn’t match the type which was used when setting a value, an error is returned.

In case of any error, `out_value` is not modified.

`out_value` has to be a pointer to an already allocated variable of the given type.
// Example of using nvs_get_i32:

```c
int32_t max_buffer_size = 4096; // default value
esp_err_t err = nvs_get_i32(my_handle, "max_buffer_size", &max_buffer_size);
assert(err == ESP_OK || err == ESP_ERR_NVS_NOT_FOUND);
// if ESP_ERR_NVS_NOT_FOUND was returned, max_buffer_size will still
// have its default value.
```

### Parameters
- **handle** - [in] Handle obtained from nvs_open function.
- **key** - [in] Key name. Maximum length is (NVS_KEY_NAME_MAX_SIZE-1) characters. Shouldn’t be empty.
- **out_value** - Pointer to the output value. May be NULL for nvs_get_str and nvs_get_blob, in this case required length will be returned in length argument.

### Returns
- ESP_OK if the value was retrieved successfully
- ESP_FAIL if there is an internal error; most likely due to corrupted NVS partition (only if NVS assertion checks are disabled)
- ESP_ERR_NVS_NOT_FOUND if the requested key doesn’t exist
- ESP_ERR_NVS_INVALID_HANDLE if handle has been closed or is NULL
- ESP_ERR_NVS_INVALID_NAME if key name doesn’t satisfy constraints
- ESP_ERR_NVS_INVALID_LENGTH if length is not sufficient to store data

```c
esp_err_t nvs_get_u8 (nvs_handle_t handle, const char* key, uint8_t*out_value)
get uint8_t value for given key

This function is the same as nvs_get_i8 except for the data type.
```

```c
esp_err_t nvs_get_i16 (nvs_handle_t handle, const char* key, int16_t*out_value)
get int16_t value for given key

This function is the same as nvs_get_i8 except for the data type.
```

```c
esp_err_t nvs_get_u16 (nvs_handle_t handle, const char* key, uint16_t*out_value)
get uint16_t value for given key

This function is the same as nvs_get_i8 except for the data type.
```

```c
esp_err_t nvs_get_i32 (nvs_handle_t handle, const char* key, int32_t*out_value)
get int32_t value for given key

This function is the same as nvs_get_i8 except for the data type.
```

```c
esp_err_t nvs_get_u32 (nvs_handle_t handle, const char* key, uint32_t*out_value)
get uint32_t value for given key

This function is the same as nvs_get_i8 except for the data type.
```

```c
esp_err_t nvs_get_i64 (nvs_handle_t handle, const char* key, int64_t*out_value)
get int64_t value for given key

This function is the same as nvs_get_i8 except for the data type.
```

```c
esp_err_t nvs_get_u64 (nvs_handle_t handle, const char* key, uint64_t*out_value)
get uint64_t value for given key

This function is the same as nvs_get_i8 except for the data type.
```

```c
esp_err_t nvs_get_str (nvs_handle_t handle, const char* key, char*out_value, size_t*length)
get string value for given key

These functions retrieve the data of an entry, given its key. If key does not exist, or the requested variable type
doesn’t match the type which was used when setting a value, an error is returned.
In case of any error, out_value is not modified.

All functions expect out_value to be a pointer to an already allocated variable of the given type.

nvs_get_str and nvs_get_blob functions support WinAPI-style length queries. To get the size necessary to store the value, call nvs_get_str or nvs_get_blob with zero out_value and non-zero pointer to length. Variable pointed to by length argument will be set to the required length. For nvs_get_str, this length includes the zero terminator. When calling nvs_get_str and nvs_get_blob with non-zero out_value, length has to be non-zero and has to point to the length available in out_value. It is suggested that nvs_get/set_str is used for zero-terminated C strings, and nvs_get/set_blob used for arbitrary data structures.

```c
// Example (without error checking) of using nvs_get_str to get a string into
// dynamic array:
size_t required_size;
nvs_get_str(my_handle, "server_name", NULL, &required_size);
char* server_name = malloc(required_size);
nvs_get_str(my_handle, "server_name", server_name, &required_size);

// Example (without error checking) of using nvs_get_blob to get a binary data
// into a static array:
uint8_t mac_addr[6];
size_t size = sizeof(mac_addr);
nvs_get_blob(my_handle, "dst_mac_addr", mac_addr, &size);
```

**Parameters**
- **handle** - [in] Handle obtained from nvs_open function.
- **key** - [in] Key name. Maximum length is (NVS_KEY_NAME_MAX_SIZE-1) characters. Shouldn’t be empty.
- **out_value** - [out] Pointer to the output value. May be NULL for nvs_get_str and nvs_get_blob, in this case required length will be returned in length argument.
- **length** - [inout] A non-zero pointer to the variable holding the length of out_value. In case out_value a zero, will be set to the length required to hold the value. In case out_value is not zero, will be set to the actual length of the value written. For nvs_get_str this includes zero terminator.

**Returns**
- ESP_OK if the value was retrieved successfully
- ESP_FAIL if there is an internal error; most likely due to corrupted NVS partition (only if NVS assertion checks are disabled)
- ESP_ERR_NVS_NOT_FOUND if the requested key doesn’t exist
- ESP_ERR_NVS_INVALID_HANDLE if handle has been closed or is NULL
- ESP_ERR_NVS_INVALID_NAME if key name doesn’t satisfy constraints
- ESP_ERR_NVS_INVALID_LENGTH if length is not sufficient to store data

```c
esp_err_t nvs_get_blob(nvs_handle_t handle, const char *key, void *out_value, size_t *length)
```

This function behaves the same as nvs_get_str, except for the data type.

```c
esp_err_t nvs_open(const char *namespace_name, nvs_open_mode_t open_mode, nvs_handle_t *out_handle)
```

Open non-volatile storage with a given namespace from the default NVS partition.

Multiple internal ESP-IDF and third party application modules can store their key-value pairs in the NVS module. In order to reduce possible conflicts on key names, each module can use its own namespace. The default NVS partition is the one that is labelled “nvs” in the partition table.

**Parameters**
- **namespace_name** - [in] Namespace name. Maximum length is (NVS_KEY_NAME_MAX_SIZE-1) characters. Shouldn’t be empty.
- **open_mode** - [in] NVS_READWRITE or NVS_READONLY. If NVS_READONLY, will open a handle for reading only. All write requests will be rejected for this handle.
• **out_handle** -[out] If successful (return code is zero), handle will be returned in this argument.

**Returns**

- ESP_OK if storage handle was opened successfully
- ESP_FAIL if there is an internal error; most likely due to corrupted NVS partition (only if NVS assertion checks are disabled)
- ESP_ERR_NVS_NOT_INITIALIZED if the storage driver is not initialized
- ESP_ERR_NVS_PART_NOT_FOUND if the partition with label “nvs” is not found
- ESP_ERR_NVS_NOT_FOUND if namespace doesn’t exist yet and mode is NVS_READONLY
- ESP_ERR_NVS_INVALID_NAME if namespace name doesn’t satisfy constraints
- ESP_ERR_NO_MEM in case memory could not be allocated for the internal structures
- ESP_ERR_NVS_NOT_ENOUGH_SPACE if there is no space for a new entry or there are too many different namespaces (maximum allowed different namespaces: 254)
- ESP_ERR_NOT_ALLOWED if the NVS partition is read-only and mode is NVS_READWRITE
- ESP_ERR_INVALID_ARG if out_handle is equal to NULL
- other error codes from the underlying storage driver

```c
esp_err_t nvs_open_from_partition(const char* part_name, const char *namespace_name,
                                  nvs_open_mode_t open_mode, nvs_handle_t *out_handle)
```

Open non-volatile storage with a given namespace from specified partition.

The behaviour is same as nvs_open() API. However this API can operate on a specified NVS partition instead of default NVS partition. Note that the specified partition must be registered with NVS using nvs_flash_init_partition() API.

**Parameters**

- **part_name** -[in] Label (name) of the partition of interest for object read/write/erase
- **namespace_name** -[in] Namespace name. Maximum length is (NVS_KEY_NAME_MAX_SIZE-1) characters. Shouldn’t be empty.
- **open_mode** -[in] NVS_READWRITE or NVS_READONLY. If NVS_READONLY, will open a handle for reading only. All write requests will be rejected for this handle.
- **out_handle** -[out] If successful (return code is zero), handle will be returned in this argument.

**Returns**

- ESP_OK if storage handle was opened successfully
- ESP_FAIL if there is an internal error; most likely due to corrupted NVS partition (only if NVS assertion checks are disabled)
- ESP_ERR_NVS_NOT_INITIALIZED if the storage driver is not initialized
- ESP_ERR_NVS_PART_NOT_FOUND if the partition with specified name is not found
- ESP_ERR_NVS_NOT_FOUND if namespace doesn’t exist yet and mode is NVS_READONLY
- ESP_ERR_NVS_INVALID_NAME if namespace name doesn’t satisfy constraints
- ESP_ERR_NO_MEM in case memory could not be allocated for the internal structures
- ESP_ERR_NVS_NOT_ENOUGH_SPACE if there is no space for a new entry or there are too many different namespaces (maximum allowed different namespaces: 254)
- ESP_ERR_NOT_ALLOWED if the NVS partition is read-only and mode is NVS_READWRITE
- ESP_ERR_INVALID_ARG if out_handle is equal to NULL
- other error codes from the underlying storage driver

```c
esp_err_t nvs_set_blob(nvs_handle_t handle, const char *key, const void *value, size_t length)
```

set variable length binary value for given key

Sets variable length binary value for the key. Function uses 2 overhead and 1 entry per each 32 bytes of new data from the pool of available entries. See nvs_get_stats. In case of value update for existing key, space occupied by the existing value and 2 overhead entries are returned to the pool of available entries. Note that the underlying storage will not be updated until nvs_commit is called.

**Parameters**
• **handle** – [in] Handle obtained from `nvs_open` function. Handles that were opened read only cannot be used.

• **key** – [in] Key name. Maximum length is (NVS_KEY_NAME_MAX_SIZE-1) characters. Shouldn’t be empty.

• **value** – [in] The value to set.

• **length** – [in] length of binary value to set, in bytes; Maximum length is 508000 bytes or (97.6% of the partition size - 4000) bytes whichever is lower.

**Returns**

• ESP_OK if value was set successfully

• ESP_FAIL if there is an internal error; most likely due to corrupted NVS partition (only if NVS assertion checks are disabled)

• ESP_ERR_NVS_INVALID_HANDLE if handle has been closed or is NULL

• ESP_ERR_NVS_READ_ONLY if storage handle was opened as read only

• ESP_ERR_NVS_INVALID_NAME if key name doesn’t satisfy constraints

• ESP_ERR_NVS_NOT_ENOUGH_SPACE if there is not enough space in the underlying storage to save the value

• ESP_ERR_NVS_REMOVE_FAILED if the value wasn’t updated because flash write operation has failed. The value was written however, and update will be finished after re-initialization of nvs, provided that flash operation doesn’t fail again.

• ESP_ERR_NVS_VALUE_TOO_LONG if the value is too long

---

```c
esp_err_t nvs_erase_key (nvs_handle_t handle, const char *key)
```

Erase key-value pair with given key name.

Note that actual storage may not be updated until `nvs_commit` function is called.

**Parameters**

• **handle** – [in] Storage handle obtained with `nvs_open`. Handles that were opened read only cannot be used.

• **key** – [in] Key name. Maximum length is (NVS_KEY_NAME_MAX_SIZE-1) characters. Shouldn’t be empty.

**Returns**

• ESP_OK if erase operation was successful

• ESP_FAIL if there is an internal error; most likely due to corrupted NVS partition (only if NVS assertion checks are disabled)

• ESP_ERR_NVS_INVALID_HANDLE if handle has been closed or is NULL

• ESP_ERR_NVS_READ_ONLY if handle was opened as read only

• ESP_ERR_NVS_NOT_FOUND if the requested key doesn’t exist

• other error codes from the underlying storage driver

---

```c
esp_err_t nvs_erase_all (nvs_handle_t handle)
```

Erase all key-value pairs in a namespace.

Note that actual storage may not be updated until `nvs_commit` function is called.

**Parameters**

• **handle** – [in] Storage handle obtained with `nvs_open`. Handles that were opened read only cannot be used.

**Returns**

• ESP_OK if erase operation was successful

• ESP_FAIL if there is an internal error; most likely due to corrupted NVS partition (only if NVS assertion checks are disabled)

• ESP_ERR_NVS_INVALID_HANDLE if handle has been closed or is NULL

• ESP_ERR_NVS_READ_ONLY if handle was opened as read only

• ESP_ERR_NVS_NOT_FOUND if the requested key doesn’t exist

• other error codes from the underlying storage driver

---

```c
esp_err_t nvs_commit (nvs_handle_t handle)
```

Write any pending changes to non-volatile storage.

After setting any values, `nvs_commit()` must be called to ensure changes are written to non-volatile storage. Individual implementations may write to storage at other times, but this is not guaranteed.
Chapter 2. API Reference

Parameters **handle** -[in] Storage handle obtained with `nvs_open`. Handles that were opened read only cannot be used.

**Returns**
- ESP_OK if the changes have been written successfully
- ESP_ERR_NVS_INVALID_HANDLE if handle has been closed or is NULL
- other error codes from the underlying storage driver

```c
void nvs_close(nvs_handle_t handle)
```
Close the storage handle and free any allocated resources.

This function should be called for each handle opened with `nvs_open` once the handle is not in use any more. Closing the handle may not automatically write the changes to nonvolatile storage. This has to be done explicitly using `nvs_commit` function. Once this function is called on a handle, the handle should no longer be used.

Parameters **handle** -[in] Storage handle to close

```c
esp_err_t nvs_get_stats(const char* part_name, nvs_stats_t *nvs_stats)
```
Fill structure `nvs_stats_t`. It provides info about memory used by NVS.

This function calculates the number of used entries, free entries, available entries, total entries and number of namespaces in partition.

```c
// Example of nvs_get_stats() to get overview of actual statistics of data.
nvs_stats_t nvs_stats;
nvs_get_stats(NULL, &nvs_stats);
printf("Count: UsedEntries = (%lu), FreeEntries = (%lu), AvailableEntries = (%lu), AllEntries = (%lu)\n",
nvs_stats.used_entries, nvs_stats.free_entries, nvs_stats.available_entries, nvs_stats.total_entries);
```

**Parameters**
- **part_name** -[in] Partition name NVS in the partition table. If pass a NULL than will use NVS_DEFAULT_PART_NAME ("nvs").
- **nvs_stats** -[out] Returns filled structure `nvs_states_t`. It provides info about used memory the partition.

**Returns**
- ESP_OK if the changes have been written successfully. Return param `nvs_stats` will be filled.
- ESP_ERR_NVS_PART_NOT_FOUND if the partition with label "name" is not found. Return param `nvs_stats` will be filled 0.
- ESP_ERR_NVS_NOT_INITIALIZED if the storage driver is not initialized. Return param `nvs_stats` will be filled 0.
- ESP_ERR_INVALID_ARG if `nvs_stats` is equal to NULL.
- ESP_ERR_INVALID_STATE if there is page with the status of INVALID. Return param `nvs_stats` will be filled not with correct values because not all pages will be counted. Counting will be interrupted at the first INVALID page.

```c
esp_err_t nvs_get_used_entry_count(nvs_handle_t handle, size_t *used_entries)
```
Calculate all entries in a namespace.

An entry represents the smallest storage unit in NVS. Strings and blobs may occupy more than one entry. Note that to find out the total number of entries occupied by the namespace, add one to the returned value `used_entries` (if err is equal to ESP_OK). Because the name space entry takes one entry.

```c
// Example of nvs_get_used_entry_count() to get amount of all key-value pairs in one namespace:
```
nvs_open("namespace1", NVS_READWRITE, &handle);
...

size_t used_entries;
size_t total_entries_namespace;
if(nvs_get_used_entry_count(handle, &used_entries) == ESP_OK){
    // the total number of entries occupied by the namespace
    total_entries_namespace = used_entries + 1;
}

Parameters
- handle [in] Handle obtained from nvs_open function.
- used_entries [out] Returns amount of used entries from a namespace.

Returns
- ESP_OK if the changes have been written successfully. Return param used_entries will be filled valid value.
- ESP_ERR_NVS_NOT_INITIALIZED if the storage driver is not initialized. Return param used_entries will be filled 0.
- ESP_ERR_NVS_INVALID_HANDLE if handle has been closed or is NULL. Return param used_entries will be filled 0.
- ESP_ERR_NVS_INVALID_ARG if used_entries is equal to NULL.
- Other error codes from the underlying storage driver. Return param used_entries will be filled 0.

esp_err_t nvs_entry_find (const char *part_name, const char *namespace_name, nvs_type_t type, nvs_iterator_t *output_iterator)

Create an iterator to enumerate NVS entries based on one or more parameters.

// Example of listing all the key-value pairs of any type under specified partition and namespace
nvs_iterator_t it = NULL;
esp_err_t res = nvs_entry_find(<nvs_partition_name>, <namespace>, NVS_TYPE_-ANY, &it);
while(res == ESP_OK) {
    nvs_entry_info_t info;
    nvs_entry_info(it, &info); // Can omit error check if parameters are guaranteed to be non-NULL
    printf("key '%s', type '%d' \n", info.key, info.type);
    res = nvs_entry_next(&it);
}  
nvs_release_iterator(it);

Parameters
- part_name [in] Partition name
- namespace_name [in] Set this value if looking for entries with a specific namespace. Pass NULL otherwise.
- type [in] One of nvs_type_t values.
- output_iterator [out] Set to a valid iterator to enumerate all the entries found. Set to NULL if no entry for specified criteria was found. If any other error except ESP_ERR_INVALID_ARG occurs, output_iterator is NULL, too. If ESP_ERR_INVALID_ARG occurs, output_iterator is not changed. If a valid iterator is obtained through this function, it has to be released using nvs_release_iterator when not used any more, unless ESP_ERR_INVALID_ARG is returned.

Returns
- ESP_OK if no internal error or programming error occurred.
- ESP_ERR_NVS_NOT_FOUND if no element of specified criteria has been found.
• ESP_ERR_NO_MEM if memory has been exhausted during allocation of internal structures.
• ESP_ERR_INVALID_ARG if any of the parameters is NULL. Note: don’t release output_iterator in case ESP_ERR_INVALID_ARG has been returned

```c
esp_err_t nvs_entry_find_in_handle(nvs_handle_t handle, nvs_type_t type, nvs_iterator_t *output_iterator)

Create an iterator to enumerate NVS entries based on a handle and type.
```

```c
// Example of listing all the key-value pairs of any type under specified...
handle (which defines a partition and namespace)

nvs_iterator_t it = NULL;
esp_err_t res = nvs_entry_find_in_handle(<nvs_handle>, NVS_TYPE_ANY, &it);
while(res == ESP_OK) {
  nvs_entry_info_t info;
  nvs_entry_info(info); // Can omit error check if parameters are...--guaranteed to be non-NULL
  printf("key '"%s'", type '"%d'
", info.key, info.type);
  res = nvs_entry_next(&it);
}
nvs_release_iterator(it);
```

**Parameters**

- **handle** - [in] Handle obtained from nvs_open function.
- **type** - [in] One of nvs_type_t values.
- **output_iterator** - [out] Set to a valid iterator to enumerate all the entries found. Set to NULL if no entry for specified criteria was found. If any other error except ESP_ERR_INVALID_ARG occurs, output_iterator is NULL, too. If ESP_ERR_INVALID_ARG occurs, output_iterator is not changed. If a valid iterator is obtained through this function, it has to be released using nvs_release_iterator when not used any more, unless ESP_ERR_INVALID_ARG is returned.

**Returns**

- ESP_OK if no internal error or programming error occurred.
- ESP_ERR_NVS_NOT_FOUND if no next element matching the iterator criteria.
- ESP_ERR_INVALID_ARG if output_iterator parameter is NULL. Note: don’t release output_iterator in case ESP_ERR_INVALID_ARG has been returned

```c
esp_err_t nvs_entry_next(nvs_iterator_t *iterator)

Advances the iterator to next item matching the iterator criteria.
```

Note that any copies of the iterator will be invalid after this call.

**Parameters**

- **iterator** - [inout] Iterator obtained from nvs_entry_find or nvs_entry_find_in_handle function. Must be non-NULL. If any error except ESP_ERR_INVALID_ARG occurs, iterator is set to NULL. If ESP_ERR_INVALID_ARG occurs, iterator is not changed.

**Returns**

- ESP_OK if no internal error or programming error occurred.
- ESP_ERR_NVS_NOT_FOUND if no next element matching the iterator criteria.
- ESP_ERR_INVALID_ARG if iterator is NULL.
- Possibly other errors in the future for internal programming or flash errors.

```c
esp_err_t nvs_entry_info(const nvs_iterator_t iterator, nvs_entry_info_t *out_info)

Fills nvs_entry_info_t structure with information about entry pointed to by the iterator.
```
Parameters

- `iterator` - *[in]* Iterator obtained from `nvs_entry_find` or `nvs_entry_find_in_handle` function. Must be non-NULL.
- `out_info` - *[out]* Structure to which entry information is copied.

Returns

- `ESP_OK` if all parameters are valid; current iterator data has been written to `out_info`
- `ESP_ERR_INVALID_ARG` if one of the parameters is NULL.

```c
void nvs_release_iterator (nvs_iterator_t iterator)
```

Release iterator.

Parameters:

- `iterator` - *[in]* Release iterator obtained from `nvs_entry_find` or `nvs_entry_find_in_handle` or `nvs_entry_next` function. NULL argument is allowed.

Structures

```c
struct nvs_entry_info_t
```

information about entry obtained from `nvs_entry_info` function

Public Members

```c
char namespace_name[NVS_NS_NAME_MAX_SIZE]
```

Namespace to which key-value belong

```c
char key[NVS_KEY_NAME_MAX_SIZE]
```

Key of stored key-value pair

```c
nvs_type_t type
```

Type of stored key-value pair

```c
struct nvs_stats_t
```

Note: Info about storage space NVS.

Public Members

```c
size_t used_entries
```

Number of used entries.

```c
size_t free_entries
```

Number of free entries. It includes also reserved entries.

```c
size_t available_entries
```

Number of entries available for data storage.

```c
size_t total_entries
```

Number of all entries.

```c
size_t namespace_count
```

Number of namespaces.
Macros

ESP_ERR_NVS_BASE
Starting number of error codes

ESP_ERR_NVS_NOT_INITIALIZED
The storage driver is not initialized

ESP_ERR_NVS_NOT_FOUND
A requested entry couldn’t be found or namespace doesn’t exist yet and mode is NVS_READONLY

ESP_ERR_NVS_TYPE_MISMATCH
The type of set or get operation doesn’t match the type of value stored in NVS

ESP_ERR_NVS_READ_ONLY
Storage handle was opened as read only

ESP_ERR_NVS_NOT_ENOUGH_SPACE
There is not enough space in the underlying storage to save the value

ESP_ERR_NVS_INVALID_NAME
Namespace name doesn’t satisfy constraints

ESP_ERR_NVS_INVALID_HANDLE
Handle has been closed or is NULL

ESP_ERR_NVS_REMOVE_FAILED
The value wasn’t updated because flash write operation has failed. The value was written however, and update will be finished after re-initialization of nvs, provided that flash operation doesn’t fail again.

ESP_ERR_NVS_KEY_TOO_LONG
Key name is too long

ESP_ERR_NVS_PAGE_FULL
Internal error; never returned by nvs API functions

ESP_ERR_NVS_INVALID_STATE
NVS is in an inconsistent state due to a previous error. Call nvs_flash_init and nvs_open again, then retry.

ESP_ERR_NVS_INVALID_LENGTH
String or blob length is not sufficient to store data

ESP_ERR_NVS_NO_FREE_PAGES
NVS partition doesn’t contain any empty pages. This may happen if NVS partition was truncated. Erase the whole partition and call nvs_flash_init again.

ESP_ERR_NVS_VALUE_TOO_LONG
Value doesn’t fit into the entry or string or blob length is longer than supported by the implementation

ESP_ERR_NVS_PART_NOT_FOUND
Partition with specified name is not found in the partition table
**ESP_ERR_NVS_NEW_VERSION_FOUND**
NVS partition contains data in new format and cannot be recognized by this version of code

**ESP_ERR_NVS_XTS_ENCR_FAILED**
XTS encryption failed while writing NVS entry

**ESP_ERR_NVS_XTS_DECR_FAILED**
XTS decryption failed while reading NVS entry

**ESP_ERR_NVS_XTS_CFG_FAILED**
XTS configuration setting failed

**ESP_ERR_NVS_XTS_CFG_NOT_FOUND**
XTS configuration not found

**ESP_ERR_NVS_ENCR_NOT_SUPPORTED**
NVS encryption is not supported in this version

**ESP_ERR_NVS_KEYS_NOT_INITIALIZED**
NVS key partition is uninitialized

**ESP_ERR_NVS_CORRUPT_KEY_PART**
NVS key partition is corrupt

**ESP_ERR_NVS_WRONG_ENCRYPTION**
NVS partition is marked as encrypted with generic flash encryption. This is forbidden since the NVS encryption works differently.

**ESP_ERR_NVS_CONTENT_DIFFERS**
Internal error; never returned by nvs API functions. NVS key is different in comparison

**NVS_DEFAULT_PART_NAME**
Default partition name of the NVS partition in the partition table

**NVS_PART_NAME_MAX_SIZE**
maximum length of partition name (excluding null terminator)

**NVS_KEY_NAME_MAX_SIZE**
Maximum length of NVS key name (including null terminator)

**NVS_NS_NAME_MAX_SIZE**
Maximum length of NVS namespace name (including null terminator)

**Type Definitions**

typedef uint32_t nvs_handle_t
    Opaque pointer type representing non-volatile storage handle

typedef nvs_handle_t nvs_handle
typedef nvs_open_mode_t nvs_open_mode

typedef struct nvs_opaque_iterator_t *nvs_iterator_t
    Opaque pointer type representing iterator to nvs entries

Enumerations

e num nvs_open_mode_t
    Mode of opening the non-volatile storage.
    Values:

    enumerator NVS_READONLY
        Read only

    enumerator NVS_READWRITE
        Read and write

e num nvs_type_t
    Types of variables.
    Values:

    enumerator NVS_TYPE_U8
        Type uint8_t

    enumerator NVS_TYPE_I8
        Type int8_t

    enumerator NVS_TYPE_U16
        Type uint16_t

    enumerator NVS_TYPE_I16
        Type int16_t

    enumerator NVS_TYPE_U32
        Type uint32_t

    enumerator NVS_TYPE_I32
        Type int32_t

    enumerator NVS_TYPE_U64
        Type uint64_t

    enumerator NVS_TYPE_I64
        Type int64_t

    enumerator NVS_TYPE_STR
        Type string
Chapter 2. API Reference

enumerator `NVS_TYPE_BLOB`
    Type blob

enumerator `NVS_TYPE_ANY`
    Must be last

2.9.4 NVS Encryption

Overview

This guide provides an overview of the NVS encryption feature. NVS encryption helps to achieve secure storage on the device flash memory.

Data stored in NVS partitions can be encrypted using XTS-AES in the manner similar to the one mentioned in disk encryption standard IEEE P1619. For the purpose of encryption, each entry is treated as one `sector` and relative address of the entry (w.r.t., partition-start) is fed to the encryption algorithm as `sector-number`.

NVS encryption can be facilitated by enabling `CONFIG_NVS_ENCRYPTION` and `CONFIG_NVS_SEC_KEY_PROTECTION SCHEME` > `CONFIG_NVS_SEC_KEY_PROTECT USING_FLASH_ENC` or `CONFIG_NVS_SEC_KEY_PROTECT USING HMAC` depending on the scheme to be used.

NVS Encryption: Flash Encryption-Based Scheme

In this scheme, the keys required for NVS encryption are stored in yet another partition, which is protected using Flash Encryption. Therefore, enabling Flash Encryption becomes a prerequisite for NVS encryption here.

NVS encryption is enabled by default when Flash Encryption is enabled. This is done because Wi-Fi driver stores credentials (like SSID and passphrase) in the default NVS partition. It is important to encrypt them as default choice if platform level encryption is already enabled.

For using NVS encryption using this scheme, the partition table must contain the `NVS Key Partition`. Two partition tables containing the `NVS Key Partition` are provided for NVS encryption under the partition table option (menuconfig>Partition Table). They can be selected with the project configuration menu (idf.py menuconfig). Please refer to the example `security/flash_encryption` for how to configure and use the NVS encryption feature.

NVS Key Partition An application requiring NVS encryption support (using the Flash Encryption-based scheme) needs to be compiled with a key-partition of the type `data` and subtype `key`. This partition should be marked as encrypted and its size should be the minimum partition size (4 KB). Refer to Partition Tables for more details. Two additional partition tables which contain the `NVS Key Partition` are provided under the partition table option (menuconfig>Partition Table). They can be directly used for NVS encryption. The structure of these partitions is depicted below:

```
+-----------+--------------+-------------+----+
| XTS encryption key (32) | +---------------------------------------------+
| +---------------------------------------------+
| XTS tweak key (32) | +---------------------------------------------+
| +---------------------------------------------+
| CRC32 (4) | +---------------------------------------------+
+-----------+--------------+-------------+----+
```

The XTS encryption keys in the `NVS Key Partition` can be generated in one of the following two ways.

Generate the keys on ESP32-S3 chip itself
When NVS encryption is enabled, the `nvs_flash_init()` API function can be used to initialize the encrypted default NVS partition. The API function internally generates the XTS encryption keys on the ESP chip. The API function finds the first NVS Key Partition.

Then the API function automatically generates and stores the NVS keys in that partition by making use of the `nvs_flash_generate_keys()` API function provided by `nvs_flash/include/nvs_flash.h`. New keys are generated and stored only when the respective key partition is empty. The same key partition can then be used to read the security configurations for initializing a custom encrypted NVS partition with help of `nvs_flash_secure_init_partition()`.

The API functions `nvs_flash_secure_init()` and `nvs_flash_secure_init_partition()` do not generate the keys internally. When these API functions are used for initializing encrypted NVS partitions, the keys can be generated after startup using the `nvs_flash_generate_keys()` API function provided by `nvs_flash.h`. The API function then writes those keys onto the key-partition in encrypted form.

**Note:** Please note that `nvs_keys` partition must be completely erased before you start the application in this approach. Otherwise the application may generate the `ESP_ERR_NVS_CORRUPT_KEY_PART` error code assuming that `nvs_keys` partition is not empty and contains malformed data. You can use the following command for this:

```
parttool.py --port PORT --partition-table-file=PARTITION_TABLE_FILE -- --partition-table-offset PARTITION_TABLE_OFFSET erase_partition -- --partition-type=data --partition-subtype=nvs_keys
```

Use a pre-generated NVS key partition

This option will be required by the user when keys in the NVS Key Partition are not generated by the application. The NVS Key Partition containing the XTS encryption keys can be generated with the help of NVS Partition Generator Utility. Then the user can store the pre-generated key partition on the flash with help of the following two commands:

1. Build and flash the partition table

   ```
   idf.py partition-table partition-table-flash
   ```

2. Store the keys in the NVS Key Partition (on the flash) with the help of `parttool.py` (see Partition Tool section in partition-tables for more details)

   ```
   parttool.py --port PORT --partition-table-offset PARTITION_TABLE_OFFSET_ -- --write_partition --partition-name="name of nvs_key partition" --input... --NVS_KEY_PARTITION_FILE
   ```

**Note:** If the device is encrypted in flash encryption development mode and you want to renew the NVS key partition, you need to tell `parttool.py` to encrypt the NVS key partition and you also need to give it a pointer to the unencrypted partition table in your build directory (build/partition_table) since the partition table on the device is encrypted, too. You can use the following command:

```
parttool.py --esptool-write-args encrypt --port PORT --partition-table- --file=PARTITION_TABLE_FILE --partition-table-offset PARTITION_TABLE_ --OFFSET write_partition --partition-name="name of nvs_key partition" -- --input NVS_KEY_PARTITION_FILE
```

Since the key partition is marked as encrypted and Flash Encryption is enabled, the bootloader will encrypt this partition using flash encryption key on the first boot.

It is possible for an application to use different keys for different NVS partitions and thereby have multiple key-partitions. However, it is a responsibility of the application to provide the correct key-partition and keys for encryption
NVS Encryption: HMAC Peripheral-Based Scheme

In this scheme, the XTS keys required for NVS encryption are derived from an HMAC key programmed in eFuse with the purpose `esp_efuse_purpose_t::ESP_EFUSE_KEY_PURPOSE_HMAC_UP`. Since the encryption keys are derived at runtime, they are not stored anywhere in the flash. Thus, this feature does not require a separate NVS Key Partition.

**Note:** This scheme enables us to achieve secure storage on ESP32-S3 **without enabling flash encryption**.

**Important:** Please take note that this scheme uses one eFuse block for storing the HMAC key required for deriving the encryption keys.

- When NVS encryption is enabled, the `nvs_flash_init()` API function can be used to initialize the encrypted default NVS partition. The API function first checks whether an HMAC key is present at `CONFIG_NVS_SEC_HMAC_EFUSE_KEY_ID`.

  **Note:** The valid range for the config `CONFIG_NVS_SEC_HMAC_EFUSE_KEY_ID` is from 0 (`hmac_key_id_t::HMAC_KEY0`) to 5 (`hmac_key_id_t::HMAC_KEY5`). By default, the config is set to 6 (`hmac_key_id_t::HMAC_KEY_MAX`), which have to be configured before building the user application.

- If no key is found, a key is generated internally and stored at the eFuse block specified at `CONFIG_NVS_SEC_HMAC_EFUSE_KEY_ID`.

- If a key is found with the purpose `esp_efuse_purpose_t::ESP_EFUSE_KEY_PURPOSE_HMAC_UP`, the same is used for the derivation of the XTS encryption keys.

- If the specified eFuse block is found to be occupied with a key with a purpose other than `esp_efuse_purpose_t::ESP_EFUSE_KEY_PURPOSE_HMAC_UP`, an error is thrown.

- The API `nvs_flash_init()` then automatically generates the NVS keys on demand by using the `nvs_flash_generate_keys_v2()` API function provided by the `nvs_flash/include/nvs_flash.h`. The same keys can also be used to read the security configurations (see `nvs_flash_read_security_cfg_v2()`) for initializing a custom encrypted NVS partition with help of `nvs_flash_secure_init_partition()`.

- The API functions `nvs_flash_secure_init()` and `nvs_flash_secure_init_partition()` do not generate the keys internally. When these API functions are used for initializing encrypted NVS partitions, the keys can be generated after startup using the `nvs_flash_generate_keys_v2()` API function or take and populate the NVS security configuration structure `nvs_sec_cfg_t` with `nvs_flash_read_security_cfg_v2()` and feed them into the above APIs.

**Note:** Users can program their own HMAC key in eFuse block beforehand by using the following command:

```
espefuse.py -p PORT burn_key <BLOCK_KEYN> <hmac_key_file.bin> HMAC_UP
```

Encrypted Read/Write

The same NVS API functions `nvs_get_*` or `nvs_set_*` can be used for reading of, and writing to an encrypted NVS partition as well.

Encrypt the default NVS partition
To enable encryption for the default NVS partition, no additional step is necessary. When **CONFIG_NVSEC_ENCRYPTION** is enabled, the `nvs_flash_init()` API function internally performs some additional steps to enable encryption for the default NVS partition depending on the scheme being used (set by **CONFIG_NVSEC_KEY_PROTECTION_SCHEME**).

For the flash encryption-based scheme, the first **NVS Key Partition** found is used to generate the encryption keys while for the HMAC one, keys are generated using the HMAC key burnt in eFuse at **CONFIG_NVSEC_HMAC_EFUSE_KEY_ID** (refer to the API documentation for more details).

Alternatively, `nvs_flash_secure_init()` API function can also be used to enable encryption for the default NVS partition.

**Encrypt a custom NVS partition**

To enable encryption for a custom NVS partition, `nvs_flash_secure_init_partition()` API function is used instead of `nvs_flash_init_partition()`.

When `nvs_flash_secure_init()` and `nvs_flash_secure_init_partition()` API functions are used, the applications are expected to follow the steps below in order to perform NVS read/write operations with encryption enabled:

1. Populate the NVS security configuration structure `nvs_sec_cfg_t`
   
   - For the Flash Encryption-based scheme
     
     * Find key partition and NVS data partition using `esp_partition_find_*` API functions.
     * Populate the `nvs_sec_cfg_t` struct using the `nvs_flash_read_security_cfg()` or `nvs_flash_generate_keys()` API functions.
   
   - For the HMAC-based scheme
     
     * Set the scheme-specific config data with `nvs_sec_config_hmac_t` and register the HMAC-based scheme with the API `nvs_sec_provider_register_hmac()` which will also populate the scheme-specific handle (see `nvs_sec_scheme_t`).
     * Populate the `nvs_sec_cfg_t` struct using the `nvs_flash_read_security_cfg_v2()` or `nvs_flash_generate_keys_v2()` API functions.

2. Initialise NVS partition using the `nvs_flash_secure_init()` or `nvs_flash_secure_init_partition()` API functions.

3. Open a namespace using the `nvs_open()` or `nvs_open_from_partition()` API functions.
4. Perform NVS read/write operations using `nvs_get_*` or `nvs_set_*`.
5. Deinitialise an NVS partition using `nvs_flash_deinit()`.

**Note:** While using the HMAC-based scheme, the above workflow can be used without enabling any of the config options for NVS encryption - `CONFIG_NVS_ENCRYPTION`, `CONFIG_NVS_SEC_KEY_PROTECTION_SCHEME` -> `CONFIG_NVS_SEC_KEY_PROTECT_USING_HMAC` and `CONFIG_NVS_SEC_HMAC_EFUSE_KEY_ID` to encrypt the default as well as custom NVS partitions with `nvs_flash_secure_init()` API.

### NVS Security Provider

The component `nvs_sec_provider` stores all the implementation-specific code for the NVS encryption schemes and would also accommodate any future schemes. This component acts as an interface to the `nvs_flash` component for the handling of encryption keys. `nvs_sec_provider` has a configuration menu of its own, based on which the selected security scheme and the corresponding settings are registered for the `nvs_flash` component.

This component offers factory functions with which a particular security scheme can be registered without having to worry about the APIs to generate and read the encryption keys (e.g., `nvs_sec_provider_register_hmac()`). Refer to the `security/nvs_encryption_hmac` example for API usage.

### API Reference

#### Header File

- `components/nvs_sec_provider/include/nvs_sec_provider.h`
- This header file can be included with:

  ```
  #include "nvs_sec_provider.h"
  ```

- This header file is a part of the API provided by the `nvs_sec_provider` component. To declare that your component depends on `nvs_sec_provider`, add the following to your CMakeLists.txt:

  ```
  REQUIRES nvs_sec_provider
  ```

  or

  ```
  PRIV_REQUIRES nvs_sec_provider
  ```

#### Functions

- `esp_err_t nvs_sec_provider_register_flash_enc` (const `nvs_sec_config_flash_enc_t` *`sec_scheme_cfg`, `nvs_sec_scheme_t` **`sec_scheme_handle_out`)

  Register the Flash-Encryption based scheme for NVS Encryption.

  **Parameters**
  - `sec_scheme_cfg` - [in] Security scheme specific configuration data
  - `sec_scheme_handle_out` - [out] Security scheme specific configuration handle

  **Returns**
  - ESP_OK, if `sec_scheme_handle_out` was populated successfully with the scheme configuration:
  - ESP_ERR_INVALID_ARG, if `scheme_cfg_hmac` is NULL;
  - ESP_ERR_NO_MEM, No memory for the scheme-specific handle
  - `sec_scheme_handle_out`
  - ESP_ERR_NOT_FOUND, if no `nvs_keys` partition is found

- `esp_err_t nvs_sec_provider_register_hmac` (const `nvs_sec_config_hmac_t` *`sec_scheme_cfg`, `nvs_sec_scheme_t` **`sec_scheme_handle_out`)

  Register the HMAC-based scheme for NVS Encryption.
Chapter 2. API Reference

Parameters
- `sec_scheme_cfg`  [in] Security scheme specific configuration data
- `sec_scheme_handle_out`  [out] Security scheme specific configuration handle

Returns
- ESP_OK, if `sec_scheme_handle_out` was populated successfully with the scheme configuration;
- ESP_ERR_INVALID_ARG, if `scheme_cfg_hmac` is NULL;
- ESP_ERR_NO_MEM, No memory for the scheme-specific handle

`esp_err_t nvs_sec_provider_deregister(nvs_sec_scheme_t *sec_scheme_handle)`
Deregister the NVS encryption scheme registered with the given handle.

Parameters `sec_scheme_handle`  [in] Security scheme specific configuration handle

Returns
- ESP_OK, if the scheme registered with `sec_scheme_handle` was deregistered successfully
- ESP_ERR_INVALID_ARG, if `sec_scheme_handle` is NULL;

Structures

`struct nvs_sec_config_flash_enc_t`  
Flash encryption-based scheme specific configuration data.

Public Members

- `const esp_partition_t *nvs_keys_part`  
Partition of subtype `nvs_keys` holding the NVS encryption keys

`struct nvs_sec_config_hmac_t`  
HMAC-based scheme specific configuration data.

Public Members

- `hmac_key_id_t hmac_key_id`  
HMAC Key ID used for generating the NVS encryption keys

Macros

- `ESP_ERR_NVSECBASE`  
Starting number of error codes
- `ESP_ERR_NVSECHMACKEYNOTFOUND`  
HMAC Key required to generate the NVS encryption keys not found
- `ESP_ERR_NVSECHMACKEYBLKALREADYUSED`  
Provided eFuse block for HMAC key generation is already in use
- `ESP_ERR_NVSECHMACKEYGENERATIONFAILED`  
Failed to generate/write the HMAC key to eFuse
Chapter 2. API Reference

ESP_ERR_NVS_SEC_HMAC_XTS_KEYS_DERIV_FAILED
Failed to derive the NVS encryption keys based on the HMAC-based scheme

NVS_SEC_PROVIDER_CFG_FLASH_ENC_DEFAULT()
Helper for populating the Flash encryption-based scheme specific configuration data.

NVS_SEC_PROVIDER_CFG_HMAC_DEFAULT()
Helper for populating the HMAC-based scheme specific configuration data.

Enumerations

e num nvs_sec_scheme_id_t
NVS Encryption Keys Protection Scheme.

Values:

e enumeratornvsSEC_SCHEME_FLASH_ENC
Protect NVS encryption keys using Flash Encryption

e enumeratornvsSEC_SCHEME_HMAC
Protect NVS encryption keys using HMAC peripheral

e enumeratornvsSEC_SCHEME_MAX

2.9.5 NVS Partition Generator Utility

Introduction

The utility nvs_flash/nvs_partition_generator/nvs_partition_gen.py creates a binary file, compatible with the NVS architecture defined in Non-Volatile Storage Library, based on the key-value pairs provided in a CSV file.

This utility is ideally suited for generating a binary blob, containing data specific to ODM/OEM, which can be flashed externally at the time of device manufacturing. This allows manufacturers to generate many instances of the same application firmware with customized parameters for each device, such as a serial number.

Prerequisites

To use this utility in encryption mode, install the following packages:

- cryptography

All the required packages are included in requirements.txt in the root of the ESP-IDF directory.

CSV File Format Each line of a CSV file should contain 4 parameters, separated by a comma. The table below describes each of these parameters.
### Chapter 2. API Reference

<table>
<thead>
<tr>
<th>No.</th>
<th>Parameter</th>
<th>Description</th>
<th>Notes</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Key</td>
<td>Key of the data. The data can be accessed later from an application using this key.</td>
<td></td>
</tr>
<tr>
<td>2</td>
<td>Type</td>
<td>Supported values are file, data, and namespace.</td>
<td></td>
</tr>
<tr>
<td>3</td>
<td>Encoding</td>
<td>Supported values are: u8, i8, u16, i16, u32, i32, u64, i64, string, hex2bin, base64, and binary. This specifies how actual data values are encoded in the resulting binary file. The difference between the string and binary encoding is that string data is terminated with a NULL character, whereas binary data is not.</td>
<td></td>
</tr>
<tr>
<td>4</td>
<td>Value</td>
<td>Data value</td>
<td>Encoding and Value cells for the namespace field type should be empty. Encoding and Value of namespace are fixed and are not configurable. Any values in these cells are ignored.</td>
</tr>
</tbody>
</table>

**Note:** The first line of the CSV file should always be the column header and it is not configurable.

Below is an example dump of such a CSV file:

```csv
key,type,encoding,value            <!-- column header
namespace_name,namespace,           <!-- First entry should be of type "namespace"
key1,data,u8,1
key2,file,string,/path/to/file
```

**Note:**

Make sure there are no spaces:
- before and after ``,`
- at the end of each line in a CSV file

**NVS Entry and Namespace Association**

When a namespace entry is encountered in a CSV file, each following entry will be treated as part of that namespace until the next namespace entry is found. At this point, all the following entries will be treated as part of the new namespace.

**Note:** First entry in a CSV file should always be a namespace entry.

**Multipage Blob Support**

By default, binary blobs are allowed to span over multiple pages and are written in the format mentioned in Section Structure of Entry. If you intend to use the older format, the utility provides an option to disable this feature.
Chapter 2. API Reference

Encryption-Decryption Support

The NVS Partition Generator utility also allows you to create an encrypted binary file and decrypt an encrypted one. The utility uses the XTS-AES encryption. Please refer to NVS Encryption for more details.

Running the Utility

Usage:

```
python nvs_partition_gen.py [-h] (generate,generate-key,encrypt,decrypt) ...
```

Optional Arguments:

<table>
<thead>
<tr>
<th>No.</th>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>-h/--help</td>
<td>Show the help message and exit</td>
</tr>
</tbody>
</table>

Commands:

Run `nvs_partition_gen.py {command} -h` for additional help

<table>
<thead>
<tr>
<th>No.</th>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>generate</td>
<td>Generate NVS partition</td>
</tr>
<tr>
<td>2</td>
<td>generate-key</td>
<td>Generate keys for encryption</td>
</tr>
<tr>
<td>3</td>
<td>encrypt</td>
<td>Generate NVS encrypted partition</td>
</tr>
<tr>
<td>4</td>
<td>decrypt</td>
<td>Decrypt NVS encrypted partition</td>
</tr>
</tbody>
</table>

Generate NVS Partition (Default) Usage:

```
python nvs_partition_gen.py generate [-h] [--version {1,2}] [--outdir OUTDIR] --input input output size
```

Positional Arguments:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>input</td>
<td>Path to CSV file to parse</td>
</tr>
<tr>
<td>output</td>
<td>Path to output NVS binary file</td>
</tr>
<tr>
<td>size</td>
<td>Size of NVS partition in bytes (must be multiple of 4096)</td>
</tr>
</tbody>
</table>

Optional Arguments:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>-h/--help</td>
<td>Show the help message and exit</td>
</tr>
<tr>
<td>--version {1,2}</td>
<td>Set multipage blob version (Default: Version 2)</td>
</tr>
<tr>
<td></td>
<td>Version 1 - Multipage blob support disabled</td>
</tr>
<tr>
<td></td>
<td>Version 2 - Multipage blob support enabled</td>
</tr>
<tr>
<td>--outdir OUTDIR</td>
<td>Output directory to store file created (Default: current directory)</td>
</tr>
</tbody>
</table>

You can run the utility to generate NVS partition using the command below. A sample CSV file is provided with the utility:

```
python nvs_partition_gen.py generate sample_singlepage_blob.csv sample.bin 0x3000
```
Generate Encryption Keys Partition

**Usage:**
```
```

**Optional Arguments:**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>-h/--help</td>
<td>Show the help message and exit</td>
</tr>
<tr>
<td>--keyfile KEYFILE</td>
<td>Path to output encryption keys file</td>
</tr>
<tr>
<td>--outdir OUTDIR</td>
<td>Output directory to store files created. (Default: current directory)</td>
</tr>
</tbody>
</table>

**Optional Arguments (HMAC scheme-specific):**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>--key_protect_hmac</td>
<td>If set, the NVS encryption key protection scheme based on HMAC peripheral is used; else the default scheme based on flash encryption is used</td>
</tr>
<tr>
<td>--kp_hmac_keygen</td>
<td>Generate the HMAC key for HMAC-based encryption scheme</td>
</tr>
<tr>
<td>--kp_hmac_keyfile KP_HMAC_KEYFILE</td>
<td>Path to output the HMAC key file</td>
</tr>
<tr>
<td>--kp_hmac_inputkey KP_HMAC_INPUTKEY</td>
<td>File having the HMAC key for generating the NVS encryption keys</td>
</tr>
</tbody>
</table>

You can run the utility to generate only the encryption key partition using the command below:
```
python nvs_partition_gen.py generate-key
```

For generating encryption key for the HMAC-based scheme, the following commands can be used:

- Generate the HMAC key and the NVS encryption keys:
  ```
  python nvs_partition_gen.py generate-key --key_protect_hmac --kp_hmac_keygen
  ```

**Note:** Encryption key of the format `<outdir>/keys/keys-<timestamp>.bin` and HMAC key of the format `<outdir>/keys/hmac-keys-<timestamp>.bin` are created.

- Generate the NVS encryption keys, given the HMAC key:
  ```
  python nvs_partition_gen.py generate-key --key_protect_hmac --kp_hmac_inputkey --testdata/sample_hmac_key.bin
  ```

**Note:** You can provide the custom filename for the HMAC key as well as the encryption key as a parameter.

Generate Encrypted NVS Partition

**Usage:**
```
```
Positional Arguments:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>input</td>
<td>Path to CSV file to parse</td>
</tr>
<tr>
<td>output</td>
<td>Path to output NVS binary file</td>
</tr>
<tr>
<td>size</td>
<td>Size of NVS partition in bytes (must be multiple of 4096)</td>
</tr>
</tbody>
</table>

Optional Arguments:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>-h/-help</td>
<td>Show the help message and exit</td>
</tr>
</tbody>
</table>
| --version {1,2} | Set multipage blob version (Default: Version 2) 
Version 1 - Multipage blob support disabled 
Version 2 - Multipage blob support enabled |
| --keygen      | Generates key for encrypting NVS partition |
| --keyfile KEYFILE | Path to output encryption keys file |
| --inputkey INPUTKEY | File having key for encrypting NVS partition |
| --outdir OUTDIR | Output directory to store file created (Default: current directory) |

Optional Arguments (HMAC scheme-specific):

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>--key_protect_hmac</td>
<td>If set, the NVS encryption key protection scheme based on HMAC peripheral is used; else the default scheme based on flash encryption is used</td>
</tr>
<tr>
<td>--kp_hmac_keygen</td>
<td>Generate the HMAC key for HMAC-based encryption scheme</td>
</tr>
<tr>
<td>--kp_hmac_keyfile KP_HMAC_KEYFILE</td>
<td>Path to output HMAC key file</td>
</tr>
<tr>
<td>--kp_hmac_inputkey KP_HMAC_INPUTKEY</td>
<td>File having the HMAC key for generating the NVS encryption keys</td>
</tr>
</tbody>
</table>

You can run the utility to encrypt NVS partition using the command below. A sample CSV file is provided with the utility:

- Encrypt by allowing the utility to generate encryption keys:

```
python nvs_partition_gen.py encrypt sample_singlepage_blob.csv sample_encr.bin--0x3000 --keygen
```

**Note**: Encryption key of the format <outdir>/keys/keys-<timestamp>.bin is created.

- To generate an encrypted partition using the HMAC-based scheme, the above command can be used along with some additional parameters.
  - Encrypt by allowing the utility to generate encryption keys and the HMAC-key:

```
python nvs_partition_gen.py encrypt sample_singlepage_blob.csv sample_encr.bin 0x3000 --keygen --key_protect_hmac --kp_hmac_keygen
```

**Note**: Encryption key of the format <outdir>/keys/keys-<timestamp>.bin and HMAC key of the format <outdir>/keys/hmac-keys-<timestamp>.bin are created.

  - Encrypt by allowing the utility to generate encryption keys with user-provided HMAC-key:
Chapter 2. API Reference

Note: You can provide the custom filename for the HMAC key as well as the encryption key as a parameter.

- Encrypt by allowing the utility to generate encryption keys and store it in provided custom filename:

```
python nvs_partition_gen.py encrypt sample_singlepage_blob.csv sample_encr.bin
  --0x3000 --keygen --key_protect_hmac --kp_hmac_inputkey testdata/
  --sample_hmac_key.bin
```

Note:
- Encryption key of the format `<outdir>/keys/sample_keys.bin` is created.
- This newly created file having encryption keys in `keys/` directory is compatible with NVS key-partition structure. Refer to NVS Key Partition for more details.

- Encrypt by providing the encryption keys as input binary file:

```
python nvs_partition_gen.py encrypt sample_singlepage_blob.csv sample_encr.bin
  --0x3000 --inputkey sample_keys.bin
```

### Decrypt Encrypted NVS Partition

#### Usage:

```
python nvs_partition_gen.py decrypt [-h] [--outdir OUTDIR] input key output
```

#### Positional Arguments:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>input</td>
<td>Path to encrypted NVS partition file to parse</td>
</tr>
<tr>
<td>key</td>
<td>Path to file having keys for decryption</td>
</tr>
<tr>
<td>output</td>
<td>Path to output decrypted binary file</td>
</tr>
</tbody>
</table>

#### Optional Arguments:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>-h/--help</td>
<td>Show the help message and exit</td>
</tr>
<tr>
<td>--outdir OUTDIR</td>
<td>Output directory to store files created. (Default: current directory)</td>
</tr>
</tbody>
</table>

You can run the utility to decrypt encrypted NVS partition using the command below:

```bash
python nvs_partition_gen.py decrypt sample_encr.bin sample_keys.bin sample_decr.bin
```

You can also provide the format version number:

- Multipage blob support disabled (Version 1)
- Multipage blob support enabled (Version 2)

#### Multipage Blob Support Disabled (Version 1)

You can run the utility in this format by setting the version parameter to 1, as shown below. A sample CSV file for the same is provided with the utility:

```
python nvs_partition_gen.py generate sample_singlepage_blob.csv sample.bin 0x3000
  --version 1
```
Multipage Blob Support Enabled (Version 2)  You can run the utility in this format by setting the version parameter to 2, as shown below. A sample CSV file for the same is provided with the utility:

```
python nvs_partition_gen.py generate sample_multipage_blob.csv sample.bin 0x4000 --version 2
```

Note:
- Minimum NVS Partition Size needed is 0x3000 bytes.
- When flashing the binary onto the device, make sure it is consistent with the application’s sdkconfig.

Caveats

- Utility does not check for duplicate keys and will write data pertaining to both keys. You need to make sure that the keys are distinct.
- Once a new page is created, no data will be written in the space left on the previous page. Fields in the CSV file need to be ordered in such a way as to optimize memory.
- 64-bit datatype is not yet supported.

2.9.6 NVS Partition Parser Utility

Introduction

The utility `nvs_flash/nvs_partition_tool/nvs_tool.py` loads and parses an NVS storage partition for easier debugging and data extraction. The utility also features integrity check which scans the partition for potential errors. Data blobs are encoded in base64 format.

Encrypted Partitions

This utility does not support decryption. To decrypt the NVS partition, please use the `NVS Partition Generator Utility` which does support NVS partition encryption and decryption.

Usage

There are two output format styles available with the `-f` or `--format` option:
- `json` - All of the output is printed as a JSON.
- `text` - The output is printed as a human-readable text with different selectable output styles mentioned below.

For the `text` output format, the utility provides six different output styles with the `-d` or `--dump` option:
- `all` (default) - Prints all entries with metadata.
- `written` - Prints only written entries with metadata.
- `minimal` - Prints written `namespace:key = value` pairs.
- `namespaces` - Prints all written namespaces
- `blobs` - Prints all blobs and strings (reconstructs them if they are chunked).
- `storage_info` - Prints entry states count for every page.

Note: There is also a `none` option which will not print anything. This can be used with the integrity check option if the NVS partition contents are irrelevant.
Chapter 2. API Reference

The utility also provides an integrity check feature via the \texttt{-i} or \texttt{--integrity-check} option (available only with the \texttt{text} format as it would invalidate the \texttt{json} output). This feature scans through the entire partition and prints potential errors. It can be used with the \texttt{-d none} option which will print only the potential errors.

2.9.7 SD/SDIO/MMC Driver

Overview

The SD/SDIO/MMC driver currently supports SD memory, SDIO cards, and eMMC chips. This is a protocol level driver built on top of SDMMC and SD SPI host drivers.

SDMMC and SD SPI host drivers (\texttt{driver/sdmmc/include/driver/sdmmc_host.h} and \texttt{driver/spi/include/driver/sdsdi_host.h}) provide API functions for:

- Sending commands to slave devices
- Sending and receiving data
- Handling error conditions within the bus

For functions used to initialize and configure:

- SDMMC host, see \texttt{SDMMC Host API}
- SD SPI host, see \texttt{SD SPI Host API}

The SDMMC protocol layer described in this document handles the specifics of the SD protocol, such as the card initialization and data transfer commands.

The protocol layer works with the host via the \texttt{sdmmc_host_t} structure. This structure contains pointers to various functions of the host.

Pin Configurations

..only:: SOC_SDMMC_USE_IOMUX and not SOC_SDMMC_USE_GPIO_MATRIX

SDMMC pins are dedicated, you don’t have to configure the pins.

..only:: SOC_SDMMC_USE_GPIO_MATRIX and not SOC_SDMMC_USE_IOMUX

SDMMC pin signals are routed via GPIO Matrix, so you will need to configure the pins in \texttt{sdmmc_slot_config_t}.

..only:: esp32p4

SDMMC have two slots:

- slot 0 pins are dedicated for UHS-I mode. This is not yet supported in the driver.
- slot 1 pins are routed via GPIO Matrix, and it’s for non UHS-I usage. You will need to configure the pins in \texttt{sdmmc_slot_config_t} to use the slot 1.

Application Example

An example which combines the SDMMC driver with the FATFS library is provided in the \texttt{storage/sd_card} directory of ESP-IDF examples. This example initializes the card, then writes and reads data from it using POSIX and C library APIs. See README.md file in the example directory for more information.
**Combo (Memory + IO) Cards**  The driver does not support SD combo cards. Combo cards are treated as IO cards.

**Thread Safety**  Most applications need to use the protocol layer only in one task. For this reason, the protocol layer does not implement any kind of locking on the `sdmmc_card_t` structure, or when accessing SDMMC or SD SPI host drivers. Such locking is usually implemented on a higher layer, e.g., in the filesystem driver.

**Protocol Layer API**

The protocol layer is given the `sdmmc_host_t` structure. This structure describes the SD/MMC host driver, lists its capabilities, and provides pointers to functions of the driver. The protocol layer stores card-specific information in the `sdmmc_card_t` structure. When sending commands to the SD/MMC host driver, the protocol layer uses the `sdmmc_command_t` structure to describe the command, arguments, expected return values, and data to transfer if there is any.

**Using API with SD Memory Cards**

1. To initialize the host, call the host driver functions, e.g., `sdmmc_host_init()`, `sdmmc_host_init_slot()`.
2. To initialize the card, call `sdmmc_card_init()` and pass to it the parameters `host` - the host driver information, and `card` - a pointer to the structure `sdmmc_card_t` which will be filled with information about the card when the function completes.
3. To read and write sectors of the card, use `sdmmc_read_sectors()` and `sdmmc_write_sectors()` respectively and pass to it the parameter `card` - a pointer to the card information structure.
4. If the card is not used anymore, call the host driver function - e.g., `sdmmc_host_deinit()` - to disable the host peripheral and free the resources allocated by the driver.

**Using API with eMMC Chips**  From the protocol layer’s perspective, eMMC memory chips behave exactly like SD memory cards. Even though eMMCs are chips and do not have a card form factor, the terminology for SD cards can still be applied to eMMC due to the similarity of the protocol (`sdmmc_card_t`, `sdmmc_card_init`). Note that eMMC chips cannot be used over SPI, which makes them incompatible with the SD SPI host driver.

To initialize eMMC memory and perform read/write operations, follow the steps listed for SD cards in the previous section.

**Using API with SDIO Cards**  Initialization and the probing process are the same as with SD memory cards. The only difference is in data transfer commands in SDIO mode.

During the card initialization and probing, performed with `sdmmc_card_init()`, the driver only configures the following registers of the IO card:

1. The IO portion of the card is reset by setting RES bit in the I/O Abort (0x06) register.
2. If 4-line mode is enabled in host and slot configuration, the driver attempts to set the Bus width field in the Bus Interface Control (0x07) register. If setting the filed is successful, which means that the slave supports 4-line mode, the host is also switched to 4-line mode.
3. If high-speed mode is enabled in the host configuration, the SHS bit is set in the High Speed (0x13) register.

In particular, the driver does not set any bits in (1) I/O Enable and Int Enable registers, (2) I/O block sizes, etc. Applications can set them by calling `sdmmc_io_write_byte()`.

For card configuration and data transfer, choose the pair of functions relevant to your case from the table below.
Action | Read Function | Write Function
---|---|---
Read and write a single byte using IO_RW_DIRECT (CMD52) | sd-mmc_io_read_byte() | sd-mmc_io_write_byte() |
Read and write multiple bytes using IO_RW_EXTENDED (CMD53) in byte mode | sd-mmc_io_read_bytes() | sd-mmc_io_write_bytes() |
Read and write blocks of data using IO_RW_EXTENDED (CMD53) in block mode | sd-mmc_io_read_blocks() | sd-mmc_io_write_blocks() |

SDIO interrupts can be enabled by the application using the function `sdmmc_io_enable_int()`. When using SDIO in 1-line mode, the D1 line also needs to be connected to use SDIO interrupts.

If you want the application to wait until the SDIO interrupt occurs, use `sdmmc_io_wait_int()`.

API Reference

Header File

- components/sdmmc/include/sdmmc_cmd.h
- This header file can be included with:
  ```c
  #include "sdmmc_cmd.h"
  ```
- This header file is a part of the API provided by the sdmmc component. To declare that your component depends on sdmmc, add the following to your CMakelists.txt:
  ```cmake
  REQUIRES sdmmc
  ```
  or
  ```cmake
  PRIV_REQUIRES sdmmc
  ```

Functions

**esp_err_t sdmmc_card_init** (const *sdmmc_host_t*host,*sdmmc_card_t*out_card)

Probe and initialize SD/MMC card using given host.

**Note:** Only SD cards (SDSC and SDHC/SDXC) are supported now. Support for MMC/eMMC cards will be added later.

**Parameters**

- host - pointer to structure defining host controller
- out_card - pointer to structure which will receive information about the card when the function completes

**Returns**

- ESP_OK on success
- One of the error codes from SDMMC host controller

void **sdmmc_card_print_info** (FILE *stream,const *sdmmc_card_t*card)

Print information about the card to a stream.

**Parameters**

- stream - stream obtained using fopen or fdopen
- card - card information structure initialized using sdmmc_card_init

**esp_err_t sdmmc_get_status** (*sdmmc_card_t*card)

Get status of SD/MMC card

**Parameters**

- card - pointer to card information structure previously initialized using sdmmc_card_init
Chapter 2. API Reference

**Returns**
- ESP_OK on success
- One of the error codes from SDMMC host controller

```c
esp_err_t sdmmc_write_sectors(sdmmc_card_t *card, const void *src, size_t start_sector, size_t sector_count)
```

Write given number of sectors to SD/MMC card

**Parameters**
- **card** – pointer to card information structure previously initialized using sdmmc_card_init
- **src** – pointer to data buffer to read data from; data size must be equal to sector_count * card->csd.sector_size
- **start_sector** – sector where to start writing
- **sector_count** – number of sectors to write

**Returns**
- ESP_OK on success or sector_count equal to 0
- One of the error codes from SDMMC host controller

```c
esp_err_t sdmmc_read_sectors(sdmmc_card_t *card, void *dst, size_t start_sector, size_t sector_count)
```

Read given number of sectors from the SD/MMC card

**Parameters**
- **card** – pointer to card information structure previously initialized using sdmmc_card_init
- **dst** – pointer to data buffer to write into; buffer size must be at least sector_count * card->csd.sector_size
- **start_sector** – sector where to start reading
- **sector_count** – number of sectors to read

**Returns**
- ESP_OK on success or sector_count equal to 0
- One of the error codes from SDMMC host controller

```c
esp_err_t sdmmc_erase_sectors(sdmmc_card_t *card, size_t start_sector, size_t sector_count, sdmmc_erase_arg_t arg)
```

Erase given number of sectors from the SD/MMC card

**Parameters**
- **card** – pointer to card information structure previously initialized using sdmmc_card_init
- **start_sector** – sector where to start erase
- **sector_count** – number of sectors to erase
- **arg** – erase command (CMD38) argument

**Returns**
- ESP_OK on success or sector_count equal to 0
- One of the error codes from SDMMC host controller

```c
esp_err_t sdmmc_can_discard(sdmmc_card_t *card)
```

Check if SD/MMC card supports discard

**Parameters**
- **card** – pointer to card information structure previously initialized using sdmmc_card_init

**Returns**
- ESP_OK if supported by the card/device
- ESP_FAIL if not supported by the card/device

```c
esp_err_t sdmmc_can_trim(sdmmc_card_t *card)
```

Check if SD/MMC card supports trim

**Note:** When sdmmc_erase_sectors used with cards in SDSPi mode, it was observed that card requires re-init after erase operation.
**Parameters**
card – pointer to card information structure previously initialized using sdmmc_card_init

**Returns**
- ESP_OK if supported by the card/device
- ESP_FAIL if not supported by the card/device

`esp_err_t sdmmc_mmc_can_sanitize(sdmmc_card_t *card)`

Check if SD/MMC card supports sanitize

**Parameters**
card – pointer to card information structure previously initialized using sdmmc_card_init

**Returns**
- ESP_OK if supported by the card/device
- ESP_FAIL if not supported by the card/device

`esp_err_t sdmmc_mmc_sanitize(sdmmc_card_t *card, uint32_t timeout_ms)`

Sanitize the data that was unmapped by a Discard command

**Note:** Discard command has to precede sanitize operation. To discard, use MMC_DICARD_ARG with sdmmc_erase_sectors argument

**Parameters**
- card – pointer to card information structure previously initialized using sdmmc_card_init
- timeout_ms – timeout value in milliseconds required to sanitize the selected range of sectors.

**Returns**
- ESP_OK on success
- One of the error codes from SDMMC host controller

`esp_err_t sdmmc_full_erase(sdmmc_card_t *card)`

Erase complete SD/MMC card

**Parameters**
card – pointer to card information structure previously initialized using sdmmc_card_init

**Returns**
- ESP_OK on success
- One of the error codes from SDMMC host controller

`esp_err_t sdmmc_io_read_byte(sdmmc_card_t *card, uint32_t function, uint32_t reg, uint8_t *out_byte)`

Read one byte from an SDIO card using IO_RW_DIRECT (CMD52)

**Parameters**
- card – pointer to card information structure previously initialized using sdmmc_card_init
- function – IO function number
- reg – byte address within IO function
- out_byte – [out] output, receives the value read from the card

**Returns**
- ESP_OK on success
- One of the error codes from SDMMC host controller

`esp_err_t sdmmc_io_write_byte(sdmmc_card_t *card, uint32_t function, uint32_t reg, uint8_t in_byte, uint8_t *out_byte)`

Write one byte to an SDIO card using IO_RW_DIRECT (CMD52)

**Parameters**
- card – pointer to card information structure previously initialized using sdmmc_card_init
- function – IO function number
- reg – byte address within IO function
- in_byte – value to be written
• **out_byte** [out] if not NULL, receives new byte value read from the card (read-after-write).

**Returns**

• ESP_OK on success
• One of the error codes from SDMMC host controller

```c
esp_err_t sdmmc_io_read_bytes(sdmmc_card_t *card, uint32_t function, uint32_t addr, void *dst, size_t size)
```

Read multiple bytes from an SDIO card using IO_RW_EXTENDED (CMD53)

This function performs read operation using CMD53 in byte mode. For block mode, see `sdmmc_io_read_blocks`.

**Parameters**

• **card** – pointer to card information structure previously initialized using `sdmmc_card_init`
• **function** – IO function number
• **addr** – byte address within IO function where reading starts
• **dst** – buffer which receives the data read from card
• **size** – number of bytes to read

**Returns**

• ESP_OK on success
• ESP_ERR_INVALID_SIZE if size exceeds 512 bytes
• One of the error codes from SDMMC host controller

```c
esp_err_t sdmmc_io_write_bytes(sdmmc_card_t *card, uint32_t function, uint32_t addr, const void *src, size_t size)
```

Write multiple bytes to an SDIO card using IO_RW_EXTENDED (CMD53)

This function performs write operation using CMD53 in byte mode. For block mode, see `sdmmc_io_write_blocks`.

**Parameters**

• **card** – pointer to card information structure previously initialized using `sdmmc_card_init`
• **function** – IO function number
• **addr** – byte address within IO function where writing starts
• **src** – data to be written
• **size** – number of bytes to write

**Returns**

• ESP_OK on success
• ESP_ERR_INVALID_SIZE if size exceeds 512 bytes
• One of the error codes from SDMMC host controller

```c
esp_err_t sdmmc_io_read_blocks(sdmmc_card_t *card, uint32_t function, uint32_t addr, void *dst, size_t size)
```

Read blocks of data from an SDIO card using IO_RW_EXTENDED (CMD53)

This function performs read operation using CMD53 in block mode. For byte mode, see `sdmmc_io_read_bytes`.

**Parameters**

• **card** – pointer to card information structure previously initialized using `sdmmc_card_init`
• **function** – IO function number
• **addr** – byte address within IO function where writing starts
• **dst** – buffer which receives the data read from card
• **size** – number of bytes to read, must be divisible by the card block size.

**Returns**

• ESP_OK on success
• ESP_ERR_INVALID_SIZE if size is not divisible by 512 bytes
• One of the error codes from SDMMC host controller

```c
esp_err_t sdmmc_io_write_blocks(sdmmc_card_t *card, uint32_t function, uint32_t addr, const void *src, size_t size)
```
Write blocks of data to an SDIO card using IO_RW_EXTENED (CMD53)

This function performs write operation using CMD53 in block mode. For byte mode, see sdmmc_io_write_bytes.

Parameters
- `card` — pointer to card information structure previously initialized using sdmmc_card_init
- `function` — IO function number
- `addr` — byte address within IO function where writing starts
- `src` — data to be written
- `size` — number of bytes to read, must be divisible by the card block size.

Returns
- ESP_OK on success
- ESP_ERR_INVALID_SIZE if size is not divisible by 512 bytes
- One of the error codes from SDMMC host controller

```c
esp_err_t sdmmc_io_enable_int (sdmmc_card_t *card)
```

Enable SDIO interrupt in the SDMMC host

Parameters `card` — pointer to card information structure previously initialized using sdmmc_card_init

Returns
- ESP_OK on success
- ESP_ERR_NOT_SUPPORTED if the host controller does not support IO interrupts

```c
esp_err_t sdmmc_io_wait_int (sdmmc_card_t *card, TickType_t timeout_ticks)
```

Block until an SDIO interrupt is received

Slave uses D1 line to signal interrupt condition to the host. This function can be used to wait for the interrupt.

Parameters
- `card` — pointer to card information structure previously initialized using sdmmc_card_init
- `timeout_ticks` — time to wait for the interrupt, in RTOS ticks

Returns
- ESP_OK if the interrupt is received
- ESP_ERR_NOT_SUPPORTED if the host controller does not support IO interrupts
- ESP_ERR_TIMEOUT if the interrupt does not happen in timeout_ticks

```c
esp_err_t sdmmc_io_get_cis_data (sdmmc_card_t *card, uint8_t *out_buffer, size_t buffer_size, size_t *inout_cis_size)
```

Get the data of CIS region of an SDIO card.

You may provide a buffer not sufficient to store all the CIS data. In this case, this function stores as much data into your buffer as possible. Also, this function will try to get and return the size required for you.

Parameters
- `card` — pointer to card information structure previously initialized using sdmmc_card_init
- `out_buffer` — Output buffer of the CIS data
- `buffer_size` — Size of the buffer.
- `inout_cis_size` — Mandatory, pointer to a size, input and output.
  - input: Limitation of maximum searching range, should be 0 or larger than buffer_size.
    The function searches for CIS_CODE_END until this range. Set to 0 to search infinitely.
  - output: The size required to store all the CIS data, if CIS_CODE_END is found.

Returns
- ESP_OK: on success
- ESP_ERR_INVALID_RESPONSE: if the card does not (correctly) support CIS.
- ESP_ERR_INVALID_SIZE: CIS_CODE_END found, but buffer_size is less than required size, which is stored in the inout_cis_size then.
- ESP_ERR_NOT_FOUND: if the CIS_CODE_END not found. Increase input value of
inout_cis_size or set it to 0, if you still want to search for the end; output value of inout_cis_size is invalid in this case.

and other error code return from sdmmc_io_read_bytes

esp_err_t sdmmc_io_print_cis_info (uint8_t *buffer, size_t buffer_size, FILE *fp)
Parse and print the CIS information of an SDIO card.

**Note:** Not all the CIS codes and all kinds of tuples are supported. If you see some unresolved code, you can add the parsing of these code in sdmmc_io.c and contribute to the IDF through the Github repository.

using sdmmc_card_init

---

**Parameters**

- **buffer** - Buffer to parse
- **buffer_size** - Size of the buffer.
- **fp** - File pointer to print to, set to NULL to print to stdout.

**Returns**

- ESP_OK: on success
- ESP_ERR_NOT_SUPPORTED: if the value from the card is not supported to be parsed.
- ESP_ERR_INVALID_SIZE: if the CIS size fields are not correct.

---

**Header File**

- components/driver/sdmmc/include/driver/sdmmc_types.h
- This header file can be included with:

  ```c
  #include "driver/sdmmc_types.h"
  ```

- This header file is a part of the API provided by the driver component. To declare that your component depends on driver, add the following to your CMakeLists.txt:

  ```cmake
  REQUIRES driver
  ```
  or

  ```cmake
  PRIV_REQUIRES driver
  ```

---

**Structures**

**struct sdmmc_csd_t**
Decoded values from SD card Card Specific Data register

**Public Members**

**int csd_ver**
CSD structure format

**int mmc_ver**
MMC version (for CID format)

**int capacity**
total number of sectors
int sector_size
   sector size in bytes

int read_block_len
   block length for reads

int card_command_class
   Card Command Class for SD

int tr_speed
   Max transfer speed

struct sdmmc_cid_t
   Decoded values from SD card Card IDentification register

   Public Members

   int mfg_id
      manufacturer identification number

   int oem_id
      OEM/product identification number

   char name[8]
      product name (MMC v1 has the longest)

   int revision
      product revision

   int serial
      product serial number

   int date
      manufacturing date

struct sdmmc_scr_t
   Decoded values from SD Configuration Register Note: When new member is added, update reserved bits accordingly

   Public Members

   uint32_t sd_spec
      SD Physical layer specification version, reported by card

   uint32_t erase_mem_state
      data state on card after erase whether 0 or 1 (card vendor dependent)
### Public Members

**uint32_t bus_width**
- bus widths supported by card: BIT(0) — 1-bit bus, BIT(2) — 4-bit bus

**uint32_t reserved**
- reserved for future expansion

**uint32_t rsvd_mnf**
- reserved for manufacturer usage

**struct sdmmc_ssr_t**
- Decoded values from SD Status Register Note: When new member is added, update reserved bits accordingly

**Public Members**

**uint32_t alloc_unit_kb**
- Allocation unit of the card, in multiples of kB (1024 bytes)

**uint32_t erase_size_au**
- Erase size for the purpose of timeout calculation, in multiples of allocation unit

**uint32_t cur_bus_width**
- SD current bus width

**uint32_t discard_support**
- SD discard feature support

**uint32_t fule_support**
- SD FULE (Full User Area Logical Erase) feature support

**uint32_t erase_timeout**
- Timeout (in seconds) for erase of a single allocation unit

**uint32_t erase_offset**
- Constant timeout offset (in seconds) for any erase operation

**uint32_t reserved**
- reserved for future expansion

**struct sdmmc_ext_csd_t**
- Decoded values of Extended Card Specific Data

**Public Members**

**uint8_t rev**
- Extended CSD Revision
uint8_t power_class
    Power class used by the card

uint8_t erase_mem_state
    data state on card after erase whether 0 or 1 (card vendor dependent)

uint8_t sec_feature
    secure data management features supported by the card

struct sdmmc_switch_func_rsp_t
    SD SWITCH_FUNC response buffer

Public Members

uint32_t data[512 / 8 / sizeof(uint32_t)]
    response data

struct sdmmc_command_t
    SD/MMC command information

Public Members

uint32_t opcode
    SD or MMC command index

uint32_t arg
    SD/MMC command argument

sdmmc_response_t response
    response buffer

void *data
    buffer to send or read into

size_tdatalen
    length of data in the buffer

size_t buflen
    length of the buffer

size_t blklen
    block length

int flags
    see below
struct sdmmc_host_t
SD/MMC Host description
This structure defines properties of SD/MMC host and functions of SD/MMC host which can be used by upper layers.

Public Members

uint32_t flags
flags defining host properties

int slot
slot number, to be passed to host functions

int max_freq_khz
max frequency supported by the host

float io_voltage
I/O voltage used by the controller (voltage switching is not supported)

esp_err_t (*init)(void)
Host function to initialize the driver

esp_err_t (*set_bus_width)(int slot, size_t width)
host function to set bus width

size_t (*get_bus_width)(int slot)
host function to get bus width

esp_err_t (*set_bus_ddr_mode)(int slot, bool ddr_enable)
host function to set DDR mode

esp_err_t (*set_card_clk)(int slot, uint32_t freq_khz)
host function to set card clock frequency

esp_err_t (*set_cclk_always_on)(int slot, bool cclk_always_on)
host function to set whether the clock is always enabled

esp_err_t (*do_transaction)(int slot, sdmmc_command_t *cmdinfo)
host function to do a transaction

esp_err_t (*deinit)(void)
host function to deinitialize the driver
**Chapter 2. API Reference**

`esp_err_t (*deinit_p)(int slot)`
- Host function to deinitialize the driver, called with the `slot`.

`esp_err_t (*io_int_enable)(int slot)`
- Host function to enable SDIO interrupt line.

`esp_err_t (*io_int_wait)(int slot, TickType_t timeout_ticks)`
- Host function to wait for SDIO interrupt line to be active.

`int command_timeout_ms`
- Timeout, in milliseconds, of a single command. Set to 0 to use the default value.

`esp_err_t (*get_real_freq)(int slot, int *real_freq)`
- Host function to provide real working freq, based on SDMMC controller setup.

`sdmmc_delay_phase_t input_delay_phase`
- Input delay phase, this will only take into effect when the host works in SDMMC_FREQ_HIGHSPEED or SDMMC_FREQ_52M. Driver will print out how long the delay is.

`esp_err_t (*set_input_delay)(int slot, sdmmc_delay_phase_t delay_phase)`
- Set input delay phase.

**struct sdmmc_card_t**
- SD/MMC card information structure

**Public Members**

`sdmmc_host_t host`
- Host with which the card is associated.

`uint32_t ocr`
- OCR (Operation Conditions Register) value.

`sdmmc_cid_t cid`
- Decoded CID (Card IDentification) register value.

`sdmmc_response_t raw_cid`
- Raw CID of MMC card to be decoded after the CSD is fetched in the data transfer mode.

`sdmmc_csd_t csd`
- Decoded CSD (Card-Specific Data) register value.

`sdmmc_scr_t scr`
- Decoded SCR (SD card Configuration Register) value.

`sdmmc_ssr_t ssr`
- Decoded SSR (SD Status Register) value.
decoded EXT_CSD (Extended Card Specific Data) register value

uint16_t rca
RCA (Relative Card Address)

uint16_t max_freq_khz
Maximum frequency, in kHz, supported by the card

int real_freq_khz
Real working frequency, in kHz, configured on the host controller

uint32_t is_mem
Bit indicates if the card is a memory card

uint32_t is_sdio
Bit indicates if the card is an IO card

uint32_t is_mmc
Bit indicates if the card is MMC

uint32_t num_io_functions
If is_sdio is 1, contains the number of IO functions on the card

uint32_t log_bus_width
log2(bus width supported by card)

uint32_t is_ddr
Card supports DDR mode

uint32_t reserved
Reserved for future expansion

Macros

SDMMC_HOST_FLAG_1BIT
host supports 1-line SD and MMC protocol

SDMMC_HOST_FLAG_4BIT
host supports 4-line SD and MMC protocol

SDMMC_HOST_FLAG_8BIT
host supports 8-line MMC protocol

SDMMC_HOST_FLAG_SPI
host supports SPI protocol

SDMMC_HOST_FLAG_DDR
host supports DDR mode for SD/MMC
Chapter 2. API Reference

**SDMMC_HOST_FLAG_DEINIT_ARG**

host deinit function called with the slot argument

**SDMMC_FREQ_DEFAULT**

SD/MMC Default speed (limited by clock divider)

**SDMMC_FREQ_HIGHSPEED**

SD High speed (limited by clock divider)

**SDMMC_FREQ_PROBING**

SD/MMC probing speed

**SDMMC_FREQ_52M**

MMC 52MHz speed

**SDMMC_FREQ_26M**

MMC 26MHz speed

**Type Definitions**

```c
typedef uint32_t sdmmc_response_t[4]

SD/MMC command response buffer
```

**Enumerations**

```c
enum sdmmc_delay_phase_t

SD/MMC Host clock timing delay phases

This will only take effect when the host works in SDMMC_FREQ_HIGHSPEED or SDMMC_FREQ_52M. Driver will print out how long the delay is, in picosecond (ps).

Values:

enumerator SDMMC_DELAY_PHASE_0

Delay phase 0

enumerator SDMMC_DELAY_PHASE_1

Delay phase 1

enumerator SDMMC_DELAY_PHASE_2

Delay phase 2

enumerator SDMMC_DELAY_PHASE_3

Delay phase 3
```

```c
enum sdmmc_erase_arg_t

SD/MMC erase command(38) arguments SD: ERASE: Erase the write blocks, physical/hard erase.

DISCARD: Card may deallocate the discarded blocks partially or completely. After discard operation the previously written data may be partially or fully read by the host depending on card implementation.

MMC: ERASE: Does TRIM, applies erase operation to write blocks instead of Erase Group.
```
DISCARD: The Discard function allows the host to identify data that is no longer required so that the device can erase the data if necessary during background erase events. Applies to write blocks instead of Erase Group. After discard operation, the original data may be remained partially or fully accessible to the host dependent on device.

Values:

enumerator **SDMMC_ERASE_ARG**
Erase operation on SD, Trim operation on MMC

enumerator **SDMMC_DISCARD_ARG**
Discard operation for SD/MMC

### 2.9.8 Partitions API

#### Overview

The `esp_partition` component has higher-level API functions which work with partitions defined in the Partition Tables. These APIs are based on lower level API provided by *SPI Flash API*.

**Partition Table API**

ESP-IDF projects use a partition table to maintain information about various regions of SPI flash memory (bootloader, various application binaries, data, filesystems). More information can be found in *Partition Tables*.

This component provides API functions to enumerate partitions found in the partition table and perform operations on them. These functions are declared in `esp_partition.h`:

- `esp_partition_find()` checks a partition table for entries with specific type, returns an opaque iterator.
- `esp_partition_get()` returns a structure describing the partition for a given iterator.
- `esp_partition_next()` shifts the iterator to the next found partition.
- `esp_partition_iterator_release()` releases iterator returned by `esp_partition_find()`.
- `esp_partition_find_first()` is a convenience function which returns the structure describing the first partition found by `esp_partition_find()`.
- `esp_partition_read()`, `esp_partition_write()`, `esp_partition_erase_range()` are equivalent to `esp_flash_read()`, `esp_flash_write()`, `esp_flash_erase_region()`, but operate within partition boundaries.

**See Also**

- *Partition Tables*
- *Over The Air Updates (OTA)* provides high-level API for updating applications stored in flash.
- *Non-Volatile Storage Library* provides a structured API for storing small pieces of data in SPI flash.

**API Reference - Partition Table**

**Header File**

- `components/esp_partition/include/esp_partition.h`
- This header file can be included with:

```c
#include "esp_partition.h"
```
This header file is a part of the API provided by the esp_partition component. To declare that your component depends on esp_partition, add the following to your CMakeLists.txt:

```cmake
REQUIRES esp_partition
```
or

```cmake
PRIV_REQUIRES esp_partition
```

**Functions**

`esp_partition_iterator_t / esp_partition_find` *(esp_partition_type_t type, esp_partition_subtype_t subtype, const char *label)*

Find partition based on one or more parameters.

**Parameters**

- `type` – Partition type, one of esp_partition_type_t values or an 8-bit unsigned integer. To find all partitions, no matter the type, use ESP_PARTITION_TYPE_ANY, and set subtype argument to ESP_PARTITION_SUBTYPE_ANY.
- `subtype` – Partition subtype, one of esp_partition_subtype_t values or an 8-bit unsigned integer. To find all partitions of given type, use ESP_PARTITION_SUBTYPE_ANY.
- `label` – (optional) Partition label. Set this value if looking for partition with a specific name. Pass NULL otherwise.

**Returns** iterator which can be used to enumerate all the partitions found, or NULL if no partitions were found. Iterator obtained through this function has to be released using esp_partition_iterator_release when not used any more.

`const esp_partition_t * esp_partition_find_first` *(esp_partition_type_t type, esp_partition_subtype_t subtype, const char *label)*

Find first partition based on one or more parameters.

**Parameters**

- `type` – Partition type, one of esp_partition_type_t values or an 8-bit unsigned integer. To find all partitions, no matter the type, use ESP_PARTITION_TYPE_ANY, and set subtype argument to ESP_PARTITION_SUBTYPE_ANY.
- `subtype` – Partition subtype, one of esp_partition_subtype_t values or an 8-bit unsigned integer. To find all partitions of given type, use ESP_PARTITION_SUBTYPE_ANY.
- `label` – (optional) Partition label. Set this value if looking for partition with a specific name. Pass NULL otherwise.

**Returns** pointer to esp_partition_t structure, or NULL if no partition is found. This pointer is valid for the lifetime of the application.

`const esp_partition_t * esp_partition_get` *(esp_partition_iterator_t iterator)*

Get esp_partition_t structure for given partition.

**Parameters** `iterator` – Iterator obtained using esp_partition_find. Must be non-NULL.

**Returns** pointer to esp_partition_t structure. This pointer is valid for the lifetime of the application.

`esp_partition_iterator_t / esp_partition_next` *(esp_partition_iterator_t iterator)*

Move partition iterator to the next partition found.

Any copies of the iterator will be invalid after this call.

**Parameters** `iterator` – Iterator obtained using esp_partition_find. Must be non-NULL.

**Returns** NULL if no partition was found, valid esp_partition_iterator_t otherwise.

`void esp_partition_iterator_release` *(esp_partition_iterator_t iterator)*

Release partition iterator.

**Parameters** `iterator` – Iterator obtained using esp_partition_find. The iterator is allowed to be NULL, so it is not necessary to check its value before calling this function.
**Chapter 2. API Reference**

`const esp_partition_t *esp_partition_verify(const esp_partition_t *partition)`

Verify partition data.

Given a pointer to partition data, verify this partition exists in the partition table (all fields match.)

This function is also useful to take partition data which may be in a RAM buffer and convert it to a pointer to the permanent partition data stored in flash.

Pointers returned from this function can be compared directly to the address of any pointer returned from `esp_partition_get()`, as a test for equality.

**Parameters**
- `partition` – Pointer to partition data to verify. Must be non-NULL. All fields of this structure must match the partition table entry in flash for this function to return a successful match.

**Returns**
- If partition not found, returns `NULL`.
- If found, returns a pointer to the `esp_partition_t` structure in flash. This pointer is always valid for the lifetime of the application.

`esp_err_t esp_partition_read(const esp_partition_t *partition, size_t src_offset, void *dst, size_t size)`

Read data from the partition.

Partitions marked with an encryption flag will automatically be read and decrypted via a cache mapping.

**Parameters**
- `partition` – Pointer to partition structure obtained using `esp_partition_find_first` or `esp_partition_get`. Must be non-NULL.
- `dst` – Pointer to the buffer where data should be stored. Pointer must be non-NULL and buffer must be at least `size` bytes long.
- `src_offset` – Address of the data to be read, relative to the beginning of the partition.
- `size` – Size of data to be read, in bytes.

**Returns**
- ESP_OK, if data was read successfully; ESP_ERR_INVALID_ARG, if `src_offset` exceeds partition size; ESP_ERR_INVALID_SIZE, if read would go out of bounds of the partition; or one of error codes from lower-level flash driver.

`esp_err_t esp_partition_write(const esp_partition_t *partition, size_t dst_offset, const void *src, size_t size)`

Write data to the partition.

Before writing data to flash, corresponding region of flash needs to be erased. This can be done using `esp_partition_erase_range` function.

Partitions marked with an encryption flag will automatically be written via the `esp_flash_write_encrypted()` function. If writing to an encrypted partition, all write offsets and lengths must be multiples of 16 bytes. See the `esp_flash_write_encrypted()` function for more details. Unencrypted partitions do not have this restriction.

**Note:** Prior to writing to flash memory, make sure it has been erased with `esp_partition_erase_range` call.

**Parameters**
- `partition` – Pointer to partition structure obtained using `esp_partition_find_first` or `esp_partition_get`. Must be non-NULL.
- `dst_offset` – Address where the data should be written, relative to the beginning of the partition.
- `src` – Pointer to the source buffer. Pointer must be non-NULL and buffer must be at least `size` bytes long.
- `size` – Size of data to be written, in bytes.

**Returns**
- ESP_OK, if data was written successfully; ESP_ERR_INVALID_ARG, if `dst_offset` exceeds partition size; ESP_ERR_INVALID_SIZE, if write would go out of bounds of the partition; ESP_ERR_NOT_ALLOWED, if partition is read-only; or one of error codes from lower-level flash driver.
Esp_err_t esp_partition_read_raw (const esp_partition_t *partition, size_t src_offset, void *dst, size_t size)

Read data from the partition without any transformation/decryption.

**Note:** This function is essentially the same as esp_partition_read() above. It just never decrypts data but returns it as is.

**Parameters**
- partition – Pointer to partition structure obtained using esp_partition_find_first or esp_partition_get. Must be non-NULL.
- dst – Pointer to the buffer where data should be stored. Pointer must be non-NULL and buffer must be at least ‘size’ bytes long.
- src_offset – Address of the data to be read, relative to the beginning of the partition.
- size – Size of data to be read, in bytes.

**Returns** ESP_OK, if data was read successfully; ESP_ERR_INVALID_ARG, if src_offset exceeds partition size; ESP_ERR_INVALID_SIZE, if read would go out of bounds of the partition; or one of error codes from lower-level flash driver.

Esp_err_t esp_partition_write_raw (const esp_partition_t *partition, size_t dst_offset, const void *src, size_t size)

Write data to the partition without any transformation/encryption.

Before writing data to flash, corresponding region of flash needs to be erased. This can be done using esp_partition_erase_range function.

**Note:** This function is essentially the same as esp_partition_write() above. It just never encrypts data but writes it as is.

**Note:** Prior to writing to flash memory, make sure it has been erased with esp_partition_erase_range call.

**Parameters**
- partition – Pointer to partition structure obtained using esp_partition_find_first or esp_partition_get. Must be non-NULL.
- dst_offset – Address where the data should be written, relative to the beginning of the partition.
- src – Pointer to the source buffer. Pointer must be non-NULL and buffer must be at least ‘size’ bytes long.
- size – Size of data to be written, in bytes.

**Returns** ESP_OK, if data was written successfully; ESP_ERR_INVALID_ARG, if dst_offset exceeds partition size; ESP_ERR_INVALID_SIZE, if write would go out of bounds of the partition; ESP_ERR_NOT_ALLOWED, if partition is read-only; or one of the error codes from lower-level flash driver.

Esp_err_t esp_partition_erase_range (const esp_partition_t *partition, size_t offset, size_t size)

Erase part of the partition.

**Parameters**
- partition – Pointer to partition structure obtained using esp_partition_find_first or esp_partition_get. Must be non-NULL.
- offset – Offset from the beginning of partition where erase operation should start. Must be aligned to partition->erase_size.
**size** - Size of the range which should be erased, in bytes. Must be divisible by partition->erase_size.

**Returns** ESP_OK, if the range was erased successfully; ESP_ERR_INVALID_ARG, if iterator or dst are NULL; ESP_ERR_INVALID_SIZE, if erase would go out of bounds of the partition; ESP_ERR_NOT_ALLOWED, if partition is read-only; or one of error codes from lower-level flash driver.

```c
esp_err_t esp_partition_mmap (const esp_partition_t *partition, size_t offset, size_t size,
                              esp_partition_mmap_memory_t memory, const void **out_ptr,
                              esp_partition_mmap_handle_t *out_handle)
```

Configure MMU to map partition into data memory.

Unlike spi_flash_mmap function, which requires a 64kB aligned base address, this function doesn’t impose such a requirement. If offset results in a flash address which is not aligned to 64kB boundary, address will be rounded to the lower 64kB boundary, so that mapped region includes requested range. Pointer returned via `out_ptr` argument will be adjusted to point to the requested offset (not necessarily to the beginning of mmap-ed region).

To release mapped memory, pass handle returned via `out_handle` argument to esp_partition_munmap function.

**Parameters**

- **partition** – Pointer to partition structure obtained using esp_partition_find_first or esp_partition_get. Must be non-NULL.
- **offset** – Offset from the beginning of partition where mapping should start.
- **size** – Size of the area to be mapped.
- **memory** – Memory space where the region should be mapped
- **out_ptr** – Output, pointer to the mapped memory region
- **out_handle** – Output, handle which should be used for esp_partition_munmap call

**Returns** ESP_OK, if successful

```c
void esp_partition_munmap (esp_partition_mmap_handle_t handle)
```

Release region previously obtained using esp_partition_mmap.

**Note:** Calling this function will not necessarily unmap memory region. Region will only be unmapped when there are no other handles which reference this region. In case of partially overlapping regions it is possible that memory will be unmapped partially.

**Parameters**

- **handle** – Handle obtained from spi_flash_mmap

```c
esp_err_t esp_partition_get_sha256 (const esp_partition_t *partition, uint8_t *sha_256)
```

Get SHA-256 digest for required partition.

For apps with SHA-256 appended to the app image, the result is the appended SHA-256 value for the app image content. The hash is verified before returning, if app content is invalid then the function returns ESP_ERR_IMAGE_INVALID. For apps without SHA-256 appended to the image, the result is the SHA-256 of all bytes in the app image. For other partition types, the result is the SHA-256 of the entire partition.

**Parameters**

- **partition** – [in] Pointer to info for partition containing app or data. (fields: address, size and type, are required to be filled).
- **sha_256** – [out] Returned SHA-256 digest for a given partition.

**Returns**

- ESP_OK: In case of successful operation.
- ESP_ERR_INVALID_ARG: The size was 0 or the sha_256 was NULL.
- ESP_ERR_NO_MEM: Cannot allocate memory for sha256 operation.
- ESP_ERR_IMAGE_INVALID: App partition doesn’t contain a valid app image.
- ESP_FAIL: An allocation error occurred.

```c
bool esp_partition_check_identity (const esp_partition_t *partition_1, const esp_partition_t *partition_2)
```
Chapter 2. API Reference

Check for the identity of two partitions by SHA-256 digest.

Parameters
- **partition_1** – [in] Pointer to info for partition 1 containing app or data. (fields: address, size and type, are required to be filled).
- **partition_2** – [in] Pointer to info for partition 2 containing app or data. (fields: address, size and type, are required to be filled).

Returns
- True: In case of the two firmware is equal.
- False: Otherwise

```
esp_err_t esp_partition_register_external (esp_flash_t *flash_chip, size_t offset, size_t size, const char *label, esp_partition_type_t type, esp_partition_subtype_t subtype, const esp_partition_t **out_partition)
```

Register a partition on an external flash chip.

This API allows designating certain areas of external flash chips (identified by the `esp_flash_t` structure) as partitions. This allows using them with components which access SPI flash through the `esp_partition` API.

Parameters
- **flash_chip** – Pointer to the structure identifying the flash chip
- **offset** – Address in bytes, where the partition starts
- **size** – Size of the partition in bytes
- **label** – Partition name
- **type** – One of the partition types (ESP_PARTITION_TYPE_*), or an integer. Note that applications can not be booted from external flash chips, so using ESP_PARTITION_TYPE_APP is not supported.
- **subtype** – One of the partition subtypes (ESP_PARTITION_SUBTYPE_*), or an integer.
- **out_partition** – [out] Output, if non-NULL, receives the pointer to the resulting `esp_partition_t` structure

Returns
- ESP_OK on success
- ESP_ERR_NO_MEM if memory allocation has failed
- ESP_ERR_INVALID_ARG if the new partition overlaps another partition on the same flash chip
- ESP_ERR_INVALID_SIZE if the partition doesn’t fit into the flash chip size

```
esp_err_t esp_partition_deregister_external (const esp_partition_t *partition)
```

Deregister the partition previously registered using `esp_partition_register_external`.

Parameters **partition** – pointer to the partition structure obtained from `esp_partition_register_external`

Returns
- ESP_OK on success
- ESP_ERR_NOT_FOUND if the partition pointer is not found
- ESP_ERR_INVALID_ARG if the partition comes from the partition table
- ESP_ERR_INVALID_ARG if the partition was not registered using `esp_partition_register_external` function.

Structures

```
struct esp_partition_t
```

partition information structure

This is not the format in flash, that format is `esp_partition_info_t`.

However, this is the format used by this API.
Public Members

`esp_flash_t *flash_chip`
SPI flash chip on which the partition resides

`esp_partition_type_t type`
partition type (app/data)

`esp_partition_subtype_t subtype`
partition subtype

`uint32_t address`
starting address of the partition in flash

`uint32_t size`
size of the partition, in bytes

`uint32_t erase_size`
size the erase operation should be aligned to

`char label[17]`
partition label, zero-terminated ASCII string

`bool encrypted`
flag is set to true if partition is encrypted

`bool readonly`
flag is set to true if partition is read-only

Macros

`ESP_PARTITION_SUBTYPE_OTA(i)`
Convenience macro to get `esp_partition_subtype_t` value for the i-th OTA partition.

Type Definitions

`typedef uint32_t esp_partition_mmap_handle_t`
Opaque handle for memory region obtained from `esp_partition_mmap`.

`typedef struct esp_partition_iterator_opaque_ *esp_partition_iterator_t`
Opaque partition iterator type.

Enumerations

`enum esp_partition_mmap_memory_t`
Enumeration which specifies memory space requested in an mmap call.

`Values`:

`enum`erator `ESP_PARTITION_MMAP_DATA`
map to data memory (Vaddr0), allows byte-aligned access, 4 MB total
enumerator **ESP_PARTITION_MMAP_INST**  
map to instruction memory (Vaddr1-3), allows only 4-byte-aligned access, 11 MB total

enum **esp_partition_type_t**  
Partition type.

**Note:** Partition types with integer value 0x00-0x3F are reserved for partition types defined by ESP-IDF. Any other integer value 0x40-0xFE can be used by individual applications, without restriction.

**Values:**

enumerator **ESP_PARTITION_TYPE_APP**  
Application partition type.

evernamer **ESP_PARTITION_TYPE_DATA**  
Data partition type.

evernamer **ESP_PARTITION_TYPE_ANY**  
Used to search for partitions with any type.

enum **esp_partition_subtype_t**  
Partition subtype.

Application-defined partition types (0x40-0xFE) can set any numeric subtype value.

**Note:** These ESP-IDF-defined partition subtypes apply to partitions of type ESP_PARTITION_TYPE_APP and ESP_PARTITION_TYPE_DATA.

**Values:**

enumerator **ESP_PARTITION_SUBTYPE_APP_FACTORY**  
Factory application partition.

evernamer **ESP_PARTITION_SUBTYPE_APP_OTA_MIN**  
Base for OTA partition subtypes.

evernamer **ESP_PARTITION_SUBTYPE_APP_OTA_0**  
OTA partition 0.

evernamer **ESP_PARTITION_SUBTYPE_APP_OTA_1**  
OTA partition 1.

evernamer **ESP_PARTITION_SUBTYPE_APP_OTA_2**  
OTA partition 2.

evernamer **ESP_PARTITION_SUBTYPE_APP_OTA_3**  
OTA partition 3.
enumerator **ESP_PARTITION_SUBTYPE_APP_OTA_4**
OTA partition 4.

enumerator **ESP_PARTITION_SUBTYPE_APP_OTA_5**
OTA partition 5.

enumerator **ESP_PARTITION_SUBTYPE_APP_OTA_6**
OTA partition 6.

enumerator **ESP_PARTITION_SUBTYPE_APP_OTA_7**
OTA partition 7.

enumerator **ESP_PARTITION_SUBTYPE_APP_OTA_8**
OTA partition 8.

enumerator **ESP_PARTITION_SUBTYPE_APP_OTA_9**
OTA partition 9.

enumerator **ESP_PARTITION_SUBTYPE_APP_OTA_10**
OTA partition 10.

enumerator **ESP_PARTITION_SUBTYPE_APP_OTA_11**
OTA partition 11.

enumerator **ESP_PARTITION_SUBTYPE_APP_OTA_12**
OTA partition 12.

enumerator **ESP_PARTITION_SUBTYPE_APP_OTA_13**
OTA partition 13.

enumerator **ESP_PARTITION_SUBTYPE_APP_OTA_14**
OTA partition 14.

enumerator **ESP_PARTITION_SUBTYPE_APP_OTA_15**
OTA partition 15.

enumerator **ESP_PARTITION_SUBTYPE_APP_OTA_MAX**
Max subtype of OTA partition.

enumerator **ESP_PARTITION_SUBTYPE_APP_TEST**
Test application partition.

enumerator **ESP_PARTITION_SUBTYPE_DATA_OTA**
OTA selection partition.

enumerator **ESP_PARTITION_SUBTYPE_DATA_PHY**
PHY init data partition.
enumerator ESP_PARTITION_SUBTYPE_DATA_NVS
NVS partition.

enumerator ESP_PARTITION_SUBTYPE_DATA_COREDUMP
COREDUMP partition.

enumerator ESP_PARTITION_SUBTYPE_DATA_NVS_KEYS
Partition for NVS keys.

enumerator ESP_PARTITION_SUBTYPE_DATA_EFUSE_EM
Partition for emulate eFuse bits.

enumerator ESP_PARTITION_SUBTYPE_DATA_UNDEFINED
Undefined (or unspecified) data partition.

enumerator ESP_PARTITION_SUBTYPE_DATA_ESPHTTPD
ESPHTTPD partition.

enumerator ESP_PARTITION_SUBTYPE_DATA_FAT
FAT partition.

enumerator ESP_PARTITION_SUBTYPE_DATA_SPIFFS
SPIFFS partition.

enumerator ESP_PARTITION_SUBTYPE_DATA_LITTLEFS
LITTLEFS partition.

enumerator ESP_PARTITION_SUBTYPE_ANY
Used to search for partitions with any subtype.

2.9.9 SPIFFS Filesystem

Overview

SPIFFS is a file system intended for SPI NOR flash devices on embedded targets. It supports wear levelling, file system consistency checks, and more.

Notes

- Currently, SPIFFS does not support directories, it produces a flat structure. If SPIFFS is mounted under /spiffs, then creating a file with the path /spiffs/tmp/myfile.txt will create a file called /tmp/myfile.txt in SPIFFS, instead of myfile.txt in the directory /spiffs/tmp.
- It is not a real-time stack. One write operation might take much longer than another.
- For now, it does not detect or handle bad blocks.
- SPIFFS is able to reliably utilize only around 75% of assigned partition space.
• When the filesystem is running out of space, the garbage collector is trying to find free space by scanning the filesystem multiple times, which can take up to several seconds per write function call, depending on required space. This is caused by the SPIFFS design and the issue has been reported multiple times (e.g., here) and in the official SPIFFS github repository. The issue can be partially mitigated by the SPIFFS configuration.
• Deleting a file does not always remove the whole file, which leaves unusable sections throughout the filesystem.
• When the chip experiences a power loss during a file system operation it could result in SPIFFS corruption. However the file system still might be recovered via esp_spiffs_check function. More details in the official SPIFFS FAQ.

Tools

spiffsgen.py  spiffsgen.py is a write-only Python SPIFFS implementation used to create filesystem images from the contents of a host folder. To use spiffsgen.py, open Terminal and run:

```
python spiffsgen.py <image_size> <base_dir> <output_file>
```

The required arguments are as follows:

- **image_size**: size of the partition onto which the created SPIFFS image will be flashed.
- **base_dir**: directory for which the SPIFFS image needs to be created.
- **output_file**: SPIFFS image output file.

There are also other arguments that control image generation. Documentation on these arguments can be found in the tool’s help:

```
python spiffsgen.py --help
```

These optional arguments correspond to a possible SPIFFS build configuration. To generate the right image, please make sure that you use the same arguments/configuration as were used to build SPIFFS. As a guide, the help output indicates the SPIFFS build configuration to which the argument corresponds. In cases when these arguments are not specified, the default values shown in the help output will be used.

When the image is created, it can be flashed using esptool.py or parttool.py.

Aside from invoking the spiffsgen.py standalone by manually running it from the command line or a script, it is also possible to invoke spiffsgen.py directly from the build system by calling spiffs_create_partition_image:

```
spiffs_create_partition_image(<partition> <base_dir> [FLASH_IN_PROJECT] [DEPENDS...
```

This is more convenient as the build configuration is automatically passed to the tool, ensuring that the generated image is valid for that build. An example of this is while the image_size is required for the standalone invocation, only the partition name is required when using spiffs_create_partition_image—the image size is automatically obtained from the project’s partition table.

spiffs_create_partition_image must be called from one of the component CMakeLists.txt files.

Optionally, users can opt to have the image automatically flashed together with the app binaries, partition tables, etc. on idf.py flash by specifying FLASH_IN_PROJECT. For example:

```
spiffs_create_partition_image(my_spiffs_partition my_folder FLASH_IN_PROJECT)
```

If FLASH_IN_PROJECT/SPIFFS_IMAGE_FLASH_IN_PROJECT is not specified, the image will still be generated, but you will have to flash it manually using esptool.py, parttool.py, or a custom build system target.

There are cases where the contents of the base directory itself is generated at build time. Users can use DEPENDS/SPIFFS_IMAGEDEPENDS to specify targets that should be executed before generating the image:

```
add_custom_target(dep COMMAND ...)
spiffs_create_partition_image(my_spiffs_partition my_folder DEPENDS dep)
```
For an example, see storage/spiffsgen.

**mkspiffs**  Another tool for creating SPIFFS partition images is **mkspiffs**. Similar to **spiffsgen.py**, it can be used to create an image from a given folder and then flash that image using **esptool.py**.

For that, you need to obtain the following parameters:

- **Block Size**: 4096 (standard for SPI Flash)
- **Page Size**: 256 (standard for SPI Flash)
- **Image Size**: Size of the partition in bytes (can be obtained from a partition table)
- **Partition Offset**: Starting address of the partition (can be obtained from a partition table)

To pack a folder into a 1-Megabyte image, run:

```
mkspiffs -c [src_folder] -b 4096 -p 256 -s 0x100000 spiffs.bin
```

To flash the image onto ESP32-S3 at offset 0x110000, run:

```
python esptool.py --chip esp32s3 --port [port] --baud [baud] write_flash -z -0x110000 spiffs.bin
```

**Notes on Which SPIFFS Tool to Use**  The two tools presented above offer very similar functionality. However, there are reasons to prefer one over the other, depending on the use case.

**Use **spiffsgen.py** in the following cases:**

1. If you want to simply generate a SPIFFS image during the build. **spiffsgen.py** makes it very convenient by providing functions/commands from the build system itself.
2. If the host has no C/C++ compiler available, because **spiffsgen.py** does not require compilation.

**Use **mkspiffs** in the following cases:**

1. If you need to unpack SPIFFS images in addition to image generation. For now, it is not possible with **spiffsgen.py**.
2. If you have an environment where a Python interpreter is not available, but a host compiler is available. Otherwise, a pre-compiled **mkspiffs** binary can do the job. However, there is no build system integration for **mkspiffs** and the user has to do the corresponding work: compiling **mkspiffs** during build (if a pre-compiled binary is not used), creating build rules/targets for the output files, passing proper parameters to the tool, etc.

- **Partition Table documentation**

**Application Example**

An example of using SPIFFS is provided in the **storage/spiffs** directory. This example initializes and mounts a SPIFFS partition, then writes and reads data from it using POSIX and C library APIs. See the README.md file in the example directory for more information.

**High-level API Reference**

**Header File**

- components/spiffs/include/esp_spiffs.h
- This header file can be included with:

```
#include "esp_spiffs.h"
```
This header file is a part of the API provided by the spiffs component. To declare that your component depends on spiffs, add the following to your CMakeLists.txt:

```cmake
REQUIRES spiffs
```
or

```cmake
PRIV_REQUIRES spiffs
```

### Functions

**`esp_err_t esp_vfs_spiffs_register(const esp_vfs_spiffs_conf_t *conf)`**

Register and mount SPIFFS to VFS with given path prefix.

**Parameters**
- `conf` — Pointer to `esp_vfs_spiffs_conf_t` configuration structure

**Returns**
- **ESP_OK** if success
- **ESP_ERR_NO_MEM** if objects could not be allocated
- **ESP_ERR_INVALID_STATE** if already mounted or partition is encrypted
- **ESP_ERR_NOT_FOUND** if partition for SPIFFS was not found
- **ESP_FAIL** if mount or format fails

**`esp_err_t esp_vfs_spiffs_unregister(const char* partition_label)`**

Unregister and unmount SPIFFS from VFS

**Parameters**
- `partition_label` — Same label as passed to `esp_vfs_spiffs_register`.

**Returns**
- **ESP_OK** if successful
- **ESP_ERR_INVALID_STATE** already unregistered

**`bool esp_spiffs_mounted(const char* partition_label)`**

Check if SPIFFS is mounted

**Parameters**
- `partition_label` — Optional, label of the partition to check. If not specified, first partition with subtype=spiffs is used.

**Returns**
- **true** if mounted
- **false** if not mounted

**`esp_err_t esp_spiffs_format(const char* partition_label)`**

Format the SPIFFS partition

**Parameters**
- `partition_label` — Same label as passed to `esp_vfs_spiffs_register`.

**Returns**
- **ESP_OK** if successful
- **ESP_FAIL** on error

**`esp_err_t esp_spiffs_info(const char* partition_label, size_t* total_bytes, size_t* used_bytes)`**

Get information for SPIFFS

**Parameters**
- `partition_label` — Same label as passed to `esp_vfs_spiffs_register`
- `total_bytes` — [out] Size of the file system
- `used_bytes` — [out] Current used bytes in the file system

**Returns**
- **ESP_OK** if success
- **ESP_ERR_INVALID_STATE** if not mounted

**`esp_err_t esp_spiffs_check(const char* partition_label)`**

Check integrity of SPIFFS

**Parameters**
- `partition_label` — Same label as passed to `esp_vfs_spiffs_register`

**Returns**
- **ESP_OK** if successful
• ESP_ERR_INVALID_STATE if not mounted
• ESP_FAIL on error

ESP_err_t esp_spiffs_gc(const char *partition_label, size_t size_to_gc)

Perform garbage collection in SPIFFS partition.

Call this function to run GC and ensure that at least the given amount of space is available in the partition. This function will fail with ESP_ERR_NOT_FINISHED if it is not possible to reclaim the requested space (that is, not enough free or deleted pages in the filesystem). This function will also fail if it fails to reclaim the requested space after CONFIG_SPIFFS_GC_MAX_RUNS number of GC iterations. On one GC iteration, SPIFFS will erase one logical block (4kB). Therefore the value of CONFIG_SPIFFS_GC_MAX_RUNS should be set at least to the maximum expected size_to_gc, divided by 4096. For example, if the application expects to make room for a 1MB file and calls esp_spiffs_gc(label, 1024 * 1024), CONFIG_SPIFFS_GC_MAX_RUNS should be set to at least 256. On the other hand, increasing CONFIG_SPIFFS_GC_MAX_RUNS value increases the maximum amount of time for which any SPIFFS GC or write operation may potentially block.

Parameters

• partition_label – Label of the partition to be garbage-collected. The partition must be already mounted.
• size_to_gc – The number of bytes that the GC process should attempt to make available.

Returns

• ESP_OK on success
• ESP_ERR_NOT_FINISHED if GC fails to reclaim the size given by size_to_gc
• ESP_ERR_INVALID_STATE if the partition is not mounted
• ESP_FAIL on all other errors

Structures

struct esp_vfs_spiffs_conf_t

Configuration structure for esp_vfs_spiffs_register.

Public Members

const char *base_path

File path prefix associated with the filesystem.

const char *partition_label

Optional, label of SPIFFS partition to use. If set to NULL, first partition with subtype=spiffs will be used.

size_t max_files

Maximum files that could be open at the same time.

bool format_if_mount_failed

If true, it will format the file system if it fails to mount.

2.9.10 Virtual Filesystem Component
Overview

Virtual filesystem (VFS) component provides a unified interface for drivers which can perform operations on file-like objects. These can be real filesystems (FAT, SPIFFS, etc.) or device drivers which provide a file-like interface.

This component allows C library functions, such as fopen and fprintf, to work with FS drivers. At a high level, each FS driver is associated with some path prefix. When one of C library functions needs to open a file, the VFS component searches for the FS driver associated with the file path and forwards the call to that driver. VFS also forwards read, write, and other calls for the given file to the same FS driver.

For example, one can register a FAT filesystem driver with the /fat prefix and call fopen("/fat/file.txt", "w"). Then the VFS component calls the function open of the FAT driver and pass the argument /file.txt to it together with appropriate mode flags. All subsequent calls to C library functions for the returned FILE* stream will also be forwarded to the FAT driver.

FS Registration

To register an FS driver, an application needs to define an instance of the esp_vfs_t structure and populate it with function pointers to FS APIs:

```c
esp_vfs_t myfs = {
    .flags = ESP_VFS_FLAG_DEFAULT,
    .write = &myfs_write,
    .open = &myfs_open,
    .fstat = &myfs_fstat,
    .close = &myfs_close,
    .read = &myfs_read,
};
ESP_ERROR_CHECK(esp_vfs_register("/data", &myfs, NULL));
```

Depending on the way the FS driver declares its API functions, either read, write, etc., or read_p, write_p, etc., should be used.

Case 1: API functions are declared without an extra context pointer (the FS driver is a singleton):

```c
ssize_t myfs_write(int fd, const void *data, size_t size);
```

// In definition of esp_vfs_t:
//.flags = ESP_VFS_FLAG_DEFAULT,
//.write = &myfs_write,
//... other members initialized

// When registering FS, context pointer (third argument) is NULL:
ESP_ERROR_CHECK(esp_vfs_register("/data", &myfs, NULL));

Case 2: API functions are declared with an extra context pointer (the FS driver supports multiple instances):

```c
ssize_t myfs_write(myfs_t* fs, int fd, const void *data, size_t size);
```

// In definition of esp_vfs_t:
//.flags = ESP_VFS_FLAG_CONTEXT_PTR,
//.write_p = &myfs_write,
//... other members initialized

// When registering FS, pass the FS context pointer into the third argument
// (hypothetical myfs_mount function is used for illustrative purposes)
myfs_t* myfs_inst1 = myfs_mount(partition1->offset, partition1->size);
ESP_ERROR_CHECK(esp_vfs_register("/data1", &myfs, myfs_inst1));

// Can register another instance:
Synchronous Input/Output Multiplexing  
Synchronous input/output multiplexing by `select()` is supported in the VFS component. The implementation works in the following way.

1. `select()` is called with file descriptors which could belong to various VFS drivers.
2. The file descriptors are divided into groups each belonging to one VFS driver.
3. The file descriptors belonging to non-socket VFS drivers are handed over to the given VFS drivers by `start_select()`, described later on this page. This function represents the driver-specific implementation of `select()` for the given driver. This should be a non-blocking call which means the function should immediately return after setting up the environment for checking events related to the given file descriptors.
4. The file descriptors belonging to the socket VFS driver are handed over to the socket driver by `socket_select()` described later on this page. This is a blocking call which means that it will return only if there is an event related to socket file descriptors or a non-socket driver signals `socket_select()` to exit.
5. Results are collected from each VFS driver and all drivers are stopped by de-initialization of the environment for checking events.
6. The `select()` call ends and returns the appropriate results.

Non-Socket VFS Drivers  
If you want to use `select()` with a file descriptor belonging to a non-socket VFS driver, then you need to register the driver with functions `start_select()` and `end_select()` similarly to the following example:

```c
// In definition of esp_vfs_t:
    .start_select = &uart_start_select,
    .end_select = &uart_end_select,
    // ... other members initialized
```

`start_select()` is called for setting up the environment for detection of read/write/error conditions on file descriptors belonging to the given VFS driver.

`end_select()` is called to stop/deinitialize/free the environment which was setup by `start_select()`.

**Note:** `end_select()` might be called without a previous `start_select()` call in some rare circumstances. `end_select()` should fail gracefully if this is the case (i.e., should not crash but return an error instead).

Please refer to the reference implementation for the UART peripheral in `vfs/vfs_uart.c` and most particularly to the functions `esp_vfs_dev_uart_register()`, `uart_start_select()`, and `uart_end_select()` for more information.

Please check the following examples that demonstrate the use of `select()` with VFS file descriptors:

- `peripherals/uart/uart_select`
- `system/select`

Socket VFS Drivers  
A socket VFS driver is using its own internal implementation of `select()` and non-socket VFS drivers notify it upon read/write/error conditions.

A socket VFS driver needs to be registered with the following functions defined:

```c
// In definition of esp_vfs_t:
    .socket_select = &lwip_select,
    .get_socket_select_semaphore = &lwip_get_socket_select_semaphore,
    .stop_socket_select = &lwip_stop_socket_select,
    .stop_socket_select_isr = &lwip_stop_socket_select_isr,
    // ... other members initialized
```
socket_select() is the internal implementation of select() for the socket driver. It works only with file descriptors belonging to the socket VFS.

get_socket_select_semaphore() returns the signalization object (semaphore) which is used in non-socket drivers to stop the waiting in socket_select().

stop_socket_select() call is used to stop the waiting in socket_select() by passing the object returned by get_socket_select_semaphore().

stop_socket_select_isr() has the same functionality as stop_socket_select() but it can be used from ISR.

Please see lwip/port/esp32xx/vfs_lwip.c for a reference socket driver implementation using LWIP.

**Note:** If you use select() for socket file descriptors only then you can disable the CONFIG_VFS_SUPPORT_SELECT option to reduce the code size and improve performance. You should not change the socket driver during an active select() call or you might experience some undefined behavior.

### Paths

Each registered FS has a path prefix associated with it. This prefix can be considered as a “mount point” of this partition.

In case when mount points are nested, the mount point with the longest matching path prefix is used when opening the file. For instance, suppose that the following file systems are registered in VFS:

- FS 1 on /data
- FS 2 on /data/static

Then:

- FS 1 will be used when opening a file called /data/log.txt
- FS 2 will be used when opening a file called /data/static/index.html
- Even if /index.html" does not exist in FS 2, FS 1 will **not** be searched for /static/index.html.

As a general rule, mount point names must start with the path separator (/) and must contain at least one character after path separator. However, an empty mount point name is also supported and might be used in cases when an application needs to provide a “fallback” file system or to override VFS functionality altogether. Such file system will be used if no prefix matches the path given.

VFS does not handle dots (.) in path names in any special way. VFS does not treat .. as a reference to the parent directory. In the above example, using a path /data/static/../log.txt will not result in a call to FS 1 to open /log.txt. Specific FS drivers (such as FATFS) might handle dots in file names differently.

When opening files, the FS driver receives only relative paths to files. For example:

1. The myfs driver is registered with /data as a path prefix.
2. The application calls fopen("/data/config.json", ...).
3. The VFS component calls myfs_open("/config.json", ...).
4. The myfs driver opens the /config.json file.

VFS does not impose any limit on total file path length, but it does limit the FS path prefix to ESP_VFS_PATH_MAX characters. Individual FS drivers may have their own filename length limitations.

### File Descriptors

File descriptors are small positive integers from 0 to FD_SETSIZE - 1, where FD_SETSIZE is defined in sys/select.h. The largest file descriptors (configured by CONFIG_LWIP_MAX_SOCKETS) are reserved for sockets. The VFS component contains a lookup-table called s_fd_table for mapping global file descriptors to VFS driver indexes registered in the s_vfs array.
Standard IO Streams (stdin, stdout, stderr)

If the menuconfig option UART for console output is not set to None, then stdin, stdout, and stderr are configured to read from, and write to, a UART. It is possible to use UART0 or UART1 for standard IO. By default, UART0 is used with 115200 baud rate; TX pin is GPIO1; RX pin is GPIO3. These parameters can be changed in menuconfig.

Writing to stdout or stderr sends characters to the UART transmit FIFO. Reading from stdin retrieves characters from the UART receive FIFO.

By default, VFS uses simple functions for reading from and writing to UART. Writes busy-wait until all data is put into UART FIFO, and reads are non-blocking, returning only the data present in the FIFO. Due to this non-blocking read behavior, higher level C library calls, such as fscanf("%d\n", &var);, might not have desired results.

Applications which use the UART driver can instruct VFS to use the driver’s interrupt driven, blocking read and write functions instead. This can be done using a call to the esp_vfs_dev_uart_use_driver function. It is also possible to revert to the basic non-blocking functions using a call to esp_vfs_dev_uart_use_nonblocking.

VFS also provides an optional newline conversion feature for input and output. Internally, most applications send and receive lines terminated by the LF (‘\n’) character. Different terminal programs may require different line termination, such as CR or CRLF. Applications can configure this separately for input and output either via menuconfig, or by calls to the functions esp_vfs_dev_uart_port_set_rx_line_endings and esp_vfs_dev_uart_port_set_tx_line_endings.

Standard Streams and FreeRTOS Tasks  FILE objects for stdin, stdout, and stderr are shared between all FreeRTOS tasks, but the pointers to these objects are stored in per-task struct _reent.

The following code is transferred to fprintf(__getreent()->_stderr, "42\n"); by the preprocessor:

```c
fprintf(stderr, "42\n");
```

The __getreent() function returns a per-task pointer to struct _reent in newlib libc. This structure is allocated on the TCB of each task. When a task is initialized, _stdin, _stdout, and _stderr members of struct _reent are set to the values of _stdin, _stdout, and _stderr of _GLOBAL_REENT (i.e., the structure which is used before FreeRTOS is started).

Such a design has the following consequences:

• It is possible to set stdin, stdout, and stderr for any given task without affecting other tasks, e.g., by doing stdin = fopen("/dev/uart/1", "r").
• Closing default stdin, stdout, or stderr using fclose closes the FILE stream object, which will affect all other tasks.
• To change the default stdin, stdout, stderr streams for new tasks, modify _GLOBAL_REENT->_stdin(_stdout, _stderr) before creating the task.

eventfd()

eventfd() call is a powerful tool to notify a select() based loop of custom events. The eventfd() implementation in ESP-IDF is generally the same as described in man(2) eventfd except for:

• esp_vfs_eventfd_register() has to be called before calling eventfd()
• Options EFD_CLOEXEC, EFD_NONBLOCK and EFD_SEMAPHORE are not supported in flags.
• Option EFD_SUPPORT_ISR has been added in flags. This flag is required to read and write the eventfd in an interrupt handler.

Note that creating an eventfd with EFD_SUPPORT_ISR will cause interrupts to be temporarily disabled when reading, writing the file and during the beginning and the ending of the select() when this file is set.

API Reference

Header File
Chapter 2. API Reference

- components/vfs/include/esp_vfs.h
- This header file can be included with:

  ```
  #include "esp_vfs.h"
  ```

- This header file is a part of the API provided by the vfs component. To declare that your component depends on vfs, add the following to your CMakelists.txt:

  ```
  REQUIRES vfs
  ```

  ```
  or
  ```

  ```
  PRIV_REQUIRES vfs
  ```

Functions

**ssize_t esp_vfs_write** (struct _reent *r, int fd, void *data, size_t size)

These functions are to be used in newlib syscall table. They will be called by newlib when it needs to use any of the syscalls.

**off_t esp_vfs_lseek** (struct _reent *r, int fd, off_t size, int mode)

**ssize_t esp_vfs_read** (struct _reent *r, int fd, void *data, size_t size)

**int esp_vfs_open** (struct _reent *r, const char *path, int flags, int mode)

**int esp_vfs_close** (struct _reent *r, int fd)

**int esp_vfs_fstat** (struct _reent *r, int fd, struct stat *st)

**int esp_vfs_stat** (struct _reent *r, const char *path, struct stat *st)

**int esp_vfs_link** (struct _reent *r, const char *n1, const char *n2)

**int esp_vfs_unlink** (struct _reent *r, const char *path)

**int esp_vfs_rename** (struct _reent *r, const char *src, const char *dst)

**int esp_vfs_utime** (const char *path, const struct utimbuf *times)

**esp_err_t esp_vfs_register** (const char *base_path, const esp_vfs_t *vfs, void *ctx)

Register a virtual filesystem for given path prefix.

Parameters

- **base_path** – file path prefix associated with the filesystem. Must be a zero-terminated C string, may be empty. If not empty, must be up to ESP_VFS_PATH_MAX characters long, and at least 2 characters long. Name must start with a “/” and must not end with “/”. For example, “/data” or “/dev/spi” are valid. These VFSes would then be called to handle file paths such as “/data/myfile.txt” or “/dev/spi0”. In the special case of an empty base_path, a “fallback” VFS is registered. Such VFS will handle paths which are not matched by any other registered VFS.
- **vfs** – Pointer to esp_vfs_t, a structure which maps syscalls to the filesystem driver functions. VFS component doesn’t assume ownership of this pointer.
- **ctx** – If vfs->flags has ESP_VFS_FLAG_CONTEXT_PTR set, a pointer which should be passed to VFS functions. Otherwise, NULL.

Returns ESP_OK if successful, ESP_ERR_NO_MEM if too many VFSes are registered.

**esp_err_t esp_vfs_register_fd_range** (const esp_vfs_t *vfs, void *ctx, int min_fd, int max_fd)

Special case function for registering a VFS that uses a method other than open() to open new file descriptors from the interval <min_fd; max_fd>.

This is a special-purpose function intended for registering LWIP sockets to VFS.

Parameters

- **vfs** – Pointer to esp_vfs_t. Meaning is the same as for esp_vfs_register().
• **ctx** – Pointer to context structure. Meaning is the same as for esp_vfs_register().
• **min_fd** – The smallest file descriptor this VFS will use.
• **max_fd** – Upper boundary for file descriptors this VFS will use (the biggest file descriptor plus one).

    Returns ESP_OK if successful, ESP_ERR_NO_MEM if too many VFSes are registered, ESP_ERR_INVALID_ARG if the file descriptor boundaries are incorrect.

**esp_err_t esp_vfs_register_with_id** (const esp_vfs_t *vfs, void *ctx, esp_vfs_id_t *vfs_id)

    Special case function for registering a VFS that uses a method other than open() to open new file descriptors. In comparison with esp_vfs_register_fd_range, this function doesn’t pre-registers an interval of file descriptors.

    File descriptors can be registered later, by using esp_vfs_register_fd.

    Parameters
    • **vfs** – Pointer to esp_vfs_t. Meaning is the same as for esp_vfs_register().
    • **ctx** – Pointer to context structure. Meaning is the same as for esp_vfs_register().
    • **vfs_id** – Here will be written the VFS ID which can be passed to esp_vfs_register_fd for registering file descriptors.

    Returns ESP_OK if successful, ESP_ERR_NO_MEM if too many VFSes are registered, ESP_ERR_INVALID_ARG if the file descriptor boundaries are incorrect.

**esp_err_t esp_vfs_unregister** (const char *base_path)

    Unregister a virtual filesystem for given path prefix

    Parameters **base_path** – File prefix previously used in esp_vfs_register call

    Returns ESP_OK if successful, ESP_ERR_INVALID_STATE if VFS for given prefix hasn’t been registered

**esp_err_t esp_vfs_unregister_with_id** (esp_vfs_id_t vfs_id)

    Unregister a virtual filesystem with the given index

    Parameters **vfs_id** – The VFS ID returned by esp_vfs_register_with_id

    Returns ESP_OK if successful, ESP_ERR_INVALID_STATE if VFS for the given index hasn’t been registered

**esp_err_t esp_vfs_register_fd** (esp_vfs_id_t vfs_id, int*fd)

    Special function for registering another file descriptor for a VFS registered by esp_vfs_register_with_id.

    Parameters
    • **vfs_id** – VFS identifier returned by esp_vfs_register_with_id.
    • **fd** – The registered file descriptor will be written to this address.

    Returns ESP_OK if the registration is successful, ESP_ERR_NO_MEM if too many file descriptors are registered, ESP_ERR_INVALID_ARG if the arguments are incorrect.

**esp_err_t esp_vfs_register_fd_with_local_fd** (esp_vfs_id_t vfs_id, int local_fd, bool permanent, int*fd)

    Special function for registering another file descriptor with given local_fd for a VFS registered by esp_vfs_register_with_id.

    Parameters
    • **vfs_id** – VFS identifier returned by esp_vfs_register_with_id.
    • **local_fd** – The fd in the local vfs. Passing -1 will set the local fd as the (*fd) value.
    • **permanent** – Whether the fd should be treated as permanent (not removed after close())
    • **fd** – The registered file descriptor will be written to this address.

    Returns ESP_OK if the registration is successful, ESP_ERR_NO_MEM if too many file descriptors are registered, ESP_ERR_INVALID_ARG if the arguments are incorrect.

**esp_err_t esp_vfs_unregister_fd** (esp_vfs_id_t vfs_id, int fd)

    Special function for unregistering a file descriptor belonging to a VFS registered by esp_vfs_register_with_id.

    Parameters
    • **vfs_id** – VFS identifier returned by esp_vfs_register_with_id.
    • **fd** – File descriptor which should be unregistered.
Returns ESP_OK if the registration is successful, ESP_ERR_INVALID_ARG if the arguments are incorrect.

```c
int esp_vfs_select (int nfds, fd_set *readfds, fd_set *writefds, fd_set *errorfds, struct timeval *timeout)
```

Synchronous I/O multiplexing which implements the functionality of POSIX select() for VFS.

Parameters

- `nfds` - Specifies the range of descriptors which should be checked. The first nfds descriptors will be checked in each set.
- `readfds` - If not NULL, then points to a descriptor set that on input specifies which descriptors should be checked for being ready to read, and on output indicates which descriptors are ready to read.
- `writefds` - If not NULL, then points to a descriptor set that on input specifies which descriptors should be checked for being ready to write, and on output indicates which descriptors are ready to write.
- `errorfds` - If not NULL, then points to a descriptor set that on input specifies which descriptors should be checked for error conditions, and on output indicates which descriptors have error conditions.
- `timeout` - If not NULL, then points to `timeval` structure which specifies the time period after which the functions should time-out and return. If it is NULL, then the function will not time-out. Note that the timeout period is rounded up to the system tick and incremented by one.

Returns The number of descriptors set in the descriptor sets, or -1 when an error (specified by `errno`) have occurred.

```c
void esp_vfs_select_triggered (esp_vfs_select_sem_t sem)
```

Notification from a VFS driver about a read/write/error condition.

This function is called when the VFS driver detects a read/write/error condition as it was requested by the previous call to `start_select`.

Parameters `sem` - semaphore structure which was passed to the driver by the `start_select` call

```c
void esp_vfs_select_triggered_isr (esp_vfs_select_sem_t sem, BaseType_t *woken)
```

Notification from a VFS driver about a read/write/error condition (ISR version)

This function is called when the VFS driver detects a read/write/error condition as it was requested by the previous call to `start_select`.

Parameters

- `sem` - semaphore structure which was passed to the driver by the `start_select` call
- `woken` - is set to pdTRUE if the function wakes up a task with higher priority

```c
ssize_t esp_vfs_pread (int fd, void *dst, size_t size, off_t offset)
```

Implements the VFS layer of POSIX `pread()`

Parameters

- `fd` - File descriptor used for read
- `dst` - Pointer to the buffer where the output will be written
- `size` - Number of bytes to be read
- `offset` - Starting offset of the read

Returns A positive return value indicates the number of bytes read. -1 is return on failure and `errno` is set accordingly.

```c
ssize_t esp_vfs_pwrite (int fd, const void *src, size_t size, off_t offset)
```

Implements the VFS layer of POSIX `pwrite()`

Parameters

- `fd` - File descriptor used for write
- `src` - Pointer to the buffer from where the output will be read
- `size` - Number of bytes to write
- `offset` - Starting offset of the write
Returns A positive return value indicates the number of bytes written. -1 is return on failure and errno is set accordingly.

Structures

struct esp_vfs_select_sem_t
VFS semaphore type for select()

Public Members

bool is_sem_local
   type of “sem” is SemaphoreHandle_t when true, defined by socket driver otherwise

void *sem
   semaphore instance

struct esp_vfs_t
VFS definition structure.
This structure should be filled with pointers to corresponding FS driver functions.
VFS component will translate all FDs so that the filesystem implementation sees them starting at zero. The caller sees a global FD which is prefixed with an pre-filesystem-implementation.
Some FS implementations expect some state (e.g. pointer to some structure) to be passed in as a first argument. For these implementations, populate the members of this structure which have _p suffix, set flags member to ESP_VFS_FLAG_CONTEXT_PTR and provide the context pointer to esp_vfs_register function. If the implementation doesn’t use this extra argument, populate the members without _p suffix and set flags member to ESP_VFS_FLAG_DEFAULT.
If the FS driver doesn’t provide some of the functions, set corresponding members to NULL.

Public Members

int flags
   ESP_VFS_FLAG_CONTEXT_PTR and/or ESP_VFS_FLAG_READONLY_FS or ESP_VFS_FLAG_DEFAULT

ssize_t (*write_p)(void *p, int fd, const void *data, size_t size)
   Write with context pointer

ssize_t (*write)(int fd, const void *data, size_t size)
   Write without context pointer

off_t (*lseek_p)(void *p, int fd, off_t size, int mode)
   Seek with context pointer

off_t (*lseek)(int fd, off_t size, int mode)
   Seek without context pointer

ssize_t (*read_p)(void *ctx, int fd, void *dst, size_t size)
   Read with context pointer
ssize_t (*read)(int fd, void *dst, size_t size)
    Read without context pointer

ssize_t (*pread_p)(void *ctx, int fd, void *dst, size_t size, off_t offset)
    pread with context pointer

ssize_t (*pread)(int fd, void *dst, size_t size, off_t offset)
    pread without context pointer

ssize_t (*pwrite_p)(void *ctx, int fd, const void *src, size_t size, off_t offset)
    pwrite with context pointer

ssize_t (*pwrite)(int fd, const void *src, size_t size, off_t offset)
    pwrite without context pointer

int (*open_p)(void *ctx, const char *path, int flags, int mode)
    open with context pointer

int (*open)(const char *path, int flags, int mode)
    open without context pointer

int (*close_p)(void *ctx, int fd)
    close with context pointer

int (*close)(int fd)
    close without context pointer

int (*fstat_p)(void *ctx, int fd, struct stat *st)
    fstat with context pointer

int (*fstat)(int fd, struct stat *st)
    fstat without context pointer

int (*stat_p)(void *ctx, const char *path, struct stat *st)
    stat with context pointer

int (*stat)(const char *path, struct stat *st)
    stat without context pointer

int (*link_p)(void *ctx, const char *n1, const char *n2)
    link with context pointer

int (*link)(const char *n1, const char *n2)
    link without context pointer

int (*unlink_p)(void *ctx, const char *path)
    unlink with context pointer
    unlink with context pointer
int (*unlink)(const char *path)
    unlink without context pointer

int (*rename_p)(void *ctx, const char *src, const char *dst)
    rename with context pointer

int (*rename)(const char *src, const char *dst)
    rename without context pointer

DIR *(opendir_p)(void *ctx, const char *name)
    opendir with context pointer

DIR *(opendir)(const char *name)
    opendir without context pointer

struct dirent *(readdir_p)(void *ctx, DIR *pdir)
    readdir with context pointer

struct dirent *(readdir)(DIR *pdir)
    readdir without context pointer

int (*readdir_r_p)(void *ctx, DIR *pdir, struct dirent *entry, struct dirent **out_dirent)
    readdir_r with context pointer

int (*readdir_r)(DIR *pdir, struct dirent *entry, struct dirent **out_dirent)
    readdir_r without context pointer

long (*telldir_p)(void *ctx, DIR *pdir)
    telldir with context pointer

long (*telldir)(DIR *pdir)
    telldir without context pointer

void (*seekdir_p)(void *ctx, DIR *pdir, long offset)
    seekdir with context pointer

void (*seekdir)(DIR *pdir, long offset)
    seekdir without context pointer

int (*closedir_p)(void *ctx, DIR *pdir)
    closedir with context pointer

int (*closedir)(DIR *pdir)
    closedir without context pointer

int (*mkdir_p)(void *ctx, const char *name, mode_t mode)
    mkdir with context pointer
int (*mkdir)(const char *name, mode_t mode)
    mkdir without context pointer

int (*rmdir_p)(void *ctx, const char *name)
    rmdir with context pointer

int (*rmdir)(const char *name)
    rmdir without context pointer

int (*fcntl_p)(void *ctx, int fd, int cmd, int arg)
    fcntl with context pointer

int (*fcntl)(int fd, int cmd, int arg)
    fcntl without context pointer

int (*ioctl_p)(void *ctx, int fd, int cmd, va_list args)
    ioctl with context pointer

int (*ioctl)(int fd, int cmd, va_list args)
    ioctl without context pointer

int (*fsync_p)(void *ctx, int fd)
    fsync with context pointer

int (*fsync)(int fd)
    fsync without context pointer

int (*access_p)(void *ctx, const char *path, int amode)
    access with context pointer

int (*access)(const char *path, int amode)
    access without context pointer

int (*truncate_p)(void *ctx, const char *path, off_t length)
    truncate with context pointer

int (*truncate)(const char *path, off_t length)
    truncate without context pointer

int (*ftruncate_p)(void *ctx, int fd, off_t length)
    ftruncate with context pointer

int (*ftruncate)(int fd, off_t length)
    ftruncate without context pointer

int (*utime_p)(void *ctx, const char *path, const struct utimbuf *times)
    utime with context pointer
int (*utime)(const char *path, const struct utimbuf *times)
    utime without context pointer

int (*tcsetattr_p)(void *ctx, int fd, int optional_actions, const struct termios *p)
    tcsetattr with context pointer

int (*tcsetattr)(int fd, int optional_actions, const struct termios *p)
    tcsetattr without context pointer

int (*tcgetattr_p)(void *ctx, int fd, struct termios *p)
    tcgetattr with context pointer

int (*tcgetattr)(int fd, struct termios *p)
    tcgetattr without context pointer

int (*tcdrain_p)(void *ctx, int fd)
    tcdrain with context pointer

int (*tcdrain)(int fd)
    tcdrain without context pointer

int (*tcflush_p)(void *ctx, int fd, int select)
    tcflush with context pointer

int (*tcflush)(int fd, int select)
    tcflush without context pointer

int (*tcflow_p)(void *ctx, int fd, int action)
    tcflow with context pointer

int (*tcflow)(int fd, int action)
    tcflow without context pointer

pid_t (*tcgetsid_p)(void *ctx, int fd)
    tcgetsid with context pointer

pid_t (*tcgetsid)(int fd)
    tcgetsid without context pointer

int (*tcsendbreak_p)(void *ctx, int fd, int duration)
    tcsendbreak with context pointer

int (*tcsendbreak)(int fd, int duration)
    tcsendbreak without context pointer

esp_err_t (*start_select)(int nfds, fd_set *readfds, fd_set *writefds, fd_set *exceptfds,
                          esp_vfs_select_sem_t sem, void **end_select_args)
    start_select is called for setting up synchronous I/O multiplexing of the desired file descriptors in the
given VFS
int (*socket_select)(int nfds, fd_set *readfds, fd_set *writefds, fd_set *errorfds, struct timeval *timeout)
socket select function for socket FDs with the functionality of POSIX select(); this should be set only for the socket VFS

void (*stop_socket_select)(void *sem)
called by VFS to interrupt the socket_select call when select is activated from a non-socket VFS driver; set only for the socket driver

void (*stop_socket_select_isr)(void *sem, BaseType_t *woken)
stop_socket_select which can be called from ISR; set only for the socket driver

void *(get_socket_select_semaphore)(void)
deprecated

esp_err_t (*end_select)(void *end_select_args)
get_socket_select_semaphore returns semaphore allocated in the socket driver; set only for the socket driver

Macros

MAX_FDS
Maximum number of (global) file descriptors.

ESP_VFS_PATH_MAX
Maximum length of path prefix (not including zero terminator)

ESP_VFS_FLAG_DEFAULT
Default value of flags member in esp_vfs_t structure.

ESP_VFS_FLAG_CONTEXT_PTR
Flag which indicates that FS needs extra context pointer in syscalls.

ESP_VFS_FLAG_READONLY_FS
Flag which indicates that FS is located on read-only partition.

Type Definitions

typedef int esp_vfs_id_t

Header File

- components/vfs/include/esp_vfs_dev.h
- This header file can be included with:

```c
#include "esp_vfs_dev.h"
```

- This header file is a part of the API provided by the vfs component. To declare that your component depends on vfs, add the following to your CMakeLists.txt:

```cmake
REQUIRES vfs
```

or
Functions

```c
void esp_vfs_dev_uart_register (void)
```

This function is called from startup code to enable serial output

```c
void esp_vfs_dev_uart_set_rx_line_endings (esp_line_endings_t mode)
```

Set the line endings expected to be received on UART.

This specifies the conversion between line endings received on UART and newlines (' ', LF) passed into stdin:

- ESP_LINE_ENDINGS_CRLF: convert CRLF to LF
- ESP_LINE_ENDINGS_CR: convert CR to LF
- ESP_LINE_ENDINGS_LF: no modification

**Note:** this function is not thread safe w.r.t. reading from UART

Parameters **mode** – line endings expected on UART

```c
void esp_vfs_dev_uart_set_tx_line_endings (esp_line_endings_t mode)
```

Set the line endings to send to UART.

This specifies the conversion between newlines (' ', LF) on stdout and line endings sent over UART:

- ESP_LINE_ENDINGS_CRLF: convert LF to CRLF
- ESP_LINE_ENDINGS_CR: convert LF to CR
- ESP_LINE_ENDINGS_LF: no modification

**Note:** this function is not thread safe w.r.t. writing to UART

Parameters **mode** – line endings to send to UART

```c
int esp_vfs_dev_uart_port_set_rx_line_endings (int uart_num, esp_line_endings_t mode)
```

Set the line endings expected to be received on specified UART.

This specifies the conversion between line endings received on UART and newlines (' ', LF) passed into stdin:

- ESP_LINE_ENDINGS_CRLF: convert CRLF to LF
- ESP_LINE_ENDINGS_CR: convert CR to LF
- ESP_LINE_ENDINGS_LF: no modification
Chapter 2. API Reference

**Note:** this function is not thread safe w.r.t. reading from UART

### Parameters

- **uart_num** - the UART number
- **mode** - line endings to send to UART

### Returns

0 if succeeded, or -1 when an error (specified by errno) have occurred.

```c
int esp_vfs_dev_uart_port_set_tx_line_endings (int uart_num, esp_line_endings_t mode)
```

Set the line endings to sent to specified UART.

This specifies the conversion between newlines (`
`, LF) on stdout and line endings sent over UART:

- ESP_LINE_ENDINGS_CRLF: convert LF to CRLF
- ESP_LINE_ENDINGS_CR: convert LF to CR
- ESP_LINE_ENDINGS_LF: no modification

**Note:** this function is not thread safe w.r.t. writing to UART

### Parameters

- **uart_num** - the UART number
- **mode** - line endings to send to UART

### Returns

0 if succeeded, or -1 when an error (specified by errno) have occurred.

```c
void esp_vfs_dev_uart_use_nonblocking (int uart_num)
```

set VFS to use simple functions for reading and writing UART Read is non-blocking, write is busy waiting until TX FIFO has enough space. These functions are used by default.

**Parameters**

- **uart_num** - UART peripheral number

```c
void esp_vfs_dev_uart_use_driver (int uart_num)
```

set VFS to use UART driver for reading and writing

**Note:** application must configure UART driver before calling these functions With these functions, read and write are blocking and interrupt-driven.

**Parameters**

- **uart_num** - UART peripheral number

```c
void esp_vfs_usb_serial_jtag_use_driver (void)
```

set VFS to use USB-SERIAL-JTAG driver for reading and writing

**Note:** application must configure USB-SERIAL-JTAG driver before calling these functions With these functions, read and write are blocking and interrupt-driven.

```c
void esp_vfs_usb_serial_jtag_use_nonblocking (void)
```

set VFS to use simple functions for reading and writing UART Read is non-blocking, write is busy waiting until TX FIFO has enough space. These functions are used by default.
Chapter 2. API Reference

Header File

- components/vfs/include/esp_vfs_eventfd.h
- This header file can be included with:

  ```
  #include "esp_vfs_eventfd.h"
  ```

- This header file is a part of the API provided by the vfs component. To declare that your component depends on vfs, add the following to your CMakeLists.txt:

  ```
  REQUIRES vfs
  ```

  or

  ```
  PRIV_REQUIRES vfs
  ```

Functions

- `esp_err_t esp_vfs_eventfd_register (const esp_vfs_eventfd_config_t *config)`
  Registers the event vfs.

  Returns ESP_OK if successful, ESP_ERR_NO_MEM if too many VFSes are registered.

- `esp_err_t esp_vfs_eventfd_unregister (void)`
  Unregisters the event vfs.

  Returns ESP_OK if successful, ESP_ERR_INVALID_STATE if VFS for given prefix hasn’t been registered

- `int eventfd (unsigned int initval, int flags)`

Structures

- `struct esp_vfs_eventfd_config_t`
  Eventfd vfs initialization settings.

Public Members

- `size_t max_fds`
  The maximum number of eventfds supported

Macros

- `EFD_SUPPORT_ISR`
- `ESP_VFS_EVENTD_CONFIG_DEFAULT ()`

2.9.11 Wear Levelling API

Overview

Most of flash memory and especially SPI flash that is used in ESP32-S3 has a sector-based organization and also has a limited number of erase/modification cycles per memory sector. The wear levelling component helps to distribute wear and tear among sectors more evenly without requiring any attention from the user.
The wear levelling component provides API functions related to reading, writing, erasing, and memory mapping of data in external SPI flash through the partition component. The component also has higher-level API functions which work with the FAT filesystem defined in FAT filesystem.

The wear levelling component, together with the FAT FS component, uses FAT FS sectors of 4096 bytes, which is a standard size for flash memory. With this size, the component shows the best performance but needs additional memory in RAM.

To save internal memory, the component has two additional modes which both use sectors of 512 bytes:

- **Performance mode.** Erase sector operation data is stored in RAM, the sector is erased, and then data is copied back to flash memory. However, if a device is powered off for any reason, all 4096 bytes of data is lost.
- **Safety mode.** The data is first saved to flash memory, and after the sector is erased, the data is saved back. If a device is powered off, the data can be recovered as soon as the device boots up.

The default settings are as follows:

- Sector size is 512 bytes
- Performance mode

You can change the settings through the configuration menu.

The wear levelling component does not cache data in RAM. The write and erase functions modify flash directly, and flash contents are consistent when the function returns.

### Wear Levelling access API functions

This is the set of API functions for working with data in flash:

- `wl_mount` - initializes the wear levelling module and mounts the specified partition
- `wl_unmount` - unmounts the partition and deinitializes the wear levelling module
- `wl_erase_range` - erases a range of addresses in flash
- `wl_write` - writes data to a partition
- `wl_read` - reads data from a partition
- `wl_size` - returns the size of available memory in bytes
- `wl_sector_size` - returns the size of one sector

As a rule, try to avoid using raw wear levelling functions and use filesystem-specific functions instead.

### Memory Size

The memory size is calculated in the wear levelling module based on partition parameters. The module uses some sectors of flash for internal data.

### See Also

- **FAT Filesystem Support**
- **Partition Tables**

### Application Example

An example that combines the wear levelling driver with the FATFS library is provided in the storage/wear_levelling directory. This example initializes the wear levelling driver, mounts FatFs partition, as well as writes and reads data from it using POSIX and C library APIs. See storage/wear_levelling/README.md for more information.
Chapter 2. API Reference

High-level API Reference

Header Files

- `fatfs/vfs/esp_vfs_fat.h`

High-level wear levelling functions `esp_vfs_fat_spiflash_mount_rw_wl()`, `esp_vfs_fat_spiflash_unmount_rw_wl()` and `struct esp_vfs_fat_mount_config_t` are described in *FAT Filesystem Support*.

Mid-level API Reference

Header File

- `components/wear_levelling/include/wear_levelling.h`
- This header file can be included with:

```c
#include "wear_levelling.h"
```
- This header file is a part of the API provided by the `wear_levelling` component. To declare that your component depends on `wear_levelling`, add the following to your CMakeLists.txt:

```cmake
REQUIRES wear_levelling
```

or

```cmake
PRIV_REQUIRES wear_levelling
```

Functions

```c
esp_err_t wl_mount (const esp_partition_t *partition, wl_handle_t *out_handle)
```

Mount WL for defined partition.

**Parameters**

- `partition` – that will be used for access
- `out_handle` – handle of the WL instance

**Returns**

- ESP_OK, if the WL allocation is successful;
- ESP_ERR_INVALID_ARG, if the arguments for WL configuration are not valid;
- ESP_ERR_NO_MEM, if the WL allocation fails because of insufficient memory;

```c
esp_err_t wl_unmount (wl_handle_t handle)
```

Unmount WL for defined partition.

**Parameters**

- `handle` – WL partition handle

**Returns**

- ESP_OK, if the operation is successful;
- or one of error codes from lower-level flash driver.

```c
esp_err_t wl_erase_range (wl_handle_t handle, size_t start_addr, size_t size)
```

Erase part of the WL storage.

**Parameters**

- `handle` – WL handle that are related to the partition
- `start_addr` – Address from where erase operation should start. Must be aligned to the result of function `wl_sector_size(…)`.
- `size` – Size of the range which should be erased, in bytes. Must be divisible by the result of function `wl_sector_size(…)`.

**Returns**

- ESP_OK, if the given range was erased successfully;
- ESP_ERR_INVALID_ARG, if iterator or dst are NULL;
- ESP_ERR_INVALID_SIZE, if erase would go out of bounds of the partition;
- or one of error codes from lower-level flash driver.
**esp_err_t** **wl_write**( **wl_handle_t** handle, size_t dest_addr, const void *src, size_t size)

Write data to the WL storage.

Before writing data to flash, corresponding region of flash needs to be erased. This can be done using **wl_erase_range** function.

**Note:** Prior to writing to WL storage, make sure it has been erased with **wl_erase_range** call.

**Parameters**

- **handle** - WL handle corresponding to the WL partition
- **dest_addr** - Address where the data should be written, relative to the beginning of the partition.
- **src** - Pointer to the source buffer. Pointer must be non-NULL and buffer must be at least ‘size’ bytes long.
- **size** - Size of data to be written, in bytes.

**Returns**

- ESP_OK, if data was written successfully;
- ESP_ERR_INVALID_ARG, if dst_offset exceeds partition size;
- ESP_ERR_INVALID_SIZE, if write would go out of bounds of the partition;
- or one of error codes from lower-level flash driver.

**esp_err_t** **wl_read**( **wl_handle_t** handle, size_t src_addr, void *dest, size_t size)

Read data from the WL storage.

**Parameters**

- **handle** - WL module instance that was initialized before
- **dest** - Pointer to the buffer where data should be stored. The Pointer must be non-NULL and the buffer must be at least ‘size’ bytes long.
- **src_addr** - Address of the data to be read, relative to the beginning of the partition.
- **size** - Size of data to be read, in bytes.

**Returns**

- ESP_OK, if data was read successfully;
- ESP_ERR_INVALID_ARG, if src_offset exceeds partition size;
- ESP_ERR_INVALID_SIZE, if read would go out of bounds of the partition;
- or one of error codes from lower-level flash driver.

**size_t** **wl_size**( **wl_handle_t** handle)

Get the actual flash size in use for the WL storage partition.

**Parameters** **handle** - WL module handle that was initialized before

**Returns** usable size, in bytes

**size_t** **wl_sector_size**( **wl_handle_t** handle)

Get sector size of the WL instance.

**Parameters** **handle** - WL module handle that was initialized before

**Returns** sector size, in bytes

**Macros**

**WL_INVALID_HANDLE**

**Type Definitions**

typedef int32_t **wl_handle_t**

wear levelling handle

Code examples for this API section are provided in the **storage** directory of ESP-IDF examples.
2.10 System API

2.10.1 App Image Format

Application Image Structures

An application image consists of the following:

1. The `esp_image_header_t` structure describes the mode of SPI flash and the count of memory segments.
2. The `esp_image_segment_header_t` structure describes each segment, its length, and its location in ESP32-S3’s memory, followed by the data with a length of `data_len`. The data offset for each segment in the image is calculated in the following way:

   - offset for 0 Segment = `sizeof(esp_image_header_t)` + `sizeof(esp_image_segment_header_t)`
   - offset for 1 Segment = offset for 0 Segment + length of 0 Segment + `sizeof(esp_image_segment_header_t)`
   - offset for 2 Segment = offset for 1 Segment + length of 1 Segment + `sizeof(esp_image_segment_header_t)`
   - ...

The count of each segment is defined in the `segment_count` field that is stored in `esp_image_header_t`. The count cannot be more than `ESP_IMAGE_MAX_SEGMENTS`.

To get the list of your image segments, please run the following command:

```python
esptool.py --chip esp32s3 image_info build/app.bin
```

You can also see the information on segments in the ESP-IDF logs while your application is booting:

```
I (443) esp_image: segment 0: paddr=0x00020020 vaddr=0x3f400020 size=0x13ce0 (...) 81120 map
I (489) esp_image: segment 1: paddr=0x00033d08 vaddr=0x3ff80000 size=0x00000 (0) 502 load
I (530) esp_image: segment 2: paddr=0x00033d10 vaddr=0x3ff80000 size=0x00000 (0) 502 load
```

(continues on next page)
For more details on the type of memory segments and their address ranges, see ESP32-S3 Technical Reference Manual > System and Memory > Internal Memory [PDF].

3. The image has a single checksum byte after the last segment. This byte is written on a sixteen byte padded boundary, so the application image might need padding.

4. If the hash_appended field from esp_image_header_t is set then a SHA256 checksum will be appended. The value of the SHA256 hash is calculated on the range from the first byte and up to this field. The length of this field is 32 bytes.

5. If the option CONFIG_SECURE_SIGNED_APPS_SCHEME is set to ECDSA then the application image will have an additional 68 bytes for an ECDSA signature, which includes:
   - version word (4 bytes)
   - signature data (64 bytes)

6. If the option CONFIG_SECURE_SIGNED_APPS_SCHEME is set to RSA or ECDSA (V2) then the application image will have an additional signature sector of 4 KB in size. For more details on the format of this signature sector, please refer to Signature Block Format.

Application Description

The DROM segment of the application binary starts with the esp_app_desc_t structure which carries specific fields describing the application:

- magic_word: the magic word for the esp_app_desc_t structure
- secure_version: see Anti-rollback
- version: see App version1
- project_name: filled from PROJECT_NAME1
- time and date: compile time and date
- idf_ver: version of ESP-IDF1
- app_elf_sha256: contains SHA256 hash for the application ELF file

This structure is useful for identification of images uploaded via Over-the-Air (OTA) updates because it has a fixed offset = sizeof(esp_image_header_t) + sizeof(esp_image_segment_header_t). As soon as a device receives the first fragment containing this structure, it has all the information to determine whether the update should be continued with or not.

To obtain the esp_app_desc_t structure for the currently running application, use esp_app_get_description().

1 The maximum length is 32 characters, including null-termination character. For example, if the length of PROJECT_NAME exceeds 31 characters, the excess characters will be disregarded.
To obtain the `esp_app_desc_t` structure for another OTA partition, use `esp_ota_get_partition_description()`.

**Adding a Custom Structure to an Application**

Users also have the opportunity to have similar structure with a fixed offset relative to the beginning of the image. The following pattern can be used to add a custom structure to your image:

```c
const __attribute__((section(".rodata_custom_desc"))) esp_custom_app_desc_t custom_app_desc = { ... }
```

Offset for custom structure is `sizeof(esp_image_header_t) + sizeof(esp_image_segment_header_t) + sizeof(esp_app_desc_t)`.

To guarantee that the custom structure is located in the image even if it is not used, you need to add `target_link_libraries(${COMPONENT_TARGET} "-u custom_app_desc")` into `CMakeLists.txt`.

**API Reference**

**Header File**

- `components/bootloader_support/include/esp_app_format.h`
- This header file can be included with:
  ```c
  #include "esp_app_format.h"
  ```

- This header file is a part of the API provided by the `bootloader_support` component. To declare that your component depends on `bootloader_support`, add the following to your `CMakeLists.txt`:
  ```
  REQUIRES bootloader_support
  
  or
  
  PRIV_REQUIRES bootloader_support
  ```

**Structures**

**struct esp_image_header_t**

Main header of binary image.

**Public Members**

- `uint8_t magic`
  Magic word `ESP_IMAGE_HEADER_MAGIC`

- `uint8_t segment_count`
  Count of memory segments

- `uint8_t spi_mode`
  flash read mode (`esp_image_spi_mode_t as uint8_t`)

- `uint8_t spi_speed`
  flash frequency (`esp_image_spi_freq_t as uint8_t`)
uint8_t spi_size
    flash chip size (esp_image_flash_size_t as uint8_t)

uint32_t entry_addr
    Entry address

uint8_t wp_pin
    WP pin when SPI pins set via efuse (read by ROM bootloader, the IDF bootloader uses software to
    configure the WP pin and sets this field to 0xEE=disabled)

uint8_t spi_pin_drv[3]
    Drive settings for the SPI flash pins (read by ROM bootloader)

esp_chip_id_t chip_id
    Chip identification number

uint8_t min_chip_rev
    Minimal chip revision supported by image After the Major and Minor revision eFuses were introduced
    into the chips, this field is no longer used. But for compatibility reasons, we keep this field and the data in
    it. Use min_chip_rev_full instead. The software interprets this as a Major version for most of the chips
    and as a Minor version for the ESP32-C3.

uint16_t min_chip_rev_full
    Minimal chip revision supported by image, in format: major * 100 + minor

uint16_t max_chip_rev_full
    Maximal chip revision supported by image, in format: major * 100 + minor

uint8_t reserved[4]
    Reserved bytes in additional header space, currently unused

uint8_t hash_appended
    If 1, a SHA256 digest “simple hash” (of the entire image) is appended after the checksum. Included
    in image length. This digest is separate to secure boot and only used for detecting corruption. For secure
    boot signed images, the signature is appended after this (and the simple hash is included in the signed
    data).

struct esp_image_segment_header_t
    Header of binary image segment.

Public Members

uint32_t load_addr
    Address of segment

uint32_t data_len
    Length of data
Macros

ESP_IMAGE_HEADER_MAGIC
The magic word for the `esp_image_header_t` structure.

ESP_IMAGE_MAX_SEGMENTS
Max count of segments in the image.

Enumerations

enum esp_chip_id_t
ESP chip ID.
Values:

  enumerator ESP_CHIP_ID_ESP32
    chip ID: ESP32

  enumerator ESP_CHIP_ID_ESP32S2
    chip ID: ESP32-S2

  enumerator ESP_CHIP_ID_ESP32C3
    chip ID: ESP32-C3

  enumerator ESP_CHIP_ID_ESP32S3
    chip ID: ESP32-S3

  enumerator ESP_CHIP_ID_ESP32C2
    chip ID: ESP32-C2

  enumerator ESP_CHIP_ID_ESP32C6
    chip ID: ESP32-C6

  enumerator ESP_CHIP_ID_ESP32H2
    chip ID: ESP32-H2

  enumerator ESP_CHIP_ID_ESP32P4
    chip ID: ESP32-P4

  enumerator ESP_CHIP_ID_INVALID
    Invalid chip ID (we defined it to make sure the esp_chip_id_t is 2 bytes size)

enum esp_image_spi_mode_t
SPI flash mode, used in `esp_image_header_t`.
Values:

  enumerator ESP_IMAGE_SPI_MODE_QIO
    SPI mode QIO

  enumerator ESP_IMAGE_SPI_MODE_QOUT
    SPI mode QOUT
enumerator ESP_IMAGE_SPI_MODE_DIO
   SPI mode DIO

enumerator ESP_IMAGE_SPI_MODE_DOUT
   SPI mode DOUT

enumerator ESP_IMAGE_SPI_MODE_FAST_READ
   SPI mode FAST_READ

enumerator ESP_IMAGE_SPI_MODE_SLOW_READ
   SPI mode SLOW_READ

enum esp_image_spi_freq_t
   SPI flash clock division factor.
   Values:

enumerator ESP_IMAGE_SPI_SPEED_DIV_2
   The SPI flash clock frequency is divided by 2 of the clock source

enumerator ESP_IMAGE_SPI_SPEED_DIV_3
   The SPI flash clock frequency is divided by 3 of the clock source

enumerator ESP_IMAGE_SPI_SPEED_DIV_4
   The SPI flash clock frequency is divided by 4 of the clock source

enumerator ESP_IMAGE_SPI_SPEED_DIV_1
   The SPI flash clock frequency equals to the clock source

enum esp_image_flash_size_t
   Supported SPI flash sizes.
   Values:

enumerator ESP_IMAGE_FLASH_SIZE_1MB
   SPI flash size 1 MB

enumerator ESP_IMAGE_FLASH_SIZE_2MB
   SPI flash size 2 MB

enumerator ESP_IMAGE_FLASH_SIZE_4MB
   SPI flash size 4 MB

enumerator ESP_IMAGE_FLASH_SIZE_8MB
   SPI flash size 8 MB

enumerator ESP_IMAGE_FLASH_SIZE_16MB
   SPI flash size 16 MB
2.10.2 Bootloader Image Format

The bootloader image consists of the same structures as the application image, see Application Image Structures. The only difference is in the Bootloader Description structure.

To get information about the bootloader image, please run the following command:

```
esptool.py --chip esp32s3 image_info build/bootloader/bootloader.bin --version 2
```

---

File size: 26576 (bytes)

ESP32 image header

```
Image version: 1
Entry point: 0x40080658
Segments: 4
Flash size: 2MB
Flash freq: 40m
Flash mode: DIO
```

ESP32 extended image header

```
WP pin: 0xee
Flash pins drive settings: clk_drv: 0x0, q_drv: 0x0, d_drv: 0x0, cs0_drv: 0x0, hd_drv: 0x0, wp_drv: 0x0
Chip ID: 0
Minimal chip revision: v0.0, (legacy min_rev = 0)
Maximal chip revision: v3.99
```

Segments information

```
1 0x01bb0 0x3fff0030 0x00000018 BYTE_ACCESSIBLE, DRAM, DIRAM_DRAM
2 0x03c90 0x40078000 0x00001bd0 CACHE_APP
3 0x00004 0x40080400 0x00005868 IRAM
4 0x00f2c 0x40080404 0x00005874 IRAM
```

ESP32 image footer

```
Checksum: 0x65 (valid)
Validation hash: 6f31a7f8512f26f6bce7c3b270f93bf6cf1ee4602c322998ca8ce27433527e92... (~valid)
```

(continues on next page)
Bootloader Description

The DRAM0 segment of the bootloader binary starts with the `esp_bootloader_desc_t` structure which carries specific fields describing the bootloader. This structure is located at a fixed offset = `sizeof(esp_image_header_t) + sizeof(esp_image_segment_header_t)`.

- **magic_byte** - the magic byte for the `esp_bootloader_desc` structure.
- **reserved** - reserved for the future IDF use.
- **version** - bootloader version, see `CONFIG_BOOTLOADER_PROJECT_VER`
- **idf_ver** - ESP-IDF version.
- **date and time** - compile date and time.
- **reserved2** - reserved for the future IDF use.

* - The maximum length is 32 characters, including null-termination character.

To get the `esp_bootloader_desc_t` structure from the running bootloader, use `esp_bootloader_get_description()`.

To get the `esp_bootloader_desc_t` structure from a running application, use `esp_ota_get_bootloader_description()`.

API Reference

Header File

- `components/esp_bootloader_format/include/esp_bootloader_desc.h`

This header file can be included with:

```c
#include "esp_bootloader_desc.h"
```

This header file is a part of the API provided by the `esp_bootloader_format` component. To declare that your component depends on `esp_bootloader_format`, add the following to your CMakeLists.txt:

```cmake
REQUIRES esp_bootloader_format
```

or

```cmake
PRIV_REQUIRES esp_bootloader_format
```

Functions

```c
const esp_bootloader_desc_t *esp_bootloader_get_description(void)
```

Return `esp_bootloader_desc` structure.

Intended for use by the bootloader.

**Returns**  Pointer to `esp_bootloader_desc` structure.

Structures

```c
struct esp_bootloader_desc_t
```

Bootloader description structure.
Chapter 2. API Reference

Public Members

uint8_t magic_byte
    Magic byte ESP_BOOTLOADER_DESC_MAGIC_BYTE

uint8_t reserved[3]
    reserved for IDF

uint32_t version
    Bootloader version

char idf_ver[32]
    Version IDF

char date_time[24]
    Compile date and time

uint8_t reserved2[16]
    reserved for IDF

Macros

ESP_BOOTLOADER_DESC_MAGIC_BYTE
    The magic byte for the esp_bootloader_desc structure that is in DRAM.

2.10.3 Application Level Tracing

Overview

ESP-IDF provides a useful feature for application behavior analysis called Application Level Tracing. The feature can be enabled in menuconfig and allows transfer of arbitrary data between the host and ESP32-S3 via JTAG interface with minimal overhead on program execution.

Developers can use this library to send application specific state of execution to the host, and receive commands or other types of information in the opposite direction at runtime. The main use cases of this library are:

1. Collecting application specific data, see Application Specific Tracing.
2. Lightweight logging to the host, see Logging to Host.
3. System behaviour analysis, see System Behavior Analysis with SEGGER SystemView.

API Reference

Header File

- components/app_trace/include/esp_app_trace.h
- This header file can be included with:

```c
#include "esp_app_trace.h"
```

- This header file is a part of the API provided by the app_trace component. To declare that your component depends on app_trace, add the following to your CMakeLists.txt:
Chapter 2. API Reference

REQUIRES app_trace
or
PRIV_REQUIRES app_trace

Functions

esp_err_t esp_apptrace_init (void)

Initializes application tracing module.

**Note:** Should be called before any esp_apptrace_xxx call.

**Returns** ESP_OK on success, otherwise see esp_err_t

void esp_apptrace_down_buffer_config (uint8_t *buf, uint32_t size)

Configures down buffer.

**Note:** Needs to be called before attempting to receive any data using esp_apptrace_down_buffer_get and esp_apptrace_read. This function does not protect internal data by lock.

**Parameters**

- `buf` – Address of buffer to use for down channel (host to target) data.
- `size` – Size of the buffer.

uint8_t *esp_apptrace_buffer_get (esp_apptrace_dest_t dest, uint32_t size, uint32_t tmo)

Allocates buffer for trace data. Once the data in the buffer is ready to be sent, esp_apptrace_buffer_put must be called to indicate it.

**Parameters**

- `dest` – Indicates HW interface to send data.
- `size` – Size of data to write to trace buffer.
- `tmo` – Timeout for operation (in us). Use ESP_APPTRACE_TMO_INFINITE to wait indefinitely.

**Returns** non-NULL on success, otherwise NULL.

esp_err_t esp_apptrace_buffer_put (esp_apptrace_dest_t dest, uint8_t *ptr, uint32_t tmo)

Indicates that the data in the buffer is ready to be sent. This function is a counterpart of and must be preceded by esp_apptrace_buffer_get.

**Parameters**

- `dest` – Indicates HW interface to send data. Should be identical to the same parameter in call to esp_apptrace_buffer_get.
- `ptr` – Address of trace buffer to release. Should be the value returned by call to esp_apptrace_buffer_get.
- `tmo` – Timeout for operation (in us). Use ESP_APPTRACE_TMO_INFINITE to wait indefinitely.

**Returns** ESP_OK on success, otherwise see esp_err_t

esp_err_t esp_apptrace_write (esp_apptrace_dest_t dest, const void *data, uint32_t size, uint32_t tmo)

Writes data to trace buffer.

**Parameters**

- `dest` – Indicates HW interface to send data.
- `data` – Address of data to write to trace buffer.
- `size` – Size of data to write to trace buffer.
• **tmo** – Timeout for operation (in us). Use ESP_APPTRACE_TMO_INFINITE to wait indefinitely.

**Returns** ESP_OK on success, otherwise see esp_err_t

```c
int esp_apptrace_vprintf_to(esp_apptrace_dest_t dest, uint32_t tmo, const char *fmt, va_list ap)
```

vprintf-like function to send log messages to host via specified HW interface.

**Parameters**

- **dest** – Indicates HW interface to send data.
- **tmo** – Timeout for operation (in us). Use ESP_APPTRACE_TMO_INFINITE to wait indefinitely.
- **fmt** – Address of format string.
- **ap** – List of arguments.

**Returns** Number of bytes written.

```c
int esp_apptrace_vprintf(const char *fmt, va_list ap)
```

vprintf-like function to send log messages to host.

**Parameters**

- **fmt** – Address of format string.
- **ap** – List of arguments.

**Returns** Number of bytes written.

```c
esp_err_t esp_apptrace_flush(esp_apptrace_dest_t dest, uint32_t tmo)
```

Flushes remaining data in trace buffer to host.

**Parameters**

- **dest** – Indicates HW interface to flush data on.
- **tmo** – Timeout for operation (in us). Use ESP_APPTRACE_TMO_INFINITE to wait indefinitely.

**Returns** ESP_OK on success, otherwise see esp_err_t

```c
esp_err_t esp_apptrace_flush_nolock(esp_apptrace_dest_t dest, uint32_t min_sz, uint32_t tmo)
```

Flushes remaining data in trace buffer to host without locking internal data. This is a special version of esp_apptrace_flush which should be called from panic handler.

**Parameters**

- **dest** – Indicates HW interface to flush data on.
- **min_sz** – Threshold for flushing data. If current filling level is above this value, data will be flushed. TRAX destinations only.
- **tmo** – Timeout for operation (in us). Use ESP_APPTRACE_TMO_INFINITE to wait indefinitely.

**Returns** ESP_OK on success, otherwise see esp_err_t

```c
esp_err_t esp_apptrace_read(esp_apptrace_dest_t dest, void *data, uint32_t *size, uint32_t tmo)
```

Reads host data from trace buffer.

**Parameters**

- **dest** – Indicates HW interface to read the data on.
- **data** – Address of buffer to put data from trace buffer.
- **size** – Pointer to store size of read data. Before call to this function pointed memory must hold requested size of data
- **tmo** – Timeout for operation (in us). Use ESP_APPTRACE_TMO_INFINITE to wait indefinitely.

**Returns** ESP_OK on success, otherwise see esp_err_t

```c
uint8_t *esp_apptrace_down_buffer_get(esp_apptrace_dest_t dest, uint32_t *size, uint32_t tmo)
```

Retrieves incoming data buffer if any. Once data in the buffer is processed, esp_apptrace_down_buffer_put must be called to indicate it.

**Parameters**

- **dest** – Indicates HW interface to receive data.
• **size** – Address to store size of available data in down buffer. Must be initialized with requested value.
• **tmo** – Timeout for operation (in us). Use ESP_APPTRACE_TMO_INFINITE to wait indefinitely.

**Returns** non-NULL on success, otherwise NULL.

```c
esp_err_t esp_apptrace_down_buffer_put(esp_apptrace_dest_t dest, uint8_t *ptr, uint32_t tmo)
```

Indicates that the data in the down buffer is processed. This function is a counterpart of and must be preceded by `esp_apptrace_down_buffer_get`.

**Parameters**

- **dest** – Indicates HW interface to receive data. Should be identical to the same parameter in call to `esp_apptrace_down_buffer_get`.
- **ptr** – Address of trace buffer to release. Should be the value returned by call to `esp_apptrace_down_buffer_get`.
- **tmo** – Timeout for operation (in us). Use ESP_APPTRACE_TMO_INFINITE to wait indefinitely.

**Returns** ESP_OK on success, otherwise see esp_err_t

```c
bool esp_apptrace_host_is_connected(esp_apptrace_dest_t dest)
```

Checks whether host is connected.

**Parameters** **dest** – Indicates HW interface to use.

**Returns** true if host is connected, otherwise false

```c
void *esp_apptrace_fopen(esp_apptrace_dest_t dest, const char *path, const char *mode)
```

Opens file on host. This function has the same semantic as ‘fopen’ except for the first argument.

**Parameters**

- **dest** – Indicates HW interface to use.
- **path** – Path to file.
- **mode** – Mode string. See fopen for details.

**Returns** non-zero file handle on success, otherwise 0

```c
int esp_apptrace_fclose(esp_apptrace_dest_t dest, void *stream)
```

Closes file on host. This function has the same semantic as ‘fclose’ except for the first argument.

**Parameters**

- **dest** – Indicates HW interface to use.
- **stream** – File handle returned by `esp_apptrace_fopen`.

**Returns** Zero on success, otherwise non-zero. See fclose for details.

```c
size_t esp_apptrace_fwrite(esp_apptrace_dest_t dest, const void *ptr, size_t size, size_t nmemb, void *stream)
```

Writes to file on host. This function has the same semantic as ‘fwrite’ except for the first argument.

**Parameters**

- **dest** – Indicates HW interface to use.
- **ptr** – Address of data to write.
- **size** – Size of an item.
- **nmemb** – Number of items to write.
- **stream** – File handle returned by `esp_apptrace_fopen`.

**Returns** Number of written items. See fwrite for details.

```c
size_t esp_apptrace_fread(esp_apptrace_dest_t dest, void *ptr, size_t size, size_t nmemb, void *stream)
```

Read file on host. This function has the same semantic as ‘fread’ except for the first argument.

**Parameters**

- **dest** – Indicates HW interface to use.
- **ptr** – Address to store read data.
- **size** – Size of an item.
- **nmemb** – Number of items to read.
- **stream** – File handle returned by `esp_apptrace_fopen`.
Returns  Number of read items. See fread for details.

int esp_apptrace_fseek (esp_apptrace_dest_t dest, void *stream, long offset, int whence)
Set position indicator in file on host. This function has the same semantic as ‘fseek’ except for the first argument.

Parameters
• dest  – Indicates HW interface to use.
• stream – File handle returned by esp_apptrace_fopen.
• offset – Offset. See fseek for details.
• whence – Position in file. See fseek for details.

Returns  Zero on success, otherwise non-zero. See fseek for details.

int esp_apptrace_ftell (esp_apptrace_dest_t dest, void *stream)
Get current position indicator for file on host. This function has the same semantic as ‘ftell’ except for the first argument.

Parameters
• dest  – Indicates HW interface to use.
• stream – File handle returned by esp_apptrace_fopen.

Returns  Current position in file. See ftell for details.

int esp_apptrace_fstop (esp_apptrace_dest_t dest)
Indicates to the host that all file operations are complete. This function should be called after all file operations
are finished and indicate to the host that it can perform cleanup operations (close open files etc.).

Parameters dest  – Indicates HW interface to use.

Returns  ESP_OK on success, otherwise see esp_err_t

int esp_apptrace_feof (esp_apptrace_dest_t dest, void *stream)
Test end-of-file indicator on a stream. This function has the same semantic as ‘feof’ except for the first argument.

Parameters
• dest  – Indicates HW interface to use.
• stream – File handle returned by esp_apptrace_fopen.

Returns  Non-Zero if end-of-file indicator is set for stream. See feof for details.

void esp_gcov_dump (void)
Triggers gcov info dump. This function waits for the host to connect to target before dumping data.

Enumerations

enum esp_apptrace_dest_t
Application trace data destinations bits.

Values:

enumerator ESP_APTRACE_DEST_JTAG
JTAG destination.

enumerator ESP_APTRACE_DEST_TRAX
xxx_TRAX name is obsolete, use more common xxx_JTAG

enumerator ESP_APTRACE_DEST_UART
UART destination.

enumerator ESP_APTRACE_DEST_MAX
Chapter 2. API Reference

enumerator **ESP_APTRACE_DEST_NUM**

Header File

- **components/app_trace/include/esp_sysview_trace.h**
- This header file can be included with:
  ```
  #include "esp_sysview_trace.h"
  ```
- This header file is a part of the API provided by the **app_trace** component. To declare that your component depends on **app_trace**, add the following to your **CMakeLists.txt**:
  ```
  REQUIRES app_trace
  or
  PRIV_REQUIRES app_trace
  ```

Functions

**static inline esp_err_t esp_sysview_flush** (uint32_t tmo)

Flushes remaining data in SystemView trace buffer to host.

  **Parameters**
  - **tmo** - Timeout for operation (in us). Use ESP_APTRACE_TMO_INFINITE to wait indefinitely.
  
  **Returns** ESP_OK.

**int esp_sysview_vprintf** (const char *format, va_list args)

vprintf-like function to sent log messages to the host.

  **Parameters**
  - **format** - Address of format string.
  - **args** - List of arguments.
  
  **Returns** Number of bytes written.

**esp_err_t esp_sysview_heap_trace_start** (uint32_t tmo)

Starts SystemView heap tracing.

  **Parameters**
  - **tmo** - Timeout (in us) to wait for the host to be connected. Use -1 to wait forever.
  
  **Returns** ESP_OK on success, ESP_ERR_TIMEOUT if operation has been timed out.

**esp_err_t esp_sysview_heap_trace_stop** (void)

Stops SystemView heap tracing.

  **Returns** ESP_OK.

**void esp_sysview_heap_trace_alloc** (void *addr, uint32_t size, const void *callers)

Sends heap allocation event to the host.

  **Parameters**
  - **addr** - Address of allocated block.
  - **size** - Size of allocated block.
  - **callers** - Pointer to array with callstack addresses. Array size must be CONFIG_HEAP_TRACING_STACK_DEPTH.

**void esp_sysview_heap_trace_free** (void *addr, const void *callers)

Sends heap de-allocation event to the host.

  **Parameters**
  - **addr** - Address of de-allocated block.
  - **callers** - Pointer to array with callstack addresses. Array size must be CONFIG_HEAP_TRACING_STACK_DEPTH.
2.10.4 Call Function with External Stack

Overview

A given function can be executed with a user-allocated stack space which is independent of current task stack. This mechanism can be used to save stack space wasted by tasks which call a common function with intensive stack usage such as printf. The given function can be called inside the shared stack space, which is a callback function deferred by calling `esp_execute_shared_stack_function()`, passing that function as a parameter.

Usage

`esp_execute_shared_stack_function()` takes four arguments:

- a mutex object allocated by the caller, which is used to protect if the same function shares its allocated stack
- a pointer to the top of stack used for that function
- the size of stack in bytes
- a pointer to the shared stack function

The user-defined function is deferred as a callback and can be called using the user-allocated space without taking space from current task stack.

The usage may look like the code below:

```c
void external_stack_function(void)
{
    printf("Executing this printf from external stack! \n");
}

//Let us suppose we want to call printf using a separated stack space
//allowing the app to reduce its stack size.
void app_main()
{
    //Allocate a stack buffer, from heap or as a static form:
    StackType_t *shared_stack = malloc(8192 * sizeof(StackType_t));
    assert(shared_stack != NULL);

    //Allocate a mutex to protect its usage:
    SemaphoreHandle_t printf_lock = xSemaphoreCreateMutex();
    assert(printf_lock != NULL);

    //Call the desired function using the macro helper:
    esp_execute_shared_stack_function(printf_lock,
            shared_stack,
            8192,
            external_stack_function);

    vSemaphoreDelete(printf_lock);
    free(shared_stack);
}
```

API Reference

Header File

- `components/esp_system/include/esp_expression_with_stack.h`
- This header file can be included with:
Functions
void esp_execute_shared_stack_function (SemaphoreHandle_t lock, void *stack, size_t stack_size, shared_stack_function function)

Calls user defined shared stack space function.

Note: if either lock, stack or stack size is invalid, the expression will be called using the current stack.

Parameters
- **lock** - Mutex object to protect in case of shared stack
- **stack** - Pointer to user allocated stack
- **stack_size** - Size of current stack in bytes
- **function** - Pointer to the shared stack function to be executed

Macros
ESP_EXECUTE_EXPRESSION_WITH_STACK (lock, stack, stack_size, expression)

Type Definitions
typedef void (*shared_stack_function)(void)

2.10.5 Chip Revision

Overview

ESP32-S3 may have different revisions. These revisions mainly fix some issues, and sometimes also bring new features to the chip. Versioning Scheme describes the versioning of these chip revisions, and the APIs to read the versions at runtime.

There are some considerations of compatibility among application, ESP-IDF version, and chip revisions:

- Applications may depend on some fixes/features provided by a chip revision.
- When using updated version of hardware, the hardware may be incompatible with earlier versions of ESP-IDF.

Compatibility Checks of ESP-IDF describes how the application can specify its chip revision requirements, and the way ESP-IDF checks the compatibility. After that, there is troubleshooting information for this mechanism.

Versioning Scheme

A chip’s revision number is typically expressed as vX.Y, where:

- X means a **Major** wafer version. If it is changed, it means that the current software version is not compatible with this released chip and the software must be updated to use this chip.
- Y means a **Minor** wafer version. If it is changed that means the current software version is compatible with the released chip, and there is no need to update the software.

If a newly released chip does not contain breaking changes, the chip can run the same software as the previous chip. As such, the new chip’s revision number will only increment the minor version while keeping the major version the same (e.g., v1.1 to v1.2).
Conversely, if a newly released chip contains breaking changes, the chip cannot run the same software as the previous chip. As such, the new chip’s revision number will increment the major version and set the minor version to 0 (e.g., v1.1 to v2.0).

This versioning scheme was selected to indicate the derivation relationship of chip revisions, and clearly distinguish changes in chips between breaking changes and non-breaking changes.

ESP-IDF is designed to execute seamlessly on future chip minor revisions with the same logic as the chip’s nearest previous minor revision. Thus, users can directly port their compiled binaries to newer MINOR chip revisions without upgrading their ESP-IDF version and re-compile the whole project.

When a binary is executed on a chip revision of unexpected MAJOR revision, the software is also able to report issues according to the MAJOR revision. The major and minor versioning scheme also allows hardware changes to be branchable.

**Note:** The current chip revision scheme using major and minor versions was introduced from ESP-IDF v5.0 onwards. Thus bootloaders built using earlier versions of ESP-IDF will still use the legacy chip revision scheme of wafer versions.

### EFuse Bits for Chip Revisions

Chips have several eFuse version fields:

- **Major wafer version** (`WAFER_VERSION_MAJOR` eFuse)
- **Minor wafer version** (`WAFER_VERSION_MINOR` eFuse)
- **Ignore maximum revision** (`DISABLE_WAFER_VERSION_MAJOR` eFuse). See [Compatibility Checks of ESP-IDF](#) on how this is used.

**Note:** The previous versioning logic was based on a single eFuse version field (`WAFER_VERSION`). This approach makes it impossible to mark chips as breaking or non-breaking changes, and the versioning logic becomes linear.

### Chip Revision APIs

These APIs help to get chip revision from eFuses:

- `efuse_hal_chip_revision()`. It returns revision in the `major * 100 + minor` format.
- `efuse_hal_get_major_chip_version()`. It returns Major revision.
- `efuse_hal_get_minor_chip_version()`. It returns Minor revision.

The following Kconfig definitions (in `major * 100 + minor` format) that can help add the chip revision dependency to the code:

- `CONFIG_ESP32S3_REV_MIN_FULL`
- `CONFIG_ESP_REV_MIN_FULL`
- `CONFIG_ESP32S3_REV_MAX_FULL`
- `CONFIG_ESP_REV_MAX_FULL`

### Compatibility Checks of ESP-IDF

When building an application that needs to support multiple revisions of a particular chip, the minimum and maximum chip revision numbers supported by the build are specified via Kconfig.

The minimum chip revision can be configured via the `CONFIG_ESP32S3_REV_MIN` option. Specifying the minimum chip revision will limit the software to only run on a chip revisions that are high enough to support some features or bugfixes.

The maximum chip revision cannot be configured and is automatically determined by the current ESP-IDF version being used. ESP-IDF will refuse to boot any chip revision exceeding the maximum chip revision. Given that it is impossible for a particular ESP-IDF version to foresee all future chip revisions, the maximum chip revision is usually set to maximum supported MAJOR version + 99. The “Ignore Maximum Revision” eFuse can be set to...
Chapter 2. API Reference

bypass the maximum revision limitation. However, the software is not guaranteed to work if the maximum revision is ignored.

Below is the information about troubleshooting when the chip revision fails the compatibility check. Then there are technical details of the checking and software behavior on earlier version of ESP-IDF.

Troubleshooting

1. If the 2nd stage bootloader is run on a chip revision smaller than minimum revision specified in the image (i.e., the application), a reboot occurs. The following message will be printed:

   ```
   Image requires chip rev >= v3.0, but chip is v1.0
   ```

   To resolve this issue,
   - Use a chip with the required minimum revision or higher.
   - Lower the `CONFIG_ESP32S3_REV_MIN` value and rebuild the image so that it is compatible with the chip revision being used.

2. If application does not match minimum and maximum chip revisions, a reboot occurs. The following message will be printed:

   ```
   Image requires chip rev <= v2.99, but chip is v3.0
   ```

   To resolve this issue, update ESP-IDF to a newer version that supports the chip’s revision (`CONFIG_ESP32S3_REV_MAX_FULL`). Alternatively, set the Ignore maximal revision bit in eFuse or use a chip revision that is compatible with the current version of ESP-IDF.

Representing Revision Requirements of a Binary Image The 2nd stage bootloader and the application binary images contain the `esp_image_header_t` header, which stores information specifying the chip revisions that the image is permitted to run on. This header has 3 fields related to revisions:

- `min_chip_rev` - Minimum chip MAJOR revision required by image (but for ESP32-C3 it is MINOR revision). Its value is determined by `CONFIG_ESP32S3_REV_MIN`.
- `min_chip_rev_full` - Minimum chip MINOR revision required by image in format: major * 100 + minor. Its value is determined by `CONFIG_ESP32S3_REV_MIN`.
- `max_chip_rev_full` - Maximum chip revision required by image in format: major * 100 + minor. Its value is determined by `CONFIG_ESP32S3_REV_MAX_FULL`. It can not be changed by user. Only Espressif can change it when a new version will be supported in ESP-IDF.

Maximum And Minimum Revision Restrictions The order for checking the minimum and maximum revisions during application boot up is as follows:

1. The 1st stage bootloader (ROM bootloader) does not check minimum and maximum revision fields from `esp_image_header_t` before running the 2nd stage bootloader.
2. The initialization phase of the 2nd stage bootloader checks that the 2nd stage bootloader itself can be launched on the chip of this revision. It extracts the minimum revision from the header of the bootloader image and checks against the chip revision from eFuses. If the chip revision is less than the minimum revision, the bootloader refuses to boot up and aborts. The maximum revision is not checked at this phase.
3. Then the 2nd stage bootloader checks the revision requirements of the application. It extracts the minimum and maximum revisions from the header of the application image and checks against the chip revision from eFuses. If the chip revision is less than the minimum revision or higher than the maximum revision, the bootloader refuses to boot up and aborts. However, if the Ignore maximum revision bit is set, the maximum revision constraint can be ignored. The ignore bit is set by the customer themselves when there is confirmation that the software is able to work with this chip revision.
4. Furthermore, at the OTA update stage, the running application checks if the new software matches the chip revision. It extracts the minimum and maximum revisions from the header of the new application image and checks against the chip revision from eFuses. It checks for revision matching in the same way that the bootloader does, so that the chip revision is between the min and max revisions (logic of ignoring max revision also applies).
Backward Compatibility with Bootloaders Built by Older ESP-IDF Versions  

The old bootloaders (ESP-IDF < v5.0) do not know about Major and Minor wafer version eFuses. They use one single eFuse for this - wafer version.

ESP32-S3 chip support was added in ESP-IDF v4.2. ESP32-S3 chips have rev_min in esp_image_header_t header set to 0 because Minimum Supported ESP32-S2 Revision Kconfig option was not introduced, which means that the old bootloader does not check the chip revision. Any app can be loaded by such bootloader in range v0.0 to v3.15.

Please check the chip version using esptool chip_id command.

API Reference

Header File

- components/hal/include/hal/efuse_hal.h
- This header file can be included with:

  ```c
  #include "hal/efuse_hal.h"
  ```

Functions

void efuse_hal_get_mac(uint8_t *mac)
get factory mac address

uint32_t efuse_hal_chip_revision(void)
Returns chip version.

  Returns Chip version in format: Major * 100 + Minor

uint32_t efuse_hal_blk_version(void)
Return block version.

  Returns Block version in format: Major * 100 + Minor

bool efuse_hal_flash_encryption_enabled(void)
Is flash encryption currently enabled in hardware?
Flash encryption is enabled if the FLASH_CRYPT_CNT efuse has an odd number of bits set.

  Returns true if flash encryption is enabled.

bool efuse_hal_get_disable_wafer_version_major(void)
Returns the status of whether the bootloader (and OTA) will check the maximum chip version or not.

  Returns true - Skip the maximum chip version check.

uint32_t efuse_hal_get_major_chip_version(void)
Returns major chip version.

uint32_t efuse_hal_get_minor_chip_version(void)
Returns minor chip version.
2.10.6 Console

ESP-IDF provides console component, which includes building blocks needed to develop an interactive console over serial port. This component includes the following features:

- Line editing, provided by `linenoise` library. This includes handling of backspace and arrow keys, scrolling through command history, command auto-completion, and argument hints.
- Splitting of command line into arguments.
- Argument parsing, provided by `argtable3` library. This library includes APIs used for parsing GNU style command line arguments.
- Functions for registration and dispatching of commands.
- Functions to establish a basic REPL (Read-Evaluate-Print-Loop) environment.

**Note:** These features can be used together or independently. For example, it is possible to use line editing and command registration features, but use `getopt` or custom code for argument parsing, instead of `argtable3`. Likewise, it is possible to use simpler means of command input (such as `fgets`) together with the rest of the means for command splitting and argument parsing.

**Note:** When using a console application on a chip that supports a hardware USB serial interface, we suggest to disable the secondary serial console output. The secondary output will be output-only and consequently does not make sense in an interactive application.

### Line Editing

Line editing feature lets users compose commands by typing them, erasing symbols using the backspace key, navigating within the command using the left/right keys, navigating to previously typed commands using the up/down keys, and performing autocompletion using the tab key.

**Note:** This feature relies on ANSI escape sequence support in the terminal application. As such, serial monitors which display raw UART data cannot be used together with the line editing library. If you see `\[6n` or similar escape sequence when running `system/console` example instead of a command prompt (e.g., `esp>`), it means that the serial monitor does not support escape sequences. Programs which are known to work are GNU screen, minicom, and `esp-idf-monitor` (which can be invoked using `idf.py monitor` from project directory).

Here is an overview of functions provided by `linenoise` library.

### Configuration

Linenoise library does not need explicit initialization. However, some configuration defaults may need to be changed before invoking the main line editing function.

- `linenoiseClearScreen()`: Clear terminal screen using an escape sequence and position the cursor at the top left corner.
- `linenoiseSetMultiLine()`: Switch between single line and multi line editing modes. In single line mode, if the length of the command exceeds the width of the terminal, the command text is scrolled within the line to show the end of the text. In this case the beginning of the text is hidden. Single line mode needs less data to be sent to refresh screen on each key press, so exhibits less glitching compared to the multi line mode. On the flip side, editing commands and copying command text from terminal in single line mode is harder. Default is single line mode.
- `linenoiseAllowEmpty()`: Set whether linenoise library returns a zero-length string (if `true`) or `NULL` (if `false`) for empty lines. By default, zero-length strings are returned.
- `linenoiseSetMaxLineLen()`
Set maximum length of the line for linenoise library. Default length is 4096 bytes. The default value can be updated to optimize RAM memory usage.

Main Loop

- **linenoise()**
  In most cases, console applications have some form of read/eval loop. linenoise() is the single function which handles user’s key presses and returns the completed line once the enter key is pressed. As such, it handles the read part of the loop.
- **linenoiseFree()**
  This function must be called to release the command line buffer obtained from linenoise() function.

Hints and Completions

- **linenoiseSetCompletionCallback()**
  When the user presses the tab key, linenoise library invokes the completion callback. The callback should inspect the contents of the command typed so far and provide a list of possible completions using calls to linenoiseAddCompletion() function. linenoiseSetCompletionCallback() function should be called to register this completion callback, if completion feature is desired.
  console component provides a ready made function to provide completions for registered commands, esp_console_get_completion() (see below).
- **linenoiseAddCompletion()**
  Function to be called by completion callback to inform the library about possible completions of the currently typed command.
- **linenoiseSetHintsCallback()**
  Whenever user input changes, linenoise invokes the hints callback. This callback can inspect the command line typed so far, and provide a string with hints (which can include list of command arguments, for example). The library then displays the hint text on the same line where editing happens, possibly with a different color.
- **linenoiseSetFreeHintsCallback()**
  If the hint string returned by hints callback is dynamically allocated or needs to be otherwise recycled, the function which performs such cleanup should be registered via linenoiseSetFreeHintsCallback().

History

- **linenoiseHistorySetMaxLen()**
  This function sets the number of most recently typed commands to be kept in memory. Users can navigate the history using the up/down arrows keys.
- **linenoiseHistoryAdd()**
  Linenoise does not automatically add commands to history. Instead, applications need to call this function to add command strings to the history.
- **linenoiseHistorySave()**
  Function saves command history from RAM to a text file, for example on an SD card or on a filesystem in flash memory.
- **linenoiseHistoryLoad()**
  Counterpart to linenoiseHistorySave(), loads history from a file.
- **linenoiseHistoryFree()**
  Releases memory used to store command history. Call this function when done working with linenoise library.

Splitting of Command Line into Arguments

console component provides esp_console_split_argv() function to split command line string into arguments. The function returns the number of arguments found (argc) and fills an array of pointers which can be passed as argv argument to any function which accepts arguments in argc, argv format.

The command line is split into arguments according to the following rules:

- Arguments are separated by spaces
- If spaces within arguments are required, they can be escaped using \ (backslash) character.
• Other escape sequences which are recognized are `\` (which produces literal backslash) and `"`, which produces a double quote.
• Arguments can be quoted using double quotes. Quotes may appear only in the beginning and at the end of the argument. Quotes within the argument must be escaped as mentioned above. Quotes surrounding the argument are stripped by `esp_console_split_argv` function.

Examples:

- `abc def 1 20 .3` > `[abc, def, 1, 20, .3]`
- `abc "123 456" def` > `[abc, 123 456, def]`
- `’a \ b\c”` > `[a b\c]`

**Argument Parsing**

For argument parsing, `console` component includes `argtable3` library. Please see tutorial for an introduction to `argtable3`. Github repository also includes examples.

**Command Registration and Dispatching**

`console` component includes utility functions which handle registration of commands, matching commands typed by the user to registered ones, and calling these commands with the arguments given on the command line.

Application first initializes command registration module using a call to `esp_console_init()`, and calls `esp_console_cmd_register()` function to register command handlers.

For each command, application provides the following information (in the form of `esp_console_cmd_t` structure):

- Command name (string without spaces)
- Help text explaining what the command does
- Optional hint text listing the arguments of the command. If application uses Argtable3 for argument parsing, hint text can be generated automatically by providing a pointer to argtable argument definitions structure instead.
- The command handler function.

A few other functions are provided by the command registration module:

- `esp_console_run()`
  - This function takes the command line string, splits it into argc/argv argument list using `esp_console_split_argv()`, looks up the command in the list of registered components, and if it is found, executes its handler.
- `esp_console_register_help_command()`
  - Adds help command to the list of registered commands. This command prints the list of all the registered commands, along with their arguments and help texts.
- `esp_console_get_completion()`
  - Callback function to be used with `linenoiseSetCompletionCallback()` from linenoise library. Provides completions to linenoise based on the list of registered commands.
- `esp_console_get_hint()`
  - Callback function to be used with `linenoiseSetHintsCallback()` from linenoise library. Provides argument hints for registered commands to linenoise.

**Initialize Console REPL Environment**

To establish a basic REPL environment, `console` component provides several useful APIs, combining those functions described above.

In a typical application, you only need to call `esp_console_new_repl_uart()` to initialize the REPL environment based on UART device, including driver install, basic console configuration, spawning a thread to do REPL task and register several useful commands (e.g., `help`).
After that, you can register your own commands with `esp_console_cmd_register()`. The REPL environment keeps in init state until you call `esp_console_start_repl()`. Likewise, if your REPL environment is based on USB_SERIAL_JTAG device, you only need to call `esp_console_new_repl_usb_serial_jtag()` at first step. Then call other functions as usual.

### Application Example

Example application illustrating usage of the `console` component is available in `system/console` directory. This example shows how to initialize UART and VFS functions, set up linenoise library, read and handle commands from UART, and store command history in Flash. See README.md in the example directory for more details. Besides that, ESP-IDF contains several useful examples which are based on the `console` component and can be treated as “tools” when developing applications. For example, `peripherals/i2c/i2c_tools`, `wifi/iperf`.

### API Reference

#### Header File

- `components/console/esp_console.h`
- This header file can be included with:
  ```c
  #include "esp_console.h"
  ```
- This header file is a part of the API provided by the `console` component. To declare that your component depends on `console`, add the following to your CMakeLists.txt:
  ```
  REQUIRES console
  or
  PRIV_REQUIRES console
  ```

#### Functions

- `esp_err_t esp_console_init` (const `esp_console_config_t *config`)
  initialize console module

  **Note:** Call this once before using other console module features

  **Parameters**
  - `config` – console configuration

  **Returns**
  - ESP_OK on success
  - ESP_ERR_NO_MEM if out of memory
  - ESP_ERR_INVALID_STATE if already initialized
  - ESP_ERR_INVALID_ARG if the configuration is invalid

- `esp_err_t esp_console_deinit` (void)
  de-initialize console module

  **Note:** Call this once when done using console module functions

  **Returns**
  - ESP_OK on success
  - ESP_ERR_INVALID_STATE if not initialized yet
**esp_err_t esp_console_cmd_register**(const esp_console_cmd_t *cmd)

Register console command.

**Parameters**
- **cmd** - pointer to the command description; can point to a temporary value

**Returns**
- ESP_OK on success
- ESP_ERR_NO_MEM if out of memory
- ESP_ERR_INVALID_ARG if command description includes invalid arguments

**esp_err_t esp_console_run**(const char *cmdline, int *cmd_ret)

Run command line.

**Parameters**
- **cmdline** - command line (command name followed by a number of arguments)
- **cmd_ret** - [out] return code from the command (set if command was run)

**Returns**
- ESP_OK, if command was run
- ESP_ERR_INVALID_ARG, if the commandline is empty, or only contained whitespace
- ESP_ERR_NOT_FOUND, if command with given name wasn’t registered
- ESP_ERR_INVALID_STATE, if esp_console_init wasn’t called

**size_t esp_console_split_argv**(char *line, char **argv, size_t argv_size)

Split command line into arguments in place.

```c
- This function finds whitespace-separated arguments in the given input line.
- 'abc def 1 20 .3' -> ['abc', 'def', '1', '20', '.3']
- Argument which include spaces may be surrounded with quotes. In this case spaces are preserved and quotes are stripped.
- 'abc "123 456" def' -> ['abc', '123 456', 'def']
- Escape sequences may be used to produce backslash, double quote, and space:
- 'a \ b\c"' -> ['a b\c"']
```

**Note:** Pointers to at most argv_size - 1 arguments are returned in argv array. The pointer after the last one (i.e. argv[argc]) is set to NULL.

**Parameters**
- **line** - pointer to buffer to parse; it is modified in place
- **argv** - array where the pointers to arguments are written
- **argv_size** - number of elements in argv_array (max. number of arguments)

**Returns**
- number of arguments found (argc)

**void esp_console_get_completion**(const char *buf, linenoiseCompletions *lc)

Callback which provides command completion for linenoise library.

When using linenoise for line editing, command completion support can be enabled like this:

```
linenoiseSetCompletionCallback(&esp_console_get_completion);
```

**Parameters**
- **buf** - the string typed by the user
- **lc** - linenoiseCompletions to be filled in
const char *esp_console_get_hint (const char *buf, int *color, int *bold)
Callback which provides command hints for linenoise library.
When using linenoise for line editing, hints support can be enabled as follows:
linenoiseSetHintsCallback((linenoiseHintsCallback*)&esp_console_get_hint);
The extra cast is needed because linenoiseHintsCallback is defined as returning a char* instead of const char*.

Parameters
• buf – line typed by the user
• color –[out] ANSI color code to be used when displaying the hint
• bold –[out] set to 1 if hint has to be displayed in bold

Returns string containing the hint text. This string is persistent and should not be freed (i.e.
 linenoiseSetFreeHintsCallback should not be used).

esp_err_t esp_console_register_help_command (void)
Register a ‘help’ command.
Default ‘help’ command prints the list of registered commands along with hints and help strings if no additional
argument is given. If an additional argument is given, the help command will look for a command with the
same name and only print the hints and help strings of that command.

Returns
• ESP_OK on success
• ESP_ERR_INVALID_STATE, if esp_console_init wasn’t called

esp_err_t esp_console_new_repl_uart (const esp_console_dev_uart_config_t *dev_config, const
esp_console_repl_config_t *repl_config, esp_console_repl_t **ret_repl)
Establish a console REPL environment over UART driver.

Attention This function is meant to be used in the examples to make the code more compact. Applications
which use console functionality should be based on the underlying linenoise and esp_console functions.

Note: This is an all-in-one function to establish the environment needed for REPL, includes:
• Install the UART driver on the console UART (8n1, 115200, REF_TICK clock source)
• Configures the stdin/stdout to go through the UART driver
• Initializes linenoise
• Spawn new thread to run REPL in the background

Parameters
• dev_config –[in] UART device configuration
• repl_config –[in] REPL configuration
• ret_repl –[out] return REPL handle after initialization succeed, return NULL otherwise

Returns
• ESP_OK on success
• ESP_FAIL Parameter error

esp_err_t esp_console_new_repl_usb_cdc (const esp_console_dev_usb_cdc_config_t *dev_config, const
esp_console_repl_config_t *repl_config, esp_console_repl_t **ret_repl)
Establish a console REPL environment over USB CDC.

Attention This function is meant to be used in the examples to make the code more compact. Applications
which use console functionality should be based on the underlying linenoise and esp_console functions.
Chapter 2. API Reference

Note: This is a all-in-one function to establish the environment needed for REPL, includes:

- Initializes linenoise
- Spawn new thread to run REPL in the background

Parameters

- `dev_config` [in] USB CDC configuration
- `repl_config` [in] REPL configuration
- `ret_repl` [out] return REPL handle after initialization succeed, return NULL otherwise

Returns

- ESP_OK on success
- ESP_FAIL Parameter error

```c
esp_err_t esp_console_new_repl_usb_serial_jtag(const esp_console_dev_usb_serial_jtag_config_t *dev_config, const esp_console_repl_config_t *repl_config, esp_console_repl_t **ret_repl)
```

Establish a console REPL (Read-eval-print loop) environment over USB-SERIAL-JTAG.

Attention This function is meant to be used in the examples to make the code more compact. Applications which use console functionality should be based on the underlying linenoise and esp_console functions.

Note: This is an all-in-one function to establish the environment needed for REPL, includes:

- Initializes linenoise
- Spawn new thread to run REPL in the background

Parameters

- `dev_config` [in] USB-SERIAL-JTAG configuration
- `repl_config` [in] REPL configuration
- `ret_repl` [out] return REPL handle after initialization succeed, return NULL otherwise

Returns

- ESP_OK on success
- ESP_FAIL Parameter error

```c
esp_err_t esp_console_start_repl(esp_console_repl_t *repl)
```

Start REPL environment.

Note: Once the REPL gets started, it won’t be stopped until the user calls repl->del(repl) to destroy the REPL environment.

Parameters `repl` [in] REPL handle returned from esp_console_new_repl_xxx

Returns

- ESP_OK on success
- ESP_ERR_INVALID_STATE, if repl has started already

Structures

```c
struct esp_console_config_t
```

Parameters for console initialization.
Public Members

size_t max_cmdline_length
length of command line buffer, in bytes

size_t max_cmdline_args
maximum number of command line arguments to parse

uint32_t heap_alloc_caps
where to (e.g. MALLOC_CAP_SPIRAM) allocate heap objects such as cmds used by esp_console

int hint_color
ASCII color code of hint text.

int hint_bold
Set to 1 to print hint text in bold.

struct esp_console_repl_config_t
Parameters for console REPL (Read Eval Print Loop)

Public Members

uint32_t max_history_len
maximum length for the history

const char *history_save_path
file path used to save history commands, set to NULL won’t save to file system

uint32_t task_stack_size
repl task stack size

uint32_t task_priority
repl task priority

const char *prompt
prompt (NULL represents default: “esp> “)

size_t max_cmdline_length
maximum length of a command line. If 0, default value will be used

struct esp_console_dev_uart_config_t
Parameters for console device: UART.

Public Members

int channel
UART channel number (count from zero)
### Chapter 2. API Reference

```c
int baud_rate
    Comunication baud rate.

int tx_gpio_num
    GPIO number for TX path, -1 means using default one.

int rx_gpio_num
    GPIO number for RX path, -1 means using default one.
```

```c
struct esp_console_dev_usb_cdc_config_t
    Parameters for console device: USB CDC.
```

**Note:** It’s an empty structure for now, reserved for future.

```c
struct esp_console_dev_usb_serial_jtag_config_t
    Parameters for console device: USB-SERIAL-JTAG.
```

**Note:** It’s an empty structure for now, reserved for future.

```c
struct esp_console_cmd_t
    Console command description.
```

#### Public Members

```c
const char *command
    Command name. Must not be NULL, must not contain spaces. The pointer must be valid until the call
to `esp_console_deinit`.

const char *help
    Help text for the command, shown by help command. If set, the pointer must be valid until the call to
esp_console_deinit. If not set, the command will not be listed in ‘help’ output.

const char *hint
    Hint text, usually lists possible arguments. If set to NULL, and ‘argtable’ field is non-NULL, hint will be
generated automatically

    esp_console_cmd_func_t func
    Pointer to a function which implements the command.

void *argtable
    Array or structure of pointers to arg_xxx structures, may be NULL. Used to generate hint text if ‘hint’
is set to NULL. Array/structure which this field points to must end with an arg_end. Only used for the
duration of esp_console_cmd_register call.
```

```c
struct esp_console_repl_s
    Console REPL base structure.
```
**Public Members**

```c
esp_err_t (*del)(esp_console_repl_t *repl)
```
Delete console REPL environment.

- **Param repl [in]** REPL handle returned from esp_console_new_repl_xxx
- **Return**
  - ESP_OK on success
  - ESP_FAIL on errors

**Macros**

- `ESP_CONSOLE_CONFIG_DEFAULT()`
  Default console configuration value.

- `ESP_CONSOLE_REPL_CONFIG_DEFAULT()`
  Default console repl configuration value.

- `ESP_CONSOLE_DEV_UART_CONFIG_DEFAULT()`

- `ESP_CONSOLE_DEV_CDC_CONFIG_DEFAULT()`

- `ESP_CONSOLE_DEV_USB_SERIAL_JTAG_CONFIG_DEFAULT()`

**Type Definitions**

- `typedef struct linenoiseCompletions linenoiseCompletions`

- `typedef int (*esp_console_cmd_func_t)(int argc, char **argv)`
  Console command main function.

  - **Param argc** number of arguments
  - **Param argv** array with argc entries, each pointing to a zero-terminated string argument
  - **Return** console command return code, 0 indicates “success”

- `typedef struct esp_console_repl_s esp_console_repl_t`
  Type defined for console REPL.

### 2.10.7 eFuse Manager

**Introduction**

The eFuse Manager library is designed to structure access to eFuse bits and make using these easy. This library operates eFuse bits by a structure name which is assigned in eFuse table. This sections introduces some concepts used by eFuse Manager.

**Hardware Description**

The ESP32-S3 has a number of eFuses which can store system and user parameters. Each eFuse is a one-bit field which can be programmed to 1 after which it cannot be reverted back to 0. Some of system parameters are using these eFuse bits directly by hardware modules and have special place (for example EFUSE_BLK0).

For more details, see ESP32-S3 Technical Reference Manual > eFuse Controller (eFuse) [PDF]. Some eFuse bits are available for user applications.

ESP32-S3 has 11 eFuse blocks each of the size of 256 bits (not all bits are available):
• EFUSE_BLK0 is used entirely for system purposes;
• EFUSE_BLK1 is used entirely for system purposes;
• EFUSE_BLK2 is used entirely for system purposes;
• EFUSE_BLK3 (also named EFUSE_BLK_USER_DATA) can be used for user purposes;
• EFUSE_BLK4 (also named EFUSE_BLK_KEY0) can be used as key (for secure_boot or flash_encryption) or for user purposes;
• EFUSE_BLK5 (also named EFUSE_BLK_KEY1) can be used as key (for secure_boot or flash_encryption) or for user purposes;
• EFUSE_BLK6 (also named EFUSE_BLK_KEY2) can be used as key (for secure_boot or flash_encryption) or for user purposes;
• EFUSE_BLK7 (also named EFUSE_BLK_KEY3) can be used as key (for secure_boot or flash_encryption) or for user purposes;
• EFUSE_BLK8 (also named EFUSE_BLK_KEY4) can be used as key (for secure_boot or flash_encryption) or for user purposes;
• EFUSE_BLK9 (also named EFUSE_BLK_KEY5) can be used for any purpose except for flash encryption (due to a HW bug);
• EFUSE_BLK10 (also named EFUSE_BLK_SYS_DATA_PART2) is reserved for system purposes.

Each block is divided into 8 32-bits registers.

eFuse Manager Component

The component has API functions for reading and writing fields. Access to the fields is carried out through the structures that describe the location of the eFuse bits in the blocks. The component provides the ability to form fields of any length and from any number of individual bits. The description of the fields is made in a CSV file in a table form. To generate from a tabular form (CSV file) in the C-source uses the tool `efuse_table_gen.py`. The tool checks the CSV file for uniqueness of field names and bit intersection, in case of using a custom file from the user’s project directory, the utility checks with the common CSV file.

CSV files:

• common (esp_efuse_table.csv) - contains eFuse fields which are used inside the ESP-IDF. C-source generation should be done manually when changing this file (run command `idf.py efuse-common-table`). Note that changes in this file can lead to incorrect operation.
• custom - (optional and can be enabled by `CONFIG_EFUSE_CUSTOM_TABLE`) contains eFuse fields that are used by the user in their application. C-source generation should be done manually when changing this file and running `idf.py efuse-custom-table`.

Description CSV File

The CSV file contains a description of the eFuse fields. In the simple case, one field has one line of description. Table header:

```
# field_name, efuse_block(EFUSE_BLK0..EFUSE_BLK10), bit_start(0..255), bit_count(1..256), comment
```

Individual params in CSV file the following meanings:

**field_name**

Name of field. The prefix `ESP_EFUSE_` is added to the name, and this field name is available in the code. This name is used to access the fields. The name must be unique for all fields. If the line has an empty name, then this line is combined with the previous field. This allows you to set an arbitrary order of bits in the field, and expand the field as well (see `MAC_FACTORY` field in the common table). The field_name supports structured format using . to show that the field belongs to another field (see `WR_DIS` and `RD_DIS` in the common table).

**efuse_block**

Block number. It determines where the eFuse bits are placed for this field. Available EFUSE_BLK0..EFUSE_BLK10.
Chapter 2. API Reference

**bit_start**

Start bit number (0..255). The `bit_start` field can be omitted. In this case, it is set to `bit_start + bit_count` from the previous record, if it has the same efuse_block. Otherwise (if efuse_block is different, or this is the first entry), an error will be generated.

**bit_count**

The number of bits to use in this field (1..-). This parameter cannot be omitted. This field also may be `MAX_BLK_LEN` in this case, the field length has the maximum block length.

**comment**

This param is using for comment field, it also move to C-header file. The comment field can be omitted.

If a non-sequential bit order is required to describe a field, then the field description in the following lines should be continued without specifying a name, indicating that it belongs to one field. For example two fields `MAC_FACTORY` and `MAC_FACTORY_CRC`:

```
# Factory MAC address #
#######################
MAC_FACTORY, EFUSE_BLK0, 72, 8, Factory MAC addr [0]
| EFUSE_BLK0, 64, 8, Factory MAC addr [1]
| EFUSE_BLK0, 56, 8, Factory MAC addr [2]
| EFUSE_BLK0, 48, 8, Factory MAC addr [3]
| EFUSE_BLK0, 40, 8, Factory MAC addr [4]
| EFUSE_BLK0, 32, 8, Factory MAC addr [5]
MAC_FACTORY_CRC, EFUSE_BLK0, 80, 8, CRC8 for factory MAC address
```

This field is available in code as `ESP_EFUSE_MAC_FACTORY` and `ESP_EFUSE_MAC_FACTORY_CRC`.

### Structured eFuse Fields

```
WR_DIS, EFUSE_BLK0, 0, 32, Write protection
WR_DIS.RD_DIS, EFUSE_BLK0, 0, 1, Write protection for RD DIS
| FIELD_1
| FIELD_2 (includes B1 and B2)
| FIELD_2.B1
| FIELD_2.B2
| FIELD_3
| FIELD_3.ALIAS
| FIELD_3 (just a alias for WR_DIS.FIELD_3)
| FIELD_4
| --FIELD_4
```

The structured eFuse field looks like `WR_DIS.RD_DIS` where the dot points that this field belongs to the parent field - `WR_DIS` and cannot be out of the parent’s range.

It is possible to use some levels of structured fields as `WR_DIS.FIELD_2.B1` and `B2`. These fields should not be crossed each other and should be in the range of two fields: `WR_DIS` and `WR_DIS.FIELD_2`.

It is possible to create aliases for fields with the same range, see `WR_DIS.FIELD_3` and `WR_DIS.FIELD_3.ALIAS`.

The ESP-IDF names for structured eFuse fields should be unique. The `efuse_table_gen` tool generates the final names where the dot is replaced by `_.` The names for using in ESP-IDF are `ESP_EFUSE_WR_DIS`, `ESP_EFUSE_WR_DIS_RD_DIS`, `ESP_EFUSE_WR_DIS_FIELD_2_B1`, etc.
The `efuse_table_gen` tool checks that the fields do not overlap each other and must be within the range of a field if there is a violation, then throws the following error:

```plaintext
Field at USER_DATA, EFUSE_BLK3, 0, 256 intersected with SERIAL_NUMBER, EFUSE_BLK3, 0, 32
```

**Solution:** Describe `SERIAL_NUMBER` to be included in `USER_DATA` (USER_DATA.SERIAL_NUMBER).

```plaintext
Field at FEILD, EFUSE_BLK3, 0, 50 out of range FEILD.MAJOR_NUMBER, EFUSE_BLK3, 0, 60, 32
```

**Solution:** Change `bit_start` for `FIELD.MAJOR_NUMBER` from 60 to 0, so `MAJOR_NUMBER` is in the `FEILD` range.

### `efuse_table_gen.py` Tool

The tool is designed to generate C-source files from CSV file and validate fields. First of all, the check is carried out on the uniqueness of the names and overlaps of the field bits. If an additional custom file is used, it will be checked with the existing common file (esp_efuse_table.csv). In case of errors, a message will be displayed and the string that caused the error. C-source files contain structures of type `esp_efuse_desc_t`.

To generate a `common` files, use the following command `idf.py efuse-common-table` or:

```bash
cd $IDF_PATH/components/efuse/
./efuse_table_gen.py --idf_target esp32s3 esp32s3/esp_efuse_table.csv
```

After generation in the folder `$IDF_PATH/components/efuse/esp32s3` create:

- `esp_efuse_table.c` file.
- In include folder `esp_efuse_table.c` file.

To generate a `custom` files, use the following command `idf.py efuse-custom-table` or:

```bash
cd $IDF_PATH/components/efuse/
./efuse_table_gen.py --idf_target esp32s3 esp32s3/esp_efuse_table.csv PROJECT_PATH/main/esp_efuse_custom_table.csv
```

After generation in the folder `PROJECT_PATH/main` create:

- `esp_efuse_custom_table.c` file.
- In include folder `esp_efuse_custom_table.c` file.

To use the generated fields, you need to include two files:

```c
#include "esp_efuse.h"
#include "esp_efuse_table.h" // or "esp_efuse_custom_table.h"
```

### Supported Coding Scheme

Coding schemes are used to protect against data corruption. ESP32-S3 supports two coding schemes:

- **None.** EFUSE_BLK0 is stored with four backups, meaning each bit is stored four times. This backup scheme is automatically applied by the hardware and is not visible to software. EFUSE_BLK0 can be written many times.
- **RS.** EFUSE_BLK1 - EFUSE_BLK10 use Reed-Solomon coding scheme that supports up to 5 bytes of automatic error correction. Software encodes the 32-byte EFUSE_BLKx using RS (44, 32) to generate a 12-byte check code, and then burn the EFUSE_BLKx and the check code into eFuse at the same time. The eFuse Controller automatically decodes the RS encoding and applies error correction when reading back the eFuse block. Because the RS check codes are generated across the entire 256-bit eFuse block, each block can only be written to one time.
To write some fields into one block, or different blocks in one time, you need to use the batch writing mode. Firstly set this mode through `esp_efuse_batch_write_begin()` function then write some fields as usual using the `esp_efuse_write_...` functions. At the end to burn them, call the `esp_efuse_batch_write_commit()` function. It burns prepared data to the eFuse blocks and disables the batch recording mode.

**Note:** If there is already pre-written data in the eFuse block using the Reed-Solomon encoding scheme, then it is not possible to write anything extra (even if the required bits are empty) without breaking the previous encoding data. This encoding data will be overwritten with new encoding data and completely destroyed (however, the payload eFuses are not damaged). It can be related to: CUSTOM_MAC, SPI_PAD_CONFIG HD, SPI_PAD_CONFIG_CS, etc. Please contact Espressif to order the required pre-burnt eFuses.

FOR TESTING ONLY (NOT RECOMMENDED): You can ignore or suppress errors that violate encoding scheme data in order to burn the necessary bits in the eFuse block.

**eFuse API**

Access to the fields is via a pointer to the description structure. API functions have some basic operation:

- `esp_efuse_read_field_blob()` - returns an array of read eFuse bits.
- `esp_efuse_read_field_cnt()` - returns the number of bits programmed as “1”.
- `esp_efuse_write_field_blob()` - writes an array.
- `esp_efuse_write_field_cnt()` - writes a required count of bits as “1”.
- `esp_efuse_get_field_size()` - returns the number of bits by the field name.
- `esp_efuse_read_reg()` - returns value of eFuse register.
- `esp_efuse_write_reg()` - writes value to eFuse register.
- `esp_efuse_get_coding_scheme()` - returns eFuse coding scheme for blocks.
- `esp_efuse_read_block()` - reads key to eFuse block starting at the offset and the required size.
- `esp_efuse_write_block()` - writes key to eFuse block starting at the offset and the required size.
- `esp_efuse_batch_write_begin()` - sets the batch mode of writing fields.
- `esp_efuse_batch_write_commit()` - writes all prepared data for batch writing mode and reset the batch writing mode.
- `esp_efuse_batch_write_cancel()` - reset the batch writing mode and prepared data.
- `esp_efuse_get_key_dis_read()` - Returns a read protection for the key block.
- `esp_efuse_set_key_dis_read()` - Sets a read protection for the key block.
- `esp_efuse_get_key_dis_write()` - Returns a write protection for the key block.
- `esp_efuse_set_key_dis_write()` - Sets a write protection for the key block.
- `esp_efuse_get_key_purpose()` - Returns the current purpose set for an eFuse key block.
- `esp_efuse_write_key()` - Programs a block of key data to an eFuse block
- `esp_efuse_write_keys()` - Programs keys to unused eFuse blocks
- `esp_efuse_find_purpose()` - Finds a key block with the particular purpose set.
- `esp_efuse_get_keypurpose_dis_write()` - Returns a write protection of the key purpose field for an eFuse key block (for esp32 always true).
- `esp_efuse_key_block_unused()` - Returns true if the key block is unused, false otherwise.

For frequently used fields, special functions are made, like this `esp_efuse_get_pkg_ver()`.

**eFuse API for Keys**

EFUSE_BLK_KEY0 - EFUSE_BLK_KEY5 are intended to keep up to 6 keys with a length of 256-bits. Each key has an `ESP_EFUSE_KEY_PURPOSE_x` field which defines the purpose of these keys. The purpose field is described in `esp_efuse_purpose_t`.

The purposes like `ESP_EFUSE_KEY_PURPOSE_XTS_AES...` are used for flash encryption.

The purposes like `ESP_EFUSE_KEY_PURPOSE_SECURE_BOOT_DIGEST...` are used for secure boot.

There are some eFuse APIs useful to work with states of keys.
• *esp_efuse_get_purpose_field()* - Returns a pointer to a key purpose for an eFuse key block.
• *esp_efuse_get_key()* - Returns a pointer to a key block.
• *esp_efuse_set_key_purpose()* - Sets a key purpose for an eFuse key block.
• *esp_efuse_set_keypurpose_dis_write()* - Sets a write protection of the key purpose field for an eFuse key block.
• *esp_efuse_find_unused_key_block()* - Search for an unused key block and return the first one found.
• *esp_efuse_count_unused_key_blocks()* - Returns the number of unused eFuse key blocks in the range EFUSE_BLK_KEY0..EFUSE_BLK_KEY_MAX
• *esp_efuse_get_digest_revoke()* - Returns the status of the Secure Boot public key digest revocation bit.
• *esp_efuse_set_digest_revoke()* - Sets the Secure Boot public key digest revocation bit.
• *esp_efuse_get_write_protect_of_digest_revoke()* - Returns a write protection of the Secure Boot public key digest revocation bit.
• *esp_efuse_set_write_protect_of_digest_revoke()* - Sets a write protection of the Secure Boot public key digest revocation bit.

**How to Add a New Field**

1. Find a free bits for field. Show *esp_efuse_table.csv* file or run idf.py show-efuse-table or the next command:

```
$ ./efuse_table_gen.py esp32s3/esp_efuse_table.csv --info
```

Used bits in efuse table:

EFUSE_BLK0
[0 31] [0 0] [2 2] ... [22 30] [30 38] [32 38] [40 52] [57 58] [68 70] [80 111]...[116 121] [124 157] [159 161]

EFUSE_BLK1
[0 122] [141 175] [183 191]

EFUSE_BLK10
[0 255]

EFUSE_BLK2
[0 129] [132 254]

EFUSE_BLK3
[0 255] [200 247]

EFUSE_BLK4
[0 255]

EFUSE_BLK5
[0 255]

EFUSE_BLK6
[0 255]

EFUSE_BLK7
[0 255]

EFUSE_BLK8
[0 255]

EFUSE_BLK9
[0 255]

Note: Not printed ranges are free for using. (bits in EFUSE_BLK0 are reserved for Espressif)
The number of bits not included in square brackets is free (some bits are reserved for Espressif). All fields are checked for overlapping.

To add fields to an existing field, use the Structured efuse fields technique. For example, adding the fields: SERIAL_NUMBER, MODEL_NUMBER and HARDWARE_REV to an existing USER_DATA field. Use . (dot) to show an attachment in a field.

<table>
<thead>
<tr>
<th>Field Name</th>
<th>EFUSE Block</th>
<th>Bit Start</th>
<th>Bit Count</th>
</tr>
</thead>
<tbody>
<tr>
<td>USER_DATA.SERIAL_NUMBER</td>
<td>EFUSE.BLK3</td>
<td>0</td>
<td>32</td>
</tr>
<tr>
<td>USER_DATA.MODEL_NUMBER</td>
<td>EFUSE.BLK3</td>
<td>32</td>
<td>10</td>
</tr>
<tr>
<td>USER_DATA.HARDWARE_REV</td>
<td>EFUSE.BLK3</td>
<td>42</td>
<td>10</td>
</tr>
</tbody>
</table>

2. Fill a line for field: field_name, efuse_block, bit_start, bit_count, comment.
3. Run a show_efuse_table command to check eFuse table. To generate source files run efuse_common_table or efuse_custom_table command.

You may get errors such as intersects with or out of range. Please see how to solve them in the Structured efuse fields article.

**Bit Order**

The eFuses bit order is little endian (see the example below), it means that eFuse bits are read and written from LSB to MSB:

```
$ espefuse.py dump

USER_DATA (BLOCK3) [3] read_regs: 03020100 07060504 0B0A0908...
-> 0F0E0D0C 13121111 17161514 1B1A1918 1F1E1D1C

BLOCK4 (BLOCK4) [4] read_regs: 03020100 07060504 0B0A0908...
-> 0F0E0D0C 13121111 17161514 1B1A1918 1F1E1D1C
```

where is the register representation:

- EFUSE_RD_USR_DATA0_REG = 0x03020100
- EFUSE_RD_USR_DATA1_REG = 0x07060504
- EFUSE_RD_USR_DATA2_REG = 0x0B0A0908
- EFUSE_RD_USR_DATA3_REG = 0x0F0E0D0C
- EFUSE_RD_USR_DATA4_REG = 0x13121111
- EFUSE_RD_USR_DATA5_REG = 0x17161514
- EFUSE_RD_USR_DATA6_REG = 0x1B1A1918
- EFUSE_RD_USR_DATA7_REG = 0x1F1E1D1C

where is the byte representation:

```
byte[0] = 0x00, byte[1] = 0x01, ... byte[3] = 0x03, byte[4] = 0x04, ..., byte[31] -= 0x1F
```

For example, csv file describes the USER_DATA field, which occupies all 256 bits (a whole block).

Thus, reading the eFuse USER_DATA block written as above gives the following results:

```c
uint8_t buf[32] = { 0 };
esp_efuse_read_field_blob(ESP_EFUSE_USER_DATA, &buf, sizeof(buf) * 8);
// buf[0] = 0x00, buf[1] = 0x01, ... buf[31] = 0x1F
```

(continues on next page)
Get eFuses During Build

There is a way to get the state of eFuses at the build stage of the project. There are two cmake functions for this:

- `espefuse_get_json_summary()` - It calls the `espefuse.py` summary command and returns a json string (it is not stored in a file).
- `espefuse_get_efuse()` - It finds a given eFuse name in the json string and returns its property.

The json string has the following properties:

```json
{
   "MAC": {
      "bit_len": 48,
      "block": 0,
      "category": "identity",
      "description": "Factory MAC Address",
      "efuse_type": "bytes:6",
      "name": "MAC",
      "pos": 0,
      "readable": true,
      "value": "94:b9:7e:5a:6e:58 (CRC 0xe2 OK)",
      "word": 1,
      "writeable": true
   }
}
```

These functions can be used from a top-level project CMakeLists.txt (get-started/hello_world/CMakeLists.txt):

```cmake
# ...
project(hello_world)
espefuse_get_json_summary(efuse_json)
espefuse_get_efuse(ret_data $<efuse_json> "MAC" "value")
message("MAC: "$<ret_data>)
```

The format of the `value` property is the same as shown in `espefuse.py` summary.
There is an example test system/efuse/CMakeLists.txt which adds a custom target efuse-summary. This allows you to run the idf.py efuse-summary command to read the required eFuses (specified in the efuse_names list) at any time, not just at project build time.

**Debug eFuse & Unit Tests**

**Virtual eFuses** The Kconfig option CONFIG_EFUSE_VIRTUAL virtualizes eFuse values inside the eFuse Manager, so writes are emulated and no eFuse values are permanently changed. This can be useful for debugging app and unit tests. During startup, the eFuses are copied to RAM. All eFuse operations (read and write) are performed with RAM instead of the real eFuse registers.

In addition to the CONFIG_EFUSE_VIRTUAL option there is CONFIG_EFUSE_VIRTUAL_KEEP_IN_FLASH option that adds a feature to keep eFuses in flash memory. To use this mode the partition_table should have the efuse partition. partition.csv: "efuse_em, data, efuse, , 0x2000,". During startup, the eFuses are copied from flash or, in case if flash is empty, from real eFuse to RAM and then update flash. This option allows keeping eFuses after reboots (possible to test secure_boot and flash_encryption features with this option).

**Flash Encryption Testing** Flash Encryption (FE) is a hardware feature that requires the physical burning of eFuses: key and FLASH_CRYPT_CNT. If FE is not actually enabled then enabling the CONFIG_EFUSE_VIRTUAL_KEEP_IN_FLASH option just gives testing possibilities and does not encrypt anything in the flash, even though the logs say encryption happens. The bootloader_flash_write() is adapted for this purpose. But if FE is already enabled on the chip and you run an application or bootloader created with the CONFIG_EFUSE_VIRTUAL_KEEP_IN_FLASH option then the flash encryption/decryption operations will work properly (data are encrypted as it is written into an encrypted flash partition and decrypted when they are read from an encrypted partition).

**espefuse.py** esptool includes a useful tool for reading/writing ESP32-S3 eFuse bits - espefuse.py.

```
espefuse.py -p PORT summary

Header File

- components/efuse/include/esp_efuse.h
- This header file can be included with:

```c
#include "esp_efuse.h"
```
This header file is a part of the API provided by the `efuse` component. To declare that your component depends on `efuse`, add the following to your `CMakeLists.txt`:

```
REQUIRES efuse
```

or

```
PRIV_REQUIRES efuse
```

### Functions

#### `esp_err_t esp_efuse_read_field_blob`

 reads bits from EFUSE field and writes it into an array.

```
esp_err_t esp_efuse_read_field_blob(const esp_efuse_desc_t *field[], void *dst, size_t dst_size_bits)
```

The number of read bits will be limited to the minimum value from the description of the bits in “field” structure or “dst_size_bits” required size. Use “esp_efuse_get_field_size()” function to determine the length of the field.

**Note:** Please note that reading in the batch mode does not show uncommitted changes.

#### Parameters

- `field` - [in] A pointer to the structure describing the fields of efuse.
- `dst` - [out] A pointer to array that will contain the result of reading.
- `dst_size_bits` - [in] The number of bits required to read. If the requested number of bits is greater than the field, the number will be limited to the field size.

#### Returns

- ESP_OK: The operation was successfully completed.
- ESP_ERR_INVALID_ARG: Error in the passed arguments.

#### `bool esp_efuse_read_field_bit`

 reads a single bit eFuse field as a boolean value.

```
bool esp_efuse_read_field_bit(const esp_efuse_desc_t *field[])
```

**Note:** The value must exist and must be a single bit wide. If there is any possibility of an error in the provided arguments, call `esp_efuse_read_field_blob()` and check the returned value instead.

**Note:** If assertions are enabled and the parameter is invalid, execution will abort

**Note:** Please note that reading in the batch mode does not show uncommitted changes.

#### Parameters

- `field` - [in] A pointer to the structure describing the fields of efuse.

#### Returns

- true: The field parameter is valid and the bit is set.
- false: The bit is not set, or the parameter is invalid and assertions are disabled.

#### `esp_err_t esp_efuse_read_field_cnt`

 reads bits from EFUSE field and returns number of bits programmed as “1”.

```
esp_err_t esp_efuse_read_field_cnt(const esp_efuse_desc_t *field[], size_t*out_cnt)
```

If the bits are set not sequentially, they will still be counted.

**Note:** Please note that reading in the batch mode does not show uncommitted changes.

#### Parameters
Chapter 2. API Reference

- **field** – [in] A pointer to the structure describing the fields of efuse.
- **out_cnt** – [out] A pointer that will contain the number of programmed as “1” bits.

**Returns**
- ESP_OK: The operation was successfully completed.
- ESP_ERR_INVALID_ARG: Error in the passed arguments.

```c
esp_err_t esp_efuse_write_field_blob (const esp_efuse_desc_t *field[], const void *src, size_t src_size_bits)
```

Writes array to EFUSE field.

The number of write bits will be limited to the minimum value from the description of the bits in “field” structure or “src_size_bits” required size. Use “esp_efuse_get_field_size()” function to determine the length of the field. After the function is completed, the writing registers are cleared.

**Parameters**
- **field** – [in] A pointer to the structure describing the fields of efuse.
- **src** – [in] A pointer to array that contains the data for writing.
- **src_size_bits** – [in] The number of bits required to write.

**Returns**
- ESP_OK: The operation was successfully completed.
- ESP_ERR_INVALID_ARG: Error in the passed arguments.
- ESP_ERR_EFUSE_REPEATED_PROG: Error repeated programming of programmed bits is strictly forbidden.
- ESP_ERR_EFUSE_CODING: Error range of data does not match the coding scheme.

```c
esp_err_t esp_efuse_write_field_cnt (const esp_efuse_desc_t *field[], size_t cnt)
```

Writes a required count of bits as “1” to EFUSE field.

If there are no free bits in the field to set the required number of bits to “1”, ESP_ERR_EFUSE_CNT_IS_FULL error is returned, the field will not be partially recorded. After the function is completed, the writing registers are cleared.

**Parameters**
- **field** – [in] A pointer to the structure describing the fields of efuse.
- **cnt** – [in] Required number of programmed as “1” bits.

**Returns**
- ESP_OK: The operation was successfully completed.
- ESP_ERR_INVALID_ARG: Error in the passed arguments.
- ESP_ERR_EFUSE_CNT_IS_FULL: Not all requested cnt bits is set.

```c
esp_err_t esp_efuse_write_field_bit (const esp_efuse_desc_t *field[])
```

Write a single bit eFuse field to 1.

For use with eFuse fields that are a single bit. This function will write the bit to value 1 if it is not already set, or does nothing if the bit is already set.

This is equivalent to calling esp_efuse_write_field_cnt() with the cnt parameter equal to 1, except that it will return ESP_OK if the field is already set to 1.

**Parameters**
- **field** – [in] Pointer to the structure describing the eFuse field.

**Returns**
- ESP_OK: The operation was successfully completed, or the bit was already set to value 1.
- ESP_ERR_EFUSE_INVALID_ARG: Error in the passed arguments, including if the eFuse field is not 1 bit wide.

```c
esp_err_t esp_efuse_set_write_protect (esp_efuse_block_t blk)
```

Sets a write protection for the whole block.

After that, it is impossible to write to this block. The write protection does not apply to block 0.

**Parameters**
- **blk** – [in] Block number of eFuse. (EFUSE_BLK1, EFUSE_BLK2 and EFUSE_BLK3)

**Returns**
Chapter 2. API Reference

- ESP_OK: The operation was successfully completed.
- ESP_ERR_INVALID_ARG: Error in the passed arguments.
- ESP_ERR_EFUSE_CNT_IS_FULL: Not all requested cnt bits is set.
- ESP_ERR_NOT_SUPPORTED: The block does not support this command.

`esp_err_t esp_efuse_set_read_protect(esp_efuse_block_t blk)`

Sets a read protection for the whole block.

After that, it is impossible to read from this block. The read protection does not apply to block 0.

**Parameters**
- `blk` - [in] Block number of eFuse. (EFUSE_BLK1, EFUSE_BLK2 and EFUSE_BLK3)

**Returns**
- ESP_OK: The operation was successfully completed.
- ESP_ERR_INVALID_ARG: Error in the passed arguments.
- ESP_ERR_EFUSE_CNT_IS_FULL: Not all requested cnt bits is set.
- ESP_ERR_NOT_SUPPORTED: The block does not support this command.

`int esp_efuse_get_field_size(const esp_efuse_desc_t *field[])`

Returns the number of bits used by field.

**Parameters**
- `field` - [in] A pointer to the structure describing the fields of efuse.

**Returns**
- Returns the number of bits used by field.

`uint32_t esp_efuse_read_reg(esp_efuse_block_t blk, unsigned int num_reg)`

Returns value of efuse register.

This is a thread-safe implementation. Example: EFUSE_BLK2_RDATA3_REG where (blk=2, num_reg=3)

**Note:** Please note that reading in the batch mode does not show uncommitted changes.

**Parameters**
- `blk` - [in] Block number of eFuse.
- `num_reg` - [in] The register number in the block.

**Returns**
- Value of register

`esp_err_t esp_efuse_write_reg(esp_efuse_block_t blk, unsigned int num_reg, uint32_t val)`

Write value to efuse register.

Apply a coding scheme if necessary. This is a thread-safe implementation. Example: EFUSE_BLK3_WDATA0_REG where (blk=3, num_reg=0)

**Parameters**
- `blk` - [in] Block number of eFuse.
- `num_reg` - [in] The register number in the block.
- `val` - [in] Value to write.

**Returns**
- ESP_OK: The operation was successfully completed.
- ESP_ERR_EFUSE_REPEATED_PROG: Error repeated programming of programmed bits is strictly forbidden.

`esp_efuse_coding_scheme_t esp_efuse_get_coding_scheme(esp_efuse_block_t blk)`

Return efuse coding scheme for blocks.

Note: The coding scheme is applicable only to 1, 2 and 3 blocks. For 0 block, the coding scheme is always NONE.

**Parameters**
- `blk` - [in] Block number of eFuse.

**Returns**
- Return efuse coding scheme for blocks
**esp_err_t esp_efuse_read_block (esp_efuse_block_t blk, void *dst_key, size_t offset_in_bits, size_t size_bits)**

Read key to efuse block starting at the offset and the required size.

**Note:** Please note that reading in the batch mode does not show uncommitted changes.

**Parameters**
- **blk** — [in] Block number of eFuse.
- **dst_key** — [in] A pointer to array that will contain the result of reading.
- **offset_in_bits** — [in] Start bit in block.
- **size_bits** — [in] The number of bits required to read.

**Returns**
- ESP_OK: The operation was successfully completed.
- ESP_ERR_INVALID_ARG: Error in the passed arguments.
- ESP_ERR_CODING: Error range of data does not match the coding scheme.

**esp_err_t esp_efuse_write_block (esp_efuse_block_t blk, const void *src_key, size_t offset_in_bits, size_t size_bits)**

Write key to efuse block starting at the offset and the required size.

**Parameters**
- **blk** — [in] Block number of eFuse.
- **src_key** — [in] A pointer to array that contains the key for writing.
- **offset_in_bits** — [in] Start bit in block.
- **size_bits** — [in] The number of bits required to write.

**Returns**
- ESP_OK: The operation was successfully completed.
- ESP_ERR_INVALID_ARG: Error in the passed arguments.
- ESP_ERR_CODING: Error range of data does not match the coding scheme.
- ESP_ERR_EFUSE_REPEATED_PROG: Error repeated programming of programmed bits

**uint32_t esp_efuse_get_pkg_ver (void)**

Returns chip package from efuse.

**Returns** chip package

**void esp_efuse_reset (void)**

Reset efuse write registers.

Efuse write registers are written to zero, to negate any changes that have been staged here.

**Note:** This function is not threadsafe, if calling code updates efuse values from multiple tasks then this is caller’s responsibility to serialise.

**esp_err_t esp_efuse_disable_rom_download_mode (void)**

Disable ROM Download Mode via eFuse.

Permanently disables the ROM Download Mode feature. Once disabled, if the SoC is booted with strapping pins set for ROM Download Mode then an error is printed instead.

**Note:** Not all SoCs support this option. An error will be returned if called on an ESP32 with a silicon revision lower than 3, as these revisions do not support this option.

**Note:** If ROM Download Mode is already disabled, this function does nothing and returns success.
Returns

- ESP_OK If the eFuse was successfully burned, or had already been burned.
- ESP_ERR_NOT_SUPPORTED (ESP32 only) This SoC is not capable of disabling UART download mode
- ESP_ERR_INVALID_STATE (ESP32 only) This eFuse is write protected and cannot be written

`esp_err_t esp_efuse_set_rom_log_scheme (esp_efuse_rom_log_scheme_t log_scheme)`

Set boot ROM log scheme via eFuse.

**Note:** By default, the boot ROM will always print to console. This API can be called to set the log scheme only once per chip, once the value is changed from the default it can’t be changed again.

**Parameters**

- `log_scheme`  – Supported ROM log scheme

**Returns**

- ESP_OK If the eFuse was successfully burned, or had already been burned.
- ESP_ERR_NOT_SUPPORTED (ESP32 only) This SoC is not capable of setting ROM log scheme
- ESP_ERR_INVALID_STATE This eFuse is write protected or has been burned already

`esp_err_t esp_efuse_enable_rom_secure_download_mode (void)`

Switch ROM Download Mode to Secure Download mode via eFuse.

Permanently enables Secure Download mode. This mode limits the use of ROM Download Mode functions to simple flash read, write and erase operations, plus a command to return a summary of currently enabled security features.

**Note:** If Secure Download mode is already enabled, this function does nothing and returns success.

**Note:** Disabling the ROM Download Mode also disables Secure Download Mode.

**Returns**

- ESP_OK If the eFuse was successfully burned, or had already been burned.
- ESP_ERR_INVALID_STATE ROM Download Mode has been disabled via eFuse, so Secure Download mode is unavailable.

`uint32_t esp_efuse_read_secure_version (void)`

Return secure_version from efuse field.

**Returns**

- Secure version from efuse field

`bool esp_efuse_check_secure_version (uint32_t secure_version)`

Check secure_version from app and secure_version and from efuse field.

**Parameters**

- `secure_version`  – Secure version from app.

**Returns**

- True: If version of app is equal or more then secure_version from efuse.

`esp_err_t esp_efuse_update_secure_version (uint32_t secure_version)`

Write efuse field by secure_version value.

Update the secure_version value is available if the coding scheme is None. Note: Do not use this function in your applications. This function is called as part of the other API.

**Parameters**

**Returns**
Chapter 2. API Reference

- ESP_OK: Successful.
- ESP_FAIL: secure version of app cannot be set to efuse field.
- ESP_ERR_NOT_SUPPORTED: Anti rollback is not supported with the 3/4 and Repeat coding scheme.

**esp_err_t esp_efuse_batch_write_begin (void)**

Set the batch mode of writing fields.

This mode allows you to write the fields in the batch mode when need to burn several efuses at one time. To enable batch mode call begin() then perform as usually the necessary operations read and write and at the end call commit() to actually burn all written efuses. The batch mode can be used nested. The commit will be done by the last commit() function. The number of begin() functions should be equal to the number of commit() functions.

Note: If batch mode is enabled by the first task, at this time the second task cannot write/read efuses. The second task will wait for the first task to complete the batch operation.

```c
// Example of using the batch writing mode.

// set the batch writing mode
esp_efuse_batch_write_begin();

// use any writing functions as usual
esp_efuse_write_field_blob(ESP_EFUSE_...);
esp_efuse_write_field_cnt(ESP_EFUSE_...);
esp_efuse_set_write_protect(EFUSE_BLKx);
esp_efuse_write_reg(EFUSE_BLKx, ...);
esp_efuse_write_block(EFUSE_BLKx, ...);
esp_efuse_write(ESP_EFUSE_1, 3); // ESP_EFUSE_1 == 1, here we write a new...--value = 3. The changes will be burn by the commit() function.
esp_efuse_read...(ESP_EFUSE_1); // this function returns ESP_EFUSE_1 == 1...--because uncommitted changes are not readable, it will be available only...--after commit.
...

// esp_efuse_batch_write APIs can be called recursively.
esp_efuse_batch_write_begin();
esp_efuse_set_write_protect(EFUSE_BLKx);
esp_efuse_batch_write_commit(); // the burn will be skipped here, it will be...--done in the last commit().
...

// Write all of these fields to the efuse registers
esp_efuse_batch_write_commit();
esp_efuse_read...(ESP_EFUSE_1); // this function returns ESP_EFUSE_1 == 3.
```

Note: Please note that reading in the batch mode does not show uncommitted changes.

**Returns**

- ESP_OK: Successful.

**esp_err_t esp_efuse_batch_write_cancel (void)**

Reset the batch mode of writing fields.

It will reset the batch writing mode and any written changes.

**Returns**
Chapter 2. API Reference

- ESP_OK: Successful.
- ESP_ERR_INVALID_STATE: The batch mode was not set.

`esp_err_t esp_efuse_batch_write_commit (void)`

Writes all prepared data for the batch mode.

Must be called to ensure changes are written to the efuse registers. After this the batch writing mode will be reset.

**Returns**
- ESP_OK: Successful.
- ESP_ERR_INVALID_STATE: The deferred writing mode was not set.

`bool esp_efuse_block_is_empty (esp_efuse_block_t block)`

Checks that the given block is empty.

**Returns**
- True: The block is empty.
- False: The block is not empty or was an error.

`bool esp_efuse_get_key_dis_read (esp_efuse_block_t block)`

Returns a read protection for the key block.

**Parameters**
- `block` [in] A key block in the range EFUSE_BLK_KEY0..EFUSE_BLK_KEY_MAX

**Returns**
- True: The key block is read protected
- False: The key block is readable.

`esp_err_t esp_efuse_set_key_dis_read (esp_efuse_block_t block)`

Sets a read protection for the key block.

**Parameters**
- `block` [in] A key block in the range EFUSE_BLK_KEY0..EFUSE_BLK_KEY_MAX

**Returns**
- ESP_OK: Successful.
- ESP_ERR_INVALID_ARG: Error in the passed arguments.
- ESP_ERR_EFUSE_REPEATED_PROG: Error repeated programming of programmed bits is strictly forbidden.
- ESP_ERR_CODING: Error range of data does not match the coding scheme.

`bool esp_efuse_get_key_dis_write (esp_efuse_block_t block)`

Returns a write protection for the key block.

**Parameters**
- `block` [in] A key block in the range EFUSE_BLK_KEY0..EFUSE_BLK_KEY_MAX

**Returns**
- True: The key block is write protected
- False: The key block is writeable.

`esp_err_t esp_efuse_set_key_dis_write (esp_efuse_block_t block)`

Sets a write protection for the key block.

**Parameters**
- `block` [in] A key block in the range EFUSE_BLK_KEY0..EFUSE_BLK_KEY_MAX

**Returns**
- ESP_OK: Successful.
- ESP_ERR_INVALID_ARG: Error in the passed arguments.
- ESP_ERR_EFUSE_REPEATED_PROG: Error repeated programming of programmed bits is strictly forbidden.
- ESP_ERR_CODING: Error range of data does not match the coding scheme.

`bool esp_efuse_key_block_unused (esp_efuse_block_t block)`

Returns true if the key block is unused, false otherwise.

An unused key block is all zero content, not read or write protected, and has purpose 0 (ESP_EFUSE_KEY_PURPOSE_USER)

**Parameters**
- `block` key block to check.

**Returns**
- True if key block is unused,
- False if key block is used or the specified block index is not a key block.
bool `esp_efuse_find_purpose` (esp_efuse_purpose_t purpose, esp_efuse_block_t *block)

Find a key block with the particular purpose set.

**Parameters**

- `purpose` [in] Purpose to search for.
- `block` [out] Pointer in the range EFUSE_BLK_KEY0..EFUSE_BLK_KEY_MAX which will be set to the key block if found. Can be NULL, if only need to test the key block exists.

**Returns**

- True: If found,
- False: If not found (value at block pointer is unchanged).

bool `esp_efuse_get_keypurpose_dis_write` (esp_efuse_block_t block)

Returns a write protection of the key purpose field for an fuse key block.

**Note:** For ESP32: no keypurpose, it returns always True.

const esp_efuse_desc_t **`esp_efuse_get_purpose_field` (esp_efuse_block_t block)

Returns a pointer to a key purpose for an fuse key block.

To get the value of this field use esp_efuse_read_field_blob() or esp_efuse_get_key_purpose().

const esp_efuse_desc_t **`esp_efuse_get_key` (esp_efuse_block_t block)

Returns a pointer to a key block.

**esp_efuse_set_key_purpose** (esp_efuse_block_t block, esp_efuse_purpose_t purpose)

Sets a key purpose for an fuse key block.

**Parameters**

- `block` [in] A key block in the range EFUSE_BLK_KEY0..EFUSE_BLK_KEY_MAX
- `purpose` [in] Key purpose.

**Returns**

- ESP_OK: Successful.
- ESP_ERR_INVALID_ARG: Error in the passed arguments.
- ESP_ERR_EFUSE_REPEATED_PROG: Error repeated programming of programmed bits is strictly forbidden.
- ESP_ERR_CODING: Error range of data does not match the coding scheme.

**esp_err_t` esp_efuse_set_keypurpose_dis_write` (esp_efuse_block_t block)

Sets a write protection of the key purpose field for an fuse key block.

**Parameters**

- `block` [in] A key block in the range EFUSE_BLK_KEY0..EFUSE_BLK_KEY_MAX
Returns

- ESP_OK: Successful.
- ESP_ERR_INVALID_ARG: Error in the passed arguments.
- ESP_ERR_EFUSE_REPEATED_PROG: Error repeated programming of programmed bits is strictly forbidden.
- ESP_ERR_CODING: Error range of data does not match the coding scheme.

```c
esp_efuse_block_t esp_efuse_find_unused_key_block (void)
```
Search for an unused key block and return the first one found.

Returns First unused key block, or EFUSE_BLK_KEY_MAX if no unused key block is found.

```c
unsigned esp_efuse_count_unused_key_blocks (void)
```
Return the number of unused efuse key blocks in the range EFUSE_BLK_KEY0..EFUSE_BLK_KEY_MAX.

```c
bool esp_efuse_get_digest_revoke (unsigned num_digest)
```
Returns the status of the Secure Boot public key digest revocation bit.

Parameters
- `num_digest` - [in] The number of digest in range 0..2

Returns
- True: If key digest is revoked,
- False: If key digest is not revoked.

```c
esp_err_t esp_efuse_set_digest_revoke (unsigned num_digest)
```
Sets the Secure Boot public key digest revocation bit.

Parameters
- `num_digest` - [in] The number of digest in range 0..2

Returns
- ESP_OK: Successful.
- ESP_ERR_INVALID_ARG: Error in the passed arguments.
- ESP_ERR_EFUSE_REPEATED_PROG: Error repeated programming of programmed bits is strictly forbidden.
- ESP_ERR_CODING: Error range of data does not match the coding scheme.

```c
bool esp_efuse_get_write_protect_of_digest_revoke (unsigned num_digest)
```
Returns a write protection of the Secure Boot public key digest revocation bit.

Parameters
- `num_digest` - [in] The number of digest in range 0..2

Returns
- True: The revocation bit is write protected. False: The revocation bit is writeable.

```c
esp_err_t esp_efuse_set_write_protect_of_digest_revoke (unsigned num_digest)
```
Sets a write protection of the Secure Boot public key digest revocation bit.

Parameters
- `num_digest` - [in] The number of digest in range 0..2

Returns
- ESP_OK: Successful.
- ESP_ERR_INVALID_ARG: Error in the passed arguments.
- ESP_ERR_EFUSE_REPEATED_PROG: Error repeated programming of programmed bits is strictly forbidden.
- ESP_ERR_CODING: Error range of data does not match the coding scheme.

```c
esp_err_t esp_efuse_write_key (esp_efuse_block_t block, esp_efuse_purpose_t purpose, const void *key, size_t key_size_bytes)
```
Program a block of key data to an efuse block.

The burn of a key, protection bits, and a purpose happens in batch mode.

Parameters
- `block` - [in] Block to read purpose for. Must be in range EFUSE_BLK_KEY0 to EFUSE_BLK_KEY_MAX. Key block must be unused (esp_efuse_key_block_unused).
- `purpose` - [in] Purpose to set for this key. Purpose must be already unset.
- `key` - [in] Pointer to data to write.
• **key_size_bytes** —[in] Bytes length of data to write.

**Returns**
- ESP_OK: Successful.
- ESP_ERR_INVALID_ARG: Error in the passed arguments.
- ESP_ERR_INVALID_STATE: Error in efuses state, unused block not found.
- ESP_ERR_EFUSE_REPEATED_PROG: Error repeated programming of programmed bits is strictly forbidden.
- ESP_ERR_CODING: Error range of data does not match the coding scheme.

`esp_err_t esp_efuse_write_keys (const esp_efuse_purpose_t purposes[], uint8_t keys[][32], unsigned number_of_keys)`

Program keys to unused efuse blocks.

The burn of keys, protection bits, and purposes happens in batch mode.

**Parameters**
- **purposes** —[in] Array of purposes (purpose[number_of_keys]).
- **keys** —[in] Array of keys (uint8_t keys[number_of_keys][32]). Each key is 32 bytes long.
- **number_of_keys** —[in] The number of keys to write (up to 6 keys).

**Returns**
- ESP_OK: Successful.
- ESP_ERR_INVALID_ARG: Error in the passed arguments.
- ESP_ERR_INVALID_STATE: Error in efuses state, unused block not found.
- ESP_ERR_NOT_ENOUGH_UNUSED_KEY_BLOCKS: Error not enough unused key blocks available
- ESP_ERR_EFUSE_REPEATED_PROG: Error repeated programming of programmed bits is strictly forbidden.
- ESP_ERR_CODING: Error range of data does not match the coding scheme.

`esp_err_t esp_secure_boot_read_key_digests (esp_secure_boot_key_digests_t *trusted_key_digests)`

Read key digests from efuse. Any revoked/missing digests will be marked as NULL.

**Parameters**
- **trusted_key_digests** —[out] Trusted keys digests, stored in this parameter after successfully completing this function. The number of digests depends on the SOC’s capabilities.

**Returns**
- ESP_OK: Successful.
- ESP_FAIL: If trusted_keys is NULL or there is no valid digest.

`esp_err_t esp_efuse_check_errors (void)`

Checks eFuse errors in BLOCK0.

It does a BLOCK0 check if eFuse EFUSE_ERR_RST_ENABLE is set. If BLOCK0 has an error, it prints the error and returns ESP_FAIL, which should be treated as esp_restart.

---
**Note:** Refers to ESP32-C3 only.

**Returns**
- ESP_OK: No errors in BLOCK0.
- ESP_FAIL: Error in BLOCK0 requiring reboot.

**Structures**

struct **esp_efuse_desc_t**

Type definition for an eFuse field.
Chapter 2. API Reference

**Public Members**

```c
esp_efuse_block_t efuse_block
```
Block of eFuse

```c
uint8_t bit_start
```
Start bit [0..255]

```c
uint16_t bit_count
```
Length of bit field [1...]

```c
struct esp_secure_boot_key_digests_t
```
Pointers to the trusted key digests.
The number of digests depends on the SOC’s capabilities.

**Public Members**

```c
const void *key_digests[3]
```
Pointers to the key digests

**Macros**

`ESP_ERR_EFUSE`
Base error code for efuse api.

`ESP_OK_EFUSE_CNT`
OK the required number of bits is set.

`ESP_ERR_EFUSE_CNT_IS_FULL`
Error field is full.

`ESP_ERR_EFUSE_REPEATED_PROG`
Error repeated programming of programmed bits is strictly forbidden.

`ESP_ERR_CODING`
Error while a encoding operation.

`ESP_ERR_NOT_ENOUGH_UNUSED_KEY_BLOCKS`
Error not enough unused key blocks available

`ESP_ERR_DAMAGED_READING`
Error. Burn or reset was done during a reading operation leads to damage read data. This error is internal to the efuse component and not returned by any public API.

**Enumerations**

```c
enum esp_efuse_rom_log_scheme_t
```
Type definition for ROM log scheme.

*Values:*
Chapter 2. API Reference

enumerator ESP_EFUSE_ROM_LOG_ALWAYS_ON
Always enable ROM logging

enumerator ESP_EFUSE_ROM_LOG_ON_GPIO_LOW
ROM logging is enabled when specific GPIO level is low during start up

enumerator ESP_EFUSE_ROM_LOG_ON_GPIO_HIGH
ROM logging is enabled when specific GPIO level is high during start up

enumerator ESP_EFUSE_ROM_LOG_ALWAYS_OFF
Disable ROM logging permanently

2.10.8 Error Code and Helper Functions

This section lists definitions of common ESP-IDF error codes and several helper functions related to error handling. For general information about error codes in ESP-IDF, see Error Handling.
For the full list of error codes defined in ESP-IDF, see Error Codes Reference.

API Reference

Header File

- components/esp_common/include/esp_check.h
- This header file can be included with:

```
#include "esp_check.h"
```

Macros

**ESP_RETURN_ON_ERROR** (x, log_tag, format, ...)
Macro which can be used to check the error code. If the code is not ESP_OK, it prints the message and returns. In the future, we want to switch to C++20. We also want to become compatible with clang. Hence, we provide two versions of the following macros. The first one is using the GNU extension `##__VA_ARGS__`. The second one is using the C++20 feature `VA_OPT()`. This allows users to compile their code with standard C++20 enabled instead of the GNU extension. Below C++20, we haven’t found any good alternative to using `##__VA_ARGS__`. Macro which can be used to check the error code. If the code is not ESP_OK, it prints the message and returns.

**ESP_RETURN_ON_ERROR_ISR** (x, log_tag, format, ...)
A version of ESP_RETURN_ON_ERROR() macro that can be called from ISR.

**ESP_GOTO_ON_ERROR** (x, goto_tag, log_tag, format, ...)
Macro which can be used to check the error code. If the code is not ESP_OK, it prints the message, sets the local variable ‘ret’ to the code, and then exits by jumping to ‘goto_tag’.

**ESP_GOTO_ON_ERROR_ISR** (x, goto_tag, log_tag, format, ...)
A version of ESP_GOTO_ON_ERROR() macro that can be called from ISR.

**ESP_RETURN_ON_FALSE** (a, err_code, log_tag, format, ...)
Macro which can be used to check the condition. If the condition is not ‘true’, it prints the message and returns with the supplied ‘err_code’.
ESP_RETURN_ON_FALSE_ISR (a, err_code, log_tag, format, ...)
A version of ESP_RETURN_ON_FALSE() macro that can be called from ISR.

ESP_GOTO_ON_FALSE (a, err_code, goto_tag, log_tag, format, ...)
Macro which can be used to check the condition. If the condition is not ‘true’, it prints the message, sets the local variable ‘ret’ to the supplied ‘err_code’, and then exits by jumping to ‘goto_tag’.

ESP_GOTO_ON_FALSE_ISR (a, err_code, goto_tag, log_tag, format, ...)
A version of ESP_GOTO_ON_FALSE() macro that can be called from ISR.

Header File
- components/esp_common/include/esp_err.h
- This header file can be included with:

```c
#include "esp_err.h"
```

Functions
c const char *esp_err_to_name (esp_err_t code)
Returns string for esp_err_t error codes.

This function finds the error code in a pre-generated lookup-table and returns its string representation.

The function is generated by the Python script tools/gen_esp_err_to_name.py which should be run each time an esp_err_t error is modified, created or removed from the IDF project.

**Parameters**
- **code** – esp_err_t error code

**Returns**
- string error message

c const char *esp_err_to_name_r (esp_err_t code, char *buf, size_t buflen)
Returns string for esp_err_t and system error codes.

This function finds the error code in a pre-generated lookup-table of esp_err_t errors and returns its string representation. If the error code is not found then it is attempted to be found among system errors.

The function is generated by the Python script tools/gen_esp_err_to_name.py which should be run each time an esp_err_t error is modified, created or removed from the IDF project.

**Parameters**
- **code** – esp_err_t error code
- **buf** – [out] buffer where the error message should be written
- ** buflen** – Size of buffer buf. At most buflen bytes are written into the buf buffer (including the terminating null byte).

**Returns**
- buf containing the string error message

Macros
ESP_OK
esp_err_t value indicating success (no error)

ESP_FAIL
Generic esp_err_t code indicating failure

ESP_ERR_NO_MEM
Out of memory

ESP_ERR_INVALID_ARG
Invalid argument
ESP_ERR_INVALID_STATE
Invalid state

ESP_ERR_INVALID_SIZE
Invalid size

ESP_ERR_NOT_FOUND
Requested resource not found

ESP_ERR_NOT_SUPPORTED
Operation or feature not supported

ESP_ERR_TIMEOUT
Operation timed out

ESP_ERR_INVALID_RESPONSE
Received response was invalid

ESP_ERR_INVALID_CRC
CRC or checksum was invalid

ESP_ERR_INVALID_VERSION
Version was invalid

ESP_ERR_INVALID_MAC
MAC address was invalid

ESP_ERR_NOT_FINISHED
Operation has not fully completed

ESP_ERR_NOT_ALLOWED
Operation is not allowed

ESP_ERR_WIFI_BASE
Starting number of WiFi error codes

ESP_ERR_MESH_BASE
Starting number of MESH error codes

ESP_ERR_FLASH_BASE
Starting number of flash error codes

ESP_ERR_HW_CRYPTO_BASE
Starting number of HW cryptography module error codes

ESP_ERR_MEMPROT_BASE
Starting number of Memory Protection API error codes
Chapter 2. API Reference

ESP_ERROR_CHECK(x)

Macro which can be used to check the error code, and terminate the program in case the code is not ESP_OK. Prints the error code, error location, and the failed statement to serial output.

Disabled if assertions are disabled.

ESP_ERROR_CHECK_WITHOUT_ABORT(x)

Macro which can be used to check the error code. Prints the error code, error location, and the failed statement to serial output. In comparison with ESP_ERROR_CHECK(), this prints the same error message but isn’t terminating the program.

Type Definitions
typedef int esp_err_t

2.10.9 ESP HTTPS OTA

Overview

esp_https_ota provides simplified APIs to perform firmware upgrades over HTTPS. It is an abstraction layer over the existing OTA APIs.

Application Example

```c
esp_err_t do_firmware_upgrade()
{
    esp_http_client_config_t config = {
        .url = CONFIG_FIRMWARE_UPGRADE_URL,
        .cert_pem = (char*)server_cert_pem_start,
    };
    esp_https_ota_config_t ota_config = {
        .http_config = &config,
    };
    esp_err_t ret = esp_https_ota(&ota_config);
    if (ret == ESP_OK) {
        esp_restart();
    } else {
        return ESP_FAIL;
    }
    return ESP_OK;
}
```

Server Verification

Please refer to ESP-TLS: TLS Server Verification for more information on server verification. The root certificate in PEM format needs to be provided to the esp_http_client_config_t::cert_pem member.

Note: The server-endpoint root certificate should be used for verification instead of any intermediate ones from the certificate chain. The reason is that the root certificate has the maximum validity and usually remains the same for a long period of time. Users can also use the esp_http_client_config_t::crt_bundle_attach member for verification by the ESP x509 Certificate Bundle feature, which covers most of the trusted root certificates.
Partial Image Download over HTTPS

To use the partial image download feature, enable `partial_http_download` configuration in `esp_https_ota_config_t`. When this configuration is enabled, firmware image will be downloaded in multiple HTTP requests of specified sizes. Maximum content length of each request can be specified by setting `max_http_request_size` to the required value.

This option is useful while fetching image from a service like AWS S3, where mbedTLS Rx buffer size (`CONFIG_MBEDTLS_SSL_IN_CONTENT_LEN`) can be set to a lower value which is not possible without enabling this configuration.

Default value of mbedTLS Rx buffer size is set to 16 KB. By using `partial_http_download` with `max_http_request_size` of 4 KB, size of mbedTLS Rx buffer can be reduced to 4 KB. With this configuration, memory saving of around 12 KB is expected.

Signature Verification

For additional security, signature of OTA firmware images can be verified. For more information, please refer to Secure OTA Updates Without Secure Boot.

Advanced APIs

`esp_https_ota` also provides advanced APIs which can be used if more information and control is needed during the OTA process.

Example that uses advanced ESP HTTPS OTA APIs: `system/ota/advanced_https_ota`.

OTA Upgrades with Pre-Encrypted Firmware

To perform OTA upgrades with pre-encrypted firmware, please enable `CONFIG_ESP_HTTPS_OTA_DECRYPT_CB` in component menuconfig.

Example that performs OTA upgrade with pre-encrypted firmware: `system/ota/pre_encrypted_ota`.

OTA System Events

ESP HTTPS OTA has various events for which a handler can be triggered by the Event Loop Library when the particular event occurs. The handler has to be registered using `esp_event_handler_register()`. This helps the event handling for ESP HTTPS OTA.

`esp_https_ota_event_t` has all the events which can happen when performing OTA upgrade using ESP HTTPS OTA.

Event Handler Example

```c
/* Event handler for catching system events */
static void event_handler(void* arg, esp_event_base_t event_base, int32_t event_id, void* event_data) {
    if (event_base == ESP_HTTPS_OTA_EVENT) {
        switch (event_id) {
            case ESP_HTTPS_OTA_START:
                ESP_LOGI(TAG, "OTA started");
                break;
            case ESP_HTTPS_OTA_CONNECTED:
                ESP_LOGI(TAG, "Connected to server");
                break;
        }
    }
}
```

(continues on next page)
case ESP_HTTPS_OTA_GET_IMG_DESC:
    ESP_LOGI(TAG, "Reading Image Description");
    break;
case ESP_HTTPS_OTA_VERIFY_CHIP_ID:
    ESP_LOGI(TAG, "Verifying chip id of new image: %d", *(esp_chip_id_t *)event_data);
    break;
case ESP_HTTPS_OTA_DECRYPT_CB:
    ESP_LOGI(TAG, "Callback to decrypt function");
    break;
case ESP_HTTPS_OTA_WRITE_FLASH:
    ESP_LOGD(TAG, "Writing to flash: %d written", *(int *)event_data);
    break;
case ESP_HTTPS_OTA_UPDATE_BOOT_PARTITION:
    ESP_LOGI(TAG, "Boot partition updated. Next Partition: %d", *(esp_partition_subtype_t *)event_data);
    break;
case ESP_HTTPS_OTA_FINISH:
    ESP_LOGI(TAG, "OTA finish");
    break;
case ESP_HTTPS_OTA_ABORT:
    ESP_LOGI(TAG, "OTA abort");
    break;
}

Expected data type for different ESP HTTPS OTA events in the system event loop:

- ESP_HTTPS_OTA_START: NULL
- ESP_HTTPS_OTA_CONNECTED: NULL
- ESP_HTTPS_OTA_GET_IMG_DESC: NULL
- ESP_HTTPS_OTA_VERIFY_CHIP_ID: esp_chip_id_t
- ESP_HTTPS_OTA_DECRYPT_CB: NULL
- ESP_HTTPS_OTA_WRITE_FLASH: int
- ESP_HTTPS_OTA_UPDATE_BOOT_PARTITION: esp_partition_subtype_t
- ESP_HTTPS_OTA_FINISH: NULL
- ESP_HTTPS_OTA_ABORT: NULL

**API Reference**

**Header File**

- components/esp_https_ota/include/esp_https_ota.h
- This header file can be included with:

```
#include "esp_https_ota.h"
```

- This header file is a part of the API provided by the esp_https_ota component. To declare that your component depends on esp_https_ota, add the following to your CMakeLists.txt:

```
REQUIRES esp_https_ota
```

or

```
PRIV_REQUIRES esp_https_ota
```

**Functions**
esp_err_t esp_https_ota (const esp_https_ota_config_t *ota_config)

HTTPS OTA Firmware upgrade.

This function allocates HTTPS OTA Firmware upgrade context, establishes HTTPS connection, reads image
data from HTTP stream and writes it to OTA partition and finishes HTTPS OTA Firmware upgrade operation.
This API supports URL redirection, but if CA cert of URLs differ then it should be appended to cert.pem
member of ota_config->http_config.

**Note:** This API handles the entire OTA operation, so if this API is being used then no other APIs from
esp_https_ota component should be called. If more information and control is needed during the HTTPS
OTA process, then one can use esp_https_ota_begin and subsequent APIs. If this API returns suc-
sessfully, esp_restart() must be called to boot from the new firmware image.

**Parameters**
ota_config – [in] pointer to esp_https_ota_config_t structure.

**Returns**
- ESP_OK: OTA data updated, next reboot will use specified partition.
- ESP_FAIL: For generic failure.
- ESP_ERR_INVALID_ARG: Invalid argument
- ESP_ERR_OTA_VALIDATE_FAILED: Invalid app image
- ESP_ERR_NO_MEM: Cannot allocate memory for OTA operation.
- ESP_ERR_FLASH_OP_TIMEOUT or ESP_ERR_FLASH_OP_FAIL: Flash write
  failed.
- For other return codes, refer OTA documentation in esp-idf’s app_update component.

esp_err_t esp_https_ota_begin (const esp_https_ota_config_t *ota_config, esp_https_ota_handle_t *handle)

Start HTTPS OTA Firmware upgrade.

This function initializes ESP HTTPS OTA context and establishes HTTPS connection. This function must
be invoked first. If this function returns successfully, then esp_https_ota_perform should be called
to continue with the OTA process and there should be a call to esp_https_ota_finish on completion
of OTA operation or on failure in subsequent operations. This API supports URL redirection, but if CA cert
of URLs differ then it should be appended to cert.pem member of http_config, which is a part of
ota_config. In case of error, this API explicitly sets handle to NULL.

**Note:** This API is blocking, so setting is_async member of http_config structure will result in an
error.

**Parameters**
ota_config – [in] pointer to esp_https_ota_config_t structure
handle – [out] pointer to an allocated data of type esp_https_ota_handle_t
which will be initialsed in this function

**Returns**
- ESP_OK: HTTPS OTA Firmware upgrade context initialised and HTTPS connection es-
tablished
- ESP_FAIL: For generic failure.
- ESP_ERR_INVALID_ARG: Invalid argument (missing/incorrect config, certificate, etc.)
- For other return codes, refer documentation in app_update component and esp_http_client
  component in esp-idf.

esp_err_t esp_https_ota_perform (esp_https_ota_handle_t https_ota_handle)

Read image data from HTTP stream and write it to OTA partition.

This function reads image data from HTTP stream and writes it to OTA partition. This function must be called
only if esp_https_ota_begin() returns successfully. This function must be called in a loop since it returns after
every HTTP read operation thus giving you the flexibility to stop OTA operation midway.

**Parameters**
https_ota_handle – [in] pointer to esp_https_ota_handle_t structure
**Returns**

- ESP_ERR_HTTPS_OTA_IN_PROGRESS: OTA update is in progress, call this API again to continue.
- ESP_OK: OTA update was successful
- ESP_FAIL: OTA update failed
- ESP_ERR_INVALID_ARG: Invalid argument
- ESP_ERR_INVALID_VERSION: Invalid chip revision in image header
- ESP_ERR_OTA_VALIDATE_FAILED: Invalid app image
- ESP_ERR_NO_MEM: Cannot allocate memory for OTA operation.
- ESP_ERR_FLASH_OP_TIMEOUT or ESP_ERR_FLASH_OP_FAIL: Flash write failed.
- For other return codes, refer OTA documentation in esp-idf’s app_update component.

```c
bool esp_https_ota_is_complete_data_received (esp_ota_handle_t https_ota_handle)
```

Checks if complete data was received or not.

**Note:** This API can be called just before esp_https_ota_finish() to validate if the complete image was indeed received.

**Parameters**

- `https_ota_handle` - [in] pointer to esp_https_ota_handle_t structure

**Returns**

- false
- true

```c
esp_err_t esp_https_ota_finish (esp_ota_handle_t https_ota_handle)
```

Clean-up HTTPS OTA Firmware upgrade and close HTTPS connection.

This function closes the HTTP connection and frees the ESP HTTPS OTA context. This function switches the boot partition to the OTA partition containing the new firmware image.

**Note:** If this API returns successfully, esp_restart() must be called to boot from the new firmware image esp_https_ota_finish should not be called after calling esp_https_ota_abort

**Parameters**

- `https_ota_handle` - [in] pointer to esp_https_ota_handle_t structure

**Returns**

- ESP_OK: Clean-up successful
- ESP_ERR_INVALID_STATE
- ESP_ERR_INVALID_ARG: Invalid argument
- ESP_ERR_OTA_VALIDATE_FAILED: Invalid app image

```c
esp_err_t esp_https_ota_abort (esp_ota_handle_t https_ota_handle)
```

Clean-up HTTPS OTA Firmware upgrade and close HTTPS connection.

This function closes the HTTP connection and frees the ESP HTTPS OTA context.

**Note:** esp_https_ota_abort should not be called after calling esp_https_ota_finish

**Parameters**

- `https_ota_handle` - [in] pointer to esp_https_ota_handle_t structure

**Returns**

- ESP_OK: Clean-up successful
- ESP_ERR_INVALID_STATE: Invalid ESP HTTPS OTA state
- ESP_FAIL: OTA not started
- ESP_ERR_NOT_FOUND: OTA handle not found
- ESP_ERR_INVALID_ARG: Invalid argument
esp_err_t esp_https_ota_get_img_desc(esp_https_ota_handle_t https_ota_handle, esp_app_desc_t *new_app_info)

Reads app description from image header. The app description provides information like the "Firmware version" of the image.

**Note:** This API can be called only after esp_https_ota_begin() and before esp_https_ota_perform(). Calling this API is not mandatory.

**Parameters**
- **https_ota_handle** - [in] pointer to esp_https_ota_handle_t structure
- **new_app_info** - [out] pointer to an allocated esp_app_desc_t structure

**Returns**
- ESP_ERR_INVALID_ARG: Invalid arguments
- ESP_ERR_INVALID_STATE: Invalid state to call this API. esp_https_ota_begin() not called yet.
- ESP_FAIL: Failed to read image descriptor
- ESP_OK: Successfully read image descriptor

int esp_https_ota_get_image_len_read(esp_https_ota_handle_t https_ota_handle)

This function returns OTA image data read so far.

**Note:** This API should be called only if esp_https_ota_perform() has been called at least once or if esp_https_ota_get_img_desc has been called before.

**Parameters**
- **https_ota_handle** - [in] pointer to esp_https_ota_handle_t structure

**Returns**
- -1 On failure
- total bytes read so far

int esp_https_ota_get_image_size(esp_https_ota_handle_t https_ota_handle)

This function returns OTA image total size.

**Note:** This API should be called after esp_https_ota_begin() has been already called. This can be used to create some sort of progress indication (in combination with esp_https_ota_get_image_len_read())

**Parameters**
- **https_ota_handle** - [in] pointer to esp_https_ota_handle_t structure

**Returns**
- -1 On failure or chunked encoding
- total bytes of image

**Structures**

struct esp_https_ota_config_t

ESP HTTPS OTA configuration.

**Public Members**

const esp_http_client_config_t *http_config

ESP HTTP client configuration
**Chapter 2. API Reference**

**http_client_init_cb_t**

Callback after ESP HTTP client is initialised

**bool** `bulk_flash_erase`

Erase entire flash partition during initialization. By default flash partition is erased during write operation and in chunk of 4K sector size

**bool** `partial_http_download`

Enable Firmware image to be downloaded over multiple HTTP requests

**int** `max_http_request_size`

Maximum request size for partial HTTP download

**Macros**

`ESP_ERR_HTTPS_OTA_BASE`

`ESP_ERR_HTTPS_OTA_IN_PROGRESS`

**Type Definitions**

```c
typedef void *esp_https_ota_handle_t

typedef esp_err_t (*http_client_init_cb_t)(esp_http_client_handle_t)
```

**Enumerations**

```c
enum esp_https_ota_event_t

Events generated by OTA process.

Values:

enumerator `ESP_HTTPS_OTA_START`

OTA started

enumerator `ESP_HTTPS_OTA_CONNECTED`

Connected to server

enumerator `ESP_HTTPS_OTA_GET_IMG_DESC`

Read app description from image header

enumerator `ESP_HTTPS_OTA_VERIFY_CHIP_ID`

Verify chip id of new image

enumerator `ESP_HTTPS_OTA_DECRYPT_CB`

Callback to decrypt function

enumerator `ESP_HTTPS_OTA_WRITE_FLASH`

Flash write operation
```
enumerator **ESP_HTTPS_OTA_UPDATE_BOOT_PARTITION**
    Boot partition update after successful ota update

enumerator **ESP_HTTPS_OTA_FINISH**
    OTA finished

enumerator **ESP_HTTPS_OTA_ABORT**
    OTA aborted

### 2.10.10 Event Loop Library

**Overview**

The event loop library allows components to declare events so that other components can register handlers – codes that execute when those events occur. This allows loosely-coupled components to attach desired behavior to state changes of other components without application involvement. This also simplifies event processing by serializing and deferring code execution to another context.

One common case is, if a high-level library is using the Wi-Fi library: it may subscribe to *ESP32 Wi-Fi Programming Model* directly and act on those events.

**Note:** Various modules of the Bluetooth stack deliver events to applications via dedicated callback functions instead of via the Event Loop Library.

**Using esp_event APIs**

There are two objects of concern for users of this library: events and event loops.

An event indicates an important occurrence, such as a successful Wi-Fi connection to an access point. A two-part identifier should be used when referencing events, see *declaring and defining events* for details. The event loop is the bridge between events and event handlers. The event source publishes events to the event loop using the APIs provided by the event loop library, and event handlers registered to the event loop respond to specific types of events.

Using this library roughly entails the following flow:

1. The user defines a function that should run when an event is posted to a loop. This function is referred to as the event handler, and should have the same signature as `esp_event_handler_t`.
2. An event loop is created using `esp_event_loop_create()`, which outputs a handle to the loop of type `esp_event_loop_handle_t`. Event loops created using this API are referred to as user event loops. There is, however, a special type of event loop called the default event loop which is discussed in *default event loop*.
3. Components register event handlers to the loop using `esp_event_handler_register_with()`. Handlers can be registered with multiple loops, see *notes on handler registration*.
4. Event sources post an event to the loop using `esp_event_post_to()`.
5. Components wanting to remove their handlers from being called can do so by unregistering from the loop using `esp_event_handler_unregister_with()`.
6. Event loops that are no longer needed can be deleted using `esp_event_loop_delete()`.

In code, the flow above may look like as follows:
// 1. Define the event handler
void run_on_event(void* handler_arg, esp_event_base_t base, int32_t id, void* event_data)
{
    // Event handler logic
}

void app_main()
{
    // 2. A configuration structure of type esp_event_loop_args_t is needed to
    // specify the properties of the loop to be created. A handle of type esp_event_
    // loop_handle_t is obtained, which is needed by the other APIs to reference the
    // loop to perform their operations.
    esp_event_loop_args_t loop_args = {
        .queue_size = ...,
        .task_name = ...,
        .task_priority = ...,
        .task_stack_size = ...,
        .task_core_id = ...
    };

    esp_event_loop_handle_t loop_handle;
    esp_event_loop_create(&loop_args, &loop_handle);

    // 3. Register event handler defined in (1). MY_EVENT_BASE and MY_EVENT_ID
    // specify a hypothetical event that handler run_on_event should execute when it
    // gets posted to the loop.
    esp_event_handler_register_with(loop_handle, MY_EVENT_BASE, MY_EVENT_ID, run_on_event, ...);

    ...

    // 4. Post events to the loop. This queues the event on the event loop. At
    // some point, the event loop executes the event handler registered to the posted
    // event, in this case, run_on_event. To simplify the process, this example calls
    // esp_event_post_to from app_main, but posting can be done from any other task
    // (which is the more interesting use case).
    esp_event_post_to(loop_handle, MY_EVENT_BASE, MY_EVENT_ID, ...);

    ...

    // 5. Unregistering an unneeded handler
    esp_event_handler_unregister_with(loop_handle, MY_EVENT_BASE, MY_EVENT_ID, run_on_event);

    ...

    // 6. Deleting an unneeded event loop
    esp_event_loop_delete(loop_handle);
}

### Declaring and Defining Events

As mentioned previously, events consist of two-part identifiers: the event base and the event ID. The event base identifies an independent group of events; the event ID identifies the event within that group. Think of the event base and event ID as a person’s last name and first name, respectively. A last name identifies a family, and the first name identifies a person within that family.

The event loop library provides macros to declare and define the event base easily.

Event base declaration:
ESP_EVENT_DECLARE_BASE(EVENT_BASE)

Event base definition:

ESP_EVENT_DEFINE_BASE(EVENT_BASE)

**Note**: In ESP-IDF, the base identifiers for system events are uppercase and are postfixed with _EVENT. For example, the base for Wi-Fi events is declared and defined as WIFI_EVENT, the Ethernet event base ETHERNET_EVENT, and so on. The purpose is to have event bases look like constants (although they are global variables considering the definitions of macros ESP_EVENT_DECLARE_BASE and ESP_EVENT_DEFINE_BASE).

For event IDs, declaring them as enumerations is recommended. Once again, for visibility, these are typically placed in public header files.

Event ID:

```c
enum {
    EVENT_ID_1,
    EVENT_ID_2,
    EVENT_ID_3,
    ...
}
```

 Default Event Loop

The default event loop is a special type of loop used for system events (Wi-Fi events, for example). The handle for this loop is hidden from the user, and the creation, deletion, handler registration/deregistration, and posting of events are done through a variant of the APIs for user event loops. The table below enumerates those variants, and the user event loops equivalent.

<table>
<thead>
<tr>
<th>User Event Loops</th>
<th>Default Event Loops</th>
</tr>
</thead>
<tbody>
<tr>
<td>esp_event_loop_create()</td>
<td>esp_event_loop_create_default()</td>
</tr>
<tr>
<td>esp_event_loop_delete()</td>
<td>esp_event_loop_delete_default()</td>
</tr>
<tr>
<td>esp_event_handler_register_with()</td>
<td>esp_event_handler_register()</td>
</tr>
<tr>
<td>esp_event_handler_unregister_with()</td>
<td>esp_event_handler_unregister()</td>
</tr>
<tr>
<td>esp_event_post_to()</td>
<td>esp_event_post()</td>
</tr>
</tbody>
</table>

If you compare the signatures for both, they are mostly similar except for the lack of loop handle specification for the default event loop APIs.

Other than the API difference and the special designation to which system events are posted, there is no difference in how default event loops and user event loops behave. It is even possible for users to post their own events to the default event loop, should the user opt to not create their own loops to save memory.

**Notes on Handler Registration**

It is possible to register a single handler to multiple events individually by using multiple calls to esp_event_handler_register_with(). For those multiple calls, the specific event base and event ID can be specified with which the handler should execute.

However, in some cases, it is desirable for a handler to execute on the following situations:

1. all events that get posted to a loop
2. all events of a particular base identifier
This is possible using the special event base identifier `ESP_EVENT_ANY_BASE` and special event ID `ESP_EVENT_ANY_ID`. These special identifiers may be passed as the event base and event ID arguments for `esp_event_handler_register_with()`.

Therefore, the valid arguments to `esp_event_handler_register_with()` are:

1. `<event base>, <event ID>` - handler executes when the event with base `<event base>` and event ID `<event ID>` gets posted to the loop
2. `<event base>, ESP_EVENT_ANY_ID` - handler executes when any event with base `<event base>` gets posted to the loop
3. `ESP_EVENT_ANY_BASE, ESP_EVENT_ANY_ID` - handler executes when any event gets posted to the loop

As an example, suppose the following handler registrations were performed:

```c
esp_event_handler_register_with(loop_handle, MY_EVENT_BASE, MY_EVENT_ID, run_on_event_1, ...);
esp_event_handler_register_with(loop_handle, MY_EVENT_BASE, ESP_EVENT_ANY_ID, run_on_event_2, ...);
esp_event_handler_register_with(loop_handle, ESP_EVENT_ANY_BASE, ESP_EVENT_ANY_ID, ...
    run_on_event_3, ...);
```

If the hypothetical event `MY_EVENT_BASE, MY_EVENT_ID` is posted, all three handlers `run_on_event_1`, `run_on_event_2`, and `run_on_event_3` would execute.

If the hypothetical event `MY_EVENT_BASE, MY_OTHER_EVENT_ID` is posted, only `run_on_event_2` and `run_on_event_3` would execute.

If the hypothetical event `MY_OTHER_EVENT_BASE, MY_OTHER_EVENT_ID` is posted, only `run_on_event_3` would execute.

**Handler Un-Registering Itself**  In general, an event handler run by an event loop is not allowed to do any registering/unregistering activity on that event loop. There is one exception, though: un-registering itself is allowed for the handler. E.g., it is possible to do the following:

```c
void run_on_event(void* handler_arg, esp_event_base_t base, int32_t id, void* event_data)
{
    esp_event_loop_handle_t* loop_handle = (esp_event_loop_handle_t*) handler_arg;
    esp_event_handler_unregister_with(loop_handle, MY_EVENT_BASE, MY_EVENT_ID, run_on_event);
}
```

**Handler Registration and Handler Dispatch Order**  The general rule is that, for handlers that match a certain posted event during dispatch, those which are registered first also get executed first. The user can then control which handlers get executed first by registering them before other handlers, provided that all registrations are performed using a single task. If the user plans to take advantage of this behavior, caution must be exercised if there are multiple tasks registering handlers. While the ‘first registered, first executed’ behavior still holds true, the task which gets executed first also gets its handlers registered first. Handlers registered one after the other by a single task are still dispatched in the order relative to each other, but if that task gets pre-empted in between registration by another task that also registers handlers; then during dispatch those handlers also get executed in between.
Event Loop Profiling

A configuration option CONFIG_ESP_EVENT_LOOP_PROFILING can be enabled in order to activate statistics collection for all event loops created. The function esp_event_dump() can be used to output the collected statistics to a file stream. More details on the information included in the dump can be found in the esp_event_dump() API Reference.

Application Example

Examples of using the esp_event library can be found in system/esp_event. The examples cover event declaration, loop creation, handler registration and deregistration, and event posting.

Other examples which also adopt esp_event library:

• NMEA Parser, which decodes the statements received from GPS.

API Reference

Header File

• components/esp_event/include/esp_event.h

This header file can be included with:

```c
#include "esp_event.h"
```

This header file is a part of the API provided by the esp_event component. To declare that your component depends on esp_event, add the following to your CMakeLists.txt:

```cmake
REQUIRES esp_event

or

PRIV_REQUIRES esp_event
```

Functions

**esp_err_t esp_event_loop_create**(const esp_event_loop_args_t *event_loop_args,

```c
esp_event_loop_handle_t *event_loop)
```

Create a new event loop.

Parameters

• event_loop_args – [in] configuration structure for the event loop to create

• event_loop – [out] handle to the created event loop

Returns

• ESP_OK: Success

• ESP_ERR_INVALID_ARG: event_loop_args or event_loop was NULL

• ESP_ERR_NO_MEM: Cannot allocate memory for event loops list

• ESP_FAIL: Failed to create task loop

• Others: Fail

**esp_err_t esp_event_loop_delete**(esp_event_loop_handle_t event_loop)

Delete an existing event loop.

Parameters

• event_loop – [in] event loop to delete, must not be NULL

Returns

• ESP_OK: Success

• Others: Fail

**esp_err_t esp_event_loop_create_default**(void)

Create default event loop.

Returns
Chapter 2. API Reference

- ESP_OK: Success
- ESP_ERR_NO_MEM: Cannot allocate memory for event loops list
- ESP_ERR_INVALID_STATE: Default event loop has already been created
- ESP_FAIL: Failed to create task loop
- Others: Fail

**esp_err_t esp_event_loop_delete_default (void)**
Delete the default event loop.

**Returns**
- ESP_OK: Success
- Others: Fail

**esp_err_t esp_event_loop_run (esp_event_loop_handle_t event_loop, TickType_t ticks_to_run)**
Dispatch events posted to an event loop.

This function is used to dispatch events posted to a loop with no dedicated task, i.e. task name was set to NULL in event_loop_args argument during loop creation. This function includes an argument to limit the amount of time it runs, returning control to the caller when that time expires (or some time afterwards). There is no guarantee that a call to this function will exit at exactly the time of expiry. There is also no guarantee that events have been dispatched during the call, as the function might have spent all the allotted time waiting on the event queue. Once an event has been dequeued, however, it is guaranteed to be dispatched. This guarantee contributes to not being able to exit exactly at time of expiry as (1) blocking on internal mutexes is necessary for dispatching the dequeued event, and (2) during dispatch of the dequeued event there is no way to control the time occupied by handler code execution. The guaranteed time of exit is therefore the allotted time + amount of time required to dispatch the last dequeued event.

In cases where waiting on the queue times out, ESP_OK is returned and not ESP_ERR_TIMEOUT, since it is normal behavior.

**Note:** encountering an unknown event that has been posted to the loop will only generate a warning, not an error.

**Parameters**
- event_loop - [in] event loop to dispatch posted events from, must not be NULL
- ticks_to_run - [in] number of ticks to run the loop

**Returns**
- ESP_OK: Success
- Others: Fail

**esp_err_t esp_event_handler_register (esp_event_base_t event_base, int32_t event_id, esp_event_handler_t event_handler, void *event_handler_arg)**
Register an event handler to the system event loop (legacy).

This function can be used to register a handler for either: (1) specific events, (2) all events of a certain event base, or (3) all events known by the system event loop.

- specific events: specify exact event_base and event_id
- all events of a certain base: specify exact event_base and use ESP_EVENT_ANY_ID as the event_id
- all events known by the loop: use ESP_EVENT_ANY_BASE for event_base and ESP_EVENT_ANY_ID as the event_id

Registering multiple handlers to events is possible. Registering a single handler to multiple events is also possible. However, registering the same handler to the same event multiple times would cause the previous registrations to be overwritten.
Chapter 2. API Reference

Note: the event loop library does not maintain a copy of event_handler_arg, therefore the user should ensure that event_handler_arg still points to a valid location by the time the handler gets called.

Parameters

• event_base [in] the base ID of the event to register the handler for
• event_id [in] the ID of the event to register the handler for
• event_handler [in] the handler function which gets called when the event is dispatched
• event_handler_arg [in] data, aside from event data, that is passed to the handler when it is called

Returns

• ESP_OK: Success
• ESP_ERR_NO_MEM: Cannot allocate memory for the handler
• ESP_ERR_INVALID_ARG: Invalid combination of event base and event ID
• Others: Fail

esp_err_t esp_event_handler_register_with (esp_event_loop_handle_t event_loop, esp_event_base_t event_base, int32_t event_id, esp_event_handler_t event_handler, void *event_handler_arg)

Register an event handler to a specific loop (legacy).

This function behaves in the same manner as esp_event_handler_register, except the additional specification of the event loop to register the handler to.

Note: the event loop library does not maintain a copy of event_handler_arg, therefore the user should ensure that event_handler_arg still points to a valid location by the time the handler gets called.

Parameters

• event_loop [in] the event loop to register this handler function to, must not be NULL
• event_base [in] the base ID of the event to register the handler for
• event_id [in] the ID of the event to register the handler for
• event_handler [in] the handler function which gets called when the event is dispatched
• event_handler_arg [in] data, aside from event data, that is passed to the handler when it is called

Returns

• ESP_OK: Success
• ESP_ERR_NO_MEM: Cannot allocate memory for the handler
• ESP_ERR_INVALID_ARG: Invalid combination of event base and event ID
• Others: Fail

esp_err_t esp_event_handler_instance_register_with (esp_event_loop_handle_t event_loop, esp_event_base_t event_base, int32_t event_id, esp_event_handler_t event_handler, void *event_handler_arg, esp_event_handler_instance_t *instance)

Register an instance of event handler to a specific loop.

This function can be used to register a handler for either: (1) specific events, (2) all events of a certain event base, or (3) all events known by the system event loop.

• specific events: specify exact event_base and event_id
• all events of a certain base: specify exact event_base and use ESP_EVENT_ANY_ID as the event_id
• all events known by the loop: use ESP_EVENT_ANY_BASE for event_base and ESP_EVENT_ANY_ID as the event_id

Besides the error, the function returns an instance object as output parameter to identify each registration. This is necessary to remove ( unregister) the registration before the event loop is deleted.

Registering multiple handlers to events, registering a single handler to multiple events as well as registering the same handler to the same event multiple times is possible. Each registration yields a distinct instance object which identifies it over the registration lifetime.

Note: the event loop library does not maintain a copy of event_handler_arg, therefore the user should ensure that event_handler_arg still points to a valid location by the time the handler gets called

Parameters
• event_loop - [in] the event loop to register this handler function to, must not be NULL
• event_base - [in] the base ID of the event to register the handler for
• event_id - [in] the ID of the event to register the handler for
• event_handler - [in] the handler function which gets called when the event is dispatched
• event_handler_arg - [in] data, aside from event data, that is passed to the handler when it is called
• instance - [out] An event handler instance object related to the registered event handler and data, can be NULL. This needs to be kept if the specific callback instance should be unregistered before deleting the whole event loop. Registering the same event handler multiple times is possible and yields distinct instance objects. The data can be the same for all registrations. If no unregistration is needed, but the handler should be deleted when the event loop is deleted, instance can be NULL.

Returns
• ESP_OK: Success
• ESP_ERR_NO_MEM: Cannot allocate memory for the handler
• ESP_ERR_INVALID_ARG: Invalid combination of event base and event ID or instance is NULL
• Others: Fail

```
esp_err_t esp_event_handler_instance_register(esp_event_base_t event_base, int32_t event_id, esp_event_handler_t event_handler, void *event_handler_arg, esp_event_handler_instance_t *instance)
```

Register an instance of event handler to the default loop.

This function does the same as esp_event_handler_instance_register_with, except that it registers the handler to the default event loop.

Note: the event loop library does not maintain a copy of event_handler_arg, therefore the user should ensure that event_handler_arg still points to a valid location by the time the handler gets called

Parameters
• event_base - [in] the base ID of the event to register the handler for
• event_id - [in] the ID of the event to register the handler for
• event_handler - [in] the handler function which gets called when the event is dispatched
• event_handler_arg - [in] data, aside from event data, that is passed to the handler when it is called
• instance - [out] An event handler instance object related to the registered event handler and data, can be NULL. This needs to be kept if the specific callback instance should be unregistered before deleting the whole event loop. Registering the same event handler
multiple times is possible and yields distinct instance objects. The data can be the same for all registrations. If no unregistration is needed, but the handler should be deleted when the event loop is deleted, instance can be NULL.

Returns

- ESP_OK: Success
- ESP_ERR_NO_MEM: Cannot allocate memory for the handler
- ESP_ERR_INVALID_ARG: Invalid combination of event base and event ID or instance is NULL
- Others: Fail

```c
esp_err_t esp_event_handler_unregister(esp_event_base_t event_base, int32_t event_id, esp_event_handler_t event_handler)
```

Unregister a handler with the system event loop (legacy).

Unregisters a handler, so it will no longer be called during dispatch. Handlers can be unregistered for any combination of event_base and event_id which were previously registered. To unregister a handler, the event_base and event_id arguments must match exactly the arguments passed to `esp_event_handler_register()` when that handler was registered. Passing ESP_EVENT_ANY_BASE and/or ESP_EVENT_ANY_ID will only unregister handlers that were registered with the same wildcard arguments.

Note: When using ESP_EVENT_ANY_ID, handlers registered to specific event IDs using the same base will not be unregistered. When using ESP_EVENT_ANY_BASE, events registered to specific bases will also not be unregistered. This avoids accidental unregistration of handlers registered by other users or components.

Parameters

- `event_base` [in] the base of the event with which to unregister the handler
- `event_id` [in] the ID of the event with which to unregister the handler
- `event_handler` [in] the handler to unregister

Returns

- ESP_OK: Success
- ESP_ERR_INVALID_ARG: Invalid combination of event base and event ID
- Others: Fail

```c
esp_err_t esp_event_handler_unregister_with(esp_event_loop_handle_t event_loop, esp_event_base_t event_base, int32_t event_id, esp_event_handler_t event_handler)
```

Unregister a handler from a specific event loop (legacy).

This function behaves in the same manner as `esp_event_handler_unregister`, except the additional specification of the event loop to unregister the handler with.

Parameters

- `event_loop` [in] the event loop with which to unregister this handler function, must not be NULL
- `event_base` [in] the base of the event with which to unregister the handler
- `event_id` [in] the ID of the event with which to unregister the handler
- `event_handler` [in] the handler to unregister

Returns

- ESP_OK: Success
- ESP_ERR_INVALID_ARG: Invalid combination of event base and event ID
- Others: Fail

```c
esp_err_t esp_event_handler_instance_unregister_with(esp_event_loop_handle_t event_loop, esp_event_base_t event_base, int32_t event_id, esp_event_handler_instance_t instance)
```

Unregister a handler instance from a specific event loop.
Unregisters a handler instance, so it will no longer be called during dispatch. Handler instances can be unregistered for any combination of event_base and event_id which were previously registered. To unregister a handler instance, the event_base and event_id arguments must match exactly the arguments passed to esp_event_handler_instance_register() when that handler instance was registered. Passing ESP_EVENT_ANY_BASE and/or ESP_EVENT_ANY_ID will only unregister handler instances that were registered with the same wildcard arguments.

**Note:** When using ESP_EVENT_ANY_ID, handlers registered to specific event IDs using the same base will not be unregistered. When using ESP_EVENT_ANY_BASE, events registered to specific bases will also not be unregistered. This avoids accidental unregistration of handlers registered by other users or components.

### Parameters
- `event_loop [in]` the event loop with which to unregister this handler function, must not be NULL
- `event_base [in]` the base of the event with which to unregister the handler
- `event_id [in]` the ID of the event with which to unregister the handler
- `instance [in]` the instance object of the registration to be unregistered

### Returns
- ESP_OK: Success
- ESP_ERR_INVALID_ARG: Invalid combination of event base and event ID
- Others: Fail

```c
esp_err_t esp_event_handler_instance_unregister
    (esp_event_base_t event_base, int32_t event_id,
     esp_event_handler_instance_t instance)
```

Unregister a handler from the system event loop.

This function does the same as esp_event_handler_instance_unregister_with, except that it unregisters the handler instance from the default event loop.

### Parameters
- `event_base [in]` the base of the event with which to unregister the handler
- `event_id [in]` the ID of the event with which to unregister the handler
- `instance [in]` the instance object of the registration to be unregistered

### Returns
- ESP_OK: Success
- ESP_ERR_INVALID_ARG: Invalid combination of event base and event ID
- Others: Fail

```c
esp_err_t esp_event_post
    (esp_event_base_t event_base, int32_t event_id,
     const void *event_data, size_t event_data_size,
     TickType_t ticks_to_wait)
```

Posts an event to the system default event loop. The event loop library keeps a copy of event_data and manages the copy’s lifetime automatically (allocation + deletion); this ensures that the data the handler receives is always valid.

### Parameters
- `event_base [in]` the event base that identifies the event
- `event_id [in]` the event ID that identifies the event
- `event_data [in]` the data, specific to the event occurrence, that gets passed to the handler
- `event_data_size [in]` the size of the event data
- `ticks_to_wait [in]` number of ticks to block on a full event queue

### Returns
- ESP_OK: Success
- ESP_ERR_TIMEOUT: Time to wait for event queue to unblock expired, queue full when posting from ISR
- ESP_ERR_INVALID_ARG: Invalid combination of event base and event ID
- Others: Fail

```
esp_err_t esp_event_post_to(esp_event_loop_handle_t event_loop, esp_event_base_t event_base, int32_t event_id, const void *event_data, size_t event_data_size, TickType_t ticks_to_wait)
```

Posts an event to the specified event loop. The event loop library keeps a copy of event_data and manages the copy’s lifetime automatically (allocation + deletion); this ensures that the data the handler receives is always valid.

This function behaves in the same manner as esp_event_post_to, except the additional specification of the event loop to post the event to.

**Parameters**
- `event_loop` [in] the event loop to post to, must not be NULL
- `event_base` [in] the event base that identifies the event
- `event_id` [in] the event ID that identifies the event
- `event_data` [in] the data, specific to the event occurrence, that gets passed to the handler
- `event_data_size` [in] the size of the event data
- `ticks_to_wait` [in] number of ticks to block on a full event queue

**Returns**
- ESP_OK: Success
- ESP_ERR_TIMEOUT: Time to wait for event queue to unblock expired, queue full when posting from ISR
- ESP_ERR_INVALID_ARG: Invalid combination of event base and event ID
- Others: Fail

```
esp_err_t esp_event_isr_post(esp_event_base_t event_base, int32_t event_id, const void *event_data, size_t event_data_size, BaseType_t *task_unblocked)
```

Special variant of esp_event_post for posting events from interrupt handlers.

**Note:** this function is only available when CONFIG_ESP_EVENT_POST_FROM_ISR is enabled

```
esp_err_t esp_event_isr_post_to(esp_event_loop_handle_t event_loop, esp_event_base_t event_base, int32_t event_id, const void *event_data, size_t event_data_size, BaseType_t *task_unblocked)
```

Special variant of esp_event_post_to for posting events from interrupt handlers.

**Parameters**
- `event_base` [in] the event base that identifies the event
- `event_id` [in] the event ID that identifies the event
- `event_data` [in] the data, specific to the event occurrence, that gets passed to the handler
- `event_data_size` [in] the size of the event data; max is 4 bytes
- `task_unblocked` [out] an optional parameter (can be NULL) which indicates that an event task with higher priority than currently running task has been unblocked by the posted event; a context switch should be requested before the interrupt is existed.

**Returns**
- ESP_OK: Success
- ESP_FAIL: Event queue for the default event loop full
- ESP_ERR_INVALID_ARG: Invalid combination of event base and event ID, data size of more than 4 bytes
- Others: Fail
### esp_event_post

**Note:** this function is only available when `CONFIG_ESP_EVENT_POST_FROM_ISR` is enabled

**Note:** when this function is called from an interrupt handler placed in IRAM, this function should be placed in IRAM as well by enabling `CONFIG_ESP_EVENT_POST_FROM_IRAM_ISR`

**Parameters**

- `event_loop` [in] the event loop to post to, must not be NULL
- `event_base` [in] the event base that identifies the event
- `event_id` [in] the event ID that identifies the event
- `event_data` [in] the data, specific to the event occurrence, that gets passed to the handler
- `event_data_size` [in] the size of the event data
- `task_unblocked` [out] an optional parameter (can be NULL) which indicates that an event task with higher priority than currently running task has been unblocked by the posted event; a context switch should be requested before the interrupt is existed.

**Returns**

- ESP_OK: Success
- ESP_FAIL: Event queue for the loop full
- ESP_ERR_INVALID_ARG: Invalid combination of event base and event ID, data size of more than 4 bytes
- Others: Fail

```c
esp_err_t esp_event_post(esp_event_loop_t *event_loop, esp_event_base_t event_base, uint16_t event_id, const void *event_data, size_t event_data_size, esp_task_unblocked_t *task_unblocked);
```

### esp_event_dump

Dumps statisticsof all event loops.

Dumps event loop info in the format:

```
    event loop
      handler
        handler
        ...
    event loop
      handler
        handler
        ...
```

where:

- `event loop` format: `address,name rx:total_received dr:total_dropped` where:
  - `address` - memory address of the event loop
  - `name` - name of the event loop, 'none' if no dedicated task
  - `total_received` - number of successfully posted events
  - `total_dropped` - number of events unsuccessfully posted due to queue being full

- `handler` format: `address ev;base, id inv:total_invoked run:total_runtime` where:
  - `address` - address of the handler function
  - `base, id` - the event specified by event base and ID this handler executes
  - `total_invoked` - number of times this handler has been invoked
  - `total_runtime` - total amount of time used for invoking this handler

```c
esp_err_t esp_event_dump(FILE *file);
```
Chapter 2. API Reference

Note: this function is a noop when CONFIG_ESP_EVENT_LOOP_PROFILING is disabled

**Parameters**  
file –[in] the file stream to output to

**Returns**
- ESP_OK: Success
- ESP_ERR_NO_MEM: Cannot allocate memory for event loops list
- Others: Fail

**Structures**

```c
struct esp_event_loop_args_t
```
Configuration for creating event loops.

**Public Members**

```c
int32_t queue_size
```
size of the event loop queue

```c
const char *task_name
```
name of the event loop task; if NULL, a dedicated task is not created for event loop

```c
UBaseType_t task_priority
```
priority of the event loop task, ignored if task name is NULL

```c
uint32_t task_stack_size
```
stack size of the event loop task, ignored if task name is NULL

```c
BaseType_t task_core_id
```
core to which the event loop task is pinned to, ignored if task name is NULL

**Header File**

- `components/esp_event/include/esp_event_base.h`
- This header file can be included with:

```c
#include "esp_event_base.h"
```
- This header file is a part of the API provided by the esp_event component. To declare that your component depends on esp_event, add the following to your CMakeLists.txt:

```cmake
REQUIRES esp_event
```
or

```cmake
PRIV_REQUIRES esp_event
```

**Macros**

```c
ESP_EVENT_DECLARE_BASE (id)
```
```c
ESP_EVENT_DEFINE_BASE (id)
```
Chapter 2. API Reference

ESP_EVENT_ANY_BASE
   register handler for any event base

ESP_EVENT_ANY_ID
   register handler for any event id

Type Definitions

typedef void *esp_event_loop_handle_t
   a number that identifies an event with respect to a base

typedef void (*esp_event_handler_t)(void *event_handler_arg, esp_event_base_t event_base, int32_t event_id, void *event_data)
   function called when an event is posted to the queue

   typedef void *esp_event_handler_instance_t
   context identifying an instance of a registered event handler

2.10.11 FreeRTOS Overview

Overview

FreeRTOS is an open source RTOS (real-time operating system) kernel that is integrated into ESP-IDF as a component. Thus, all ESP-IDF applications and many ESP-IDF components are written based on FreeRTOS. The FreeRTOS kernel is ported to all architectures (i.e., Xtensa and RISC-V) available of ESP chips.

Furthermore, ESP-IDF provides different implementations of FreeRTOS in order to support SMP (Symmetric Multiprocessing) on multi-core ESP chips. This document provides an overview of the FreeRTOS component, the different FreeRTOS implementations offered by ESP-IDF, and the common aspects across all implementations.

Implementations

The official FreeRTOS (henceforth referred to as Vanilla FreeRTOS) is a single-core RTOS. In order to support the various multi-core ESP targets, ESP-IDF supports different FreeRTOS implementations as listed below:

ESP-IDF FreeRTOS ESP-IDF FreeRTOS is a FreeRTOS implementation based on Vanilla FreeRTOS v10.5.1, but contains significant modifications to support SMP. ESP-IDF FreeRTOS only supports two cores at most (i.e., dual core SMP), but is more optimized for this scenario by design. For more details regarding ESP-IDF FreeRTOS and its modifications, please refer to the FreeRTOS (ESP-IDF) document.

Note: ESP-IDF FreeRTOS is currently the default FreeRTOS implementation for ESP-IDF.
Amazon SMP FreeRTOS Amazon SMP FreeRTOS is an SMP implementation of FreeRTOS that is officially supported by Amazon. Amazon SMP FreeRTOS is able to support N-cores (i.e., more than two cores). Amazon SMP FreeRTOS can be enabled via the `CONFIG_FREERTOS_SMP` option. For more details regarding Amazon SMP FreeRTOS, please refer to the official Amazon SMP FreeRTOS documentation.

Warning: The Amazon SMP FreeRTOS implementation (and its port in ESP-IDF) are currently in experimental/beta state. Therefore, significant behavioral changes and breaking API changes can occur.

Configuration

Kernel Configuration Vanilla FreeRTOS requires that ports and applications configure the kernel by adding various `#define config...` macro definitions to the `FreeRTOSConfig.h` header file. Vanilla FreeRTOS supports a list of kernel configuration options which allow various kernel behaviors and features to be enabled or disabled.

However, for all FreeRTOS ports in ESP-IDF, the `FreeRTOSConfig.h` header file is considered private and must not be modified by users. A large number of kernel configuration options in `FreeRTOSConfig.h` are hard-coded as they are either required/not supported by ESP-IDF. All kernel configuration options that are configurable by the user are exposed via menuconfig under Component Config/FreeRTOS/Kernel.

For the full list of user configurable kernel options, see Project Configuration. The list below highlights some commonly used kernel configuration options:

- `CONFIG_FREERTOS_UNICORE` runs FreeRTOS only on CPU0. Note that this is not equivalent to running Vanilla FreeRTOS. Furthermore, this option may affect behavior of components other than freertos. For more details regarding the effects of running FreeRTOS on a single core, refer to ESP-IDF FreeRTOS Single Core (if using ESP-IDF FreeRTOS) or the official Amazon SMP FreeRTOS documentation. Alternatively, users can also search for occurrences of `CONFIG_FREERTOS_UNICORE` in the ESP-IDF components.

- `CONFIG_FREERTOS_ENABLE_BACKWARD_COMPATIBILITY` enables backward compatibility with some FreeRTOS macros/types/functions that were deprecated from v8.0 onwards.

Port Configuration All other FreeRTOS related configuration options that are not part of the kernel configuration are exposed via menuconfig under Component Config/FreeRTOS/Port. These options configure aspects such as:

- The FreeRTOS ports themselves (e.g., tick timer selection, ISR stack size)
- Additional features added to the FreeRTOS implementation or ports

Using FreeRTOS

Application Entry Point Unlike Vanilla FreeRTOS, users of FreeRTOS in ESP-IDF must never call `vTaskStartScheduler()` and `vTaskEndScheduler()`. Instead, ESP-IDF starts FreeRTOS automatically. Users must define a `void app_main(void)` function which acts as the entry point for user’s application and is automatically invoked on ESP-IDF startup.

- Typically, users would spawn the rest of their application’s task from `app_main`.
- The `app_main` function is allowed to return at any point (i.e., before the application terminates).
- The `app_main` function is called from the `main` task.

Background Tasks During startup, ESP-IDF and the FreeRTOS kernel automatically create multiple tasks that run in the background (listed in the the table below).
Table 10: List of Tasks Created During Startup

<table>
<thead>
<tr>
<th>Task Name</th>
<th>Description</th>
<th>Stack Size</th>
<th>Priority</th>
</tr>
</thead>
<tbody>
<tr>
<td>Idle Tasks (IDLE\text{x})</td>
<td>An idle task (IDLE\text{x}) is created for (and pinned to) each CPU core, where ( x ) is the CPU core’s number. The ( x ) is dropped when single-core configuration is enabled.</td>
<td>CON-Core 0</td>

</tbody>
</table>

**Note:** Note that if an application uses other ESP-IDF features (e.g., Wi-Fi or Bluetooth), those features may create their own background tasks in addition to the tasks listed in the table above.

**FreeRTOS Additions**

ESP-IDF provides some supplemental features to FreeRTOS such as Ring Buffers, ESP-IDF style Tick and Idle Hooks, and TLSP deletion callbacks. See FreeRTOS (Supplemental Features) for more details.

**FreeRTOS Heap**

Vanilla FreeRTOS provides its own selection of heap implementations. However, ESP-IDF already implements its own heap (see Heap Memory Allocation), thus ESP-IDF does not make use of the heap implementations provided by Vanilla FreeRTOS. All FreeRTOS ports in ESP-IDF map FreeRTOS memory allocation or free calls (e.g., pvPortMalloc() and pvPortFree()) to ESP-IDF heap API (i.e., heap_caps_malloc() and heap_caps_free()). However, the FreeRTOS ports ensure that all dynamic memory allocated by FreeRTOS is placed in internal memory.

**Note:** If users wish to place FreeRTOS tasks/objects in external memory, users can use the following methods:

- Allocate the task or object using one of the ...CreateWithCaps() API, such as xTaskCreateWithCaps() and xQueueCreateWithCaps() (see IDF Additional API for more details).
- Manually allocate external memory for those objects using heap_caps_malloc(), then create the objects from the allocated memory using on of the ...CreateStatic() FreeRTOS functions.

**2.10.12 FreeRTOS (ESP-IDF)**
Overview

The original FreeRTOS (hereinafter referred to as Vanilla FreeRTOS) is a compact and efficient real-time operating system supported on many single-core MCUs and SoCs. However, to support numerous dual-core ESP targets, such as ESP32, ESP32-S3, and ESP32-P4, ESP-IDF provides an implementation of FreeRTOS with dual-core symmetric multiprocessing (SMP) capabilities (hereinafter referred to as ESP-IDF FreeRTOS).

ESP-IDF FreeRTOS is based on Vanilla FreeRTOS v10.5.1 but contains significant modifications to both API and kernel behavior in order to support dual-core SMP. This document describes the API and behavioral differences between Vanilla FreeRTOS and ESP-IDF FreeRTOS.

Note: This document assumes that the reader has a requisite understanding of Vanilla FreeRTOS, i.e., its features, behavior, and API usage. Refer to the Vanilla FreeRTOS documentation for more details.

Note: ESP-IDF FreeRTOS can be built for a single core by enabling the `CONFIG_FREERTOS_UNICORE` configuration option. ESP targets that are single core always have the `CONFIG_FREERTOS_UNICORE` option enabled. However, note that building with `CONFIG_FREERTOS_UNICORE` enabled does not equate to building with Vanilla FreeRTOS, as some of the behavioral and API changes of ESP-IDF are still present. For more details, see ESP-IDF FreeRTOS Single Core.

This document is split into the following parts.

Symmetric Multiprocessing

Basic Concepts  Symmetric multiprocessing is a computing architecture where two or more identical CPUs (cores) are connected to a single shared main memory and controlled by a single operating system. In general, an SMP system:

- has multiple cores running independently. Each core has its own register file, interrupts, and interrupt handling.
- presents an identical view of memory to each core. Thus, a piece of code that accesses a particular memory address has the same effect regardless of which core it runs on.

The main advantages of an SMP system compared to single-core or asymmetric multiprocessing systems are that:

- the presence of multiple CPUs allows for multiple hardware threads, thus increasing overall processing throughput.
- having symmetric memory means that threads can switch cores during execution. This, in general, can lead to better CPU utilization.

Although an SMP system allows threads to switch cores, there are scenarios where a thread must or should only run on a particular core. Therefore, threads in an SMP system also have a core affinity that specifies which particular core the thread is allowed to run on.

- A thread that is pinned to a particular core is only able to run on that core.
- A thread that is unpinned will be allowed to switch between cores during execution instead of being pinned to a particular core.
**SMP on an ESP Target** ESP targets such as ESP32, ESP32-S3, and ESP32-P4 are dual-core SMP SoCs. These targets have the following hardware features that make them SMP-capable:

- Two identical cores are known as CPU0 and CPU1. This means that the execution of a piece of code is identical regardless of which core it runs on.
- Symmetric memory (with some small exceptions).
  - If multiple cores access the same memory address simultaneously, their access will be serialized by the memory bus.
  - True atomic access to the same memory address is achieved via an atomic compare-and-swap instruction provided by the ISA.
- Cross-core interrupts that allow one CPU to trigger an interrupt on another CPU. This allows cores to signal each other.

**Note:** CPU0 is also known as Protocol CPU or PRO_CPU and CPU1 is also known as Application CPU or APP_CPU. The PRO_CPU and APP_CPU aliases for CPU0 and CPU1 exist in ESP-IDF as they reflect how typical ESP-IDF applications utilize the two CPUs. Typically, the tasks responsible for handling wireless networking (e.g., Wi-Fi or Bluetooth) are pinned to CPU0, thus the name PRO_CPU; whereas the tasks handling the remainder of the application are pinned to CPU1, thus the name APP_CPU.

**Tasks**

**Creation** Vanilla FreeRTOS provides the following functions to create a task:

- `xtaskCreate()` creates a task. The task’s memory is dynamically allocated.
- `xtaskCreateStatic()` creates a task. The task’s memory is statically allocated, i.e., provided by the user.

However, in an SMP system, tasks need to be assigned a particular affinity. Therefore, ESP-IDF provides a PinnedToCore version of Vanilla FreeRTOS’s task creation functions:

- `xtaskCreatePinnedToCore()` creates a task with a particular core affinity. The task’s memory is dynamically allocated.
- `xtaskCreateStaticPinnedToCore()` creates a task with a particular core affinity. The task’s memory is statically allocated, i.e., provided by the user.

The PinnedToCore versions of the task creation function API differ from their vanilla counterparts by having an extra `xCoreID` parameter that is used to specify the created task’s core affinity. The valid values for core affinity are:

- 0, which pins the created task to CPU0
- 1, which pins the created task to CPU1
- `tskNO_AFFINITY`, which allows the task to be run on both CPUs

Note that ESP-IDF FreeRTOS still supports the vanilla versions of the task creation functions. However, these standard functions have been modified to essentially invoke their respective PinnedToCore counterparts while setting the core affinity to tskNO_AFFINITY.

**Note:** ESP-IDF FreeRTOS also changes the units of `ulStackDepth` in the task creation functions. Task stack sizes in Vanilla FreeRTOS are specified in a number of words, whereas in ESP-IDF FreeRTOS, the task stack sizes are specified in bytes.

**Execution** The anatomy of a task in ESP-IDF FreeRTOS is the same as in Vanilla FreeRTOS. More specifically, ESP-IDF FreeRTOS tasks:

- Can only be in one of the following states: Running, Ready, Blocked, or Suspended.
- Task functions are typically implemented as an infinite loop.
- Task functions should never return.
Deletion  Task deletion in Vanilla FreeRTOS is called via `vTaskDelete()`. The function allows deletion of another task or the currently running task if the provided task handle is NULL. The actual freeing of the task’s memory is sometimes delegated to the idle task if the task being deleted is the currently running task.

ESP-IDF FreeRTOS provides the same `vTaskDelete()` function. However, due to the dual-core nature, there are some behavioral differences when calling `vTaskDelete()` in ESP-IDF FreeRTOS:

- When deleting a task that is currently running on the other core, a yield is triggered on the other core, and the task’s memory is freed by one of the idle tasks.
- A deleted task’s memory is freed immediately if it is not running on either core.

Please avoid deleting a task that is running on another core as it is difficult to determine what the task is performing, which may lead to unpredictable behavior such as:

- Deleting a task that is holding a mutex.
- Deleting a task that has yet to free memory it previously allocated.

Where possible, please design your own application so that when calling `vTaskDelete()`, the deleted task is in a known state. For example:

- Tasks self-deleting via `vTaskDelete(NULL)` when their execution is complete and have also cleaned up all resources used within the task.
- Tasks placing themselves in the suspend state via `vTaskSuspend()` before being deleted by another task.

SMP Scheduler

The Vanilla FreeRTOS scheduler is best described as a fixed priority preemptive scheduler with time slicing meaning that:

- Each task is given a constant priority upon creation. The scheduler executes the highest priority ready-state task.
- The scheduler can switch execution to another task without the cooperation of the currently running task.
- The scheduler periodically switches execution between ready-state tasks of the same priority in a round-robin fashion. Time slicing is governed by a tick interrupt.

The ESP-IDF FreeRTOS scheduler supports the same scheduling features, i.e., Fixed Priority, Preemption, and Time Slicing, albeit with some small behavioral differences.

Fixed Priority  In Vanilla FreeRTOS, when the scheduler selects a new task to run, it always selects the current highest priority ready-state task. In ESP-IDF FreeRTOS, each core independently schedules tasks to run. When a particular core selects a task, the core will select the highest priority ready-state task that can be run by the core. A task can be run by the core if:

- The task has a compatible affinity, i.e., is either pinned to that core or is unpinned.
- The task is not currently being run by another core.

However, please do not assume that the two highest priority ready-state tasks are always run by the scheduler, as a task’s core affinity must also be accounted for. For example, given the following tasks:

- Task A of priority 10 pinned to CPU0
- Task B of priority 9 pinned to CPU0
- Task C of priority 8 pinned to CPU1

The resulting schedule will have Task A running on CPU0 and Task C running on CPU1. Task B is not run even though it is the second-highest priority task.

Preemption  In Vanilla FreeRTOS, the scheduler can preempt the currently running task if a higher priority task becomes ready to execute. Likewise in ESP-IDF FreeRTOS, each core can be individually preempted by the scheduler if the scheduler determines that a higher-priority task can run on that core.

However, there are some instances where a higher-priority task that becomes ready can be run on multiple cores. In this case, the scheduler only preempts one core. The scheduler always gives preference to the current core when...
multiple cores can be preempted. In other words, if the higher priority ready task is unpinned and has a higher priority than the current priority of both cores, the scheduler will always choose to preempt the current core. For example, given the following tasks:

- Task A of priority 8 currently running on CPU0
- Task B of priority 9 currently running on CPU1
- Task C of priority 10 that is unpinned and was unblocked by Task B

The resulting schedule will have Task A running on CPU0 and Task C preempting Task B given that the scheduler always gives preference to the current core.

**Time Slicing**

The Vanilla FreeRTOS scheduler implements time slicing, which means that if the current highest ready priority contains multiple ready tasks, the scheduler will switch between those tasks periodically in a round-robin fashion.

However, in ESP-IDF FreeRTOS, it is not possible to implement perfect Round Robin time slicing due to the fact that a particular task may not be able to run on a particular core due to the following reasons:

- The task is pinned to another core.
- For unpinned tasks, the task is already being run by another core.

Therefore, when a core searches the ready-state task list for a task to run, the core may need to skip over a few tasks in the same priority list or drop to a lower priority in order to find a ready-state task that the core can run.

The ESP-IDF FreeRTOS scheduler implements a Best Effort Round Robin time slicing for ready-state tasks of the same priority by ensuring that tasks that have been selected to run are placed at the back of the list, thus giving unselected tasks a higher priority on the next scheduling iteration (i.e., the next tick interrupt or yield).

The following example demonstrates the Best Effort Round Robin time slicing in action. Assume that:

- There are four ready-state tasks of the same priority AX, B0, C1, and D1 where:
  - The priority is the current highest priority with ready-state.
  - The first character represents the task’s name, i.e., A, B, C, D.
  - The second character represents the task’s core pinning, and X means unpinned.
- The task list is always searched from the head.

1. Starting state. None of the ready-state tasks have been selected to run.

   Head [ AX , B0 , C1 , D0 ] Tail

2. Core 0 has a tick interrupt and searches for a task to run.

   Task A is selected and moved to the back of the list.

   Core0--|

   Head [ AX , B0 , C1 , D0 ] Tail

   0

   Head [ B0 , C1 , D0 , AX ] Tail

3. Core 1 has a tick interrupt and searches for a task to run.

   Task B cannot be run due to incompatible affinity, so core 1 skips to Task C.

   Task C is selected and moved to the back of the list.

   Core1-------| 0

(continues on next page)
Head [ B0 , C1 , D0 , AX ] Tail

0 1

Head [ B0 , D0 , AX , C1 ] Tail

--------------------------------------------------------------------------------

4. Core 0 has another tick interrupt and searches for a task to run.
   Task B is selected and moved to the back of the list.

Core0--|-- 1
Head [ B0 , D0 , AX , C1 ] Tail

1 0
Head [ D0 , AX , C1 , B0 ] Tail

--------------------------------------------------------------------------------

5. Core 1 has another tick and searches for a task to run.
   Task D cannot be run due to incompatible affinity, so core 1 skips to Task A.
   Task A is selected and moved to the back of the list.

Core1-----|-- 0
Head [ D0 , AX , C1 , B0 ] Tail

0 1
Head [ D0 , C1 , B0 , AX ] Tail

The implications to users regarding the Best Effort Round Robin time slicing:

• Users cannot expect multiple ready-state tasks of the same priority to run sequentially as is the case in Vanilla FreeRTOS. As demonstrated in the example above, a core may need to skip over tasks.
• However, given enough ticks, a task will eventually be given some processing time.
• If a core cannot find a task runnable task at the highest ready-state priority, it will drop to a lower priority to search for tasks.
• To achieve ideal round-robin time slicing, users should ensure that all tasks of a particular priority are pinned to the same core.

Tick Interrupts  Vanilla FreeRTOS requires that a periodic tick interrupt occurs. The tick interrupt is responsible for:

• Incrementing the scheduler’s tick count
• Unblocking any blocked tasks that have timed out
• Checking if time slicing is required, i.e., triggering a context switch
• Executing the application tick hook

In ESP-IDF FreeRTOS, each core receives a periodic interrupt and independently runs the tick interrupt. The tick interrupts on each core are of the same period but can be out of phase. However, the tick responsibilities listed above are not run by all cores:

• CPU0 executes all of the tick interrupt responsibilities listed above
• CPU1 only checks for time slicing and executes the application tick hook

Note: CPU0 is solely responsible for keeping time in ESP-IDF FreeRTOS. Therefore, anything that prevents CPU0 from incrementing the tick count, such as suspending the scheduler on CPU0, will cause the entire scheduler’s
timekeeping to lag behind.

**Idle Tasks**  Vanilla FreeRTOS will implicitly create an idle task of priority 0 when the scheduler is started. The idle task runs when no other task is ready to run, and it has the following responsibilities:

- Freeing the memory of deleted tasks
- Executing the application idle hook

In ESP-IDF FreeRTOS, a separate pinned idle task is created for each core. The idle tasks on each core have the same responsibilities as their vanilla counterparts.

**Scheduler Suspension**  Vanilla FreeRTOS allows the scheduler to be suspended/resumed by calling `vTaskSuspendAll()` and `xTaskResumeAll()` respectively. While the scheduler is suspended:

- Task switching is disabled but interrupts are left enabled.
- Calling any blocking/yielding function is forbidden, and time slicing is disabled.
- The tick count is frozen, but the tick interrupt still occurs to execute the application tick hook.

On scheduler resumption, `xTaskResumeAll()` catches up all of the lost ticks and unblock any timed-out tasks.

In ESP-IDF FreeRTOS, suspending the scheduler across multiple cores is not possible. Therefore when `vTaskSuspendAll()` is called on a particular core (e.g., core A):

- Task switching is disabled only on core A but interrupts for core A are left enabled.
- Calling any blocking/yielding function on core A is forbidden. Time slicing is disabled on core A.
- If an interrupt on core A unblocks any tasks, tasks with affinity to core A will go into core A’s own pending ready task list. Unpinned tasks or tasks with affinity to other cores can be scheduled on cores with the scheduler running.
- If the scheduler is suspended on all cores, tasks unblocked by an interrupt will be directed to the pending ready task lists of their pinned cores. For unpinned tasks, they will be placed in the pending ready list of the core where the interrupt occurred.
- If core A is CPU0, the tick count is frozen, and a pended tick count is incremented instead. However, the tick interrupt will still occur in order to execute the application tick hook.

When `xTaskResumeAll()` is called on a particular core (e.g., core A):

- Any tasks added to core A’s pending ready task list will be resumed.
- If core A is CPU0, the pended tick count is unwound to catch up with the lost ticks.

**Warning:** Given that scheduler suspension on ESP-IDF FreeRTOS only suspends scheduling on a particular core, scheduler suspension is **NOT** a valid method ensuring mutual exclusion between tasks when accessing shared data. Users should use proper locking primitives such as mutexes or spinlocks if they require mutual exclusion.

**Disabling Interrupts**  Vanilla FreeRTOS allows interrupts to be disabled and enabled by calling `taskDISABLE_INTERRUPTS` and `taskENABLE_INTERRUPTS` respectively.

ESP-IDF FreeRTOS provides the same API, however, interrupts are only disabled or enabled on the current core.

**Warning:** Disabling interrupts is a valid method of achieving mutual exclusion in Vanilla FreeRTOS (and single-core systems in general). However, in an SMP system, disabling interrupts is **NOT** a valid method ensuring mutual exclusion. Refer to Critical Sections for more details.

**Critical Sections**

**API Changes**  Vanilla FreeRTOS implements critical sections by disabling interrupts, which prevents preemptive context switches and the servicing of ISRs during a critical section. Thus a task_ISR that enters a critical section is
guaranteed to be the sole entity to access a shared resource. Critical sections in Vanilla FreeRTOS have the following API:

- `taskENTER_CRITICAL()` enters a critical section by disabling interrupts
- `taskEXIT_CRITICAL()` exits a critical section by reenabling interrupts
- `taskENTER_CRITICAL_FROM_ISR()` enters a critical section from an ISR by disabling interrupt nesting
- `taskEXIT_CRITICAL_FROM_ISR()` exits a critical section from an ISR by reenabling interrupt nesting

However, in an SMP system, merely disabling interrupts does not constitute a critical section as the presence of other cores means that a shared resource can still be concurrently accessed. Therefore, critical sections in ESP-IDF FreeRTOS are implemented using spinlocks. To accommodate the spinlocks, the ESP-IDF FreeRTOS critical section APIs contain an additional spinlock parameter as shown below:

- Spinlocks are of `portMUX_TYPE` (**not to be confused to FreeRTOS mutexes**)
- `taskENTER_CRITICAL(&spinlock)` enters a critical section from a task context
- `taskEXIT_CRITICAL(&spinlock)` exits a critical section from a task context
- `taskENTER_CRITICAL_ISR(&spinlock)` enters a critical section from an interrupt context
- `taskEXIT_CRITICAL_ISR(&spinlock)` exits a critical section from an interrupt context

**Note:** The critical section API can be called recursively, i.e., nested critical sections. Entering a critical section multiple times recursively is valid so long as the critical section is exited the same number of times it was entered. However, given that critical sections can target different spinlocks, users should take care to avoid deadlocking when entering critical sections recursively.

Spinlocks can be allocated statically or dynamically. As such, macros are provided for both static and dynamic initialization of spinlocks, as demonstrated by the following code snippets.

- Allocating a static spinlock and initializing it using `portMUX_INITIALIZER_UNLOCKED`:

```c
// Statically allocate and initialize the spinlock
static portMUX_TYPE my_spinlock = portMUX_INITIALIZER_UNLOCKED;

void some_function(void)
{
    taskENTER_CRITICAL(&my_spinlock);
    // We are now in a critical section
    taskEXIT_CRITICAL(&my_spinlock);
}
```

- Allocating a dynamic spinlock and initializing it using `portMUX_INITIALIZE()`:

```c
// Allocate the spinlock dynamically
portMUX_TYPE *my_spinlock = malloc(sizeof(portMUX_TYPE));
// Initialize the spinlock dynamically
portMUX_INITIALIZE(my_spinlock);
...

taskENTER_CRITICAL(my_spinlock);
// Access the resource
taskEXIT_CRITICAL(my_spinlock);
```

**Implementation** In ESP-IDF FreeRTOS, the process of a particular core entering and exiting a critical section is as follows:

- For `taskENTER_CRITICAL(&spinlock)` or `taskENTER_CRITICAL_ISR(&spinlock)`
  1. The core disables its interrupts or interrupt nesting up to `configMAX_SYSCALL_INTERRUPT_PRIORITY`.
  2. The core then spins on the spinlock using an atomic compare-and-set instruction until it acquires the lock. A lock is acquired when the core is able to set the lock’s owner value to the core’s ID.
3. Once the spinlock is acquired, the function returns. The remainder of the critical section runs with
interrupts or interrupt nesting disabled.

- For `taskEXIT_CRITICAL(&spinlock)` or `taskEXIT_CRITICAL_ISR(&spinlock)
  1. The core releases the spinlock by clearing the spinlock’s owner value.
  2. The core re-enables interrupts or interrupt nesting.

Restrictions and Considerations  Given that interrupts (or interrupt nesting) are disabled during a critical section,
there are multiple restrictions regarding what can be done within critical sections. During a critical section, users
should keep the following restrictions and considerations in mind:

- Critical sections should be kept as short as possible
  - The longer the critical section lasts, the longer a pending interrupt can be delayed.
  - A typical critical section should only access a few data structures and/or hardware registers.
  - If possible, defer as much processing and/or event handling to the outside of critical sections.
- FreeRTOS API should not be called from within a critical section
- Users should never call any blocking or yielding functions within a critical section

Misc

Floating Point Usage  Usually, when a context switch occurs:

- the current state of a CPU’s registers is saved to the stack of the task being switched out
- the previously saved state of the CPU’s registers is loaded from the stack of the task being switched in

However, ESP-IDF FreeRTOS implements Lazy Context Switching for the Floating Point Unit (FPU) registers of a
CPU. In other words, when a context switch occurs on a particular core (e.g., CPU0), the state of the core’s FPU
registers is not immediately saved to the stack of the task getting switched out (e.g., Task A). The FPU registers are
left untouched until:

- A different task (e.g., Task B) runs on the same core and uses FPU. This will trigger an exception that saves
  the FPU registers to Task A’s stack.
- Task A gets scheduled to the same core and continues execution. Saving and restoring the FPU registers is not
  necessary in this case.

However, given that tasks can be unpinned and thus can be scheduled on different cores (e.g., Task A switches to
CPU1), it is unfeasible to copy and restore the FPU registers across cores. Therefore, when a task utilizes FPU by
using a `float` type in its call flow, ESP-IDF FreeRTOS will automatically pin the task to the current core it is
running on. This ensures that all tasks that use FPU are always pinned to a particular core.

Furthermore, ESP-IDF FreeRTOS by default does not support the usage of FPU within an interrupt context given
that the FPU register state is tied to a particular task.

Note:  ESP targets that contain an FPU do not support hardware acceleration for double precision floating point
arithmetic (double). Instead, `double` is implemented via software, hence the behavioral restrictions regarding
the `float` type do not apply to `double`. Note that due to the lack of hardware acceleration, `double` operations
may consume significantly more CPU time in comparison to `float`.

ESP-IDF FreeRTOS Single Core  Although ESP-IDF FreeRTOS is an SMP scheduler, some ESP targets are
single-core (such as ESP32-S2 and ESP32-C3). When building ESP-IDF applications for these targets, ESP-IDF
FreeRTOS is still used but the number of cores will be set to 1 (i.e., the `CONFIG_FREERTOS_UNICORE` will always
be enabled for single-core targets).

For multicore targets (such as ESP32 and ESP32-S3), `CONFIG_FREERTOS_UNICORE` can also be set. This results in
ESP-IDF FreeRTOS only running on CPU0, and all other cores will be inactive.

Note:  Users should bear in mind that enabling `CONFIG_FREERTOS_UNICORE` is NOT equivalent to running
Vanilla FreeRTOS. The additional APIs of ESP-IDF FreeRTOS can still be called, and the behavior changes of
ESP-IDF FreeRTOS incur a small amount of overhead even when compiled for only a single core.

API Reference

This section introduces FreeRTOS types, functions, and macros. It is automatically generated from FreeRTOS header files.

Task API

Header File

- components/freertos/FreeRTOS-Kernel/include/freertos/task.h
- This header file can be included with:

```c
#include "freertos/task.h"
```

Functions

static inline BaseType_t xTaskCreate(TaskFunction_t pxTaskCode, const char*const pcName, const configSTACK_DEPTH_TYPE usStackDepth, void*const pvParameters, UBaseType_t uxPriority, TaskHandle_t*const pxCreatedTask)

Create a new task and add it to the list of tasks that are ready to run.

Internally, within the FreeRTOS implementation, tasks use two blocks of memory. The first block is used to hold the task’s data structures. The second block is used by the task as its stack. If a task is created using xTaskCreate() then both blocks of memory are automatically dynamically allocated inside the xTaskCreate() function. (see https://www.FreeRTOS.org/a00111.html). If a task is created using xTaskCreateStatic() then the application writer must provide the required memory. xTaskCreateStatic() therefore allows a task to be created without using any dynamic memory allocation.

See xTaskCreateStatic() for a version that does not use any dynamic memory allocation.

xTaskCreate() can only be used to create a task that has unrestricted access to the entire microcontroller memory map. Systems that include MPU support can alternatively create an MPU constrained task using xTaskCreateRestricted().

Example usage:

```c
// Task to be created.
void vTaskCode( void * pvParameters )
{
    for( ;; )
    {
        // Task code goes here.
    }
}

// Function that creates a task.
void vOtherFunction( void )
{
    static uint8_t ucParameterToPass;
    TaskHandle_t xHandle = NULL;

    // Create the task, storing the handle. Note that the passed parameter ucParameterToPass
    // must exist for the lifetime of the task, so in this case is declared static. If it was just an
    // (continues on next page)
```
// an automatic stack variable it might no longer exist, or at least have been corrupted, by the time the new task attempts to access it.
xTaskCreate( vTaskCode, "NAME", STACK_SIZE, &ucParameterToPass, tskIDLE_PRIORITY, &xHandle );
configASSERT( xHandle );

// Use the handle to delete the task.
if( xHandle != NULL )
{
    vTaskDelete( xHandle );
}

Note: If configNUMBER_OF_CORES > 1, this function will create an unpinned task (see tskNO_AFFINITY for more details).

Note: If program uses thread local variables (ones specified with "__thread” keyword) then storage for them will be allocated on the task’s stack.

Parameters

• pxTaskCode - Pointer to the task entry function. Tasks must be implemented to never return (i.e. continuous loop).
• pcName - A descriptive name for the task. This is mainly used to facilitate debugging. Max length defined by configMAX_TASK_NAME_LEN - default is 16.
• usStackDepth - The size of the task stack specified as the NUMBER OF BYTES. Note that this differs from vanilla FreeRTOS.
• pvParameters - Pointer that will be used as the parameter for the task being created.
• uxPriority - The priority at which the task should run. Systems that include MPU support can optionally create tasks in a privileged (system) mode by setting bit portPRIVILEGE_BIT of the priority parameter. For example, to create a privileged task at priority 2 the uxPriority parameter should be set to (2 | portPRIVILEGE_BIT).
• pxCreatedTask - Used to pass back a handle by which the created task can be referenced.

Returns pdPASS if the task was successfully created and added to a ready list, otherwise an error code defined in the file projdefs.h

static inline TaskHandle_t xTaskCreateStatic(TaskFunction_t pxTaskCode, const char *const pcName, const uint32_t ulStackDepth, void *const pvParameters, UBaseType_t uxPriority, StackType_t *const puxStackBuffer, StaticTask_t *const pxTaskBuffer) Create a new task and add it to the list of tasks that are ready to run.

Internally, within the FreeRTOS implementation, tasks use two blocks of memory. The first block is used to hold the task’s data structures. The second block is used by the task as its stack. If a task is created using xTaskCreate() then both blocks of memory are automatically dynamically allocated inside the xTaskCreate() function. (see https://www.FreeRTOS.org/a00111.html). If a task is created using xTaskCreateStatic() then the application writer must provide the required memory. xTaskCreateStatic() therefore allows a task to be created without using any dynamic memory allocation.

Example usage:
// Dimensions of the buffer that the task being created will use as its stack.
// NOTE: This is the number of words the stack will hold, not the number of bytes. For example, if each stack item is 32-bits, and this is set to 100,
// then 400 bytes (100 * 32-bits) will be allocated.
#define STACK_SIZE 200

// Structure that will hold the TCB of the task being created.
StaticTask_t xTaskBuffer;

// Buffer that the task being created will use as its stack. Note this is an array of StackType_t variables. The size of StackType_t is dependent on the RTOS port.
StackType_t xStack[STACK_SIZE];

// Function that implements the task being created.
void vTaskCode( void * pvParameters )
{
    // The parameter value is expected to be 1 as 1 is passed in the call to xTaskCreateStatic().
    configASSERT( ( uint32_t ) pvParameters == 1UL );

    for( ;; )
    {
        // Task code goes here.
    }
}

// Function that creates a task.
void vOtherFunction( void )
{
    TaskHandle_t xHandle = NULL;

    // Create the task without using any dynamic memory allocation.
    xHandle = xTaskCreateStatic( vTaskCode, // Function that implements the task.
                                  "NAME", // Text name for the task.
                                  STACK_SIZE, // Stack size in words, not bytes.
                                  ( void * ) 1, // Parameter passed into the task.
                                  tskIDLE_PRIORITY, // Priority at which the task is created.
                                  &xStack, // Array to use as the task's stack.
                                  &xTaskBuffer ); // Variable to hold the task's data structure.

    // pxStackBuffer and pxTaskBuffer were not NULL, so the task will have been created, and xHandle will be the task's handle. Use the handle to suspend the task.
    vTaskSuspend( xHandle );
}

Note: If configNUMBER_OF_CORES > 1, this function will create an unpinned task (see tskNO_AFFINITY for more details).

Note: If program uses thread local variables (ones specified with "__thread" keyword) then storage for them will be allocated on the task’s stack.
Parameters

- **pxTaskCode** – Pointer to the task entry function. Tasks must be implemented to never return (i.e. continuous loop).
- **pcName** – A descriptive name for the task. This is mainly used to facilitate debugging. The maximum length of the string is defined by configMAX_TASK_NAME_LEN in FreeRTOSConfig.h.
- **ulStackDepth** – The size of the task stack specified as the NUMBER OF BYTES. Note that this differs from vanilla FreeRTOS.
- **pvParameters** – Pointer that will be used as the parameter for the task being created.
- **uxPriority** – The priority at which the task will run.
- **puxStackBuffer** – Must point to a StackType_t array that has at least ulStackDepth indexes - the array will then be used as the task’s stack, removing the need for the stack to be allocated dynamically.
- **pxTaskBuffer** – Must point to a variable of type StaticTask_t, which will then be used to hold the task’s data structures, removing the need for the memory to be allocated dynamically.

Returns

If neither puxStackBuffer nor pxTaskBuffer are NULL, then the task will be created and a handle to the created task is returned. If either puxStackBuffer or pxTaskBuffer are NULL then the task will not be created and NULL is returned.

```
void vTaskAllocateMPURegions ( TaskHandle_t xTask, const MemoryRegion_t *const pxRegions)
```

Memory regions are assigned to a restricted task when the task is created by a call to xTaskCreateRestricted(). These regions can be redefined using vTaskAllocateMPURegions().

Example usage:

```
// Define an array of MemoryRegion_t structures that configures an MPU region // allowing read/write access for 1024 bytes starting at the beginning of the // ucOneKByte array. The other two of the maximum 3 definable regions are // unused so set to zero.
static const MemoryRegion_t xAltRegions[ portNUM_CONFIGURABLE_REGIONS ] = {
    // Base address    Length   Parameters
    { ucOneKByte,     1024,    portMPU_REGION_READ_WRITE },
    { 0,              0,       0 },
    { 0,              0,       0 }
};

void vATask( void *pvParameters )
{
    // This task was created such that it has access to certain regions of // memory as defined by the MPU configuration. At some point it is // desired that these MPU regions are replaced with that defined in the // xAltRegions const struct above. Use a call to vTaskAllocateMPURegions() // for this purpose. NULL is used as the task handle to indicate that this // function should modify the MPU regions of the calling task.
    vTaskAllocateMPURegions( NULL, xAltRegions );

    // Now the task can continue its function, but from this point on can only // access its stack and the ucOneKByte array (unless any other statically // defined or shared regions have been declared elsewhere).
}
```

Parameters

- **xTask** – The handle of the task being updated.
- **pxRegions** – A pointer to a MemoryRegion_t structure that contains the new memory region definitions.
void vTaskDelete (TaskHandle_t xTaskToDelete)

INCLUDE_vTaskDelete must be defined as 1 for this function to be available. See the configuration section for more information.

Remove a task from the RTOS real time kernel’s management. The task being deleted will be removed from all ready, blocked, suspended and event lists.

NOTE: The idle task is responsible for freeing the kernel allocated memory from tasks that have been deleted. It is therefore important that the idle task is not starved of microcontroller processing time if your application makes any calls to vTaskDelete(). Memory allocated by the task code is not automatically freed, and should be freed before the task is deleted.

See the demo application file death.c for sample code that utilises vTaskDelete().

Example usage:

```c
void vOtherFunction( void )
{
    TaskHandle_t xHandle;

    // Create the task, storing the handle.
    xTaskCreate( vTaskCode, "NAME", STACK_SIZE, NULL, tskIDLE_PRIORITY, &xHandle );

    // Use the handle to delete the task.
    vTaskDelete( xHandle );
}
```

Parameters xTaskToDelete – The handle of the task to be deleted. Passing NULL will cause the calling task to be deleted.

void vTaskDelay (const TickType_t xTicksToDelay)

Delay a task for a given number of ticks. The actual time that the task remains blocked depends on the tick rate. The constant portTICK_PERIOD_MS can be used to calculate real time from the tick rate - with the resolution of one tick period.

INCLUDE_vTaskDelay must be defined as 1 for this function to be available. See the configuration section for more information.

vTaskDelay() specifies a time at which the task wishes to unblock relative to the time at which vTaskDelay() is called. For example, specifying a block period of 100 ticks will cause the task to unblock 100 ticks after vTaskDelay() is called. vTaskDelay() does not therefore provide a good method of controlling the frequency of a periodic task as the path taken through the code, as well as other task and interrupt activity, will affect the frequency at which vTaskDelay() gets called and therefore the time at which the task next executes. See xTaskDelayUntil() for an alternative API function designed to facilitate fixed frequency execution. It does this by specifying an absolute time (rather than a relative time) at which the calling task should unblock.

Example usage:

```c
void vTaskFunction( void * pvParameters )
{
    // Block for 500ms.
    const TickType_t xDelay = 500 / portTICK_PERIOD_MS;

    for( ;; )
        { // Simply toggle the LED every 500ms, blocking between each toggle.
            vToggleLED();
            vTaskDelay( xDelay );
        }
}
```
Parameters **xTicksToDelay** – The amount of time, in tick periods, that the calling task should block.

BaseType_t **xTaskDelayUntil** (TickType_t *const pxPreviousWakeTime, const TickType_t xTimeIncrement)

INCLUDE_xTaskDelayUntil must be defined as 1 for this function to be available. See the configuration section for more information.

Delay a task until a specified time. This function can be used by periodic tasks to ensure a constant execution frequency.

This function differs from **vTaskDelay** () in one important aspect: **vTaskDelay** () will cause a task to block for the specified number of ticks from the time **vTaskDelay** () is called. It is therefore difficult to use **vTaskDelay** () by itself to generate a fixed execution frequency as the time between a task starting to execute and that task calling **vTaskDelay** () may not be fixed [the task may take a different path though the code between calls, or may get interrupted or preempted a different number of times each time it executes].

Whereas **vTaskDelay** () specifies a wake time relative to the time at which the function is called, **xTaskDelayUntil** () specifies the absolute (exact) time at which it wishes to unblock.

The macro pdMS_TO_TICKS() can be used to calculate the number of ticks from a time specified in milliseconds with a resolution of one tick period.

Example usage:

```c
void vTaskFunction( void * pvParameters )
{
    TickType_t xLastWakeTime;
    const TickType_t xFrequency = 10;
    BaseType_t xWasDelayed;

    // Initialise the xLastWakeTime variable with the current time.
    xLastWakeTime = xTaskGetTickCount();
    for( ;; )
    {
        // Wait for the next cycle.
        xWasDelayed = xTaskDelayUntil( &xLastWakeTime, xFrequency );

        // Perform action here. xWasDelayed value can be used to determine
        // whether a deadline was missed if the code here took too long.
    }
}
```

Parameters

- **pxPreviousWakeTime** – Pointer to a variable that holds the time at which the task was last unblocked. The variable must be initialised with the current time prior to its first use (see the example below). Following this the variable is automatically updated within **xTaskDelayUntil** ()
- **xTimeIncrement** – The cycle time period. The task will be unblocked at time *pxPreviousWakeTime + xTimeIncrement*. Calling **xTaskDelayUntil** with the same **xTimeIncrement** parameter value will cause the task to execute with a fixed interface period.

Returns Value which can be used to check whether the task was actually delayed. Will be pdTRUE if the task was delayed and pdFALSE otherwise. A task will not be delayed if the next expected wake time is in the past.
Chapter 2. API Reference

BaseType_t xTaskAbortDelay(TaskHandle_t xTask)

INCLUDED_xTaskAbortDelay must be defined as 1 in FreeRTOSConfig.h for this function to be available.

A task will enter the Blocked state when it is waiting for an event. The event it is waiting for can be a temporal event (waiting for a time), such as when vTaskDelay() is called, or an event on an object, such as when xQueueReceive() or ulTaskNotifyTake() is called. If the handle of a task that is in the Blocked state is used in a call to xTaskAbortDelay() then the task will leave the Blocked state, and return from whichever function call placed the task into the Blocked state.

There is no ‘FromISR’ version of this function as an interrupt would need to know which object a task was blocked on in order to know which actions to take. For example, if the task was blocked on a queue the interrupt handler would then need to know if the queue was locked.

**Parameters**
- **xTask** - The handle of the task to remove from the Blocked state.

**Returns**
- If the task referenced by xTask was not in the Blocked state then pdFAIL is returned.
- Otherwise pdPASS is returned.

UBaseType_t uxTaskPriorityGet(const TaskHandle_t xTask)

INCLUDED_uxTaskPriorityGet must be defined as 1 for this function to be available. See the configuration section for more information.

Obtain the priority of any task.

Example usage:

```c
void vAFunction(void) {
    TaskHandle_t xHandle;

    // Create a task, storing the handle.
    xTaskCreate( vTaskCode, "NAME", STACK_SIZE, NULL, tskIDLE_PRIORITY, &xHandle );

    // ... 

    // Use the handle to obtain the priority of the created task.
    // It was created with tskIDLE_PRIORITY, but may have changed // it itself.
    if( uxTaskPriorityGet( xHandle ) != tskIDLE_PRIORITY ) {
        // The task has changed it's priority.
    }

    // ...

    // Is our priority higher than the created task?
    if( uxTaskPriorityGet( xHandle ) < uxTaskPriorityGet( NULL ) ) {
        // Our priority (obtained using NULL handle) is higher.
    }
}
```

**Parameters**
- **xTask** - Handle of the task to be queried. Passing a NULL handle results in the priority of the calling task being returned.

**Returns**
The priority of xTask.

UBaseType_t uxTaskPriorityGetFromISR(const TaskHandle_t xTask)

A version of uxTaskPriorityGet() that can be used from an ISR.
**eTaskState eTaskGetState (TaskHandle_t xTask)**

INCLUDE_eTaskGetState must be defined as 1 for this function to be available. See the configuration section for more information.

Obtain the state of any task. States are encoded by the eTaskState enumerated type.

**Parameters**
- **xTask** – Handle of the task to be queried.

**Returns**
The state of xTask at the time the function was called. Note the state of the task might change between the function being called, and the functions return value being tested by the calling task.

void **vTaskGetInfo (TaskHandle_t xTask, TaskStatus_t *pxTaskStatus, BaseType_t xGetFreeStackSpace, eTaskState eState)**

configUSE_TRACE_FACILITY must be defined as 1 for this function to be available. See the configuration section for more information.

Populates a TaskStatus_t structure with information about a task.

Example usage:

```c
void vAFunction( void )
{
    TaskHandle_t xHandle;
    TaskStatus_t xTaskDetails;

    // Obtain the handle of a task from its name.
    xHandle = xTaskGetHandle("Task_Name");

    // Check the handle is not NULL.
    configASSERT( xHandle );

    // Use the handle to obtain further information about the task.
    vTaskGetInfo( xHandle,
                 &xTaskDetails,
                 pdTRUE, // Include the high water mark in xTaskDetails.
                 eInvalid ); // Include the task state in xTaskDetails.
}
```

**Parameters**
- **xTask** – Handle of the task being queried. If xTask is NULL then information will be returned about the calling task.
- **pxTaskStatus** – A pointer to the TaskStatus_t structure that will be filled with information about the task referenced by the handle passed using the xTask parameter.
- **xGetFreeStackSpace** – The TaskStatus_t structure contains a member to report the stack high water mark of the task being queried. Calculating the stack high water mark takes a relatively long time, and can make the system temporarily unresponsive - so the xGetFreeStackSpace parameter is provided to allow the high water mark checking to be skipped. The high watermark value will only be written to the TaskStatus_t structure if xGetFreeStackSpace is not set to pdFALSE;
- **eState** – The TaskStatus_t structure contains a member to report the state of the task being queried. Obtaining the task state is not as fast as a simple assignment - so the eState parameter is provided to allow the state information to be omitted from the TaskStatus_t structure. To obtain state information then set eState to eInvalid - otherwise the value passed in eState will be reported as the task state in the TaskStatus_t structure.

void **vTaskPrioritySet (TaskHandle_t xTask, UBaseType_t uxNewPriority)**

INCLUDE_vTaskPrioritySet must be defined as 1 for this function to be available. See the configuration section for more information.

Set the priority of any task.
A context switch will occur before the function returns if the priority being set is higher than the currently executing task.

Example usage:

```c
void vAFunction( void )
{
    TaskHandle_t xHandle;

    // Create a task, storing the handle.
    xTaskCreate( vTaskCode, "NAME", STACK_SIZE, NULL, tskIDLE_PRIORITY, &xHandle, ...
                   );

    // ...

    // Use the handle to raise the priority of the created task.
    vTaskPrioritySet( xHandle, tskIDLE_PRIORITY + 1 );

    // ...

    // Use a NULL handle to raise our priority to the same value.
    vTaskPrioritySet( NULL, tskIDLE_PRIORITY + 1 );
}
```

**Parameters**

- `xTask` – Handle to the task for which the priority is being set. Passing a NULL handle results in the priority of the calling task being set.
- `uxNewPriority` – The priority to which the task will be set.

void `vTaskSuspend(TaskHandle_t xTaskToSuspend)`

INCLUDE `vTaskSuspend` must be defined as 1 for this function to be available. See the configuration section for more information.

Suspend any task. When suspended a task will never get any microcontroller processing time, no matter what its priority.

Calls to `vTaskSuspend` are not accumulative - i.e. calling `vTaskSuspend()` twice on the same task still only requires one call to `vTaskResume()` to ready the suspended task.

Example usage:

```c
void vAFunction( void )
{
    TaskHandle_t xHandle;

    // Create a task, storing the handle.
    xTaskCreate( vTaskCode, "NAME", STACK_SIZE, NULL, tskIDLE_PRIORITY, &xHandle, ...
                   );

    // ...

    // Use the handle to suspend the created task.
    vTaskSuspend( xHandle );

    // ...

    // The created task will not run during this period, unless
    // another task calls vTaskResume( xHandle ).
```

(continues on next page)
//...  

// Suspend ourselves.
void vTaskSuspend( NULL );

// We cannot get here unless another task calls vTaskResume
// with our handle as the parameter.
}

Parameters xTaskToSuspend – Handle to the task being suspended. Passing a NULL handle will cause the calling task to be suspended.

Example usage:

void vAFunction( void )
{
  TaskHandle_t xHandle;

  // Create a task, storing the handle.
  xTaskCreate( vTaskCode, "NAME", STACK_SIZE, NULL, tskIDLE_PRIORITY, &xHandle );

  //...

  // Use the handle to suspend the created task.
  vTaskSuspend( xHandle );

  //...

  // The created task will not run during this period, unless
  // another task calls vTaskResume( xHandle ).

  //...

  // Resume the suspended task ourselves.
  vTaskResume( xHandle );

  // The created task will once again get microcontroller processing
  // time in accordance with its priority within the system.
}

Parameters xTaskToResume – Handle to the task being readied.

BaseType_t xTaskResumeFromISR( TaskHandle_t xTaskToResume )

INCLUDE_xTaskResumeFromISR must be defined as 1 for this function to be available. See the configuration section for more information.

An implementation of vTaskResume() that can be called from within an ISR.
A task that has been suspended by one or more calls to vTaskSuspend() will be made available for running again by a single call to xTaskResumeFromISR().

xTaskResumeFromISR() should not be used to synchronise a task with an interrupt if there is a chance that the interrupt could arrive prior to the task being suspended - as this can lead to interrupts being missed. Use of a semaphore as a synchronisation mechanism would avoid this eventuality.

Parameters xTaskToResume – Handle to the task being readied.

Returns pdTRUE if resuming the task should result in a context switch, otherwise pdFALSE. This is used by the ISR to determine if a context switch may be required following the ISR.

void vTaskSuspendAll (void)

Suspends the scheduler without disabling interrupts. Context switches will not occur while the scheduler is suspended.

After calling vTaskSuspendAll() the calling task will continue to execute without risk of being swapped out until a call to xTaskResumeAll() has been made.

API functions that have the potential to cause a context switch (for example, xTaskDelayUntil(), xQueueSend(), etc.) must not be called while the scheduler is suspended.

Example usage:

```c
void vTask1( void * pvParameters )
{
    for(;;)
    {
        // Task code goes here.
        // ...
        // At some point the task wants to perform a long operation during
        // which it does not want to get swapped out. It cannot use
        // taskENTER_CRITICAL() / taskEXIT_CRITICAL() as the length of the
        // operation may cause interrupts to be missed - including the
        // ticks.
        // Prevent the real time kernel swapping out the task.
        vTaskSuspendAll();
        // Perform the operation here. There is no need to use critical
        // sections as we have all the microcontroller processing time.
        // During this time interrupts will still operate and the kernel
        // tick count will be maintained.
        // ...
        // The operation is complete. Restart the kernel.
        xTaskResumeAll();
    }
}
```

BaseType_t xTaskResumeAll (void)

Resumes scheduler activity after it was suspended by a call to vTaskSuspendAll().

xTaskResumeAll() only resumes the scheduler. It does not unsuspend tasks that were previously suspended by a call to vTaskSuspend().

Example usage:

```c
void vTask1( void * pvParameters )
{
    (continues on next page)
```
for(;; )
{
    // Task code goes here.
    // ...
    // At some point the task wants to perform a long operation during
    // which it does not want to get swapped out. It cannot use
    // taskENTER_CRITICAL()/taskEXIT_CRITICAL() as the length of the
    // operation may cause interrupts to be missed - including the
    // ticks.
    // Prevent the real time kernel swapping out the task.
    vTaskSuspendAll();

    // Perform the operation here. There is no need to use critical
    // sections as we have all the microcontroller processing time.
    // During this time interrupts will still operate and the real
    // time kernel tick count will be maintained.
    // ...

    // The operation is complete. Restart the kernel. We want to force
    // a context switch - but there is no point if resuming the scheduler
    // caused a context switch already.
    if( !xTaskResumeAll() )
    {
        taskYIELD();
    }
}

**Returns** If resuming the scheduler caused a context switch then pdTRUE is returned, otherwise
pdFALSE is returned.

**TickType_t xTaskGetTickCount (void)**

**Returns** The count of ticks since vTaskStartScheduler was called.

**TickType_t xTaskGetTickCountFromISR (void)**

This is a version of xTaskGetTickCount() that is safe to be called from an ISR - provided that TickType_t is
the natural word size of the microcontroller being used or interrupt nesting is either not supported or not being
used.

**Returns** The count of ticks since vTaskStartScheduler was called.

**UBaseType_t uxTaskGetNumberOfTasks (void)**

**Returns** The number of tasks that the real time kernel is currently managing. This includes all
ready, blocked and suspended tasks. A task that has been deleted but not yet freed by the idle
task will also be included in the count.

**char *pcTaskGetName (TaskHandle_t xTaskToQuery)**

**Returns** The text (human readable) name of the task referenced by the handle xTaskToQuery. A
task can query its own name by either passing in its own handle, or by setting xTaskToQuery
to NULL.

**TaskHandle_t xTaskGetHandle (const char *pcNameToQuery)**

**NOTE:** This function takes a relatively long time to complete and should be used sparingly.
Returns  The handle of the task that has the human readable name pcNameToQuery. NULL is returned if no matching name is found. INCLUDE_xTaskGetHandle must be set to 1 in FreeRTOSConfig.h for pcTaskGetHandle() to be available.

BaseType_t xTaskGetStaticBuffers (TaskHandle_t xTask, StackType_t **ppuxStackBuffer, StaticTask_t **ppxTaskBuffer)

Retrieve pointers to a statically created task’s data structure buffer and stack buffer. These are the same buffers that are supplied at the time of creation.

Parameters
• xTask – The task for which to retrieve the buffers.
• ppuxStackBuffer – Used to return a pointer to the task’s stack buffer.
• ppxTaskBuffer – Used to return a pointer to the task’s data structure buffer.

Returns  pdTRUE if buffers were retrieved, pdFALSE otherwise.

UBaseType_t uxTaskGetStackHighWaterMark (TaskHandle_t xTask)

Returns the high water mark of the stack associated with xTask. That is, the minimum free stack space there has been (in words, so on a 32 bit machine a value of 1 means 4 bytes) since the task started. The smaller the returned number the closer the task has come to overflowing its stack.

uxTaskGetStackHighWaterMark() and uxTaskGetStackHighWaterMark2() are the same except for their return type. Using configSTACK_DEPTH_TYPE allows the user to determine the return type. It gets around the problem of the value overflowing on 8-bit types without breaking backward compatibility for applications that expect an 8-bit return type.

Parameters  xTask – Handle of the task associated with the stack to be checked. Set xTask to NULL to check the stack of the calling task.

Returns  The smallest amount of free stack space there has been (in words, so actual spaces on the stack rather than bytes) since the task referenced by xTask was created.

configSTACK_DEPTH_TYPE uxTaskGetStackHighWaterMark2 (TaskHandle_t xTask)

Returns the high water mark of the stack associated with xTask. That is, the minimum free stack space there has been (in words, so on a 32 bit machine a value of 1 means 4 bytes) since the task started. The smaller the returned number the closer the task has come to overflowing its stack.

uxTaskGetStackHighWaterMark() and uxTaskGetStackHighWaterMark2() are the same except for their return type. Using configSTACK_DEPTH_TYPE allows the user to determine the return type. It gets around the problem of the value overflowing on 8-bit types without breaking backward compatibility for applications that expect an 8-bit return type.

Parameters  xTask – Handle of the task associated with the stack to be checked. Set xTask to NULL to check the stack of the calling task.

Returns  The smallest amount of free stack space there has been (in words, so actual spaces on the stack rather than bytes) since the task referenced by xTask was created.

void vTaskSetApplicationTaskTag (TaskHandle_t xTask, TaskHookFunction_t pxHookFunction)

Sets pxHookFunction to be the task hook function used by the task xTask. Passing xTask as NULL has the effect of setting the calling tasks hook function.

TaskHookFunction_t xTaskGetApplicationTaskTag (TaskHandle_t xTask)

Returns the pxHookFunction value assigned to the task xTask. Do not call from an interrupt service routine - call xTaskGetApplicationTaskTagFromISR() instead.

TaskHookFunction_t xTaskGetApplicationTaskTagFromISR (TaskHandle_t xTask)

Returns the pxHookFunction value assigned to the task xTask. Can be called from an interrupt service routine.
void **vTaskGetThreadLocalStoragePointer (TaskHandle_t xTaskToQuery, BaseType_t xIndex)

This function is used to provide a statically allocated block of memory to FreeRTOS to hold the Idle Task TCB. This function is required when configSUPPORT_STATIC_ALLOCATION is set. For more information see this URI: https://www.FreeRTOS.org/a00110.html#configSUPPORT_STATIC_ALLOCATION

Parameters
- **ppxIdleTaskTCBBuffer** – A handle to a statically allocated TCB buffer
- **ppxIdleTaskStackBuffer** – A handle to a statically allocated Stack buffer for the idle task
- **pulIdleTaskStackSize** – A pointer to the number of elements that will fit in the allocated stack buffer

Example usage:

```c
void vTaskGetRunTimeStats (char *pcWriteBuffer)
{
    TaskStatus_t *pxTaskStatusArray;
    volatile BaseType_t uxArraySize, x;
    configRUN_TIME_COUNTER_TYPE ulTotalRunTime, ulStatsAsPercentage;

    (continues on next page)
```
// Make sure the write buffer does not contain a string.
pxWriteBuffer = 0x00;

// Take a snapshot of the number of tasks in case it changes while this
// function is executing.
uxArraySize = uxTaskGetNumberOfTasks();

// Allocate a TaskStatus_t structure for each task. An array could be
// allocated statically at compile time.
pxTaskStatusArray = pvPortMalloc( uxArraySize * sizeof( TaskStatus_t ) );

if( pxTaskStatusArray != NULL )
{
    // Generate raw status information about each task.
    uxArraySize = uxTaskGetSystemState( pxTaskStatusArray, uxArraySize, &ulTotalRunTime );

    // For percentage calculations.
    ulTotalRunTime /= 100UL;

    // Avoid divide by zero errors.
    if( ulTotalRunTime > 0 )
    {
        // For each populated position in the pxTaskStatusArray array,
        // format the raw data as human readable ASCII data
        for( x = 0; x < uxArraySize; x++ )
        {
            // What percentage of the total run time has the task used?
            // This will always be rounded down to the nearest integer.
            // ulTotalRunTimeDiv100 has already been divided by 100.
            ulStatsAsPercentage = pxTaskStatusArray[ x ].ulRunTimeCounter / ulTotalRunTime;

            if( ulStatsAsPercentage > 0UL )
            {
                sprintf( pcWriteBuffer, "%s\t%lu\t%lu%%%r\n",...
                        pxTaskStatusArray[ x ].pcTaskName, pxTaskStatusArray[ x ].ulRunTimeCounter,
                        ulStatsAsPercentage );
            }
            else
            {
                // If the percentage is zero here then the task has
                // consumed less than 1% of the total run time.
                sprintf( pcWriteBuffer, "%s\t%lu\t<1%%%r\n",...
                        pxTaskStatusArray[ x ].pcTaskName, pxTaskStatusArray[ x ].ulRunTimeCounter );
            }

            pcWriteBuffer += strlen( (char *) pcWriteBuffer );
        }
    }
    pcWriteBuffer += strlen(pvPortFree( pxTaskStatusArray ));
}

Parameters
- **pxTaskStatusArray** A pointer to an array of TaskStatus_t structures. The array
must contain at least one TaskStatus_t structure for each task that is under the control of
the RTOS. The number of tasks under the control of the RTOS can be determined using the
uxTaskGetNumberOfTasks() API function.
• **uxArraySize** - The size of the array pointed to by the pxTaskStatusArray parameter. The size is specified as the number of indexes in the array, or the number of TaskStatus_t structures contained in the array, not by the number of bytes in the array.

• **pulTotalRunTime** - If configGENERATE_RUN_TIME_STATS is set to 1 in FreeRTOSConfig.h then *pulTotalRunTime is set by uxTaskGetSystemState() to the total run time (as defined by the run time stats clock, see [https://www.FreeRTOS.org/rtos-run-time-stats.html](https://www.FreeRTOS.org/rtos-run-time-stats.html)) since the target booted. pulTotalRunTime can be set to NULL to omit the total run time information.

**Returns** The number of TaskStatus_t structures that were populated by uxTaskGetSystemState(). This should equal the number returned by the uxTaskGetNumberOfTasks() API function, but will be zero if the value passed in the uxArraySize parameter was too small.

```c
void vTaskList (char *pcWriteBuffer)
```

configUSE_TRACE_FACILITY and configUSE_STATS_FORMATTING_FUNCTIONS must both be defined as 1 for this function to be available. See the configuration section of the FreeRTOS.org website for more information.

**NOTE 1:** This function will disable interrupts for its duration. It is not intended for normal application runtime use but as a debug aid.

Lists all the current tasks, along with their current state and stack usage high water mark. Tasks are reported as blocked (‘B’), ready (‘R’), deleted (‘D’) or suspended (‘S’).

**PLEASE NOTE:**

This function is provided for convenience only, and is used by many of the demo applications. Do not consider it to be part of the scheduler.

vTaskList() calls uxTaskGetSystemState(), then formats part of the uxTaskGetSystemState() output into a human readable table that displays task: names, states, priority, stack usage and task number. Stack usage specified as the number of unused StackType_t words stack can hold on top of stack - not the number of bytes.

vTaskList() has a dependency on the sprintf() C library function that might bloat the code size, use a lot of stack, and provide different results on different platforms. An alternative, tiny, third party, and limited functionality implementation of sprintf() is provided in many of the FreeRTOS/Demo sub-directories in a file called printf-stdarg.c (note printf-stdarg.c does not provide a full snprintf() implementation!).

It is recommended that production systems call uxTaskGetSystemState() directly to get access to raw stats data, rather than indirectly through a call to vTaskList().

**Parameters** **pcWriteBuffer** — A buffer into which the above mentioned details will be written, in ASCII form. This buffer is assumed to be large enough to contain the generated report. Approximately 40 bytes per task should be sufficient.

```c
void vTaskGetRunTimeStats (char *pcWriteBuffer)
```

configGENERATE_RUN_TIME_STATS and configUSE_STATS_FORMATTING_FUNCTIONS must both be defined as 1 for this function to be available. The application must also then provide definitions for portCONFIGURE_TIMER_FOR_RUN_TIME_STATS() and portGET_RUN_TIME_COUNTER_VALUE() to configure a peripheral timer/counter and return the timer's current count value respectively. The counter should be at least 10 times the frequency of the tick count.

**NOTE 1:** This function will disable interrupts for its duration. It is not intended for normal application runtime use but as a debug aid.

Setting configGENERATE_RUN_TIME_STATS to 1 will result in a total accumulated execution time being stored for each task. The resolution of the accumulated time value depends on the frequency of the timer configured by the portCONFIGURE_TIMER_FOR_RUN_TIME_STATS() macro. Calling vTaskGetRunTimeStats() writes the total execution time of each task into a buffer, both as an absolute count value and as a percentage of the total system execution time.

**NOTE 2:**

This function is provided for convenience only, and is used by many of the demo applications. Do not consider it to be part of the scheduler.
vTaskGetRunTimeStats() calls uxTaskGetSystemState(), then formats part of the uxTaskGetSystemState() output into a human readable table that displays the amount of time each task has spent in the Running state in both absolute and percentage terms.

vTaskGetRunTimeStats() has a dependency on the sprintf() C library function that might bloat the code size, use a lot of stack, and provide different results on different platforms. An alternative, tiny, third party, and limited functionality implementation of sprintf() is provided in many of the FreeRTOS/Demo sub-directories in a file called printf-stdarg.c (note printf-stdarg.c does not provide a full snprintf() implementation!).

It is recommended that production systems call uxTaskGetSystemState() directly to get access to raw stats data, rather than indirectly through a call to vTaskGetRunTimeStats().

**Parameters**

- **pcWriteBuffer** — A buffer into which the execution times will be written, in ASCII form. This buffer is assumed to be large enough to contain the generated report. Approximately 40 bytes per task should be sufficient.

**configRUN_TIME_COUNTER_TYPE ulTaskGetIdleRunTimeCounter (void)**

The total run time of the idle task or the percentage of the total run time consumed by the idle task. This is the amount of time the idle task has actually been executing. The unit of time is dependent on the frequency configured using the portCONFIGURE_TIMER_FOR_RUN_TIME_STATS() and portGET_RUN_TIME_COUNTER_VALUE() macros. While uxTaskGetSystemState() and vTaskGetRunTimeStats() writes the total execution time of each task into a buffer, ulTaskGetIdleRunTimeCounter() returns the total execution time of just the idle task and ulTaskGetIdleRunTimePercent() returns the percentage of the CPU time used by just the idle task.

Note the amount of idle time is only a good measure of the slack time in a system if there are no other tasks executing at the idle priority, tickless idle is not used, and configIDLE_SHOULD_YIELD is set to 0.

**Note:** If configNUMBER_OF_CORES > 1, calling this function will query the idle task of the current core.

**Returns**

The total run time of the idle task or the percentage of the total run time consumed by the idle task. This is the amount of time the idle task has actually been executing. The unit of time is dependent on the frequency configured using the portCONFIGURE_TIMER_FOR_RUN_TIME_STATS() and portGET_RUN_TIME_COUNTER_VALUE() macros.

**configRUN_TIME_COUNTER_TYPE ulTaskGetIdleRunTimePercent (void)**

Wait for a direct to task notification to be pending at a given index within an array of direct to task notifications.

Each task has a private array of “notification values” (or ‘notifications’), each of which is a 32-bit unsigned integer (uint32_t). The constant configTASK-notification-ARRAY_ENTRIES sets the number of indexes in the array, and (for backward compatibility) defaults to 1 if left undefined. Prior to FreeRTOS V10.4.0 there was only one notification value per task.

Events can be sent to a task using an intermediary object. Examples of such objects are queues, semaphores, mutexes and event groups. Task notifications are a method of sending an event directly to a task without the need for such an intermediary object.
A notification sent to a task can optionally perform an action, such as update, overwrite or increment one of the task’s notification values. In that way task notifications can be used to send data to a task, or be used as light weight and fast binary or counting semaphores.

A notification sent to a task will remain pending until it is cleared by the task calling xTaskNotifyWaitIndexed() or ulTaskNotifyTakeIndexed() (or their un-indexed equivalents). If the task was already in the Blocked state to wait for a notification when the notification arrives then the task will automatically be removed from the Blocked state (unblocked) and the notification cleared.

A task can use xTaskNotifyWaitIndexed() to [optionally] block to wait for a notification to be pending, or ulTaskNotifyTakeIndexed() to [optionally] block to wait for a notification value to have a non-zero value. The task does not consume any CPU time while it is in the Blocked state.

**NOTE** Each notification within the array operates independently - a task can only block on one notification within the array at a time and will not be unblocked by a notification sent to any other array index.

Backward compatibility information: Prior to FreeRTOS V10.4.0 each task had a single “notification value”, and all task notification API functions operated on that value. Replacing the single notification value with an array of notification values necessitated a new set of API functions that could address specific notifications within the array. xTaskNotifyWait() is the original API function, and remains backward compatible by always operating on the notification value at index 0 in the array. Calling xTaskNotifyWait() is equivalent to calling xTaskNotifyWaitIndexed() with the uxIndexToWaitOn parameter set to 0.

**Parameters**

- **uxIndexToWaitOn** - The index within the calling task’s array of notification values on which the calling task will wait for a notification to be received. uxIndexToWaitOn must be less than configTASK_NOTIFICATION_ARRAY_ENTRIES. xTaskNotifyWait() does not have this parameter and always waits for notifications on index 0.
- **ulBitsToClearOnEntry** - Bits that are set in ulBitsToClearOnEntry value will be cleared in the calling task’s notification value before the task checks to see if any notifications are pending, and optionally blocks if no notifications are pending. Setting ulBitsToClearOnEntry to ULONG_MAX (if limits.h is included) or 0xffffffffUL (if limits.h is not included) will have the effect of resetting the task’s notification value to 0. Setting ulBitsToClearOnEntry to 0 will leave the task’s notification value unchanged.
- **ulBitsToClearOnExit** - If a notification is pending or received before the calling task exits the xTaskNotifyWait() function then the task’s notification value (see the xTaskNotify() API function) is passed out using the pulNotificationValue parameter. Then any bits that are set in ulBitsToClearOnExit will be cleared in the task’s notification value (note *pulNotificationValue is set before any bits are cleared). Setting ulBitsToClearOnExit to ULONG_MAX (if limits.h is included) or 0xffffffffUL (if limits.h is not included) will have the effect of resetting the task’s notification value to 0 before the function exits. Setting ulBitsToClearOnExit to 0 will leave the task’s notification value unchanged when the function exits (in which case the value passed out in pulNotificationValue will match the task’s notification value).
- **pulNotificationValue** - Used to pass the task’s notification value out of the function. Note the value passed out will not be effected by the clearing of any bits caused by ulBitsToClearOnExit being non-zero.
- **xTicksToWait** - The maximum amount of time that the task should wait in the Blocked state for a notification to be received, should a notification not already be pending when xTaskNotifyWait() was called. The task will not consume any processing time while it is in the Blocked state. This is specified in kernel ticks, the macro pdMS_TO_TICKS( value_in_ms ) can be used to convert a time specified in milliseconds to a time specified in ticks.

**Returns** If a notification was received (including notifications that were already pending when xTaskNotifyWait was called) then pdPASS is returned. Otherwise pdFAIL is returned.

```c
void vTaskGenericNotifyGiveFromISR( TaskHandle_t xTaskToNotify, UBaseType_t uxIndexToNotify, BaseType_t *pxHigherPriorityTaskWoken )
```

A version of xTaskNotifyGiveIndexed() that can be called from an interrupt service routine (ISR).

Chapter 2. API Reference

configUSE_TASK_NOTIFICATIONS must be undefined or defined as 1 for this macro to be available.

Each task has a private array of “notification values” (or ‘notifications’), each of which is a 32-bit unsigned integer (uint32_t). The constant configTASK_NOTIFICATION_ARRAY_ENTRIES sets the number of indexes in the array, and (for backward compatibility) defaults to 1 if left undefined. Prior to FreeRTOS V10.4.0 there was only one notification value per task.

Events can be sent to a task using an intermediary object. Examples of such objects are queues, semaphores, mutexes and event groups. Task notifications are a method of sending an event directly to a task without the need for such an intermediary object.

A notification sent to a task can optionally perform an action, such as update, overwrite or increment one of the task’s notification values. In that way task notifications can be used to send data to a task, or be used as light weight and fast binary or counting semaphores.

vTaskNotifyGiveIndexedFromISR() is intended for use when task notifications are used as light weight and faster binary or counting semaphore equivalents. Actual FreeRTOS semaphores are given from an ISR using the xSemaphoreGiveFromISR() API function, the equivalent action that instead uses a task notification is vTaskNotifyGiveIndexedFromISR().

When task notifications are being used as a binary or counting semaphore equivalent then the task being notified should wait for the notification using the uTaskNotifyTakeIndexed() API function rather than the xTaskNotifyWaitIndexed() API function.

NOTE Each notification within the array operates independently - a task can only block on one notification within the array at a time and will not be unblocked by a notification sent to any other array index.

Backward compatibility information: Prior to FreeRTOS V10.4.0 each task had a single “notification value”, and all task notification API functions operated on that value. Replacing the single notification value with an array of notification values necessitated a new set of API functions that could address specific notifications within the array. xTaskNotifyFromISR() is the original API function, and remains backward compatible by always operating on the notification value at index 0 within the array. Calling xTaskNotifyGiveFromISR() is equivalent to calling xTaskNotifyGiveIndexedFromISR() with the uxIndexToNotify parameter set to 0.

Parameters

- xTaskToNotify – The handle of the task being notified. The handle to a task can be returned from the xTaskCreate() API function used to create the task, and the handle of the currently running task can be obtained by calling xTaskGetCurrentTaskHandle().
- uxIndexToNotify – The index within the target task’s array of notification values to which the notification is to be sent. uxIndexToNotify must be less than configTASK_NOTIFICATION_ARRAY_ENTRIES. xTaskNotifyGiveFromISR() does not have this parameter and always sends notifications to index 0.
- pxHigherPriorityTaskWoken – vTaskNotifyGiveFromISR() will set *pxHigherPriorityTaskWoken to pdTRUE if sending the notification caused the task to which the notification was sent to leave the Blocked state, and the unblocked task has a priority higher than the currently running task. If vTaskNotifyGiveFromISR() sets this value to pdTRUE then a context switch should be requested before the interrupt is exited. How a context switch is requested from an ISR is dependent on the port - see the documentation page for the port in use.

BaseType_t xTaskGenericNotifyStateClear(TaskHandle_t xTask, UBseType_t uxIndexToClear)

configUSE_TASK_NOTIFICATIONS must be undefined or defined as 1 for these functions to be available.

Each task has a private array of “notification values” (or ‘notifications’), each of which is a 32-bit unsigned integer (uint32_t). The constant configTASK_NOTIFICATION_ARRAY_ENTRIES sets the number of indexes in the array, and (for backward compatibility) defaults to 1 if left undefined. Prior to FreeRTOS V10.4.0 there was only one notification value per task.

If a notification is sent to an index within the array of notifications then the notification at that index is said to be ‘pending’ until it is read or explicitly cleared by the receiving task. xTaskNotifyStateClearIndexed() is the function that clears a pending notification without reading the notification value. The notification value at the same array index is not altered. Set xTask to NULL to clear the notification state of the calling task.
Backward compatibility information: Prior to FreeRTOS V10.4.0 each task had a single “notification value”, and all task notification API functions operated on that value. Replacing the single notification value with an array of notification values necessitated a new set of API functions that could address specific notifications within the array. xTaskNotifyStateClear() is the original API function, and remains backward compatible by always operating on the notification value at index 0 within the array. Calling xTaskNotifyStateClear() is equivalent to calling xTaskNotifyStateClearIndexed() with the uxIndexToNotify parameter set to 0.

Parameters

- **xTask** – The handle of the RTOS task that will have a notification state cleared. Set xTask to NULL to clear a notification state in the calling task. To obtain a task’s handle create the task using xTaskCreate() and make use of the pxCreatedTask parameter, or create the task using xTaskCreateStatic() and store the returned value, or use the task’s name in a call to xTaskGetHandle().
- **uxIndexToClear** – The index within the target task’s array of notification values to act upon. For example, setting uxIndexToClear to 1 will clear the state of the notification at index 1 within the array. uxIndexToClear must be less than config-TASK_NOTIFICATION_ARRAY_ENTRIES. ulTaskNotifyStateClear() does not have this parameter and always acts on the notification at index 0.

Returns

pdTRUE if the task’s notification state was set to eNotWaitingNotification, otherwise pdFALSE.

```c
uint32_t ulTaskGenericNotifyValueClear(TaskHandle_t xTask, UBaseType_t uxIndexToClear, uint32_t ulBitsToClear)
```

Each task has a private array of “notification values” (or ‘notifications’), each of which is a 32-bit unsigned integer (uint32_t). The constant configTASK_NOTIFICATION_ARRAY_ENTRIES sets the number of indexes in the array, and (for backward compatibility) defaults to 1 if left undefined. Prior to FreeRTOS V10.4.0 there was only one notification value per task.

ulTaskNotifyValueClearIndexed() clears the bits specified by the ulBitsToClear bit mask in the notification value at array index uxIndexToClear of the task referenced by xTask.

Backward compatibility information: Prior to FreeRTOS V10.4.0 each task had a single “notification value”, and all task notification API functions operated on that value. Replacing the single notification value with an array of notification values necessitated a new set of API functions that could address specific notifications within the array. ulTaskNotifyValueClear() is the original API function, and remains backward compatible by always operating on the notification value at index 0 within the array. Calling ulTaskNotifyValueClear() is equivalent to calling ulTaskNotifyValueClearIndexed() with the uxIndexToClear parameter set to 0.

Parameters

- **xTask** – The handle of the RTOS task that will have bits in one of its notification values cleared. Set xTask to NULL to clear bits in a notification value of the calling task. To obtain a task’s handle create the task using xTaskCreate() and make use of the pxCreatedTask parameter, or create the task using xTaskCreateStatic() and store the returned value, or use the task’s name in a call to xTaskGetHandle().
- **uxIndexToClear** – The index within the target task’s array of notification values in which to clear the bits. uxIndexToClear must be less than config-TASK_NOTIFICATION_ARRAY_ENTRIES. ulTaskNotifyValueClear() does not have this parameter and always clears bits in the notification value at index 0.
- **ulBitsToClear** – Bit mask of the bits to clear in the notification value of xTask. Set a bit to 1 to clear the corresponding bits in the task’s notification value. Set ulBitsToClear to 0xffffffff (UINT_MAX on 32-bit architectures) to clear the notification value to 0. Set ulBitsToClear to 0 to query the task’s notification value without clearing any bits.

Returns

The value of the target task’s notification value before the bits specified by ulBitsToClear were cleared.

```c
void vTaskSetTimeOutState(TimeOut_t *const pxTimeOut)
```

Capture the current time for future use with xTaskCheckForTimeOut().
Parameters `pxTimeOut` - Pointer to a timeout object into which the current time is to be captured. The captured time includes the tick count and the number of times the tick count has overflowed since the system first booted.

`BaseType_t xTaskCheckForTimeOut (TimeOut_t *const pxTimeOut, TickType_t *const pxTicksToWait)`

Determines if `pxTicksToWait` ticks has passed since a time was captured using a call to `vTaskSetTimeOutState()`. The captured time includes the tick count and the number of times the tick count has overflowed.

Example Usage:

```c
size_t xUART_Receive( uint8_t *pucBuffer, size_t uxWantedBytes )
{
    size_t uxReceived = 0;
    TickType_t xTicksToWait = MAX_TIME_TO_WAIT;
    TimeOut_t xTimeOut;

    // Initialize xTimeOut. This records the time at which this function
    // was entered.
    vTaskSetTimeOutState( &xTimeOut );

    // Loop until the buffer contains the wanted number of bytes, or a
    // timeout occurs.
    while( UART_bytes_in_rx_buffer( pxUARTInstance ) < uxWantedBytes )
    {
        // The buffer didn’t contain enough data so this task is going to
        // enter the Blocked state. Adjusting xTicksToWait to account for
        // any time that has been spent in the Blocked state within this
        // function so far to ensure the total amount of time spent in the
        // Blocked state does not exceed MAX_TIME_TO_WAIT.
        if( xTaskCheckForTimeOut( &xTimeOut, &xTicksToWait ) != pdFALSE )
        {
            // Timed out before the wanted number of bytes were available,
            // exit the loop.
            break;
        }

        // Wait for a maximum of xTicksToWait ticks to be notified that the
        // receive interrupt has placed more data into the buffer.
        ulTaskNotifyTake( pdTRUE, xTicksToWait );
    }

    // Attempt to read uxWantedBytes from the receive buffer into pucBuffer.
    // The actual number of bytes read (which might be less than
    // uxWantedBytes) is returned.
    uxReceived = UART_read_from_receive_buffer( pxUARTInstance, pucBuffer, uxWantedBytes );

    return uxReceived;
}
```

(continues on next page)
See also:
https://www.FreeRTOS.org/xTaskCheckForTimeOut.html

Parameters

• **pxTimeOut**  – The time status as captured previously using vTaskSetTimeOutState. If the timeout has not yet occurred, it is updated to reflect the current time status.

• **pxTicksToWait**  – The number of ticks to check for timeout i.e. if pxTicksToWait ticks have passed since pxTimeOut was last updated (either by vTaskSetTimeOutState() or xTaskCheckForTimeOut()), the timeout has occurred. If the timeout has not occurred, pxTicksToWait is updated to reflect the number of remaining ticks.

Returns  If timeout has occurred, pdTRUE is returned. Otherwise pdFALSE is returned and pxTicksToWait is updated to reflect the number of remaining ticks.

BaseType_t xTaskCatchUpTicks (TickType_t xTicksToCatchUp)

This function corrects the tick count value after the application code has held interrupts disabled for an extended period resulting in tick interrupts having been missed.

This function is similar to vTaskStepTick(), however, unlike vTaskStepTick(), xTaskCatchUpTicks() may move the tick count forward past a time at which a task should be removed from the blocked state. That means tasks may have to be removed from the blocked state as the tick count is moved.

**Parameters**  xTicksToCatchUp  – The number of tick interrupts that have been missed due to interrupts being disabled. Its value is not computed automatically, so must be computed by the application writer.

**Returns**  pdTRUE if moving the tick count forward resulted in a task leaving the blocked state and a context switch being performed. Otherwise pdFALSE.

Structures

struct xTASK_STATUS

Used with the uxTaskGetSystemState() function to return the state of each task in the system.

Public Members

**TaskHandle_t**  xHandle

The handle of the task to which the rest of the information in the structure relates.

const char *pcTaskName

A pointer to the task’s name. This value will be invalid if the task was deleted since the structure was populated!

UBaseType_t xTaskNumber

A number unique to the task.

**eTaskState**  eCurrentState

The state in which the task existed when the structure was populated.

UBaseType_t uxCurrentPriority

The priority at which the task was running (may be inherited) when the structure was populated.
Chapter 2. API Reference

**UBaseType_t uxBasePriority**

The priority to which the task will return if the task’s current priority has been inherited to avoid unbounded priority inversion when obtaining a mutex. Only valid if configUSE_MUTEXES is defined as 1 in FreeRTOSConfig.h.

**configRUN_TIME_COUNTER_TYPE ulRunTimeCounter**

The total run time allocated to the task so far, as defined by the run time stats clock. See [https://www.FreeRTOS.org/rtos-run-time-stats.html](https://www.FreeRTOS.org/rtos-run-time-stats.html). Only valid when configGENERATE_RUN_TIME_STATS is defined as 1 in FreeRTOSConfig.h.

**StackType_t* pxStackBase**

Points to the lowest address of the task’s stack area.

**configSTACK_DEPTH_TYPE usStackHighWaterMark**

The minimum amount of stack space that has remained for the task since the task was created. The closer this value is to zero the closer the task has come to overflowing its stack.

**BaseType_t xCoreID**

Core this task is pinned to (0, 1, or tskNO_AFFINITY). If configNUMBER_OF_CORES == 1, this will always be 0.

**Macros**

**tskIDLE_PRIORITY**

Defines the priority used by the idle task. This must not be modified.

**tskNO_AFFINITY**

Macro representing and unpinned (i.e., “no affinity”) task in xCoreID parameters

**taskYIELD()**

Macro for forcing a context switch.

**taskENTER_CRITICAL(x)**

Macro to mark the start of a critical code region. Preemptive context switches cannot occur when in a critical region.

NOTE: This may alter the stack (depending on the portable implementation) so must be used with care!

**taskENTER_CRITICAL_FROM_ISR()**

**taskENTER_CRITICAL_ISR(x)**

**taskEXIT_CRITICAL(x)**

Macro to mark the end of a critical code region. Preemptive context switches cannot occur when in a critical region.

NOTE: This may alter the stack (depending on the portable implementation) so must be used with care!

**taskEXIT_CRITICAL_FROM_ISR(x)**

**taskDISABLE_INTERRUPTS()**

Macro to disable all maskable interrupts.

**taskENABLE_INTERRUPTS()**

Macro to enable microcontroller interrupts.
taskSCHEDULER_SUSPENDED

Definitions returned by xTaskGetSchedulerState(). taskSCHEDULER_SUSPENDED is 0 to generate more optimal code when configASSERT() is defined as the constant is used in assert() statements.

taskSCHEDULER_NOT_STARTED

taskSCHEDULER_RUNNING

xTaskNotifyIndexed(xTaskToNotify, uxIndexToNotify, ulValue, eAction)

cfgUSE_TASK_NOTIFICATIONS must be undefined or defined as 1 for these functions to be available.

Sends a direct to task notification to a task, with an optional value and action.

Each task has a private array of “notification values” (or ‘notifications’), each of which is a 32-bit unsigned integer (uint32_t). The constant configTASK-notification_ARRAY_ENTRIES sets the number of indexes in the array, and (for backward compatibility) defaults to 1 if left undefined. Prior to FreeRTOS V10.4.0 there was only one notification value per task.

Events can be sent to a task using an intermediary object. Examples of such objects are queues, semaphores, mutexes and event groups. Task notifications are a method of sending an event directly to a task without the need for such an intermediary object.

A notification sent to a task can optionally perform an action, such as update, overwrite or increment one of the task’s notification values. In that way task notifications can be used to send data to a task, or be used as light weight and fast binary or counting semaphores.

A task can use xTaskNotifyWaitIndexed() or ulTaskNotifyTakeIndexed() to [optionally] block to wait for a notification to be pending. The task does not consume any CPU time while it is in the Blocked state.

A notification sent to a task will remain pending until it is cleared by the task calling xTaskNotifyWaitIndexed() or ulTaskNotifyTakeIndexed() (or their un-indexed equivalents). If the task was already in the Blocked state to wait for a notification when the notification arrives then the task will automatically be removed from the Blocked state (unblocked) and the notification cleared.

**NOTE** Each notification within the array operates independently - a task can only block on one notification within the array at a time and will not be unblocked by a notification sent to any other array index.

Backward compatibility information: Prior to FreeRTOS V10.4.0 each task had a single “notification value”, and all task notification API functions operated on that value. Replacing the single notification value with an array of notification values necessitated a new set of API functions that could address specific notifications within the array. xTaskNotify() is the original API function, and remains backward compatible by always operating on the notification value at index 0 in the array. Calling xTaskNotify() is equivalent to calling xTaskNotifyIndexed() with the uxIndexToNotify parameter set to 0.

```c

| eSetBits   | The target notification value is bitwise ORed with ulValue. xTaskNotifyIndexed() always returns pdPASS in this case. |
| eIncrement | The target notification value is incremented. ulValue is not used and xTaskNotifyIndexed() always returns pdPASS in this case. |
| eSetValueWithOverwrite | The target notification value is set to the value of ulValue, even if the task being notified had not yet processed the previous notification at the same array index (the task already had a notification pending at that index). xTaskNotifyIndexed() always returns pdPASS in this case. |
| eSetValueWithoutOverwrite | If the task being notified did not already have a notification pending at the same array index then the target notification value is set to ulValue and xTaskNotifyIndexed() will return pdPASS. If the task being notified already had a notification pending at the same array index then no action is performed and pdFAIL is returned. |
```

Espressif Systems 2050 Release v5.3-dev-277-gc8243465e4 Submit Document Feedback
Chapter 2. API Reference

eNoAction - The task receives a notification at the specified array index without the notification value at that index being updated. ulValue is not used and xTaskNotifyIndexed() always returns pdPASS in this case.

pulPreviousNotificationValue - Can be used to pass out the subject task’s notification value before any bits are modified by the notify function.

Parameters

- **xTaskToNotify** – The handle of the task being notified. The handle to a task can be returned from the xTaskCreate() API function used to create the task, and the handle of the currently running task can be obtained by calling xTaskGetCurrentTaskHandle().

- **uxIndexToNotify** – The index within the target task’s array of notification values to which the notification is to be sent. uxIndexToNotify must be less than configTASK_NOTIFICATION_ARRAY_ENTRIES. xTaskNotify() does not have this parameter and always sends notifications to index 0.

- **ulValue** – Data that can be sent with the notification. How the data is used depends on the value of the eAction parameter.

- **eAction** – Specifies how the notification updates the task’s notification value, if at all. Valid values for eAction are as follows:

  Returns Depend on the value of eAction. See the description of the eAction parameter.

**xTaskNotifyAndQueryIndexed** (xTaskToNotify, uxIndexToNotify, ulValue, eAction, pulPreviousNotificationValue)

xTaskNotifyAndQueryIndexed() performs the same operation as xTaskNotifyIndexed() with the addition that it also returns the subject task’s prior notification value (the notification value at the time the function is called rather than when the function returns) in the additional pulPreviousNotificationValue parameter.

xTaskNotifyAndQuery() performs the same operation as xTaskNotify() with the addition that it also returns the subject task’s prior notification value (the notification value as it was at the time the function is called, rather than when the function returns) in the additional pulPreviousNotificationValue parameter.

**xTaskNotifyIndexedFromISR** (xTaskToNotify, uxIndexToNotify, ulValue, eAction, pxHigherPriorityTaskWoken)

**configUSE_TASK_NOTIFICATIONS** must be undefined or defined as 1 for these functions to be available.

A version of xTaskNotifyIndexed() that can be used from an interrupt service routine (ISR).

Each task has a private array of “notification values” (or ‘notifications’), each of which is a 32-bit unsigned integer (uint32_t). The constant configTASK_NOTIFICATION_ARRAY_ENTRIES sets the number of indexes in the array, and (for backward compatibility) defaults to 1 if left undefined. Prior to FreeRTOS V10.4.0 there was only one notification value per task.

Events can be sent to a task using an intermediary object. Examples of such objects are queues, semaphores, mutexes and event groups. Task notifications are a method of sending an event directly to a task without the need for such an intermediary object.

A notification sent to a task can optionally perform an action, such as update, overwrite or increment one of the task’s notification values. In that way task notifications can be used to send data to a task, or be used as light weight and fast binary or counting semaphores.

A task can use xTaskNotifyWaitIndexed() to [optionally] block to wait for a notification to be pending, or ulTaskNotifyTakeIndexed() to [optionally] block to wait for a notification value to have a non-zero value. The task does not consume any CPU time while it is in the Blocked state.

A notification sent to a task will remain pending until it is cleared by the task calling xTaskNotifyWaitIndexed() or ulTaskNotifyTakeIndexed() (or their un-indexed equivalents). If the task was already in the Blocked state to wait for a notification when the notification arrives then the task will automatically be removed from the Blocked state (unblocked) and the notification cleared.

**NOTE** Each notification within the array operates independently - a task can only block on one notification within the array at a time and will not be unblocked by a notification sent to any other array index.
Backward compatibility information: Prior to FreeRTOS V10.4.0 each task had a single “notification value”, and all task notification API functions operated on that value. Replacing the single notification value with an array of notification values necessitated a new set of API functions that could address specific notifications within the array. \texttt{xTaskNotifyFromISR()} is the original API function, and remains backward compatible by always operating on the notification value at index 0 within the array. Calling \texttt{xTaskNotifyFromISR()} is equivalent to calling \texttt{xTaskNotifyIndexedFromISR()} with the \texttt{uxIndexToNotify} parameter set to 0.

\texttt{eSetBits} - The task’s notification value is bitwise ORed with \texttt{ulValue}. \texttt{xTaskNotify()} always returns \texttt{pdPASS} in this case.

\texttt{eIncrement} - The task’s notification value is incremented. \texttt{ulValue} is not used and \texttt{xTaskNotify()} always returns \texttt{pdPASS} in this case.

\texttt{eSetValueWithOverwrite} - The task’s notification value is set to the value of \texttt{ulValue}, even if the task being notified had not yet processed the previous notification (the task already had a notification pending). \texttt{xTaskNotify()} always returns \texttt{pdPASS} in this case.

\texttt{eSetValueWithoutOverwrite} - If the task being notified did not already have a notification pending then the task’s notification value is set to \texttt{ulValue} and \texttt{xTaskNotify()} will return \texttt{pdPASS}. If the task being notified already had a notification pending then no action is performed and \texttt{pdFAIL} is returned.

\texttt{eNoAction} - The task receives a notification without its notification value being updated. \texttt{ulValue} is not used and \texttt{xTaskNotify()} always returns \texttt{pdPASS} in this case.

\textbf{Parameters}

- \texttt{uxIndexToNotify} – The index within the target task’s array of notification values to which the notification is to be sent. \texttt{uxIndexToNotify} must be less than \texttt{configTASK\_NOTIFICATION\_ARRAY\_ENTRIES}. \texttt{xTaskNotifyFromISR()} does not have this parameter and always sends notifications to index 0.
- \texttt{xTaskToNotify} – The handle of the task being notified. The handle to a task can be returned from the \texttt{xTaskCreate()} API function used to create the task, and the handle of the currently running task can be obtained by calling \texttt{xTaskGetCurrentTaskHandle()}.
- \texttt{ulValue} – Data that can be sent with the notification. How the data is used depends on the value of the \texttt{eAction} parameter.
- \texttt{eAction} – Specifies how the notification updates the task’s notification value, if at all. Valid values for \texttt{eAction} are as follows:
  - \texttt{pxHigherPriorityTaskWoken} – \texttt{xTaskNotifyFromISR()} will set \texttt{pxHigherPriorityTaskWoken} to \texttt{pdTRUE} if sending the notification caused the task to which the notification was sent to leave the Blocked state, and the unblocked task has a priority higher than the currently running task. If \texttt{xTaskNotifyFromISR()} sets this value to \texttt{pdTRUE} then a context switch should be requested before the interrupt is exited. How a context switch is requested from an ISR is dependent on the port - see the documentation page for the port in use.

\textbf{Returns} Dependent on the value of \texttt{eAction}. See the description of the \texttt{eAction} parameter.

\texttt{xTaskNotifyAndQueryIndexedFromISR()} performs the same operation as \texttt{xTaskNotifyIndexedFromISR()} with the addition that it also returns the subject task’s prior notification value (the notification value at the time the function is called rather than at the time the function returns) in the additional \texttt{pulPreviousNotificationValue} parameter.

\texttt{xTaskNotifyAndQueryFromISR()} performs the same operation as \texttt{xTaskNotifyFromISR()} with the addition that it also returns the subject task’s prior notification value (the notification value at the time the function is called rather than at the time the function returns) in the additional \texttt{pulPreviousNotificationValue} parameter.

\texttt{xTaskNotifyWait()} performs the same operation as \texttt{xTaskNotifyFromISR()} with the addition that it also returns the subject task’s prior notification value (the notification value at the time the function is called rather than at the time the function returns) in the additional \texttt{pulPreviousNotificationValue} parameter.
xTaskNotifyWaitIndexed (uxIndexToWaitOn, ulBitsToClearOnEntry, ulBitsToClearOnExit, pulNotificationValue, xTicksToWait)

xTaskNotifyGiveIndexed (xTaskToNotify, uxIndexToNotify)

Sends a direct task notification to a particular index in the target task’s notification array in a manner similar to giving a counting semaphore.

configUSE_TASK_NOTIFICATIONS must be undefined or defined as 1 for these macros to be available.

Each task has a private array of “notification values” (or ‘notifications’), each of which is a 32-bit unsigned integer (uint32_t). The constant configTASK_NOTIFICATION_ARRAY_ENTRIES sets the number of indexes in the array, and (for backward compatibility) defaults to 1 if left undefined. Prior to FreeRTOS V10.4.0 there was only one notification value per task.

Events can be sent to a task using an intermediary object. Examples of such objects are queues, semaphores, mutexes and event groups. Task notifications are a method of sending an event directly to a task without the need for such an intermediary object.

A notification sent to a task can optionally perform an action, such as update, overwrite or increment one of the task’s notification values. In that way task notifications can be used to send data to a task, or be used as light weight and fast binary or counting semaphores.

xTaskNotifyGiveIndexed() is a helper macro intended for use when task notifications are used as light weight and faster binary or counting semaphore equivalents. Actual FreeRTOS semaphores are given using the xSemaphoreGive() API function, the equivalent action that instead uses a task notification is xTaskNotifyGiveIndexed().

When task notifications are being used as a binary or counting semaphore equivalent then the task being notified should wait for the notification using the ulTaskNotifyTakeIndexed() API function rather than the xTaskNotifyWaitIndexed() API function.

NOTE Each notification within the array operates independently - a task can only block on one notification within the array at a time and will not be unblocked by a notification sent to any other array index.

Backward compatibility information: Prior to FreeRTOS V10.4.0 each task had a single “notification value”, and all task notification API functions operated on that value. Replacing the single notification value with an array of notification values necessitated a new set of API functions that could address specific notifications within the array. xTaskNotifyGive() is the original API function, and remains backward compatible by always operating on the notification value at index 0 in the array. Calling xTaskNotifyGive() is equivalent to calling xTaskNotifyGiveIndexed() with the uxIndexToNotify parameter set to 0.

Parameters

- xTaskToNotify – The handle of the task being notified. The handle to a task can be returned from the xTaskCreate() API function used to create the task, and the handle of the currently running task can be obtained by calling xTaskGetCurrentTaskHandle().
- uxIndexToNotify – The index within the target task’s array of notification values to which the notification is to be sent. uxIndexToNotify must be less than configTASK_NOTIFICATION_ARRAY_ENTRIES. xTaskNotifyGive() does not have this parameter and always sends notifications to index 0.

Returns xTaskNotifyGive() is a macro that calls xTaskNotify() with the eAction parameter set to eIncrement - so pdPASS is always returned.

vTaskNotifyGiveFromISR (xTaskToNotify, pxHigherPriorityTaskWoken)

vTaskNotifyGiveIndexedFromISR (xTaskToNotify, uxIndexToNotify, pxHigherPriorityTaskWoken)

ulTaskNotifyTakeIndexed (uxIndexToWaitOn, xClearCountOnExit, xTicksToWait)

Waits for a direct to task notification on a particular index in the calling task’s notification array in a manner similar to taking a counting semaphore.

configUSE_TASK_NOTIFICATIONS must be undefined or defined as 1 for this function to be available.
Each task has a private array of “notification values” (or ‘notifications’), each of which is a 32-bit unsigned integer (uint32_t). The constant configTASK_NOTIFICATION_ARRAY_ENTRIES sets the number of indexes in the array, and (for backward compatibility) defaults to 1 if left undefined. Prior to FreeRTOS V10.4.0 there was only one notification value per task.

Events can be sent to a task using an intermediary object. Examples of such objects are queues, semaphores, mutexes and event groups. Task notifications are a method of sending an event directly to a task without the need for such an intermediary object.

A notification sent to a task can optionally perform an action, such as update, overwrite or increment one of the task’s notification values. In that way task notifications can be used to send data to a task, or be used as light weight and fast binary or counting semaphores.

ulTaskNotifyTakeIndexed() is intended for use when a task notification is used as a faster and lighter weight binary or counting semaphore alternative. Actual FreeRTOS semaphores are taken using the xSemaphoreTake() API function, the equivalent action that instead uses a task notification is ulTaskNotifyTakeIndexed().

When a task is using its notification value as a binary or counting semaphore other tasks should send notifications to it using the xTaskNotifyGiveIndexed() macro, or xTaskNotifyIndex() function with the eAction parameter set to elcrement.

ulTaskNotifyTakeIndexed() can either clear the task’s notification value at the array index specified by the uIndexToWaitOn parameter to zero on exit, in which case the notification value acts like a binary semaphore, or decrement the notification value on exit, in which case the notification value acts like a counting semaphore.

A task can use ulTaskNotifyTakeIndexed() to [optionally] block to wait for a notification. The task does not consume any CPU time while it is in the Blocked state.

Where as xTaskNotifyWaitIndexed() will return when a notification is pending, ulTaskNotifyTakeIndexed() will return when the task’s notification value is not zero.

**NOTE** Each notification within the array operates independently - a task can only block on one notification within the array at a time and will not be unblocked by a notification sent to any other array index.

Backward compatibility information: Prior to FreeRTOS V10.4.0 each task had a single “notification value”, and all task notification API functions operated on that value. Replacing the single notification value with an array of notification values necessitated a new set of API functions that could address specific notifications within the array. ulTaskNotifyTake() is the original API function, and remains backward compatible by always operating on the notification value at index 0 in the array. Calling ulTaskNotifyTake() is equivalent to calling ulTaskNotifyTakeIndexed() with the uIndexToWaitOn parameter set to 0.

**Parameters**

- **uxIndexToWaitOn** - The index within the calling task’s array of notification values on which the calling task will wait for a notification to be non-zero. uxIndexToWaitOn must be less than configTASK_NOTIFICATION_ARRAY_ENTRIES. xTaskNotifyTake() does not have this parameter and always waits for notifications on index 0.

- **xClearCountOnExit** - if xClearCountOnExit is pdFALSE then the task’s notification value is decremented when the function exits. In this way the notification value acts like a counting semaphore. If xClearCountOnExit is not pdFALSE then the task’s notification value is cleared to zero when the function exits. In this way the notification value acts like a binary semaphore.

- **xTicksToWait** - The maximum amount of time that the task should wait in the Blocked state for the task’s notification value to be greater than zero, should the count not already be greater than zero when ulTaskNotifyTake() was called. The task will not consume any processing time while it is in the Blocked state. This is specified in kernel ticks, the macro pdMS_TO_TICKS( value_in_ms ) can be used to convert a time specified in milliseconds to a time specified in ticks.

**Returns** The task’s notification count before it is either cleared to zero or decremented (see the xClearCountOnExit parameter).

*xTaskNotifyStateClear (xTask)*
Chapter 2. API Reference

**xTaskNotifyStateClearIndexed** (xTask, uxIndexToClear)

**ulTaskNotifyValueClear** (xTask, ulBitsToClear)

**ulTaskNotifyValueClearIndexed** (xTask, uxIndexToClear, ulBitsToClear)

**Type Definitions**

typedef struct tskTaskControlBlock *TaskHandle_t

typedef BaseType_t (*TaskHookFunction_t)(void*)

Defines the prototype to which the application task hook function must conform.

typedef struct xTASK_STATUS TaskStatus_t

Used with the uxTaskGetSystemState() function to return the state of each task in the system.

**Enumerations**

denum eTaskState

Task states returned by eTaskGetState.

Values:

enumerator eRunning

A task is querying the state of itself, so must be running.

enumerator eReady

The task being queried is in a ready or pending ready list.

enumerator eBlocked

The task being queried is in the Blocked state.

enumerator eSuspended

The task being queried is in the Suspended state, or is in the Blocked state with an infinite time out.

enumerator eDeleted

The task being queried has been deleted, but its TCB has not yet been freed.

enumerator eInvalid

Used as an ‘invalid state’ value.

denum eNotifyAction

Actions that can be performed when vTaskNotify() is called.

Values:

enumerator eNoAction

Notify the task without updating its notify value.

enumerator eSetBits

Set bits in the task’s notification value.
enumerator **eIncrement**
   Increment the task’s notification value.

enumerator **eSetValueWithOverwrite**
   Set the task’s notification value to a specific value even if the previous value has not yet been read by the task.

enumerator **eSetValueWithoutOverwrite**
   Set the task’s notification value if the previous value has been read by the task.

enum **eSleepModeStatus**
   Possible return values for eTaskConfirmSleepModeStatus().
   Values:

        enumerator **eAbortSleep**
           A task has been made ready or a context switch pended since portSUPPRESS_TICKS_AND_SLEEP() was called - abort entering a sleep mode.

        enumerator **eStandardSleep**
           Enter a sleep mode that will not last any longer than the expected idle time.

Queue API

Header File

- components/freertos/FreeRTOS-Kernel/include/freertos/queue.h

This header file can be included with:

```
#include "freertos/queue.h"
```

Functions

**BaseType_t xQueueGenericSend** (*QueueHandle_t xQueue, const void *const pvItemToQueue, TickType_t xTicksToWait, const BaseType_t xCopyPosition*)

It is preferred that the macros xQueueSend(), xQueueSendToFront() and xQueueSendToBack() are used in place of calling this function directly.

Post an item on a queue. The item is queued by copy, not by reference. This function must not be called from an interrupt service routine. See xQueueSendFromISR () for an alternative which may be used in an ISR.

Example usage:

```c
struct AMessage
{
    char ucMessageID;
    char ucData[20];
} xMessage;

uint32_t ulVar = 10UL;

void vATask(void *pvParameters)
{
    QueueHandle_t xQueue1, xQueue2;
    (continues on next page)
```
struct AMessage *pxMessage;

// Create a queue capable of containing 10 uint32_t values.
xQueue1 = xQueueCreate( 10, sizeof( uint32_t ) );

// Create a queue capable of containing 10 pointers to AMessage structures.
// These should be passed by pointer as they contain a lot of data.
xQueue2 = xQueueCreate( 10, sizeof( struct AMessage * ) );

...}

if( xQueue1 != 0 )
{
    // Send an uint32_t. Wait for 10 ticks for space to become
    // available if necessary.
    if( xQueueGenericSend( xQueue1, ( void * ) &ulVar, ( TickType_t ) 10,...
    //queueSEND_TO_BACK ) != pdPASS )
    {
        // Failed to post the message, even after 10 ticks.
    }
}

if( xQueue2 != 0 )
{
    // Send a pointer to a struct AMessage object. Don't block if the
    // queue is already full.
    pxMessage = & xMessage;
    xQueueGenericSend( xQueue2, ( void * ) &pxMessage, ( TickType_t ) 0,...
    //queueSEND_TO_BACK );
}

// ... Rest of task code.

Parameters

- **xQueue** - The handle to the queue on which the item is to be posted.
- **pvItemToQueue** - A pointer to the item that is to be placed on the queue. The size of
  the items the queue will hold was defined when the queue was created, so this many bytes
  will be copied from pvItemToQueue into the queue storage area.
- **xTicksToWait** - The maximum amount of time the task should block waiting for space
  to become available on the queue, should it already be full. The call will return immediately
  if this is set to 0 and the queue is full. The time is defined in tick periods so the constant
  portTICK_PERIOD_MS should be used to convert to real time if this is required.
- **xCopyPosition** - Can take the value queueSEND_TO_BACK to place the item at the
  back of the queue, or queueSEND_TO_FRONT to place the item at the front of the queue
  (for high priority messages).

Returns

- pdTRUE if the item was successfully posted, otherwise errQUEUE_FULL.

Subtype_t xQueuePeek( QueueHandle_t xQueue, void *const pvBuffer, TickType_t xTicksToWait)

Receive an item from a queue without removing the item from the queue. The item is received by copy so a
buffer of adequate size must be provided. The number of bytes copied into the buffer was defined when the
queue was created.

Successfully received items remain on the queue so will be returned again by the next call, or a call to
xQueueReceive().

This macro must not be used in an interrupt service routine. See xQueuePeekFromISR() for an alternative that
can be called from an interrupt service routine.
Example usage:

```c
struct AMessage
{
    char ucMessageID;
    char ucData[ 20 ];
} xMessage;

QueueHandle_t xQueue;

// Task to create a queue and post a value.
void vATask( void *pvParameters )
{
    struct AMessage *pxMessage;

    // Create a queue capable of containing 10 pointers to AMessage structures.
    // These should be passed by pointer as they contain a lot of data.
    xQueue = xQueueCreate( 10, sizeof( struct AMessage * ) );
    if( xQueue == 0 )
    {
        // Failed to create the queue.
    }
    // ...

    // Send a pointer to a struct AMessage object. Don't block if the
    // queue is already full.
    pxMessage = & xMessage;
    xQueueSend( xQueue, ( void * ) &pxMessage, ( TickType_t ) 0 );

    // ... Rest of task code.
}

// Task to peek the data from the queue.
void vADifferentTask( void *pvParameters )
{
    struct AMessage *pxRxedMessage;

    if( xQueue != 0 )
    {
        // Peek a message on the created queue. Block for 10 ticks if a
        // message is not immediately available.
        if( xQueuePeek( xQueue, & pxRxedMessage, ( TickType_t ) 10 ) )
        {
            // pcRxedMessage now points to the struct AMessage variable posted
            // by vATask, but the item still remains on the queue.
        }
    }
    // ... Rest of task code.
}
```

Parameters

- **xQueue** - The handle to the queue from which the item is to be received.
- **pvBuffer** - Pointer to the buffer into which the received item will be copied.
- **xTicksToWait** - The maximum amount of time the task should block waiting for an item to receive should the queue be empty at the time of the call. The time is defined in tick periods so the constant portTICK_PERIOD_MS should be used to convert to real time if this is required. xQueuePeek() will return immediately if xTicksToWait is 0 and the queue is empty.

Returns pdTRUE if an item was successfully received from the queue, otherwise pdFALSE.
Chapter 2. API Reference

BaseType_t `xQueuePeekFromISR` (QueueHandle_t xQueue, void *const pvBuffer)

A version of `xQueuePeek()` that can be called from an interrupt service routine (ISR).

Receive an item from a queue without removing the item from the queue. The item is received by copy so a buffer of adequate size must be provided. The number of bytes copied into the buffer was defined when the queue was created.

Successfully received items remain on the queue so will be returned again by the next call, or a call to `xQueueReceive()`.

**Parameters**

- **xQueue** - The handle to the queue from which the item is to be received.
- **pvBuffer** - Pointer to the buffer into which the received item will be copied.

**Returns**

`pdTRUE` if an item was successfully received from the queue, otherwise `pdFALSE`.

BaseType_t `xQueueReceive` (QueueHandle_t xQueue, void *const pvBuffer, TickType_t xTicksToWait)

Receive an item from a queue. The item is received by copy so a buffer of adequate size must be provided. The number of bytes copied into the buffer was defined when the queue was created.

Successfully received items are removed from the queue.

This function must not be used in an interrupt service routine. See `xQueueReceiveFromISR` for an alternative that can.

Example usage:

```c
struct AMessage
{
    char ucMessageID;
    char ucData[20];
} xMessage;

QueueHandle_t xQueue;

// Task to create a queue and post a value.
void vATask( void *pvParameters )
{
    struct AMessage *pxMessage;
    // Create a queue capable of containing 10 pointers to AMessage structures.
    // These should be passed by pointer as they contain a lot of data.
    xQueue = xQueueCreate( 10, sizeof( struct AMessage * ) );
    if( xQueue == 0 )
    {
        // Failed to create the queue.
    }
    // ... 
    // Send a pointer to a struct AMessage object. Don't block if the
    // queue is already full.
    pxMessage = & xMessage;
    xQueueSend( xQueue, ( void * ) &pxMessage, ( TickType_t ) 0 );
    // ... Rest of task code.
}

// Task to receive from the queue.
void vADifferentTask( void *pvParameters )
{
    struct AMessage *pxRxedMessage;
```

(continues on next page)
if( xQueue != 0 )
{
    // Receive a message on the created queue. Block for 10 ticks if a
    // message is not immediately available.
    if ( xQueueReceive( xQueue, &pxRxedMessage, ( TickType_t ) 10 ) )
    {
        // pcRxedMessage now points to the struct AMessage variable posted
        // by vATask.
    }
}
// ... Rest of task code.

Parameters

• xQueue -The handle to the queue from which the item is to be received.
• pvBuffer -Pointer to the buffer into which the received item will be copied.
• xTicksToWait -The maximum amount of time the task should block waiting for an
  item to receive should the queue be empty at the time of the call. xQueueReceive() will
  return immediately if xTicksToWait is zero and the queue is empty. The time is defined
  in tick periods so the constant portTICK_PERIOD_MS should be used to convert to real
  time if this is required.

Returns pdTRUE if an item was successfully received from the queue, otherwise pdFALSE.

UBaseType_t uxQueueMessagesWaiting ( const QueueHandle_t xQueue )

Return the number of messages stored in a queue.

Parameters xQueue -A handle to the queue being queried.
Returns The number of messages available in the queue.

UBaseType_t uxQueueSpacesAvailable ( const QueueHandle_t xQueue )

Return the number of free spaces available in a queue. This is equal to the number of items that can be sent to
the queue before the queue becomes full if no items are removed.

Parameters xQueue -A handle to the queue being queried.
Returns The number of spaces available in the queue.

void vQueueDelete ( QueueHandle_t xQueue )

Delete a queue - freeing all the memory allocated for storing of items placed on the queue.

Parameters xQueue -A handle to the queue to be deleted.

BaseType_t xQueueGenericSendFromISR ( QueueHandle_t xQueue, const void *const pvItemToQueue,
     BaseType_t *const pxHigherPriorityTaskWoken, const
     BaseType_t xCopyPosition )

It is preferred that the macros xQueueSendFromISR(), xQueueSendToFrontFromISR() and xQueueSendTo-
BackFromISR() be used in place of calling this function directly. xQueueGiveFromISR() is an equivalent for
use by semaphores that don’ t actually copy any data.

Post an item on a queue. It is safe to use this function from within an interrupt service routine.

Items are queued by copy not reference so it is preferable to only queue small items, especially when called
from an ISR. In most cases it would be preferable to store a pointer to the item being queued.

Example usage for buffered IO (where the ISR can obtain more than one value per call):

void vBufferISR ( void )
{
    char cIn;
}
Chapter 2. API Reference

BaseType_t xHigherPriorityTaskWokenByPost;

// We have not woken a task at the start of the ISR.
xHigherPriorityTaskWokenByPost = pdFALSE;

// Loop until the buffer is empty.
do {
    // Obtain a byte from the buffer.
    cIn = portINPUT_BYTE(RX_REGISTER_ADDRESS);

    // Post each byte.
    xQueueGenericSendFromISR(xRxQueue, &cIn, &xHigherPriorityTaskWokenByPost, queueSEND_TO_BACK);
} while(portINPUT_BYTE(BUFFER_COUNT));

// Now the buffer is empty we can switch context if necessary. Note that the
// name of the yield function required is port specific.
if(xHigherPriorityTaskWokenByPost)
{
    portYIELD_FROM_ISR();
}

Parameters

• xQueue - The handle to the queue on which the item is to be posted.
• pvItemToQueue - A pointer to the item that is to be placed on the queue. The size of
  the items the queue will hold was defined when the queue was created, so this many bytes
  will be copied from pvItemToQueue into the queue storage area.
• pxHigherPriorityTaskWoken - xQueueGenericSendFromISR() will set *pxHigherPriorityTaskWoken to pdTRUE if sending to the queue caused a task to unblock,
  and the unblocked task has a priority higher than the currently running task. If xQueueGenericSendFromISR() sets this value to pdTRUE then a context switch should be re-
 quested before the interrupt is exited.
• xCopyPosition - Can take the value queueSEND_TO_BACK to place the item at the
  back of the queue, or queueSEND_TO_FRONT to place the item at the front of the queue
  (for high priority messages).

Returns pdTRUE if the data was successfully sent to the queue, otherwise errQUEUE_FULL.

BaseType_t xQueueGiveFromISR(QueueHandle_t xQueue, BaseType_t *const pxHigherPriorityTaskWoken)

BaseType_t xQueueReceiveFromISR(QueueHandle_t xQueue, void *const pvBuffer, BaseType_t *const pxHigherPriorityTaskWoken)

Receive an item from a queue. It is safe to use this function from within an interrupt service routine.

Example usage:

QueueHandle_t xQueue;

// Function to create a queue and post some values.
void vAFunction(void *pvParameters)
{
    char cValueToPost;
    const TickType_t xTicksToWait = { TickType_t }0xff;

    // Create a queue capable of containing 10 characters.
    xQueue = xQueueCreate(10, sizeof(char));

(continues on next page)
if (xQueue == 0)
{
    // Failed to create the queue.
}

// ...

// Post some characters that will be used within an ISR. If the queue
// is full then this task will block for xTicksToWait ticks.
cValueToPost = 'a';
xQueueSend(xQueue, (void*) &cValueToPost, xTicksToWait);
cValueToPost = 'b';
xQueueSend(xQueue, (void*) &cValueToPost, xTicksToWait);
// ... keep posting characters ... this task may block when the queue
// becomes full.
cValueToPost = 'c';
xQueueSend(xQueue, (void*) &cValueToPost, xTicksToWait);

// ISR that outputs all the characters received on the queue.
void vISR_Routine(void)
{
    BaseType_t xTaskWokenByReceive = pdFALSE;
    char cRxedChar;
    while (xQueueReceiveFromISR(xQueue, (void*) &cRxedChar, &
                                &xTaskWokenByReceive))
    {
        // A character was received. Output the character now.
        vOutputCharacter(cRxedChar);

        // If removing the character from the queue woke the task that was
        // posting onto the queue xTaskWokenByReceive will have been set to
        // pdTRUE. No matter how many times this loop iterates only one
        // task will be woken.
    }

    if (xTaskWokenByReceive != (char) pdFALSE)
    {
        taskYIELD();
    }
}
Chapter 2. API Reference

**Parameters** `xQueue` – The handle of the queue being queried

**Returns** `pdFALSE` if the queue is not full, or `pdTRUE` if the queue is full.

**Return**

Type `UBaseType_t uxQueueMessagesWaitingFromISR(const QueueHandle_t xQueue)`

A version of `uxQueueMessagesWaiting()` that can be called from an ISR. Return the number of messages stored in a queue.

**Parameters** `xQueue` – A handle to the queue being queried.

**Returns** The number of messages available in the queue.

```
void vQueueAddToRegistry(QueueHandle_t xQueue, const char* pcQueueName)
```

The registry is provided as a means for kernel aware debuggers to locate queues, semaphores and mutexes. Call `vQueueAddToRegistry()` add a queue, semaphore or mutex handle to the registry if you want the handle to be available to a kernel aware debugger. If you are not using a kernel aware debugger then this function can be ignored.

`configQUEUE_REGISTRY_SIZE` defines the maximum number of handles the registry can hold. `configQUEUE_REGISTRY_SIZE` must be greater than 0 within FreeRTOSConfig.h for the registry to be available. Its value does not affect the number of queues, semaphores and mutexes that can be created - just the number that the registry can hold.

If `vQueueAddToRegistry` is called more than once with the same `xQueue` parameter, the registry will store the `pcQueueName` parameter from the most recent call to `vQueueAddToRegistry`.

**Parameters**

- `xQueue` – The handle of the queue being added to the registry. This is the handle returned by a call to `xQueueCreate()`. Semaphore and mutex handles can also be passed in here.

- `pcQueueName` – The name to be associated with the handle. This is the name that the kernel aware debugger will display. The queue registry only stores a pointer to the string - so the string must be persistent (global or preferably in ROM/Flash), not on the stack.

```
void vQueueUnregisterQueue(QueueHandle_t xQueue)
```

The registry is provided as a means for kernel aware debuggers to locate queues, semaphores and mutexes. Call `vQueueAddToRegistry()` add a queue, semaphore or mutex handle to the registry if you want the handle to be available to a kernel aware debugger, and `vQueueUnregisterQueue()` to remove the queue, semaphore or mutex from the registry. If you are not using a kernel aware debugger then this function can be ignored.

**Parameters** `xQueue` – The handle of the queue being removed from the registry.

```
const char* pcQueueGetName(QueueHandle_t xQueue)
```

The queue registry is provided as a means for kernel aware debuggers to locate queues, semaphores and mutexes. Call `pcQueueGetName()` to look up and return the name of a queue in the queue registry from the queue’s handle.

**Parameters** `xQueue` – The handle of the queue the name of which will be returned.

**Returns** If the queue is in the registry then a pointer to the name of the queue is returned. If the queue is not in the registry then NULL is returned.

**QueueSetHandle_t xQueueCreateSet(const UBaseType_t uxEventQueueLength)**

Queue sets provide a mechanism to allow a task to block (pend) on a read operation from multiple queues or semaphores simultaneously.

See FreeRTOS/Source/Demo/Common/Minimal/QueueSet.c for an example using this function.

A queue set must be explicitly created using a call to `xQueueCreateSet()` before it can be used. Once created, standard FreeRTOS queues and semaphores can be added to the set using calls to `xQueueAddToSet()`. `xQueueSelectFromSet()` is then used to determine which, if any, of the queues or semaphores contained in the set is in a state where a queue read or semaphore take operation would be successful.

Note 1: See the documentation on [https://www.FreeRTOS.org/RTOS-queue-sets.html](https://www.FreeRTOS.org/RTOS-queue-sets.html) for reasons why queue sets are very rarely needed in practice as there are simpler methods of blocking on multiple objects.

Note 2: Blocking on a queue set that contains a mutex will not cause the mutex holder to inherit the priority of the blocked task.
Chapter 2. API Reference

Note 3: An additional 4 bytes of RAM is required for each space in a every queue added to a queue set. Therefore counting semaphores that have a high maximum count value should not be added to a queue set.

Note 4: A receive (in the case of a queue) or take (in the case of a semaphore) operation must not be performed on a member of a queue set unless a call to xQueueSelectFromSet() has first returned a handle to that set member.

**Parameters**

uxEventQueueLength - Queue sets store events that occur on the queues and semaphores contained in the set. uxEventQueueLength specifies the maximum number of events that can be queued at once. To be absolutely certain that events are not lost uxEventQueueLength should be set to the total sum of the length of the queues added to the set, where binary semaphores and mutexes have a length of 1, and counting semaphores have a length set by their maximum count value. Examples:

- If a queue set is to hold a queue of length 5, another queue of length 12, and a binary semaphore, then uxEventQueueLength should be set to 
  \((5 + 12 + 1)\), or 18.
- If a queue set is to hold three binary semaphores then uxEventQueueLength should be set to 
  \((1 + 1 + 1)\), or 3.
- If a queue set is to hold a counting semaphore that has a maximum count of 5, and a counting semaphore that has a maximum count of 3, then uxEventQueueLength should be set to 
  \((5 + 3)\), or 8.

**Returns**

If the queue set is created successfully then a handle to the created queue set is returned. Otherwise NULL is returned.

```c
BaseType_t xQueueAddToSet(QueueSetMemberHandle_t xQueueOrSemaphore, QueueSetHandle_t xQueueSet)
```

Adds a queue or semaphore to a queue set that was previously created by a call to xQueueCreateSet().

See FreeRTOS/Source/Demo/Common/Minimal/QueueSet.c for an example using this function.

Note 1: A receive (in the case of a queue) or take (in the case of a semaphore) operation must not be performed on a member of a queue set unless a call to xQueueSelectFromSet() has first returned a handle to that set member.

**Parameters**

- xQueueOrSemaphore - The handle of the queue or semaphore being added to the queue set (cast to an QueueSetMemberHandle_t type).
- xQueueSet - The handle of the queue set to which the queue or semaphore is being added.

**Returns**

If the queue or semaphore was successfully added to the queue set then pdPASS is returned. If the queue could not be successfully added to the queue set because it is already a member of a different queue set then pdFAIL is returned.

```c
BaseType_t xQueueRemoveFromSet(QueueSetMemberHandle_t xQueueOrSemaphore, QueueSetHandle_t xQueueSet)
```

Removes a queue or semaphore from a queue set. A queue or semaphore can only be removed from a set if the queue or semaphore is empty.

See FreeRTOS/Source/Demo/Common/Minimal/QueueSet.c for an example using this function.

**Parameters**

- xQueueOrSemaphore - The handle of the queue or semaphore being removed from the queue set (cast to an QueueSetMemberHandle_t type).
- xQueueSet - The handle of the queue set in which the queue or semaphore is included.

**Returns**

If the queue or semaphore was successfully removed from the queue set then pdPASS is returned. If the queue was not in the queue set, or the queue (or semaphore) was not empty, then pdFAIL is returned.

```c
QueueSetMemberHandle_t xQueueSelectFromSet(QueueHandle_t xQueueSet, const TickType_t xTicksToWait)
```

xQueueSelectFromSet() selects from the members of a queue set a queue or semaphore that either contains data (in the case of a queue) or is available to take (in the case of a semaphore). xQueueSelectFromSet()
effectively allows a task to block (pend) on a read operation on all the queues and semaphores in a queue set simultaneously.

See FreeRTOS/Source/Demo/Common/Minimal/QueueSet.c for an example using this function.

Note 1: See the documentation on https://www.FreeRTOS.org/RTOS-queue-sets.html for reasons why queue sets are very rarely needed in practice as there are simpler methods of blocking on multiple objects.

Note 2: Blocking on a queue set that contains a mutex will not cause the mutex holder to inherit the priority of the blocked task.

Note 3: A receive (in the case of a queue) or take (in the case of a semaphore) operation must not be performed on a member of a queue set unless a call to xQueueSelectFromSet() has first returned a handle to that set member.

**Parameters**
- xQueueSet – The queue set on which the task will (potentially) block.
- xTicksToWait – The maximum time, in ticks, that the calling task will remain in the Blocked state (with other tasks executing) to wait for a member of the queue set to be ready for a successful queue read or semaphore take operation.

**Returns**
xQueueSelectFromSet() will return the handle of a queue (cast to a QueueSetMemberHandle_t type) contained in the queue set that contains data, or the handle of a semaphore (cast to a QueueSetMemberHandle_t type) contained in the queue set that is available, or NULL if no such queue or semaphore exists before before the specified block time expires.

**QueueSetMemberHandle_t xQueueSelectFromSetFromISR (QueueSetHandle_t xQueueSet)**

A version of xQueueSelectFromSet() that can be used from an ISR.

**Macros**

**xQueueCreate (uxQueueLength, uxItemSize)**

Creates a new queue instance, and returns a handle by which the new queue can be referenced.

Internally, within the FreeRTOS implementation, queues use two blocks of memory. The first block is used to hold the queue’s data structures. The second block is used to hold items placed into the queue. If a queue is created using xQueueCreate() then both blocks of memory are automatically dynamically allocated inside the xQueueCreate() function. (see https://www.FreeRTOS.org/a00111.html). If a queue is created using xQueueCreateStatic() then the application writer must provide the memory that will get used by the queue. xQueueCreateStatic() therefore allows a queue to be created without using any dynamic memory allocation.

Example usage:

```c
struct AMessage
{
    char ucMessageID;
    char ucData[ 20 ];
};

void vATask( void *pvParameters )
{
    QueueHandle_t xQueue1, xQueue2;

    // Create a queue capable of containing 10 uint32_t values.
    xQueue1 = xQueueCreate( 10, sizeOf( uint32_t ) );
    if( xQueue1 == 0 )
    {
        // Queue was not created and must not be used.
    }

    // Create a queue capable of containing 10 pointers to AMessage structures.
```

(continues on next page)
// These should be passed by pointer as they contain a lot of data.
xQueue2 = xQueueCreate( 10, sizeof( struct AMessage * ) );
if( xQueue2 == 0 )
{
    // Queue was not created and must not be used.
}
// ... Rest of task code.

Parameters

• **uxQueueLength** - The maximum number of items that the queue can contain.
• **uxItemSize** - The number of bytes each item in the queue will require. Items are queued by copy, not by reference, so this is the number of bytes that will be copied for each posted item. Each item on the queue must be the same size.

**Returns** If the queue is successfully created then a handle to the newly created queue is returned. If the queue cannot be created then 0 is returned.

**xQueueCreateStatic** (uxQueueLength, uxItemSize, pucQueueStorage, pxQueueBuffer)

Creates a new queue instance, and returns a handle by which the new queue can be referenced.

Internally, within the FreeRTOS implementation, queues use two blocks of memory. The first block is used to hold the queue’s data structures. The second block is used to hold items placed into the queue. If a queue is created using xQueueCreate() then both blocks of memory are automatically dynamically allocated inside the xQueueCreate() function. (see [https://www.FreeRTOS.org/a00111.html](https://www.FreeRTOS.org/a00111.html)). If a queue is created using xQueueCreateStatic() then the application writer must provide the memory that will get used by the queue. xQueueCreateStatic() therefore allows a queue to be created without using any dynamic memory allocation.

Example usage:

```c
struct AMessage
{
    char ucMessageID;
    char ucData[ 20 ];
};

#define QUEUE_LENGTH 10
#define ITEM_SIZE sizeof( uint32_t )

// xQueueBuffer will hold the queue structure.
StaticQueue_t xQueueBuffer;

// ucQueueStorage will hold the items posted to the queue. Must be at least
// [ (queue length) * ( queue item size) ] bytes long.
uint8_t ucQueueStorage[ QUEUE_LENGTH * ITEM_SIZE ];

void vATask( void *pvParameters )
{
    QueueHandle_t xQueue1;

    // Create a queue capable of containing 10 uint32_t values.
xQueue1 = xQueueCreate( QUEUE_LENGTH, // The number of items the queue can...
                        ITEM_SIZE     // The size of each item in the queue
                        & ucQueueStorage[ 0 ] ), // The buffer that will...
                        & xQueueBuffer ); // The buffer that will hold the...
                        queue structure.
```

(continues on next page)
// The queue is guaranteed to be created successfully as no dynamic memory
// allocation is used. Therefore xQueue1 is now a handle to a valid queue.

... Rest of task code.

Parameters

- **uxQueueLength** - The maximum number of items that the queue can contain.
- **uxItemSize** - The number of bytes each item in the queue will require. Items are queued by copy, not by reference, so this is the number of bytes that will be copied for each posted item. Each item on the queue must be the same size.
- **pucQueueStorage** - If uxItemSize is not zero then pucQueueStorage must point to a uint8_t array that is at least large enough to hold the maximum number of items that can be in the queue at any one time - which is (uxQueueLength * uxItemSize) bytes. If uxItemSize is zero then pucQueueStorage can be NULL.
- **pxQueueBuffer** - Must point to a variable of type StaticQueue_t, which will be used to hold the queue’s data structure.

Returns If the queue is created then a handle to the created queue is returned. If pxQueueBuffer is NULL then NULL is returned.

**xQueueGetStaticBuffers** (xQueue, ppucQueueStorage, ppxStaticQueue)

Retrieve pointers to a statically created queue’s data structure buffer and storage area buffer. These are the same buffers that are supplied at the time of creation.

Parameters

- **xQueue** - The queue for which to retrieve the buffers.
- **ppucQueueStorage** - Used to return a pointer to the queue’s storage area buffer.
- **pxxStaticQueue** - Used to return a pointer to the queue’s data structure buffer.

Returns pdTRUE if buffers were retrieved, pdFALSE otherwise.

**xQueueSendToFront** (xQueue, pvItemToQueue, xTicksToWait)

Post an item to the front of a queue. The item is queued by copy, not by reference. This function must not be called from an interrupt service routine. See xQueueSendFromISR() for an alternative which may be used in an ISR.

Example usage:

```c
struct AMessage
{
    char ucMessageID;
    char ucData[20];
} xMessage;

uint32_t ulVar = 10UL;

void vATask( void *pvParameters )
{
    QueueHandle_t xQueue1, xQueue2;
    struct AMessage *pxMessage;

    // Create a queue capable of containing 10 uint32_t values.
    xQueue1 = xQueueCreate( 10, sizeof( uint32_t ) );

    // Create a queue capable of containing 10 pointers to AMessage structures.
    // These should be passed by pointer as they contain a lot of data.
    xQueue2 = xQueueCreate( 10, sizeof( struct AMessage * ) );
}
```

(continues on next page)
// ...
if (xQueue1 != 0)
{
    // Send an uint32_t. Wait for 10 ticks for space to become
    // available if necessary.
    if (xQueueSendToFront( xQueue1, (void *) &ulVar, (TickType_t) 10 ) != pdPASS )
    {
        // Failed to post the message, even after 10 ticks.
    }
}

if (xQueue2 != 0)
{
    // Send a pointer to a struct AMessage object. Don't block if the
    // queue is already full.
    pxMessage = &xMessage;
    xQueueSendToFront( xQueue2, (void *) pxMessage, (TickType_t) 0 );
}

// ... Rest of task code.

Parameters
- **xQueue** - The handle to the queue on which the item is to be posted.
- **pvItemToQueue** - A pointer to the item that is to be placed on the queue. The size of
  the items the queue will hold was defined when the queue was created, so this many bytes
  will be copied from pvItemToQueue into the queue storage area.
- **xTicksToWait** - The maximum amount of time the task should block waiting for space
  to become available on the queue, should it already be full. The call will return immediately
  if this is set to 0 and the queue is full. The time is defined in tick periods so the constant
  portTICK_PERIOD_MS should be used to convert to real time if this is required.

Returns pdTRUE if the item was successfully posted, otherwise errQUEUE_FULL.

xQueueSendToBack (xQueue, pvItemToQueue, xTicksToWait)
This is a macro that calls xQueueGenericSend().

Post an item to the back of a queue. The item is queued by copy, not by reference. This function must not be
called from an interrupt service routine. See xQueueSendFromISR () for an alternative which may be used in
an ISR.

Example usage:

```c
struct AMessage
{
    char ucMessageID;
    char ucData[20];
} xMessage;

uint32_t ulVar = 10UL;

void vATask ( void *pvParameters )
{
    QueueHandle_t xQueue1, xQueue2;
    struct AMessage *pxMessage;
```
// Create a queue capable of containing 10 uint32_t values.
xQueue1 = xQueueCreate( 10, sizeof( uint32_t ) );

// Create a queue capable of containing 10 pointers to AMessage structures.
// These should be passed by pointer as they contain a lot of data.
xQueue2 = xQueueCreate( 10, sizeof( struct AMessage * ) );

// ...
if( xQueue1 != 0 )
{
    // Send an uint32_t. Wait for 10 ticks for space to become
    // available if necessary.
    if( xQueueSendToBack( xQueue1, ( void * ) &ulVar, ( TickType_t ) 10 ) != pdPASS )
    {
        // Failed to post the message, even after 10 ticks.
    }
}

if( xQueue2 != 0 )
{
    // Send a pointer to a struct AMessage object. Don't block if the
    // queue is already full.
    pxMessage = & xMessage;
    xQueueSendToBack( xQueue2, ( void * ) &pxMessage, ( TickType_t ) 0 );
}

// ... Rest of task code.

Parameters

- xQueue - The handle to the queue on which the item is to be posted.
- pvItemToQueue - A pointer to the item that is to be placed on the queue. The size of
  the items the queue will hold was defined when the queue was created, so this many bytes
  will be copied from pvItemToQueue into the queue storage area.
- xTicksToWait - The maximum amount of time the task should block waiting for space
  to become available on the queue, should it already be full. The call will return immediately
  if this is set to 0 and the queue is full. The time is defined in tick periods so the constant
  portTICK_PERIOD_MS should be used to convert to real time if this is required.

Returns

pdTRUE if the item was successfully posted, otherwise errQUEUE_FULL.

xQueueSend(xQueue, pvItemToQueue, xTicksToWait)

This is a macro that calls xQueueGenericSend(). It is included for backward compatibility with versions of
FreeRTOS.org that did not include the xQueueSendToFront() and xQueueSendToBack() macros. It is equiva-
lent to xQueueSendToBack().

Post an item on a queue. The item is queued by copy, not by reference. This function must not be called from
an interrupt service routine. See xQueueSendFromISR() for an alternative which may be used in an ISR.

Example usage:

```c
struct AMessage
{
    char ucMessageID;
    char ucData[ 20 ];
} xMessage;
```

(continues on next page)
```c
uint32_t ulVar = 10UL;

void vATask( void *pvParameters )
{
   QueueHandle_t xQueue1, xQueue2;
   struct AMessage *pxMessage;

   // Create a queue capable of containing 10 uint32_t values.
   xQueue1 = xQueueCreate( 10, sizeof( uint32_t ) );

   // Create a queue capable of containing 10 pointers to AMessage structures.
   // These should be passed by pointer as they contain a lot of data.
   xQueue2 = xQueueCreate( 10, sizeof( struct AMessage * ) );

   // ...
   if( xQueue1 != 0 )
   {
      // Send an uint32_t. Wait for 10 ticks for space to become
      // available if necessary.
      if( xQueueSend( xQueue1, ( void * ) &ulVar, ( TickType_t ) 10 ) != pdPASS )
      {
         // Failed to post the message, even after 10 ticks.
      }
   }
   if( xQueue2 != 0 )
   {
      // Send a pointer to a struct AMessage object. Don't block if the
      // queue is already full.
      pxMessage = & xMessage;
      xQueueSend( xQueue2, ( void * ) &pxMessage, ( TickType_t ) 0 );
   }

   // ... Rest of task code.
}
```

**Parameters**

- **xQueue** - The handle to the queue on which the item is to be posted.
- **pvItemToQueue** - A pointer to the item that is to be placed on the queue. The size of the items the queue will hold was defined when the queue was created, so this many bytes will be copied from pvItemToQueue into the queue storage area.
- **xBitsToWait** - The maximum amount of time the task should block waiting for space to become available on the queue, should it already be full. The call will return immediately if this is set to 0 and the queue is full. The time is defined in tick periods so the constant portTICK_PERIOD_MS should be used to convert to real time if this is required.

**Returns**

pdTRUE if the item was successfully posted, otherwise errQUEUE_FULL.

---

**xQueueOverwrite** (xQueue, pvItemToQueue)

Only for use with queues that have a length of one - so the queue is either empty or full.

Post an item on a queue. If the queue is already full then overwrite the value held in the queue. The item is queued by copy, not by reference.

This function must not be called from an interrupt service routine. See xQueueOverwriteFromISR () for an alternative which may be used in an ISR.

**Example usage:**
```c
void vFunction( void *pvParameters )
{
    QueueHandle_t xQueue;
    uint32_t ulVarToSend, ulValReceived;

    // Create a queue to hold one uint32_t value. It is strongly
    // recommended *not* to use xQueueOverwrite() on queues that can
    // contain more than one value, and doing so will trigger an assertion
    // if configASSERT() is defined.
    xQueue = xQueueCreate( 1, sizeof( uint32_t ) );

    // Write the value 10 to the queue using xQueueOverwrite().
    ulVarToSend = 10;
    xQueueOverwrite( xQueue, &ulVarToSend );

    // Peeking the queue should now return 10, but leave the value 10 in
    // the queue. A block time of zero is used as it is known that the
    // queue holds a value.
    ulValReceived = 0;
    xQueuePeek( xQueue, &ulValReceived, 0 );

    if( ulValReceived != 10 )
    {
        // Error unless the item was removed by a different task.
    }

    // The queue is still full. Use xQueueOverwrite() to overwrite the
    // value held in the queue with 100.
    ulVarToSend = 100;
    xQueueOverwrite( xQueue, &ulVarToSend );

    // This time read from the queue, leaving the queue empty once more.
    // A block time of 0 is used again.
    xQueueReceive( xQueue, &ulValReceived, 0 );

    // The value read should be the last value written, even though the
    // queue was already full when the value was written.
    if( ulValReceived != 100 )
    {
        // Error!
    }

    // ...
}
```

**Parameters**

- **xQueue** – The handle of the queue to which the data is being sent.
- **pvItemToQueue** – A pointer to the item that is to be placed on the queue. The size of the items the queue will hold was defined when the queue was created, so this many bytes will be copied from pvItemToQueue into the queue storage area.

**Returns**

`xQueueOverwrite()` is a macro that calls `xQueueGenericSend()`, and therefore has the same return values as `xQueueSendToFront()`. However, `pdPASS` is the only value that can be returned because `xQueueOverwrite()` will write to the queue even when the queue is already full.

**xQueueSendToFrontFromISR(xQueue, pvItemToQueue, pxHigherPriorityTaskWoken)**

This is a macro that calls `xQueueGenericSendToFrontFromISR()`.

Post an item to the front of a queue. It is safe to use this macro from within an interrupt service routine.

Items are queued by copy not reference so it is preferable to only queue small items, especially when called
from an ISR. In most cases it would be preferable to store a pointer to the item being queued.

Example usage for buffered IO (where the ISR can obtain more than one value per call):

```c
void vBufferISR( void )
{
    char cIn;
    BaseType_t xHigherPriorityTaskWoken;

    // We have not woken a task at the start of the ISR.
    xHigherPriorityTaskWoken = pdFALSE;

    // Loop until the buffer is empty.
    do
    {
        // Obtain a byte from the buffer.
        cIn = portINPUT_BYTE( RX_REGISTER_ADDRESS );

        // Post the byte.
        xQueueSendToFrontFromISR( xRxQueue, &cIn, &xHigherPriorityTaskWoken );
    } while( portINPUT_BYTE( BUFFER_COUNT ) );

    // Now the buffer is empty we can switch context if necessary.
    if( xHigherPriorityTaskWoken )
    {
        taskYIELD ();
    }
}
```

**Parameters**

- `xQueue` - The handle to the queue on which the item is to be posted.
- `pvItemToQueue` - A pointer to the item that is to be placed on the queue. The size of the items the queue will hold was defined when the queue was created, so this many bytes will be copied from `pvItemToQueue` into the queue storage area.
- `pxHigherPriorityTaskWoken` - `xQueueSendToFrontFromISR()` will set `*pxHigherPriorityTaskWoken` to `pdTRUE` if sending to the queue caused a task to unblock, and the unblocked task has a priority higher than the currently running task. If `xQueueSendToFrontFromISR()` sets this value to `pdTRUE` then a context switch should be requested before the interrupt is exited.

**Returns**

`pdTRUE` if the data was successfully sent to the queue, otherwise `errQUEUE_FULL`.

`xQueueSendToBackFromISR` (xQueue, pvItemToQueue, pxHigherPriorityTaskWoken)

This is a macro that calls `xQueueGenericSendFromISR()`.

Post an item to the back of a queue. It is safe to use this macro from within an interrupt service routine.

Items are queued by copy not reference so it is preferable to only queue small items, especially when called from an ISR. In most cases it would be preferable to store a pointer to the item being queued.

Example usage for buffered IO (where the ISR can obtain more than one value per call):

```c
void vBufferISR( void )
{
    char cIn;
    BaseType_t xHigherPriorityTaskWoken;

    // We have not woken a task at the start of the ISR.
    xHigherPriorityTaskWoken = pdFALSE;
```

(continues on next page)
// Loop until the buffer is empty.
    do
    {
        // Obtain a byte from the buffer.
        cIn = portINPUT_BYTE( RX_REGISTER_ADDRESS );

        // Post the byte.
        xQueueSendToBackFromISR( xRxQueue, &cIn, &xHigherPriorityTaskWoken );
    } while( portINPUT_BYTE( BUFFER_COUNT ) );

    // Now the buffer is empty we can switch context if necessary.
    if( xHigherPriorityTaskWoken )
        taskYIELD();

---

### Parameters

- **xQueue** - The handle to the queue on which the item is to be posted.
- **pvItemToQueue** - A pointer to the item that is to be placed on the queue. The size of the items the queue will hold was defined when the queue was created, so this many bytes will be copied from pvItemToQueue into the queue storage area.
- **pxHigherPriorityTaskWoken** - `xQueueSendToBackFromISR()` will set *px-HigherPriorityTaskWoken to pdTRUE if sending to the queue caused a task to unblock, and the unblocked task has a priority higher than the currently running task. If `xQueueSendToBackFromISR()` sets this value to pdTRUE then a context switch should be requested before the interrupt is exited.

### Returns

- pdTRUE if the data was successfully sent to the queue, otherwise errQUEUE_FULL.

---

### xQueueOverwriteFromISR(xQueue, pvItemToQueue, pxHigherPriorityTaskWoken)

A version of `xQueueOverwrite()` that can be used in an interrupt service routine (ISR).

Only for use with queues that can hold a single item - so the queue is either empty or full.

Post an item on a queue. If the queue is already full then overwrite the value held in the queue. The item is queued by copy, not by reference.

---

Example usage:

```c
QueueHandle_t xQueue;

void vFunction( void *pvParameters )
{
    // Create a queue to hold one uint32_t value. It is strongly
    // recommended *not* to use xQueueOverwriteFromISR() on queues that can
    // contain more than one value, and doing so will trigger an assertion
    // if configASSERT() is defined.
    xQueue = xQueueCreate( 1, sizeof( uint32_t ) );
}

void vAnInterruptHandler( void )
{
    // xHigherPriorityTaskWoken must be set to pdFALSE before it is used.
    BaseType_t xHigherPriorityTaskWoken = pdFALSE;
    uint32_t ulVarToSend, ulValReceived;
    // (continues on next page)
```
/ Write the value 10 to the queue using xQueueOverwriteFromISR().
ulVarToSend = 10;
xQueueOverwriteFromISR( xQueue, &ulVarToSend, &xHigherPriorityTaskWoken );

// The queue is full, but calling xQueueOverwriteFromISR() again will still
// pass because the value held in the queue will be overwritten with the
// new value.
ulVarToSend = 100;
xQueueOverwriteFromISR( xQueue, &ulVarToSend, &xHigherPriorityTaskWoken );

// Reading from the queue will now return 100.

// ...

if( xHigherPriorityTaskWoken == pdTRUE )
{
    // Writing to the queue caused a task to unblock and the unblocked task
    // has a priority higher than or equal to the priority of the currently
    // executing task (the task this interrupt interrupted). Perform a-
    // context
    // switch so this interrupt returns directly to the unblocked task.
    portYIELD_FROM_ISR(); // or portEND_SWITCHING_ISR() depending on the port.
}

/*
 Parameters

- xQueue - The handle to the queue on which the item is to be posted.
- pvItemToQueue - A pointer to the item that is to be placed on the queue. The size of
  the items the queue will hold was defined when the queue was created, so this many bytes
  will be copied from pvItemToQueue into the queue storage area.
- pxHigherPriorityTaskWoken - xQueueOverwriteFromISR() will set *pxHigherPriorityTaskWoken to pdTRUE if sending to the queue caused a task to unblock, and the unblocked task has a priority higher than the currently running task. If xQueueOverwriteFromISR() sets this value to pdTRUE then a context switch should be requested before the interrupt is exited.

Returns xQueueOverwriteFromISR() is a macro that calls xQueueGenericSendFromISR(), and therefore has the same return values as xQueueSendToFrontFromISR(). However, pdPASS is the only value that can be returned because xQueueOverwriteFromISR() will write to the queue even when the queue is already full.

xQueueSendFromISR (xQueue, pvItemToQueue, pxHigherPriorityTaskWoken)
This is a macro that calls xQueueGenericSendFromISR(). It is included for backward compatibility with versions of FreeRTOS.org that did not include the xQueueSendToBackFromISR() and xQueueSendToFrontFromISR() macros.

Post an item to the back of a queue. It is safe to use this function from within an interrupt service routine. Items are queued by copy not reference so it is preferable to only queue small items, especially when called from an ISR. In most cases it would be preferable to store a pointer to the item being queued.

Example usage for buffered IO (where the ISR can obtain more than one value per call):

void vBufferISR( void )
{
    char cIn;
    BaseType_t xHigherPriorityTaskWoken;
    // We have not woken a task at the start of the ISR.
*/
```c
void xQueueSendFromISR(xQueue, pvItemToQueue, pxHigherPriorityTaskWoken);
```

**Parameters**

- `xQueue` - The handle to the queue on which the item is to be posted.
- `pvItemToQueue` - A pointer to the item that is to be placed on the queue. The size of the items the queue will hold was defined when the queue was created, so this many bytes will be copied from `pvItemToQueue` into the queue storage area.
- `pxHigherPriorityTaskWoken` - `xQueueSendFromISR()` will set `pxHigherPriorityTaskWoken` to `pdTRUE` if sending to the queue caused a task to unblock, and the unblocked task has a priority higher than the currently running task. If `xQueueSendFromISR()` sets this value to `pdTRUE` then a context switch should be requested before the interrupt is exited.

**Returns**

- `pdTRUE` if the data was successfully sent to the queue, otherwise `errQUEUE_FULL`.

```c
xQueueReset(xQueue)
```

Reset a queue back to its original empty state. The return value is now obsolete and is always set to `pdPASS`.

**Type Definitions**

typedef struct QueueDefinition *QueueHandle_t

typedef struct QueueDefinition *QueueSetHandle_t

Type by which queue sets are referenced. For example, a call to `xQueueCreateSet()` returns an `xQueueSet` variable that can then be used as a parameter to `xQueueSelectFromSet()`, `xQueueAddToSet()`, etc.

```c
typedef struct QueueDefinition *QueueSetMemberHandle_t
```

Queue sets can contain both queues and semaphores, so the `QueueSetMemberHandle_t` is defined as a type to be used where a parameter or return value can be either an `QueueHandle_t` or an `SemaphoreHandle_t`.

**Semaphore API**

**Header File**

- `components/freertos/FreeRTOS-Kernel/include/freertos/semphr.h`
- This header file can be included with:
#include "freertos/semphr.h"

**Macros**

- `semBINARY_SEMAPHORE_QUEUE_LENGTH`
- `semSEMAPHORE_QUEUE_ITEM_LENGTH`
- `semGIVE_BLOCK_TIME`

**vSemaphoreCreateBinary** (xSemaphore)

In many usage scenarios it is faster and more memory efficient to use a direct to task notification in place of a binary semaphore! [https://www.FreeRTOS.org/RTOS-task-notifications.html](https://www.FreeRTOS.org/RTOS-task-notifications.html)

This old vSemaphoreCreateBinary() macro is now deprecated in favour of the xSemaphoreCreateBinary() function. Note that binary semaphores created using the vSemaphoreCreateBinary() macro are created in a state such that the first call to ‘take’ the semaphore would pass, whereas binary semaphores created using xSemaphoreCreateBinary() are created in a state such that the the semaphore must first be ‘given’ before it can be ‘taken’.

**Macro** that implements a semaphore by using the existing queue mechanism. The queue length is 1 as this is a binary semaphore. The data size is 0 as we don’t want to actually store any data - we just want to know if the queue is empty or full.

This type of semaphore can be used for pure synchronisation between tasks or between an interrupt and a task. The semaphore need not be given back once obtained, so one task/interrupt can continuously ‘give’ the semaphore while another continuously ‘takes’ the semaphore. For this reason this type of semaphore does not use a priority inheritance mechanism. For an alternative that does use priority inheritance see xSemaphoreCreateMutex().

Example usage:

```c
SemaphoreHandle_t xSemaphore = NULL;

void vATask( void * pvParameters )
{
    // Semaphore cannot be used before a call to vSemaphoreCreateBinary ().
    // This is a macro so pass the variable in directly.
    vSemaphoreCreateBinary( xSemaphore );

    if( xSemaphore != NULL )
    {
        // The semaphore was created successfully.
        // The semaphore can now be used.
    }
}
```

**Parameters**

- `xSemaphore` – Handle to the created semaphore. Should be of type SemaphoreHandle_t.

**xSemaphoreCreateBinary**()

Creates a new binary semaphore instance, and returns a handle by which the new semaphore can be referenced.

In many usage scenarios it is faster and more memory efficient to use a direct to task notification in place of a binary semaphore! [https://www.FreeRTOS.org/RTOS-task-notifications.html](https://www.FreeRTOS.org/RTOS-task-notifications.html)
Internally, within the FreeRTOS implementation, binary semaphores use a block of memory, in which the semaphore structure is stored. If a binary semaphore is created using \texttt{xSemaphoreCreateBinary()} then the required memory is automatically dynamically allocated inside the \texttt{xSemaphoreCreateBinary()} function. (see https://www.FreeRTOS.org/a00111.html). If a binary semaphore is created using \texttt{xSemaphoreCreateBinaryStatic()} then the application writer must provide the memory. \texttt{xSemaphoreCreateBinaryStatic()} therefore allows a binary semaphore to be created without using any dynamic memory allocation.

The old \texttt{vSemaphoreCreateBinary()} macro is now deprecated in favour of this \texttt{xSemaphoreCreateBinary()} function. Note that binary semaphores created using the \texttt{xSemaphoreCreateBinary()} macro are created in a state such that the first call to ‘take’ the semaphore would pass, whereas binary semaphores created using \texttt{xSemaphoreCreateBinary()} are created in a state such that the semaphore must first be ‘given’ before it can be ‘taken’.

This type of semaphore can be used for pure synchronisation between tasks or between an interrupt and a task. The semaphore need not be given back once obtained, so one task/interrupt can continuously ‘give’ the semaphore while another continuously ‘takes’ the semaphore. For this reason this type of semaphore does not use a priority inheritance mechanism. For an alternative that does use priority inheritance see \texttt{xSemaphoreCreateMutex()}.

Example usage:

```c
SemaphoreHandle_t xSemaphore = NULL;

void vATask( void * pvParameters )
{
    // Semaphore cannot be used before a call to xSemaphoreCreateBinary().
    // This is a macro so pass the variable in directly.
    xSemaphore = xSemaphoreCreateBinary();

    if( xSemaphore != NULL )
    {
        // The semaphore was created successfully.
        // The semaphore can now be used.
    }
}
```

**Returns** Handle to the created semaphore, or NULL if the memory required to hold the semaphore’s data structures could not be allocated.

\textbf{xSemaphoreCreateBinaryStatic} (pxStaticSemaphore)

Creates a new binary semaphore instance, and returns a handle by which the new semaphore can be referenced.

**NOTE:** In many usage scenarios it is faster and more memory efficient to use a direct to task notification in place of a binary semaphore! https://www.FreeRTOS.org/RTOS-task-notifications.html

Internally, within the FreeRTOS implementation, binary semaphores use a block of memory, in which the semaphore structure is stored. If a binary semaphore is created using \texttt{xSemaphoreCreateBinary()} then the required memory is automatically dynamically allocated inside the \texttt{xSemaphoreCreateBinary()} function. (see https://www.FreeRTOS.org/a00111.html). If a binary semaphore is created using \texttt{xSemaphoreCreateBinaryStatic()} then the application writer must provide the memory. \texttt{xSemaphoreCreateBinaryStatic()} therefore allows a binary semaphore to be created without using any dynamic memory allocation.

This type of semaphore can be used for pure synchronisation between tasks or between an interrupt and a task. The semaphore need not be given back once obtained, so one task/interrupt can continuously ‘give’ the semaphore while another continuously ‘takes’ the semaphore. For this reason this type of semaphore does not use a priority inheritance mechanism. For an alternative that does use priority inheritance see \texttt{xSemaphoreCreateMutex()}.

Example usage:
SemaphoreHandle_t xSemaphore = NULL;
StaticSemaphore_t xSemaphoreBuffer;

void vATask( void * pvParameters )
{
    // Semaphore cannot be used before a call to xSemaphoreCreateBinary().
    // The semaphore's data structures will be placed in the xSemaphoreBuffer variable, the address of which is passed into the function. The
    // function's parameter is not NULL, so the function will not attempt any
    // dynamic memory allocation, and therefore the function will not return
    // return NULL.
    xSemaphore = xSemaphoreCreateBinary( &xSemaphoreBuffer );
}

// Rest of task code goes here.

Parameters

• pxStaticSemaphore—Must point to a variable of type StaticSemaphore_t, which will
  then be used to hold the semaphore’s data structure, removing the need for the memory
to be allocated dynamically.

Returns
If the semaphore is created then a handle to the created semaphore is returned. If
pxSemaphoreBuffer is NULL then NULL is returned.

xSemaphoreTake(xSemaphore, xBlockTime)

Macro to obtain a semaphore. The semaphore must have previously been created with a call to xSemaphoreCreateBinary(), xSemaphoreCreateMutex() or xSemaphoreCreateCounting().

Example usage:

SemaphoreHandle_t xSemaphore = NULL;

// A task that creates a semaphore.
void vATask( void * pvParameters )
{
    // Create the semaphore to guard a shared resource.
    xSemaphore = xSemaphoreCreateBinary();
}

// A task that uses the semaphore.
void vAnotherTask( void * pvParameters )
{
    // ... Do other things.

    if( xSemaphore != NULL )
    {
        // See if we can obtain the semaphore. If the semaphore is not available
        // wait 10 ticks to see if it becomes free.
        if( xSemaphoreTake( xSemaphore, (TickType_t) 10 ) == pdTRUE )
        {
            // We were able to obtain the semaphore and can now access the
            // shared resource.

            // ...

            // We have finished accessing the shared resource. Release the
            // semaphore.
            xSemaphoreGive( xSemaphore );
        }
        else
        {
            // Semaphore is not available, so we wait 10 more ticks to see if it
            // becomes free.
            vTaskDelay( ( TickType_t ) 10 );
            xSemaphoreTake( xSemaphore, (TickType_t) 10 ) == pdTRUE
        }
    }
}

(continues on next page)
{ // We could not obtain the semaphore and can therefore not access // the shared resource safely.
}
}

Parameters

- **xSemaphore** - A handle to the semaphore being taken - obtained when the semaphore was created.
- **xBlockTime** - The time in ticks to wait for the semaphore to become available. The macro portTICK_PERIOD_MS can be used to convert this to a real time. A block time of zero can be used to poll the semaphore. A block time of portMAX_DELAY can be used to block indefinitely (provided INCLUDE_vTaskSuspend is set to 1 in FreeRTOSConfig.h).

Returns pdTRUE if the semaphore was obtained. pdFALSE if xBlockTime expired without the semaphore becoming available.

```c
xSemaphoreTakeRecursive(xMutex, xBlockTime)
```

Macro to recursively obtain, or ‘take’, a mutex type semaphore. The mutex must have previously been created using a call to xSemaphoreCreateRecursiveMutex();

configUSE_RECURSIVE_MUTEXES must be set to 1 in FreeRTOSConfig.h for this macro to be available.

This macro must not be used on mutexes created using xSemaphoreCreateMutex().

A mutex used recursively can be ‘taken’ repeatedly by the owner. The mutex doesn’t become available again until the owner has called xSemaphoreGiveRecursive() for each successful ‘take’ request. For example, if a task successfully ‘takes’ the same mutex 5 times then the mutex will not be available to any other task until it has also ‘given’ the mutex back exactly five times.

Example usage:

```c
SemaphoreHandle_t xMutex = NULL;

// A task that creates a mutex.
void vATask( void * pvParameters )
{
    // Create the mutex to guard a shared resource.
    xMutex = xSemaphoreCreateRecursiveMutex();
}

// A task that uses the mutex.
void vAnotherTask( void * pvParameters )
{
    // ... Do other things.
    if( xMutex != NULL )
    {
        // See if we can obtain the mutex. If the mutex is not available // wait 10 ticks to see if it becomes free.
        if( xSemaphoreTakeRecursive( xSemaphore, ( TickType_t ) 10 ) == pdTRUE )
        {
            // We were able to obtain the mutex and can now access the // shared resource.
            // ...
            // For some reason due to the nature of the code further calls to // xSemaphoreTakeRecursive() are made on the same mutex. In real // code these would not be just sequential calls as this would make
```
API Reference

Chapter 2

(continued from previous page)

// no sense. Instead the calls are likely to be buried inside
// a more complex call structure.
xSemaphoreTakeRecursive( xMutex, (TickType_t)10 );
xSemaphoreTakeRecursive( xMutex, (TickType_t)10 );

// The mutex has now been 'taken' three times, so will not be
// available to another task until it has also been given back
// three times. Again it is unlikely that real code would have
// these calls sequentially, but instead buried in a more complex
// call structure. This is just for illustrative purposes.
xSemaphoreGiveRecursive( xMutex );
xSemaphoreGiveRecursive( xMutex );
xSemaphoreGiveRecursive( xMutex );

// Now the mutex can be taken by other tasks.
}
else
{
    // We could not obtain the mutex and can therefore not access
    // the shared resource safely.
}
}
}

Parameters

- **xMutex** - A handle to the mutex being obtained. This is the handle returned by
  xSemaphoreCreateRecursiveMutex();
- **xBlockTime** - The time in ticks to wait for the semaphore to become available. The
  macro portTICK_PERIOD_MS can be used to convert this to a real time. A block time
  of zero can be used to poll the semaphore. If the task already owns the semaphore then
  xSemaphoreTakeRecursive() will return immediately no matter what the value of xBlock-
  Time.

Returns pdTRUE if the semaphore was obtained. pdFALSE if xBlockTime expired without the
semaphore becoming available.

**xSemaphoreGive**(xSemaphore)

Macro to release a semaphore. The semaphore must have previously been created with a call to
xSemaphoreCreateBinary(), xSemaphoreCreateMutex() or xSemaphoreCreateCounting(). and obtained using
xSemaphoreTake().

This macro must not be used from an ISR. See xSemaphoreGiveFromISR () for an alternative which can be
used from an ISR.

This macro must also not be used on semaphores created using xSemaphoreCreateRecursiveMutex().

Example usage:

```c
SemaphoreHandle_t xSemaphore = NULL;

void vATask( void * pvParameters )
{
    // Create the semaphore to guard a shared resource.
    // xSemaphore - vSemaphoreCreateBinary();

    if( xSemaphore != NULL )
    {
        if( xSemaphoreGive( xSemaphore ) != pdTRUE )
```
// We would expect this call to fail because we cannot give
// a semaphore without first "taking" it!

// Obtain the semaphore - don't block if the semaphore is not
// immediately available.
if (xSemaphoreTake(xSemaphore, (TickType_t)0))
{
    // We now have the semaphore and can access the shared resource.
    // ...

    // We have finished accessing the shared resource so can free the
    // semaphore.
    if (xSemaphoreGive(xSemaphore) != pdTRUE)
    {
        // We would not expect this call to fail because we must have
        // obtained the semaphore to get here.
    }
}
}

Parameters

- **xSemaphore** - A handle to the semaphore being released. This is the handle returned when the semaphore was created.

Returns

- pdTRUE if the semaphore was released.
- pdFALSE if an error occurred. Semaphores are implemented using queues. An error can occur if there is no space on the queue to post a message - indicating that the semaphore was not first obtained correctly.

### xSemaphoreGiveRecursive(xMutex)

*Macro* to recursively release, or ‘give’ , a mutex type semaphore. The mutex must have previously been created using a call to xSemaphoreCreateRecursiveMutex();

configUSE_RECURSIVE_MUTEXES must be set to 1 in FreeRTOSConfig.h for this macro to be available.

This macro must not be used on mutexes created using xSemaphoreCreateMutex().

A mutex used recursively can be ‘taken’ repeatedly by the owner. The mutex doesn’t become available again until the owner has called xSemaphoreGiveRecursive() for each successful ‘take’ request. For example, if a task successfully ‘takes’ the same mutex 5 times then the mutex will not be available to any other task until it has also ‘given’ the mutex back exactly five times.

Example usage:

```c
SemaphoreHandle_t xMutex = NULL;

// A task that creates a mutex.
void vATask( void * pvParameters )
{
    // Create the mutex to guard a shared resource.
    xMutex = xSemaphoreCreateRecursiveMutex();
}

// A task that uses the mutex.
void vAnotherTask( void * pvParameters )
{
    // ... Do other things.
}
```

(continues on next page)
if( xMutex != NULL )
{
    // See if we can obtain the mutex. If the mutex is not available
    // wait 10 ticks to see if it becomes free.
    if( xSemaphoreTakeRecursive( xMutex, (TickType_t) 10 ) == pdTRUE )
    {
        // We were able to obtain the mutex and can now access the
        // shared resource.
        // ...
        // For some reason due to the nature of the code further calls to
        // xSemaphoreTakeRecursive() are made on the same mutex. In real
        // code these would not be just sequential calls as this would make
        // no sense. Instead the calls are likely to be buried inside
        // a more complex call structure.
        xSemaphoreTakeRecursive( xMutex, (TickType_t) 10 );
        xSemaphoreTakeRecursive( xMutex, (TickType_t) 10 );
        // The mutex has now been 'taken' three times, so will not be
        // available to another task until it has also been given back
        // three times. Again it is unlikely that real code would have
        // these calls sequentially, it would be more likely that the calls
        // to xSemaphoreGiveRecursive() would be called as a call stack
        // unwound. This is just for demonstrative purposes.
        xSemaphoreGiveRecursive( xMutex );
        xSemaphoreGiveRecursive( xMutex );
        xSemaphoreGiveRecursive( xMutex );
        // Now the mutex can be taken by other tasks.
    }
    else
    {
        // We could not obtain the mutex and can therefore not access
        // the shared resource safely.
    }
}

Parameters

• **xMutex** - A handle to the mutex being released, or ‘given’. This is the handle returned
  by xSemaphoreCreateMutex();

Returns  pdTRUE if the semaphore was given.

**xSemaphoreGiveFromISR(xSemaphore, pxHigherPriorityTaskWoken)**

*Macro* to release a semaphore. The semaphore must have previously been created with a call to
xSemaphoreCreateBinary() or xSemaphoreCreateCounting().

Mutex type semaphores (those created using a call to xSemaphoreCreateMutex()) must not be used with this
macro.

This macro can be used from an ISR.

Example usage:

```c
#define LONG_TIME 0xffff
#define TICKS_TO_WAIT 10
SemaphoreHandle_t xSemaphore = NULL;
// Repetitive task.
```
void vATask( void * pvParameters )
{
    for( ;; )
    {
// We want this task to run every 10 ticks of a timer. The semaphore
// was created before this task was started.

// Block waiting for the semaphore to become available.
    if( xSemaphoreTake( xSemaphore, LONG_TIME ) == pdTRUE )
    {
// It is time to execute.
// ...

// We have finished our task. Return to the top of the loop where
// we will block on the semaphore until it is time to execute
// again. Note when using the semaphore for synchronisation with an
// ISR in this manner there is no need to 'give' the semaphore back.
    }
}

// Timer ISR
void vTimerISR( void * pvParameters )
{
    static uint8_t ucLocalTickCount = 0;
    static BaseType_t xHigherPriorityTaskWoken;

    // A timer tick has occurred.
    // ... Do other time functions.
    // Is it time for vATask () to run?
    xHigherPriorityTaskWoken = pdFALSE;
    ucLocalTickCount++;
    if( ucLocalTickCount >= TICKS_TO_WAIT )
    {
// Unblock the task by releasing the semaphore.
        xSemaphoreGiveFromISR( xSemaphore, &xHigherPriorityTaskWoken );

// Reset the count so we release the semaphore again in 10 ticks time.
        ucLocalTickCount = 0;
    }
    if( xHigherPriorityTaskWoken != pdFALSE )
    {
// We can force a context switch here. Context switching from an
// ISR uses port specific syntax. Check the demo task for your port
// to find the syntax required.
    }
}

Parameters
- xSemaphore - A handle to the semaphore being released. This is the handle returned when the semaphore was created.
- pxHigherPriorityTaskWoken - xSemaphoreGiveFromISR() will set *pxHigherPriorityTaskWoken to pdTRUE if giving the semaphore caused a task to unblock, and the unblocked task has a priority higher than the currently running task. If xSemaphoreGiveFromISR() sets this value to pdTRUE then a context switch should be requested before the interrupt is exited.

Returns pdTRUE if the semaphore was successfully given, otherwise errQUEUE_FULL.
**xSemaphoreTakeFromISR** (xSemaphore, pxHigherPriorityTaskWoken)

*Macro* to take a semaphore from an ISR. The semaphore must have previously been created with a call to xSemaphoreCreateBinary() or xSemaphoreCreateCounting().

Mutex type semaphores (those created using a call to xSemaphoreCreateMutex()) must not be used with this macro.

This macro can be used from an ISR, however taking a semaphore from an ISR is not a common operation. It is likely to only be useful when taking a counting semaphore when an interrupt is obtaining an object from a resource pool (when the semaphore count indicates the number of resources available).

**Parameters**

- **xSemaphore** - A handle to the semaphore being taken. This is the handle returned when the semaphore was created.
- **pxHigherPriorityTaskWoken** - xSemaphoreTakeFromISR() will set *pxHigherPriorityTaskWoken* to pdTRUE if taking the semaphore caused a task to unblock, and the unblocked task has a priority higher than the currently running task. If xSemaphoreTakeFromISR() sets this value to pdTRUE then a context switch should be requested before the interrupt is exited.

**Returns** pdTRUE if the semaphore was successfully taken, otherwise pdFALSE

**xSemaphoreCreateMutex()**

Creates a new mutex type semaphore instance, and returns a handle by which the new mutex can be referenced.

Internally, within the FreeRTOS implementation, mutex semaphores use a block of memory, in which the mutex structure is stored. If a mutex is created using xSemaphoreCreateMutex() then the required memory is automatically dynamically allocated inside the xSemaphoreCreateMutex() function. (see https://www.FreeRTOS.org/a00111.html). If a mutex is created using xSemaphoreCreateMutexStatic() then the application writer must provided the memory. xSemaphoreCreateMutexStatic() therefore allows a mutex to be created without using any dynamic memory allocation.

Mutexes created using this function can be accessed using the xSemaphoreTake() and xSemaphoreGive() macros. The xSemaphoreTakeRecursive() and xSemaphoreGiveRecursive() macros must not be used.

This type of semaphore uses a priority inheritance mechanism so a task ‘taking’ a semaphore MUST ALWAYS ‘give’ the semaphore back once the semaphore it is no longer required.

Mutex type semaphores cannot be used from within interrupt service routines.

See xSemaphoreCreateBinary() for an alternative implementation that can be used for pure synchronisation (where one task or interrupt always ‘gives’ the semaphore and another always ‘takes’ the semaphore) and from within interrupt service routines.

**Example usage:**

```c
SemaphoreHandle_t xSemaphore;

void vATask( void * pvParameters )
{
    // Semaphore cannot be used before a call to xSemaphoreCreateMutex().
    // This is a macro so pass the variable in directly.
    xSemaphore = xSemaphoreCreateMutex();

    if( xSemaphore != NULL )
    {
        // The semaphore was created successfully.
        // The semaphore can now be used.
    }
}
```

**Returns** If the mutex was successfully created then a handle to the created semaphore is returned. If there was not enough heap to allocate the mutex data structures then NULL is returned.
**xSemaphoreCreateMutexStatic**(pxMutexBuffer)

Creates a new mutex type semaphore instance, and returns a handle by which the new mutex can be referenced.

Internally, within the FreeRTOS implementation, mutex semaphores use a block of memory, in which the mutex structure is stored. If a mutex is created using xSemaphoreCreateMutex() then the required memory is automatically dynamically allocated inside the xSemaphoreCreateMutex() function. (see https://www.FreeRTOS.org/a00111.html). If a mutex is created using xSemaphoreCreateMutexStatic() then the application writer must provided the memory. xSemaphoreCreateMutexStatic() therefore allows a mutex to be created without using any dynamic memory allocation.

Mutexes created using this function can be accessed using the xSemaphoreTake() and xSemaphoreGive() macros. The xSemaphoreTakeRecursive() and xSemaphoreGiveRecursive() macros must not be used.

This type of semaphore uses a priority inheritance mechanism so a task ‘taking’ a semaphore MUST ALWAYS ‘give’ the semaphore back once the semaphore it is no longer required.

Mutex type semaphores cannot be used from within interrupt service routines.

See xSemaphoreCreateBinary() for an alternative implementation that can be used for pure synchronisation (where one task or interrupt always ‘gives’ the semaphore and another always ‘takes’ the semaphore) and from within interrupt service routines.

**Example usage:**

```c
SemaphoreHandle_t xSemaphore;
StaticSemaphore_t xMutexBuffer;

void vATask( void * pvParameters )
{
    // A mutex cannot be used before it has been created. xMutexBuffer is
    // into xSemaphoreCreateMutexStatic() so no dynamic memory allocation is
    // attempted.
    xSemaphore = xSemaphoreCreateMutexStatic( &xMutexBuffer );

    // As no dynamic memory allocation was performed, xSemaphore cannot be NULL,
    // so there is no need to check it.
}
```

**Parameters**
- **pxMutexBuffer** – Must point to a variable of type StaticSemaphore_t, which will be used to hold the mutex’s data structure, removing the need for the memory to be allocated dynamically.

**Returns**
If the mutex was successfully created then a handle to the created mutex is returned. If pxMutexBuffer was NULL then NULL is returned.

**xSemaphoreCreateRecursiveMutex()**

Creates a new recursive mutex type semaphore instance, and returns a handle by which the new recursive mutex can be referenced.

Internally, within the FreeRTOS implementation, recursive mutexes use a block of memory, in which the mutex structure is stored. If a recursive mutex is created using xSemaphoreCreateRecursiveMutex() then the required memory is automatically dynamically allocated inside the xSemaphoreCreateRecursiveMutex() function. (see https://www.FreeRTOS.org/a00111.html). If a recursive mutex is created using xSemaphoreCreateRecursiveMutexStatic() then the application writer must provide the memory that will get used by the mutex. xSemaphoreCreateRecursiveMutexStatic() therefore allows a recursive mutex to be created without using any dynamic memory allocation.

Mutexes created using this macro can be accessed using the xSemaphoreTakeRecursive() and xSemaphoreGiveRecursive() macros. The xSemaphoreTake() and xSemaphoreGive() macros must not be used.

A mutex used recursively can be ‘taken’ repeatedly by the owner. The mutex doesn’t become available again until the owner has called xSemaphoreGiveRecursive() for each successful ‘take’ request. For example,
if a task successfully ‘takes’ the same mutex 5 times then the mutex will not be available to any other task until it has also ‘given’ the mutex back exactly five times.

This type of semaphore uses a priority inheritance mechanism so a task ‘taking’ a semaphore MUST ALWAYS ‘give’ the semaphore back once the semaphore it is no longer required.

Mutex type semaphores cannot be used from within interrupt service routines.

See xSemaphoreCreateBinary() for an alternative implementation that can be used for pure synchronisation (where one task or interrupt always ‘gives’ the semaphore and another always ‘takes’ the semaphore) and from within interrupt service routines.

Example usage:

```c
SemaphoreHandle_t xSemaphore;

void vATask( void * pvParameters )
{
    // Semaphore cannot be used before a call to xSemaphoreCreateMutex().
    // This is a macro so pass the variable in directly.
    xSemaphore = xSemaphoreCreateRecursiveMutex();

    if( xSemaphore != NULL )
    {
        // The semaphore was created successfully.
        // The semaphore can now be used.
    }
}
```

**Returns** xSemaphore Handle to the created mutex semaphore. Should be of type SemaphoreHandle_t.

**xSemaphoreCreateRecursiveMutexStatic** (pxStaticSemaphore)

Creates a new recursive mutex type semaphore instance, and returns a handle by which the new recursive mutex can be referenced.

Internally, within the FreeRTOS implementation, recursive mutexes use a block of memory, in which the mutex structure is stored. If a recursive mutex is created using xSemaphoreCreateRecursiveMutex() then the required memory is automatically dynamically allocated inside the xSemaphoreCreateRecursiveMutex() function. (see https://www.FreeRTOS.org/a00111.html). If a recursive mutex is created using xSemaphoreCreateRecursiveMutexStatic() then the application writer must provide the memory that will get used by the mutex. xSemaphoreCreateRecursiveMutexStatic() therefore allows a recursive mutex to be created without using any dynamic memory allocation.

Mutexes created using this macro can be accessed using the xSemaphoreTakeRecursive() and xSemaphoreGiveRecursive() macros. The xSemaphoreTake() and xSemaphoreGive() macros must not be used.

A mutex used recursively can be ‘taken’ repeatedly by the owner. The mutex doesn’t become available again until the owner has called xSemaphoreGiveRecursive() for each successful ‘take’ request. For example, if a task successfully ‘takes’ the same mutex 5 times then the mutex will not be available to any other task until it has also ‘given’ the mutex back exactly five times.

This type of semaphore uses a priority inheritance mechanism so a task ‘taking’ a semaphore MUST ALWAYS ‘give’ the semaphore back once the semaphore it is no longer required.

Mutex type semaphores cannot be used from within interrupt service routines.

See xSemaphoreCreateBinary() for an alternative implementation that can be used for pure synchronisation (where one task or interrupt always ‘gives’ the semaphore and another always ‘takes’ the semaphore) and from within interrupt service routines.
Example usage:

```c
SemaphoreHandle_t xSemaphore;
StaticSemaphore_t xMutexBuffer;

void vATask( void * pvParameters )
{
    // A recursive semaphore cannot be used before it is created. Here a recursive mutex is created using xSemaphoreCreateRecursiveMutexStatic().
    // The address of xMutexBuffer is passed into the function, and will hold the mutexes data structures - so no dynamic memory allocation will be attempted.
